ENGINEER OF RECORD CERTIFICATION

I, Stuart C. Pearson, of AMEC E&E, PC at 209-35 Northern Blvd, Bayside, New York am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for the design of the remedial program activities and construction inspections, and I certify that the Operable Units 1 and 2 Groundwater Treatment Systems Extraction/Recovery Well Electrical System Upgrades were completed and that construction activities were completed in substantial conformance with the Department-approved Design (AMEC, June 2020a) and Work Plan for Operable Units 1 and 2 Groundwater Treatment Systems Extraction/Recovery Well Electrical System Upgrade (EnSafe, March 2021a).

SECTION 1
INTRODUCTION AND SITE BACKGROUND

On behalf of Lockheed Martin Corporation (Lockheed Martin), EnSafe Inc. (EnSafe) has prepared this Construction Completion Report (CCR) for electrical upgrades to the existing Operable Unit (OU) 1 and OU2 groundwater treatment systems (GWTS) that were performed at the Former Unisys Site located in the Village of Lake Success and Town of North Hempstead, New York (the Site). The Site is listed by New York State Department of Environmental Conservation (NYSDEC) as a Class 2, Inactive Hazardous Waste Site (NYSDEC Site No. 130045). This CCR includes project and site background information, a description of the pre-construction and construction activities completed, and deviations from the design.

1.1 SITE BACKGROUND

The Site is located at 1111 Marcus Avenue, Lake Success, New York and is a 90-acre property fully developed with the former main manufacturing building, smaller support buildings, three recharge basins, and parking lots (Figure 1 and Figure 2). Currently, the Site is occupied by multiple tenants for commercial use. The surrounding properties are used for residential and commercial activities.

Groundwater at the Site is impacted by chlorinated volatile organic compounds (VOCs), predominantly: trichloroethene, tetrachloroethene, cis-1,2-dichloroethene, and Freon 113. Soil and sediment at the Site are impacted by metals and polycyclic aromatic hydrocarbons.

The Site consists of two OUs: OU1 (the 90-acre site) and OU2 (the off-site groundwater contamination). The remedy for both OUs includes GWTSs, as well as other remedial components including a soil vapor extraction system, two active sub-slab depressurization systems (SSDSs), a passive venting system, environmental easements, water supply protection, and a Site Management Plan (currently draft).

1.2 PURPOSE OF UPGRADES

The existing electrical and instrumentation controls at the extraction wells (EWs) and recovery wells (RWs) for the OU1 and OU2 GWTSs were originally installed over ten years ago. The majority of the components had reached the end of their operational life expectancy and needed to be upgraded or replaced to improve reliability of the system. Improvements to electrical service also included a new variable frequency drive (VFD) at the OU2 RW, as identified for the NYSDEC.

Work was performed in general accordance with the 100% Revised Design: Operable Units 1 and 2 Extraction/Recovery Well Electrical Upgrades (AMEC, June 2020a) and the Work Plan for Operable Units 1 and 2 Groundwater Treatment Systems Extraction/Recovery Well Electrical System Upgrade (EnSafe, March 2021a), as described in this CCR. Areas of work can be found on Figure 3.

SECTION 2
EXTRACTION WELL ELECTRICAL UPGRADES

2.1 PROJECT ORGANIZATION

Listed below are the key companies and personnel involved with completing this work.

- Principal Responsible Party – Lockheed Martin Corporation
- Remediation Technical Operations (RTO) – CDM Smith
- Engineer of Record – AMEC E&E, PC (AMEC)
- Primary Contractor – EnSafe
- Key EnSafe Subcontractors:
    - Construction – EnviroTrac
        - Electrician – Hinck Electrical Contactors
        - Electrical Controls – Eagle Controls
        - Independent Third Party Electrical Inspection – Electrical Inspectors, Inc.
    - Waste Disposal – Innovative Recycling Technologies
- Soil Compaction and Concrete Testing – Soil Mechanics Drilling Corp.

2.2 GOVERNING DOCUMENTS

- 100% Revised Design: Operable Units 1 and 2 Extraction/Recovery Well Electrical Upgrades (AMEC, June 2020a)
- Startup, Testing, and Commissioning Plan: Operable Units 1 and 2 Extraction/Recovery Well Electrical Upgrades (AMEC, March 2021)
- Work Plan for Operable Units 1 and 2 Groundwater Treatment Systems Extraction/Recovery Well Electrical System Upgrade (EnSafe, March 2021a), which included the following plans:
    - Community Air Monitoring Plan
    - Construction Management Plan
    - Construction Quality Control Plan
    - Health and Safety Plan

- Emergency Response Plan
- Traffic Control and Transportation Plan
- Security Plan
- Site and Temporary Facilities Layout Plan
- Environmental Protection and Erosion Control Plan
- Waste Management Plan
- Permit Compliance Plan

2.3 SUBMITTALS

Submittals to the Engineer of Record (AMEC) included warranties, insurance, shop drawings, manufacturers' certifications, product literature and data, samples, information submittals, requests for information, and procurement of materials in accordance with the Drawings and Specifications (AMEC 2020a). Submittals were approved as compliant with design except as noted in Section 2.18. The submittal register is provided in Appendix A.

2.4 PERMITS

The work was subject to Village of Lake Success Application for Permit to Build or Install (Commercial Building Permit) (Permit No.: 20-106A) and Town of North Hempstead Application for Electrical Equipment Installation (Permit No.: 20210998).

After the completion of the work, UL inspections of electrical components were completed by an independent third-party company, Electrical Inspectors, Inc., of East Meadow, New York. The inspection of OU2 and RW-100 was completed on May 25, 2021 with no deficiencies found by the electrical inspector. The OU1 and associated vault inspections were completed on May 25, 2021 with no deficiencies found by the electrical inspector. The inspection certificates were provided to the Town of North Hempstead and Village of Lake Success on July 27, 2021 to finalize the permits. Copies of permits and the Inspection Certifications are provided in Appendix B.

2.5 APPROVALS

NYSDEC and the New York State Department of Health approved the Work Plan on March 10, 2021 (Appendix C). There were no additional approvals required from NYSDEC or the New York State Department of Health to complete this work.

2.6 COMMUNICATIONS AND REPORTING

The Work Plan required the preparation and submittal of daily reports and weekly reports. Each daily report contains a summary of weather, equipment, work performed, photographs, and other pertinent information. The daily reports were prepared by the Site Health and Safety Officer and uploaded to the project SharePoint site for team review (Appendix D). The weekly reports were provided to Lockheed Martin and NYSDEC via email (Appendix E).

Weekly progress meetings were held via teleconference to discuss progress, deviations, and other relevant information.

2.7 SCHEDULE

Work was performed the following days; details can be provided in each day's report (Appendix D):

- March 15 through April 22, 2021
- April 28 through May 10, 2021
- May 17, 2021
- June 3, 2021
- June 14 and 15, 2021
- June 28, 2021

2.8 MOBILIZATION

2.8.1 Construction Kickoff Meeting/Operational Readiness Review

A pre-construction meeting/Operational Readiness Review was held with EnSafe, Lockheed Martin, the RTO (CDM Smith), the Engineer (AMEC), and EnviroTrac on February 24, 2021 prior to field mobilization to confirm and document the readiness of all contractors/subcontractors, operators, and equipment/materials/systems to perform the intended work.

2.8.2 Photo Documentation of Site

The site was photographed after work was completed to document work areas disturbed and modified during this construction program. Progress photographs are provided in the daily reports (Appendix D) and the pre- and post-construction photographs are provided in Appendix F.

2.8.3 Delivery of Materials and Equipment and Site Preparation

The construction staging area was established in the parking lot outside of the OU1 GWTS building where materials and equipment were staged for the project. The construction work areas were established at each well vault as work progressed. Existing fencing was utilized at RW-100 and temporary fencing was not required at the OU1 vaults because the work was contained within the vaults. Erosion control (silt fencing) was installed at OU2 prior to excavation activities.

Traffic, vehicles, and equipment were managed in accordance with the Traffic Control and Transportation Plan. Complaints made to Lockheed Martin or EnSafe personnel were addressed as soon as possible. The following complaints were received:

- The OU1 property owner raised concern regarding tire impressions and ruts in a grassy area. The ruts were caused by subcontractor equipment traveling the grassy area following a rainy day. The grassy area was raked and seeded once work in the area was complete.
- The OU1 property owner raised concern regarding damaged sprinklers near the OU1 RWs. The area was investigated, and it was determined the damaged sprinkler was outside of work areas. Therefore, damage to the sprinklers was not caused by EnSafe staff or subcontractors.

2.8.4 Intrusive Fieldwork Requirements

Utility location and mark-out were conducted by a private utility locator in addition to contacting the one-call service for New York State. The one-call service was notified at least 72 hours prior to any excavation work. A dig permit and risk handling checklist were completed as needed. Existing information regarding suspected or known underground utilities and structures was provided to the private utility locators to assist with utility and services location. The utility mark-out report, dig permit, and risk handling checklist are provided in Appendix G.

2.8.5 Personnel Mobilization

Field personnel completed a site orientation including review of the site-specific Health and Safety Plan (HASP) before or upon mobilizing to the Site. Onsite personnel were properly trained in

Occupational Safety and Health Administration hazardous-waste operations (HAZWOPER) and annual refresher training. Onsite personnel also received radiation awareness training and were informed regarding site-specific radiation hazards.

2.9 CONSTRUCTION OVERSIGHT

EnSafe provided one full-time on-site construction manager/superintendent/health and safety officer as well as a support team (engineering support, project manager, etc.) for project management and construction quality control oversight; tasks included:

- Construction management and field oversight of staff, materials, and equipment to ensure work was implemented in accordance with the design documents, work plans, and permits
- Implementing site and work controls to protect the workforce, site occupants, environment, and property, including confined spacy entry permits
- Implementing health and safety requirements and performing daily health and safety tailgate meetings
- Inspections and testing
- Coordinating and hosting inspections by regulatory authorities as needed; submitting copies of inspection reports and certifications
- Implementing the Construction Quality Control Plan and associated quality controls

2.10 HEALTH AND SAFETY

Work was performed in accordance with governmental requirements, including Site and worker safety requirements mandated by Federal OSHA, as prescribed in the Project-Specific HASP and the Emergency Response Plan (EnSafe, March 2021a). EnSafe and all subcontractors participated in daily safety tailgate meetings and conformed to HASP requirements. The daily tailgate meetings were documented in the daily Safe Work Assessment and Permit (Appendix H).

Safety audits were performed on April 7, 2021 and June 14, 2021; these audits did not identify any deficiencies (Appendix H).

COVID-19 precautions such as wearing masks and maintaining distances as much as practicable were also taken as required by New York State and local authorities.

2.11 COMMUNITY AIR MONITORING

Because intrusive ground surface activities were limited to the OU2 GWTS site and were surficial in nature, the community air monitoring plan was to consist of dust monitoring during the OU2 GWTS site work. Due to a miscommunication with the subcontractor, air monitoring was not performed during the only time intrusive work was performed as part of this project (3 hours on March 29, 2021); however, no visible dust was generated during this work.

2.12 DEMOLITION

Demolition activities included the abandonment and removal of corroded electrical equipment and electrical panels in the EW-1R, RW-1RS, RW-1RD, and RW-100 well vaults, including:

- Performing inventory and recording the condition of items scheduled as "remove and re-install."
- Protecting structures, equipment, permanent fixtures, and existing finish work from soiling or damage, as required.
- Disconnecting and capping utilities within the work area as needed in coordination with the utilities. Other utilities serving occupied or used facilities, except when authorized, were maintained and protected.
- Removal of existing electrical panels from each EW/RW vault.
- Removal of abandoned conduits and electrical equipment in each EW/RW vault.
- Filling holes in the EW/RW vaults walls from removal of existing equipment and conduit.
- Sealing existing and new vault electrical penetrations.
- Maintenance of erosion control measures.

2.13 SITE WORK

Site work activities included installing a concrete pad for the RW-100 VFD and remote control panel (RCP). Tasks included:

- Clearing and grubbing
- Excavation for new concrete pad
- Onsite management of soil for site grading
- Backfilling and compaction

    - Fill material consisted of approximately two cubic yards of crushed stone subbase that was placed below the concrete pad. This material was obtained from Tilcon New York's West Nyack Quarry, which is a 100% virgin traprock source.

- Installation of new cast-in-place concrete pad
- Site grading and seeding
- Maintenance of erosion control measures

Installation of a concrete pad for the OU1 harmonic filter required the following tasks:

- Removal of asphalt surface material
- Preparation and compaction of subgrade material for concrete pad installation (no subsurface soils were removed)
- Installation of new cast-in-place concrete pad
- Removal of forms and repair of asphalt around concrete pad

Installation of a concrete pad for the OU2 vault stairs required the following tasks:

- Removal of asphalt surface material
- Management of subsurface soil (re-use on-site)
- Preparation and compaction of subgrade material for concrete pad installation
- Installation of new cast-in-place concrete pad
- Remove forms and repair asphalt around concrete pad

2.14 SYSTEM WORK

2.14.1 Electrical Equipment Upgrades

EnSafe and its subcontractors completed upgrades to electrical equipment at the EW-1R, RW-1RS, RW-1RD, and RW-100 well vaults in accordance with the Work Plan, Drawings and Specifications; permits; and local, state, and federal codes and regulations. Tasks included:

- OU1 GWTS
    - Replacing electrical and instrumentation RCPs at OU1 GWTS well vaults EW-1R, RW-1RD, and RW-1RS
- OU2 GWTS
    - Installing new Allen-Bradley PowerFlex 755 VFD for RW-100 well pump

  - Installing two new electrical panels above grade at the RW-100 well vault
  - Installing a new breaker at the motor control center (MCC)
- OU1 and OU2 GWTSs
  - Replacing electrical junction boxes, conduit, outlets, light fixtures, and switches to remain in the vaults after removal of the RCP, starter panel, and power panel with corrosion resistant materials
  - Installing active harmonics filters at each GWTS
  - Inspection and testing of the new installations
  - Maintenance of erosion and sediment control measures during construction
  - Protection of the existing operating systems during construction activities
  - Patching and repair of well vaults

The following required criteria were met by the installation:

- Code required clear space in front of panel: 36-inches minimum, 42 inches minimum for 480-volt panels (48 inches in front of equipment)
- Code required maximum height to panel disconnect: 6 feet, 6 inches
- Minimum spacing between panels: 6 inches for room to install conduit hubs
- Mounting: Stainless steel unistrut mounted on a new concrete pad adjacent to the existing vault
- Enclosures: National Electrical Manufacturers Association 4X Stainless Steel
- Area classification: Non-hazardous (no hazardous classification areas)

Power distribution from the MCCs in each GWTS to the well vaults did not change with this design; existing feeds from the MCCs were connected to the new panels which in turn feed individual devices.

2.14.2 Instrumentation and Controls Upgrades

EnSafe and its subcontractors completed upgrades to existing instrumentation and control systems in accordance with the Work Plan, Drawings and Specifications; permits; and local, state, and federal codes and regulations. Tasks included:

- OU1 and OU2 GWTSs
  - Installing new RCPs inside the EW-1R, RW-1RS, and RW-1RD well vaults and outside the RW-100 well vaults
  - Connecting existing input/output (I/O) to the new RCPs
  - Installing new water level transducers
  - Installing new intrusion alarms on each panel
  - Installing a new intrusion alarm vault at each well vault
  - Providing spare I/O for future use
  - Upgrading ethernet switches associated with the fiberoptic system to provide a self-healing network such that one break of the fiber does not take down all pumps (this includes upgrades for fiberoptic connections at the MCPs and OU1 GWTS RW-3)
  - Reprogramming the MCPs to update the supervisory control and data acquisition (SCADA) systems, including the Main SSDS SCADA, Win911, and the historian (located at the Main SSDS Control Room) to accommodate the new controls
  - Inspection and testing of the new installations and controls
  - Replacing the existing RW-100 1769 CompactLogix Programmable Logic Controller with an Allen-Bradley 1794 Flex I/O module (reused the existing Allen-Bradley 1794 Flex I/O modules at EW-1R, RW-1RS, and RW-1RD)
- OU2 GWTS
  - The automatic control of the RW-100 well pump was added based on flow rate. The Programmable Logic Controller will automatically adjust the VFD output to control the pump flow rate to the setpoint entered in the SCADA interface. Manual overrides of the automatic control are available at the SCADA interface and at the RCP.

2.15 START-UP, TESTING, AND INSPECTIONS

2.15.1 System Startup and Testing

Startup testing of the GWTSs was performed by AMEC and EnSafe, along with its subcontractors, and in coordination with the operations, maintenance, and monitoring contractor in accordance with the *Starting, Testing, and Commissioning Plan: Operable Units 1 and 2 Extraction/Recovery Well Variable Frequency Drive Upgrade* (AMEC 2021). Startup testing included calibration of instrumentation and control devices; performing inspections and testing; implementing start-up and shake-down procedures of the control and monitoring equipment associated with the

EW/RWs; and all else required to produce a fully functioning system and to complete this work in accordance with the final design documents.

During this startup phase, each system component was started and tested through its full range of operational capability and then the system was started as a whole. The system tests verified the functionality and operational conditions including normal, alarm, manual, auto, and off. Following successful system start-up as determined by the Engineer, a demonstration test was conducted.

Testing documentation is provided in Appendix I; Operation and Maintenance Manuals are provided in Appendix J.

2.15.2 Concrete and Compaction Testing

The RTO coordinated third party concrete and compaction testing for the RW-100 concrete pad on April 5, 2021. Concrete and compaction testing were performed by Soil Mechanics Drilling Corp. of Seaford, New York. Concrete and compaction test results are included in Appendix K.

2.15.3 Substantial Completion Inspection

The substantial completion inspection was performed by AMEC on June 3, 2021. Minor items were noted and resolved by June 28, 2021; the Engineer's representative was present during the June 28, 2021 site visit to confirm all minor items were addressed to their satisfaction.

2.16 SITE RESTORATION AND DEMOBILIZATION

Upon completion of work, signs of the construction such as work areas, structures, foundations of temporary structures, and stockpiles of excess or waste materials were removed. Demobilization included removal of equipment, materials, debris, and other items that were delivered to the Site and/or generated during the work that are not part of the permanent installations; final cleanup of the project site; removal of erosion and sedimentation control facilities; and final restoration of the work area including maintenance of seeded areas until new vegetation is established. Temporary facilities at the Site were terminated and removed.

2.17 ADDITIONAL WORK

During implementation of the work, the following additional tasks that were not part of the design were also performed:

- **Fiber optic loop:** Prior to the initiation of work at the OU1 vaults, a concern was raised that the fiber optic loop was unable to maintain communication with the main control panel if the power was shut off at one of the EW vaults, RW-1RS or RW-1RD. This condition would cause the entire system to shut down. During the time that power was off, a temporary connection was required within the RW-1RS and RW-1RD vaults in order to maintain communication and allow the remainder of the system to operate. Additional programming was also conducted within the system controls, further allowing a single well to be off-line with the remainder of the system operational.

- **Grounding at RW-100:** Upon beginning work at RW-100, it was determined that a ground grid was not present as originally indicated on the design drawings. As a result, grounding at RW-100 was accomplished via a newly installed grounding rod.

- **Damaged conduit at RW-100:** During excavation for the concrete pad at RW-100, a damaged electrical conduit was discovered below grade and within the footprint of the excavation. The damaged conduit was inspected and based on the presence of tape around the damaged section, it was apparent that a previous repair had been attempted to the conduit, prior to the excavation work. Hinck repaired the damaged electrical conduit by disconnecting the wires in the conduit from the control panel and pulling them back through the conduit to the damaged section, cutting out the damaged section and installing a new coupling, pulling wires back to control panel, and then reconnecting the wires to the control panel.

- **OU1 harmonic filter:** The final design for the OU1 harmonic filter implied it would be mounted to an existing wall. However, based on field conditions, it was determined that wall mounting was not feasible. The Engineer then directed that the OU1 harmonic filter be installed on a reinforced concrete pad located along the western exterior of the OU1 groundwater treatment building. EnviroTrac completed the concrete pad by removing existing asphalt in the area of the proposed concrete pad, compacting underlying soil (subbase), and pouring a 6-inch thick, 4-foot by 3-foot slab-on-grade concrete pad with 6-inch reinforcing wire fabric. The Engineer and RTO did not require soil compaction or concrete testing related to the installation of this OU1 harmonic filter pad because the concrete pad was installed on undisturbed, compacted subbase.

- **Stray voltage:** Stray voltage was previously identified at vaults EW-1R, RW-1RS, and RW-1RD prior to the initiation of this project. At the request of the RTO and Engineer, on June 28, 2021 EnSafe's electrical contractor visited the site to perform an investigation into possible sources of the stray voltage. During the investigation, the electrical contractor was able to isolate the occurrence of stray voltage and determined it was from the inductance of voltage across the 480-volt pump power cables and the applicable vault power cables that run in the same conduit to the EW-1R, RW-1RS, and RW-1RD vaults.

2.18 DEVIATIONS

Record drawings are included in Appendix L. Deviations from the design are shown on the drawings and are summarized below:

- **Grounding at RW-100:** Grounding at RW-100 was accomplished via a grounding rod, after it was determined that the ground grid was not present, as discussed in Section 2.17.

- **OU1 harmonic filter:** The OU1 harmonic filter was installed on a concrete pad instead of mounted to the treatment building, as discussed in Section 2.17

- **OU2 vault stairs installation:** The project design included stairs to be installed at the utility vault outside the OU2 treatment building. The stairs were determined to require a foundation or support system for long term stability. A concrete pad was designed and constructed where the stairs were placed. Railings on the stairs and vault were also provided as additional safety measures.

- **RW-100 Structural supports**: The structural supports for the electrical panels at RW-100 were constructed of 1.5 inch Unistrut rather than the 3" x 3" hollow structural sections. An angled brace was added to the vertical supports, located 18 inches up and 18 inches out from the base.

- **Washing and rinsing of electrical components and piping:** This was not required because the materials removed did not include piping that contained contaminated groundwater.

SECTION 3
WASTE MANAGEMENT REPORT

EnSafe and its subcontractors managed, coordinated, and directed waste management activities including loading, removal, transportation, and proper disposal at Lockheed Martin-approved scrap and construction/demolition waste facilities in accordance with the Project-Specific Waste Management Plan; applicable local, state, and federal regulations; and Lockheed Martin procedures. Because waste soils were not generated, NYSDEC approval of disposal facilities was not required.

3.1 WASTES GENERATED

Generated wastes are summarized in the table below.

Waste	Quantity	Disposal Facility and Location
Electrical and piping demolition materials (non-metal; non-recyclable)	1 cubic yard box (approximately 700 lbs)[1]	Veolia ES Technical Solutions Flanders, New Jersey, with final disposal at Environmental Recovery Corporation Lancaster, Pennsylvania
Excess plastic and conduit (non-recyclable)		
Asphalt	1 cub yard box (approximately 500 lbs)	
Electrical and piping demolition materials (metal, recyclable)	2,000 lbs	Arrow Scrap West Babylon, New York
Excess Soil	Excess soils were not generated; excavated materials from the RW-100 vault and installation of stairs at OU2 were regraded onsite.	
Water	There were no water wastes generated from this work.	

Notes:

[1] Because this waste shipped for final disposal with soil waste from a concurrent project on the Site, this waste was shipped under manifest as "non-hazardous soil" even though a profile was established for "non-hazardous metal and debris."

Wastes were handled and managed in accordance with NYSDEC guidance and regulations, including New York Codes, Rules and Regulations Part 375, and applicable United States Department of Transportation, United States Environmental Protection Agency, and Resource Conservation and Recovery Act regulations.

3.2 WASTE CHARACTERIZATION

Because waste soils and water were not generated during this work, waste characterization was not required.

3.3 WASTE STORAGE

Wastes were stored in lined cubic yard boxes and located either inside the staging area adjacent to the OU1 GWTS building or inside of the Main SSDS building, pending approvals for off-site disposal.

3.4 DOCUMENTATION

Waste management documentation including chain of custody forms, shipping documents, and facility receipts are provided in Appendix M.

OWNER'S AUTHORIZATION

I (we) hereby certify that:

1. I (we) agree to permit the Building Inspector and any officer or employee of the Town of North Hempstead to enter upon the premises in the discharge of their duties with this application.
2. Approved plans and a copy of the approved permit shall remain on the premises at all times until a Certificate of Completion is issued. These plans shall be made available to the Building Inspector upon request.
3. Building Inspector shall be given a minimum forty-eight (48) hours notice to make the required inspection and no work shall continue until such inspection has been completed and approved.
4. Owner or his/her representative shall be responsible to arrange for all required inspections.
5. Owner shall be responsible for the presence of the appropriate representative for the required inspection as directed by the Building Inspector.
6. Permit shall expire three (3) months from the date of issuance unless construction is in progress. No work is to be started until permit has been received and posted by the owner / applicant. Commencement of any work prior to the receipt and posting of the permit will result in the assessment of double fees penalties pursuant to §2-28 C of the Code of the Town of North Hempstead
7. Work shall be permitted between the hours of 7:30 AM and 6:00 PM, Monday through Friday only.
8. Occupancy or use of the premises without first obtaining Certificate of Completion / Approval is unlawful and may subject the owner of the premises to the penalties described in the Code of the Town of North Hempstead.

I Peter McLean (Property Owner) deposes and says that he/she resides at 1111 Marcus Ave., North Hempstead in the State of NY, that he/she is the owner in fee of all certain lots, parcel of land shown on the attached survey, Section 8 Block B18 Lot (s) 300H situated, lying and being within the unincorporated area of the Town of North Hempstead; that I/we have read and understand items one (1) through nine (8) as here in stated, recognize that he/she is responsible for all activities occurring on the property, and that failure to comply with any of the items, not withstanding any other items defined in the Code of the Town of North Hempstead, may result in the temporary suspension or permanent revocation of the permits issued for construction on the premises in accordance with the Code of the Town of North Hempstead.

SAMPLING, TESTING & INSPECTIONS	
Description	**Company/Personnel**
NA	

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
Demo debris of assorted metal conduits/wire/fittings from RW-1RD; consists of conduit, boxes, box covers, wire, etc.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	On site	EnSafe (MBG/NM) Hinck (BH/GC), and EnviroTrac (JW) on site.
07:06	Air Monitoring	4 gas meter/ PID calibrated.
08:00	Mobilization	EnSafe (RM) on site. all parties speak about heading over for a mobilization meeting is the SSDS building
08:10	Meeting	Every party mobilizes to the SSDS building for the pre work meeting. The work plan was discussed as well as completed the radiation training. Lockout tag out between Hinck and PES was reviewed. EnSafe conducted the health and safety meeting as well as went over specifics in the work plan.
09:30	Meeting complete	All parties head back to OU1 to convoy to RW-1RD
09:35	EnviroTrac offsite	
09:57	RW-1RD	EnSafe and Hinck are on site at RW-1RD. RM and Hinck head down into vault to check out the work area before work is started. Hinck pulls their material truck up onto the lawn and parks near the vault p. 4 gas meter deployed and has no response to vaults air conditions. See “confined space alternate procedures permit and certification” form.
10:50	Delivery	Dean from Eagle here to drop of fiber box and control panel box.
11:00	RW-1RS	EnSafe (RM) wants to go into vault RW-1RS. EnSafe opens vault and deploys 4 gas meter and it doesn’t alarm. Pictures we’re taken and RM exits vault.
11:28	Start up	Hinck is starting to unload tools and some conduit from their box truck.

11:45	Demo starts	Hinck begins removing the existing corroded conduit from RW-1RD. After speaking with the foreman, Hinck plans to continue demolition for the reminder of the day.
13:35	Air Monitoring	4-gas/PID values remain the same. They haven't fluctuated yet.
14:03	Fiber box	Hinck is lowering the fiber box for fiber optic into the vault for it to be mounted.
14:41	Fiber box	Fiber box is mounted. Work will continue tomorrow.
15:00	Demobilization	Hinck loads all demoed waste into truck and brings to OU1 treatment plant drum storage area. All demo waste placed inside fenced area - PES approved this location. Temporary storage until proper disposal coordinated. All vaults closed and secured.
15:15	Demobilization	Hinck offsite MBG/NM review day's work
15:48	Offsite	EnSafe (MBG and NPM) offsite.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
Conduit, PVC pipe, unistrut, junction boxes and the control panel (see photo)

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	EnSafe (MBG and NPM) as well as Hinck Electric (BH and GC) rally at meeting point OU1. NPM Performs safety meeting.
07:28	RW-1RD	NPM on site at RW-1RD with Hinck. Vault opened to provide passive ventilation. 5 minutes elapse. 4 gas meter is bump tested and placed at the opening of the vault. The readings clear. O2: 20.9% CO: 0 ppm H2S: 0 ppm LEL: 0% VOC: 0ppm. Hinck begins to unload tooling from their box truck which was kept at OU1 overnight. Based on 4-gas readings, Hinck given clearance to enter vault.
09:45	RW-1RD	Paul Lanzillotta from Eagle came over to talk with Hinck about shut down of well. MBG is notifying PES that the shutdown will happening at approximately 11:00am. Observe readings on 4 gas meter and note 3 0ppm of VOCs (all others OK). Notify Hinck and conclude that it is the PVC glue being used by Hinck in vault setting is causing the elevated VOC reading. With glue capped, VOC reading drop back to normal level. Will continue to monitor VOC levels.
10:05	RW-1RS	Hinck needs to get into vault RW-1RS to plug in an extension cord that they are using for temporary power. EnSafe (NPM) unlocks vaults to ventilate. He waits about 5 minutes then puts 4 gas meter in. Readings are all normal. Hinck enters vault to do work.

10:10	Call to Dave (Plant supervisor)	Hinck calls Dave (PES) to discuss the plan for the system shutdown. Dave gives the okay and indicates PES is currently doing sampling so will need approx. 1 hr before conducting shutdown. Hinck OK with timeline, have other tasks to complete. Wayne (PES) to call when ready to execute shutdown. Paul with Eagle offsite. EnSafe asks Hinck if they are alright working in vault environments with the PVC glue. Hinck confirms they are alright with working in the vault. 4 gas meter monitoring/ documenting will take place more thoroughly.
11:06	Delivery	Hinck pickup truck is on site dropping off some material for the job.
11:33	4 gas meter check	All readings within background except VOCs are at 8 ppm.
11:34	Shutdown	Hinck coordinated with PES. Shutdown process is starting now.
11:43	Shutdown	PES informs Hinck of system shutdown. PES confirms power is shutdown at vault. The power to the well pump and power going to vault RW-1RD are locked out and tagged. Hinck checks power on the vaults end and is ready to start work. Hinck proceeds with switching connections.
12:13	Start up	Hinck got their wires transferred over and spliced through in new junction box. Hinck then calls Dave and there finds out there are alarms in the system where there shouldn't be. Hinck is going to call Eagle to get them back to vault RW-1RD to look at the fiber connections.
13:30	Eagle on site	Eagle has returned to site to check out the fiber that was hooked up by Hinck. He couldn't see any problem and is headed over to OU1 to check to see if there is a problem on that end. Paul heads to OU1
14:29	System running	Problem was solved at OU1. The system is up and running. Power is still down at RW-1RD and will remain down until work is complete.
14:30	Demobilization	Hinck is starting to pass tools up from vault to get packed up to head off site. They will need to put their lock on the lock out tag out before they leave site
14:46	Demobilization	Hinck and EnSafe drive to OU1 to unload waste and talk about how the day went. Hinck puts there locks over the PES locks that are on "RW-1RS VAULT POWER" as well as the well pump for the vault.
15:15	Demobilization	Hinck and EnSafe offsite.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
NA

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck (GC and BH) and EnSafe(NPM and MBG) meet at OU1 rally point. NPM conducts safety meeting.
07:26	RW-1RD	Hinck and NPM convoy to RW-1RD. NPM opens the vault to naturally ventilate for 5 mins. The 4 gas meter is then bump checked. All readings come back normal: 02: 20.9% CO: 0ppm H2S: 0 ppm LEL: 0% VOC: 0ppm The monitor's tubing is lowered into the vault. The monitor still reads fine after a few minutes, EnSafe gives Hinck clearance to enter the vault and begin work.
07:36	Mobilization	Hinck starts the day by unloading tools off box truck and lowering them down into the vault. They get a drop light set up down in the vault for sufficient light to work. Hinck shuts down main breaker to the sub panel killing power in the vault. BH locks it out with single breaker lockout device to ensure it won't get accidentally flipped on.

08:12	Delivery	Hinck gets a delivery from one of their guys in a pickup truck. It consisted of a few small boxes. He is on site for about 10 minutes then heads off site.
08:26	Gas monitor reading	NPM checks gas monitor and all readings are normal besides VOCs which is reading 6 ppm. Hinck is using PVC glue in the vault so we expect to see VOCs above background multiple times today. NPM informs Hinck of the elevated reading, both parties agree its related to PVC glue and will monitor with Hinck if they would like additional ventilation.
09:59	Gas monitor reading	NPM checks gas monitor and everything is still reading normal besides VOC. VOC spiked to 50 ppm but dropped down after a few seconds and is now ranging from 6-10 ppm. Hinck indicates that they don't have any physical effects and want to continue work with one vault hatch open.
10:47	RW-1RD	Hinck has new power panel mounted to wall. They are continuing to add new PVC conduit circuits. BH thinks they will get to the knife switch on the back half of the vault today so they are beginning to organize their material/tools to do so.
10:53	Gas monitor reading	All readings came back normal. VOCs went down and are hovering between 0.6-1.0 ppm
11:57	CDM and EnviroTrac on site	Craig Moore (CDM) as well as Theodore Masters (EnviroTrac) on site at RW-1RD. I conduct a safety meeting for both parties and let them on site. Craig is taking notes. Theodore heads down into vault and takes pictures for upcoming work.
12:06	CDM and EnviroTrac offsite	
13:20	Delivery	Hinck gets another delivery from their pickup truck. This order consisted of some unistrut and two boxes of miscellaneous material
13:33	Eagle on site	Eagle is on site to drop off two new control panels. Hinck and Eagle unload them off Eagle's pickup and load them into Hinck's box truck. The drop off included the internals to the back box in RW-1RD, the back box and internals for RW-1RS, as well as the back box the vault after that.
14:08	Control Panel	Hinck lowers Eagle control panel in vault RW-1RD. It took Hinck and NPM to lower the control panel into the vault. Now they are pulling tools out of the vault and packing up the box truck.
15:00	Off site	Hinck is offsite. No waste was generated today so there was no demobilization at OU1. Hinck left the site from RW-1RD.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck (Gabe Costa and Bob Herrmann) and EnSafe (NPM and MBG) meet at OU1 rally point. NPM conducts safety meeting.
07:37	Mobilization	Hinck and NPM convoy to RW-1RD. NPM opens the vault to naturally ventilate for 5 mins. The 4 gas meter is then bump checked. All readings come back normal: 02: 20.9% CO: 0ppm H2S: 0 ppm LEL: 0% VOC: 2 ppm The monitors tubing is lowered into the vault. The monitor still reads fine after a few minutes, EnSafe gives Hinck clearance to enter the vault and begin work.
07:38	Mobilization	Hinck starts the day by unloading tools off box truck and lowering them down into the vault. They get a drop light set up down in the vault for sufficient light to work. Hinck shuts down main breaker to the sub panel killing power in the vault. BH locks it out with single breaker lockout device to ensure it won't get accidentally flipped on.
08:28	RW-1RD	NPM hears 4 gas go into alarm. He rushes over to check it out. VOCs have spiked to 350 ppm. Hinck is ordered to get out of the vault. NPM opens second vault hatch to allow more air flow. After a few minutes the gas meter is reading normal once again. The problem was once again correlated to the PVC glue being used.
08:40	Checking out vaults EW-1R and RW-3	NPM and BH head over to vaults EW-1R and RW-3 to check out the specs on distance between the two. Hinck needed to know if

		there was conduit running between the two. There were two conduits in fact running between the two vaults.
09:44	Visitors	Tom Whitaker from AMEC comes by the site to see the progress made on RW-1RD. He and BH speak about the progress. I conduct a safety meeting with Tom to explain the hazards. Tom and BH go down into the vault to look at the progress.
10:13	Visitors	Tom (AMEC) is back on site to oversee some of the electrical work. Kevin Loyst with FPM is on site. He is just looking for general progress of the project to report it back to the town of Lake Success. He is on site for about 5 mins then leaves.
10:13	Gas monitoring	4 gas meter is still picking up above average VOCs. Whenever PVC glue is in use it will range from 20-100 ppm. A large spike has not occurred since the second vault hatch was opened. Hinck is running conduit for various outlets and switches.
10:59	RW-1RD	Hinck is starting to pull wire through the new conduits they ran to feed to circuits.
11:17	Gas monitoring	Hasn't been a spike in VOCs for about an hour. NPM checks monitor and everything is reading normal. VOC's are hovering around 6 ppm.
12:00	DW-1RD	Hinck continues to run wire to circuits in need of power. GFCI complete as well the receptacles being jumped out to each other.
12:29	Gas monitoring	NPM checks gas meter and every measurement is normal. There's hasn't been a VOC spike in two hours. Directly correlated to PVC glue use.
13:31	AMEC is offsite	Tom (AMEC) is offsite. Hinck continues work.
14:23	PVC coated galvanized lipe	After Tom (AMEC) electrical inspection from early today, Hinck brought up the fact that there is preexisting piping that is in good condition to stay. It is PVC coated galvanized pipe. Tom discussed this with AMEC Engineer of Record. According to Tom, AMEC Engineer of Record approved that the PVC coated galvanized can stay, so it will not be replaced.
14:42	Site secured	The work site in secured. Hinck is off site.
14:55	Site secured	Grabbed secured site photo. NPM is offsite.

PHOTO - Post work

Black pipe now secured on unistrut. Was hanging originally, more secure

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
Metal pipe, conduit, and wire from RW-1RS and RW-1RD.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	Hinck (Gabe Costa) and EnSafe (Nick McCarthy) meet at OU1. GC informs NPM that Hinck's, Bob Herrmann, is running late. GC and NPM decide to head to vault RW-1RD and BH will meet us there when he arrives on site. NPM conducts a safety meeting with GC.
07:15	RW-1RD	NPM and GC on site at RW-1RD. GC pulls their box truck(refer to equipment used on site page for info) up next to RW-1RD. NPM bump checks the 4 gas meter with both the 4 gas mixture and isobutylene. Both bump check's readings came back within 5% of the gas meters thresholds. NPM opens vault to let ventilate for 5 minutes. The readings on the meter are normal: 02: 20.9% CO: 0ppm H2S: 0 ppm LEL: 0% VOC: 0 ppm He places the 4 gas meter in and waits for readings. They come back normal. NPM gives GC clearance to start lowering tools down into the vault.
07:20	BH on site	BH is on site at RW-1D. NPM conducts a safety meeting with BH and informs him the vaults atmospheric conditions are fine to enter. Hincks shuts down main breaker to the sub panel killing

		power in the vault. BH locks it out with single breaker lockout device to ensure it won't get accidentally flipped on.
08:17	RW-1RD	Hinck is working on tying in a few circuits to the sub panel. Both BH and GC are working in the vault together.
09:14	Delivery	Hinck receives a delivery. It consists of PVC piping and unistrut.
10:43	RW-1RS	BH asks NPM if he could open vault RW-1RS so he could spec out what has to be done. NPM opens vault and lets ventilate for 5 minutes. NPM places 4 gas meter into vault and leaves it in for a few minutes. The readings are coming back normal. NPM gives BH the approval to go into vault.
10:43	Craig Moore onsite	Craig Moore is on site. He will be on and off site throughout the day checking on progress. He's moving between the DW-15 and VFD projects.
12:01	Craig Moore offsite	Craig Moore with CDM Smith is offsite after checking in on progress.
12:46	RW-1RS	BH is offsite, he has a work call related to the project. GC is going to transition to RW-1RS to start working on what he can for the remainder of the day. Before he starts work, NOM opens the vault, lets it ventilate for 5 minutes then places the 4 gas into the vault. NPM waits 5 minutes to see if readings on 4 gas change. The readings remain constant, NPM gives GC clearance to enter vault and start work. GC informs NPM that main breaker in sub panel is off and is locked out and tagged. GC will start demolition.
13:19	PES	Dave and Wayne with PES swing by RW-1RD/DW-1RS to take some readings.
13:22	Offsite	Hinck and PES are offsite.
13:46	Offsite	NPM is offsite after securing vaults.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) are on site as well as Ensafe's (NPM). NPM starts day by calibrating 4 gas meter. The multi gas span passes, all thresholds are within 2% of the limits they should hit from the calibration gas. VOC calibration passes. NPM then conducts a safety meeting with BH and GC. Craig Moore with CDM Smith is on site and will be on site periodically throughout the day to observe the power up of vault RW-1RD.
07:20	RW-1RD	Hinck and NPM are on site at RW-1RD. NPM opens both RW-1RD and RW-1RS and lets them ventilate for 5 minutes. The 4 gas meter goes into RW-1RD. The readings come back normal: O2: 20.9% CO: 0 ppm H2S: 0 ppm LEL: 0% VOCs: 0 ppm NPM gives Hinck clearance to enter RW-1RD.
07:28	Mobilization	Hinck begins to unload tools off box truck and lower them into vault. They will start the day by wiring in the rest of the sub panel in RW-1RD. Hinck informs NPM that was power is shut off to vault RW-1RD so they can begin work.
07:48	RW-1RS	GC wants to continue demo in RW-1RS. The sub panel in RW-1RD is close to complete. NPM drops 4 gas meter in RW-1RS. Readings come back normal. 02: 20.9% CO: 0ppm H2S: 0ppm LEL: 0%

		VOCs: 0 ppm GC gets clearance from NPM to go into vault. GC informs NPM the main breaker is shut off to vault RW-1RS so they can begin work.
07:52	Eagle on site	Paul L with Eagle is on site. NPM conducts safety meeting him. Paul will be periodically on and off site throughout the day.
08:17	Eagle back on site	Paul and Mike from Eagle are on site. They will be putting a configuration into the module in vault RW-1RD. The configuration is for the fiber communication between wells. NPM conducts a safety meeting with Mike. Paul informs NPM that the power up can happen within the hour.
08:25	RW-1RD	Splices made up in sub panel so they are ready to power up sub panel, which will power up Eagle's panel. Hinck has removed their lock and tag at OU1. PES will have to remove their lock to flip power on. Once power is on the the fibers in temp box will be moved over to Eagle panel. Two hard wired circuits will be tied in, the float switch and the e stop. Eagle and Hinck will check to see if float switch and emergency stop are working correctly.
08:52	System shut down	BH calls Wayne (PES) to ask for system shutdown to power up RW-1RD. Wayne will remove his lock on the breaker powering RW-1RD. The shutdown will be happening in 15 minutes.
09:07	System is shutdown	Wayne calls BH to inform him that the system is shutdown. Sub panel has power at RW-1RD. Well pump also has power but the disconnect will remain in the off position.
09:27	Fiber transfer	Hinck is transferring fibers from temp fiber box to Eagle control panel. Temp fiber box is removed from wall and taken out of the vault. Eagle connecting fiber to module. Emergency stop and float switch are landed.
10:18	Testing	Paul with Eagle Informs that there is communication through fiber from RW-1RD. Everything is working as it should. The float switch is working fine, as well as the emergency stop. Every test done at RW-1RD is seen at OU1 as it should. Next step, is start up.
10:44	RW-1RS	GC continues demo in RW-1RS.
10:53	Wayne on site	Wayne is on site. He did some tests while Hinck took amperage readings. everything checked out fine. Wayne is offsite. He will head back to OU1 to do some calculations then he will be back.
11:22	RW-1RS	Hinck is going to to temp feed the circuits that can't go offline at RW-1RS with power from the live receptacle circuit from RW-1RD so they can continue demolition.

12:45	Wayne on site	Wayne came and tested the flow rate, emergency stop, as well as the float. Each component worked the way it should. Wayne is offsite to reset the vault from OU1 to power it back up. Eagle is offsite.
12:49	RW-1RS	Hinck has been running new pvc conduit in n RW-1RS and has made some good progress.
12:57	RW-1RD	All tests have been run. It is complete aside from the supervised run time. Wayne informs NPM that they may start the wells supervised time today or they may wait until tomorrow. Thursday is the latest start up time for the well. Wayne heads off site.
14:00	RW-1RD	Vault is complete. PES has run tests and will have a supervised run tomorrow. Hinck continues demo in RW-1RS. Hinck has also started to put up some new conduit and boxes.
14:30	Hinck off site	
15:00	EnSafe off site

Description
See Nicholas McCarthy daily report

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00		Marshall Gibson at DW-15; see daily report for DW-15.
09:00	Drilling	Receive call from Nick McCarthy, EnSafe VFD. EnviroTrac at OU1 to do RW-100 mark out. MBG to OU1
09:15	OU1 Utility Markout	Meet with EnviroTrac: Jim Wilkinson and Mike Alliegro Utility Detection, Inc. Rob Fontain Markout area adjacent to Treatment Building for harmonic filter. Once complete - head over to OU2. Complete H&S meeting before driving over. Bob Hermann with Hinck comes by and asks to join for OU2 Markout - MBG agrees
09:45	OU2 Utility Markout	MBG/EnviroTrac/Utility Detection/Hinck at OU2 for utilitymarkout. MBG opens RW-100 vault to allow for visual assessment by BH (Hinck)
11:15	OU2 Utility Markout	Hinck offsite, back to OU1
11:41	OU2 utility markout	Mark out complete MBG/EnviroTrac/Utility Detection offsite. Vault to RW-100 and gates secured
11:51	DW15	MBG back at DW15 to check on progress; see daily report for DW-15.

		MBG stops by vault RW-1RS to check on progress/see how NM is doing.
13:30	Check in with Nick	NM indicates no issues, that Hinck has mostly demoed elec. components in vault that can be locked out from sub panel in vault. According to Hinck, they will be ready to shutdown RW-1RS tomorrow morning. MBG to DW15; see daily report for DW-15.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
RW-100 demolition waste: metal conduit, corroded pipe and circuits

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) as well as EnSafe (NPM) rally at our meeting point at OU1. NPM conducts safety meeting with BH and GC. GC heads out with Hinck's box truck to get gas.
07:10	RW-1RS	Hinck and NPM convoy to RW-1RD. NPM opens the vault to naturally ventilate for 5 mins. The 4 gas meter is then bump checked. All readings come back normal: 02: 20.9% CO: 0ppm H2S: 0 ppm LEL: 0% VOC: 0ppm The monitor's tubing is lowered into the vault. The monitor still reads fine after a few minutes, EnSafe gives Hinck clearance to enter the vault and begin work.
07:29	RW-1RS	Hinck starts the day by unloading tools off box truck and lowering them down into the vault. Hinck shuts down main breaker to the sub panel killing power in the vault. BH locks it out with single breaker lockout device to ensure it won't get accidentally flipped on.
08:52	PES and EnviroTrac	Dave and Wayne with PES come over to RW-1RD. They take a few readings down inside the vault and head off site. Tom Wilkinson with EnviroTrac is on site to check out the vaults and see progress. Tom asks NPM how to get to RW-100 because he needs to do his mark outs for the site work. I call Marshall with EnSafe. Marshall and Tom will meet at OU1 and go from there.
09:42	BH heads to RW-100	BH heads to RW-100 to assess the project and see what he needs when that vault starts. GC remains in vault RW-1RS and

		new PVC conduit. Readings on 4 gas meter have remained normal so far with today's work. VOCs have peaked today at 4 ppm with all other readings remaining constant
09:56	Delivery	Hinck receives a delivery from one of their pickup trucks. It consisted of one small box of consumables.
11:29	RW-1RS	GC is working on pulling some wire to feed some circuits within the vault.
12:26	RW-1RS	BH is back on site from RW-100. GC is working on demoing some metal conduit within the vault. He is placing the demolished pieces outside the vault onto the grass. Not onto the rim on the vault.
13:46	Demo	Hinck is adding PVC and removing the corroded pipe with all circuits that come off of the sub panel
14:20	Clean up	Hinck begins to clean up and raise tools out of the vault. They will be doing the switch over of the fiber tomorrow to demo the rest of the corroded material.
14:47	Offsite	Hinck and EnSafe both from site. Site is locked and secured.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
RW-1RD demolition waste: corroded control panel and few corroded conduits

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Gabe Costa (GC) and Bob Herrmann (BH) as well as EnSafe's Nick McCarthy (NPM) rally at OU1. NPM conducts a safety meeting and they head to RW-1RS.
07:17	Eagle	Mike from Eagle stops by RW-1RS to drop off the internals of the control panel that Hinck will installing today. Mike then heads to OU1 to speak with Wayne about shutdown. NPM bump checks the 4 gas meter and the readings are within 2% of the calibration gas limits. NPM drops the hose into RW-1RS. NPM then opens RW-1RD to let ventilate. The monitor is reading normal in RW-1RS. NPM gives Hinck clearance to go into vault. Hinck locks out main breaker on sub panel.
08:12	Eagle back on site	Mike with Eagle is back on site. He informs Hinck that Eagle has confirmed with PES that they are ready to switch the panel over. Hinck takes apart the splice that ran from RW-1RD to RW-1RS so there is no power in RW-1RS while they work. Eagle disconnects the fiber from their panel. Hinck reroutes it to the temp fiber box and makes the connection. Mike heads to OU1 to see if the communication from OU1 to RW-1RS is good.
10:08	RW-1RS	Mike with Eagle back on site. He informs Hinck and EnSafe that Dave a with PES says communication from both ends is fine. Mike is offsite. Both water pump and power panel are locked out and tagged at OU1.
10:33	RW-1RS	Hinck continues demo in RW-1RD. They have removed the corroded control panel and removed it from the vault. They have also removed a few corroded conduits.
11:13	Demo continues	Hinck continues demo in RW-1RS. Craig Moore with CDM is on site to observe progress.
12:41	RW-1RS	Hinck continues work in RW-1RS. They are preparing to mount the control panels outer box.

13:13	RW-1RS	Hinck has installed the unistrut and is now mounting the back box for Eagle's control panel.
14:18	RW-1RS	Hinck has mounted Eagle's back box. They have also installed new unistrut behind the power panel and have removed the old unistrut from the vault. Gas monitoring has remained low all day. No PVC glue was used. VOCs only reason reached 3 ppm and held at 0 ppm for the majority of the day.
14:21	Demobilization	Hinck begins to raise their tools out of the vault. They will resume work tomorrow morning.
14:42	Offsite	Hinck is offsite. NPM grabs post work photos and secures the vault. NPM is also off site.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	On site	Hinck (Gabe Costa and Bob Herrmann)and EnSafe(NPM and MBG) meet at OU1 rally point. NPM conducts safety meeting
07:15	Mobilization	Hinck and NPM convoy to RW-1RD. NPM opens the vault to naturally ventilate for 5 mins. The 4 gas meter is then bump checked. All readings come back normal: 02: 20.9% CO: 0ppm H2S: 0 ppm LEL: 0% VOC: 2 ppm The monitors tubing is lowered into the vault. The monitor still reads fine after a few minutes, EnSafe gives Hinck clearance to enter the vault and begin work. The power and pump remain locked out and tagged from yesterday.
07:29	RW-1RS	Hinck starts the day by unloading tools off box truck and lowering them down into the vault. They get a drop light set up down in the vault for sufficient light to work.
08:06	RW-1RS	Hinck begins to unbolt the power panel in the vault to replace another piece of unistrut and hardware behind it.
08:18	CDM Smith	Craig Moore on site for a visit. He takes some pictures and heads off site.
09:23	RW-1RS	MBG onsite, NPM go to DW15 to oversee drilling. Before leaving NPM provides MBG with H&S meeting Hinck working in vault installing unistrut. 4-gas meter reading ok

		Hinck continues with installing unistrut and conduit.
10:33	RW-1RS	Hinck using PVC glue and noting on 4-gas slight bump in VOCs ranging from 1.2 - 4.6 ppm. All other measurements good/normal on 4-gas
12:06	RW-1RS	Hinck continues to work on installing pvc piping. They have ran pipe between the owner panel and Eagle panel.
14:07	RW-1RS	Hinck has ran a second conduit from the power panel to Eagle panel.
14:14	Demobilization	Hinck begins to clean up and raise tools up out of the vault.
15:00	Offsite	Hinck and EnSafe are both offsite.

08:45	Mobilization	MBG to OU1 to with EnviroTrac team PM - Jim Wilkinson (JM) Foreman - Mike Alliegro (MA) Operator - Ken Davies (KD) Assistant - Steve Smith (SS)
08:50	Mobilization	Conduct H&S meeting with team - see SWAP
09:00	Mobilization	According to JW - EnviroTrac was onsite at 0800 MA states that mini-excavator delivery was early and that he had already received the mini at RW-100, and had returned to OU1. Team departs OU1 to travel to RW-100
09:20	Mobilization	Team arrive at RW-100. MBG collects pre-construction photos of site/unlock gates, etc. EnviroTrac begins organizing equipment. During this MBG and EnviroTrac review work plan for day. Goal for today is to install silt fencing, move brush pile out of fenced area, and excavate area for concrete pad, adjacent to RW-100 vault.

09:45	EnviroTrac	JW offsite. JW indicates that hoping to get backfill delivered tomorrow. Asphalt cut at OU1 treatment building may occur this week, depending on approvals. JW indicates EnviroTrac has large building permit sign for OU1.
09:50	Excavation	EnviroTrac moves brush pile to outside fenced area with mini-. Also working on installing silt fencing.
10:22	Excavation	EnviroTrac utilizes skid steer to get 300-gal tote out of truck. Also, lay plywood over travel area above the water main from RW-100
10:38	Excavation	Begin excavating for concrete pad
11:43	Excavation	Approx. 3ft below grade at southern end of vault - EnviroTrac going to start hand digging to locate electrical conduits
12:05	Excavation	Encounter conduit at approx. 38”. Keep excavating.
12:20	Excavation	Encounter a second conduit - this one was previously cracked and repaired with duct tape. There is wire in conduit. It appears that the fitting at where the plastic conduit in the excavation meets the metal conduit at the vault did not align properly at time of install and used duct tape to complete the connection. Send RM a photo and call him to discuss.
13:47	Demobilization	EnviroTrac is done excavating for concrete pad. They cover stockpiled soil (to be used for re-grading) and setup caution tape around open excavation. Both the mini- and the skid steer are within the fenced area. Estimate approx. 6-8 cu. yds. soil excavated and stockpiled for re-grading
13:52	Demobilization	EnviroTrac offsite MBG secures gates/offsite to DW15
14:00	Porta-Potty	Receive call from porta-potty delivery guy - meet him at school and bring him to RW-100.
14:32	Porta-potty	Delivery complete. MBG to DW15

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
EW-1 demolition waste: conduit and wire (see photo)

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
06:59	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) are on site at OU1. EnSafe's (NPM) is on site. They both head to RW-1RS.
07:22	RW-1RS	Hinck pulls box truck up to the vault and begins unloading tools. The vault is opened to ventilate before Hinck starts work. NPM tries to calibrate the 4 gas meter. The LEL fails during the multi sensor span. All other readings come back within 1% of span gas readings. NPM tires multiple ways to calibrate the LEL. After several attempts, LEL still fails. Marshall with EnSafe calls Pine. They said it probably is a failing sensor. Marshall will pick up a new gas meter from Pine at 12 today. NPM gives Hinck clearance to start work based on the history of the air monitoring of the vaults. BH heads to OU1 to speak with Eagle.
08:25	Dave on site	Dave with PES is on site. NPM tells him the situation with the 4 gas meter. He brought one so the monitoring will be covered until Marshall gets back with new gas meter. Dave puts monitoring hose into the vault. The readings come back normal. 02: 20.9% CO: 0ppm LEL: 0% H2S: 0ppm BH returns to RW-1RS. He informs NPM that he has removed his lock on the well pump and the power locks going to RW-1RS. Wayne with PES has also removed his locks on the well pump breaker and the power breaker for RW-1RS. Dave remains on site to take readings within the vault.
08:45	Power	The power to RW-1RS has been flipped on as well as power to the well pump. There is now power going to RW-1RD. Paul with Eagle is on site.

09:00	PES gives clearance	PES had to change out some bag filters before Hinck can start work with wiring in the emergency stop and the float switch. PES gives Hinck clearance to start work.
09:41	RW-1RS	Hinck begins to connect the emergency stop and the float switch. Once they are done the fiber will be changed from temp box to Eagle panel.
10:03	Fiber	Hinck has removed the temporary fiber box and taken it out of the vault. They will now be transferring the fiber connection to Eagle's control panel. Paul with Eagle will then check the connections and confirm communication between the RW-1RS and OU1.
10:30	Delivery	Hinck receives delivery from a Hinck pickup truck. It consists of the miscellaneous material and the core bore drill they will use for RW-100
11:05	RW-1RS	Paul from Eagle informs NPM that he can confirm the float switch and emergency stop do work at RW-1RS's end. Paul heads over to OU1 and will be in communication with Hinck to see if there is communication between RW-1RS and OU1. Paul is offsite. Hinck works on some of the remaining demolition that needs to be done.
11:26	RW-1RS	Hinck is performing amperage readings with Dave as a preliminary test before start up.
12:03	EW-1	NPM and GC head to EW-1 so GC can start bringing tools and material into the vault for set up. NPM arrives first, he opens vault to let ventilate for 5 mins. NPM then outs Dave's four gas meter into the vault. The readings come back normal. GC begins to bring material down into the vault.
12:41	EW-1	GC begins demo in EW-1. He confirms with NPM that the breakers in sub panel are shut off. He will only be demoing the circuits coming off the sub panel. He starts with demoing the conduit that is up top near the vault hatch.
14:00	Demobilization	GC begins cleanup process.
15:00	Offsite	Hinck and EnSafe are both offsite.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Onsite	Hinck's Bob Herrmann (BH) and EnSafe's Nick McCarthy arrive at OU1. Hinck's Gabe Costa will not be coming in today. NPM conducts safety meeting with BH. BH starts box truck and leads the convoy to RW-100 (OU2).
07:19	RW-100	BH and NPM arrive at RW-100. NPM bump checks the 4 gas meter, the readings come back normal. Refer to Confined space program to see initial entry readings. NPM places gas meters hose in vault and proper ventilation. NPM gives BH clearance to enter vault when he's ready.
07:44	RW-100	Hinck is unloading tools to prepare for work. He informs overlooks work plan to make sure he knows the objective. BH enters vault to begin measuring out the Borings.
08:14	RW-100	BH begins marking out drawings on the exterior of the vault.
10:09	Drilling	BH is mounting coring drill to the exterior of the vault, prepping to core the first hole.
10:35	1st Boring	1st boring is complete. From when the drill started, to when it came through to the interior of the vault took 7 minutes.
11:01	2nd boring	The 2nd boring is complete. BH moves onto the 3rd
11:13	3rd boring	3rd boring is complete. BH moves onto the fourth
11:35	4th boring	4th boring complete. BH moves onto the 5th
12:01	5th boring	5th boring is complete. BH moves onto the 6th
12:27	6th Boring	6th boring is complete. BH moves onto the 7th
12:45	7th Boring	7th boring is complete. BH moves onto the 8th.
13:06	8th Boring	The 8th (final) boring is complete.
14:03	Demobilization	BH begins the cleanup process.

14:40	Offsite	Hinck is offsite. NPM remains on site to secure it.
14:51	Site secured	NPM secures sites and heads over to meet with Marshall Gibson.
15:00	Waste cover	NPM and Marshall cover the waste that has been generated from the vaults with a sheet of thick plastic. We weight it down. NPM is offsite.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
NA

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	On site at OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) arrive at OU1 with EnSafe's Nick McCarthy (NPM). NPM conducts safety meeting. All parties convoy over to OU2.
08:11	OU2	Hinck and EnSafe arrive at RW-100. Hinck will start the day by repairing the existing PVC conduit that had been taped together where the PVC met the galvanized pipe.
08:15	PES	BH gets approval from Wayne to go ahead with the repair. GC disconnects the wire that go through damage pipe and pulls them back to the point of the repair. He puts on a new coupling and reglues the pipe. GC then pulls the wires back through into the control panel and connects them. Hinck is ready for the system to start back up.
10:16	Apparatus construction	Hinck begins to construct an apparatus that will make sure each conduit is at the same distance off the vault wall. It will also make sure each pipe will be coming up straight into the VFD.
11:17	Apparatus continued	The construction of the apparatus continues.
12:20	Apparatus continued	Construction and assembly of the apparatus continues. Hinck has mounted 3 of 8 conduits to it so far. They are just under halfway done.
13:14	Apparatus continued	Hinck has installed 6 of 8 pipes to the apparatus. 2 pipes remain. Hinck is also installing the mechanisms to make them watertight within the bore hole.
13:20	MBG on site	MBG is on site. He, NPM and Hinck discuss the scheduling for tomorrow. BH explains he will need tomorrow morning to finish the work. MBG says he will speak with Rob McCarthy (EnSafe) and EnviroTrac.

14:05	Apparatus continued	Hinck makes progress on pipe apparatus. They now have all 8 pipes from vault secured to it. They are now working on the piping that is going between the VFD's panels.
14:25		BH states that Hinck will work late today in order for EnviroTrac to come on site tomorrow to dump the filler material first thing in the AM.
14:47	Apparatus complete	Hinck has completed the structure that has the conduits secured to it for the VFD. The hammer drill they have to drive the ground in isn't working. Hinck will have to come back at some point tomorrow to drive the ground rod in.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
EW -1 demolition waste

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Gabe Costa (GC) and Bob Herrmann (BH) as well as EnSafe's Nick McCarthy (NPM) arrive at OU1. NPM conducts safety meeting. Both parties convoy to EW-1.
07:14	EW-1	NPM opens vault to let ventilate. Hinck begins to take tools out of the van. NPM bump checks the gas meter. Readings come back normal. Refer to confined space form to see readings. NPM puts gas monitoring hose into vault.
07:31	RW-100	BH informs NPM that he is going to bring GC over to RW-100 to drive the ground rod in before EnviroTrac begins their work.
07:44	RW-100	Hinck begins working on driving the ground rod in the VFD work area.
08:18	Ground rod complete	The ground rod has been driven into the ground. Refer to photos to see the work complete. Both parties convoy back to EW-1.
08:38	EW-1	Hinck begins to remove some waste that was generated a few days prior. They load it into Hinck's pickup truck. GC then continues demoing conduit in EW-1.
09:25	AMEC on site	AMEC is on site to oversee some work being performed. Demolition continues as GC works in the vault.
11:25	Eagle panel	Hinck continues demo of conduits that are being fed off the sub panel in EW-1. They also unload Eagle's new control panel and bring it down into the vault. The waste generated is getting loaded directly into Hinck's truck and will be transported to OU1 to be off loaded today.
12:59	Plan for Monday	BH informs NPM that he will be dumping the 2nd truck load of waste over at OU1. He will then be heading out afterwards. BH also informs NPM that he spoke with Eagle and they are ready

		for system shutdown on Monday to service EW-1. GC and Tom Whitaker are still on site.
13:29	AMEC offsite	BH offsite to go look at other job. Tom Whitaker is offsite.
14:15	EW-1	GC continues demo for the remainder of the day.
14:46	Hinck and EnSafe offsite	All parties off site. EW-1 is locked and secured.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
Demolition wastes: conduit

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) are on site at OU1. EnSafe Nick McCarthy (NPM) is also on site. NPM performs safety meeting. Both parties head over to EW-1.
07:23	EW-1	Hinck and EnSafe on site at EW-1. NPM calibrates the 4 gas meter. The readings from both calibration gases pass. NPM opens EW-1 to let ventilate. He places the gas monitoring tube into the vault. The readings come back normal. Refer to confined space permit form for details. Hinck begins to think about where they will pull power from to feed the vault temporarily when it gets locked out.
08:37	Eagle on site	Paul with Eagle is on site. He speaks with BH. They will go down into vault to make sure the components that Hinck thinks are there, are in fact there. NPM gives Paul a safety meeting. Hinck and Eagle head down into the vault.
09:48	Wayne on site	Wayne with PES is on site at EW-1. He and BH are discussing where Hinck can pull power from to temporarily feed EW-1 when it gets locked out. After discussion, Hinck will pull power from RW-3 and sleeve an extension cord in PVC over to EW-1. The lock on the vault is still able to work. PES is okay with the idea. EnSafe doesn't see an issue. See photo for reference.
09:51	PES and Eagle offsite	Wayne and Paul are offsite for the time being. Paul will be heading down to OU1 to check communication between OU1 and EW-1 when the fiber gets switched to temp box.
10:55	BH off site	BH heads to OU1 to speak with Eagle to check communication with EW-1.
11:04	BH back at EW-1	BH informs NPM, there is communication established between EW-1 and OU1. Hinck will be begin demoing the control panel in EW-1. EW-1's power and well pump are locked out and tagged. Demolition begins.

11:31	PES	Dave with PES is on site to see what the progress looks like at EW-100. He commented on adding some sort of visibility marker to the PVC piping enclosing the extension cord. Hinck agrees. Dave heads offsite to RW-100. Craig Moore with CDM Smith also stopped by to check on progress. He also heads off site to RW-100.
12:43	Demolition	Demolition continues. Hinck is removing conduit and putting it directly into the back of Hinck's truck. It will be transported to OU1 storage area at the end of the day.
13:59	Control panel	Demolition is 95% complete. The new Eagle control panel has been mounted. New conduits have also been installed into panel.
14:15	Property manager	Property manager (believed to be Peter McClean) of the buildings on site stopped by at EW-1. He asked if NPM was with Hinck. NPM replies he's overseeing an electrical project and is with EnSafe. Property manager asks NPM to take a walk to discuss an issue of a leak in the irrigation system. NPM agrees and they walk toward RW-1RS. Property manager thought it was related to manhole work that had been done recently, NPM informs him that Hinck has been working within the concrete vaults only. Property manager goes and speaks with another contractor on site. NPM walks back to RW-1RS. Property manager comes back to his car and heads offsite.
14:25	Demobilization	Hinck begins to clean up tools and tidy up the job site.
15:00	Offsite	Hinck and EnSafe are off site. Site is locked and secured.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
Asphalt from the saw cut stockpiled at OU1

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) are on site with EnSafe's Nick McCarthy (NPM) at OU1. EnviroTrac's Ken Davies (KD) and Stephen Smith (SS) are also on site. NPM conducts safety meeting with EnviroTrac. NPM tells Hinck to head to EW-1 and he will meet them there after setting EnviroTrac up.
07:12	Lawn damage	NPM leads EnviroTrac over the RW-1 to show them the lawn damage that will be fixed today. They explain that they will be making the saw cut first and doing the lawn care second. They will get a few bags of topsoil prior. EnviroTrac heads back to OU1. NPM heads her to EW-1 to meet with Hinck.
07:34	EW-1	NPM conducts a safety meeting with Hinck. NPM bump checks the 4 gas meter with both calibration gases. NPM opens the vault door to let ventilate then place the gas monitoring hose into the vault. The readings come back normal. Refer to confined Spence entry sheet for details. NPM gives Hinck clearance t enter vault. NPM heads back to OU1 to meet with EnviroTrac.
07:48	OU1	NPM and EnviroTrac discuss the game plan of the sawcut. They explain they will build a wooden frame to specs. Lay it in the work spine and spray paint the perimeter to give the outline of the pad. They will then sawcut while one worker operates the saw and the other sprays continues water on the blade as dust control. NPM calls Rob McCarthy to see if work should begin without PES on site. Rob tells NPM to whet in set up, but don't start cutting until PES is here.
08:16	PES on site	Wayne with PES arrives at OU1. Saw cutting begins.
08:33	Saw cut complete	EnviroTrac saw cuts the perimeter painted on the ground. They then make a few more cuts so they can pry a piece up to start removal.

09:12	Saw cutting	EnviroTrac has to do extra saw cutting to pry the pieces out of the ground. They didn't expect it to be so thick. It looked around 5-6" thick. NPM heads over to EW-1 to check on Hinck.
09:54	EW-1	Hinck has been chipping at installing PVC piping within the vault. They will be installing PVC and unistrut for the remainder of the day. NPM head back to OU1 to see progress on saw cutting.
10:08	OU1	EnviroTrac has removed all the asphalt. Some spots were 7" thick. They had installed the wood for the form are putting rebar in now.
11:00	OU1 Pad complete	Pad at OU1 is formed and complete its rebar and mesh. Concrete will be poured tomorrow. EnviroTrac will soon head over to RW-1RD to fix the damaged lawn area. NPM heads over to EW-1.
11:16	EW-1	Tom Whitaker is on site with AMEC to oversee some of the project. Hinck continues to install PVC conduit.
11:36	AMEC off site	
12:06	EnviroTrac offsite.	NPM heads over to RW-1RD to check on EnviroTrac. They finished and have head off site. See photos for grass repair.
12:31	NPM speaks with Northwell Landscaper	NPM finds a Northwell landscaper and asks if he could take a walk with him to track down the sprinkler head that may a potential leak. He agrees. Both parties head over to RW-1RD. After walking the route Hinck's truck took, the landscaper said there aren't any sprinklers on that path, but they are more near the curbside. NPM couldn't track down one sprinkler head that was in both of the truck's paths. NPM heads back to EW-1.
13:50	EW-1	Hinck continues installing PVC. They have also started wire through the piping.
14:30	Demobilization	Hinck begins to clean up and organize the work site for tomorrow. Conduit installation will continue.
15:00	Offsite	Hinck and EnSafe are both offsite. The site is locked and secured.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	MBG on-site at OU1. EnviroTrac team on-site Foreman: Mike Alliegro (MA) Crew Chief: Ken Davies (KD) Assistant: Steve Smith (SS) Assistant: Nick Zarcone (NZ) According to KD, concrete delivery schedule has been moved back to around 0900-0930
07:10	Tailgate meeting	MBG conducts H&S meeting - see SWAP MBG collects photos of form work/rebar
07:30	Safety Audit - EW-1R	MBG goes to vault EW-1R and performs a Safety Audit with Nick McCarthy (EnSafe).
09:10	Concrete delivery	MBG returns to OU1 and concrete delivery in progress. According to KD, Nicolia Redi-Mix arrived on-site at OU1 at approx. 0900 to deliver concrete for harmonic filter pad. By the time I arrived, form for concrete pad already filled. According to MA, estimate approx. 0.25 yds delivered to OU1 concrete pad MBG collects photos of finished pour, along with pre-pour photos of form work/re-bar, and send them via text to Jerry DeLucia, North Hampstead Inspector - per his request MBG to RW-100 to unlock gate/provide access for concrete

09:33	Concrete delivery RW-100	Nicolia on-site at RW-100. EnviroTrac on-site at RW-100 Begin delivering concrete into form for pad
09:46	Concrete test	During pour EnviroTrac collects a grab sample of concrete from the chute, while concrete being delivered to fill form
09:55	CDM Smith	Craig Moore with CDM Smith on-site at RW-100. MBG conducts a H&S meeting with Craig
10:15	Concrete delivery	Nicolia finishes delivery, washes out/ offsite. Estimate approx. 5.75 yds delivered for the RW-100 pad. Total concrete today approx. 6 yds
10:20	RW-100 pad	EnviroTrac NZ and SS working ion RW-100 pad EnviroTrac MA and KD return to OU1 to finish that pad/add chamfer
10:20	CDM Smith	CDM Smith offsite to VFD work/EW-1R.
10:35	OU1	MBG to OU1 to see progress. EnviroTrac complete broom trowel and are wrapping up. Both MA and KD to head back to RW-100 to help out there. MBG receives call from RM. Discuss status. Indicate to RM that EnviroTrac to return tomorrow to pull forms and complete restoration. RM asks that grass seed be spread at RW-100, once grading complete. RM also asks that soil sample for waste disposal be collected from DW15 drums.
11:10	RW-100	MBG returns to RW-100 and lets EnviroTrac know about grass seed. EnviroTrac working on concrete pad - letting it set-up a little longer before final trowel.
12:09	RW-100	EnviroTrac completes RW-100 concrete pad. Picking up materials, etc.
12:20	Demobilization	EnviroTrac offsite. MBG secures gate and return to EW-1R to check in with Nick.

13:10	Equipment	MBG offsite to Pine to get Non-Haz Waste labels for drums at DW15 (ran out of labels on 4/2 and have a few still requiring labeling) After Pine, MBG heads to Ace hardware to get wrench so that soil drums from DW15 can be opened to allow sampling.
14:15	Drum labeling	MBG back on-site and goes to DW15 to label any drums. At DW15 label 4 water drums and 4 soil drums. Complete a full inspection and all drums (water and soil) are all labeled
15:15	Demobilization	MBG offsite for day. Will complete drum soil sampling tomorrow/cover temp. water drum storage area.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) on site at OU1 along with EnSafe's Nick McCarthy (NPM). NPM conducts a safety meeting. Both parties convoy to EW-1.
07:19	EW-1	Hinck will be finishing the remaining prep work for the start up which will occur today. NPM bump checks the 4 gas meter with both calibration gases. The bump checks pass. NPM puts the gas monitors hose into the vault. The readings come back normal. Refer to confined space paperwork to see details.
08:30	EW-1	Hinck continues preparation.
09:15	EW-1	Hinck is ready for system shutdown to transfer over fiber optics to Eagle's panel.
10:00	Eagle on site	Paul Lanzilotta with Eagle is on site. He heads over to OU1 to prepare for the system shutdown.
10:27	System shutdown	Paul calls BH to inform him the system is shutdown. Paul also informs BH that he will notify when ready to do the fiber swap over at OU1.
10:48	Eagle on site	Paul with Eagle is on site at EW-1. Eagle and Hinck head down into EW-1 to swap over the fiber connections.
11:53	Eagle heads to OU1	Paul heads over to OU1 to see if there is communication between OU1 and EW-1.
13:17	Eagle on site	Paul remains at OU1. Mike Hagan on site at EW-1. Eagle has run into a slight delay where the configuration isn't up to date on the module in EW-1. This means it isn't establishing communication between EW-1 and OU1. Mike Hagan brought the tools to fix the issue. He uploads the configuration and heads off site.
13:52	PES calls BH	Wayne with PES calls BH to inform him that we will be starting up momentarily at EW-1. PES will run EW-1 temporarily and shut

		off when everyone goes offsite. PES will perform their tests tomorrow morning.
13:59	EW-1 up and running	EW-1 is running. According to Eagle and PES all components check out fine.
14:30	Demobilization	Hinck starts to pick up tools and tidy up the job site.
15:00	Offsite	Hinck and EnSafe both offsite. Refer to photos for today's progress of PVC installation. Site is locked and secured.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) on site at OU1 as well as EnSafe's Nick McCarthy (NPM). NPM conducts a safety meeting, both parties convoy to EW-1.
07:23	EW-1	Hinck begins to unload tooling off the truck. NPM bump checks the 4 gas meter with both calibration gases. The tests pass. NPM opens vault to let ventilate then puts the hose of the gas meter inside. The readings come back fine. Refer to confined space sheet for details.
08:08	W-1	Hinck continues to unload tools and material off the truck and take it down into the vault.
09:06	PES	Wayne and Dave are on site at EW-1. They are conducting their tests while the well is on its supervised run period. They test both floats, the emergency stop as well as the switches on the control panel. The also will do a pump tests.
09:35	EW-1	Hinck is organizing their work space. They are passing stuff that they don't need out of the vault to make sure they have everything they need to complete this vault, as well material for the next vault.
10:38	Tom Whitaker on site	Time Whitaker is on site to oversee work that has been done.
11:39	PES	Dave with PES is on site to amperage and voltage readings.
12:00	PES is offsite	PES readings came back fine, all components seem to be operating fine. PES heads offsite.
13:05	Organization	Hinck is beginning to remove tools from vault. They are close to completion. They are gathering material and counting the material they have and making lists of what they need for RW-100.

13:29	EW-1 complete	Work in EW-1 is complete. Hinck, EnSafe and PES will now convoy down to OU2 to check out the work that needs to be done there.
14:18	OU2	All parties arrive at OU2. We all do a walkthrough of the building and we discuss what work will be performed tomorrow. GC will be pulling wires through preexisting piping to get communication wires from the buildings control panel to the box that Hinck will wall mount.
14:42	OU1	Hinck, PES, end EnSafe all off site. Hinck and EnSafe head to OU1 to drop off the waste generated from today. Just a few old pipes.
15:00	Offsite	Hinck and EnSafe both offsite.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	OU1	Hinck's Gabe Costa (GC) on site with EnSafe's Nick McCarthy (NPM). NPM performs safety meeting. Both parties wait for PES' arrival to get a key to get into OU2.
07:35	PES on site	Dave with PES is on site at OU1. He does what he has to do then leads us over to SSDS building so Hinck can grab a bigger ladder.
08:38	OU2	Dave let's NPM and GC into OU2 and heads offsite. GC brings ladder and wire into building. GC then examines the pipes and opens up a junction box to determine which pipe will work to pull wires through.
10:41	OU2	GC finds his pipe and sends a fiberglass snake from one end to the other. The tapes his wires on one end and pulls them through.
11:30	Demobilized	Hinck begins to clean up tools and begins to organize the truck. Craig Moore with CDM Smith is on site to take some notes. He heads offsite about 15 minutes of being here.
12:15	OU2	GC is finished organizing the truck at the moment, his tools and material are clean up from the worksite. He makes a small list about future material and planning. Hinck and EnSafe head to EW-1.
12:36	EW-1	Hinck picks up comes and barriers that were left on site as well as some miscellaneous scraps around the vault. GC loads the cones into the truck and heads to OU1.
13:37	OU1	Hinck and EnSafe organize the scrap pile that has been accumulating at OU1. GC begins to organize the truck after the scrap pile is organized.
14:36	Offsite	Hinck and EnSafe are offsite. Work will resume Monday with Hinck installing the light bulbs in the fixtures of all vaults as well as final cleaning them.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Gabe Costa (GC) and EnSafe's Nick McCarthy (NPM) arrive OU1. NPM gives Gabe Costa a safety meeting. Both parties head over to RW-1RD.
07:28	RW-1RD	NPM and GC are on site at RW-1RD. GC will be cleaning up the vaults of left over scrap material and installing the bulbs in the light fixtures that were previously installed.
08:07	RW-1RD	GC beings to unload some material and place it next to the vault. NPM calibrates the 4 gas meter. Both calibration gas readings come back normal. NPM opens Rw-1RD and places the gas monitoring hose into the vault. The readings come back normal. Refer to confined space sheet to see details of readings.
09:34	RW-1RS	GC moves onto cleaning Rw-1RS and installing the bulbs in the vaults light fixture.
10:15	RW-1RS	GC has finished installing light and cleaning up debris in RW-1RS. GC gets a call from Bob Herrmann(BH) that he will be arriving on site soon and would like to meet at RW-100.
10:29	GC and NPM head to RW-100	NPM and GC arrive at RW-100 along with BH. He is driving a large truck (Chevy 8500). The truck will be used to move and located the large panels of the VFD that will be delivered tomorrow. The truck will be left on site tonight.
10:43	RW-100	GC starts installing PVC conduit for some circuits in RW-100. He's starting near the ladder entrance where the lighting switch and receptacles will go. NPM gets word from BH that Eagle will be delivering their VFD set up tomorrow. BH says to expect the delivery around 8:00 am. It will include the components for the VFD as well as the harmonic filter for OU2.
12:14	RW-100	PVC installation continues.
13:00	RW-100	PVC conduit installation continued.

13:49	RW-100	Hinck begins to demobilize. They start taking tools out of the vault and organizing the. Arterial they are leaving within the vault.
15:00	Offsite	EnSafe and Hinck are both offsite. We will meet at RW-100 tomorrow.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	RW-100	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) meet with EnSafe's Nick McCarthy (NPM) at RW-100. NPM conducts a safety meeting. He then unlocks gate and heads over to vault.
07:15	RW-100	NPM opens vault to let ventilate. He then bump checks the gas meter with both gases. Both tests pass, he puts the meters hose into the vault. The readings come back normal. Refer to confined space paperwork for details.
07:33	RW-100	Hinck begins to unload material and tools out of their truck to bring it over to the vault.
09:49	RW-100	Hinck begins to install PVC conduit in continuation from yesterday.
09:56	Delivery	Hinck gets a delivery which consists of a few important items. One being the harmonic filter for OU2. The substation for the VFD. More conduit. Dave with PES shows up on site at the time of the delivery.
10:06	OU2	Substation is dropped off and left on new poured concrete pad at RW-100. BH and NPM drive over to OU2 to unload harmonic filter.
10:25	OU2	The harmonic filter is set in place in OU2 until it will be installed. See pictures for details. Wayne with PES confirms the spot where it is placed is okay to remain there until installed. BH and NPM travel back to RW-100.
11:13	RW-100	BH informs NPM that Eagle will not be making their delivery today. They are still doing testing to their panel. BH says that are planning on coming at 10:30:tomorrow morning, but will try to push them to come earlier. GC remains on site and will continue to install conduit.
12:28	RW-100	GC is pulling wires through conduits.

13:30	RW-100	GC continues to pull wires into pipes. See photos for work progress.
14:15	Demobilization	Hinck begins to demobilize. They being to lift tools from the vault as well and organize the job site. Work will continue tomorrow. Eagle's delivery of VFD panel is scheduled for tomorrow at 10:30 am.
14:49	Offsite	Both Hinck and EnSafe are offsite. Site is locked and secured.

WASTE ACCUMULATED, STOCKPILED AND TRANSPORTED OFFSITE
Description
RW-100 demolition waste: conduit and wiring

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	RW-100	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) as well as EnSafe's Nick McCarthy (NPM) meet at RW-100. NPM performs safety meeting and bump checks his gas meter. Hinck begins to unload material and tools. Hinck lowers tools into vault and begins to pull wires in continuation from yesterday.
09:09	CDM Smith	Craig Moore with CDM Smith is on site to observe some progress. GC has removed some corroded pipe from the vault as well as the heater that is very rusted.
10:58	Eagle delivery	Eagle's VFD panel delivery has arrived. Hinck is using the boom truck to the lift the large control cabinet out of the bed of Eagle's flat bed truck. A Large cabinet as well as smaller cabinet are unloaded from Eagle's truck. See photos for reference.
11:33	RW-100	Hinck is now setting up the large cabinet on the VFD concrete pad. GC is operating the boom truck. BH is cutting the PVC pipes that go into it the correct length. The cabinet is then lifted by the boom truck, lower onto the pipes. The pipes are traced out onto the cabinet, holes are drilled and the cabinet will be placed on top.
12:49	RW-100	Hinck is constructing the metal framing that will support the large cabinet, the smaller cabinet as well as the sub station. It is made of unistrut.
13:35	RW-100	Hinck is now marking out anchors for the large cabinet on the concrete pad, they have also marked out where the pvc comes up into the cabinet. GC lifts the cabinet into the air and will drill out the holes for the conduit to enter.
14:23	RW-100	Large cabinet is in place and bolted down. All conduits coming in are secured.
15:01	Offsite	Hinck and EnSafe are both offsite.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:02	RW-100	Nick McCarthy (NPM) with EnSafe arrives at RW-100. He Bump checks the gas meter and opens the vault for ventilation. Hinck arrives on site. Bob Herrmann (BH) and Gabe Costa (GC). NPM conducts safety meeting. BH informs NPM that I can close the vault up today because they will be working on hanging more components of the VFD. No confined space work will be performed and no circuits are energized near the work they are doing. Refer to SWAP for safety practices for today.
07:31	RW-100	Hinck begins to unload tools from their truck. They are going to start the day by mounting the substation to the frame that was constructed yesterday.
08:04	RW-100	The substation is mounted. Hinck and EnSafe head over to OU2 to begin work on the harmonic filter.
09:21	OU2	Hinck is beginning to unpackaged the harmonic filter. They are removing all of the wood that the filter came packaged in, as well as removing shrink wrap around it.
10:23	OU2	Hinck is prepping unistrut by taking measurements and cutting to mount to the wall. They are also drilling into the brick and setting anchors to hold the unistrut.
11:25	OU2	Hinck is prepping for the hanging of the harmonic filter. There are pieces on unistrut on both sides of the brick wall to support the harmonic filter. See photos for detail.
13:33	OU2	The harmonic filter is mounted and secured. See photos for details.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Gabe Costa (GC) and EnSafe's Nick McCarthy (NPM) meet at OU1. Both parties convoy over to RW-100 to meet with Hinck's Bob Herrmann (BH).
07:16	RW-100	NPM and GC arrive at RW-100 and meet up with BH. NPM conducts a safety meeting. NPM bump checks the gas meter with both calibration gases. The results come back fine. Refer to daily confined space form attached to the report. NPM unlocks gate, head over to vault and unlocks that as well. The vault ventilates for 5 minutes then NPM drops the gas meters hose down inside it. The readings come back fine. Hinck begins to unload tools and bring material over to work zone.
07:39	Small Cabinet (RCP)	Hinck begins the day by starting to mount the small cabinet (Last piece to the VFD) at RW-100. They drill hops in the underside of the cabinet where the PVC pipes will come up into it from the ground.
08:41	Small cabinet (RCP)	Drilling for PVC pipes continues.
09:34	Small cabinet (RCP)	Hinck is now operating the boom truck to lift the small cabinet up and lower it onto the PVC piping.
10:19	Small cabinet (RCP)	Hinck has completed RCP installation. The PVC piping is in and the cabinet is secured to the rack.
12:09	Small cabinet (RCP)	Hinck is pulling grounds through the VFD cabinets.
14:02	Small Cabinet	Grounds have been pulled through each cabinet and down into the vault.
14:30	Demobilization	Hinck begins to demobilize and clean up the site.
15:00	Offsite	Both Hinck and EnSafe are offsite, the site is locked and secured.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	MBG on-site at OU1 Hinck on-site Foreman- Bob Hermonn (BH) Assistant - Gabe Costa (GC) Team heads to RW-100
07:10	Mobilization	Team arrives at RW-100 MBG conducts H&S meeting
07:20	Air monitoring	MBG calibrates 4-gas meter - see form Open RW-100 and allow to passively ventilate for 5-min. O2 = 20.9% H2S = 0ppm CO = 0ppm LEL = 0% VOCs = 0ppm Give Hinck approval to enter vault
07:45	Electrical work	Discuss RW-100 start-up schedule with BH BH indicates that Eagle's earliest availability is next Tuesday. BH believes it may not take a full day for Eagle to complete programming so may be ready for start-up either late-Tuesday or Wednesday morning. BH indicates tentative schedule will be support re-start Tuesday then set harmonic filter at OU1 on Wednesday. BH indicates

		that if RW-100 start-up occurs Wednesday Hinck can support both activities. Hinck will not be onsite tomorrow or Monday. MBG contacts both RM and Dave Kahn with tentative schedule.
08:15	CDM Smith	Craig Moore with CDM Smith on-site Go over general schedule and progress update with him
08:30	Electrical work	Call RM to discuss overall project schedule and update.
09:02	Air Monitoring	Check 4-gas meter O2 = 20.9% LEL = 0% CO = 0ppm H2S = 0ppm VOCs = 0ppm
09:54	Air Monitoring	Check 4-gas readings same as 0902
09:55	Electrical work	Hinck still or king on wiring between vault and above ground control panels MBG offsite to OU1 to address electrical waste
11:40	Electrical work	MBG back on-site at RW-100 Hinck is wrapping up for day. Tom Whitaker on-site (AMEC), as well. Tom indicates he was onsite around 1115
12:03	Demobilization	Team offsite for day. MBG and CDM Smith go back to OU1 for waste management
13:20	Waste Management	MBG called Randy Burnett with IRT regarding waste. Asked if both asphalt and demo waste could be put in same bins (co-mingled) or separated. Rand indicated OK for both asphalt and demo debris into same bins (ok to co-mingle) MBG and Craig with CDM Smith brought over asphalt and plastic electrical junction boxes to bins. MBG then loads up truck for second run to bins
13:25	CDM Smith	Craig Moore offsite
13:37	Waste Management	All waste from OU1/RW-100 not segregated for metal recycling in 2 bins at SSDS. 1 bin full second approx. three-quarters full.

		Return to OU1 and cover remaining scrap metal pile
14:00	Demobilization	MBG offsite and to Pine to pick-up CAMP equipment. Call RM and provide update on today's progress

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) arrive at OU1 with EnSafe's Nick McCarthy (NPM). NPM conducts a safety meeting. GC and NPM drive over to RW-100 to get Hinck's box truck. BH remains at OU1.
07:08	RW-100	GC gets into box truck and both parties head back to OU1. NPM secures RW-100 prior to leaving.
07:30	OU1	GC and NPM meet back up with BH at OU1. Hinck has a delivery with Consisting of the harmonic filter for OU1 and a boom truck on site. The boom truck sets up then the delivery flat bed comes in behind. BH tethers the filter to the boom truck and it gets hoisted into the air.
08:25	OU1	The filters holes at the base are marked out, hammer drilled and anchors are put in place. The filter is then lifted and lowered onto the anchors. The filter is secure in place.
08:36	OU1	Hinck and EnSafe head over to RW-100 to meet with Eagle.
10:26	RW-100	Paul Lanzilotta and Mike Hagan with Eagle are on site at RW-100.
11:46	RW-100	Hinck is with Eagle within the vault figuring out logistics to some minor errors.
12:45	OU2	Mike and Paul head to OU2 to work out some minor issues.
13:47	RW-100	Mike and Paul are back on site at RW-100. They are good on both ends of communication between RW-100 and OU2. They are ready to bump start the system to test it momentarily.

13:49	RW-100	Dave with PES is on site. He will oversee the start up and follow his procedure while taking readings.
14:38	RW-100	PES ran into some issues with the pressure read out dials. The two of them that are in the vault were clogged with a fine packed sediment. Dave will change of the fitting leading to the gauges while the vault is shut down tomorrow AM. Testing will resume after the gauges are giving correct read outs. Hinck begins to demobilize.
15:01	Offsite	Eagle, Hinck PES and CDM Smith are all off site. NPM locks and secures the vault, as well as the entrance gate. EnSafe is offsite.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	RW-100	Hinck's Gabe Costa (GC) and Bob Herrmann (BH) meet EnSafe's Nick McCarthy (NPM) at RW-100. NPM opens the vault to let ventilate. He then bump checks the gas meter with both calibration gases. Both tests come back normal. Refer to confined space sheet for details. NPM lowers the monitors hose into the vault. The readings come back normal. Hinck is able to work in the vault.
07:19	RW-100	BH informs NPM that Mike Hagan with Eagle will be arriving at 11am. Hinck doesn't have much to do at RW-100 until Mike arrives so NPM closes up the vault and heads to RW-1RS/RW-1RD.
07:37	RW-1RD	Hinck will begin to prep for the mounting of the transducer box in both vaults. GC will start in RW-1RD. Hinck begins to unload tools and material from their truck. NPM opens the vault and drops the hose into the vault. The readings come back fine. NPM gives GC permission to start work.
09:20	RW-1RD	GC is mounting the transducer box in RW-1RD. He will mount the box and terminate the wires associated.
10:13	RW-1RD	BH heads over to RW-100 to meet with Dave from PES. Dave has finished swapping out the clogged pipe fitting with new ones. BH will terminate a wire that disconnected to fix the fitting. GC and NPM remain at RW-1RD.
11:20		GC has finished mounting the transducer box and terminating the wires. He moves onto installing the transducer in RW-1RS.
12:13	RW-1RS	GC has completed the installation of the transducer box and termination of wires. EnSafe , Hinck and AMEC move onto EW-1 to install the transducer.

13:04	EW-1	Hinck completes the installation of the transducer within EW-1. NPM heads to DW-15 to remove the plastic that the plastic that was left behind that was placed under the drill rig when it was in operation. Hinck heads to RW-100.
13:32	DW-15	NPM folds up plastic sheeting and places it in the back of his truck. He also puts up fencing barricade at the entrance of the job site. NPM heads to RW-100.
13:43	RW-100	Hinck parks their box truck at RW-100 and heads offsite. Dave with PES and Mike Hagan are at RW-100 troubleshooting some communication issues.
15:01	RW-100	Mike will continue trouble shooting tomorrow morning and the testing should be performed on Monday.
15:30	Offsite	PES, Eagle and EnSafe head offsite. The site is secured and the fences are locked.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:02	RW-100	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) meet with EnSafe's Nick McCarthy (NPM) at RW-100. Mike Hagan with Eagle is on site as well. NPM unlocks the job site. Hinck begins to unload tooling and material. There won't be any confined space done at RW-100. The vault will remain locked. No gas monitoring.
07:51	RW-100	Hinck begins the day installing unistrut behind the VFD cabinets to add more support. Mike continues troubleshooting from yesterday.
08:38	RW-100	Mike heads over to OU2 to work something out on his end. Hinck stays at RW-100 finishing the support strut.
09:49	RW-100	Hinck completes the support strut at RW-100. Hinck and EnSafe head over to OU2 to continue work on the harmonic filter.
09:57	OU2	Hinck unloads tooling and material to begin work on the harmonic filter at OU2. No confined space work will happen at OU2. No need for gas monitor.
10:38	OU2	Hinck receives a delivery consisting on conduit and fitting for the harmonic filter at OU2.
11:13	OU2	GC continues work at on piping into the harmonic filter.
12:18	OU2	GC has completed piping from the filter into the junction box. He starts to pull the wires from the junction box down into the filter.
13:02	OU2	Hinck begins to pack up tools and organize the work space. Mike with Eagle remains on site. He continues to work on programming the control panel at OU2.
15:00	Offsite	EnSafe and Eagle are both offsite. Work will resume Monday. The site is locked and secured.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	OU2	Hinck's Gabe Costa (GC) and Bob Herrmann (BH) meets with EnSafe's Nick McCarthy (NPM) at OU2. NPM unlocks the gate leading to the site. We wait for Wayne with PES to arrive to unlock door to the building.
07:14	OU2	Wayne with PES arrives on site and unlocks the doors to the facility. Hinck begins to unload tools and material. Today they will drill through the brick wall that the filter is on to get to the power source on the other side.
08:28	OU2	Hinck begins drilling to get through the wall. First a pilot hole, then the final diameter hole.
09:26	OU2	Pipe work is complete on the harmonic filter at OU2. Hinck will begin landing wires with Eagle there to oversee the terminations.
10:04	OU2	Wayne comes over and tells BH that they are going to run the pump test at RW-100, even though Dave Kahn is not here today. BH agrees and heads over to RW-100 along with Mike. GC continues to land wires for the harmonic filter. Wayne is going to head over to RW-100 soon. He's waiting on John Zeta with PES to come over to RW-100. He will go down into the influent vault to take readings. NPM will be the attendee for this vault when John is down in it.
10:09	OU2	Wayne and NPM wait for John to arrive.
10:18	OU2	John Zeta arrives on site. Wayne explains the procedure to him and what John will be doing because unfamiliar with the process. NPM bump checks the 4 gas meter, readings come back normal, refer to confined space sheet for details. NPM puts the gas meters hose into the vault. Readings come back fine, John is clear to enter the vault.

11:15	RW-100	The testing begins at RW-100. Wayne is on the phone with John. John is taking flow readings while Wayne is at RW-100 changing the flow manually. BH is taking amperage readings.
11:33	RW-100	Pump testing complete. Flows and amperage were recorded. GC continues to work on pipe work for OU2's harmonic filter. Mike and BH are communication back and forth with Wayne going through their start up checklist.
13:24	OU2	GC continues to work on the harmonic filter in OU2. He is now pulling wire through the pipes he has installed. Mike and Wayne are in communication back and forth testing the remaining components in the RW-100 start up.
14:20	OU2	GC has completed piping 95% of the piping for the harmonic filter at OU2. He has to pull wires in one remaining pipe, land the wires, and the filter will be ready to be put into service. Mike continues programming to work out minor kinks. Hinck begins to pack up their tools and clean up the work area.
15:10	Offsite	Hinck, EnSafe and Eagle are offsite. Work will resume tomorrow.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:06	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) meet EnSafe's Nick McCarthy (NPM) at OU1. We will both drive over to OU2.
07:18	OU2	NPM unlocks gate at OU2 and we drive up to building. Dave with PES pulls in behind us. Hinck will finish the piping the harmonic filter and landing wires.
07:35	OU2	Hinck is get the working on getting power to the harmonic filter. They will run a wire from the power source to the panel and land the wires. Craig Moore with CDM Smith is on site to observe some work take place.
08:41	OU2	BH needs to get in contact with representative from the harmonic filter company is continue the install. He runs into the issue of having left over pieces and not knowing what they do. While he does that, GC will begin work on the harmonic filter piping at OU1.
09:43	OU1	EnSafe and Hinck head over to OU1.
09:47	OU1	BH and GC talk about the piping route they will take and what needs to be done.
10:39	OU1	BH heads back to OU2 to get in the phone with a harmonic filter representative to see what he needs to do. GC continues working on pipe work for OU1 filter.
12:12	OU1	BH returns to OU1. GC is having trouble drilling holes for the conduit to get though the wall. He is hitting a lot of rebar.
12:43	OU1	GC has got the holes drilled. He now transitions to pipe work.
13:41	OU2	BH and GC mount the breaker into the power source within the building at OU1. The breaker will feed the harmonic filter. BH wears arc flash gear to put the breaker in.

14:23	OU2	Hinck begins to clean up tools and debris around the job site. Work will continue at OU1 tomorrow.
15:01	OU1	Both EnSafe and Hinck are offsite.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) meet with EnSafe's Nick McCarthy (NPM) at OU1. Hinck will start the day at OU1 continuing the pipe work for the harmonic filter.
08:21	Eagle on site	Eagle's Paul Lanzilotta (PL) and Mike Hagan (MH) are on site and will be working on trouble shooting the minor issues they have been having between RW-100 and OU2. Hinck is unloading tools and material. GC has begun pipe work.
10:12	OU1	Hinck continues pipe work inside OU1. Rain is starting to come down pretty hard.
10:44	RW-1RS	NPM heads over to watch over Mike from Eagle as he's down in the vault. Dave has a 4 gas meter in the vault prior to NPMs arrival. Paul explains to NPM that they are 95% complete between all vaults. They are swapping out some communication devices that have been giving them problems in Rw-1RS.
11:15	RW-1RS	Eagle finishing swapping a communication device at RW-1RS. They will be heading to OU1 to continue working out kinks in the system. BH comes to RW-1RS to check out the flickering light issue.
12:13	OU1	Hinck has completed checking out the flickering light issue. Wayne thought it was related to stray voltage issue, but after Hinck troubleshooting, BH determined that all the vaults are getting the same amount of power and that didn't seem to be the issue. GC continues pipe work. He's piping to the panel from where the pipe comes through the wall. Mike is continuing troubleshooting low voltage issues. BH, NPM and Wayne he's back to OU1.
12:08	OU1	Mike is continuing to troubleshoot issues at the control panel at OU1. GC works on piping.

14:18	OU1	Hinck begins to take pack up tools and clean up the job site. Refer to photos for work progress.
15:07	Offsite	Hinck, EnSafe and Eagle are offsite. Work will resume tomorrow at OU1.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:06	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) meet with EnSafe's Nick McCarthy (NPM) at OU1. Wayne with PES is here when we arrive. NPM conducts a safety meeting, Hinck begins to unload tooling to continue the pipe work on OU1's harmonic filter.
08:07	OU1	BH informs NPM the representative for the harmonic filter will be on site on Monday to help get the harmonic filter into service.
09:09	OU1	Pipe work continues.
10:43	OU2	Pipe work complete at OU1, Hinck will now take a trip over to OU2 to run the wire that will feed power to the harmonic filter. Tom Whitaker with Wood is on site at OU2.
12:25	OU1	Hinck has completed pulling wire at OU2. All they need to do is install the breaker and it will be ready for the filter rep to come out and put it into service. Hinck, EnSafe and Wood all head back to OU1 to pull the power feed wires through the pipes there.
12:47	OU1	Power feeder wire has been pulled through at OU1. GC begins to terminate the wires within the Filter. BH terminates the wire on the breakers end.
14:00	OU1	BH has completed terminating the wires to the breaker. GC has also finished terminating his end to the filter.
14:29	OU1	Hinck begins to pack up their tools and organize the job site. Wire pulling will continue tomorrow at OU1.
14:40	Offsite	Hinck and EnSafe are offsite. Wayne with PES remains onsite.

PHOTO - OU1 Harmonic filter	PHOTO - OU1 Harmonic Filter
	
The feeder wires come though the elbow, run down the wall (blue arrow) and tie into the breaker (Red box). The system is locked out by Hinck's lock.	Final section of tubing added and fixed to the harmonic filters panel. The feeder wires were pulled though the large diameter pipe. The other two pipes still need wires.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	OU1	Hinck's Bob Herrmann (BH) and Gabe Costa (GC) meet with EnSafe's Nick McCarthy (NPM) at OU1. Mike Hagan with Eagle is also on site. Along with Dave Kahn with PES.
07:37	OU1	Hinck begins to work on pulling a collection of wires from the harmonic filter into OU1. Mike continues troubleshooting from a few days ago to work out the small kinks.
08:18	RW-100	Hinck completed pulling the wires that they needed to. Hinck, Eagle and EnSafe will all head over to RW-100. Hinck will be plugging up holes from previous anchors and voids with hydraulic cement. Mike will be troubleshooting some communication issues. NPM bump checks the 4 gas meter. The results come back normal. Check confined space form for details. NPM puts the 4 gas meter hose down into the vault. Readings come back normal. EnSafe gives Hinck clearance to begin work.
09:48	Shutdown	OU2 gets shut down so Mike can work on what he needs to do. GC heads down into the vault it's the cement. Dave confirms with Mike that OU2 is safe to shut down and is locked out. There's no power going to the vault.
11:02	RW-100	Cement work and communication trouble shooting continue.
12:20	RW-100	Cement work and troubleshooting complete in RW-100. EnSafe, Hinck and Eagle head to OU2 to continue cement work and Mike will troubleshoot.
12:34	OU2	GC cements around the pipes that are coming out of the harmonic filter and going through the wall to the power panel.
13:27		GC has finished cementing around the pipe work. Refer to the photos for the finished product. Mike continues to troubleshoot minor issues in the control panel.

14:18	OU2	Hinck is offsite. They will be back Monday to meet up with the harmonic filter representative. Mike heads to OU1 to continue his troubleshooting.
15:05	Offsite	EnSafe and Eagle are offsite.

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:01	RW-1RS	EnSafe's Nick McCarthy (NPM) meets up with Hinck's Bob Herrmann (BH) and Gabe Costa (GC) at RW-1RD. Hinck will be installing the last minor things in the vault. NPM conducts a safety meeting. He then opens to the vault to let ventilate. NPM calibrates the 4 gas meter. Results come back normal, he then puts the gas meters hose down into the vault, the meters readings come back normal. See confined space form for details.
07:41	RW-1RD	GC has completed installing a heater for the controls panel in RW-1RD. It will control humidity within the control panel to stop corrosion. GC moves over to RW-1RS to install another heater.
08:29	RW-1RS	GC completes the installation of RW-1RS's heater. He transitions back to RW-1RD to fill all voids in the concrete with hydraulic cement.
09:15	RW-1RD	GC has completed work with the hydraulic cement truck is RW-1RD. He will transition to cement work in RW-1RS.
09:44	OU2	BH is at OU2 with the harmonic filter representative. He informs me the tech will be there until 12 this afternoon. BH says the tech says everything is going smooth so far.
10:30	EW-1	GC has completed install the control panel heaters and doing cement work in RW-1RS and RW-1RD. NPM and GC now transition to EW-1 to finish the odds and ends that are left.
11:37	EW-1	GC completes the check list left at EW-1. We transition back to OU1 to finish up the cement patch work that's left.
12:07	OU1	GC begins to patch the holes from the drilling for the harmonic filter. BH informs NPM that we they do not have a key component in setting up the harmonic filter. They are missing a terminal block for the CTE. Once that comes in, Hinck will be back. Dave with have to shut OU1 down for an hour. After that,

		the representative for the filter can come out and set up the filter.
13:23	OU1	GC finishes patch work at OU1. Hinck begins to demobilize.
13:50	OU1	Hinck and EnSafe are both offsite. Work will resume next Monday at OU1.

SUMMARY OF WORK ACTIVITIES

Time	Title	Notes
07:00	Mobilization	MBG on-site at OU2 treatment building, waiting on EnviroTrac to arrive.
07:30	Mobilization	EnviroTrac on-site, had been waiting for me at OU1. Mike Alliegro - foreman Ken Davies - assistant Steve Smith - labor Waiting on PES for access to OU2.
07:40	Mobilization	PES on-site provides access to OU2 Conduct H&S meeting with EnviroTrac
08:39	Stair layout	Assemble/layout stairs. Based on design sketch by EnviroTrac, end of stairs (step-side) is adjacent to a water valve box. In addition, discover an electrical junction box in depression adjacent to water valve. This electrical box was covered with silt, is in a depression, and was likely not visible during initial inspection back in April. Work with EnviroTrac team and come up with plausible solution. Waiting on Jim Wilkinson with EnviroTrac to arrive to further evaluate solution.

09:15	Stair layout	Jim Wilkinson with EnviroTrac on-site. Go over layout/options and best approach appears to be to rotate stairs 180 degrees so that they steps protrude past the right hand side of vault. Mark out location of asphalt cut - MBG takes photos and send to RM to discuss change. RM traveling says he will call back once at office to discuss - approximately 20 minutes. Mike and Ken offsite to get supplies for concrete form and frost-free fill.
10:15	Stair layout	Receive call from RM to discuss stair layout change. Ultimately decided that proposed new layout of rotating stair system 180 degrees is best approach. Concrete pad will be approximately 8.5” above grade so that landing is flush with top of vault. RM also suggests adding bollards at corners of pad. Rotating stairs will cause both sides of stairs to be “open”. Current system only has railing on one side - EnviroTrac to get railing for other side. Dave Kahn with PES on-site. Review stair layout with him and he has no further comments/suggestions.
10:20	Asphalt removal	Steve and Jim begin saw-cutting asphalt for removal
11:00	Asphalt removal	Asphalt removal going slow - asphalt is approximately 5-inches thick Mike and Ken back onsite. Jim offsite
12:30	Asphalt removal	Asphalt removal complete. Removed pieces of asphalt loaded into EnviroTrac trucks for disposal at their facility as solid waste. Crew breaks for lunch
12:30	Stairs layout	Received a call from RM and he stated that he had heard from AMEC on changes to layout and their only comment was to ensure concrete started at a depth of no less than 10” below grade. Due this change, EnviroTrac believes a concrete delivery, rather than hand-mix, is preferred. RM agrees. RM and I discuss backfill and if 6” base necessary. I tell RM that fill material under asphalt is similar to a bank-run gravel. RM

		states that if that material is consistent to depth (12”), acceptable to not add the 6” base specified in the drawings. OK to just compact, then lay XPS Styrofoam insulation in excavation.
13:00	Soil removal	Crew begins removing soil from area of concrete pad. Soil is placed into a depression in a grassy area adjacent to the driveway. Crew will need to excavate to 12” below grade to account for 2” of insulation board
13:35	Compaction	Soil removal complete to 12” below grade. Run plate compactor over base of excavation and install XPS insulation.
14:00	Demobilization	EnviroTrac secures site - offsite. Wayne with PES on-site, he secures building/gate. MBG offsite to DW15 to inspect drum storage
14:10	Drum Inspection	MBG at DW15. Soil drum storage area OK. Water drum storage area OK. Inspect soil roll-off and top secure. Remove cover at downslope corner and note approximately 4-inches water at this end. Likely will require solidification prior to offsite transport. Resecure top.
15:00	Demobilization	MBG offsite

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	MBG on-site at OU2 treatment building Wayne with PES on-site, unlocks gate/building. Discuss how to manage work flow once I leave for day and Wayne asks EnviroTrac close building door and OK to dummy-lock gate. He will be back at end-of-day to ensure everything secured. EnviroTrac on-site Ken Davies- Foreman Steve Smith - Assistant Casey Byran - Laborer Conduct H&S meeting
07:15	Form work	EnviroTrac working on completing form for concrete pour. KD indicates concrete delivery still scheduled for 1000. Depending on how day goes, EnviroTrac may cut asphalt for bollards.
08:29	Utility markout	Premier Infrastructure and Utilities on-site to verify location of gas line. Called in by EnviroTrac. Walk site with Premier and gas line is already pre-marked and located on opposite side of building. Confirm with Premier that location of pad is only place excavating performed / to be performed. Premier offsite

08:46	Form work	Form for pad is complete. 2” XPS insulation in base and foam expansion joint along vault wall. During pour, wire mesh to be laid in after form approx. half-filled. When pour is complete, form will be pulled. Space between pad and excavation sidewall will be back filled with gravel to approx. 2” bgs and finished flush to grade with asphalt cold patch.
09:10	MBG offsite	EnviroTrac remains onsite. KD will text me photos at end of day

SUMMARY OF WORK ACTIVITIES		
Time	**Title**	**Notes**
07:00	Mobilization	MBG on-site Tom Whitaker - AMEC Hinck - Bob Hermonn (BH) - foreman Hinck- Andrew Ferrizz (AF) - assistant All on-site; conduct H&S tailgate meeting
07:10	Mobilization	Check in with Dave and Wayne with PES regarding stray voltage investigation. BH indicates pumps/system will need to be off during investigation for stray voltage. BH will coordinate with PES. Review punch list items - all are on the OU1 side and will address each one while doing stray voltage investigation at each vault. MBG obtains a 4-gas meter from PES to screen vaults during work.
08:00	RW-1RD	Begin at RW-1RD. MBG opens vault and allow to passively ventilate. After 5-min check readings: O2 = 20.9% H2S = 0ppm CO = 0ppm LEL = 0% Give permission to enter vault. Open RW-1RS and allow that to start ventilating as well

09:20	RW-1RD	Hinck has checked both pump and vault power - both appear OK, no sig. issues with wire insulation. Have PES re-power pump and check - do not see stray voltage, suggesting an induced voltage is occurring.
09:24	Vault air Monitoring RW-1RD	O2 = 20.9% CO = 0ppm H2S = 0ppm LEL = 0%
09:53	RW-1RD	Through inspection, it's thought that an improper bound may be occurring at vault transformer, due to paint. Add a ground leg between circuit panel bus-bar and circuit panel ground. Re-check and no change. Readings are consistent across all 3 legs, suggesting issue may lie before vaults. At AMEC's recommendation, leave added ground leg.
10:10	RW-1RS	Begin work at RW-1RS
10:17	OU2 stairs	Jim Wilkinson with EnviroTrac on-site to install railing at OU2 stairs. MBG and Jim offsite to OU2
10:30	OU2 stairs	Conduct H&S meeting EnviroTrac installs handrail and secures with screws. EnviroTrac offsite once complete MBG offsite / secure gate and back to OU1
10:45	RW-1RS	MBG back on-site at OU1. Hinck no longer at RW-1RS, have gone to treatment building to investigate stray voltage
12:15	GWT Building OU1	Hinck investigation at OU1 treatment building identifies that for each vault RW-1RS, RW-1RD, and EW-1R, both vault power and pump power are run in their own conduit (i.e. EW-1R pump and vault power are run in the same conduit, presumably to EW-1R vault, same applies to others). Additionally, by testing at the MCC panel it appears that the stray voltage is due to induction of electricity across the 480V lines run in the conduit. TW with AMEC agrees with induction causing stray voltage issue.

13:30	Punch list EW-1R	Team to EW-1R to complete punch list. MBG opens vault, allows to passively ventilate for 5min and based on 4-gas meter readings being acceptable, allow Hinck access to vault. O2 = 20.9% CO = 0ppm H2S = 0ppm LEL = 0% Hinck coats nipple going into disconnect with Plastibond. Punch list identified that an additional bonding wire was required for ground; however, upon inspection this is not needed. TW with AMEC agrees. Secure vault
14:00	Punch list	Hinck, AMEC, MBG discuss punch list. Noted that there were some discrepancies in the June 3rd email from Bob Maple vs. what was encountered in the field. Specifically, the running of the #6 bonding wire was needed at RW-1RD, though not specified. It's likely Bob Maple got well IDs confused. TW agrees and concurs that all punch list items completed, as specified.
14:30	Demobilization	Return to OU1 treatment building, return their 4-gas meter, and check-out with PES. Give Dave with PES an update on status, that Hinck work complete. Dave agrees and tells me that Eagle will be out on Wed. or Thursday to address transducer water level issue. PES opens electrical vault behind treatment building and team confirms no spliced wires in vault.
14:40	Demobilization	MBG/Hinck/AMEC off site. MBG to DW-15 to collect soil sample from drum (see that contractor form).

Re: Weekly Report – March 15 to 19, 2021
OU1 and OU2 VFD / Electrical Upgrade Project
Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of March 15 to 19 includes:

- Project Kick-Off, Health and Safety Meeting, Radiation Training – March 15
- Work initiated at vault RW-1RD – March 15
- Pump RW-1RD shutdown on March 16, reprogramming and fiber optic bypass allowed other pumps to remain operational, the system continued to run at 850 gpm with increased flow from RW-3.
- Remote control panel replacement and electric work continued March 16 to 19

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated next Week

The work anticipated for the week of March 22 to 26 includes:

- Restart of Pump RW-1RD, following restart and commissioning plan
- Operate RW-1RD and begin work at RW-1RS
- Pump RW-1RS expected shutdown will be March 24
- Utility mark out at OU2, RW-100, expected March 23

March 31, 2021

Mr. Girish Desai Via email: girish.desai@dec.ny.gov

Re: Weekly Report – March 22 to 26, 2021
OU1 and OU2 VFD / Electrical Upgrade Project
Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of March 22 to 26 includes:

- Restart of Pump RW-1RD, following restart and commissioning plan
- Operate RW-1RD and begin work at RW-1RS
- Pump RW-1RS shutdown March 24, reprogramming and fiber optic bypass allowed other pumps to remain operational, the system continued to run at 850 gpm with increased flow from RW-3.
- Utility mark out at OU2, RW-100, March 23

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated next Week

The work anticipated for the week of March 22 to 26 includes:

- Restart of Pump RW-1RS, following restart and commissioning plan
- Operate RW-1RS and begin work at EW-1R
- OU2 – RW100 - Expose conduits and exterior of vault, core for conduit installation
- OU2 – RW100 - Prepare for concrete pad installation

Schedule

Based on the status of work, there are no deviations to the schedule previously provided to

Lockheed Martin via the weekly schedule updates.

Deviations from Work Plan

None.

Future Work Details Being Finalized

- Fiber optic evaluation and programming

Community Air Monitoring

Community air monitoring was not performed for this project as there were no intrusive activities performed this week.

Sincerely,

EnSafe, Inc., by

Re: Weekly Report – March 29 to April 2, 2021
OU1 and OU2 VFD / Electrical Upgrade Project
Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of March 29 to April 2 includes:

- Completed electrical upgrades and restarted Pump RW-1RS (March 30), following the restart and commissioning plan
- Operated RW-1RS and adjusted flow from other wells to maintain the 850 gpm operation of the system
- Began work at EW-1R without shutting down the well pump
- OU2 – RW100 - Exposed conduits and exterior of vault, core for conduit installation
- OU2 – RW100 - Prepare for concrete pad installation, including placement of backfill

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated Next Week

The work anticipated for the week of April 5 to 9 includes:

- Shut down pump EW-1R, complete electrical and panel replacement work while adjusting other wells to maintain the full flow to the system
- OU2 – RW100 – Complete compaction testing of backfill; prepare rebar and forms for concrete pad
- OU1 – Harmonic Filter Pad – Remove asphalt and prepare area for concrete pad construction, install form

- Concrete placement for pads at OU2 RW100 and OU1 Harmonic Filter

Schedule

Based on the status of work, there are no deviations to the schedule previously provided to Lockheed Martin via the weekly schedule updates.

Deviations from Work Plan

CAMP data was not collected during the shallow soil removal (3 feet) at RW-100 (March 29) due to the limited timeframe (2 to 3 hours) during which the work was completed and a mis-communication that affected CAMP equipment availability.

Future Work Being Developed

- Fiber optic evaluation and programming

Community Air Monitoring

Community air monitoring data was not collected during intrusive work at RW-100, as described above. No other intrusive activity was conducted during this project last week.

Sincerely,

EnSafe, Inc., by

Rob McCarthy
Project Manager

Re: Weekly Report – April 5 to 9, 2021
OU1 and OU2 VFD / Electrical Upgrade Project
Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of April 5 to 9 includes:

- Shut down pump EW-1R, complete electrical and panel replacement work
- Restart of Pump EW-1R, following restart and commissioning plan with an average down time for each well at OU1 of approximately 4 days
- OU2 – RW100 –
    - complete compaction testing of backfill
    - prepare rebar and forms for concrete pad
    - pour concrete pad
    - remove forms and regrade soil in area of concrete pad
- OU1 – Harmonic Filter Pad –
    - remove asphalt and prepare area for concrete pad construction, install form
    - pour concrete pad

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated Next Week

The work anticipated for the week of April 12 to 16 includes:

- Shut down OU2 / RW-100 pump, complete electrical and panel replacement work

Schedule

Based on the status of work, there are no deviations to the schedule previously provided to Lockheed Martin via the weekly schedule updates. The project is currently anticipated to be completed 2 to 3 weeks earlier than originally estimated.

Deviations from Work Plan

None.

Future Work Being Developed

- Fiber optic evaluation and programming

Community Air Monitoring

Community air monitoring was not performed for this project as there were no intrusive activities performed this week.

Re: Weekly Report – April 12 to 16, 2021
OU1 and OU2 VFD / Electrical Upgrade Project
Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of April 12 to 16 includes:

- Final ancillary work was conducted within the EW-1R vault
- OU2 – RW100 – remained operational for this week
    - Prepared the aboveground panel, equipment, conduits, wiring for connection to the well pump without shutting it down
    - Received the active harmonic filter and placed within OU2 treatment building

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated Next Week

The work anticipated for the week of April 19 to 23 includes:

- Shut down OU2 / RW-100 pump for several days
    - complete electrical and panel replacement work
- OU2/RW-100 may restart late in the week, pending completion of electric panel work

Schedule

Based on the status of work, there are no deviations to the schedule previously provided to Lockheed Martin via the weekly schedule updates. The project is currently anticipated to be completed 2 to 3 weeks earlier than originally estimated.

Deviations from Work Plan

None.

Future Work Being Developed

- Fiber optic evaluation and programming
- Harmonic filter installation

Community Air Monitoring

Community air monitoring was not performed for this project as there were no intrusive activities performed this week.

Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of April 19 to 23 includes:

- OU2 – RW100 – Shut down on April 19
  - Prepare aboveground panel, equipment, conduits, wiring and VFD installation
  - Complete electric wiring from aboveground panels to vault components

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated Next Week

The work anticipated for the week of April 26 to 30 includes:

- Complete electrical wiring and VFD installation at the OU2 GWTS
- Programming of VFD and new panel
- OU2/RW-100 restart, expected by April 29th
- Connect wiring to the active harmonic filter and activate for the OU2 electrical system
- Complete installation of pressure transducers within the OU1/2 GWTS wells

Schedule

Based on the status of work, there are no deviations to the schedule previously provided to Lockheed Martin via the weekly schedule updates. The project is currently anticipated to be completed 2 to 3 weeks earlier than originally estimated.

Deviations from Work Plan

None.

Future Work Being Developed

- Fiber optic evaluation and programming
- Harmonic filter installation

Re: Weekly Report – April 26 to 30, 2021
OU1 and OU2 VFD / Electrical Upgrade Project
Former Unisys Site, Lake Success, New York

Dear Mr. Desai,

EnSafe Inc. is pleased to submit this Weekly Report for the OU1 and OU2 VFD Installation and Electrical Upgrade Project at the Former Unisys Site, Lake Success, New York.

Work Performed this Week

Work performed the week of April 26 to 30 includes:

- OU2 – RW100 – Shut down on April 19
  - Completed electrical wiring and VFD installation
  - Initial programming of VFD and new panels
- OU1 – Transducers installed at RW-1RS, RW-1RD, EW-1R

Daily health and safety meeting forms, contractor summary forms, photographs, and additional information describing the work are maintained in our internal files and are available if requested.

Work Anticipated Next Week

The work anticipated for the week of May 3 to 7 includes:

- Complete programming of VFD and new panel
- OU2/RW-100 restart
- Wire active harmonic filter and connect into OU2 electrical system
- Conduit and begin wiring active harmonic filter at OU1

Schedule

Based on the status of work, there are no deviations to the schedule previously provided to Lockheed Martin via the weekly schedule updates. The project is currently anticipated to be completed 2 to 3 weeks earlier than originally estimated.

Deviations from Work Plan

None.

Future Work Being Developed

- Fiber optic evaluation and programming

Community Air Monitoring

Community air monitoring was not performed for this project as there were no intrusive activities performed this week.

APPENDIX G

INTRUSIVE FIELD WORK REQUIREMENTS

LOCKHEED MARTIN

Dig Permit

See Enterprise Operations Procedure EO-28, Digging Projects, for instructions.

Date	Project Manager
March 26, 2021	Rob McCarthy, EnSafe

Building/Location
OU2 RW-100 fenced area

Purpose of excavation
Installation of concrete pad. Digging effort will be limited to the depth required for installation of the concrete pad (~3') and will include regrading of existing soil in the immediate area of the proposed pad.

Company/LM organization performing dig
EnSafe's subcontractor EnviroTrac

Planned dig date	Duration	Start time
March 29, 2021	1 week	10:00 AM
Expected depth	**Width**	**Length**
1-3'	7'	15'

Underground utilities identified?	Overhead utilities?	Electrical lines?	Gas lines?
☑ Yes ☐ No	☐ Yes ☑ No ☐ N/A	☑ Yes ☐ No	☐ Yes ☑ No
Sewer?	**Water?**	**Telecommunications?**	**Other? Specify:**
☐ Yes ☑ No	☑ Yes ☐ No	☑ Yes ☐ No	☑ Yes ☐ No

Site-specific or customer utility locating requirements completed?
☐ Yes ☐ No ☑ N/A

Sketch of dig project (or attach drawing)
See attached design drawing.

Utility location and mark out completed for EnviroTrac by Utility Detection, Inc. on March 23, 2021.
Utilities identified are the private electric, communications, and water line associated with the extraction well in the adjacent vault. The natural gas extending through the fenced area was also located.
Utilities have been cleared/marked by Dig Ticket #210881442.

Project Man 	Date March 29, 2021	Customer	Date
Telecommunications	Date	Customer	Date
ESH	Date	Customer	Date
Building/Facility Manager			Date

LOCKHEED MARTIN

Risk Handling Checklist

Project Manager: Use this checklist to develop risk handling plans before the dig starts. You must also review Enterprise Operations Procedure EO-28, Digging Projects.

General Questions	☑	What Lockheed Martin processes could be affected by the dig? OU2 GWTS utilities or vault
	☑	What are the safety hazards? construction hazards, weather ,slips trips falls, struck by, vehicles
	☑	What could fail? OU2 GWTS
	☑	How could it fail? Damage to OU2 GWTS utilities
	☑	Does the area need to be returned to its normal state when the work is complete? Yes
	☑	How could the dig affect operations/test/production? Yes, OU2 GWTS.
	☑	Have potential risks been addressed with area management?
	☑	Am I comfortable with any risk handling plans, understanding the potential impact?
Traffic Control	☑	Ensure proper signage and communication.
	☑	Coordinate road or access closures through Industrial Security before starting the dig.
	☑	Ensure the work area is isolated from foot traffic by placing barriers and warning lights as required by EO-28.
	☑	Ensure that vehicle traffic will be safe.
	☑	Ensure that product transport will be safe.
Excavation	☑	Review facility drawings to identify utilities. Research old drawings as necessary.
	☑	Discuss the project with Facility Engineering/Maintenance staff who may have unique knowledge about the construction area not documented in facility drawings.
	☑	Process form EO-28-1, Dig Permit. Use this opportunity to explain the process and relate expectations to the contractor/LM organization that will perform the dig.
	☑	Have LM Telecommunications and the local utility identification service locate and mark utilities/underground obstacles.
	☑	Coordinate with other ongoing projects in the affected area.
	☑	Make every effort not to excavate around live utilities in service. Schedule an outage in advance or have Maintenance temporarily shut down and isolate the utilities while excavating.
	☑	If live utilities cannot be shut down while excavating, know where to isolate or shut them down if they are damaged while excavating.
	☑	Have a spotter(s) work with the equipment operator. Hand dig when necessary.
	☑	Excavate along the side of the utility; not on top.
	☑	Weather may affect the dig. Ensure water pipes are protected during freezing weather, especially if the trench will be left open over night. Rain may cause the side of the trench to slough, which can undermine and break pipes/conduit.
	☑	Ensure care when moving trench boxes in and out of trenches so pipes/conduit aren't damaged by the boxes.
	☑	Ensure surface drainage is controlled so that water doesn't get into the excavation and undermine soil supporting utilities.
	☑	Ensure stocked material is kept far enough back (minimum 2 feet) so that material and rocks don't fall on utilities in the open hole.
	☑	Ensure backfilling is done carefully: Re-bed utilities with proper material, filling all voids below. Keep inappropriate material from falling on or being placed in the trench. Be careful when compacting backfill in the two feet directly above the utility.
	☑	Keep the as-built utility drawing in the field while the excavation site is open. Take pictures if possible (horizontal alignment and elevations), if known utilities deviate from facility drawings or if utilities are found that are not on facility drawings. Give the modified as-built drawings to the Building/Facility Manager, who will update the drawing database.
	☑	Ensure that the equipment operator digs slowly and remains in control.
Personal Safety	☑	Ensure that trenching and shoring methods comply with the applicable OSHA regulations and are overseen by a "Competent Person," as defined in those regulations.
	☑	Regularly inspect methods to prevent violations.
	☑	Ensure LM employees do not dig or enter any excavation that is more than four feet deep.

Site Emergency Number	911
Project Number Lookup	
Project Number	0888827878
Project	LM Greatneck electrial
Client	Lockheed Martin
Project Manager	Rob McCarthy
Location	Great Neck VFD
Date/Time	03/15/2021
Notice	If any work involves confined spaces, excavations, lock out tag out (LOTO), energized circuits, chemical exposure, or working at unguarded heights >4', contact the Corporate Health and Safety Manager or Senior Safety PM unless an approved HASP is in place.
Work Description	

Activities

Task	Confined Space Work
Hazards	
Hazards Other	Potential hazardous atmosphere
Controls	
Controls Other	Ventilation as well as 4 gas PID monitoring

Activities (1)

Task	Labor
Hazards	Physical - Slip/Trip/Fall - same level
Hazards Other	Environmental-weather
Controls	Foot : Safety shoes, Head/Face : Hard hat, Head/Face : Safety glasses w/ side shields (ANSI Z71)
Controls Other	Breaks if needed. Use vehicle as warming station. Hydrate as needed.

Activities (2)

Task	COVID
Hazards	
Hazards Other	Biological
Controls	
Controls Other	Social distancing and masks

Work Description	

Activities

Task	Confined space work
Hazards	
Hazards Other	Potential hazardous environment
Controls	
Controls Other	Initial ventilation (open both vault doors) and 4 gas meter monitoring throughout day

Activities (1)

Task	Entering and exiting vault
Hazards	Physical - Falls - from height (> 4 feet), Physical - Slip/Trip/Fall - same level
Hazards Other	
Controls	
Controls Other	Use guardrail, awareness and lower tools in if possible. Don't place tools on concrete pad surrounding vault. They may get knocked into opening.

Activities (2)

Task	Labor
Hazards	
Hazards Other	Environmental- cold weather
Controls	
Controls Other	Use car as warming station if necessary.

Work Description	

Activities

Task	Confined space work
Hazards	
Hazards Other	Potential hazardous atmosphere and changing atmospheric conditions.
Controls	
Controls Other	Passive ventilation, 4 gas monitoring throughout work day

Activities (1)

Task	Entering vault
Hazards	Physical - Falls - from height (> 4 feet), Physical - Slip/Trip/Fall - same level
Hazards Other	
Controls	
Controls Other	Use caution and awareness. Lower tools in if possible. Keep large objects off the rim of the vault if they aren't being used.

Activities (2)

Task	Labor
Hazards	
Hazards Other	PVC glue used in vault.
Controls	
Controls Other	Step out to grab fresh air if necessary.

Activities (3)

Task	COVID
Hazards	

ENSAFE - CORP - SWAP (beta)

Hazards Other	Biological
Controls	
Controls Other	Social Distancing and masks

Activities (4)

Task	Electrical work
Hazards	
Hazards Other	Potential live circuits
Controls	
Controls Other	Lock out tag out

Activities (5)

Task	Demolition
Hazards	Physical - Cutting, sawing, shearing, or severing action
Hazards Other	
Controls	
Controls Other	Safety glasses, gloves, safety boots.

Jobsite Safety Audit Checklist

Jobsite	UM - VFD / OU1	Date	4/7/21

1. Personal Protective Equipment	Points	YES	NO	N/A
A. High visibility hard hat and safety vest	4	X		
B. Safety glasses	2		X	
C. Face shield or goggles				X
D. Protective toed safety boots	4	X		
E. Full body harness and lanyard or retractable				X
F. Hearing protection				X
G. Respirators				X
H. Gloves (Rings can tear nitrile or latex gloves)	4	X		
16				

2. Heavy Equipment	Points	YES	NO	N/A
A. Have pre-shift inspections been performed?				X
B. Are vehicles being operated safely (speed, capacity, etc.)	4	X		
C. Is operator wearing seat belt?	4	X		
D. Is vehicle in satisfactory condition?	4	X		
E. Are backup alarms operational?	4	X		
F. Are fire extinguisher, lights, brakes, etc., operational?	2		X	
20				

3. Excavations	Points	YES	NO	N/A
A. Are excavations adequately shored or sloped?				X
B. Is access to and from excavations adequate?				
C. Are daily inspections being completed by a competent person?				
D. Are exposed rebar or fence stakes properly capped?				
E. Are excavations adequately barricaded?				
F. Is completed digging and excavation permit available onsite?				

4. Barricades & Signs	Points	YES	NO	N/A
A. Are required barricades in place, in good condition, and maintained?	4	X		
B. Are necessary signs in place, in good condition, and maintained?	4	X		
8				

5. Machine Guarding	Points	YES	NO	N/A
A. Are all nip points guarded?				X
B. Are rotating shafts guarded or is access restricted?	4	X		
C. Are E-stops (E-ropes, E-Buttons, etc.) operative and tested daily?				X
D. Are manufacturer guards in place on all tools and equipment?	4	X		
8				

6. Electrical	Points	YES	NO	N/A
A. Have extension cords been inspected & the inspection documented?				X
B. Are (Ground Fault Circuit Interrupts) GFCIs used as required?	4	X		
C. Are required distances maintained between high voltage lines and mobile equipment?				X
4				

7. Housekeeping	Points	YES	NO	N/A
A. Are work areas organized and clear of clutter and debris?	4	X		
B. Are aisles, footpaths, and walkways clear?	4	X		
C. Is equipment stored properly?	4	X		
12

Jobsite Safety Audit Checklist

D. Area all waste streams identified, properly labeled, and disposed?	4	X		
E. Are all containers properly labeled? 8	4	X		
8. Tools	**Points**	**YES**	**NO**	**N/A**
A. Are hand tools appropriate for task and in good condition?	4	X		
B. Are power tools appropriate for task, grounded, & in good condition?	4	X		
C. Is lifting equipment inspected and in good condition? 8				X
D. Are slings, cables & chains inspected & the inspection documented?				X
9. Health	**Points**	**YES**	**NO**	**N/A**
A. Are adequate first aid kits available onsite?	2		X	
B. Are supervisors trained in First Aid?	4	X		
C. Has emergency evacuation plan been developed and tested?	3		X	
D. Are adequate heat stress controls in place? 28	4	X		
E. Are public areas maintained in a sanitary manner?	4	X		
F. Are hazardous chemical product containers properly labeled?	4	X		
G. Are Safety Data Sheets available for all hazardous chemicals onsite?	4	X		
10. Additional Items	**Points**	**YES**	**NO**	**N/A**
A. Hydration supplies available at work sites?	4	X		
B. Hand/face washing provisions available?	4	X		
C. Site specific HASP been reviewed by all employees and documented?	4	X		
D. Daily SWAP usage in place and documented? 24	4	X		
E. Emergency Contact list available for review?	4	X		
G. Are daily toolbox safety meetings being conducted?	4	X		
Total Points	129/136			

Comments

OVERALL JOB SAFETY BEING FOLLOWED - DISCUSS W/TEAM NEEDED AREAS OF IMPROVEMENT, SUCH AS WEARING SAFETY GLASSES CONSISTENTLY, NOT WHEN JUST OPERATING A POWER TOOL, ETC. FIRST-AID/FIRE EXT. / TESTING OF EMERGENCY PLAN IS PM'S RESP. NOT NM / HICNK

Auditors Signature: [signature] **Date:** 4/7/21

ENSAFE

Were audit findings reviewed with site supervisor and assigned to a responsible person for correction? X Yes _____ No
Were the audit findings submitted to Corporate Safety for review? _____ Yes X No

Corrective Actions

Item Number	Responsible Person	Date	Corrective Actions
1.B	Nick McCarthy	4/7/21	Nick needs to be diligent w/ Hands on consistently reminding need for safety glasses / not just when operating equip-b.
2.F.	Marshall Gibson	4/7/21	MBG needs to supply Nick w/ first aid.
9.A	Marshall Gibson	4/7/21	MBG needs to supply Nick w/ first aid kit
9.B	Marshall Gibson	4/7/21	Emergency evacuation plan has been developed but MBG needs to conduct test

Additional Comments: Overall Site Work Area - Review w/ Team. Most issues related to Admin. / Not Nick's Race/Resp.

4 = Excellent, 3 = Good, 2 = Items Missing, 1 = Deficient, 0 = Total Non-Compliance	

EnSafe Supervisor: MARSHALL GIBSON **Signature:** _____ **Date:** 6/14/21

Auditor: MARSHALL GIBSON **Signature:** _____ **Date:** 6/14/21

Near Miss #1: On the first day of demolition at vault RW-1RD, the first vault worked on, Hinck was lifting tools and demoed equipment out of the vault and placing them on the concrete just outside the hatch. A piece of equipment was not laid flat and nearly rolled back into the vault, which would have stuck the worker in the vault who was still positioned under the hatch opening. The team identified this immediately and changed how equipment and tools are removed from the vault – ensuring an assistant is next to the vault and helping to move items away from the edge of the vault opening, as items come up.

Near Miss #2: During construction of the concrete forms for the new stairs at OU2, an Envirotrac worker was cutting long pieces of lumbar into smaller lengths for use. During one cut, the power tool jammed, causing the long side of the board to sway erratically, resulting in an awkward/dangerous position of the power tool blade in relation to the worker's body. Following the incident, work flow was changed such that 1 crew member would hold the long end secure, while the other crew member completed the cut.

Safe Work Modification #1: At the first vault, RW-1RD, during the first day of replacement work, it was noted that the PID on the 4-gas meter was getting high measurements. After some investigation, the source of the VOCs was determined to be from the PVC glue Hinck was using. The second hatch to the vault was opened, to increase ventilation, which reduced the hazard. Moving forward, we increase ventilation by opening additional hatches on days Hinck is using the PVC glue.

Safe Work Modification #2: At vault RW-1RD, Hinck was attempting to lower the temporary fiber control box into the vault. One worker was in the vault, reaching up to grasp the control box as the other worker was lowering it from above. The above worker was bending awkwardly to get the box low enough for the other worker to grasp hold. The above worker realized the bad position his body was in and stopped the procedure. He subsequently got some rope and tied it around the box, such that it could be lowered into the vault using good ergonomics. This process was repeated at the other vaults, moving forward.

GREATROCK Automation

97 Rome Street
Farmingdale, NY 11735
Phone: (631) 270-1508

REPORT

1. On May 19th, 2021 Great Rock Automation successfully completed startup at Lockheed Martin OU-1 for a TCI HGA Series Active Harmonic Filter.

2. The HGA Active Filter has successfully reduced harmonics and corrected the power factor at the Lockheed Martin Facility OU-1.

3. The table below shows the measurements taken from the Active Filter's touch screen before and during operation. Please note while the VTHD may have increased, a VTHD of 2.6% is still acceptable according to IEEE 519-2014 - IEEE Recommended Practice and Requirements for Harmonic Control in Electric Power Systems

	Prior to Active Filter Operation	During Active Filter Operation
Power Factor	-0.95	1.00
Current Total Harmonic Distortion (ITHD)	16.5%	5.2%
Current Total Demand Distortion (ITDD)	3.3%	1.0%
Voltage Total Harmonic Distortion (VTHD)	1.8%	2.6%

4. The Voltage/Current plot prior to operation shows a non-linear current waveform:

5. The Voltage/Current plot during operation shows a linear current waveform:

HPS TruWave Active Harmonic Filter Pre-Start-up Checklist

Please contact Hammond Power Solutions (HPS) 4 weeks prior to your desired date to schedule a start up. In order to help us provide the start-up commissioning of your TruWave Active Harmonic Filter (AHF) without any delay, extra cost, voiding or limiting of the warranty, we require the following checklist to be completed, signed and returned to Hammond Power Solutions via email at least 24 hours prior to scheduling.

Electricians - please refer to local electrical regulations and the supplied TruWave Operations and Maintenance Manual (O&M) for proper installation practices. If there are any installation questions, please contact Hammond Power Solutions or our local representative.

Model Number	Serial #:
WAHF1K100A	11222-3/21

☐ All of the AHF's are wired and ready for start-up.
If all AHF's are not ready, ____ are ready.

Note: Our start-up service assumes all AHF's are available for start-up at the same time (up to 5 per day). Extra trips due to AHF's not being ready will result in extra travel charges.

Project and Site Coordination

☐ Jobsite is available for shutdown to accommodate the equipment start-up. Delays caused by the inability to shut down the equipment are not included in our start-up service and will be invoiced.

☐ Customer's representatives scheduled to be available for training at the time of our start-up visit. Additional job visits for customer training (i.e. Owner's demos) are not included unless explicitly stated on our confirming order.

☐ Current Transformers installed on the service bus and wired to the AHF's per the O&M Manual?

☐ Verify no Power Factor Correction Capacitors are installed between the AHF's connection to the main bus and the Variable Frequency Drives that are being mitigated.

☐ Sufficient overhead lighting available for our services?

☐ The AHF located indoors. If not, please coordinate a time and date when the weather is suitable for start-up.
☐ The job site accessible by a standard passenger vehicle.

Equipment Condition

☐ The AHF been installed without any shipping or installation damage. Shipping Damage is not covered by the HPS warranty. Shipping Damage will not be repaired during a start-up visit. Any freight claims must be filed with the freight company and HPS should be notified.
☐ The AHF clean and free of dust and debris. Cleaning dust and/or debris from the enclosure is not part of our start-up service.
☐ The area around the AHF is clean and safe to enter and move around in. Delays caused by site conditions are not covered by the start-up service.
☐ Terminating conduit to the AHF can cause debris and conductive material on the AHF surfaces. Surfaces are clean from debris. Cleaning the enclosure and AHF circuitry is not part of the start-up service and will be invoiced. Damage caused by foreign objects (metal shavings, etc.) in our circuitry is not covered by warranty.
☐ The AHF is mounted per the spacing requirements specified in the manual. Damage caused by restriction of air flow is not covered under warranty. Extra labor on start-up services caused by inaccessibility due to improper mounting will be invoiced.
☐ The AHF in a clean, uncontaminated environment. Do not attempt to operate the AHF in a heavy dust environment unless a suitable enclosure and cooling is provided to stop dust from entering enclosure. Damage due to contamination is not covered by warranty. Do not attempt to operate the AHF with non-HPS provided dust covers. Heat damage is not covered by warranty.
☐ The AHF in an environment with humidity below 95% and temperatures between 16 °C (60 °F) and 40 °C (104 °F)? Check for heat sources.

Electrical Installation

☐ Review HPS TruWave Operations and Maintenance (O&M) Manual thoroughly before performing field start-up procedure
☐ Installation per one-line drawings supplied at bidding time. If Not:
    ☐ Updated one-line drawings sent for review.
☐ Confirm proper input voltage
☐ Confirm that line current sensors are installed on the proper phases in the proper orientation, and wired properly to the CT interface board. Failure to do so may result in additional start-up time if TruWave diagnostics indicates improper installation.
☐ All wiring and cabling tightened per torque requirements in O&M Manual
☐ Grounding wire is installed to the chassis grounding lug. Grounding the conduit and attaching it to the removable conduit plate is inadequate for safe and reliable operation.
☐ The grounding wire is terminated to the utility grounding bus bar or a properly installed grounding rod.
☐ Shielded wire is installed for the DC control circuit interface connections.

■ The shielded wire is terminated to the AHF grounding terminal and is terminated on one end only.
■ The interconnect wiring is terminated in the AHF per the installation diagram provided with the O&M Manual?
■ The AHF to Main Buss cabling is installed in a conduit separate from other wiring.
■ Check Power and Control fuses for continuite
■ Power factor correction capacitors are not located in devices between the AHF and the VFD's or other devices for which Harmonic Mitigation is being provided.
■ All power and control wiring is installed, terminated and ready for power and testing. Delays and/or extra trips due to incomplete installation are not included in our start-up service and will be invoiced.
■ The system is completed and ready for operational testing.

System Start-Up – **To Be Completed at Start-Up Time**

■ Energize system according to the procedure in the Quick Start guide or O&M Manual.
■ Review CT setup display and follow procedure in the quick start Guide to verify proper CT installation.
☐ Perform any corrective action if required by TruWave Diagnostics.
☐ Document any corrective actions.
■ Enable system using the "RUN" command icon on front panel touch screen.
■ Confirm proper operation of system by reviewing information displayed on the "OPERATING STATUS" display screens.
☐ Perform any corrective action if required by TruWave Diagnostics.
☐ Document any corrective actions.
■ Obtain system status report via USB connection when system is fully operational and save information for reference to Flash Drive.
■ Verify and record harmonic correction data (Line and Load; THD I%, Power factor, RMS current, etc.).
☐ If a separate power meter verification is required, end user or installer to supply meter and record values.

☐ The control contractor's wiring is complete and operational for system performance test from the AHF's integral monitoring circuits and HMI. Unless explicitly stated in our confirming order, additional jobsite visits for control start-up are not included, and will be invoiced.

WARNING! Damage caused by applying power to the AHF prior to our start-up services is not covered under the start-up services. Warranty coverage may be affected if power is applied prior to our checkout.

Invoiced amounts per HPS standard rates and not per start-up quotation. Additional invoices must be placed by customer before work is completed.

Executive Summary

On Monday, May 10th, 2021 commissioning was performed at Lockheed Martin, located at 62 Olive St. Lake Success, NY 11020. The system under test was the Hammond WAHF1K100A Harmonic Filter.

Infrared Analysis

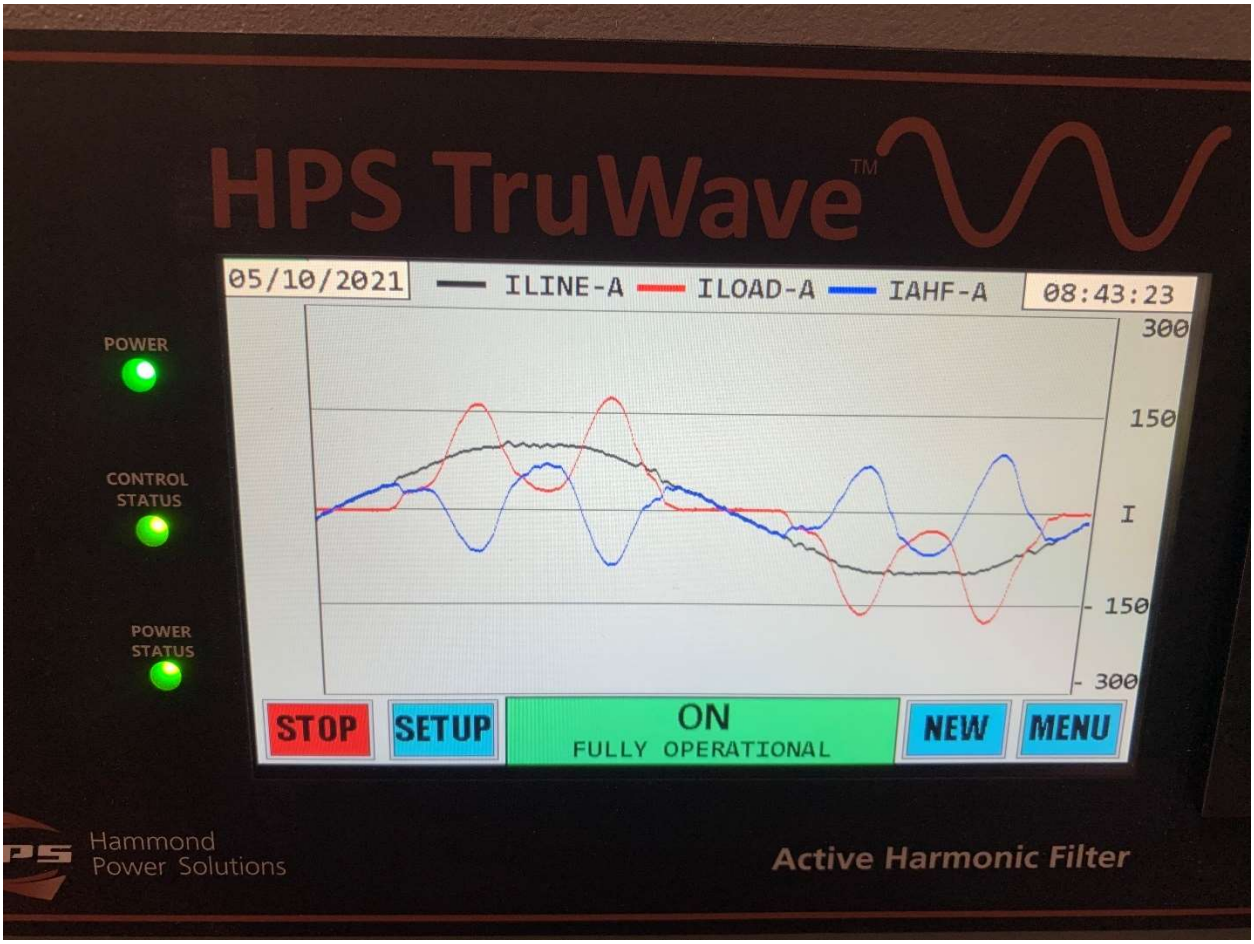
An infrared scan was performed on all UPS components, wiring, connections, as well as all associated input and output distribution during the burn in. *There were no infrared issues to report.* A sample of the infrared scan is shown in the report.

Hammond WAHF1K100A Harmonic Filter

The following pages show the waveforms recorded by harmonic filter during commissioning on the unit.

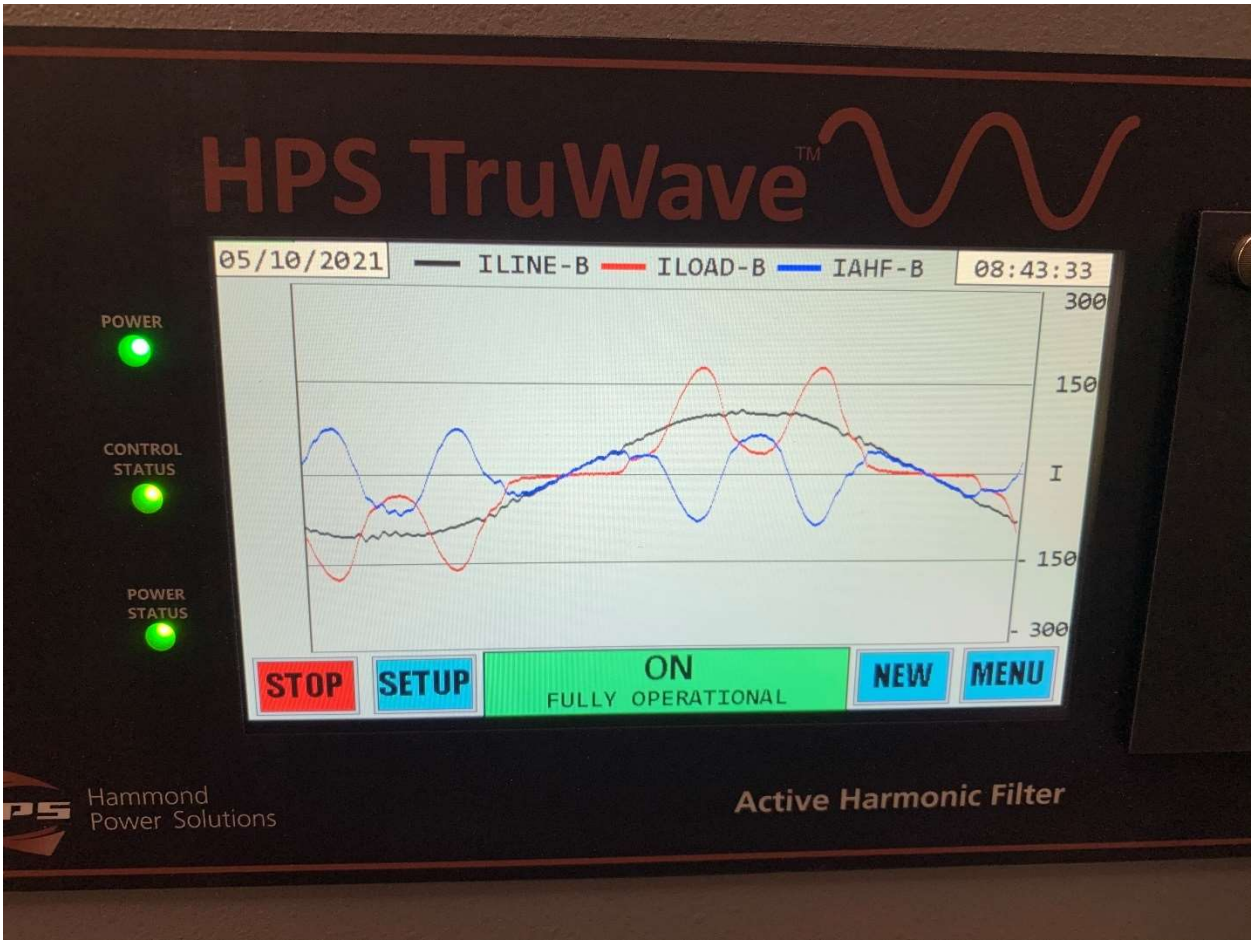
A Phase Current

The following waveform represents the input current, load current, and the harmonic filter current for A phase during commissioning.



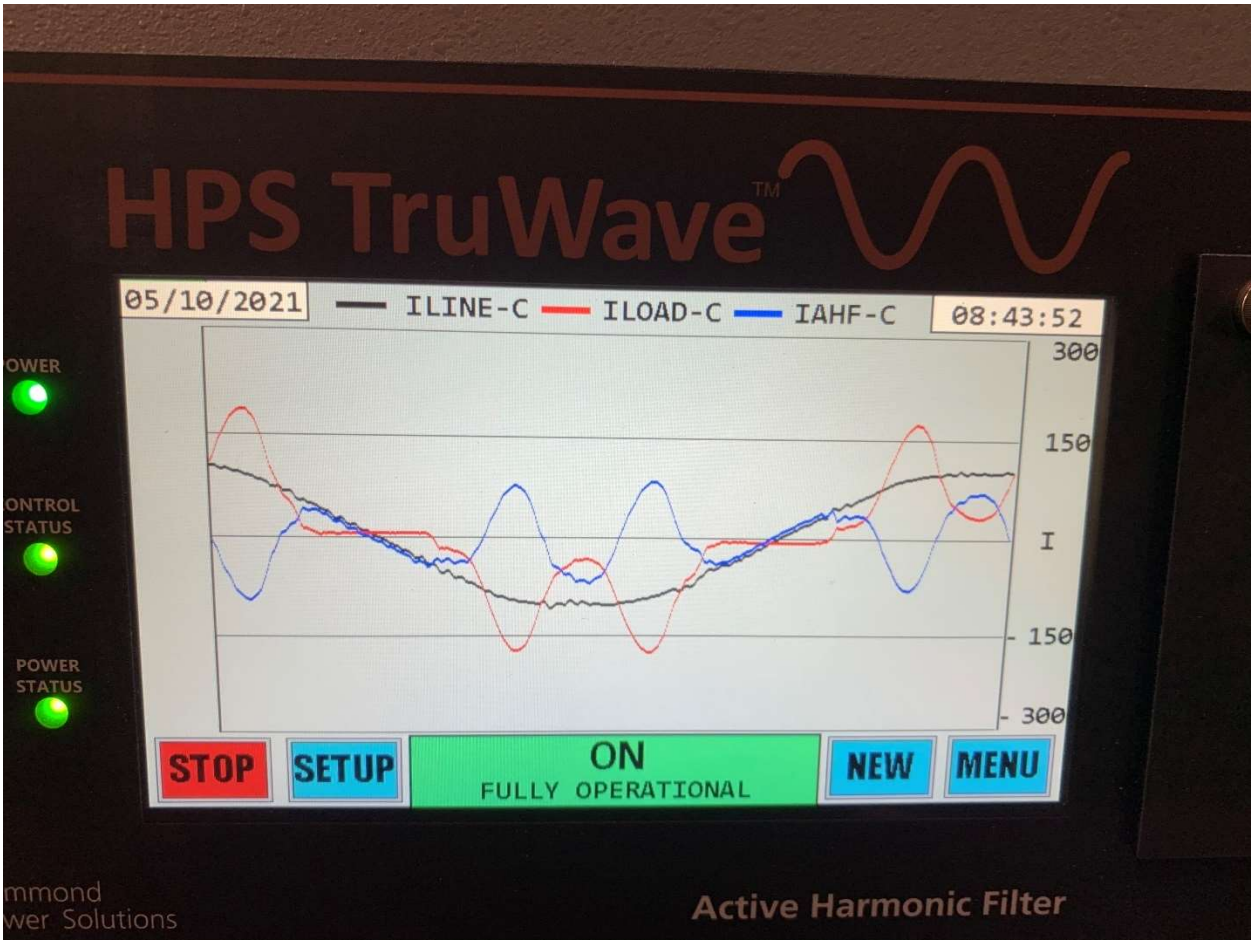
B Phase Currents

The following waveform represents the input current, load current, and the harmonic filter current for B phase during commissioning.



C Phase Currents

The following waveform represents the input current, load current, and the harmonic filter current for C phase during commissioning.



Display Readings

The following reading were recorded from the harmonic filter.

	Line			Load		
TOTAL AMPS	71.7	75.8	74.0	83.4	88.0	86.4
HARMONIC AMPS	2.5	2.5	2.5	44.0	44.0	45.2
HARM THDR	3.50%	3.30%	3.30%	52.80%	50.00%	52.30%
KW/KVA/PF	62.9	63.6	0.989	62.1	73.9	0.84

AHF AMPS	42.1	42.3	43.5
INV AMPS	43.3	43.3	44.7
LINE VOLTS	496.8	497.9	495.57
AHF HF/DC	1.1	1.3	
%CT LOAD	10%		

% LOADED	42%	42%	44%
LINE FREQ	59.98		
VOLT THDR	1%	0.8	0.8
NUETRAL AMPS	2.2		
DC VOLTS(LO+HI)	821.0	411.3	409.7

Unit Parameters

The following are the parameters set on the harmonic filter.

CUSTOMER PARAMETERS	
CT CURRENT RATIO:	800
CT PLACEMENT:	Line
NUMBER OF CTS:	3

Equipment Utilized

A Flir T400 Infrared Camera was utilized to perform infrared thermal scans on harmonic filter. The specifications for the camera are:

Thermal sensitivity (NETD) 0.05°C @ +30° (+86°F) / 50mK
Detector type Focal Plane Array (FPA), uncooled microbolometer
IR resolution 320 x 240
Spectral range 7.5 to 13 µm
Digital zoom and pan/focus 1-8X continuous/auto & manual focus
IFOV (with 25° lens) 1.36 mRad

SCE-36EL3012SSLP

Product Specifications:

Part Number: SCE-36EL3012SSLP
Description: S.S. EL Enclosure
Height: 36.00"
Width: 30.00"
Depth: 12.00"
Price Code: S5
List Price: $1,703.48
Catalog Page: 274
Est. Ship Weight: 94.00 lbs

RW-1RS, RW-1RD, EW-1R

Construction
- 0.075 In. stainless steel Type 304.
- Seams continuously welded and ground smooth.
- Flange trough collar around all sides of door opening.
- Pour in place oil & water resistant gasket
- Collar studs 3/8-16 provided for mounting optional panels.
- Stainless steel concealed hinges.
- Removable and interchangeable doors.
- Black quarter turn latches.
- Latches are opened or closed with a screwdriver (optional tamper-resistant inserts are available).
- Mounting holes in back of enclosure.
- Mounting hardware, sealing washer and hole plug included.
- Removable print pocket furnished if height and width of enclosure is greater than 12 inches.
- Ground studs on door and body.

Application
Designed to house electrical and electronic controls, instruments and components in areas which may be regularly hosed down or are in very wet conditions. Provides protection from dust, dirt, oil, and water. For outdoor applicationS a drip shield is recommended.

Options
Optional mounting feet available. Door hardware available.

Finish
#4 brushed finish on all exterior surfaces. Optional sub-panels are powder coated white.

Industry Standards - (IS6)
- NEMA Type 3R, 4, 4X, 12 and Type 13
- UL Listed Type 3R, 4, 4X and 12
- CSA Type 4, 4X and 12
- IEC 60529
- IP 66

Notes
Special Instructions apply for IS3, IS4 and IS6 to maintain the environmental rating of Type 3R for these parts. Instructions are located on the enclosure door. Drip shield is required on IS3, drip shield is recommended on IS4 and IS6. Drain holes are required on all.

Optional Accessories
- SCE-36P30 Subpanel, Bent
- SCE-36P30GALV Subpanel, Bent Galvanized
- SCE-BVK Breather Vent

RW-100 SP-1 VFD PANEL

Construction
- 0.104 In. stainless Steel Type 304
- Seams continuously welded and ground smooth.
- Flange trough collar around all sides of door opening.
- Removable centerpost.
- Heavy duty lifting eyes anchored into reinforced top.
- Body stiffeners.
- Stainless Steel concealed hinges.
- Black keylocking/padlocking handles.
- 3-point latching mechanism.
- Removable print pocket.
- 12 In. removable floor stands.
- Panel supports.
- Provision for mechanical interlock.
- Pour in place oil & water resistant gasket
- Ground stud on door and body.
- Provisions for light kit.
- Collar studs 3/8-16 provided for mounting optional panels.

Application
Designed to house electrical and electronic controls, instrumentation and components in indoor & outdoor locations. For outdoor applications a drip shield is recommended.

Options
Provisions for mechanical interlock. See Accessory section to order.

Finish
#4 brushed finish on all exterior surfaces. Optional sub-panels are powder coated white.

SCE-BVK

Product Specifications:

Part Number: SCE-BVK
Description: Breather Vent
Height: 2.75"
Width: 2.00"
Depth: 1.50"
Price Code: P2
List Price: $20.75
Catalog Page: 375
Est. Ship Weight: 0.20 lbs

RW-1RS, RW-1RD, EW-1R PANELS ONLY

Application
Designed for indoor or outdoor applications to handle the large negative pressure differential caused in a tightly sealed enclosure in extreme weather conditions or wash down applications that draw water into the enclosure. Adding a Breather Vent will equalize this pressure differential. Installed on the side of your enclosure as a breather or installed on the bottom as a drain and vent. Breather vents are made of corrosion and UV resistant Polycarbonate material.

Industry Standards - (IS24)
- UL Component Recognized

Notes

RW-100 RCP & RW-100 SP-1 VFD PANEL

Construction
- 0.075 In. carbon steel.

Application
Designed for installation into Enviroline Series Two-Door Floor-Mounted enclosures with center channel, to be installed in the front of an enclosure and to swing out of the enclosure. Kit consists of heavy gauge brackets, hinges, and mounting hardware. Installed by detaching door hinge from enclosure and installing swing out panel kit to the existing holes. Hinge is supplied with the enclosure. Made from steel. Kit contains one panel and all hardware for one dead front behind one door.

Finish
Powder Coated white inside and out.

Product Specifications:

Part Number: SCE-HF2001A
Description: Heater W/ Thermostat
Height: 5.41"
Width: 4.38"
Depth: 4.56"
Price Code: P1
List Price: $432.67
Catalog Page: 380
Est. Ship Weight: 4.00 lbs

RW-100 RCP

Construction
- Brushed Aluminum housing.
- Thermostat Range 0° to 100°F (-18° to 38°C).
- Heat discharge at the top of the heater.
- Panel mount.
- Air volume of 16 CFM on 125 & 200 Watt Heaters, 26 CFM on 400 & 800 Watt Heaters.
- Heat Indicator Light.
- Switch for Auto tuning on and off with the heating thermostat or set to - Fan - to run continuous & independent of the heating thermostat.
- Temperature differential hysteresis 5.4°F
- UL Recognized Component.

Application
Designed to protect electrical controls, instruments and sensitive components from low temperatures and the effects of condensation and corrosion by maintaining a stable temperature within the electrical enclosure. These heaters are not intended for use in hazardous, wet, dusty or dirty locations.

Finish
Brushed Aluminum

Industry Standards - (IS24)

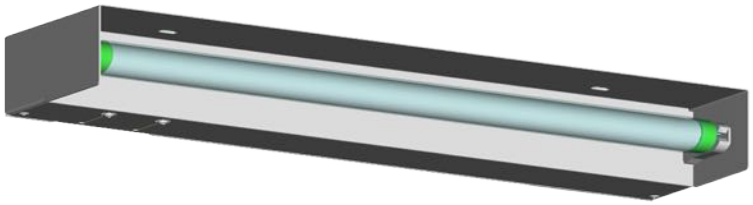
SCE-LF18NO

Product Specifications:



Part Number: SCE-LF18NO
Description: Fixture, LED Light w/o Outlet
Height: 2.75"
Width: 18.18"
Depth: 4.00"
Price Code: P2
List Price: $185.90
Catalog Page: 392
Est. Ship Weight: 6.00 lbs
Operating Temperature: -4 to 140 Degrees F

Construction
- 4000K Frosted White
- 18 inch 850 Lumens
- 24 inch 900 Lumens
- LF1824 24VDC 500 Lumens

Application
LED light fixture is designed to provide interior lighting for an enclosure. Can be mounted to light channels in the top of an enclosure or on the front flange of most enclosures. Door activated adjustable switch, switch can be removed and relocated. Terminal block on each end of fixture, making it easy to wire and daisy chain multiple lights continuously. LED bulb with PVC frosted white protective light diffuser included. Housing made from steel and powder coated white. Units with convenience receptacle outlet are 120 VAC with ground 50/60 HZ. Without convenience receptacle outlet 100 to 277 VAC 50/60 HZ. With the exception of SCE-LF1824VDC.

SCE-N12FA1010

Product Specifications:

Part Number: SCE-N12FA1010
Description: Fan Assembly (115v)
Height: 12.80"
Width: 12.80"
Depth: 6.30"
Price Code: P1
List Price: $578.57
Catalog Page: 376
Est. Ship Weight: 6.00 lbs

RW-100 SP-1

Application
Easy to install snap fit design for use in enclosures that require cooling but have limited space in NEMA 1 and 12 applications. Housing and grille are made of black heat resistant (ABS-FR), self-extinguishing material. Fans are available in 115 or 230 volt AC, 60/50 Hertz (HZ) single phase or 24 volt DC.

Industry Standards - (IS24)
- UL Component Recognized

Notes
Type 12 - IEC 60529 IP 54
UL File Component Recognized SA32278
UL Listed E498756

List Price: $107.33
Catalog Page: 378
Est. Ship Weight: 2.06 lbs

RW-100 RCP

Application
Designed for use with Type 12 fan and filter kits to prevent rain, sleet, snow, dropping water or fluids from being drawn into the enclosure. Removable cover for easy access to fan and filter kits. Made of heavy gauge galvannealed steel. "SS" parts are made of Type 304 stainless steel.

Finish
ANSI-61 gray powder coat.
"SS" parts with #4 brushed finish.
**-05 Powder Coated White.

Industry Standards - (IS11)
- UL Component Recognized Type 3R

Notes
UL File # E69392

Fan and Filter Kit are sold separately.

Optional Accessories

SCE-TEMNO

Product Specifications:

Part Number: SCE-TEMNO
Description: Thermostat (Normally Open)
Height: 2.40"
Width: 1.26"
Depth: 1.42"
Price Code: P1
List Price: $50.05
Catalog Page: 374
Est. Ship Weight: 1.00 lbs

FAN CONTROL; TEMPERATURE MONITORING FOR SP-1

Application
Designed to regulate air temperature in enclosures that operate with heaters or fans. This mechanical bi-metallic thermostat has a set point range of 30° to 140° F and is easily installed on 35mm mounting rail. (NC) contact normally closed, or (NO) contact normally open, switch capacity 10 amp 120-250 VAC Resistive load and 1 amp 120-250VAC Inductive load, 1.25 amp 24VDC.

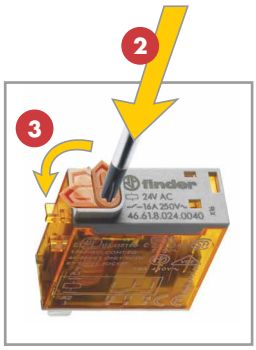
C: Option 74
LED (DC, non-polarized)



Lockable test button and mechanical flag indicator (0040, 0054, 0074)

The dual-purpose Finder test button can be used in two ways:
Case 1) The plastic pip (located directly below the test button) remains intact. In this case, when the test button is pushed, the contacts operate. When the test button is released the contacts return to their former state.
Case 2) The plastic pip is broken-off (using an appropriate cutting tool). In this case, (in addition to the above function), when the test button is pushed and rotated, the contacts are latched in the operating state, and remain so until the test button is rotated back to its former position.
In both cases ensure that the test button actuation is swift and decisive.

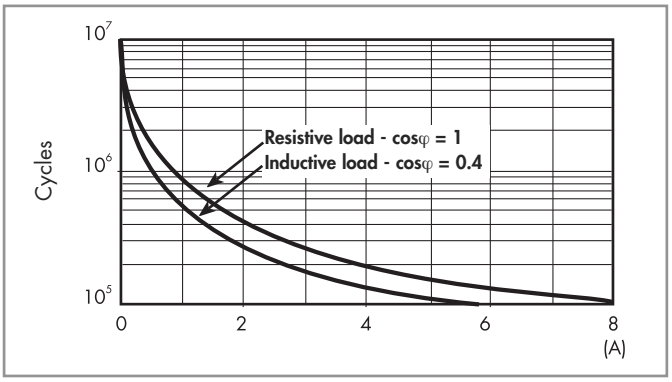
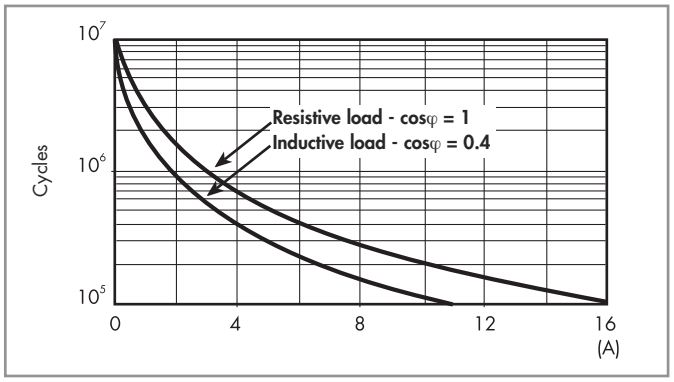
Contact specification

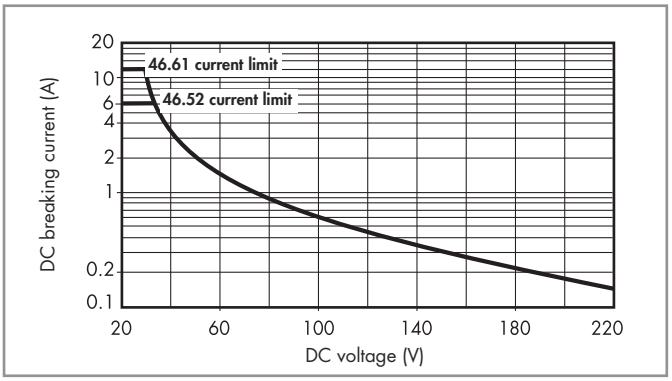
F 46 - Electrical life (AC) v contact current
Type 46.52



F 46 - Electrical life (AC) v contact current
Type 46.61



H 46 - Maximum DC1 breaking capacity



- When switching a resistive load (DC1) having voltage and current values under the curve, an electrical life of ≥ 100·10³ can be expected.
- In the case of DC13 loads, the connection of a diode in parallel with the load will permit a similar electrical life as for a DC1 load.
  Note: the release time for the load will be increased.

Lockable test button and mechanical flag indicator (0040, 0050, 0054, 0070, 0074)

The dual-purpose Finder test button can be used in two ways:
Case 1) The plastic pip (located directly above the test button) remains intact. In this case, when the test button is pushed, the contacts operate. When the test button is released the contacts return to their former state.
Case 2) The plastic pip is broken-off (using an appropriate cutting tool). In this case, (in addition to the above function), when the test button is pushed and rotated, the contacts are latched in the operating state, and remain so until the test button is rotated back to its former position. In both cases ensure that the test button actuation is swift and decisive.

C60SP are multi-standard miniature circuit breakers and supplementary protection as defined by UL 1077. It combines following functions:

- circuit protection against short-circuit currents
- circuit protection against overload currents
- tripping and fault indication by the addition of auxiliaries.

3P Series Molded Case Circuit Breakers Overview

Overview

Designed to provide branch and feeder circuit protection in industrial control panels, this line of Molded Case Circuit Breakers supplies protection against overload in conductors and short circuit in connected equipment such as motors. They are UL listed for installation in UL 508 control panels. Their small size, in relation to standard circuit breakers or other comparable devices, saves panel space. Four frame sizes and all standard accessories are available.

Features

- UL489 listed performance for branch circuit overcurrent protection and disconnecting means
- Patented contact conductor designs featuring high-speed "blow-open" action, providing superior performance when high level fault currents produce extra-ordinary electromechanical forces
- Advanced arc extinguishing technology
- Toggle handle provides three positions (on/off/tripped) along with visual indicators
- Manufactured in ISO 9000 certified facilities
- HACR (heating, air conditioning and refrigeration) rated
- G-Frame and F-Frame breakers are suitable for reverse feed
- K-Frame and L-Frame breakers include 3-pole adjustable magnetic trip.

Manufactured by Eaton Corporation

Listings

- UL 489 MCCB, File: E7819
- Field-installed accessories: UL file E64983
- CSA 22.2 No.5, File: 43556
- IEC 157-1
- NEMA Standards Pub. No. AB1-1993

Note: These parts available for sale to North American locations only.

Rotary Handle

A universal rotary handle is available for each frame size of molded case circuit breaker. The handles are suitable for use with NEMA 1, 12, 4 or 4x enclosures. Features include the following:

- Large handle easily accommodates gloves
- Global ON/OFF markings (I/ON, O/OFF) and TRIP indication on handle
- Access Handle Lock-Off by pressing arrow on handle insert
- Door interlock and defeater
- Metal shaft and base
- Pipe valve operation (ON=Vertical, OFF=Horizontal) with 90 degree rotation
- UL 489, IEC 947-1/-2, CSA

Flex Shaft™ Flexible Handle

Meeting crucial time limits for shutdown procedures is easier with an externally mounted handle. The flexible handle makes it possible to operate the circuit breaker externally and can be used in enclosures of varying depths and heights. It can be used with NEMA 1, NEMA 3R and NEMA 12 enclosures, and it accepts up to three padlock shackles.

Note: A minimum bending radius of four inches is necessary for proper operation.

Product Type	Fused and non-fused rotary disconnect switches	Non-fused IEC rotary disconnect switches
Current Range	20…1200 A	125…1250 A
Main Applications	• UL 98 ratings “suitable as service entrance disconnecting means” • UL 508, CSA ratings “suitable as at-motor disconnect” • UL and IEC applications	• Disconnecting means • IEC applications
Functionality	• 3- or 4-pole fusible or non-fusible disconnect for standard OFF-ON or emergency stop in a main panel disconnect application • 4th pole available as modular accessory • Test mode switch position	• 3- or 4-pole non-fusible disconnect for standard OFF-ON or emergency stop in a main panel disconnect application • 4th pole available as modular accessory
Mounting Styles	20…63 A: DIN Rail/Panel mounting; 100…1250 A: Panel mounting	Panel mounting
Handles	• Available in rotary styles, UL Type 1/3R/4/4X/12, IP66, standard, or test mode versions • Handle colors in black and red/yellow and padlockable versions • 30 A/60 A legend markers (optional) — uses Cat. No. 1492-MS6X12 markers	• Available in rotary styles, UL Type 1/3R/4/4X/12, IP66, or standard versions • Handle colors in black and red/yellow and padlockable versions
Open Switch or Enclosed	• Open switch • Enclosed: UL/CSA rated enclosure for 20…63 A devices	• Open switch
UL/CSA Electrical Ratings:		
Rated Voltage U_e	690V AC	690V AC
Rated Current I_e	20…1200 A	125…1250 A
Rated Power P_e [FLA]	Varies w/ 1- or 3-phase switch, voltage	Varies w/ 1- or 3-phase switch, voltage
Short-Circuit Ratings	200 kA	200 kA
Mechanical Life [ops]	Up to 10 000	Up to 10 000
IEC Rated Current I_e		
Ambient Operational Temperature	-20…+60 °C (-4…+140 °F)	-20…+60 °C (-4…+140 °F)
Ambient Enclosed Temperature	-20…+60 °C (-4…+140 °F)	-20…+60 °C (-4…+140 °F)
Ambient Storage Temperature	-40…+65 °C (-40…+149 °F)	-40…+65 °C (-40…+149 °F)
Protection class per IEC 529	• Disconnects with terminal shroud or terminal screen: IP20 • 194R-J100-1753, front mounting: IP20 • Fuse carriers: IP30	• Front-mounted disconnects with terminal shroud or terminal screen: IP20
Optional Accessories	• IP66 handles • Multi-length shafts • Auxiliary contacts • Terminal covers • NFPA 79 internal handle with shaft	• IP66 handles • Multi-length shafts • Auxiliary contacts • Terminal covers

Product Overview

The Bulletin 194R line of fused and non-fused rotary disconnect switches provides the flexibility to meet worldwide applications. The disconnect switches are UL Listed and CSA Certified and are designed to meet IEC 60947-3, VDE, DIN, BS, and applicable NEMA requirements.

Features

- 20 A...1250 A Sizes
- Fused switch versions:
  - BS88 -DIN
  - CSA HRCII-C - CSA HRCI-MISC - HRC-L
  - UL Class J- UL Class CC - UL Class L
  - NFC
- IP66 (Type 3R, 3, 12, 4, 4X) operating handle ingress ratings
- Handle with or without test mode
- Padlockable handle for up to three padlocks
- 6 auxiliary contacts can be added
- Suitable as service entrance disconnecting means (UL 98)
- Suitable as at-motor disconnecting means (UL 508)

Catalog Number Explanation

Fourth pole (20...63 A), additional auxiliary contacts, and handle options available in accessory section.

Flex I/O

In-Cabinet Modular I/O Platform

Benefits

Reduced Space: Wire direct from sensor to terminal base and eliminate terminal strip

Functionality: 4- through 32-point modules offer functions of larger rack-based I/O

Increased Productivity: Easy configuration and setup of I/O modules using wizards speeds engineeringm and installation

Reduced Downtime: Removal and Insertion Under Power (RIUP) and diagnostics

Exceptional Choices: Over 90 catalog numbers and a breadth of specialty modules meet the needs of a wide variety of applications

Network Flexibility: Communicates on EtherNet/IP, ControlNet, DeviceNet, Remote I/O and other open networks

Improved Plant Operations: HART analog modules pass through HART data to asset management software or controller for improved plant operations

Flex I/O

FLEX™ I/O offers all the functions of larger rack-based I/O without the space requirements. Its cost effectiveness, flexibility, modularity, and reliability have made it the most popular distributed I/O platform with over 4 million modules sold.

FLEX I/O helps eliminate multiple long wiring runs, reduces terminations per point, decreases engineering and installation costs and time, and substantially reduces downtime. It complements all processor platforms from Rockwell Automation for a distributed I/O solution. In addition, it acts as local I/O for the FlexLogix™ programmable automation controller for a tightly integrated control and I/O solution.

Your FLEX I/O system can communicate on EtherNet/IP™, ControlNet™, DeviceNet™, and many other open networks including, but not limited to, Remote I/O, PROFIBUS DP®, and Interbus-S. Independently select the I/O, termination style, and network to meet your application needs. Adapters and other components are available for adding to your system as your requirements change.

FLEX I/O Products

The following table lists the available FLEX I/O products.

General Specifications	
Operating Temperature	0...55 °C (32....131 °F)
Storage Temperature	-40...85 °C (-40...185 °F)
Relative Humidity	5...95% non-condensing
Shock, Operating*	30 g peak acceleration, 11(±1) ms pulse width
Shock, Non-Operating*	50 g peak acceleration, 11(±1) ms pulse width
Vibration*	Tested 5 g @ 10...500 Hz per IEC 68-2-6
	* To maintain these specifications, you must use DIN rail locks

Dimensions and Weights			
		Dimentions (HxWxD), Approx.	**Weight**
I/O Modules		46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in)	0.1 kg (0.3 lb)
I/O Adapters≠		87 x 68 x 69 mm (3.4 x 2.7 x 2.7 in)	0.2 kg (0.4 lb)
Terminal Bases		94 x 94 x 69 mm (3.4 x 3.7 x 2.7 in)	0.2 kg (0.5 lb)
Power Supplies	1794-PS13	87 x 68 x 69 mm (3.4 x 2.7 x 2.7 in)	0.2 kg (0.5 lb)

Available 1794 Adapter Modules	2

A FLEX I/O™ adapter module interfaces FLEX I/O modules to an I/O scanner port across a communication network. The FLEX I/O adapter module contains a built-in power supply that converts 24V DC to 5V DC necessary to transfer and receive all the I/O data and configuration for the entire rack.

Your 1794 FLEX I/O system can communicate on:

- EtherNet/IP, single media or redundant
- ControlNet, single media or redundant
- DeviceNet
- Many other open networks including, Remote I/O, PROFIBUS DP, and others from Encompass partners

Additional Resources

These documents contain additional information concerning related products from Rockwell Automation.

Resource	Description
Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1	Provides general guidelines for installing a Rockwell Automation industrial system.
Product Certifications website, http://www.rockwellautomation.com/products/certification/	Provides declarations of conformity, certificates, and other certification details.

You can view or download publications at http://www.rockwellautomation.com/literature/. To order paper copies of technical documentation, contact your local Allen-Bradley® distributor or Rockwell Automation sales representative.

Available 1794 Adapter Modules

You can select these types of adapter modules.

FLEX I/O Adapter Module Types

Network	Application Requirement
EtherNet/IP	• Plant management (material handling) • Configuration, data collection, and control on a single, high-speed network • Time-critical applications with no established schedule • Data sent regularly • Internet/Intranet connection • Built-in switch, or high availability requirement (2-port AENTR)
ControlNet	• High-speed transfer of time-critical data between controllers and I/O devices • Deterministic and repeatable data delivery • Media redundancy
DeviceNet	• Connections of low-level devices to plant floor controllers • More diagnostics for improved data collection and fault detection • Less wiring and reduced start-up time than a traditional, hard-wired system
Remote I/O	• Connections to Remote I/O networks
PROFIBUS	• Connection to PROFIBUS DP and DPV1 networks

Rockwell Automation

Important User Information

Solid state equipment has operational characteristics differing from those of electromechanical equipment. Safety Guidelines for the Application, Installation and Maintenance of Solid State Controls (publication SGI-1.1 available from your local Rockwell Automation sales office or online at http://www.rockwellautomation.com/literature/) describes some important differences between solid state equipment and hard-wired electromechanical devices. Because of this difference, and also because of the wide variety of uses for solid state equipment, all persons responsible for applying this equipment must satisfy themselves that each intended application of this equipment is acceptable.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

	**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.
	**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence
	**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.
	**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.
IMPORTANT	Identifies information that is critical for successful application and understanding of the product.

Allen-Bradley, CompactLogix, ControlLogix, FLEX, FLEX Ex, FLEX I/O-XT, Integrated Architecture, PanelView, Rockwell Automation, Rockwell Software, and TechConnect are trademarks of Rockwell Automation, Inc.

CIP, ControlNet, DeviceNet, and Ethernet/IP are trademarks of ODVA, Inc.

Trademarks not belonging to Rockwell Automation are property of their respective companies.

New and Updated Information

This table contains the additions made to this revision.

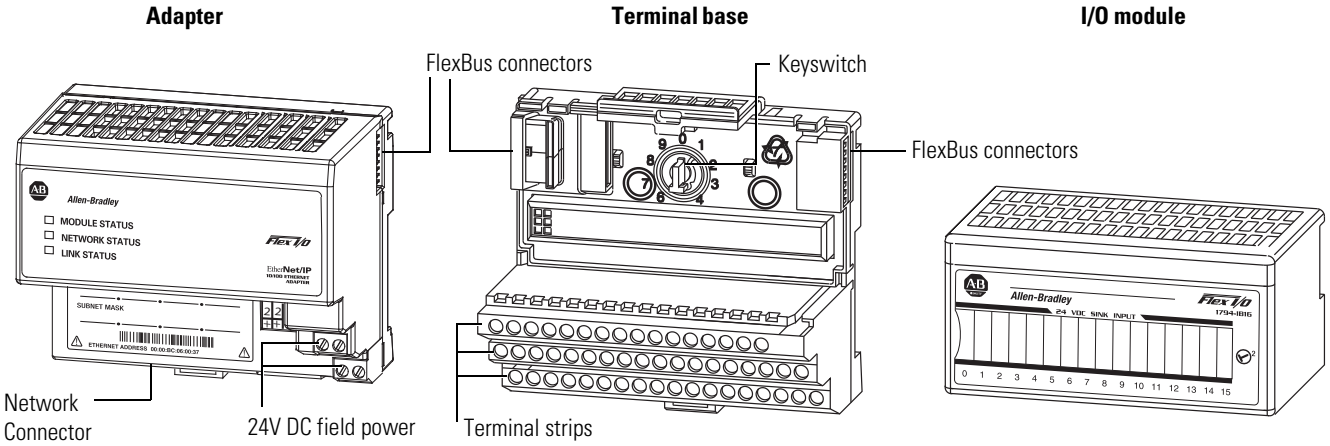
Topic	Page
Added temperature, operating data to all 1794 product sections and corrected Operating Temperature information from 185 °F to 158 °F	Chapters 1, 2, 3, and 7
Updated general FLEX I/O and FLEX I/O-XT specifications table	11
Updated table on discontinued catalogs	16
Corrected 1794-OB1D module type information	25
Updated analog I/O module summary table	45
Updated FLEX I/O Analog input comparison table	46
Added new section for 1794-IF4ICFXT	50
Updated Common Terminal Base Characteristics table	75
Updated general specifications comparison table for each FLEX I/O terminal base unit	75
Updated 1794 FLEX I/O and FLEX IO-XT related publications table	129
Updated 1797 FLEX Ex I/O related publications table	134

Notes:

About the FLEX I/O and FLEX Ex I/O Systems

1794 FLEX I/O Overview

FLEX™ I/O offers:



FLEX I/O is a Distributed I/O System that connects to several Networks including EtherNet/IP™, ControlNet®, and DeviceNet®.

Flexible, low-cost, modular I/O for distributed applications. FLEX I/O offers all the functions of larger, rack-based I/O without the space requirements.

Independently select the I/O, termination style, and network to meet your application needs.

Two separate connection terminals for field power let you daisy chain power connections to adjacent terminal bases.

One adapter communicates with up to eight I/O modules. Allows connection to:

- 256 digital input/output points, or
- 96 analog input/output points, or
- mix of I/O to meet your needs.

Modularity of FLEX I/O system provides choice of network and ease of expansion. The wiring terminations are done almost entirely on the terminal base. Terminal base termination selection includes screw-clamp, spring-clamp, and cage-clamp to wire directly to 2-, 3-, or 4-wire devices. Additional options of D-shell, knife disconnect, and fused terminal bases are available.

Adjustable keyswitch helps prevent incorrect module insertion into a preconfigured terminal base.

Terminal bases can be exchanged without moving other bases in your system.

If desired, connect individual power supplies to each base to isolate modules. Plug the I/O module into the terminal base to connect the I/O bus and field devices.

Remove and insert modules under power. No direct wiring to the module enables you to change modules without disturbing field wiring or system power.

Mix and match I/O modules. There is a wide variety of digital, analog, and specialty modules.

Each FLEX I/O system contains at least one adapter, one terminal base, and one I/O module.

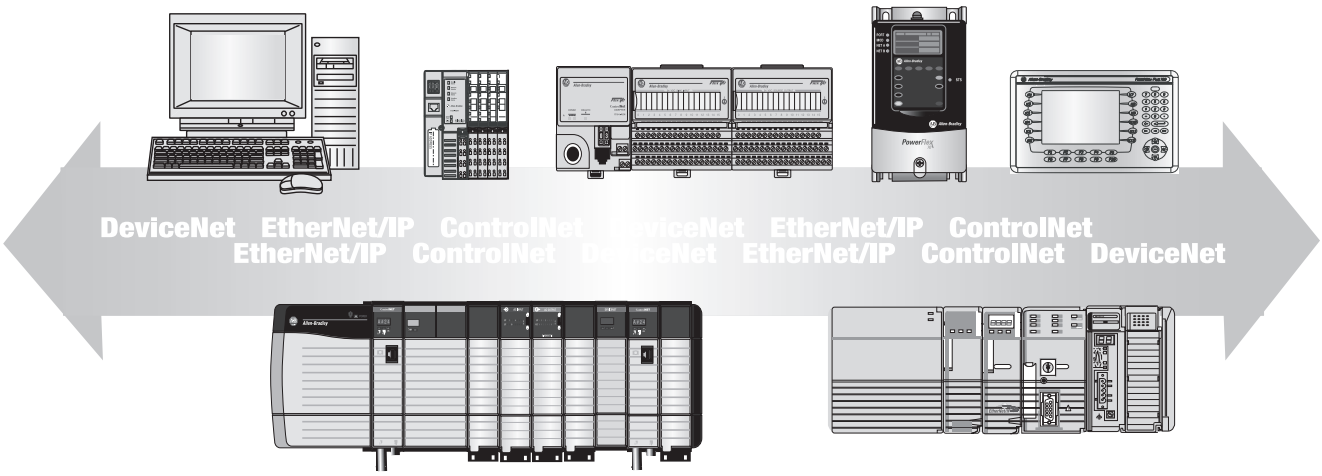
You can power the system with a FLEX power supply (1794-PS13 or -PS3), a 1606 switched mode power supply, or any other compatible power source. Use the terminal block on the terminal base to wire your field devices directly. Wiring directly saves you:

- installation and testing time
- multiple, long wiring runs and external terminal blocks
- control cabinet panel space

FLEX I/O provides additional savings if system problems develop. Combining your field-wiring terminations and the I/O interface into the same location saves you time and money by making your system easier to maintain and troubleshoot. Additionally, the full-featured FLEX I/O system lets you, in non-hazardous location, remove, and insert modules under backplane power without disrupting your system.

Your FLEX I/O system can communicate on EtherNet/IP, ControlNet, DeviceNet, and many other open networks including, but not limited, to Remote I/O and PROFIBUS DP.

Adapters and other components are available for adding to your system as your specific application requirements change.



1794 FLEX I/O XT Overview

FLEX I/O-XT™ modules are designated for extreme environment use.

They differ from their non-XT counterparts only in operational temperature ranges and conformal coating is standard for FLEX I/O-XT products.

FLEX I/O-XT modules meet or exceed the following standards:

- ANSI / ISA-S71.04-1985; Class G1, G2, and G3 Environments
- CEI IEC 6065A-4; Class 1 and 2 Environments
- UL 746E
- MIL-1-46058C to ASTM-G21; (Tropicalization and fungicide)

These standards specify common emissions and classify their concentration levels in a number of industrial processes. Just a few of the common reactive agents that the FLEX I/O-XT modules protect against are:

- H2S – Hydrogen sulfide
- SO2, SO3 – Sulfur dioxide
- CnHn – Hydrocarbons
- NOx – Oxides of nitrogen
- CI2 – Wet Chlorine / Dry Chlorine
- NH3 – Ammonia

General FLEX I/O and FLEX I/O XT Specifications

The following table shows the similarities and differences between the FLEX I/O and the FLEX I/O-XT specifications.

Specifications Comparison

Attribute[1]	1794 FLEX I/O	1794 FLEX I/O XT
Temperature, operating[2]	0…55 °C (32…131 °F)	-20...+70 °C (-4....+158 °F)
Temperature, nonoperating	-40…+85 °C (-40…+185 °F)	-40...+85 °C (-40...+185 °F)
Relative humidity	5…95% noncondensing	
Shock, operating[3]	30 g peak acceleration, 11 (±1) ms pulse width	
Shock, nonoperating[1]	50 g peak acceleration, 11 (±1) ms pulse width	
Vibration	Tested 5 g @ 10…500 Hz per IEC 68-2-6	
Wire size	0.34 mm^2…2.5 mm^2 (22…12 AWG) stranded copper wire rated at 75 °C or higher 1.2 mm (3/64 in.) insulation max	
Atmospheric protection[4]	non-conformal coated	conformal coated to meet or exceed the following standards: • ANSI / ISA-S71.04-1985; Class G1, G2, and G3 Environments • CEI IEC 6065A-4; Class 1 and 2 Environments • UL 746E • MIL-1-46058C to ASTM-G21; (Tropicalization and fungicide)

Specifications Comparison

(1) For all other product-specific specifications, including environmental and certification, see the product sections within this Selection Guide.

(2) Operating temperature may vary per catalog. Refer to the product sections within this selection guide for catalog-specific information.

(3) To maintain these specifications, you must use DIN rail locks.

(4) General specifications does not apply to catalogs that are conformal coated but non-XT modules. Refer to the respective technical data sheet for module-specific data.

(5) See the Product Certification website, http://www.rockwellautomation.com/global/certification/overview.page for Declarations of Conformity, Certificates, and other certification details.

Specify a FLEX I/O or FLEX I/O XT System

Follow these steps as you specify your FLEX I/O or FLEX I/O XT system:

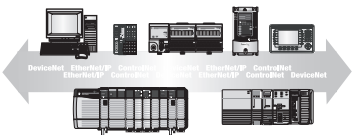
?	Step	See	Page
	1 Select a communication adapter Choose the network for your operating system.	CIP Network Infrastructure Select a Network	15 16
	2 Select I/O modules based on field device • location of the device • your application • number of points needed • number of points available per module • number of modules Or use the Integrated Architecture® Builder tool at http://www.rockwellautomation.com/en/e-tools/configuration.html	Digital I/O Modules FLEX I/O Analog, Thermocouple and RTD Modules FLEX I/O Counter Modules	23 44 67
	3 Select a terminal base Choose an appropriate terminal base for your modules.	General Specification Comparison	75
	4 Choose appropriate power supplies • Choose appropriate power supply • Ensure sufficient power for the communication adapter and modules	Power Supply Definitions Power Requirements and Transformer Sizing	77 78
	5 Determine mounting requirements and select accessories • Determine whether to panel mount or DIN rail mount the FLEX I/O system and at what orientation (horizontal or vertical) • Choose appropriate optional accessories to enhance your system	panel mount or DIN rail mount 1794-CE1 and 1794-CE3 Extender Cables 1794-NM1 FLEX I/O Mounting Kit 1492-EA35 DIN Rail Locks 1794-LBL FLEX I/O Label Kit	121 123 123 124 124

Notes:

Select FLEX I/O Communication Adapters

Step 1 – Select:

a communication adapter based on the appropriate network



A FLEX I/O adapter module interfaces FLEX I/O modules to an I/O scanner port across a communication network. The FLEX I/O adapter module contains a built-in power supply that converts 24V DC to 5V DC for the backplane to power the FLEX I/O modules.

- Your 1794 FLEX I/O system can communicate on:
- EtherNet/IP
- ControlNet, single media or redundant
- DeviceNet
- Many other open networks including, Remote I/O, PROFIBUS DP, and others from Encompass partners

CIP Network Infrastructure

The Common Industrial Protocol (CIP™) allows complete integration of control with information, multiple CIP networks, and standard Internet technologies. CIP provides manufacturers with a scalable and coherent architecture incorporating discrete, process, safety, synchronization and motion applications using the same network technology as the ERP, MES enterprise levels applications. Ultimately, network convergence helps align technology with business goals for business process transformation and enterprise-wide visibility.

The following networks share the Common Industrial Protocol at their upper levels, while remaining media independent at their lower levels. This allows manufacturers to specify the best network for their application and eliminate costly and complex gateways when connecting dissimilar upper level networks.

- EtherNet/IP is an open industrial networking standard that supports implicit and explicit messaging and uses commercial, off-the-shelf Ethernet equipment and physical media.
- ControlNet allows intelligent, high-speed control devices to share the information required for supervisory control, work-cell coordination, operator interface, remote device configuration, programming, and troubleshooting.
- DeviceNet offers high-speed access to plant-floor data from a broad range of plant floor devices and a significant reduction in wiring.

Select a Network

You can configure your system for information exchange between a range of field devices and a specific scanner. You select the communication adapters for the networks that meet your needs:

Network Comparison by Application Requirement

Application Requirements	Network[1]	Communication Adapter
• Plant management (material handling) • Configuration, data collection, and control on a single, high-speed network • Time-critical applications with no established schedule • Data sent regularly • Internet/Intranet connection • Built-in switch, or high availability requirement (2-port AENTR)	EtherNet/IP	1794-AENT 1794-AENTR 1794-AENTRXT
• High-speed transfer of time-critical data between controllers and I/O devices • Deterministic and repeatable data delivery • Media redundancy	ControlNet	1794-ACN15 1794-ACN15K[2][3] 1794-ACNR15[4] 1794-ACNR15XT[5]
• Connections of low-level devices to plant floor controllers • More diagnostics for improved data collection and fault detection • Less wiring and reduced startup time than a traditional, hard-wired system	DeviceNet	1794-ADN 1794-ADNK
• Connections to Remote I/O networks	Remote I/O	1794-ASB[3] 1794-ASB2[3]
• Connection to PROFIBUS DP and DPV1 networks	PROFIBUS DP PROFIBUS DPV1	1794-APB[3] 1794-APBDPV1

(1) Communication adapters and other components are available for adding to your system as your specific application requirements change. For more information, go to www.rockwellautomation.com/encompass and search for products under the FLEX I/O platform.

(2) Modules that have the letter K in the last position of the catalog number, before the series designation, refer to conformal coated versions of the standard modules. These modules meet the following certifications: ANSI / ISA-S71.04-1985, Class G1, G2, and G3 environments; CEI IEC 6065A-4 Class 1 and 2 environments; UL 746E.

(3) Discontinued catalogs may not have updated specifications. For more information about a specific discontinued catalog, refer to individual installation instructions.

(4) Modules that have the letter R in the catalog number, before the series designation, refer to redundancy versions of the standard modules and are meant for redundancy networks.

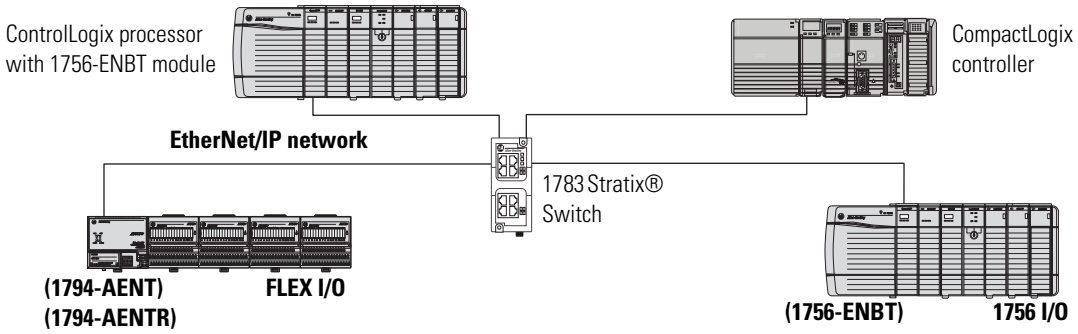
(5) Modules that have the letters XT in the catalog number, before the series designation, refer to extended temperatures version of the standard modules.

EtherNet/IP Network

EtherNet/IP is a network suitable for use in industrial environment and time-critical applications. EtherNet/IP uses standard Ethernet and TCP/IP technologies and an open application layer protocol called the Control and Information Protocol (CIP). CIP is also the application layer used in DeviceNet and ControlNet networks. The open Application Layer protocol makes interoperability and interchangeability of industrial automation and control devices on EtherNet/IP a reality for automation and control applications.

The 1794-AENT and 1794-AENTR connect FLEX I/O to Ethernet/IP enabled controllers such as ControlLogix® or CompactLogix™.

Figure 1 - EtherNet/IP Communication

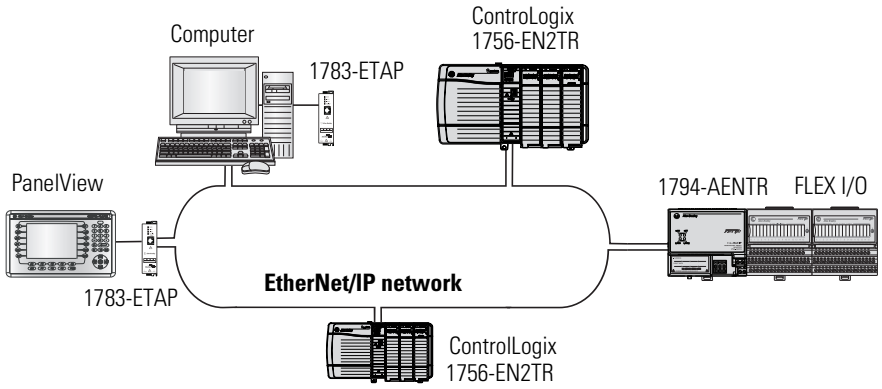


FLEX I/O EtherNet/IP Adapter Specifications

Attribute	1794-AENT	1794-AENTR	1794-AENTRXT
I/O module capacity	8		
Communication rate	10/100 Mbps		
Power consumption at 24V DC	9.6 W	9.3 W	
Power dissipation, max	7.3 W @ 19.2V DC	7.1 W @ 19.2V DC	6.1 W @ 19.2V DC
Thermal dissipation	24.9 BTU/hr @ 24V DC	24.2 BTU/hr @ 24V DC	20.8 BTU/hr @ 24V DC
Power supply 24V current load	450 mA	400 mA @ 24V DC 500 mA max	
Power supply input voltage, nom	24V DC		
Operating voltage range	19.2…31.2V DC (includes 5% AC ripple)		
Ethernet interface	1 – RJ45 category 5	2 – RJ45 category 5	
Dimensions (HxWxD), approx	87 x 94 x 69 mm 3.4 x 3.7 x 2.7 in.	87 x 94 x 92 mm 3.44 x 3.7 x 3.6 in.	
Temperature, operating	0…55 °C (32…131 °F)		-25…+70 °C (-13…+158 °F)

Device Level Ring Topology

A DLR network is a single-fault tolerant ring network intended for the interconnection of automation devices. FLEX I/O modules can connect to a DLR network using EtherNet/IP taps. The following is an illustration of how FLEX I/O systems can be integrated into a DLR topology.



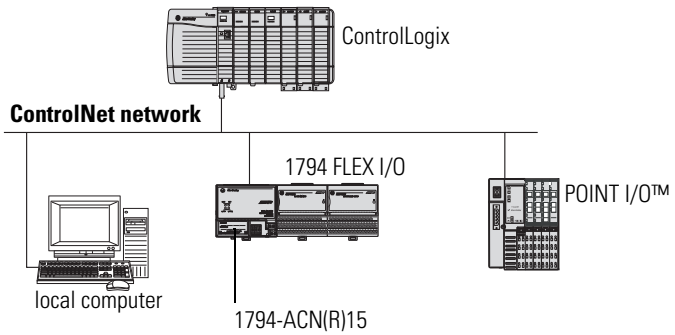
ControlNet Network

ControlNet is a real-time control network that provides high-speed transport of both time-critical I/O and interlocking data and messaging data, including upload/download of programming and configuration data on a single physical media link. The ControlNet network's highly efficient data transfer capability significantly enhances I/O performance and peer-to-peer communication in any system or application where it is used.

The 1794-ACNR15 adapter is capable of accepting redundant ControlNet cable media. The 1794-ACN15 is a non-redundant version.

The following diagram shows the FLEX I/O platform on a ControlNet network.

Figure 2 - ControlNet Communication



FLEX I/O ControlNet Adapter Specifications

Attribute	1794-ACN15, 1794-ACN15K(1), 1794-ACNR15, 1794-ACNR15XT
I/O module capacity	8
Communication rate	5 Mbps
Power consumption at 24V	7.9 W
Inrush current at 24V	23 A for 2 ms
Power dissipation, max	4.6 W @ 19.2V DC
Thermal dissipation	15.7 BTU/hr @ 19.2V DC
Power supply 24V current load	330 mA
Power supply 24V output current, max	450 mA
Power supply input voltage, nom	24V DC
Operating voltage range	19.2…31.2V DC (includes 5% AC ripple)
ControlNet cable	Allen-Bradley RG-6/U Quad shield coax, part no. 1786-RG6 (standard-PVC CM-CL2) or 1786-RG6F/A (high-flex)
Isolation voltage	Tested @ 850V DC for 1 s, user power to system
Dimensions (HxWxD), approx	87 x 94 x 92 mm 3.4 x 3.7 x 3.6 in.
Temperature, operating	-20…+55 °C (-4…+131 °F) -25…+70 °C (-13…+158 °F) – **1794-ACNR15XT only**

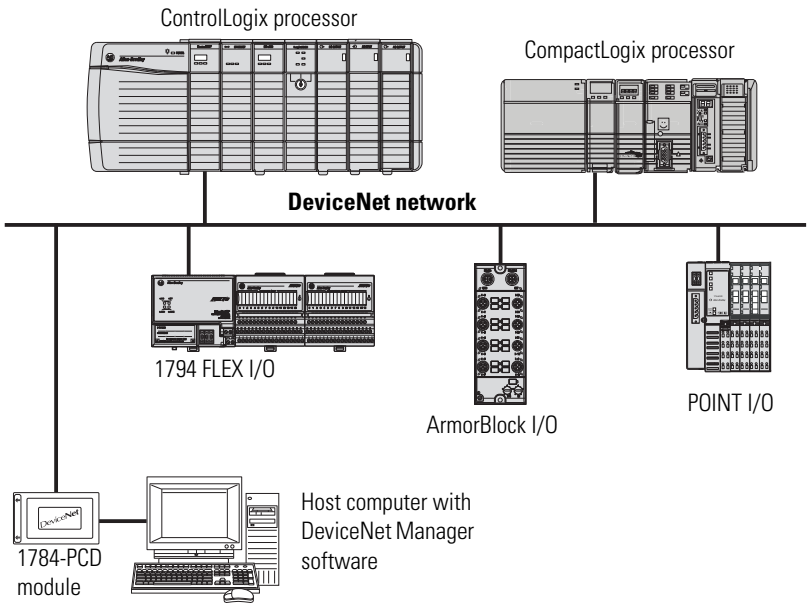
(1) Discontinued catalogs may not have updated specifications. For more information about a specific discontinued catalog, refer to individual installation instructions.

DeviceNet Network

The DeviceNet network is an open low-level network that provides connections between simple industrial devices (such as sensors and actuators) and higher-level devices (such as PLCs and computers). The DeviceNet network uses the proven Common Industrial Protocol (CIP) to provide the control, configure, and data collection capabilities for industrial devices. The DeviceNet network is a flexible network that works with devices from multiple vendors.

The following illustration shows the FLEX I/O platform on a DeviceNet network.

DeviceNet Communication



FLEX I/O DeviceNet Adapter Specifications

Attribute	1794-ADN, 1794-ADNK
I/O module capacity	8
Communication rate	125 Kbps 250 Kbps 500 Kbps
Power consumption at 24V	7.9 W
Inrush current at 24V	23 A for 2 ms
Power dissipation, max	4.6 W @ 19.2V DC
Thermal dissipation	15.7 BTU/hr @ 19.2V DC
Power supply 24V current load	330 mA
Power supply 24V output current, max	450 mA
Power supply input voltage, nom	24V DC
Operating voltage range	19.2…31.2V DC (includes 5% AC ripple)
DeviceNet cable	Allen-Bradley part no. 1485C-P1-Cxxx. See publication DNET-UM072 for more information. Extended Local Cable: 1794-CE1 (0.3 m) or 1794-CE3 (0.9 m)
Isolation voltage	Tested @ 850V DC for 1 s, user power to system
Dimensions (HxWxD), approx	87 x 68 x 69 mm 3.4 x 2.7 x 2.7 in.
Temperature, operating	-20…+70 °C (-4…+158 °F)

Other Networks – Remote I/O

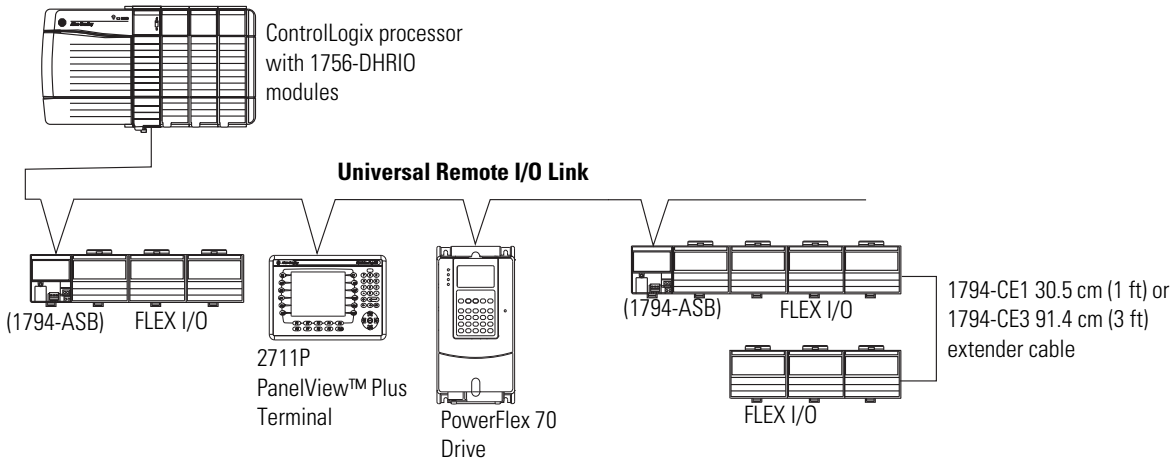
The 1794-ASB and 1794-ASB2 adapters provide connection to the Remote I/O network.

The 1794-ASB2 supports only two FLEX I/O modules. The 1794-ASBLT is only for use with classic PLC 5/15 or PLC 5/25 processors.

ATTENTION: Do not use these Remote I/O adapters with the Classic PLC-5/15 or PLC-5/25 processors. Improper operation of the remote I/O may result.

- 1794-ASB, Series E
- 1794-ASB2, Series D
- 1794-ASB2K, Series D

Other Network Communication



FLEX I/O Remote I/O Adapter Specifications

Attribute	1794-ASB[1], 1794-ASBLT[1][2]	1794-ASB2[1]
I/O module capacity	8	2
Communication rate	57.6 Kbps 115.2 Kbps 230.4 Kbps	
Power consumption at 24V	7.9 W	4.2 W
Inrush current at 24V	23 A for 2 ms	
Power dissipation, max	4.6 W @ 19.2V DC	3.4 W @ 19.2V DC
Thermal dissipation	15.7 BTU/hr @ 19.2V DC	11.6 BTU/hr @ 19.2V DC
Power supply 24V current load	330 mA	175 mA
Power supply input voltage, nom	24V DC	
Operating voltage range	19.2…31.2V DC (includes 5% AC ripple)	

FLEX I/O Remote I/O Adapter Specifications

Attribute	1794-ASB[1], 1794-ASBLT[1][2]	1794-ASB2[1]
DeviceNet cable	Remote I/O: Belden 9463 or equivalent as specified in Allen-Bradley Approved Vendor List, publication ICCG-2.2 Allen-Bradley pin connector part no. 942029-03	
Isolation voltage	Tested @ 850V DC for 1 s, user power to system	
Dimensions (HxWxD), approx	87 x 68 x 69 mm 3.4 x 2.7 x 2.7 in.	
Temperature, operating	-20…+55 °C (-4…+131 °F)	

(1) Discontinued catalogs may not have updated specifications. For more information about a specific discontinued catalog, refer to individual installation instructions.

(2) The 1794-ASBLT is only for use with Class PLC 5/15 or PLC 5/25 processors.

Other Networks – PROFIBUS DP

Use the 1794-APB or 1794-APBDPV1 adapter to connect to a PROFIBUS DP network.

FLEX I/O PROFIBUS I/O Adapter Specifications

Attribute	1794-APB[1]	1794-APBDPV1
I/O module capacity	8	
Communication rate	57.6 Kbps 115.2 Kbps 230.4 Kbps	All rates up to 12 Mbps
Power consumption at 24V	7.9 W	9.6 W
Inrush current at 24V	23 A for 2 ms	
Power dissipation, max	5.3 W @ 19.2V DC	4.2 W @ 19.2V DC
Thermal dissipation	17.9 BTU/hr @ 19.2V DC	14 BTU/hr @ 19.2V DC
Power supply 24V current load	450 mA	640 mA
Power supply input voltage, nom	24V DC	
Operating voltage range	19.2…31.2V DC (includes 5% AC ripple)	
PROFIBUS connector	9-pin D-shell; PROFIBUS standard drop cable	
Isolation voltage	Tested @ 850V DC for 1 s, user power to system	Tested @ 850V DC for 60 s, PROFIBUS to backplane to power
Dimensions (HxWxD), approx	87 x 68 x 69 mm 3.4 x 2.7 x 2.7 in.	
Temperature, operating	0…55 °C (32…131 °F)	

(1) Discontinued catalogs may not have updated specifications. For more information about a specific discontinued catalog, refer to individual installation instructions.

Our Encompass partners offer adapters for connecting to RS-232/422/485, Serial/DF1, and Modbus. For details, go to www.rockwellautomation.com/encompass/ and search for products under the platform FLEX I/O.

Select FLEX I/O Modules

Step 2 – Select:

I/O Modules

The FLEX I/O module plugs into the terminal base, connecting to the I/O bus and field devices. Since there is no direct wiring to the I/O module, you can remove and insert modules under backplane power, enabling you to change modules without disturbing field wiring, other I/O modules, or FLEX backplane power. This eliminates costly downtime and the inefficiencies of restarting a system.

The choices and flexibility you have with I/O types range from digital and analog to temperature and motion control. FLEX I/O allows you to use as many as eight terminal bases per adapter which can provide a maximum of 256 digital I/O points or 96 analog channels per adapter. You can mix and match digital and analog I/O with mounting and wiring options, supplying you with a successful distributed system solution.

This flexibility gives you the following choices of I/O signal types:

- Digital: AC and DC voltage signals
- Analog: current or voltage
- Relay: normally open, 2 A capability
- Protected outputs: non-latching, latching, and with diagnostics
- Temperature: thermocouple or RTD
- Motion: high-speed counters, flow metering, and totalization
- Combo modules: combination of input and output capability
- Harsh environments: use FLEX I/O XT in harsh environments
- Intrinsic Safety (IS): use FLEX Ex I/O in hazardous areas to connect to field devices

Digital I/O Modules

Digital I/O modules interface with field devices such as:

- pushbutton and limit switches
- on/off actuators such as motor starters, pilot lights, and annunciators
- Relay contacts

Features

Modules are available in different densities ranging from 8 to 32 points.

- Digital I/O modules cover a wide electrical range:

120V AC: Input/Output and Isolated Input/Output, 8 and 16 point

220V AC: Input/Output, 8 point

24V DC: Input/Output/Combination, Sink/Source, Protected, Electronically Fused, Diagnostic, 8, 16, and 32 point

48V DC: Sink Input/Source Output, 16 point

Relay: Sink/Source, 8 point

- Isolated inputs and outputs can be used in applications such as motor control centers where individual control transformers are used.
- Protected outputs (P) have electronic protection which acts to shut the output down in reaction to a short circuit, overload, or over-temperature condition.
  Recovery from shutdown is automatic upon removal of the output fault. No fault status is provided to the processor.
- Electronic Fused (EP) module acts to open the output when a fault occurs. The fuse can be reset by operating a pushbutton, via software, or by cycling the input power. Fault status is provided to the processor.
- Diagnostic (D) modules detect, indicate, and report to the processor the following faults:

  open input or output field devices or wiring

  shorted output field devices

  shorted input or output wiring

  reverse polarity of user supply wiring
- Selectable input filter times from <1...60 ms.
- LED for each channel indicating status of:

  corresponding input device

  output signal

Digital I/O Module Summary

Catalog Number	Inputs	Outputs	Terminal Base Unit	Electrical Range	Module Type
AC Modules					
1794-IA8	8	—	1794-TBN, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TBKD, 1794-TB3K, 1794-TB3SK, 1794-TBNK	120V AC	Nonisolated inputs
1794-IA8I					Isolated inputs
1794-IA16	16		1794-TB3, 1794-TB3S, 1794-TBN(1), 1794-TB3K, 1794-TB3SK, 1794-TBNK	120V AC	Nonisolated inputs
1794-IM8	8	—	1794-TBN, 1794-TBNK	240V AC	
1794-IM16	16				
1794-OA8	—	8	1794-TBNF, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TBN, 1794-TBKD, 1794-TB3K, 1794-TB3SK, 1794-TBNK	120V AC	Nonisolated outputs
1794-OA8I					Isolated outputs
1794-OA16		16	1794-TB3, 1794-TB2, 1794-TB3S,1794-TB3K 1794-TB3SK, 1794-TBN(1), 1794-TBKD, 1794-TBNK	120V AC	Nonisolated outputs
1794-OM8		8	1794-TBNF, 1794-TBN, 1794-TBNK	240V AC	
1794-OM16		16			

Digital I/O Module Summary

Catalog Number	Inputs	Outputs	Terminal Base Unit	Electrical Range	Module Type
DC Modules					
1794-IB8	8	—	1794-TB3, 1794-TB3S, 1794-TB3K, 1794-TB3SK	24V DC	Nonisolated inputs
1794-IB16	16	—

Relay Modules					
1794-OW8	—	8	1794-TB2, 1794-TB3, 1794-TB3S, 1794-TBN, 1794-TBNF, 1794-TB3K, 1794-TB3SK, 1794-TBNK	24V DC	Isolated outputs Electromagnetic relays
1794-OW8XT					Isolated outputs Electromagnetic relays Extended temperatures

(1) Auxiliary terminal strips are required when using the 1794-TBN.

Select Input Filter Times for Digital Modules

Input filter times can be set to the following values (EtherNet/IP, ControlNet, and DeviceNet only).

Input Filter Times – AC Modules

Filter Times for Inputs	Maximum Times (ms)			
	OFF to ON		ON to OFF	
	1794-IA8, 1794-IA8I	1794-IA16, 1794-IM8	1794-IA8, 1794-IA8I	1794-IA16, 1794-IM8
Filter time 0 (default)	8.4(1)	7.5	26.4(2)	26.5
1	8.6	8	26.6	27
2	9	9	27	28
3	10	10	28	29
4	12	12	30	31
5	16	16	34	35
6	24	24.5	42	44
7	40	42	58	60.5

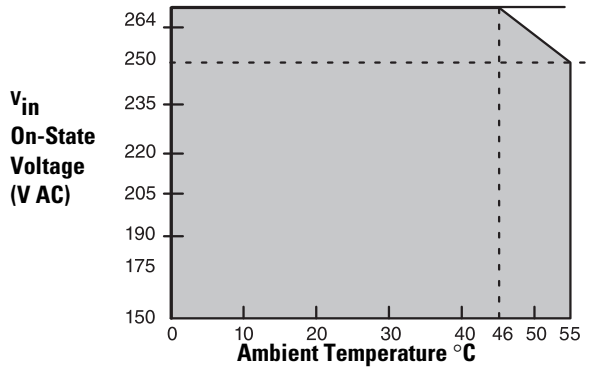
(1) OFF to ON filter is 8 ms.

(2) ON to OFF filter is 26 ms.

Input Filter Times – DC Modules

Filter Times for Inputs	Maximum Times (ms)
	OFF to ON and ON to OFF
	1794-IB8, 1794-IB16, 1794-IB32, 1794-IV16, 1794-IC16, 1794-IB10XOB6, 1794-IB16XOB16P
Filter time 0 (default)	0.25
1	0.5
2	1
3	2
4	4
5	8
6	16
7	32

Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 220V AC supply voltages and ambient temperatures.

= All mounting positions (including normal horizontal, vertical, inverted horizontal) safe operating range.

Modules Specifications

The following section shows more detailed module specifications in comparative groups to facilitate your selection based on your requirements.

FLEX I/O Digital AC Input Modules

Digital AC Input Comparison

Specification	1794-IA8, 1794-IA8I	1794-IA16	1794-IM8	1794-IM16
Voltage, on-state input, nom	120V AC[1]		240V AC	

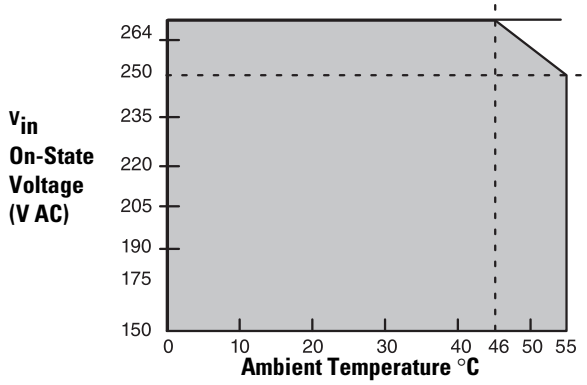
Digital AC Input Comparison

Specification	1794-IA8, 1794-IA8I	1794-IA16	1794-IM8	1794-IM16
Terminal base unit	1794-TBN, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TBKD, 1794-TB3K, 1794-TB3SK, 1794-TBNK	1794-TB3, 1794-TB3S, 1794-TBN(2), 1794-TB3K, 1794-TB3SK, 1794-TBNK	1794-TBN, 1794-TBNK	
Current, on-state input, nom	12 mA @ 120V AC, 60 Hz		10 mA @ 240V AC, 60 Hz	11 mA @ 240V AC, 60 Hz
Input impedance, nom	10.6 kΩ	10 kΩ	22.3 kΩ	22.2 kΩ
Voltage, on-state input, min	65V AC	74V AC	159V AC	
Voltage, off-state input, max	43V AC	20V AC	40V AC	
Current, on-state input, min	7.1 mA	5.5 mA @ 74V AC, 47 Hz	5.3 mA @ 159V AC, 47 Hz	
Current, off-state input, max	2.9 mA		2.6 mA	
Power dissipation, max	4.5 W @ 132V AC	6.4 W @ 132V AC	4.7 W @ 264V AC	6 W @ 264V AC
Thermal dissipation, max	15.3 BTU/hr @ 132V AC	21.8 BTU/hr @ 132V AC	16.2 BTU/hr @ 264V AC	20.47 BTU/hr @ 264V AC
Dimensions (HxWxD)	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed			
Isolation voltage	120V (continuous), Basic Insulation Type Type tested at 1250V AC (1240V for 1794-IA8I) for 60 s, between field side and system No isolation between individual channels Routine tested to 2150V DC for 1 s, between field side and system No isolation between individual channels	120V (continuous), Basic Insulation Type Type tested at 1264V AC for 60 s, between field side and system No isolation between individual channels Routine tested at 2150V DC for 1 s, between field side and system No isolation between individual channels	250V (continuous), Basic Insulation Type, field side to backplane No isolation between individual channels Type tested at 1250V AC for 60 s	
Temperature, operating	-20…+55 °C (-4…+131 °F)	0…55 °C (32…131 °F)	0…55 °C (32…131 °F)	

(1) 1794-IA8I – isolated voltage.

(2) Auxiliary terminal strips are required when using the 1794-TBN.

1794-IM8 Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 220V AC supply voltages and ambient temperatures.

= All mounting positions (including normal horizontal, vertical, inverted horizontal) safe operating range.

FLEX I/O Digital AC Output Modules

Digital AC Output Comparison

Specification	1794-OA8, 1794-OA8I	1794-OA16	1794-OM8	1794-OM16
Voltage, on-state output, nom	120V AC[2]		220V AC	240V AC
Terminal base unit	1794-TBN, 1794-TBNF, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TBKD, 1794-TBNK, 1794-TB3K, 1794-TB3SK	1794-TBN[4], 1794-TBNF, 1794-TB2, 1794-TB3S, 1794-TBKD, 1794-TBNK, 1794-TB3K, 1794-TB3SK	1794-TBN, 1794-TBNF, 1794-TBNK	
Current, on-state output, min	5 mA per output			
Current, on-state output, max	500 mA pre output @ 55 °C [3] 750 mA per output @ 35 °C 1.0 A on 4 nonadjacent outputs and 500 mA on the remaining 4 outputs @ 30 °C	500 mA per output @ 55 °C[5]	500 mA @ 55 °C[6]	
Current, on-state output, per module	4.0 A (8 outputs @ 500 mA)	4.0 A (16 outputs @ 250 mA)	4.0 A (8 outputs @ 500 mA)[5]	4.0 A (16 outputs @ 250 mA)
Leakage current, off-state output, max	2.25 mA		2.5 mA	
Voltage drop, on-state output, max	1.0V @ 0.5 A	1.5V @ 0.5 A		
Output surge current, max	7 A for 45 ms, repeatable every 8 s	7 A for 40 ms, repeatable every 8 s		
Voltage, on-state output, min[1]	85V AC		159V AC	
Voltage, on-state output, nom	120V AC		240V AC	
Voltage, on-state output, max	132V AC		264V AC	
Power dissipation, max	4.1 W @ 0.5 A 6.3 W @ 0.75 A 6.3 W @ 1.0 A	4.7 W @ 0.5 A	5 W @ 0.5 A	6 W @ 264V AC
Thermal dissipation, max	14.0 BTU/hr @ 0.5 A 21.1 BTU/hr @ 0.75 A 21.4 BTU/hr @ 1.0 A	16.1 BTU/hr @ 0.5 A	17.1 BTU/hr @ 0.5 A	20.47 BTU/hr @ 264V AC
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed			
Isolation voltage	120V (continuous), I/O to system (and channel to channel for 1794-OA8I) No isolation between individual channels Tested to 2150V DC for 1 s and 1250V AC for 60 s		Tested at 2600V DC for 1 s, I/O to system No isolation between individual channels	250V (continuous), Basic Insulation Type, field side to backplane No isolation between individual channels Type tested at 1250V AC for 60 s
Temperature, operating	-20…+55 °C (-4…+131 °F)	0…55 °C (32…131 °F)		

(1) The external AC supply voltage must be capable of a 50 A surge for 1/2 cycle at power-up.

(2) 1794-OA8I – isolated voltage

(3) sufficient to operate an A-B 500 NEMA size 3 motor starter

(4) Auxiliary terminal strips are required when using the 1794-TBN for the 1794-OA16.

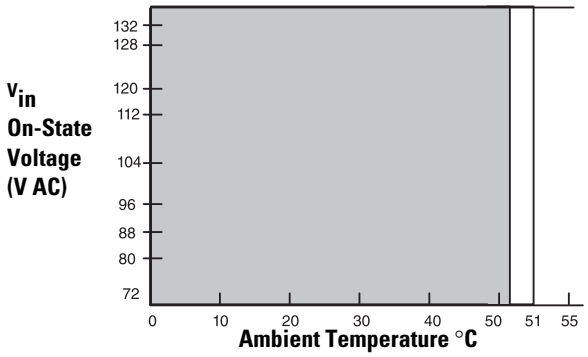
(5) If using 0.5 A outputs, alternate wiring so that no two 0.5 A outputs are adjacent. See the 1794-OA16 Derating Curve for mounting other than the normal horizontal.

(6) See the 1794-OM8 Derating Curve.

IMPORTANT

- The output signal delay, OFF to ON or ON to OFF is 1/2 cycle maximum.
- Modules have a yellow status indicator for each channel. These indicators are driven from the logic-side circuitry.
- Module outputs are not fused. Fusing of individual outputs is required. If applicable, the 1794-TBNF is recommended, otherwise you must provide external fusing. The following fuses are recommended:
  - 1794-OA8, 1794-OA8I – Use 1.6 A, 250V Slow-Blow, Littelfuse (part number 23901.6); San-o SD6-1.6 A (AB part number 94171304). The 1794-TBNF comes with SD6-1.6 A fuses installed.
  - 1794-OA16 – Use 2.5 A, 150V MQ2 normal fuse.
  - 1794-OM8 – Use 0.8 A, 250V MQ4 normal fuse.

1794-OA16 Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 220V AC supply voltages and ambient temperatures.

□ = Normal mounting safe operating range ▭ included
▭ = Other mounting positions (including inverted horizontal, vertical) safe operating range

FLEX I/O Digital DC Output Modules

- 1794-OB8 and 1794-OB16 provide 16 sourcing 1/2 Amp outputs (8 for the 1794-OB8) over a wide 10...31.2V DC input voltage range.
- 1794-OV16 is the sinking version of the 1794-OB16.
- 1794-OV32 is the 32 output version of the 1794-OV16.
- 1794-OC16 is the 48V DC version of the 1794-OB16.
- These modules are not fused. External fusing is strongly recommended or use protected output modules. Module outputs are not fused. Fusing of outputs is recommended. If fusing is desired, you must provide external fusing.

  For 1794-OB8, 1794-OB16, and 1794-OV16 use SAN-O MQ4-800 mA fuse.

  For 1794-OC16 use 2 A, 150V AC MQ2 normal fuse.

Digital DC Output Comparison

Temperature, operating	-20…+55 °C (-4…+131 °F)		-20…+55 °C (-4…+131 °F)	0…55 °C (32…131 °F)		

(1) OFF to ON delay is the time from a valid output ON signal to output energization. ON to OFF delay is the time from a valid output OFF signal to output de-energization.

FLEX I/O Digital DC Protected Output Modules

- 1794-OB16P provides 16 sourcing 1/2 Amp outputs self-protected against shorts, overloads, and over temperature. The faulted output will automatically return when the fault is removed. No feedback to the processor is provided.
- 1794-OB16PXT is the extended temperature version of the 1794-OB16P module. The module is conformal coated.
- 1794-OB8EP provides 8 sourcing 2 Amp outputs with electronic fuse type of overload protection, which opens when overloaded. The fuse can be 'reset' several ways. Fault status is provided to the processor.
- 1794-OB8EPXT is the extended temperature version of the 1794-OB8EP module. The module is conformal coated.
- 1794-OB32P provides 32 self-protected sourcing 1/2 Amp outputs in 2 groups of 16 outputs. Separate voltage sources can be used with each group.
- 1794-OV16P is the sinking version of the 1794-OB16P.

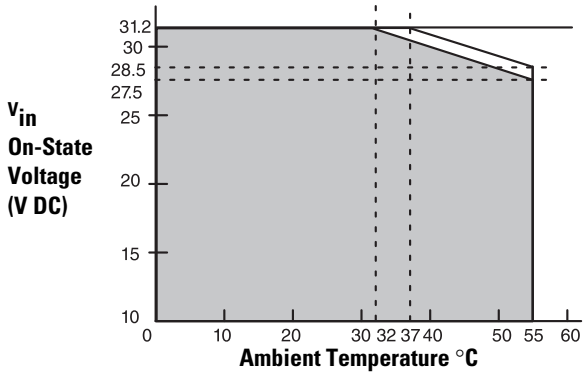
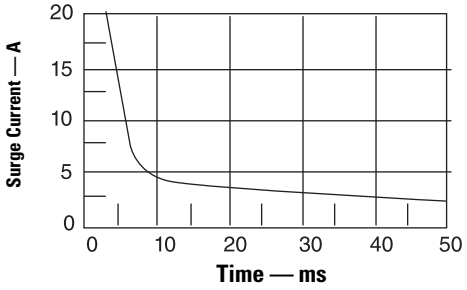
1794-OB16P Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 24V DC supply voltages and ambient temperatures.

= Normal mounting safe operating range included
= Other mounting positions (including inverted horizontal, vertical) safe operating range

1794-OB8EP Output Minimum Surge



FLEX I/O Digital DC Diagnostic Modules

1794-IB16D is the diagnostic version of the 1794-IB16.

1794-OB16D is the diagnostic version of the 1794-OB16.

The modules can detect open wire, short circuit, and reverse polarity of external power. When the module detects a fault, the module fault LED status indicator lights up, the corresponding red channel LED status indicator lights up, and the corresponding module error bit (open wire, short circuit, or reverse power bit) is set. The reporting function provides results of the diagnostics as bits in its data table.

The modules have 16-bi-color channel LED status indicators and one red module status indicator. These indicators are driven from the customer field side power.

Digital DC Diagnostic Input Module

Specification	1794-IB16D
Voltage, on-state input, min	10V DC, sinking
Voltage, on-state input, nom	24V DC
Voltage, on-state input, max	31.2 DC(1)
Voltage, off-state input, max	5.0V DC
Current, on-state input, nom	8.2 mA @ 24V DC
Current, on-state input, max	12.1 mA @ 31.2V DC
Terminal base unit	1794-TB32, 1794-TB32S
Input impedance, max.	3.1 kΩ
Current, on-state input, min	2.0 mA @ 10V DC
Current, off-state input, max	1.5 mA
Power dissipation, max	8.5 W @ 31.2V DC
Thermal dissipation, max	29 BTU/hr @ 31.2V DC
Detected reverse polarity voltage	10V min(2)
Sensor voltage drop, max	2.2V DC
Current, sensor source, max	50 mA
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Isolation voltage	50V continuous, I/O to system Tested to 2121V DC for 1 s, I/O to system No isolation between individual channels
Temperature, operating	0…55 °C (32…131 °F)

(1) See 1794-IB16D Derating Curves.

(2) Module must detect if the reverse polarity external power supply voltage is greater than the value.

Digital DC Diagnostic Output Module

Specification	1794-OB16D
Voltage, on-state output, min	10V DC, sinking
Voltage, on-state output, max	31.2 DC
Voltage drop, on-state output, max	0.5V DC @ 0.5 A
Terminal base unit	1794-TB3, 1794-TB3S, 1794-TB3K, 1794-TB3SK
Current, on-state output, min	2.0 mA per channel
Current, on-state output, max	500 mA per channel 8 A per module
Leakage current, off-state output, max	0.5 mA
Output surge current, max	2 A for 50 ms, repeatable every 2 s
External DC supply voltage range	10…31.2V DC (5% AC ripple)
External DC supply current range	56…78 mA
Power dissipation, max	4.8 W @ 31.2V DC
Thermal dissipation, max	16.4 BTU/hr @ 31.2V DC
Short circuit protection	Thermal shutdown (auto reset)(1)
Open wire detection, off-state leakage current	0.1 mA(2)
Detect reverse polarity voltage, min	10V(3)
Current, sensor source, max	Yes
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Isolation voltage	50V continuous, I/O to system Tested to 2121V DC for 1 s, I/O to system No isolation between individual channels
Temperature, operating	0…55 °C (32…131 °F)

(1) Short circuit protection detection condition: when external power active, output signal active, and output port voltage less than 2V.

(2) When external power active and output signal inactive

(3) Module must detect if the reverse polarity external power supply voltage is greater than the value.

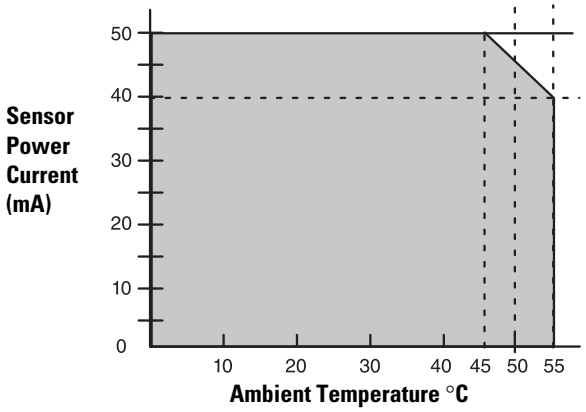
Sensor Power



FLEX I/O Digital DC Combination Modules

The 1794-IB16XOB16P module has outputs that are self-protected against shorts, overload, and over temperature similar to the 1794-OB16P module.

The 1794-IB10XOB6 module requires the use of external fusing for individual outputs.

The 1794-IB10XOB6XT module is the extended temperature version of the 1794-IB10XOB6 module.

Digital DC Combination Modules

Specification	1794-IB10XOB6, 1794-IB10XOB6XT[2]	1794-IB16XOB16P[3]

Digital DC Combination Modules

Specification	1794-IB10XOB6, 1794-IB10XOB6XT[2]	1794-IB16XOB16P[3]
Voltage, off-state output, max	31.2V DC	
Leakage current, off-state output, max	0.5 mA	
Output delay time, OFF to ON, max[1]	0.5 ms	
Output delay time, ON to OFF, max	1.0 ms	
Output surge current, max	4 A for 50 ms repeatable every 2 s	1.5 A for 50 ms repeatable every 2 s
Voltage, off-state input, max	5.0V DC	
Current, on-state input, min	7.1 mA	5.5 mA @ 74V AC, 47 Hz
Current, off-state input, min	1.5 mA	
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed	
External DC supply voltage range	10…31.2V DC (includes 5% AC ripple)	
External DC supply current range	8 mA @ 10V DC 15 mA @ 19.2V DC 19 mA @ 24V DC 25 mA @ 31.2V DC	78 mA @ 10V DC
Temperature, operating	**1794-IB10XOB6:** -20…+55 °C (-4…+131 °F) **1794-IB10XOB6XT:** -20…+70 °C (-4…+158 °F)	0…55 °C (32…131 °F)

(1) Output OFF to ON or ON to OFF delay is the time from the module issuing an output on or off until the output actually turns on or off

(2) Module outputs are not fused. Fusing is recommended. If fusing is desired, you must supply external fusing. Use SAN-O MQ4-3A or Littelfuse 235-003.

(3) Outputs are electronically protected against overloads and shorts.

FLEX I/O Digital Contact Output Modules (Relay)

The 1794-OW8 module provides 8 isolated Form A (normally open) contacts capable of switching up to 2 A at up to 230V AC and 125V DC.

Do not attempt to increase load current or wattage capability beyond the maximum rating by connecting two or more outputs in parallel. The slightest variation in relay switching time may cause one relay to momentarily switch the total load current. Apply only +24V DC power to the power terminals on the terminal base. Make certain that all relay wiring is properly connected before applying any power to the module.

Total current draw through the terminal base unit is limited to 10 A. Separate power connections to the terminal base unit may be necessary.

The use of external fuses or a fused terminal base is required for individual outputs.

The 1794-OW8XT module is the extended temperature version of the 1794-OW8 module. The module is conformal coated.

Digital Contact Output Modules

Specification	1794-OW8	1794-OW8XT
Number of outputs	8	
Terminal base unit	1794-TB2, 1794-TB3, 1794-TB3S, 1794-TBN, 1794-TBNF, 1794-TB3K, 1794-TB3SK, 1794-TBNKF	
External DC supply voltage range	19.2…31.2V DC (includes 5% AC ripple)	
External DC supply current, nom	125 mA	
Leakage current, off-state output, max	1 mA @ 240V AC (through a snubber)	
Output delay time, OFF to ON, max	10 ms(1)	
Output delay time, ON to OFF, max	10 ms(2)	
Relay output current rating, resistive	2.0 A @ 5…30V DC 0.22 A @ 125V DC 2.0 A @ 125V AC 2.0 A @ 250V AC	
Relay output current rating, inductive	0.98 A steady state @ 5…30V DC, L/R = 7ms 0.5 A steady state @ 48V DC, L/R = 7ms 0.22 A steady state @ 125V DC, L/R = 7ms 2.0 A steady state, 15 A make @ 120V AC, PF = cos θ = 0.35 2.0 A steady state, 7.5 A make @ 240V AC, PF = cos θ = 0.35	
Contact resistance, initial	30 mΩ	
Switching frequency	0.3 Hz (1 operation every 3 s)	
Bounce time, mean	1.2 ms	
Contact load, min	100 µA @ 100 mV DC	
Mechanical life	100,000 operations at rated loads	
Fusing	3.0 A. 250V AC slow blow fuse (Littelfuse part number 239003).	
Power dissipation, max	5.5 W @ 31.2V DC	
Thermal dissipation, max	18.8 BTU/hr @ 31.2V DC	
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed	
Isolation voltage	250V (continuous), Basic Insulation Type, relay to relay, relay to backplane, and relay to power 50V (continuous), Basic Insulation Type, power to backplane Type tested at 1500V AC for 60 s, relay to relay, all combinations. Type tested at 3250V DC for 60 s, relay to backplane and relay to power Type tested at 720V DC for 60 s, power to backplane.	
Temperature, operating	-20…+55 °C (-4…+131 °F)	-20…+70 °C (-4…+158 °F)

(1) time from valid output on signal to relay energization by module.

(2) time from valid output off signal to relay deenergization by module.

FLEX I/O Analog, Thermocouple and RTD Modules

Choose analog, thermocouple, or RTD I/O modules when you need:

- **Individually configurable channels** allow the module to be used with a variety of sensors.
- **Online configuration**. Modules can be configured in RUN mode using programming software or the control program. This allows you to change configuration while the system is operating.
- **Selectable input filters** on many modules allow you to select from several different filter frequencies for each channel that best meets the performance needs of your application. Lower filter settings provide greater noise rejection and resolution. Higher filter settings provide faster performance. *Note: Isolated analog modules have four filter selections; the thermocouple module has ten; and the combined RTD/thermocouple module has eight.*
- **Ability to direct output device operation during an abnormal condition.**
  Each channel of the output module can be individually configured to hold its last value or assume a user-defined value on either a run-to-program or run-to-fault condition. This feature allows you to set the condition of your analog devices, and therefore your control process, which may help to ensure a reliable shutdown.
- **Selectable response to broken input sensor.** This feature provides feedback to the controller that a field device is not connected. This allows you to specify corrective action based on the channel condition.
- **Single-ended or differential inputs depending on module.** Analog modules have single-ended inputs while isolated analog and temperature modules have differential inputs. Single-ended voltage sensors reduce costs. Differential inputs are more expensive, but are typically more noise immune.
- **Over- and under-range detection and indication** are available with most modules. This eliminates the need to test values in the control program. While standard analog modules have limited diagnostics, temperature and isolated analog modules provide over-range, under-range, and wire-off diagnostics with alarm bits.
- **On-board scaling** is performed by the temperature modules and is user configurable for either °C, °F, °K, Ohms, or mV. This eliminates the need to scale the data in the user program.
- **Accuracy and resolution varies by module** and the associated application. Specifications are given for each module at it's operational conditions.
- **Internal calibration is performed** in the analog modules (1794-IE8, 1794-OE4, and 1794-IE4XOE2). User calibration is recommended (yearly) for isolated analog and temperature modules. All modules come factory calibrated.

Analog I/O Module Summary

Catalog Number	Inputs	Outputs	Terminal Base Unit	Module Type
1794-IE8	8	—	1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS	Selectable, non-isolated inputs
1794-IE8XT			1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS	Selectable, non-isolated inputs, Extended temperatures
1794-IE8H			1794-TB3G, 1794-TB3GS, 1794-TB3GK, 1794-TB3GSK	Single-ended, non-isolated, HART-enabled inputs
1794-IE12	12			Single-ended inputs
1794-IF4I	4	—	1794-TBN, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS, 1794-TBNK, 1794-TB3K, 1794-TB3SK, 1794-TB3TK, 1794-TB3TSK	Single-ended, isolated inputs
1794-IF4IXT				Single-ended inputs, Isolated, Extended temperatures
1794-IF4ICFXT	4	—	1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS, 1794-TBN	Isolated input
1794-IF8IH	8	—	1794-TB3, 1794-TB3S, 1794-TB3K, 1794-TB3SK	Single-ended, isolated, HART-enabled inputs
1794-IR8			1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS, 1794-TBKD, 1794-TB3K, 1794-TB3SK, 1794-TB3TK, 1794-TB3TSK	Non-isolated relay inputs
1794-IRT8			1794-TB3G, 1794-TB3GS, 1794-TB3GK, 1794-TB3GSK, 1794-TB3GT (series B only)	Non-isolated RTD/Thermocouple inputs
1794-IRT8XT				Non-isolated RTD/Thermocouple inputs, Extended temperatures
1794-IT8			1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS, 1794-TB3K, 1794-TB3SK, 1794-TB3TK, 1794-TB3TSK(3)	Non-isolated, Thermocouple, Millivolt inputs
1794-IE4XOE2	4	2		Single-ended, non-isolated I/O
1794-IE4XOE2XT				Single-ended, non-isolated I/O, Extended temperatures
1794-IE8XOE4	8	4	1794-TB3G, 1794-TB3GS, 1794-TB3GK, 1794-TB3GSK	Single-ended, non-isolated I/O
1794-IF2XOF2I	2	2	1794-TBN, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS, 1794-TBNK, 1794-TB3K, 1794-TB3SK, 1794-TB3TK, 1794-TB3TSK	Single-ended, isolated I/O
1794-IF2XOF2IXT				Single-ended, isolated I/O, Extended temperatures
1794-OE4	—	4		Selectable, non-isolated outputs
1794-OE4XT				Selectable, non-isolated outputs, Extended temperatures
1794-OE8H(1)		8	1794-TB3G, 1794-TB3GS, 1794-TB3GK, 1794-TB3GSK	Single-ended, non-isolated, HART-enabled outputs
1794-OE12(2)		12		Single-ended, non-isolated outputs
1794-OF4I		4	1794-TBN, 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, 1794-TB3TS, 1794-TBNK, 1794-TB3K, 1794-TB3SK, 1794-TB3TK, 1794-TB3TSK	Source isolated outputs
1794-OF4IXT				Source isolated outputs, Extended temperatures
1794-OF8IH		8	1794-TB3, 1794-TB3S, 1794-TB3K, 1794-TB3SK	Single-ended, isolated, HART-enabled outputs

(1) Do not exceed length of 30 m (100 ft) for signal cabling.

(2) Not supported by 1747-SN or 1747-BSN for use on RIO with SLC controllers.

(3) 1794-TB2, 1794-TB3, 1794-TB3S for mV inputs only.

Modules Specifications

The following section shows more detailed module specifications in comparative groups to facilitate your selection based on your requirements.

FLEX I/O Analog Input Modules

Analog Input Comparison

Catalog Number	Input Signal Range	Accuracy Drift with Temperature	External DC Supply Current, Nom	Power Dissipation, Max	Thermal Dissipation, Max
1794-IE8(1)	4…20 mA 0…20 mA ±10V 0…10V	Current Input: 0.0407% Full Scale/°C Voltage Input: 0.0428% Full Scale/°C	60 mA @ 24V DC	3 W @ 31.2V DC	10.2 BTU/hr @ 31.2V DC
1794-IE8XT					
1794-IE8H	4…20 mA	0.05%/°C of output signal range	295 mA @ 24V DC	3.9 W	13.5 BTU/hr
1794-IE12	4…20 mA (user configurable) 0…20 mA (user configurable)	Current Input: 0.004% Full Scale/°C Voltage Input: 0.004% Full Scale/°C	30 mA @ 24V DC; 45 mA @ 10.0V DC	1.2 W @ 31.2V DC; 1.1 W @ 24V DC; 0.9 W @ 10.0V DC	4.1 BTU/hr @ 31.2V DC
1794-IF4I(1)	4…20 mA 0…20 mA ±20 mA ±10V 0…10V ±5V 0…5V	Current Input: 0.0038% Full Scale/°C Voltage Input: 0.0028% Full Scale/°C	80 mA @ 24V DC	2.0 W @ 31.2V DC	6.9 BTU/hr @ 31.2V DC
1794-IF4IXT					6.8 BTU/hr @ 31.2V DC
1794-IF4ICFXT					
1794-IF8IH	4…20 mA (user configurable) 0…20 mA (user configurable)	0.4% Full Scale for 0…55 °C	190 mA @ 24V DC	4.8 W @ 31.2V DC	6.8 BTU/hr @ 31.2V DC
1794-IR8(1)(2)	1…433 Ω	—	140 mA @ 24V DC	3 W @ 31.2V DC	10.2 BTU/hr @ 31.2V DC
1794-IRT8(1)(2)	-40…+100 mV DC for thermocouples 0…325 mV DC for RTDs 0…500 Ω for resistance range	—	85 mA @ 24V DC		
1794-IRT8XT			95 mA @ 24V DC		
1794-IT8(1)(2)	±76.5 mV	—	150 mA @ 24V DC		
1794-IE8XOE4	4…20 mA (user configurable) 0…20 mA (user configurable)	Current Input or Output: 0.004% Full Scale @ 25 °C Voltage Input or Output: 0.004% Full Scale @ 25 °C	140 mA @ 24V DC; 280 mA @ 10.0V DC	3.0 W @ 31.2V DC; 2.3 W @ 24V DC; 2.0 W @ 10.0V DC	10.3 BTU/hr @ 31.2V DC
1794-IE4XOE2(1)	4…20 mA 0…20 mA ±10V 0…10V	Current Input: 0.0407% Full Scale/°C Voltage Input: 0.0428% Full Scale/°C Current Output: 0.0069% Full Scale/°C Voltage Output: 0.0045% Full Scale/°C	70 mA @ 24V DC	4.0 W @ 31.2V DC	13.6 BTU/hr @ 31.2V DC
1794-IE4XOE2XT			164 mA @ 10.5V DC		15.3 BTU/hr @ 31.2V DC
1794-IF2XOF2I(1)	4…20 mA 0…20 mA ±20 mA ±10V 0…10V ±5V 0…5V	Current Input: 0.0038% Full Scale/°C Voltage Input: 0.0028% Full Scale/°C Current Output: 0.0025% Full Scale/°C Voltage Output: 0.0012% Full Scale/°C	150 mA @ 24V DC	3.3 W @ 31.2V DC	11 BTU/hr @ 31.2V DC
1794-IF2XOF2IXT				2.0 W @ 31.2V DC	6.8 BTU/hr @ 31.2V DC

(1) Each module's channel is individually selectable or as a group of four.

(2) For the accuracy calculation, refer to the module's user manual.

1794-IE8 and 1794-IE8XT Analog 8 Input Module

The 1794-IE8 is a voltage/current measurement module that works with a variety of input sensors to measure input voltage in ±10V range or input current in the 0...20 mA range. Each channel is individually configurable for the desired input range. Use the 1794-IE8 with 2-, 3-, and 4-wire input sensor field devices.

The 1794-IE8XT module is the extended temperature version of the 1794-IE8 module. The module is conformal coated.

IMPORTANT Only connect either a voltage input or a current input per channel, not both.

Use caution to prevent ground loops when using a common ground, since the channels are not isolated.

Analog 8 Input Modules

Specification	1794-IE8 and 1794-IE8XT
Voltage, input, max overload	30V, single channel, continuous
Current, input, max overload	32 mA, single channel, continuous
Input impedance, nom	Current Input: 238 Ω Voltage Input: 100 kΩ
Input resolution	12 bits – unipolar 11 bits + sign – bipolar 5.13 µA/cnt 2.56 mV/cnt – unipolar 5.13 mV/cnt – bipolar
Data format	16-bit 2's complement, left-justified
Input conversion type	Successive approximation
Input conversion rate	256 µs all channels
Normal mode rejection ratio	Current input: -3 dB @ 9 Hz; -20 dB/decade -15.3 dB @ 50 Hz -16.8 dB @ 60 Hz Voltage input: -3 dB @ 17 Hz; -20 dB/decade -10 dB @ 50 Hz -11.4 dB @ 60 Hz
Calibration	None required
Step response to 63% of FS, input	Current input: 18.2 ms Voltage input: 9.4 ms
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Accuracy	Current input: 0.20% Full Scale @ 25 °C (77 °F) Voltage input: 0.20% Full Scale @ 25 °C (77 °F)(1)
Temperature, operating	**1794-IE8:** -20…+55 °C (-4…131 °F) **1794-IE8XT:** -20…+70 °C (-4…+158 °F)

(1) Includes offset, gain, non-linearity, and repeatability error terms

1794-IE8H HART Enabled Analog 8 Input Module

The 1794-IE8H is a HART enabled analog input module that works with HART enabled input sensors with input current in the 0...20 mA range. Use the 1794-IE8H with 2 or 3 wire transmitters. This module provides wire-off detection on a per-channel basis. The HART analog module can only be used on ControlNet or EtherNet/IP networks with one HART field device per channel.

HART Enabled Analog 8 Input Module

Specification	1794-IE8H
Voltage, input, max overload	—
Current, input, max overload	—
Isolation voltage	50V (continuous), Basic Insulation Type No isolation between individual channels
Input resolution	16 bits
Input resistance	—
Data format	Configurable
Input conversion type	—
Input conversion rate	10 ms (50 Hz) 8.33 ms (60 Hz)
Normal mode rejection ratio	—
Step response to 99% of FS, input	80 ms
Calibration	—
Dimensions (HxWxD), approx	46 x 94 x 75 mm (1.8 x 3.7 x 2.9 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Resolution	16 bit
Accuracy	Current input: 0.1% Full Scale @ 20 °C (68 °F)
Temperature, operating	-20…+55 °C (-4…+131 °F)

1794-IE12 Analog 12 Input Module

The 1794-IE12 is a voltage or current measurement module that measures input voltage in a ±10V range or current in the 0...20 mA range. Each channel is individually configurable and the out-of-range notification is by channel.

Analog 12 Input Module

Specification	1794-IE12
Voltage, input, max overload	30 continuous, single channel
Current, input, max overload	32 mA continuous, single channel
Isolation voltage	50 (continuous), Basic Insulation Type Type tested at 850V DC for 60 s, between field side and system No isolation between individual channels
Input resolution	320 μV/cnt 0.641μA/cnt

Analog 12 Input Module

Specification	1794-IE12
Input resistance	Current input: <100 Ω Voltage input: >1 MΩ
Data format	16 bits, 2's complement
Input conversion type	Successive approximation
Input conversion rate	8.0 ms all channels
Normal mode rejection ratio	Voltage/current terminal: -3 dB @ 0.05 Hz -20 dB/decade -52 dB @ 50 Hz -54 dB @ 60 Hz Voltage/current terminal with Quick Step: -3 dB @ 1.5 Hz; -20 dB/decade -29 dB @ 50 Hz -31 dB @ 60 Hz
Step response to 63% of FS, input	Current or voltage input: 1.3 s (0.09 s with Quick Step)
Calibration	None required
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Resolution	16 bit unipolar 15 bit + bipolar
Accuracy	Current input: 0.1% Full Scale @ 25 °C (77 °F) Voltage input: 0.1% Full Scale @ 25 °C (77 °F)(1)
Temperature, operating	20...+60 °C (-4...+140 °F)

(1) Includes offset, gain, non-linearity, and repeatability error terms

1794-IF4I and 1794-IF4IXT Isolated Analog 4 Input Module

The 1794-IF4I and 1794-IF4IXT are input modules with channel-to-channel isolation that work with a variety of input sensors to measure input voltage in ±10V range or input current in the 0...20 mA range. Each channel is individually configurable for the desired input range. Use the 1794-IF4I or 1794-IF4IXT with 2-, 3-, and 4-wire input sensor field devices.

The 1794-IF4IXT is the extended temperature version of the 1794-IF4I module.

Settings to these parameters affect all inputs set to 150 Hz, 300 Hz, or 600 Hz. The parameters do not affect channels set at 1200 Hz.

IMPORTANT Only connect either a voltage input or a current input per channel, not both.

Isolated Analog Input Modules

Specification	1794-IF4I, 1794-IF4IXT
Voltage, input, max overload	30V, single channel, continuous
Current, input, max overload	32 mA, single channel, continuous

Isolated Analog Input Modules

Specification	1794-IF4I, 1794-IF4IXT
Input resolution	16 bits – unipolar 15 bits + sign – bipolar 0.320 μA/cnt – unipolar 0.640 μA/cnt – bipolar 0.156 mV/cnt – unipolar 0.313 mV/cnt – bipolar
Input resistance	Current input: <100 Ω(1) Voltage input: >10 MΩ
Data format	2's complement 2's complement percent binary offset binary
Input conversion type	Sigma Delta
Input conversion rate	2.5/5.0/7.5 ms all channels
Normal mode rejection ratio	-3 dB @ 12 Hz (300 Hz conversion rate) -80.0 dB @ 50 Hz (300 Hz conversion rate)
Calibration	Factory calibrated(2)
Step response to 63% of FS, input	Current or voltage input: 1200 Hz conversion rate = 0.6 ms 600 Hz conversion rate = 6.7 ms 300 Hz conversion rate = 13.4 ms 150 Hz conversion rate = 26.7 ms
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Resolution	16 bit unipolar 15 bit + bipolar
Accuracy	Current input: 0.1% Full Scale @ 25 °C (77 °F) Voltage input: 0.1% Full Scale @ 25 °C (77 °F)(3)
Temperature, operating	**1794-IF4I:** 0…55 °C (32…131 °F) **1794-IF4IXT:** -20…+70 °C (-4…+158 °F)

(1) If 24V DC is removed from the module, input resistance = 10 kΩ.

(2) Can be calibrated in field when necessary.

(3) Includes offset, gain, non-linearity, and repeatability error terms

1794-IF4ICFXT FLEX XT I/O Isolated Input Analog Module

In addition to the features supported by the 1794-IF4I and 1794-IF4IXT modules, the 1794-IF4ICFXT features three additional parameters that allow additional control over the way the analog signals are processed by the module. The settings are at the module level.

Settings to these parameters affect all inputs set to 150 Hz, 300 Hz, or 600 Hz. The parameters do not affect channels set at 1200 Hz.

IMPORTANT Only connect either a voltage input or a current input per channel, not both.

Isolated Analog Input Modules

Specification	1794-IF4ICFXT
Maximum overload	30V continuous or 32 mA continuous, one channel at a time
Input resistance Voltage terminal Current terminal	 >10 MΩ <100 Ω(1)
Data format	2's complement 2's complement percent binary offset binary
Conversion type	Sigma Delta
Update rate	2.5/5.0/7.5 ms all channels (see input update rate table in publication 1794-IN130
Normal mode rejection ratio - voltage or current Terminal	-3 dB @ 12 Hz (300 Hz conversion rate) -80 dB @ 50 Hz (300 Hz conversion rate) -3 dB @ 6 Hz (150 Hz conversion rate) -80 dB @ 60 Hz (150 Hz conversion rate)
Calibration required	Factory calibrated. Can be calibrated in field when necessary
Step response to 63% - voltage or current terminal	1200 Hz conversion rate = 0.6 ms 600 Hz conversion rate = 06.7 ms 300 Hz conversion rate = 13.4 ms 150 Hz conversion rate = 26.7 ms
Dimensions (HxWxD), approx	46 mm x 94 mm x 75 mm (1.8 in. x 3.7 in. x 2.95 in.) with module installed in base
Resolution Voltage Current	16 bits - unipolar; 15 bits plus sign - bipolar 0.156 mV/cnt unipolar; 0313 mV/cnt bipolar 0.320 µA/cnt unipolar; 0.640 µA/cnt bipolar
Accuracy	
Temperature, operating	-20…+70 °C (-4…+158 °F)

(1) If 24V DC is removed from the module, input resistance = 10 kΩ.

1794-IF8IH HART Enabled Analog 8 Input Module

The 1794-IF8IH accepts up to 8 analog inputs. The inputs are isolated and will accept current in either of the following two ranges: 4...20 mA or 0...20 mA. The default input range is 0...20 mA. The inputs have both fixed hardware filters and selectable firmware digital filters.

HART Enabled Analog 8 Input Module

Specification	1794-IF8IH
Current input, max overload	32 mA DC continuous, for any or all channels
Isolation voltage	120V (continuous), Basic Insulation Type Type tested @ 1000V AC for 60 s, between user power to system, channel to system, and channel to channel
Input resolution	16 bits – unipolar 15 bits + sign – bipolar 0.320 μA/cnt unipolar 0.640 μA/cnt bipolar
Input resistance	249 Ω ±1%
Data format	Engineering Units Percent of Full Scale Proportional Count
Input conversion type	Sigma Delta Analog to Digital Converter
Normal mode rejection ratio	> 70 dB @ 50/60 Hz (4.17 Hz ADC conversion rate) > 65 dB @ 50/60 Hz (10.0 Hz ADC conversion rate) > 75 dB @ 50 Hz (16.7 Hz ADC conversion rate) > 85 dB @ 60 Hz (19.6 Hz ADC conversion rate)
Calibration	Factory calibrated(1)
Step response to 63% of FS, input	4.17 Hz conversion rate = 480 ms 10.0 Hz conversion rate = 200 ms 16.7 Hz conversion rate = 120 ms 19.6 Hz conversion rate = 101 ms 62 Hz conversion rate = 32 ms 470 Hz conversion rate = 4 ms
Dimensions (HxWxD), approx	46 x 94 x 75 mm (1.8 x.7 x 2.9 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Accuracy	0.1% Full Scale @ 25 °C
Temperature, operating	0…55 °C (32…131 °F)

(1) Can be calibrated in field when necessary.

1794-IR8 RTD Input Module

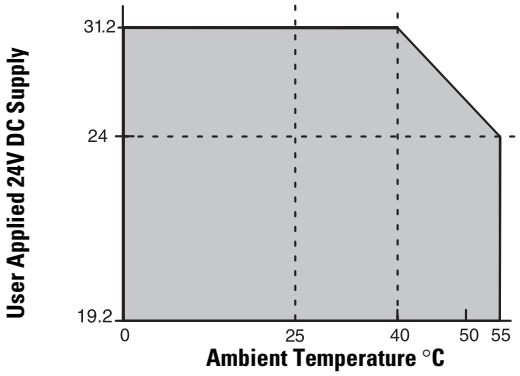
The 1794-IR8 is a temperature-measuring module that accepts 2- and 3-wire RTDs. use the 1794-IR8 in applications where channel fast-update rate is not required. If you need channel fast-update rates, use the 1794-IRT8 module described on page 54.

RTD Input Module

Specification	1794-IR8
Input resolution	16 bits across 435 Ω
Sensors supported	Resistance: 100 Ω Pt μ = 0.00385 Euro (-200…+870 °C) 100 Ω Pt μ = 0.003916 U.S. (-200…+630 °C) 200 Ω Pt μ = 0.00385 Euro (-200…+630 °C) 500 Ω Pt μ = 0.00385 U.S. (-200…+630 °C) 100 Ω Nickel μ = 0.00618 (-60…+250 °C) 120 Ω Nickel μ = 0.00672 (-60…+250 °C) 200 Ω Nickel μ = 0.00618 (-60…+250 °C) 500 Ω Nickel μ = 0.00618 (-60…+250 °C) 10 Ω Copper μ = 0.00427 (-200…+260 °C)
Data format	16 bits, 2's complement, left justified; Offset binary
Settling time	100% of final value available at system throughput rate
Normal mode rejection ratio	60 dB @ 60 Hz for A/D filter cutoff @ 15 Hz
Common mode rejection ratio	-120 dB @ 60 Hz -100 dB @ 50 Hz with A/D filter cutoff @ 10 Hz
Common mode voltage	0V between channels (common return)
Accuracy, normal mode (max)(1)	0.05% Full Scale (low humidity) without calibration
Accuracy, enhanced mode (typical)	0.01% Full Scale (low humidity) without calibration
System throughput, normal mode	Programmable from 28…325 ms/channel 325 ms (1 channel scanned) 2.6 s (8 channels scanned)
System throughput, enhanced mode	Programmable from 56…650 ms/channel 650 ms (1 channel scanned) 2.925 s (8 channels scanned)
Open RTD detection	Out of range upscale reading
Open circuit detection type	Available at system throughput rate
Overvoltage capability	35V DC, 25V AC continuous @ 25 °C 250V peak transient
Channel bandwidth	DC to 2.62 Hz (-3 dB)
RTD excitation current	718.39 μA
RFI immunity	Error of <1% of range @ 10V/m, 27…1000 MHz
Gain drift with temperature	Normal mode: 20 ppm/ °C max Enhanced mode: 10 ppm/ °C max
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	-20…+55 °C (-4…+131 °F)

(1) The number is based on the hardware of the module only. Additional errors are introduced depending on the sensor used., environment, and other factors. Contact technical support for more information.

1794-IR8 Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 24V DC supply voltages and ambient temperatures.

= Safe operating area

1794-IRT8 and 1794-IRT8XT Thermocouple/RTD Input Module

The 1794-IRT8 is a high-speed, high-accuracy temperature/mV measuring module that accepts thermocouple inputs, 2-, 3-, and 4-wire RTD inputs, and mV source inputs.

The 1794-IRT8 offers the following:

- wire-off, over-range, and under-range detection
- good common mode rejection
- usage with long thermocouple wiring
- effective in noisy environments
- usage with grounded or ungrounded thermocouples
- more stability with ambient temperature changes than with the 1794-IR8 and the 1794-IT8

Release of Series B version provides capability to work with grounded thermocouples.

Use cold junction compensators 1794-CJC2 in thermocouple mode. Two cold junction compensators are shipped with the 1794-IRT8.

The 1794-IRT8XT is the extended temperature version of the 1794-IRT8 module. The module is conformal coated.

Thermocouple/RTD Input Module

Specification	1794-IRT8 and 1794-IRT8XT
Input resolution	14 bits
Supported RTD types	Resistance: 100 Ω Pt μ = 0.00385 Euro (-200…+870 °C) 100 Ω Pt μ = 0.003916 U.S. (-200…+630 °C) 200 Ω Pt μ = 0.00385 Euro (-200…+400 °C) 200 Ω Pt μ = 0.003916 U.S. (-200…+400 °C) 100 Ω Nickel μ = 0.00618 (-60…+250 °C) 120 Ω Nickel μ = 0.00672 (-60…+320 °C) 200 Ω Nickel μ = 0.00618 (-60…+200 °C) 10 Ω Copper μ = 0.00427 (-200…+260 °C)
Supported Thermocouple types	Type B: 300…1800 °C (572…3272 °F) Type E: -270…+1000 °C (-454…+1832 °F) Type J: -210…+1200 °C (-346…+2192 °F) Type K: -270…+1372°C (-454…+2502 °F) Type N: -270…+1300°C (-454…+2372 °F) Type R: -50…+1768°C (-58…+3214 °F) Type S: -50…+1768°C (-58…+3214 °F) Type T: -270…+400°C (-454…+752 °F) Type TXK/XK (L): -200…+800°C (-328…+1472 °F)
Accuracy	0.05% of full range in mV mode with filtering selected Hardware only = 0.10% of full rang in mV mode
Common mode rejection ratio	-80 dB @ 5V peak-to-peak 50…60 Hz
Common mode input range	Series A – ±4V Series B – ±15V
System throughput	7.4 ms – mV 8.0 ms – Ω – 2-wire 10.0 ms – Ω – 3-wire 10.4 ms – Ω – 4-wire 8.0 ms – Ω – 2-wire RTD (°F) 10.4 ms – Ω – 4-wire RDT (°F) 8.8 ms – Ω – 2-wire RDT (°C), (°K) 10.8 ms – Ω – 4-wire RDT (°C), (°K) 9.8 ms – Ω – 3-wire RDT (°F) 10.0 ms – Ω – 3-wire RDT (°C), (°K) 8.0 ms – Thermocouples (°F) 8.8 ms – Thermocouples (°C), (°K)[1]
Open circuit detection type	Series A: RTD and TC modes – open input – module defaults to max value Series B: RTD mode – open input – module defaults to max value Series B: TC mode – open input – module defaults to min value
Excitation current	630 μA
Overvoltage capability	Series A: 7V DC continuous @ 25 °C Series B: 15V DC continuous @ 25 °C
Open input detection time	0…3.8 s for Series A, revision D or earlier Immediate detection (max 2 scans) for Series A, revision E or later Immediate detection (max 2 scans) for Series B
Cold junction compensation range	0…70 °C for firmware Series A, revision D or earlier -20…100 °C for firmware Series A, revision E or later -20…100 °C for firmware Series B
Cold junction compensation	A-B Cold Junction Compensation Kit, 1794-CJC[2]

Thermocouple/RTD Input Module

Specification	1794-IRT8 and 1794-IRT8XT
Data format	°C (implied decimal point XXX.X) °F (implied decimal point XXX.X) °K (implied decimal point XXX.X) -32767…32767 0…65535 0…5000 (Ω mode) (implied decimal point XXX.X) -4000…10000 (mV mode) (implied decimal point XXX.XX)
Overall drift with temperature, max	Series A: 150 ppm/ °C of span Series B: 50 ppm/ °C of span
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	**1794-IRT8:** -20…+55 °C (-4…+131 °F) **1794-IRT8XT:** -20…+70 °C (-4…+158 °F)

(1) For maximum throughput, short circuit all unused channels.

(2) Kit supplied with the module and contains 2 compensators.

1794-IT8 Thermocouple/mV Input Module

The 1794-IT8 module is a temperature/mV measuring module that accepts inputs from a variety of thermocouples and from the mV source in the range of ±76.5 mV. Choose the 1794-IT8 module when you need the following:

- A cost effective module.
- Applications that don't require high accuracy or high speed.
- Support for grounded or ungrounded thermocouples.

Use cold junction compensators (cat. no. 1794-CJC2) in thermocouple mode. Two cold junction compensators are shipped with the 1794-IT8 module. This module is suitable to work with grounded thermocouples, if certain guidelines are followed. Refer to the module's user manual for more information.

The FLEX I/O cold junction compensator kit, containing two compensators, is included with the 1794-IT8 module. You can order additional compensators using the above catalog number.

Thermocouple/mV Input Module

Specification	1794-IT8
Input resolution	16 bits (2.384 µV typical)
Supported Thermocouple types	Type B: 300…1800 °C (572…3272 °F) Type C: 0…2315 °C (32…4199 °F) Type E: -270…+1000 °C (-454…+1832 °F) Type J: -210…+1200 °C (-346…+2192 °F) Type K: -270…+1372°C (-454…+2502 °F) Type N: -270…+1300°C (-454…+2372 °F) Type R: -50…+1768°C (-58…+3214 °F) Type S: -50…+1768°C (-58…+3214 °F) Type T: -270…+400°C (-454…+752 °F) Type TXK/XK (L): -200…+800°C (-328…+1472 °F)

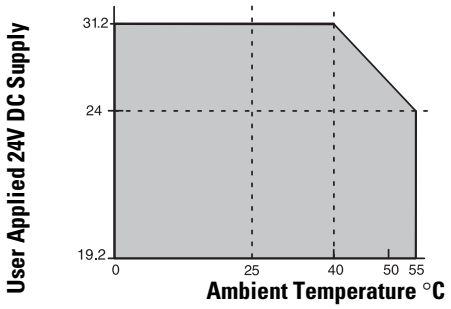
Thermocouple/mV Input Module

Specification	1794-IT8
Data format	16 bits, 2's complement; Offset binary (unipolar)
Settling time	100% of final value available at system throughput rate
Normal mode rejection ratio	60 dB @ 60 Hz
Common mode rejection ratio	-115 dB @ 60 Hz -100 dB @ 50 Hz
Common mode input range	± 10V
Accuracy(1)	With filter (max): 0.025% Full Scale @ 24 °C (±0.5 °C) Without filter (max): 0.05% Full Scale @ 24 °C (±0.5 °C)
System throughput	325 ms (1 channel scanned), programmable to 28 ms 2.6 s (8 channels scanned), programmable to 224 ms
Open input detection	Available at system throughput rate
Open circuit detection type	Out of range reading (upscale)
Overvoltage capability	35V DC, 25V AC continuous @ 25 °C 250V peak transient
Channel bandwidth	0…2.62 Hz (-3 dB)
RFI immunity	Error of <1% of range @ 10V/m, 27…1000 MHz
Input offset drift with temperature	+6 μV/°C max
Gain drift with temperature, max	10 ppm/ °C
Overall drift with temperature, max	50 ppm/ °C of span
Cold junction compensation range	0…70 °C
Cold junction compensation	A-B Cold Junction Compensation Kit, 1794-CJC(2)
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	-20…+55 °C (-4…+131 °F)

(1) The number is based on the hardware of the module only. Refer to the user manual for the complete error calculation procedure.

(2) Kit supplied with the module and contains 2 compensators.

1794-IRT8 Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 24V DC supply voltages and ambient temperatures.

= Safe operating area

1794-IE8XOE4 8 Input/4 Output Analog Combination Module

The 1794-IE8XOE4 is a combination module with 8 inputs and 4 outputs. Inputs can be configured individually for different modes, as can outputs. Inputs accept signals from 2, 3, and 4 wire input sensors in the ranges of ±10V or 0... 20 mA. Outputs produce signals in the range of ±10V or 0...20 mA.

8 Input / 4 Output Analog Combination Module

Specification	1794-IE8XOE4
Calibration	None required
Input conversion type	Successive approximation
Input conversion rate	8 ms all channels
Input resolution	16 bit, 2's complement 320 μV/cnt 0.641 μA/cnt
Data format	16 bits, 2's complement
Step response to 63% of FS, input	Current or voltage input: 1.3 s (0.09 s with Quick Step)
Step response to 63% of FS, output	-70% 1st convert 96% 2nd convert 100% 3rd convert
Normal mode rejection ratio	Voltage/current terminal: -3 dB @ 0.05 Hz; -20 dB/decade -52 dB @ 50 Hz -54 dB @ 60 Hz Voltage/current terminal with Quick Step: -3 dB @ 1.5 Hz; -20 dB/decade -29 dB @ 50 Hz -31 dB @ 60 Hz
Accuracy(1)	Current input or output: 0.1% Full Scale @ 25 °C Voltage input or output: 0.1% Full Scale @ 25 °C
Accuracy drift with temperature	Current input or output: 0.004% Full Scale @ 25 °C Voltage input or output: 0.004% Full Scale @ 25 °C
Input impedance(2)	Current input: <100 Ω Voltage input: >1 MΩ
Voltage input, overload, max	30V, single channel, continuous
Output resolution	16 bit, 2's complement 320 μV/cnt 0.641 μA/cnt
Output conversion type	Digital-to-analog converter
Output conversion rate	Outputs: DAC
Current load on voltage output, max	3 mA
Resistive load on current output	0…750 Ω over full power supply range
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	-20...+60 °C (-4...+140 °F)

(1) Includes offset, gain, non-linearity and repeatability error terms.

(2) If 24V DC is removed from the module, input resistance = 10 KΩ.

1794-IE4XOE2 and 1794-IE4XOE2XT 4 Input/2 Output Analog Combination Modules

The 1794-IE4XOE2 is a combination module with 4 inputs and 2 outputs. Inputs can be configured individually for different modes. Inputs accept signals from a variety of inputs sensors (2-, 3-, and 4-wire) in the range of ±10V or 0...20 mA. Outputs are also individually configurable for different modes. Outputs produce signals in the range of ±10V or 0...20 mA.

1794-IE4XOE2XT is the extended temperature version of the 1794-IE4XOE2.

4 Input / 2 Output Analog Combination Modules

Specification	1794-IE4XOE2, 1794-IE4XOE2XT
Calibration	None required
Input conversion type	Successive approximation
Input conversion rate	256 μs all channels
Input resolution	12 bits – unipolar 11 bits + sign – bipolar 5.13 μA/cnt 2.56 μV/cnt – unipolar 5.13 μV/cnt – bipolar
Data format	16 bits, 2's complement; left-justified
Step response to 63% of FS, input	Current input: 18.2 ms Voltage input: 9.4 ms
Step response to 63% of FS, output	Current or voltage output: 24 ms
Normal mode rejection ratio	Current input: -3 dB @ 9 Hz; -20 dB/decade -15.3 dB @ 50 Hz -16.8 dB @ 60 Hz Voltage input: -3 dB @ 17 Hz; -20 dB/decade -10 dB @ 50 Hz -11.4 dB @ 60 Hz
Accuracy[1]	Current input: 0.20% Full Scale @ 25 °C Voltage input: 0.20% Full Scale @ 25 °C Current output: 0.425% Full Scale @ 25 °C Voltage output: 0.133% Full Scale @ 25 °C
Accuracy drift with temperature	Current input: 0.0407% Full Scale @ 25 °C Voltage input: 0.0428% Full Scale @ 25 °C Current output: 0.0069% Full Scale @ 25 °C Voltage output: 0.0045% Full Scale @ 25 °C
Input impedance	Current input: 238 Ω Voltage input: 100 kΩ
Voltage input, overload, max	30V, single channel, continuous
Output resolution	12 bits + sign 5.13 μA/cnt 2.56 mV/cnt
Output conversion type	Pulse width modulation
Output conversion rate	1.024 ms all channels
Current load on voltage output, max	3 mA
Resistive load on current output	15…750 Ω

4 Input / 2 Output Analog Combination Modules

Specification	1794-IE4XOE2, 1794-IE4XOE2XT
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	**1794-IE4XOE2:** -20…+55 °C (-4…+131 °F) **1794-IE4XOE2XT:** -20…+70 °C (-4…+158 °F)

(1) Includes offset, gain, non-linearity and repeatability error terms.

1794-IF2XOF2I and 1794-IF2XOF2IXT 2 Input/2 Output Isolated Analog Combination Module

The 1794-IF2XOF2I is a combination module with 2 inputs and 2 outputs with isolated, individually-configurable channels. Inputs accept signals from a variety of input sensors (2-, 3-, and 4-wire) in the range of ±10V or ±20 mA. Outputs produce signals in the range of ±10V or 0...20 mA.

The 1794-IF2XOF2IXT is the extended temperature version of the 1794-IF2XOF2I module.

ATTENTION: Only connect either a voltage input or a current input per channel, not both.

2 Input/2 Output Isolated Combination Module

Specification	1794-IF2XOF2I, 1794-IF2XOF2IXT
Calibration	Factory calibration(2)
Input conversion type	Sigma Delta
Input conversion rate	2.5/5.0/7.5 ms all channels
Input resolution	16 bit – unipolar 15 bit + sign – bipolar 0.156 mV/cnt – unipolar 0.313 mV/cnt – bipolar 0.320 µA/cnt – unipolar 0.640 µA/cnt – bipolar
Isolation voltage	120V continuous (when used with 1794-TB3, 1794-TB3S, 1794-TB2, 1794-TB3T, or 1794-TB3TS) 250V continuous (when used with 1794-TBN) Tested at 1500V AC for 60 s and 2550V DC for 1 s, channel to channel, I/O to system
Data format	16 bits, 2's complement 2's complement percent binary offset binary
Step response to 63% of FS, input	Current or voltage input: 1200 Hz conversion rate = 0.6 ms 600 Hz conversion rate = 6.7 ms 300 Hz conversion rate = 13.4 ms 150 Hz conversion rate = 26.7 ms

2 Input/2 Output Isolated Combination Module

Specification	1794-IF2XOF2I, 1794-IF2XOF2IXT
Normal mode rejection ratio	-3 dB @ 12 Hz (300 Hz conversion rate) -80.0 dB @ 50 Hz (300 Hz conversion rate) -3 dB at 6 Hz (150 Hz conversion rate) -80 dB at 60 Hz (150 Hz conversion rate)
Accuracy(1)	Current input or output: 0.1% Full Scale @ 25 °C Voltage input or output: 0.1% Full Scale @ 25 °C
Accuracy drift with temperature	Current input: 0.0038% Full Scale/°C Voltage input: 0.0028% Full Scale /°C Current output: 0.0025% Full Scale /°C Voltage output: 0.0012% Full Scale /°C
Input impedance	Current input: <100 Ω Voltage input: >1 MΩ(3)
Voltage input, overload, max	30V, single channel, continuous
Output resolution	15 bit + sign 0.656 μA/cnt 0.320 mV/cnt
Output conversion type	Digital-to-analog converter
Output conversion rate	2.5/5.0 ms
Current load on voltage output, max	3 mA
Resistive load on current output	0…750 Ω
Dimensions (HxWxD), approx	**1794-IF2XOF2I:** 46 x 94 x 53 mm (1.8 x 3.7 x 2.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed **1794-IF2XOF2IXT:** 46 x 94 x 75 mm (1.8 x 3.7 x 2.9 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Temperature, operating	**1794-IF2XOF2I:** -20…+55 °C (-4…+131 °F) **1794-IF2XOF2IXT:** -20…+70 °C (-4…+158 °F)

(1) Includes offset, gain, non-linearity and repeatability error terms.

(2) Can be calibrated in field when necessary.

(3) If 24V DC is removed from the module, input resistance = 10 KΩ.

FLEX I/O Analog Output Modules

Analog Output Comparison

Catalog Number	Output Signal Range	External DC Supply Current, Nom	Power Dissipation, Max	Thermal Dissipation, Max

1794-OE8H HART Enabled Analog 8 Output Module

The 1794-OE8H is a HART enabled analog output module that works with HART enabled field devices that use current in the 0...20 mA range. Use with 2 wire devices. This module provides wire-off detection on a per-channel basis.

This module can be used on ControlNet, EtherNet/IP, or PROFIBUS DP networks. One HART field device per channel.

HART Enabled Analog 8 Output Module

Specification	1794-OE8H
Output resolution	13 bit
Data format	Configurable
Output conversion type	—
Output conversion rate	10 ms for all channels
Step response to 99% of FS, output	13 ms to 99% of FS 115 ms during HART communication
Current load on voltage output, max	0…22 mA @ > 15V
Output current, resistive load	0…680 Ω @ 22 mA 0…770 Ω @ 20 mA
Accuracy	0.1% Full Scale @ 20 °C (68 °F)
Accuracy drift with temperature	0.010% Full Scale @ 20 °C (68 °F)

HART Enabled Analog 8 Output Module

Specification	1794-OE8H
Calibration	—
Isolation voltage	50V (continuous), Basic Insulation Type No isolation between individual channels
Power dissipation, max	6.1 W
Thermal dissipation, max	20.8 BTU/hr
Wire size	0.34…2.5 mm^2 (22...12 AWG) solid or stranded shielded copper wire rated at 75 °C (167 °F) or greater 1.2 mm (3/64 in.) insulation max
Wire category	2 – on signal ports 2 – on power ports(1)
Dimensions (HxWxD), approx	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Temperature, operating	-20...+55 °C (-4...+131 °F)

(1) Use this Conductor Category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

1794-OE12 Analog 12 Output Module

1794-OE12 module is a High Density analog output module, capable of providing current in the range of 0...20mA or voltage in the range of ±10V, depending on the user configuration. Out of Range status bit exists for each channel.

Analog 12 Output Module

Specification	1794-OE12
Output resolution	320 µV/cnt 0.641 µA/cnt
Data format	Configurable
Output conversion type	Digital to analog converter
Output conversion rate	Outputs: DAC
Step response to 63% of FS, output	~70% 1st convert 96% 2nd convert 100% 3rd convert
Current load on voltage output, max	3 mA
Output current, resistive load	0…750 Ω over full power supply range
Accuracy	Current Output: 0.1% Full Scale at 25 °C Voltage Output: 0.1% Full Scale at 25 °C
Accuracy drift w/temp	Current Output: 0.004% Full Scale/°C Voltage Output: 0.004% Full Scale/°C
Calibration	None required
Isolation voltage	50V (continuous), Basic Insulation Type Type tested at 850V DC for 60 s, between field side and system No isolation between individual channels

Analog 12 Output Module

Specification	1794-OE12
Power dissipation, max	4.0 W @ 31.2V DC 4.3 W @ 24V DC 4.0 W @ 10.0V DC
Thermal dissipation, max	14.7 BTU/hr @ 24V DC
Wire size	0.34…2.5 mm^2 (22...12 AWG) solid or stranded shielded copper wire rated at 75 °C (167 °F) or greater 1.2 mm (3/64 in.) insulation max
Wire category	2 – on signal ports 2 – on power ports(1)
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 3.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	-20...+60 °C (-4...+140 °F)

(1) Use this Conductor Category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

1794-OF4I and 1794-OF4IXT Isolated Analog 4 Output Module

The 1794-OF4I module provides 4 isolated outputs for 2-, 3-, and 4-wire output devices that use voltage in the range of ±10V or 0...20 mA current.

1794-OF4IXT is the extended temperature version of the 1794-OF4I module.

Isolated Analog 4 Output Module

Specification	1794-OF4I, 1794-OF4IXT
Output resolution	15 bit + sign 0.656 µA/cnt 0.320 mV/cnt
Data format	2's complement 2's complement percent binary offset binary
Output conversion type	Digital to analog converter
Output conversion rate	2.5/5.0 ms
Step response to 63% of FS, output	Current or voltage output: <25 µs
Current load on voltage output, max	3 mA
Output current, resistive load	0…750 Ω
Accuracy	Current input: 0.1% Full Scale @ 25 °C (77 °F) Voltage input: 0.1% Full Scale @ 25 °C (77 °F)(1)
Accuracy drift w/temp	Current input: 0.0025% Full Scale /°C Voltage input: 0.0012% Full Scale/°C
Calibration	Factory calibrated

Isolated Analog 4 Output Module

Specification	1794-OF4I, 1794-OF4IXT
Isolation voltage	120V (continuous), when used with 1794-TB2, 1794-TB3, 1794-TB3S, 1794-TB3T, or 1794-TB3TS 250V (continuous), when used with 1794-TBN Type tested at 1500V AC for 60 s, and 2550V DC for 1 s, channel to channel, I/O to system
Power dissipation, max	4.7 W @ 31.2V DC
Thermal dissipation, max	16 BTU/hr @ 31.2V DC
Wire size	0.34... 2.5 mm^2 (22...12 AWG) solid or stranded shielded copper wire rated at 75 °C (167 °F) or greater 1.2 mm (3/64 in.) insulation max
Wire category	2 – on signal ports 3 – on power ports(2)
Dimensions (HxWxD), approx	**1794-OF4I:** 46 x 94 x 53 mm (1.8 x 3.7 x 3.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed **1794-OF4IXT:** 46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Temperature, operating	**1794-OF4I:** -20…+55 °C (-4…+131 °F) **1794-OF4IXT:** -20…+70 °C (-4…+158 °F)

(1) Includes offset, gain, non-linearity, and repeatability error terms

(2) Use this Conductor Category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

1794-OF8IH HART Isolated Analog 8 Output Module

The 1794-OF8IH modules provides 8 HART enabled isolated outputs for 2-, 3-, and 4-wire output devices that use voltage in the range of ±10V or 0...20 mA current.

HART Enabled Isolated Analog 8 Output Module

Specification	1794-OF8IH
Output resolution	16 bits – unipolar 0.305 µA/cnt unipolar
Data format	Engineering units Percent of Full Scale RAW/proportional count
Output conversion type	16 Bit Digital to Analog Converter
Output conversion rate	10 ms
Step response to 63% of FS, output	< 70 ms
Output current, resistive load	0…750 Ω
Accuracy	± 0.1% Full Scale at 25 °C ± 0.35% Full Scale at 0…55 °C
Accuracy drift w/temp	± 0.008% /ºC 0.0038 Full Scale /°C
Calibration	Factory calibrated

HART Enabled Isolated Analog 8 Output Module

Specification	1794-OF8IH
Isolation voltage	120V (continuous), Basic Insulation Type Type tested at 1000V AC for 60 s, between user power to system, channel to system, and channel to channel
Power dissipation, max	5.0 W @ 31.2V DC
Thermal dissipation, max	16 BTU/hr @ 31.2V DC
Wire size	0.34... 2.5 mm^2 (22...12 AWG) solid or stranded shielded copper wire rated at 75 °C (167 °F) or greater 1.2 mm (3/64 in.) insulation max
Wire category	2 – on signal ports 3 – on power ports(1)
Dimensions (HxWxD), approx	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Temperature, operating	0…55 °C (32…131 °F)

(1) Use this Conductor Category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

FLEX I/O Counter Modules

In order to decide which FLEX I/O counter module would best suit your application needs, you should identify the following:

- What type of application the module will be used for
- What field devices, signal levels, and signal type are being connected to the counter module

Counter Module Comparison

Catalog Number	Application	Network Capability	Number of Inputs/ Outputs	External DC Supply Current, Nom	Power Dissipation, Max	Thermal Dissipation, Max
1794-IJ2 1794-IJ2XT	Rational control, including: • turbine generators • motors • drives • gears • shaft	All networks supported by FLEX I/O	2 Input 2 Output	220 mA @ 19.2V DC 180 mA @ 24V DC 140 mA @ 31.2V DC	4.5 W @ 31.2V DC	15.3 BTU/hr @ 31.2V DC
1794-VHSC	Applications including: • packaging • material handling • flow monitoring • cut-to-length • motor speed control • monitoring	ControlNet: • 1794-ACN15 • 1794-ACNR15 EtherNet/IP: • 1794-AENT • 1794-AENTR	2 Input 2 Output	100 mA @ 24V DC(1)	5 W @ 31.2V DC	17.1 BTU/hr @ 31.2V DC

Counter Module Comparison

Catalog Number	Application	Network Capability	Number of Inputs/ Outputs	External DC Supply Current, Nom	Power Dissipation, Max	Thermal Dissipation, Max
1794-ID2	Applications including: • quality counting • positioning • speed calculations	All networks supported by FLEX I/O	2 Input	150 mA @ 12V DC 75 mA @ 24V DC	5.0 W @ 26.4V DC	17.1 BTU/hr @ 26.4V DC
1794-IP4	Applications including: • counting pulse from flow meters • counting pulse from density meters • quality counting • speed calculations		4 Input			

(1) Does not represent power required to supply the inputs or outputs

1794-IJ2 and 1794-IJ2XT 24V DC Input Frequency Module

The 1794-IJ2 is essentially a tachometer with the capability of reporting frequency, acceleration, and direction. Outputs are activated by alarms. Input devices range from magnetic pickup to flowmeters, to incremental encoders to proximity detectors. This intelligent I/O module is designed to perform high-speed frequency algorithms. The module provides 2 frequency inputs, 2 gate inputs, and 2 outputs. The frequency inputs are capable of accepting frequencies up to 32 KHz. The module accepts and returns binary data.

The 1794-IJ2 measures frequency over a user-specified time interval. A frequency calculation can start before the time interval has elapsed, if a user-specified number of frequency input pulses have occurred.

The module's primary target is high-speed, accurate frequency measurement. As such, a high-speed internal clock is synchronized with the frequency input to count over a user-selected sampling time or a user-defined number of frequency input pulses.

Power to the module is supplied from the external power supply. All power for input devices (24V DC) is supplied by the I/O module. Outputs are used to set alarms depending on the input conditions.

The 1794-IJ2 module accepts the following frequency inputs:

- 24V DC IEC1+ proximity switch as defined by standard IEC 1131-2
- 24V DC contact switch with wire off capability
- 500 mV AC magnetic pickup
- 50 mV AC magnetic pickup
- 6V AC vortex
- 3V AC vortex

The 1794-IJ2 module accepts the following gate inputs:

- 24V DC IEC1+ proximity switch as defined by standard IEC 1131-2
- 24V DC contact switch
- 500 mV AC magnetic pickup
- 50 mV AC magnetic pickup

Customer supplied power, ranging from 10...31.2V DC, is connected internally to the power output transistor. When an output is turned on, current flows into the source out of the drain, through the load connected to the ground of the customer supply (customer return). Diode D6 protects the power output transistors from damage due to inductive loads. Output Q1 is a thermally protected FET and will turn off at 3 A (approximately). After an output goes into thermal shutdown, you must fix the cause of the shutdown and toggle the outputs ON and OFF to reenergize the output. RT1 protects D6 and Q1 if power supply polarity is reversed.

The frequency input module isolated power supply consists of 1 isolated 24V DC power supply that provides 2 current limited outputs of 30 mA maximum (1 for each channel).

24V DC Input Frequency Module

Specification	1794-IJ2, 1794-IJ2XT
Processing time	≤ 4 ms
Input frequency, max	1…32 kHz w/sine wave 1…32 kHz w/square wave input
Frequency value, max	32,767 or 3,276.7 (dependent on range)
Input pulse width, min	20 μs
Voltage, on-state input, min	10V (24V IEC+1 proximity, encoder input or switch inputs)
Voltage, on-state input, nom	24V DC
Voltage, on-state input, max	Limited to isolated 24V DC power supply
Current, on-state input, min	2.0 mA
Current, on-state input, nom	9.0 mA
Current, on-state input, max	10.0 mA
Voltage, off-state input, max	5.0V DC on 24V DC IECI + terminal
Current, off-state input, max	1.5 mA into 24V DC IECI + terminal
Wire-off detection	0.4 mA for proximity, encoder, or contact switch with 50 kW shunt resistor
Impedance, frequency input	>5 kΩ for 50 mV extended magnetic pickup >5 kΩ for 500 mV magnetic pickup >10 kΩ for 3V vortex flowmeter >10 kΩ for 6V vortex flowmeter >2.5 kΩ for 24V DC IEC1+ proximity or encoder input >2.5 kΩ for 24V DC contact switch input
Impedance, gate input	>5 kΩ for 50 mV extended magnetic pickup >5 kΩ for 500 mV magnetic pickup >2.5 kΩ for 24V DC IEC1+ proximity or encoder input >2.5 kΩ for 24V DC contact switch input
Output voltage source	Customer supplied
Voltage, on-state output, min	10V DC
Voltage, on-state output, nom	24V DC
Voltage, on-state output, max	31.2V DC
Current, on-state output, min	1.0 mA per output
Current, on-state output, max	1.0 A per channel sourced out of module(1)
Output surge current, max	2 A for 50 ms, repeatable every 2 s
Voltage drop, on-state output, max	0.9V DC @ 1 A
Output control	Outputs individually assignable to: Frequency % Full Scale Acceleration alarm
Output switching time	Triggered by frequency alarm or acceleration alarm Turn On: < 0.5 ms Turn Off: < 1 ms

24V DC Input Frequency Module

Specification	1794-IJ2, 1794-IJ2XT
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 3.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	**1794-IJ2:** -20…+55 °C (-4…+131 °F) **1794-IJ2XT:** -20…+70 °C (-4…+158 °F)

(1) Current Limited: All outputs can be on simultaneously without derating.

1794-VHSC 2 Channel Very High Speed Counter Module

A counter module has two incremental quadrature encoder interfaces each with three inputs (A, B, and Z). Each input module has ± inputs for connection to pulse transmitters with complementary or non-complementary signals.

The counter can count pulses of one or two pulse trains for up/down counting and detection of a selectable number of edges (X1, X2, X4). Each of the two counters has an upper limit of 1 MHz, a 24-bit counter register, a preset register, and a latch register.

Power to the module is supplied from an external 24V power supply. The 1794-VHSC has two outputs that can be configured for overlapping, multiple windows, and/or pulse-width modulation.

2 Channel Very High Speed Counter Module

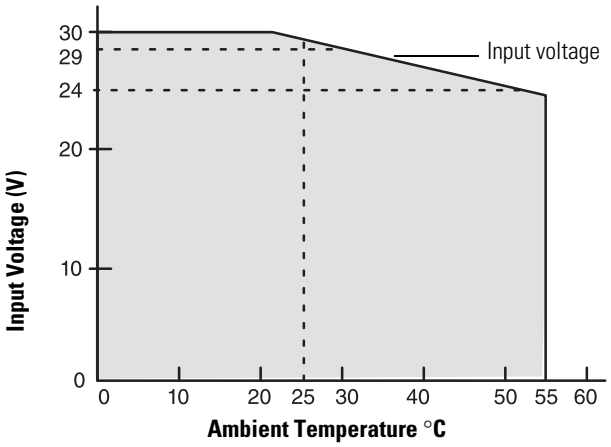
Specification	1794-VHSC
Input groups	2 groups of A/A, B/B, and Z/Z pairs with 5V DC or 15…24V DC terminations
Input frequency, max	1.0 MHz counter and encoder X1 (no filters) 500 kHz encoder X2 (no filters) 250 kHz encoder X4 (no filters)
Voltage, on-state input, min	5V DC terminations: >2.6V DC 15…24V DC terminations: >12.5V DC
Voltage, on-state input, max	5V DC terminations: ±6V 15…24V DC terminations: Refer to derating curve
Voltage, off-state input, min	5V DC terminations: ≤ 1.25V DC 15…24V DC terminations: ≤ 1.8V DC
Current, on-state input, min	>5 mA
Current, on-state input, max	≤ 0.250 mA
Input filter selections	5: Off, 10 μs, 100 μs, 1.0 ms, 10.0 ms per A/B/Z group
Output control	Outputs can be tied to 8 compare windows
Output supply voltage range	5…7V DC or 10…31V DC
Leakage current, off-state output, max	≤ 0.3 mA
Voltage drop, on-state output, max	5V operation – 0.5 A 12…24V operation – 1.0 A

2 Channel Very High Speed Counter Module

Specification	1794-VHSC
Current, on-state output, max	5V operation – 0.5 A 12…24V operation – 1.0 A
Current per output pair, max	5V operation – 0.9 A 12…24V operation – 4.0 A
Short circuit current	5V operation – 0.9V DC @ 0.5 A(1) 12…24V operation – 0.9V DC @ 1.0 A
Output delay time, OFF to ON	25 μs (load dependent)
Output delay time, ON to OFF	150 μs (load dependent)
Dimensions (HxWxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 3.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	0…55 °C (32…131 °F)

(1) Outputs are short circuit protected and turned off until power is cycled.

1794-VHSC Derating Curve



The area within the curve represents the safe operating range for the module under various conditions of user supplied 24V DC supply voltages and ambient temperatures. This includes all possible mounting positions, including inverted horizontal.

= Safe operating area

1794-ID2 2 Input Pulse Counter Module

The 1794-ID2 module is a 2-channel counter used in applications where pulse counting is required. Typical input devices include quadrature incremental encoders with or without reference and/or gate function and pulse transmitters. You can use one or two pulse trains.

2 Input Pulse Counter Module

Specification	1794-ID2
Input pulse width	Each signal condition must be stable for at least 2 ms to be recognized
Input groups	2 groups of A, B, Z, G inputs
Counting frequency, max	100 kHz
Cable type	Input: Belden 8761
Wire category	2(1)
Conductor length, max	304.8 m (1000 ft)
Input signal range	3 mA @ 6V DC 9 mA @ 12V DC 15 mA @ 24V DC
Dimensions (WxHxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 3.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	0…55 °C (32…131 °F)

(1) Use this Conductor Category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

1794-IP4 4 Input Pulse Counter Module

The pulse counter modules perform high-speed scaling, calculation operations for various industrial applications. Some sample applications include:

- quantity counting
- speed calculation
- flow monitoring

All the input devices for the pulse counter module should be able to provide the input signal of 6V amplitude. The 1794-IP4 has a 6V minimum threshold for an input ON condition and a maximum 3V threshold for an input OFF condition. The region between 3V and 6V is a transitional one and therefore requires input signals to pass cleanly through that region.

4 Input Pulse Counter Module

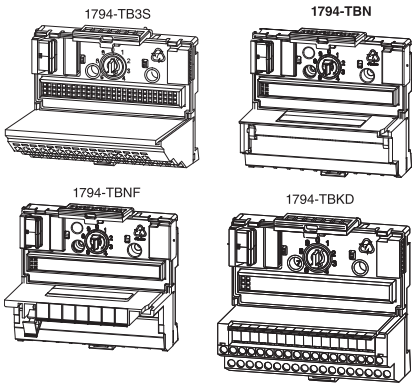
Specification	1794-IP4
Counting frequency, max	100 kHz(1)
Input frequency, max	100
Input signal range	3 mA @ 6V DC 9 mA @ 12V DC 15 mA @ 24V DC
Overflow	Maximum period – 65 ms when 1 MHz internal clock selected Maximum period – 6.5 ms when 10 MHz internal clock selected
Dimensions (WxHxD), approx	46 x 94 x 53 mm (1.8 x 3.7 x 3.1 in.) 94 x 94 x 69 mm (3.7 x 3.7 x 2.7 in.) installed
Temperature, operating	0…55 °C (32…131 °F)

(1) Each signal condition must be stable for at least 2 ms to be recognized.

Select a FLEX I/O Terminal Base Unit

Step 3 – Select:

the appropriate terminal base unit for your module and system



Each FLEX I/O module requires a terminal base unit that snaps onto the DIN rail to the right of the I/O adapter. The terminal bases provide terminal connection points for the I/O wiring and plug together to form the backplane. They are available with screw, clamp, or spring terminations.

Common Terminal Base Characteristics

Current Capacity, max	Wire Size	Dimensions (HxWxD)
10	0.34…3.3 mm^2 (22…12 AWG) solid or stranded copper wire rated at 75 °C (167 °F) or greater, 1.2 mm (3/64 in.) insulation max	94 x 94 x 69 mm 3.7 x 3.7 x 2.7 in. **1794-TB37DS and 1794-TB62DS*** (1) 127 x 94 x 69 mm 5.0 x 3.7 x 2.7 in

(1) Measured with expansion module installed.

The following table is a comparison of general specifications for each FLEX I/O terminal base unit. For compatibility with FLEX I/O modules, see Table Digital I/O Module Summary on page 24.

General Specification Comparison

Catalog(1)	Termination Type	Connections	Used in Applications	Current Capacity, max	Wiring Category	Purpose	Temperature, operating
1794-TB2	Cage clamp	16 I/O; 18 common; 2 +V	Up to 132V AC/156V DC	10	2	A generic 2-wire version of the 1794-TB3.	-20…+55 °C (-4…+131 °F)
1794-TB3, 1794-TB3K(2)		16 I/O; 18 common; 18 +V			Module dependent	Primarily intended for use with input modules when using 3-wire input proximity switches – can also be used with output modules.	-20…+70 °C (-4…+158 °F)
1794-TB3S, 1794-TB3SK	Spring clamp					A spring clamp version of the 1794-TB3 – provides faster, simpler wire installation.	
1794-TB32	Cage clamp	32 I/O; 8 common; 8 +V	Up to 31.2V DC			A 32-point version of the 1794-TB3 to be used with 32-point digital modules and the 1794-IB16D module.	
1794-TB32S	Spring clamp					A spring clamp version of the 1794-TB32.	
1794-TB3G, 1794-TB3GK(2)	Grounded screw clamp	36 I/O; 2 common; 2 +V; 10 chassis ground				A screw clamp terminal base unit with individual grounding used with certain analog modules.	
1794-TB3GS, 1794-TB3GSK(2)	Grounded spring clamp				2	A spring clamp version of the 1794-TB3G.	

General Specification Comparison

Catalog[1]	Termination Type	Connections	Used in Applications	Current Capacity, max	Wiring Category	Purpose	Temperature, operating
1794-TB3T, 1794-TB3TK	Cage clamp, temperature	16 I/O; 10 common; 4 +V; 8 chassis ground; 2 sets of CJC for temperature modules	Up to 132V AC/156V DC	10	Module dependent	A cage clamp terminal base to be used with the 1794-IT8 or 1794-IRT8 module (when used in thermocouple mode) – also provides chassis ground connections for the 1794-IR8 and analog modules.	-20…+70 °C (-4…+158 °F)
1794-TB3GT	Cage clamp, grounded			V/COM terminals: 10 A I/O terminals: 2 A			
1794-TB3TS, 1794-TB3TSK[2]	Spring clamp, temperature	16 I/O; 10 common; 4 +V; 8 chassis ground; 2 sets of CJC for temperature modules	Up to 132V AC/156V DC	10	2	A spring clamp version of the 1794-TB3T.	-20…+70 °C (-4…+158 °F)
1794-TBKD[3]	Cage clamp, knife disconnect	16 I/O; 18 common; 2 +V	—		Module dependent	A cage clamp terminal base with 16 knife disconnects.	0…55 °C (32…131 °F)
1794-TBN, 1794-TBNK[2]	Screw clamp, NEMA-style	16 I/O; 2 common; 2 +V	264V AC/DC			A NEMA-style screw clamp terminal base for larger gauge wires with a cover for I/O wiring.	-20…+70 °C (-4…+158 °F)
1794-TBNF	Screw clamp, fused NEMA-style					Provides eight 5 x 20 mm fused, screw terminals with a cover for I/O wiring – shipped with fuses for the 1794-OA8 module; can be used to fuse the 1794-OM8 and 1794-OW8 modules with a replacement fuse.[4]	-20…+55 °C (-4…+131 °F)
1794-TB37DS	D-shell	37 Pin; digital and analog	—		Module dependent	A 37-pin D-shell termination for both digital and analog modules.	0…55 °C (32…131 °F)
1794-TB62DS		62 Point;				A 62-pin D-shell termination for both digital and analog modules.	

(1) Isolation voltage, channel to channel, is determined by the insert module. Use this conductor category information for planning conductor routing. Refer to Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

(2) The letter K in the last position of the catalog number, before the series designation, indicates a conformal coated versions of standard modules and can be used with extended temperature modules (modules ending in -XT).

(3) Discontinued catalogs may not have updated specifications. For more information about a specific discontinued catalog, refer to individual installation instructions.

(4) Contains eight 5 x 20 mm fuses (one for each even-numbered terminal – 0…14 on row B). Shipped with 1.6 A, 250V AC Slow Blow fuse suitable for the 1794-OA8 AC output module. Refer to individual installation instructions for fusing recommendations for other modules. Littlefuse PN23901.6 A-B PN94171304, SAN-O PNSD6-1.6A.

Select a FLEX I/O Power Supply

Step 4 – Select:

if power consumption exceeds the maximum for a single power supply, install additional power supplies

FLEX I/O modules are interfaced to the I/O link through a FLEX I/O adapter module with a built-in 24V DC input power supply. The FLEX I/O modules receive power from the adapter/power supply through the backplane. The 120V AC to 24V DC power supply (1794-PS13 or 1794-PS3) is also available for powering the adapter/power supply.

General Specification Comparison

Catalog	Power Supply Input Voltage, nom	Power Supply Input Power	Apparent Input Power, max	Transformer Load, max	Output Current, max	Output Voltage, nom	Dimensions (HxWxD), approx
1794-PS3	120V/220V AC	86 W	205 VA	250 VA	3.0 A	24V DC	87 x 94 x 69 mm (3.4 x 3.7 x 2.7 in.)
1794-PS13		36 W	53 VA	90 VA	1.3 A		87 x 69 x 69 mm (3.4 x 2.7 x 2.7 in.)

Power Supply Definitions

Module Supply Voltage — This is typically either 120V AC or 24V DC nominal voltage that is supplied from an external power source wired to the module terminal base unit.

All Flex I/O adapters provide internal power to the maximum possible number of 8 Flex I/O modules. Power supply modules are required to provide 24V to the adapters.

The 1794-PS13 power supply is capable of supplying a maximum of 1.3 A at 24V DC. The output surge current is sufficient to drive four adapters with a surge of 23 A for 2 ms each operating at 24V DC.

The 1794-PS3 power supply is capable of supplying a maximum of 3 A(1) at 24V DC. The output surge current is sufficient to drive six adapters with a surge of 23 A for 2 ms each operating at 24V DC.

Non-Allen-Bradley DC power supplies can also be used, but should operate within the specifications for the devices they are powering. Size the power supply by calculating the total current consumed by summing the currents for each of the modules used for the power supply operating voltage applied.

(1) This refers to horizontal mounting: 2.8 A maximum for all other mountings. Refer to the derating curve in the installation instructions for that module.

The 1606 switched mode power supplies are capable of supplying a maximum of up to 40 A at 24V DC and can be used as an alternative when more power is needed.

Digital Input Modules require supplied 24V DC (19.2...31.2V DC) and consume the currents listed in the module specifications.

Digital Output Modules require supplied 24V DC (19.2...31.2V DC) and consume the currents listed in the module specifications plus the total current consumed by their loads. The load current is limited by the maximum load current and surge listed.

Combination Digital Modules have a combination of inputs and outputs. The current load should be determined as described for the combined input and output specifications listed.

Analog Input Modules require supplied 24V DC (19.2...31.2V DC) and consume the currents listed in the module specifications. In addition, adequate power must be supplied to the 1794-IE8 and 1794-IF4I transmitters to deliver input terminal voltage or drive 20 mA into the input impedance listed. This power source may be the same as the module power and can be included in the power supply calculated.

Analog Output Modules require supplied 24V DC (19.2...31.2V DC) and consume the currents listed plus the total current consumed by their loads. The load current is limited by maximum current or resistive load permitted per channel.

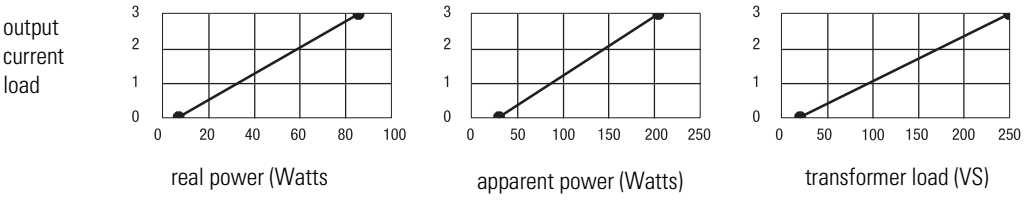
Combination Analog Modules have a combination of analog inputs and outputs. The current load should be determined as described previously for the combined modules and output specifications listed. The output load current is limited by the maximum current or resistive load permitted per channel. In addition, adequate power must be supplied to the 1794-IE8 and 1794-IF4I transmitters to deliver input terminal voltage or drive 20 mA into the input impedance listed. This power source may be the same as the module power and can be included in the power supply calculation.

Counter Modules require module power, transmitter input power, and in some cases output load power. If output load power is required, use a separate power supply for output load power for noise immunity.

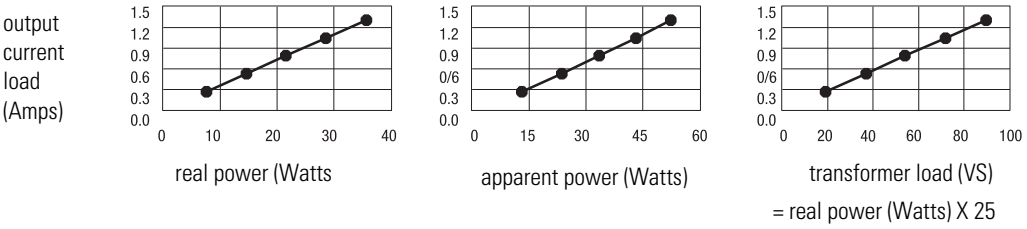
Power Requirements and Transformer Sizing

- Use the real power value in watts for determining the amount of heat dissipation you will have inside the enclosure.
- Use the apparent power value in VA for estimated power distribution sizing.
- Use the transformer load value in VA of each power supply plus all other loads on a transformer to determine the required transformer size.

1794-PS3 AC/DC



1794-PS13 AC/DC

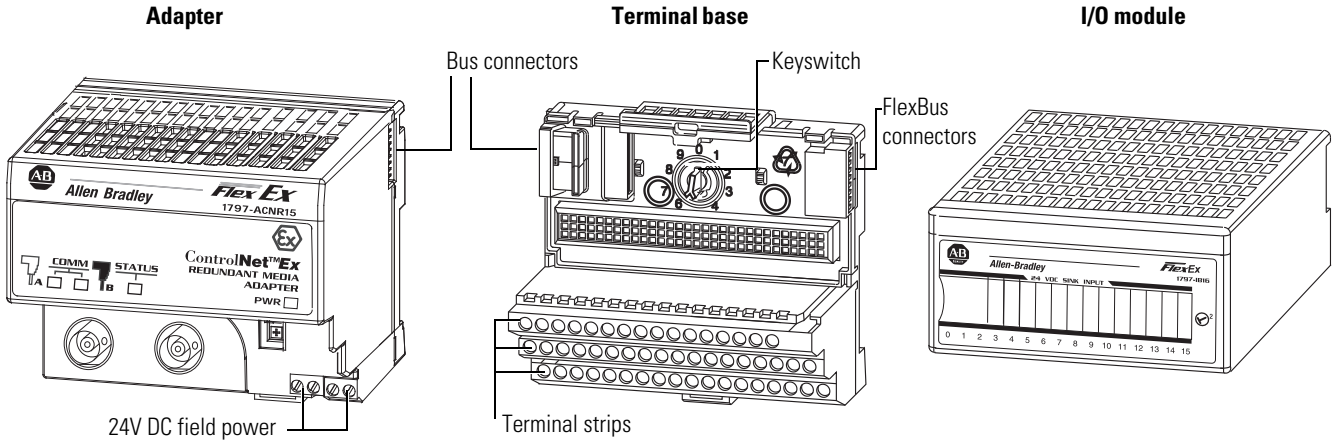


Notes:

About the FLEX Ex I/O Systems

1797 FLEX Ex I/O Overview

FLEX Ex™ I/O offers:



FLEX Ex I/O leverages advanced technologies allowing the application to move to a distributed architecture in the hazardous area. We have taken our experience gained with the standard FLEX I/O system and used it to create an intrinsically safe system with the same look, feel, and ease of use.

Mounts without purged or explosion-proof enclosures in the hazardous area. FLEX Ex I/O is a modular I/O system that eliminates the need for Intrinsic Safety (IS) barriers/isolators or long wiring runs to the control cabinet.

One adapter communicates with up to eight I/O modules. Allows connection to:

- 128 digital inputs/outputs, or
- 64 analog inputs, or
- mix to meet your needs.

Redundant media ControlNet adapter communicates with up to eight I/O modules and can be mounted in the hazardous area.

Adjust the keyswitch to prevent incorrect module insertion into a preconfigured terminal base.

Exchange terminal bases without moving other bases in your system.

Connect FLEX Ex power supplies to the terminal base that provides power to the I/O modules and field devices. No additional power supplies are needed.

Plug the I/O module into the terminal base. Use the module to connect to the I/O bus and field devices.

Remove and insert modules under power. No direct wiring to the module enables you to change modules without disturbing field wiring or system power.

Mix and match I/O modules. Wide variety of digital, analog, temperature, frequency, and HART modules.

FlexBus Isolator allows connection to standard FLEX I/O adapters and I/O thus providing a choice of other networks.

Conformal coating on all modules meets the noxious gas requirement of ISAS71.04-1985 severity level G3 for hydrogen sulfide, sulfur dioxide, chlorine, nitrogen dioxide, hydrogen fluoride, ammonia, and ozone.

FLEX Ex combines a terminal strip and intrinsic-safety isolation with an I/O interface. Use the terminal strip on the terminal base to wire your field devices directly. The FLEX Ex design also offers these features:

- modularity for distributed IS systems
- all of the features of a larger, rack-based system
- installation near the field devices to reduce wiring costs and complexity
- terminations for field wiring eliminating the need for marshalling or extra terminal strips
- ControlNet-based networking solution in the hazardous area with ControlNet Ex products
- DIN-rail mounting

FLEX Ex provides additional value if system problems develop. The terminal base lets you remove and insert I/O modules under power without rewiring or disrupting your system. Combining your field-wiring terminations, IS isolation, and the I/O interface into the same location saves you time, money, and makes your system easier to maintain and troubleshoot. Additional benefits include:

- galvanic isolation between the I/O backplane, input circuitry, and power supply
- dual-fault protection IS circuits provide the highest fault tolerance
- I/O circuitry provides full IS field-device protection
- the modules themselves are IS protected for installation in hazardous environments

FLEX Ex I/O modules may be removed and inserted while operating under power. Network module maintenance and cable connections can be made in the hazardous area while the system is in operation and the area is hazardous.

FLEX Ex Typical Configurations

The following are typical configurations of FLEX Ex I/O in an intrinsically safe system:

- FLEX Ex I/O modules are interfaced through a ControlNet Ex I/O adapter module to a coax ControlNet segment that is confined to the hazardous area. This coax ControlNet Ex segment is interfaced through a ControlNet Ex coax drop repeater module and ControlNet Ex fiber media port adapter to a fiber-optic ControlNet segment, which is fed through from the safe area. A FLEX Ex power supply powers the repeater module, fiber media port adapter, ControlNet Ex I/O adapter module, and I/O modules individually. This configuration is best for long distances and a large number of nodes.
- The FLEX Ex ControlNet barrier allows connection to a ControlNet Ex I/O adapter module in the hazardous area via coax directly from the safe area. The barrier is mounted in the safe area. This is more economical for intermediate distances and nodes.
- Sensors and actuators in a hazardous area can be connected to FLEX Ex I/O modules, which are connected through a bus isolator module and connector to a FLEX I/O adapter in a safe area thus allowing connectivity to DeviceNet, ControlNet, Universal Remote I/O, and EtherNet/IP. This configuration may be most economical for low-point applications or when networks other than ControlNet are required.
- FLEX Ex I/O modules in a hazardous area can be connected through an extender cable to a FlexBus feed-through connector in an explosion-proof enclosure. Inside the enclosure, the feed-through connector is connected through a FLEX Ex extender cable, and then a bus isolator module and connector, to a FLEX I/O adapter.

Entity-Based Architecture

Entity parameters provide a system of quantifying and matching safe levels for voltage, current, inductance, and capacitance when connecting intrinsically safe field devices and system devices together.

Configuration of the FLEX Ex system is based on the entity parameter method. Using entity parameters allows high system flexibility in matching field and system devices. This provides maximum utility to the IS system designer and installer. For more information, refer to the FLEX Ex System Certification Reference Manual, publication 1797-RM001.

Hazardous Area Designation

A hazardous area is designated as any location in which a combustible material is or may be present in the atmosphere in sufficient concentration to produce an ignitable mixture.

The North American method identifies these areas by Class, Division, and Group while the IEC (CENELEC) designates these areas by Zone and Gas Group.

Recently, North America has adopted the Zone method of identifying hazardous locations as an option to the Division method.

Class Designation

Class identifies the type of hazardous atmosphere.

Class I	Gas or vapor
Class II	Dust
Class III	Fiber or flying (no group designation)

Division/Zone Designations

Division/Zone identifies the likelihood of a hazardous atmosphere being present.

	Division Method (North America)	IEC Standard Zone Method
Ignitable mixture present continuously (long periods)	Division 1	Zone 0 (Zone 20 - Dust)
Ignitable mixture present intermittently		Zone 1 (Zone 21 - Dust)
Ignitable mixture is not normally present	Division 2	Zone 2 (Zone 22 - Dust)

Gas/Dust Groups

Hazardous locations are grouped according to their ignition properties.

Typical Gas	North American Gas Group	IEC Gas Group
Acetylene	A	IIC
Hydrogen	B	
Ethylene	C	IIB
Propane	D	IIA
Methane[1]	D	I
Metal dust	E	—
Coal dust	F	
Grain dust	G	

(1) Mining applications under jurisdiction of MSHA.

Use in North American Hazardous Locations

FLEX Ex modules are rated for installation in Class I Division 1 & 2, Groups A-D hazardous areas. They are also rated to connect to field devices that are located in Class I, II, or III, Groups A-G hazardous areas.

If FLEX Ex components are to be installed in a Class II or III location in your application, you must mount them in a suitable, dust-proof enclosure with the appropriate connectors, glans, and seals. For example, a NEMA 9 enclosure may be appropriate. The FLEX Ex modules are rated to connect to devices located in Class II or III locations.

FLEX Ex modules are rated for installation in North American Class I Zone 1 & 2, Groups IIC, IIB, & IIA hazardous areas. They are also rated to connect to field devices that are located in North American Class I Zone 0, 1, & 2, Groups IIC, IIB, & IIA hazardous areas.

As always, observe local code requirements when applying your FLEX Ex application. For more information, refer to the FLEX Ex System Certification Reference Manual, publication 1797-RM001.

Use in ATEX Hazardous Locations

FLEX Ex modules are rated for installation in European Zones 1, 2 and 22. They are also rated to connect to field devices that are located in European Zones 0, 1, 2, 21 and 22 hazardous areas. The FLEX Ex power supplies (1797-PS1E and -PS2E2) are rated for use in Zone 1 and 22.

If FLEX Ex components are to be installed in a European Zone method dust or fiber location in your application, you must mount them in an approved, dust-proof enclosure with the appropriate connectors, glans, and seals. Pepperl+Fuchs have three cabinets that are approved for use with FLEX Ex components in Zone 22 applications: IVK2-ISRPI-V8LC; IVK2-ISRPI-V8HYW; and IVK2-ISRPI-V16LC. P+F has offices in Twinsburg, Ohio, USA, and Mannheim, Germany. See their website at www.pepperl-fuchs.com.

As always, observe local code requirements when applying your FLEX Ex application. For more information and full certification, refer to the FLEX Ex System Certification Reference Manual, publication 1797-RM001.

Specify a FLEX Ex System

Follow these steps as you specify your FLEX Ex I/O system:

?	Step	See	Page
	1 Select an adapter and distribution method Choose an adapter and fiber hub or coax barrier to distribute FLEX Ex into the hazardous area. Or, choose a bus isolator pair to connect to various networks.	Select FLEX Ex I/O Communication Adapters and Distribution Method	89
		1797-RPFM ControlNet Ex 3 km Fiber Media Port Adapter	92
		1797-BCNR Coax Barrier Module	92
		1797-BIC Bus Isolator Module and 1797-CEC FlexBus Connector	94
	2 Determine the I/O devices • location of the device • number of points needed • appropriate catalog number • number of points available per module • number of modules	Digital I/O Modules	97
		Analog Modules	101
		HART Interface Modules	105
		Counter I/O Module	108
	3 Select a terminal base Choose an appropriate terminal base for your modules.	Terminal Base Wiring Diagrams	111
	4 Select power supplies • Choose appropriate power supply • Ensure sufficient power for the communication adapter and modules	Select a FLEX Ex I/O Power Supply	113
		Understanding System Planning	114
		Assigning Power Supplies	116
		Hazardous Area Installation	117

	5 Select optional accessories • Determine whether to panel mount or DIN rail mount the FLEX I/O system and at what orientation (horizontal or vertical) • Choose appropriate optional accessories to enhance your system	Mount the FLEX System	121
		1794-CE1 and 1794-CE3 Extender Cables	123
		1797-BOOT ControlNet BNC Boot	125
		1797-INS Trunk Insulator and 1797-EXMK Marking Kit	125
		ControlNet Ex Taps	126

Notes:

Select FLEX Ex I/O Communication Adapters and Distribution Method

Step 1 – Select:

the communication adapter for the ControlNet Ex network the coax barrier to distribute into hazardous areas

The diagnostic capabilities and determinism of the ControlNet network make it an ideal choice for distributing I/O into hazardous area applications.

The redundant media ControlNet Ex communications adapter (1797-ACNR15) is high speed and capable of communicating with as many as 8 I/O modules for up to 128 I/O points.

The ControlNet Ex segment in the hazardous area must be protected from other ControlNet segments in safe areas. Isolation can be achieved via two approaches: by converting coax to fiber with a pair of fiber hubs/repeaters or by using a coax barrier.

The combination of a ControlNet fiber hub (1786-RPA and -RPFM) and a ControlNet Ex fiber hub (1797-RPA and 1797-RPFM) allows for flawless, high-speed, deterministic data flow and messaging between hazardous and safe areas. This combination functions as an intrinsically safe isolator between hazardous and safe areas and can provide long-distance communication up to three kilometers. It is best for longer distance and largest number of adapters and I/O points.

An intrinsically safe network and I/O system installed in the hazardous area allows your data to be gathered at its origin and transported out of the area with minimum amount of wiring. Cable penetrations into the hazardous area, cable trays, and conduit are all drastically reduced.:

Network Comparison by Application Requirement

Catalog Number.	Description	Agency Certification	Intrinsically Safe Output Characteristics	Intrinsically Safe Power Supply (V, -V)	See page:

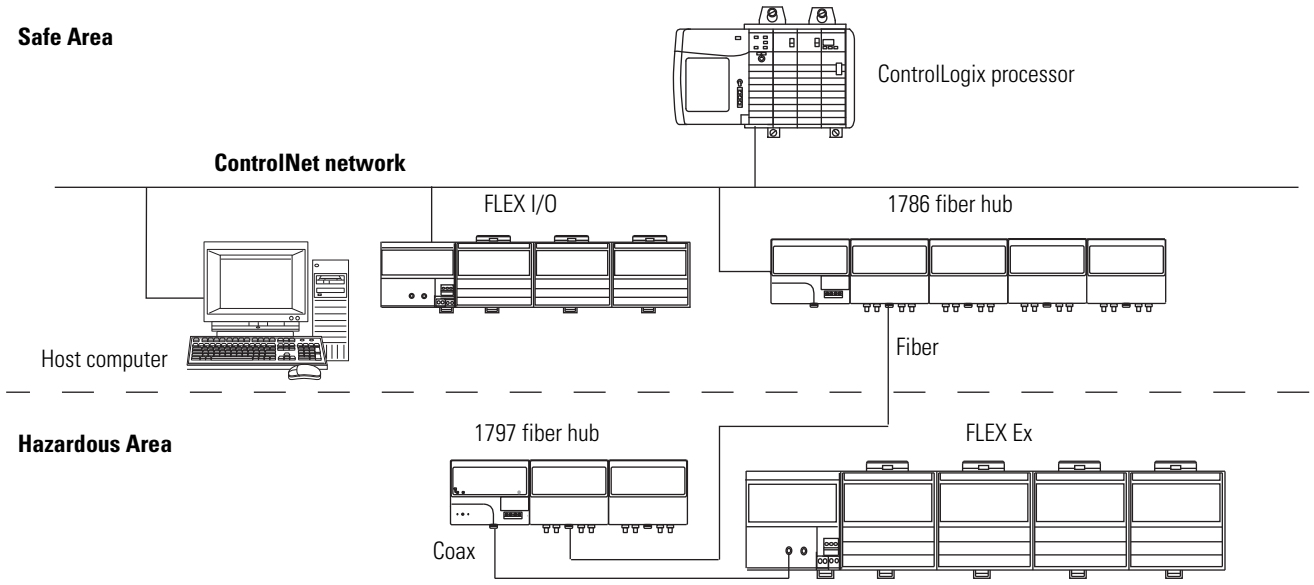
(1) For Class II Division 1 Groups E, F, G and Class III, modules must be installed in a UL listed Type 4, 4X, 6, 6P, 9, 12, or 12K enclosure.

Figure 1 - Distribution Between Areas



1797-ACNR15 Dual Media ControlNet Ex 1.5 Adapter

The 1797-ACNR15 interfaces FLEX Ex I/O modules to a coax segment of a ControlNet Ex I/O link. It provides power to the backplane to run bus interface circuitry aboard I/O modules and is capable of dual ControlNet Ex cable media.

FLEX I/O EtherNet/IP Adapter Specifications

Attribute	1797-ACNR15
I/O module capacity	8
Temperature, operating	-20…+70°C (-4 …+158°F)
Communication interface	Quad-shield RG-6 coax
Communication rate	5 Mbps
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
Dimensions (HxWxD), approx	94 x 94 x 91 mm (3.7 x 3.7 x 3.58 in.)
Weight, approx.	0.2 kg (0.44 lbs)
Thermal dissipation	29 BTU/hr

1797-RPA ControlNet Ex Coax Drop Repeater Module

The 1797-RPA functions as part of the fiber repeater hub within the hazardous area to extend the length of the ControlNet Ex segments to interlink systems all operating within the area. It functions as the intelligent starter block for a multiport repeater and is configured with at least one media adapter.

FLEX I/O ControlNet Adapter Specifications

Attribute	1797-RPA
Fiber media port adapter capacity	2
Temperature, operating	-20…+70°C (-4 …+158°F)
ControlNet cable	Quad-shield RG-6 coax
Communication rate	5 Mbps
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
Power dissipation	8.5 W
Dimensions (HxWxD), approx	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed
Weight, approx.	0.2 kg (0.44 lbs)
Thermal dissipation	29 BTU/hr

1797-RPFM ControlNet Ex 3 km Fiber Media Port Adapter

The 1797-RPFM (part of the fiber repeater hub) functions as a non-intelligent fiber to backplane conversion device and converts glass fiber infrared LED media signals to backplane signals for use by the 1797-RPA repeater module.

FLEX I/O DeviceNet Adapter Specifications

Attribute	1797-RPFM
Communication interface	Fiber optic cable
Fiber type	62.5/125 mm
Fiber termination type	ST (plastic or ceramic)
Communication rate	5 Mbps
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
Power dissipation	Included in 1797-RPA
Dimensions (HxWxD), approx	94 x 94 x 91 mm (3.7 x 3.7 x 3.58 in.)
Weight, approx.	0.1 kg (0.22 lbs)
Thermal dissipation	Included in 1797-RPA

1797-BCNR Coax Barrier Module

The redundant media ControlNet coax barrier (1797-BCNR) isolates the ControlNet segment in the safe area from that in the hazardous area. It allows connection into the hazardous area without converting to/from fiber media. The barrier can support up to 20 adapters and distances up to 500 meters. Thus, it addresses intermediate size applications in a highly cost-effective manner. The barrier can be mounted in safe, Division 2 or Zone 2 areas.

When using a 1797-BCNR, the total allowable length of a segment containing standard RG-6 quad-shield cable depends on the number of taps in your segment. There is no minimum trunk-cable section length requirement. The maximum allowable length of a segment that contains a 1797-BCNR is 500 m (1640 ft) with two taps connected. Each additional tap decreases the maximum length of the segment according to the chart. The maximum number of taps allowed on a segment is 20 with a maximum length of 250 m (820 ft).

FLEX I/O Remote I/O Adapter Specifications

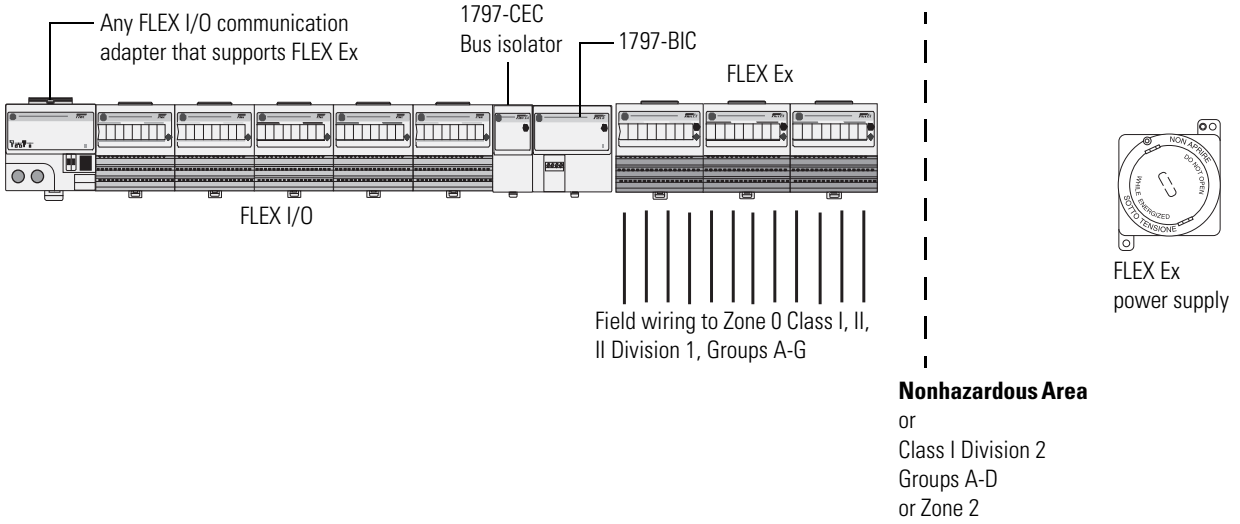
Attribute	1797-BCNR
Temperature, operating	-20…+70°C (-4 …+158°F)
ControlNet Ex system characteristics	U_0 = 7V I_0 = 55 mA @ 52 KHz P_0 = negligible
Non Ex ControlNet characteristics	U_n = 5V U_m = 253V AC I = not defined P = not defined
ControlNet communication rate	5 Mbps
Transmission attenuation	-7.84 dB
Noxious Gas exposure	—
Dimensions (HxWxD), approx.	70 x 100 x 90 mm (2.76 x 3.94 x 3.55 in.)
Weight, approx.	0.2 kg (0.44 lbs)

1797-BIC Bus Isolator Module and 1797-CEC FlexBus Connector

The bus isolator modules, 1797-BIC and -CEC, allow you to configure FLEX Ex modules and FLEX I/O modules on the DIN Rail when attached to the same adapter and grouped together on appropriate sides of the bus isolator module. This highly flexible, cost-effective solution combines intrinsically safe and non-intrinsically safe systems.

Intermixed system can be configured for use in the:

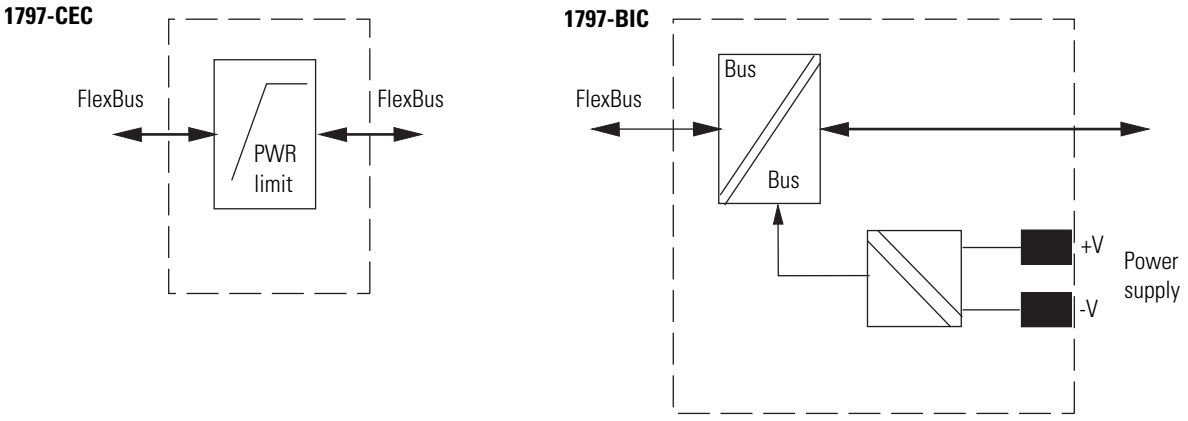
- safe area much like traditional IS and I/O systems
- hazardous and safe control equipment where the distance of physical separation is short
- FLEX Ex I/O with communication adapters that are not intrinsically safe



The 1797-BIC and -CEC modules provide an IS-compatible mechanism to separate two sections of the backplane, allowing IS and non-IS field-device wiring to the same I/O group. It converts hazardous power to IS-safe power to run one side of the bus receiver/transmitter circuitry and IS-safe power to slave side modules. A total of eight I/O modules (1794 FLEX I/O or 1797 FLEX Ex I/O) may be attached to the adapter.

When combining 1794 FLEX I/O and 1797 FLEX Ex I/O, the 1794 FLEX I/O modules are placed to the left of the 1797-BIC and -CEC modules while the 1797 FLEX Ex I/O modules are placed on the right.

IMPORTANT A FLEX Ex power supply (1797-PSxxx) must be used to power the 1797 FLEX Ex I/O regardless of where they are located.



Attribute	1797-BIC
I/O module capacity	8(1)
Isolation voltage	System to System and System Slave Side to Power Supply: Galvanic to DIN EN 50020
Power consumption, max	0.15 A @ 18…32V DC
Power source failure, max input	U_m = 253V AC
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
Power dissipation	2.1 W
Thermal dissipation	7.2 BTU/hr
Dimensions HxWxD	87 x 94 x 75 mm 3.4 x 3.7 x 2.95 in.
Weight, approx.	0.2 kg (0.44 lbs)

(1) 8 FLEX Ex modules. Note that a total of eight I/O modules can be attached to a 1794 FLEX I/O adapter. The 1797-BIC and 1797-CEC are not included in this number. In intermixed systems, the number of 1797 FLEX Ex I/O modules (attached onto the 1797-BIC) plus the number of 1794 FLEX I/O modules (connected between the adapter and the 1797-CEC) cannot exceed eight.

Notes:

Select FLEX Ex I/O Modules

Step 2 – Select:

I/O modules based on field devices

FLEX Ex follows a producer/consumer model for remote I/O. Input modules produce data for the system. Controllers, output modules, and intelligent modules produce and consume data. The producer/consumer model multicasts data. This means that multiple nodes can consume the same data at the same time from a single device.

FLEX Ex I/O modules offer 2 through 16 I/O each. You can connect together a maximum of eight FLEX Ex I/O modules with a FLEX Ex I/O adapter, for a maximum of 128 I/O per assembly.

Mix and match digital and analog I/O to meet your application needs.

Digital I/O Modules

Digital I/O modules have digital I/O circuits that interface to on/off sensors (pushbuttons and limit switches) and actuators (motor starters, pilot lights, and annunciators).

These outputs are controlled by the PLC controller while the inputs control the state of corresponding bits in the PLC.

Features

- Modules detect, indicate, and report the following faults:
  - open input or output field devices or wiring
  - shorted output field devices
  - shorted input or output wiring
  - Selectable input filter times from less than 1 to 33 ms.
- LED for each channel indicating status of:
  - corresponding input device
  - output signal

Digital I/O Module Summary

Catalog Number	Inputs	Outputs	Terminal Base Unit	Electrical Range	Module Type
Input Modules					
1797-IBN16	16	—	1797-TB3, 1797-TB3S	—	Nonisolated NAMUR inputs
Output Modules					
1797-OB4D	—	4	1797-TB3, 1797-TB3S	—	Nonisolated source outputs

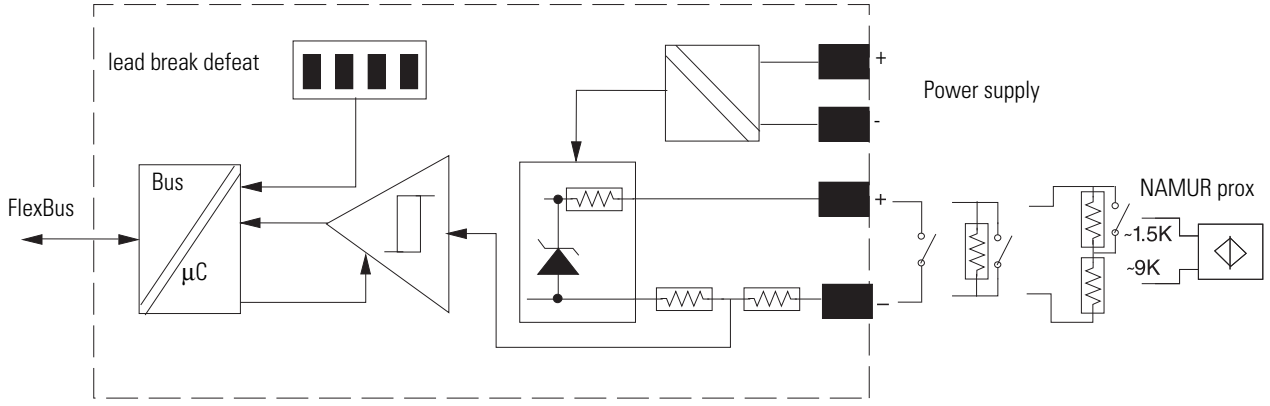
Modules Specifications

The following section shows more detailed module specifications in comparative groups to facilitate your selection based on your requirements.

1797-IBN16 16 Point Non-isolated NAMUR Input Module

- Fault detection, fault bits in data table and status indicator LED (per channel) blinking red (1 Hz)
- Lead breakage defeat on four-channel group basis via module DIP switch selection
- Fault detection can be disabled via data table
- Programmable digital input filtering 1...33 ms (OFF to ON and ON to OFF)
- All channels updated to FlexBus ≤ 500 µs
- Compatible with NAMUR sensors and dry contacts

Schematic drawing of the 1797-IBN16 module



16 Point Non-isolated NAMUR Input Module

Specification	1797-IBN16
Number of inputs	16
Input type	EN 60947-5-6, NAMUR compatible
Current, on-state input, min	2.1 mA
Current, off-state input, max	1.2 mA
Hysteresis	0.2 mA
Input frequency, max	1000 Hz
Input pulse width	≥25µs for on or off
Load voltage, max	U/V = 7.5V DC
Short circuit current	7.5 mA
Short circuit threshold current	> 6 mA
Lead breakage threshold current	≤ 0.15 mA
Input delay time, OFF to ON	1 ms, 2 ms, 3 ms, 5 ms, 9 ms, 17 ms, 33 ms(1)
Input delay time, ON to OFF	1 ms, 2 ms, 3 ms, 5 ms, 9 ms, 17 ms, 33 ms(2)

16 Point Non-isolated NAMUR Input Module

Specification	1797-IBN16
Intrinsically safe input type	II (1)2G Ex ib[ia] IIC T4 Class I, Div. 1, Groups A-D and Class I, Zone 1, AEx ib/[ia] IIC
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
FLEX Ex power consumption	2.8 W @ 9V
Power dissipation	2.8 W
Thermal dissipation, max	9.6 BTU/hr
Dimensions (HxWxD), approx	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed

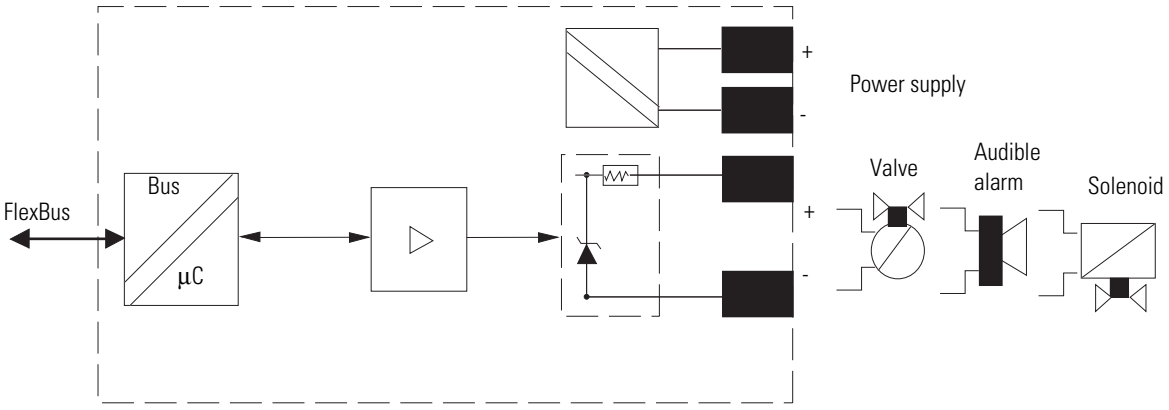
(1) 1 ms default selectable.

(2) 1 ms default selectable.

1797-OB4D 24V DC 4 Point Non-isolated Source Output Module

- 4 output channels referenced to a single supply
- Yellow LED to indicate output state, output ON = LED ON
- Fault indication, signal to the backplane and status indicator LED (per channel) blinking red for fault
- Output short circuit detection
- Output wire-off detection
- Output wire-off detection on per channel basis via module data bit
- Electronically short-circuit protected, fault reported to controller
- All channels updated from the backplane every 2 ms
- Output fault state programmable

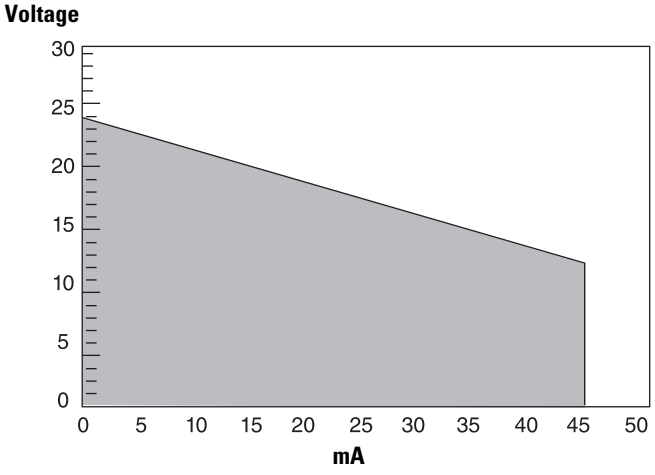
Schematic Drawing of the 1797-OB4D Module



24V DC 4 Point Non-isolated Source Output Module

Specification	1797-OB4D
Number of outputs	4
Output load range	30…5000 Ω
Fault detection	Fault bits in data table and LED (per channel) blinking red (1 Hz)
Protection	Overload
Output delay time, OFF to ON	≤ 1.2 ms
Output delay time, ON to OFF	≤ 1.2 ms
Intrinsically safe output type	II (1)2G Ex ib[ia] IIC T4 Class I, Div. 1, Groups A-D and Class I, Zone 1, AEx ib/[ia] IIC
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
FLEX Ex power consumption	7.5 W @ 9V
Power dissipation	5 W
Thermal dissipation, max	17.07 BTU/hr
Dimensions (H x W x D)	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed

1797-OB4D Output Voltage/Current Capability



Analog Modules

Choose analog I/O modules when you need:

- **Configurable channels** allow the module to be used with a variety of sensors.
- **On-board scaling** eliminates the need to scale the data in the controller. Controller processing time and power are preserved for more important tasks, such as I/O control, communications, or other user-driven functions.
- **On-line configuration**. Modules can be configured in RUN mode using the programming software or the control program. This allows you to change configuration while the system is operating. For example, the input filter for a particular channel could be changed, or a channel could be disabled based on a batch condition.
- **Over- and under-range detections and indications** eliminates the need to test values in the control program, saving valuable processing power of the controller. In addition, since alarms are handled by the module, the response is faster and only a single bit needs to be monitored to determine if an error condition has occurred.
- **Ability to direct output device operation during an abnormal condition**. Each channel of the output module can be individually configured to hold its last value or assume a user-defined value on either a run-to-program or run-to-fault condition. This feature allows you to set the condition of your analog devices, and therefore your control process, which may help to ensure a reliable shutdown.
- **Selectable input filters** allows you to select from several different filter frequencies for each channel that best meets the performance needs of your application based on environmental limitations. Lower filter settings provide greater noise rejection and resolution. Higher filter settings provide faster performance.
- **Selectable response to broken input sensor**. This feature provides feedback to the controller that a field device is not connected or operating properly. This allows you to specify corrective action based on the bit or channel condition.

Analog I/O Module Summary

Catalog Number	Inputs	Outputs	Terminal Base Unit	Signal Range	Module Type
Input Modules					
1797-IE8	8	—	1797-TB3, 1797-TB3S	0…20 mA	16-bit single-ended, nonisolated inputs
1797-IE8H					16-bit single-ended, nonisolated inputs with HART capability
1797-IE8NF					16-bit single-ended, nonisolated inputs with noise filter
1797-IRT8				0…500 Ω -40…100 mV TC RTD	16-bit, nonisolated RTD thermocouple/mV inputs

Analog I/O Module Summary

Catalog Number	Inputs	Outputs	Terminal Base Unit	Signal Range	Module Type
Output Modules					
1797-OE8	—	8	1797-TB3, 1797-TB3S	0…20 mA 4…20 mA	16-bit single-ended, nonisolated outputs
1797-OE8H					16-bit single-ended, nonisolated outputs with HART capability

Module Specifications

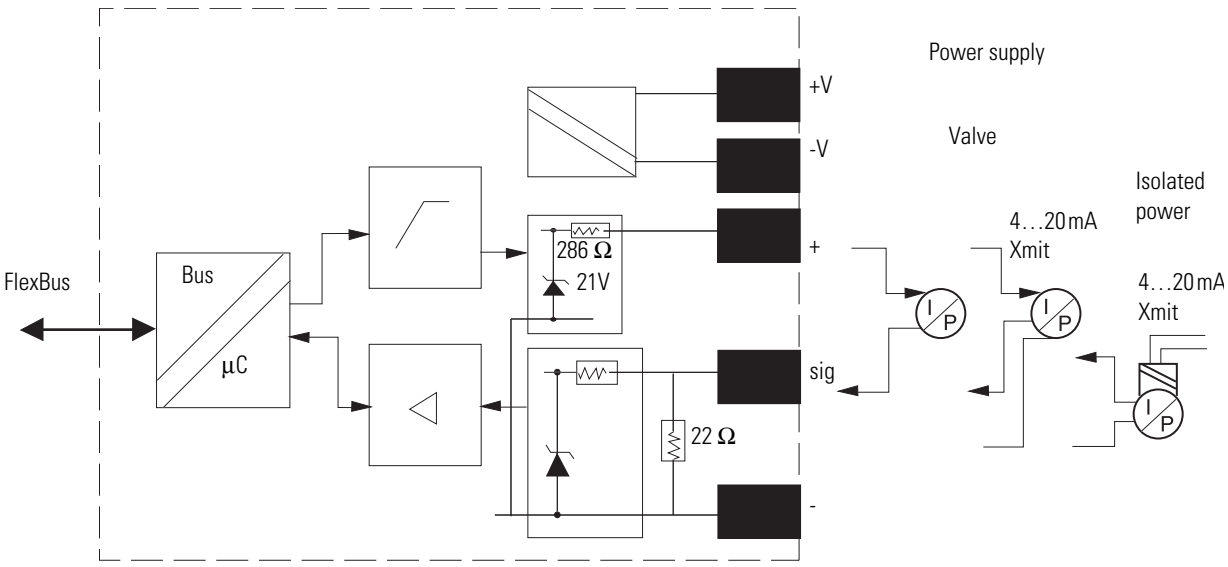
The following section shows more detailed module specifications in comparative groups to facilitate your selection based on your requirements.

1797-IE8, 1797-IE8H (HART), and 1797-IE8NF (with Noise Filter) 8 Point 16-bit Single-ended Non-isolated Analog Input Modules

Eight single-ended input channels referenced to a single common

- 3-wire input for 2- and 3-wire transmitters
- Functional data: normal input
  input current = 4...20 mA, full-current range
  0...22 mA to allow for over and underrange indication
- Wire-off detection, signal to the backplane and LED (per channel) blinking red for fault
- Wire-off detection on per channel basis via module data bits
- Input filter cutoff programmable
- Resolution: 16 bits
- Accuracy: 0.1%
- The 1797-IE8 is typically used to act on change-of-state and high-speed applications. It is not compatible with HART handheld devices.
- The 1797-IE8NF has additional hardware filtering that damps out spurious signals and can be used for slower changing, steady-state processes. It has slower step response than the 1797-IE8 (100 ms versus 4 ms). It is compatible with HART handheld devices.
- The 1797-IE8H is similar to the 1797-IE8NF with real time data table updates. It also supports pass-through of HART commands as unscheduled ControlNet messages. It is compatible with FDT software packages.

Schematic Drawing of the 1797-IE8 Module



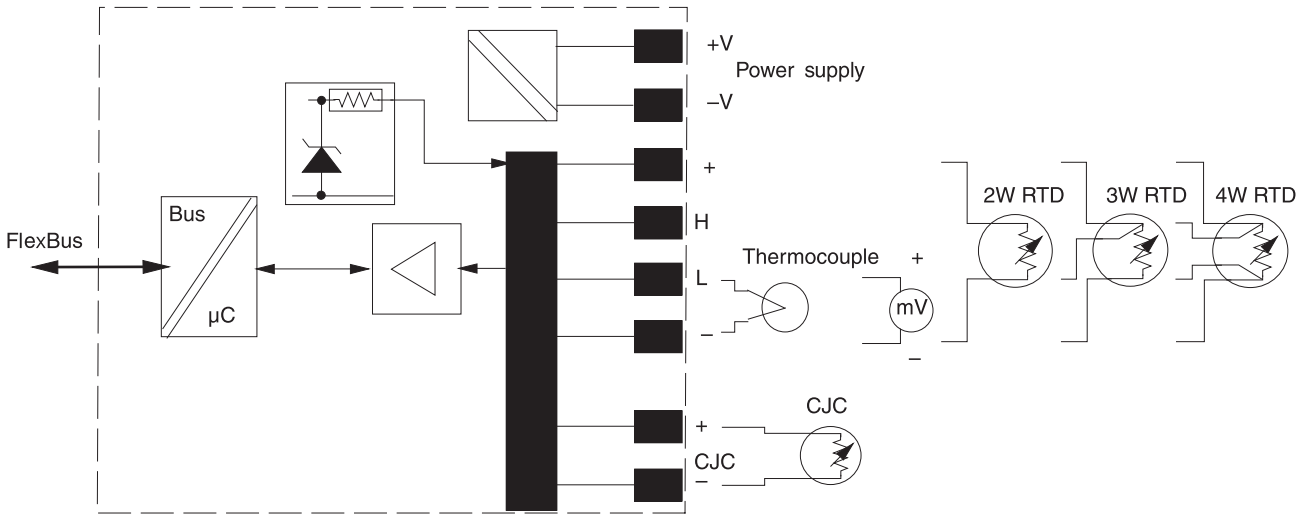
FLEX Ex Analog Input Comparison

Specification	1797-IE8	1797-IE8NF	1797-IE8H
Input resolution	16 bits		
Input signal range	0…22 mA		
Transfer characteristics, temperature drift	0.1% of output signal range at 20 °C (68 °F)		
Functional data range	> 15V @ 22 mA > 21.5V @ 0 mA		> 17V @ 22 mA > 23V @ 0 mA
Data format	Configurable		
Step response to 99% of Full Scale	4 ms	80 ms	100 ms
Update time, module to adapter	200…1600 µs		
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985		
FLEX Ex power consumption	7.5 W @ 9V		7.1 W @ 9V
Power dissipation, max	5.2 W		
Thermal dissipation, max	17.75 BTU/hr		13.5 BTU/hr
Instrinsically safe input type	$U_0 \leq$ 23.7V $I_0 \leq$ 93.5 mA $P_0 \leq$ 555 mW		$U_0 \leq$ 24.4V $I_0 \leq$ 92.5 mA $P_0 \leq$ 565 mW
	II (1)2G Ex ib[ia] IIC T4 Class I, Div. 1, Groups A-D and Class I, Zone 1, AEx ib [ia] IIC		
Dimensions (HxWxD), approx.	46.0 x 94.0 x 75.0 mm (1.8 x 3.7 x 2.95 in.)		

1797-IRT8 8 Point 16-bit Non-isolated RTD Thermocouple/mV Input Module

- input channels referenced to a single common
  - RTD mode
  - RTD types Pt100, Pt200, Ni100, Ni200, Ni120, Cu10
  - 2-, 3-, and 4-wire connection
  - sensor lead breakage and short circuit detection all 4 leads
  - measuring resistance 0...500 Ω
  - accuracy: 0.1% of span at 20 °C, filter cutoff < 1 Hz
- mV mode
  - input voltage -40...100 mV differential sensing
  - sensor breakage detection
- thermocouple mode
  - types B, E, J, K, TXK/XK (L), N, R, S, T
  - cold junction compensation (CJC)
  - external reference junction (programmable)
  - sensor breakage detection
  - accuracy: 0.1% of span, filter cutoff < 1 Hz
  - accuracy of CJC: ± 1 C/K

Schematic Drawing of the 1797-IRT8 Module



8 Point 16-bit Non-isolated RTD Thermocouple/mV Input Module

Specification	1797-IRT8
Input type	Suitable for Pt 100, Pt200, Ni 100, Ni120, Ni200, Cu10 RTD, Thermocouple Type B, E, J, K, N, R, S, T, TXK/XK(L) Configuration via internal bus

8 Point 16-bit Non-isolated RTD Thermocouple/mV Input Module

Specification	1797-IRT8
Input signal range	0…500 Ω -40…100 mV TC RTD
Settling time	8 ms to 99% of final value (mV mode, °F thermocouple)
Open RTD detection	Out of range upscale reading
Lead resistance compensation	< 15 Ω total
Transfer characteristics, accuracy	RTD: 0.1% of span @ 20 °C, filter cutoff < 1 Hz Thermocouple: 0.1% of span @ 20 °C, filter cutoff < 1 Hz Cold junction compensation: ± 1 °C
Temperature drift	150ppm/ °C (primary range)
Data organization	Overrange Alarm – Individually for each channel Lead Breakage Alarm – Individually for each channel Fault State – Individually for each channel (includes overrange, lead breakage and short circuit) Sensor Mode RTD 2, 3, or 4-wire – Common to groups of 4 channels (ch 0…3, ch 4…7) TC Sensor Type (for example TC, Type B, E, J..., RTD or mV) - Common to groups of 4 channels (ch 0…3, ch 4…7) Internal Reference Junction (TC mode) – Common to all channels (0 °C, 20 °C, 25 °C, 30 °C, 40 °C, 50 °C, 60 °C, 70 °C
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
FLEX Ex power consumption	1.6 W @ 9V
Power dissipation, max	1.6 W
Thermal dissipation, max	5.46 BTU/hr
Dimensions (H x W x D)	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed

HART Interface Modules

FLEX Ex HART analog modules (1797-IE8H and 1797-OE8H) are ideal for use in applications that need connection with FDT (Field Device Tool) compatible asset management software, such as Rockwell Software FieldCare HART Communication bundle or Endress + Hauser Fieldcare. For HART Device Type Management (DTM) programs and drivers, go to http://www.ab.com/io, and select Configurations Files, DTM files for HART.

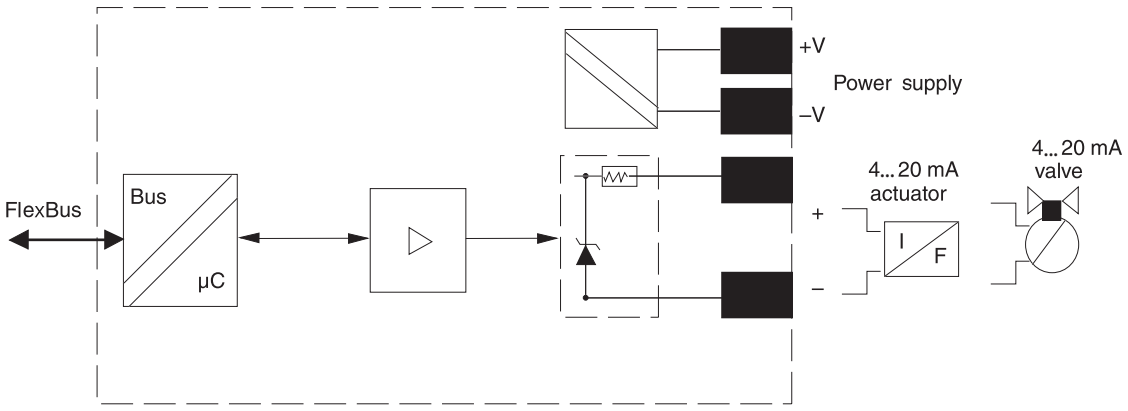
- FLEX HART analog modules can be used on ControlNet or EtherNet/IP. The FLEX Ex Ethernet adapter requires firmware v3.1 or later, which is flash upgradeable, to support these modules.
- Each HART field device is wired to its own input or output channel:
  - 8 single-ended channels
  - does not support multi-drop
  - 2- or 3-wire devices
- HART commands can be transmitted by unscheduled message:
  - sample RLL subroutines are available.
  - currently limited to one instance of RLL subroutine per module, one channel at a time.

FLEX Ex I/O Analog Output Modules

1797-OE8 and 1797-OE8H (HART) 8 Point 13-bit Single-ended Non-isolated Analog 8 Output Module

- Eight dual-ended output channels referenced over sense resistors to a single common
- Functional data:
  - normal output
  - current = 4...20 mA, full current
  - range = 0...22 mA to allow for over- and under-range indication
- Output wire-off detection, LED (per channel) blinking red for fault, threshold < 2 mA
- Output wire-off detection on per channel basis via module data bits
- Short circuit detection
- All channels updated to the backplane every 4 ms
- Resolution: 13 bits
- Accuracy: 0.1%
- One power supply loop for one module
- Output fault state programmable
- The 1797-OE8 and 1797-OE8H can be used in digital mode for low energy digital field devices.
- The 1797-OE8H is similar to the 1797-OE8 with real time data table updates. It also supports pass-through of HART commands as unscheduled ControlNet messages. It is compatible with FDT software packages.

Schematic Drawing of the 1797-OE8 and 1797-OE8H Modules



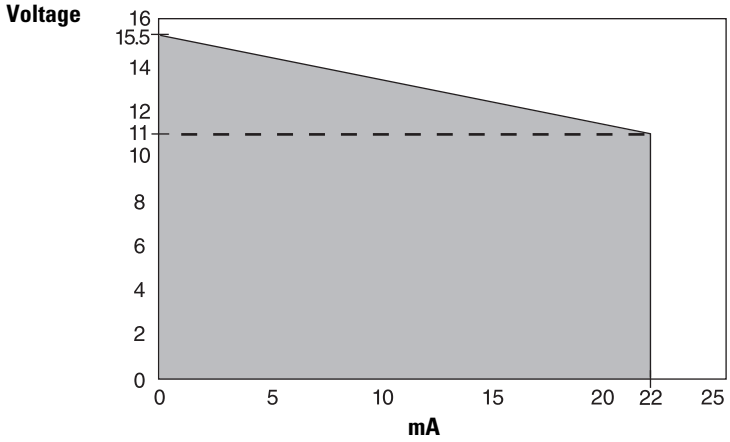
8 Point 13-bit Single-ended Non-isolated Analog 8 Output Modules

Specification	1797-OE8	1797-OE8H
Output resolution	13 bits	
Output load range	0…500 Ω @ 22 mA > 11V @ 22 mA	0…680 Ω @ 22 mA > 15V @ 22 mA
Step response to 99% of Full Scale	4 ms	18 ms; 115 ms with HART active

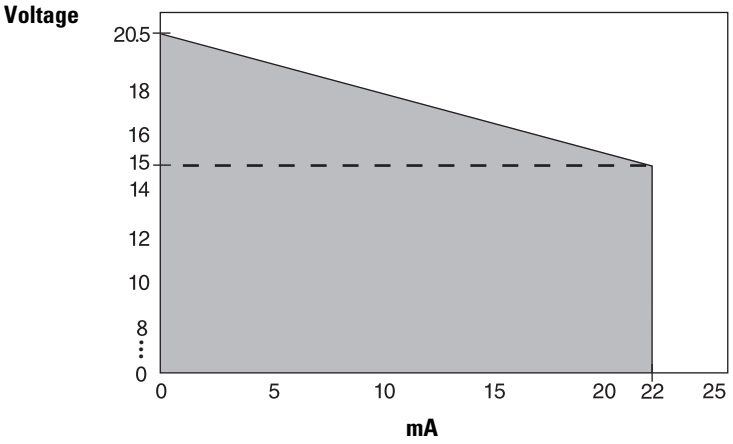
8 Point 13-bit Single-ended Non-isolated Analog 8 Output Modules

Specification	1797-OE8	1797-OE8H
Transfer characteristics, accuracy	0.1% of output signal at 20 °C (68 °F)	
Transfer characteristics, temperature drift	0.010%/C of output signal range	
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985	
FLEX Ex power consumption	6.3 W @ 9V	6.1 W @ 9V
Power dissipation, max	5.4 W	6.1 W
Thermal dissipation, max	18.4 BTU/hr	20.8 BTU/hr
Intrinsically safe output type	II (1)2G Ex ib[ia] IIC T4 Class I, Div. 1, Groups A-D and Class I, Zone 1, AEx ib [ia] IIC	
Instrinsically safe input characteristics	Ch 0…7 Terminals: 0…1; 4…5; 8…9; 12…13; 17…18; 21…22; 25…26; 29…30 $U_0 \leq$ 21V $I_0 \leq$ 100 mA $P_0 \leq$ 520 mW	Ch 0…7 Terminals: 0…1; 4…5; 8…9; 12…13; 17…18; 21…22; 25…26; 29…30 $U_0 \leq$ 21.6V $I_0 \leq$ 92 mA $P_0 \leq$ 500 mW
Dimensions (H x W x D), approx	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed	

1797-OE8 Output Voltage/Current Capability



1797-OE8H Output Voltage/Current Capability



Counter I/O Module

Ideal for applications requiring rotational control, the FLEX Ex counter is essentially a tachometer with the capability of reporting frequency, acceleration, and direction. Outputs are activated by alarms. Input devices range from magnetic pickup to flowmeters, to incremental encoders to proximity detectors.

This intelligent I/O module is designed to perform high-speed frequency algorithms. The module provides two frequency inputs, two gate inputs, and two outputs. The frequency inputs are capable of accepting frequencies up to 32 kHz. The module accepts and returns binary data.

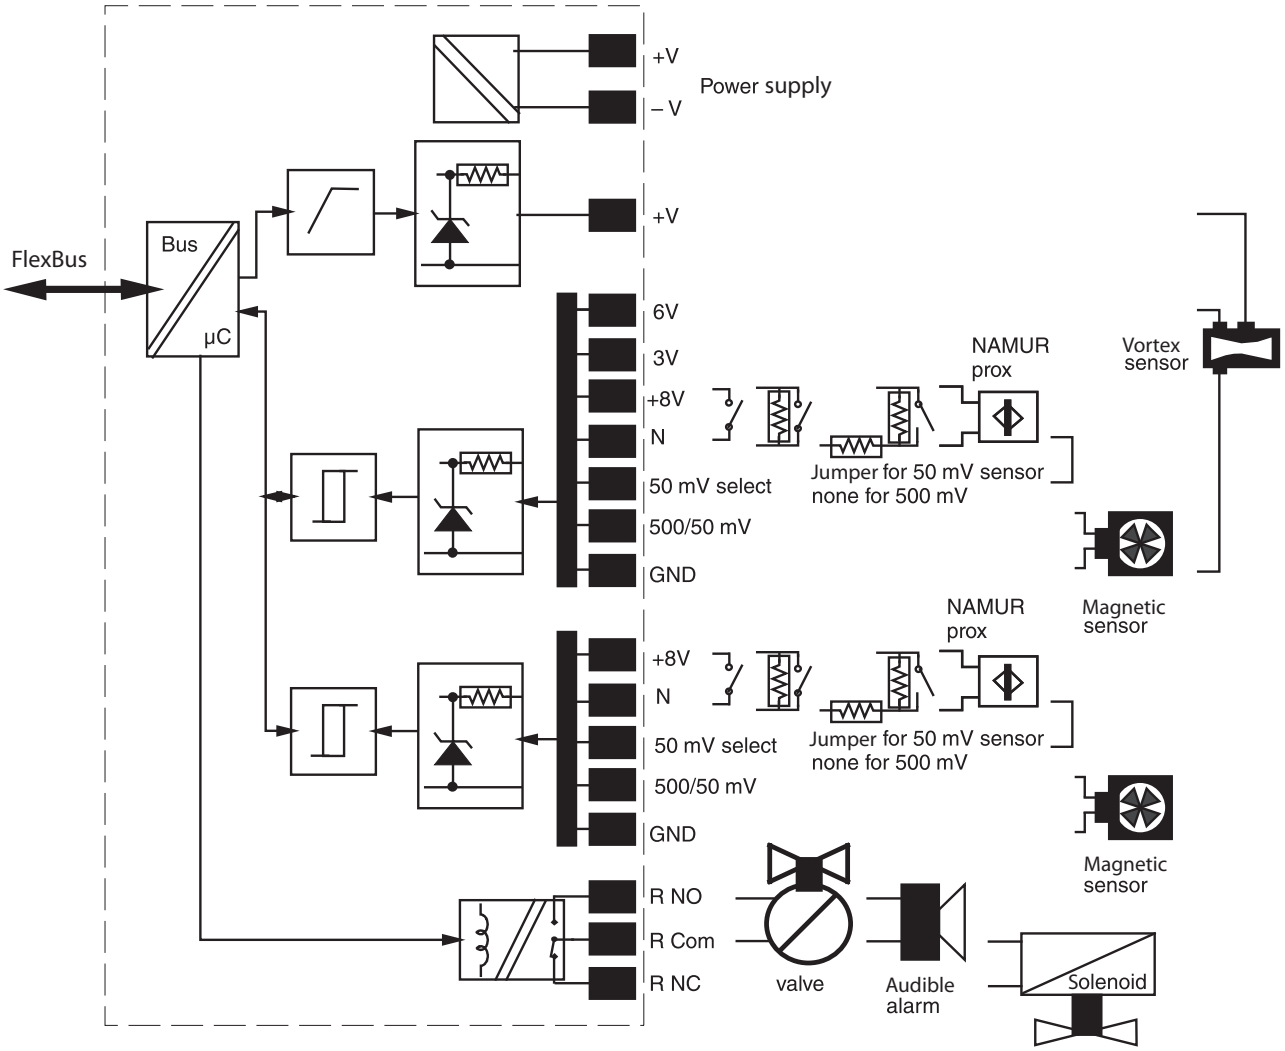
The counter measures frequency over a user-specified time interval. A frequency calculation can start before the time interval clock is synchronized with the frequency input to count over a user-selected sampling time or a user-defined number of frequency input pulses. All power for input devices (24V DC) is supplied by the module.

1797-IJ2 2 Input Frequency Counter Module

- Software configurable frequency operating mode, with independent selections per frequency input
- Frequency inputs, two gate inputs, and two outputs
- Functional data: four selectable ranges: 50 mV; 500 mV (magnetic pickup); flowmeter; and NAMUR
- Provides IS power to drive up to two NAMUR and two flowmeter frequency inputs and/or contact switches and NAMUR gate inputs
- NAMUR lead breakage indication for any lead, signal to the backplane and LED (per channel) blinking red for fault
- NAMUR lead breakage defeat on per channel basis via module data table (NAMUR inputs only)
- Frequency count range up to 32 kHz

- Calculate frequency on time interval or input count
- Programmable scaling
- Acceleration value calculated
- Maximum frequency or acceleration alarms
- All channels updated to the backplane every ≤ 4 ms (according to sampling time)

Schematic Diagram for the 1797-IJ2 Module



2 Input Frequency Counter Module

Specification	1797-IJ2
Number of inputs	2
Flowmeter input signal threshold	3V or 6V, selectable
Flowmeter input voltage available	< 15V @ 20 mA
Magnetic pickup input signal	50 mV or 500 mV, selectable
Processing time	≤ 4 ms

2 Input Frequency Counter Module

Specification	1797-IJ2
Input frequency range	1.0…32,767 Hz
Frequency resolution, min	Sampling Time – Accuracy 2 ms – 0.043% 4 ms – 0.033% 5 ms – 0.031% 10 ms – 0.027% 20 ms – 0.025% 50 ms – 0.023% 100 ms – 0.023% 200 ms – 0.023% 500 ms – 0.023% 1000 ms – 0.023%
Frequency input, characteristics	Magnetic pickup: 50 mV, 500 mV NAMUR: 8V, 8 mA Flowmeter: low ≥ 3V; high ≥ 6V
Impedance, frequency input	> 5 kΩ magnetic pickup > 10 kΩ flowmeter
Number of outputs	2
FLEX Ex power consumption	4.25 W
Power dissipation, max	4.25 W
Thermal dissipation, max	14.5 BTU/hr
Instrinsically safe input characteristics	EN 60947-5-6 (NAMUR)
Noxious gas exposure	Tested to severity level G3, ISA-S71.04-1985
Dimensions (H x W x D)	46 x 94 x 75 mm (1.8 x 3.7 x 2.95 in.) 94 x 94 x 91 mm (3.7 x 3.7 x 3.6 in.) installed

Select a FLEX Ex I/O Terminal Base Unit

Step 3 – Select:

the appropriate terminal base unit for your module and system

Each FLEX Ex I/O module requires a FLEX Ex I/O terminal base unit that snaps onto the DIN rail to the right of the I/O adapter. The terminal bases provide terminal connection points for the I/O wiring and plug together to form the backplane. They are available with screw, clamp, or spring terminations.

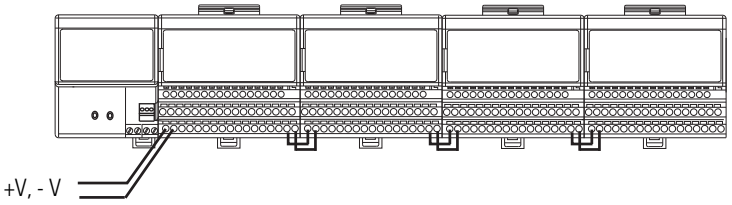
The following table is a comparison of general specifications for each FLEX Ex I/O terminal base unit. For compatibility with FLEX Ex I/O modules, see Table Digital I/O Module Summary on page 97 and Table Analog I/O Module Summary on page 101.

Terminal Base Wiring Diagrams

1797-TB3 and 1797-TB3S

Wiring when total module current draw is less than 8.5 W

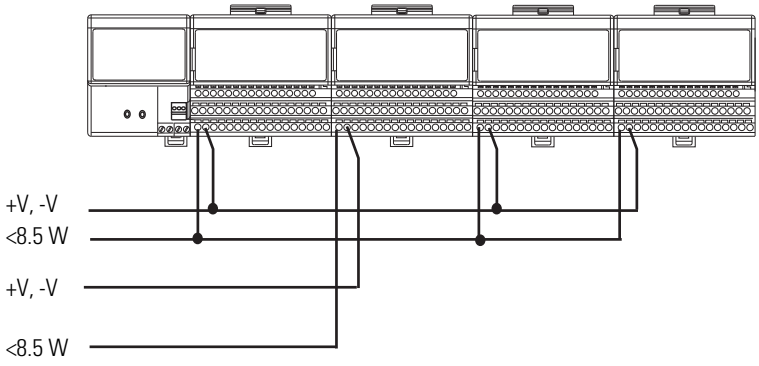
Daisy-chaining Using Adapter Power Supply



Use this method when the total module power draw is less that 8.5 W. Otherwise, power is connected to individual modules.

Wiring when total module current draw is greater than 8.5 W

Combination Daisy-chaining and Separate Power Supplies.



Separate power supply can be brought in on the last module in the chain if necessary. Make sure you do not jumper to the adapter if using this method.

Use this method when the total current draw through terminal base units is greater than 8.5 W.

Select a FLEX Ex I/O Power Supply

Step 4 – Select:

if power consumption exceeds the maximum for a single power supply, install additional power supplies

The power supply is an essential component in the operation of an intrinsically safe system. It must isolate the unsafe incoming power from the control system and limit the available energy to IS-safe levels.

FLEX Ex I/O power supplies provide power for the FLEX Ex ControlNet network, communication adapter, I/O modules, fiber hub, and IS field devices. No other power sources are needed to operate any components attached to the FLEX Ex system in the hazardous area. Power for valves, actuators, or transmitters come from the FLEX Ex modules.

FLEX Ex I/O power supply modules must be used to supply power to FLEX Ex I/O modules. Other power supplies are not allowed in order to meet the certification of the system. Power for valves, actuators, and transmitters come from the FLEX Ex modules.

There are two types of enclosures: (N-Type) explosion-proof with 1 inch conduit pipe thread input/output terminations that are certified in North America and (E-Type) flame-proof with increased safety input/output terminations that are certified to European standards. Each type is available in 24V DC or 85...253V AC for supply sources.

The 24V DC power supply includes dual power feeds for sour input redundancy whereas the AC power supplies support daisy chaining.

Common features include:

- four channels, 8.5 W output each channel
- outputs are IS galvanically isolated from the source
- all channels are independently IS limited

General Specification Comparison

Catalog	Description	Input Voltage, max	Output Power (W)	Dimensions (HxWxD), approx	Weight approx
1797-PS1N	FLEX Ex 85…250V AC Power Supply	250V AC	34 W[1]	174 x 174 x 140 mm (6.9 x 6.9 x 5.51 in.)	6 kg (13.2 lbs)
1797-PS1E	FLEX Ex 24V DC Power Supply	253V AC		260 x 174 x 140 mm (10.2 x 6.9 x 5.51 in.)	6.9 kg (15.2 lbs)
1797-PS2N2	FLEX Ex conduit pipe North American-certified Power Supply	32V DC max		174 x 174 x 140 mm (6.9 x 6.9 x 5.51 in.)	6.1 kg (13.4 lbs)
1797-PS2E2	FLEX Ex flame-proof European-certified Power Supply			260 x 174 x 140 mm (10.2 x 6.9 x 5.51in.)	7 kg (15.4 lbs)

(1) 8.5 W at each of 4 outputs.

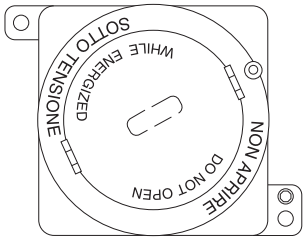
N Type Power Supply

1797-PS1N
or
1797-PS2N2



Understanding System Planning

Part of system planning is determining what modules are needed for the application, how many power supplies are needed, how to best partition the system, and where to locate the system cabinets.

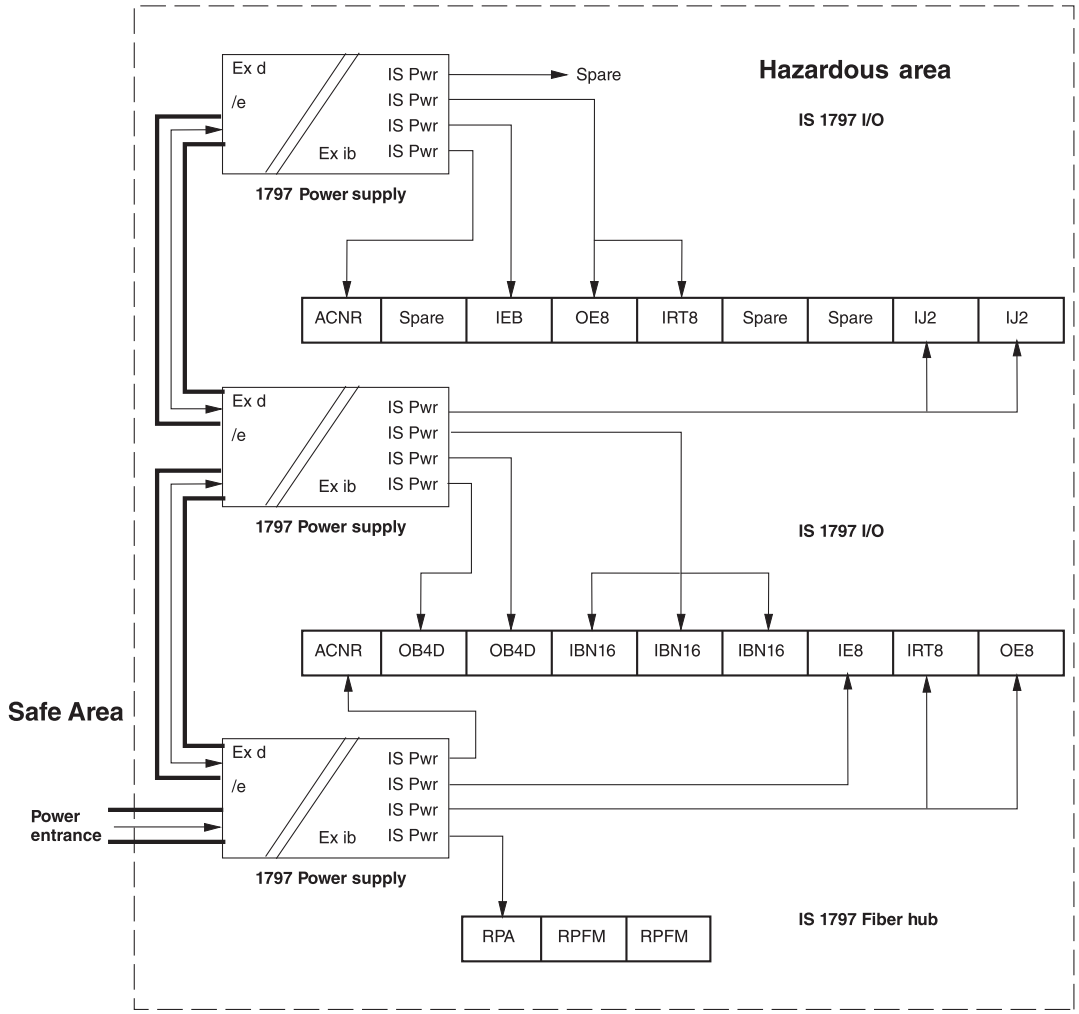
A key task in the development cycle is determining the number of power supply outputs (thus power supplies) you will need.

Each power supply has four independent IS power outputs capable of 8.5W each. In this example, we required eleven IS power outputs so three power supplies were sufficient.

Power Requirements

Modules	Requires
Fiber hub	8.5 W
Two ControlNet adapters	8.5 W each
Two analog inputs	7.5 W each
Two analog outputs	6.3 W each
Two thermocouple inputs	1.6 W each
Two digital outputs	7.5 W each
Three NAMUR digital inputs	2.8 W each
Two counter inputs	4.25 W each

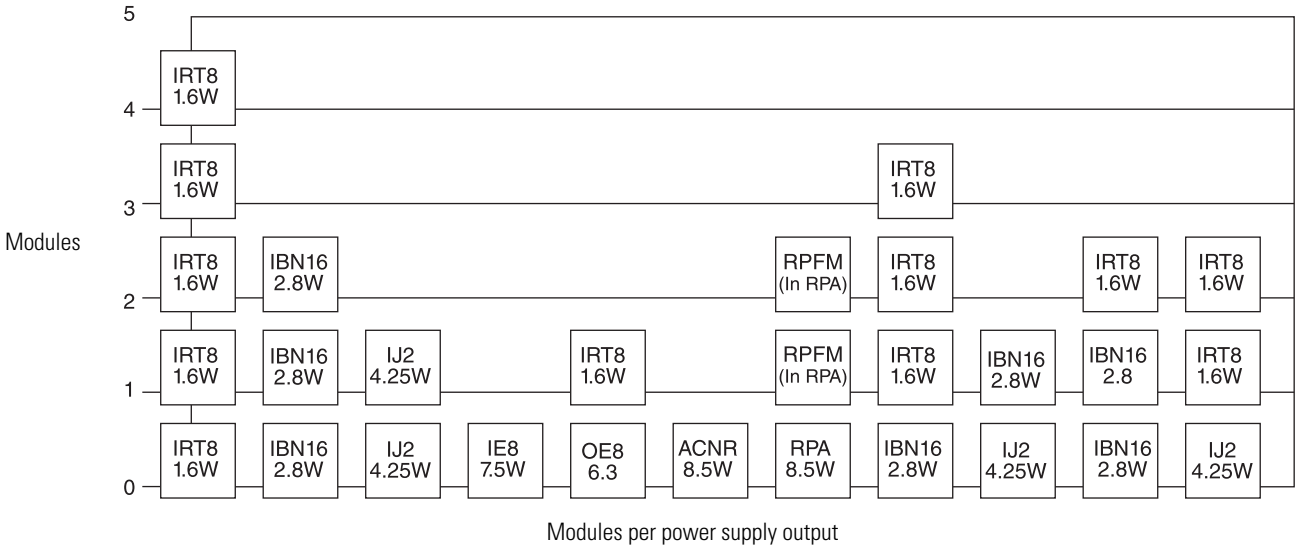
The total number of power supplies needed depends on the modules used and the total system configuration. The following illustration shows how this example may be configured.



Assigning Power Supplies

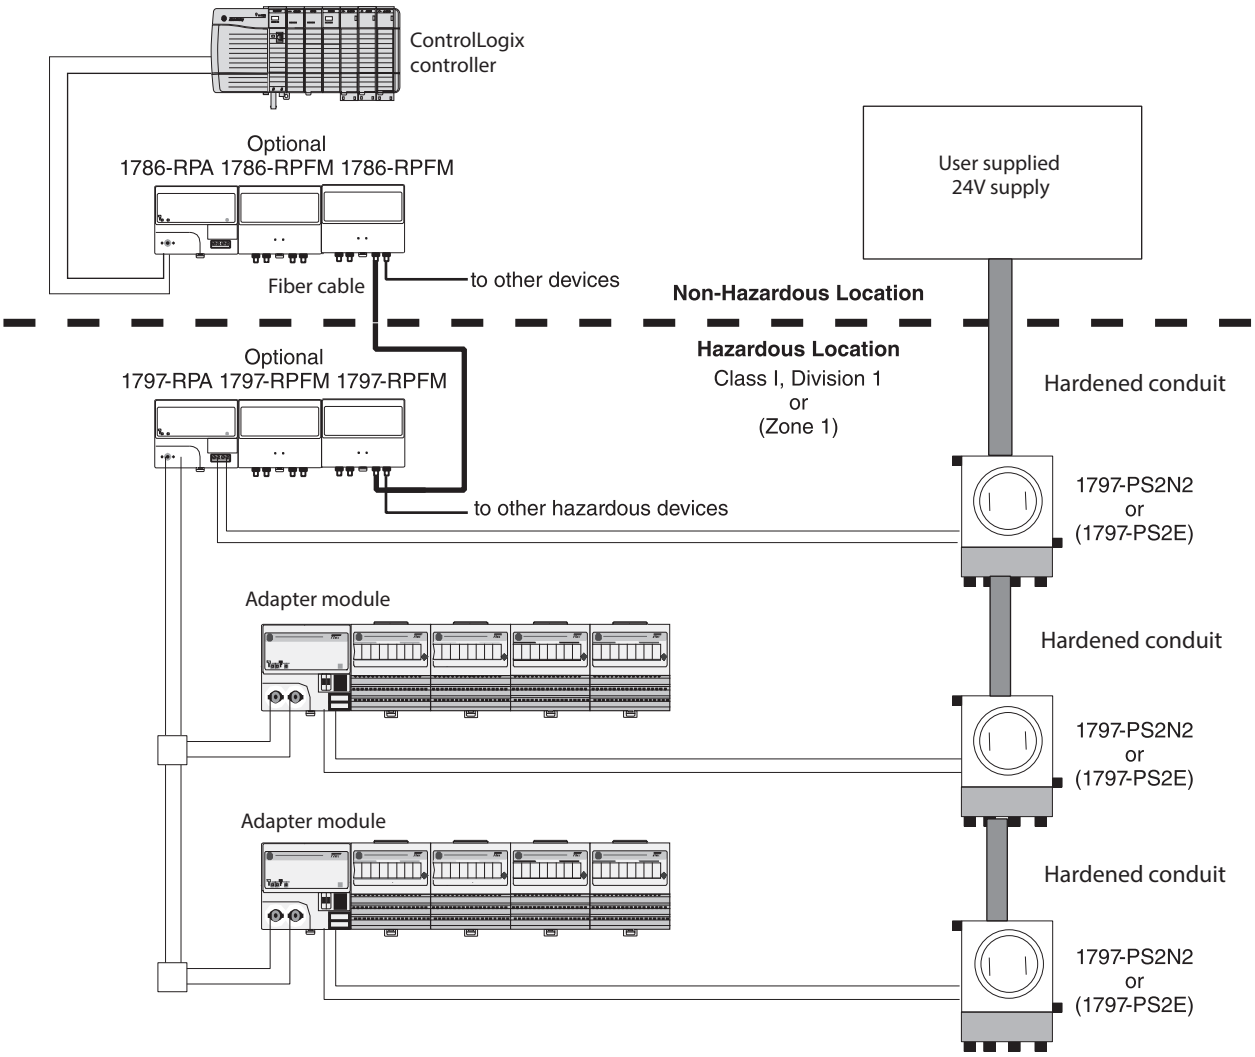
Note the amount of power each module requires and assign it to a power supply output. Continue to assign modules to the power supply output until the supply's output power rating is consumed.

Each power supply output in the FLEX Ex system is rated for 8.5 W. Modules can be attached to the output until their combined power equals that number. Do not exceed the power supply maximum of 8.5 W.



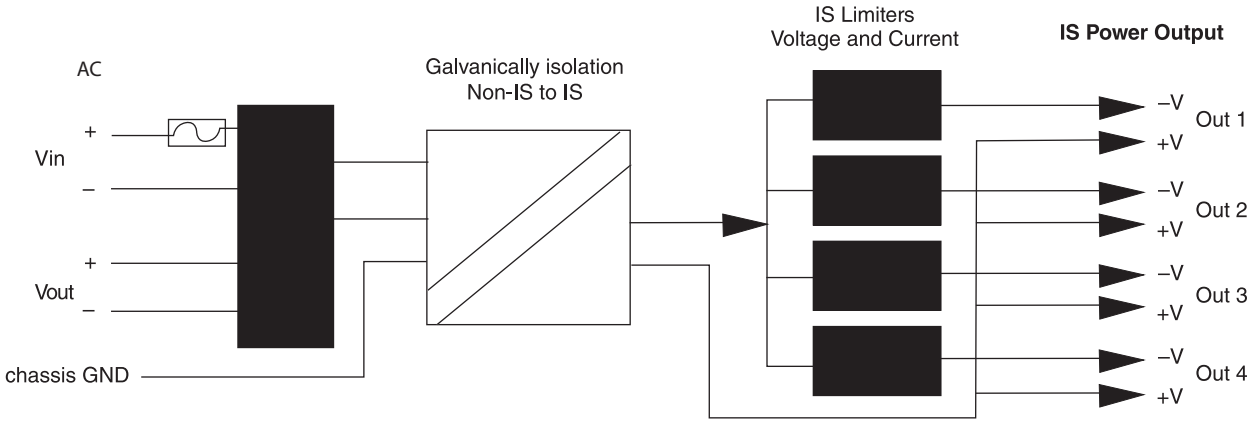
Hazardous Area Installation

The following illustration provides an example of how power supplies are arranged within the FLEX Ex system when using fiber hubs.



1797-PS1N and 1797-PS1E 85V…253V AC In/Quad-Ex DC Out

Type of Power Input



1797-PS2N2 and 1797-PS2E2 24V DC In/Quad-Ex DC Out

Type of Power Input

(1) 8.5 W at each of 4 outputs.

(2) Refer to individual installation instructions for mounting dimensions.

Notes:

Mount the FLEX System

Step 6 – Select:

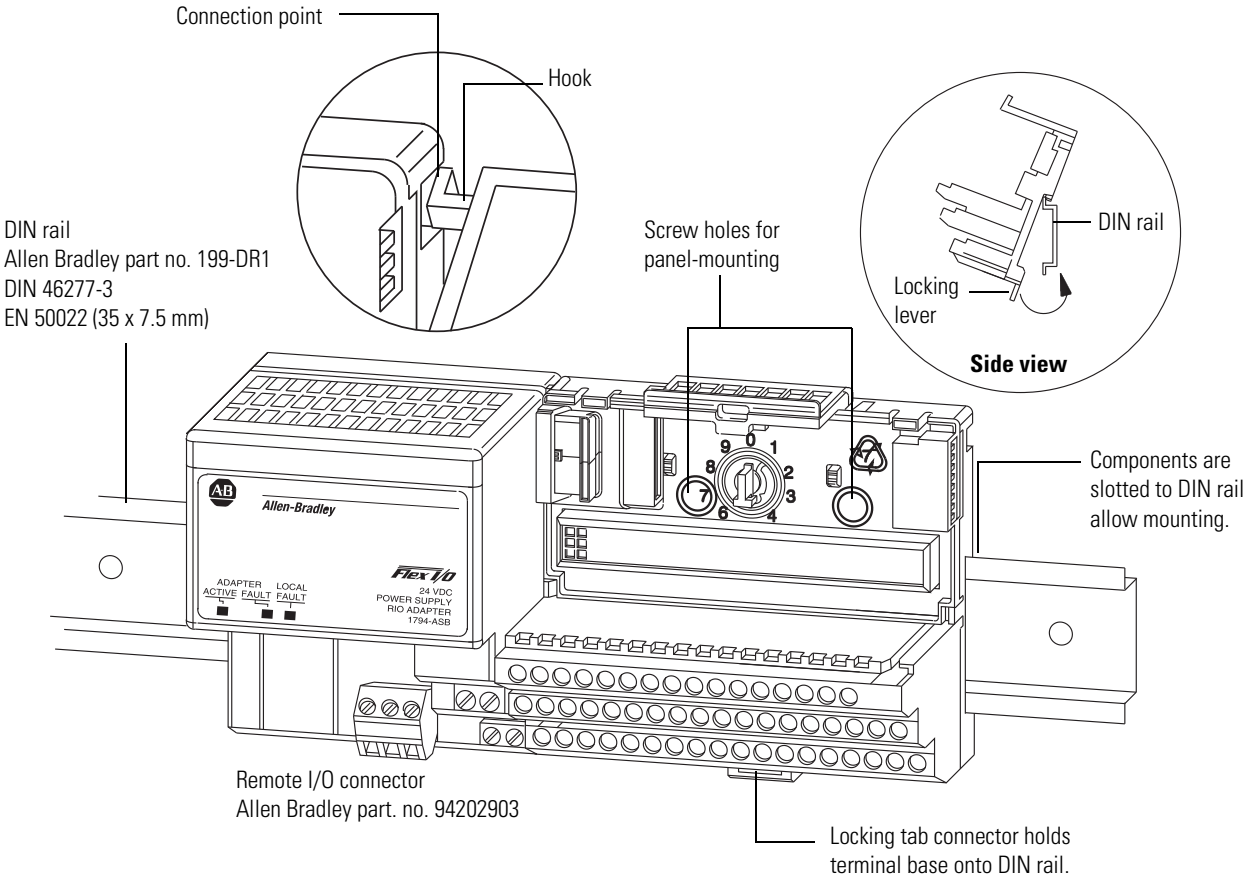
•panel mount or DIN rail mount

•appropriate number of panels or DIN rails based on the number of modules and the physical requirements

•one end cap per controller system

You can horizontally or vertically mount the FLEX I/O or FLEX Ex I/O system on a standard 35 mm DIN rail. The adapter and terminal base unit easily snap on the DIN rail by hand. Use a flat-blade screwdriver to remove components from the DIN rail.

Screw holes allow you to horizontally or vertically panel-mount your system in an enclosure. Maintain at least 25 mm (1 in.) of air space around your FLEX system.



When properly installed, FLEX I/O and FLEX Ex I/O are grounded through the DIN rail to chassis ground. Use a zinc-plated, yellow-chromated steel DIN rail to assure proper grounding. Using other DIN rail materials, for example, aluminum or plastic, which can corrode, oxidize, or are poor conductors can result in improper or intermittent platform grounding.

If installing FLEX on non-recommended DIN rail materials, use the mounting holes provided with each terminal base, or use a 1794-NM1 mounting kit with an approved mounting bracket. Use mounting screws with star washers to provide the FLEX platform with a chassis ground connection that is not likely to be affected by shock, vibration, or oxidation over time.

The hook (on the terminal base unit) and adjacent connection point (on the communication adapter) keep the terminal base units tight together. These components are capable of maintaining a reliable connection in case of shock and/or vibration. Refer to the environmental specifications section for each module.

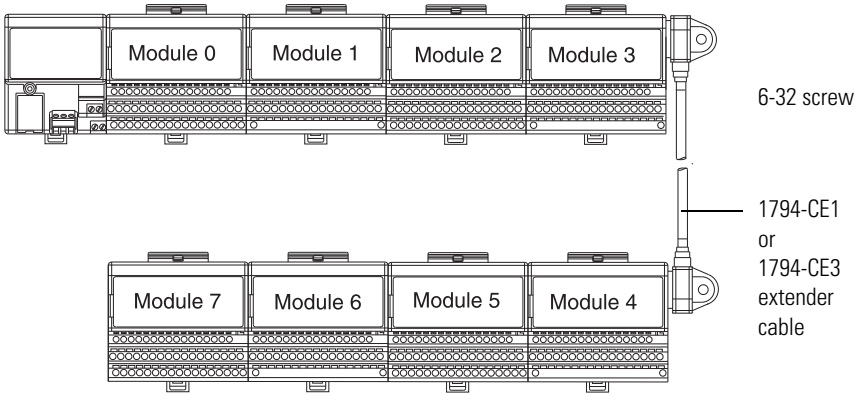
Select Optional Accessories

Step 5 – Select:

optional accessories for FLEX I/O and FLEX I/O-XT modules

1794-CE1 and 1794-CE3 Extender Cables

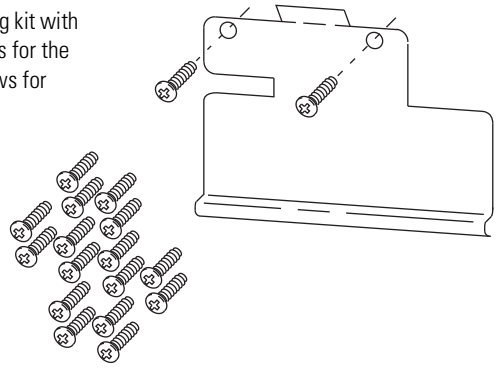
Use one optional 1794-CE1 – 0.3 m (1 ft) or 1794-CE3 – 0.9 m (3 ft) extender cable, per system, to arrange your system in two rows or split your system into horizontal and vertical orientation. The cable can be used between any module or between adapters and modules.



1794-NM1 FLEX I/O Mounting Kit

Use the optional 1794-NM1 FLEX I/O mounting kit to mount your FLEX I/O system on a panel without a DIN Rail.

1794-NM1 mounting kit with 18 screws (2 screws for the adapter and 2 screws for each module)



1492-EA35 DIN Rail Locks

When you use FLEX I/O modules in a high-vibration installation, and particularly when mounting the modules vertically, we recommend using DIN-rail locks (Allen-Bradley part number 1492-EA35).

1794-LBL FLEX I/O Label Kit

Use the label kit to tailor the label on your FLEX I/O terminal base unit to meet your needs. The label kit includes a diecut drawing and label sheet with five labels.

1794-N2 FLEX I/O Dummy Filler Module

This module is used to fill in an otherwise empty slot: a terminal base with no I/O module. It contains no electronics.

1794-CJC2

This Cold Junction Compensation kit contains two replacements for the CJCs supplied with 1794-IT8 and 1794-IRT8 modules.

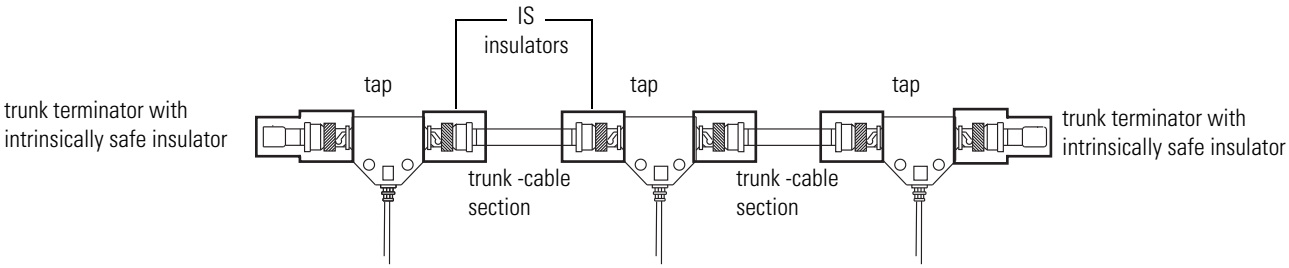
Step 5 – Select:

optional accessories for FLEX Ex I/O modules

1797-BOOT ControlNet BNC Boot

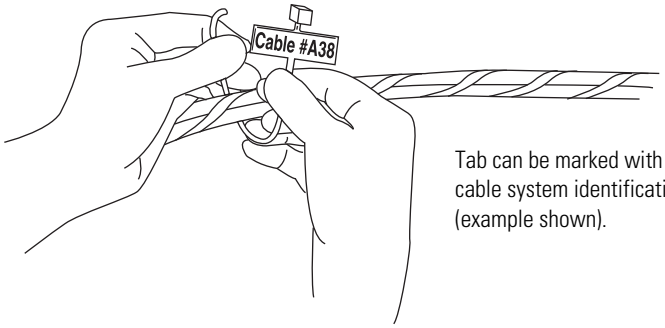
Use the ControlNet BNC boot, trunk isolator, and marking kit in your cable connections.

The 1797-BOOT covers the BNC connector on the ControNet Ex trunk cable. The kit contains 50 pieces.



1797-INS Trunk Insulator and 1797-EXMK Marking Kit

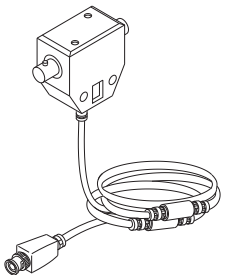
The 1797-INS is a bag of 50 assorted insulators that you can use to replace those shipped with the product. The 1797-EXMK is a marking kit for FLEX Ex cable, containing 100 pieces.



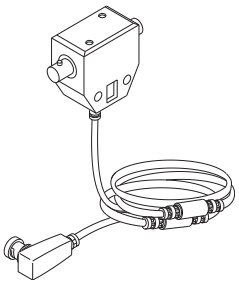
Tab can be marked with cable system identification (example shown).

ControlNet Ex Taps

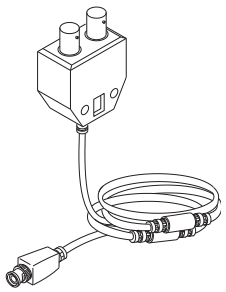
1797-TPS ControlNet Ex Straight T-Tap



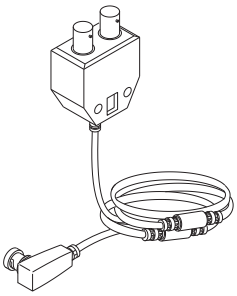
1797-TPR ControlNet Ex Right-Angle T-Tap



1797-TPYS ControlNet Ex Straight Y-Tap

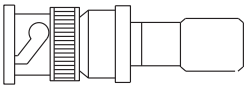


1797-TPYR ControlNet Ex Right-Angle Y-Tap



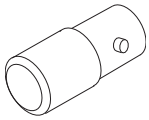
1797-XT ControlNet Ex 75Ω Terminator

The terminator is sold in lots of 50.



1797-TCAP ControlNet Tap Terminator

This kit contains five pieces.



1786-RG6 Coax Trunk Cable

The 1786-RG6 Coax Trunk Cable can be used in Flex Ex applications in hazardous areas.

Notes:

The PanelView™ 5310 terminals are operator interface devices that monitor and control devices attached to ControlLogix® 5570 and 5580, and CompactLogix™ L1, L2, and L3 controllers over an EtherNet/IP™ network. Animated graphic and text displays provide operators with a view into the operating state of a machine or process. Operators interact with the control system by using the touch screen.

The PanelView 5310 terminals include these features and capabilities:

- Tightly integrated control and design environment allows information to be shared between the PanelView 5310 terminal and the Logix platforms.
- The Studio 5000® environment provides one point of access for the Studio 5000 View Designer® and Studio 5000 Logix Designer® applications.(1)
- Connection to one ControlLogix 5570, ControlLogix 5580, or CompactLogix L1, L2, or L3 controller with revision 27 firmware or later.
- Supports a maximum of 100 user-defined screens.
- Supports a maximum of 4,000 Logix-based alarms.(1)
- Easily configured screen navigation menu.
- Conformal coating available for all terminal sizes.

(1) PanelView 5310 firmware can support up to 4,000 Logix-based alarms in a single controller if you use Studio 5000 View Designer application version 5 and Studio 5000 Logix Designer application version 32 or higher. Of the 4,000 alarms, no more than 1,000 can be instruction-based. Earlier versions of the Studio 5000 View Designer or Studio 5000 Logix Designer applications can support up to 1,000 Logix-based alarms.

Summary of Changes

This publication contains new and updated information as indicated in this table.

Topic	Page
Added catalog numbers for the PanelView 5310 conformal-coated terminals.	1
Added a statement about conformal coating to the bulleted list.	1
Added a line to the Technical Specifications table for conformal coating availability. Also added catalog numbers for the conformal-coated terminals to this table.	3
Added catalog numbers for protective overlays that are available for the PanelView 5310 terminals.	6

Environmental Specifications

This table provides environmental specifications for the PanelView 5310 terminals.

Attribute	Value
Temperature, operating	0…50 °C (32…122 °F)
Temperature, nonoperating	-25…+70 °C (-13…+158 °F)
Relative humidity	5…95% without condensation
Vibration	0.012 pk-pk, 10…57 Hz 2 g peak at 57…500 Hz
Shock, operating	15 g at 11 ms
Shock, nonoperating	30 g at 11 ms
Altitude, operating	Sea level to 2,000 m (6,562 ft)
Enclosure ratings	NEMA and UL Type 4X, 12, 13, and classified by UL as IP66 (when mounted on a flat surface of an equivalent enclosure)

Certifications

This table provides certification information for the PanelView 5310 terminals.

Certification(1)	Value
c-UL-us	c-UL-us Listed to UL 61010-1, UL 61010-2-201, CAN/CSA-C22.2 No. 61010-1, and CAN/CSA-C22.2 No. 61010-2-201; see 2713P-CT002
CE (EMC)	European Union EMC Directive, compliance with: • EN 61131-2; Programmable Controllers (pertinent EMC sections); see 2713P-CT004
EAC	Russian Customs Union TP TC 020/2011 EMC Technical Regulation; see 2713P-CT001
EtherNet/IP	ODVA conformance tested to EtherNet/IP specifications; see 2713P-CT005
KC	KC registered; see 2713P-CT001
RCM	Australian Radiocommunications Act, compliance with: • EN 61000-6-4; Industrial Emissions; see 2713P-CT003
Morocco	Moroccan EMC Directive, compliance with: • NM EN 61131-2; Programmable Controllers EMC; see 2713P-CT008
RoHS	• China RoHS • European RoHS • Turkey RoHS (EEE Yönetmeliğine Uygundur. In Conformity with the EEE Regulation.) • UAE RoHS ENV-CT001

(1) When marked. See the Rockwell Automation® Product Certifications site at rok.auto/certifications for declarations of conformity, certificates, and other certification details.

Technical Specifications

This section provides technical specifications for the PanelView 5310 terminals.

Operator input	Touch				
Conformal coated	Yes				
Display type	Color TFT LCD (thin-film-transistor, liquid-crystal display)				
Display size, diagonal	5.7-in. screen	7-in. widescreen	9-in. widescreen	10.4-in. screen	12.1-in. widescreen
View area, W x H	115 x 86 mm (4.5 x 3.4 in.)	152 x 91 mm (6.0 x 3.6 in.)	196 x 118 mm (7.7 x 4.6 in.)	211 x 158 mm (8.3 x 6.2 in.)	261 x 163 mm (10.3 x 6.4 in.)
Display resolution/ aspect ratio	640 x 480 VGA/4:3	800 x 480 WVGA/5:3	800 x 480 WVGA/5:3	800 x 600 SVGA/4:3	1280 x 800 WXGA/16:10
Color depth	24-bit color graphics (16.7 million colors)				
Brightness, typical	300 cd/m^2 (Nits)				
Backlight	• Light-emitting diode, non-replaceable • Life: 50,000 h min at 40 °C (104 °F) to half-brightness				
Backlight power consumption, typical	2.4 W	3 W	3.5 W	4 W	5 W
Touch screen	• Analog resistive • Actuation rating: 1 million presses • Operating force: <100 grams				
Battery (real-time clock backup)	• Accuracy: +/-2 minutes per month. • Battery life: 4 years min at 25 °C (77 °F) • Replacement: CR2032 lithium coin cell				
Memory RAM User available	 1 GB RAM 1 GB nonvolatile storage for projects				
Secure Digital (SD) card slot	One SD card slot for external storage; supports cat. no. 1784-SD*x* cards. See Secure Digital (SD) Cards on page 6.				
USB ports Host Device	 One USB high-speed 2.0 host port (type A) supports removable drives for external storage. One high-speed 2.0 device port (type B) supports connection to host computer (available in a future release).				
Ethernet port	One 10/100Base-T, Auto MDI/MDI-X Ethernet port for controller communication.				
Status indicators	STS (status, green), ERR (error, red)				
Software	Studio 5000 environment provides single portal to View Designer and Logix Designer applications.				
Electrical					
USB host port (type A)	0.5 A at 5V DC				
Input voltage	24V DC nom (18…30V DC)				
Power consumption, max	13 W		14 W	15 W	16 W
Power consumption, typical	9 W		11 W	12 W	12 W
Power dissipation	31 BTU/hr.		38 BTU/hr.	41 BTU/hr.	41 BTU/hr.

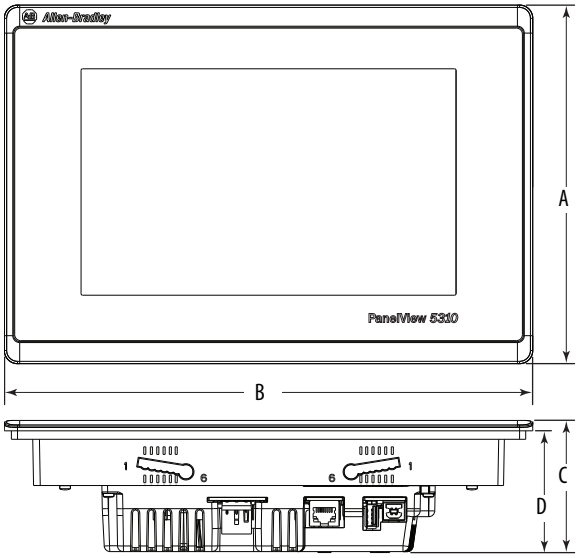
Attribute	6-in. Touch 2713P-T6CD1 2713P-T6CD1-B(1) 2713P-T6CD1-K(2)	7-in. Wide Touch 2713P-T7WD1 2713P-T7WD1-B(1) 2713P-T7WD1-K(2)	9-in. Wide Touch 2713P-T9WD1 2713P-T9WD1-B(1) 2713P-T9WD1-K(2)	10.4-in. Touch 2713P-T10CD1 2713P-T10CD1-B(1) 2713P-T10CD1-K(2)	12.1-in. Wide Touch 2713P-T12WD1 2713P-T12WD1-B(1) 2713P-T12WD1-K(2)
Inrush current, max	15 A				
Power supply	Supports safety extra low voltage and protected extra low voltage 24V DC supplies(3)(4)				
Mechanical					
Weight, approx	0.79 kg (1.7 lb)	2.0 kg (4.4 lb)	2.41 kg (5.31 lb)	3.35 kg (7.39 lb)	3.65 kg (8.0 lb)
Terminal dimensions, approx	See PanelView 5310 Terminal and Cutout Dimensions on this page.				
Cutout dimensions, approx	See PanelView 5310 Terminal and Cutout Dimensions on this page.				

(1) Add -B to the end of a catalog number to order a terminal without the Allen-Bradley® logo and product identification, for example, 2713P-T7WD1-B.
(2) Add -K to the end of a catalog number to order a terminal with conformal coating, for example, 2713P-T6CD1-K.
(3) DC-powered terminals support safety extra low voltage (SELV) and protective extra-low voltage (protected extra low voltage) 24V DC power supplies, such as catalog numbers 1606-XLP95E, 1606-XLP100E, and 2711P-RSACDIN.
(4) Where PELV is defined in IEC 61131-2.

Terminal Dimensions

This section provides dimensions for the PanelView 5310 terminals. The 9-inch widescreen terminal is shown for illustrative purposes. All other terminal sizes look similar.

PanelView 5310 Terminal Dimensions - (9-in. widescreen terminal shown)



PanelView 5310 Terminal and Cutout Dimensions

Terminal Size (in.)	Input Type	Terminal Dimensions				Cutout Dimensions	
		Height (A) mm (in.)	Width (B) mm (in.)	Overall Depth (C) mm (in.)	Mounted Depth (D) mm (in.)	Height (A) mm (in.)	Width (B) mm (in.)
6	Touch	153 (6.0)	186 (7.3)	69.5 (2.74)	64 (2.5)(1)	123 (4.84)	156 (6.14)
7		178 (7.0)	237 (9.3)			148 (5.82)	207 (8.15)
9		190 (7.48)	280 (11.02)			162 (6.38)	252 (9.92)
10.4		252 (9.92)	297 (11.69)			224 (8.82)	269 (10.59)
12.1		246 (9.69)	340 (13.39)			218 (8.58)	312 (12.28)

(1) When mounted in a panel, the front of the bezel extends less than 6 mm (0.24 in.) from the panel.

SOFTWARE TO BE USED

Studio 5000 Environment

Use the Studio 5000 environment to create HMI applications for the PanelView 5310 terminal platform. This environment includes these major components:

- **Studio 5000 View Designer** – you can create and design a project for a specific PanelView 5310 terminal and download the project to the terminal.

  You can create an application for any PanelView 5310 terminal and reuse that same application across the entire platform.
- **Studio 5000 Logix Designer** – you can develop control logic for a CompactLogix or ControlLogix controller and download the logic to the controller.

In the Studio 5000 environment, you can create an application for any PanelView 5310 terminal and reuse that same application across the entire platform.

Accessories

This section lists accessories for the PanelView 5310 terminals.

Power Supplies and Replacement Power Terminal Blocks

Cat. No.	Description	Quantity
1606-XLB120E	DIN rail power supply, 24…28V DC output voltage, 120 W	1
1606-XLP100E	DIN rail power supply, 24…28V DC output voltage, 100 W	1
1606-XLP95E	DIN rail power supply, 24…28V DC output voltage, 95 W	1
2711P-RSACDIN	DIN rail power supply, AC-to-DC, 85…265V AC, 47…63 Hz	1
2711-TBDC	3-pin DC power terminal block	10

Mounting Hardware

Cat. No.	Description	Quantity
2711P-RMCP(1)	Mounting levers (black)	16

(1) Catalog number 2711P-RMCP mounting levers are used with the PanelView 5310 terminals. Do not use gray mounting levers; they are not compatible with PanelView 5310 terminals.

Secure Digital (SD) Cards(1)

Cat. No.	Description
1784-SD1	1 GB SD card
1784-SD2	2 GB SD card
1784-SDHC8	8-GB SDHC card
1784-SDHC32	32-GB SDHC card
2711C-RCSD	USB to SD adapter for SD card

(1) To help reduce the chance of corruption when you use SD Cards or USB drives with the terminal, Rockwell Automation recommends that you use only the above SD card catalog numbers.

The SD™ and SDHC™ accessory cards in the above table have been designed to meet industrial robustness and environmental requirements. Rockwell Automation recommends that you use these accessory cards with the terminal to help reduce the chances of corruption. Studio 5000 View Designer software requires the following for SD cards that are inserted into the HMI device:

- 4 GB of free space
- A supported SDHC card type, preferably one listed in the Secure Digital (SD) Cards table
- An environmental rating for the PanelView 5000 environment
- A supported format of either FAT32 or ext3

USB Programming Cable

Cat. No.	Description	Length
6189V-USBCBL2	Programming cable that connects the device port of the terminal to a USB host port of a computer	1.8 m (5.9 ft)

Battery Replacement

Cat. No.	Description	Quantity
2711P-RY2032	Lithium coin cell battery, CR2032 equivalent	1

Protective Overlays

Cat. No.(1)	Display Size	Quantity
2711P-RGT6S	6-in.	3
2711P-RGT7SP	7-in. widescreen	
2711P-RGT9SP	9-in. widescreen	
2711P-RGT10SP	10.4-in.	
2711P-RGT12SP	12.1-in. widescreen	

(1) Although these protective overlays were designed for the PanelView 5510 terminals, they can also be used for the PanelView 5310 terminals. However, when these overlays are used on a PanelView 5310 terminal, there is an increased air gap between the overlay and the terminal screen.

Catalog Numbers 2713P-T6CD1, 2713P-T6CD1-B, 2713P-T6CD1-K, 2713P-T7WD1, 2713P-T7WD1-B, 2713P-T7WD1-K, 2713P-T9WD1, 2713P-T9WD1-B, 2713P-T9WD1-K, 2713P-T10CD1, 2713P-T10CD1-B, 2713P-T10CD1-K, 2713P-T12WD1, 2713P-T12WD1-B, 2713P-T12WD1-K

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

	**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.
	**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.
IMPORTANT	Identifies information that is critical for successful application and understanding of the product.

Labels may also be on or inside the equipment to provide specific precautions.

	**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.
	**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.
	**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

Notes:

This manual describes how to install, configure, operate, and troubleshoot the PanelView™ 5310 terminals. This manual does not provide procedures on how to create applications that run on the terminals, or ladder logic that runs in the controller.

Other tasks that you must do include:

- Configure the Ethernet settings and update the firmware of the terminal.

  IMPORTANT You must configure the Ethernet settings and update the firmware before you can download a View Designer project and use the terminal. See Initial Startup on page 37.

- Create a project by using the Studio 5000 View Designer® application.
- Create control logic for the controller by using the Studio 5000 Logix Designer® application.

Summary of Changes

This manual contains new and updated information as indicated in the following table.

Topic	Page
Added catalog numbers for the PanelView 5310 conformal-coated terminals.	—
Added a statement about conformal coating to the bulleted list.	11
Updated the Catalog Number Explanation table with conformal coating catalog numbers.	16
Added conformal coating catalog numbers to the Product Selection table.	16
Added instructions on how to configure the keypad size.	42
Added instructions for modifying the PanelView 5000 screen color settings by using HMI device tags.	54
Added instructions on how to load an application from removable media.	63
Added instructions on how to view and export the alarm history.	78

Package Contents

The PanelView 5310 terminals ship with these items.

Item	Description
Hardware	• Mounting levers for panel installation • Removable DC power terminal block
Documents	• PanelView 5310 Terminals Product Information, publication 2713P-PC001 • Cutout Templates for PanelView 5310 Terminals, publication 2713P-DS001

Request Corresponding Source for Open Source Packages

The software included in this product contains copyrighted software that is licensed under one or more open source licenses. Copies of those licenses are included with the software. Corresponding Source for open source packages included in this product can be found at the websites identified in the product documentation.

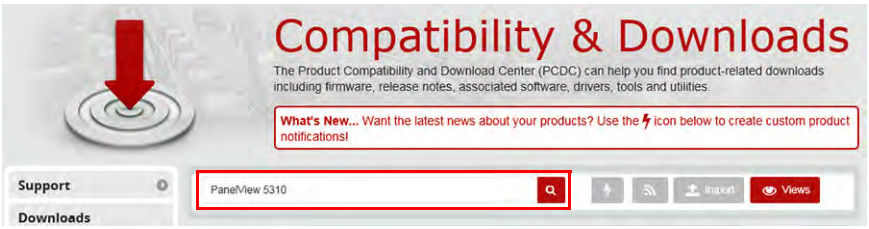
You may alternately obtain complete Corresponding Source by contacting Rockwell Automation via our Contact form on the Rockwell Automation website: http://www.rockwellautomation.com/global/about-us/contact/contact.page. Please include 'Open Source' as part of the request text.

IMPORTANT	Do not modify the DMK file. The DMK file is used in firmware updates and a modified DMK file can cause the firmware update to fail.

Product Firmware and Release Notes

Product firmware and release notes are available online at the Product Compatibility and Download Center at https://compatibility.rockwellautomation.com/Pages/home.aspx.

1. On the PCDC home page, search for your product.



2. On the search results page, find the firmware and release notes for your product.

See the Product Compatibility and Download Center Quick Start Guide, publication PCDC-QS001, for instructions on how to find and download firmware and release notes for the terminal.

About the PanelView 5310 Terminals

The PanelView™ 5310 terminals are operator interface devices that monitor and control devices attached to ControlLogix controllers, CompactLogix™ 5370, 5380, or 5480 controllers, or CompactLogix L1, L2, or L3 controllers over an EtherNet/IP™ network. Animated graphic and text displays provide operators with a view into the operating state of a machine or process. Operators interact with the control system by using the touch screen.

The PanelView 5310 terminals include these features and capabilities:

- Tightly integrated control and design environment allows information to be shared between the PanelView 5310 terminal and the Logix platforms.
- The Studio 5000® environment provides one point of access for the Studio 5000 View Designer® and Studio 5000 Logix Designer® applications.(1)
- Connection to one ControlLogix, CompactLogix 5370, 5380, or 5480 controller, or CompactLogix L1, L2, or L3 controller with revision 27 firmware or later.
- Supports a maximum of 100 user-defined screens.
- Supports a maximum of 4,000 Logix-based alarms.(1)
- Easily configured screen navigation menu.
- Conformal coating available for all terminal sizes.

(1) PanelView 5310 firmware can support up to 4,000 Logix-based alarms in one controller if you use Studio 5000 View Designer application version 5 and Studio 5000 Logix Designer application version 32 or higher. Of the 4,000 alarms, no more than 1,000 can be instruction-based. Earlier versions of the Studio 5000 View Designer or Studio 5000 Logix Designer applications can support up to 1,000 Logix-based alarms.

Hardware Features

The PanelView 5310 terminal features fixed-hardware configurations in a range of display sizes with touch screen input.

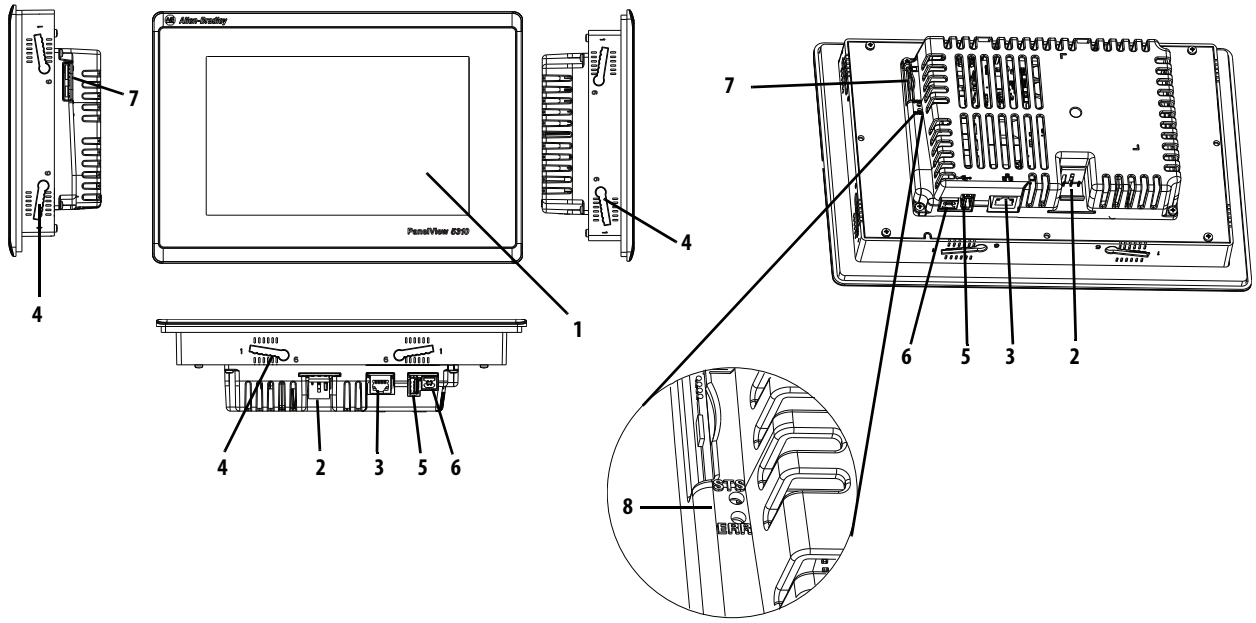

Table 1 - Hardware Features

Item	Feature	Description
1	Display/Touch screen	TFT color, SVGA, VGA, WVGA, or WXGA graphic display with a touch screen available in sizes of 5.7-in., 7-in., 9-in., 10.4-in., and 12.1-in.
2	Power	24V DC nom (18…30V DC) non-isolated power input
3	Ethernet port	One 10/100Base-T, Auto MDI/MDI-X, EtherNet/IP port for controller communication.
4	Mounting slots	Mounting levers insert into the slots to mount device in a panel or enclosure. The number of slots varies by terminal size.
5	Universal serial bus (USB) host port	One USB 2.0 high-speed (type A) host port.
6	USB device port	One USB 2.0 high-speed (type B) device port to connect a host computer that is software-feature dependent.
7	SD card slot	One slot that supports an SD™ or SDHC™ card that is recommended in Table 5 on page 17.
8	Status Indicators	STS indicator (green) indicates that the terminal is on and in use. ERR indicator (red) indicates hardware and firmware faults.

Operator Control

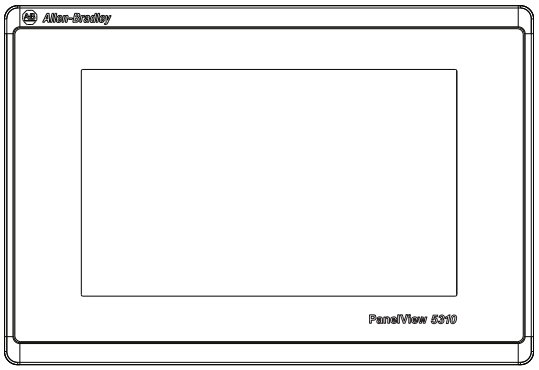
All PanelView 5310 terminals have a color display with a touch screen for operator control. The resistive touch screen provides accurate, durable touch control for industrial applications.

ATTENTION: The touch screen accepts input from a finger, stylus, or gloved hand for operation in dry or wet environments.

The plastic stylus must have a minimum tip RADIUS of 1.3 mm (0.051 in.). Any other object or tool can damage the touch screen.

ATTENTION: Do not perform multiple operations simultaneously. Multiple simultaneous operations can result in unintended operation.

Touch only one operating element on the screen with one finger at a time.



TIP During runtime, a virtual keyboard or numeric keypad opens on HMI displays for data entry.

Touch Gestures

The PanelView 5310 terminal supports touch gestures to interact with screen elements during runtime. Standard touch gestures include:

- **Tap** – Briefly touch the target on the HMI display with your fingertip.
- **Drag** – Move your fingertip over the target on the HMI display without contact loss.

For a list of actions you can perform by using touch gestures, see the View Designer help.

Studio 5000 Environment

Use the Studio 5000 environment to create HMI applications for the PanelView 5310 terminal.

The Studio 5000 environment includes these applications:

- **View Designer** – you can create and design a project for a specific PanelView 5310 terminal and download the project to the terminal.

  You can create an application for any PanelView 5310 terminal and reuse that same application across the entire platform.
- **Logix Designer application** – you can develop control logic for a CompactLogix or ControlLogix controller and download the logic to the controller.

Figure 1 - How Studio 5000 Applications Work Together

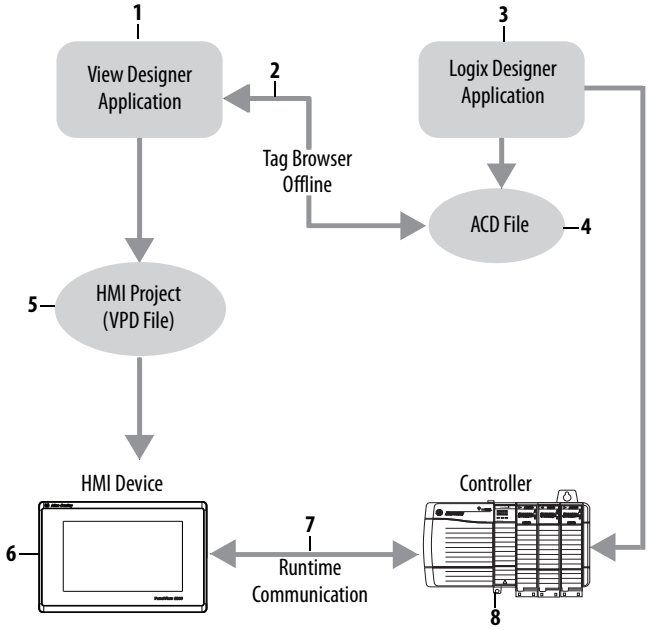


Table 2 describes how the View Designer and Logix Designer applications work together to create an HMI runtime project.

Table 2 - Studio 5000 Applications and Tools

Item	Component	Description
1	View Designer application	A Studio 5000 application that is used to build HMI projects. Studio 5000 View Designer projects are stored as VPD files that can be downloaded to the PanelView 5310 terminal.
2	Tag browser	A tool that is used to search for and select tags within a Studio 5000 Logix Designer application ACD project file. You can bind the tags to graphic element properties and properties of an HMI display. The Studio 5000 View Designer application uses the tag browser to read data from an ACD file.
3	Logix Designer application	A Studio 5000 application that is used to develop control logic for an industrial automation system. The Studio 5000 Logix Designer application interfaces with controllers to read and write tag information. Studio 5000 Logix Designer application projects are stored as ACD files that can be downloaded to the controller.
4	ACD file	An Automation Controller Database (ACD) file. An ACD file is a Logix Designer application project file that contains the logic or code, including tags and data types, which runs within a controller.
5	HMI project (VPD file)	A View Project Database (VPD) file. A VPD project is a file that contains the operator interface application, including HMI displays, controller references, and information about the HMI device to run the application.
6	HMI device	A Human Machine Interface (HMI) device, such as the PanelView 5310 terminal, which runs the HMI project. At runtime, the HMI device communicates directly with the controller.
7	Runtime	The environment in which the runtime HMI project communicates with the controller. During runtime, the HMI device runs the downloaded project, exchanges data with the controller, animates displayed data, and responds to operator input.
8	Controller	A logic controller such as a ControlLogix or CompactLogix controller.

EtherNet/IP Communication

The PanelView 5310 terminals contain EtherNet/IP technology. These terminals communicate with ControlLogix or CompactLogix controllers over an Ethernet connection with linear network topologies. Star technology is also supported when using switches.

Typical Configuration

Linear and star network topologies are supported. See these topics for examples:

- Linear Network Topology on page 36
- Star Network Topology on page 36

Catalog Number Explanation

This table provides an explanation of the catalog numbers.

Bulletin	Input Type	Display Size	Display Type	Power	Ethernet Port	–	Special Option
	|	|	|	|	|	|
2713P-	**T** = Touch	**6** = 5.7-in.	**C** = Color, 4:3 aspect ratio	**D** = DC	**1** = Single	–	**B** = Without brand identity[2]
		7 = 7-in.	**W** = Color, widescreen[1] aspect ratio				**K** = Conformal coating[3]
		9 = 9-in.					
		10 = 10.4-in.					
		12 = 12.1-in.					

(1) Depending on the PanelView 5310 terminal model, the widescreen aspect ratio is either 5:3 or 16:10. For further details, see the Product Selections section on this page.
(2) A catalog number with -B at its end (for example, 2713P-T9WD1-B) is a terminal without the Allen-Bradley logo and product identification on the front bezel.
(3) A catalog number with -K at its end (for example, 2713P-T6CD1-K) is a terminal with conformal coating.

Product Selections

This table provides information for the product selections.

Cat. No.	Display				Input Power	Ethernet Port	Memory	
Touch Screen	Display Size	Type	Aspect Ratio	Pixels (W x H)			RAM	User[1]
2713P-T6CD1 2713P-T6CD1-B 2713P-T6CD1-K	5.7-in.	VGA TFT color	4:3	640 x 480	DC	One	1 GB	1 GB
2713P-T7WD1 2713P-T7WD1-B 2713P-T7WD1-K	7-in.	WVGA TFT color	5:3	800 x 480				
2713P-T9WD1 2713P-T9WD1-B 2713P-T9WD1-K	9-in.							
2713P-T10CD1 2713P-T10CD1-B 2713P-T10CD1-K	10.4-in.	SVGA TFT color	4:3	800 x 600				
2713P-T12WD1 2713P-T12WD1-B 2713P-T12WD1-K	12.1-in.	WXGA TFT color	16:10	1280 x 800				

(1) Nonvolatile memory that is available to store projects.

Accessories

Table 3 through Table 7 list accessories for the PanelView 5310 terminals.

Table 3 - Power Supplies and Power Terminal Blocks

Cat. No.	Description	Quantity
1606-XLB120E	DIN rail power supply, 24…28V DC output voltage, 120 W	1
1606-XLP100E	DIN rail power supply, 24…28V DC output voltage, 100 W	1
1606-XLP95E	DIN rail power supply, 24…28V DC output voltage, 95 W	1
2711P-RSACDIN	DIN rail power supply, AC-to-DC, 85…265V AC, 47…63 Hz	1
2711-TBDC	3-pin DC power terminal block	10

Table 4 - Mounting Hardware

Cat. No.	Description	Quantity
2711P-RMCP(1)	Mounting levers (black)	16

(1) Use catalog number 2711P-RMCP mounting levers (black) for PanelView 5310 terminals. Do not use gray mounting levers; they are not compatible with PanelView 5310 terminals.

Table 5 - Secure Digital (SD) Cards (1)

Cat. No.	Description	Quantity
1784-SD1	1-GB SD card	1
1784-SD2	2-GB SD card	1
1784-SDHC8	8-GB SDHC card	1
1784-SDHC32	32-GB SDHC card	1
2711C-RCSD	USB to SD adapter for SD card	1

(1) To help reduce the chance of corruption when you use SD Cards or USB drives with the terminal, Rockwell Automation recommends that you use only the above SD card catalog numbers.

SD™ and SDHC™ accessory cards in Table 5 have been designed to meet industrial robustness and environmental requirements. Rockwell Automation recommends that you use these accessory cards with the terminal to help reduce the chances of corruption. Studio 5000 View Designer software requires the following for SD cards that are inserted into the HMI device:

- 4 GB of free space if the project uses data logging
- A supported SDHC card type, preferably one listed in Table 5
- An environmental rating for the PanelView 5310 environment
- A supported format of either FAT32 or ext3

Table 6 - USB Programming Cable

Cat. No.	Description	Length
6189V-USBCBL2	Programming cable that connects the device port of the terminal to a USB host port of a computer.	1.8 m (5.9 ft)

Table 7 - Battery Replacement

Cat. No.	Description	Quantity
2711P-RY2032	Lithium coin-cell battery, CR2032 equivalent	1

Table 8 - Protective Overlays

Cat. No.(1)	Display Size	Quantity
2711P-RGT6S	6-in.	3
2711P-RGT7SP	7-in. widescreen	
2711P-RGT9SP	9-in. widescreen	
2711P-RGT10SP	10.4-in.	
2711P-RGT12SP	12.1-in. widescreen	

(1) Although these protective overlays were designed for the PanelView 5510 terminals, they can also be used for the PanelView 5310 terminals. However, when these overlays are used on a PanelView 5310 terminal, there is an increased air gap between the overlay and the terminal screen.

Ethernet Cables

See the Industrial Ethernet Media Brochure, publication 1585-BR001, for recommended Ethernet cables and media solutions.

See the USB to Serial Adapter Quick Start Guide, publication GMSC10-QS003, for information on USB to serial port adapters.

Install the PanelView 5310 Terminal

Connect Power	33
Connect to a Network	34
Initial Startup	37

ATTENTION: Do not use a PanelView™ 5310 terminal for emergency stops or other controls critical to the safety of personnel or equipment. Use separate hard-wired operator interface devices that do not depend on solid-state electronics.

Installation Precautions

Read and follow these precautions before you install the PanelView 5310 terminal.

Environment and Enclosure Information

ATTENTION: This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC 60664-1), at altitudes up to 2000 m (6561 ft) without derating. The terminals are intended for use with programmable logic controllers.

This equipment is considered Group 1, Class A industrial equipment according to IEC CISPR 11. Without appropriate precautions, there can be difficulties with electromagnetic compatibility in residential and other environments due to conducted or radiated disturbances.

Korean Radio Wave Suitability Registration - When so marked this equipment is registered for Electromagnetic Conformity Registration as business equipment (A), not home equipment. Sellers or users are required to take caution in this regard.

이 기기는 업무용 (A 급) 전자파적합기기로서 판 매자 또는 사용자는 이 점을 주의하시기 바 라 며 , 가정외의 지역에서 사용하는 것을 목적으 로 합니다 .

This equipment is supplied as open-type equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that can be present, and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. The terminals meet specified NEMA, UL Type, and IEC ratings only when mounted in a panel or enclosure with the equivalent rating. Subsequent sections of this publication can contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional installation requirements.
- NEMA 250 and IEC 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure.

Wiring and Safety Guidelines

ATTENTION: Use publication NFPA 70E, Electrical Safety Requirements for Employee Workplaces, IEC 60364 Electrical Installations in Buildings, or other applicable wiring safety requirements for the country of installation when wiring the devices. In addition to the NFPA guidelines, here are some other guidelines to follow:

- Connect the device and other similar electronic equipment to its own branch circuit.
- Protect the input power by a fuse or circuit breaker rated at no more than 15 A.
- Route incoming power to the device by a separate path from the communication lines.
- Cross power and communication lines at right angles if they must cross.
- Communication lines can be installed in the same conduit as low-level DC I/O lines (less than 10V).
- Shield and ground cables appropriately to avoid electromagnetic interference (EMI). Grounding minimizes noise from EMI and is a safety measure in electrical installations.

For more information on grounding recommendations, refer to the National Electrical Code published by the National Fire Protection Association.

Outdoor Installation Recommendations

When you use a PanelView 5310 terminal outdoors, follow these recommendations to maximize the field life of the front bezel and display:

- Do not expose terminal to direct sunlight
- Add UV protection and/or shielding
- Manage terminal temperature
- Mount terminal in an acceptable position
- Select a proper enclosure

Ultraviolet (UV) and infrared radiation can reduce the field life of any electronic terminal. While the materials used in the terminal bezels provide long field life, that life can be improved by proper installation and by following the suggested guidelines.

UV radiation from the sun causes all plastics to fade or yellow and become brittle over time. Avoid direct sunlight exposure, use a sacrificial antiglare overlay and/or use a shield to shade the terminal to help protect the front of the terminal from direct exposure to UV radiation and greatly increase its field life. When you install a sun shield that closes over the display, the temperature between the sun shield and the display cannot exceed the maximum temperature of the display, which is 50 °C (122 °F). Adequately ventilate all sun shields to help prevent excess heat rise on the terminal display.

Use stirring fans or active cooling in high altitude and high ambient temperature locations to keep the internal enclosure temperature below 50 °C (122 °F).

Verify that the ambient temperature at which the product is operating does not fall below its minimum rated 0 °C (32 °F).

Minimize the temperature differential between the inside of the terminal enclosure and the front panel to help reduce the potential for condensation and possible pressure variation between the inside and outside of the terminal.

If possible, avoid placing the terminal on the south (north in the southern hemisphere) or west side of the cabinet, which helps reduce the heat rise due to solar heating during the hottest part of the day.

Mount the terminal vertically to minimize solar heating on the display. Do not mount the terminal in a sloped enclosure if it exposes the terminal to direct sunlight. For more information, see Mounting Considerations on page 23.

To help protect the terminal from water and dust, mount it in a proper enclosure by following the instructions in the PanelView 5310 Terminals Product Information, publication 2713P-PC001. The terminals meet specified NEMA, UL Type, and IEC ratings only when properly mounted in a panel or enclosure with the equivalent rating. Other sections of this publication can contain additional information about specific enclosure type ratings that are required to comply with certain product safety certifications.

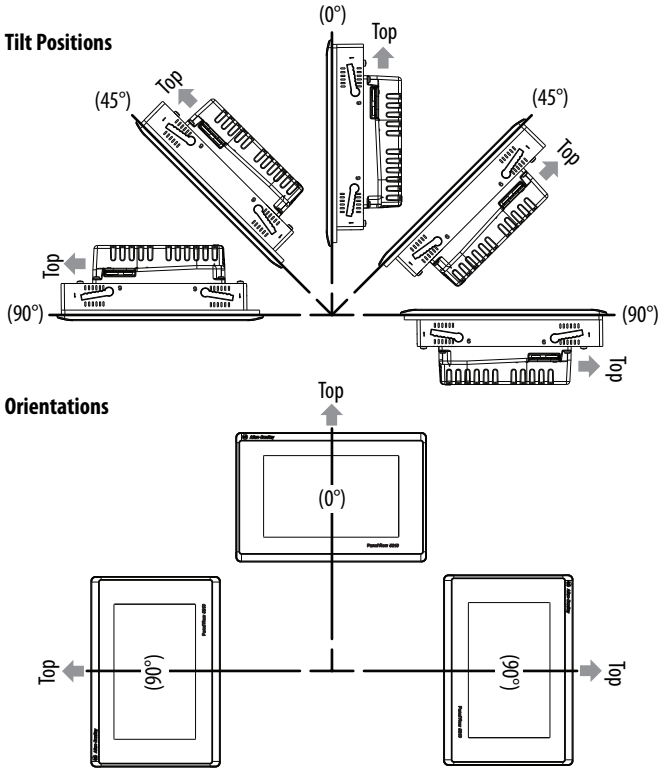
ATTENTION: Failure to follow the recommended installation practices for outdoor use can substantially reduce terminal life and void its warranty.

Mounting Considerations

Consider the following items when mounting the PanelView 5310 terminal:

- Figure 2 shows the acceptable mounting positions where the terminal functions properly.
- Mount the terminal at a height suitable for most operators.
- Mount the terminal in an area that has good lighting.
- Do not mount the terminal where it is exposed to direct sunlight.

Figure 2 - Acceptable Mounting Positions for PanelView 5310 Terminals



Mounting Clearances

Plan for adequate space around the terminal, inside the enclosure, for ventilation and cables. Consider the heat from other devices in the enclosure. The ambient temperature around the terminal must be 0...50 °C (32...122 °F).

Table 9 - Minimum Required Clearances

Terminal Area	Minimum Clearance
Top	51 mm (2 in.)
Bottom	102 mm (4 in.)
Side	25 mm (1 in.) 102 mm (4 in.) is required to insert and remove an SD™ or SDHC™ card, or cable on one side
Back	0 mm (0 in.)

Panel Guidelines

The terminals are panel-mounted devices that mount in the door or wall of a NEMA, UL Type, or IP rated enclosure:

- Enclosure panels must meet the panel thickness requirements in Table 11 on page 26.
- The material strength and stiffness of the panel must be sufficient to hold the terminal and maintain an appropriate seal against water and dust.
- The panel surface must be flat and free of imperfections to maintain an adequate seal and NEMA, UL Type, or IP ratings.

Panel Cutout Dimensions

Use the template that is shipped with your terminal to mark the cutout dimensions.

PanelView 5310 - Panel Cutout Dimensions

Terminal Size (in.)	Input Type	Height, mm (in.)	Width, mm (in.)
6	Touch	123 (4.84)	156 (6.14)
7		150 (5.9)	210 (8.25)
9		162 (6.38)	252 (9.92)
10.4		224 (8.82)	269 (10.59)
12.1		218 (8.58)	312 (12.28)

Terminal Dimensions

This section provides terminal dimensions.

Figure 3 - PanelView 5310 Terminal Dimensions (9-in. wide terminal shown)

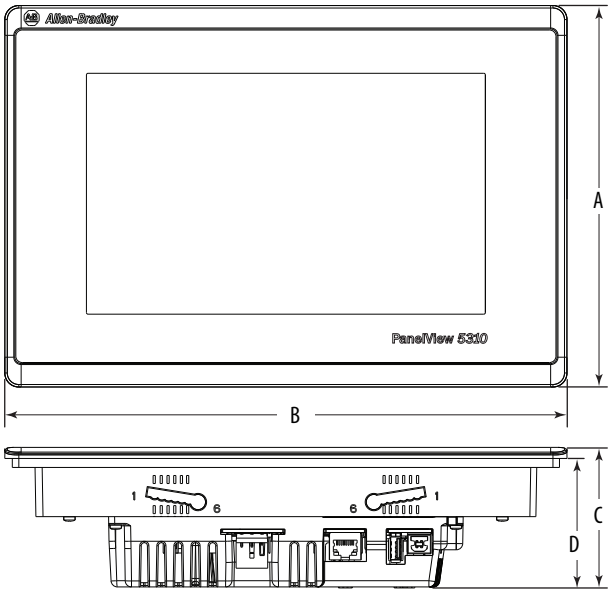


Table 10 - PanelView 5310 Terminal Dimensions

Display Size (in.)	Input Type	Height (A) mm (in.)	Width (B) mm (in.)	Overall Depth (C) mm (in.)	Mounted Depth (D) mm (in.)
6	Touch	153 (6)	186 (7.3)	69.5 (2.74)	64 (2.5)(1)
7		178 (7)	237 (9.3)		
9		190 (7.5)	280 (11)		
10.4		252 (9.92)	297 (11.69)		
12.1		246 (9.7)	340 (13.4)		

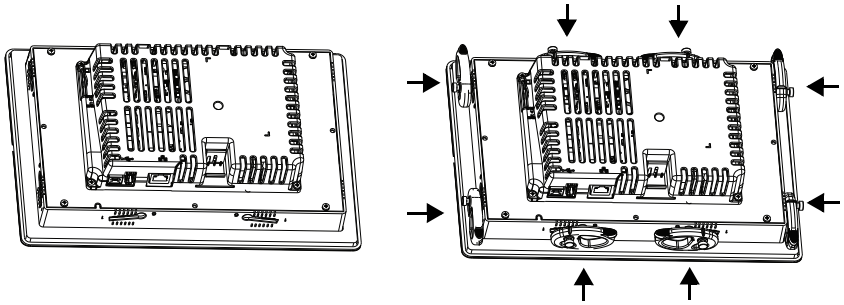
(1) When mounted in a panel, the front of the bezel extends less than 6 mm (0.24 in.) from the panel.

Prepare for Panel Mounting

Before mounting a terminal in a panel, read this section and the entire installation procedure on page 29.

IMPORTANT Use catalog number 2711P-RMCP mounting levers (black) for PanelView 5310 terminals. Do not use gray mounting levers; they are not compatible with PanelView 5310 terminals.

Mounting levers insert into the slots around the bezel to secure the terminal in the panel. The number of mounting levers varies by terminal size.

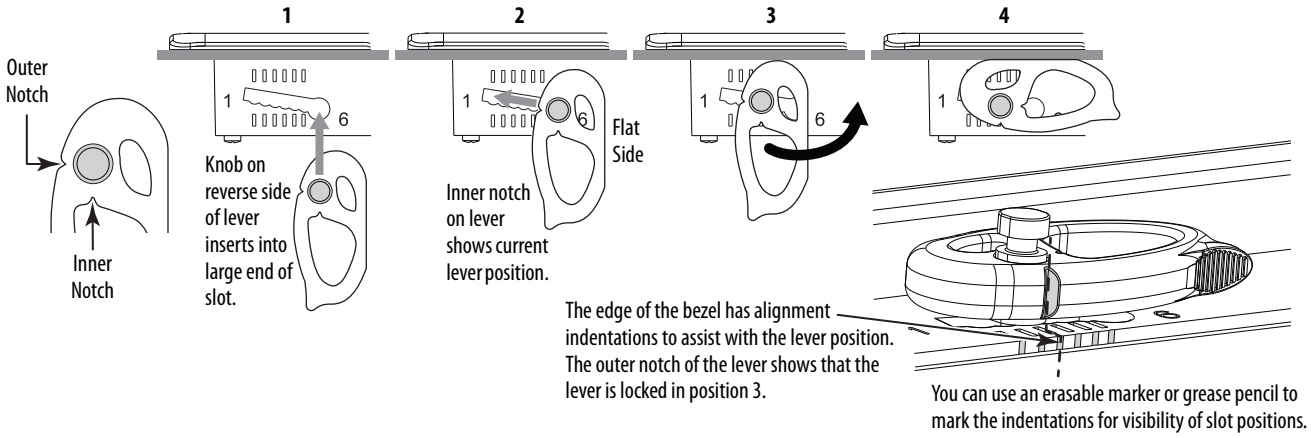


Each slot has six notches with alignment marks that are locking positions for a mounting lever. The thickness of the panel that you mount the terminal in determines the locking position that is required to maintain a NEMA, UL Type, and IP seal.

Table 11 - Mounting Lever Locking Positions

Mounting Slot	Mounting Lever Lock Position	Panel Thickness Range	Typical Gauge
	1	1.50…2.01 mm (0.060…0.079 in.)	16
	2	2.03…2.64 mm (0.08…0.104 in.)	14
	3	2.67…3.15 mm (0.105…0.124 in.)	12
	4	3.17…3.66 mm (0.125…0.144 in.)	10
	5	3.68…4.16 mm (0.145…0.164 in.)	8/9
	6	4.19…4.80 mm (0.165…0.188 in.)	7

Always orient a mounting lever vertically before inserting it into a slot. This method is the only way to slide the mounting lever knob within the slot for positioning. After sliding the mounting lever to a specific notch, rotate the mounting lever toward the panel to lock it in position. The flat side of the mounting lever must come into contact with the panel.



Initially, you secure the terminal in the panel by sliding each mounting lever to a position that is one or two notches greater than the final lock position. For example, if the final lock position is 1, slide each mounting lever to position 2 or 3. Follow the sequence specific to the terminal size shown in Figure 5 on page 28.

TIP If the lock position is 6, slide the mounting lever to the large end of the slot or insertion hole.

Figure 4 on page 27 shows the mounting lever orientation and locking sequence for a 9-in. terminal. See Figure 5 on page 28 for locking sequence and mounting lever orientations for all terminals.

Figure 4 - Mounting Levers Shown in Locked Position

All mounting levers are locked in position 4, which is appropriate for a panel thickness of 3.17…3.66 mm (0.125…0.144 in.).

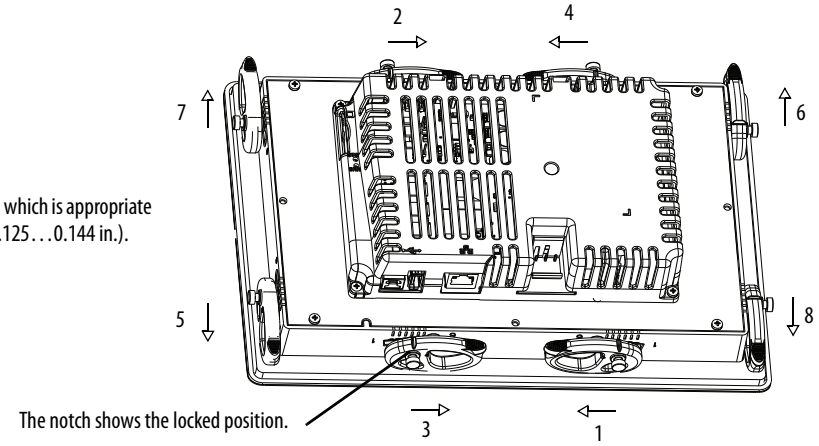


Figure 5 - Mounting Lever Orientation and Lock Sequence

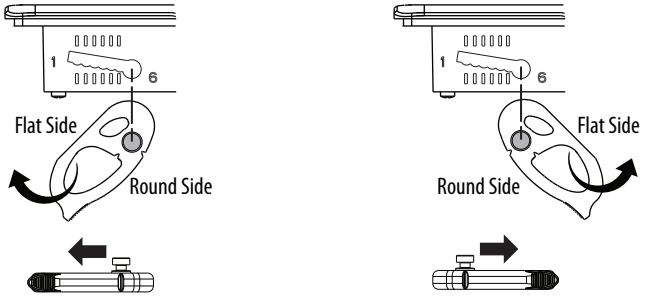
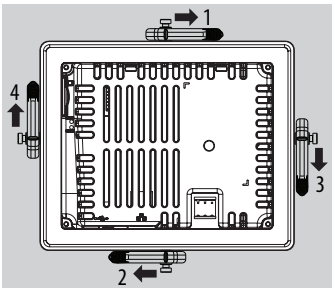
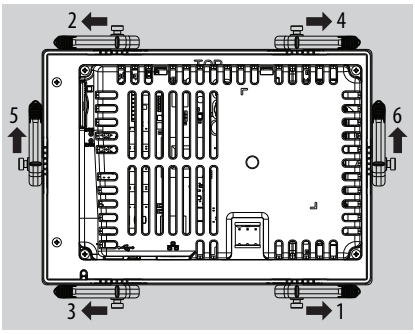


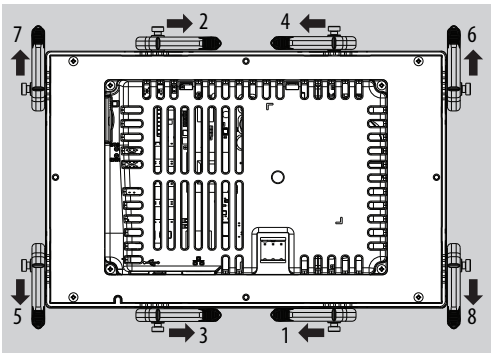
6-in. Touch Screen – 4 Levers



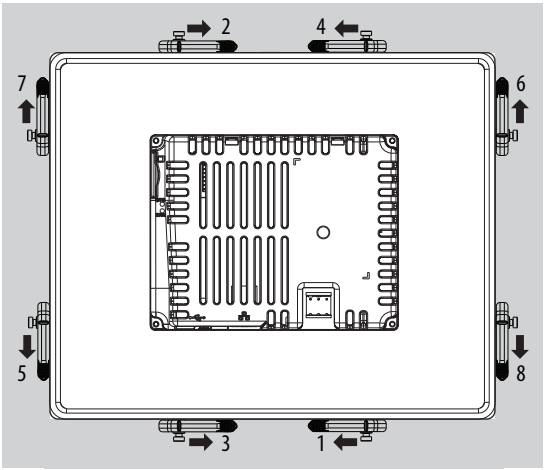
7-in. Touch Widescreen – 6 Levers



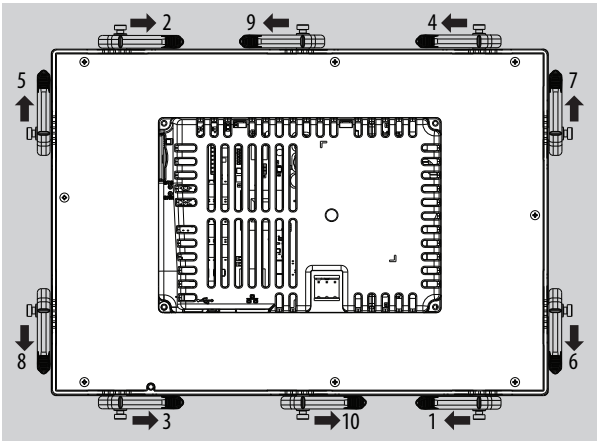
9-in. Touch Widescreen – 8 Levers



10.4-in. Touch Screen – 8 Levers



12.1-in. Touch Widescreen – 10 Levers



IMPORTANT The mounting lever orientations that are shown are required to maintain NEMA, UL Type, and IP seals. If you require a NEMA, UL Type, or IP seal, do not use a mounting lever in another orientation than shown.

Mount the Terminal in a Panel

The PanelView 5310 terminals are designed for single-person installation. No tools are required except for tools to make the panel cutout.

To mount the terminal in a panel, follow these steps.

ATTENTION: Disconnect all electrical power from the panel before making the panel cutout.

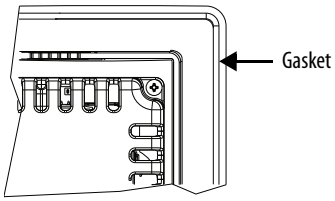
Make sure that the area around the panel cutout is clear and that the panel is clean of any debris, oil, or other chemicals.

Make sure that metal cuttings do not enter any components that are already installed in the panel and that the edges of the cutout have no burrs or sharp edges.

Failure to follow these precautions can result in personal injury or damage to panel components.

1. Use the cutout dimensions on page 24 to cut an opening in the panel.
2. Verify that the sealing gasket is present on the terminal.

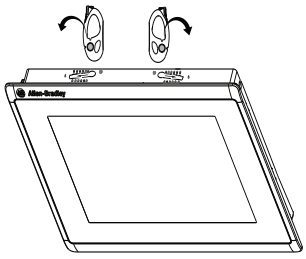
   This gasket forms a compression seal. Do not use sealing compounds.

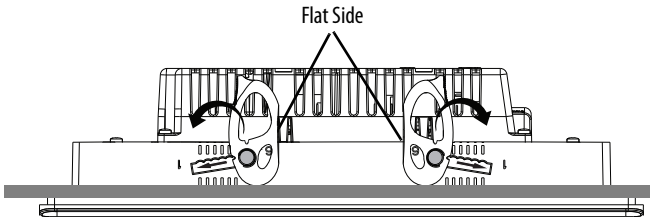


3. Insert and stabilize the terminal in the panel cutout.
   a. Insert levers in the top corner slots in the orientation that is shown and rotate the non-flat side of the levers toward panel.

TIP The mounting levers for PanelView 5310 terminals are black (catalog number 2711P-RMCP).

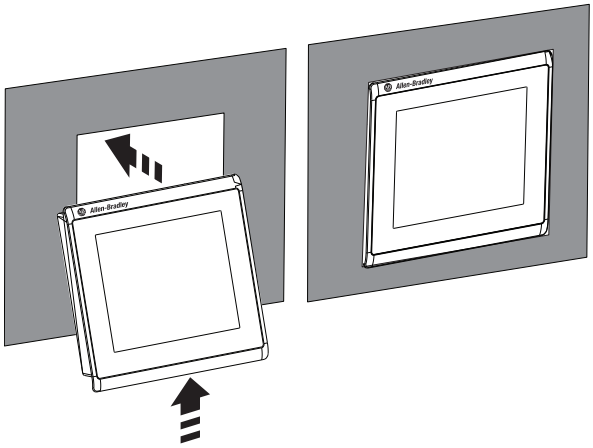
Do not use gray mounting levers; they are not compatible with PanelView 5310 terminals.





b. Tilt the terminal toward the panel cutout and guide upward into the cutout. Make sure that the levers stay intact.

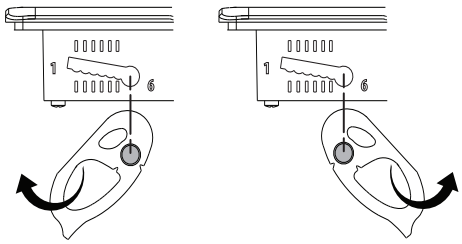
TIP The levers help prevent the terminal from falling out of the panel.



c. Pull the top of the terminal toward you to verify that the levers are still intact and the terminal is stabilized in the panel.

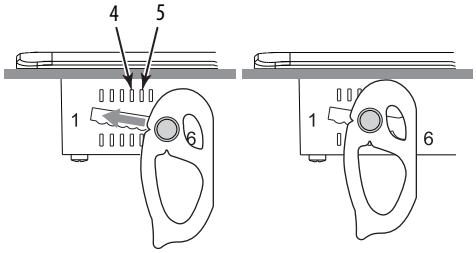
d. Insert the remaining levers in the slots by using the orientations in Figure 5 on page 28 that are correct for your terminal.

The direction that you rotate the levers varies for each terminal size.



4. Slide and rotate each lever to a notch that is one or two positions greater than the final lock position. Start with the first lever in the sequence.

For example, if the final lock position is 3, slide the lever to notch 4 or 5.

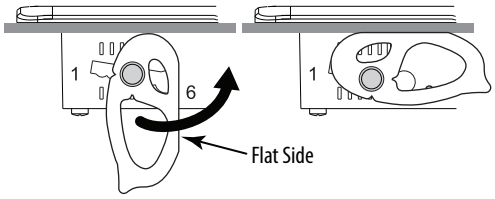


TIP To help position the levers and identify the final slot position, use the alignment marks or previous marks you made on the bezel.

a. See Table 11 on page 26 to get the final lock position of the levers.

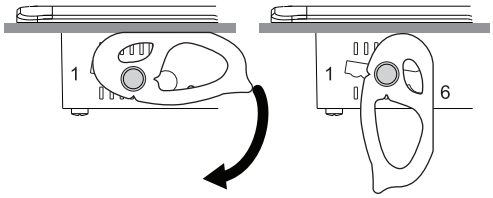
b. See Figure 5 on page 28 to get the locking sequence.

c. Rotate each lever until its flat side comes in contact with the panel.



5. Adjust each lever to its final lock position shown in the same locking sequence in Figure 5 on page 28.

a. Unlock lever one in the sequence by rotating it away from the bezel.



b. With the lever positioned vertically to the slot, slide the lever to the final locking position in Table 11 on page 26.

The outer notch of the lever aligns with the bezel indentation.

c. Carefully rotate the lever back toward panel.

TIP A broken lever does not damage the product.

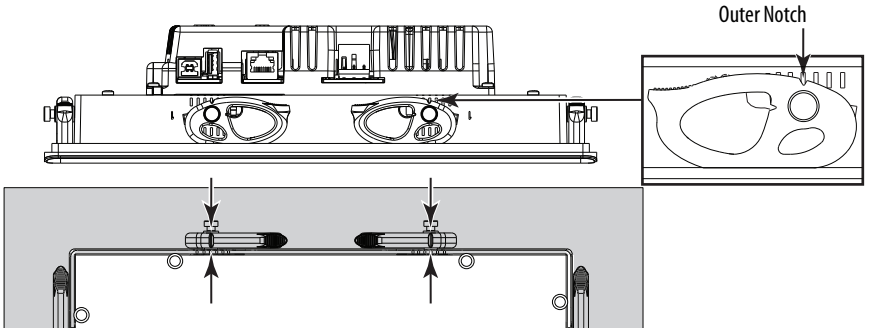
d. Lock the remaining levers to their final position.

6. Inspect all levers and make sure each is in the correct locked position.

ATTENTION: All levers must be in the correct and same locked position to provide an adequate gasket seal between the terminal and the panel. Rockwell Automation assumes no responsibility for water or chemical damage to the terminal or other equipment within the enclosure because of improper installation.

The notch on the outside of lever shows its locked position.

These two views show levers that are locked in position 4.



Remove and Replace Power Terminal Block

The product has a three-pin terminal block for DC power connections. You can remove the terminal block for ease of installation, wiring, and maintenance.

SHOCK HAZARD: Turn off the power before you connect or disconnect wiring. If the power is on, an electric arc can occur.

Failure to turn power off can result in electric shock or damage to the terminal.

Use a 0.6 x 3.5 mm screwdriver for terminal block wiring.

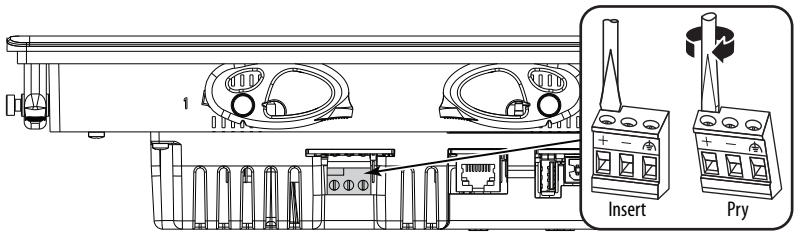
Table 12 - Wire Specifications for Power Input Terminal Block

Wire Type	Dual-wire Size(1)	Single-wire Size	Strip Length	Screw Torque
Stranded or solid Cu 90 °C (194 °F)	0.3…1.3 mm^2 22…16 AWG	0.3…2.1 mm^2 (22…14 AWG)	7 mm (0.28 in.)	0.56 N•m (5.0 lb•in)

(1) Two-wire maximum per terminal.

To remove the power terminal block, follow these steps.

1. Insert the tip of a small screwdriver into the terminal block access slot.
2. To release the locking mechanism, gently pry the terminal block away from terminal.



To install the power terminal block, follow these steps.

1. Press the terminal block base in first with the terminal block leaning outward.
2. Gently push the top of the terminal block back to vertical position to snap in the locking tab.

Connect Power

The terminals have a 24V DC non-isolated power supply at these power ratings.

Table 13 - DC Power Ratings

Terminal	Power Supply	Input Voltage	Power Consumption
2713P-T6CD1	Non-isolated	24V DC nom (18…30V DC)	13 W max (0.54 A at 24V DC)
2713P-T7WD1			
2713P-T9WD1			14 W max (0.58 A at 24V DC)
2713P-T10CD1			15 W max (0.62 A at 24V DC)
2713P-T12WD1			16 W max (0.67 A at 24V DC)

ATTENTION: The power supply is internally protected against reverse polarity. Do not connect DC+ or DC- to the earth ground terminal, which can damage the terminal. Do not connect AC power, or more than 30V DC, which can also damage the terminal.

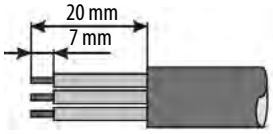
The terminals support operation from a safety extra low voltage (SELV) or protective extra low voltage (PELV) 24V DC power supply. Supported power supplies include catalog numbers 1606-XLP95E, 1606-XLP100E, 1606-XLP120E, and 2711P-RSACDIN.

ATTENTION: Use a SELV or PELV supply as required by local wiring codes for your installation. The SELV and PELV power sources provide protection so that under normal and single fault conditions, the voltage between conductors and earth ground does not exceed a safe value.

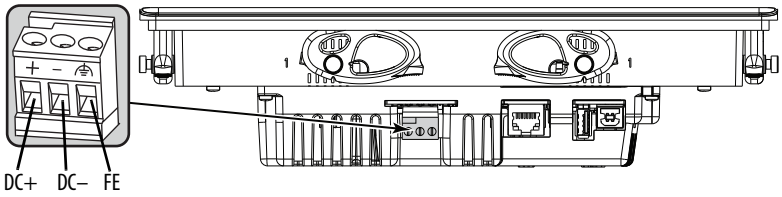
To power the terminal from the same power source as other equipment, use a DC power bus.

To connect the operator terminal to a DC power source, follow these steps.

1. Verify that the wiring is not connected to a power source.
2. Strip 7 mm (0.28 in.) of insulation from your power supply wires.



3. Secure the DC power wires to the marked terminals (+ and –) on the terminal block.



4. Secure the functional earth (FE) ground wire to the GND terminal on the terminal block.

   The GND terminal must be connected to a low-impedance FE ground.

> **ATTENTION:** The FE ground connection to FE ground is mandatory. This connection is required for noise immunity, reliability, and Electromagnetic Compliance (EMC) with the European Union (EU) EMC Directive for CE marking conformance. This connection is required for safety by Underwriters Laboratory (UL).

> **IMPORTANT** Secure the power cable to help prevent these actions:
>
> - Vibration at the connector.
> - Pulling when the panel door is opened and closed, or when personnel are working inside the panel.

5. Apply power to the operator terminal.

Connect to a Network

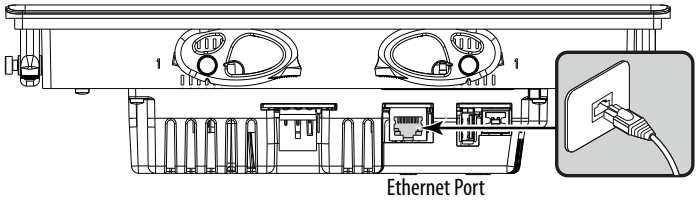
The Ethernet port connects to controllers on an EtherNet/IP™ network by using standard Ethernet connections. These types of networks are supported:

- Linear Network Topology on page 36
- Star Network Topology on page 36

Ethernet Port

The terminal has one 10/100Base-T, Auto MDI/MDI-X, Ethernet port for controller communication.

The terminal connects to an EtherNet/IP network by using a CAT5, CAT5E, or CAT6 twisted-pair, Ethernet cable with RJ45 connectors.



> **IMPORTANT** To help prevent accidental disconnection of the Ethernet cable, follow these steps:
>
> - To minimize vibration at the connector and help reduce the chance that personnel working inside the panel can accidentally disconnect the cable, secure the Ethernet cable.
> - To help prevent pulling on the cable when the panel door is opened and closed, do not install the Ethernet cable too tightly. Leave some slack in the cable.

The maximum cable length between the Ethernet port and a 10/100Base-T port on an Ethernet hub (without repeaters or fiber) is 100 m (328 ft).

SHOCK HAZARD: Do not connect or disconnect any communication cable with power that is applied to this device or any device on the network. If the power is on, an electric arc can occur.

Failure to turn power off can result in electric shock or damage to the terminal.

Table 14 - Ethernet Connector Pinout

Connector	Pin	Pin Name
View of RJ45 Connector  	1	TD+
	2	TD-
	3	RD+
	4	Unused
	5	Unused
	6	RD-
	7	Unused
	8	Unused
	Shield connection	No direct connection (AC coupled to chassis GND)

The Ethernet port has two indicators that provide the status of activity.

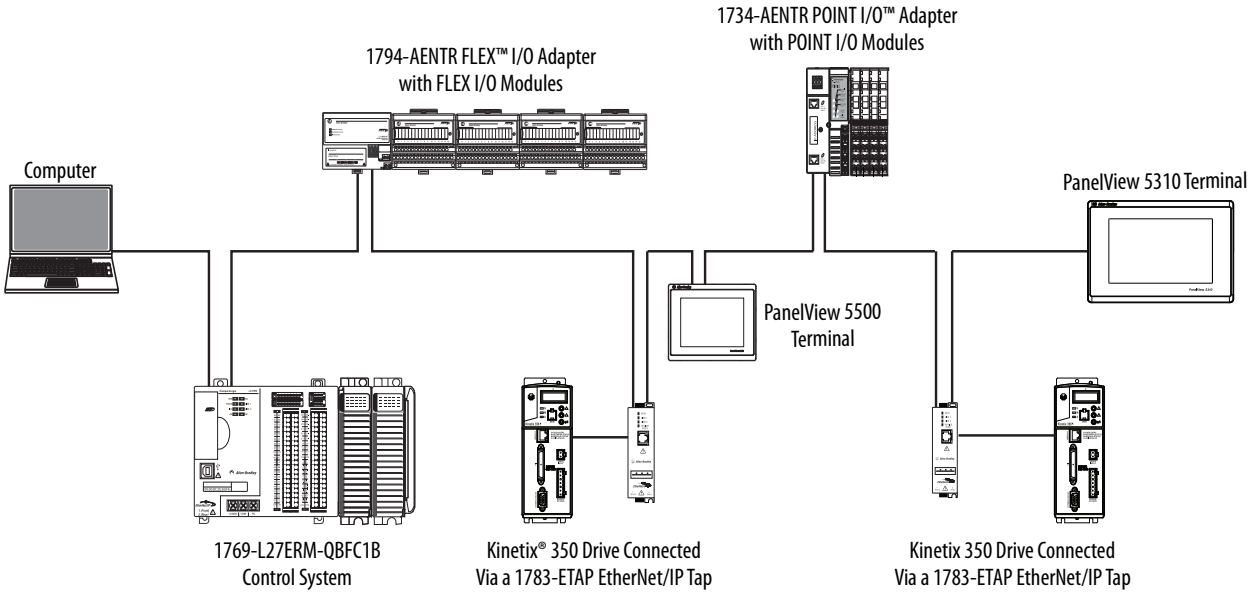
Table 15 - Ethernet Status Indicators

Indicator	Color	Description
Link integrity	Green	On when a link is present.
Activity	Yellow	Blinks when activity is detected on the Ethernet link.

Linear Network Topology

A linear network topology is a collection of devices that are daisy-chained together across an EtherNet/IP network. Devices that can connect to a linear network topology use embedded switch technology so you do not need a separate switch, as required in star network topologies.

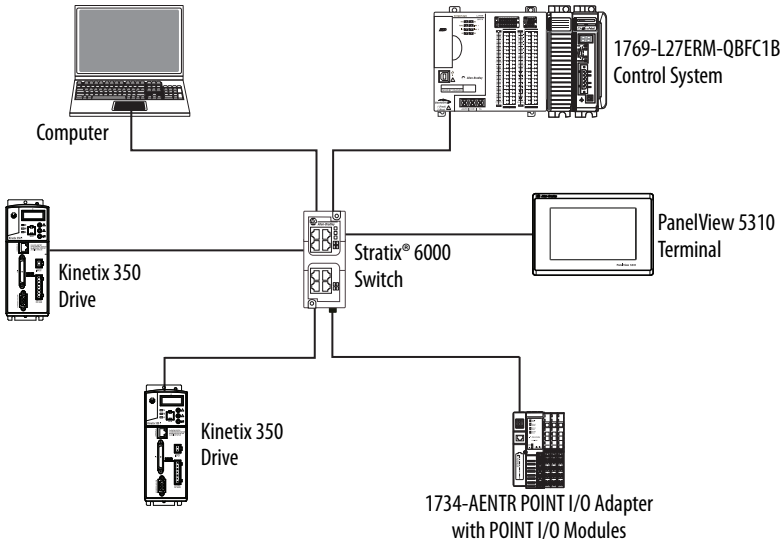
Figure 6 - PanelView 5310 Terminal at the End of a Linear Network



Star Network Topology

A star network topology is a traditional EtherNet/IP network that has multiple devices that are connected to each other via an Ethernet switch.

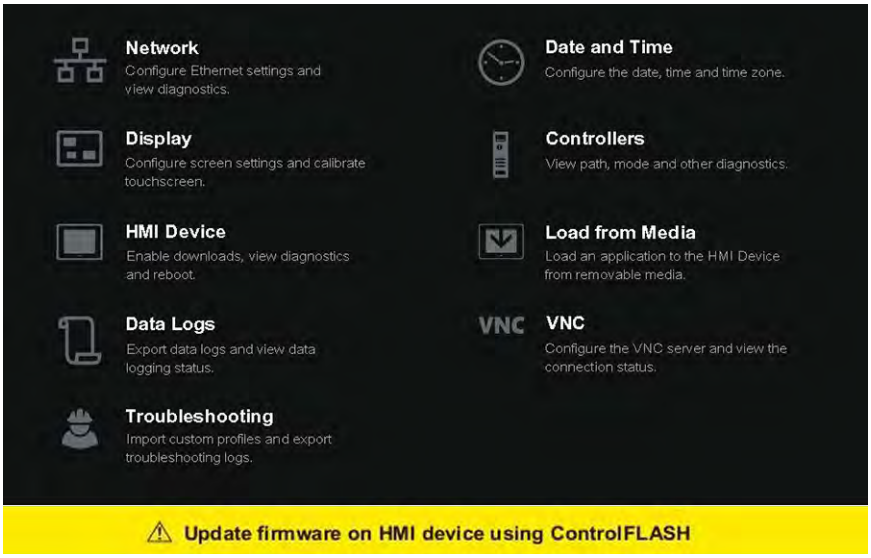
Figure 7 - PanelView 5310 Terminal Connected Via a Stratix 6000 Switch



Initial Startup

IMPORTANT You must configure the Ethernet settings and update the firmware before you can download a View Designer project and use the terminal. See Update the Firmware before You Use the Terminal on page 37.

If you attempt to configure the terminal settings without updating the firmware, the Settings menu shows an update firmware message at the bottom of the screen.



Update the Firmware before You Use the Terminal

When power is turned on, the terminal goes through its startup sequence. The Welcome screen displays with a Configure the Ethernet Network button.

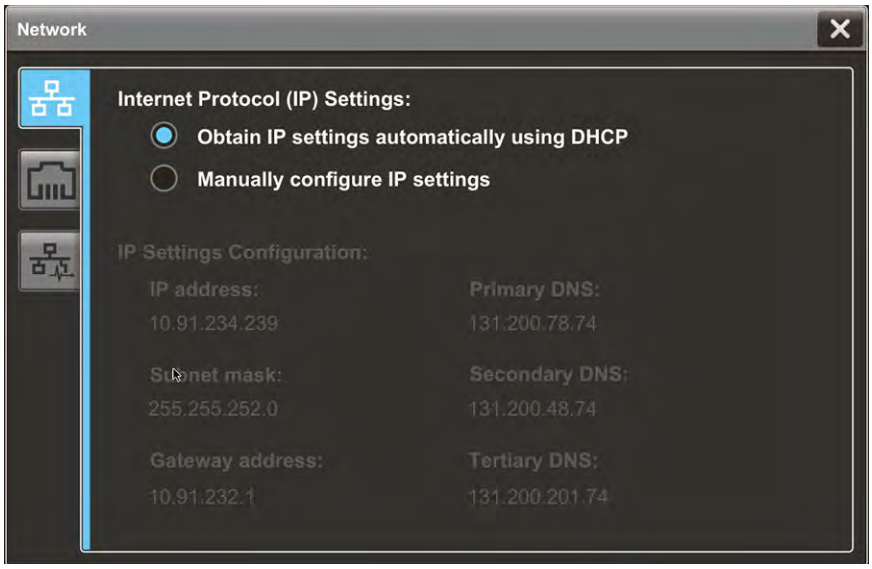
To configure the Ethernet settings and update the firmware, follow these steps.

1. Start up the terminal.

   The Welcome dialog box displays.

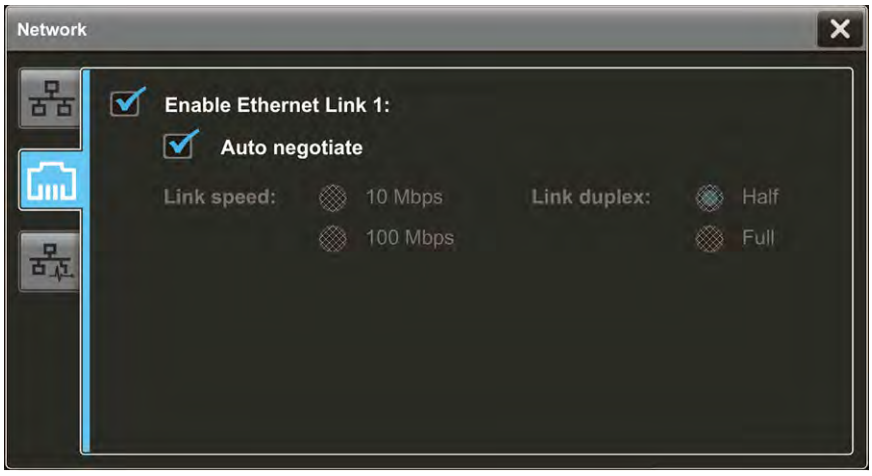
2. Tap Configure the Ethernet Network.

   The Internet Protocol (IP) Settings dialog box displays.



3. Configure the IP settings for the terminal.
   - To obtain an IP address automatically, see Use DHCP to Assign an IP Address for the Terminal on page 47.
   - To configure IP settings manually, see Assign a Static IP Address for the Terminal on page 48.
4. Tap the Ethernet icon.
5. Configure the Ethernet ports for the terminal.

   See Configure the Ethernet Port on page 50.



6. Update the firmware by using the ControlFLASH™ software.

   Begin the update at Get the Terminal Firmware on page 87.

You can now download a View Designer application to the terminal. After the application is downloaded, the terminal resets then automatically launches the application.

Runtime Environment

During runtime, the PanelView™ 5310 terminal runs HMI projects. A project is configured and downloaded to your terminal from the View Designer application. The project launches each time that the terminal restarts.

The terminal exchanges data values with the controller, animates the displayed data, and responds when you press keys or touch a screen or element on a screen.

During runtime, you can perform these tasks:

- Navigate screens and their graphic elements
- View and manage alarms
- View and perform operations on a trend chart
- Display error information
- Configure terminal settings and view diagnostic information

Here is an example of a screen in a project that is downloaded to the terminal.

Item	Name	Description
1	Alarm status indicator button	Opens the Alarm Summary screen. A button on the screen turns red and flashes when there are active alarms that are unacknowledged. The button returns to its pictured default state with a gray icon when all alarms return to normal, even if alarms are unacknowledged.
2	Unacked (unacknowledged) number	Displays the number of unacknowledged alarms in the project, regardless of the inhibit state of the alarms.
3	Previous button	Opens the previous screen in the navigation history of the terminal.
4	Next button	Opens the next screen in the navigation history of the terminal. **IMPORTANT:** Using the Next button requires that a previous screen is first displayed.
5	Navigation button	Displays the navigation menu at the bottom of the screen. Use the Navigation menu to display shortcuts and folder contents.
6	Log On	Logs you on and off the project. The name of the logged-on user appears in the system banner. **IMPORTANT:** The logged-on user sees only the screens for which the user has access.
7	General Di agnostics status	Displays data log status and project event errors when the following conditions occur: • The data log is exporting. • The data log is in error while collecting data or exporting. • The media containing the data log is ready to remove without corrupting files or making files read-only on the USB storage device or SD card. • Tags in the data log are in error. You can select the icon to view the error details. A data log status icon only appears when a project contains a data log and there are no project event errors. • Project events and data logs are in error. You can select the icon to open the predefined popup for data log and project event status details. • Project events are in error. You can select the icon to view the error details. The Project Event Error ion only appears when a project event is in error.
8	Network status	Appears only if there is an issue with network communication. Tap the icon to open the Device Configuration Network popup for details about the issue.
9	Controller status	Appears only if there is an issue with the controller. Tap the icon to open the Controllers popup for details about the issue.
10	Time and date	Displays the current time and date.
11	System banner	Appears at the top of each screen in a project.
12	Project screen	Displays screens, shortcuts, and popups of a project that is created in the View Designer application.
13	Navigation menu	Displays menu items that you have access to when you are logged in. To display the navigation menu, press the Navigation button below the screen or in the system banner above the screen. You can tab to menu items to open the screens of the project. Tap a menu item to display that project in the screen. The navigation menu also provides access to the Settings menu for the terminal.

Enter Data With Virtual Keyboards

The virtual keyboard or virtual numeric keypad opens during runtime when text or numeric input is required.

- The virtual keyboard opens on the PanelView 5310 terminal screen when you tap a field or element that requires text or numeric input.
- The virtual numeric keypad opens on the PanelView 5310 terminal screen when you tap a field or element that requires only numeric input.

Figure 8 - Virtual Keyboard

Table 16 - Virtual Keyboard Description

Item	Feature	Description
1	Text entry field	Tap the letters, numbers, and character keys to enter text into this field. The text entry field is always active when the keyboard is open.
2	Clear	Tap this button to remove all characters that are entered in the text entry field.
3	Backspace	Tap this key to delete one character to the left at a time.
4	éüç	Tap this key to toggle between Roman characters and alpha-European characters. Numeric keys are not part of the alpha-European keyboard.
5	Arrow keys	Tap the left arrow key to move the cursor one space to the left. Tap the right arrow key to move the cursor one space to the right.
6	Cancel	Tap Cancel to cancel the entry.
7	OK	Tap OK to complete the entry.
8	Space bar	Tap the space bar to enter a space in the text entry field.
9	#?= ABC	Tap this key to toggle between symbols and alpha-numeric characters: • When in symbol mode, the key displays as ABC. • When in alpha-numeric mode, the key displays as #?=.
10	Shift	Tap this key to toggle the keyboard between uppercase and lowercase letters. The keyboard returns to lowercase characters after one character has been entered.
11	Caps lock	Tap this key to toggle the keyboard between uppercase or lowercase letters. The keyboard remains in the selected state until you tap this key again.

Figure 9 - Virtual Numeric Keypad

Table 17 - Virtual Numeric Keypad Description

Item	Feature	Description
1	Numeric entry field	The numeric entry field into which you type the numeric value for the graphic element.
2	Min-Max value	The displayed minimum and maximum values you can enter for the selected field or element.
3	Clear	Tap the X to remove all numbers that are entered into the numeric entry field.
4	Backspace	Tap the backspace button to delete one number to the left at a time.
5	+ _	Tap the positive-negative value button to toggle between a positive or negative number.
6	Cancel	Tap Cancel to cancel the entry.
7	OK	Tap OK to complete the entry.

Specify Keypad or Keyboard Size

If you prefer to work with a larger-size keypad or keyboard, PanelView provides a larger size option.

To specify the keypad or keyboard size, follow these steps.

1. In View Designer, select Project Properties.
2. In the Project Properties dialog box, select Application in the left panel.

3. In the Keypad and Keyboard Size section, select either Normal or Large.

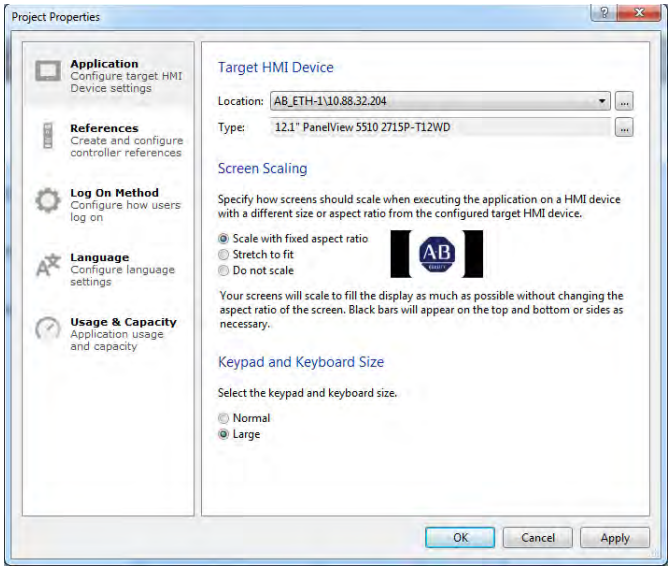

Figure 10 provides a comparison between the Normal and Large size keypad. The larger size of both the keypad and keyboard gives you easier touch operation, which is useful if you use gloves during equipment operation.

Figure 10 - Normal versus Large Keypad

Normal Size Keypad

Large Size Keypad

Log On to the Terminal

When you log on to the terminal, the screens that you have security access to appear as items in the navigation menu. For example, if you have been assigned the administrator role, all screens that have administrator access appear in the navigation menu.

TIP
- The Guest user is logged on automatically at system startup. Anyone that is not logged on to the system can view or access only those screens assigned the level of security that is given to the Guest user account.
- Screen security and user roles are assigned in Studio 5000 View Designer® and cannot be modified on the PanelView 5310 terminal.

To log on to the terminal, follow these steps.

1. In the system banner at the top of the screen, tap 
.

   The Log On dialog box opens.

2. Tap the User Name field.

   The virtual keyboard opens.
3. To enter your user name with no spaces, tap the keys.
4. Tap OK.
5. Tap the Password field.

   The virtual keyboard opens.
6. To enter your password with no spaces, tap the keys.

   Passwords are case-sensitive.
7. Tap OK.
8. Tap Log on.

   The Log On dialog box closes and your user name appears on the Log On button on the status banner.

TIP
- You can only be logged on as one user at a time.
- If you are already logged on to the terminal, you can log on as another user. Open the Log On dialog box, enter another user name and password, then tap Log On.

Log Off of the Terminal

When you log off, these actions occur:

- The Guest user is logged in by default.
- If the Guest user has access to the current screen, the terminal continues to display the current screen.
- If the Guest user does not have access to the current screen, the Home screen for the project is displayed.

To log off the terminal, follow these steps.

1. In the status banner at the top of the screen, tap 
that shows your user name.

   The Log On dialog box opens.

2. Tap Log Off.

   You are logged off the terminal.

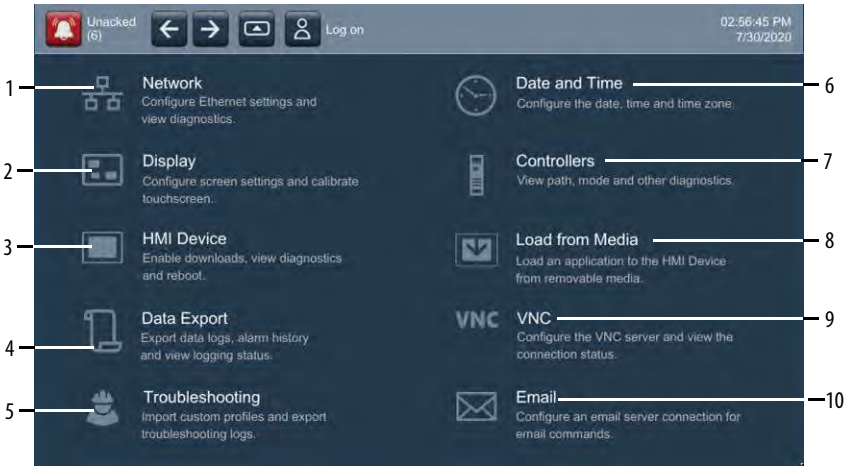
Settings Menu

You can access configuration parameters and systemwide information for the terminal from the Navigation menu.

To open the Settings menu, follow these steps.

1. On an application screen, press  .

2. On the Settings screen, tab to the menu item and press Enter.



Item	Menu Topic	Tasks That You Can Perform
1	Network	• Configure a static or dynamic device IP address • Configure Ethernet Link 1 settings • View network diagnostics
2	Display	• Adjust the brightness of the display • Enable or disable the screen saver • Configure the screen saver settings • Calibrate the touch screen
3	HMI Device	• Enable or disable downloads and firmware updates • Enter an HMI device name • View the catalog number and current firmware revision • View terminal diagnostic information • Restart the terminal
4	Data Export	• Export data logs • Remove the SD™ or SDHC™ card safely • View data logging status • Export alarm history
5	Troubleshooting	• Select a default or imported profile for troubleshooting • Save the troubleshooting log to a USB drive or SD card for Rockwell Automation technical support
6	Date and Time	• Set the date and time on the terminal • Set the time zone on the terminal
7	Controllers	• View general information for the controller • View diagnostic information for the controller
8	Load from Media	• Load an application to the HMI device from removable media
9	VNC	• Configure the VNC server and view the connection status
10	Email	• Configure the terminal to send and receive email

Configure the IP Address of the Terminal

You can configure the IP address of the terminal to use the Dynamic Host Configuration Protocol (DHCP), or manually configure a static IP address.

A project is downloaded to the terminal from the View Designer software through the IP address of the terminal.

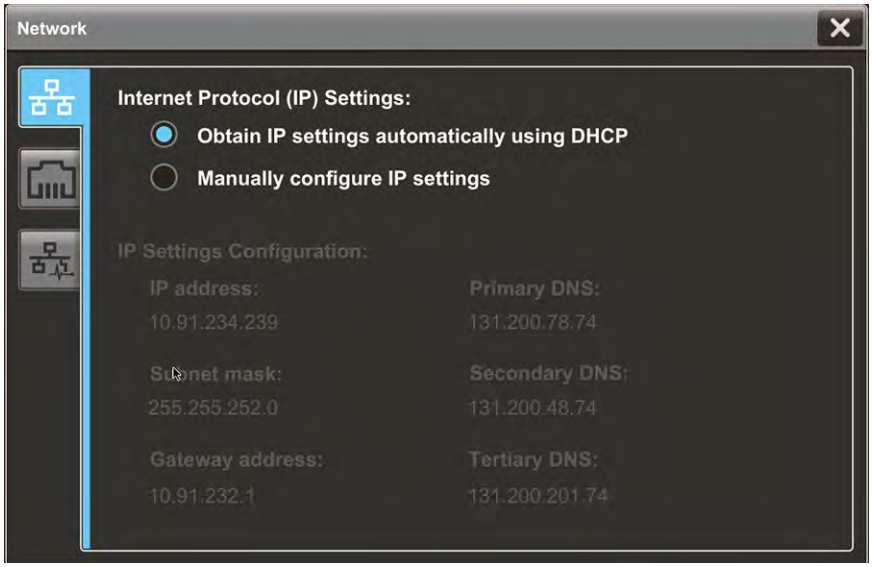
TIP You cannot configure network IP addresses in the View Designer software.

Use DHCP to Assign an IP Address for the Terminal

In a DHCP configuration, the network assigns the IP address, subnet mask, and default gateway address fields.

To configure DHCP for the terminal, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .
3. Tap the Obtain IP settings automatically using DHCP radio button.

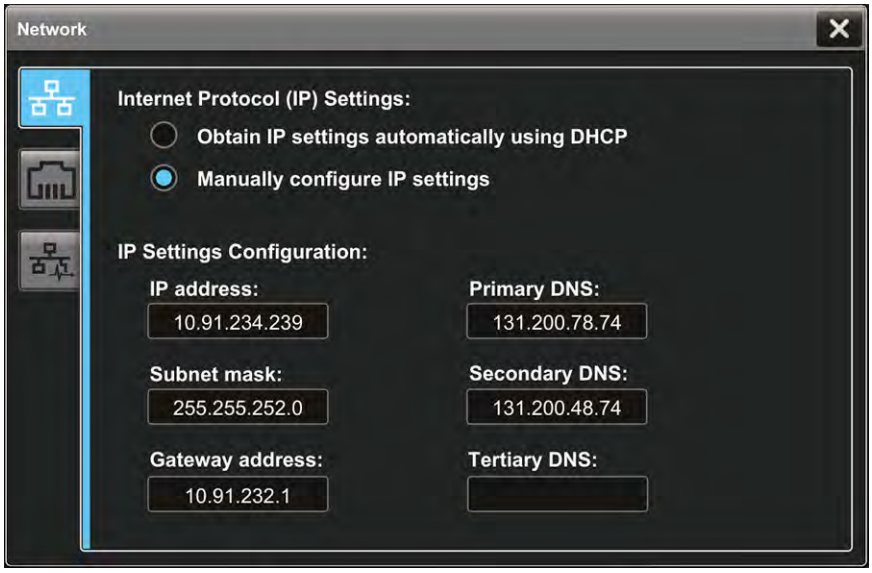


4. To close the window, tap  .

Assign a Static IP Address for the Terminal

To assign a static IP address for the terminal, follow these steps.

1. On an application screen, press .
2. On the Settings screen, tap .
3. Tap the Manually configure IP settings radio button.



Follow these guidelines to assign the IP Settings Configuration.

Parameter	Description
IP address	The range of values for the first set of numbers is 1…255. The range of values for last three sets of numbers is 0…255
Subnet mask	The subnet mask address must be identical to server subnet mask.
Gateway address	Optional address.

4. Tap the IP address field.

   The virtual keyboard opens.
5. To enter the IP address, use the virtual keyboard.
6. Tap OK to close the virtual keyboard.
7. Repeat steps 4...6 for the subnet mask and the Gateway address fields.
8. To close the window, tap .

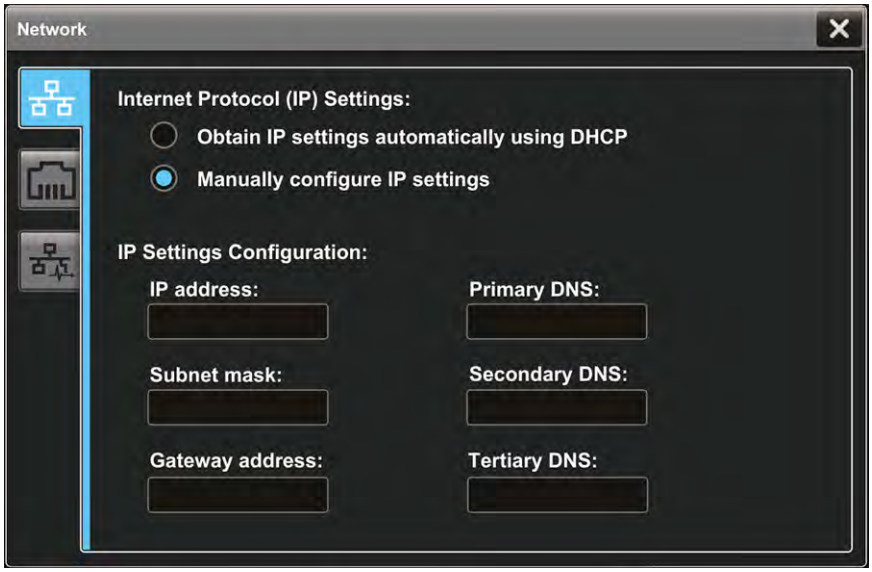
Configure a DNS Address for the Terminal

The domain name system (DNS) translates Internet domain and host names to IP addresses. DNS automatically converts a name that is typed in a web browser address bar to the IP addresses of web server that host that site. You can configure DNS addresses for common domain or host names.

TIP You cannot configure DNS addresses within the View Designer software.

To configure a DNS address for the terminal, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .
3. Tap the Manually configure IP settings radio button.



Follow these guidelines to assign the DNS settings.

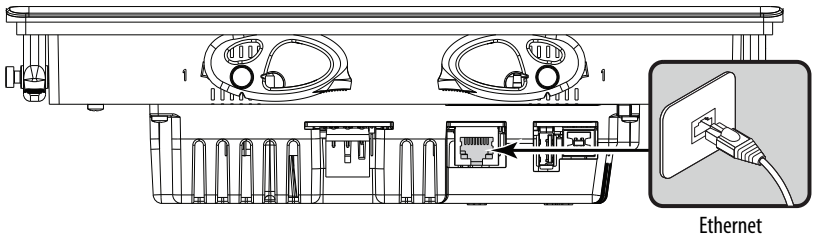
Parameter	Description
Primary DNS	The range of values for this address is 0…255
Secondary DNS	The range of values for this address is 0…255
Tertiary DNS	The range of values for this address is 0…255

4. Tap the Primary DNS field.

   The virtual keyboard opens.
5. To enter the DNS address, use the virtual keyboard.
6. Tap OK to close the virtual keyboard.
7. Repeat steps 4…6 for the Secondary DNS and the Tertiary DNS fields.
8. To close the window, tap  .

Configure the Ethernet Port

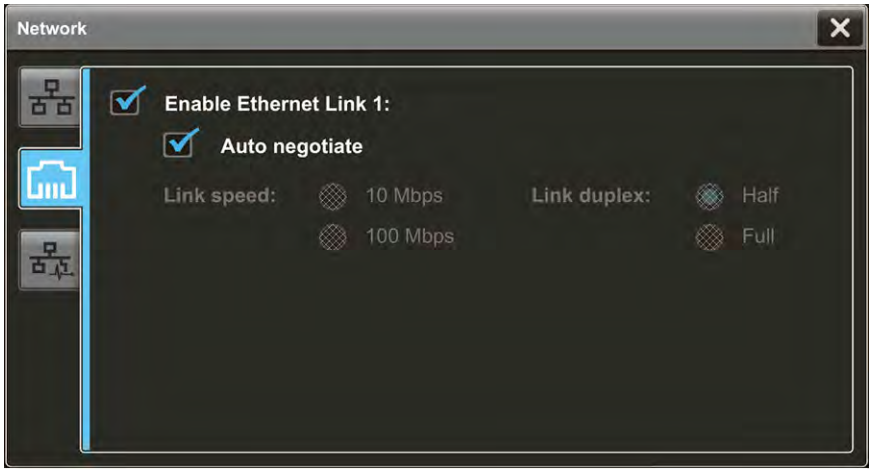
You can configure the link speed and duplex mode for the Ethernet port on the terminal. The port is identified as Ethernet Link 1.



TIP You cannot configure the Ethernet port within the View Designer software.

To view or change the link settings of the Ethernet port, follow these steps.

1. On an application screen, press .
2. On the Settings screen, tap .
3. Tap the Ethernet icon.



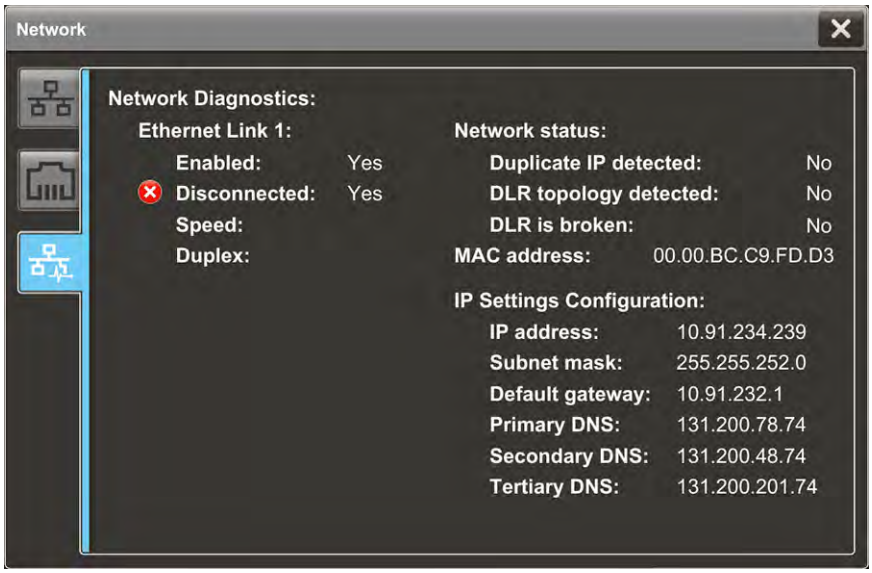
4. Select the Ethernet options for your network configuration:
   - Tap the Enable Ethernet Link 1 checkbox to add or remove the check mark. The option is enabled when the box is checked.
   - To set the speed and duplex options that are based on the network connection, tap the Auto negotiate checkbox. The option is enabled when the box is checked.
   - To set the speed and duplex options, tap the Auto negotiate checkbox to remove the check mark from the box. Then tap the speed and duplex options for your network.
5. To close the window, tap .

View the Network Diagnostics

From the Network Diagnostics screen, you can view Ethernet Link 1 network connection data, network status data, and IP settings configuration data.

To view the Network Diagnostics screen, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .
3. Tap the network diagnostic icon.



4. To close the window, tap  .

Use the Data Export Feature

You can export a configured data log or alarm history from the terminal to removable media to view tag values collected on the terminal. The exported ZIP file contains individual CSV files for each data log in the project. You can then open the exported data log file on a personal computer to view the values in the data log.

To export a data log or alarm history to removable media, follow these steps.

IMPORTANT Before you can export a data log, verify that a FAT32-formatted USB device or SD card is inserted in the terminal.

1. On an application screen, press  .
2. On the Settings screen, tap  .

3. In the Export to file box, type a name for the export file.

   Datalog is the default name.
4. Under Destination, select the media type.
5. Tap Export.

   A progress bar appears to show export progress, and a data log popup displays the date and time of the last exported data log.
6. If an SD card is used, verify the following before you remove the media:
   a. After the data export completes and the progress bar disappears, tap 
   .
   b. Verify that the Data Logger status changes from Running to Remove SD card.
   c. You can safely remove the SD card.
7. To close the window, tap  .

Adjust the Brightness of the Display

You can adjust the brightness level of the terminal display in increments from 1...100%.

- 1% is the minimum display visibility.
- 100% is the maximum display visibility.

TIP Lower the brightness level to reduce the power that the backlight consumes, and extend the life of the backlight.

These tags can also be set to control backlight brightness level:

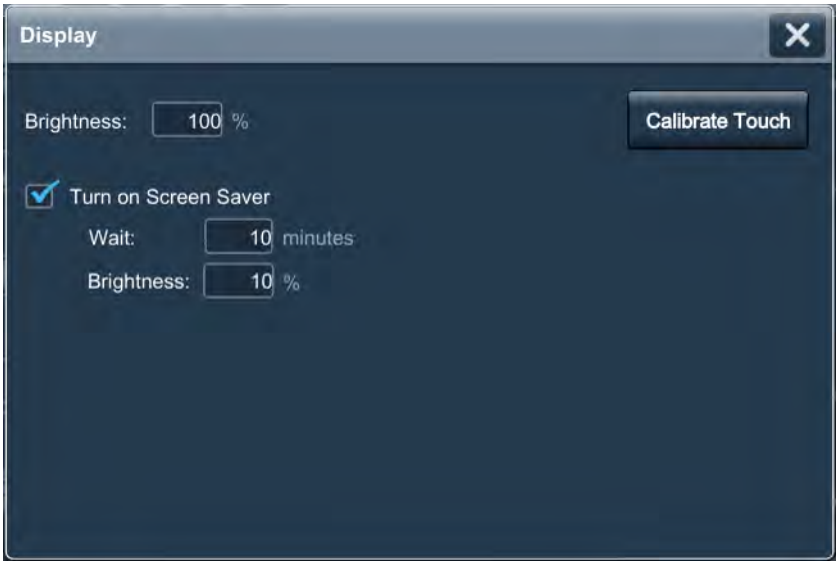
::Local:HMIDevice.Display.BacklightIntensity

::Local:HMIDevice.Display.ScreenSaverIntensity

To adjust the brightness of the display, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .
3. Tap the Brightness field.

   The virtual numeric keypad opens.

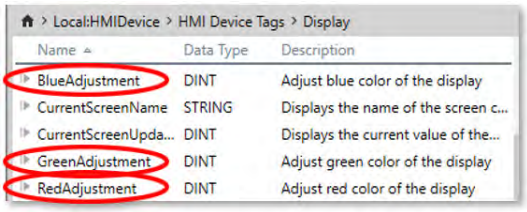


4. Enter the value for the brightness in increments from 1...100%.
5. Tap OK.
6. To close the window, tap  .

Modify Screen Color Settings By Using HMI Device Tags

If you need to adjust the color of the PanelView 5000 LCD display, there are three HMI device tags available under the Display category:

- BlueAdjustment
- GreenAdjustment
- RedAdjustment



To use these tags, bind them to Numeric Input elements you put on your custom screen. The default value for each color is 50. To make the color more or less pronounced, enter higher or lower values using your Numeric Inputs.

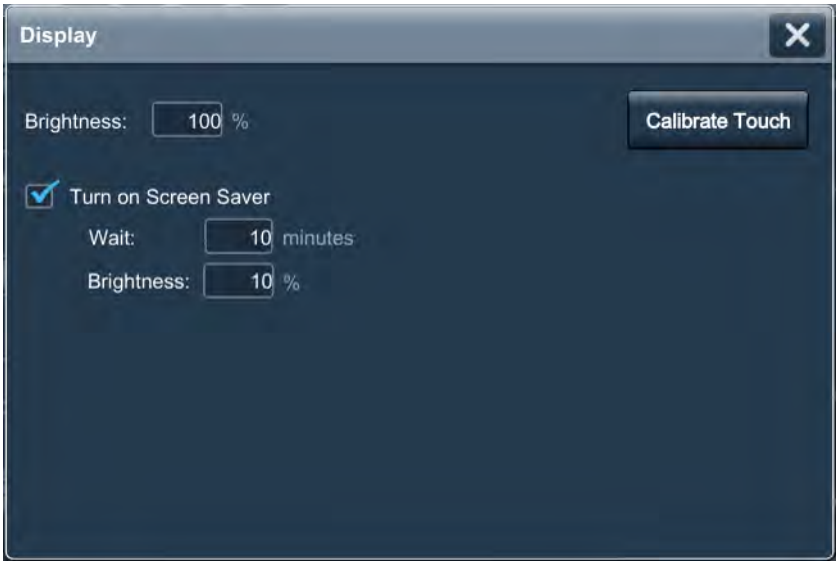
Configure the Display Screen Saver

The screen saver extends the life of the back light by dimming the brightness level when activity is not sensed for a specified amount of time. When the screen saver is activated, the terminal displays a moving image at a reduced brightness level. When user input is sensed, the screen saver is deactivated and the display brightness returns to its configured level.

TIP After the screen saver is deactivated, touch or keypad input is ignored for at least 0.5 seconds.

To configure the brightness and screen saver for the display, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .



3. To add or remove the check mark next to Turn on Screen Saver, tap the checkbox.

   The option is enabled when the box is checked.

4. Tap the Wait field.

   The virtual numeric keyboard opens.

5. Enter the number of continuous, idle minutes from 1...5999 to wait before activating the screen saver.

   The default is 10 minutes.

6. Tap OK.

7. Tap the Brightness (%) field.

   The virtual numeric keyboard opens.

8. Enter the value for the brightness in increments from 1...100%.

9. Tap OK.

10. To close the window, tap  .

Calibrate the Touch Screen

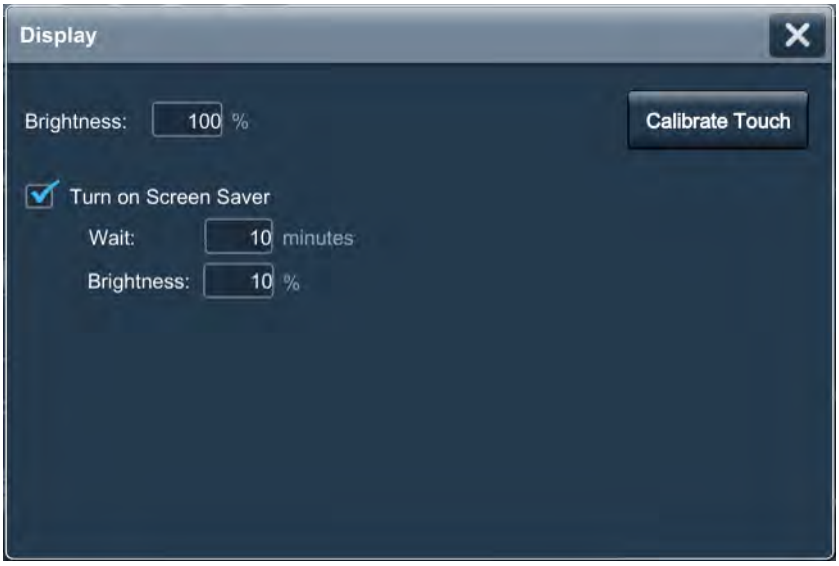
The touch screen is calibrated at the factory. After installation, you can recalibrate the touch screen to compensate for parallax if the screen is viewed at an angle.

The calibration process requires you to touch a series of targets on the screen.

IMPORTANT For accuracy and to help prevent damage to the touch screen, use a plastic stylus device with a minimum tip radius of 1.3 mm (0.051 in.).

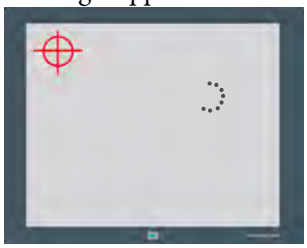
To calibrate the touch screen, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .



3. Tap **Calibrate Touch**.

   A red target appears on the screen.



4. Press and hold the center of the target until the target completes the circle.

   The next target appears.

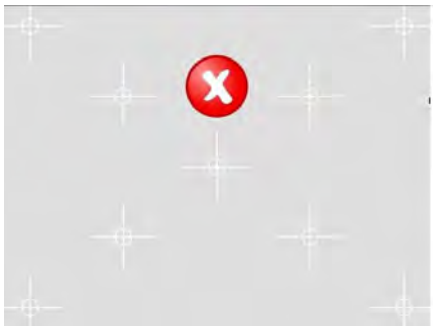
   TIP Touch inside the target areas before the progress indicator completes a circle.

5. Continue to press and hold the centers of all remaining targets as they appear.

   All processed targets are replaced with white targets.

A green circle with a check indicates a successful calibration.

A red circle with an X indicates a failed calibration.



If the calibration fails, the process automatically repeats. Continue the calibration until the calibration is successful.

TIP The calibration is retained after a reset or power cycle.

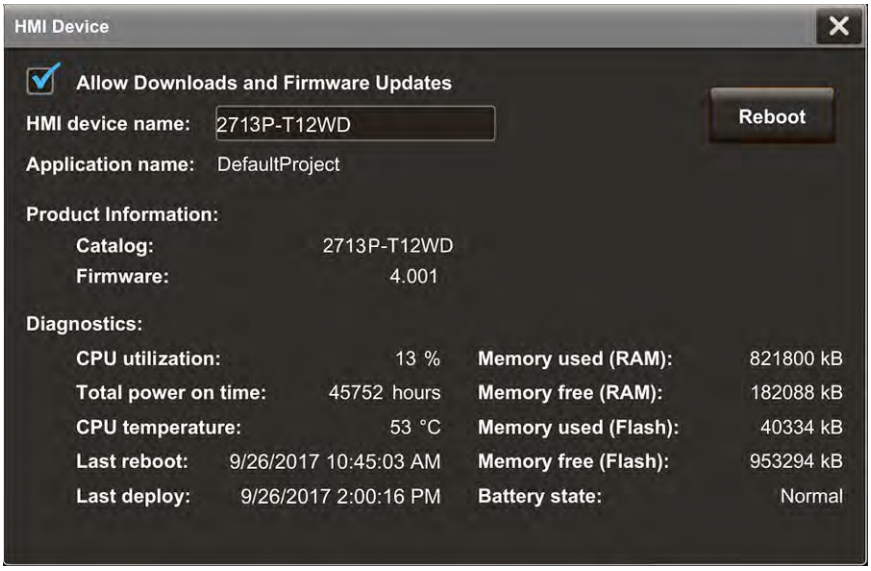
6. Tap OK.
7. To close the window, tap .

Disable Downloads to the Terminal

As a security measure, you can disable downloads to the terminal, including application downloads and firmware updates. Disable downloads to help prevent the current application from being replaced when an application is downloaded from the View Designer application.

To disable downloads to the terminal, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .



3. Tap the Allow Downloads and Firmware Updates checkbox to clear the checkbox.
   - Downloads are not permitted when the checkbox is cleared.
   - Downloads are permitted when the checkbox is checked.
4. To close the window, tap  .

While this setting is unchecked, you cannot download another application to the terminal or update the terminal firmware.

Attempts to download an application from the View Designer application results in an error.

Change the HMI Device Name

Each terminal has a unique default HMI device name that identifies it to other devices on the network. You can view or change this name.

To view or change the HMI device name, follow these steps.

1. On an application screen, press .
2. On the Settings screen, tap .

   The HMI device name field shows the current name.

3. Tap the HMI device name field.

   The virtual keyboard opens.

4. To enter or modify the current name, tap the virtual keyboard keys.

   TIP
   - You can enter up to 15 characters including letters, numbers, and hyphens.
   - The first character of the terminal name must be an upper or lowercase letter.

5. Tap OK.
6. To close the window, tap .

View the Firmware Revision

You can view the current firmware revision on the terminal. You need this information for firmware updates, or when you call technical support.

To view the firmware revision, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .

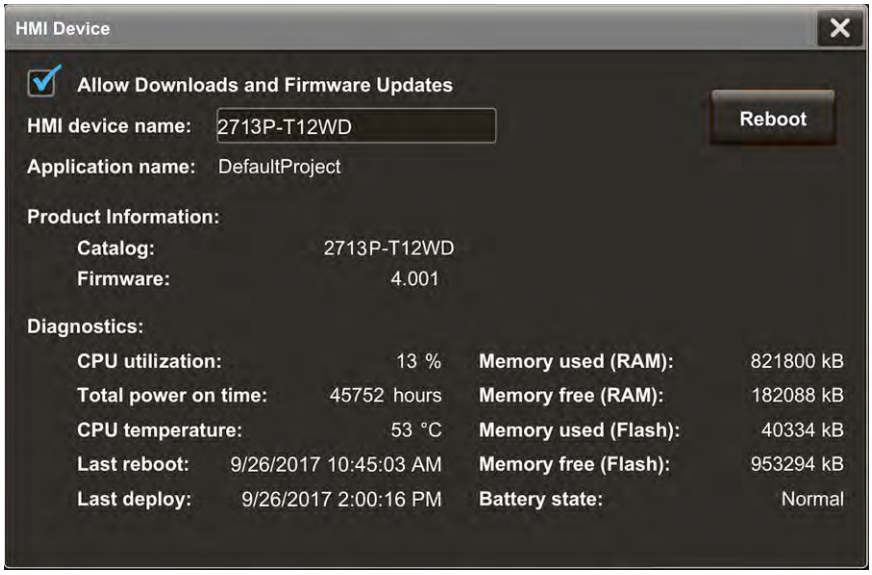
   View the firmware revision under Product Information.

3. To close the window, tap  .

Display Terminal Diagnostics

To view the diagnostic data for the terminal, follow these steps.

1. On an application screen, press .
2. On the Settings screen, tap .



3. View the information under Diagnostics.

Diagnostic Parameter	Description
CPU utilization	The processor usage.
Total power on time	The total time the terminal has been running (powered).
CPU temperature	Displays the current temperature of the CPU: • Normal: 25…94 °C (77…201 °F) • High: 100 °C (212 °F) and higher An over-temperature condition of 105…110 °C (221…230 °F) causes a delayed automatic system restart. The restarts continue indefinitely until the system is cool enough to resume normal operation.
Last reboot	Displays the date and time for the most recent restart of the terminal.
Last deploy	Displays the date and time of the most recent project application download.
Memory used (RAM)	The total RAM memory that is in use.
Memory free (RAM)	The total RAM memory that is remaining.
Memory used (Flash)	The total nonvolatile memory that is in use.
Memory free (Flash)	The total nonvolatile memory that is remaining.
Battery state	• Normal • Low • Depleted

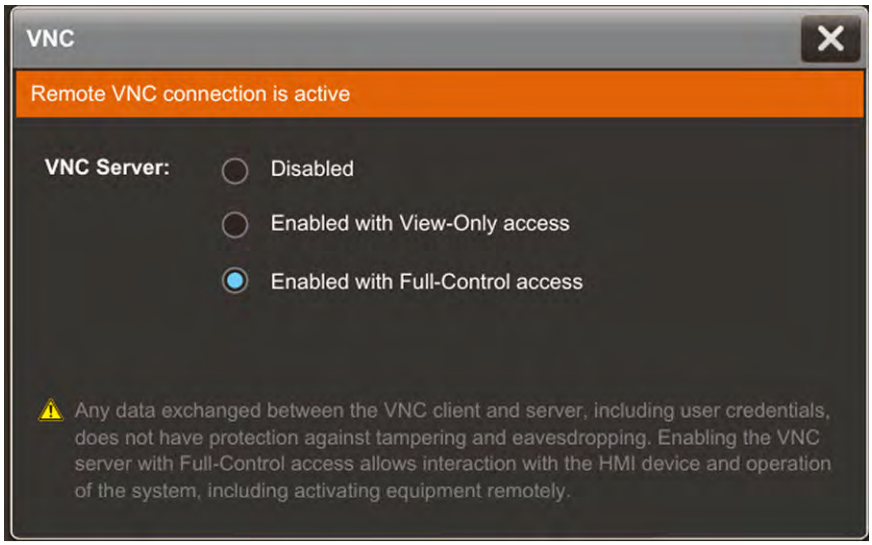
4. To close the window, tap .

Enable the VNC Server

You can enable VNC to connect remotely to a PanelView 5310 terminal. Use the Remote Connectivity screen to enable or disable the VNC server.

To enable or disable a VNC connection, follow these steps.

1. On an application screen, press .
2. On the Settings screen, tap **VNC**.



3. Select an access:
   - **Disabled:** Disables the VNC server
   - **Enabled with view-only access:** You can only view content on the HMI device
   - **Enabled with full-control access:** You can view content and interact with the HMI device

     TIP A warning displays with full-control access that the full-control connection is unprotected.

4. To close the window, tap .

Load an Application from Removable Media

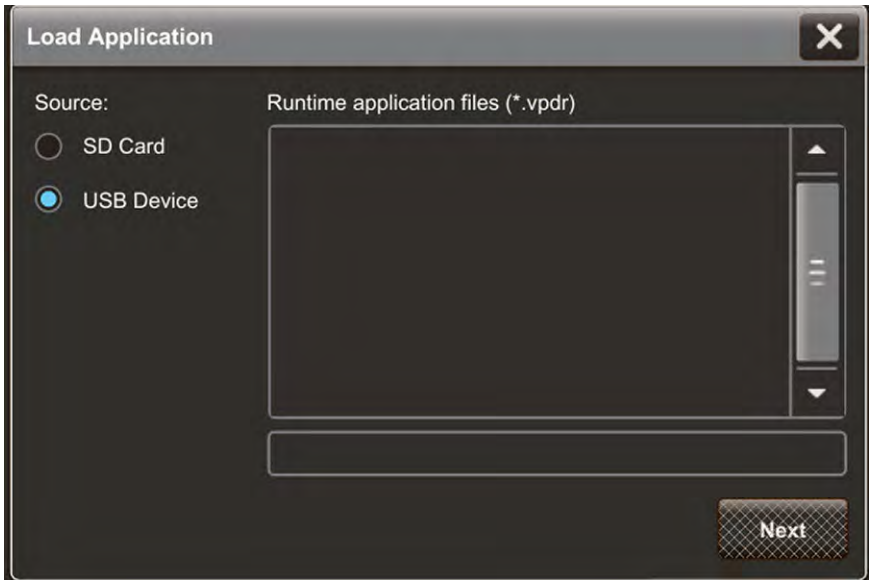
You can load a runtime application from removable media to the HMI device. For PanelView terminals with firmware version 6.0 or higher, if you load a runtime application and it requires a different firmware version than the version on the PanelView terminal, the Load from Media procedure updates the firmware.

To load a runtime application from removable media, follow these steps.

1. Insert a USB storage device or SD card with the runtime application into the HMI device.

   IMPORTANT Verify the following before you insert removable media into the terminal:
   - The format is FAT32 for the USB device or the SD card
   - The media has write permissions and sufficient space

2. On an application screen, press  .
3. On the Settings screen, tap  .



4. Select the appropriate source.
5. From the Runtime application files panel, select the runtime application to load.
6. The application appears in the box underneath the Runtime application files panel.
7. Tap  .
8. Under HMI to controller path, specify the path to use to load the runtime application:
   - **Keep path currently in use on HMI device:** Use the controller path currently used on the HMI device; the current HMI to controller path appears
   - **Load path defined in the runtime application file:** Use the controller path configured in the runtime application on the removable media

Note: To allow Load from Media to install a new revision of firmware on the PanelView 5000, copy the firmware .dmk file to the root directory of the SD card or USB drive. The firmware major revision must match the major revision of View Designer used to create the .vpdr project. Firmware .dmk files are usually a part of the Studio 5000 install located at: C:\Users\Public\Documents\Rockwell Automation\Firmware Kits.

9. Tap Load.

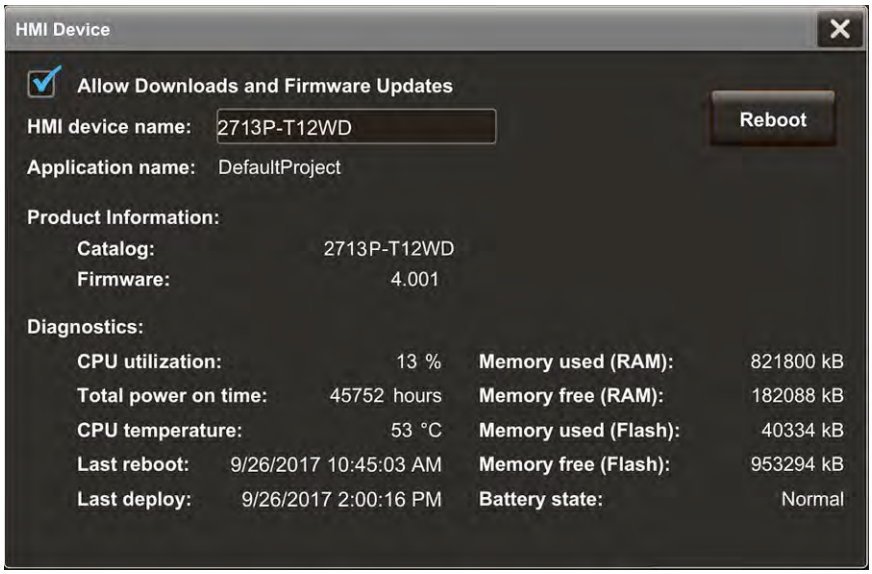
   The HMI device performs a firmware update if needed and then loads and runs the runtime application.
   The Home screen of the runtime application opens on the HMI device.

10. To close the window without performing the load from media, tap ✕.

Reboot the Terminal

To restart the terminal, follow these steps.

1. On an application screen, press .
2. On the Settings screen, tap .



3. Tap Reboot.

   You are prompted to confirm the reboot.

4. To reboot the terminal, tap Yes.

   If you tap Yes to reboot the terminal, it restarts and displays the project that is downloaded to the terminal.

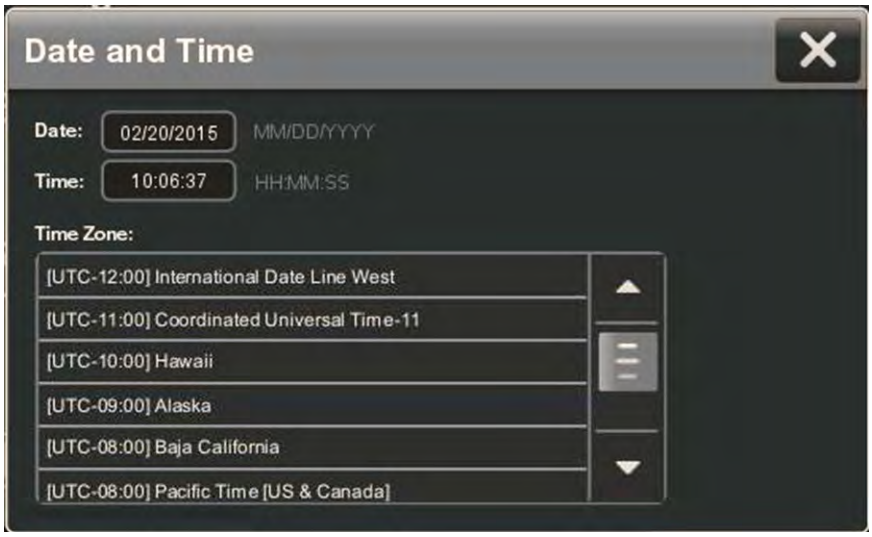
   To cancel, tap No, and then tap ✕ to close the window.

Change the Date and Time

You can change the date and time that is used for terminal operations. The date and time is displayed on the terminal screen and recorded in log files. You can also change the time zone for the terminal.

To change the date and time that is used for terminal operations, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap  .



3. Change the Date and Time fields as appropriate.
   a. Tap a Date or Time field.
      The virtual keyboard opens.
   b. Enter a value and tap OK.

Date and Time Parameters		Valid Values
Date MM/DD/YYYY Enter the date format including the '/' characters.	Year	Up to 2999
	Month	1…12
	Day	0…31
Time HH:MM:SS (24-hour format) Enter the time format including the ':' characters.	Hour	0…23
	Minute	0…60
	Second	0…60

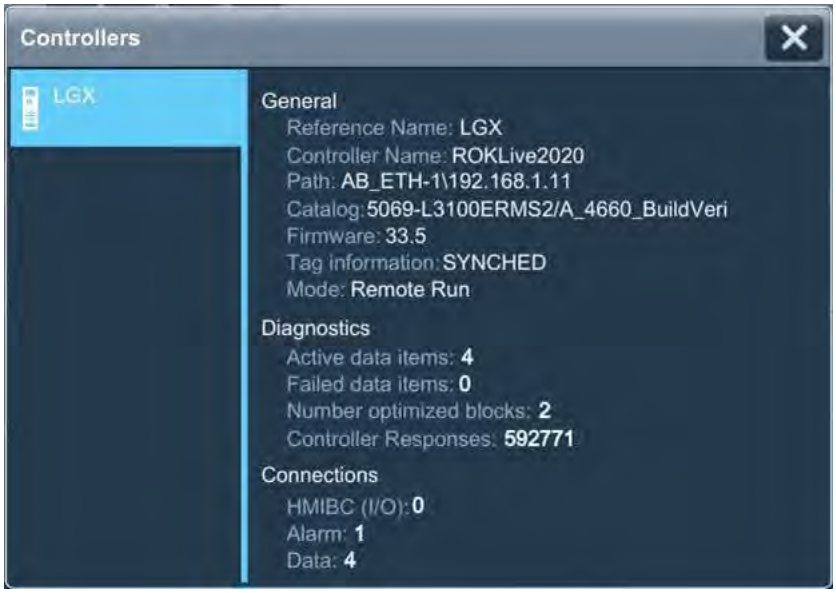
4. Change the time zone, if desired.
   a. To move up and down the list, press and drag the scroll bar (or press and hold an arrow button).
      Or tab to the list and use the arrows keys on the physical keypad of the terminal.
   b. Tap the time zone for the terminal.
      The time on the terminal is adjusted to match the selected time zone.
5. To close the window, tap  .

View Information for the Configured Controller

You can view general information for the controller that is configured to operate with the terminal.

To view the general information for the controller, follow these steps.

1. On an application screen, press  .
2. On the Settings screen, tap Controllers.



The general information for the controller includes the following data.

Data Type	Description
Reference Name	The name of the controller reference that is configured in the View Designer application. The name does not appear if a controller is not configured for the project.
Controller Name	The name of the controller that is configured in the Logix Designer application. The name does not appear if a controller is not configured for the project.
Path	The communication path for the controller. The path does not appear if a controller is not configured for the project.
Catalog	The Catalog number of the controller. The catalog number does not appear if the controller is disconnected from the network.
Firmware	The major and minor revision numbers for the firmware in the controller. The firmware revision numbers do not appear if the controller is disconnected from the network.
Tag information	The synchronization state to process changes from the controller. For example, the state can be Synchronized, Updating, or Detecting changes. Some tag information cannot appear if the controller tag information is not synchronized (UNINITIATED).
Mode	The operating mode of the controller. For example, the mode can be Run, Program, or Fault. The mode does not appear if the controller is disconnected from the network.

The diagnostic information for the controller includes the following data.

Data Type	Description
Active data items	The number of data items on scan for the controller.
Failed data items	The number of failed data items on scan for the controller.
Number optimized blocks	The numeric of optimized data blocks on scan for the controller.
Controller Responses	The number of responses received from the controller.

The connection information for the controller includes the following data.

Data Type	Description
HMIBC (I/O)	The number of Class 1 Common Industrial Protocol (CIP) connections to the controller.
Alarm	The number of alarm CIP connections to the controller.
Data	The number of Class 3 CIP connections to the controller.

3. To close the window, tap  .

Notes:

Monitor and Manage Control System Alarms

Topic	Page
Alarm Indicator	69
Alarm Help Menu	70
View the Alarm Summary	72
Manage the Alarms	73
Alarm Detail Pane Descriptions	74
Filter the Alarms	76

Alarm Indicator

The Unacked icon in the system banner displays the number of unacknowledged alarms for the system.

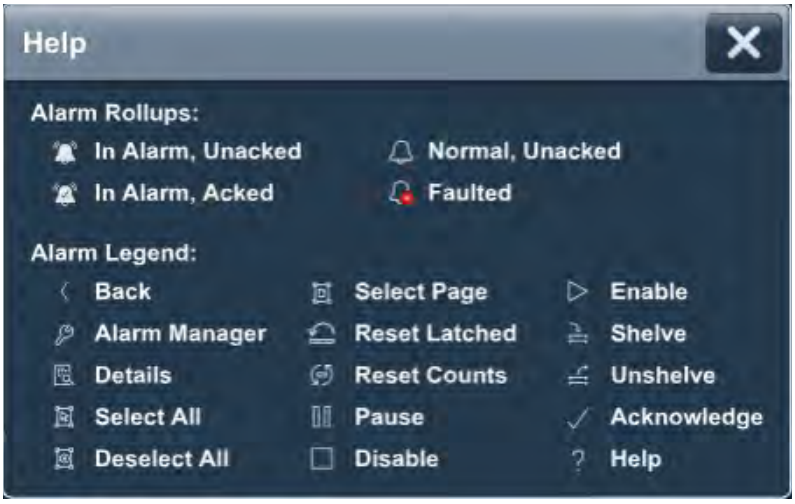
To open the alarm summary and view process and machine alarms, tap  .

Alarm Help Menu

To view a brief description of the alarm function keys and status counts, follow these steps.

1. Open the Alarm Summary (page 72) or Alarm Manager (page 73) screen.
2. Tap ?.

   The Help window displays a brief description of the alarm function keys and status counts.



3. To close the window, tap ✕.

See Table 18 for a detailed description of the alarm function keys and alarm status counts.

Table 18 - Alarm Function Key Descriptions

Symbol	Function Key or Message	Description
✓	Acknowledge	Indicates that you are aware of the alarm. This button changes the state of the alarm from unacknowledged to acknowledged.
	Alarm Manager	Opens the alarm manager screen. The alarm manager lists all alarms that are configured in the system and their current states. Therefore, the alarm manager shows alarms that are not shown in the alarm summary, and provides additional tasks for alarms.
〈	Back	Opens the previously displayed screen. When you open the alarm manager screen from the alarm summary screen, this button reopens the alarm summary screen.
	Deselect All	Deselects all alarms in the alarm table, including the alarms that are not displayed on the current page of alarms.
	Details	Hides or shows the details pane, which contains the details of the last selected alarm. The details pane appears on the bottom half of large alarm tables and replaces the list of alarms in medium alarm tables. If no alarm is selected, the details pane is empty.
□	Disable	Stops the alarm condition from being evaluated. In effect, turns off the selected alarm. You can only disable an entire alarm. You cannot disable an individual alarm condition.

Table 18 - Alarm Function Key Descriptions (Continued)

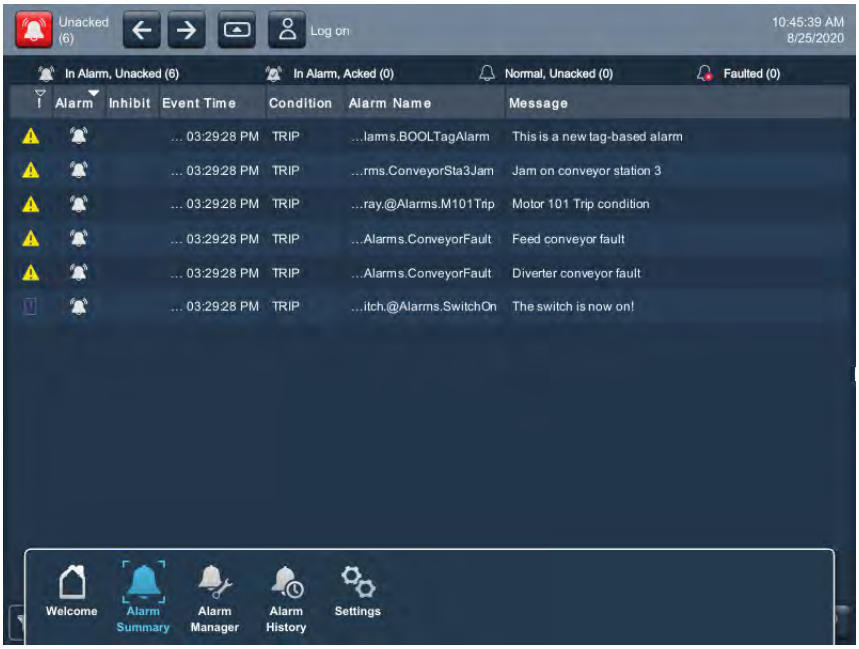
Symbol	Function Key or Message	Description
	Enable	Enables the selected alarms in the alarm manager table, which allows the alarm condition to be evaluated, which turns on the alarm. An enabled alarm enables all conditions for that alarm. You cannot enable an individual alarm condition.
	Faulted	Provides a count of the alarms in a faulted state.
	Help	Provides a description of the help buttons and alarm status.
	In Alarm, Acked	Provides a count of the alarms in an acknowledged state.
	In Alarm, Unacked	Provides a count of the alarms in an unacknowledged state.
	Normal, Unacked	Provides a count of the alarms where the input of the alarm has returned to normal, but the alarm has not yet been acknowledged.
	Pause	Stops updates to the alarm summary table for 10 seconds, or until another operation is performed on the table. While updates to the alarm summary table are paused, alarms in the controller are still evaluated. When the table is no longer paused, any changes to alarm states are reflected in the table and updates resume.
	Reset Counts	Resets the alarm count in the controller and the alarm count value in the details pane of the alarm manager table to zero. The reset is performed for all conditions of the currently selected alarm.
	Reset Latched	Sets the selected digital latched state of the alarm to normal if the input of the alarm has returned to normal. A reset of a digital latched alarm acknowledges the alarm, if it is not acknowledged.
	Select All	Selects all alarms in the alarm table, including the alarms that are not displayed on the current page of alarms.
	Select Page	Selects all alarms that are displayed on the current page of alarms.
	Shelve	Helps prevent the notification of new state changes to the selected alarm if the alarm is acknowledged. Updates to the alarm do not appear. The alarm remains shelved until the shelve duration from the controller expires automatically or you unshelve the alarm manually. Updates to the alarm then resume. When you shelve an alarm in the alarm summary table, you shelve only the selected alarm conditions. When you shelve an alarm in the alarm manager table, you shelve all conditions of the alarm. From the condition list in the details pane of the alarm manager table, you can also shelve individual alarm conditions.
	Unshelve	Unshelves the selected alarm in the alarm manager table, which allows notification of new state changes to alarms. From the condition list in the details pane of the alarm manager table, unshelve individual alarm conditions.

View the Alarm Summary

The alarm summary lists alarms that are in alarm or out of alarm but still unacknowledged. It displays one alarm condition per row. Use the alarm summary to monitor and interact with alarms.

To view the alarm summary for the control system, follow these steps.

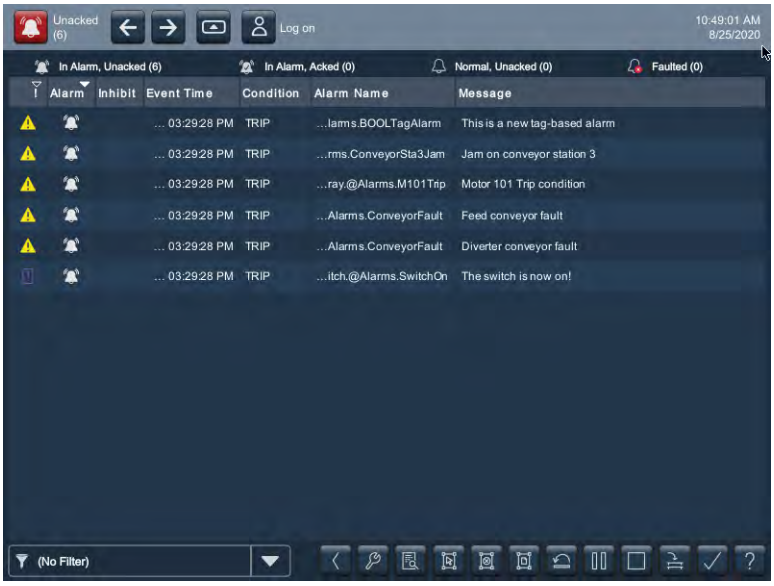
1. On an application screen, press  .



2. Tap  , or tab to the menu item and press Enter.

3. To interact with the alarms, tap the alarm function keys.

   See Alarm Help Menu on page 70 for a description of the keys.



4. To return to the navigation menu, tap the navigation button on an application screen.

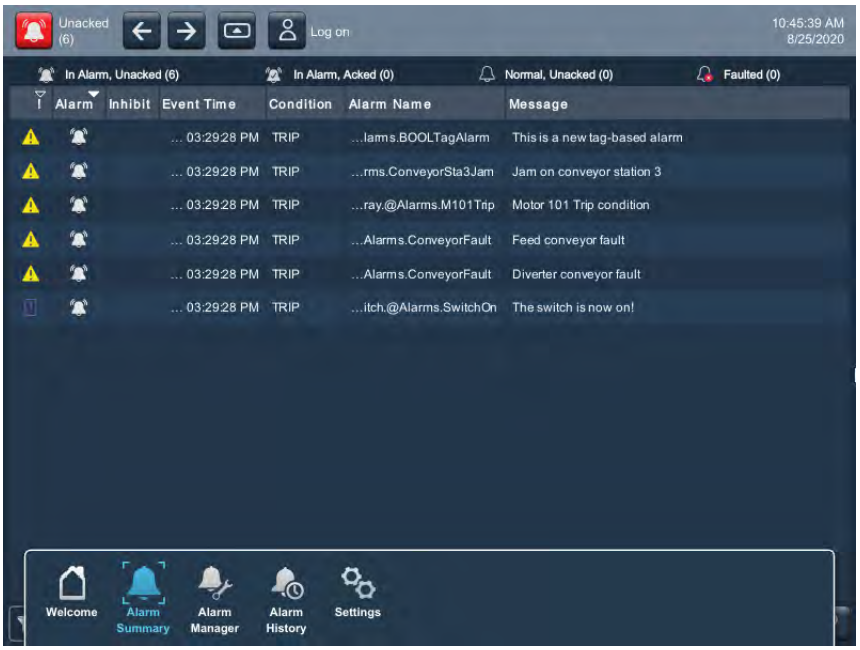
5. To return to the application screens, tap an application icon.

Manage the Alarms

The Alarm Manager lists all alarms that are configured in a system and their current states.

To manage the alarms for the control system, follow these steps.

1. On an application screen, press  .

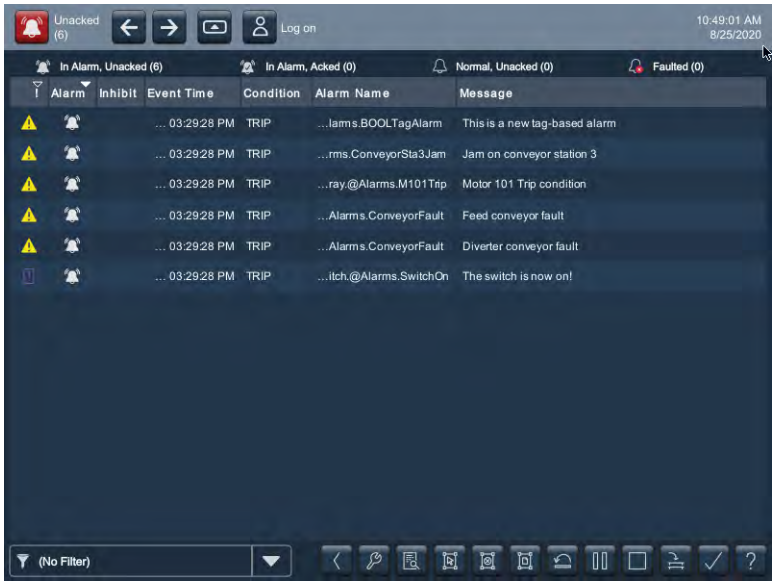


2. Tap 

, or tab to the menu item and press Enter.

3. To manage the alarms, tap the alarm function keys.

   See Alarm Help Menu on page 70 for a description of the keys.



4. To return to the navigation menu, tap  on an application screen.
5. To return to the application screens, tap an application icon.

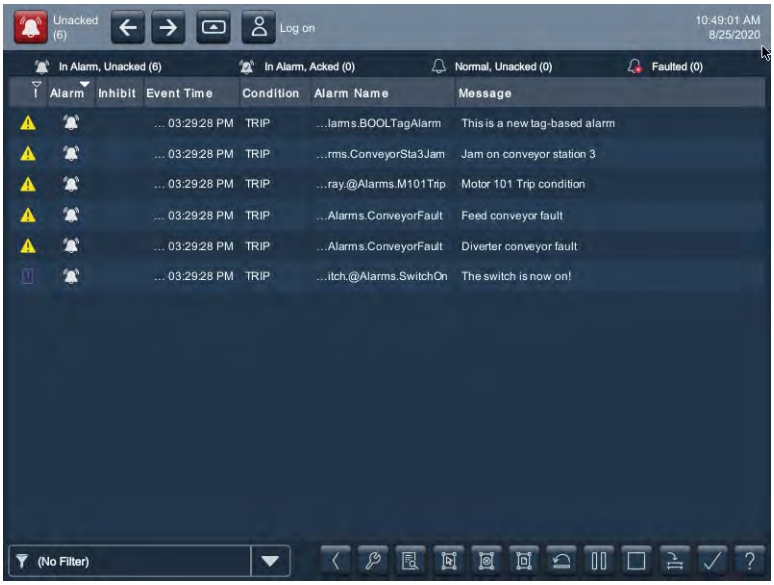
Alarm Detail Pane Descriptions

The details pane shows details for the selected alarm condition of a selected alarm. Condition details display the selected alarm condition in the alarm manager table.

To view the details pane for a selected alarm, follow these steps.

1. Open the Alarm Summary (page 72) or Alarm Manager (page 73) screen.
2. Tap  .

The details pane displays a list of alarm states and conditions.



Tap  again to toggle off the details pane.

See Table 19 for a description of the alarm details.

Table 19 - Alarm Detail Descriptions

Alarm Detail	Description
Acknowledge Time	The time the selected alarm was acknowledged.
Alarm Class	The user-defined class that is assigned to the alarm in the Studio 5000 Logix Designer project.
Alarm Count	The number of times the alarm condition has entered the In Alarm state.
Alarm State	The state of the alarm condition: • Normal Unacknowledged (Normal, Unacked) • In Alarm Acknowledged (In Alarm, Acked) • In Alarm Unacknowledged (In Alarm, Unacked) • Normal Acknowledged (Acknowledge)
Condition	• Analog conditions include: HIHI, HI, LO, LOLO, ROC_POS, and ROC_NEG • Discrete conditions include: TRIP and TRIP_L
Current Value	The current tag input value that results in the alarm state.
Disable Time	The time the selected alarm was disabled.
Enable Time	The time the selected alarm was enabled.

Table 19 - Alarm Detail Descriptions (Continued)

Alarm Detail	Description
Event Category	• Digital events are categorized as discrete. • Analog events are categorized as level.
Event Time	The date and time the alarm event occurred.
In Alarm Time	The time the selected alarm entered the In Alarm state.
Inhibit State	The value that is applied to the alarm condition that inhibits the alarm at some level. These states, indicated by an icon in the alarm table, include: • Bad Quality • Disabled • Suppressed • Shelved These states can be combined. When an alarm has multiple inhibit states that are applied, the icon of the highest inhibit state appears in the table.
Limit Value Exceeded	The condition limit that is assigned to the alarm in the Studio 5000 Logix Designer application project.
Max Shelve Duration	The maximum time the alarm can be shelved.
Message	The message that is assigned to the alarm in the Studio 5000 Logix Designer application project.
Name	The name of the alarm. This name includes the controller name of the alarm and the tag name. It can also include the name of the program if the tag is defined at the program level. Therefore, the alarm name can be configured in these configurations: ::ControllerName.TagName Or ::ControllerName\ProgramName.TagName
Out of Alarm Time	The time the selected alarm entered the Normal or Inactive state.
Priority	The urgency of the alarm condition: • Low • Medium • High • Urgent
Quality	The list of reasons why the alarm is of bad quality. This field is blank in the alarm summary because the alarm summary does not show bad quality alarms.
Severity	The numeric value that is mapped to the assigned priority of the alarm condition: • 1…250 (low) • 251…500 (medium) • 501…750 (high) • 751…1000 (urgent)
Shelve Duration	The default time for which the selected alarm condition is shelved to help prevent the notification of new state changes. Shelve duration is assigned to the alarm in the Studio 5000 Logix Designer project.
Shelve Time	The time the selected alarm was shelved.
Suppress Time	The time the selected alarm was suppressed.
Tag 1 Value	The value of the associated tag parameter 1.
Tag 2 Value	The value of the associated tag parameter 2.
Tag 3 Value	The value of the associated tag parameter 3.
Tag 4 Value	The value of the associated tag parameter 4.
Unshelve Time	The time the selected alarm was unshelved. If the alarm is shelved, this time is the time that the alarm is unshelved automatically when the shelve duration expires.
Unsuppress Time	The time the selected alarm was unsuppressed.

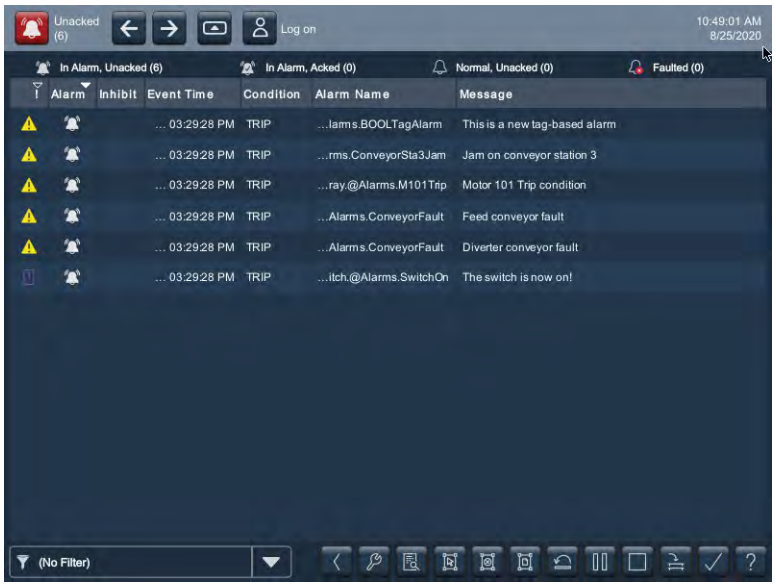
Filter the Alarms

You can filter the alarms to view only the alarms in the selected alarm state.

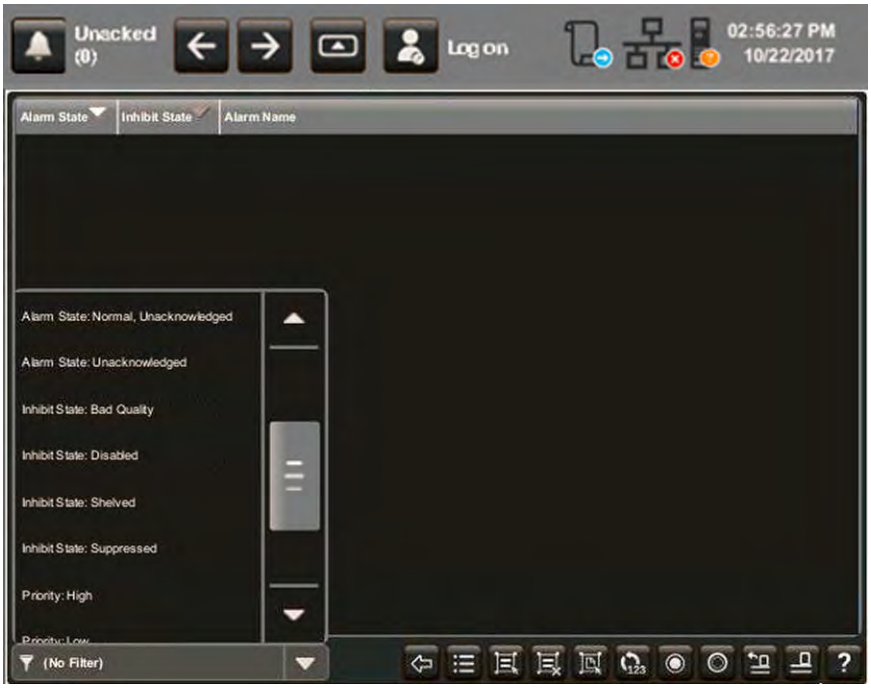
TIP Filters are defined for the alarm summary, alarm manager, and alarm history viewer in View Designer.

To filter the alarms, follow these steps.

1. To the right of the filter field, tap .

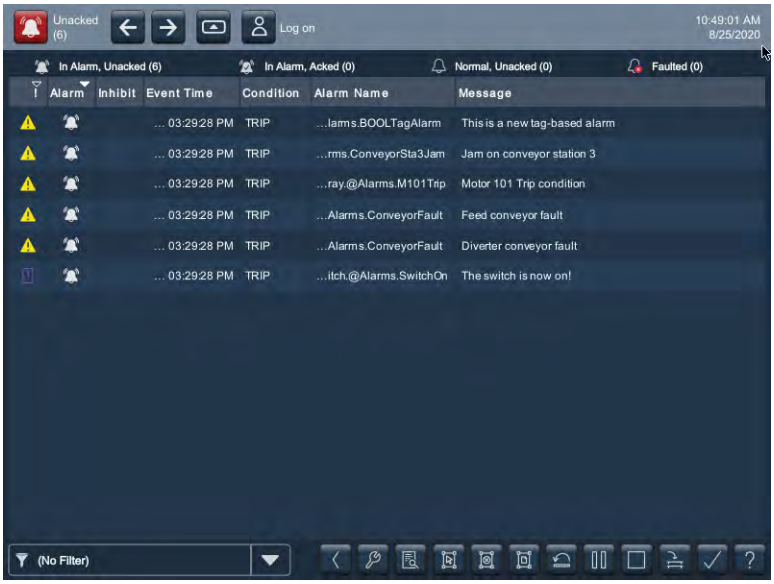


2. To scroll through the filter choices, tap the up or down arrows on the scroll bar.



3. Tap the alarm filter that you want to use.

The selected filter displays in the filter pull-down menu.



To change the filter, tap the filter pull-down menu and select another filter.

To turn off the filter, tap (No Filter).

View the Alarm History

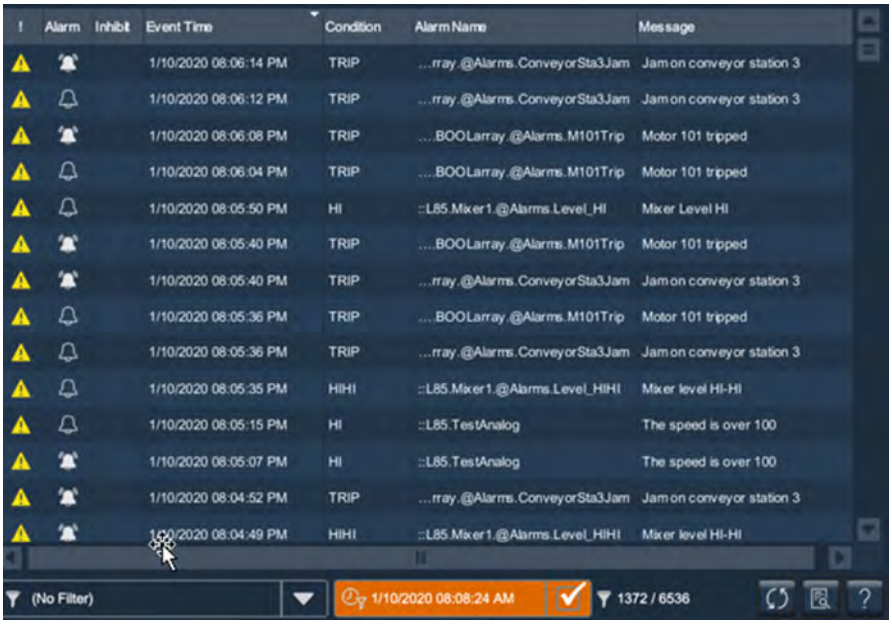
The PanelView 5310 terminal stores up to 40,000 alarms. The Alarm History Viewer lets you view the alarm history at runtime. You can sort columns, filter by alarm attributes and by time, and view a details pane to see more information about a selected alarm record. The viewer supports both tag-based and instruction-based Logix alarms.

To view the alarm history, follow these steps:

1. On an application screen, press  .
2. Tap 

, and press Enter.

   The Alarm History Viewer displays the alarm history.



3. To change the way information is presented, you can sort columns by clicking on the column header or select filters by following the instructions in Filter the Alarms on page 76.

Export the Alarm History

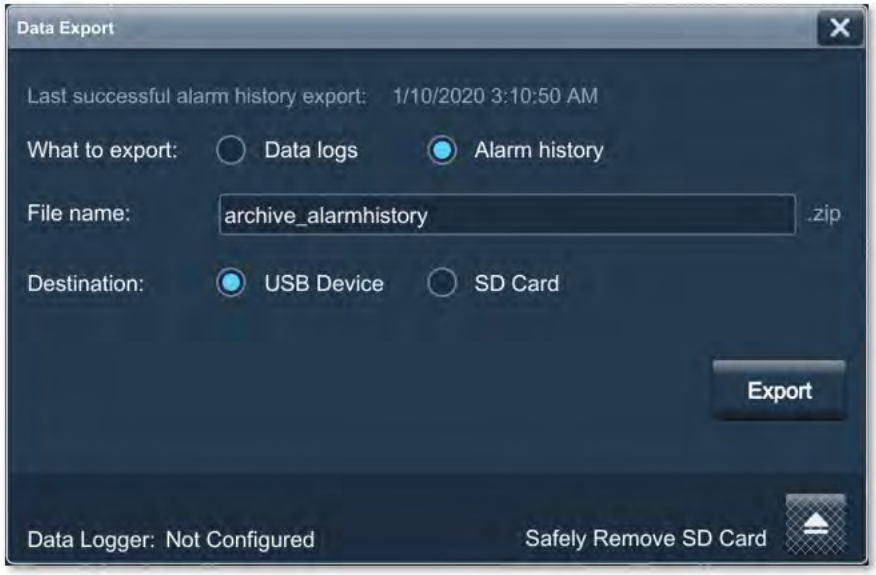
You can export the alarm history to an SD card or USB drive. The alarm history is exported as a zipped .CSV file that can be opened and analyzed in Excel.

To export the alarm history, follow these steps:

1. Insert a USB device or an SD card into the PanelView terminal.
2. Navigate to the Settings screen.
3. Click Data Export.
4. In the Data Export dialog box, do the following:
   a. Select Alarm history.
   b. In the File name field, type a name for the file to be exported.

c. Select either USB Device or SD Card.

d. Click Export.



The alarm history is saved as a .zip file containing a .csv file. The .csv file can be opened in Excel for further analysis.

Notes:

Install and Replace Components

Topic	Page
Accessories and Replacement Parts	81
Voltage Precautions	81
Electrostatic Discharge Precautions	82
Connect to USB Ports	82
Insert an SD Card	83
Replace the Battery	84

Accessories and Replacement Parts

You can view a list of accessories and replacement parts in Table 3 through Table 7 in Chapter 1.

Review the specifications of a new component before you install it to verify that it is compatible with the terminal. Record the model, serial number, and any other pertinent information of new components for future reference.

IMPORTANT We recommend that you use only Allen-Bradley® approved accessories and replacement parts.

Voltage Precautions

The terminals contain line voltages. Disconnect all power to the terminal before you install or remove components.

SHOCK HAZARD: Disconnect all power to the terminal before you remove components.

Failure to disconnect power can result in severe electrical shock to an individual or damage to the terminal.

Electrostatic Discharge Precautions

ATTENTION: Electrostatic discharge (ESD) can damage static-sensitive devices or microcircuitry.

- Disconnect all power before you work on the terminal as detailed in Voltage Precautions on page 81.
- Observe proper packaging and grounding techniques to help prevent damage.

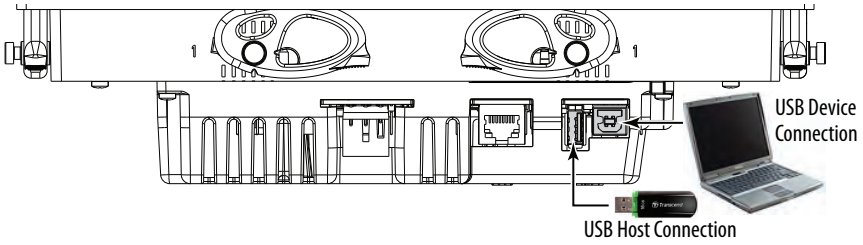
Follow these ESD precautions when you handle this terminal:

- Touch a grounded object to discharge potential static.
- Use an anti-static wriststrap connected to the work surface.
- Use properly grounded tools and equipment.
- Avoid touching pins, leads, or circuitry.
- Always hold components with a printed circuit board (PCB) by its edges and place it with the assembly side down.

Connect to USB Ports

Each terminal has one USB 2.0 (type A) host connection and one USB 2.0 (type B) device connection.

IMPORTANT The USB host connection is intended for temporary use with USB drives during deployment (user application file transfers) or maintenance (file transfers and troubleshooting profiles). It can be used with an external hub, keyboard, and mouse during runtime operations but it is not recommended for data logging or user application runtime files.



Icons identify the USB host connections. The USB host connection supports 0.5 A at 5V DC. Connected USB devices must not exceed this power load.

Table 20 - USB Connector Pinout

USB Port	USB Icon	USB Connector	Pin	Signal	Description
Host			1	VCC	+5V
			2	D-	Data -
Device			3	D+	Data +
			4	GND	Ground

ATTENTION: USB devices that are not powered by the USB port must adhere to the following:

- The USB device must be within the same enclosure as the terminal.
- The USB device must be connected to a ground system common with the terminal or used with a USB hub that provides galvanic isolation.
- The USB device port is not for runtime operation.

Connect only externally powered USB hubs to the terminal that are USB 2.0 compatible. Before you attach devices to a USB hub, make sure that the power adapter is connected and powered on.

USB Cables

Use high-speed, USB 2.0 certified cables for error-free transmissions.

IMPORTANT	The terminals have not been tested with USB 3.0 cables. We recommend only the use of USB 2.0 certified cables.

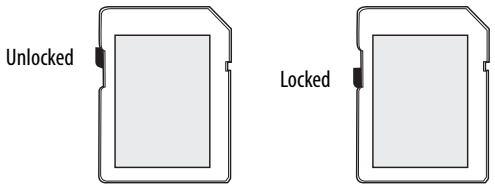
Insert an SD Card

Only use a SD™ or SDHC™ card to load troubleshooting profiles and to save troubleshooting logs. For a list of cards recommended by Rockwell Automation, see Table 5 on page 17. The SD cards are hot-swappable; they can be inserted and removed while the terminal is powered on and in operation.

The SD card slot is accessible from the inside or back of the panel when the operator terminal is installed.

Follow these steps to install an SD card in the card slot.

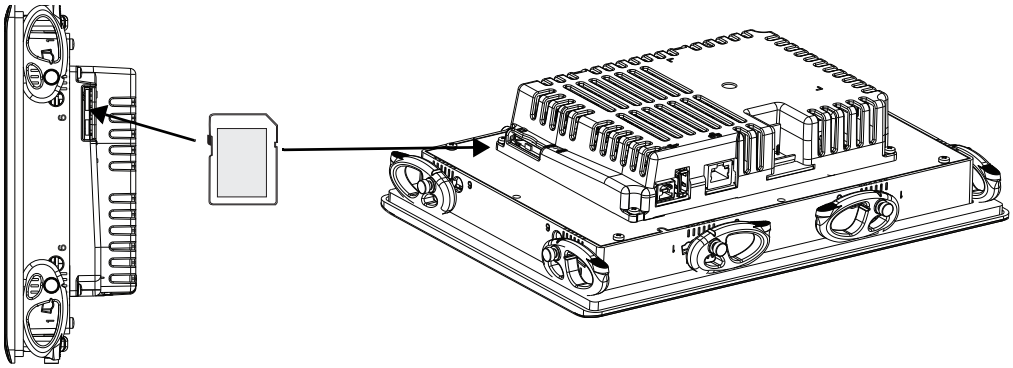
1. Verify that the SD card is locked or unlocked according to your preference.
   - If unlocked, the terminal can write data to or read data from the card.
   - If locked, the terminal can only read data from the card.



ATTENTION: Orient the SD card correctly before inserting into slot. If you force the card into the slot, you can damage the card or the terminal.

2. Insert the SD card firmly into the slot.

   The SD card snaps into the retention feature.



To remove the card, press the card so the retention feature releases the card, and pull out the card.

Replace the Battery

The product has a lithium battery that provides backup power for the real-time clock and static RAM. The battery can be replaced while the product is mounted in the panel. No special tools are required to replace the battery.

This product contains a sealed lithium battery, which may need to be replaced during the life of the product.

At the end of its life, the battery contained in this product should be collected separately from any unsorted municipal waste.

The collection and recycling of batteries helps protect the environment and contributes to the conservation of natural resources as valuable materials are recovered.

WARNING: There is a danger of explosion if the lithium battery or real-time clock module in this product is incorrectly replaced. Do not replace the battery or real-time clock module unless power has been removed.

Replace the battery only with catalog number 2711P-RY2032 or an equivalent CR2032 coin-cell battery.

Do not dispose of the lithium battery or real-time clock module in a fire or incinerator. Dispose of used batteries in accordance with local regulations.

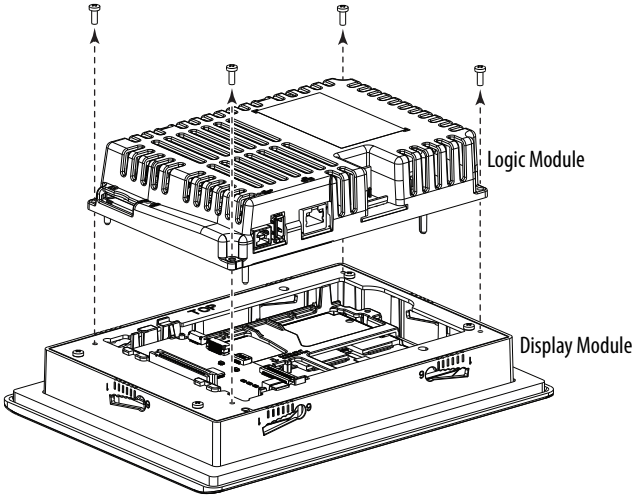
For safety information on the handling of lithium batteries, including handling and disposal of leaking batteries, see Guidelines for Handling Lithium Batteries, publication AG 5-4.

Perchlorate material – special handling may apply. See www.dtsc.ca.gov/hazardouswaste/perchlorate.

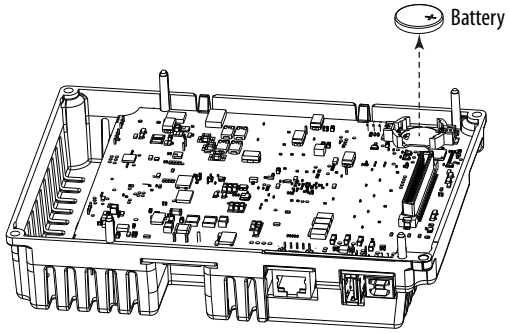
This perchlorate warning only applies to primary Lithium Manganese Dioxide ($LiMnO_2$) cells or batteries, and products containing these cells or batteries, sold or distributed in California, USA.

To replace the battery, follow these steps.

1. Disconnect power from the terminal.
2. Remove the screws from the logic module.

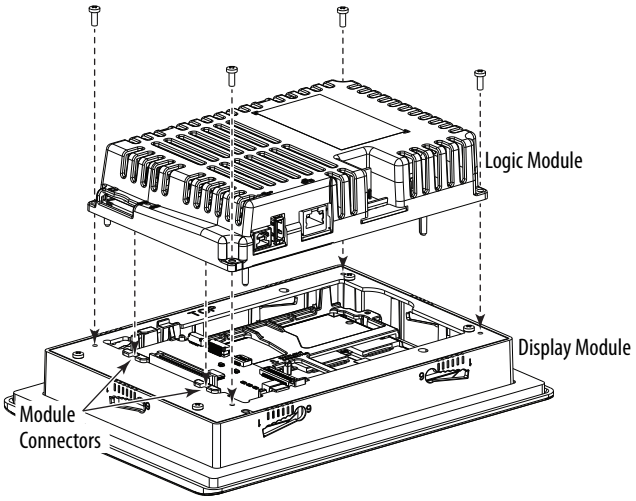


3. Carefully lift the logic module away from the display module and turn over to expose the circuit board.
4. Locate the coin-cell battery on the circuit board.



5. Remove the battery by lifting the side of the battery.
6. Insert the new battery so the positive (+) polarity faces up.

7. Reattach the logic module by aligning the connector on the bottom of the logic module with the connector on the display module.



8. Push down on the logic module and make sure that it is fully seated.
9. Torque the screws to 0.68...0.90 N•m (6...8 lb•in).

Update Firmware

Topic	Page
Before You Begin	87
Get the Terminal Firmware	87
Install the ControlFLASH Plus Software	88
Update the Firmware by Using ControlFLASH Plus Software	88
Verify the Firmware Update	89

Before You Begin

Perform these tasks to prepare for the update:

- Verify that FactoryTalk® Linx and ControlFLASH Plus™ are installed.
- Verify that FactoryTalk Linx is configured with an Ethernet driver to communicate with the PanelView® 5000 terminal.
- Verify that downloads to the terminal are allowed. If downloads are disabled, you cannot update the terminal firmware.

  See Disable Downloads to the Terminal on page 58 and make sure that downloads are allowed to the terminal.
- Verify the catalog number of your product and the current firmware revision on the terminal.

  See View the Firmware Revision on page 60 to get the catalog number and current firmware revision.
- Verify that you have a View Designer .vpd file of your application currently running on the PanelView 5000 terminal. If not, upload the application to View Designer, so you can re-download it after the firmware update.

  The firmware update clears the existing application on the PanelView 5000 terminal, but maintains configuration data such as Ethernet settings, display brightness, time and date, and touch screen settings.

Get the Terminal Firmware

To download terminal firmware and release notes, see Product Firmware and Release Notes on page 8.

The terminal firmware is also typically installed along with Studio 5000 in default folder C:\Users\Public\Documents\Rockwell Automation\Firmware Kits.

Install the ControlFLASH Plus Software

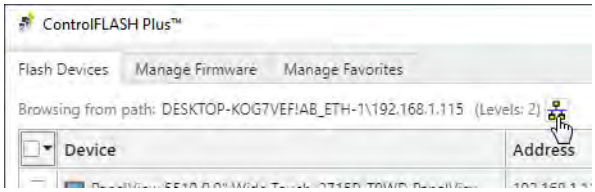
ControlFLASH Plus or ControlFLASH software is required to update firmware on the PanelView 5310 terminal. This software is included in the Studio 5000® installation package.

For details on how to install ControlFLASH software, see the ControlFLASH Plus Quick Start Guide, publication CFP-QS001.

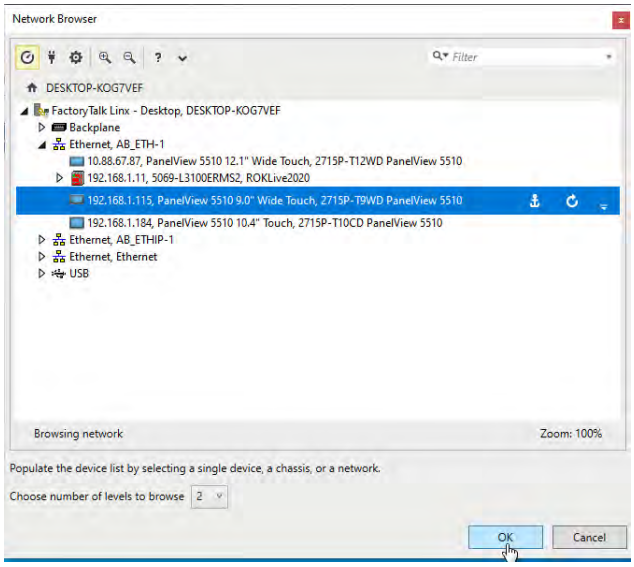
Update the Firmware by Using ControlFLASH Plus Software

To use the ControlFLASH Plus software to update the firmware in a PanelView 5310 terminal, follow these steps.

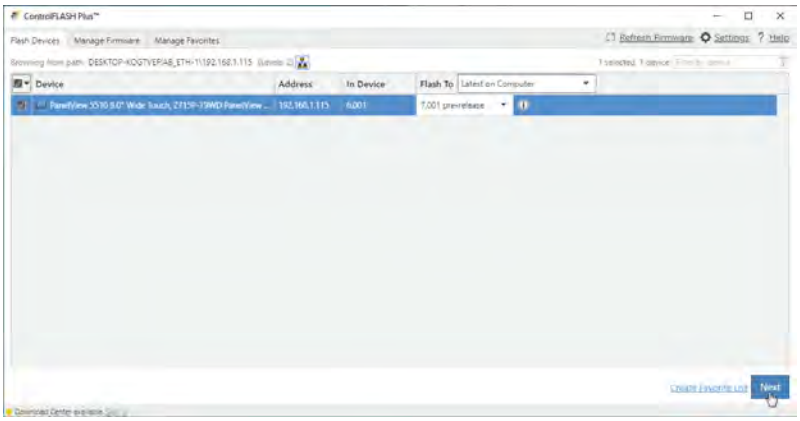
1. Click Start>FLASH Programming Tools>ControlFLASH Plus.
2. To open the FactoryTalk Linx Network Browser, click the Network Browse button.



3. Select your PanelView 5000 terminal, and click OK.

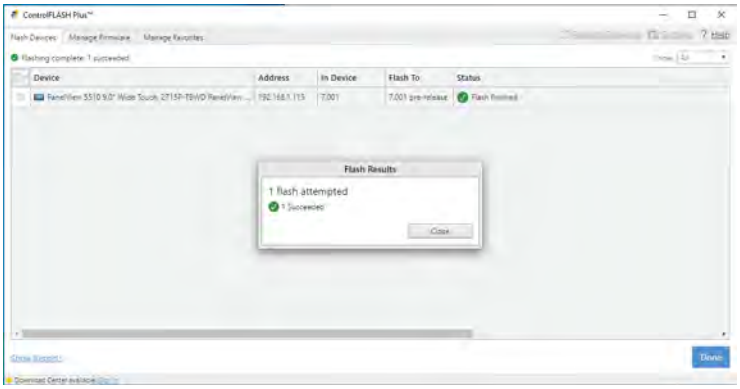


4. Select the firmware version to use in the Flash To column, make sure the checkbox to the left of your PanelView 5000 terminal is selected, and then press Next.



5. Read the warning and confirm the flash update by pressing Flash.

6. Once the flash update is complete, press Close.



7. To exit ControlFLASH Plus, press Done.

Verify the Firmware Update

To verify that the firmware revision is updated, use the HMI Device settings. For instructions on how to do this, see View the Firmware Revision on page 60.

Notes:

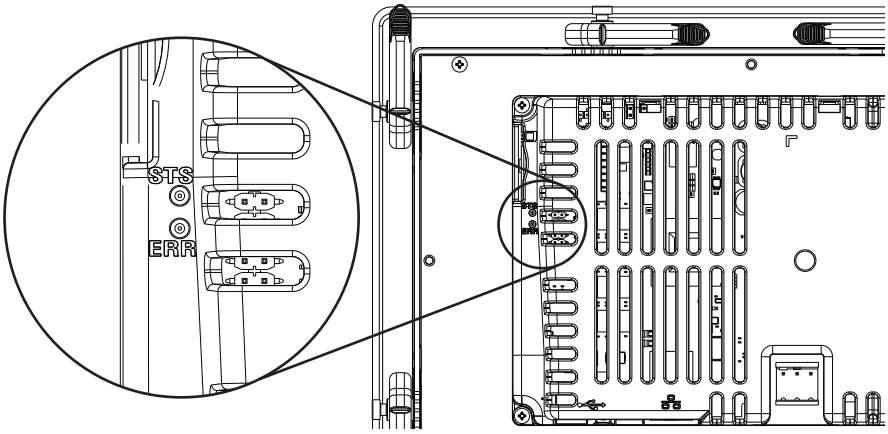
Troubleshooting

Topic	Page
Status Indicators	92
Troubleshooting Profiles	92
Terminal Does Not Start Up	97
Terminal Restarts Intermittently	97
Touch Screen Issues	97
Display Issues	98
Ethernet Issues	99
Cannot Download Application to Terminal	99
Performance Is Slow	99
Resistance to Chemicals	100
Clean the Display	100
Ship the Terminal	101
Restore Factory Defaults	101
Dispose of the Terminal	102

Status Indicators

The back of the terminal has two indicators to identify system status:

- Status (STS) indicates that the terminal is on and in use. Its light color is green.
- Error (ERR) indicates hardware and firmware faults. Its light color is red.



At startup, the STS and ERR indicators blink on and off, then the STS indicator blinks to signal progress during startup. If the indicators remain off, check the power cable.

After a successful startup, the STS indicator remains on.

Table 21 shows indicator states if the terminal stops during startup.

Table 21 - Fault Indicator States during Terminal during Startup

ERR (red) Indicator	STS (green) Indicator	Description	Recommended Action
Blinking	On	Recoverable firmware error.	Reload the firmware.
	Off	Recoverable configuration failure	Restore factory defaults. Refer to Restore Factory Defaults on page 101.
On	On	Fatal hardware error	Replace the terminal.
	Blinking	Fatal display hardware error	Verify that nothing is touching the terminal during startup and try rebooting the terminal again. If the indicator continues to blink after the second startup attempt, replace the terminal.

Troubleshooting Profiles

Rockwell Automation compiles data about your system in a secure, encrypted format. This profile is stored on the terminal and can be used to improve usability and assist with troubleshooting.

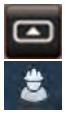
If you contact technical support, a representative can ask you to export the troubleshooting log to a USB drive, or SD™ or SDHC™ card. You can also import a troubleshooting profile from a USB drive or SD card to capture additional data.

TIP If removable media is needed, then the USB device or SD card must be FAT32 formatted, have write permissions, and sufficient space.

Import a Troubleshooting Profile

The Troubleshooting window indicates whether a default or imported troubleshooting profile is being used in the terminal. If an imported file is in use, a green check mark and the name of the imported file appears next to the Import Profile button.

To import a troubleshooting profile from a USB drive or SD card, follow these steps.

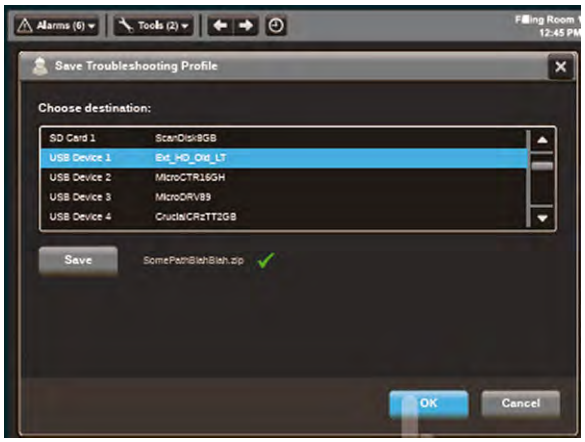


1. Press the navigation button on an application screen.
2. On the Settings screen, tap Troubleshooting.
3. Insert a USB drive or SD card that contains the troubleshooting profile into the appropriate slot on the terminal.
4. Tap Import Profile.

5. Tap to select the target USB device or SD card that contains the profile.
6. Tap Save.

7. To close the window, tap OK.

The name of the imported file is displayed. A green check next to the file name means that the import is complete.



ATTENTION: Do not remove the USB drive or SD card before the import operation is complete. Otherwise, the USB drive or SD card can become corrupt.

8. Tap OK.

   The file is stored on the terminal and captures data in an encrypted format for use by Rockwell Automation technical support.

Export a Troubleshooting Log

To export the troubleshooting log to a USB device or SD card, follow these steps.

1. Press the navigation button on an application screen.
2. On the Settings screen, tap Troubleshooting.
3. Insert a USB drive or SD card into a slot on the terminal.
4. Tap Export.

The troubleshooting log is exported and the date a time of the last export is displayed next to the Export button.

ATTENTION: Do not remove the USB drive or SD card before the import operation is complete. Otherwise, the USB drive or SD card can become corrupt.

5. To close the window, tap  .

Your technical support contact at Rockwell Automation can provide you with information on where to send the profile.

Terminal Does Not Start Up

If the terminal does not start up normally, check the table for possible causes.

Table 22 - Terminal Does Not Start Up Properly

Check For	What to Do	See
Insufficient power	Make sure that device is receiving adequate power: • Check the DC power requirements.	page 33
Improper power wiring	Verify that the power wiring is correct: • Check the wiring specifications. • Check the DC power wiring.	page 32 page 33
Status indicators	Check the status indicators during startup.	page 92
Stalled progress indicator	If a terminal stalls at the progress indicator and does not load an application or configuration screens, restore the factory defaults.	page 101
Does an object touch the display	Verify that nothing is pressing against the display or that you are not touching the display during startup.	

Terminal Restarts Intermittently

If the terminal restarts intermittently, check the table for possible causes.

Table 23 - Terminal Restarts Intermittently

Check For	What to Do	See
Improper power wiring	Verify that the power wiring is correct: • Check the wiring specifications. • Check the DC power wiring.	page 32 page 33
Over-temperature conditions	Make sure that the processor is not exceeding temperatures for normal terminal operations: • Check the processor temperature. • Check for adequate clearances around the terminal in the panel. • Check for the proper operating temperature.	page 61 page 23 page 61

Touch Screen Issues

If the touch screen does not operate or respond correctly to touches with a finger or stylus, check the table for possible causes.

Table 24 - Touch Screen Not Responding

Check For	What to Do	See
Improper calibration	Check for activation points offset from touch points. Calibrate the touch screen.	page 56
Non-functional touch screen	Check the touch screen for damage, such as cuts or excessive wear. If there is damage, replace the terminal.	
Multiple input elements touched	Application screens contain graphic input elements that are configured in the View Designer application. When touched, these elements perform operations in a predictable manner. For example, an input element is configured to navigate to a specific screen in the application or start a motor when touched. Multiple operations cannot be conducted simultaneously. Doing so results in an unintended operation. • Do not touch multiple input elements at one time. • Do not rest a hand or multiple fingers on the display.	

Display Issues

The display is unreadable or dims unexpectedly.

ATTENTION: If the display darkens, or if the backlight is not functioning properly, the screen can be difficult to read and use of this touch screen could result in a potentially hazardous outcome. **Do not use the touch screen under these circumstances.** The design of the system must take into account the possibility of the touch screen losing functionality and unable to be used to maintain or change control of the system. The touch screen shall not be the single point of control of critical functions and is not intended to replace an E-stop.

Design of the system should follow all applicable code and good engineering practice. Factors to consider include:

- The possibility of an unreadable display
- The possibility of an inoperable touch screen
- Unexpected communication errors or delays
- Operator error in the control of the system
- Proper use of E-stops and other safety practices

The user shall provide means to achieve a safe state during anomalies and make sure the system has adequate redundancy for critical functions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Table 25 - Dim Display

Check for	See
Low display brightness setting	Adjust the Brightness of the Display on page 53
Low brightness level of screen saver	Configure the Display Screen Saver on page 54

TIP Extend the life of the backlight by reducing the display brightness, by using the screen saver with reduced brightness, or operating at lower temperatures.

Ethernet Issues

Table 26 provides tips on how to isolate Ethernet anomalies.

Table 26 - Ethernet Connection Issues

Check for	Description
Status of invalid Ethernet connection	• Green indicator is on when a link is established. • Yellow indicator blinks when activity is detected. • Verify network connections.
Poor cable connections	Check the Ethernet cabling for the following: • Make sure that the cable is fully connected. • Check for cable crimping. • Check the Ethernet switch connections. • Check the Uplink ports.
Invalid IP address of terminal	If DHCP is enabled, the terminal automatically acquires a valid IP address from the network after startup. The TCP/IP protocol automatically assigns 169.254.*xxx.xxx* when it fails to acquire an IP address from the network. In general, an IP address that begins with 169 does not support a network connection. See Configure the IP Address of the Terminal on page 47.
Conflict Between IP addresses	If DHCP is not enabled and a static IP address is specified, make sure that the IP address does not conflict with the address of another device on the network. See Configure the IP Address of the Terminal on page 47.

Cannot Download Application to Terminal

You are unable to download an application to the terminal.

Table 27 - Unable to Download Project to Terminal

Check for	Description
Application downloads are disabled in Settings screens	Verify that downloads are enabled. See Disable Downloads to the Terminal on page 58.
Download of project to correct HMI device	Check the following in the View Designer application: • The project that is downloaded to the correct HMI device • IP address of HMI device is correct
Ethernet connection	Make sure that an Ethernet cable is connected between the computer and terminal. Verify that the Ethernet port is configured properly. See Configure the Ethernet Port on page 50.

Performance Is Slow

If the response time of the application is slow, for example screen changes or text display changes, check for the following conditions:

- Application screens that contain too many elements
- The controller has sufficient bandwidth for communications.
- Slow network performance or noise that result in retries

Resistance to Chemicals

The outer surfaces of the terminal including the bezel, touch screen overlay, and panel gasket are tested for chemical resistance. Some of the chemicals can cause discoloration, but they do not interfere with the operation of the terminal.

TIP For more information on chemical resistance of the product, go to https://rockwellautomation.custhelp.com/ and search the Knowledgebase for keywords 'Chemical Resistance PanelView Plus'.

IMPORTANT Do not operate the terminal in direct sunlight. Direct exposure to ultraviolet light can discolor the touch screen.

Clean the Display

ATTENTION: Do not use abrasive cleaners or solvents, they can damage the display. Do not scrub or use brushes.

Do not apply cleaning solution directly on the terminal screen, the solution can drip or seep onto the gasket. Apply cleaning solution to a clean sponge or soft cloth, and gently wipe the screen to remove the dirt and grime.

To clean the display, follow these steps.

1. Disconnect power from the terminal at the power source.

   ATTENTION: Do not clean a display while power is applied. If you clean a display while power is applied, you can unintentionally activate screen items.

2. To clean the display and help prevent scratches, use a clean sponge or soft cloth with mild soap or detergent.
3. Dry the display with a chamois or moist cellulose sponge to avoid water spots.

Remove Paint and Grease

To remove paint or grease from the bezel that is properly mounted in a NEMA, UL Type, or IP rated enclosure, follow these steps.

1. Rub lightly with isopropyl alcohol (70% concentration).
2. To remove residue, use a mild soap or detergent solution.
3. Rinse with clean water.

Equipment Wash Downs

ATTENTION: Do not use a high-pressure washer for cleaning the front bezel of the terminal. A high-pressure washer can damage the terminal.

Do not use a high-pressure washer for cleaning vented enclosures. Water can enter the enclosure and damage the terminal and other equipment.

Ship the Terminal

If you ship the enclosure with the terminal installed, make sure that the terminal is properly secured and protected against damage from impact, sharp objects, or abrasive materials.

ATTENTION: Rockwell Automation is not responsible for damage to a product that is shipped or transported while installed in a panel or enclosure.

Restore Factory Defaults

Restore a terminal to its default settings to refresh the terminal or to recover from an invalid application configuration. The restore process does not affect the firmware revision on the terminal.

ATTENTION: The process that restores factory defaults also removes some data.

- Upload the application with the View Designer application.
- Record the terminal settings so you can update them after the restore.

TIP If a terminal stalls at the progress indicator after a restart and does not load the application or configuration screens, you can restore the factory defaults.

The restore procedure performs the following actions:

- Removes the user application
- Restores the terminal settings to their default state

Table 28 - Factory-default Terminal Settings

Terminal Settings	Factory Default Setting
Backlight intensity: 1…100%	100%
Screen saver • Enabled or disabled • Timeout • Dimmer: 1…100%	 • Disabled • 10 minutes • 10%
Touch screen calibration	Factory calibrated
Ethernet • DHCP-enabled or static IP address • Speed: 10 Mbps, 100 Mbps, Auto sense • Duplex: Half, full, auto sense	 • DHCP-enabled • Auto sense link speed • Auto sense duplex mode

To restore the terminal to its default state, follow these steps.

1. Cycle power to the terminal.

   The Allen-Bradley logo displays during startup.

2. Wait a few seconds, and then touch the Allen-Bradley logo when the copyright line becomes brighter.

   Copyright ©2017 Rockwell Automation

   TIP Wait a few seconds before you touch the logo. If you touch the logo too soon during startup, this error text is displayed under the copyright line.

   ERROR! FEHLER! ERREUR! ERRORE!

   If this error text is displayed, cycle power to the terminal and wait a few seconds longer before you touch the logo.

   The normal startup is suspended so the restore procedure can initiate.

   You are asked if you want to restore the terminal to its defaults.

3. To continue, tap Yes, or tap Cancel to resume a normal startup.

   You are asked to confirm the removal of all user files such as applications.

4. To continue, tap Yes, or tap Cancel to resume a normal startup.

   Progress messages appear on the screen during the restore operation. When the restore is complete, the terminal performs a normal startup.

5. From the Settings menu, update the terminal network settings.
6. Download an application to the terminal by using the View Designer application.
7. From the Settings menu, update any remaining terminal settings as appropriate.

Refer to Disable Downloads to the Terminal on page 58 for details on how to modify device configuration settings.

Dispose of the Terminal

At the end of its life, collect the terminal separately from any unsorted municipal waste.

These terminals contain heavy metals that can contaminate the earth. Therefore, check with local health and sanitation agencies for ways to dispose this equipment safely.

Transmission speed	10/100 Mbps
Transmission length	100 m (per segment)
Signal LEDs	Data receive, link status
Interface	Ethernet (combo)
No. of ports	2 (Combo ports)
Connection method	SFP or RJ45 ports
Note on the connection method	Auto negotiation and autocrossing
Transmission physics	Depending on the SFP module
Transmission speed	10/100/1000 Mbps (full duplex)
Transmission length	up to 80 km (Depending on the fiber/SFP module used)
Signal LEDs	Data receive, link status

Function

Basic functions	Store-and-forward switch, complies with IEEE 802.3
Configuration memory	max. 8 GByte (SD card)
Management	Web-based management (HTTP/HTTPS)
	SNMPv1/v2/v3
Diagnostic functions	Remanente Event-Table
	RMON History
	N:1-Portmirroring
	LLDP (Link Layer Discovery Protocol)

Industrial Ethernet Switch - FL SWITCH 7006-2GC-EIP - 2701554

Technical data

Function

	SNMP-Traps
	ACD (Address Conflict Detection)
Filter functions	Quality of Service (8 priority classes)
	Port-Priorisierung
	VLAN (up to 32 VLANs)
	IGMP Snooping/Querier (v1/v2)
	Auto-Query-Port
	Extended Multicast Filtering
	Static Multicast Filtering (32 groups)
	Link Aggregation (up to 4 trunks)
Redundancy	DLR (Device Level Ring)
	RSTP (Rapid Spanning Tree Protocol)
	FRD (Fast Ring Detection)
	Large Tree Support
Additional functions	MAC-based Port Security
MAC address table	16k
IP parameterization	DHCP-Client
	DHCP Option 82 (Relay Agent)
	DHCP server (pool-based, port-based)
	BootP
PROFINET device function	Fast Startup
PROFINET conformance class	Conformance-Class A
EtherNet/IP™ supported protocols	Common Industrial Protocol (CIP)
Time synchronization	PTP 1588 (Transparent clock on the DLR ports)
Status and diagnostic indicators	LEDs: US1, US2 (power supply), Fail (alarm contact), 2 LEDs per Ethernet port (Link and switchable Activity/Speed/Duplex) EtherNet/IP™ status LED: Net, Mod
Signal contact control voltage	24 V DC (typical)
Signal contact control current	1 A (maximum)

Network expansion parameters

Cascading depth	Network, linear, and star structure: any
Maximum conductor length (twisted pair)	100 m

Supply voltage

Supply voltage	24 V DC (redundant)
Residual ripple	3.6 V_{PP} (within the permitted voltage range)
Supply voltage range	12 V DC ... 58 V DC
Typical current consumption	520 mA (at U_S = 24 V DC)

Industrial Ethernet Switch - FL SWITCH 7006-2GC-EIP - 2701554

Technical data

Supply voltage

Current consumption	520 mA

General

Mounting type	DIN rail
Type AX	Book type
Net weight	1010 g
Special properties	EtherNet/IP™
MTTF	142.37 Years (SN 29500 standard, temperature 25°C, operating cycle 21%)
	86.72 Years (SN 29500 standard, temperature 40°C, operating cycle 34.25%)
	15.25 Years (SN 29500 standard, temperature 70°C, operating cycle 100%)

Connection data

Connection method	Screw connection
Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	2.5 mm²
Conductor cross section flexible min.	0.2 mm²
Conductor cross section flexible max.	2.5 mm²
Conductor cross section AWG min.	24
Conductor cross section AWG max.	12
Stripping length	7 mm

Standards and Regulations

Electromagnetic compatibility	Conformance with EMC Directive 2004/108/EC
Type of test	Vibration resistance in acc. with EN 60068-2-6/IEC 60068-2-6
Test result	Operation/Storage/Transport: 5g, 150 Hz, Criterion 3
Noise emission	EN 61000-6-4
Noise immunity	EN 61000-6-2:2005
Vibration (storage/transport)	5g, 150 Hz, in acc. with IEC 60068-2-6
Free from substances that could impair the application of coating	Yes
Vibration (operation)	in acc. with IEC 60068-2-6: 5g, 150 Hz
Noxious gas test	ISA S71.04.2013 G3 Harsh Group A

Environmental Product Compliance

REACh SVHC	Lead 7439-92-1
China RoHS	Environmentally Friendly Use Period = 50 years
	For details about hazardous substances go to tab “Downloads”, Category “Manufacturer's declaration”

Industrial Ethernet Switch - FL NAT 2304-2GC-2SFP - 2702981

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

The figure shows a version of the product

Managed NAT Switch 2000, 4 RJ45 ports 10/100/1000 Mbps, 2 SFP ports 100/1000 Mbps, 2 Combo ports 10/100/1000 Mbps, degree of protection: IP20, PROFINET Conformance-Class B, 1:1-NAT, Virtual NAT, IP-Masquerading

Your advantages

- Suitable for PROFINET and EtherNet/IP™ networks
- Easy and fast startup and commissioning with the FL NETWORK MANAGER software
- Configuration memory
- RSTP
- DHCP client, DHCP server (pool-based and port-based), DHCP option 82
- VLANs
- MRP (client and master)
- Web-based management, SNMP
- Slim design
- -40°C ... +70°C ambient temperature
- Flexible distribution into several LAN and WAN areas
- 1:1 NAT, virtual NAT, IP masquerading, port forwarding

Key Commercial Data

Packing unit	1 pc
GTIN	4 055626 446035
GTIN	4055626446035
Weight per Piece (excluding packing)	460.000 g
Custom tariff number	85176200
Country of origin	Germany

Industrial Ethernet Switch - FL NAT 2304-2GC-2SFP - 2702981

Technical data

Note

Utilization restriction	Use in potentially explosive areas is not permitted in China.

Dimensions

Width	45 mm
Height	130 mm
Depth	115 mm

Ambient conditions

Degree of protection	IP20
Ambient temperature (operation)	-40 °C ... 70 °C
Ambient temperature (storage/transport)	-40 °C ... 85 °C
Permissible humidity (operation)	10 % ... 95 % (non-condensing)
Permissible humidity (storage/transport)	10 % ... 95 % (non-condensing)
Air pressure (operation)	79 kPa ... 108 kPa up to 2000 m above mean sea level (Without derating)
Air pressure (storage/transport)	79 kPa ... 108 kPa up to 2000 m above mean sea level (Without derating)
Degree of pollution	2

Interfaces

Interface	Ethernet (RJ45)
No. of ports	4 (RJ45 ports)
Note on the connection method	Auto negotiation and autocrossing
Transmission physics	Copper
Transmission speed	10/100/1000 Mbps
Transmission length	100 m (per segment)
Signal LEDs	Data receive, link status
Interface	SFP module
No. of ports	2 (SFP ports)
Transmission physics	Depending on the SFP module
Transmission speed	100/1000 Mbps (full duplex)
Transmission length	up to 80 km (Depending on the fiber/SFP module used)
Signal LEDs	Data receive, link status
Interface	Ethernet (combo)
No. of ports	2 (Combo ports)
Number of interfaces	2
Connection method	SFP or RJ45 ports
Note on the connection method	Auto negotiation and autocrossing
Transmission physics	Depending on the SFP module
Transmission speed	10/100/1000 Mbps (full duplex)

Industrial Ethernet Switch - FL NAT 2304-2GC-2SFP - 2702981

Technical data

Interfaces

Transmission length	up to 80 km (Depending on the fiber/SFP module used)
Signal LEDs	Data receive, link status

Function

Basic functions	Store-and-forward switch, complies with IEEE 802.3
Management	Web-based management (HTTP/HTTPS)
	Role-based user management
	SNMPv1/v2/v3
	Command-line interface (Telnet, SSH)
Diagnostic functions	RMON History
	LLDP (Link Layer Discovery Protocol)
	SNMP-Traps
	N:1-Portmirroring
	ACD (Address Conflict Detection)
	SysLog
	CRC-Surveillance
Filter functions	Quality of Service (8 priority classes)
	Class of Service
	DiffServ/DSCP
	Port-Priorisierung
	VLAN (up to 8 VLANs)
	IGMP Snooping/Querier (v1/v2)
	Auto-Query-Port
	Extended Multicast Filtering
NAT functions	1:1-NAT
	Virtual-NAT
	IP-Masquerading
	Port forwarding
Redundancy	MRP (Media Redundancy Protocol)
	RSTP (Rapid Spanning Tree Protocol)
	FRD (Fast Ring Detection)
	Large Tree Support
	LACP (Link Aggregation Control Protocol)
Additional functions	Jumbo frames (Max. 9,600 bytes)
MAC address table	8k
IP parameterization	DHCP-Client
	DHCP Option 82 (Relay Agent)
	DHCP server (pool-based, port-based)

Industrial Ethernet Switch - FL NAT 2304-2GC-2SFP - 2702981

Technical data

Function

	BootP
	DCP (Discovery and Configuration Protocol)
PROFINET device function	PROFINET device
PROFINET conformance class	Conformance-Class B
Time synchronization	SNTP (Simple Network Time Protocol)
Status and diagnostic indicators	LEDs: US1, US2 (power supply), Fail (alarm contact), 2 LEDs per Ethernet port (Link/Activity and Speed)
Signal contact control voltage	typ. 24 V DC

Security functions

Port security	MAC-based, RADIUS (IEEE 802.1X)

Network expansion parameters

Cascading depth	Network, linear, and star structure: any
Maximum conductor length (twisted pair)	100 m

Supply voltage

Supply voltage	24 V DC (redundant)
Residual ripple	3.6 V_{PP} (within the permitted voltage range)
Supply voltage range	12 V DC ... 57 V DC
Typical current consumption	290 mA (at U_S = 24 V DC and 25 °C ambient temperature)
Max. current consumption	1.5 A (U_S = Min, T_{amb} = Max, DO_I = Max)
Current consumption	290 mA

General

Mounting type	DIN rail
Type AX	Book type
Net weight	439 g
Housing material	Polycarbonate fiber reinforced
Note	Support by phone or on-site (fee is charged)
Special properties	1:1-NAT, Virtual NAT, IP-Masquerading
MTTF	362.94 Years (SN 29500 standard, temperature 25°C, operating cycle 21%)
	158.13 Years (SN 29500 standard, temperature 40°C, operating cycle 34.25%)
	19.77 Years (SN 29500 standard, temperature 70°C, operating cycle 100%)

Connection data

Connection method	Screw connection
Conductor cross section solid min.	0.08 mm²

Industrial Ethernet Switch - FL NAT 2304-2GC-2SFP - 2702981

Technical data

Connection data

Conductor cross section solid max.	1.5 mm²
Conductor cross section flexible min.	0.08 mm²
Conductor cross section flexible max.	1.5 mm²
Conductor cross section AWG min.	28
Conductor cross section AWG max.	16
Stripping length	7 mm

Standards and Regulations

Electromagnetic compatibility	Conformance with EMC Directive 2014/30/EU
Interference emission	EN 61000-6-2 EN 61000-6-4 (interference) Class A
Conducted noise emission	EN 61000-6-2 EN 61000-6-4 (conducted interference) Class A
Immunity to surge	EN 61000-6-2 EN 61000-4-5 (surge) Criterion A
Immunity to burst	EN 61000-6-2 EN 61000-4-4 (EFT burst) Criterion A
Immunity to EF	EN 61000-6-2 EN 61000-4-3 (electromagnetic fields) Criterion A
Immunity to ESD	EN 61000-6-2 EN 61000-4-2 (ESD) Criterion B
Immunity to conducted interference	EN 61000-6-2 EN 61000-4-6 (line noise immunity) Criterion A
Type of test	Free fall in accordance with EN 61131-2
Noise emission	EN 61000-6-4
Noise immunity	EN 61000-6-2
Vibration (storage/transport)	5g, 150 Hz, in acc. with IEC 60068-2-6
Free from substances that could impair the application of coating	Yes
Vibration (operation)	in acc. with IEC 60068-2-6: 5g, 150 Hz
Shock (operation)	30g (EN 60068-2-27)

Time synchronization	PTP 1588 (Transparent clock on the DLR ports)
Status and diagnostic indicators	LEDs: US1, US2 (power supply), Fail (alarm contact), 2 LEDs per Ethernet port (Link and switchable Activity/Speed/Duplex) EtherNet/IP™ status LED: Net, Mod
Signal contact control voltage	24 V DC (typical)
Signal contact control current	1 A (maximum)

Network expansion parameters

Cascading depth	Network, linear, and star structure: any
Maximum conductor length (twisted pair)	100 m

Supply voltage

Supply voltage	24 V DC (redundant)
Residual ripple	3.6 V_{PP} (within the permitted voltage range)
Supply voltage range	12 V DC ... 58 V DC
Typical current consumption	350 mA (at U_S = 24 V DC)
Current consumption	350 mA

General

Mounting type	DIN rail
Type AX	Book type
Net weight	900 g
Special properties	EtherNet/IP™
MTTF	209.8 Years (SN 29500 standard, temperature 25°C, operating cycle 21%)

Industrial Ethernet Switch - FL SWITCH 7008-EIP - 2701418

Technical data

General

	105.79 Years (SN 29500 standard, temperature 40°C, operating cycle 34.25%)
	14.78 Years (SN 29500 standard, temperature 70°C, operating cycle 100%)

Connection data

Connection method	Screw connection
Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	2.5 mm²
Conductor cross section flexible min.	0.2 mm²
Conductor cross section flexible max.	2.5 mm²
Conductor cross section AWG min.	24
Conductor cross section AWG max.	12
Stripping length	7 mm

Standards and Regulations

Electromagnetic compatibility	Conformance with EMC Directive 2004/108/EC
Type of test	Vibration resistance in acc. with EN 60068-2-6/IEC 60068-2-6
Test result	Operation/Storage/Transport: 5g, 150 Hz, Criterion 3
Noise emission	EN 61000-6-4
Noise immunity	EN 61000-6-2:2005
Vibration (storage/transport)	5g, 150 Hz, in acc. with IEC 60068-2-6
Free from substances that could impair the application of coating	Yes
Vibration (operation)	in acc. with IEC 60068-2-6: 5g, 150 Hz
Noxious gas test	ISA S71.04.2013 G3 Harsh Group A

Environmental Product Compliance

REACh SVHC	Lead 7439-92-1
China RoHS	Environmentally Friendly Use Period = 50 years

Please observe the following notes

User group of this manual

The use of products described in this manual is oriented exclusively to:

– Qualified electricians or persons instructed by them, who are familiar with applicable standards and other regulations regarding electrical engineering and, in particular, the relevant safety concepts.
– Qualified application programmers and software engineers, who are familiar with the safety concepts of automation technology and applicable standards.

Explanation of symbols used and signal words

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety measures that follow this symbol to avoid possible injury or death.

There are three different categories of personal injury that are indicated with a signal word.

DANGER This indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING This indicates a hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION This indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

This symbol together with the signal word **NOTE** and the accompanying text alert the reader to a situation which may cause damage or malfunction to the device, hardware/software, or surrounding property.

This symbol and the accompanying text provide the reader with additional information or refer to detailed sources of information.

How to contact us

Internet

Up-to-date information on Phoenix Contact products and our Terms and Conditions can be found on the Internet at:
phoenixcontact.com

Make sure you always use the latest documentation.
It can be downloaded at:
phoenixcontact.net/products

Subsidiaries

If there are any problems that cannot be solved using the documentation, please contact your Phoenix Contact subsidiary.
Subsidiary contact information is available at phoenixcontact.com.

General terms and conditions of use for technical documentation

Phoenix Contact reserves the right to alter, correct, and/or improve the technical documentation and the products described in the technical documentation at its own discretion and without giving prior notice, insofar as this is reasonable for the user. The same applies to any technical changes that serve the purpose of technical progress.

The receipt of technical documentation (in particular user documentation) does not constitute any further duty on the part of Phoenix Contact to furnish information on modifications to products and/or technical documentation. You are responsible to verify the suitability and intended use of the products in your specific application, in particular with regard to observing the applicable standards and regulations. All information made available in the technical data is supplied without any accompanying guarantee, whether expressly mentioned, implied or tacitly assumed.

In general, the provisions of the current standard Terms and Conditions of Phoenix Contact apply exclusively, in particular as concerns any warranty liability.

This manual, including all illustrations contained herein, is copyright protected. Any changes to the contents or the publication of extracts of this document is prohibited.

Phoenix Contact reserves the right to register its own intellectual property rights for the product identifications of Phoenix Contact products that are used here. Registration of such intellectual property rights by third parties is prohibited.

Other product identifications may be afforded legal protection, even where they may not be indicated as such.

1 Factoryline SWITCH 7000 range

1.1 Properties and versions

The Managed Switch from the 7000 series is an Ethernet switch which is suitable for industrial use. It is available in the following versions:

– With eight 10/100 Mbps RJ45 ports (FL SWITCH 7008-EIP)
– With six 10/100 Mbps RJ45 ports and two 10/100 Mbps FO ports in SC format for multimode (FL SWITCH 7006/2FX-EIP)
– With five 10/100 Mbps RJ45 ports, one 10/100 Mbps FO port in SC format for multimode, and two 10/100 Mbps FO ports in SC format for single mode (FL SWITCH 7005/FX-2FXSM-EIP)
– With four 10/100 Mbps RJ45 ports and four Gigabit combo ports (FL SWITCH 7004-4GC-EIP)
– With six 10/100 Mbps RJ45 ports and two Gigabit combo ports (FL SWITCH 7006-2GC-EIP)
– With four 10/100 Mbps RJ45 ports, two Fast Ethernet combo ports, and two Gigabit combo ports (FL SWITCH 7004-2TC-2GC-EIP)

The combo ports can either be used as RJ45 ports or as SFP ports (see “Description of the combo ports” on page 9).

1.1.1 Dimensions of the FL SWITCH 7000

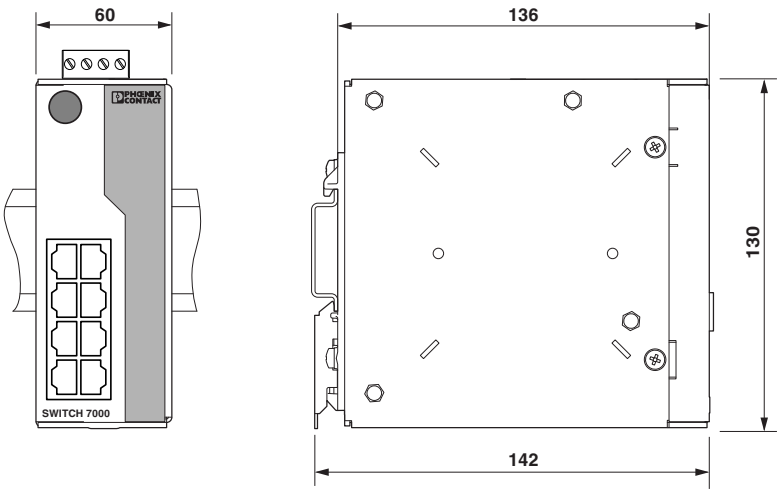

Figure 1-1 Housing dimensions

1.1.2 Elements of the Fast Ethernet devices

Figure 1-2 Elements of the Fast Ethernet devices

Number	Meaning
1	Multimode fiberglass ports
2	RJ45 ports
3	Slot for optional SD card
4	Diagnostic and status indicators
5	Mode switch with LEDs
6	Diagnostic and status indicators
7	Connection for the supply voltage
8	Connection for the floating signal contacts
9	Multimode fiberglass port
10	Single-mode fiberglass ports

1.1.3 Elements of the Gigabit devices

Figure 1-3 Elements of the Gigabit devices

Number	Meaning
1	SFP ports (see “Description of the combo ports” on page 9)
2	RJ45 ports (see “Description of the combo ports” on page 9)
3	Slot for optional SD card
4	Diagnostic and status indicators
5	Mode switch with LEDs
6	Diagnostic and status indicators
7	Connection for the supply voltage
8	Connection for the floating signal contacts

1.1.4 Description of the combo ports

Combo ports enable a high degree of flexibility when setting up networks. They consist of a corresponding RJ45 port (e.g., X5.1) and a corresponding SFP port (e.g., X5.2). Only one port of the pair can be used at a time. Each combo port can therefore be used as a copper

or fiberglass port. Inserting an SFP module disables the corresponding RJ45 port. If a combo port is used as a fiberglass port, the Link LED of the corresponding RJ45 port lights up orange when there is an active connection.

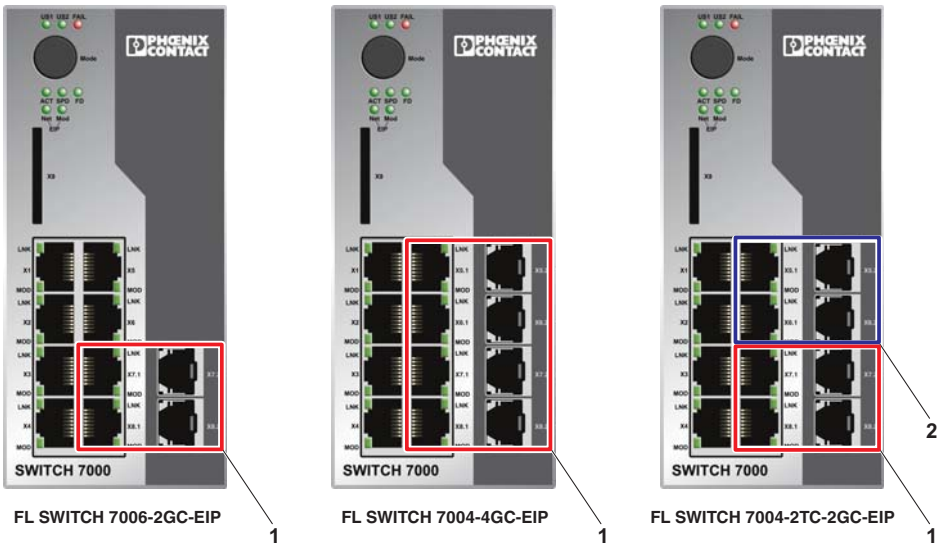

Figure 1-4 Device versions with combo ports

Number	Meaning
1	Gigabit combo ports
2	Fast Ethernet combo ports

1.1.5 Status and diagnostics indicators

Please note that the meaning of the LEDs differs in Smart mode (see “Using Smart mode” on page 19).

For versions with combo ports, the status of the SFP ports (e.g., X5.2) is indicated via the LEDs of the corresponding RJ45 port (e.g., X5.1).

Des.	Color	Status	Meaning
US1	Green	On	Supply voltage 1 within the tolerance range
		Off	Supply voltage 1 too low
US2	Green	On	Supply voltage 2 within the tolerance range
		Off	Supply voltage 2 too low
FAIL	Red	On	Signal contact open, i.e., an error has occurred
		Off	Signal contact closed, i.e., an error has not occurred
Each port has a Link LED located on the front of the device			
LNK (Link)	Green/ Orange	On	Green: link active (RJ45 port) Orange: link active (SFP port)
		Off	Link not active
Each port has an additional LED located on the front of the device. The function of the second LED (MOD) for each port can be set using the MODE button. There are three options (during the boot process the mode and port LEDs are permanently on):			
ACT (Activity)	Green	On	Transmitting/receiving telegrams
		Flashing	The device has no valid IP address
		Off	Not transmitting/receiving telegrams
SPD (Speed)	Green/ Orange	On	Green: 100 Mbps Orange: 1000 Mbps
		Off	10 Mbps if Link LED is active
FD (Duplex)	Green	On	Full duplex
		Off	Half duplex if Link LED is active
ACT/SPD/FD	Green	Flashing	Switch is in Smart mode (see “Using Smart mode” on page 19)
LEDs for EtherNet/IP™			
NET	Green/ Red	Off	Supply voltage not present or no IP parameters configured
		On (green)	CIP connection active
		Flashing (green)	IP parameters configured, no active CIP connection
		On (red)	The device has detected an IP address conflict
		Flashing (red)	An “Exclusive Owner” connection has run into a timeout
		Flashing (red/green)	The device is performing a “Power on Selftest - POST”

Des.	Color	Status	Meaning
MOD	Green/ Red	Off	Supply voltage not present
		On (green)	The device is operating correctly
		Flashing (green)	The device is not configured
		On (red)	The device has an irreversible error
		Flashing (red)	The device has a reversible error
		Flashing (red/green)	The device is performing a “Power on Selftest - POST”

2 Mounting and installation

2.1 Mounting and removing the devices

Mount the device on a clean DIN rail according to DIN EN 50022 (e.g., NS 35 ... from Phoenix Contact). To avoid contact resistance, only use clean, corrosion-free DIN rails. End brackets (E/NS 35 N, Order No. 0800886) can be mounted to the right and left of the device to stop the modules from slipping on the DIN rail.

Mounting:

- Place the module onto the DIN rail from above (A1). The upper holding keyway of the module must be hooked onto the top edge of the DIN rail. Push the module from the front towards the mounting surface (A2).

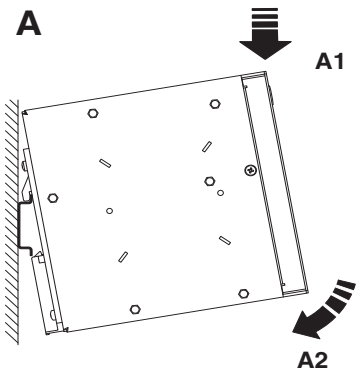

Figure 2-1 Snapping the device onto the DIN rail

- Once the module has been snapped on properly, check that it is fixed securely on the DIN rail.

Removal:

- Pull down the positive latch using a suitable tool (e.g., screwdriver). The positive latch remains snapped out. Then swivel the bottom of the device away from the DIN rail slightly (B1). Next, lift the device upwards away from the DIN rail (B2).

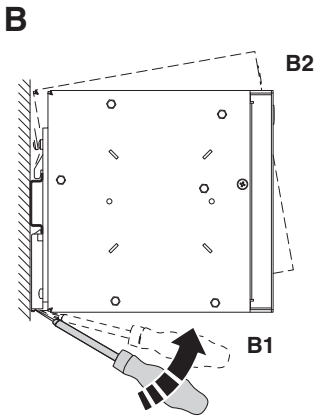

Figure 2-2 Removing the device

2.2 Installing the devices

2.2.1 Connecting the supply voltage

The device is operated using a 24 V DC voltage, which is applied via COMBICON. If required, the voltage can also be supplied redundantly (see Figure 2-4).

If redundant power supply monitoring is active (default setting), an error is indicated if only one voltage is applied. A bridge between US1 and US2 prevents this error message. It is possible to deactivate monitoring in web-based management or via SNMP.

Operation with one power supply

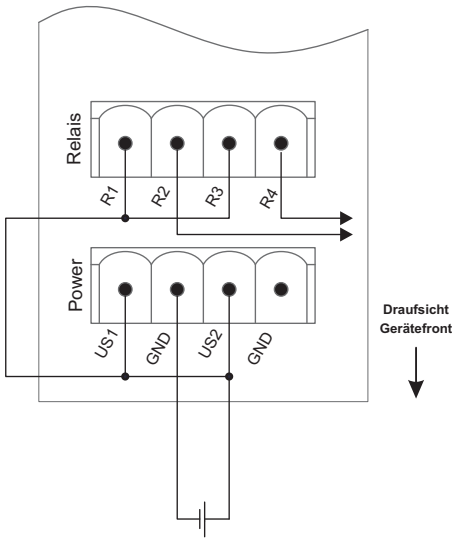

Figure 2-3 Operating the device with one power supply (example)

Redundant operation with two power supplies

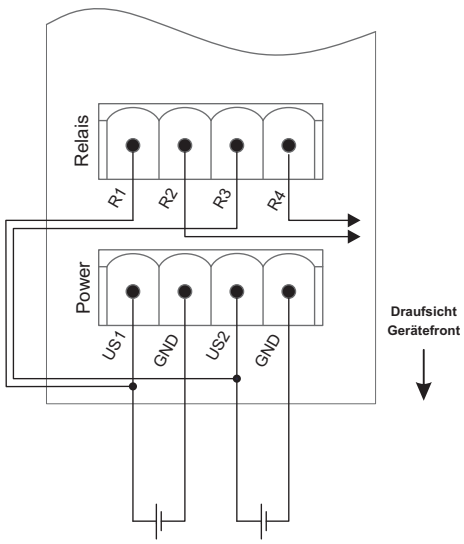

Figure 2-4 Redundant operation with two power supplies (example)

Please note that load distribution does not take place. The power supply unit with the higher voltage will supply the device on its own.

2.2.2 Grounding

Grounding protects people and machines against hazardous voltages. To avoid these dangers, as far as possible, correct grounding, taking the local conditions into account, is vital.

All Factoryline devices must be grounded so that any possible interference is shielded from the data telegram and discharged to ground potential. A conductor of at least 2.5 mm^2 must be used for grounding. Mount the module on a grounded DIN rail. The module is grounded by snapping it onto the DIN rail.

2.2.3 Floating signal contacts

Signal contact

The device has two floating signal contacts. An error is indicated when the contact is opened.

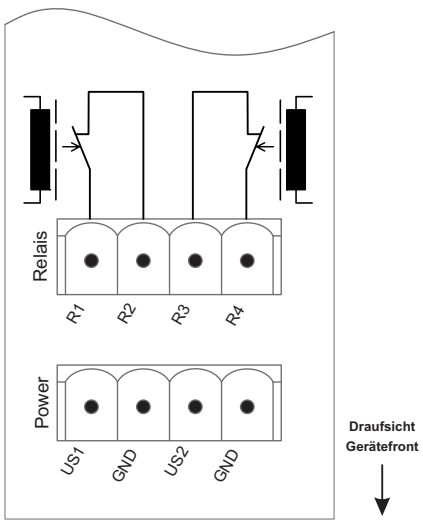

Figure 2-5 Basic circuit diagram for the signal contact

The indicated error states are configured in web-based management or via SNMP.

In the event of non-redundant voltage supply, the switch indicates the failure of a supply voltage by opening the signal contact. This error message can be prevented by connecting the supply voltage to both US1/US2 terminal blocks in parallel, as shown in Figure 2-3, or by deactivating redundant power supply monitoring in web-based management or via SNMP.

2.2.4 Assignment of the RJ45 Ethernet connectors

Please note that for operation with 1000 Mbps (Gigabit), cables with four twisted pairs (eight wires), which meet the requirements of CAT5e as a minimum, must be used.

Table 2-1 Pin assignment of RJ45 connectors

Pin number	10Base-T / 10 Mbps	100Base-T/100 Mbps	1000Base-T / 1000 Mbps
1	TD+ (transmit)	TD+ (transmit)	BI_DA+ (bidirectional)
2	TD- (transmit)	TD- (transmit)	BI_DA- (bidirectional)
3	RD+ (receive)	RD+ (receive)	BI_DB+ (bidirectional)
4	-	-	BI_DC+ (bidirectional)
5	-	-	BI_DC- (bidirectional)
6	RD- (receive)	RD- (receive)	BI_DB- (bidirectional)
7	-	-	BI_DD+ (bidirectional)
8	-	-	BI_DD- (bidirectional)

2.2.5 Use of SFP slots (principle)

The SFP slots are used by SFP modules (FO fiberglass modules in SFP format). By selecting the SFP modules, the user can specify whether the switch has multimode or single-mode FO ports, for example.

The SFP modules are available separately as accessories, see “Technical data” on page 105.

2.2.5.1 Elements of the SFP modules

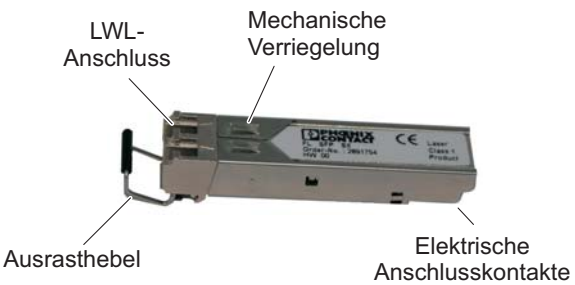

Figure 2-6 Elements of the SFP modules

2.2.5.2 Mounting the SFP modules

Inserting the SFP modules

- Insert the SFP modules in the relevant slots on the switch.

- Ensure correct mechanical alignment of the SFP modules.

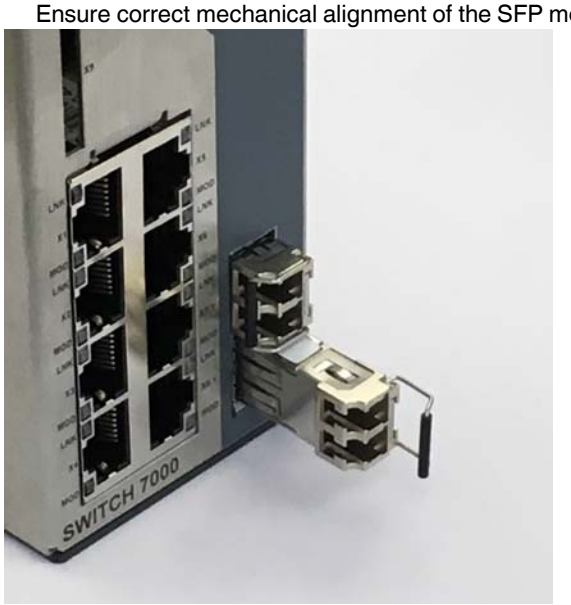

Figure 2-7 Inserting the SFP modules

Removing the SFP modules

- Remove the FO connector before removing the SFP module.
- Turn the release latch to the side and pull out the SFP module.

2.2.6 Using the SD card

The switch can optionally be configured quickly using a compatible SD card. To do so, the SD card must use the VFAT file system (standard with SD cards). SD and SDHC cards up to 8 GB max. are supported.

Please also observe that functionality of the SD card and the product can only be ensured with the use of a Phoenix Contact SD card (e.g., Order No. 2988162 // SD FLASH 2 GB). When using SD cards from other providers, it is recommended that card compatibility be verfied.

Using configuration files on the SD card

The configuration file used must be saved on the SD card under this path and file name:

FLConfig\config.cfg

Automatically reading the configuration on the SD card

To automatically read the configuration on the SD card, make sure that the card is inserted when the switch is started. As soon as the boot process is completed, as indicated by the ACT, SPD and FD LEDs no longer being on, the configuration has been incorporated into the switch's internal memory and is active in continous operation. The SD card can then be removed. The configuration also remains active when the switch is restarted, provided an SD card is not inserted in the device.

3 Startup and function

3.1 Delivery state / factory settings

By default upon delivery or after the system is reset to the factory settings, the following functions and properties are available:

- The user name is: REDACTED
- The password is: REDACTED
- All IP parameters are deleted. The switch has no valid IP address.
- The available RJ45 ports are set to auto negotiation and auto crossing
- All counters of the SNMP agent are reset
- The web server (HTTP) and SNMPv2 are activated
- Port Mirroring, Device Level Ring are deactivated
- Rapid Spanning Tree is activated
- The switch is in the “EtherNet/IP” mode.
- The alarm contacts open in the event of non-redundant power supply.
- BootP for assigning IP parameters is activated
- The MAC address table does not contain any entries
- LLDP is activated
- DHCP server is deactivated

3.2 Using Smart mode

Smart mode enables the user to change the operating mode of the switch, without having access to one of the management interfaces.

The following setting options can be selected via Smart mode:

- Activating Universal mode
- Resetting the IP configuration
- Activating EtherNet/IP mode (default setting)
- Operating with a static IP address

The Mode button is used to call/exit Smart mode and to select the desired setting. The three mode LEDs indicate the mode that is currently selected and will apply when exiting Smart mode.

3.2.1 Calling Smart mode

- Following the switch boot phase, as soon as the three mode LEDs **go out**, press and hold down the Mode button for more than five seconds. If Smart mode is active, the three LEDs (ACT, SPD, and FD) will flash.
- When Smart mode is started, the switch is initially in the “Exit without changes” state.

3.2.2 Selecting the desired setting

- To select the various settings, press the Mode button briefly and select the desired operating mode (see Table “Operating modes in Smart mode” on page 20).

3.2.3 Possible operating modes in Smart mode

The switch supports the selection of the following operating modes in Smart mode:

Table 3-1 Operating modes in Smart mode

Mode	ACT LED 1	SPD LED 2	FD LED 3
Exit Smart mode without changes	Off	Off	**On**
Setting Universal mode	Off	**On**	Off
Reset the IP configuration	**On**	**On**	**On**
Setting EtherNet/IP mode (default setting)	**On**	Off	Off
Operating with a default IP address	**On**	**On**	Off

3.2.4 Exiting Smart mode

- To exit, press and hold down the Mode button for at least five seconds. The previously selected operating mode is saved and activated.

3.3 Assigning IP parameters via BootP

BootP is activated by default.

In EtherNet/IP mode, the device still continues to send BootP requests, even after receipt of a valid IP address.

For IP address assignment, the device uses the BootP protocol. Numerous BootP servers are available on the Internet. You can use any of these programs for address assignment.

This section explains IP address assignment using the “FL NETWORK MANAGER Basic” (Order No. 2702889) and “IP Assignment Tool” software tools from Phoenix Contact.

Notes on BootP

During initial startup, the device sends BootP requests without interruption until it receives a valid IP address. As soon as it receives a valid IP address, the device stops sending BootP requests.

After a restart, the device sends three BootP requests and will only then accept the old IP address if there is no BootP response.

3.3.1 Assigning the IP address using FL NETWORK MANAGER Basic

Requirements

The device is connected to a PC with a Microsoft Windows operating system and the FL NETWORK MANAGER has been successfully installed.

Step 1: parameterizing the BootP server

- Open the FL NETWORK MANAGER software
- Open a new project in the software
- Under Tools → Options, select the BOOTP/DHCP SERVER menu item
- Configure the network interface on your PC to which the device is connected and select “BootP” mode. You can also adjust the subnet mask and configure a default gateway.
- Click “OK” to confirm the parameterization

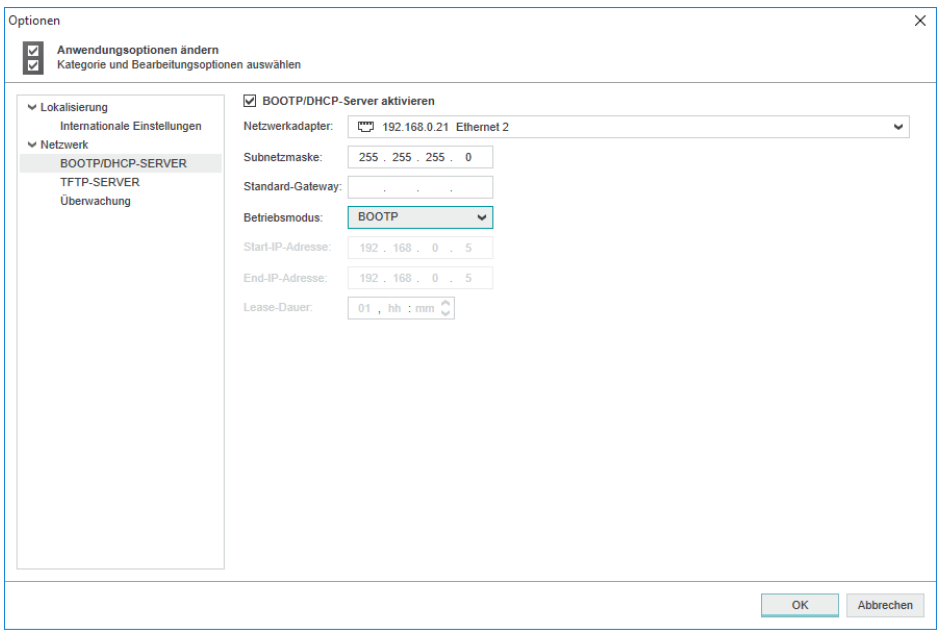

Figure 3-1 Settings for the BootP server

Step 2: starting the BootP server

- In your project in the BOOTP/DHCP SERVER window, click on the Play icon next to the selected network interface. The BootP server is now activated.

- BootP requests that are received are listed in the BOOTP/DHCP SERVER window in table format

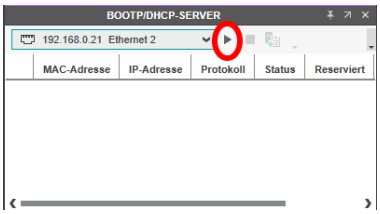

Figure 3-2 BootP server

Step 3: inserting incoming BootP requests in the reservation list and assigning IP parameters

- If you would now like to assign IP parameters to a device, such as an IP address, subnet mask or default gateway, right-click on an incoming BootP request in the BOOTP/DHCP SERVER window and select “Add to BOOTP/DHCP reservations”.
- Now enter the IP address to be assigned in the BOOTP/DHCP reservations window. The IP parameters are immediately transferred to the device.
- You can check whether IP address assignment was successful in the “IP address” column in the BOOTP/DHCP SERVER window.

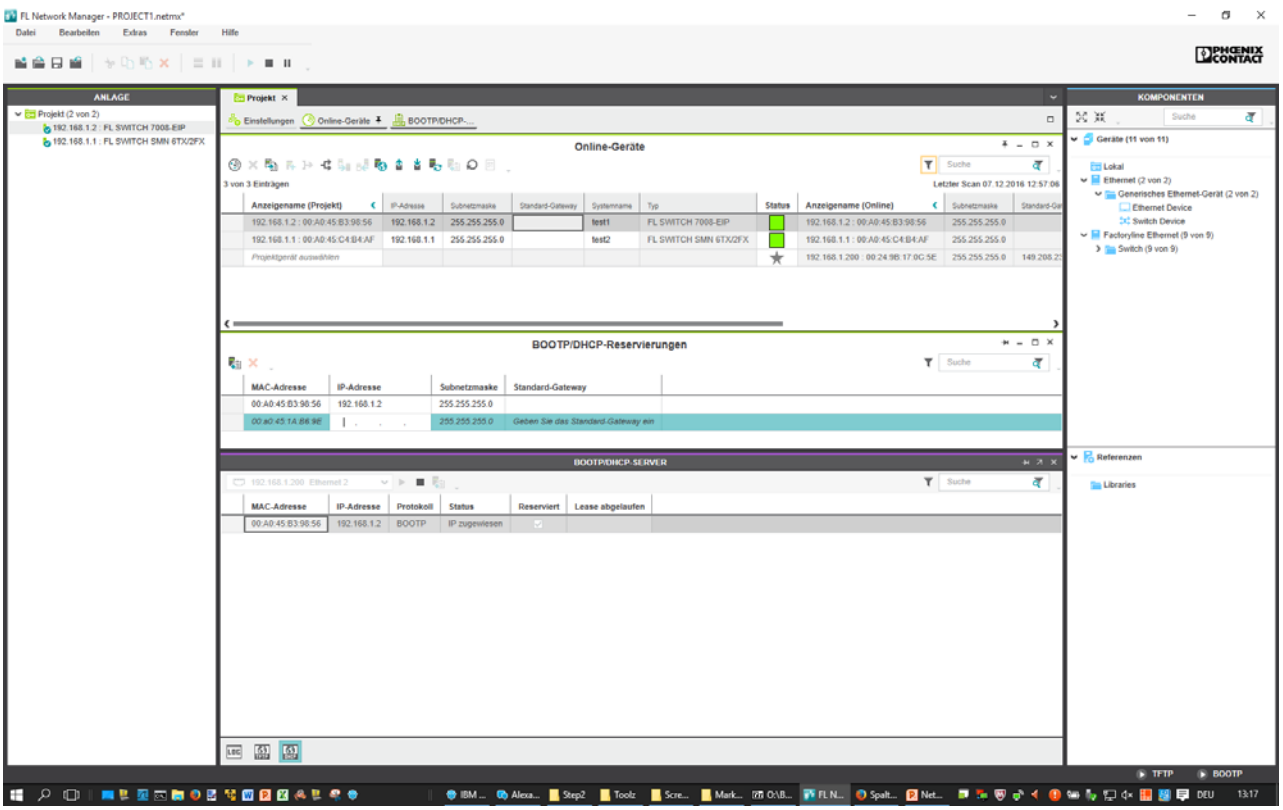

Figure 3-3 FL Network Manager with BootP/DHCP reservation list displayed

If required, the IP parameters set here can be changed in web-based management (see Unknown source of cross-reference).

3.3.2 Assigning the IP address using IPAssign.exe

Requirements

The device is connected to a computer with a Microsoft Windows operating system.

Step 1: downloading and executing the program

- On the Internet, select the link phoenixcontact.net/catalog.
- Follow further instructions in order to access the search field.
- Enter order number 2702323 in the search field, for example.

The BootP IP addressing tool can be found among the various product-related downloads.

- Double-click on the “IPAssign.exe” file.
- In the window that opens, click on the “Run” button.

Step 2: “IP Assignment Tool”

The program opens and the start screen of the addressing tool appears.

The program is mostly in English for international purposes. However, the program buttons change according to the country-specific settings.

The start screen displays the IP address of the PC. This helps when addressing the device in the following steps.

- Click on the “Next” button.

Step 3: “IP Address Request Listener”

All devices sending a BootP request are listed in the window which opens. These devices are waiting for a new IP address.

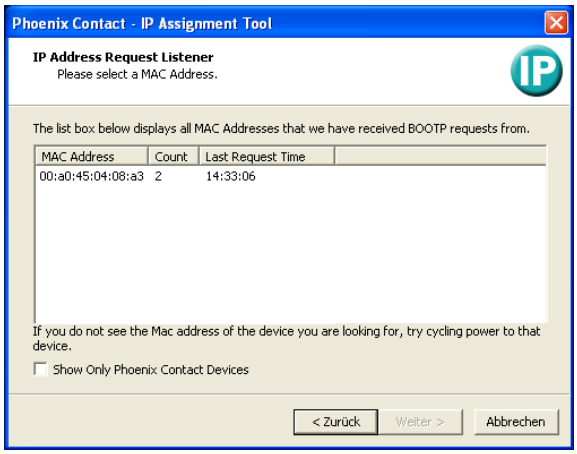

Figure 3-4 “IP Address Request Listener” window

The MAC address of the switch can be found on the sticker on the side.

In this example, the switch has MAC address 00.A0.45.04.08.A3.

- Select the device to which you want to assign an IP address.
- Click on the “Next” button.

Step 4: “Set IP Address”

The following information is displayed in the window which opens:

– IP address of the PC
– MAC address of the selected device
– IP parameters of the selected device
(IP address, subnet mask, and gateway address)
– Any incorrect settings

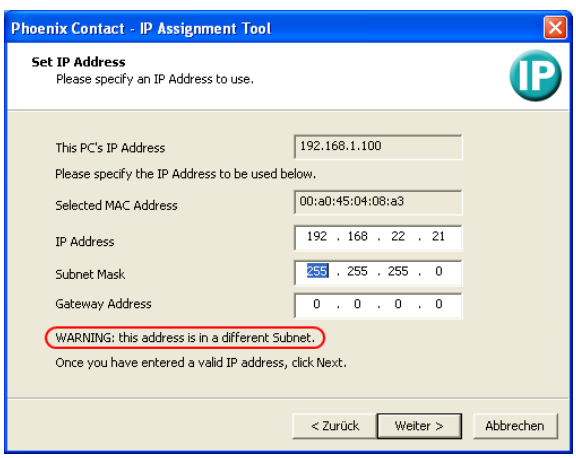

Figure 3-5 “Set IP Address” window with incorrect settings

- Adjust the IP parameters according to your requirements.

If inconsistencies are no longer detected, a message appears indicating that a valid IP address has been set.

- Click on the “Next” button.

Step 5: “Assign IP Address”

The program attempts to transmit the set IP parameters to the device.

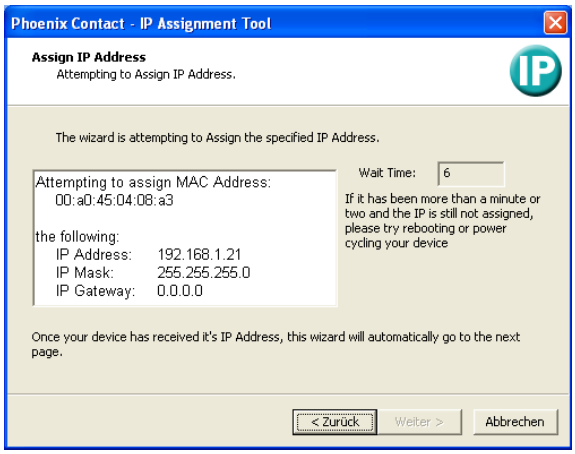

Figure 3-6 “Assign IP Address” window

Following successful transmission, the next window opens.

Step 6: completing IP address assignment

The window that opens informs you that IP address assignment has been successfully completed. It gives an overview of the IP parameters that have been transmitted to the device with the MAC address shown.

To assign IP parameters for additional devices:

- Click on the “Back” button.

To exit IP address assignment:

- Click on the “Finish” button.

If required, the IP parameters set here can be changed in web-based management (see Section “Network” on page 39).

3.4 Operating with a default IP address

For operation with a default IP address, the device receives a fixed IP address. A DHCP server is activated on the switch and assigns an IP address to the connected PC via DHCP.

To start up the device with a default IP address, activate the “Operating with a static IP address” Smart mode as described in “Using Smart mode” on page 19.

1. In the network settings on your PC, select the “Obtain an IP address automatically” option.

Deactivate all other network interfaces on your PC.

2. Connect the switch to your PC.
3. Select the “Operating with a default IP address” Smart mode as described in “Using Smart mode” on page 19.
4. The switch assigns an IP address to the PC via DHCP.
5. The switch can now be accessed via IP address “192.168.0.254”.

Set the desired IP address via web-based management.

4 Frame switching

The switch operates in store and forward mode. When receiving a data packet, the switch analyzes the source and destination addresses. The switch stores up to 16386 MAC addresses in its address table with an adjustable aging time of 10 to 825 seconds.

4.1 Store and forward

All data telegrams received by the switch are stored and checked for validity. Invalid or faulty data packets (> 1536 bytes or CRC errors) and fragments (< 64 bytes) are rejected. Valid data telegrams are forwarded by the switch.

4.2 Multi-address function

The switch learns all the source addresses for each port. Only packets with:

– Unknown source addresses
– A source address for this port or
– A multicast/broadcast address

in the destination address field are forwarded via the relevant port. The switch can learn up to 16386 addresses. This is important if more than one end device is connected to one or more ports. Several independent subnetworks can be connected to one switch.

4.2.1 Learning addresses

The switch independently learns the addresses for end devices, which are connected via this port, by evaluating the source addresses in the data telegrams. When the switch receives a data telegram, it forwards this data telegram to only that port that connects to the specified device (if the address could be learned beforehand).
The switch can learn up to 16386 addresses and store them in its table. The switch monitors the age of the learned addresses. The switch automatically deletes from its address table address entries that exceed a specific age (default: 40 seconds, adjustable from 10 to 825 seconds, aging time).

All learned entries are deleted on a restart.
A link down deletes all the entries of the affected port.

A list of detected MAC addresses can be found in the MAC address table. The MAC address table can be deleted via the “Clear” button.

The aging time is set using the “dot1dTpAgingTime” MIB object
(OID 1.3.6.1.2.1.17.4.2). The possible settings range is 10 - 825 seconds. For static configuration, an aging time of 300 seconds is recommended.

4.2.2 Prioritization

The switch supports eight priority queues (traffic classes according to IEEE 802.1Q) for adjusting the internal packet processing sequence. Data telegrams that are received are assigned to these classes according to their priority, which is specified in the VLAN/prioritization tag, where the value “0” in the tag indicates the lowest priority and the value “7” indicates the highest priority.

Processing rules

The switch controller in the device forwards received packets to the available receive queues according to the following decisions:

– BPDU packets are always assigned to the high-priority queue.
– Packets with VLAN/prioritization tag are forwarded according to the queues listed above.
– All remaining data is assigned to the low-priority queue.

4.2.2.1 Class of Service (CoS)

Class of Service refers to a mechanism used to take into consideration the value of the priority field (values 1 to 7) in VLAN data packets with a tag. The switch assigns the data streams in various processing queues, depending on the priority information contained in the CoS tag. The switch supports four internal processing queues.

4.2.2.2 Quality of Service (QoS)

Quality of Service affects the forwarding and handling of data streams and results in individual data streams being given differential treatment (usually preferential). QoS can be used, e.g., to guarantee a transmission bandwidth for individual data streams. The switch uses QoS in connection with prioritization.

5 Configuration and diagnostics in web-based management

The user-friendly web-based management (WBM) interface can be used to manage the switch from anywhere in the network using a standard browser (e.g., Internet Explorer 8/9). The configuration and diagnostic functions are clearly displayed on a graphical user interface. Every user with a network connection to the device has read/write access to that device via a browser. A wide range of information about the device itself, set parameters, and the operating state can be viewed.

Modifications to the device can only be made by entering the valid password. By default upon delivery, the user name is REDACTED and the password is REDACTED.

For security reasons, we recommend changing the existing password to a new one known only to you.

5.1 Requirements for the use of WBM

As the web server operates using the Hyper Text Transfer Protocol, a standard browser can be used. Access is via the URL “http://IP address of the device”. Example: “http://172.16.29.112”. If the web server is set to the secure HTTPS protocol in WBM, access is via the URL “http**s**://IP address of the device”. For full operation of the web pages, the browser must support JavaScript 1.2 and Cascading Style Sheets Level 1. We recommend the use of Microsoft Internet Explorer 8.0 or 9.0.

WBM can only be called using a valid IP address. By default upon delivery, the switch has no valid IP address (see “Assigning IP parameters via BootP” on page 20).

Device login is only possible if cookies are allowed in the browser settings.

Some functions are opened in pop-up windows. It is therefore only possible to use all of the functions if pop-ups are permitted in the browser settings.

In order to make changes, you must log into the device. To do so, click on the “Login” button.

By default upon delivery, the user name is REDACTED and the password is REDACTED.

Figure 5-1 Login window

5.2 Functions/information in WBM

WBM is split into the following areas:

– Information: general device information
– Configuration: device configuration
– Diagnostics: device-specific diagnostics

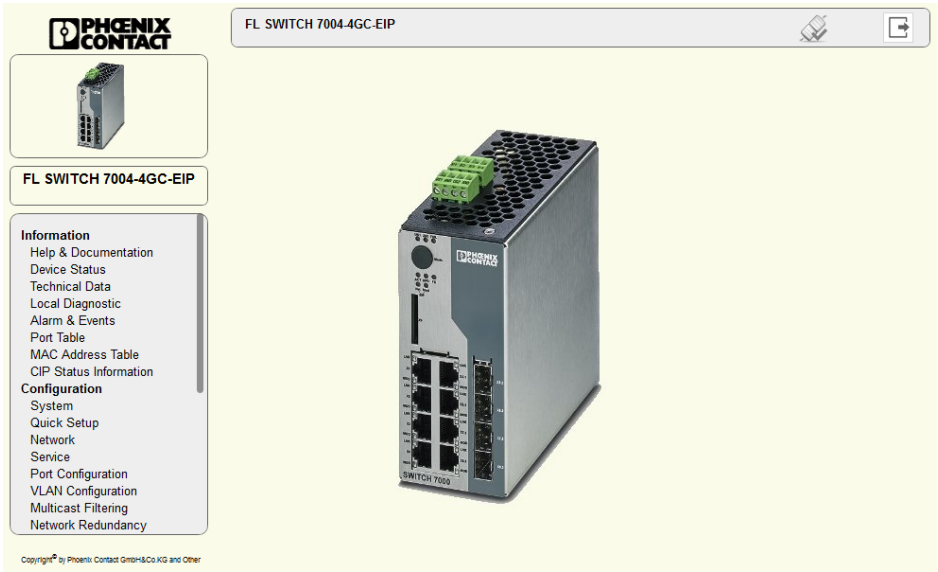

Figure 5-2 Start page for web-based management

5.2.1 Information area of WBM

5.2.1.1 Help & Documentation

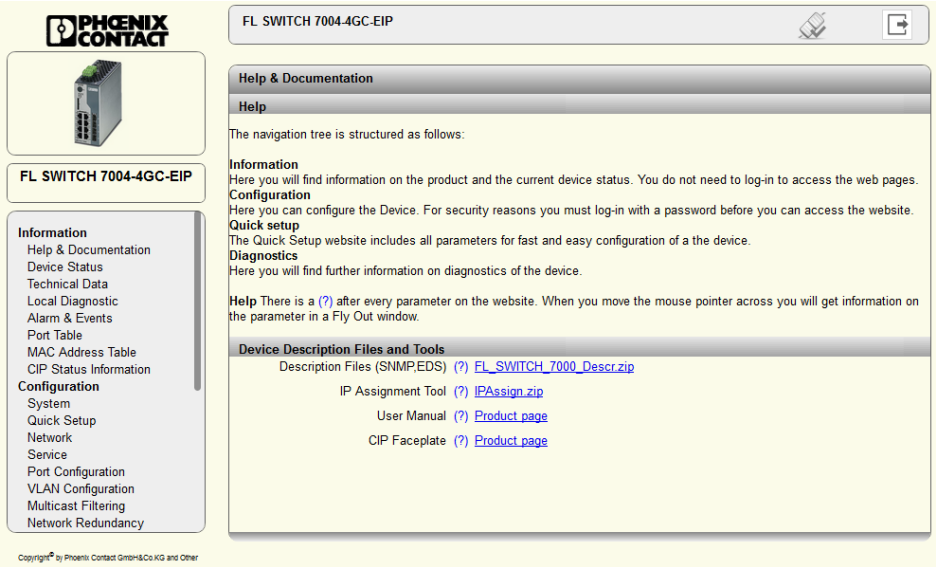

Figure 5-3 “Help & Documentation” web page

Here you will find useful information about using web-based management. On this page, the following files and software, which are supplied with the device, can be downloaded directly from the device:

– Description Files (SNMP, EDS)
– IP Assignment Tool (see Unknown source of cross-reference)

5.2.1.2 Device Status

Here you will find general information about your device, such as the serial number, firmware version or hardware version.

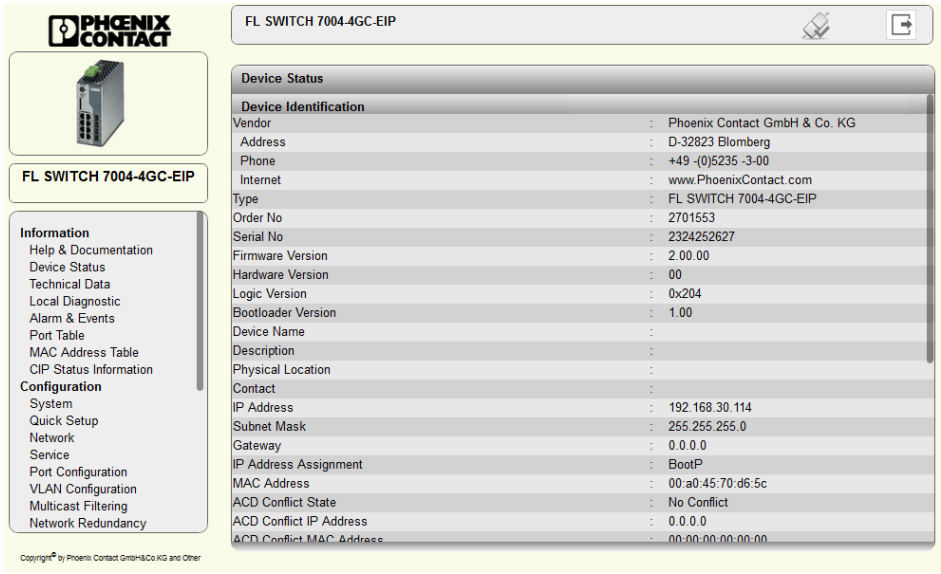

Figure 5-4 “Device Status” web page

5.2.1.3 Technical Data

Here you will find the technical data for your device, such as specifications for the power supply.

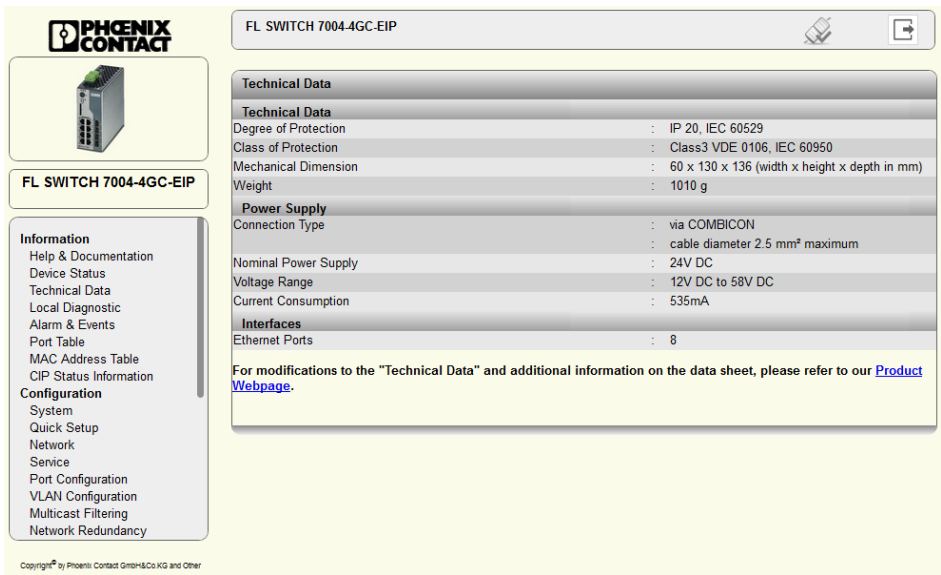

Figure 5-5 “Technical Data” web page

5.2.1.4 Local Diagnostics

Here you will find a brief explanation of how to interpret the individual LEDs on the device.

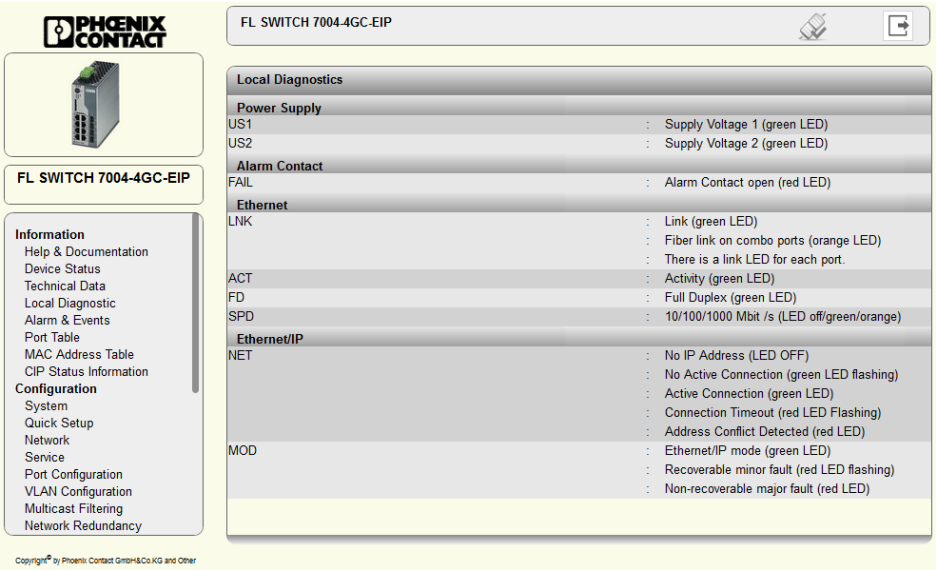

Figure 5-6 “Local Diagnostics” web page

5.2.1.5 Alarm & Events

You will find a list of alarms and events on this page. The entries in the “Event Table” are also retained after power up. The “Event Table” can be downloaded from the device in CSV format.

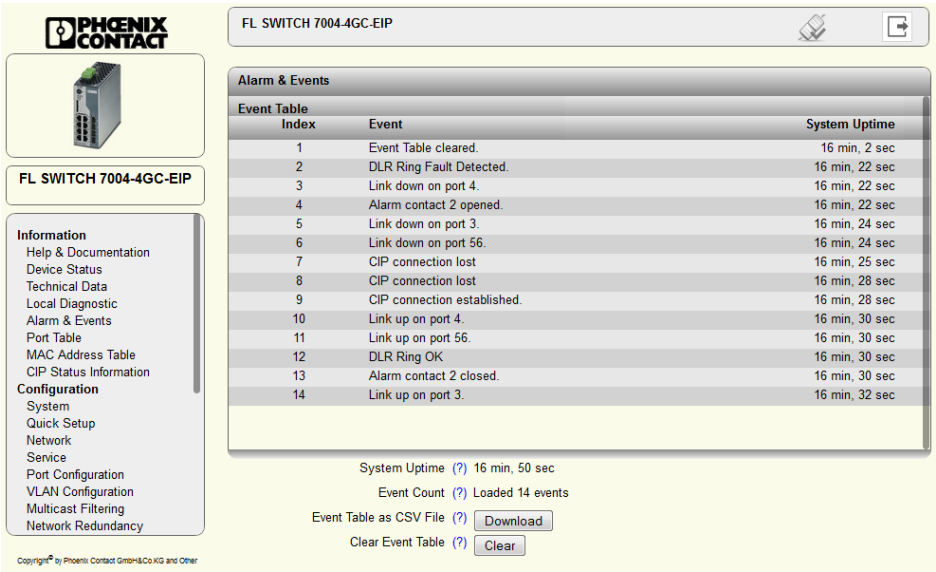

Figure 5-7 “Alarm & Events” web page

5.2.1.6 Port Table

You will find a list of the current states of the individual ports on this page.

Clicking on the “Redundancy Port Table” button opens a table with information on the individual ports and their redundancy mechanism assignment.

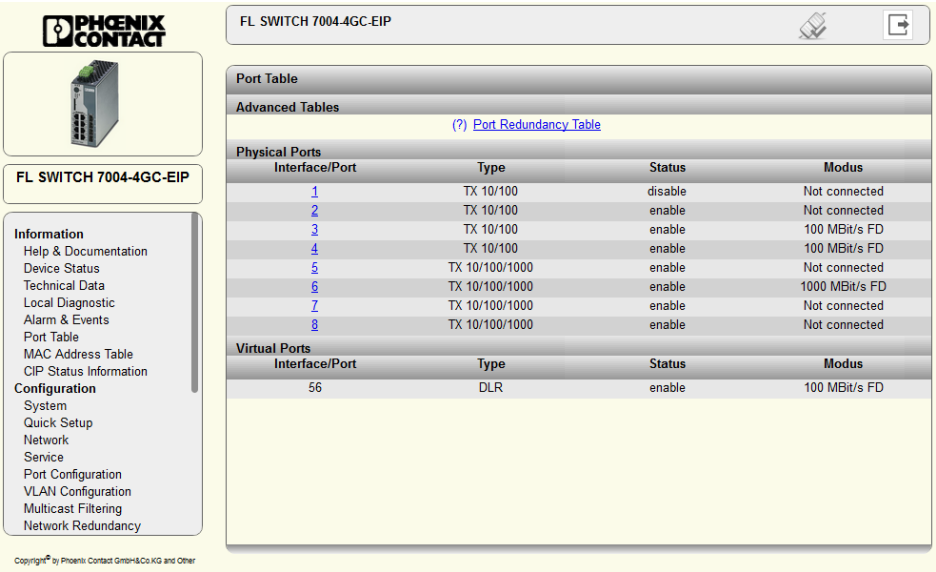

Figure 5-8 “Port Table” web page

5.2.1.7 MAC Address Table

You will find a list of the current devices in the network on this page. The list can be downloaded from the device in CSV format.

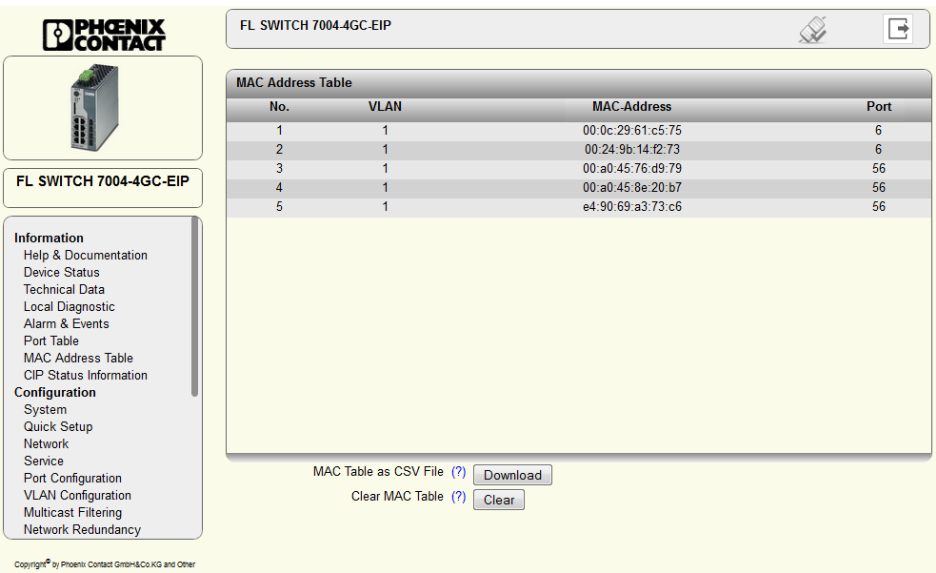

Figure 5-9 “MAC Address Table” web page

5.2.1.8 CIP Status Information

You will find the CIP status information listed on this page.

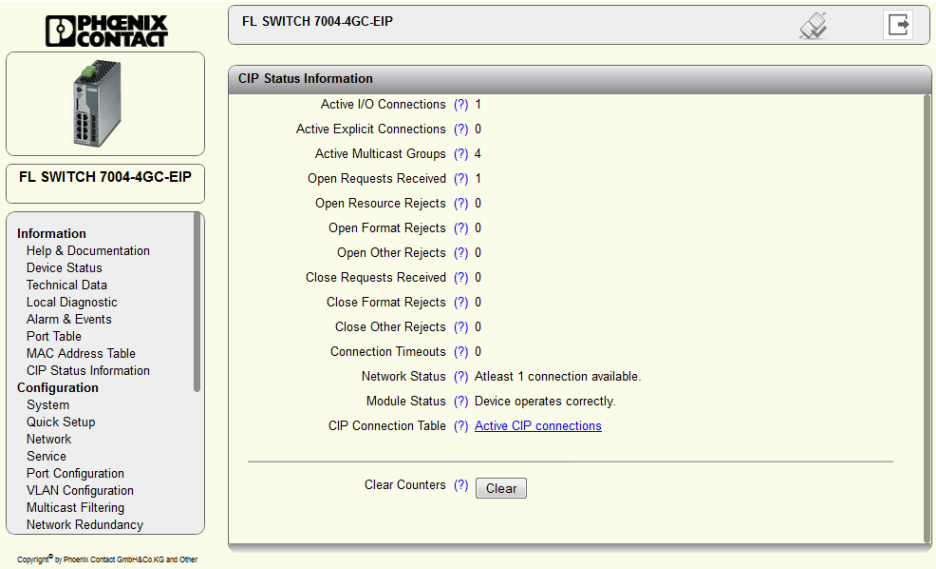

Figure 5-10 “CIP Status Information” web page

5.2.2 Configuration area of WBM

5.2.2.1 System

Reset Device: clicking on the “Reset” button restarts the device. All unsaved parameters will be lost.

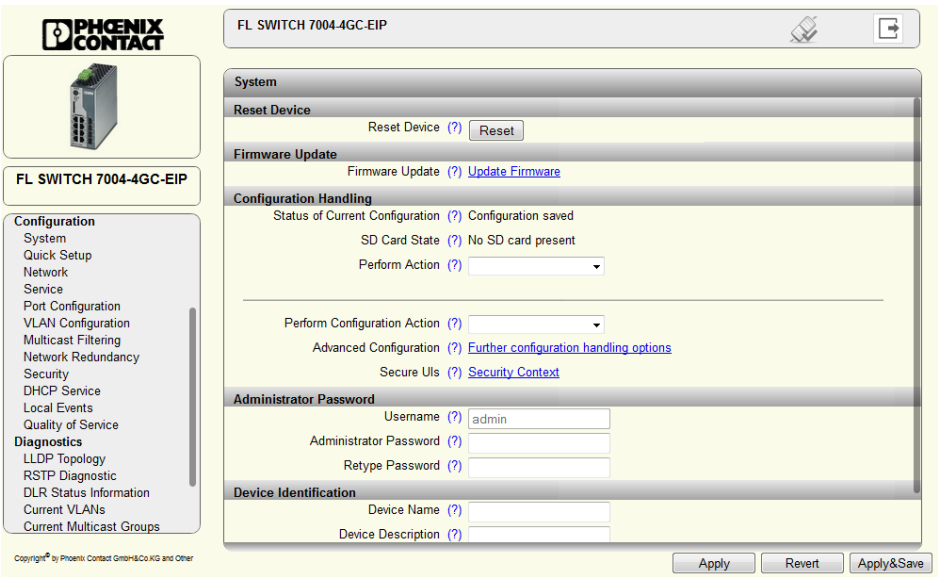

Figure 5-11 “System” web page

The connection to the device is interrupted for the boot phase.

Firmware Update

Clicking on the “Update Firmware” link opens a pop-up in which the parameters for the firmware update must be entered.

Pop-up: Update Firmware

Update via HTTP: select “HTTP” as the method. Clicking on “Browse” allows you to select the desired file on your PC. Clicking on “Apply” starts the update.

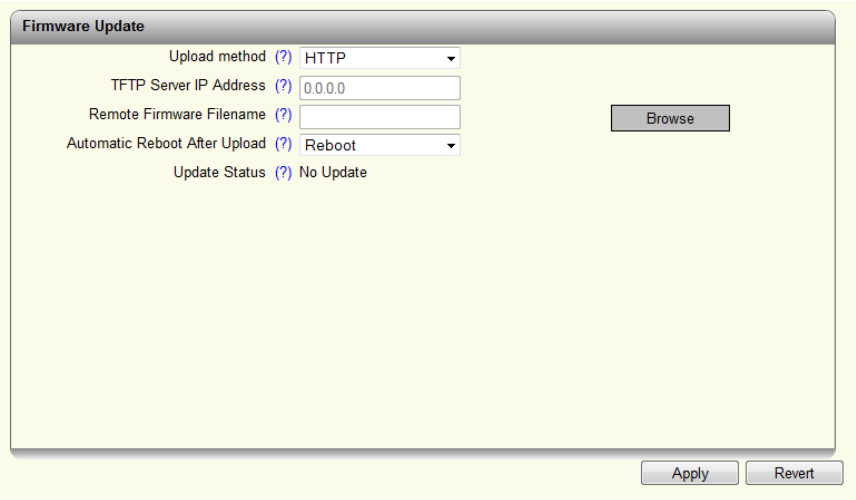

Figure 5-12 “Firmware Update via HTTP” pop-up

Update via TFTP: select “TFTP” as the method.

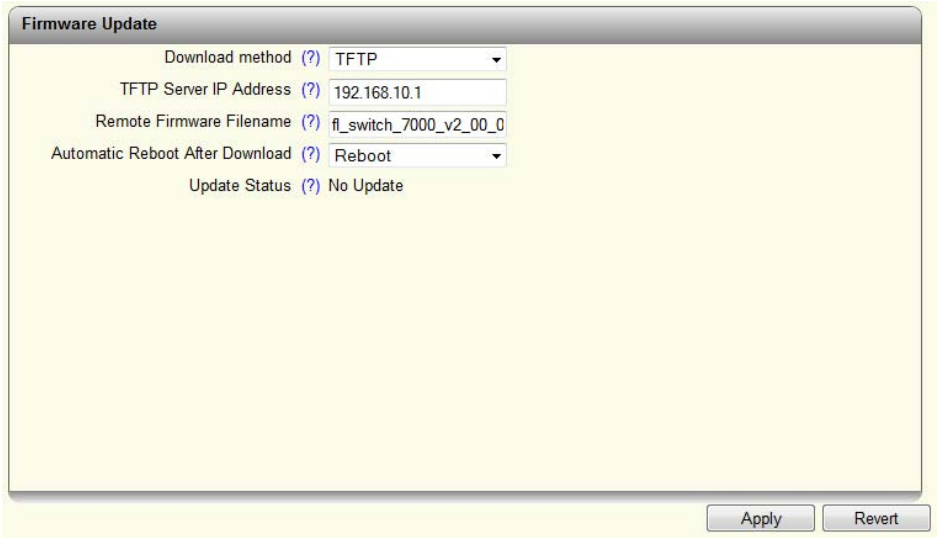

Figure 5-13 “Firmware Update via TFTP” pop-up

– TFTP server IP address:
  Here, set the IP address of the computer on which the TFTP server is active.
– Remote firmware filename:
  Here, set the name of the firmware file which is to be transferred to the device.
– Automatic reboot after upload:
  Here, set whether a reboot should be carried out after the firmware update. The firmware update starts as soon as you click on “Apply”.

Configuration Handling

Status of Current Configuration: indicates the status of the active configuration

SD Card State: indicates whether or not an SD card is inserted

This display can only be refreshed by reloading the web page.

Perform Action:

– Compare: compares the configuration file on the SD card with the one on the device.
– Clear: deletes the configuration file on the SD card.

The selected action is performed by clicking in the drop-down list.

Perform Configuration Action:

– Factory Default: resets the device configuration to the delivery state.
– Save Configuration: saves the active device configuration to the SD card.
– Reload Configuration: loads the configuration file from the SD card and applies it. The device is then restarted.

The selected action is performed by clicking in the drop-down list.

Advanced Configuration: clicking on the “Further configuration handling options” link opens a window in which the parameters for transferring a configuration file from the device to the PC (download) or from the PC to the device (upload) must be entered.

Secure UIs: clicking on the “Security Context” link opens the “Security Context” pop-up (see Page 39).

Pop-up: Advanced Configuration

File Type: select the file type here.

Direction: here you should select whether the configuration is to be uploaded to or downloaded from the device.

Update status: indicates the current transfer status.

Start transfer: click on the “Start” button to start the transfer of the configuration.

Configuration name: here you should enter the name under which you want to save the configuration on the PC.

Transfer via HTTP: select “HTTP” as the transfer method. Clicking on “Browse” allows you to select the desired file on your PC.

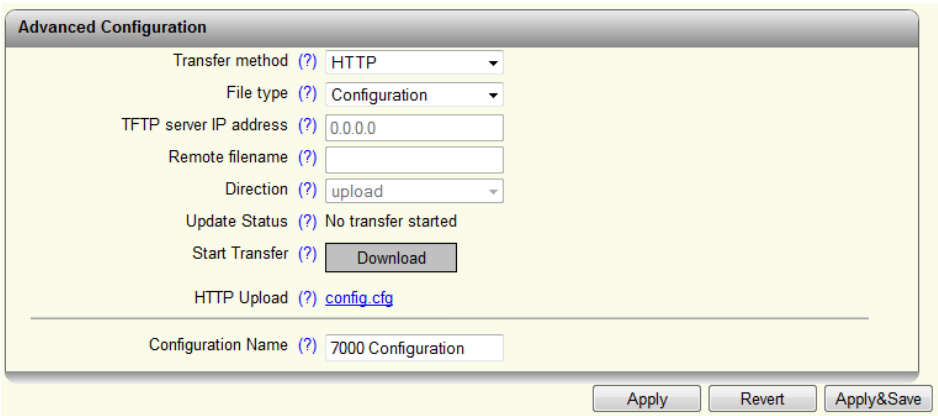

Figure 5-14 “Advanced Configuration” pop-up

Transfer via TFTP: select “TFTP” as the transfer method.

TFTP server IP address: here you should enter the IP address via which the TFTP server can be reached.

Remote filename: here you should enter the name of the file to be uploaded or downloaded.

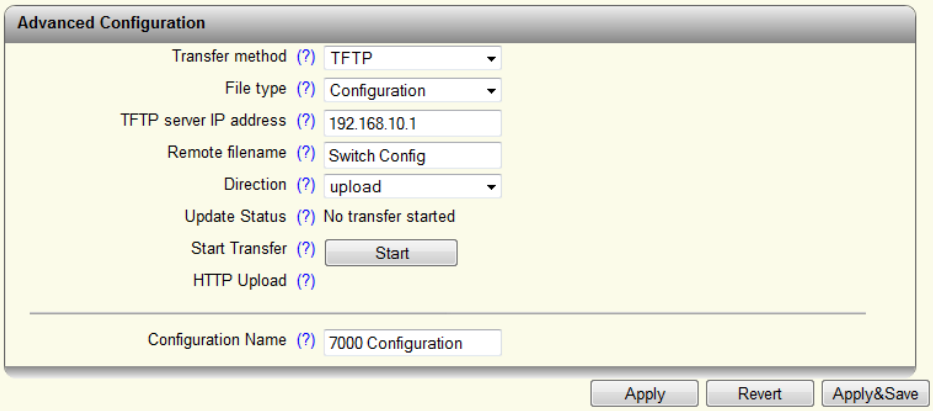

Figure 5-15 “Advanced Configuration” pop-up

Pop-up: Security Context

Create new context: clicking on the “Generate” button creates all the necessary keys and certificates for operation with HTTPS and SSH.

Current state: displays the status of the current availability of the security context.

Root CA: clicking on the “cacert.cer” link loads the Root CA certificate for the installation in the browser.

Advanced Configuration: clicking on the “File transfer” link opens the “Advanced Configuration” pop-up (see “Pop-up: Advanced Configuration” on page 38).

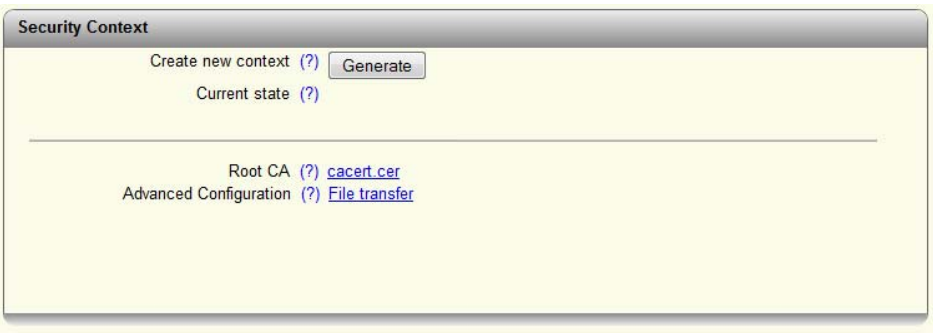

Figure 5-16 “Security Context” pop-up

Administrator Password

Figure 5-17 “Administrator Password” configuration area

You can change the administrator password here. The new password must be between 8 and 14 characters long. The new password will be activated after logout. By default upon delivery, the password is “private” (please note that it is case-sensitive). For security reasons, the input fields do not display your password, but instead “*******” is displayed.

Device Identification

Device information can be configured in this area, which is then displayed on the “Device Status” page.

Device Name: you can configure the device name here.

Device Description: you can enter a device description in this text field.

Physical Location: here you can provide the location of the device, such as the building in which it is installed.

Device Contact: you can enter a contact address in this field.

5.2.2.2 Quick Setup

The basic settings can be made in Quick Setup.

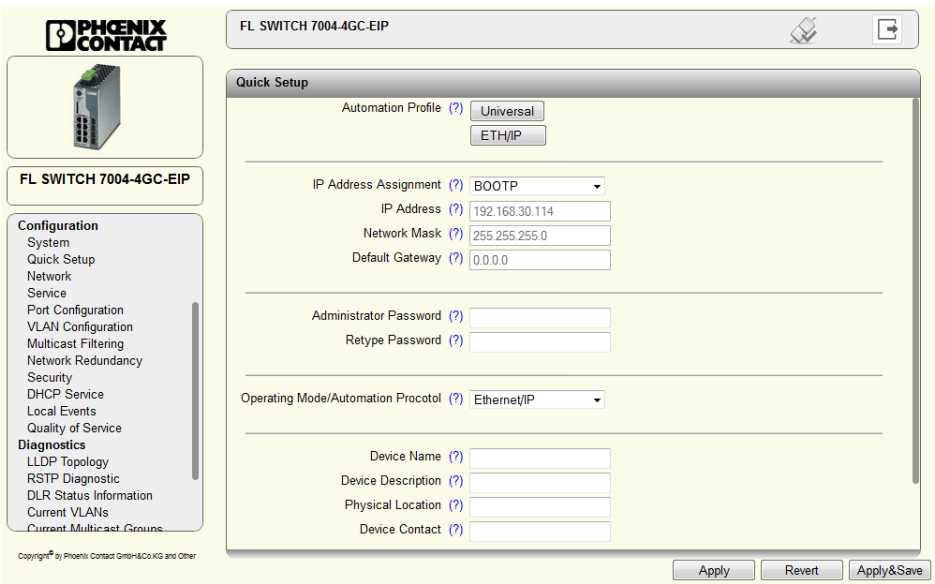

Figure 5-18 “Quick Setup” web page

Automation Profile: select a profile which is optimized for the desired operating mode.

– Universal: Standard mode
– ETH/IP: EtherNet/IP mode

IP Assignment: Select the type of IP address assignment.
– STATIC: static IP address
– BOOTP: assignment via the Bootstrap protocol
– DHCP: assignment via a DHCP server

IP address: set the desired IP address.

Network mask: set the desired subnet mask here.

Default gateway: set the desired default gateway here.

Administrator password: you can change the administrator password here.

Operation Mode/Automation Protocol: you can change the operating mode of the device here.
– None: The device operates without EtherNet/IP stack.
– EtherNet/IP: the EtherNet/IP stack is activated.

Device Name: you can enter the device name of the switch here.

Device Description: you can enter a description for the device here.

Physical Location: you can enter a location for the device here.

Device Contact: you can enter the name of a contact person for the device here.

LLDP Mode: you can enable or disable LLDP here.
– Disable: LLDP is deactivated
– Enable: LLDP is activated
– Send only: received LLDP BPDUs are ignored
– Receive only: no LLDP BPDUs are sent

The “LLDP Topology” link opens the corresponding page which can also be accessed via the menu item of the same name.

5.2.2.3 Network

The basic network settings are made here.

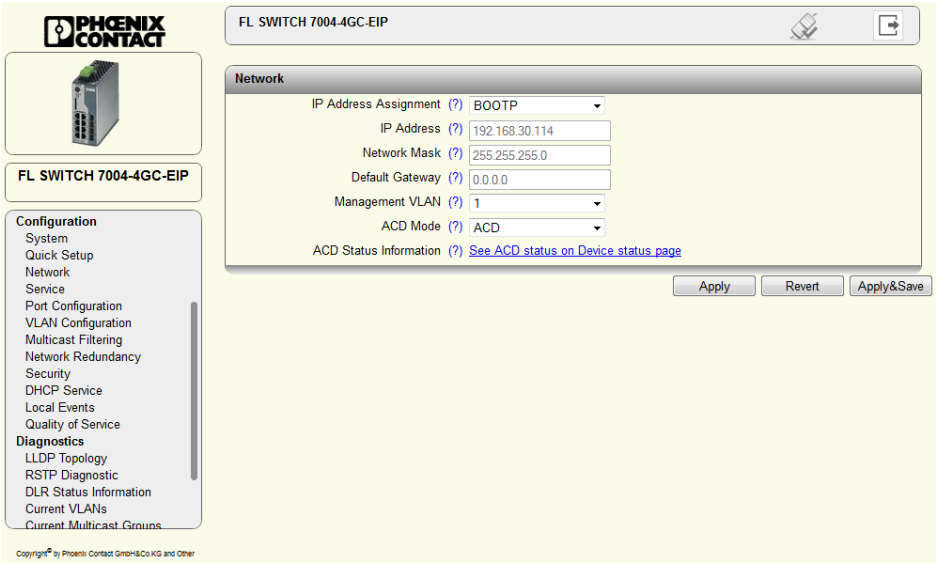

Figure 5-19 “Network” web page

IP Address Assignment: select the type of IP address assignment.

– STATIC: static IP address
– BOOTP: assignment via the Bootstrap protocol
– DHCP: assignment via a DHCP server

If you have chosen “STATIC”, now make the following settings:

IP Address: set the desired IP address.

Network Mask: set the desired subnet mask here.

Default Gateway: set the desired default gateway here.

Management VLAN: set the VLAN here, in which the management is to be located. Default: “1”

ACD Mode: you can enable/disable the “Address Conflict Detection” function here.

ACD Status Information: clicking on the link opens the “Device Status” page.

Figure 5-20 ACD status information on the “Device Status” page

5.2.2.4 Service

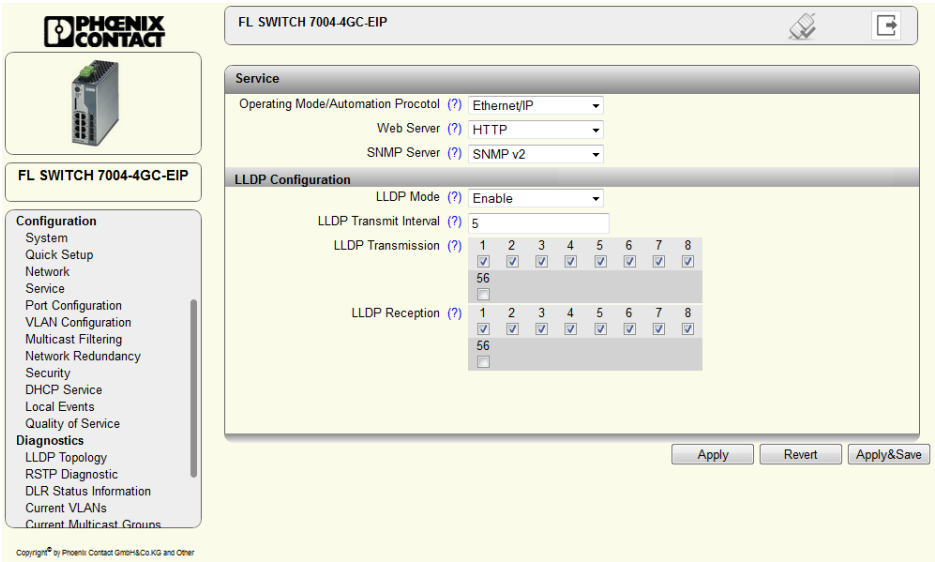

Figure 5-21 “Service” web page

Operating Mode / Automation Protocol:

– None: The device operates without stack.
– Ethernet/IP: The device operates with EtherNet/IP stack.

Web Server: you can enable/disable the web server function here.

SNMP Server: you can enable/disable the SNMP server function here.

LLDP Mode:

– Disable: LLDP is disabled
– Enable: LLDP is enabled
– Send only: only LLDP BPDUs are sent.
– Receive only: only LLDP BPDUs are received.

LLDP Transmit Interval: here you can set the interval in which LLDP telegrams are to be sent. The value must be between 5 and 32786 seconds (default: 5 s).

LLDP Transmission: you can enable/disable port-specific forwarding of LLDP telegrams here

LLDP Reception: you can enable/disable port-specific ignoring of LLDP telegrams here.

5.2.2.5 Port Configuration

Individual Port Configuration

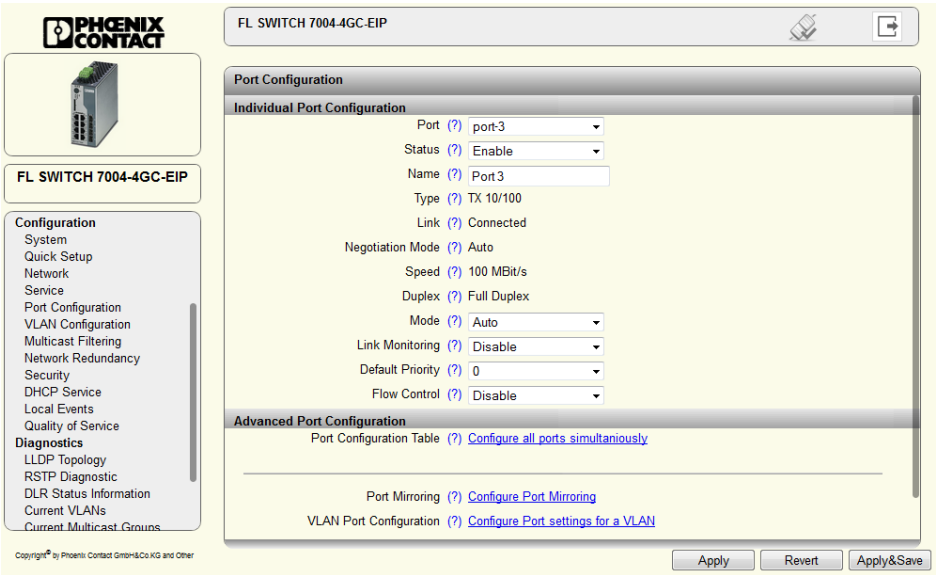

Figure 5-22 “Port Configuration” web page

Port: select the port that you want to configure individually.

Status: the port can be disabled here.

Name: you can assign the port a name.

Type: describes the physical properties of the port.

Link: displays the current link status of the port.

Negotiation Mode: displays the negotiation mode.

Speed: displays the speed at which the port is operating.

Duplex: displays the transmission mode of the port.

Mode: the port can be set to a fixed speed and transmission mode here.

Link Monitoring: here you can set whether the link behavior is to be monitored at the selected port.

Default Priority: set the priority for incoming data packets at this port here.

Flow Control: flow control for the selected port can be enabled and disabled here.

Advanced Port Configuration

Clicking on the “Configure all ports simultaneously” link takes you to the “Port Configuration Table” page. You can set the status, mode, and link monitoring there for all ports.

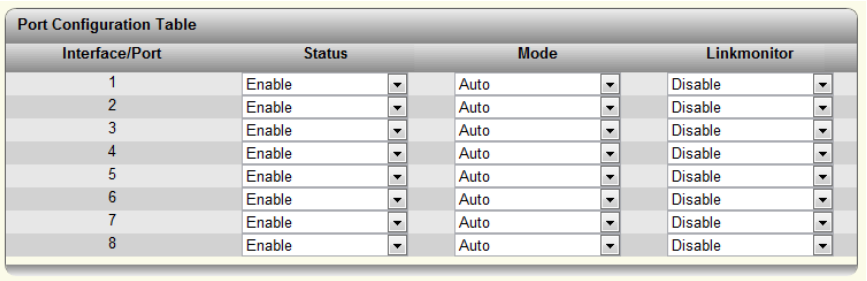

Figure 5-23 “Port Configuration Table” web page

Clicking on the “Configure Port Mirroring” button takes you to the port mirroring configuration (see “Port Mirroring” on page 62).

Clicking on the “Configure Port Settings for a VLAN” button takes you to the “VLAN Port Configuration” page (see “VLAN Configuration” on page 101).

Clicking on the “Configure Port Trunking” button takes you to the “Link Aggregation” page (see ““Link Aggregation” web page” on page 45).

Clicking on the “Configure Port Security” button takes you to the “Port Based Security” page (see ““Port Based Security” web page” on page 53).

“Link Aggregation” web page

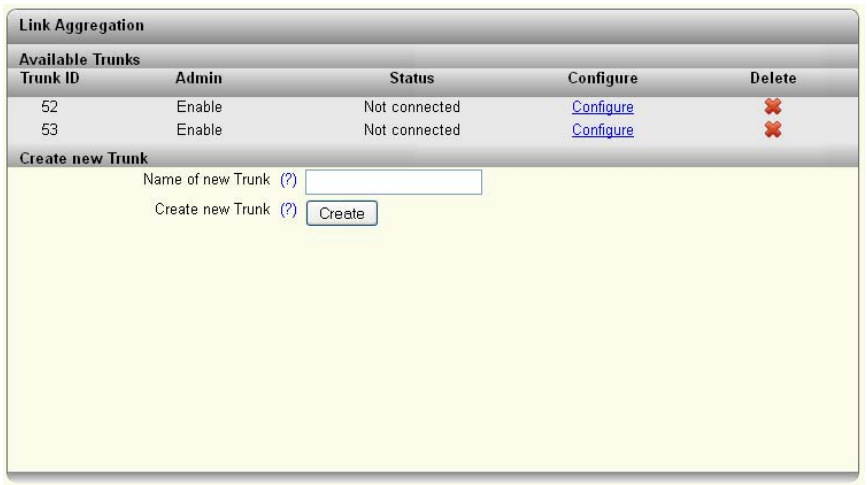

Figure 5-24 “Link Aggregation” web page

In order to create a new trunk, enter a name for the trunk in the “Name of new Trunk” field and click on the “Create” button. The trunk appears in the table at the top of the web page.

	A maximum of four trunks is possible on one device.

To configure a trunk, click on the “Configure” button next to the trunk that you wish to configure. To delete a trunk, use the red “X”.

“Configure Trunk” pop-up

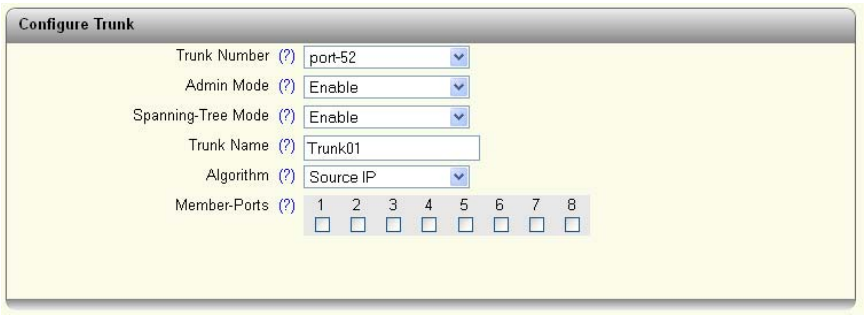

Figure 5-25 “Configure Trunk” web page

Trunk Number: all trunks created by you are displayed here. Select the trunk that you want to configure here.

Admin Mode: you can enable/disable a trunk here.

Spanning-Tree Mode: select whether the RSTP protocol is to be enabled for this trunk here.

Trunk Name: you can set a name for the trunk here.

Algorithm: you can specify the parameters that will be used as the basis for the physical output port here.

Member-Ports: select up to four ports that should belong to the trunk here.

5.2.2.6 VLAN Configuration

For additional information on “VLAN”, refer to “Virtual Local Area Network - VLAN” on page 101.

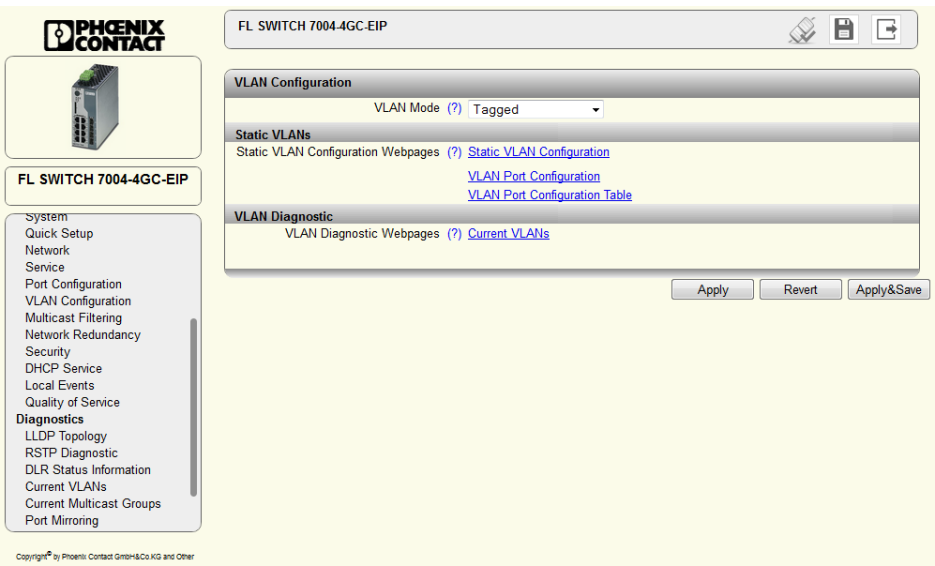

Figure 5-26 “VLAN Configuration” web page

5.2.2.7 Multicast Filtering

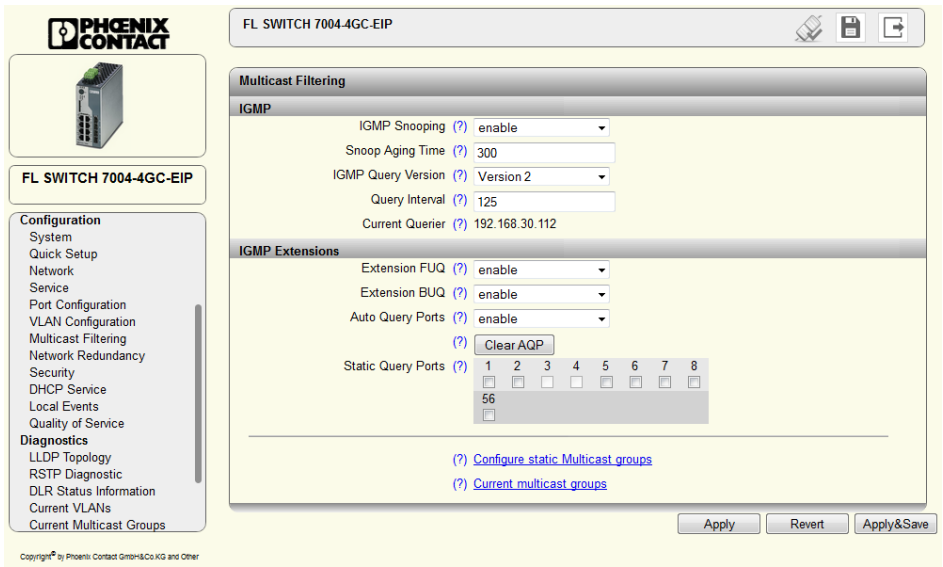

Figure 5-27 “Multicast Filtering” web page

For additional information on “Multicast”, refer to “Multicast Filtering” on page 97.

5.2.2.8 Network Redundancy

Spanning-Tree Configuration

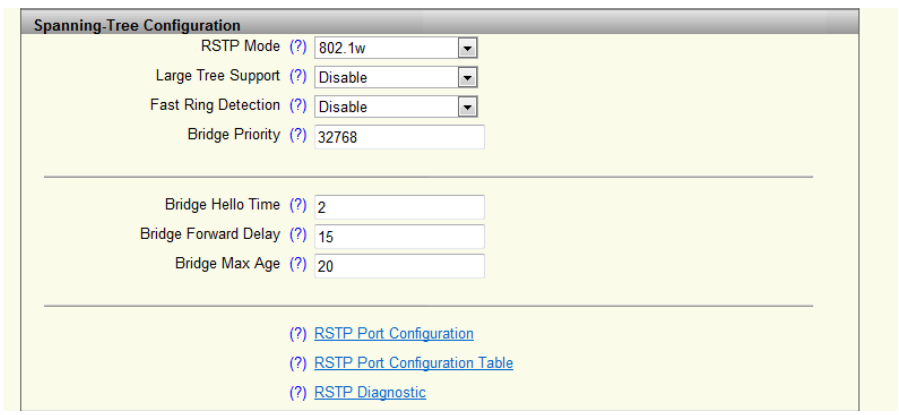

Figure 5-28 “Spanning-Tree Configuration” configuration area

RSTP Mode:

– Disable: the RSTP function is not activated
– 802.1w: the RSTP function is activated globally and operates according to standard 802.1w

The functions below are only available if “802.1w” is activated.

- Large Tree Support: the “Large Tree Support” option makes the ring topology suitable for 28 switches along the relevant path if RSTP is used. The “Large Tree Support” option could provide an RSTP ring topology with up to 57 devices.
- Fast Ring Detection: this function speeds up switch-over to a redundant path in the event of an error and provides easy diagnostics. RSTP fast ring detection provides each ring with an ID. This ID is made known to each switch in the relevant ring. A switch can belong to several different rings at the same time.
- Bridge Priority: the bridge and backup roots can be specified via “Bridge Priority”. Only multiples of 4096 are permitted. The value will be rounded automatically to the next multiple of 4096. Once you have clicked on “Apply&Save”, the initialization mechanism is started (default value: 32768).
- Bridge Hello Time: specifies the time interval within which the root bridge regularly reports to the other switches via BPDU.
- Bridge Forward Delay: the bridge forward delay value indicates how long the switch is to wait for the port state in STP mode to change from “Discarding” to “Listening” and from “Listening” to “Learning” (2 x forward delay).
- Bridge Max Age: the parameter is set by the root switch and used by all switches in the ring. The parameter is sent to make sure that each switch in the network has a constant value, against which the age of the saved configuration is tested.

Clicking on the “RSTP Port Configuration” button takes you to the “RSTP Port Configuration” pop-up.

Clicking on the “RSTP Port Configuration Table” button takes you to the “RSTP Port Configuration Table” pop-up (see Page 49).

Clicking on the “RSTP Diagnostic” button opens the “RSTP Diagnostic” page as a pop-up (see Page 60).

Pop-up: RSTP Port Configuration

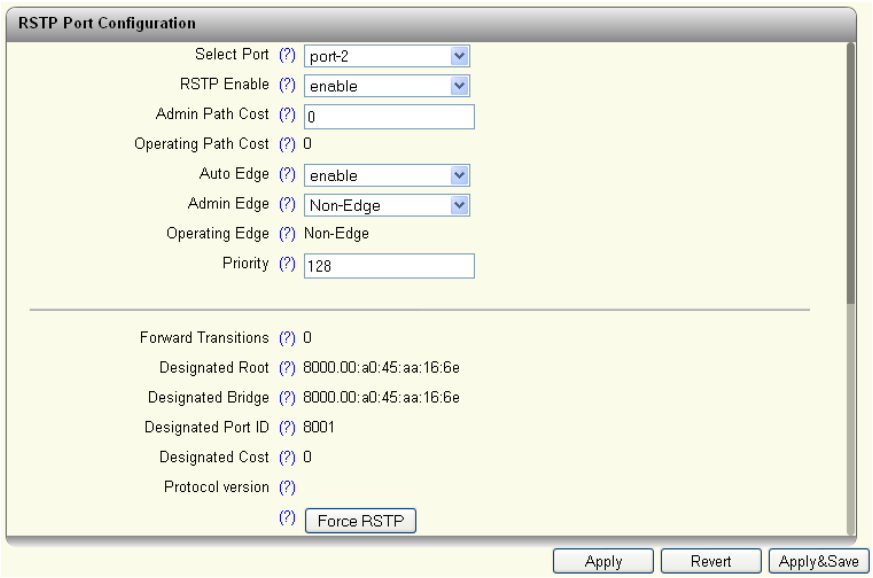

Figure 5-29 “RSTP Port Configuration” web page

Select Port: select the port for which you want to change the RSTP settings here.

RSTP Enable:

– Enable: RSTP is activated for the port
– Disable: RSTP is deactivated for the port

Admin Path Cost: displays the path costs set for this port. A path cost equal to “0” activates the cost calculation according to the transmission speed (10 Mbps = 2000000; 100 Mbps = 200000).

Operating Path Cost: displays the path costs used for this port.

Auto Edge: here you can set whether an automatic change from non-edge port to edge port is to be carried out after a link up.

Admin Edge: here you can set whether this port is to be operated as an edge port (default setting), if possible.

Operating Edge: indicates whether this port is operated as an edge port or a non-edge port.

Priority: indicates the priority set for this port (default value: 128).

Forward Transitions: indicates the number of times the port switches from the “Discarding” state to the “Forwarding” state.

Designated Root: indicates the root bridge for this spanning tree.

Designated Bridge: indicates the switch from which the port receives the best BPDUs.

Designated Port ID: indicates the port via which the BPDUs are sent from the designated bridge. The value is based on the port priority (2 digits) and the port number.

Designated Cost: displays the path costs of this segment to the root switch.

Protocol Version: displays the protocol version.

Pop-up: RSTP Port Configuration Table

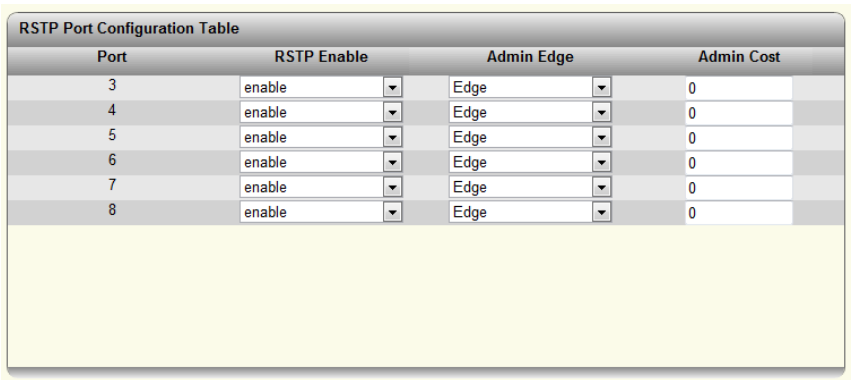

Figure 5-30 “RSTP Port Configuration Table” web page

Port: indicates the ports for which RSTP is available.

RSTP Enable: here you can individually activate or deactivate RSTP for each port.

Admin Edge: here you can set whether this port is to be operated as an edge port (default setting), if possible.

Admin Cost: displays the path costs set for this port. A path cost equal to “0” activates the cost calculation according to the transmission speed (10 Mbps = 2000000; 100 Mbps = 200000).

“Redundancy Port Table” pop-up

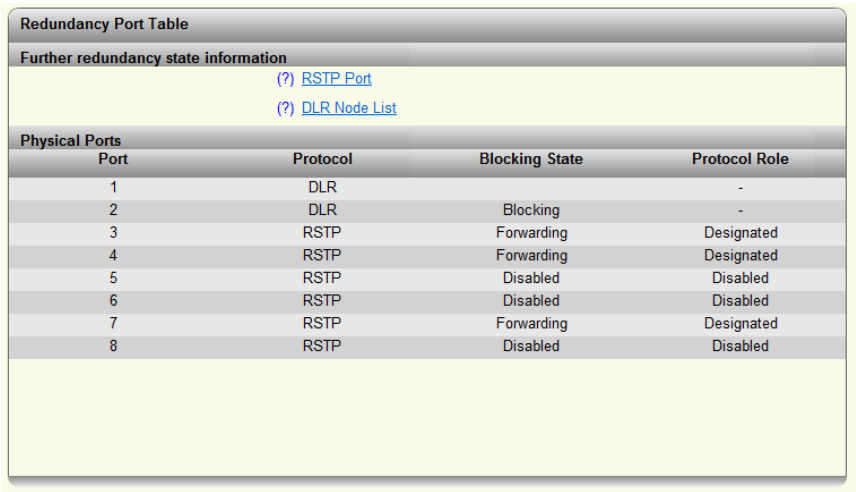

Figure 5-31 “Redundancy Port Table” web page

Device Level Ring / IEEE 1588 Transparent Clock Configuration

Device Level Ring is a ring redundancy protocol that allows up to 50 participants in the ring a switching time that is 3 ms faster. Please observe that the number of devices in the ring can be limited by the controller.

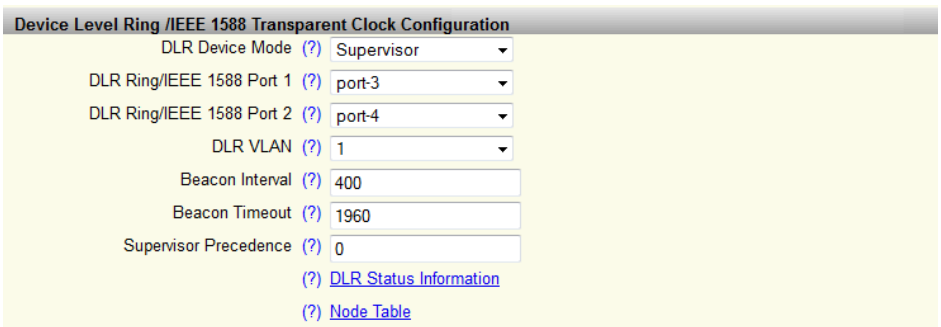

Figure 5-32 “Device Level Ring / IEEE 1588 Transparent Clock Configuration” web page

DLR Device Mode: select the role of the switch in your Device Level Ring.

– Disable: DLR is deactivated.
– Supervisor: the device acts as the master in the ring.
– Node: the device acts as a node in the ring.

The DLR ring ports can be freely configured. Port 1 and port 2 do not necessarily have to be used. Gigabit ports cannot be configured as DLR ring ports.

DLR Ring/IEEE 1588 Port 1: determines the first ring port for the Device Level Ring.

DLR Ring/IEEE 1588 Port 2: determines the second ring port for the Device Level Ring.

The following fields are only available in supervisor mode.

Make sure that the DLR ports available on the supervisor are only connected to the DLR ports of the other devices.

Beacon Interval: here you can set the interval in which the beacon telegrams are sent. The value must be between 200 and 100000 (default: 400).

Beacon Timeout: here you can set the permitted timeout of a beacon telegram. The value must be between 400 and 500000 (default: 1960).

Supervisor Precedence: set the priority of the supervisor here. The highest value has the highest priority in the network. The value must be between 0 and 255 (default: 0).

If two devices in a DLR ring are configured with the same priority, the devices with the smaller MAC address will become the supervisor. The other device will assume the role of backup supervisor.

For the two configured DLR ports, the physical settings remain available. Settings for VLAN or port trunking are deleted and are reset to the default value.

Clicking on the “Status Information” link opens the “DLR Status Information” web page as a pop-up (see “DLR Status Information” on page 61).

Clicking on the “Node Table” button opens the “DLR Node Table” pop-up, which lists all the devices in the Device Level Ring. The “DLR Node Table” is only available in supervisor mode.

“DLR Node Table” pop-up

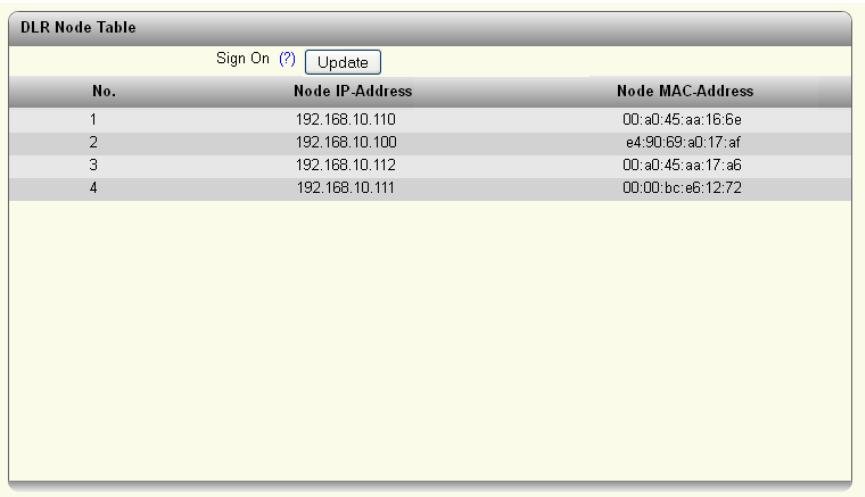

Figure 5-33 “DLR Node Table” web page

5.2.2.9 Security

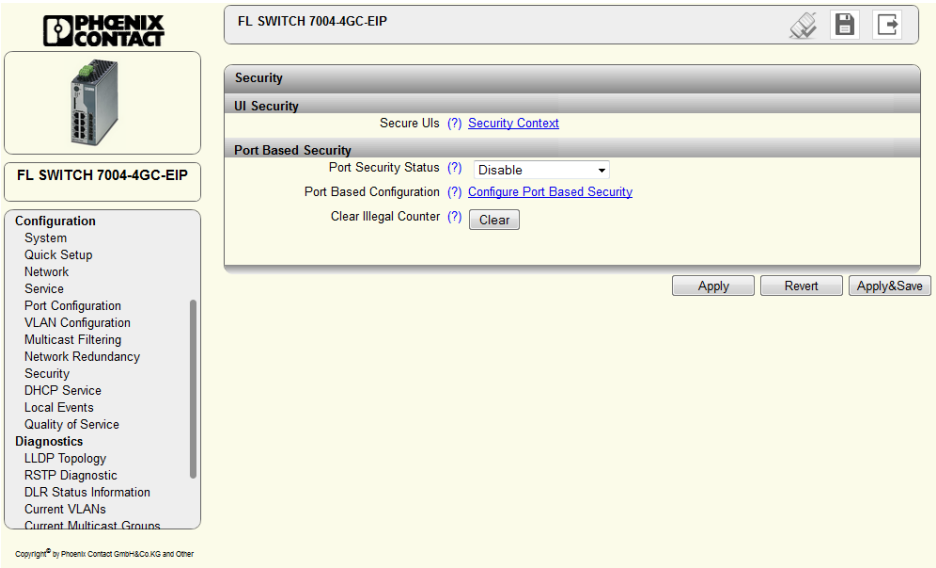

Figure 5-34 “Security” web page

Secure UIs: clicking on the “Security Context” link opens the pop-up of the same name (see Page 39).

Port Security Status: the port security can be globally activated here.

Port Based Configuration: clicking on the button opens the “Port Based Security” web page (see Page 53).

Clear Illegal Counter: clicking on the button sets the counter to “0”.

“Port Based Security” web page

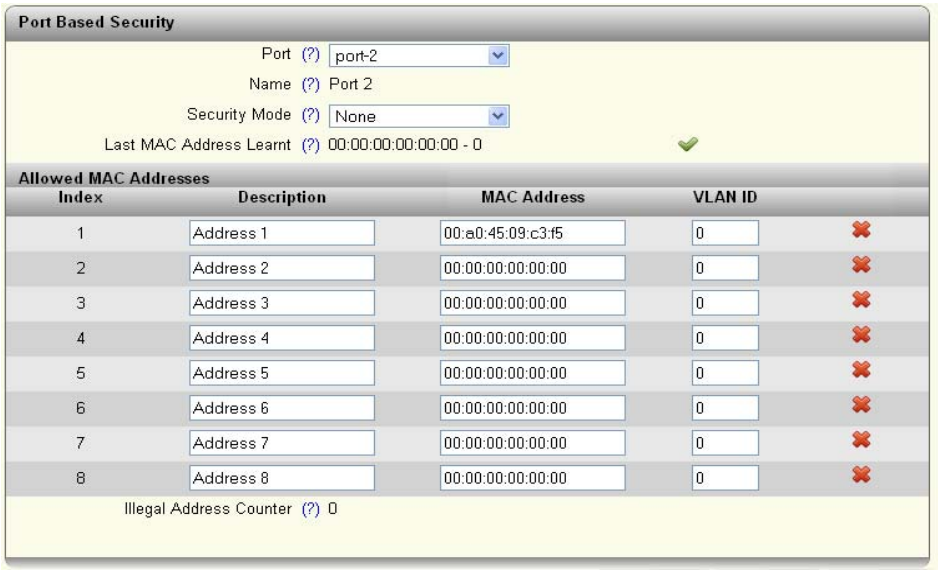

Figure 5-35 “Port Based Security” web page

Port: select the port for which the security settings should be made here.

Name: indicates the name of the selected port.

Security Mode: set here what the process should be if a MAC address that is not permitted is detected by the device.

– None: no security settings are available for this port.
– Trap: if a MAC address that is not permitted is detected at the port, a trap is sent to the predefined trap destination address. The packets are not blocked.
– Block: if a MAC address that is not permitted is detected at the port, all packets are blocked at the port and a trap is sent to the predefined trap destination address. The packets at this port remain blocked until a permitted MAC address is detected.

Last MAC Address Learned: displays the MAC address of the last connected device. By clicking on the green tick, this MAC address can be added to the list of permitted MAC addresses.

Allowed MAC Addresses

Index: indicates the index of the permitted MAC addresses.

Description: a description for a permitted MAC address can be provided here.

MAC Address: enter a MAC address, for which you want to allow access. Alternatively, you can select the green tick after the “Last MAC Address Learned” field to use the last MAC address which was learned.

VLAN ID: enter the VLAN where the device is located which occupies the permitted MAC address.

Clicking on the red “X” to the right of this column deletes the permitted MAC address for this port.

Illegal Counter: counter which counts the packets of MAC addresses that are not permitted.

5.2.2.10 DHCP Service

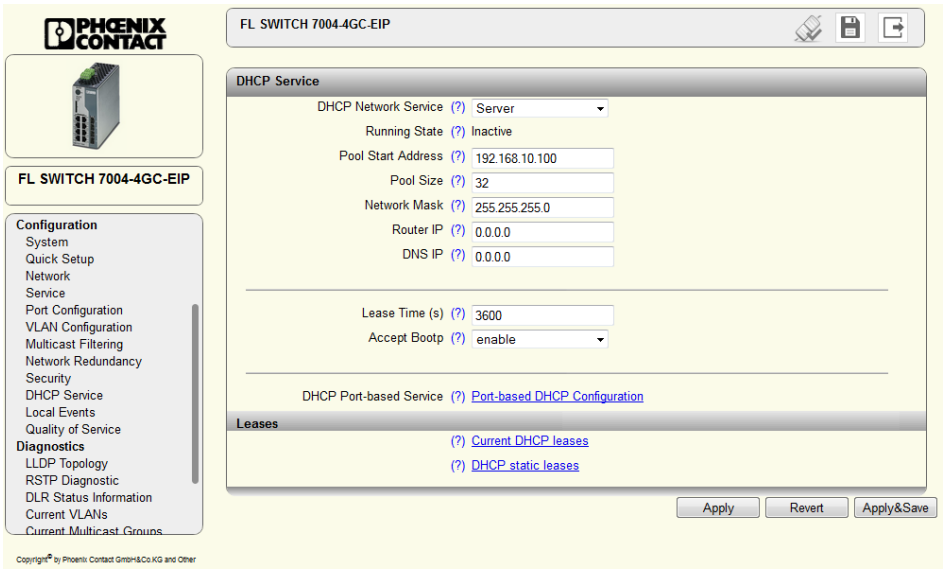

Figure 5-36 “DHCP Service” web page

DHCP Mode: select the DHCP service you wish to use here.

– None: a DHCP service is not used on the switch.
– Relay Agent: the DHCP relay agent (DHCP Option 82) is enabled.
– Server: the switch is used as the DHCP server.

The following fields are only available after selecting “Relay Agent” as the DHCP mode.

Option82: select the address which should be used as the remote ID here.

– IP: uses the IP address of the switch as the remote ID.
– MAC: uses the MAC address of the switch as the remote ID.

Server IP Address: set the IP address of the DHCP server in your network here.

Port Mode: select the ports for which the DHCP relay agent should be activated here.

The following fields are only available after selecting “Server” as the DHCP mode.

– Running State: shows the current status of the DHCP server. The status is “Inactive” if some setting options are incorrect.
– Pool Start Address: set the first IP address of the DHCP server address pool here.
– Pool Size: set the number of IP addresses in the DHCP server address pool here. Please note that the number of IP addresses must match the configured subnetwork.
– Network Mask: set the subnet mask that is assigned to the DHCP clients here.
– Router IP: set the router/default gateway IP address that is assigned to the DHCP clients here.
– DNS IP: set the DNS IP address that is assigned to the DHCP clients here.

- Lease Time(s): the time that the DHCP server leases an IP address to a client before it has to report to the server again can be set here. The value must be between 300 and 2592000 seconds, “0” is interpreted as an infinite time (default: 3600).
- Accept Bootp: here you can set whether the switch acting as the DHCP server accepts BootP requests. If this function is activated, an IP address with an infinite lease time is assigned to the requesting DHCP clients.
- Current leases: opens the “Current DHCP Leases” pop-up where the IP addresses that are currently assigned are displayed.
- Static leases: opens the “DHCP Static Leases” pop-up for configuring static IP address assignment.
- Port Local service: opens the “Port-based DHCP Configuration” pop-up.

Pop-up: Current DHCP Leases

This pop-up displays the IP addresses that are currently assigned.

- Leased IP: displays the assigned IP addresses.
- Client ID: displays the MAC address of the client to which the IP address is assigned.
- System Uptime: displays the time that has elapsed since the IP address was assigned to the client.
- Local Port: indicates the port to which the client is connected.
- State: indicates the status of the client.
- Lease count: displays the number of assigned IP addresses.
- Release: clicking on the “Release” button releases unused entries.

Pop-up: DHCP Static Leases

This pop-up displays the configured static IP assignment.

Lease list:

- IP address: displays the static IP address assigned.
- Client address: displays the MAC address of the client.
- Delete: clicking on the red cross deletes the entry.

Create new static entry:

- IP address: enter the static IP address that you wish to assign here.
- Client address: enter the MAC address to which you wish to assign a static IP address here.
- Create: click on the “Create” button to carry out static assignment.

Pop-up: Port-based DHCP Configuration

The port-based DHCP server functionality can be configured in this pop-up.

- Select Port: select the port for which you wish to carry out port-based DHCP server configuration here.
- Local Service enable: activate the port-based DHCP server functionality for the selected port here.
- Local IP: enter the IP address that is assigned to the client at the selected port here.
- Netmask: enter the subnet mask that is assigned to the client at the selected port here.
- Router: enter the gateway address that is assigned to the client at the selected port here.

– DNS: enter the DNS address that is assigned to the client at the selected port here.

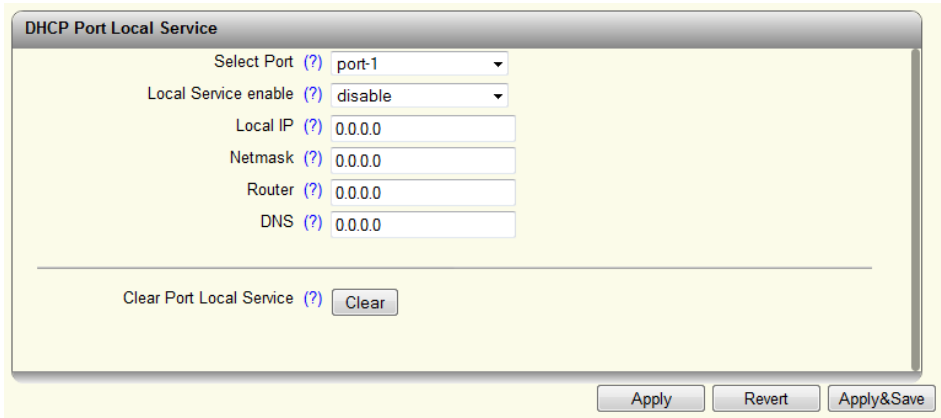

Figure 5-37 “DHCP Port Local Service” pop-up

5.2.2.11 Local Events

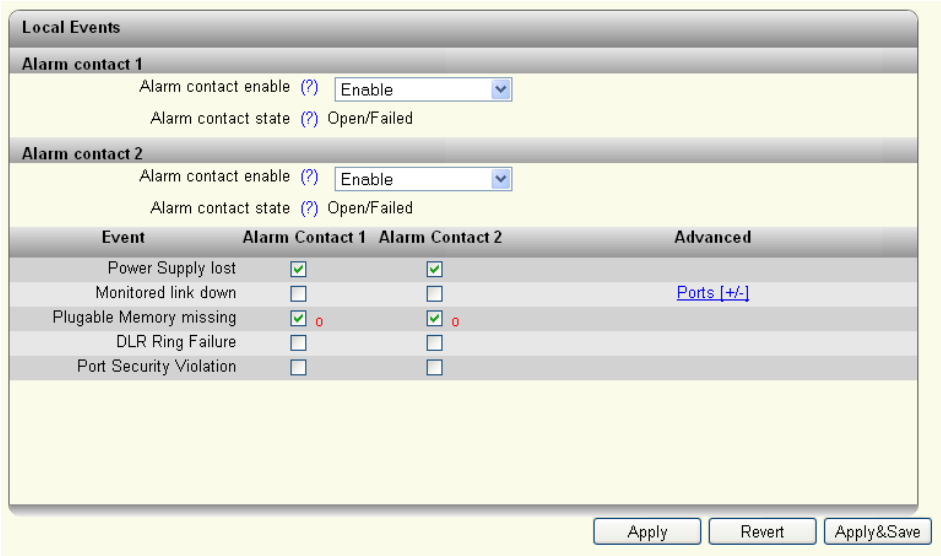

Figure 5-38 “Local Events” web page

Alarm contact 1:

Here you can activate alarm contact 1 and read the current status of the alarm contact (if a red “**o**” is present, this event has occurred).

Alarm contact 2:

Here you can activate alarm contact 2 and read the current status of the alarm contact (if a red “**o**” is present, this event has occurred).

Events: here you can determine under which conditions an alarm contact should report an error.

– Power Supply lost: in the event that US1 or US2 is lost

– Monitored link down: under “Advanced”, select the ports to which link down behavior should be reported.
– Pluggable Memory missing: an error message is generated if no memory card is present.
– DLR Ring Failure: if there is an error in the Device Level Ring, this is indicated by an error message.
– Port Security Violation: the alarm contact indicates an error if a MAC address that is not permitted is detected at a port.

5.2.2.12 Quality of Service

Flow Control

Port Configuration: clicking on the “Configure Flow Control per port” link opens the “Port Configuration” web page, which contains the configuration options for flow control.

Port Configuration Table: clicking on the “Configure Flow control for multiple ports at once” link opens the “Port Configuration Table” web page where flow control can be configured for all ports.

Storm Control

Storm Control Configuration: clicking on the “Configure Storm Control per port” link opens the “Storm Control Configuration” web page.

Storm Control Configuration Table: clicking on the “Configure Storm control for multiple ports at once” link opens the “Storm Control Configuration Table” web page.

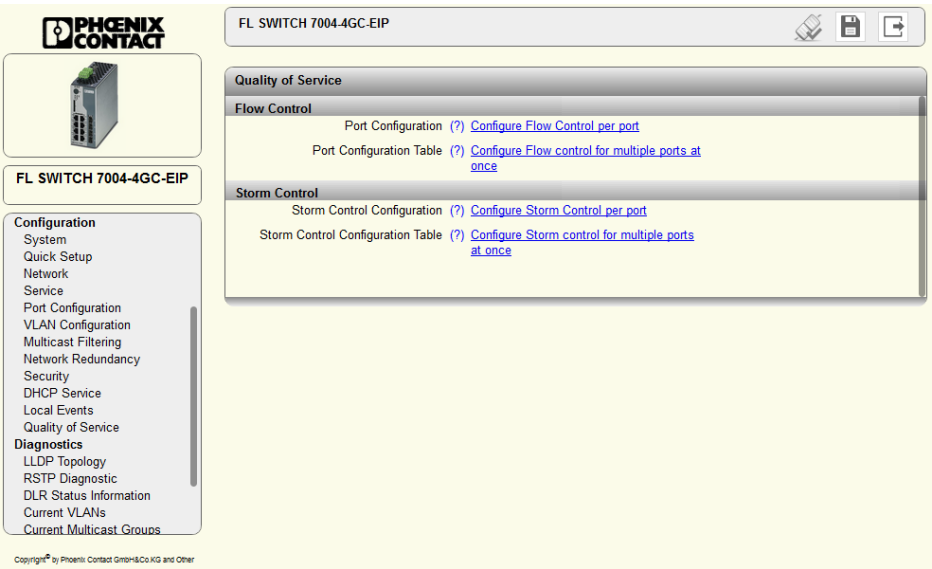

Figure 5-39 “Quality of Service” web page

“Storm Control Configuration” web page

Port: select the port here for which storm control is to be configured.

Name: the name of the selected port is displayed here.

Broadcast Storm Control: broadcast storm control can be activated or deactivated here.

Broadcast Threshold: set the threshold value in kbps for broadcast storm control here.

Multicast Storm Control: multicast storm control can be activated or deactivated here.

Multicast Threshold: set the threshold value in kbps for multicast storm control here.

Unknown Unicast Storm Control: storm control for unknown unicasts can be activated or deactivated here.

Unknown Unicast Threshold: set the threshold value in kbps for unknown unicast storm control here.

Storm Control Configuration Table: clicking on the “Configure Storm control for multiple ports at once” link opens the “Storm Control Configuration Table” web page.

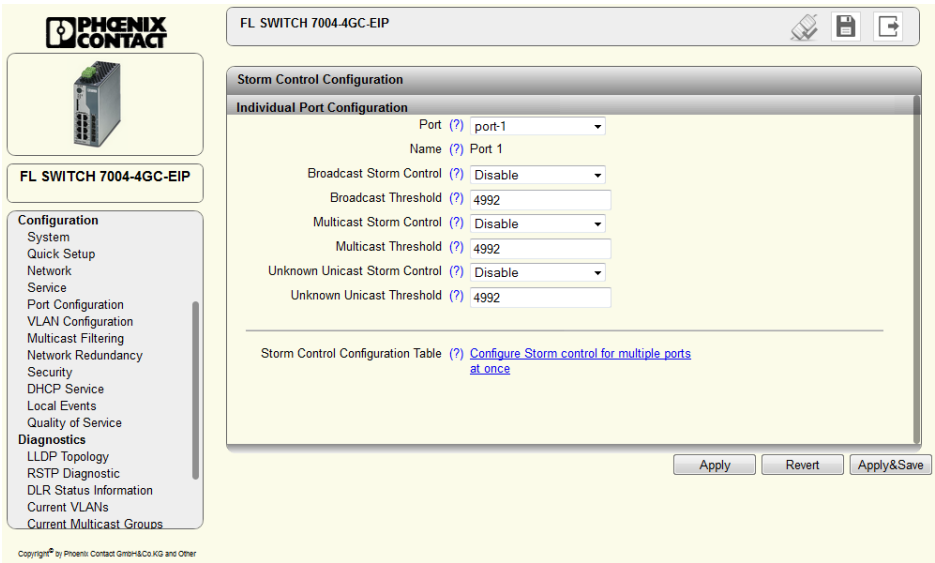

Figure 5-40 “Storm Control Configuration” web page

Web page: Storm Control Configuration Table

Broadcast Mode: broadcast storm control can be activated or deactivated here.

Broadcast Rate: set the threshold value in kbps for broadcast storm control here.

Multicast Mode: multicast storm control can be activated or deactivated here.

Multicast Rate: set the threshold value in kbps for multicast storm control here.

Unicast Mode: storm control for unknown unicasts can be activated or deactivated here.

Unicast Rate: set the threshold value in kbps for unknown unicast storm control here.

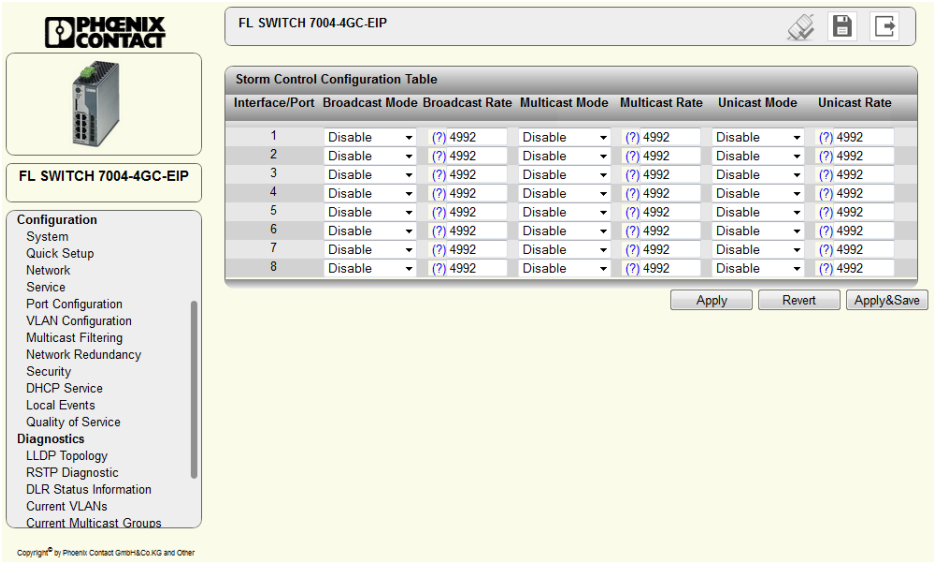

Figure 5-41 “Storm Control Configuration Table” web page

5.2.3 Diagnostics area of WBM

5.2.3.1 LLDP Topology

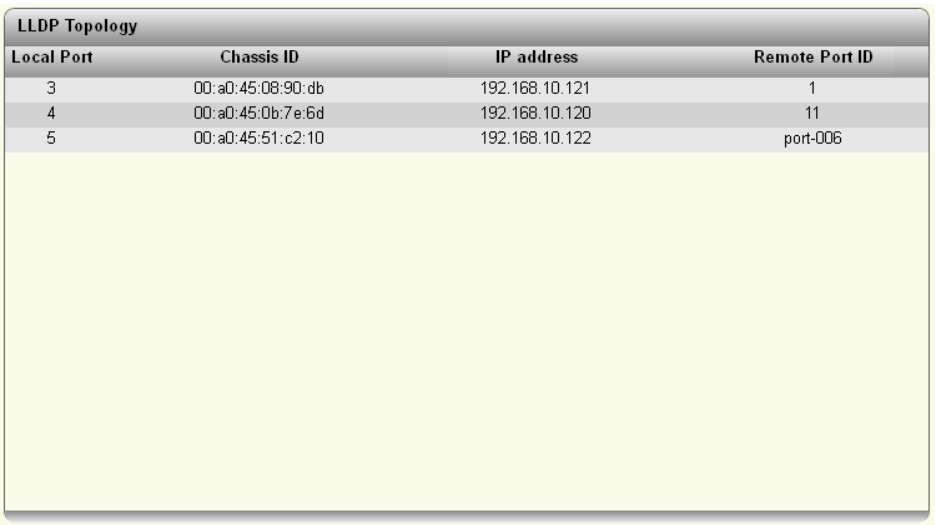

Figure 5-42 “LLDP Topology” web page

This web page provides neighborhood/topology information which the device has been able to obtain from the network to which it is connected.

5.2.3.2 RSTP Diagnostic

Figure 5-43 “RSTP Diagnostic” web page

Designated Root: indicates the root bridge for this spanning tree.

Root Port: indicates the port to which the root is connected. If the root is not directly connected, it shows the direction of the root.

Root Cost: displays the total path costs for the root.

Topology Changes: indicates the number of topology changes.

Last Topology Change: indicates when the last topology change took place.

Hello Time: shows the hello time set at the root.

Forward Delay: shows the forward delay set at the root.

Max Age: shows the max age time set at the root.

Clicking on the “Redundancy Port Table” button opens a table with information on the individual ports and their redundancy mechanism assignment.

5.2.3.3 DLR Status Information

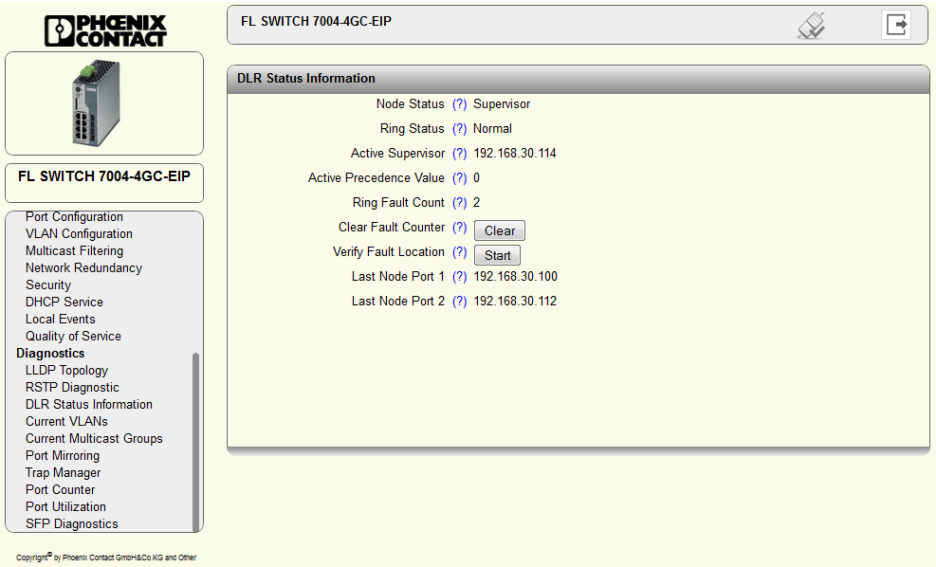

Figure 5-44 “DLR Status Information” web page

Node Status: indicates the status of the device in the DLR ring.

Ring Status: indicates the status of the DLR ring.

Active Supervisor: displays the IP address of the active DLR supervisor.

Active Precedence Value: indicates the priority value of the supervisor.

Ring Fault Counter: displays the number of errors in the ring since the last counter reset or device restart.

Clear Fault Counter: resets the ring fault counter.

Verify Fault Location: determines the last ring node that can be reached in the event of an error.

Last Node Port 1: shows the IP address of the last node that can be reached at DLR port 1.

Last Node Port 2: shows the IP address of the last node that can be reached at DLR port 2.

5.2.3.4 Current VLANs

For additional information, refer to “Current VLANs” on page 103.

5.2.3.5 Current Multicast Groups

For additional information, refer to “Multicast Filtering” on page 97.

5.2.3.6 Port Mirroring

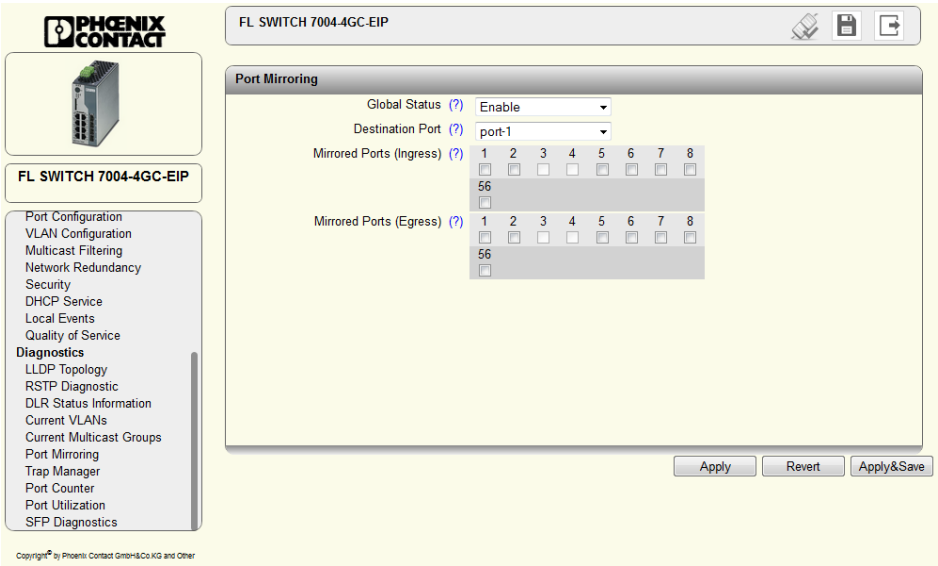

Figure 5-45 “Port Mirroring” web page

Global Status:

– Enable: port mirroring is activated globally
– Disable: port mirroring is deactivated globally

Destination Port: select the port to which the measuring device (PC) is connected here.

Mirrored Ports (Ingress): specify the ports from which the incoming data traffic should be mirrored here.

Mirrored Ports (Egress): specify the ports from which the outgoing data traffic should be mirrored here.

5.2.3.7 Trap Manager

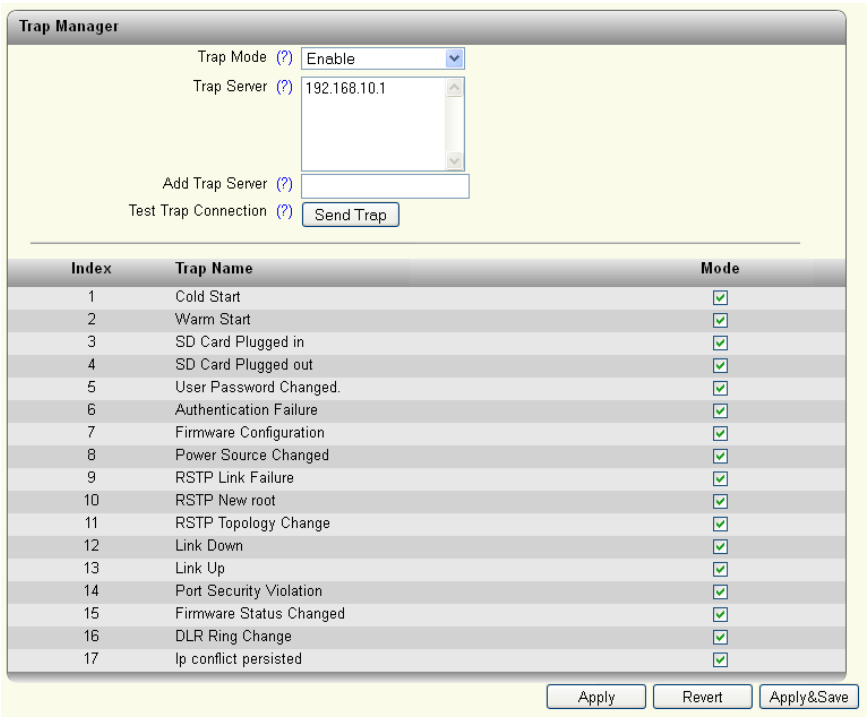

Figure 5-46 “Trap Manager” web page

Trap Mode:

– Enable: sending of SNMP traps is enabled
– Disable: sending of SNMP traps is disabled

Trap Server: All trap servers which are to receive SNMP traps from this device are displayed here.

Add Trap Server: enter the IP address of a trap server and click on “Add&Save” to create this trap server.

Test Trap Connection: the connection to the trap server is tested by clicking on the “Send Trap” button.

The table lists the SNMP traps which can be sent by the device. Here you can select the actions for which SNMP traps should be sent.

5.2.3.8 Port Counter

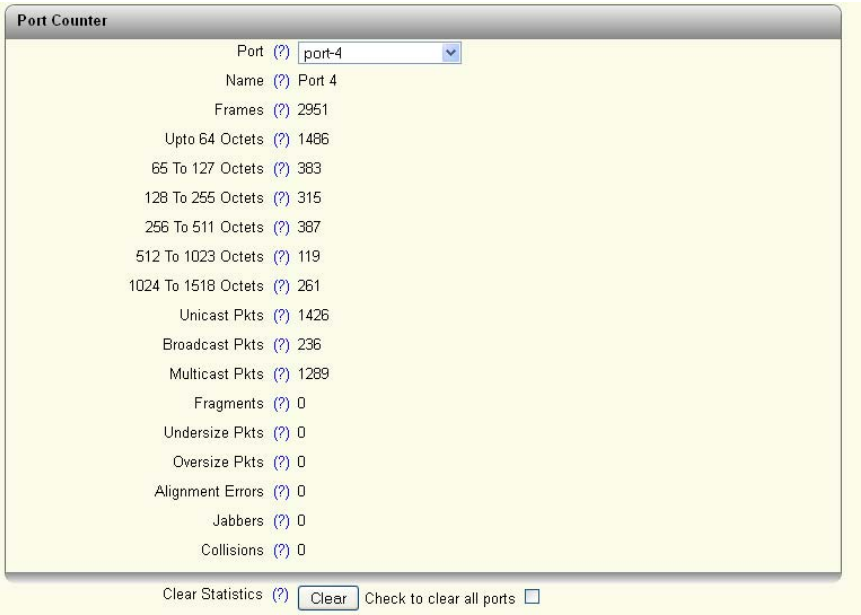

Figure 5-47 “Port Counter” web page

Here you will find an overview of the port statistics.

5.2.3.9 Port Utilization

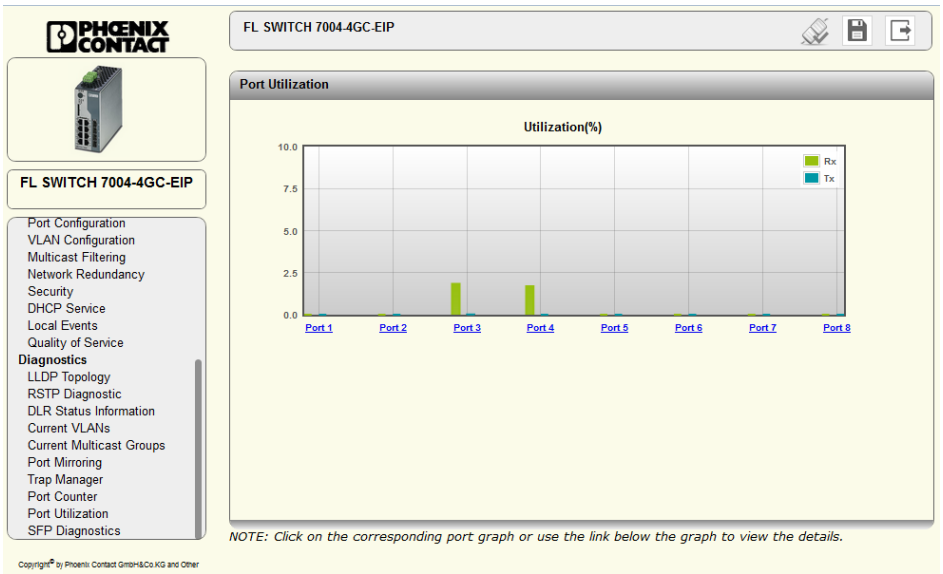

Figure 5-48 “Port Utilization” web page

Here you will find an overview of the port utilization for this device as a percentage. For a detailed overview, click on the graph of an individual port.

5.2.3.10 SFP Diagnostics

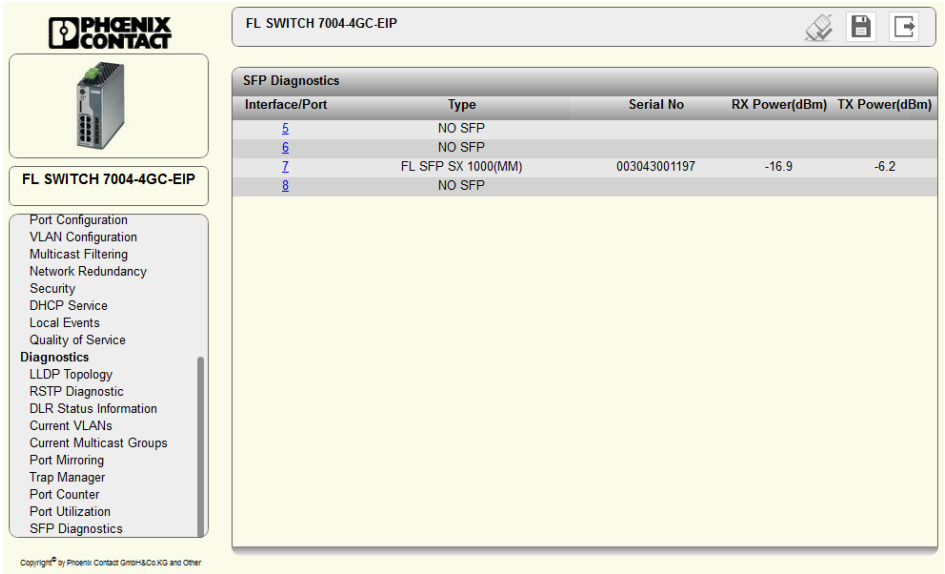

Figure 5-49 “SFP Diagnostics” web page

Here you will find an overview of the SFP ports.

Interface/Port: the ports that can be used with SFP modules are displayed here. Clicking on a port number opens the port configuration for that port.

Type: the type of SFP module used is displayed here. If no SFP module is inserted, “NO SFP” is displayed.

Serial No: the serial number of the SFP module used is displayed in this column.

RX Power (dBm): the incoming power level is displayed in this column.

TX Power (dBm): the outgoing power level is displayed in this column.

6 Simple Network Management Protocol (SNMP)

6.1 General function

SNMP is a non-proprietary standard for Ethernet management. It defines commands for reading and writing information, and defines formats for error and status messages. SNMP is also a structured model that consists of agents, their relevant Management Information Base (MIB), and a manager. The manager is a software tool that is executed on a network management station. The agents are located inside switches, bus terminals, routers, and other devices that support SNMP. The task of the agents is to collect and provide data in the MIB. The manager regularly requests and displays this information. The devices can be configured by writing data from the manager to the MIB. In the event of an emergency, the agents can also send messages (traps) directly to the manager.

All configuration modifications, which are to take effect after a device restart, must be saved permanently using the “flWorkFWCtrlConfSave” object.

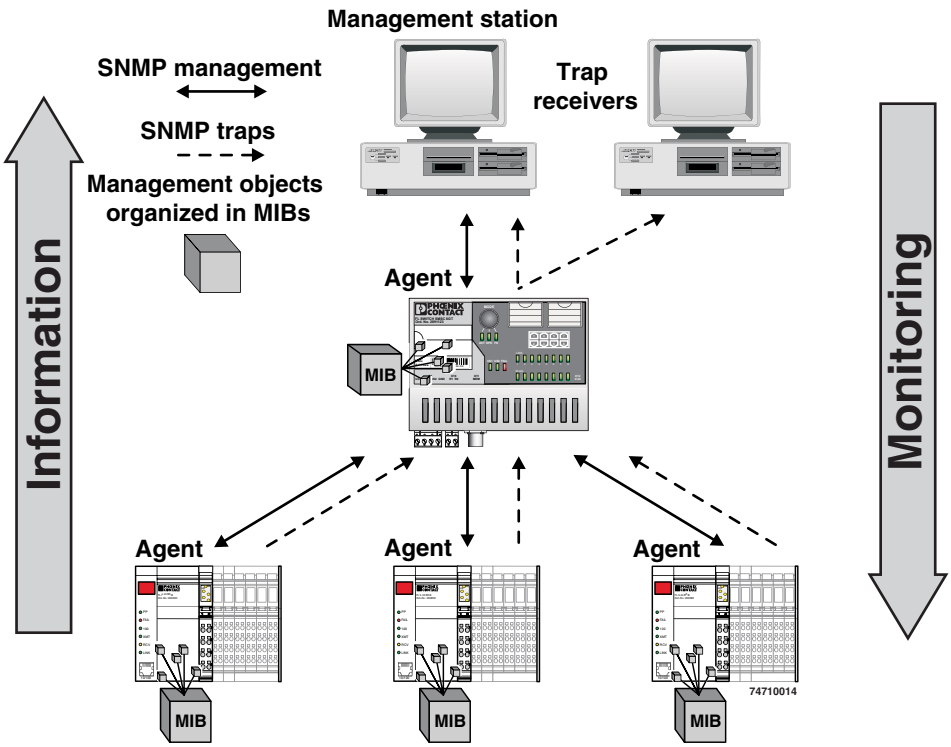

Figure 6-1 Schematic view of SNMP

SNMP interface

All managed Factoryline components have an SNMP agent. The agent of this type of device manages the following MIBs (Management Information Bases):

– FL Managed Infrastructure MIB
– lldpMIB

- RFC1213 MIB
- rmon
- snmpMIB
- ifMIB
- snmpFrameworkMIB
- etherMIB
- pBridgeMIB
- qBridgeMIB
- dot1dBridge
- rstpMIB
- IP MIB

Network management stations, such as a PC with Factory Manager, can read and modify configuration and diagnostic data from network devices via the Simple Network Management Protocol. In addition, any SNMP tools or network management tools can be used to access Factoryline products via SNMP. To do this, the MIBs supported by the relevant device must be made available to the SNMP management tools.

On the one hand, these are globally valid MIBs, which are specified and described in RFCs (Requests for Comments). This includes, for example, MIB2 according to RFC1213, which is supported by all SNMP-compatible network devices. On the other hand, manufacturers can specify their own SNMP objects, which are then assigned to a private manufacturer area in the large SNMP object tree. Manufacturers are then responsible for their own private (enterprise) areas, i.e., they must ensure that only one object (object name and parameters) is assigned to an object ID and can be published. If an object is no longer needed, it can be labeled as “expired”, but it cannot be reused with other parameters under any circumstances.

Phoenix Contact provides notification of ASN1 SNMP objects by publishing their descriptions on the Internet.

Reading SNMP objects is not password-protected. However, a password is required for read access in SNMP, but this is set to “public”, which is usual for network devices, and cannot be modified. By default upon delivery, the password for write access is REDACTED and can be changed by the user.

SNMP and the web interface use the same password, which can be changed by the user.

Another benefit for the user is the option of sending traps using the Simple Network Management Protocol.

Management Information Base (MIB)

Database which contains all the data (objects and variables) required for network management.

Agent

An agent is a software tool which collects data from the network device on which it is installed and transmits this data on request. Agents reside in all managed network components and transmit the values of specific settings and parameters to the management station. On a request of a manager or on the occurrence of a specific event, the agent transmits the collected information to the management station.

Traps

Traps are spontaneous SNMP alarm or information messages that are sent by an SNMP-compatible device when specific events occur. Traps are transmitted with maximum priority to various addresses, if required, and can then be displayed by the management station in plain text. The IP addresses that are to receive these traps (trap targets/receivers) must be set by the user on the relevant device.

trapPasswd

OID	1.3.6.1.4.1.4346.11.11.3.0.1
Description	Sent to the defined trap receivers on each modification or attempted modification of the device password and contains information about the status of the last modification or attempted modification.

trapFWHealth

OID	1.3.6.1.4.1.4346.11.11.3.0.2
Description	Sent on each firmware-related modification and contains additional information about the firmware status.

trapFWConf

OID	1.3.6.1.4.1.4346.11.11.3.0.3
Description	Sent each time the configuration is saved and informs the management station that the configuration has been saved successfully. This trap is sent in the event of configuration modifications (port name, port mode, device name, IP address, trap receiver address, port mirroring, etc.), which are not yet saved permanently. The trap therefore provides a warning that, if not saved permanently, the changes will be lost on a reset.

trapPowerSupply

OID	1.3.6.1.4.1.4346.11.11.3.0.4
Description	Sent each time the redundant power supply fails.

trapRstpRingFailure

OID	1.3.6.1.4.1.4346.11.11.3.0.6
Description	Sent in the event of a link interrupt in the redundant RSTP ring.

trapManagerConnection

OID	1.3.6.1.4.1.4346.11.11.3.0.99
Description	Trap to test the connection between the SNMP agent and the network management station.

6.2 Tree structure of the MIB

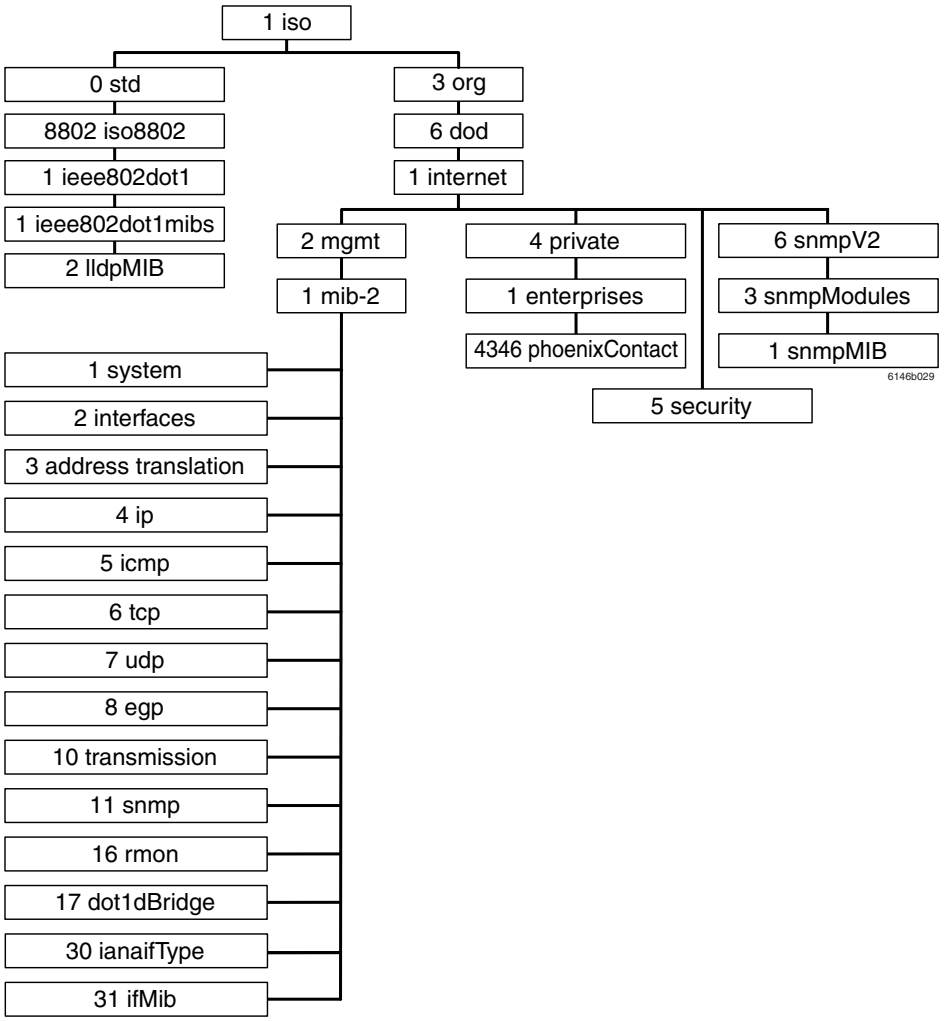

Figure 6-2 Tree structure of the MIB

Not all devices support all object classes. If an unsupported object class is requested, “not supported” is generated. If an attempt is made to modify an unsupported object class, the message “badValue” is generated.

The individual SNMP objects are located in the respective MIBs and can be downloaded from the Phoenix Contact e-shop. Note that the MIB is located in a firmware’s respective software package (zip file).

Please note that the following MIB objects are **not** available on the DLR ports:

Interface MIB

IfOutErrors, IfDiscards, IfUnknownProtos, IfOutDiscards

EtherStatsTable

EtherStatsUndersizePkts, EtherStatsOversizePkts, EtherStatsBroadcastPkts, EtherStatsMulticastPkts, EtherStatsFragments, EtherStatsJabbers, EtherStatsCollisions, EtherStats64Octets, EtherStats65-127Octets, EtherStats128-255Octets, EtherStats256-511Octets, EtherStats512-1023Octets, EtherStats1024-1518Octets

7 Device Level Ring - DLR

DLR increases the network availability, thanks to a redundant ring topology with a switch-over time of less than 3 ms for error detection and reconfiguration. DLR is a protocol that works on Layer 2 for multi-port EtherNet/IP™ devices. The use of DLR is transparent for the protocols which work on higher levels such as TCP/IP.

If a device is to be configured as ring supervisor in a DLR topology, the other switches in the ring must support DLR. Operating non-DLR switches in the ring is not recommended.

Possible topologies

The DLR protocol supports the 1-ring topology; multiple rings or overlapping rings are not possible. It is possible, when using suitable switches, to connect a redundant ring or operate multiple, restricted rings. As such, DLR protocol information must not leave the individual ring and appear in other rings.

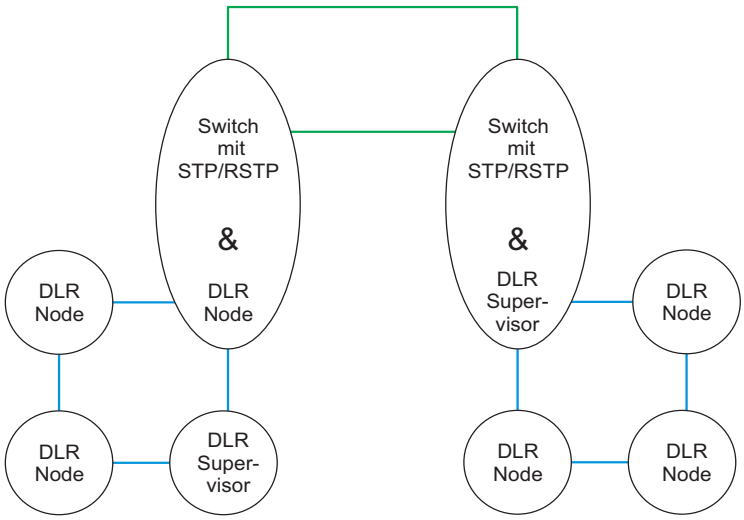

Figure 7-1 Redundant coupling of two DLR rings via STP/RSTP

The following topology shows four DLR rings, which each make up individual segments. These segments are redundantly meshed and connected with one another. As such, the individual segments are respectively separated from other segments, so that no protocol information can leave the particular ring.

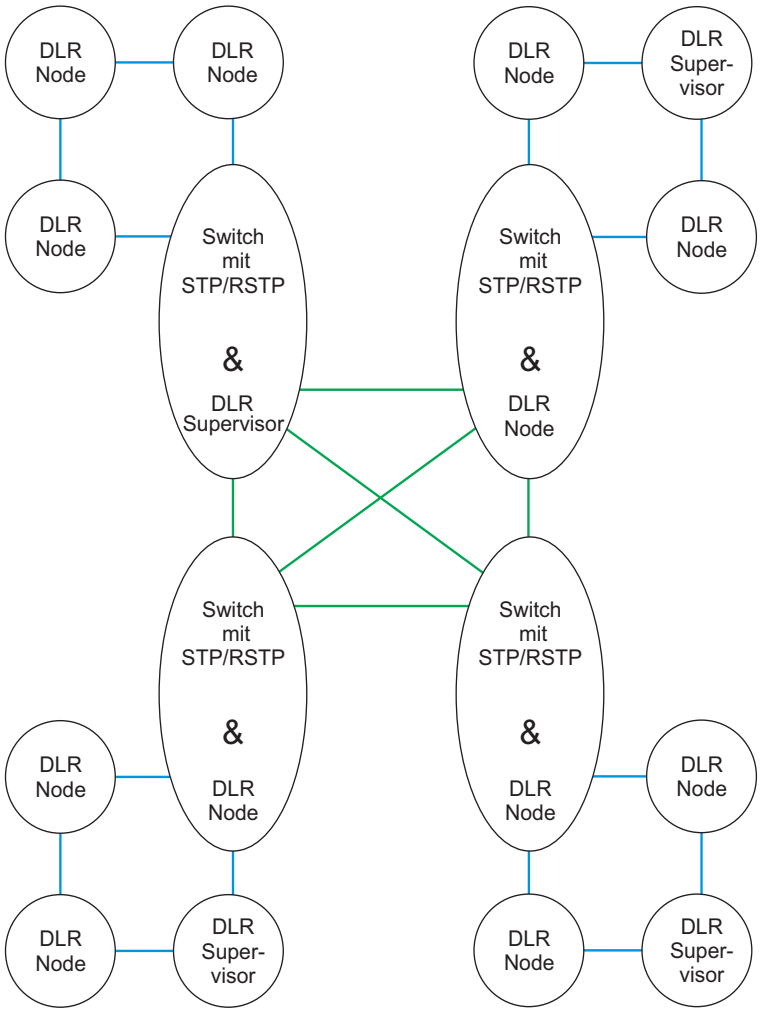

Figure 7-2 Meshed coupling of multiple DLR rings

Other possible topologies

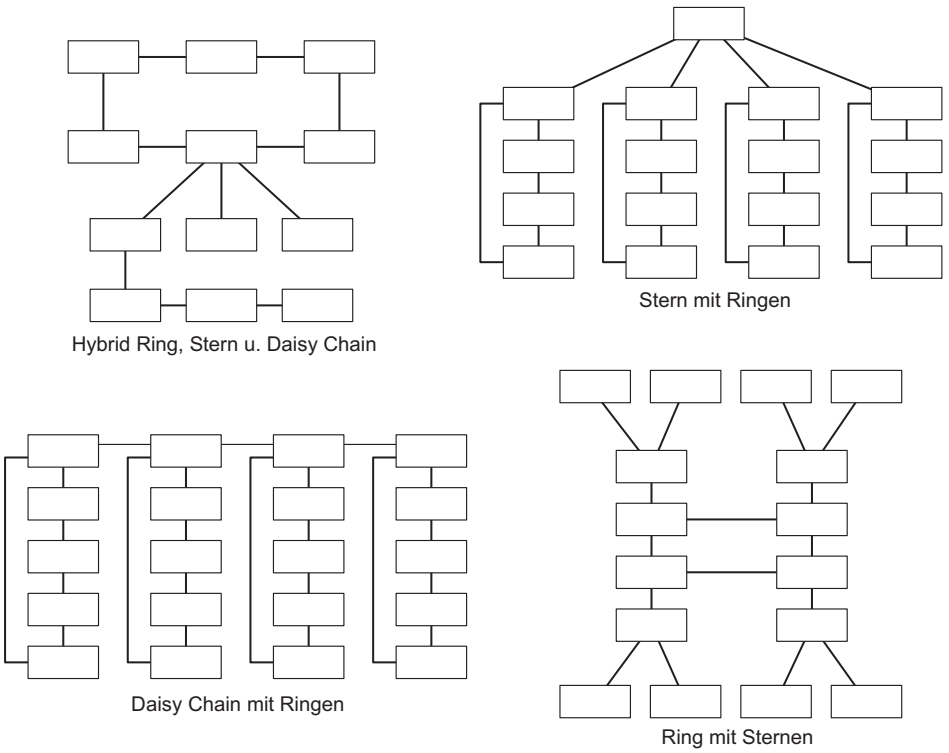

Figure 7-3 Other possible topologies

Please note that the DLR standard does **not** provide support for the following MIB objects:

Interface MIB

IfOutErrors, IfDiscards, IfUnknownProtos, IfOutDiscards

EtherStatsTable

EtherStatsUndersizePkts, EtherStatsOversizePkts, EtherStatsBroadcastPkts, EtherStatsMulticastPkts, EtherStatsFragments, EtherStatsJabbers, EtherStatsCollisions, EtherStats64Octets, EtherStats65-127Octets, EtherStats128-255Octets, EtherStats256-511Octets, EtherStats512-1023Octets, EtherStats1024-1518Octets

8 Common Industrial Protocol (CIP)

The switch supports the Common Industrial Protocol (CIP) and implements the “Managed Switch Profile”. CIP can be accessed by all ports assigned to the “Management VLAN” (VLAN 1, factory default).

EtherNet/IP™ uses the Common Industrial Protocol (CIP) as the application layer. IP and TCP or UDP are used for the network and transport layers.

CIP and EtherNet/IP™ are standardized by ODVA (www.odva.org) on a manufacturer-neutral basis.

The Common Industrial Protocol is an object-oriented protocol with two different types of communication between a controller and terminal devices.

The table below explains the two types of communication.

Table 8-1 CIP communication types

Connection type	Description
Explicit messaging	Explicit messaging is based on the principle of “request/response”. This means a controller or engineering system submits a query and the end device answers. For example, explicit messaging can be used for configuration and/or diagnostics.
Implicit messaging	Implicit messaging is used for the cyclic transmission of I/O data. This means, for example, that a terminal device sends an analog value which is present at a terminal device input. The time for a transmission cycle can be set via the Requested Packet Interval (RPI).

Electronic data sheets – EDS files

EDS files enable integration in a control system such as RSLogix.

The EDS file contains information about the parameters which can be set and configured via CIP.

Table 8-2 Devices and EDS file

Order No.	Device designation	File designation
2701418	FL SWITCH 7008-EIP	FL_SWITCH_7008_EIP.eds
2701419	FL SWITCH 7006/2FX-EIP	FL_SWITCH_7005_2FX_EIP.eds
2701420	FL SWITCH 7005/FX-2FXSM-EIP	FL_SWITCH_7005_1FX_2FXSM_EIP.eds
2701553	FL SWITCH 7004-4GC-EIP	FL_SWITCH_7004_4GC_EIP.eds
2701554	FL SWITCH 7006-2GC-EIP	FL_SWITCH_7006_2GC_EIP.eds
2702175	FL SWITCH 7004-2TC-2GC-EIP	FL_SWITCH_7002_2TC_2GC_EIP.eds

The EDS files can be loaded directly from the device via web-based management.

To do so, go to “Information” and then select the “Help & Documentation” menu item.

The EDS files are also available in the download area.

8.1 Supported EtherNet/IP™ objects

The device supports the following EtherNet/IP™ objects. Please refer to the EtherNet/IP™ specification for more detailed information, which can be obtained from ODVA.

8.1.1 Identity object (class code 01)

Table 8-3 1.1 Instance attributes

ID	Attribute	Access rule	Data type	Description
1	Vendor ID	Get	UINT	562 (Phoenix Contact)
2	Device Type	Get	UINT	44 (Managed Ethernet Switch device)
3	Product Code	Get	UINT	8400 (FL SWITCH 7008-EIP) 8401 (FL SWITCH 7006/2FX-EIP) 8402 (FL SWITCH 7005/FX-2FXSM-EIP) 8403 (FL SWITCH 7004-4GC-EIP) 8404 (FL SWITCH 7006-2GC-EIP) 8405 (FL SWITCH 7004-2TC-2GC-EIP)
4	Revision	Get	STRUCT of:	Revision of the item represented by the Identity object
	Major Revision		USINT	Major revision of the device
	Minor Revision		USINT	Minor revision of the device
5	Status	Get	WORD	Bit 0
				Bit 1
				Bit 2
				Bit 3
6	Serial Number	Get	UDINT	Serial number of the device
7	Product Name	Get	SHORT_STRING	Product name of the device

Table 8-4 1.2 Services

Service code	Class	Instance	Name of service
0x01	X	X	Get_Attribute_All
0x05	X	X	Reset
0x0E	X	X	Get_Attribute_Single

Table 8-5 1.2.1 Reset services

Value	Description
0	Normal reset without modifications to the device configuration
1	Reset to factory default
2	The device will execute the following steps: – Save IP address, subnet mask, and gateway to temporary location – Clear the configuration database/configuration file – Restore saved IP parameters – Save configuration (now only containing IP parameters)

8.1.2 Message Router object (class code 02)

Table 8-6 2.1 Class attributes

ID	Attribute	Access rule	Data type	Description
1	Revision	Get	UINT	Revision of this object
2	Max Instance	Get	UINT	Maximum instance number of this object
3	Number of Instance	Get	UINT	Instance number of this object
4	Optional attribute List	Get	STRUCT of:	List of optional instance attributes utilized in an object class implementation
	Number of attributes		UINT	Number of attributes in the optional attribute list
	Optional attributes		ARRAY of UINT	List of optional attribute numbers
5	Optional Service List	Get	STRUCT of:	List of optional services utilized in an object class implementation
	Number services		UINT	Number of services in the optional service list
	Optional services		ARRAY of UINT	List of optional service codes
6	Maximum ID Number Instance class Attributes	Get	UINT	Attribute ID number of the last class attribute of the class definition implemented in the device
7	Maximum ID Number Instance Attributes	Get	UINT	Attribute ID number of the last instance attribute of the class definition implemented in the device

Table 8-7 2.2 Instance attributes

ID	Attribute	Access rule	Data type	Description
1	Object_list	Get	STRUCT of:	List of supported objects
	Number		UINT	Number of supported classes in the class array
	Classes		ARRAY OF UINT	List of supported class codes
2	Number available	Get	UINT	Maximum number of supported connections

Table 8-8 2.3 Services

Service code	Class	Instance	Name of service
0x01	X	X	Get_Attribute_All
0x0E	X	X	Get_Attribute_Single
0x0A		X	Multiple_Service_Packet

8.1.3 Connection Manager object (class code 06)

Table 8-9 3.1 Class attributes

ID	Attribute	Access rule	Data type	Description
1	Revision	Get	UINT	Revision of this object
2	Max Instance	Get	UINT	Maximum instance number of this object
3	Number of Instance	Get	UINT	Instance number of this object
4	Optional attribute List	Get	STRUCT of:	List of optional instance attributes utilized in an object class implementation
	Number of attributes		UINT	Number of attributes in the optional attribute list
	Optional attributes		ARRAY of UINT	List of optional attribute numbers
6	Maximum ID Number Instance class Attributes	Get	UINT	Attribute ID number of the last class attribute of the class definition implemented in the device
7	Maximum ID Number Instance Attributes	Get	UINT	Attribute ID number of the last instance attribute of the class definition implemented in the device

Table 8-10 3.2 Instance attributes

ID	Attribute	Access rule	Data type	Description
1	Open Requests	Get/Set	UINT	Number of Forward Open service requests received
2	Open Format Rejects	Get/Set	UINT	Number of Forward Open service requests which were rejected due to bad format
3	Open Resources Rejects	Get/Set	UINT	Number of Forward Open service requests which were rejected due to lack of resources
4	Open Other Rejects	Get/Set	UINT	Number of Forward Open service requests which were rejected for reasons other than bad format or lack of resources
5	Close Requests	Get/Set	UINT	Number of Forward Close service requests received
6	Close Format Rejects	Get/Set	UINT	Number of Forward Close service requests which were rejected due to bad format
7	Close other Rejects	Get/Set	UINT	Number of Forward Close service requests which were rejected for reasons other than bad format or lack of resources
8	Connection Timeouts	Get/Set	UINT	Total number of connection timeouts that have occurred in connections controlled by this connection manager

Table 8-11 3.3 Services

Service code	Class	Instance	Name of service
0x01	X	X	Get_Attribute_All
0x02	-	X	Set_Attribute_All
0x0E	X	X	Get_Attribute_Single

8.1.4 TCP/IP Interface object (class code F5)

Table 8-12 4.1 Class attributes

ID	Attribute	Access rule	Data type	Description
1	Revision	Get	UINT	Revision of this object

Table 8-13 4.2 Instance attributes

ID	Attribute	Access rule	Data type	Description	
1	Status	Get	DWORD	Bit 0-3	Interface configuration status
				Bit 4	Mcast pending (always 0)
				Bit 5	Interface configuration pending
				Bit 6	AcdStatus
				Bit 7	AcdFault
2	Configuration Capability	Get	DWORD	Bit 0	BOOTP client
				Bit 2	DHCP client
				Bit 4	TCP/IP config settable via ETH/IP
				Bit 7	AcdCapable
3	Configuration Control	Get/Set	DWORD	Bit 0-3	0 = The device uses static IP configuration 1 = The device uses BOOTP 2 = The device uses DHCP
4	Physical Link Object	Get	STRUCT of:	Path to Physical Link object	
	Path Size		UINT	4	
	Path		Padded EPATH	0x20, 0xF6, 0x25, 0x01	
5	Interface Configuration	Get/Set	STRUCT of:	TCP/IP network interface configuration	
	IP Address		UDINT	Device IP address	
	Network Mask		UDINT	Device network mask	
	Gateway Address		UDINT	Default gateway address	
	Name Server		UDINT	Primary server name (always 0.0.0.0)	
	Name server 2		UDINT	Secondary server name (always 0.0.0.0)	
	Domain Name		STRING	Default domain name (always empty)	
6	Host Name	Get/Set	STRING	Device host name	
10	SelectedAcd	Set	BOOL	Activates the use of ACD	
11	LastConflictDetected	Set	STRUCT of:	Structure containing information relating to the last conflict detected	
	AcdActivity		USINT	State of ACD activity when last conflict was detected	
	RemoteMAC		Array of 6 USINT	MAC address of remote node from the ARP PDU in which a conflict was detected	
	ArpPdu		ARRAY of 28 USINT	Copy of the raw ARP PDU in which a conflict was detected	

Table 8-14 4.3 Services

8.1.6 Device Level Ring (DLR) object (class code 47)

Table 8-18 6.1 Class attributes

ID	Attribute	Access rule	Data type	Description
1	Revision	Get	UINT	Revision of this object

Table 8-19 6.2 Instance attributes

ID	Attribute	Access rule	Data type	Description
1	Network Topology	Get	USINT	0 = Linear 1 = Ring
2	Network Status	Get	USINT	0 = Normal 1 = Ring fault 2 = Unexpected loop detected 3 = Partial network fault 4 = Rapid fault/restore cycle
3	Ring Supervisor Status	Get	USINT	0 = Device is backup device 1 = Device is active ring supervisor 2 = Device is a normal ring node 3 = Device is in a non-DLR topology 4 = Device cannot support the operating ring parameters (beacon interval and/or beacon timeout)

Table 8-19 6.2 Instance attributes

ID	Attribute	Access rule	Data type	Description
4	Ring Supervisor Config	Set	STRUCT of:	Ring supervisor configuration parameters
			BOOL	Ring supervisor enable
			USINT	Ring supervisor precedence
			UDINT	Beacon interval
			UDINT	Beacon timeout
			UINT	DLR VLAN ID
5	Ring Faults Count	Get	UINT	Number of ring faults since power up
6	Last Active Node on Port 1	Get	STRUCT of:	Last active node at the end of chain through port 1 of active ring supervisor during ring fault
			UDINT	Device IP address
			ARRAY of 6 USINTs	Device MAC address
7	Last Active Node on Port 2	Get	STRUCT of:	Last active node at the end of chain through port 2 of active ring supervisor during ring fault
			UDINT	Device IP address
			ARRAY of 6 USINTs	Device MAC address
8	Ring Protocol Participants Count	Get	UINT	Number of devices in ring protocol participant list
9	Ring Protocol Participants List	Get	ARRAY of	List of device participants in ring protocol
			STRUCT of:	
			UDINT	Device IP address
			ARRAY of 6 USINTs	Device MAC address
10	Active Supervisor Address	Get	STRUCT of:	IP and/or MAC address of the active ring supervisor
			UDINT	Supervisor IP address
			ARRAY of 6 USINTs	Supervisor MAC address
11	Active Supervisor Precedence	Get	USINT	Precedence value of the active ring supervisor
12	Capability Flags	Get	DWORD	Describes the DLR capabilities of the device (1)

Table 8-20 6.3 Services

8.1.7 Simple Network Management (SNMP) object (class code 0x52)

Table 8-22 7.1 Class attributes

ID	Attribute	Access rule	Data type	Description
1	Revision	Get	UINT	Revision of this object

Table 8-23 7.2 Instance attributes

ID	Attribute	Access rule	Data type	Description
1	SnmpAgent	Get	USINT	Status of the SNMP agent
2	SnmpAgentVersion	Get	USINT	Version of SNMP agent provided (1 = SNMPv1, 3 = SNMPv3; 31 = SNMPv1 + v3)
3	Primary Network Management Identifier	Get	STRUCT of:	Network address of primary network manager
	Identifier Format		USINT	Type of identifier
	Identifier		STRING	Value of identifier
4	Secondary Network Management Identifier	Get	STRUCT of:	Network address of primary network manager
	Identifier Format		USINT	Type of identifier
	Identifier		STRING	Value of identifier
5	Notifications	Get	BOOL	Indicates if the SNMP agent will enable sending of notifications 5
6	TrapType	Get	USINT	Indicates which trap type the SNMP agent will send 6

8.1.11 Input Assemblies

Connection ID: T->O: 101: Input assembly

Table 8-36 11.1 Input assemblies

Description	Length of data	Data format	Remarks
Port admin mode	4 Bytes	Array of USINT values (1 = enabled)	LSB = Any port summary bit LSB + 1 = Port 1 E.g., 0x05 means at least one port enabled and port 2 enabled
Port link status	4 Bytes	Array of USINT values (1 = link up)	LSB = Any port summary bit LSB + 1 = Port 1 E.g., 0x05 means at least one port has link up and port 2 has link up
Padding	24 Bytes	-	Reserved for further binary port information, e.g. Redundancy information Fast Startup Information Port Access violation detected Port Thresholds exceeded Link Monitoring failure
Port RX utilization percentage	24 bytes	USINT Values representing utilization percentage	1st byte representing port 1; if less than 24 bytes are supported, further bytes will be padding bytes
Port TX utilization percentage	24 Bytes	USINT Values representing utilization percentage	1st byte representing port 1; if less than 24 bytes are supported, further bytes will be padding bytes
Alarm contact status	1 byte	Array of USINT values (1 = contact open = fail condition)	Value similar to EIP Base Switch object (51hex) instance attribute 10
Power supply status	1 byte	Array of USINT values (1 = power supply present)	Value similar to EIP Base Switch object (51hex) instance attribute 4
DLR supervisor status	1 byte	USINT Value	Value similar to EIP DLR object (47hex) instance attribute 3
DLR network status	1 byte	USINT Value	Value similar to EIP DLR object (47hex) instance attribute 2
Padding	4 Bytes	-	Reserved for RSTP status

Connection ID: T->O: 104: Input assembly

Table 8-37 11.1 Input assemblies

Description	Length of data	Data format	Remarks
Port admin mode	4 Bytes	Array of USINT values (1 = enabled)	LSB = Any port summary bit LSB + 1 = Port 1 E.g., 0x05 means at least one port enabled and port 2 enabled
Port link status	4 Bytes	Array of USINT values (1 = link up)	LSB = Any port summary bit LSB + 1 = Port 1 E.g., 0x05 means at least one port has link up and port 2 has link up
Padding	24 Bytes	-	Reserved for further binary port information, e.g. Redundancy information Fast Startup Information Port Access violation detected Port Thresholds exceeded Link Monitoring failure
Port RX utilization percentage	24 bytes	USINT Values representing utilization percentage	1st byte representing port 1; if less than 24 bytes are supported, further bytes will be padding bytes
Port TX utilization percentage	24 Bytes	USINT Values representing utilization percentage	1st byte representing port 1; if less than 24 bytes are supported, further bytes will be padding bytes
Alarm contact status	1 byte	Array of USINT values (1 = contact open = fail condition)	Value similar to EIP Base Switch object (51hex) instance attribute 10
Power supply status	1 byte	Array of USINT values (1 = power supply present)	Value similar to EIP Base Switch object (51hex) instance attribute 4
DLR supervisor status	1 byte	USINT Value	Value similar to EIP DLR object (47hex) instance attribute 3
DLR network status	1 byte	USINT Value	Value similar to EIP DLR object (47hex) instance attribute 2
Padding	4 Bytes	-	Reserved for RSTP status
DLR Ring Fault Count	2 Bytes	Array of USINT	Value similar to EIP DLR object (47hex) instance attribute 5
Last Node Port 1 - IP Address	4 Bytes	Array of USINT	Value similar to EIP DLR Object (47hx) Instance Attribute 6 part 1

Table 8-37 11.1 Input assemblies

Description	Length of data	Data format	Remarks
Last Node Port 1 - MAC ID	6 Bytes	Array of USINT	Value similar to EIP DLR Object (47hx) Instance Attribute 6 part 2.
Last Node Port 2 - IP Address	4 Bytes	Array of USINT	Value similar to EIP DLR Object (47hx) Instance Attribute 7 part 1.
Last Node Port 2 - MAC ID	6 Bytes	Array of USINT	Value similar to EIP DLR Object (47hx) Instance Attribute 7 part 2.
Verify Fault Location Status	2 Bytes	Array of USINT	Byte 0 : 1 = Operation in progress 0 = Operation ended (Default) Byte 1 : 0 = Operation Successful (Default) 1 = ERROR 0x0C = Object State Conflict
Reset Node State Status	1 byte	USINT	Byte 1 : 0 = Operation Successful (Default) 0x0C = Object State Conflict
Clear Fault Counter Status	1 byte	USINT	Byte 1 : 0 = Operation Successful (Default) This value is always 0 and is reserved for future usage.
Padding	30 Bytes	Array of USINT	Reserved for future usage

8.1.12 Output Assemblies

Connection ID: O->T: 100: Output assembly

Description	Length of data	Data format	Remarks
Admin port status	4 Bytes	Array of USINT-values (1 = enabled)	LSB = Disable all ports e.g. 0x0E means only ports 1, 2 and 3 are enabled NOTE: Due to the cyclic character of this data the controller will overwrite all settings done by other UIs (WEB, SNMP, etc.) in a cyclic manner. Triggering a save operation by any UI will save the current value issued by the controller.

Connection ID: O->T: 103: Output assembly

Description	Length of data	Data format	Remarks
Admin port status	4 Bytes	Array of USINT-values (1 = enabled)	LSB = Disable all ports e.g. 0x0E means only ports 1, 2 and 3 are enabled NOTE: Due to the cyclic character of this data the controller will overwrite all settings done by other UIs (WEB, SNMP, etc.) in a cyclic manner. Triggering a save operation by any UI will save the current value issued by the controller.
DLR Services	1 byte	USINT	Bit 0 : Verify Fault Location 1 = Trigger the event 0 = No Trigger(Default) Bit 1 : Reset Node State (Clear Rapid Fault) 1 = Trigger the event 0 = No Trigger(Default) Bit 2 : Clear Fault Counter 1 = Trigger the event 0 = No Trigger(Default) Bit 3 - 7 : Reserved.
Padding	30 Bytes	Array of USINT	Reserved for future usage.

8.1.13 Configuration Assemblies

Connection ID: O->T: 102: Configuration Assembly

Description	Length of data	Data format	Remarks
IP Address	4 Bytes	Array of USINT	Default 0. Value valid only when IP Address Assignment is static(1)
Subnet	4 Bytes	Array of USINT	Default 0. Value valid only when IP Address Assignment is static(1)
Default Gateway	4 Bytes	Array of USINT	Default 0. Value valid only when IP Address Assignment is static(1)
IP Address Assignment	1 byte	USINT	1 = STATIC 2 = BOOTP (Default) 3 = DHCP
RSTP	1 byte	USINT	2 = Enable (Default) 1 = Disable
DLR Device Mode	1 byte	USINT	1 = Disable (Default) 2 = Node 3 = Supervisor
DLR Ring Port 1	1 byte	USINT	1 (default)
DLR Ring Port 2	1 byte	USINT	2 (default)

Description	Length of data	Data format	Remarks
DLR VLAN	2 Bytes	Array of USINT	1 (default)
Beacon interval	4 Bytes	Array of USINT	400 (default)
Beacon timeout	4 Bytes	Array of USINT	1960 (default)
Supervisor Precedence	2 Bytes	Array of USINT	**Byte 0:** 0 - No-change // 1 - change **Byte 1**: Supervisor Precedence value 0 (default)
Alarm Contact 1	1 byte	USINT	2 = Enable (Default) 1 = Disable
Alarm Contact Trigger 1	2 Bytes	Array of USINT	**Byte 0** Bit 0: 0 - No-change // 1 - change Bit 1: Power Supply Lost Bit 2: Monitored Link Down Bit 3: Plugable Memory Missing Bit 4: DLR Ring Failure Bit 5: Port Security Violation **Byte 1** Reserved
Alarm Contact 2	1 byte	USINT	2 = Enable (Default) 1 = Disable
Alarm Contact Trigger 1	2 Bytes	Array of USINT	**Byte 0** Bit 0: 0 - No-change // 1 - change Bit 1: Power Supply Lost Bit 2: Monitored Link Down Bit 3: Plugable Memory Missing Bit 4: DLR Ring Failure Bit 5: Port Security Violation **Byte 1:** Reserved
Port Status (1 - 8)	4 Bytes	Array of USINT	LSB = 0 - No-change // 1 - change (e.g. 0x0F means only ports 1, 2 and 3 are enabled) Bits 1 - 8: Ports 1- 8 Bits 9 - 23: Reserved

Description	Length of data	Data format	Remarks
Port Mode (1 - 8)	16 Bytes	Array of USINT each for a port	1: Autoneg (Default) 2: Half-10 3: full-10 4: half-100 5:f ull-100 6: fast-startup **Byte 0 - 7:** Ports 1 - 8 **Byte 8 - 15:** Reserved
Link Monitoring (1 - 8)	4 Bytes	Array of USINT	LSB = 0 - No-change // 1 - change (e.g. 0x0F means only ports 1, 2 and 3 are enabled) Bits 1 - 8: Ports 1- 8 Bits 9 - 23: Reserved
Default Priority(1 - 8)	17 Bytes	Array of USINT each for a port	**Byte 0:** 0 - No-change // 1 - change **Byte 9 - 17:** Reserved 0 (default)
Port Mirroring	1 byte	USINT	2 = Enable 1 = Disable (default)
Destination Mirror Port	1 byte	USINT	1 (default)
Mirrored Virtual Ports	2 Bytes	Array of USINT	LSB Bit 0: DLR port #56 Bits 1-15: Reserved 0: Disable 1: Enable Rx and Tx
Mirrored Ports (1 - 8)	4 bytes	Array of USINT	LSB = 0 - No-change 1 - Change (e.g. 0x0F means only ports 1, 2 and 3 are enabled) 0x00 (default) Bits 1 - 8: Ports 1- 8 Bits 9 - 23: Reserved 0: Disable 1: Enable Rx and Tx
Padding	28 Bytes	Array of USINT	

8.1.14 Power source and link status assembly

Connection ID: 1: Power source and link status assembly

Table 8-38 13.1 Power source and link status assembly

Byte	Data type	Description
0	BYTE	Power source status (least significant byte)
1	BYTE	Power source status (most significant byte)
2 - 5	DWORD	Global link status (ports 1 - 4)
6 - 9	DWORD	Global link status (ports 5 - 8)

9 Multicast Filtering

9.1 Multicast Configuration

9.1.0.1 Multicast Filtering

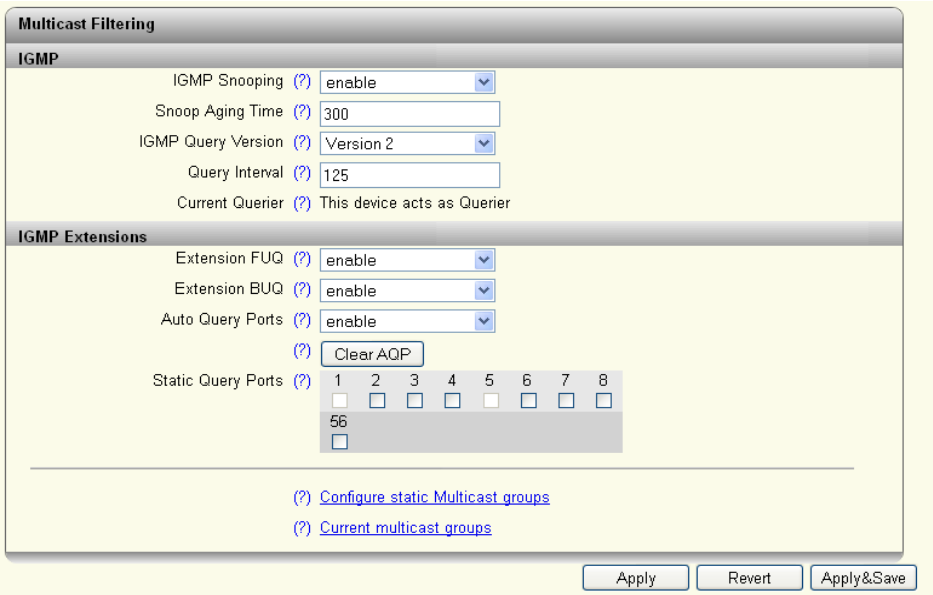

Figure 9-1 “Multicast Filtering” web page

IGMP Snooping:

– disable: the “IGMP Snooping” function is disabled
– enable: the “IGMP Snooping” function is enabled

Snoop Aging Time: The snoop aging time can be set here. The snoop aging time is the time period during which membership reports are expected from the querier. If no membership reports are received during this time, the associated ports are deleted from the multicast groups. The value must be between 30 and 3600 (default: 300).

IGMP Query Version: You can set the IGMP query version which the switch should use to send the queries here.

Query Interval: Set the interval in which the switch should send the queries here.

Current Querier: This displays the IP address of the current querier in the network.

Extension FUQ (Forward Unknown to Querier): Select here whether a multicast group should be created for unknown multicast packets which forwards the packets in the direction of the querier.

Extension BUQ (Block Unknown at Querier): Select here whether unknown multicast packets should be blocked at the querier.

Auto Query Ports: Here you can set whether automatic selection of additional query ports is activated by means of fast ring detection and/or DLR. Ports are automatically integrated in every multicast group. In the case of redundancy switch-over, the multicast packets are not blocked because the ports required are already members of the multicast group.

Clear AQP: A button for deleting the ports that are automatically assigned to the groups.

Static Query Ports: Select which ports are static query ports.

Clicking on the “Configure static Multicast Groups” button takes you to the web page for creating static multicast groups.

Pop-up: Configure static Multicast groups

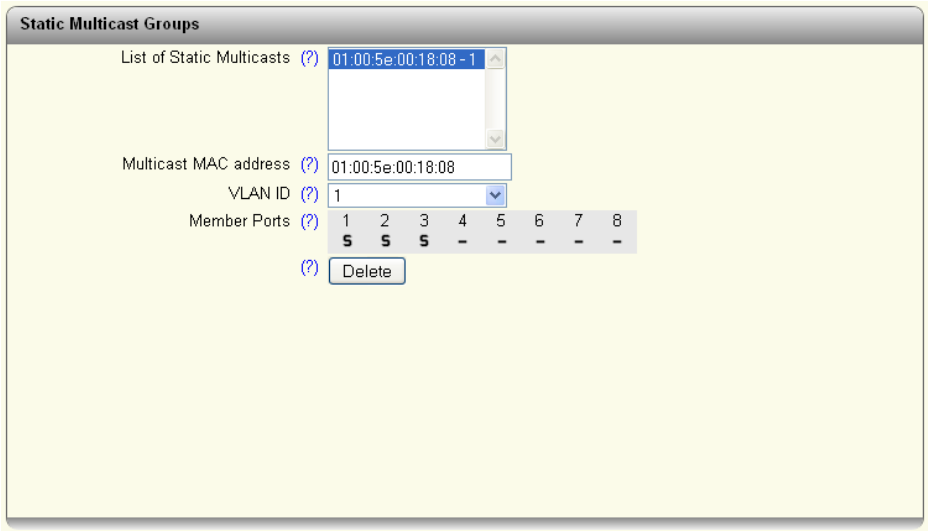

Figure 9-2 “Static Multicast Groups” web page

List of Static Multicasts: List of all static multicast groups is created.

Multicast MAC address: Enter the multicast MAC address here.

VLAN ID: Enter the VLAN here.

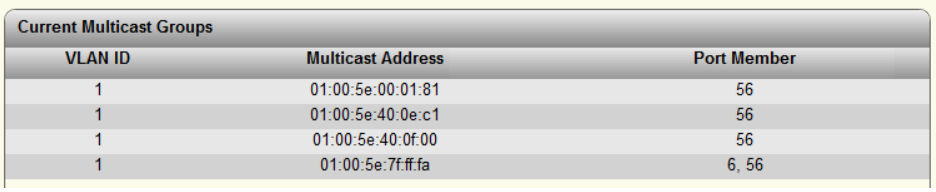
Member Ports: Select the ports which should be entered into the multicast group here.

– S: Static – static member of the multicast group.
– F: Forbidden – the port cannot be dynamically added to multicast groups. As such, the port is always excluded from the multicast group.
– -: No Member – not a member of the multicast group.
– Delete: The selected multicast group is deleted.

You can create up to 32 static multicast groups.

Clicking on the “Current Multicast Groups” link opens the “Current Multicast Groups” web page as a pop-up.

The device can manage up to 512 dynamic multicast groups.



Current Multicast Groups

VLAN ID	Multicast Address	Port Member
1	01:00:5e:00:01:81	56
1	01:00:5e:40:0e:c1	56
1	01:00:5e:40:0f:00	56
1	01:00:5e:7f:ff:fa	6, 56

Figure 9-3 “Current Multicast Groups” web page

10 Virtual Local Area Network - VLAN

10.0.0.1 VLAN Configuration

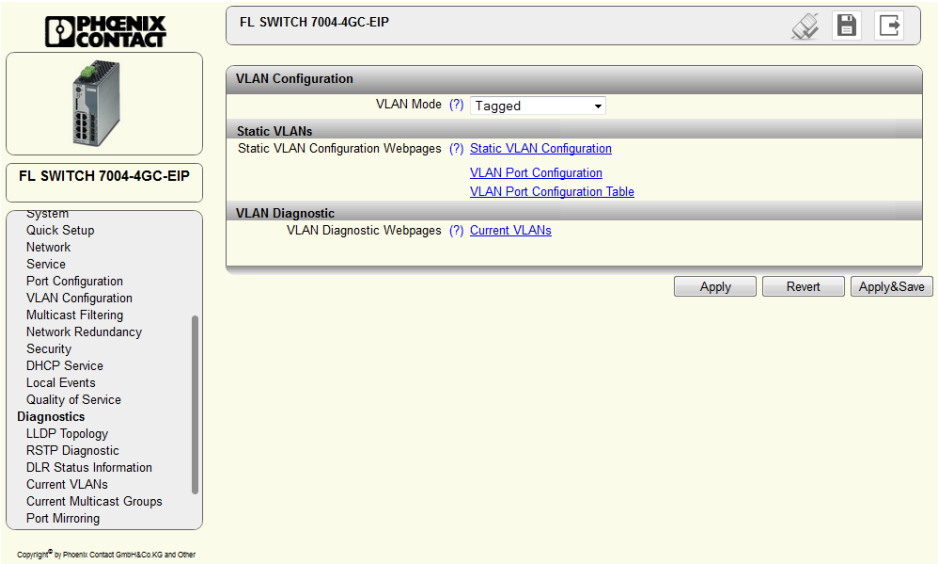


Figure 10-1 “VLAN Configuration” web page

VLAN Mode:

– Transparent: in “Transparent” mode, the switch processes the incoming data packets as described in the “Frame switching” section. Neither the structure nor the contents of the data packets are changed. The information about VLAN assignment from a tag that may be contained in the data packet is ignored.
– Tagged: In “Tagged” mode, the switch forwards the data packets depending on the VLAN assignment.

Clicking on the “Static VLAN Configuration” button takes you to the “Static VLAN Configuration” page. Up to 32 static VLANs can be set up here.

Pop-up: Static VLAN Configuration

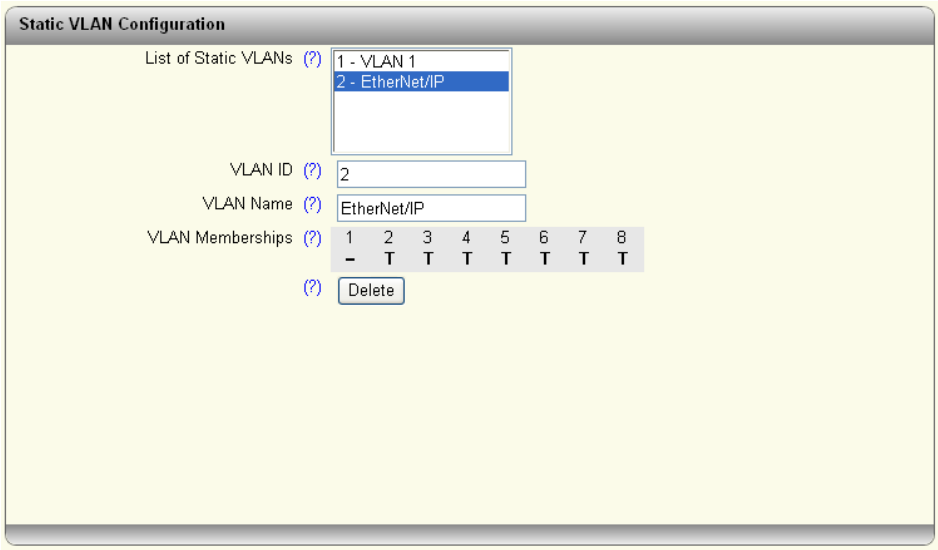

Figure 10-2 “Static VLAN Configuration” web page

List of Static VLANs: All VLANs created up to this point are displayed here.

VLAN ID: Set the VLAN ID which you wish to assign to the new VLAN here. The value must be between 2 and 4095.

VLAN Name: Specify the name of the VLAN which you wish to create here.

VLAN Memberships: Specify which ports should be located in the VLAN.

– T: tagged port
– U: untagged port
– -: not a member of the VLAN

Use the “Delete” button to delete the VLAN selected in the list.

VLAN 1 cannot be deleted.

Clicking on the “VLAN port configuration” button takes you to the “VLAN Port configuration” page.

Pop-up: VLAN Port configuration

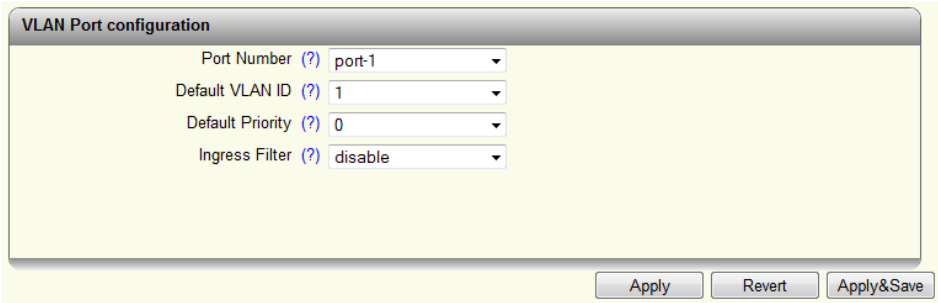

Figure 10-3 “VLAN Port configuration” web page

Port number: Enter the port for which you wish to change the VLAN settings.

Default VLAN ID: Set the VLAN ID to which the port should be assigned here.

Default Priority: Set the VLAN priority for the selected port here.

Ingress Filter: Set here whether the ingress filter should be activated.

Clicking on the “VLAN Port Table” button takes you to the VLAN port table.

Pop-up: VLAN Port Configuration Table

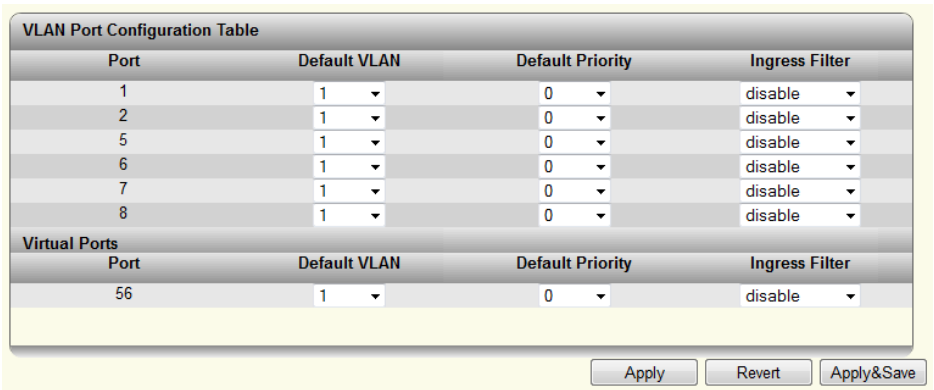

Figure 10-4 “VLAN Port Configuration Table” web page

Clicking on the “Current VLANs” link opens the “Current VLANs” web page as a pop-up.

Current VLANs

This page lists the current VLANs and displays the ports for each VLAN, which are either “Tagged” or “Untagged”.

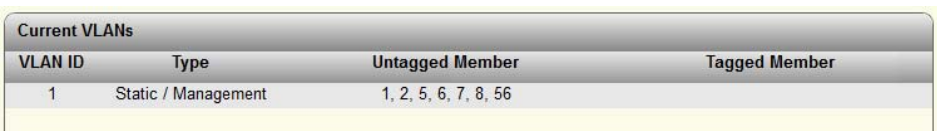

Figure 10-5 “Current VLANs” web page

11 Technical data and ordering data

11.1 Technical data

General data	
Function	Ethernet/Fast Ethernet/Gigabit Switch; conforms to standard IEEE 802.3/802.3u/802.3ab
Switch principle	Store and forward
Address table	16386 MAC addresses
SNMP	Version 2c, Version 3
Transmission capacity per port 64-byte packet size, half duplex	At 10 Mbps: 14880 pps (packets per second) At 100 Mbps: 148800 pps At 1000 Mbps: 1488000 pps
Supported MIBs	MIB II and private SNMP objects from Phoenix Contact
Housing dimensions (width x height x depth) in mm	60 x 130 x 136 (depth from top edge of DIN rail)
Permissible operating temperature	-40°C to 70°C
Permissible storage temperature	-40°C ... +85°C
Degree of protection	IP20, IEC 60529
Protection class	Class 3 VDE 0106; IEC 60536
Humidity	
Operation	10% to 95%, non-condensing
Storage	10% to 95%, non-condensing
Air pressure	
Operation	86 kPa to 108 kPa, 1500 m above sea level
Storage	66 kPa to 108 kPa, 3500 m above sea level
Ambient compatibility	Free from substances that would hinder coating with paint or varnish according to VW specification
Mounting position	Perpendicular to a standard DIN rail
Connection to protective earth ground	Snapped onto a grounded DIN rail
Weight	Up to 1010 g, typical

Supply voltage (US1/US2 redundant)	
Connection	Via COMBICON; maximum conductor cross section = 2.5 mm^2
Nominal value	24 V DC
Permissible voltage range	12 V DC to 58 V DC
Permissible ripple (within the permissible voltage range)	3.6 V_{PP}

Supply voltage (US1/US2 redundant) (Fortsetzung)	
Test voltage	500 V DC for 1 minute
Current consumption at US at 24 V DC, maximum	350 mA (FL SWITCH 7008-EIP) 470 mA (FL SWITCH 7006/2FX-EIP) 520 mA (FL SWITCH 7005/FX-2FXSM-EIP) 535 mA (FL SWITCH 7004-4GC-EIP) 520 mA (FL SWITCH 7006-2GC-EIP) 560 mA (FL SWITCH 7004-2TC-2GC-EIP)
Maximum power consumption	8.4 W (FL SWITCH 7008-EIP) 11.3 W (FL SWITCH 7006/2FX-EIP) 12.8 W (FL SWITCH 7005/FX-2FXSM-EIP) 12.9 W (FL SWITCH 7004-4GC-EIP) 12.5 W (FL SWITCH 7006-2GC-EIP) 13.5 W (FL SWITCH 7004-2TC-2GC-EIP)

Interfaces	
Number of Ethernet ports	8
Floating signal contact	
Voltage	12 - 58 V DC / 60 W, maximum
Current carrying capacity	100 mA, typical; 1 A, maximum

Ethernet interfaces	
General properties of the RJ45 ports	
Number	Up to 8 with auto crossing and auto negotiation
Connection format	8-pos. RJ45 socket on the switch
Connection medium	Twisted pair cable with a conductor cross section of 0.14 mm^2 to 0.22 mm^2
Cable impedance	100 ohms
Transfer rate	10/100/1000 Mbps (GB transfer only on GB combo ports)
Maximum network segment expansion	100 m
General properties of the fiberglass ports	
Number	up to 4
Connection format	SC format, SFP format
Connection medium	Fiberglass
Connecting plug	SC format, LC format (SFP module)
Transfer rate	100/1000 Mbps (GB transfer only on GB combo ports)
Laser protection class	1
Properties of 100 Mbps multi-mode ports in SC format	
Data transmission speed	100 Mbps, full duplex
Wavelength	1310 nm
Maximum transmission length	10 km fiberglass with F-G 50/125 µm 0.7 dB/km F1200 4.4 km fiberglass with F-G 50/125 µm 1.6 dB/km F800 17 km fiberglass with F-G 62.5/125 µm 0.7 dB/km F1000 4.6 km fiberglass with F-G 62.5/125 µm 2.6 dB/km F600
Transmission power	
Minimum	-19 dBm 62.5/125 µm -24 dBm 50/125 µm
Maximum	-14 dBm
Receiver sensitivity	

Ethernet interfaces (Fortsetzung)

Minimum	-34 dBm
Properties of 100 Mbps single-mode ports in SC format	
Data transmission speed	100 Mbps, full duplex
Wavelength	1310 nm
Maximum transmission length	44 km fiberglass with F-G 9/125 µm 0.36 dB/km 40 km fiberglass with F-G 9/125 µm 0.4 dB/km 32 km fiberglass with F-G 9/125 µm 0.5 dB/km
Transmission power	
Minimum	-15 dBm 9/125 µm
Maximum	-7 dBm
Receiver sensitivity	
Minimum	-34 dBm
Properties of the GB combo ports	
Data transfer rate (RJ45 port)	10/100/1000 Mbps
Max. transfer size (RJ45 port)	100 m
Data transfer rate (SFP port)	100/1000 Mbps (depending on the SFP module)
Wavelength (SFP port)	depending on SFP module
Maximum transmission length	80 km (depending on the SFP module)
Properties of the Fast Ethernet combo ports	
Data transfer rate (RJ45 port)	10/100 Mbps
Max. transfer size (RJ45 port)	100 m
Data transfer rate (SFP port)	100 Mbps
Wavelength (SFP port)	depending on SFP module
Maximum transmission length	40 km (depending on the SFP module)

Mechanical tests

Shock test as per IEC 60068-2-27	Operation: 30 g, half-sine shock pulse
Vibration resistance according to IEC 60068-2-6	Operation/storage/transport: 5 g, 10 Hz - 150 Hz
Free fall according to IEC 60068-2-32	1 m

Conformance with EMC Directives

Developed according to IEC 61000-6-2	
Noise emission according to EN 55022: 1998 + A1: 2000 + A2: 2003 (interference voltage)	Class A (industrial applications)
Noise emission according to EN 55011: 1998 + A1: 1999 + A2: 2002 (electromagnetic interference)	Class A (industrial applications)
Noise immunity according to EN 61000-4-2 (IEC 1000-4-2) (ESD)	Requirements according to DIN EN 61000-6-2
Contact discharge:	Test intensity 3, criterion B
Air discharge:	Test intensity 3, criterion A
Indirect discharge:	Test intensity 3, criterion A
Noise immunity according to EN 61000-4-3 (IEC 1000-4-3) (electromagnetic fields)	Requirements according to DIN EN 61000-6-2 Test intensity 3, criterion A

Conformance with EMC Directives	
Noise immunity according to EN 61000-4-6 (IEC 1000-4-6) (conducted)	Requirements according to DIN EN 61000-6-2 Test intensity 3, criterion A
Noise immunity according to EN 61000-4-4 (IEC 1000-4-4) (burst) Data cables: Power supply:	Requirements according to DIN EN 61000-6-2 Test intensity 3, criterion A Test intensity 3, criterion A
Noise immunity according to EN 61000-4-5 (IEC 1000-4-5) (surge) Data cables: Power supply:	Requirements according to DIN EN 61000-6-2 Test intensity 2, criterion A Test intensity 1, criterion A

Additional certifications	
RoHS	@EEE 2002/95/EC - WEEE 2002/96/EC

MOTOR CONTROL and PROTECTION

Specification Section 16410

ABB

THERMAL MAGNETIC MOTOR CIRCUIT PROTECTOR
MS-495-75

MAGNETIC ONLY MOTOR CIRCUIT PROTECTOR
MO-495-75

MS5100, MS495, MS497 manual motor starters
22 to 100 A – with thermal and electromagnetic protection

MS5100-100

MS495-40

MS497-100

Description

Manual motor starters (MMS) are protection devices for the main circuit. They combine motor control and protection in a single device. MMS are used mainly to switch motors manually ON/OFF and protect them and the installation fuse-less against short-circuit, overload and phase failures [1]. Fuse-less protection with a manual motor starter saves costs, space and ensures a quick reaction under short-circuit condition, by switching off the motor within milliseconds.

Ordering details

CONTACTORS and ACCESSORIES

Specification Section 16410

ABB

CONTACTOR W/AUX CONTACTS – 1 N.O. / 1 N.C.

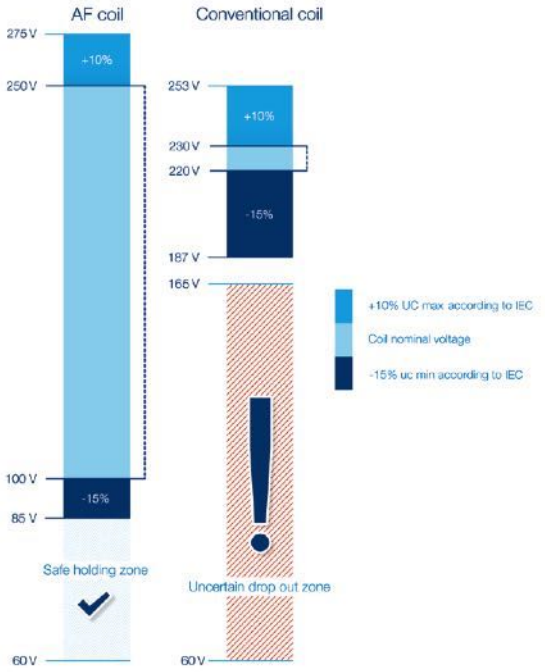
AF65-30-22-13

AF technology
Benefits

5

Reliable in all networks
The electronic system within the AF contactor continuously monitor the current and voltage apply to the coil. The contactor is safely operated in an always optimized condition and hum free.

Four coils for the entire voltage range
AF contactors feature both AC and DC control in the same product. Still, the total number of product variants compared to a conventional range is reduced by 90%. Only four coils are required to cover 24 V AC, 20 V DC - 500 V AC / DC.



Wide control voltage range
With conventional contactor technology, different contactors are needed for different network voltages. Thanks to the wide operating range of the AF contactor, it can operate just as well in Europe as in Asia or North America. The core coil of the AF contactor range covers 100-250 V AC / DC, 50 / 60 Hz.

Built-in surge suppression
With conventional contactor technology, it is recommended to use an external surge suppressor, an accessory that could cost as much as half of the contactor. With the AF technology, the surges are handled by the contactor and never reach the control circuit. One less product and one less complication to worry about.

AF80-30-00

AF40 ... AF96 contactors are mainly used for controlling 3-phase motors and power circuits up to 1000 V AC and 220 V DC. These contactors are of the block type design with 3 main poles.

- control circuit: AC or DC operated with electronic coil interface accepting a wide control voltage range (e.g. 100...250 V AC and DC), only 4 control voltage ranges covering 24...500 V 50/60 Hz and 20...500 V DC
  - can manage large control voltage variations
  - reduced panel energy consumption
  - very distinct closing and opening
  - can withstand short voltage dips and voltage sags (SEMI F47-0706 conditions of use on request).
- built-in surge suppression
- add-on auxiliary contact blocks for front or side mounting and a wide range of accessories.

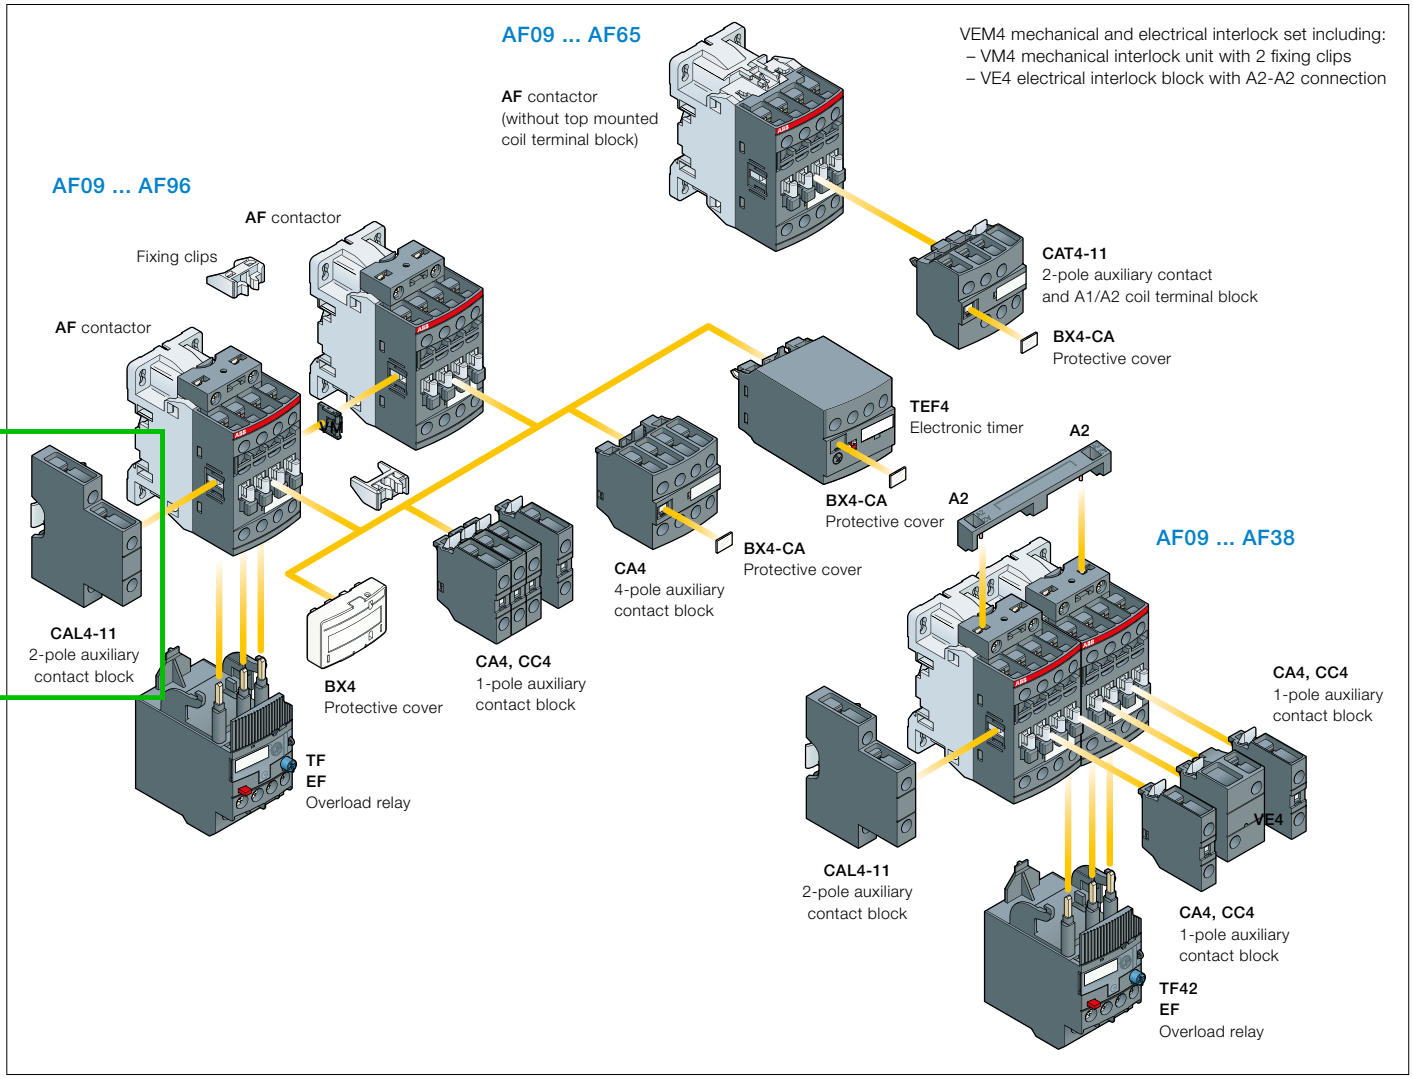
AF09 ... AF96 3-pole contactors
Main accessories

Contactor and main accessories (other accessories available)



Main accessory fitting details

Many configurations of accessories are possible depending on whether these are front-mounted or side-mounted.

Contactor types	Main poles		Built-in auxiliary contacts		Front-mounted accessories: Auxiliary contact blocks								Electronic timer		Electrical and mechanical interlock set (between 2 contactors)		Side-mounted accessories: Auxiliary contact blocks		
					1-pole CA4 / 1-pole CC4		2-pole CAT4-11		4-pole CA4				TEF4		VEM4		Left side: 2-pole CAL4-11		Right side
	Max. N.C. built-in and add-on N.C. auxiliary contacts: 4 N.C. max. on positions 1, 2, 3, 4 and 3 N.C. max. on positions 1 ±30°, 5																		
AF09 ... AF16	3	0	0	1	4 max.	or	1	or	1	or	1		–	+	1		–
AF09 ... AF16	3	0	1	0	2 max.	or	1		–	or	1		–	+	1	+	1
AF26 ... AF38	3	0	0	0	3 max.		–		–		–	+	1	+	1	or	1
	Max. add-on N.C. auxiliary contacts: 6 N.C. max. on positions 1, 1 ±30°, 2, 3, 4, 5																		
AF40 ... AF65	3	0	0	0	4 max.	or	1	or	1	or	1		–	+	1	+	1
AF80, AF96	3	0	0	0	4 max.		–	or	1	or	1		–	+	1	+	1

Overload relays fitting details (1)

Contactor types	Thermal overload relays	Electronic overload relays
AF09 ... AF38	TF42 (0.10...38 A)	EF19 (0.10...19 A)
AF26 ... AF38	TF42 (0.10...38 A)	EF45 (9...45 A)
AF40 ... AF65	TF65 (22...67 A)	EF65 (20...70 A)
AF80, AF96	TF96 (40...96 A)	EF96 (36...100 A)

The addition of an overload relay on the contactor does not prevent fitting of many other accessories as shown above.
(1) Direct mounting - No kit required.

Auxiliary contact blocks

CA5-10

CA5-40E

CAL5-11

CAL18-11

Description

The auxiliary contact blocks are used for the operation of auxiliary circuits and control circuits for standard industrial environments.

Types of auxiliary contact blocks for front mounting:

– CA5 1 or 4-pole block, instantaneous with N.O., N.C. contacts

– CC5 1-pole block, with N.O. leading contact or N.C. lagging contact.

Select the 4-pole auxiliary contact blocks CA5 type, according to the contactor type for compliance with the standard requirements (see "Terminal Marking and Positioning").

Types of auxiliary contact blocks for side mounting:

– CAL 2-pole block instantaneous N.O. + N.C. contacts.

For clipping onto the right- and/or left-hand side of the contactors.

The auxiliary contact blocks are equipped with screw type connecting terminals delivered open, protected against accidental direct contact and bear the corresponding function marking.

UA95, UA110	1	1	–	–	CAL18-11	1SFN010720R1011		2	0.050

(1) For each contactor type, refer to "Accessory fitting details" table.

Note:

– The front-mounted auxiliary contact blocks provided for the UA75 contactors can be used with the GA and GAE types

– The CAL auxiliary contact blocks can be used with GA contactors:

GA75-10-00: 2 x CAL5-11 blocks
GA75-10-11: 1 x CAL5-11 block
GAE75-10-00: 1 x CAL5-11 block
GAE75-10-11: no add-on block.

– The CAL auxiliary contact blocks can be used with UA..RA contactors. See "Accessory fitting details" for this contactor type.

120 VAC POWER SURGE PROTECTION (RCP's)

Type 3 surge protection device - PLT-SEC-T3-120-FM-UT - 2907918

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Type 2/3 surge protection, consisting of protective plug and base element, with integrated status indicator and remote signaling for single-phase power supply networks. Nominal voltage 120 V AC/DC.

Your advantages

- Easy to maintain due to consistently pluggable protection modules
- Excellent level of information provided by mechanical/visual status indicator and remote indication contact
- Your preferred connection technology can be selected as both screw connection and Push-in connection are available
- Optimal additional protection of the industrial power supply for a longer service life and increased availability of the system
- 5-year warranty on your QUINT 4 power supply when installed together with PLT-SEC, see document in the download area

The STV25K DIN Rail Series - Surge Protective Devices

SolaHD sTV25K Series provides point-of-use protection, at the dedicated equipment level, against damaging transients. Ideal for installation in electronic control cabinets found in harsh industrial environments such as the factory floor or at remote location. These devices provide 25,000 amps of surge protection, sinewave tracking, LED status indication and form C dry contacts. This DIN rail series also provides protection on all electrical paths and comes with a standard ten year product warranty.

Applications (20 Amp Max)

- Control Cabinets for Industrial Automation
- Point-of-Use Industrial/Service Equipment
- Remote Commercial or Industrial Equipment
- Instrumentation and Large Test Equipment
- Commercial and Building Automation Systems

Features

- Compact and narrow design maximizes panel space.
- Low clamping levels for more effective protection.
- Easy access terminal screws for quick mounting and installation.
- 25,000 amps of surge protection.
- Sine wave tracking and all mode protection provide consistent and reliable protection on all electrical paths.
- Thermal fusing prevents MOV overheating caused by excessive current levels.

Certifications and Compliances

- c UL us UL Recognized Component
  - UL 1449, type 2CA
  - UL 1283
- ABS Type Approved
- RoHS Compliant

STV25K Specifications

Description	Catalog Number	
	STV25K–10S	STV25K–24S
Input Voltage	120 Vac, Single Phase 0-135 Vrms	240 Vac, Single Phase 0-260 Vrms
Maximum Continuous Operating Voltage (MCOV)	150 Vrms	300 Vrms
Line Frequency	47-63 Hz	
Connection/Mounting Type	DIN Rail Mount (Chassis Mount Bracket Optional order SDN-PMBRK2) with screw terminals for #12 AWG.	
Input Current Rating	20 amps	
Phase Configuration	2 wire + GND	
Short Circuit Current Rating (SCCR)	5kA	
Nominal Discharge Current (In)	3kA	
Weight – lbs (kg)	3.0 (1.36)	
Dimensions H x W x D – in (mm)	4.87 x 2.56 x 4.75 (123.7 x 65.0 x 120.7) includes mounting bracket	
Modes of Protection	All Mode: L - N, L - L, L - G, N-G	
Status Indication	Green LED, form C Contacts	
Packaging	Metal DIN Rail Mount Enclosure, IP20	
Response Time	< 0.5 nsec	
Operating Temperature	-40°C to +60°C	
Operating Humidity	0% to 95% Non-condensing	
	Noise Attenuation	
Normal Mode **Common Mode**	50 dB Min. 40 dB Min.	
	UL 1449, Type 4 Voltage Protection Ratings (VPRs) Vpeak	
L – N **L – L** **L – G** **N – G**	500 — 500 500	— 900 900 —
	Peak Surge Current Capability	
Warranty	10 year limited warranty

STP Series Pluggable

Surge-Trap®

SURGE PROTECTIVE DEVICE

DIN-RAIL PLUGGABLE SPD FOR ANSI/UL 1449 TYPE 1 AND 2 APPLICATIONS

Surge-Trap® Pluggable Surge Protective Device (SPD) is a no-fuse, fail-safe surge suppressor featuring Mersen's patented TPMOV® technology inside. UL 1449 4th Edition approved, it is DIN-rail mountable featuring a fail-safe self-protected design, visual indicator, and a small footprint. A remote indicator option provides status to critical control circuitry. The Surge-Trap Pluggable SPD has a high short circuit rating and a thermally protected MOV, which eliminates the need for additional overcurrent protection devices.

NEW AND IMPROVED 75KA RATING

Mersen's DIN-Rail Pluggable SPD is one of a kind – the combination of a robust 75kA surge capacity along with no requirement of backup fusing creates an offering unique to the market. Add this to the reliability and safety of Mersen's patented TPMOV technology and you have a truly superior product.

RATINGS:

- **Volts (U_n):** 120-690VAC
- **Nominal Discharge Current Rating (I_n):** 10-20kA
- **Surge Capacity:** 75kA
- **Short-Circuit Current Rating (SCCR):** 200kA

FEATURES/BENEFITS:

- Easy installation or retrofit
- DIN-rail mountable
- Fail-safe, self-protected design
- Remote indicator
- Visual indicator
- IP20 finger-safe design
- Small footprint
- No additional overcurrent protection devices required
- Easy to replace modules
- 2-year warranty

APPROVALS:

- ANSI/UL 1449 4th Edition, Type 1 Component Assembly SPD, File E210793
- ANSI/IEEE C62.41.1, C62.41.2, C62.45
- RoHS Compliant

Primary-switched STEP POWER power supply for DIN rail mounting, input: 1-phase, output: 24 V DC/2.5 A

Product Description

STEP POWER power supplies for distribution boards
The STEP POWER power supply range was developed especially for building automation. The low idling losses and high degree of efficiency ensure maximum energy efficiency. They allow flexible use and can be snapped onto the DIN rail or screwed onto an even surface.

Your advantages

- Flexible mounting by simply snapping onto the DIN rail or screwing onto a level surface
- Reliable power supply thanks to high MTBF (mean time between failures) of more than 500,000 hours and U/I characteristic curve
- Energy savings thanks to maximum energy efficiency and incredibly low idling losses

RoHS

Key Commercial Data

Packing unit	1 pc
GTIN	4 046356 163224
GTIN	4046356163224
Weight per Piece (excluding packing)	320.000 g
Custom tariff number	85044030
Country of origin	Vietnam

Technical data

Dimensions

Width	72 mm
Height	90 mm
Depth	61 mm

Power supply unit - STEP-PS/ 1AC/24DC/2.5 - 2868651

Technical data

Dimensions

Installation distance right/left	0 mm / 0 mm
Installation distance top/bottom	30 mm / 30 mm

Ambient conditions

Degree of protection	IP20
Ambient temperature (operation)	-25 °C ... 70 °C (> 55° C derating : 2.5%/K)
Ambient temperature (storage/transport)	-40 °C ... 85 °C
Max. permissible relative humidity (operation)	≤ 95 % (at 25 °C, non-condensing)
Climatic class	3K3 (in acc. with EN 60721)
Degree of pollution	2

Input data

Nominal input voltage range	100 V AC ... 240 V AC
Input voltage range	85 V AC ... 264 V AC
	95 V DC ... 250 V DC
AC frequency range	45 Hz ... 65 Hz
Frequency range DC	0 Hz
Current consumption	0.8 A (120 V AC)
	0.4 A (230 V AC)
Nominal power consumption	124.3 VA
Inrush current	< 15 A (typical)
Mains buffering time	typ. 20 ms (120 V AC)
	typ. 100 ms (230 V AC)
Input fuse	3.15 A (slow-blow, internal)
Recommended breaker for input protection	6 A ... 16 A (Characteristics B, C, D, K)
Power factor (cos phi)	0.56
Type of protection	Transient surge protection
Protective circuit/component	Varistor

Output data

Nominal output voltage	24 V DC ±1 %
Setting range of the output voltage (U_{Set})	22.5 V DC ... 29.5 V DC (> 24 V DC, constant capacity restricted)
Nominal output current (I_N)	2.5 A (-25 °C ... 55 °C)
	2.75 A (-25°C ... 40°C permanent)
Output current I_{max}	4.4 A
Derating	55 °C ... 70 °C (2.5%/K)
Connection in parallel	Yes, for redundancy and increased capacity
Connection in series	yes
Feedback voltage resistance	≤ 35 V DC

Power supply unit - STEP-PS/ 1AC/24DC/2.5 - 2868651

Technical data

Output data

Protection against overvoltage at the output (OVP)	≤ 35 V DC
Control deviation	< 1 % (change in load, static 10 % ... 90 %)
	< 2 % (change in load, dynamic 10 % ... 90 %)
	< 0.1 % (change in input voltage ±10 %)
Residual ripple	< 80 mV_{PP} (20 MHz)
Output power	60 W
Typical response time	< 0.5 s
Peak switching voltages nominal load	< 40 mV_{PP} (20 MHz)
Maximum power dissipation in no-load condition	< 0.7 W
Power loss nominal load max.	9.9 W

General

Net weight	0.27 kg
Operating voltage display	Green LED
Efficiency	> 86 % (for 230 V AC and nominal values)
	> 1061000 h (40 °C)
Insulation voltage input/output	4 kV AC (type test)
	3.75 kV AC (routine test)
Insulation voltage input / PE	3.5 kV AC (type test)
	2 kV AC (routine test)
Insulation voltage output / PE	500 V DC (routine test)
Degree of protection	IP20
Protection class	II (in closed control cabinet)
Housing material	Polycarbonate
Foot latch material	POM (Polyoxymethylen)
Mounting position	horizontal DIN rail NS 35, EN 60715
Assembly instructions	alignable: 0 mm horizontally, 30 mm vertically

Connection data, input

Connection method	Screw connection
Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	2.5 mm²
Conductor cross section flexible min.	0.2 mm²
Conductor cross section flexible max.	2.5 mm²
Conductor cross section AWG min.	24
Conductor cross section AWG max.	12
Stripping length	6.5 mm
Screw thread	M3

Rail-mounted dual power outlet with two 120 V AC/15 A receptacles equipped with ground fault circuit interruption (GFCI) for 35 mm DIN rail per EN 60715. GFCI protects against shock hazards associated with ground shorts. For enhanced safety, the grounding pin is located at the top to prevent shorting between the hot and neutral blades. Auxiliary terminals allow connection of auxiliary devices for protection by the GFCI outlet.
Housing color: Ivory. National version: USA. Connection type: Screw.

PowerFlex® 750-Series AC Drives
The Power and Control You Need

With a complete power range of 0.75 to 1500 kW (1 to 2000 Hp) and 400/480 and 600/690 volt availability, the PowerFlex 750-Series is a comprehensive drive family providing productivity-enhancing benefits to a wide range of global applications.

The PowerFlex 753 and 755 AC drives offer more selection for control, communications, safety and supporting hardware options than any other drives in their class.

The PowerFlex 750-Series of AC drives was designed with your needs in mind. Your need for flexibility, productivity and ease of use has been considered in every detail of these drives. The result is a family of AC drives that provides an exceptional user experience, from initial programming through operation.

This robust family of AC drives offers high performance for a wide variety of industrial applications. The PowerFlex 753 provides general purpose control for applications ranging up to 350 Hp/250 kW while the PowerFlex 755 provides maximum flexibility and performance up to 2000 Hp/1500 kW.

Consider these key features of the PowerFlex 750-Series drives and how they can help you maximize your productivity:

Simplified Integration with Logix – The PowerFlex 753 and 755 offer seamless integration into the Logix environment for simplified and enhanced configuration, programming, commissioning, diagnostics and maintenance. Using either Add-on Profiles or embedded instructions*, you'll be able to reduce engineering time – and related costs – while improving the configuration, control and collection of data.

Communications – The PowerFlex 750-Series supports a comprehensive range of network protocols to ease integration into your architecture. The PowerFlex 755 features an embedded EtherNet/IP™ port, allowing you to easily manage drive data over EtherNet/IP networks. In addition, a dual-port EtherNet/IP option module for the PowerFlex 750-Series provides flexible and cost-effective ways to apply EtherNet/IP, including Device Level Ring functionality.

Safe Torque-off and Safe Speed Monitor – Help protect personnel and equipment while reducing machine downtime with safety solutions up to and including PLe/SIL, Cat 3 and Cat 4. These safety options provide a choice for safety levels depending on your application requirements.

DeviceLogix™ – Controls outputs and manages status information locally within the drive, allowing you to operate the drive independently or complementary to supervisory control.

Configure for Your Application – Each drive has a slot-based hardware architecture that reduces unnecessary add-ons and gives you the flexibility to select option cards to suit your application and expand your drive for future needs. Supported hardware control options are common for the series to help reduce your inventory and spare parts requirements.

Predictive Diagnostics – Prevent unplanned downtime with predictive diagnostics and built-in protection features to help guard your investment. These settings allow the PowerFlex 750-Series to keep track of information that affects the life of the drive components. PowerFlex 755 drives 250 kW/350 Hp and larger have additional diagnostic features including built-in protection devices.

Application-matched Packaging – Gain additional flexibility with packaging options that address a range of application and environmental protection requirements.

Feedback – Options include Universal, Encoder and Dual Encoder feedback options. The Universal Feedback option includes multiple feedback interfaces to support a wide range of applications. Interfaces supported are Incremental, EnDat and Hiperface for Stegmann and Heidenhain high resolution feedback, SSI and BiSS for rotary and linear applications. The drives also provide automatic feedback loss switchover.

* PowerFlex 755 uses embedded instructions

PowerFlex 753 AC Drive

The PowerFlex 753 is ideal for general purpose applications requiring speed or torque control up to 250 kW/350 Hp. Embedded I/O along with three option slots for safety, feedback, communications, 24V power or additional I/O make the drive a flexible, cost-effective solution.

PowerFlex 755 AC Drive

PowerFlex 755 is ideal for applications requiring positioning, speed or torque control up to 1500 kW/2000 Hp. The PowerFlex 755 is easily integrated with the embedded Ethernet port and has five option slots to support additional options for feedback, I/O, safety, communications, and auxiliary 24V DC control power.

The PowerFlex 755 AC drive can be integrated with a ControlLogix® or CompactLogix™ Programmable Automation Controller (PAC) via drive instructions that are actually embedded in the PAC. This level of integration is specific to PowerFlex 755 drives on EtherNet/IP.

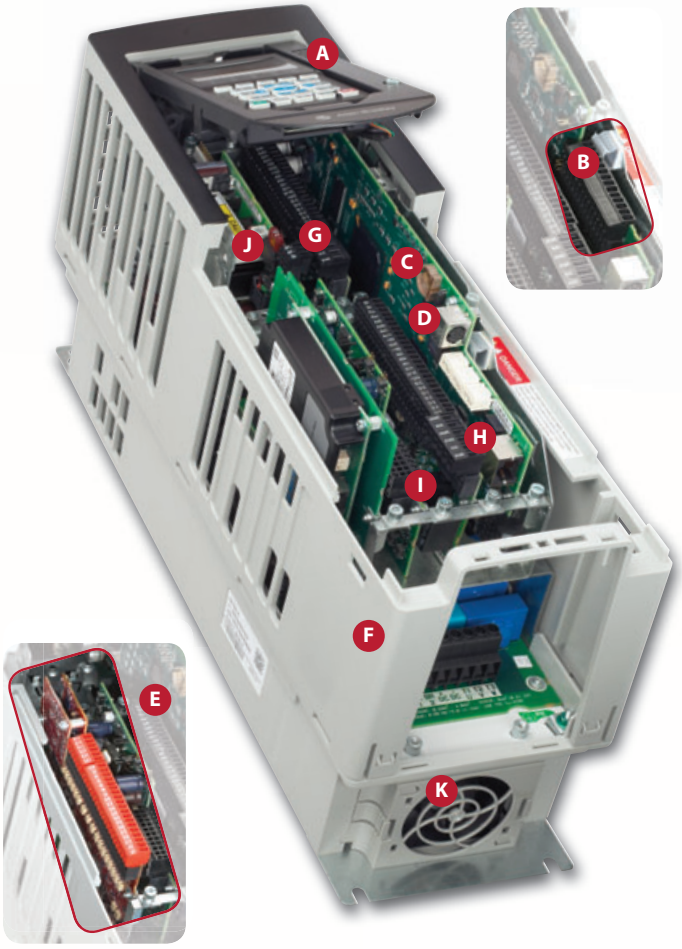
** Also previous versions of RSLogix 5000 software.

PowerFlex 750-Series AC Drive



- **A** High-definition LCD display allows for six lines of text for more meaningful explanations of parameters and events.
- **B** Standard I/O on the PowerFlex 753 provides a cost-effective solution.
- **C** Real-time clock provides time-stamped events vs. run-time data.
- **D** Additional DPI for expanded programming capability.
- **E** Increase safety performance levels with the Safe Speed Monitor option card which includes an embedded safety relay.
- **F** Packaging options to meet application requirements.
- **G** DeviceLogix embedded control technology provides function block programming for stand-alone control of basic applications.
- **H** Easily configure, control and collect drive data with standard embedded Ethernet port on the PowerFlex 755.
- **I** Slot-based mechanical architecture to support additional options for I/O, feedback, safety, communications and auxiliary power supply.
- **J** Optional Auxiliary Power Supply maintains control and communications in event that main power is not present.
- **K** Easily assessable heat sink and internal fans.

e-Tools Simplify and Enhance Use of PowerFlex 750-Series Drives

Add-on Profiles

For simplified AC drive start-up and reduced development time, we've integrated Allen-Bradley® PowerFlex drive configuration with Studio 5000™ Logix Designer software (formerly RSLogix™ 5000). This single-software approach simplifies parameter and tag programming while still allowing stand-alone drive software tool use on the factory floor.

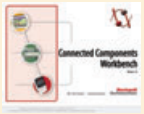
Embedded Instructions

The PowerFlex 755 AC drive can be configured with drive instructions embedded in Allen-Bradley ControlLogix and CompactLogix Programmable Automation Controllers (PAC). These are the same configuration parameters and programming instructions used by Allen-Bradley Kinetix® servo drives, providing a common, enhanced user experience.

DriveTools™ SP Software Suite

A powerful PC-based software suite, for programming, configuring and troubleshooting.

- DriveExecutive™ – for online/offline configuration and management of drives and drive peripherals
- DriveObserver™ – for real-time trending of drive information



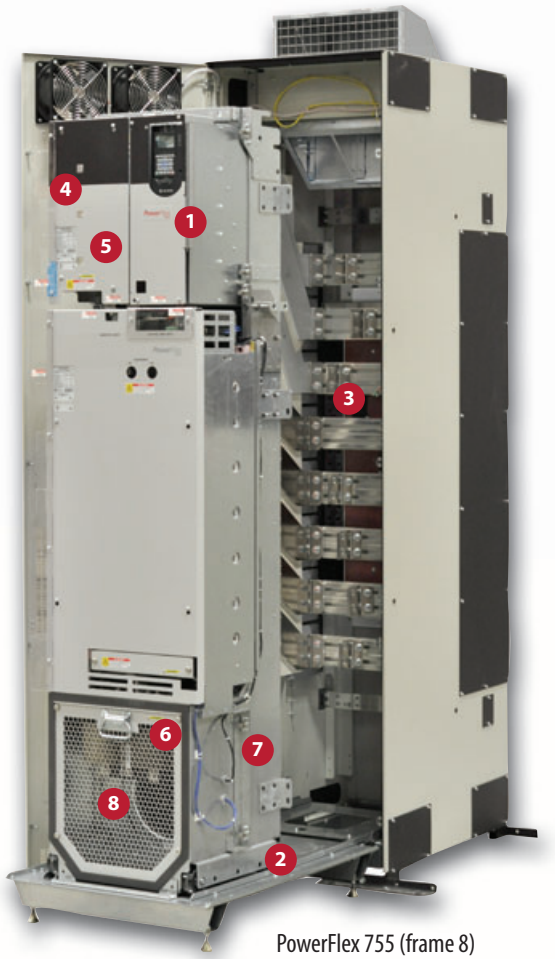
Connected Components Workbench™

Programming and configuration software supports all PowerFlex drives, Micro800™ controllers and PanelView™ component graphic terminals. This software leverages proven Rockwell Automation and Microsoft® Visual Studio® technologies for fast and easy controller programming, drive configuration and integration with the HMI editor.

PowerFlex 755 Floor Mount AC Drives

In addition to all the options and benefits available in the PowerFlex 750-Series, the PowerFlex 755 drives 250 kW/350 Hp and larger offer added benefits for maintenance and installation flexibility.

1. Control pod is common with smaller ratings providing embedded Ethernet port and 5 slots for option modules, and can be remote mounted (up to 23 m) for hassle-free access to low voltage control.
2. Roll in/out design makes the drive easy to install and service by allowing complete removal from cabinet, providing generous room for wiring behind the drive. Power wiring can stay connected while unit is rolled out.
3. Adjustable terminals provide flexibility for wiring preferences such as top or bottom entry.
4. Integrated fusing eliminates need for separately mounted drive short circuit protection. Status is reported from the drive to ease troubleshooting.
5. Replaceable surge protector reduces downtime after incoming transient voltage events. Status is reported from the drive to ease troubleshooting.
6. Integrated DC link inductor enhances protection from power system events, and reduces input harmonics.
7. Sealed cooling channel uses external air for main cooling, reducing contamination exposure for electronics.
8. Modular construction allows fast and easy replacement of parts (e.g., main blower, capacitor assembly, circuit boards), minimizing production downtime.

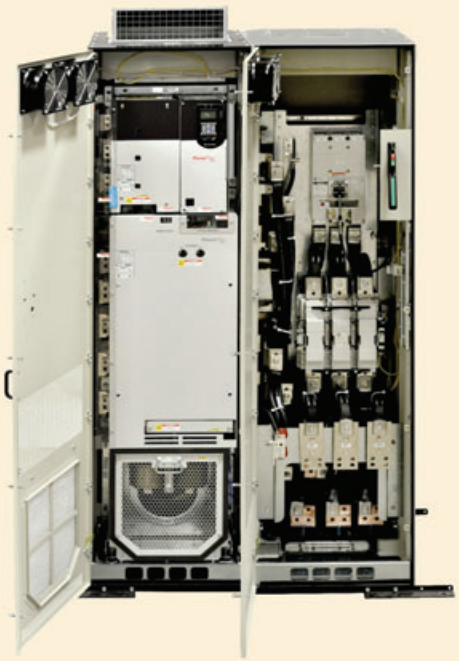


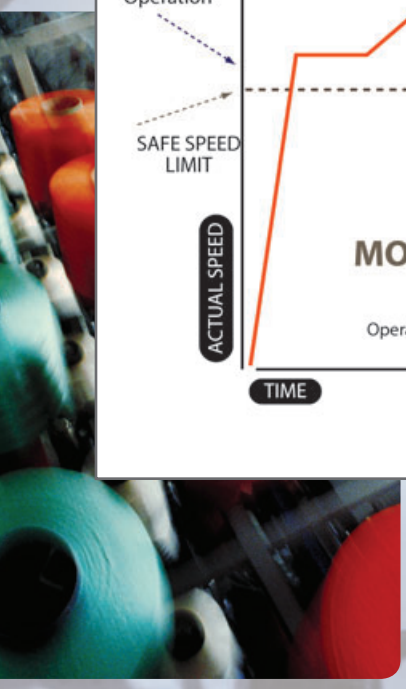
PowerFlex 755 (frame 8)
250 to 500 kW/350 to 600 Hp

PowerFlex 755 Drives with Option Bays

All PowerFlex 755 floor mount drives are available with a power option bay which provides a cost-effective solution for power disconnect and other popular power options. Based on customer specifications, components are correctly sized and optimized for the appropriate overload duty rating. By eliminating the need for accessory sizing and the possibility of installation errors, the option bay helps to reduce engineering and installation time and costs. Option Bays are available with both IP20 and IP54 environmental ratings.

View a video on the benefits of the PowerFlex 755 at:
http://ab.rockwellautomation.com/Drives/PowerFlex-755





Safety

To help you protect personnel and assets while improving machine uptime, the PowerFlex 750-Series is available with two safety options:

1. Safe Torque-Off option or
2. Safe Speed Monitor option.

Safe Torque-Off is ideal for safety-related applications requiring removal of rotational power to the motor without removing power from the drive. Safe Torque-Off functionality offers the benefit of quick start-up after a demand on the safety system, helps reduce wear from repetitive start-up, and provides safety ratings up to and including SIL, PLe, and CAT 3.

The Safe Speed Monitor option provides a solution for applications that can benefit from access to a safety zone while there is limited motion. It helps you safely monitor and control the speed of your application, which allows operators to perform process or maintenance work without stopping the machine.

In addition, Safe Speed Monitor has an integrated monitoring relay to save additional panel-space installation labor. This option carries a safety rating up to and including SIL, PLe and Cat 4.

The Safe Speed Monitor option provides the following functionality:

- Safe Torque-Off
- Stop Categories 0, 1 and 2
- Safe Stop
- Safe Limited Speed
- Safe Maximum Speed
- Safe Maximum Acceleration
- Safe Direction
- Zero-Speed Monitoring
- Door Control and Monitoring
- Enabling switch input

The Right Packaging for Your Application

Because application conditions and environments vary, PowerFlex 750-Series drives are available with a choice of packaging options. From highly flexible IP00 open styles to MCC-style cabinets and other features that help provide additional protection, there's a PowerFlex 750-Series drive with the right packaging to help you meet productivity goals.

PowerFlex 755 Floor Mount Drives with IP00, NEMA/UL Open Type Ratings

The PowerFlex 755 IP00, NEMA/UL Open Type drives are designed to provide packaging flexibility, including the option for either vertical or horizontal mounting orientations. This option is available in PowerFlex 755 floor mount drives with ratings up to 1500 kW/2000 Hp.

PowerFlex 750-Series Drives with IP54/UL Type 12 Ratings

For applications requiring additional protection from harsh environments, PowerFlex 753 and 755 drives are available with IP54/UL Type 12 enclosures. These enclosures help protect the drive from dust and splashing water and are appropriate for moderately harsh indoor environments.

PowerFlex 750-Series drives are available with a variety of enclosure options and ratings including IP00, IP20, IP54 (above left) and an extra protection flange mount (above right).

Enclosure	Rating	Temperature Range	PowerFlex 753	PowerFlex 755
Wall Mount	IP00, IP20, NEMA/UL Open Type	0 – 50 ˚C 32 – 122 ˚F	X	X
Extra Protection Flanged Mount	Front: IP00, IP20 & NEMA/UL Open Type Back: IP66 & NEMA/UL Type 4X	Front: 0 – 50 ˚C 32 – 122 ˚F Back: 0 – 40 ˚C 32 – 104 ˚F	X	X
Extra Protection Wall Mount	IP54 & NEMA/UL Type 12	0 – 40 ˚C 32 – 104 ˚F	X	X
NEMA 1 Kit	Converts Open Type to NEMA/UL Type	0 – 40 ˚C 32 – 104 ˚F	X	X
Floor Mount	IP20, IP54, IP00	0 – 40 ˚C 32 – 104 ˚F		X*

* Floor mount drives are available for PowerFlex 755 higher power ratings (above 250 kW/350 Hp) only.
PowerFlex 755 higher power drives (ratings above 250 kW/350 Hp) are available in IP00, IP20 and IP54 enclosure ratings.

Premier Integration Simplifies Development, Use and Maintenance

By combining the advanced capabilities of the Rockwell Automation Integrated Architecture™ and the communication capabilities of PowerFlex drives, you can achieve an exceptional level of integration between drives and controllers. The benefits of this integration range from reduced development time to simplified maintenance.

To achieve this integration, PowerFlex drives use add-on profiles in Studio 5000™ Logix Designer software (formerly RSLogix™ 5000) to streamline drive installation. Add-on profiles minimize the need to individually program the required parameters and tags. The result is simplified programming, which puts an end to the need to frequently refer back to user manuals for specific parameter and tag information. And all PowerFlex drives on EtherNet/IP are able to take advantage of these add-on profiles.

In addition, Automatic Device Configuration (ADC) support for the PowerFlex 750-Series drives – shown below – helps reduce downtime.

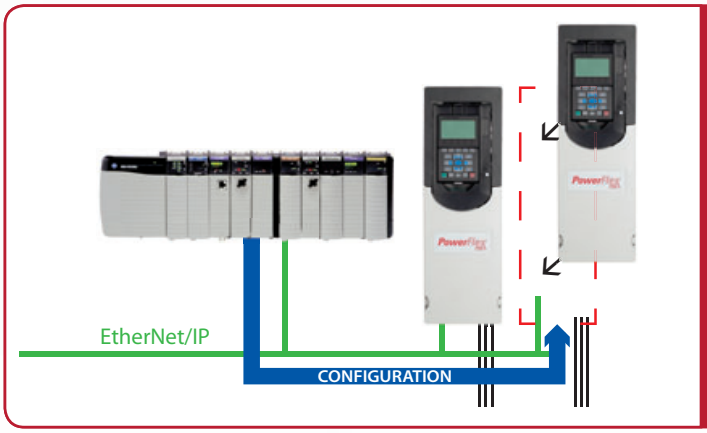
Easy-to-use tools help reduce development time and require no specialized knowledge – Wizards with advanced graphical interfaces walk you through drive parameter configuration.

Eliminate errors associated with using multiple software tools – Single development environment to configure and program your entire Logix drive system.

Access, edit and save drive information to the control system project with ease – Drive configuration is saved as part of the RSLogix project file (*.acd) and is also stored in the Logix controller, so there's no need to store and maintain multiple files – you only need one file.

Easily download global objects and faceplates – You can use the same tag names generated by the drive add-on profiles to utilize global objects and faceplates for a FactoryTalk® View HMI display

Easy to Maintain – Diagnostic, fault, alarm, and event information are integral to Studio 5000.



With Automatic Device Configuration (ADC), the Logix controller can automatically detect a replaced PowerFlex 753 or 755 drive and download all configuration parameters, eliminating the need for manual reconfiguration. (PowerFlex 753 AC drives require a dual-port EtherNet/IP communication card for ADC.)

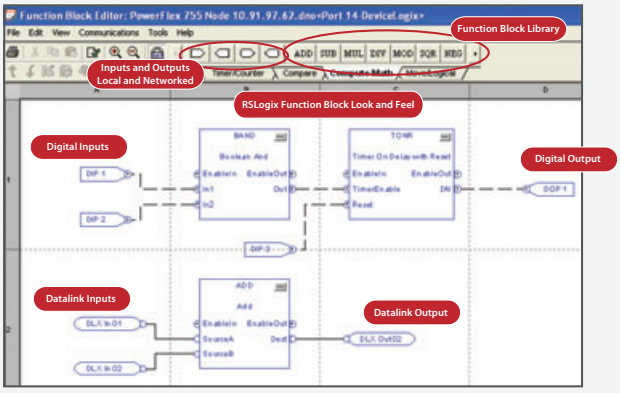
DeviceLogix™ Control Technology

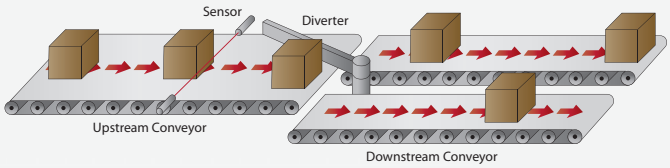
DeviceLogix control technology provides you with the flexibility to customize a drive to more closely match your application needs. DeviceLogix controls outputs and manages status information locally within the drive, allowing you to operate the drive independently or complementary to supervisory control, helping to improve system performance and productivity.

You can use the PowerFlex 750-Series DeviceLogix to:

- Speed reaction time by processing in the drive, which reduces dependency on network throughput
- Provide scaling, selector switches, or other data manipulations not already built into the drive
- Read inputs/write outputs and exclusively control the drive
- Provide an option for decision-making if communication is lost with main controller
- Control other PowerFlex drives via a Peer-to-Peer EtherNet/IP network

DeviceLogix is easily programmed via: RSLogix 5000 and DriveTools SP v 5.01.



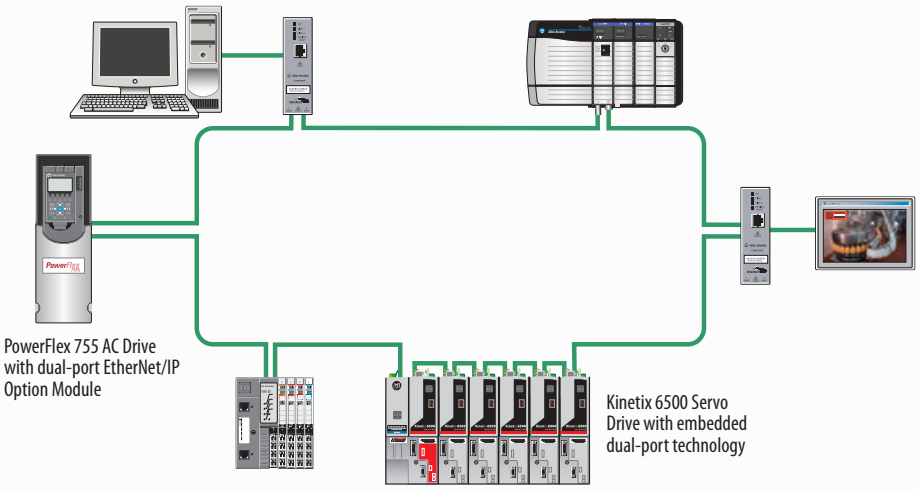


EtherNet/IP – A Single Network for Complete Machine Control

Connect Your Entire Enterprise

Benefit from the EtherNet/IP network for complete machine control that simplifies and enhances machine design.

- Low cost, high performance and easy to use as compared to a multi-network architecture
- Easily integrate any PowerFlex drive, I/O, smart actuators and any other EtherNet/IP connected device
- EtherNet/IP is an established, broadly-adopted network
- The PowerFlex 755 AC drive and Kinetix 6500 servo drive can reside on the same EtherNet/IP network and be programmed with a common set of motor control instructions available in ControlLogix and CompactLogix Programmable Automation Controllers



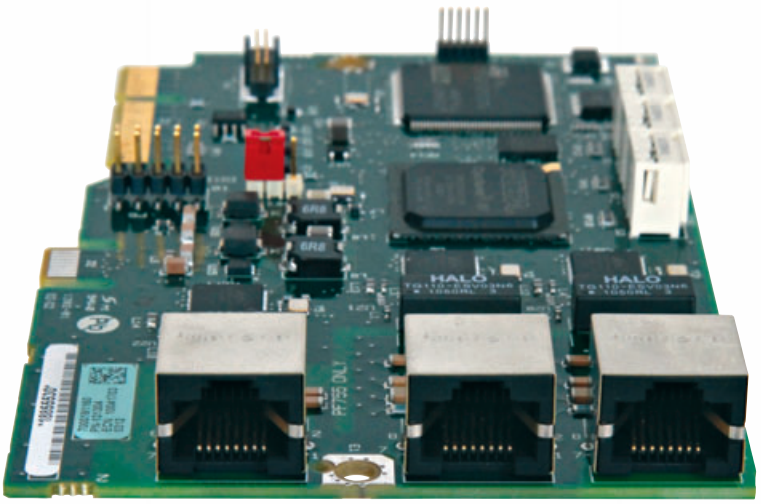
Device Level Ring (DLR) is an ODVA standard and provides fault tolerant connectivity for high drive availability. If one device on the EtherNet/IP network fails, the other devices are able to continue operation.

Dual-port EtherNet/IP Option Module for PowerFlex 750-Series AC Drives

The PowerFlex 750-Series Dual-port EtherNet/IP option module provides flexible and cost-effective ways to apply EtherNet/IP, and supports Ring, Linear and Star topologies as well as DLR functionality. DLR-based networks reduce configuration time and costs by minimizing the number of managed switches and reducing cabling needs. Users can create a single fault-tolerant DLR network that connects all components at the device level locally.

Information can be seamlessly communicated in real time to various levels of an organization, without requiring additional complexity. Getting real-time information at the right time and at the right levels of the manufacturing environment helps you enhance the agility of your business.

This solution supports optimal integration on a DLR level for the PowerFlex 755 via instructions embedded in the Logix controller, further enhancing integration into the Rockwell Automation Integrated Architecture. Only Allen-Bradley drives are able to offer optimal integration into the Integrated Architecture, providing simplified configuration, programming, commissioning, diagnostics and maintenance.



All PowerFlex 755 AC drives have a single embedded Ethernet port. This 750-Series option module provides the benefits of dual-port EtherNet/IP functionality for both the PowerFlex 753 and 755.

Description: PowerFlex 750-Series

BASE DRIVE INFORMATION

BULLETIN NUMBER
PowerFlex 755 AC Drive, with Embedded Ethernet/IP

VOLTAGE CLASS
480 VAC, 3 PH

OUTPUT CURRENT
65 Amps, 50HP ND, 40HP HD

ENCLOSURE TYPE
Open Type

INPUT TYPE
AC Input with DC Terminals

FRAME SIZE
Frame 4

EMC FILTERING OPTIONS
Filtered, CM Jumper Installed

DYNAMIC BRAKING
DB Transistor

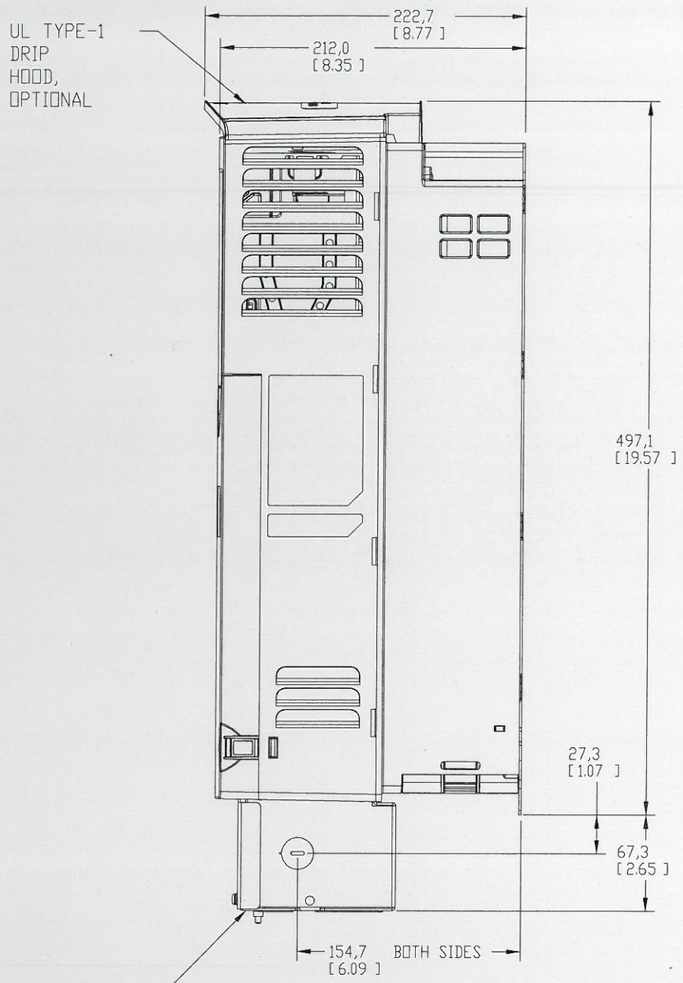
HIM
Blank (No HIM)

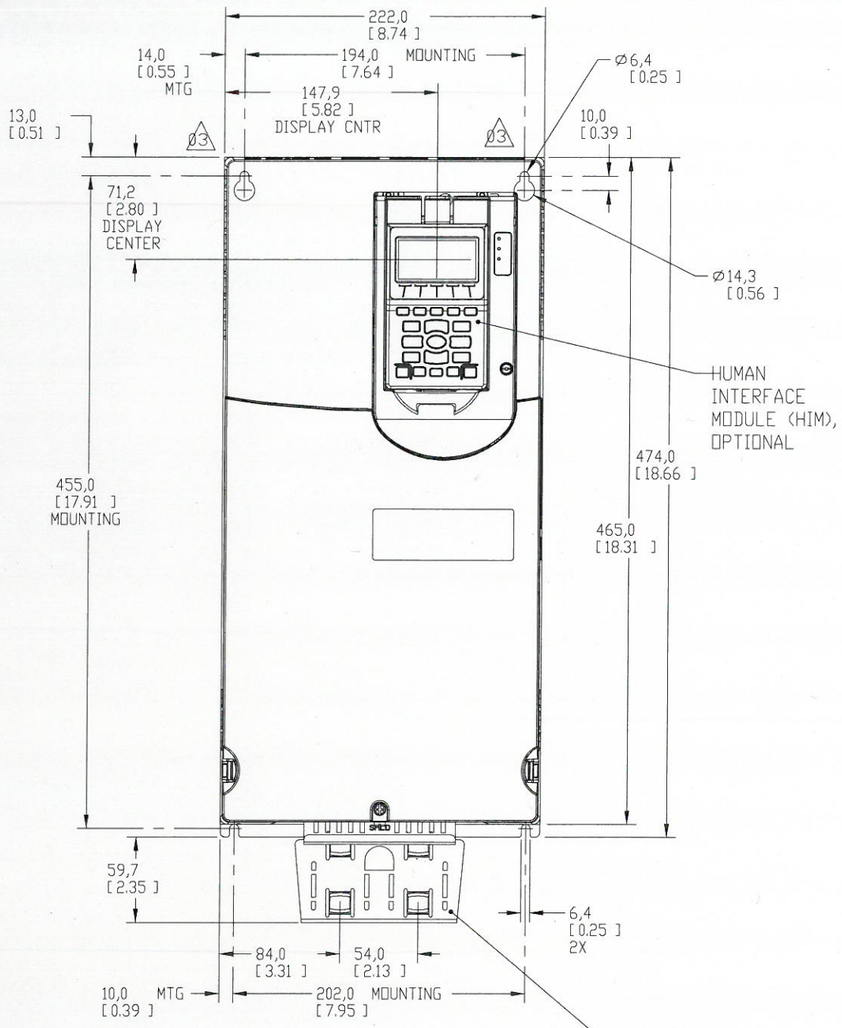
Remote Mount HMI with Extension Cable Included (Dead-Front Mount)

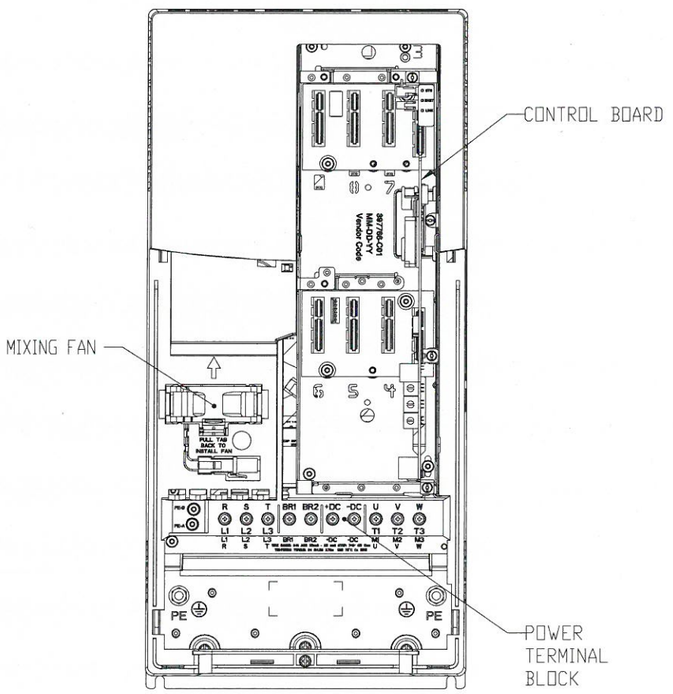
POWEROHM RESISTOR/BRAKE MODULE SELECTION

IS THIS A LIFTING, HOISTING OR TROLLEY APPLICATION?
No

ACCESSORIES







OPEN DRIVE WITH
COVER,
AND HIM BEZEL
REMOVED

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

	**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.
	**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.
IMPORTANT	Identifies information that is critical for successful application and understanding of the product.

Labels may also be on or inside the equipment to provide specific precautions.

	**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.
	**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.
	**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

Allen-Bradley, Connected Components Workbench, DriveExecutive, DriveExplorer, PowerFlex, RSLogix, SCANport, Studio 5000, Rockwell Software, and Rockwell Automation are trademarks of Rockwell Automation, Inc.

Trademarks not belonging to Rockwell Automation are property of their respective companies.

This manual contains new and updated information.

New and Updated Information

This table contains the changes made to this revision.

Topic	Page
Added information about 270 kW, 400 HP drives to the table of minimum resistances.	214

Notes:

Overview

The purpose of this manual is to provide detailed information including operation, parameter descriptions, and programming.

Who Should Use This Manual

This manual is intended for qualified personnel. You must be able to program and operate Adjustable Frequency AC Drive devices. In addition, you must have an understanding of the parameter settings and functions.

What Is Not in This Manual

The purpose of this manual is to provide detailed drive information including operation, parameter descriptions and programming.

Additional Resources

The following table lists publications that provide information about PowerFlex 750-Series drives.

Resource	Description
PowerFlex 750-Series Drive Installation Instruction, 750-IN001	Provides the basic steps required to install a PowerFlex® 750-Series AC drive.
PowerFlex 750-Series AC Drives Programming Manual, publication 750-PM001	Provides detailed information on: • I/O, control, and feedback options • Parameters and programming • Faults, alarms, and troubleshooting
PowerFlex 750-Series AC Drives Technical Data, publication 750-TD001	Provides detailed information on: • Drive specifications • Option specifications • Fuse and circuit breaker ratings
PowerFlex 20-HIM-A6 / -C6S HIM (Human Interface Module) User Manual, publication 20HIM-UM001	Provides detailed information on HIM components, operation, features.
PowerFlex 750-Series AC Drives Hardware Service Manual - Frame 8 and Larger, publication 750-TG001	Provides detailed information on: • Preventive maintenance • Component testing • Hardware replacement procedures
PowerFlex 755 Drive Embedded EtherNet/IP Adapter User Manual, publication 750COM-UM001	These publications provide detailed information on configuring, using, and troubleshooting PowerFlex 750-Series communication option modules and adapters.
PowerFlex 750-Series Drive DeviceNet Option Module User Manual, publication 750COM-UM002	
PowerFlex 7-Class Network Communication Adapter User Manuals, publications 750COM-UMxxx	

Resource	Description
PowerFlex 750-Series Safe Torque Off User Manual, publication 750-UM002	These publications provide detailed information on installation, set up, and operation of the 750-Series safety option modules.
Safe Speed Monitor Option Module for PowerFlex 750-Series AC Drives Safety Reference Manual, publication 750-RM001	
Wiring and Grounding Guidelines for Pulse Width Modulated (PWM) AC Drives, publication DRIVES-IN001	Provides basic information needed to properly wire and ground PWM AC drives.
PowerFlex AC Drives in Common Bus Configurations, publication DRIVES-AT002	Provides basic information needed to properly wire and ground common bus PWM AC drives.
Safety Guidelines for the Application, Installation and Maintenance of Solid State Control, publication SGI-1.1	Provides general guidelines for the application, installation, and maintenance of solid-state control.
A Global Reference Guide for Reading Schematic Diagrams, publication 100-2.10	Provides a simple cross-reference of common schematic/ wiring diagram symbols used throughout various parts of the world.
Guarding Against Electrostatic Damage, publication 8000-4.5.2	Provides practices for guarding against Electrostatic damage (ESD)
Product Certifications website, http://ab.com	Provides declarations of conformity, certificates, and other certification details.

The following publications provide necessary information when applying the Logix Processors.

Resource	Description
Logix5000 Controllers Common Procedures, publication 1756-PM001	This publication links to a collection of programming manuals that describe how you can use procedures that are common to all Logix5000 controller projects.
Logix5000 Controllers General Instructions, publication 1756-RM003	Provides a programmer with details about each available instruction for a Logix-based controller.
Logix5000 Controllers Process Control and Drives Instructions, publication 1756-RM006	Provides a programmer with details about each available instruction for a Logix-based controller.

The following publications provide information that is useful when planning and installing communication networks.

Resource	Description
ControlNet Coax Tap Installation Instructions, publication 1786-5.7	Provides procedures and specifications for the installation of ControlNet coaxial taps.
ControlNet Fiber Media Planning and Installation Guide, publication CNET-IN001	Provides basic information for fiber cable planning and installation.

You can view or download publications at http://www.rockwellautomation.com/literature. To order paper copies of technical documentation, contact your local Allen-Bradley distributor or Rockwell Automation sales representative.

Allen-Bradley Drives Technical Support

Product Certification

Product Certifications and Declarations of Conformity are available on the internet at www.rockwellautomation.com/products/certification.

Manual Conventions

- In this manual we refer to PowerFlex 750-Series Adjustable Frequency AC Drives as: drive, PowerFlex 750, PowerFlex 750 drive or PowerFlex 750 AC drive.
- Specific drives within the PowerFlex 750-Series can be referred to as:
  - PowerFlex 753, PowerFlex 753 drive or PowerFlex 753 AC drive
  - PowerFlex 755, PowerFlex 755 drive or PowerFlex 755 AC drive
- To help differentiate parameter names and LCD display text from other text, the following conventions are used:
  - Parameter Names appear in [brackets] after the Parameter Number. For example: P308 [Direction Mode].
  - Display text appears in “quotes.” For example: “Enabled.”
- The following words are used throughout the manual to describe an action.

Word	Meaning
Can	Possible, able to do something
Cannot	Not possible, not able to do something
May	Permitted, allowed
Must	Unavoidable, you must do this
Shall	Required and necessary
Should	Recommended
Should Not	Not recommended

General Precautions

Qualified Personnel

ATTENTION: Only qualified personnel familiar with adjustable frequency AC drives and associated machinery should plan or implement the installation, start-up and subsequent maintenance of the system. Failure to comply may result in personal injury and/or equipment damage.

Personal Safety

ATTENTION: To avoid an electric shock hazard, verify that the voltage on the bus capacitors has discharged completely before servicing. Check the DC bus voltage at the Power Terminal Block by measuring between the +DC and -DC terminals, between the +DC terminal and the chassis, and between the -DC terminal and the chassis. The voltage must be zero for all three measurements.

Hazard of personal injury or equipment damage exists when using bipolar input sources. Noise and drift in sensitive input circuits can cause unpredictable changes in motor speed and direction. Use speed command parameters to help reduce input source sensitivity.

Risk of injury or equipment damage exists. DPI or SCANport™ host products must not be directly connected together via 1202 cables. Unpredictable behavior can result if two or more devices are connected in this manner.

The drive start/stop/enable control circuitry includes solid state components. If hazards due to accidental contact with moving machinery or unintentional flow of liquid, gas or solids exists, an additional hardwired stop circuit may be required to remove the AC line to the drive. An auxiliary braking method may be required.

Hazard of personal injury or equipment damage due to unexpected machine operation exists if the drive is configured to automatically issue a Start or Run command. Do not use these functions without considering applicable local, national and international codes, standards, regulations or industry guidelines.

Product Safety

ATTENTION: An incorrectly applied or installed drive can result in component damage or a reduction in product life. Wiring or application errors such as under sizing the motor, incorrect or inadequate AC supply, or excessive surrounding air temperatures may result in malfunction of the system.

This drive contains ESD (Electrostatic Discharge) sensitive parts and assemblies. Static control precautions are required when installing, testing, servicing or repairing this assembly. Component damage may result if ESD control procedures are not followed. If you are not familiar with static control procedures, reference Guarding Against Electrostatic Damage, publication 8000-4.5.2, or any other applicable ESD protection handbook.

Configuring an analog input for 0-20 mA operation and driving it from a voltage source could cause component damage. Verify proper configuration prior to applying input signals.

A contactor or other device that routinely disconnects and reapplies the AC line to the drive to start and stop the motor can cause drive hardware damage. The drive is designed to use control input signals to start and stop the motor. If an input device is used, operation must not exceed one cycle per minute or drive damage will occur.

Drive must not be installed in an area where the ambient atmosphere contains volatile or corrosive gas, vapors or dust. If the drive is not going to be installed for a period of time, it must be stored in an area where it will not be exposed to a corrosive atmosphere.

Class 1 LED Product

ATTENTION: Hazard of permanent eye damage exists when using optical transmission equipment. This product emits intense light and invisible radiation. Do not look into module ports or fiber optic cable connectors.

Studio 5000 Environment

The Studio 5000™ Engineering and Design Environment combines engineering and design elements into a common environment. The first element in the Studio 5000 environment is the Logix Designer application. The Logix Designer application is the rebranding of RSLogix™ 5000 software and will continue to be the product to program Logix5000™ controllers for discrete, process, batch, motion, safety, and drive-based solutions.

The Studio 5000 environment is the foundation for the future of Rockwell Automation® engineering design tools and capabilities. This environment is the one place for design engineers to develop all of the elements of their control system.

Accel/Decel Time

You can configure the drive's acceleration time and deceleration time.

Acceleration Time

P535[Accel Time 1] and P536 [Accel Time 2] set the acceleration rate for all speed changes. Defined as the time to accelerate from 0 to motor nameplate frequency P27 [Motor NP Hertz] or to motor nameplate rated speed P28 [Motor NP RPM]. The setting of Hertz or RPM is programmed in P300 [Speed Units]. Selection between Acceleration Time 1 and Acceleration Time 2 is controlled by a digital input function (see Digin Functions in the PowerFlex 750-Series Programming Manual, publication 750-PM001) or by Logic Command (sent over a communication network or DeviceLogix™ software).

Adjustment range is 0.00 to 3600.00 seconds.

Deceleration Time

P537 [Decel Time 1] and P538 [Decel Time 2] set the deceleration rate for all speed changes. Defined as the time to decelerate from motor nameplate frequency P27 [Motor NP Hertz] or from motor nameplate rated speed P28 [Motor NP RPM] to 0. The setting of Hertz or RPM is programmed in P300 [Speed Units]. Selection between Deceleration Time 1 and Deceleration Time 2 is controlled by a digital input function (see Digin Functions in the PowerFlex 750-Series Programming Manual, publication 750-PM001) or by Logic Command (sent over a communication network or DeviceLogix software).

Adjustment range is 0.00 to 3600.00 seconds.

Adjustable Voltage

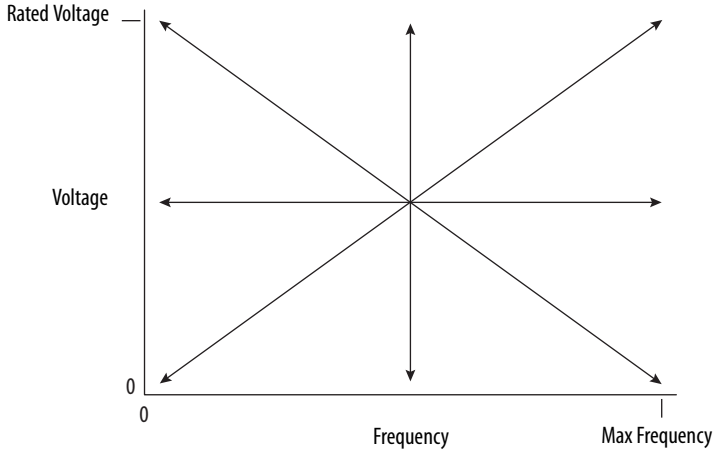
As standard AC drive applications are expanding into new markets, new control methods are required to meet these market demands for electromagnetic applications. Some of these applications, listed below, use non-motor or non-standard motors that require independent control of load frequency and voltage.

- Vibration welding
- Induction heating
- Power supplies
- Vibratory feeders or conveyors
- Electromagnetic stirring
- Resistive loads

Standard inverter control modes consist of volts per hertz (V/Hz), with boost selections, speed feedback selection, fan, pump, and economize, flux vector (FV), with encoder and encoder less modes. The control of the output voltage/frequency relationship of the variable frequency inverter must be maintained in the linear and nonlinear (over-modulation) regions. Voltage linearity is achieved by maintaining a constant voltage/frequency ratio over the entire operating region. The variable frequency inverter must deliver an adjustable-frequency alternating voltage whose magnitude is related to the output frequency. As the linear-to-nonlinear transition begins, the control must compensate for the lost voltage and deliver a linear output voltage profile.

In adjustable voltage control mode, the output voltage is controlled independently from the output frequency. The voltage and frequency components have independent references and acceleration/deceleration rates.

The adjustable voltage control mode operation enables separate control of the output voltage and the output frequency for use on applications that are typically non-motor types. The voltage and frequency components have independent references and independent acceleration and deceleration rates. Both the voltage and frequency can be set to any point within their respective range. The following graph illustrates these functional ranges.



Overview

Adjustable voltage control is enabled by setting P35 [Motor Ctrl Mode] to option 9 "Adj VltgMode." This feature provides either three-phase and single-phase output voltage. The default mode is three-phase output voltage and is selected by P1131 [Adj Vltg Config]. In single-phase mode the drive is not designed to operate single phase motors, but rather the output load is considered to have a lagging or unity power factor consisting of resistance and inductance for specially designed motor or non-motor application.

Input reference sources can be configured from P1133 [Adj Vltg Select]. The input source can be scaled and upper when lower limits are applied. A trim source can be selected reference from P1136 [Adj Vltg TrimSel] with the trim voltage added or subtracted from the voltage reference.

The scalar frequency selection and scalar frequency ramp are the same components as used in all other control modes. The exception being the frequency command and ramp are decoupled from the voltage generation for the adjustable voltage control mode to provide an independent frequency ramp. Acceleration and deceleration rates and S Curve are the same as used in all other modes. Upper and lower limits are applied to the value of the output command frequency.

The adjustable voltage control voltage ramp provides an independent voltage ramp decoupled from the scalar frequency ramp and controlled by user selectable acceleration and deceleration ramp times. There is also an adjustable percent S Curve feature.

The current limit function reduces the output voltage when the current limit is exceeded. Minimum and maximum voltage limits are applied so the output voltage is never operated outside that range.

Adjustable Voltage Control Setup

The following examples of setups for the Adjustable Voltage Control mode are a starting point for configuration. Applications can be unique and require specific parameter settings. These examples are base case only.

Table 1 - Basic Adjustable Voltage Control Parameters

Parameter No.	Parameter Name	Setting	Description
35	Motor Ctrl Mode	9 "Adj VltgMode"	Adjustable Voltage feature is used in non-motor applications.
1131	Adj Vltg Config	1	1 = 3-Phase Operation, 0 = 1-Phase Operation
1133	Adj Vltg Select	Preset 1	
1134	Adj Vltg Ref Hi	100	Percent
1140	Adj Vltg AccTime	*n* Secs	Application dependent

Parameter No.	Parameter Name	Setting	Description
1141	Adj Vltg DecTime	*n* Secs	Application dependent
1142	Adj Vltg Preset1	*n* VAC	Application dependent
1153	Dead Time Comp	*n* %	Vary from 0% to 100%. Dead Time Comp is best set to 0% when output of the Sine wave Filter is fed into a transformer, to prevent or minimize DC Offset voltages.

Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, for parameter descriptions and defaults.

When using sine wave or dv/dt filters, the PWM frequency must match the filter design. The drive's thermal protection changes the PWM frequency if over temperature conditions are detected. Set P420 [Drive OL Mode] to option 1 "Reduce CLmt" and P38 [PWM Frequency] to the filter instructions.

Additional Parameter Changes

When using adjustable voltage control it is necessary to change additional parameters beyond the feature itself. Use this table to assist in setting these parameters.

Table 2 - Adjustable Voltage Applications Parameter Settings

Parameter No.	Parameter Name	Setting	Description
38	PWM Frequency	2 kHz or 4 kHz	Match the setting with filter tuning.
40	Mtr Options Cfg	Bit 5 = 0	Reflected wave is turned off so that there are no missing pulses in the output voltage waveform and to minimize any offsets that can appear.
		Bit 8 = 1	AsyncPWMLock is on because the filter is tuned to the carrier frequency. The carrier frequency must be fixed, if it changes the filter will not work. Also, set the PWM frequency match filter tuning, either 2 kHz or 4 kHz.
		Bit 9 = 1	PWM Freq Lock is on because the filter is tuned to the carrier frequency. The carrier frequency must be fixed, if it changes the filter will not work. Also, set the PWM frequency match filter tuning, either 2 kHz or 4 kHz.
		Bit 11 = 0	The "Elect Stab" bit affects angle stability and voltage stability. Angle stability gain is set for 0 so it does not compensate for the current going into the filter's caps. Voltage stability gain is set for 0 for the same reason.
		Bit 12 = 0	Transistor diagnostics is turned off because that sequence of turning transistors on and off charges the caps in the filter and can cause an IOC trip.
43	Flux Up Enable	0	Leave at the "Manual" setting.
44	Flux Up Time	Default	Leave at 0.0000 seconds.

Parameter No.	Parameter Name	Setting	Description
60	Start Acc Boost	0	Set if there are DC offset voltages at load transformer input windings.
61	Run Boost	0	
62	Break Voltage	0	
63	Break Frequency	0	
420	Drive OL Mode	1 "Reduce CLmt"	Drive OL mode is set for reduce current limit, and not the PWM frequency as it must remain fixed.
1154	DC Offset Ctrl	1 "Enable"	This turns off any offset control programmed in the firmware.

Modulation mode is default at space vector only because 2-phase modulation will degrade the filter's performance.

IMPORTANT Do not autotune.

Application Considerations

Whatever the device the user wants to connect to the drive by using the adjustable voltage feature, that device has some type of rating associated with it. As a minimum it needs to have a current rating and voltage rating. Drive selection is based on those ratings.

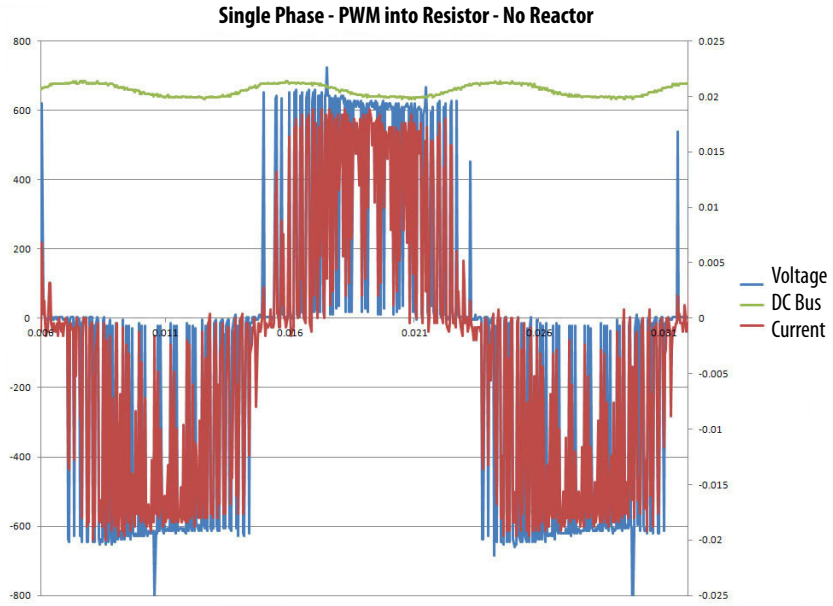
Sizing

First, consider the voltage rating of the drive. Determine what the available line voltage is and select a drive voltage rating to match. Next, select a drive that supplies the current necessary for the device's rating.

Single Phase Output

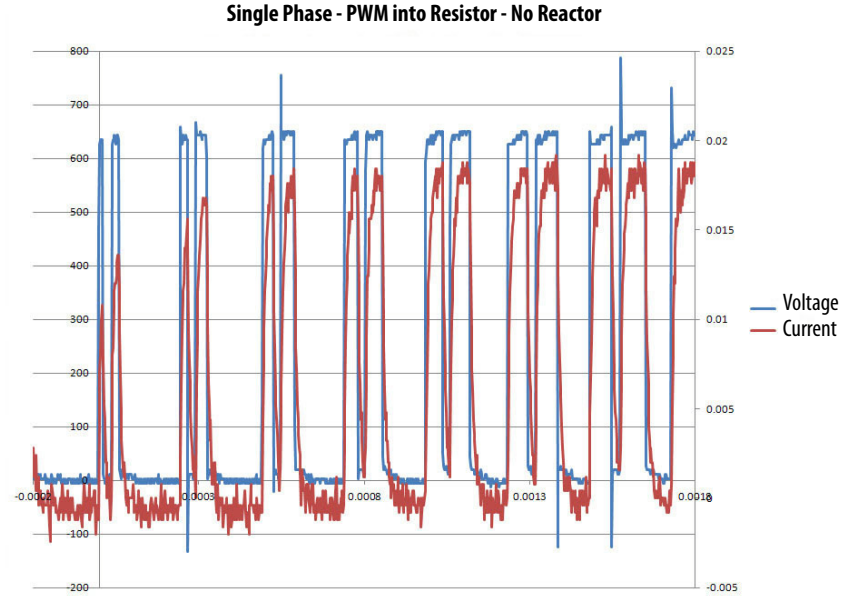
Consult Rockwell Automation before configuring a drive for single phase adjustable voltage output. Derating of the drive is necessary because of stress on the DC bus capacitor or the IGBT switching losses. When PWM is applied to a resistor, the current changes state following the voltage. For each PWM voltage pulse the current is pulsing the same way. This rapid change in current is not designed into the IGBT selection for the drive. Therefore, some sort of derating needs to be applied. Somewhere around 67% derating. When in this mode, actual losses must be measured to determine a derating percentage. Adding a reactor in series with the resistor can help by adding inductance and rounding off the corners of the current pulses. Depending on how much inductance is added, the waveform can look like a sine wave.

This is a plot showing output voltage, output current, and DC Bus voltage. Here you can see the current following the voltage in a typical PWM output.

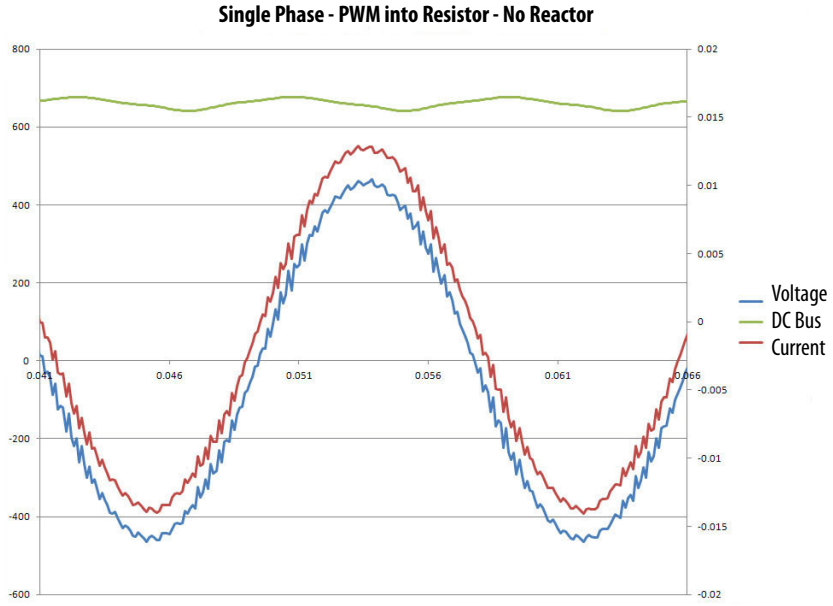


This plot enlarges some of the pulses to see the current and its shape.

Notice the tops have an abrupt change to them. Any rounding of the wave form at the top is due to the type of resistor used. The resistors used for this plot are the grid type resistors where the resistor element is coiled along its length, adding a certain amount of inductance. This inductance helps round over the leading edge of the current.



Below is the same plot with a reactor added in series. These waveform look like a sine wave and that is a function of how much inductance is added. However, the increased voltage drop must be accounted for.



Another option is to have a sine wave filter in the circuit. This lets unshielded cable to be used without the worry of PWM generated noise being injected into the facility. The cost of shielded cable versus a sine wave filter, Among other factors, has to be weighed.

When using single phase operation, connect the load to the U and V phases. The W phase is energized but is not used.

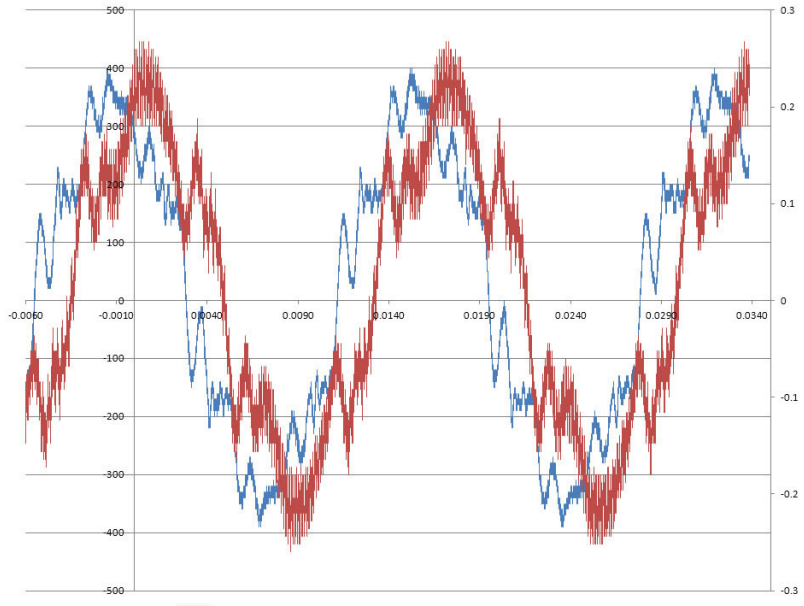
Enter your maximum current into the Motor NP Amps parameter. Also use this value in the Current Limit parameter. When started the drive attempts to ramp to the commanded voltage. If current limit is hit, the drive levels off or reduce the voltage to satisfy the current limit.

Notice the DC Bus voltage ripple in two of the plots above. If this ripple is high enough in magnitude, it can cause the drive to trip on an Input Phase Loss fault. This is due to the drive monitoring the bus ripple and if a certain delta between max volts and min volts exists for a certain amount of time, the drive assumes an input phase was lost. This fault can be disabled by setting P462 [InPhase LossActn] to option 0 “Ignore.”

Three Phase Output

If you are driving as resistive load, configure it in a three phase arrangement to avoid using the single phase mode of adjustable voltage. Use a sine wave filter to keep PWM off the resistors. If the resistors are of the ceramic type, it is possible to crack the resistor using PWM.

The following is a plot of voltage and current at the reactor. The output of the drive is sent through a sine wave filter then to the reactor. The shape of the waveform is determined by the amount of capacitance in the sine wave filter.



If you wanted to know what voltage you can expect at the three phase reactor, consider an example where the user has four reactors in series. The inductance of each is 1.2mH, 5mH, 5mH and 3mH. First item to calculate is XL for each reactor. .$XL = 2 \times pi \times f \times H$

$$XL1 = 2 \times pi \times 60 \times (1.2/1000) = 0.45ohm$$

$$XL2 = 2 \times pi \times 60 \times (5/1000) = 1.88ohm$$

$$XL3 = 2 \times pi \times 60 \times (5/1000) = 1.88ohm$$

$$XL4 = 2 \times pi \times 60 \times (3/1000) = 1.13ohm$$

Now total it. XL1 + XL2 + XL3 + XL4 = 5.35 ohm.

For a three phase reactor the current is represented by the equation,$I = V/(XL \times \sqrt{3})$

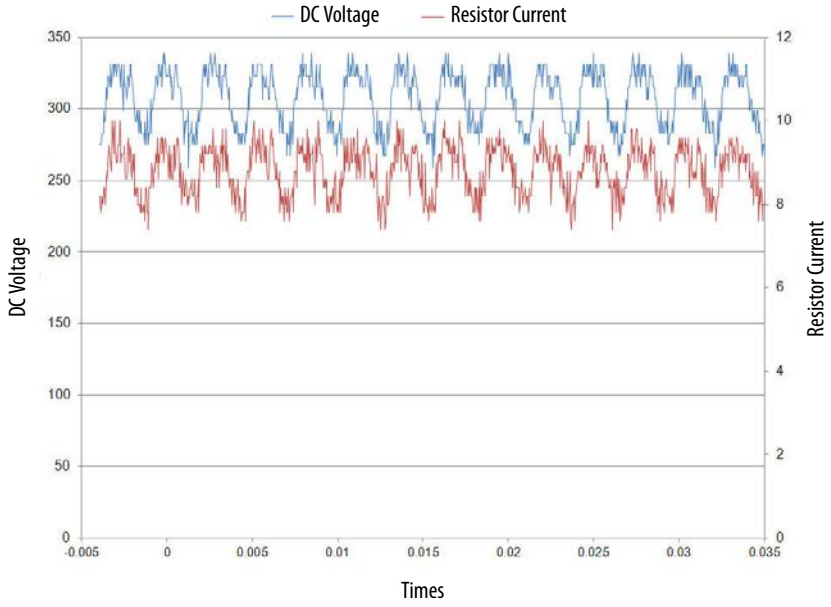
Isolate the voltage. $V = I \times XL \times \sqrt{3}$

The current value can be what the least rating of the reactors are or if the rating are greater than the drive rating, use the drive rating. In this case the drive is rated for 14 amps.

So plug in the numbers. $V = 14 \times 5.35 \times 1.73 = 129.8$

So 14 amps is realized when the voltage is 129.8 on the output. A drive with a voltage rating of 240V AC could be selected.

Below is a waveform of voltage and current at a resistor. The output of the drive runs through a sine wave filter. Then this is connected to a one to one transformer. This output is then sent to a bridge rectifier giving us pure DC. With the use of a feedback board and the drives PI loop, the voltage at the resistor was steady even if the resistance changed while running.



Other

Setting the frequency acceleration time to zero results in the drive outputting a DC voltage waveform.

If the frequency accel time is set between 0 and 1, this could trigger and anomaly where the drive outputs a frequency not equal to the commanded frequency. The

cause of this anomaly is the introduction of the jerk function. This bit needs to be off during this condition.

MOTOR CONTROL — Mtr Ctrl Options

40 **Mtr Options Cfg** — RW — 32-bit Integer

Motor Options Configuration

Configuration of motor control-related functions. For motors above 200 Hz, a carrier frequency of 8 kHz or higher is recommended. Consider drive derate and motor lead distance restrictions.

Options	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Jerk Select	Not Used	Common Mode	Xsistor Diag	Elect Stab	DB WhileStop	PWM FreqLock	AsyncPWMLock	PWM Type Sel	RS Adaption	Reflect Wave	Mtr Lead Rev	EnclsTrqProv (1)	Trq ModeJog	Trq ModeStop	Zero TrqStop
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	1	1	1	0	0	1	1	1
Bit	32	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(1) 755 drives only.

When using single phase operation, connect the load to the U and V phases. The W phase is energized but is not used.

Using a DC output can result in thermal issues. The drive may need to be derated.

Investigate Possible Derating

Derate drive for sine wave filter.

Motor or drive overload is not affected by adjustable voltage mode.

Auto Restart

The Auto Restart feature provides the ability for the drive to automatically perform a fault reset followed by a start attempt without user or application intervention. Provided the drive has been programmed with a 2 wire control scheme and the Run signal is maintained. This enables remote or unattended operation. Only certain faults are allowed to be reset. Faults listed as Non-Resettable in the programming manual indicate possible drive component malfunction and are not resettable.

Use caution when enabling this feature, because the drive attempts to issue its own start command based on user selected programming.

Configuration

Setting P348 [Auto Rstrt Tries] to a value greater than zero enables the Auto Restart feature. Setting the number of tries equal to zero disables the feature.

ATTENTION: Equipment damage and/or personal injury may result if this parameter is used in an inappropriate application. Do not use this function without considering applicable local, national and international codes, standards, regulations or industry guidelines.

P349 [Auto Rstrt Delay] sets the time, in seconds, between each reset/run attempt.

The auto reset/run feature supports the following status information.

- P936 [Drive Status 2] Bit 1 "AuRstrCntDwn" provides indication that an Auto Restart attempt is presently counting down and the drive attempts to start at the end of the timing event.
- P936 [Drive Status 2] Bit 0 "AutoRstr Act" indicates that the auto restart has been activated.

Operation

The typical steps performed in an Auto Reset/Run cycle are as follows.

1. The drive is running and an Auto Reset Run fault occurs, thus initiating the fault action of the drive.
2. After the number of seconds in P349 [Auto Rstrt Delay], the drive automatically performs an internal Fault Reset, resetting the faulted condition.
3. The drive then issues an internal Start command to start the drive.
4. If another Auto Reset Run fault occurs, the cycle repeats itself up to the number of attempts set in P348 [Auto Rstrt Tries].
5. If the drive faults repeatedly for more than the number of attempts set in P348 [Auto Rstrt Tries] with less than five minutes between each fault, the Auto Reset/Run is considered unsuccessful and the drive remains in the faulted state.
6. If the drive remains running for five minutes or more because the last reset/run without a fault, or is otherwise stopped or reset, the Auto Reset/Run is considered successful. The Auto Restart status parameters are reset, and the process repeats if another auto resettable fault occurs.

   See Aborting an Auto-Reset/Run Cycle for information on how the Reset/Run cycle can be aborted.

Beginning an Auto-Reset/Run Cycle

The following conditions must be met when a fault occurs for the drive to begin an Auto Reset/Run cycle:

- The fault type must be Auto Reset Run.
- P348 [Auto Rstrt Tries] setting must be greater than zero.
- The drive must have been running, not jogging, not auto tuning, and not stopping, when the fault occurred. (A DC Brake state is part of a stop sequence and therefore is considered stopping.)

Aborting an Auto-Reset/Run Cycle

During an Auto Reset/Run cycle the following actions/conditions abort the reset/run attempt process.

- A stop command is issued from any source. (Removal of a 2-wire run-fwd or run-rev command is considered a stop assertion.)
- A fault reset command is issued from any source.
- The enable input signal is removed.
- P348 [Auto Rstrt Tries] is set to zero.
- A Non-Resettable fault occurs.
- Power to the drive is removed.
- The Auto Reset/Run Cycle is exhausted.

After all [Auto Rstrt Tries] have been made and the drive has not successfully restarted and remained running for five minutes or more, the Auto Reset/Run cycle is considered exhausted and therefore unsuccessful. In this case the Auto Reset/Run cycle terminates and an F33 "AuRsts Exhaust" fault is indicated by P953 [Fault Status B] Bit 13 "AuRstExhaust."

Auto/Manual

The purpose of the Auto/Manual function is to permit temporary override of speed control and/or exclusive ownership of logic (start, run, direction) control. A manual request can come from any port, including HIM, digital input or other input module. However, only one port can own manual control and must release the drive back to auto control before another port can be granted manual control. When in Manual mode, the drive receives its speed reference from the port that requested manual control, unless otherwise directed by the Alternate Manual Reference Select.

The HIM can request Manual control by pressing the Controls key followed by the Manual key. Manual control is released by pressing the Controls key followed by Auto. When the HIM is granted manual control, the drive uses the speed reference in the HIM. If desired, the auto speed reference can be automatically preloaded into the HIM when entering HIM manual control, so that the transition is smooth.

Manual control can also be requested through a digital input. To do this, a digital input has to be set to request Manual control through P172 [DI Manual Ctrl]. Digital Input Manual control requests can be configured to use their own alternative speed reference to control the drive. Digital inputs can also be used in conjunction with Hand-Off-Auto Start to create a three way HOA switch that incorporates Manual mode.

The Safe Speed Monitor Option Module uses Manual mode to control the speed of the drive when entering Safe Limited Speed monitoring.

Auto/Manual Masks

The port configuration of the Auto/Manual feature is performed through a set of masks. Together, these masks set which ports can control the speed and/or logic control of the drive as well as which ports can request Manual control. The masks are configured by setting a 1 or 0 in the bit number that corresponds to the port (Bit 1 for port 1, Bit 2 for port 2, and so forth). Digital Inputs are always configured through Bit 0, regardless of what port the module physically resides in. If both [Manual Ref Mask] and [Manual Cmd Mask] for a particular port are set to 0, that port is unable to request manual control.

P324 [Logic Mask]
Logic Mask enables and disables the ports from issuing logic commands (such as start and direction) in any mode. Stop commands from any port are not masked and still stop the drive.

P325 [Auto Mask]
Auto Mask enables and disables the ports from issuing logic commands (such as start and direction) while in Auto mode. Stop commands from any port are not masked and still stop the drive.

P326 [Manual Cmd Mask]
Manual Command Mask enables and disables the ports from exclusively controlling logic commands (such as start and direction) while in Manual mode. If a port assumes Manual control, and the corresponding bit for the port in the [Manual Cmd Mask] is set, no other port is able to issue logic commands. Stop commands from any port are not masked and still stops the drive.

P327 [Manual Ref Mask]
Manual Reference Mask enables and disables the ports from controlling the speed reference while in Manual mode. If a port assumes manual control, and the corresponding bit for the port in the [Manual Ref Mask] is set, the drive is commanded to the speed reference from that port. An alternate speed reference can be commanded using P328 [Alt Man Ref Sel]. If the respective bit for the manual control port is not set, then the drive follows its normal automatic speed reference, even in Manual mode.

Alternate Manual Reference Select

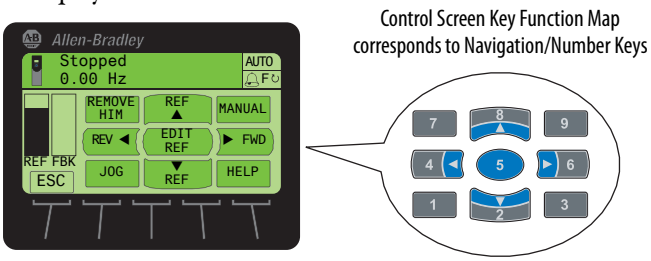
By default, the speed reference used in Manual mode comes from the port that requested manual control (For example, if a HIM in port 1 requests manual control, the speed reference in Manual mode comes from port 1). If instead it is desired to use an a different speed reference, P328 [Alt Man Ref Sel], can be used. The port selected in the parameter is used for manual reference regardless of which port requested manual control, as long as the port in manual control is allowed to set the manual reference per P327 [Manual Ref Mask]. If P328 [Alt Man Ref Sel] is an analog input, the maximum and minimum speeds can be configured through P329 [Alt Man Ref AnHi] and P330 [Alt Man Ref AnLo].

For analog input between the minimum and maximum, the drive derives the speed from these parameters through linear interpolation.

The P328 [Alt Man Ref Sel] manual reference overrides all other manual speed references, including P563 [DI ManRef Sel].

HIM Control

Manual Control can be requested through an HIM device attached to port 1, 2, or 3. The proper bits must be set in the masks (P324 [Logic Mask], P326 [Manual Cmd Mask], and P327 [Manual Ref Mask]) for the port that the HIM is attached. To request control through the HIM, press the (Controls) key to display the Control screen.

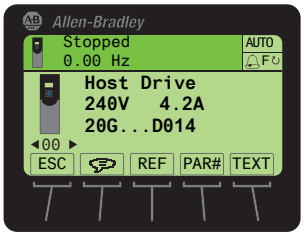


Press the 9 (Manual) key.

Press the 5 (Edit) key to confirm that you want to switch to Manual mode.

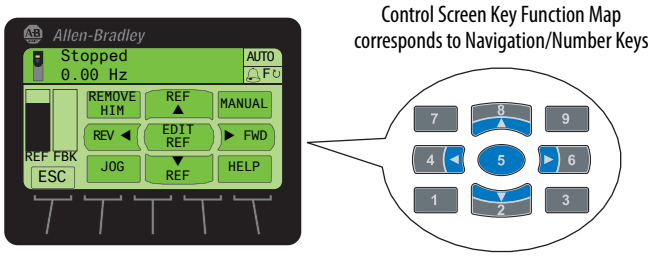
If the request is accepted, the HIM displays “MAN” in the top right corner. The display does not indicate if the drive is in Manual, but rather if that particular HIM has Manual control. A HIM still displays “AUTO” if it does not have ownership of the Manual mode, even if the drive itself is in Manual mode. To see if the drive is in Manual mode, check P935 [Drive Status 1] Bit 9.

When a HIM has Manual control of the drive, the drive uses the speed reference from the HIM unless overridden by P328 [Alt Man Ref Sel]. To change the speed reference on the HIM, navigate to the Status screen and press the middle soft key labeled REF.



If the request is not accepted, a message indicates that "Manual Control is not permitted at this time." The most likely causes are that manual control is disabled for the port or that another port currently has manual control. To check which port has manual control, look at P924 [Manual Owner].

To release Manual mode from the HIM, press the (Controls) key to display the Control screen.

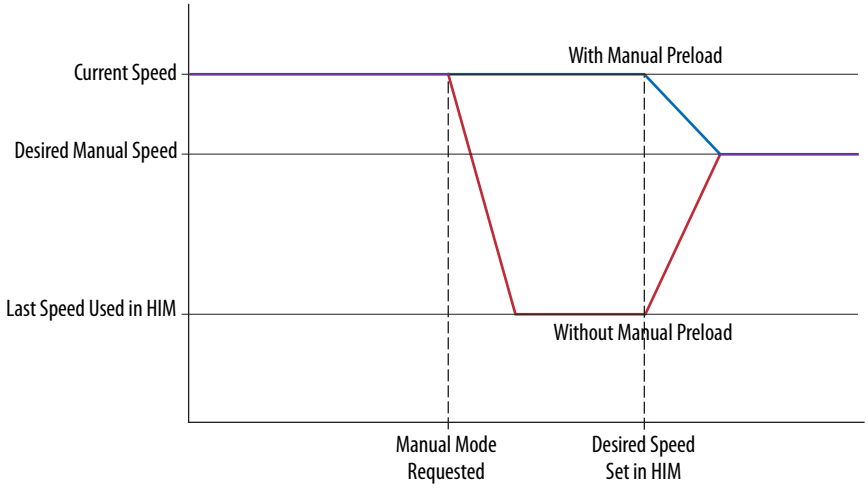


Press the 9 (Auto) key.

Press the 5 (Edit) key to confirm that you want to switch to Auto mode.

HIM Preload

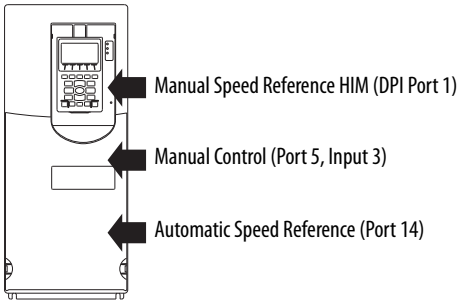
Before taking a manual control speed reference from a HIM, the drive can preload its current speed into the HIM to provide a smooth transition. Without this feature, the drive immediately transitions to whatever speed was last used in the HIM, before the operator has a chance to make their adjustment. With this feature, the drive maintains its current speed until the operator sets the speed to the desired manual reference.



The Auto/Manual HIM Preload is configured through P331 [Manual Preload]. Ports 1, 2, and 3 can be configured to have the speed reference preloaded into the HIM by setting bits 1, 2, and 3 respectively.

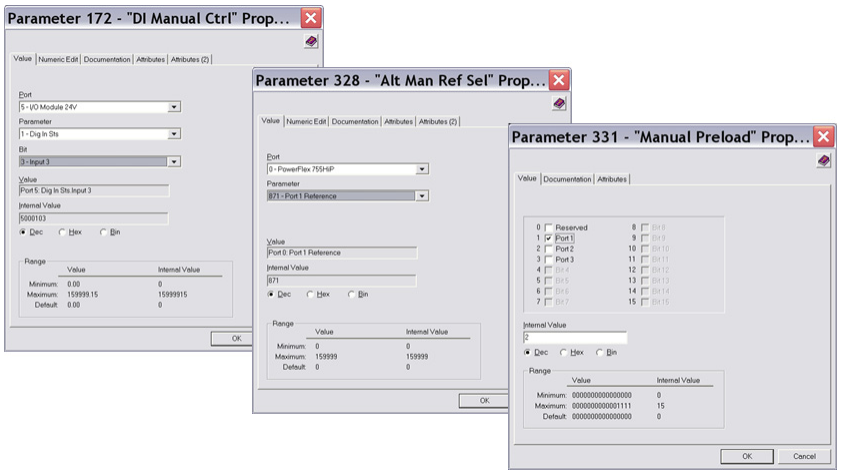
Example Scenario

The drive has a HIM in port 1 and a 24V DC I/O module in port 5. You want to select manual control from a digital input 3 on the I/O module. You want the embedded EtherNet/IP port to be the source for the speed reference in Automatic mode, and the HIM to be the source for the speed reference in Manual mode.



Required Steps

1. Set P172 [DI Manual Ctrl] to Port 5-I/O Module > 1-Dig In Sts > 3 – Input 3.
2. Set P328 [Alt Man Ref Sel] = 871 Port 1 Reference 3. Set P331 [Manual Preload] = 0000 0000 0000 0010, Bit 1 enables the preloading of the speed feedback value to the HIM at port 1 when the HIM is granted manual control.



Digital Input Control

A Digital Input can be configured to request manual control through P172 [DI Manual Ctrl]. When setting up the Auto/Manual masks, digital inputs are configured through Bit 0, regardless of what port the module physically resides in.

A speed reference for Manual mode from a digital input can be set by selecting a port in P328 [Alt Man Ref Sel]. This however causes all manual requests to use that port as a reference, whether the request was from the digital input or from a HIM. A separate manual reference port for use only when the request comes from a digital input can be configured through P563 [DI ManRef Sel]. (To see P564 [DI ManRef AnlgHi], set P301 [Access Level] to 1 "Advanced.") If P328 [Alt Man Ref Sel] is configured, it overrides P563 [DI ManRef Sel] and provides the manual reference.

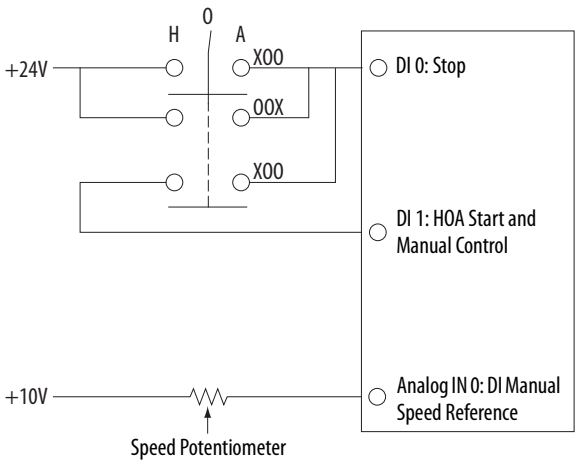
If P563 [DI ManRef Sel] is an analog input, the maximum and minimum speeds can be configured through P564 [DI ManRef AnlgHi] and P565 [DI ManRef AnlgLo]. For analog input between the minimum and maximum, the drive derives the speed from these parameters through linear interpolation.

Hand-Off-Auto

The Auto/Manual feature can be used in conjunction with a Hand-Off-Auto Start to create a H-O-A switch that starts the drive and requests manual control at the same time, allowing for a local speed reference to control the drive. See Hand-Off-Auto on page 64 for more details on the Hand-Off-Auto Start feature.

In the circuit below, a speed potentiometer was added to the analog input to provide a speed reference to the drive. When the H-O-A switch is moved from Auto to Hand, the digital input block requests manual control and issues a start command to the drive. If the digital input port receives manual control, the drive accelerates to the reference speed from the analog input. All attempts to change the speed except from the analog input are blocked. If the drive is stopped while in Hand, switch the H-O-A switch to Off and then back to Hand to restart the drive.

If another port has manual control of the drive, but does not have exclusive ownership of the logic commands (due to P326 [Manual Cmd Mask]), turning the switch to Hand causes the drive to begin moving but for the analog input to have no control over the speed.



For this circuit, set the following parameters (P301 [Access Level] must be set to 1 “Advanced” to see P563 [DI ManRef Sel]).

Number	Parameter Name	Value
158	DI Stop	Digital Input 0
172	DI Manual Ctrl	Digital Input 1
176	DI HOA Start	Digital Input 1
324	Logic Mask	xxxxxxxxxxxxxx1 (Digital In)
326	Manual Cmd Mask	xxxxxxxxxxxxxx1 (Digital In)
327	Manual Ref Mask	xxxxxxxxxxxxxx1 (Digital In)
563	DI ManRef Sel	Anlg In0 Value

The drive requests Manual mode, start, and tracks the reference speed coming from the Analog Input when the H-O-A switches to Hand. (The HIM still reads Auto. This display changes only when the HIM has control of Manual mode).

Safe Limited Speed

Safe Limited Speed through the PowerFlex Safe Speed Monitor option module uses Manual mode to control the speed of the drive. When Safe Limited Speed monitoring is enabled, the safety module requests manual control of the drive. If the drive does not reach a safe speed, as defined on the option module by P55 [Safe Speed Limit] and within P53 [LimSpd Mon Delay], the drive faults.

While the option module uses the Manual mode, it has no way to provide a speed reference or start the drive. The following parameters must thus be configured.

P326 [Manual Cmd Mask]
Turn off the bit corresponding to the safety option’s port to allow modules installed in other ports to continue to control the drive when it is operating in Manual mode. For example, if the safety option is installed in port 6, then turn off Bit 6 in this parameter.

P327 [Manual Ref Mask]
Turn on the bit corresponding to the safety option’s port to allow the safety option to command the drive to use its Manual Speed Reference when it is operating in Manual mode. For example, if the safety option is installed in port 6, then turn on Bit 6 in this parameter.

P328 [Alt Man Ref Sel]
Set this parameter to select the desired speed reference when the drive is operating in Manual mode. For example, set this parameter to the value Port 0: Preset Speed 1 to configure the drive to use P571 [Preset Speed 1] as the Manual Speed Reference. In this case, P571 [Preset Speed 1] must be less than P55 [Safe Speed Limit] in the safety option to avoid causing an SLS Speed Fault.

See the Safe Speed Monitor Option Module for PowerFlex 750-Series AC Drives Safety Reference Manual, publication 750-RM001, for more information.

Automatic Device Configuration

Automatic Device Configuration (ADC) supports the automatic download of configuration data to a Logix controller that has an EtherNet/IP connection to a PowerFlex 755 drive (firmware 4.001 or later) and its associated peripherals ADC is supported in the following:

- RSLogix 5000 software, version 20 or later
- Studio 5000 environment, version 21 or later

Project files (.ACD files) created with this software contain the configuration settings for PowerFlex drives in the project. When the project is downloaded to the controller, the configuration settings are transferred to controller memory. Earlier programming software required a manual process to download configuration settings to the controller.

ADC can also work in tandem with Firmware Supervisor. If Firmware Supervisor is set up and enabled for a drive (Exact Match keying must be used), the drive/peripheral is automatically upgraded (if necessary) prior to any ADC operation for that port.

Information on Automatic Device Configuration (ADC) can be found in the PowerFlex 755 Embedded EtherNet/IP Adapter User Manual, publication 750COM-UM001, Chapter 4, Configuring the I/O includes the following topics:

- Description of the ADC functionality
- How the Drive Add-On Profiles (AOPs) affect ADC
- Configuring a PowerFlex 755 Drive (firmware 4.001 or later) for ADC
- ADC and Logix Memory
- Storing the Drive's and Peripherals' Firmware in the Logix Controller (Firmware Supervisor)
- Special Considerations When Using a DeviceLogix software Program
- Special Considerations When Using a 20-750-S1 Safe Speed Monitor Module
- Monitoring the ADC Progress
- Examples of potential issues and solutions

Autotune

The Autotune feature is used to measure motor characteristics. The Autotune feature is made up of several individual tests, each of which is intended to identify one or more motor parameters. These tests require motor nameplate information to be entered into the drive parameters. Although some of the parameter values can be changed manually, measured values of the motor parameters provide the best performance. Each motor control mode requires its own set of tests to be performed. The information obtained from these measurements is stored in the drives non volatile memory for use during operation of the drive. The feature lets these tests to be separated into tests that don't require motor rotation (Static Tune), all tests within the selected control mode (Rotate Tune), or if the control mode requires the Inertia (Inertia Tune).

The Autotune tests are selected through the P70 [Autotune]. The feature provides a manual or automatic method for setting P73 [IR Voltage Drop], P74 [Ixo Voltage Drop] and P75 [Flux Current Ref]. Valid only when P35 [Motor Ctrl Mode] is set to 1 "Induction SV," 2 "Induct Econ," or 3 "Induction FV."

Other motor control modes such as Permanent Magnet and Interior Permanent magnet, populate other parameters associated with those control modes. See the autotune parameter set below.

Tests

Four Autotune selections are available in the PowerFlex 755 drive control. All four selections are selected from the Autotune parameter.

P70 [Autotune]

- 0 = Ready
- 1 = Calculate
- 2 = Static Tune
- 3 = Rotate Tune
- 4 = Inertia Tune

Ready

Parameter returns to this setting following a Static Tune or Rotate Tune, at which time another start transition is required to operate the drive in Normal mode. It also permits manually setting P73 [IR Voltage Drop], P74 [Ixo Voltage Drop], and P75 [Flux Current Ref].

Calculate

When the Autotune parameter is set to Calculate (default), the drive uses motor nameplate data to automatically set P73 [IR Voltage Drop], P74 [Ixo Voltage Drop], P75 [Flux Current Ref] and P621 [Slip RPM at FLA].

P73 [IR Volt Drop], P87 [PM IR Voltage], P79 [Encdrlss VltComp], P74 [Ixo Voltage Drop], P75 [Flux Current Ref], P93 [PM Dir Test Cur], and the Slip Frequency parameters are updated based on nameplate parameter values. When a nameplate parameter value is changed, the Autotune parameters are updated based on the new nameplate values.

When using Calculate, updated values come from a lookup table.

Static Tune

When the Autotune parameter is set to Static, only tests that do not create motor movement are run. A temporary command that initiates a non-rotational motor stator resistance test for the best possible automatic setting of P73 [IR Voltage Drop] in all valid modes and a non-rotational motor leakage inductance test for the best possible automatic setting of P74 [Ixo Voltage Drop] in a Flux Vector (FV) mode. A start command is required following initiation of this setting. Used when motor cannot be rotated.

Rotate Tune

The actual tests performed when Static and Rotate Tune selections are made, differ for the available motor control modes, Feedback Type and motor type selected. The tests performed are dependent on the settings of P35 [Motor Ctrl Mode], P125 [Pri Vel Fdbk Sel], and P70 [Autotune]. The parameters that are updated are then dependent on the tests run and in some cases calculated values for some parameters are used to update other parameters. Refer to Table 3.

A temporary command initiates a Static Tune and is then followed by a rotational test for the best possible automatic setting of P75 [Flux Current Ref]. In Flux Vector (FV) mode, with encoder feedback, a test for the best possible automatic setting of P621 [Slip RPM at FLA] is also run. A start command is required following initiation of this setting.

IMPORTANT	If using rotate tune for a Sensorless Vector (SV) mode, uncoupled the motor from the load or results can be invalid. With a Flux Vector (FV) mode, either a coupled or uncoupled load produces valid results. Caution must be used when connecting the load to the motor shaft and then performing an autotune. Rotation during the tune process can exceed machine limits.

Table 3 - Autotune Value Source

Control Mode	Motor Type	Feedback Select	Autotune	Rs	Xo	Idlt	Rslt	Id	Rsld	Slip	Encrls	Cemf	PmOffset

Inertia Tune

The Inertia Autotune selection involves only one test. Several parameters are updated from the test results. Refer to the tables in the Individual Tests section.

A temporary command initiates an inertia test of the motor/load combination. The motor ramps up and down while the drive measures the amount of inertia. This option applies only to FV modes selected in P35 [Motor Ctrl Mode]. Obtain final test results with the load coupled to the motor as long as the rotation won't damage the machine.

Test Dependencies

When running the flux test, the selected accel rate is used unless it is less than 10 seconds. In this case, 10 seconds is forced. In the case of the Inertia test, a 0.1 second accel rate is used. The selected direction used during normal operation is used for all rotation tests. Also, during any rotate test, the normal speed limits are enforced.

The thermal manager is always being run in the 2 ms loop, which provides protection during all of the Autotune tests.

Individual Tests

Some of the following tests are executed during an Autotune.

Resistance Test

This test is a Static test whether Static or Rotate is selected. Used to measure Stator resistance.

Inductance Tests

This test is a Static test whether Static or Rotate is selected. One test is used for Induction motors and a another is used for PM motors. The result from the Induction test is placed into the Ixo parameter and the PM test is placed into the IXd and IXq parameters.

Flux Test

This test is a Rotate test that measures the current under a no load condition. The results are used for the flux current. If a Static test is used, the resulting value is from a lookup table.

Slip Test

This test is a Rotate test that measures the difference between the rotor speed and the stator speed. This measurement is taken during acceleration.

PM Offset Test

This test can create a small amount of motor movement so it needs to be performed with the Rotate selection. The test reads the encoder position when the drive outputs zero hertz.

Inertia Test

This test is a stand alone test that is used to measure the system inertia.

The drive sets this value in P76 [Total Inertia] as seconds of inertia. This reflects the time it takes to accelerate the load at 100% torque to base speed. This information can be very useful in determining the total inertia (in lb•ft^2) that is connected to a motor shaft.

Using the following formula, $Tacc = \frac{WK^2 \times \Delta N}{308(t)}$

and rearranging it to $WK^2 = \frac{Tacc \times 308 \times (t)}{\Delta N}$

we have a formula that isolates the connected inertia.

For the variables, Tacc is the 100% rating of the drive in lb•ft. Let's say I'm using a 10 Hp drive with a 10 Hp motor. We can rearrange the Horsepower formula below to solve for torque in lb•ft.

My motor is 10hp, 1785RPM, $HP = \frac{T \times Speed}{5252}$

and rearranging it to $T = \frac{HP \times 5252}{Speed}$

So let's plug in the numbers. $T = \frac{10 \times 5252}{1785}$ T = lb•ft

And (t) comes from what the drive reports as seconds of inertia after running the inertia tune. Let's say that the drive reported 2.12 seconds of inertia. And now organizing the variables we have

Tacc = 29.42
(t) = 2.12
N = 1785

plugging these into the formula, $WK^2 = \frac{Tacc \times 308 \times (t)}{\Delta N}$ $WK^2 = 10.76$

After these calculations, one can conclude that the connected inertia is equal to 10.76 lb•ft^2. Multiplying by 0.04214011 you get 0.453 kg•m^2.

What effect can P71 [Autotune Torque] have on these calculations? Regardless of the value entered here, the drive interpolates as if this value was 100%. So the seconds of inertia reported by the drive always reflects 100% torque.

CEMF Test

This is a Rotate test used to measure a PM motors CEMF.

Autotune Parameters Information about some other Autotune Parameters not covered above.

Autotune Parameters

P71 [Autotune Torque]
Typically the default value of 50% is sufficient for most applications. You have the option of increasing this value or decreasing the value.

P73 [IR Voltage Drop]
The voltage drop due to resistance.

P74 [Ixo Voltage Drop]
The voltage drop due to Inductance.

P75 [Flux Current Ref]
The current necessary to flux up the motor. This value come from a lookup table for Static tunes and is measured during a Rotate tune. Obviously a rotate tune gives more accurate results.

P76 [Total Inertia]
Reported as seconds of inertia. See description above.

P77 [Inertia Test Lmt]
A number entered in this parameter limits the inertia tune test to a maximum number of revolutions. If violated, the drive faults on F144 "Autotune Inertia." Also, when a value is entered and the drive determines that the number of revolutions will be exceeded it goes into a decel and stops before the value is exceeded.

P78 [Encdrlss AngComp] and **P79 [Encdrlss VltComp]**
These parameters are valid only for Flux Vector motor control mode and open loop. P78 is populated only by a rotate tune. P79 is populated by a Static measurement.

P80 [PM Cfg]
This configuration parameter enables certain tests to be performed based on the motor connected.

Permanent Magnet Motors

Parameters P81 through P93 and P120 are all populated by an autotune when the motor selected is permanent magnet. The value for these parameters are determined only by a rotate tune.

Interior Permanent Magnet Motors

Parameters P1630 through P1647 are all populated by an autotune when the motor selected is interior permanent magnet. The value for these parameters are determined only by a rotate tune.

Auxiliary Power Supply

The optional Auxiliary Power Supply module, 20-750-APS, is designed to provide power to a single drive's control circuitry in the event incoming supply power to the drive is removed or lost.

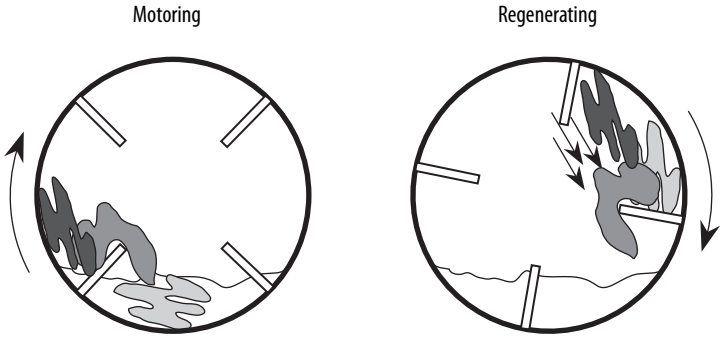
When connected to a user supplied 24V DC power source, the communication network functions remain operational and on-line. A DeviceNet program can also continue to run and control any associated input and outputs.

The auxiliary power supply module is designed to power all peripherals, I/O, and connected feedback devices.

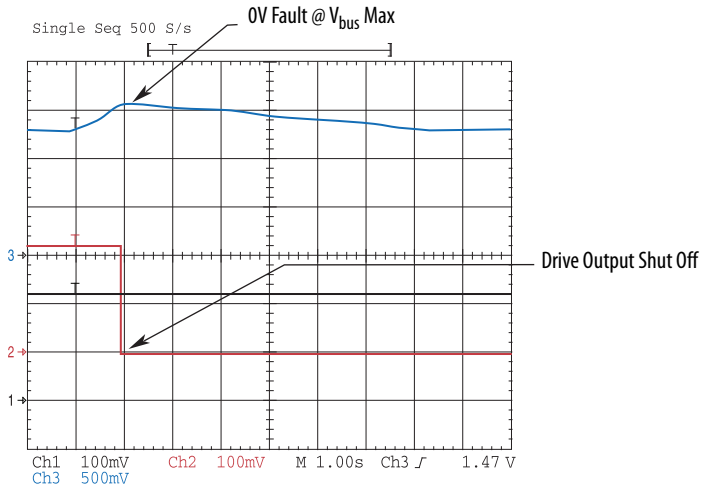
Bus Regulation

Some applications create an intermittent regeneration condition. The following example illustrates such a condition. The application is hide tanning, in which a drum is partially filled with tanning liquid and hides. When the hides are being lifted (on the left), motoring current exists. However, when the hides reach the top and fall onto a paddle, the motor regenerates power back to the drive, creating the potential for an overvoltage fault.

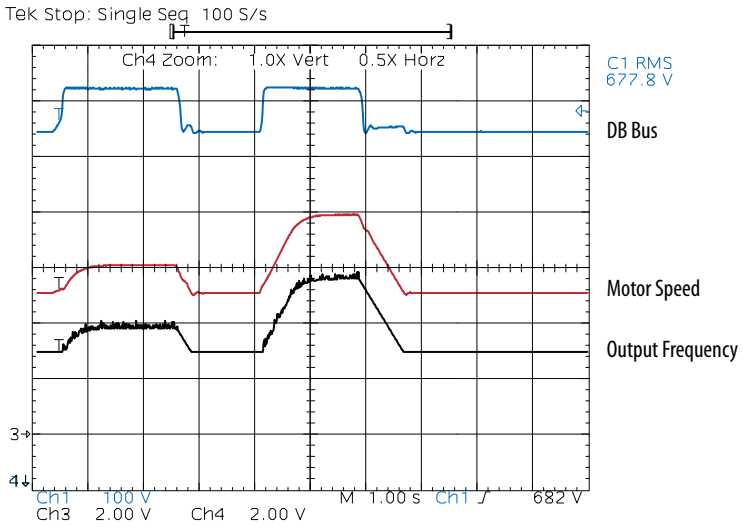
When an AC motor regenerates energy from the load, the drive DC bus voltage increases unless there is another means, of dissipating the energy, such as a dynamic braking chopper/resistor, or the drive takes some corrective action prior to the overvoltage fault value.



With bus regulation disabled, the bus voltage can exceed the operating limit and the drive faults to protect itself from excess voltage.



With bus regulation enabled, the drive can respond to the increasing voltage by advancing the output frequency until the regeneration is counteracted. This keeps the bus voltage at a regulated level below the trip point.



The bus voltage regulator takes precedence over acceleration/deceleration.

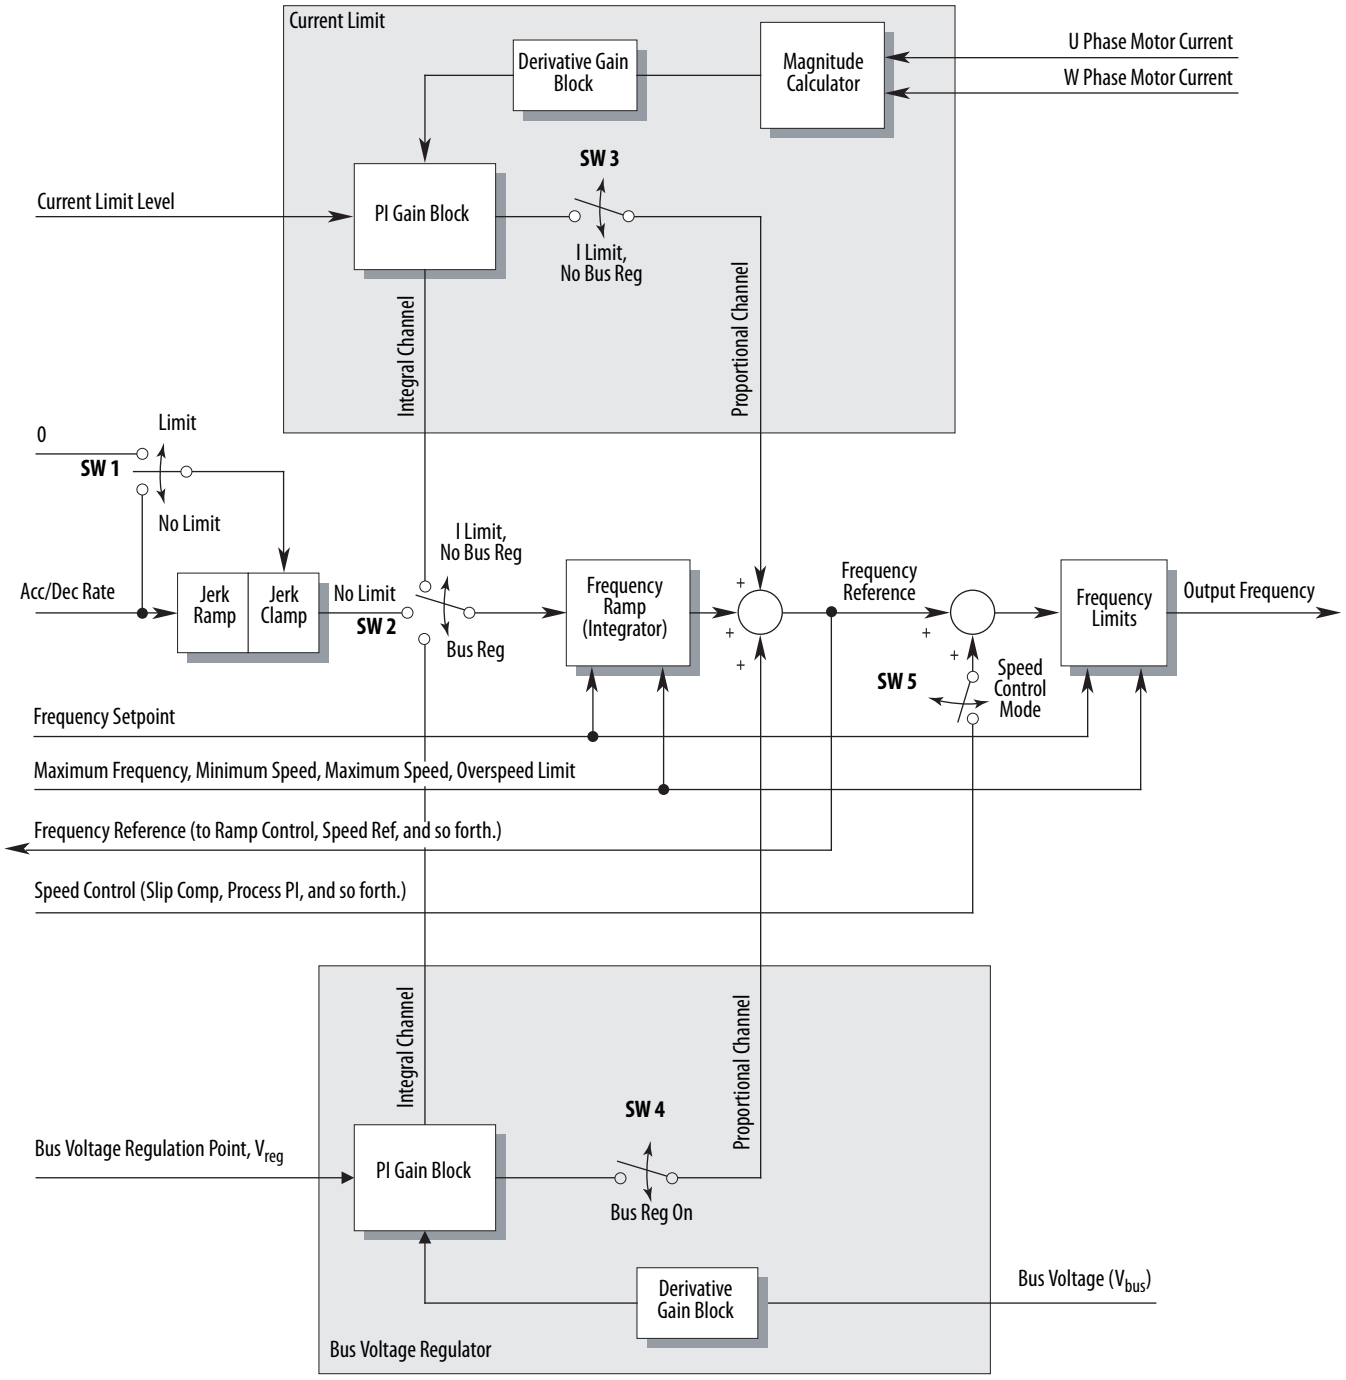
Select bus voltage regulation in the Bus Reg mode parameter.

Operation

Bus voltage regulation begins when the bus voltage exceeds the bus voltage regulation setpoint V_{reg} and the switches shown in Figure 1 move to the positions shown.

	SW 1	SW 2	SW 3	SW 4	SW 5
Bus Regulation	Limit	Bus Reg	Open	Closed	Don't Care

Figure 1 - Bus Voltage Regulator, Current Limit, and Frequency Ramp



The derivative term senses a rapid rise in the bus voltage and activates the bus regulator prior to actually reaching the bus voltage regulation setpoint V_{reg}. The derivative term is important because it minimizes overshoot in the bus voltage when bus regulation begins thereby attempting to avoid an overvoltage fault. The integral channel acts as the acceleration or deceleration rate and is fed to the frequency ramp integrator. The proportional term is added directly to the output of the frequency ramp integrator to form the output frequency. The output frequency is then limited to a maximum output frequency.

ATTENTION: The "adjust freq" portion of the bus regulator function is extremely useful for preventing nuisance overvoltage faults resulting from aggressive decelerations, overhauling loads, and eccentric loads. It forces the output frequency to be greater than commanded frequency while the drive's bus voltage is increasing towards levels that would otherwise cause a fault. However, it can also cause either of the following two conditions to occur.

1. Fast positive changes in input voltage (more than a 10% increase within 6 minutes) can cause uncommanded positive speed changes. However an "OverSpeed Limit" fault occurs if the speed reaches [Max Speed] + [Overspeed Limit]. If this condition is unacceptable, take action to 1) limit supply voltages within the specification of the drive and, 2) limit fast positive input voltage changes to less than 10%. If this operation is unacceptable and the necessary actions cannot be taken, the "adjust freq" portion of the bus regulator function must be disabled (see parameters 372 and 373).

2. Actual deceleration times can be longer than commanded deceleration times. However, a "Decel Inhibit" fault is generated if the drive stops decelerating altogether. If this condition is unacceptable, the "adjust freq" portion of the bus regulator must be disabled (see parameters 372 and 373). In addition, installing a properly sized dynamic brake resistor provides equal or better performance in most cases. **Important**: These faults are not instantaneous. Test results have shown that they can take between 2…12 seconds to occur.

Bus Regulation Modes

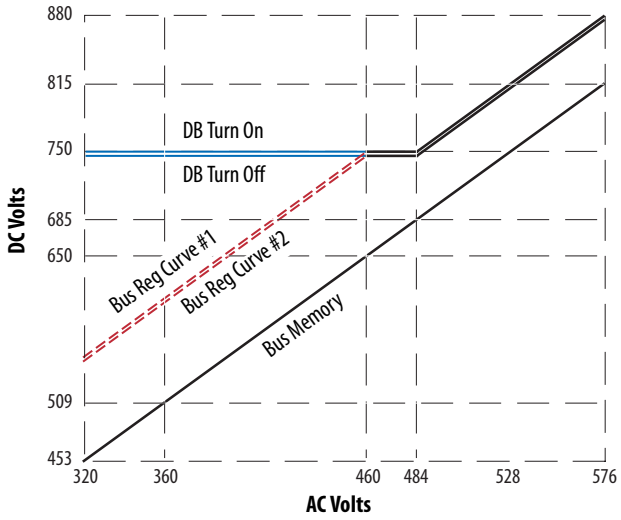
The drive can be programmed for one of five different modes to control the DC bus voltage:

- Disabled
- Adjust Frequency
- Dynamic Braking
- Both with Dynamic Braking first
- Both with Adjust Frequency first

P372 [Bus Reg Mode A] is the mode normally used by the drive unless the "DI BusReg Mode B" digital input function is used to switch between modes instantaneously, in which case P373[Bus Reg Mode B] becomes the active bus regulation mode.

The bus voltage regulation setpoint is determined from bus memory (a means to average DC bus over a period of time). The following tables and figure describe the operation.

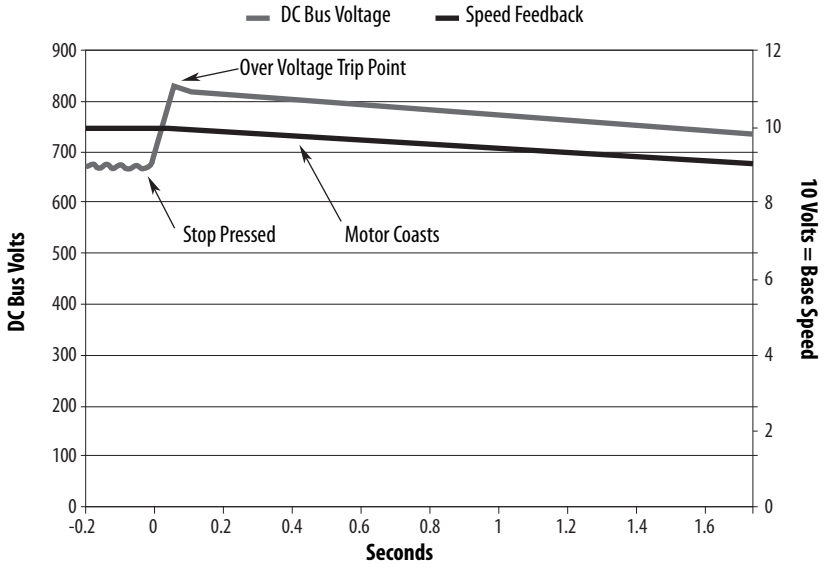
Voltage Class	DC Bus Memory	DB On Setpoint	DB Off Setpoint
480	<685V DC	750V DC	On - 8V DC
	>685V DC	Memory + 65V DC	



Option 0 "Disabled"

If [Bus Reg Mode *n*] is set to 0 "Disabled" The Voltage Regulator is off and the DB transistor is disabled. Energy returning to the DC bus increases the voltage unchecked and trips the drive on over voltage once the voltage threshold is reached.

Figure 2 - PowerFlex 750-Series Bus Regulation – Disabled

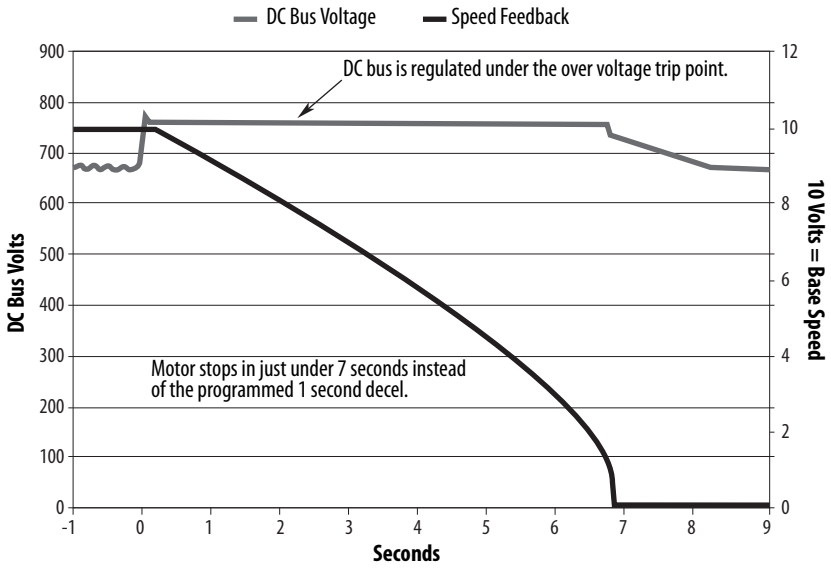


Option 1 "Adjust Freq"

If [Bus Reg Mode *n*] is set to 1 "Adjust Freq" The Bus Voltage Regulator is enabled. The Bus Voltage Regulator setpoint follows "Bus Reg Curve 1" below a DC Bus Memory of 650V DC and follows the "DB Turn On" above a DC Bus Memory of 650V DC (Table 5). For example, with a DC Bus Memory at 684V DC, the adjust frequency setpoint is 750V DC.

Below you can see the DC bus is being regulated as the speed is sacrificed to be sure the drive does not trip on over voltage.

Figure 3 - PowerFlex 750-Series Bus Regulation – Adjust Frequency



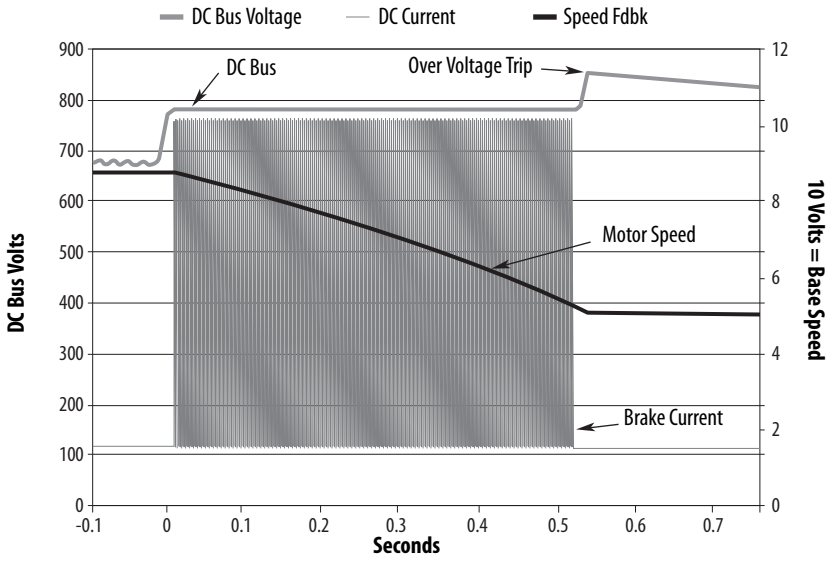
Option 2 "Dynamic Brak"

If [Bus Reg Mode *n*] is set to 2 "Dynamic Brak" The Dynamic Brake Regulator is enabled. In Dynamic Brake mode the Bus Voltage Regulator is turned off. The "DB Turn On" and turn off curves apply. For example, with a DC Bus Memory at 684V DC, the Dynamic Brake Regulator turns on at 750V DC and turns back off at 742V DC. The Dynamic Brake mode can operate differently depending upon the setting of P382 [DB Resistor Type] either External or Internal.

Internal Resistor

If the drive is set up for an internal resistor, there is a protection scheme built into the firmware such that if it is determined that too much power has been dissipated into the resistor the firmware does not allow the DB transistor to fire any longer. Thus the bus voltage rises and trips on over voltage.

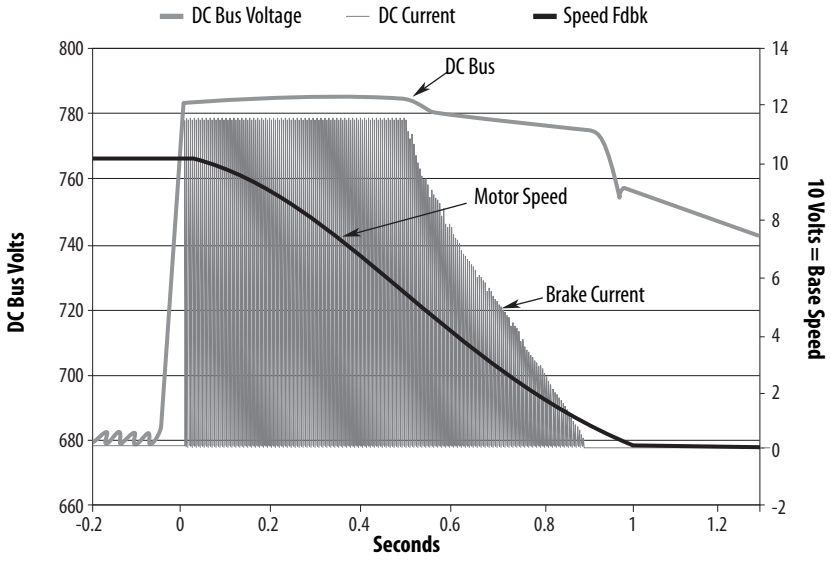
Figure 4 - PowerFlex 750-Series Bus Regulation – Internal Dynamic Brake Resistor



External Resistor

If the drive is set up for an external resistor and the resistor has been sized correctly and the regenerative power limit is set to a value that enables the regenerative power to be fully dissipated, the DB transistor continues to fire throughout the decel time.

Figure 5 - PowerFlex 750-Series Bus Regulation – External Dynamic Brake Resistor



The DB current seems as if it is decreasing toward the end of the decel. This is just a result of the sweep time of the oscilloscope and instrumentation. After all, it's not known as "Ohm's Suggestion." The point is evident that the DB transistor is pulsing through the decel.

Option 3 "Both DB 1st"

If [Bus Reg Mode *n*] is set to 3 "Both DB 1st" Both regulators are enabled, and the operating point of the Dynamic Brake Regulator is lower than that of the Bus Voltage Regulator. The Bus Voltage Regulator setpoint follows the "DB Turn On" curve. The Dynamic Brake Regulator follows the "DB Turn On" and turn off curves. For example, with a DC Bus Memory between 650 and 685V DC, the Bus Voltage Regulator setpoint is 750V DC and the Dynamic Brake Regulator turns on at 742V DC and back off at 734V DC.

It is possible that the drive can react differently between Flux Vector mode and Sensorless Vector mode. The important thing to remember here is that in SV control, the drive does **not** use the value entered into P426 [Regen Power Lmt]. If left at default (-50%) and the decel is such that it creates a large amount of regen power, the drive again attempts to protect the resistor.

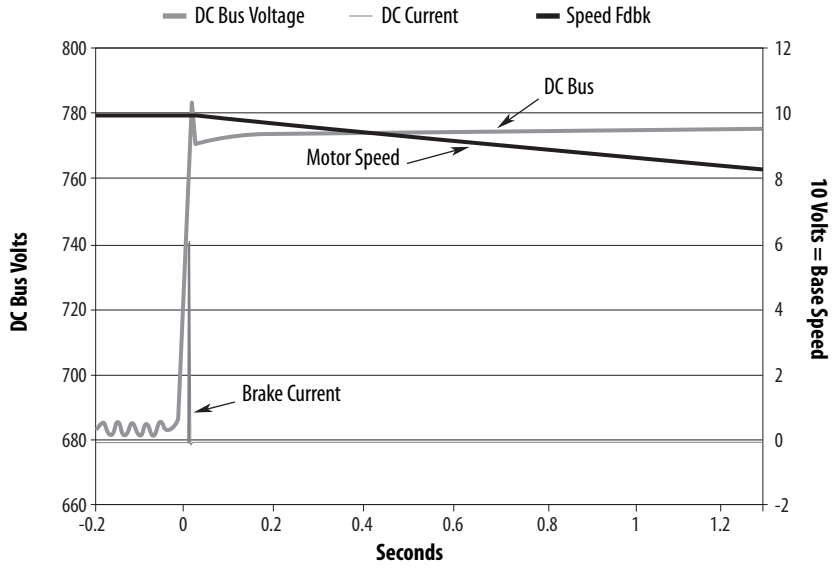
Consider the plots below.

Option 4 "Both Frq 1st"

If [Bus Reg Mode *n*] is set to 4 "Both Frq 1st" Both regulators are enabled, and the operating point of the Bus Voltage Regulator is lower than that of the Dynamic Brake Regulator. The Bus Voltage Regulator setpoint follows the "Bus Reg Curve 2" below a DC Bus Memory of 650V DC and follows the "DB Turn Off" curve above a DC Bus Memory of 650V DC (Table 4). The Dynamic Brake Regulator follows the "DB Turn On" and turn off curves. For example, with a DC Bus Memory at 684V DC, the Bus Voltage Regulator setpoint is 742V DC and the Dynamic Brake Regulator turns on at 750V DC and back off at 742V DC.

Figure 6 shows that upon a stop command the bus voltage rises immediately to a point where the DB transistor turns on briefly bringing the voltage down to a point where the bus regulator can regulate the bus by adjusting the output frequency (speed).

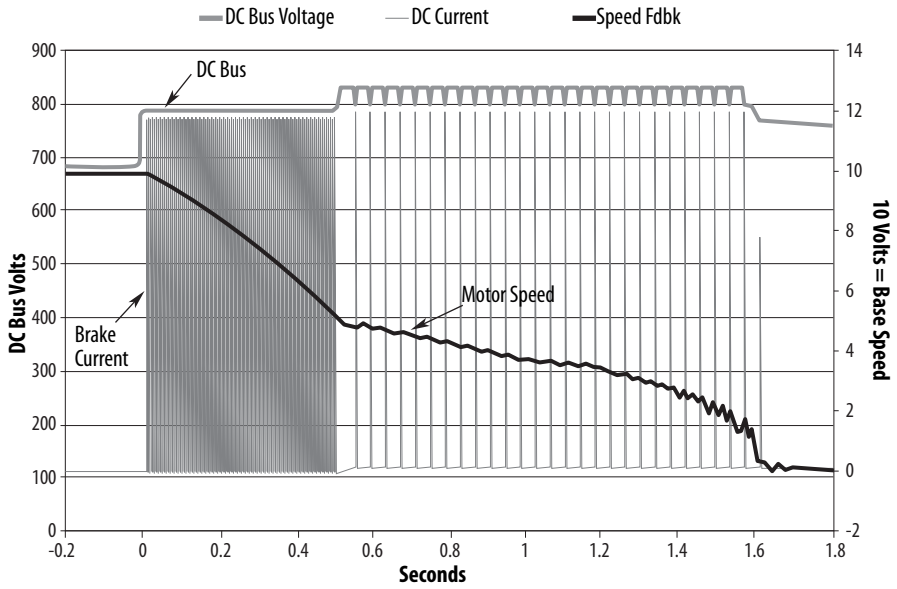
Figure 6 - PowerFlex 750-Series Bus Regulation – Both Adj First



Flux Vector (FV) Control

With the Regen Power Limit left at default, and a decel time of 0.1 seconds, the drive is limiting the amount of power to a point where the resistor could be heating up due to duty cycle considerations. So the drive stops the DB transistor from firing and switches to "Adjust Frequency" to regulate the bus and then enables another DB pulse and then back to adjust frequency and so on until the bus voltage remains below the trigger level.

Figure 7 - PowerFlex 750-Series Bus Regulation – Both DB First FV



If the Regen Power Limit is opened up to 100% for instance, the plot will look exactly the same as the Sensorless Vector mode plot show below.

Sensorless Vector (SV) Control

Because the drive is not limiting the regen power the DB is able to dissipate the power the entire decel time before duty cycle considerations limits the DB capability.

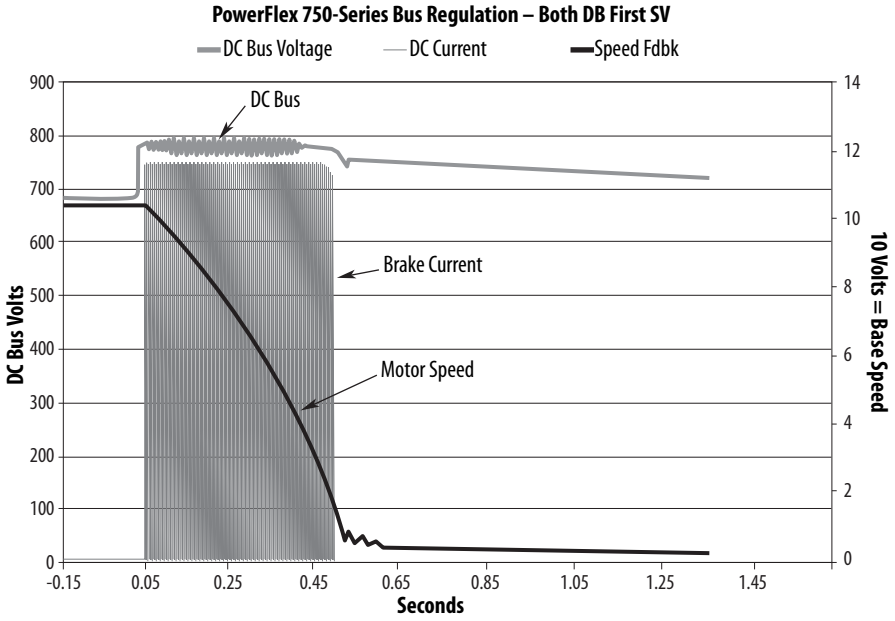


Table 4 - Bus Regulation Curves

Voltage Class	DC Bus Memory	Bus Reg Curve 1	Bus Reg Curve 2
480	< 650V DC	Memory + 100V DC	Curve 1 - 8V DC
	650V DC ≤ DC Bus Memory ≤ 685V DC	750V DC	
	> 685V DC	Memory + 65V DC	

Level/Gains

The following parameters are Level/Gains related to bus regulation.

P374 [Bus Reg Lvl Cfg]
Bus Regulation Level Configuration - Selects the reference used to determine the bus voltage regulation level for the bus voltage regulator and the reference used for the dynamic brake.

- "Bus Memory" (0) – References are determined based on P12 [DC Bus Memory].
- "BusReg Level" (1) – References are determined based on the voltage set in P375 [Bus Reg Level].

If coordinated operation of the dynamic brakes of a common bus system is desired, use this selection and set the P375 [Bus Reg Level] to coordinate the brake operation of the common bus drives.

P375 [Bus Reg Level]
Bus Regulation Level - Sets the turn-on bus voltage level for the bus voltage regulator and the dynamic brake.

Table 5 - Turn On Bus Voltage

P20 [Rated Volts] =	Default Turn On Volts =	Min/Max Setting =
< 252V	375V	375V / 389V
252…503V	750V	750 / 779V
504…629V	937V	937 / 974V
> 629V	1076V	1076 / 1118V

While the following parameters are listed and editable in the drive, they typically do not need to be adjusted in any way. Take care when adjusting because undesired operation can occur in another aspect of motor control.

P376 [Bus Limit Kp]
Bus Limit Proportional Gain - Enables a progressively faster decel when the drive is behind the programmed decel time by making the bus limiter more responsive. A higher value means the drive tries to decrease decel time.
This parameter is valid only in NON-Flux Vector modes.

P377 [Bus Limit Kd]
Bus Limit Derivative Gain - Lets you force the bus limit sooner. The higher the value the quicker the bus limit is hit and regulation starts. This can cause regulation below the typical setpoint (750VDC for 460V drive). Too high a value and normal operation of the motor can be affected. (60...60.5 Hz oscillation.)
This parameter is valid only in NON-Flux Vector modes.

P378 [Bus Limit ACR Ki]
Bus Limit Active Current Regulator Integral Gain - If you find your system makes the regulator unstable or oscillatory, a lower value in this parameter settles out the oscillations.
This parameter is valid only in NON-Flux Vector modes.

P379 [Bus Limit ACR Kp]
Bus Limit Active Current Regulator Proportional Gain - Determines the responsiveness of the active current and therefore, regenerated power and bus voltage. Raising this value can cause the output frequency (when in bus limit) to become noisy or jittery. Too low a value can cause the bus limit function to malfunction and result in a over voltage fault.
This parameter is valid only in NON-Flux Vector modes.

P380 [Bus Reg Ki]
Bus Regulator Integral Gain - When regulating the DC bus, the voltage tends to swing above and below the voltage setpoint in what looks like a ringing oscillation. This parameter affects that behavior. A lower the value reduces oscillation.
This parameter is valid only in Flux Vector modes.

P381 [Bus Reg Kp]
Bus Regulator Proportional Gain - This determines how fast the bus regulator is activated. The higher the value the faster the drive reacts once the DC voltage setpoint is reached.
This parameter is valid only in Flux Vector modes.

Once again, the likelihood of these parameters needing adjustment is highly unlikely. In fact, some descriptions related to the functionality of these parameters are intentionally left out of this text to eliminate undesired motor operation when they are adjusted unwisely.

Configurable Human Interface Module Removal

With the PowerFlex 750-Series the drives response to a HIM communication loss (removal) is configurable. This feature is available in drives with firmware revision 3.0 or later.

It is used to prevent unintended stopping of the drive by disconnecting the HIM. However, the HIM cannot be the sole source of a Stop command to enable this feature.

The configuration is similar to the communication adapter communication loss selections:

- 0 = Fault
- 1 = Stop
- 2 = Zero Data
- 3 = Hold Last
- 4 = Send Fault Config

The default setting is 0 “Fault.”

The HIM can be connected to one 1 of 3 ports per the parameters below. Each port is configured separately:

- P865 [DPI Pt1 Flt Actn] to determine the fault action at port 1.
- P866 [DPI Pt2 Flt Actn] to determine the fault action at port 2.
- P867 [DPI Pt3 Flt Actn] to determine the fault action at port 3.

If “Send Flt Cfg” is to be selected for the fault action, then configure the appropriate parameter below.

- P868 [DPI Pt1 Flt Ref] to set the speed reference if the HIM at port 1 is disconnected.
- P869 [DPI Pt2 Flt Ref] to set the speed reference if the HIM at port 2 is disconnected.
- P870 [DPI Pt3 Flt Ref] to set the speed reference if the HIM at port 3 is disconnected.

A constant value must be entered as the fault speed reference in this instance.

Droop Feature

Droop is used to shed load and is usually used when a soft coupling of two motors is present in an application. The master drive speed regulates and the follower uses droop so it does not oppose the master. The input to the droop block is the commanded motor torque. The output of the droop block reduces the speed reference. P620 [Droop RPM at FLA] sets the amount of speed, in RPM, that the speed reference is reduced when at full load torque. For example, when P620 [Droop RPM at FLA] is set to 50 RPM and the drive is running at 100% rated motor torque, the droop block subtracts 50 RPM from the speed reference.

Duty Rating

Applications require different amounts of overload current.

Normal Duty

Sizing the drive for Normal Duty enables the use of the highest continuous output current rating of the drive and an overload rating of 110% for 60 seconds (every 10 minutes) and 150% for 3 seconds (every minute).

Heavy Duty

For heavy duty applications, a drive one size larger than is required for the motor is used in the application and therefore provides a larger amount of overload current in comparison to the motor rating. Heavy Duty sizing provides at least 150% for 60 seconds (every 10 minutes) and 180% for 3 seconds (every minute).

Light Duty

The light duty setting, for a given normal duty rated drive, provides a higher continuous output current but with limited overload capability. When in light duty, the drive provides 110% for 60 seconds (every 10 minutes). The light duty setting is only available on PowerFlex 755 drives, frame 8 and larger.

The overload percentages are with respect to the connected motor rating.

The duty rating is programmed in P306 [Duty Rating]. This parameter is reset to the default setting if a Set Defaults “ALL” is executed. For drives rated under 7.5 kW (10 Hp) the normal duty and heavy duty continuous current ratings are the same, and have the heavy duty overload settings.

When changing the [Duty Rating], review P422 [Current Limit 1] and P423 [Current Limit 2].

Refer to the PowerFlex 750-Series AC Drives Technical Data, publication 750-TD001, for continuous and overload current ratings for each catalog number.

Feedback Devices

There are three different feedback option modules available for PowerFlex 750-Series AC Drives:

- Single Incremental Encoder (20-750-ENC-1)
- Dual Incremental Encoder (20-750-DENC-1)
- Universal Feedback (20-750-UFB-1)

The Dual Incremental Encoder and Universal Feedback modules each support up to two encoders while the Single Incremental Encoder supports one encoder. Multiple feedback option modules can be installed in the drive, however there is a limit of two feedback modules if using Integrated Motion on EtherNet/IP.

For more information on the option modules, including specifications and wiring information, see the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

For more information on encoder feedback options, including connections and compatibility, see Appendix E of the PowerFlex 750-Series Programming Manual, publication 750-PM001.

Flying Start

The Flying Start feature is used to start into a rotating motor, as quick as possible, and resume normal operation with a minimal impact on load or speed.

When a drive is started in its normal mode it initially applies a frequency of 0 Hz and ramps to the desired frequency. If the drive is started in this mode with the motor already spinning, large currents are generated. An over current trip can result if the current limiter cannot react quickly enough. The likelihood of an over current trip is further increased if there is a residual flux (back emf) on the spinning motor when the drive starts. Even if the current limiter is fast enough to prevent an over current trip, it can take an unacceptable amount of time for synchronization to occur and for the motor to reach its desired frequency. In addition, larger mechanical stress is placed on the application.

In Flying Start mode, the drive's response to a start command is to synchronize with the motors speed (frequency and phase) and voltage. The motor then accelerates to the commanded frequency. This process prevents an over current trip and significantly reduce the time for the motor to reach its commanded frequency. Because the drive synchronizes with the motor at its rotating speed and ramps to the proper speed, little or no mechanical stress is present.

The Sweep function is currently not in the PowerFlex 750-Series drives frame 8 and larger.

Configuration

Flying Start can be configured by setting P356 [FlyingStart Mode] to the following:

- 0 “Disabled”
- 1 “Enhanced”
- 2 “Sweep”

Disabled

Disables the feature.

Enhanced

An advanced mode that performs the motor reconnect quickly by using the motor’s CEMF as a means of detection. This mode is the typical setting for this feature.

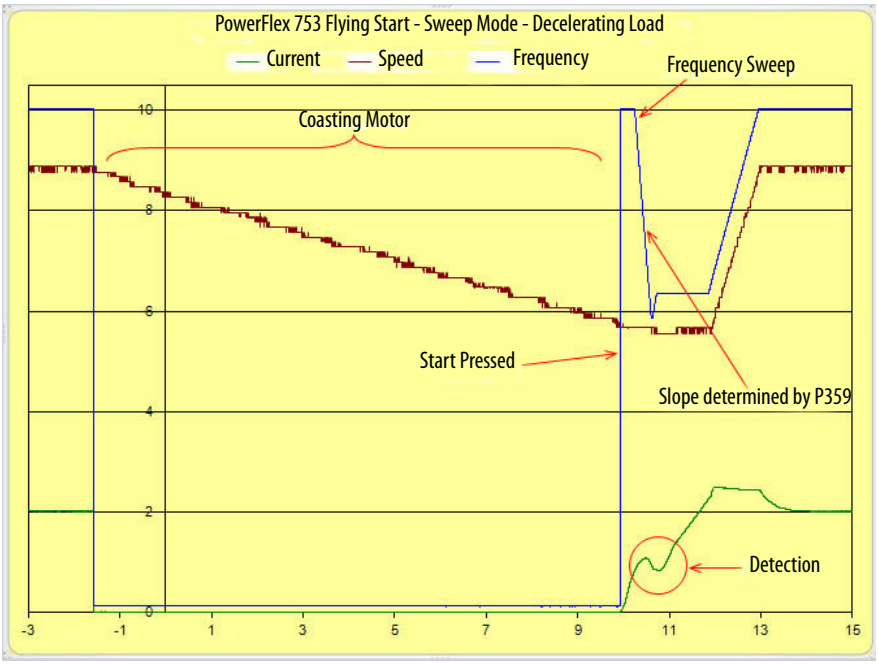
Sweep

The Frequency Sweep mode is used with output sine wave filters. It attempts a reconnect by outputting a frequency starting at P520 [Max Fwd Speed]+ P524 [Overspeed Limit] and decreasing according to a slope that is modified by P359 [FS Speed Reg Ki] until there is a change in the monitored current indicating the speed of the spinning motor has been found. If the motor was not found from the forward sweep, the drive sweeps in the reverse direction from P521 [Max Rev Speed]+ P524 [Overspeed Limit].

Scope Plots

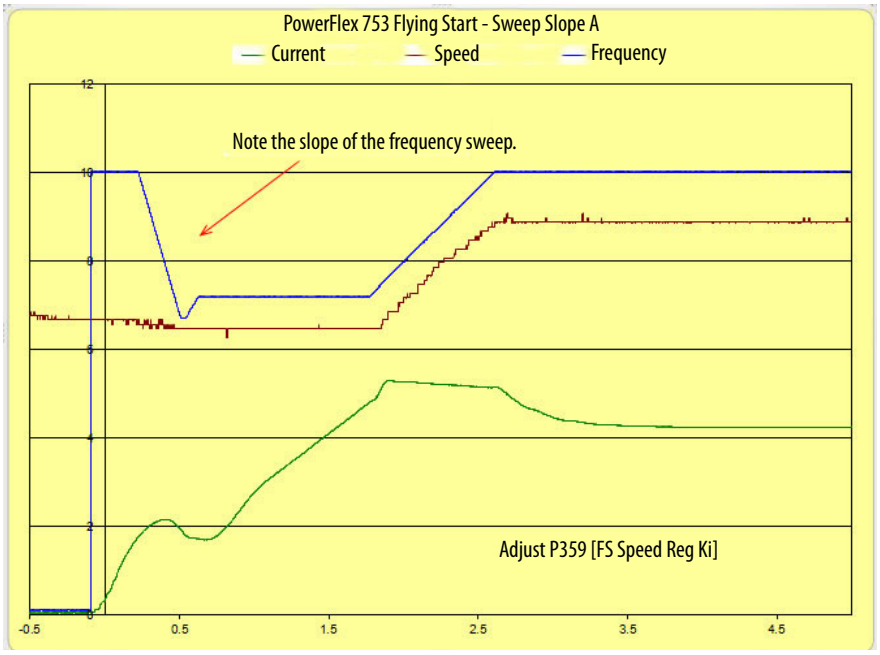
Flying Start - Sweep Mode

This plot shows a coasting motor. When a start is commanded, the output frequency jumps up to P520 [Max Fwd Speed]+ P524 [Overspeed Limit] at some current. As the sweep frequency decreases the current is monitored. When the sweep frequency matches the frequency of the coasting motor, the current reverses and detection is complete. The motor is accelerated back to commanded speed.



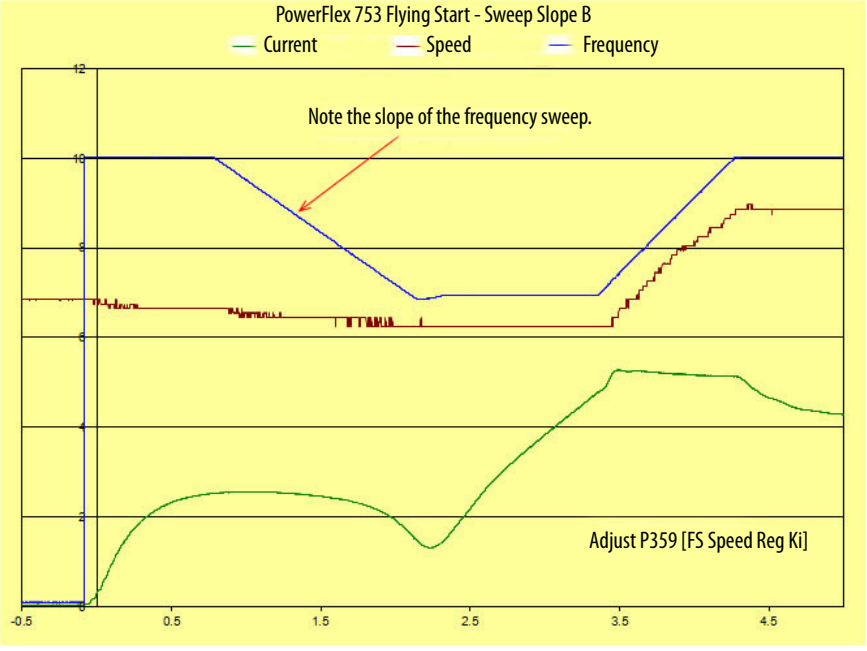
Flying Start - Sweep Slope A

This plot shows when the drive starts to sweep for the spinning motor, the frequency sweep has a certain slope associated with it. By modifying P359 [FS Speed Reg Ki] you can change the slope of this sweep.



Flying Start - Sweep Slope B

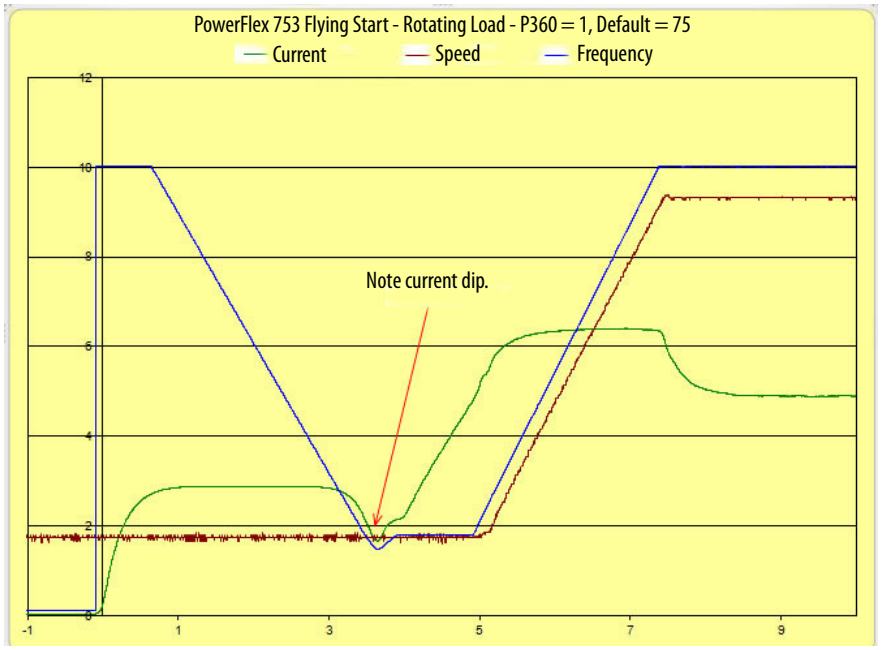
This plot shows the result of increasing P359 [FS Speed Reg Ki]. The slope is extended.



In the two samples shown above, the motor was decelerating. The sweep function and slope manipulation work the same if the motor was spinning at some constant speed.

Flying Start - Sweep Dip A

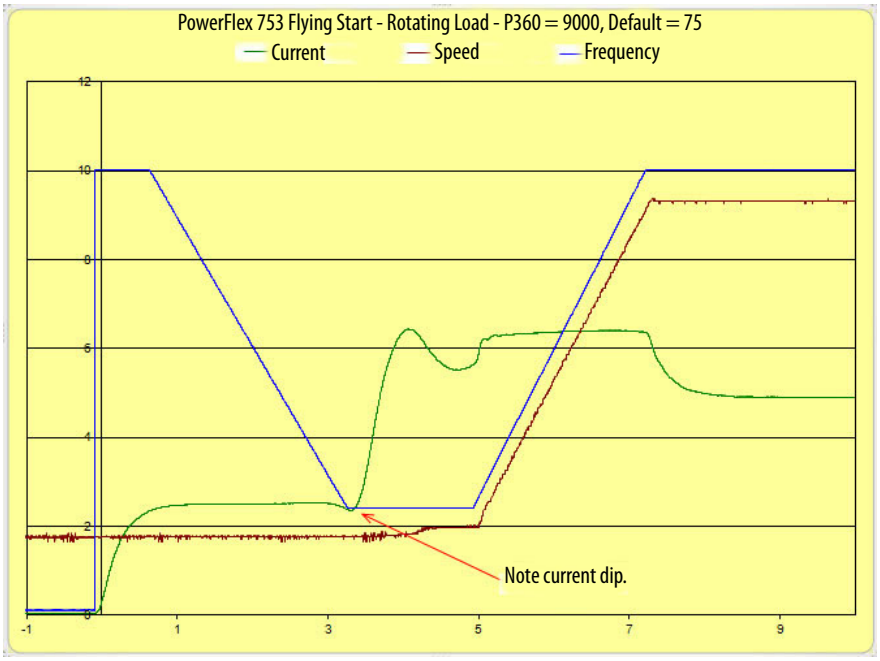
This plot shows the effect of modifying P360 [FS Speed Reg Kp]. In this plot a motor is spinning at some constant speed when the drive is issued a start command and the sweep routine is started. Note the current dip when the parameter is set to its lowest value and the drive has determined the frequency of the rotating motor. See the next plot when this parameter set to its highest setting.



Flying Start - Sweep Dip B

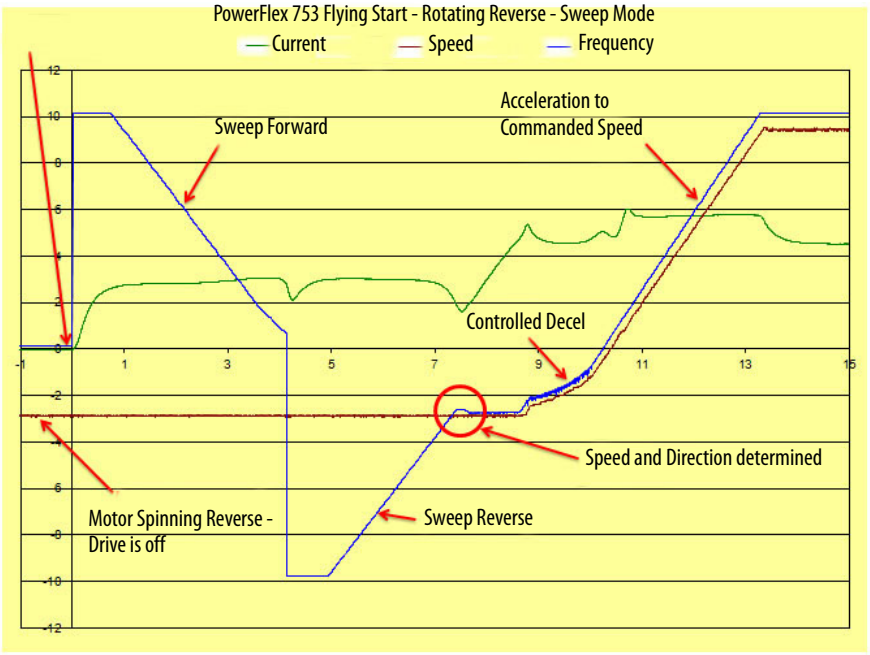
This plot shows the effect of modifying P360 [FS Speed Reg Kp]. In this plot a motor that is spinning at some constant speed when the drive is issued a start command and the sweep routine is started. Note the current dip when the parameter is set to its highest value and the drive has determined the frequency of

the rotating motor. See the previous plot when this parameter set to its lowest setting.



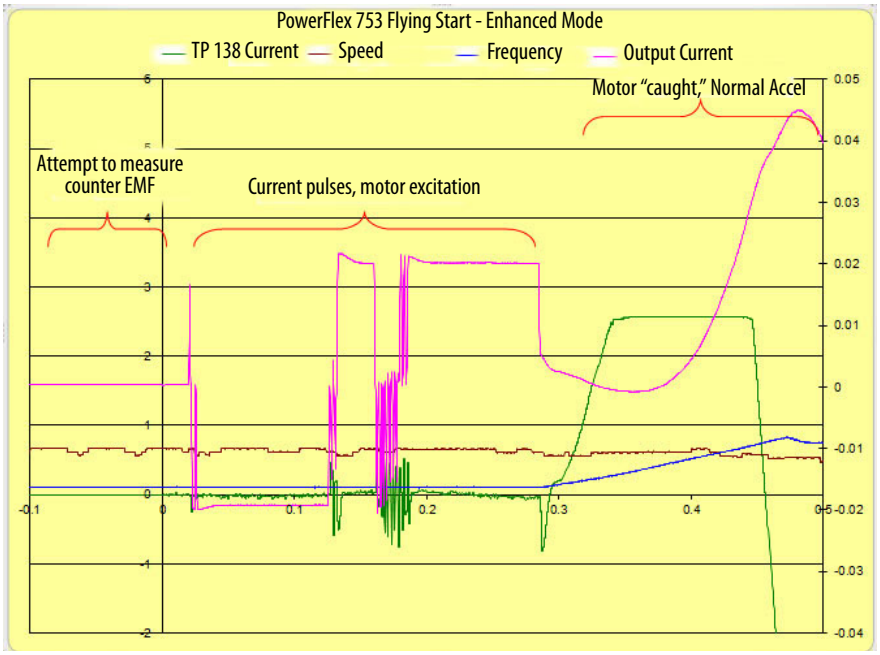
Flying Start - Sweep Reverse Rotating Motor

This plot shows the Sweep mode when the motor is rotating opposite from the commanded frequency. It starts the same as explained above. If it didn't detect the motor's speed as it reaches 3 Hz it begins to sweep in the opposite direction. From here the process continues the same as before.



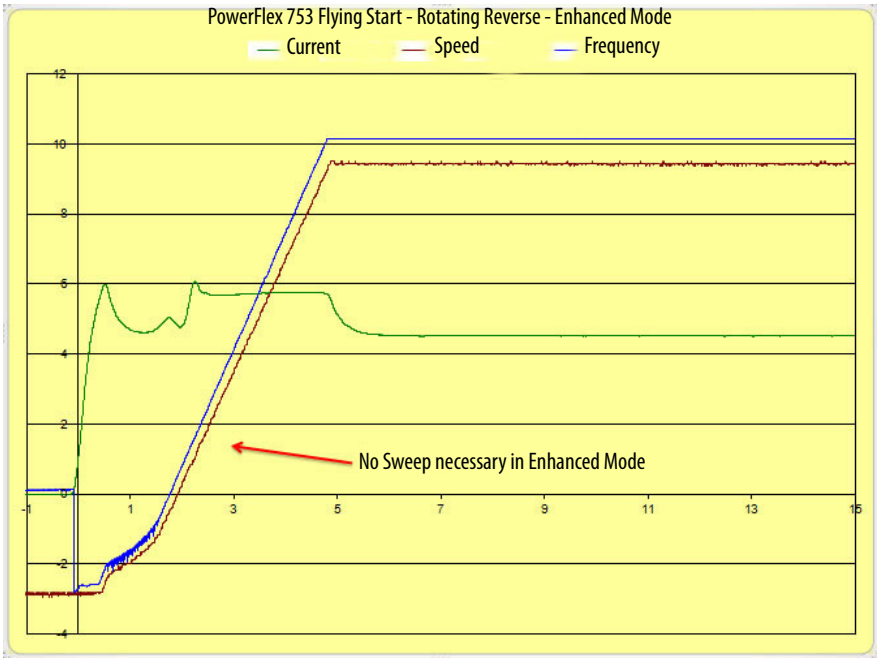
Flying Start - Enhanced Mode

This plot shows a very short time base of the Enhanced mode. If the drive detects the counter EMF of the motor it can instantly re-connect to the motor and accelerate to the commanded speed. If the drive cannot measure the CEMF (this is where the plot picks up) it sends current pulses to the motor in an attempt to excite the motor allowing the drive to detect the speed of the motor. This usually happens only at very low speeds. Once the drive has detected the motor it accelerates to the commanded speed.



Flying Start - Enhanced Mode Reverse

Here is a motor spinning in the opposite direction of the commanded speed. In Enhanced mode the detection takes a very short time and the motor is controlled to zero speed and accelerated to the commanded speed.



P357 [FS Gain]
Sweep mode - The amount of time the detection signal (current) must be below the setpoint. A very short time entered could cause false detections. Too long of a time and detection could be missed.

Enhanced mode - It's the Kp in the current regulator used in the detection process. Used along with P358.

P358 [FS Ki]
Sweep mode - Integral term in voltage recovery, indirectly connected to time; higher value can shorten recovery time but can cause unstable operation.

Enhanced mode - It's the Ki in the current regulator used in the detection process. Used along with P357.

P359 [FS Speed Reg Ki]
Sweep mode - The amount of time to sweep the frequency. A short time entered produces a steep slope on the frequency. A higher value (longer time) produces a flatter frequency sweep. Shown above.

Enhanced mode - It's the Ki in the speed regulator used in the detection process. Used along with P358.

P360 [FS Speed Reg Kp]
Sweep mode - Sets level the current must drop below. A larger value requires less change in current to indicate detection.

Enhanced mode - It's the Kp in the speed regulator used in the detection process. Used along with P357.

P361 [FS Excitation Ki]
Sweep mode - Integral term used to control the initial output voltage

Enhanced mode - Integral term used in the current regulator, which controls the motor excitation if the detection process deemed it necessary to excite the motor.

P362 [FS Excitation Kp]
Sweep mode - Proportional term used to control the initial output voltage

Enhanced mode - Proportional term used in the current regulator, which controls the motor excitation if the detection process deemed it necessary to excite the motor.

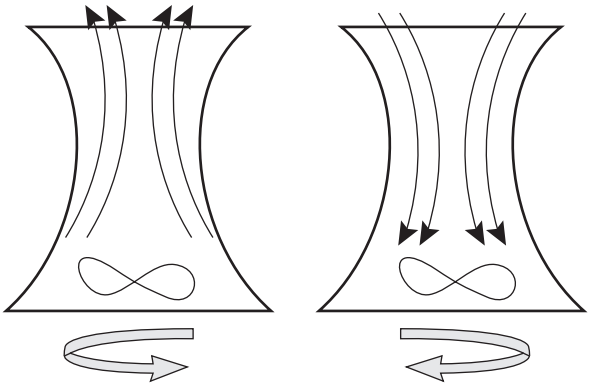
P363 [FS Reconnect Dly]
Delay time used between the issued start command and the start of the reconnect function. This is mainly used for power loss situations so the restart doesn't occur too quickly causing possible faults.

P364 [FS Msrmnt CurLvl]
There are two different measurement methods used when in Enhanced mode. If this parameter is set to zero the second method is cancelled and reconnect is attempted after the first measurement. Any other level change in this parameter could help the second measurement routine. Usually a higher number helps more.

Cooling Tower Fans Application Example

In some applications, such as large fans, wind or drafts can rotate the fan in the reverse direction when the drive is stopped. If the drive were started in the normal manner, its output begins at zero Hz, acting as a brake to bring the reverse rotating fan to a stop and then accelerating it in the correct direction. This operation can be very hard on the mechanics of the system including fans, belts and other coupling devices.

Draft/wind blows idle fans in reverse direction. Restarting at zero speed and accelerating damages fans and could break belts. Flying start alleviates the problem.



There could be occasions when the sweep as well as the CEMF detection fails at low speeds. This is due to the low levels of motor detection signals. It has been discovered that Sweep mode is more successful in these cases than Enhanced mode.

When in Sweep mode the frequency is always swept in the direction of the commanded frequency first.

Motor detection at low speeds can be difficult. Rather than get a false detection, the sweep reverses at 3 Hz.

Hand-Off-Auto

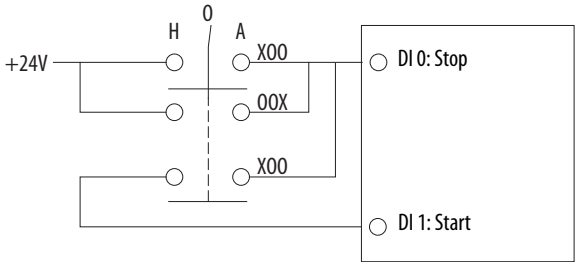
Many legacy drive installations included a circuit (such as a Hand-Off-Auto switch) that provided 3-wire start and stop signals simultaneously to the drive. PowerFlex 750-Series drives do not start unless there is a full input cycle between the stop and start signals. P176 [DI HOA Start] adds a delay to the start signal, allowing the required time interval between the start and stop signals. This enables the use of a single 3-wire control circuit to start and stop the drive.

Hand-Off-Auto Start

If P161 [DI Start] and P176 [DI HOA Start] are both configured, a "DigIn Cfg B" alarm results. You cannot use both Digital Input Start and Digital Input Hand-Off-Auto Start at the same time.

Hand-Off-Auto Example

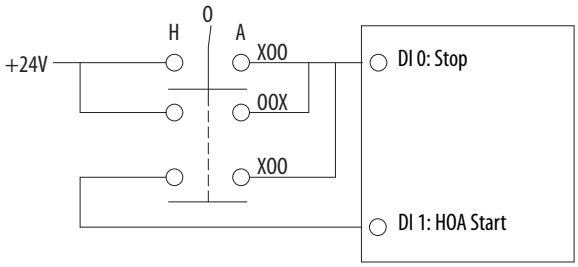
A Motor Control Cabinet has an Hand-Off-Auto switch wired as shown in the figure below.



When the switch is turned to Off, the switch is open between the source and Stop (DI:0) and between Stop and Start (DI:1). This causes the drive to be in an asserted stop. When the switch is turned to Auto, the control signal reaches the Stop input but not the Start. The drive can be stopped and started by another location. When the switch is turned to Hand, both the Stop and Start ports are energized.

In order for the drive to start, the Stop signal must be received prior to the Start. With the wiring above, the signals are nearly simultaneous, too fast to be sure that the drive is ready to start. This causes the switch to either be unreliable or not work at all. This can be remedied by adding a time delay to the start signal. By changing Digital Input 1 from DI Start to DI Hand-Off-Auto Start, the drive

automatically adds this time delay and makes sure that the system is ready to start before it receives the command.

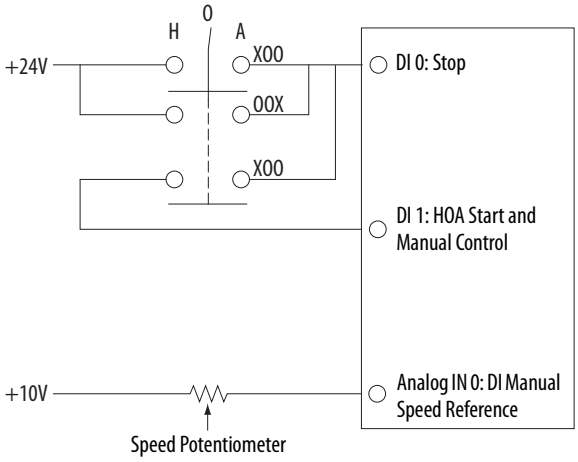


Using Hand-Off-Auto with Auto/Manual

To take control of the drive speed when switching from Auto to Hand on the H-O-A switch, the Auto/Manual feature can be used. See Auto/Manual on page 27 for more on Auto/Manual Control.

In the circuit below, a speed potentiometer was added to the analog input to provide a speed reference to the drive. When the H-O-A switch is moved from Auto to Hand, the digital input block requests manual control and issues a start command to the drive. If the digital input port receives manual control, the drive accelerates to the reference speed from the analog input. All attempts to change the speed except from the analog input are blocked. If the drive is stopped while in Hand, switch the H-O-A switch to Off and then back to Hand to restart the drive.

If another port has manual control of the drive, but does not have exclusive ownership of the logic commands (due to P326 [Manual Cmd Mask]), turning the switch to Hand causes the drive to begin moving but for the analog input to have no control over the speed.



For this circuit, set the following parameters (P301 [Access Level] must be set to 1 "Advanced" to see P563 [DI ManRef Sel]).

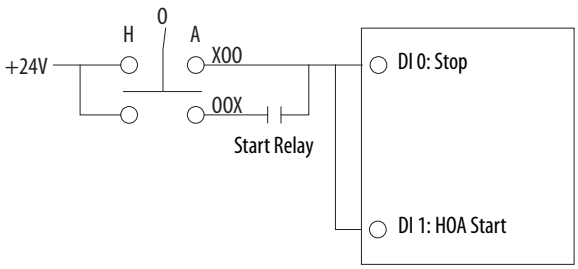
Parameter No.	Parameter Name	Value
158	DI Stop	Digital Input 0
172	DI Manual Control	Digital Input 1
176	DI HOA Start	Digital Input 1
324	Logic Mask	xxxxxxxxxxxxxx1 (Digital In)
326	Manual Cmd Mask	xxxxxxxxxxxxxx1 (Digital In)
327	Manual Ref Mask	xxxxxxxxxxxxxx1 (Digital In)
563	DI Manual Reference Select	AnIg In0 Value

The drive requests Manual mode, starts and tracks the reference speed coming from the Analog Input when the H-O-A switches to Hand. (The HIM still reads Auto. This display changes only when the HIM has control of Manual mode).

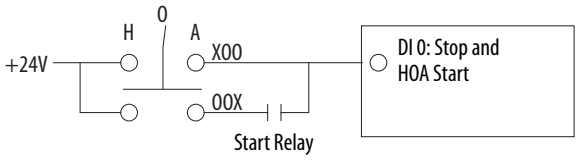
Using Hand-Off-Auto with a Start Relay

The Hand-Off-Auto switch can also be wired to ability to start the drive through a separate start relay.

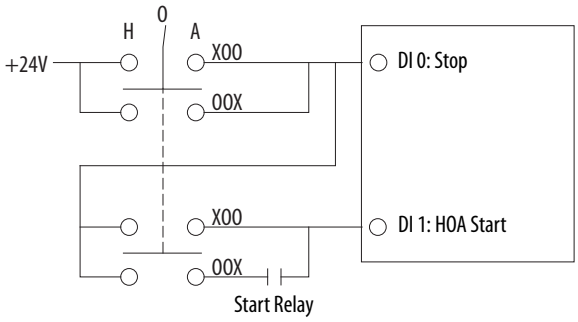
In the circuit below, the run relay closes the circuit to both the stop and start inputs when the H-O-A switch is in Auto. Using this option, the drive can be started only if the H-O-A switch is in Hand or in Auto and the Run Relay is energized. No network or HIM control of the drive is possible.



The above circuit can also be accomplished with a single digital input. Unlike P161 [DI Start], P176 [DI HOA Start] can share the same physical input with P158 [DI Stop]. The circuit can thus become the following.



To use the H-O-A switch, the run relay and allow for network or HIM control, the circuit can be wired as in the figure below.



Here, the stop input is high when the H-O-A switch is in the Hand or Auto position. This eliminates the asserted stop caused when the stop input is low, allowing for the drive to be started from several sources when the H-O-A switch is in the Auto position.

Masks

A mask is a parameter that contains one bit for each of the possible ports for the respective PowerFlex 750-Series drive. Each bit acts like a valve for issued commands. Closing the valve (setting a bit value to 0) stops the command from reaching the drive. Opening the valve (setting a bit value to 1) lets the command pass through the mask into the drive.

Table 6 - Mask Parameters and Functions

Parameter No.	Parameter Name	Description
222	Dig In Filt Mask(1)	Digital Input Filter Mask. Filters the selected digital input.
324	Logic Mask	Enables/disables ports to control the logic command (such as start and direction). Does not mask Stop commands.
325	Auto Mask	Enables/disables ports to control the logic command (such as start and direction), while in Auto mode. Does not mask Stop commands.
326	Manual Cmd Mask	Enables/disables ports to control the logic command (such as start and direction), while in Manual mode. Does not mask Stop commands.
327	Manual Ref Mask	Enables/disables ports to control the speed reference while in Manual mode. When a port is commanding Manual mode, the reference is forced to the commanding port if the respective bit in this parameter is set. If an alternate speed reference source is desired, use P328 [Alt Man Ref Sel] to select the source.
885	Port Mask Act(2)	Active status for port communication. Bit 15 “Security” determines if network security is controlling the logic mask instead of this parameter.
886	Logic Mask Act(2)	Active status of the logic mask for ports. Bit 15 “Security” determines if network security is controlling the logic mask instead of this parameter.

Parameter No.	Parameter Name	Description
887	Write Mask Act(2)	Active status of write access for ports. Bit 15 "Security" determines if network security is controlling the write mask instead of this parameter.
888	Write Mask Cfg	Enables/disables write access (parameters, links, and so forth.) for DPI ports. Changes to this parameter become effective only when power is cycled, the drive is reset or Bit 15 of P887 [Write Mask Actv], transitions from "1" to "0."
2	Dig In Filt Mask(3)	Digital Input Filter Mask. Filters the selected digital input.

(1) Used only by the PowerFlex 753 main control board.
(2) Read only parameter.
(3) Used only by I/O Module models 20-750-2263C-1R2T and 20-750-2262C-2R. (Modules with 24V DC inputs.)

The individual bits for each parameter are as follows.

Table 7 - Mask Parameters with Bit Designations

	P222 [Dig In Filt Mask] (1)	P324 [Logic Mask]	P325 [Auto Mask]	P326 [Manual Cmd Mask]	P327 [Manual Ref Mask]	P885 [Port Mask Act]	P886 [Logic Mask Act]	P887 [Write Mask Act]	P888 [Write Mask Cfg]	P2 [Dig In Filt Mask](4)

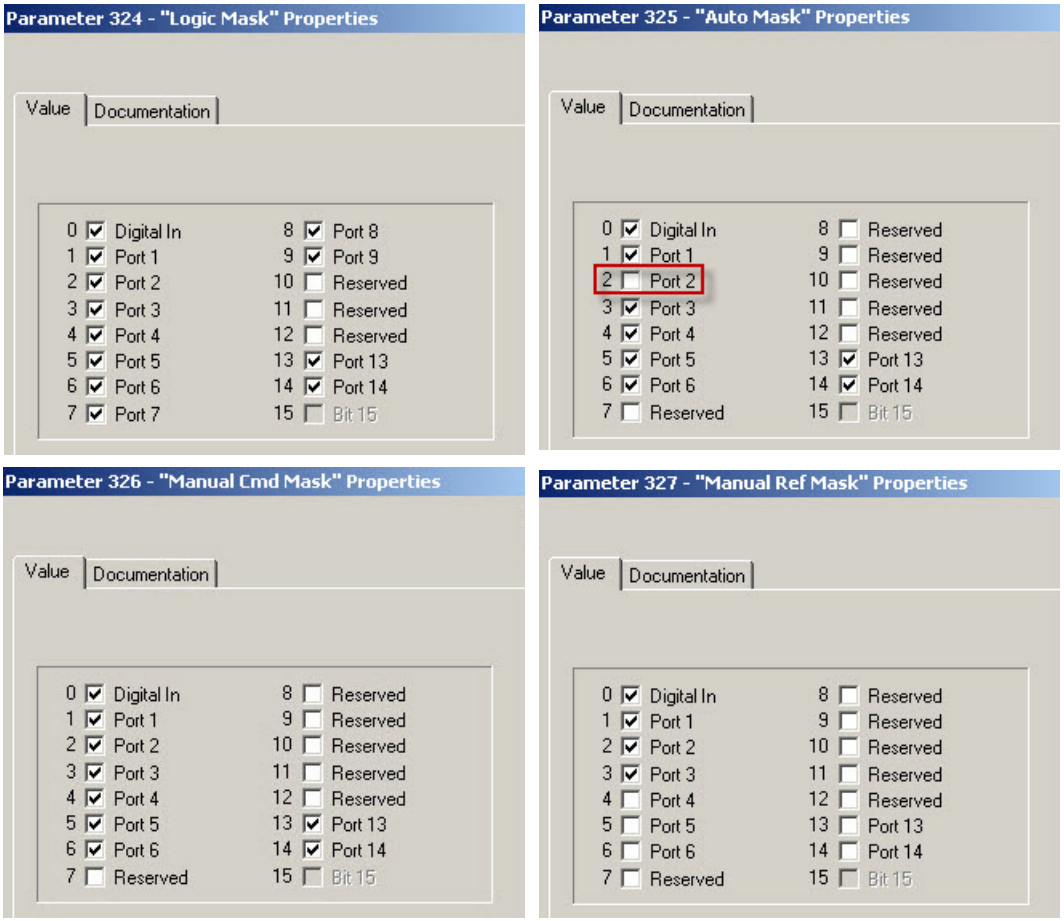
(1) Used only by the PowerFlex 753 main control board.
(2) PowerFlex 755 Frame 8 drives and larger only.
(3) PowerFlex 755 drives only.
(4) Used only by I/O Module models 20-750-2263C-1R2T and 20-750-2262C-2R. (Modules with 24V DC inputs.)

Example

A PowerFlex 755 drive is controlled via the embedded ethernet (Port 13) remotely by a PLC. Normal operation prevents any type of control from being issued from the remote HIM (Port 2). However, the ability to manually control the drive via the HIM is needed in some cases. To assure these two modes of control, masks are set as follows.



This masks out (disables) the remote HIM (Port 2) to control the logic command word (such as start, jog and direction) when the drive is in Auto mode and lets (enables) the HIM to control the logic command word when the drive is in Manual mode.

Owners

An owner is a parameter that contains one bit for each of the possible port adapters. The bits are set high (value of 1) when its adapter is currently issuing that command, and set low (Value of 0) when its adapter is not issuing that command.

Parameters and Functions

- P919 [Stop Owner] indicates which port is issuing a valid stop command.
- P920 [Start Owner] indicates which port is issuing a valid start command.
- P921 [Jog Owner] indicates which port is issuing a valid jog command.
- P922 [Dir Owner] indicates which port has exclusive control of direction command.
- P923 [Clear Flt Owner] indicates which port is currently clearing a fault.
- P924 [Manual Owner] indicates which port has requested manual control of all drive logic and reference functions.
- P925 [Ref Select Owner] indicates which port is issuing a valid reference select.

The bits for each parameter can be broken down as follows.

Options	Reserved	Port 14	Port 13 (1)	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Port 6	Port 5	Port 4	Port 3	Port 2	Port 1	Digital In
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

(1) 755 drives only.

Ownership falls into two categories.

Exclusive: Only one adapter at a time can issue the command and only one bit in the parameter is high.

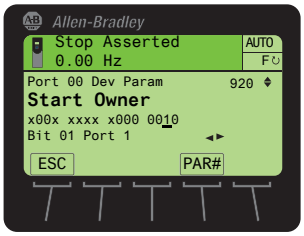
Non Exclusive: Multiple adapters can simultaneously issue the same command and multiple bits can be high.

Some ownership must be exclusive; that is, only one adapter at a time can issue certain commands and claim ownership of that function. For example, it is not allowable to have one adapter command the drive to run in the forward direction while another adapter is issuing a command to make the drive run in reverse. Direction control ownership is exclusive.

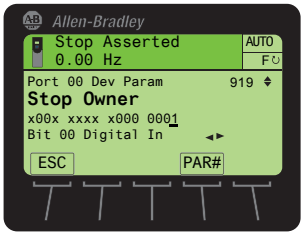
Conversely, any number of adapters can simultaneously issue stop commands. Stop control ownership is not exclusive.

Ownership Example

The operator presses the HIM Stop button to stop the drive. When the operator attempts to restart the drive by pressing the HIM Start button, the drive does not restart. The operator needs to determine why the drive will not restart. The operator first views the Start Owner to see if the HIM is issuing a valid Start. When the start button on the HIM is pressed, a valid start is being issued as shown below.



Because the start command is not maintained causing the drive to run, the operator views the Stop Owner. Note that the status bar on the HIM indicates that a stop has been asserted, but it does not indicate from which port the stop command is originating. Notice that bit 0 is a value of "1," indicating that the Stop device wired to the Digital Input terminal block is open, issuing a Stop command to the drive. Until this device is closed, a permanent Start Inhibit condition exists and the drive will not restart.



Power Loss

The drive contains a sophisticated algorithm to manage initial application of power as well as recovery from a partial power loss event. The drive also has programmable features that can minimize the problems associated with a loss of power in certain applications.

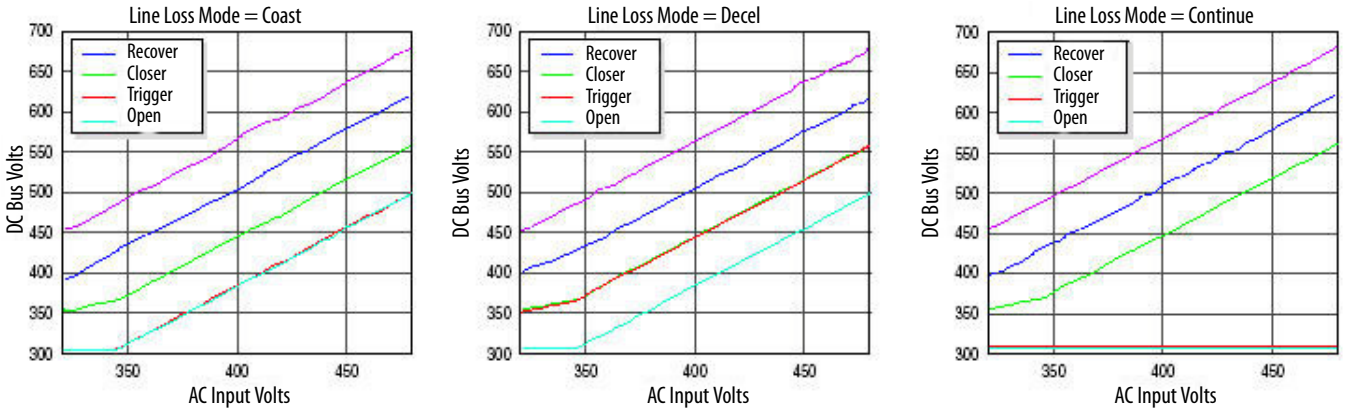
Terms and Definitions

Term	Definition
Vbus	The instantaneous DC bus voltage.
Vmem	The average DC bus voltage. A measure of the average bus voltage determined by heavily filtering bus voltage. Just after the pre-charge relay is closed during the initial power-up bus pre-charge, bus memory is set equal to bus voltage. Thereafter it is updated by ramping at a very slow rate toward Vbus. The filtered value ramps at 2.4V DC per minute (for a 480VAC drive). An increase in Vmem is blocked during deceleration to prevent a false high value due to the bus being pumped up by regeneration. Any change to Vmem is blocked during inertia ride through.
Vslew	The rate of change of Vmem in volts per minute.
Vrecover	The threshold for recovery from power loss.
Vtrigger	The threshold to detect power loss. The level is adjustable. The default is the value in the PowerFlex 750-Series Bus Level table. If "Pwr Loss Lvl" is selected as an input function AND energized, Vtrigger is set to Vmem minus [Pwr Loss Level]. Vopen is normally 60V DC below Vtrigger (in a 480VAC drive). Both Vopen and Vtrigger are limited to a minimum of Vmin. This is a factor only if [Pwr Loss Level] is set to a large value. **Important**: When using a value of P451/P454 [Pwr Loss A/B Level] that is larger than default, you must provide a minimum line impedance to limit inrush current when the power line recovers. Provide an input impedance that is equal to or greater than the equivalent of a 5% transformer with a VA rating 5 times the drive's input VA rating.
Vinertia	The software regulation reference for Vbus during inertia ride through.
Vclose	The threshold to close the pre-charge contactor.
Vopen	The threshold to open the pre-charge contactor.
Vmin	The minimum value of Vopen.
Voff	The bus voltage below which the switching power supply falls out of regulation.

Table 8 - PowerFlex 750-Series Bus Levels

Class	200/240V AC	400/480V AC	600/690V AC
Vslew	1.2V DC	2.4V DC	3.0V DC
Vrecover	Vmem – 30V	Vmem – 60V	Vmem – 75V
Vclose	Vmem – 60V	Vmem – 120V	Vmem – 150V
Vtrigger1,2	Vmem – 60V	Vmem – 120V	Vmem – 150V
Vtrigger1,3	Vmem – P451/P454 [Power Loss A/B Level]	Vmem – P451/P454 [Power Loss A/B Level]	Vmem – P451/P454 [Power Loss A/B Level]
Vopen	Vmem – P451/P454 [Power Loss A/B Level]	Vmem – P451/P454 [Power Loss A/B Level]	Vmem – P451/P454 [Power Loss A/B Level]
Vopen4	153V DC	305V DC	382V DC
Vmin	153V DC	305V DC	382V DC
Voff	–	200V DC	–

In the following diagram, the x-axis across the bottom indicates what the input voltage is into the drive and the y-axis indicates the corresponding DC Bus Voltage. Then the levels of each event are indicated in the graph. For example if I measure at the input of my drive, 450 volts - phase to phase, I find that voltage across the bottom. Now the various voltage levels can be derived according to that voltage level.



Restart after Power Recovery

If a power loss causes the drive to coast, and power recovers, the drive returns to powering the motor if it is in a Run Permit state. The drive is in a Run Permit state if the following is true:

- **3 Wire mode** - it is not faulted and if all Enable and Not Stop inputs are energized.
- **2 Wire mode** - it is not faulted and if all Enable, Not Stop, and Run inputs are energized.

Power Loss Modes

The drive is designed to operate at a nominal input voltage. When voltage falls below this nominal value by a significant amount, action can be taken to preserve the bus energy and keep the drive logic alive as long as possible. The drive has three methods of dealing with low bus voltages.

- "Coast" - Disable the drive and allow the motor to coast. (default)
- "Decel" - Decelerate the motor at a rate that regulates the DC bus until the load's kinetic energy can no longer power the drive.
- "Continue" - Allow the drive to power the motor down to 50% of the nominal DC bus voltage. When power loss occurs, P959 [Alarm Status A] Bit 0 turns on if the P449 [Power Loss Actn] is set to 1 "Alarm."

If the P449 [Power Loss Actn] is set to 3 "FltCoastStop," an F3 "Power Loss" fault occurs when the power loss event exceeds P452/455 [Pwr Loss A/B Time].

The drive faults with a F4 “UnderVoltage” fault if the bus voltage falls below Vmin and the P460 [UnderVltg Action] is set to 3 “FltCoastStop.”

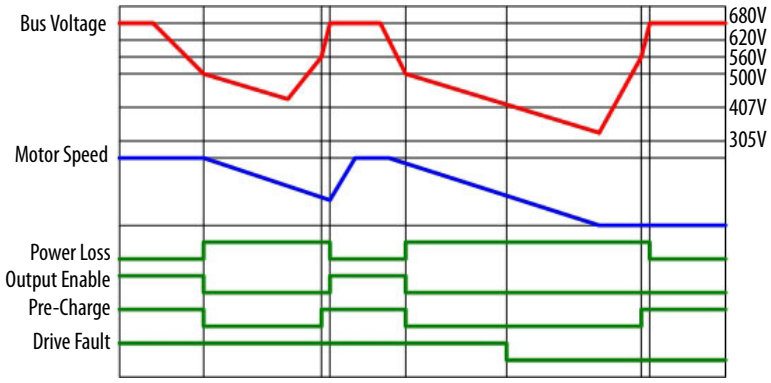
The pre-charge relay opens if the bus voltage drops below Vopen and closes if the bus voltage rises above Vclose.

If the bus voltage rises above Vrecover for 20 ms, the drive determines the power loss is over. The power loss alarm is cleared.

If the drive is in a Run Permit state, the reconnect algorithm is run to match the speed of the motor. The drive then accelerates at the programmed rate to the set speed.

Coast

This is the default mode of operation. The drive determines a power loss has occurred if the bus voltage drops below Vtrigger. If the drive is running, the inverter output is disabled and the motor coasts.



Decel

This mode of operation is useful if the mechanical load is high inertia and low friction. By recapturing the mechanical energy, converting it to electrical energy and returning it to the drive, the bus voltage is maintained. As long as there is mechanical energy, the ride through time is extended and the motor remains fully fluxed.

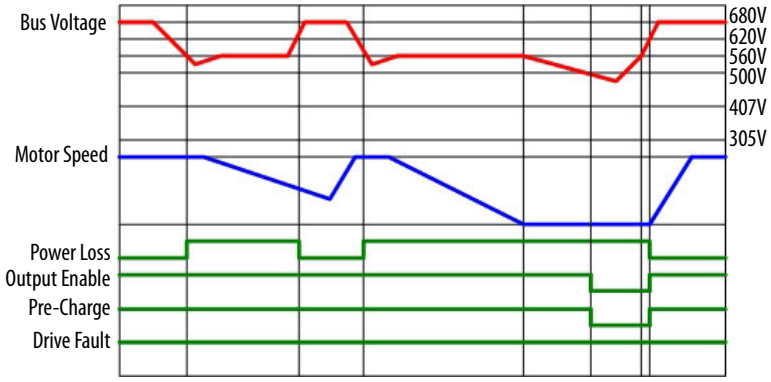
If AC input power is restored, the drive can ramp the motor to the correct speed without the need for reconnecting. The drive determines a power loss has occurred if the bus voltage drops below Vtrigger.

If the drive is running, the inertia ride through function is activated.

The load is decelerated at the correct rate so that the energy absorbed from the mechanical load regulates the DC bus to the value Vinertia.

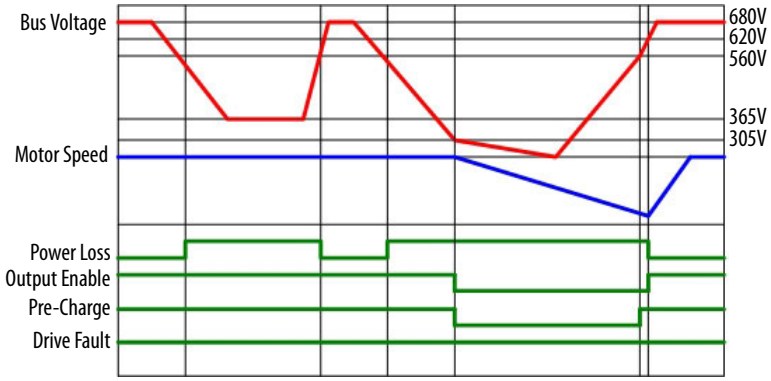
The inverter output is disabled and the motor coasts if the output frequency drops to zero or if the bus voltage drops below Vopen or if any of the Run Permit inputs are de-energized.

If the drive is still in inertia ride through operation when power returns, the drive immediately accelerates at the programmed rate to the set speed. If the drive is coasting and it is in a Run Permit state, the reconnect algorithm is run to match the speed of the motor. The drive then accelerates at the programmed rate to the set speed.



Continue

This mode provides the maximum power ride through. The input voltage can drop to 50% and the drive is still able to supply drive rated current (not drive rated power) to the motor.



ATTENTION: To guard against drive damage, a minimum line impedance must be provided to limit inrush current when the power line recovers. Provide an input impedance that is equal to or greater than the equivalent of a 5% transformer with a VA rating 6 times the drive's input VA rating.

Drive damage can occur if proper input impedance is not provided as explained below. If the value for [Power Loss Level] is greater than 18% of [DC Bus Memory], you must provide a minimum line impedance to limit inrush current when the power line recovers. Provide input impedance that is equal to or greater than the equivalent of a 5% transformer with a VA rating 5 times the drives input VA rating.

Process PID Loop

The internal PID function provides closed loop process control with proportional and integral control action. The function is designed to be used in applications that require simple control of a process without the use of a separate stand-alone loop controller.

The PID function reads a process variable input to the drive and compares it to a desired setpoint stored in the drive. The algorithm then adjusts the output of the PID regulator, changing drive output frequency to attempt zero error between the process variable and the setpoint.

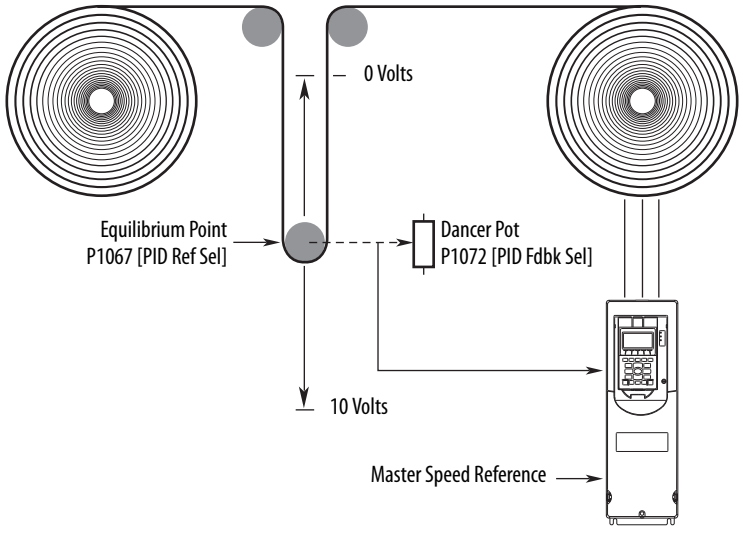
The Process PID can be used to modify the commanded speed or can be used to trim torque. There are two ways the PID Controller can be configured to modify the commanded speed.

- Speed Trim - The PID Output can be added to the master speed reference.
- Exclusive Control - PID can have exclusive control of the commanded speed.

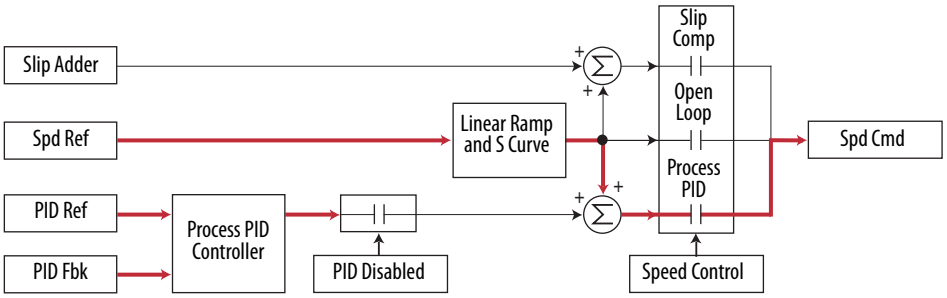
The mode of operation between speed trim, exclusive control, and torque trim is selected in P1079 [PID Output Sel].

Speed Trim Mode

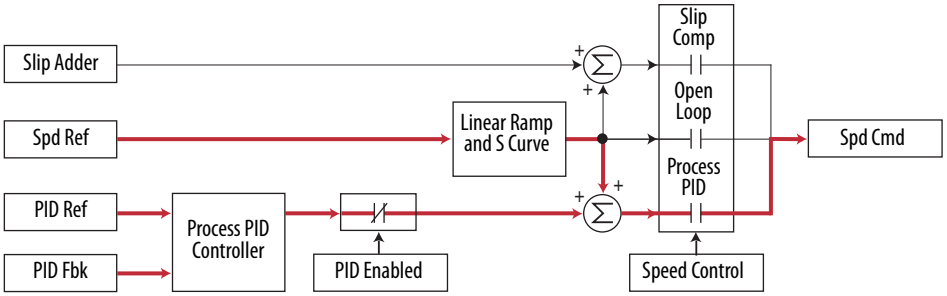
In this mode, the output of the PID regulator is summed with a master speed reference to control the process. This mode is appropriate when the process needs to be controlled tightly and in a stable manner by adding or subtracting small amounts directly to the output frequency (speed). In the following example, the master speed reference sets the wind/unwind speed and the dancer pot signal is used as a PID Feedback to control the tension in the system. An equilibrium point is programmed as PID Setpoint, and as the tension increases or decreases during winding, the master speed is trimmed to compensate and maintain tension near the equilibrium point.



When the PID is disabled the commanded speed is the ramped speed reference.



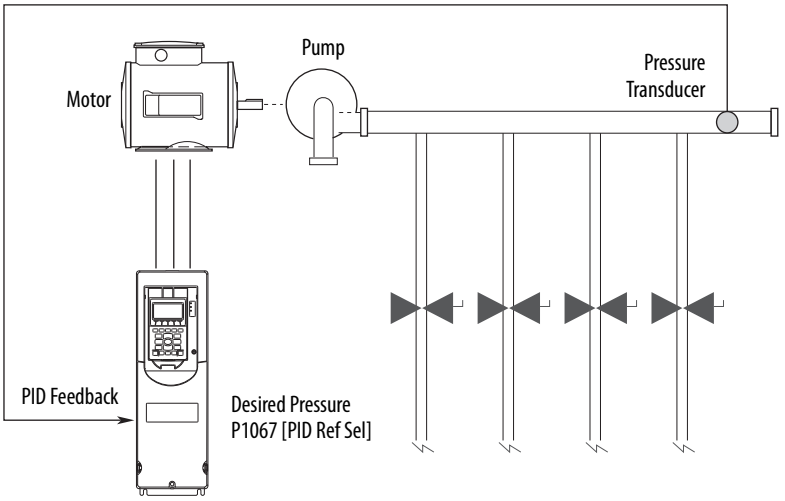
When the PID is enabled the output of the PID Controller is added to the ramped speed reference.



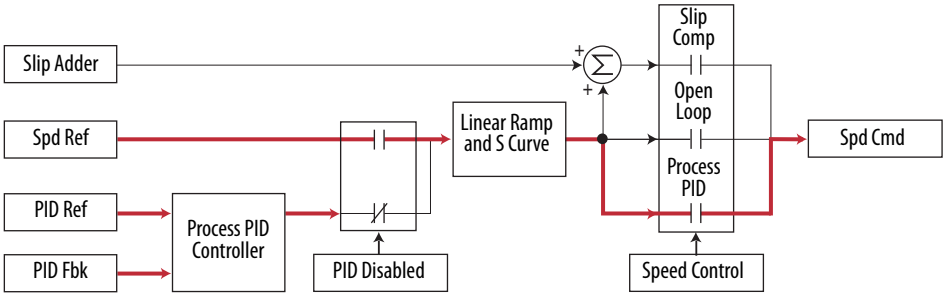
Exclusive Mode

In this mode, the output of PID regulator is the speed reference, and does not "trim" a master speed reference. This mode is appropriate when speed is unimportant and the only thing that matters is satisfying the control loop. In the pumping application example below, the reference or setpoint is the required pressure in the system. The input from the transducer is the PID feedback and changes as the pressure changes. The drive output frequency is then increased or decreased as needed to maintain system pressure regardless of flow changes. With

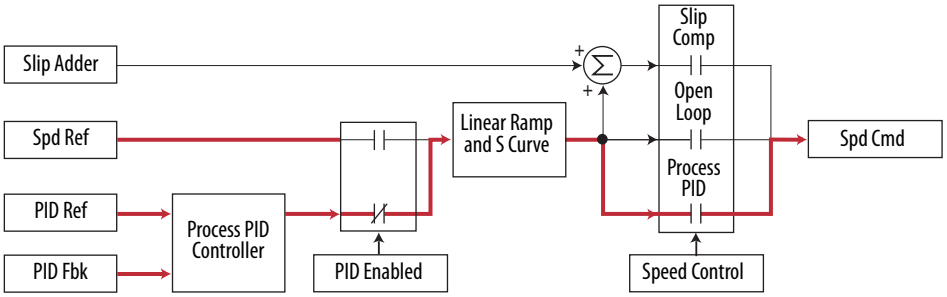
the drive turning the pump at the required speed, the pressure is maintained in the system.



However, when additional valves in the system are opened and the pressure in the system drops, the PID error alters its output frequency to bring the process back into control. When the PID is disabled the commanded speed is the ramped speed reference.



When the PID is enabled, the speed reference is disconnected and PID Output has exclusive control of the commanded speed, passing through the linear ramp and S curve.



PID Output Select

Parameter 1079 [PID Output Sel]

- "Not Used" (0) - PID output is not applied to any speed reference.
- "Speed Excl" (1) - PID output is the only reference applied to the speed reference.
- "Speed Trim" (2) - PID output is applied to speed reference as a trim value. (Default)
- "Torque Excl" (3) - PID output is only reference applied to torque reference.
- "Torque Trim" (4) - PID output is applied to torque reference as a trim value.
- "Volt Excl" (5) - PID output is only reference applied to voltage reference.
- "Volt Trim" (6) - PID output is applied to voltage reference as a trim value.

PID Configuration

Parameter 1065[PI Cfg] is a set of bits that select various modes of operation. The value of this parameter can only be changed while the drive is stopped.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type
APPLICATIONS	Process PID	1065	**PID Cfg** PID Configuration Main configuration of the Process PID controller.		RW	16-bit Integer

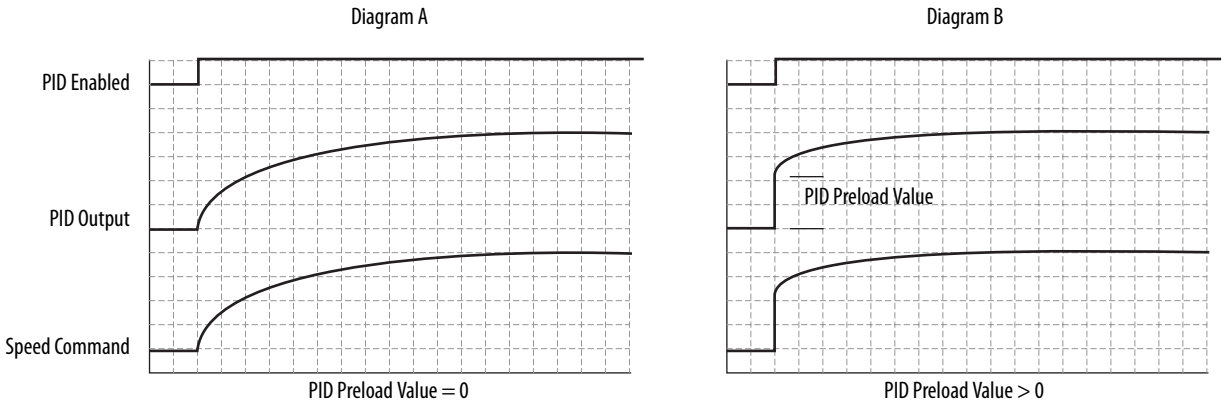
Options	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Percent Ref	Anti Windup	Stop Mode	Fdbk Sqrt	Zero Clamp	Ramp Ref	Preload Int
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0 = Disabled
1 = Enabled

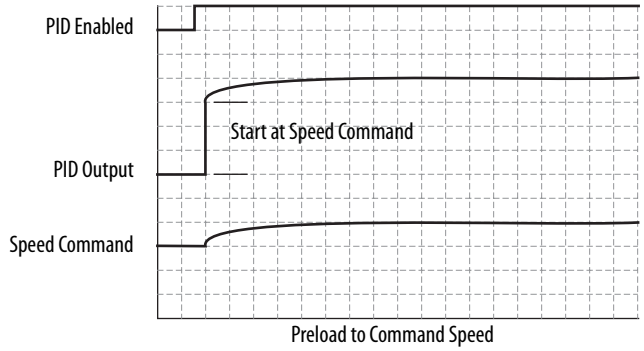
PID Preload

This feature steps the PID Output to a preload value for better dynamic response when the PID Output is enabled. Refer to the diagram below. If PID is not enabled, the PID Integrator can be initialized to the PID Preload Value or the current value of the commanded speed. The operation of Preload is selected in the PID Configuration parameter. By default, Preload Command is off and the PID Load Value is zero, causing a zero to be loaded into the integrator when the PID is disabled. As shown in Diagram A below, when the PID is enabled the PID output starts from zero and regulates to the required level. When PID is enabled with PID Load Value is set to a non-zero value the output begins with a step as shown in Diagram B below. This can result in the PID reaching steady state

sooner, however if the step is too large the drive can go into current limit and extend the acceleration.



Preload command can be used when the PID has exclusive control of the commanded speed. With the integrator preset to the commanded speed there is no disturbance in commanded speed when PID is enabled. After PID is enabled the PID output is regulated to the required level.



When the PID is configured to have exclusive control of the commanded speed and the drive is in current limit or voltage limit the integrator is preset to the commanded speed so that it knows where to resume when no longer in limit.

Ramp Ref

The PID Ramp Reference feature is used to provide a smooth transition when the PID is enabled and the PID output is used as a speed trim (not exclusive control). When PID Ramp Reference is selected in the PID Configuration parameter, and PID is disabled, the value used for the PID reference is the PID feedback. This causes the PID error to be zero. Then when the PID is enabled the value used for the PID reference ramps to the selected value for PID reference at the selected acceleration or deceleration rate. After the PID reference reaches the selected value the ramp is bypassed until the PID is disabled and enabled again. S-curve is not available as part of the PID linear ramp.

Zero Clamp

This feature limits the possible drive action to one direction only. Output from the drive is from zero to maximum frequency forward or zero to maximum frequency reverse. This removes the chance of doing a "plugging" type operation as an attempt to bring the error to zero. This bit is active only in trim mode.

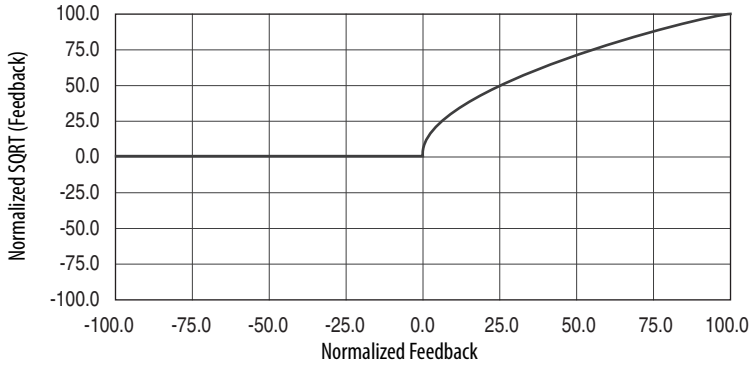
The PID has the option to limit operation so that the output frequency always has the same sign as the master speed reference. The zero clamp option is selected in the PID Configuration parameter. Zero clamp is disabled when PID has exclusive control of speed command.

For example, if master speed reference is +10 Hz and the output of the PID results in a speed adder of –15 Hz, zero clamp limits the output frequency to not become less than zero. Likewise, if master speed reference is –10 Hz and the output of the PID results in a speed adder of +15 Hz, zero clamp limits the output frequency to not become greater than zero.

Feedback Square Root

This feature uses the square root of the feedback signal as the PID feedback. This is useful in processes that control pressure, because centrifugal fans and pumps vary pressure with the square of speed.

The PID has the option to take the square root of the selected feedback signal. This is used to linearize the feedback when the transducer produces the process variable squared. The result of the square root is normalized back to full scale to provide a consistent range of operation. The option to take the square root is selected in the PID configuration parameter.



Stop Mode

When P370/371 [Stop Mode A/B] is set to 1 “Ramp” and a Stop command is issued to the drive, the PID loop continues to operate during the decel ramp until the PID output becomes more than the master reference. When set to 0 “Coast,” the drive disables PID and performs a normal stop. This bit is active in Trim mode only.

Anti-Wind Up

When P1065 [PID Cfg] Bit 5 “Anti Windup” is set to 1 “Enabled” the PID loop automatically prevents the integrator from creating an excessive error that could cause loop instability. The integrator is automatically controlled without the need for PID Reset or PID Hold inputs.

Percent Ref

When using Process PID control the output can be selected as percent of the Speed Reference. This works in Speed trim mode only, not in Torque Trim or Exclusive mode.

Examples

Percent Ref selected, Speed Reference = 43 Hz, PID Output = 10%, Maximum Frequency = 130 Hz. 4.3 Hz is added to the final speed reference.

Percent Ref not selected, Speed Reference = 43 Hz, PID Output = 10%, Maximum Frequency = 130 Hz. 13.0 Hz is added to the final speed reference.

PID Control

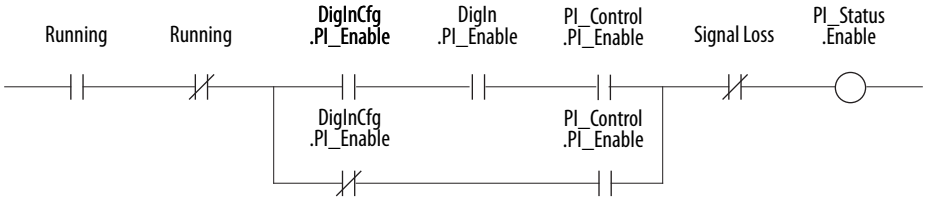
P1066 [PID Control] is a set of bits to dynamically enable and disable the operation of the process PID controller. When this parameter is interactively written to from a network it must be done through a data link so the values are not written to EEprom.

PID Enable

The PID loop can be enabled/disabled. The Enabled status of the PID loop determines when the PID regulator output is part or all of the commanded speed. The logic evaluated for the PID Enabled status is shown in the following ladder diagram.

The drive must be in Run before the PID Enabled status can turn on. The PID remains disabled when the drive is jogged. The PID is disabled when the drive begins a ramp to stop, except when it is in Trim mode and the Stop mode bit in P1065 [PID Cfg] is enabled.

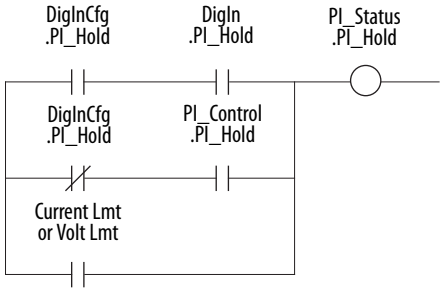
When a digital input is configured as "PI Enable," the PID Enable bit of P1066 [PID Control] must be turned On for the PID loop to become enabled. If a digital input is not configured as "PI Enable" and the PID Enable bit in [PID Control] is turned On, then the PID loop can become enabled. If the PID Enable bit of [PID Control] is left continuously, then the PID can become enabled as soon as the drive goes into Run. If analog input signal loss is detected, the PID loop is disabled.



PID Hold

The Process PID Controller has the option to hold the integrator at the current value so if some part of the process is in limit the integrator maintains the present value to avoid windup in the integrator. The logic to hold the integrator at the current value is shown in the following ladder diagram. There are three conditions under which Hold turns on.

- If a digital input is configured to provide PID Hold and that digital input is turned on then the PID integrator stops changing. Note that when a digital input is configured to provide PID Hold that takes precedence over the PID control parameter.
- If a digital input is not configured to provide PID Hold and the PID Hold bit in the PID Control parameter is turned on the PID integrator stops changing.
- If the current limit or voltage limit is active then the PID is put into Hold.



PI Reset

This feature holds the output of the integral function at zero. The term “anti windup” is often applied to similar features. It can be used for integrator preloading during transfer and can be used to hold the integrator at zero during “manual mode.”

For example a process whose feedback signal is below the reference point, creating error. The drive increases its output frequency in an attempt to bring the process into control. If, however, the increase in drive output does not zero the error, additional increases in output is commanded. When the drive reaches programmed Maximum Frequency, it is possible that a significant amount of integral value has been “built up” (windup). This can cause undesirable and sudden operation if the system were switched to manual operation and back. Resetting the integrator eliminates this windup.

Invert Error

This feature changes the “sign” of the error, creating a decrease in output for increasing error and an increase in output for decreasing error. An example of this is an HVAC system with thermostat control. In Summer, a rising thermostat reading commands an increase in drive output because cold air is being blown. In Winter, a falling thermostat commands an increase in drive output because warm air is being blown. The PID has the option to change the sign of PID Error. This is used when an increase in feedback needs to cause an increase in output. The option to invert the sign of PID Error is selected in the PID Configuration parameter.

PID Status

P1089 [PID Status] parameter is a set of bits that indicate the status of the process PID controller.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type
APPLICATIONS	Process PID	1089	**PID Status** PID Status Status of the Process PI regulator.		RO	16-bit Integer

Options	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	PID In Limit	PID Reset	PID Hold	PID Enabled
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0 = Condition False
1 = Condition True

Bit 0 "PID Enable" – PID controller is enabled.
Bit 1 "PID Hold" – Hold PID integrator.
Bit 2 "PID Reset" – Reset PID integrator.
Bit 3 "PID In Limit" – PID in limit.

PID Reference and Feedback

The selection of the source for the reference signal is entered in P1067 [PID Ref Sel]. The selection of the source for the feedback signal is selected in P1072 [PID Fdbk Sel]. The reference and feedback have the same limit of possible options.

Options include DPI adapter ports, MOP, preset speeds, analog inputs, pulse input, encoder input and PID setpoint parameter.

The value used for reference is displayed in P1090 [PID Ref Meter] as a read only parameter. The value used for feedback is displayed in P1091 [PID Fdbk Meter] as a read only parameter. These displays are active independent of PID Enabled. Full scale is displayed as ±100.00%.

PID Reference and Feedback Scaling

The analog PID reference can be limited by using P1068 [PID Ref AnlgHi] and P1069 [PID Ref AnlgLo]. [PID Ref AnlgHi] determines the high value, in percent, for the analog PID reference. [PID Ref AnlgLo] determines the low value, in percent, for the PID reference.

The analog PID feedback can be limited by using P1068 [PID Ref AnlgHi] and P1069 [PID Ref AnlgLo]. [PID Ref AnlgHi] determines the high value, in percent, for the PID feedback. [PID Ref AnlgLo] determines the low value, in percent, for the PID feedback.

Example

Display P1090 [PID Ref Meter] and P1091 [PID Fdbk Meter] as positive and negative values. Feedback from our dancer comes into Analog Input 2 as a 0-10V DC signal.

- P1067 [PID Ref Sel] = 0 “PI Setpoint”
- P1070 [PID Setpoint] = 50%
- P1072 [PID Fdbk Sel] = 2 “Analog In 2"
- P1068 [PID Ref AnlgHi] = 100%
- P1069 [PID Ref AnlgLo] = –100%
- P1073 [PID Fdbk AnlgHi] = 100%
- P1074 [PID Fdbk AnlgLo] = 0%
- P61 [Anlg In1 Hi] = 10V
- P62 [Anlg In2 Lo] = 0V

PI Feedback Scaling

- P675 [Trq Ref A Sel] = “Analog In 1”
- P61 [Anlg In1 Hi] = 10V
- P62 [Anlg In2 Lo] = 0V
- P1073 [PID Fdbk AnlgHi] = 100%
- P1074 [PID Fdbk AnlgLo] = 0%

Now 5V corresponds to 50% on the PID Feedback, and we try to maintain a PID setpoint of 50% (5V).

PID Setpoint

This parameter can be used as an internal value for the setpoint or reference for the process. If P1067 [PID Ref Sel] points to this parameter, the value entered here becomes the equilibrium point for the process.

PID Error

The PID Error is then sent to the Proportional and Integral functions, which are summed together.

PID Error Filter P1084 [PID LP Filter BW] sets up a filter for the PID Error. This is useful in filtering out unwanted signal response, such as noise in the PID loop feedback signal. The filter is a Radians/Second low pass filter.

PID Gains

Parameters P1086 [PID Prop Gain], P1087 [PID Int Time], and P1088 [PID Deriv Time] determine the response of the PID.

Proportional control (P) adjusts output based on size of the error (larger error = proportionally larger correction). If the error is doubled, then the output of the proportional control is doubled. Conversely, if the error is cut in half then the output of the proportional output is cut in half. With only proportional control there is always an error, so the feedback and the reference are never equal. [PID Prop Gain] is unit less and defaults to 1.00 for unit gain. With [PID Prop Gain] set to 1.00 and PID Error at 1.00% the PID output is 1.00% of maximum frequency.

Integral control (I) adjusts the output based on the duration of the error. (The longer the error is present, the harder it tries to correct). The integral control by itself is a ramp output correction. This type of control gives a smoothing effect to the output and continues to integrate until zero error is achieved. By itself, integral control is slower than many applications require and therefore is combined with proportional control (PI). [PID Int Time] is entered in seconds. If [PID Int Time] is set to 2.0 seconds and PI Error is 100.00% the PI output integrates from 0 to 100.00% in 2.0 seconds.

Derivative Control (D) adjusts the output based on the rate of change of the error and, by itself, tends to be unstable. The faster that the error is changing, the larger change to the output. Derivative control is usually used in torque trim mode and is usually not needed in speed mode.

For example, winders using torque control rely on PD control not PI control. Also, P1084 [PID LP Filter BW] is useful in filtering out unwanted signal response in the PID loop. The filter is a Radians/Second low pass filter.

PID Lower and Upper Limits/Output Scaling

The output value produced by the PID is displayed as ±100% in P1093 [PID Output Meter].

P1082 [PID Lower Limit] and P1081 [PID Upper Limit] are set as a percentage. In exclusive or speed trim mode, they scale the PID Output to a percentage of P37 [Maximum Freq]. In torque trim mode, they scale the PID Output as a percentage of rated motor torque.

Example

Set the PID lower and Upper limits to ±10% with Maximum Frequency set to 100 Hz. This lets the PID loop adjust the output of the drive ±10 Hz.

P1081 [PID Upper Limit] must always be greater than P1082 [PID Lower Limit].

Once the drive has reached the programmed Lower and Upper PID limits, the integrator stops integrating and no further "windup" is possible.

PID Output Mult

P1080 [PID Output Mult] enables additional scaling of the PID loop output.

Example

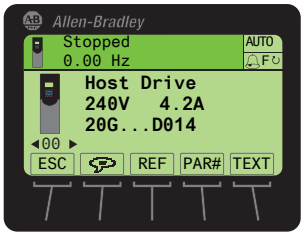
The application is a velocity controlled winder. As the roll builds up, the output gain can be reduced to allow the dancer signal to be properly reacted to by the PID loop without changing tuning of the PID loop.

PID Deadband

P1083 [PID Deadband] conditions the PID reference. If the PID reference has undesired rapid changes, the deadband can help smooth out these transitions.

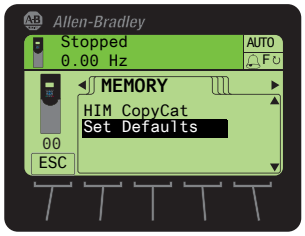
Reset Parameters to Factory Defaults

1. Access the Status Screen on the 20-HIM-A6 or 20-HIM-CS6 Human Interface Module.

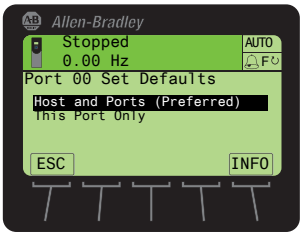


2. Use the left-right arrow keys to scroll to the port of the device whose parameters you want to set to factory defaults (for example, Port 00 for the Host Drive or the respective port number for the drive's connected peripherals).
3. Press the Folder key next to the green Start key to display its last-viewed folder.
4. Use the left-right arrow keys to scroll to the Memory folder.

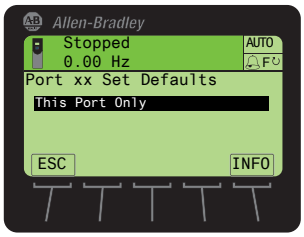
5. Use the up-down arrow keys to select Set Defaults.



6. Press the Enter (5) key to display the Set Defaults screen.



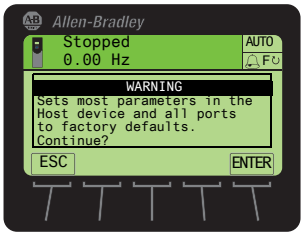
For Host Drive



For Connected Peripheral

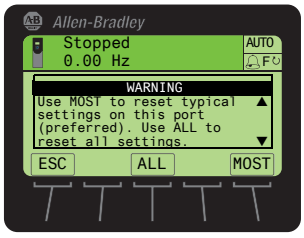
7. Use the up-down arrow keys select the appropriate action.
   - Host and Ports (Preferred): Selects the Host device and all ports for a factory default action.
   - This Port Only: Selects only this port for a factory default action. (For a description of a selected menu item, press the INFO soft key)
8. Press the Enter (5) key to display the warning pop-up box to reset defaults.

Host and Ports (preferred) Pop-up Box



Press the ENTER *soft key* to affirm and set most parameters for the Host Drive and port devices to factory defaults. In this case, refer to the Host Drive and port device user manuals for the settings that will NOT be restored—or press the ESC *soft key* to cancel.

This Port Only Pop-up Box



Press the MOST *soft key* to set MOST settings for the selected port device to factory defaults. In this case, refer to the Host Drive User Manual for the settings that will NOT be restored. Press the ALL *soft key* to set ALL settings for the selected port device to factory defaults—or press the ESC *soft key* to cancel.

A pop-up Fault warning display follows the parameter changes. This can be reset by pressing the clear soft key. And the following confirm pop-up box can be cleared by pressing the enter soft key. Pressing the escape key twice returns the display to the Status screen.

Refer to the PowerFlex 20-HIM-A6/-C6S HIM (Human Interface Module) User Manual, publication 20HIM-UM001, for further information on using the HIM and the resetting of parameters.

Sleep/Wake Mode

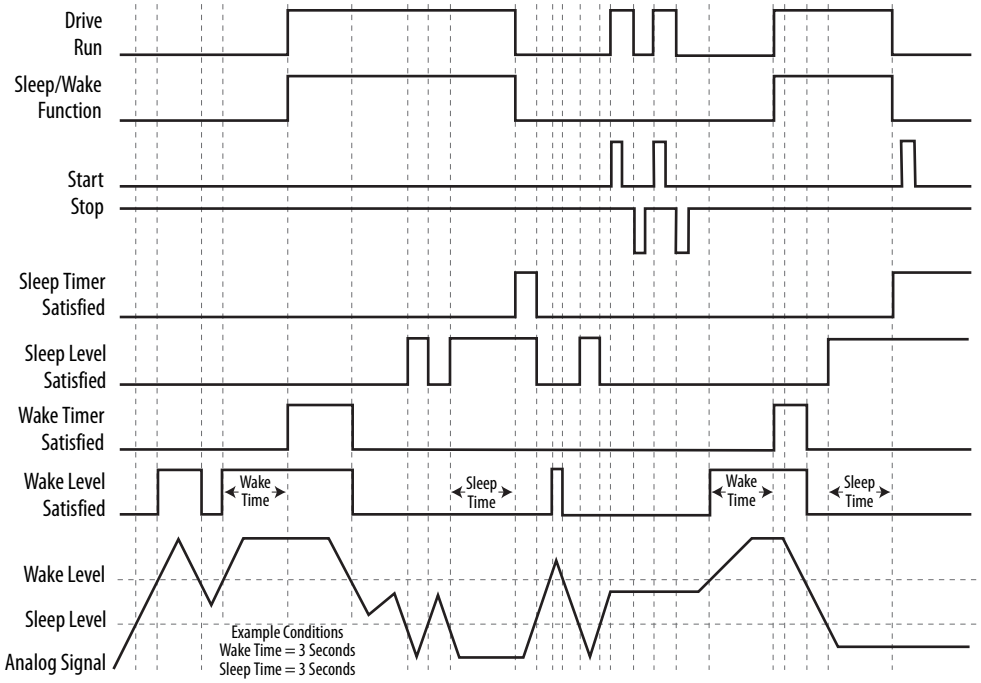
The purpose of the sleep/wake function is to Start (wake) the drive when an SleepWake RefSel signal is greater than or equal to the value in P354 [Wake Level], and Stop (sleep) the drive when an analog signal is less than or equal to the value in P352 [Sleep Level]. Setting P350 [Sleep Wake Mode] to 1 "Direct" enables the sleep/wake function to work as described.

An Invert mode also exists that changes the logic so that an analog value less than or equal to P354 [Wake Level] starts the drive and an SleepWake RefSel signal greater than or equal to P352 [Sleep Level] stops the drive.

Related Sleep/Wake parameters noted below.

Parameter No.	Parameter Name	Description
350	Sleep Wake Mode	Enables/disables the Sleep/Wake function.
351	SleepWake RefSel	Selects the source of the input controlling the sleep/wake function.
352	Sleep Level	Defines the SleepWake RefSel signal level that stops the drive.
353	Sleep Time	Defines the amount of time at or below 352 [Sleep Level] before a Stop is issued.
354	Wake Level	Defines the SleepWake RefSel signal level that starts the drive.
355	Wake Time	Defines the amount of time at or above 354 [Wake Level] before a Start is issued.

Sleep/Wake Operation



Requirements

In addition to enabling the sleep function with P350 [Sleep Wake Mode], the following conditions must be met:

- A proper value must be programmed for P352 [Sleep Level] and P354 [Wake Level].
- A sleep/wake reference must be selected in P351 [SleepWake RefSel].
- At least one of the following must be programmed (and input closed) in P155 [DI Enable], P158 [DI Stop], P163 [DI Run], P164 [DI Run Forward], or P165 [DI Run Reverse].

Conditions to Start/Restart

ATTENTION: Enabling the sleep/wake function can cause unexpected machine operation during the Wake mode. Equipment damage and/or personal injury can result if this parameter is used in an inappropriate application. Do not use this function without considering the Table 9 below and applicable local, national and international codes, standards, regulations or industry guidelines.

Table 9 - Conditions Required to Start Drive (1) (2) (3)

Input	After Powerup	After a Drive Fault		After a Stop Command
		Reset by HIM or Software "Stop"	Reset by HIM, Network/Software, or Digital Input "Clear Faults"	HIM, Network/Software or Digital Input "Stop"
Stop(4)	Stop Closed Wake Signal New Start or Run Command(5)	Stop Closed Wake Signal New Start or Run Command(5)	Stop Closed Wake Signal	Stop Closed Direct mode: SleepWake RefSel Signal > Sleep Level(7) Invert mode: SleepWake RefSel Signal < Sleep Level(8) New Start or Run Command(5)
Enable	Enable Closed Wake Signal	Enable Closed Wake Signal New Start or Run Command(5)	Enable Closed Wake Signal	Enable Closed Direct mode: SleepWake RefSel Signal > Sleep Level(7) Invert mode: SleepWake RefSel Signal < Sleep Level(8) New Start or Run Command(5)
Run Run Forward Run Reverse	Run Closed Wake Signal	New Run Command(6) Wake Signal	Run Closed Wake Signal	New Run Command Direct mode: SleepWake RefSel Signal > Sleep Level(7) Invert mode: SleepWake RefSel Signal < Sleep Level(8)

(1) When power is cycled, if all conditions are present after power is restored, restart occurs.
(2) If all conditions are present when [Sleep-Wake Mode] is "enabled," the drive starts.
(3) The active speed reference. The Sleep/Wake function and the speed reference can be assigned to the same input.
(4) Cannot use P159 [DI Cur Lmt Stop] or P160 [DI Coast Stop] as the only Stop Input. This causes the drive to go into a Sleep Cfg Alarm - Event No. 161.
(5) Command must be issued from HIM, TB or network.
(6) Run Command must be cycled.
(7) SleepWake Ref Sel signal does not need to be greater than the wake level.
(8) SleepWake Ref Sel signal does not need to be less than the wake level.

For Invert function, refer to the [Anlg In*n* LssActn] parameter.

Normal operation requires that P354 [Wake Level] be set greater than P352 [Sleep Level]. However, there are no limits that prevent the parameter settings from crossing, but the drive will not start until such settings are corrected. These levels are programmable while the drive is running. If P352 [Sleep Level] is made greater than P354 [Wake Level] while the drive is running, the drive continues to run as long as the P351 [SleepWake RefSel] signal remains at a level that doesn't trigger the sleep condition. P353 [Sleep Time] is also factored into this as well. Once the drive goes to sleep in this situation, it is not allowed to restart until the level settings are corrected (increase P354 [Wake Level], or decrease P352 [Sleep Level]). If however, the levels are corrected prior to the drive going to sleep, normal Sleep/Wake operation continues.

Timers

P353 [Sleep Time]
P355 [Wake Time]

Timers determine the length of time required for Sleep/Wake levels to produce true functions. These timers start counting when the Sleep/Wake levels are met and count in the opposite direction whenever respective level is not met. If the timer counts all the way to the user specified time, it creates an edge to toggle the Sleep/Wake function to the respective condition (sleep or wake). On powerup, timers are initialized to the state that does not permit a start condition. When the analog signal satisfies the level requirement, the timers start counting.

Interactive Functions

Separate start commands are also honored (including a digital input start), but only when the sleep timer is not satisfied. Once the sleep timer times out, the sleep function acts as a continuous stop. There are two exceptions that ignore the Sleep/Wake function.

1. When a device is commanding local control, that is HIM in Manual mode or a digital input programmed to P172 [DI Manual Ctrl].
2. When a jog command is being issued.

When a device is commanding local control, the port that is commanding it has exclusive start control (in addition to ref select), essentially overriding the Sleep/Wake function, and allowing the drive to run in the presence of a sleep situation. This holds true even for the case if digital input is programmed to P172 [DI Manual Ctrl], a digital input start or run is able to override a sleep situation.

Sleep/Wake Sources

The P351 [SleepWake RefSel] signal source for the sleep/wake function can be any analog input, whether it is being used for another function or not, a DeviceLogix software source (P90 [DLX Real OutSP1] thru P97 [DLX Real OutSP8]), or a valid numeric edit configuration. Configuring the sleep/wake source is done through P351 [SleepWake RefSel].

Also, [Anlg In*n* Hi] and [Anlg In*n* Lo] parameters have no effect on the function, however, the factory calibrated result, [Anlg In*n* Value] parameter, is used. In addition, the absolute value of the calibrated result is used, thus making the function useful for bipolar direction applications.

The analog in loss function, configured by the [Anlg In*n* LssActn] parameter, is unaffected and therefore operational with the sleep/wake function, but not tied to the sleep or wake levels and is triggered off the [Anlg In*n* Raw Value] parameter.

Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, for more details.

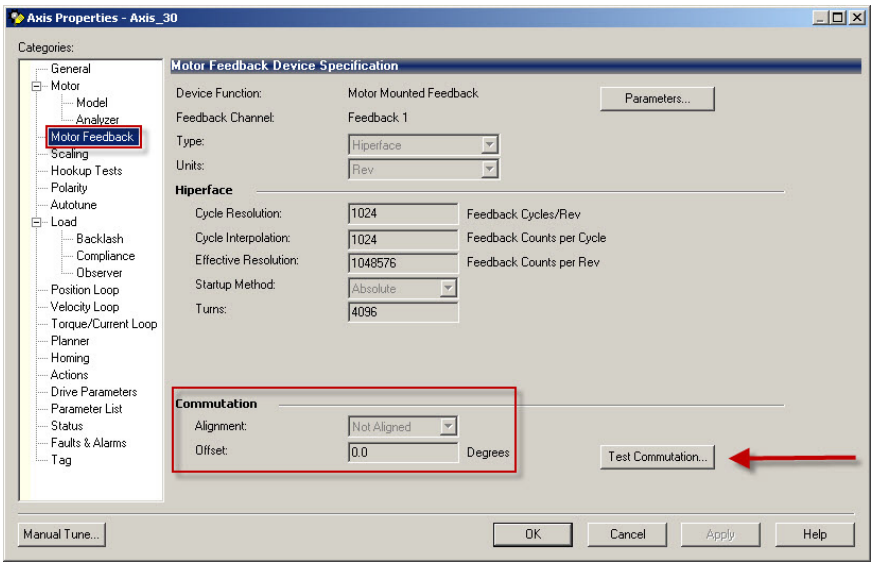
Start Permissives

Start permissives are conditions required to permit the drive to start in any mode, such as run, jog, or auto-tune. When all permissive conditions are met, the drive is considered ready to start. The ready condition is confirmed through the ready status in P935 [Drive Status 1].

Permissive Conditions

- No faults can be active.
- No Type 2 alarms can be active.
- The DI Enable input, if configured, must be closed.
- The DC bus precharge logic must indicate it is a start permissive.
- All Stop inputs must be negated nor any drive functions are issuing a stop.
- No configuration changes (parameters being modified) can be in-progress.
- The drive's safety option module logic must be satisfied.

If a CIP Motion connection is active and if alignment is set to "Not Aligned" then the "CommutNotCfg" bit is high (on). To clear this start inhibit, from the Axis Properties within the Logix Designer application, run a Commutation Test, enter the proper value into the Offset and then set the Alignment to "Controller Offset."



If all permissive conditions are met, a valid start, run or jog command starts the drive. The status of all current inhibit conditions are reflected in P933 [Start Inhibits] and the last inhibit conditions are reflected in P934 [Last StrtInhibit] details are shown below.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type
DIAGNOSTICS	Status	933	**Start Inhibits** Start Inhibits Indicates which condition is preventing the drive from starting or running.		RO	32-bit Integer

Options	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	CommutNotCfg	Profiler (1)	Sleep	Safety	Startup	Database	Stop	Precharge	Enable	Alarm	Faulted

(1) PowerFlex 755 drives only.

0 = False, 1 = True

Bit 0 "Faulted" – Drive is in a faulted state. See P951 [Last Fault Code].
Bit 1 "Alarm" – A Type 2 alarm exists. See P961 [Type 2 Alarms].
Bit 2 "Enable" – An Enable input is open.
Bit 3 "Precharge" – Drive is in precharge. See P321 [Prchrg Control], P11 [DC Bus Volts].
Bit 4 "Stop" – Drive is receiving a stop signal. See P919 [Stop Owner].
Bit 5 "Database" – Database is performing a download operation.
Bit 6 "Startup" – Startup is active and preventing a start. Go to Start-Up Routine and abort.
Bit 7 "Safety" – Safety option module is preventing a start.
Bit 8 "Sleep" – Sleep function is issuing a stop. See P 350 [Sleep Wake Mode], P351 [SleepWake RefSel].
Bit 9 "Profiler" – Profiler function is issuing a stop. See P1210 [Profile Status].
Bit 10 "CommutNotCfg" – The associated PM motor commutation function has not been configured for use.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type
DIAGNOSTICS	Status	934	**Last StrtInhibit** Last Start Inhibit Displays the Inhibit that prevented the last Start signal from starting the drive. Bits are cleared after the next successful start sequence. See parameter 933 [Start Inhibits] for bit descriptions.		RO	32-bit Integer

Options	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	CommutNotCfg	Profilier	Sleep	Safety	Startup	Database	Stop	Precharge	Enable	Alarm	Faulted

0 = False, 1 = True

Stop Modes

Stop Mode A/B can be configured as a method of stopping the drive when a stop command is given. A normal stop command and the run input changing from true to false results in a normal stop command. However, when using TorqueProve, P1100 [Trq Prove Cfg] with Bit 0 enabled, [Stop Mode A/B] must be set to 1 "Ramp."

P392 [Stop Dwell Time] can also be used with a stop command. This can be used to set an adjustable time between detecting zero speed and turning off the drive output.

The PowerFlex 750 series offers several methods for stopping a load. The stop method or mode is defined by parameters 370/371 [Stop Mode A/B] These modes include the following:

- Coast
- Ramp
- Ramp to Hold
- DC Brake
- DC Brake Auto Off
- Current Limit
- Fast Brake

Additionally, P388 [Flux Braking In] can be selected separately (not part of the Stop mode selection) to provide additional braking during a Stop command or when reducing the speed command. For Stop commands, this provides additional braking power during "Ramp" or "Ramp to Hold" selections only. If "Fast Brake" or "DC Brake" is used, "Flux Braking" is active only during speed changes (if enabled).

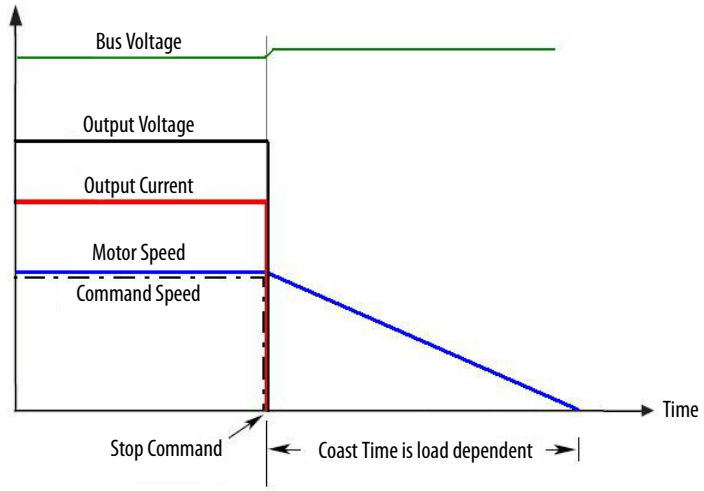
A "Ramp" selection always provides the fastest stopping time if a method to dissipate the required energy from the DC bus is provided (that is Dynamic Braking resistor, regenerative brake, and so forth.). The PowerFlex Dynamic Braking Selection Guide presented in Appendix A of the Reference Manual, explains Dynamic Braking in detail.

The alternative braking methods to external hardware brake requirements, can be enabled if the stopping time is not as restrictive. Each of these methods dissipates energy in the motor (use care to avoid motor overheating).

Braking Methods

Method	Use when application Requires	Braking Power
Coast	Power is removed from the motor and it coasts to zero speed	None
Ramp	The fastest stopping time or fastest ramp time for speed changes (external brake resistor or regenerative capability required for ramp times faster than the methods below). High duty cycles, frequent stops or speed changes. (The other methods can result in excessive motor heating).	The most
Ramp to Hold	Same as ramp above only when zero speed is reach the drive outputs a DC brake current to be sure the motor shaft doesn't move after it has stopped. This continues until the drive is started again.	Same as "Ramp"
DC Brake	DC braking is immediately applied (does not follow programmed decel ramp). May have to adjust P397 [DC Brake Kp].	Less than Ramp or Fast Brake
DCBrkAutoOff	Applies DC braking until zero speed is reached or DC brake time is reached, whichever is shorter.	Less than Ramp or Fast Brake
Current Lmt	Max torque / current applied until zero speed	Big Stuff
Fast Brake	High slip braking for maximum braking performance above base speed.	More than DC Brake / DC Brake Auto Off

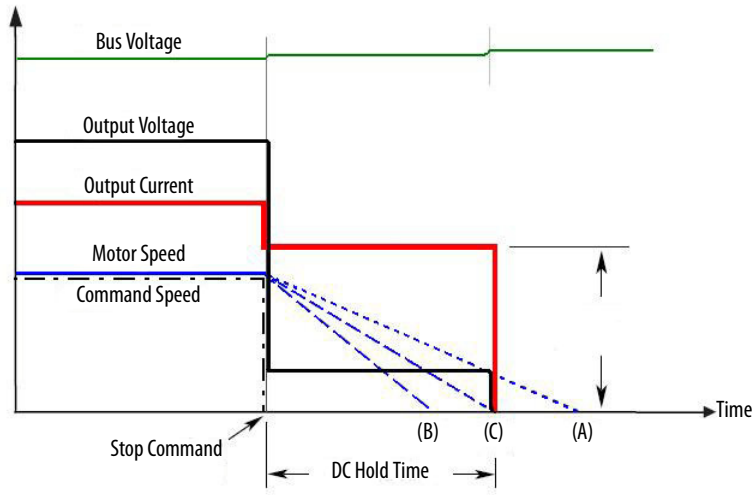
Coast



Coast is selected by setting P370/371 [Stop Mode A/B] to 0 "Coast." When in Coast to Stop, the drive acknowledges the Stop command by shutting off the output and releasing control of the motor. The load/motor will coast or free spin until the kinetic energy is dissipated.

- On Stop, the drive output goes immediately to zero (off).
- No further power is supplied to the motor. The drive has released control.
- The motor coasts for a time that is dependent on the mechanics of the system (Inertia, friction, and so forth).

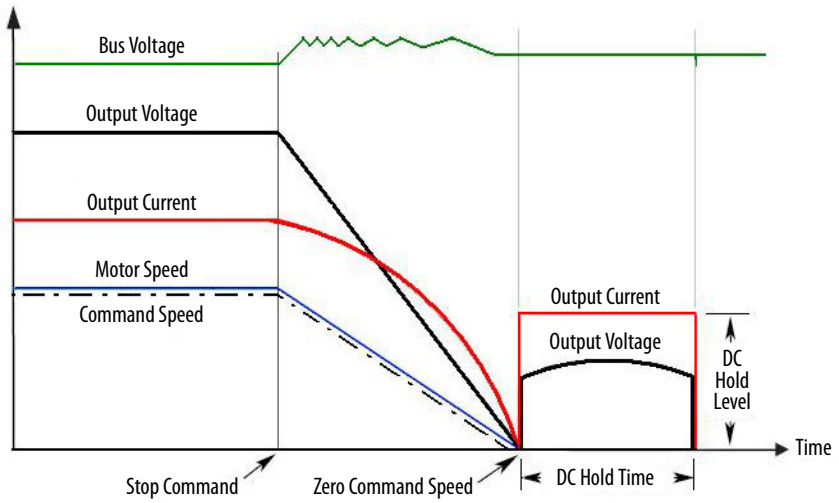
DC Brake



This method uses DC injection of the motor to Stop and/or hold the load. DC Brake is selected by setting P370/371 [Stop Mode A/B] to 3 "DC Brake." You can also choose the amount of time the braking is applied and the magnitude of the current used for braking with P395 [DC Brake Time] and P394 [DC Brake Level]. This mode of braking generates up to 40% of rated motor torque for braking and is typically used for low inertia loads with infrequent Stop cycles:

- On Stop, 3 phase drive output goes to zero (off).
- Drive outputs DC voltage on the last used phase to provide the current level programmed in P394 [DC Brake Level]. This voltage causes a stopping brake torque. If the voltage is applied for a time that is longer than the actual possible stopping time, the remaining time is used to attempt to hold the motor at zero speed (decel profile "B" on the diagram above).
- DC voltage to the motor continues for the amount of time programmed in P395 [DC BrakeTime]. Braking ceases after this time expires.
- After the DC Braking ceases, no further power is supplied to the motor. The motor/load may or may not be stopped. The drive has released control of the motor/load (decel profile "A" on the diagram above).
- The motor, if rotating, coasts from its present speed for a time that is dependent on the remaining kinetic energy and the mechanics of the system (inertia, friction, and so forth).
- Excess motor current and/or applied duration, could cause motor damage. Motor voltage can exist long after the Stop command is issued. The right combination of Brake Level and Brake Time must be determined to provide the safest, most efficient stop (decel profile "C" on the diagram above).

Ramp



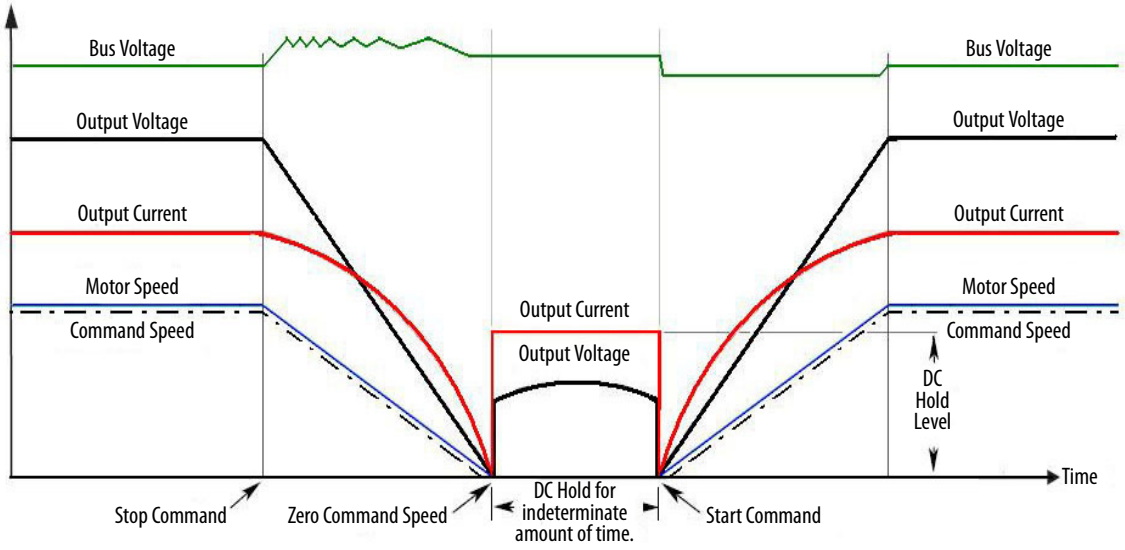
This method uses drive output reduction to stop the load.

Ramp To Stop is selected by setting parameters 370/371[Stop Mode A/B] to 1 "Ramp." The drive ramps the frequency to zero based on the deceleration time programmed into parameters 537/538 [Decel Time 1/2]. The normal mode of machine operation can utilize [Decel Time 1]. If the machine Stop requires a faster deceleration than desired for normal deceleration, [Decel Time 2] can be activated with a faster rate selected. When in Ramp mode, the drive acknowledges the Stop command by decreasing or ramping the output voltage and frequency to zero in a programmed period (Decel Time), maintaining control of the motor until the drive output reaches zero. The drive output is then shut off. The load/motor follows the decel ramp. Other factors such as bus regulation and current limit can alter the actual decel rate.

Ramp mode can also include a timed hold brake. Once the drive has reached zero output hertz on a Ramp-to-Stop and both parameters 395 [DC Brake Time] and P394 [DC Brake Level] are not zero, the drive applies DC to the motor producing current at the DC Brake Level for the DC Brake Time:

- On Stop, drive output decreases according to the programmed pattern from its present value to zero. The pattern can be linear or squared. The output decreases to zero at the rate determined by the programmed P520 [Max Fwd Speed] or P521 [Max Rev Speed] and the programmed active (Decel Time *n*).
- The reduction in output can be limited by other drive factors such as bus or current regulation.
- When the output reaches zero the output is shut off.
- The motor, if rotating, coasts from its present speed for a time that is dependent on the mechanics of the system (inertia, friction, and so forth).

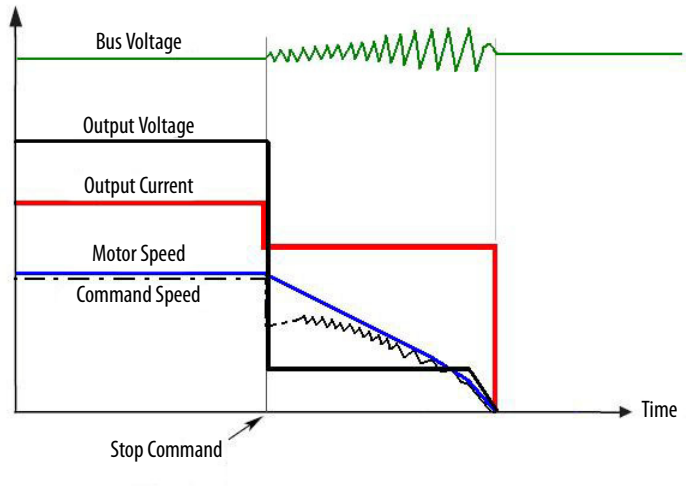
Ramp to Hold



This method combines two of the methods above. It uses drive output reduction to stop the Load and DC injection to hold the load at zero speed once it has stopped:

- On Stop, drive output decreases according to the programmed pattern from its present value to zero. The pattern can be linear or squared. The output decreases to zero at the rate determined by the programmed P37 [Maximum Freq] and the programmed active P537/538 [Decel Time 1/2]
- The reduction in output can be limited by other drive factors such as bus or current regulation.
- When the output reaches zero 3 phase drive output goes to zero (off) and the drive outputs DC voltage on the last used phase to provide the current level programmed in P394 [DC Brake Level]. This voltage causes a holding brake torque.
- DC voltage to the motor continues until a Start command is reissued or the drive is disabled.
- If a Start command is reissued, DC Braking ceases and the drive returns to normal AC operation. If an Enable command is removed, the drive enters a Not Ready state until the enable is restored.

Fast Brake

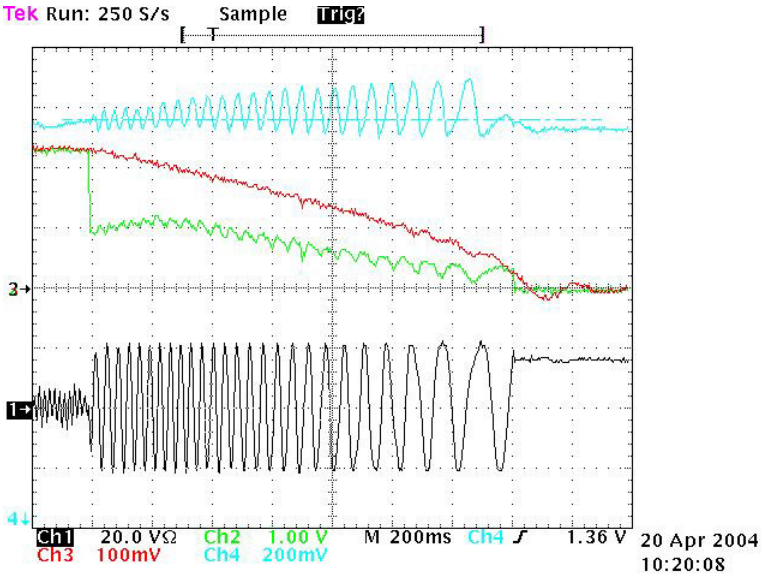


This method takes advantage of the characteristic of the induction motor whereby frequencies greater than zero (DC braking) can be applied to a spinning motor that provides more braking torque without causing the drive to regenerate:

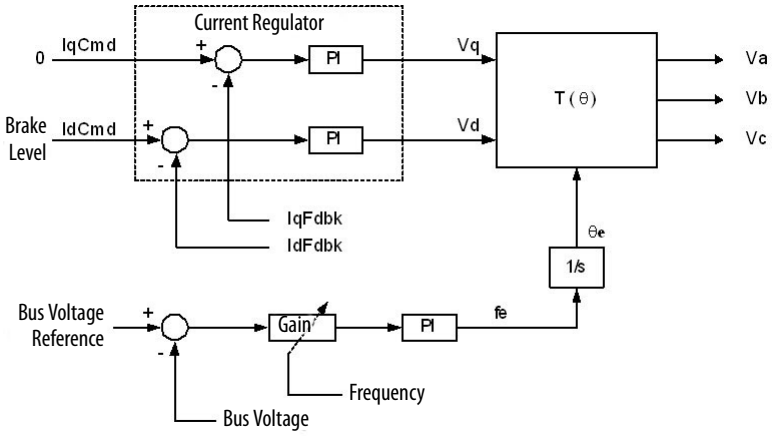
- On Stop, the drive output decreases based on the motor speed, keeping the motor out of the regen region. This is accomplished by lowering the output frequency below the motor speed where regeneration does not occur. This causes excess energy to be lost in the motor.
- The method uses a PI based bus regulator to regulate the bus voltage to a reference (that is 750V) by automatically decreasing output frequency at the proper rate.
- When the frequency is decreased to a point where the motor no longer causes the bus voltage to increase, the frequency is forced to zero. DC brake is used to complete the stop if the DC Braking Time is non-zero, then the output is shut off.
- Use of the current regulator verifies that over current trips don't occur and allow for an easily adjustable and controllable level of braking torque.
- Use of the bus voltage regulator results in a smooth, continuous control of the frequency and forces the maximum allowable braking torque to be utilized at all times.

IMPORTANT	For this feature to function properly the active [Bus Reg Mode A/B] must be set to 1 "Adjust Freq" and **not** be 0 "Disabled."

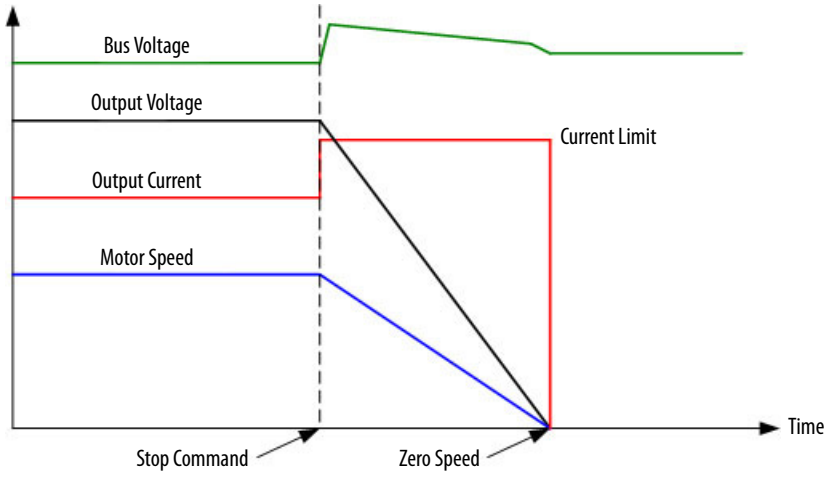
Example



Block Diagram



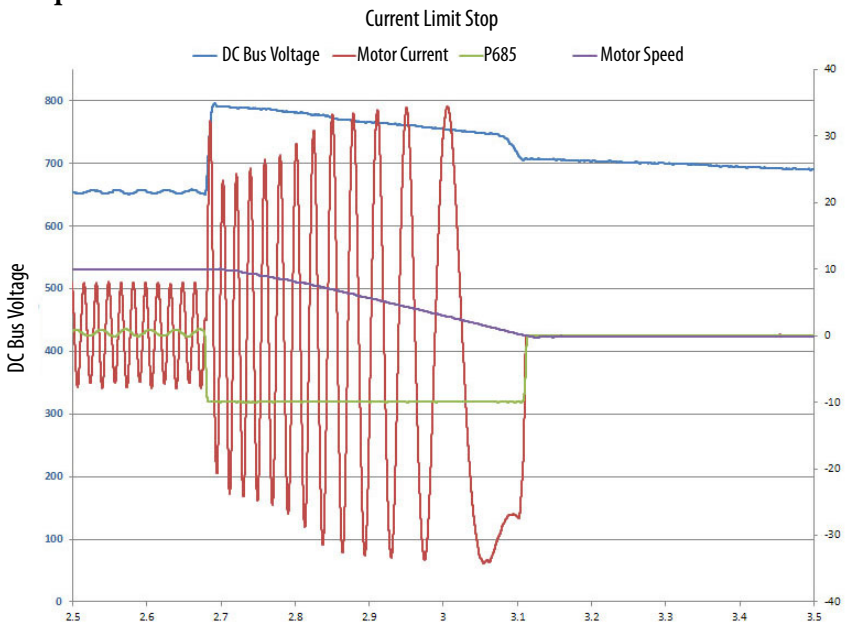
Current Limit Stop



Current Limit stop is not typically set up as the normal Stop mode. Usually the normal stop is programmed at some ramp rate. For the current limit stop a digital input is used for the function. However, you certainly could set the normal stop as CurrentLimit Stop

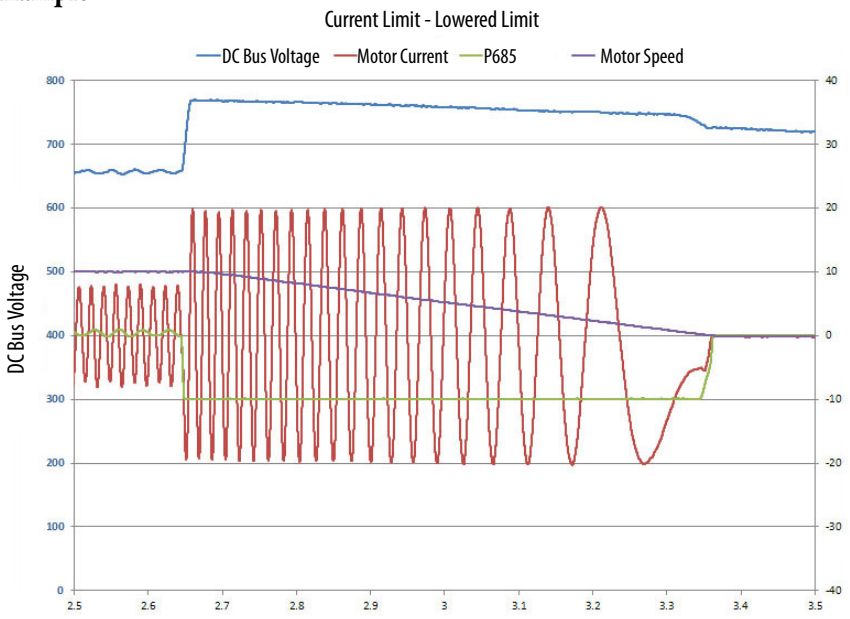
Current limit stop ramp rate is 0.1 second and is not programmable

Example



In this example the current limit was set high enough to allow the full rating of the drive to be used in the stop sequence.

Example



In this example the current limit was set at some value such that when the stop was issued the output current was clamped at that setting. Note the decel time is extended.

Voltage Class

PowerFlex drives are sometimes referred to by voltage class, which identifies the general input voltage to the drive. P305 [Voltage Class] includes a range of voltages. For example, a 400V class drive has an input voltage range of 380...480V AC. While the hardware remains the same for each class, other variables, such as factory defaults, catalog number, and power unit ratings change. In most cases the voltage of a drive can be reprogrammed to another value within the class by resetting the defaults to something other than factory settings.

P305 [Voltage Class], is required by the drive when parameter downloads occur and is generally not programmed individually. This parameter provides a "Low Voltage" and "High Voltage" setting. The default value is dependent upon the voltage that matches the catalog number (for example 400V or 480V). For example, a drive shipped as 400V (catalog code "C") has a default of "Low Voltage" for P305 [Voltage Class]. A drive shipped as 480V (catalog code "D") has a default of "High Voltage."

When a change is made to P305 [Voltage Class], the continuous current rating of the drive changes by an amount equal to the published difference between catalog numbers. With a change to the current rating, review P422 [Current Limit 1] and P423 [Current Limit 2].

Also note that a Reset to Defaults "All" resets the voltage to the original factory setting.

Feedback and I/O

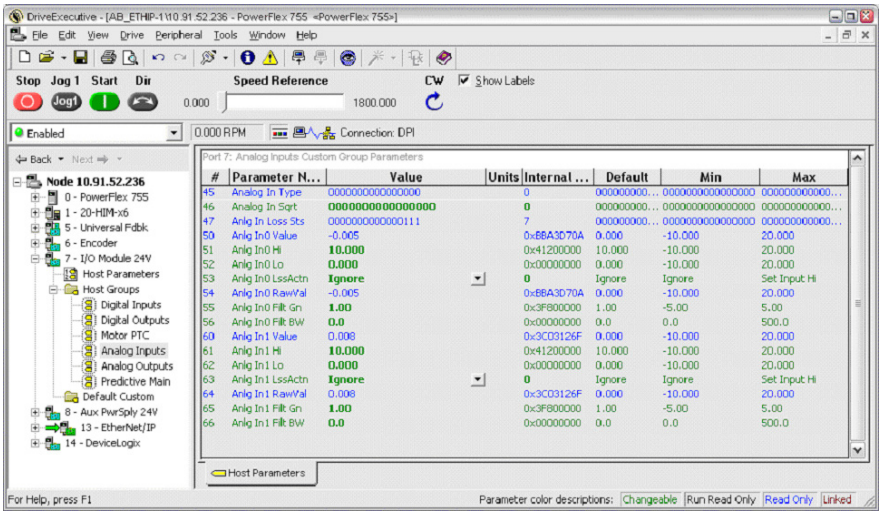
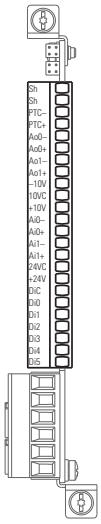
Analog Inputs

There are two analog inputs per I/O module. Up to four I/O modules can be mounted in the drive ports. See the PowerFlex 750-Series Installation Instructions, publication 750-IN001, for valid ports. Accessing the analog input parameters is done by selecting the port that the module is mounted in, then accessing the Analog Input group of parameters.



Analog Input Specifications



Terminal	Name	Description	Related Param [5]
Sh	Shield	Terminating point for wire shields when an EMC plate or conduit box is not installed.	
Sh			
Ptc–	Motor PTC (–)	Motor protection device (Positive Temperature Coefficient).	40 on Port X
Ptc+	Motor PTC (+)		
Ao0–	Analog Out 0 (–)	Bipolar, ±10V, 11 bit & sign, 2 k ohm minimum load. 4-20 mA, 11 bit & sign, 400 ohm maximum load.	75 on Port X
Ao0+	Analog Out 0 (+)		
Ao1–	Analog Out 1 (–)		85 on Port X
Ao1+	Analog Out 1 (+)		
–10V	–10 Volt Reference	2k ohm minimum.	
10VC	10 Volt Common	For (–) and (+) 10 Volt references.	
+10V	+10 Volt Reference	2k ohm minimum.	
Ai0–	Analog Input 0 (–)	Isolated [3], bipolar, differential, 11 bit & sign. Voltage mode: ±10V @ 88k ohm input impedance. Current mode: 0-20 mA @ 93 ohm input impedance.	50, 70 on Port X
Ai0+	Analog Input 0 (+)		
Ai1–	Analog Input 1 (–)		60, 70 on Port X
Ai1+	Analog Input 1 (+)		
24VC	24 Volt Common [1]	Drive supplied logic input power. 200 mA max per I/O module 600 mA max per drive	
+24V	+24 Volt DC [1]		
Di C	Digital Input Common	Common for Digital Inputs 0…5	
Di 0	Digital Input 0 [2]	24V DC - Opto isolated Low State: less than 5V DC High State: greater than 20V DC 11.2 mA DC 115V AC, 50/60 Hz [4] - Opto isolated Low State: less than 30V AC High State: greater than 100V AC	1 on Port X
Di 1	Digital Input 1 [2]		
Di 2	Digital Input 2 [2]		
Di 3	Digital Input 3 [2]		
Di 4	Digital Input 4 [2]		
Di 5	Digital Input 5 [2]		

(1) Not present on 120V versions.

(2) Digital Inputs are either 24 Volts DC (2262C) or 115 Volts AC (2262D) based on module catalog number. Be sure applied voltage is correct for I/O module.

(3) Differential Isolation - External source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.

(4) For CE compliance use shielded cable. Do not exceed 30 m (98 ft) cable length.

(5) I/O Module parameters also have a Port designation.

Analog Scaling

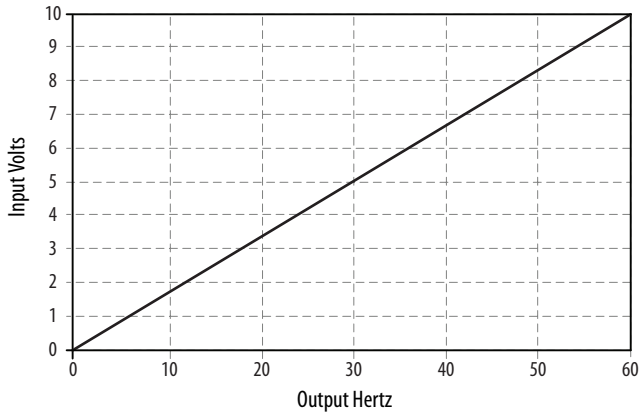
[Anlg In*n* Lo]
[Anlg In*n* Hi]

A scaling operation is performed on the value read from an analog input to convert it to units usable for some particular purpose. Control the scaling by setting parameters that associate a low and high analog value (in volts or mA) with a low and high target (in Hz).

Example 1

- P255 [Anlg In Type], Bit 0 = "0" (Voltage)
- P545 [Spd Ref A Sel] = "Analog In 1"
- P547 [Spd Ref A AnlgHi] = 60 Hz
- P548 [Spd Ref A AnlgLo] = 0 Hz
- P61 [Anlg In1 Hi] = 10V
- P62 [Anlg In1 Lo] = 0V

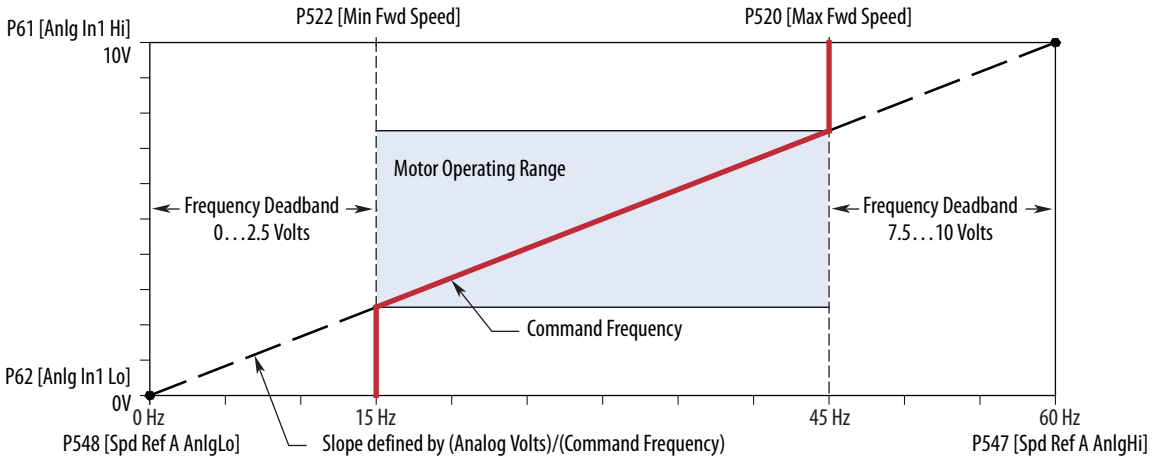
This is the default setting, where 0V represents 0 Hz and 10V represents 60 Hz providing 1024 steps (10 bit analog input resolution) between 0 and 60 Hz.



Example 2
Consider the following setup:

- P255 [Anlg In Type], Bit 0 = "0" (Voltage)
- P545 [Spd Ref A Sel] = "Analog In 1"
- P61 [Anlg In1 Hi] = 10V
- P62 [Anlg In1 Lo] = 0V
- P547 [Spd Ref A AnlgHi] = 60 Hz
- P548 [Spd Ref A AnlgLo] = 0 Hz
- P520 [Max Fwd Speed] = 45 Hz
- P522 [Min Fwd Speed] = 15 Hz

This configuration is used when non-default settings are desired for minimum and maximum speeds, but full range (0...10V) scaling from 0...60 Hz is still desired.



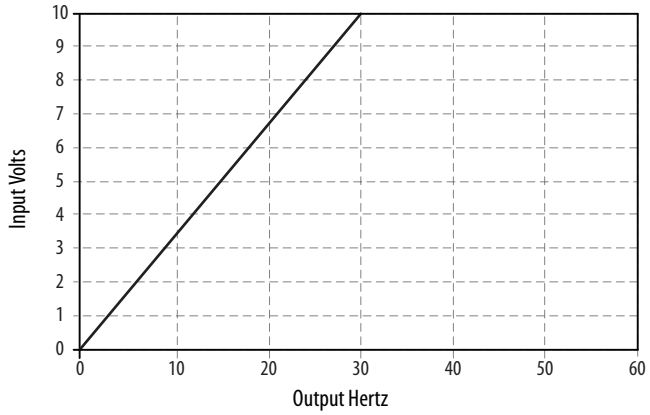
In this example, a deadband from 0...2.5V and from 7.5...10V is created. Alternatively, the analog input deadband could be eliminated while maintaining the 15 and 45 Hz limits with the following changes:

- P548 [Spd Ref A AnlgLo] = 15 Hz
- P547 [Spd Ref A AnlgHi] = 45 Hz

Example 3

- P255 [Anlg In Type], Bit 0 = "0" (Voltage)
- P545 [Spd Ref A Sel] = "Analog In 1"
- P547 [Spd Ref A AnlgHi] = 30 Hz
- P548 [Spd Ref A AnlgLo] = 0 Hz
- P61 [Anlg In1 Hi] = 10V
- P62 [Anlg In1 Lo] = 0V

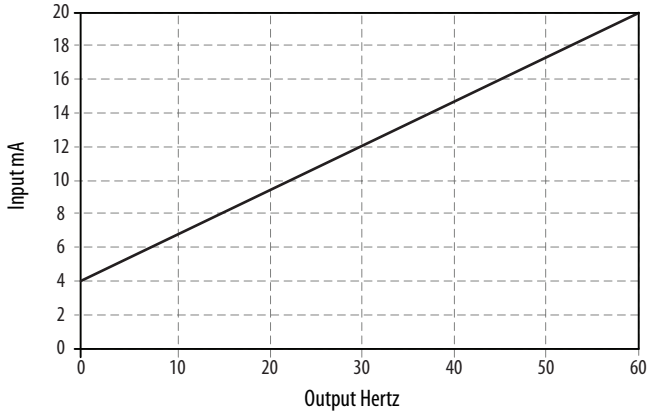
This is an application that requires only 30 Hz as a maximum output frequency but is still configured for full 10V input. The result is that the resolution of the input has been doubled, providing 1024 steps between 0 and 30 Hz.



Example 4

- P255 [Anlg In Type], Bit 0 = "1" (Current)
- P545 [Spd Ref A Sel] = "Analog In 1"
- P547 [Spd Ref A AnlgHi] = 60 Hz
- P548 [Spd Ref A AnlgLo] = 0 Hz
- P61 [Anlg In1 Hi] = 20 mA
- P62 [Anlg In1 Lo] = 4 mA

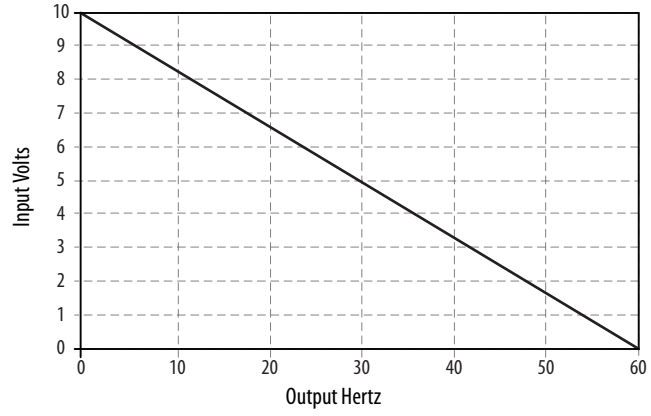
This configuration is referred to as offset. In this case, a 4...20 mA input signal provides 0...60 Hz output, providing a 4 mA offset in the speed command.



Example 5

- P255 [Anlg In Type], Bit 0 = "0" (Voltage)
- P545 [Spd Ref A Sel] = "Analog In 1"
- P547 [Spd Ref A AnlgHi] = 0 Hz
- P548 [Spd Ref A AnlgLo] = 60 Hz
- P61 [Anlg In1 Hi] = 10V
- P62 [Anlg In1 Lo] = 0V

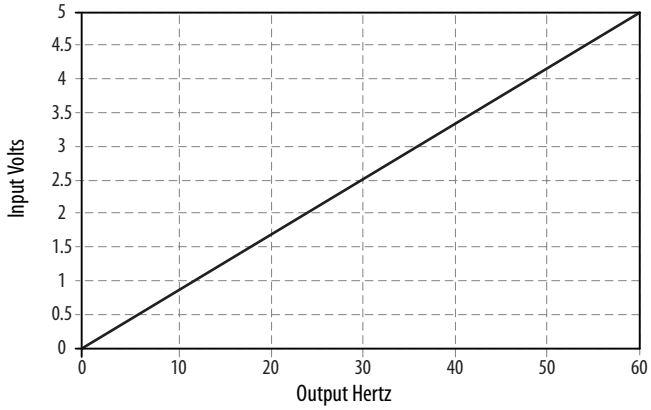
This configuration is used to invert the operation of the input signal. Here, maximum input (10V) represents 0 Hz and minimum input (0V) represents 60 Hz.



Example 6

- P255 [Anlg In Type], Bit 0 = "0" (Voltage)
- P545 [Spd Ref A Sel] = "Analog In 1"
- P547 [Spd Ref A AnlgHi] = 60 Hz
- P548 [Spd Ref A AnlgLo] = 0 Hz
- P61 [Anlg In1 Hi] = 5V
- P62 [Anlg In1 Lo] = 0V

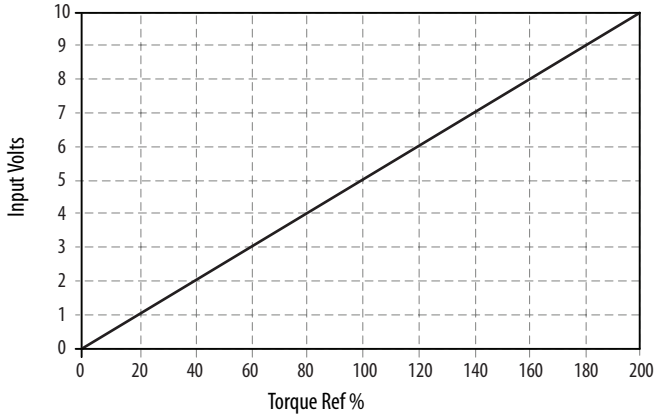
This configuration is used when the input signal is 0...5V. Here, minimum input (0V) represents 0 Hz and maximum input (5V) represents 60 Hz. This provides full scale operation from a 0...5V source.



Example 7

- P255 [Anlg In Type], Bit 0 = "0" (Voltage)
- P675 [Trq Ref A Sel] = "Analog In 1"
- P677 [Trq Ref A AnlgHi] = 200%
- P678 [Trq Ref A AnlgLo] = 0%

This configuration is used when the input signal is 0...10V. The minimum input of 0V represents a torque reference of 0% and maximum input of 10V represents a torque reference of 200%.



Square Root

The square root function can be applied to each analog input through the use of P256 [Anlg In Sqrt]. Enable the function if the input signal varies with the square of the quantity (for example drive speed) being controlled.

If the mode of the input is bipolar voltage (-10...10V), then the square root function returns 0 for all negative voltages.

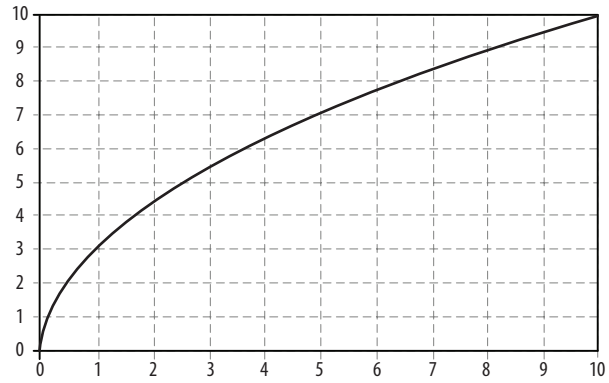
The function uses the square root of the analog value as compared to its full scale (for example $5V = 0.5$ or 50% and $\sqrt{0.5} = 0.707$) and multiplies it times the full scale of what it controls (for example 60 Hz).

The complete function can be describes as follows:

$$\left(\sqrt{\frac{\text{Analog Value - [Analog In x Lo]}}{\text{[Analog In x Hi] - [Analog In x Lo]}}}\right) \times \left(\text{[Speed Ref A Hi] – [Speed Ref A Lo]}\right) + \text{[Speed Ref A Lo]}$$

Setting high and low values to 0V, 10V, 0 Hz, and 60 Hz, the expression reduces to the following:

$$\left(\sqrt{\frac{\text{Analog Value}}{\text{10V}}}\right) \times \text{60 Hz}$$



Analog Input Loss Detection

Signal loss detection can be detected for each analog input. P47 [Anlg In Loss Sts] bits 0, 1, 2 indicate if the signal is lost. Bit 0 indicates that one or both signals are lost. P53 [Anlg In0 LssActn] and P63 [Anlg In1 LssActn] defines what action the drive takes when loss of any analog input signal occurs.

Selects drive action when an analog signal loss is detected. Signal loss is defined as an analog signal less than 1V or 2 mA. The signal loss event ends and normal operation resumes when the input signal level is greater than or equal to 1.5V or 3 mA.

- "Ignore" (0) – No action is taken.
- "Alarm" (1) – Type 1 alarm indicated.
- "Flt Minor" (2) – Minor fault indicated. If running, drive continues to run. Enable with P950 [Minor Flt Cfg]. If not enabled, acts like a major fault.
- "FltCoastStop" (3) – Major fault indicated. Coast to Stop.
- "Flt RampStop" (4) – Major fault indicated. Ramp to Stop.
- "Flt CL Stop" (5) – Major fault indicated. Current Limit Stop.
- "Hold Input" (6) – Holds input at last value.
- "Set Input Lo" (7) – Sets input to P52 [Anlg In0 Lo] or P62 [Anlg In1 Lo].
- "Set Input Hi" (8) – Sets input to P51 [Anlg In0 Hi] or P61 [Anlg In1 Hi].

If the input is in Current mode, 4 mA is the normal minimum usable input value. Any value below 3.2 mA is interpreted by the drive as a signal loss, and a value of 3.8 mA is required on the input for the signal loss condition to end.

If the input is in Unipolar Voltage mode, 2V is the normal minimum usable input value. Any value below 1.6V is interpreted by the drive as a signal loss, and a value of 1.9V is required on the input for the signal loss condition to end. No signal loss detection is possible while an input is in Bipolar Voltage mode. The signal loss condition never occurs even if signal loss detection is enabled.

Analog Outputs

There are two analog outputs per I/O module. Up to five I/O modules can be mounted in the drive ports. See 750-IN001 for valid ports. Accessing the analog output parameters is done by selecting the port that the module is mounted in then accessing the Analog Output group of parameters.

(1) Digital Inputs are either 24 Volts DC (2262C) or 115 Volts AC (2262D) based on module catalog number. Be sure applied voltage is correct for I/O module.

(2) Differential Isolation - External source must be maintained at less than 160V with respect to PE. Input provides high common mode immunity.

(3) For CE compliance use shielded cable. Do not exceed 30 m (98 ft) cable length.

(4) I/O Module parameters also have a Port designation.

Analog Output Configuration

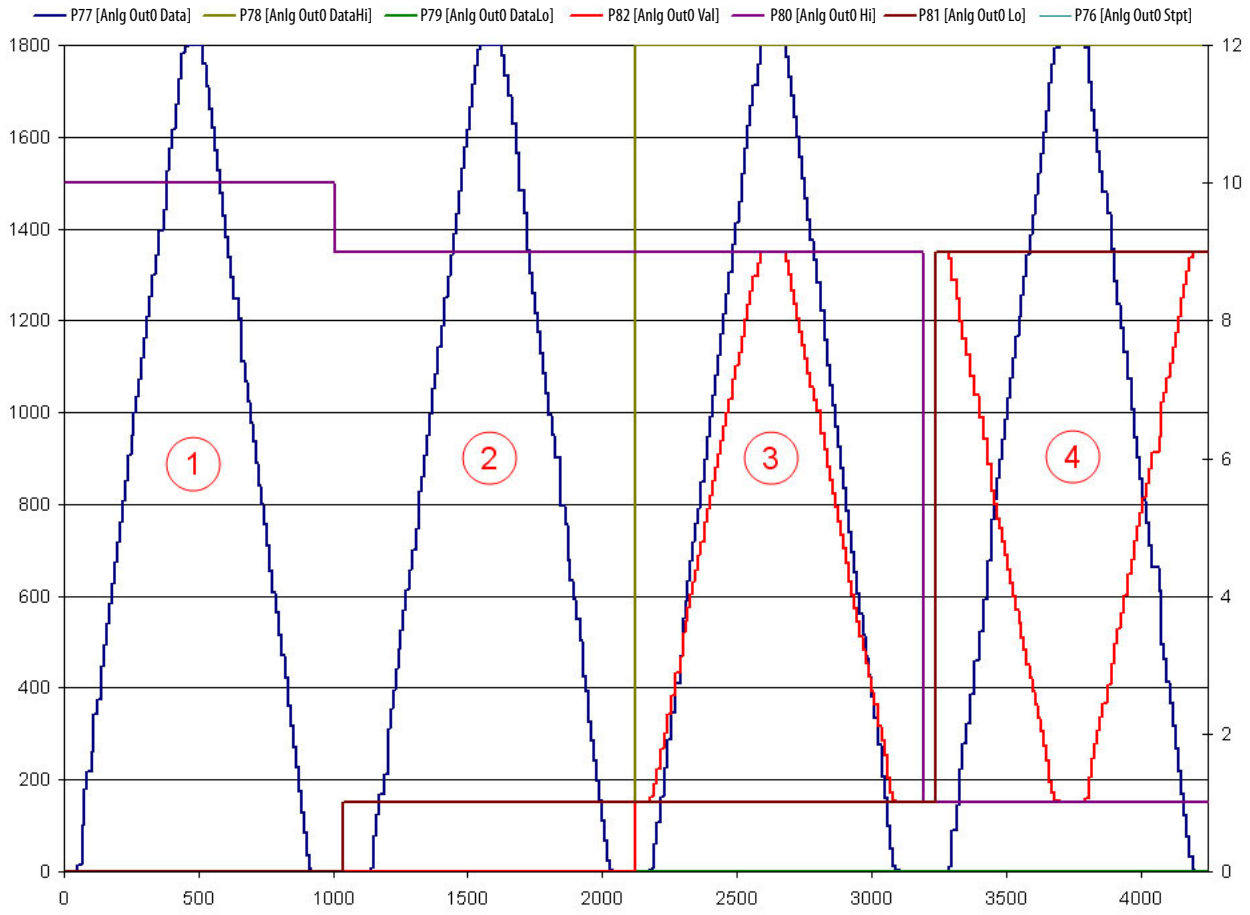
Parameters 75 and 85 [Anlg Out*n* Select] are use to specify the signal used on Analog Outputs 1 and 2, respectively. These parameters can be programmed to the following selections.

Parameter No.	Parameter Name
1	Output Frequency
2	Commanded SpdRef
3	Mtr Vel Fdbk
4	Commanded Trq
5	Torque Cur Fdbk
6	Flux Cur Fdbk
7	Output Current
8	Output Voltage
9	Output Power
11	DC Bus Volts

Scaling

The scaling for the analog output is defined by entering analog output voltages into two parameters, P91 [Anlg Out1 Lo] and P90 [Anlg Out1 Hi]. These two output voltages correspond to the bottom and top of the possible range covered by the quantity being output. Scaling of the analog outputs is accomplished with low and high analog parameter settings that are associated with fixed ranges (see the PowerFlex 750-Series Programming Manual, publication 750-PM001,) for each target function. Additionally, the PowerFlex 755 contains an adjustable scale factor to override the fixed target range. P77 [Anlg Out0 Data] and 82 [Anlg Out0 Val] are described in the following charts.

Case 1



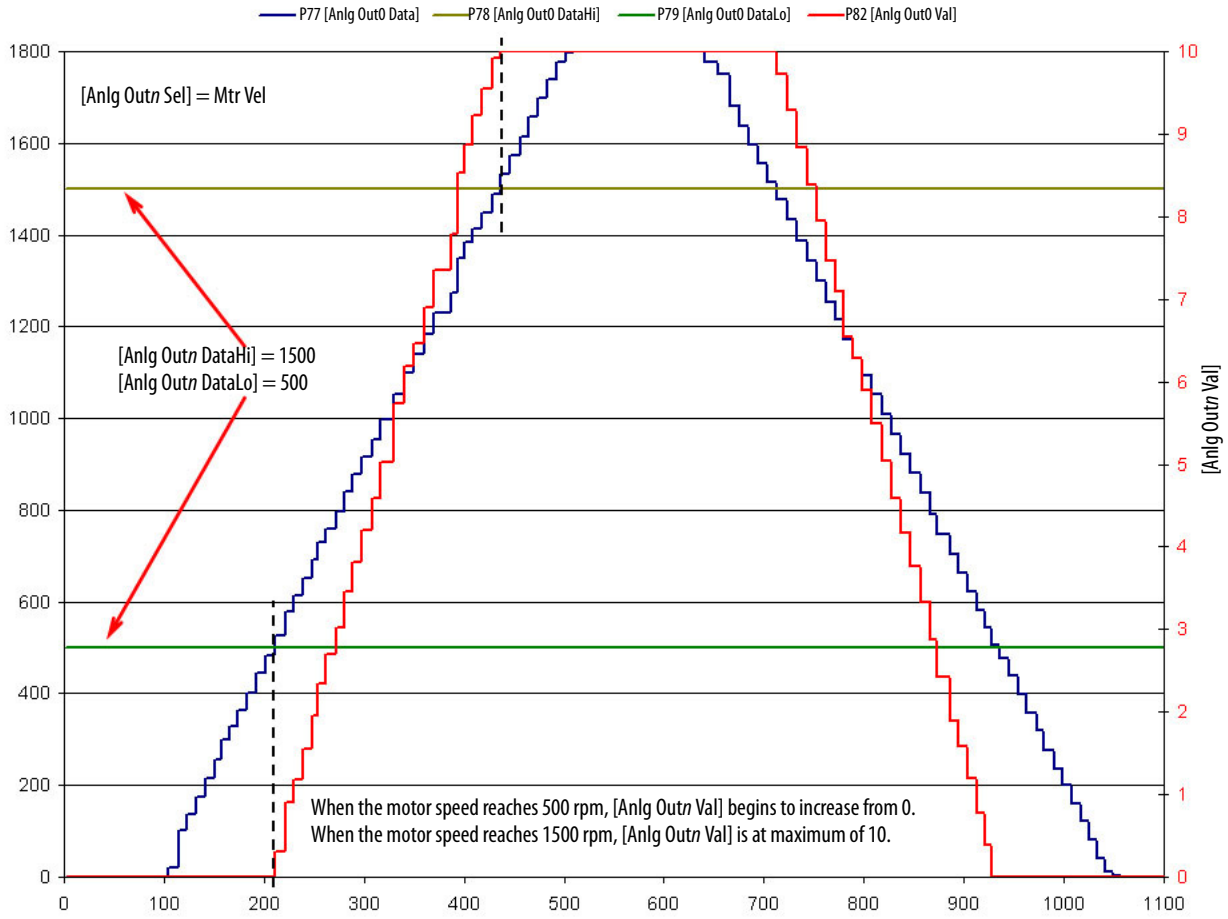
Case 1: This shows P77 [Anlg Out0 Data] the units are consistent with the selection of P75 [Anlg Out0 Sel]. In this case, the analog out select is set to P3 [Mtr Vel Fdbk] and the units are in rpm. P80 [Anlg Out0 Hi], P81 [Anlg Out0 Lo], P78 [Anlg Out0 DataHi], and P79 [Anlg Out0 DataLo] are all at default. The motor was started and ramped to 1800 rpm. Note that P82 [Anlg Out0 Val] remained zero.

Case 2: Here the P80 [Anlg Out0 Hi] is changed to 9 and P81 [Anlg Out0 Lo] is changed to 1. As the motor ramps up and down, there is no change in the value or scaling of P77 [Anlg Out0 Data]. Note that P82 [Anlg Out0 Val] is still zero.

Case 3: Now P78 [Anlg Out0 DataHi] is changed to 1800 and P79 [Anlg Out0 DataLo] is left at zero. When started P82 [Anlg Out0 Val] starts at 1 and reaches 9 when the motor speed is at maximum.

Case 4: In this section the P80 [Anlg Out0 Hi] and P81 [Anlg Out0 Lo] were reversed in value. Now when the motor ramps up and down P82 [Anlg Out0 Val] is just the opposite. It starts out at 9 and is at 1 at full speed.

Case 2



P77 [Anlg Out0 Data]
P78 [Anlg Out0 DataHi]
P79 [Anlg Out0 DataLo]
P82 [Anlg Out0 Val]
[Anlg Outn Sel] = Mtr Vel
[Anlg Outn DataHi] = 1500
[Anlg Outn DataLo] = 500
When the motor speed reaches 500 rpm, [Anlg Outn Val] begins to increase from 0.
When the motor speed reaches 1500 rpm, [Anlg Outn Val] is at maximum of 10.

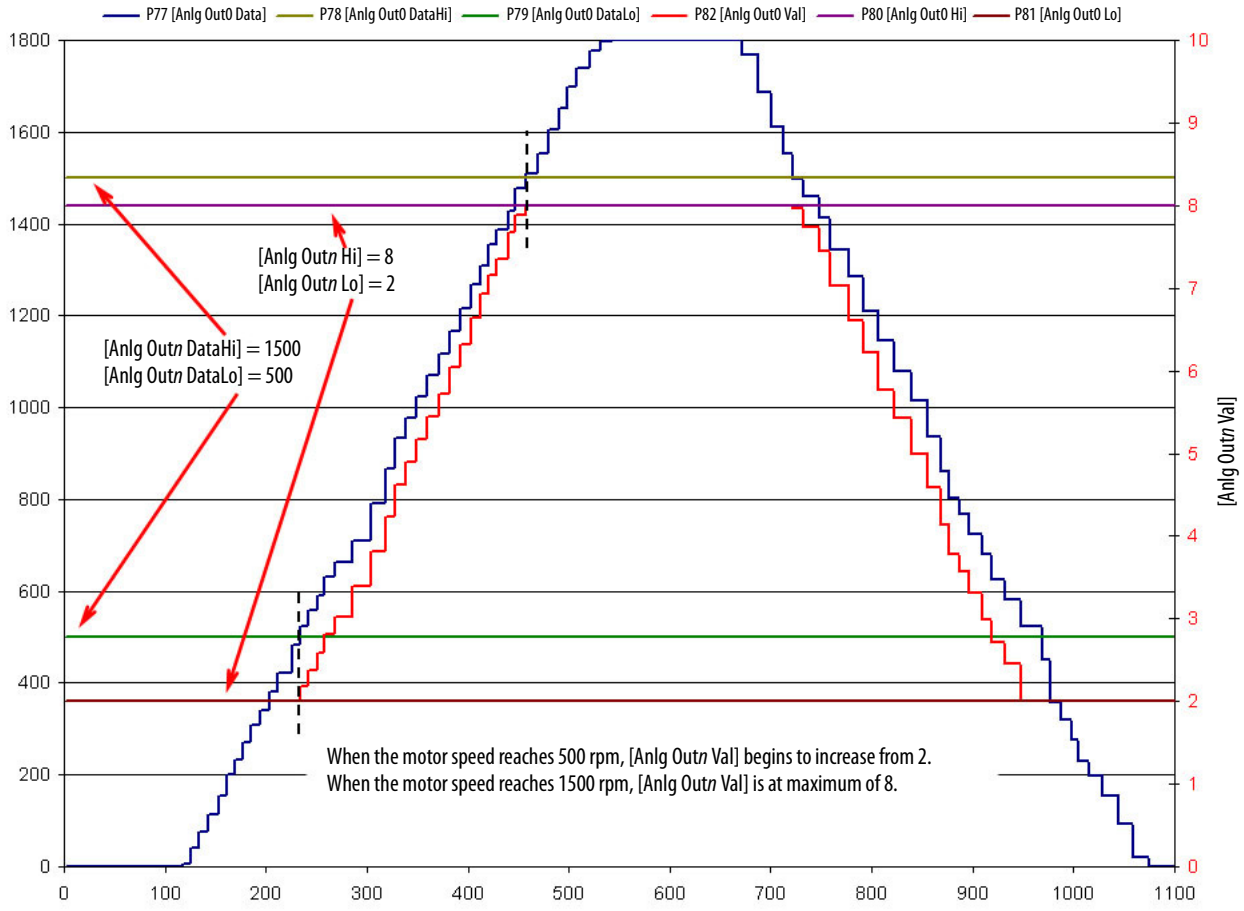
Case 3

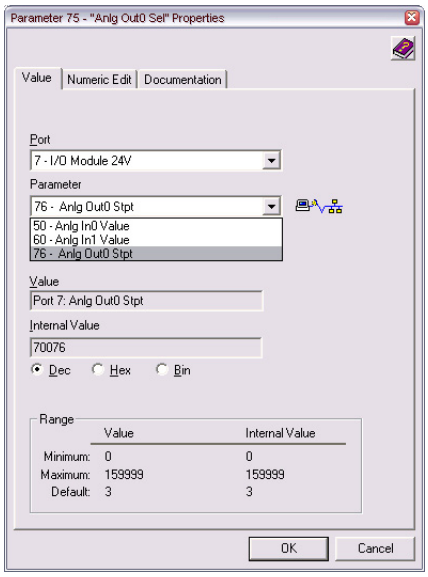


Absolute (Default)

Certain quantities used to drive the analog output are signed, for example the quantity can be both positive and negative. You have the option of having the absolute value (value without sign) of these quantities taken before the scaling occurs. Absolute value is enabled separately for each analog output via the bit enumerated P71 [Analog Out Abs].

Setpoint

Setpoint is a possible source for an analog output. It can be used to control an analog output from a communication device using a DataLink. Change P75 [Anlg Out0 Sel] to 76 [Anlg Out0 Stpt]. Then map a datalink to P76 and you'll be able to drive the analog output over a network.



Digital Inputs

Physical inputs are programmed to desired digital input functions. These parameters cannot be changed while the drive is running.

Technical Information

The PowerFlex 753 drive has three digital inputs on its main control board:

- Di 0 – Configured for 115V AC or 24V DC
  - Shared common (Di C) between Di 0ac and Di 0dc terminals
  - TB3 - bottom of the main control board
- Di 1 and Di 2 – Configured for 24V DC
  - Shared common (Di C) for Di 1 and Di 2
  - TB1 - lower front of the main control board

PowerFlex 753 Main Control Board I/O TB1 wiring examples are included in the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

The PowerFlex 755 drive has one digital input on its main control board:

- Di0 – configured for 115V AC or 24V DC
  - Shared common (Di C) between Di 0ac and Di 0dc terminals
  - TB1 - bottom of the main control board

There are also PowerFlex 750-Series option modules that expand the amount of digital inputs that can be used in both the PowerFlex 753 and 755 drives.

20-750-2262C-2R / 20-750-2263C-1R2T

- Six 24V DC input terminals:
  - Labeled as Di 0, Di 1, Di 2, Di 3, Di 4 and Di 5
  - Shared common (Di C)
  - TB1 - front of the option module

20-750-2262D-2R

- Six 115V AC input terminals:
  - Labeled as Di 0, Di 1, Di 2, Di 3, Di 4 and Di 5
  - Shared common terminal (Di C)
  - TB1 - front of the option module

PowerFlex 750-Series Option Modules I/O TB1 wiring examples are included in the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

Configuration

Digital inputs can be programmed to a desired function defined by Parameters 155 to 201 below. These parameters cannot be changed while the drive is running.

Number	Parameter Name	Number	Parameter Name	Number	Parameter Name
155	DI Enable	170	DI Jog 2 Forward	187	DI PwrLoss ModeB
156	DI Clear Fault	171	DI Jog 2 Reverse	188	DI Pwr Loss
157	DI Aux Fault	172	DI Manual Ctrl	189	DI Precharge
158	DI Stop	173	DI Speed Sel 0	190	DI Prchrg Seal
159	DI Cur Lmt Stop	174	DI Speed Sel 1	191	DI PID Enable
160	DI Coast Stop	175	DI Speed Sel 2	193	DI PID Hold
161	DI Start	176	DI HOA Start	193	DI PID Reset
162	DI Fwd Reverse	177	DI MOP Inc	194	DI PID Invert
163	DI Run	178	DI MOP Dec	195	DI Torque StptA
164	DI Run Forward	179	DI Accel 2	196	DI Fwd End Limit
165	DI Run Reverse	180	DI Decel 2	197	DI Fwd Dec Limit
166	DI Jog 1	181	DI SqTqPs Sel 0	198	DI Rev End Limit
167	DI Jog 1 Forward	182	DI SqTqPs Sel 1	199	DI Rev Dec Limit
168	DI Jog 1 Reverse	185	DI Stop Mode B	200	DI PHdwr OvrTrvl
169	DI Jog 2	186	DI BusReg Mode B	201	DI NHdwr OvrTrvl

Operation for DI Run type parameters can be defined by P150 [Digital In Cfg]:

- "Run Edge" (0) – Control function requires a rising edge (open to close transition) for the drive to run.
- "Run Level" (1) – As long as a separate "Stop" command is not issued, the level alone (no rising edge required) determines whether the drive runs. When set to 1 "Run Level" the absence of a run command is indicated as a stop asserted and P935 [Drive Status 1] Bit 0 is low.

ATTENTION: Equipment damage and/or personal injury may result if this parameter is used in an inappropriate application. Do not use this function without considering applicable local, national and international codes, standards, regulations, or industry guidelines.

Functional Descriptions

DI Enable
Closing this input lets the drive run when a Start command is issued. If the drive is already running when this input is opened, the drive will coast stop and indicate "not enabled" on the HIM (if present). This is not considered a fault condition, and no fault is generated. If this function is not configured, the drive is considered enabled.

IMPORTANT If the ENABLE (J1) jumper is removed, the Di 0 becomes a hardware enable. For the PowerFlex 753, Di 0 is found on TB3 and for the PowerFlex 755, Di 0 is found on TB1.

A combination of the hardware enable and a software enable can be utilized; however, the drive will not run if any of the inputs are open.

DI Clear Fault
The "Clear Fault" digital input function lets an external device reset drive faults through the terminal block. An open to closed transition on this input causes an active fault (if any) to be reset.

DI Aux Fault
This input function is normally closed and lets external equipment fault the drive. When this input opens, the drive faults on a F2 "Auxiliary Input" fault code. If this input function is not configured, the fault will not occur.

DI Stop
An open input causes the drive to stop and become "Not Ready." A closed input lets the drive run when given a Start or Run command. If "Start" is configured, then "Stop" must also be configured, otherwise, a digital input configuration alarm occurs.

P370 [Stop Mode A] and P371 [Stop Mode B] dictate the drive's stop action. Refer to Stop Modes on page 96 for more details.

DI Cur Lmt Stop
With this digital input function, an open input causes the drive to current limit stop. The drive acknowledges the stop command by setting the motor speed reference to zero, causing the drive to bring the motor down to zero speed as fast as the power limits, torque limits, and current limits allow. When the drive output reaches zero, the output transistors are shut off.

DI Coast Stop
With this digital input function, an open input causes the drive to Coast-to-Stop. The drive acknowledges the stop command by shutting off the output transistors and releasing control of the motor. The load/motor will coast or free spin until the mechanical energy is dissipated.

DI Start
An open to closed transition while the drive is stopped causes the drive to run in the current direction, unless the "Stop" input function is open. If "Start" is configured, then a "Stop" must also be configured.

DI Fwd Reverse
This digital input function is one of the ways to provide direction control when the "Start" or "Run" functions (not combined with direction) are used. An open input sets direction to forward. A closed input sets direction to reverse. If state of input changes and drive is running or jogging, the drive changes direction.

DI Run Forward, DI Run Reverse
These digital input functions cause the drive to run and with a specific direction, as long as the configured input is held closed. Also, these "2-wire" settings prevent any other connected device from starting the drive. An open to closed transition on one input or both inputs while the drive is stopped causes the drive to run unless the "Stop" input function is configured and open.

The table below describes the basic action taken by the drive in response to particular states of these input functions.

Run Forward	Run Reverse	Action
Open	Open	Drive stops, terminal block relinquishes direction ownership.
Open	Closed	Drive runs in reverse direction, terminal block takes direction ownership.
Closed	Open	Drive runs in forward direction, terminal block takes direction ownership.
Closed	Closed	Drive continues to run in current direction, but terminal block maintains direction ownership.

It is not necessary to program both "Run Forward" and "Run Reverse." These two functions operate with or without each other.

IMPORTANT Direction control is an "Exclusive Ownership" function (see Owners). This means that only one control device (terminal block, DPI device, HIM, and so forth) at a time is allowed to control direction at a time. The terminal block must become direction "owner" before it can be used to control direction. If another device is currently the direction owner (as indicated by P922 [Dir Owner]), it is not possible to start the drive or change direction by using the terminal block digital inputs programmed for both Run and Direction control (for example Run/Fwd).

DI Run
This digital input function is similar to "Run Forward" and "Run Reverse" settings. The only difference being that direction is determined by another input or another device's command (HIM or communication adapter).

DI Jog 1 Forward, DI Jog 1 Reverse, DI Jog 2 Forward, DI Jog 2 Reverse
Jog is a non-latched command such as Run, but overrides the normal speed reference and uses P556 [Jog Speed 1] or P557 [Jog Speed 2] respectively.

An open to closed transition on one input or both inputs while the drive is stopped causes the drive to jog unless the "Stop" input function is configured and

open. The table below describes the actions taken by the drive in response to various states of these input functions.

Jog Forward	Jog Reverse	Action
Open	Open	Drive stops if already jogging, but can be started by other means. Terminal block relinquishes direction ownership.
Open	Closed	Drive jogs in reverse direction. Terminal block takes direction ownership.
Closed	Open	Drive jogs in forward direction. Terminal block takes direction ownership.
Closed	Closed	Drive continues to jog in current direction, but terminal block maintains direction ownership.

The drive will not jog while the drive is running or while the "Stop" input is open. Start has precedence.

DI Jog 1, DI Jog 2
These digital input functions are similar to "Jog Forward" and "Jog Reverse" with the only difference being that direction is determined by another input or another device's command (HIM or communication adapter). In addition, these settings use either P556 [Jog Speed 1] or P557 [Jog Speed 2], respectively. In Unipolar mode, the absolute value is used along with a separate direction command. In Bipolar mode, the polarity of P556 [Jog Speed 1] or P557 [Jog Speed 2] determines the direction of jog.

DI Manual Ctrl
The digital input function works in conjunction with the overall Auto/Manual function. When this input is closed, it overrides other speed references, but only if another device (HIM) did not have ownership of the Manual state. If the digital input is successful in gaining manual control, the speed reference comes from P563 [DI ManRef Sel], which can be set to any of the Analog Inputs, Preset Speeds, MOP Reference, or an applicable Port Reference.

Associated with this digital input function, there is the ability to configure the drive to switch smoothly from an automatic (communicated) speed reference to manual speed reference produced by the Human Interface Module (HIM). When the drive is commanded to switch from the automatic (communicated) speed reference to the manual reference via a digital input, it preloads the last value from the speed feedback into the HIM. Then the operator can modify the manual reference on the HIM. This avoids a step change in speed that otherwise occurs from the switch. Use this feature by configuring P328 [Alt Man Ref Sel], P331 [Manual Preload], P172 [DI Manual Ctrl], and P563 [DI ManRef Sel]. This feature requires revision 2.001 of 20-HIM-A6 firmware or later.

DI Speed Sel 0, 1, and 2
These digital input functions can be used to select the speed reference. The open/closed state of all the speed select digital input functions combine to select which source is the speed reference.

DI Speed Sel 2	DI Speed Sel 1	DI Speed Sel 0	Auto Reference Source (Parameter)
0	0	0	Reference A (P545 [Spd Ref A Sel])
0	0	1	Reference A (P545 [Spd Ref A Sel])
0	1	0	Reference B (P550 [Spd Ref B Sel])
0	1	1	Preset Speed 3 (P573 [Preset Speed 3])
1	0	0	Preset Speed 4 (P574 [Preset Speed 4])
1	0	1	Preset Speed 5 (P575 [Preset Speed 5])
1	1	0	Preset Speed 6 (P576 [Preset Speed 6])
1	1	1	Preset Speed 7 (P577 [Preset Speed 7])

Refer to Speed Reference on page 251 for more details.

DI HOA Start
This digital input function provides Hand-Off-Auto control. It functions like a three-wire start signal; with the exception, that it does not require the DI Stop to be high for a full input cycle before the drive looks for a rising edge on DI HOA Start. Use this feature by configuring P176 [DI HOA Start].

DI MOP Inc, DI MOP Dec
These digital input functions are used to increment and decrement the Motor Operated Potentiometer (MOP) value inside the drive. The MOP is a reference value that can be incremented and decremented by external devices. The MOP value has a configurable preload that is retained through a power cycle. For the drive to use the MOP value as the current speed reference, either P545 [Speed Ref A Sel], P550 [Speed Ref B Sel], or P563 [DI ManRef Sel] must be set to P558 [MOP Reference].

DI Accel 2, DI Decel 2
These digital input functions toggle between primary and secondary ramp rates. For example, with a digital input programmed to P179 [DI Accel 2], an open digital input follows P535 [Accel Time 1]. A closed digital input follows P536 [Accel Time 2].

DI SpTqPs Sel 0 and 1
These digital input functions provide the ability to switch between different Speed/Torque/Position modes, (P309 [SpdTrqPsn Mode A], P310 [SpdTrqPsn Mode B], P311 [SpdTrqPsn Mode C], and P312 [SpdTrqPsn Mode D]) from digital input combinations. See Speed Torque Position on page 266 for a complete description of these modes and the digital input combinations that activate each mode.

DI Stop Mode B
This digital input function selects between two different drive Stop modes. If the input is open, then P370 [Stop Mode A] selects which Stop mode to use. If the input is closed, then P371 [Stop Mode B] selects which Stop mode to use. If this input function is not configured, then P370 [Stop Mode A] always selects which Stop mode to use. See also Stop Modes on page 96 for more details.

DI BusReg Mode B
This digital input function selects how the drive regulates excess voltage on the DC bus. If the input is open, then P372 [Bus Reg Mode A] selects which bus regulation mode to use. If the input is closed, then P373 [Bus Reg Mode B] selects which bus regulation mode to use. If this input function is not configured, then P372 [Bus Reg Mode A] always selects which bus regulation mode to use. See also Bus Regulation on page 41 for more details.

DI PwrLoss ModeB
This digital input function selects between two different drive power loss modes. If the input is open, P450 [Pwr Loss Mode A] dictates the drive's action during the Power Loss mode. If the input is closed, P371 [Stop Mode B] dictates the drive's action during the power loss. If this input function is not configured, P450 [Power Loss Mode A] always dictates the drive's action during the power loss. See also Power Loss on page 72 for more details.

DI Pwr Loss
The drive contains a sophisticated algorithm to manage initial application of power as well as recovery from a partial power loss event. This digital input function is used to force the drive into a power loss condition. If this input is open, the drive's internal algorithm dictates the power loss condition. If the input is closed, the algorithm is overridden and the drive is externally forced into a power lost condition. P449 [Power Loss Actn] configures the drive's response to a power loss time out condition and P452 [Pwr Loss A Time] or P455 [Pwr Loss B Time] set the time that the drive remains in Power Loss mode before a fault occurs. See also Power Loss on page 72 for more details.

DI Precharge
This digital input function is used to manage disconnection from a common DC bus. If the input is closed, this indicates that the drive is connected to common DC bus and normal precharge handling can occur, and that the drive can run (start permissive). If the physical input is open, this indicates that the drive is disconnected from the common DC bus, and the drive enters the precharge state and initiates a coast stop immediately to prepare for reconnection to the bus. If this input function is not configured, then the drive assumes that it is always connected to the DC bus, and no special precharge handling is done.

DI Prchrg Seal
This digital input function is used to force a unique fault when an external precharge circuit opens. P323 [Prchrg Err Cfg] dictates the action taken when an external precharge circuit has opened.

DI PID Enable
If this digital input function is closed, the operation of the Process PID loop is enabled. If this input function is open, the operation of the Process PID loop is disabled.

DI PID Hold
If this input function is closed, the integrator for the Process PID loop is held at the current value. If this input function is open, the integrator for the Process PID loop is allowed to increase.

DI PID Reset
If this input function is closed, the integrator for the Process PI loop is reset to 0. If this input function is open, the integrator for the Process PI loop integrates normally.

DI PID Invert
If this input function is closed, the PI Error is inverted. If this input function is open, the PI Error is not inverted.

DI Torque StptA
This digital input function is used to force P676 [Trq Ref A Stpt] as the source for Torque Reference A, regardless of the setting in P675 [Trq Ref A Sel]. Used when the drive is in a mode that is commanding torque. Refer to P309 [SpdTrqPsn Mode A], P310 [SpdTrqPsn Mode B], P311 [SpdTrqPsn Mode C], and P312 [SpdTrqPsn Mode D].

DI Fwd End Limit, DI Rev End Limit
These digital input functions are used to trigger a Forward End Limit and/or a Reverse End Limit. The resulting action depends on whether the drive is operating as a speed, torque or position regulator. The mode of operation is indicated by P935 [Drive Status 1] Bit 21 "Speed Mode," Bit 22 "PositionMode," and Bit 23 "Torque Mode." When the drive is operating as a speed regulator, the resulting action is to execute a "Fast Stop" command. After the drive stops in this case, it only restarts in the opposite direction (if given a new start command). This function is usually used with a limit switch near the point where the drive needs to stop. When the drive is operating as a torque regulator, the resulting action is to execute a "Fast Stop" command. After the drive stops in this case, it restarts and continues operation (if given a new start command). When the drive is operating as a position regulator, the resulting action is to execute a "Fast Stop" command. After the drive stops in this case, it restarts and continues to move towards the position reference (if given a new start command).

DI Fwd Dec Limit, DI Rev Dec Limit
These digital input functions are used to trigger a Forward Decel Limit and/or a Reverse Decel Limit. The resulting action depends on whether the drive is operating as a speed, torque or position regulator. The mode of operation is indicated by P935 [Drive Status 1] Bit 21 "Speed Mode," Bit 22 "PositionMode" and Bit 23 "Torque Mode." When the drive is operating as a speed regulator, the resulting action is to override the speed reference and decelerate to Preset Speed 1. This function is usually used with a limit switch and initiates the slowing down process prior to encountering the End Limit. When the drive is operating as a torque regulator, the drive ignores this signal and continues operating at its torque reference. When the drive is operating as a position regulator, the drive ignores this signal and continues moving towards its position reference.

DI PHdwr OvrTrvl, DI NHdwr OvrTrvl
These digital input functions are used to trigger a Positive Hardware Over-travel and/or a Negative Hardware Over-travel. The resulting action is to immediately fault and produce zero torque. After the drive is stopped, the condition needs to be cleared and the fault needs to be reset. The drive restarts (if given a new start command), and continues operation. It follows any speed reference, position reference, or torque reference. The drive's direction is not modified or limited after the restart. This function is usually used with a limit switch in a position beyond the "End Limit," as an extra safety limit to prevent torque from damaging the machine in an over-travel situation.

Status
For the PowerFlex 753 main control board Digital Inputs (Di) 0, 1, and 2, P220 [Digital In Sts] Bits 0, 1 and 2 represents its respective inputs status. For the PowerFlex 755 main control board Digital Inputs (Di) 0, P220 [Digital In Sts] Bit 0 represents its respective digital input status. For the PowerFlex 750-Series Option Module Digital Inputs (Di) 0, 1, 2, 3, 4, and 5, P1 [Dig In Sts] Bits 0, 1, 2, 3, 4, and 5 represents its respective digital input status. When the bit associated with the digital input is on, depicted by a 1, this means that the drive recognizes that the digital input is on. When the bit associated with the digital input is off, represented by a 0, this means that the drive recognizes that the digital input is off.

Configuration Conflicts
If you configure the digital inputs so that one or more selections conflict with each other, one of the digital input configuration alarms is asserted. As long as the Digital Input Conflict exists, the drive will not start. These alarms are automatically cleared by the drive as soon as the parameters are changed to remove the conflicts. These are examples of configurations that cause an alarm:

- Configuring both the "Start" input function and the "Run Forward" input function at the same time. "Start" is used only in "3-wire" Start mode, and "Run Forward" is used only in "2-wire" Run mode, therefore, do not configured at the same time.
- Configuring the same toggle input function (for instance "Fwd Reverse") to more than one physical digital input simultaneously.

These alarms, called Type 2 Alarms, are different from other alarms in that it is not possible to start the drive while the alarm is active. It is possible for any of these alarms to occur while the drive is running, because all digital input configuration parameters can be changed only while the drive is stopped. Whenever one or more of these alarms is present, the drive ready status becomes "not ready" and the HIM displays a conflict message. In addition, the drive status light flashes yellow. Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, for a complete list of Type 2 Alarms.

DigIn Cfg B
Digital input conflict. Input functions that cannot exist at the same time have been selected. Correct Digital Input configuration.

DigIn Cfg C
Digital input conflict. Input functions that cannot be assigned to the same digital input have been selected. Correct Digital Input configuration.

Block Diagrams

Figure 8 - PowerFlex 753

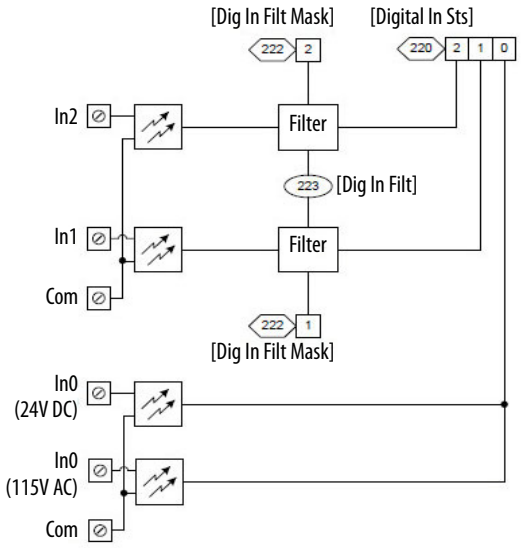


Figure 9 - PowerFlex 755

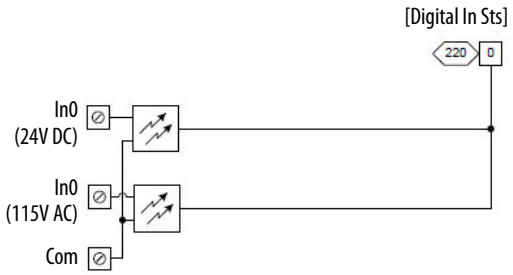

Figure 10 - PowerFlex 750-Series Option Module

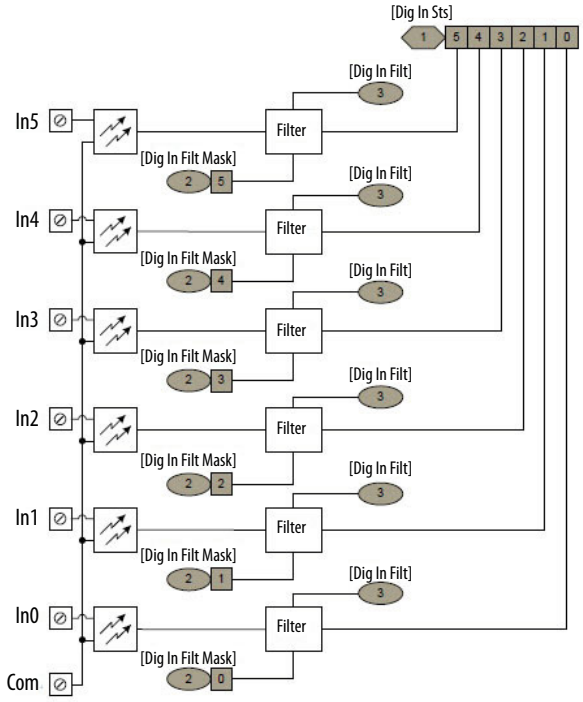


Digital Outputs

The PowerFlex 753 has one transistor output and one relay output embedded on its main control board.

The transistor output is on TB1 at the lower front of the main control board.

Terminal	Name	Description	Rating
T0	Transistor Output 0	Transistor Output	48V DC, 250 mA maximum load. Open drain output.

The relay output is on TB2 at the bottom of the main control board.

Terminal	Name	Description	Rating
R0NC	Relay 0 N.C.	Output Relay 0 normally closed contact	240V AC, 24V DC, 2A max Resistive Only
R0C	Relay 0 Common	Output Relay 0 Common	
R0NO	Relay 0 N.O.	Output Relay 0 normally open contact	240V AC, 24V DC, 2A max General Purpose (Inductive) / Resistive

Refer to the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001, for PowerFlex 753 Main Control Board I/O wiring examples.

The PowerFlex 755 has no outputs embedded on its Main Control Board.

There are PowerFlex 750-Series Option Modules that expand the amount of digital outputs that can be used in both the PowerFlex 753 and 755 drives.

Catalog numbers 20-750-2262C-2R and 20-750-2262D-2R provide two relay outputs on TB2 at the front of option module.

Terminal	Name	Description	Rating
R0NC	Relay 0 N.C.	Output Relay 0 normally closed contact	240V AC, 24V DC, 2A max Resistive Only
R0C	Relay 0 Common	Output Relay 0 common	
R0NO	Relay 0 N.O.	Output Relay 0 normally open contact	240V AC, 24V DC, 2A max General Purpose (Inductive) / Resistive
R1NC	Relay 1 N.C.	Output Relay 1 normally closed contact	240V AC, 24V DC, 2A max Resistive Only
R1C	Relay 1 Common Output	Relay 1 common	
R1NO	Relay 1 N.C.	Output Relay 1 normally open contact	240V AC, 24V DC, 2A max General Purpose (Inductive) / Resistive

Catalog number 20-750-2263C-1R2T provides one transistor output and two relay outputs on TB2 at the front of option module.

Terminal	Name	Description	Rating
R0NC	Relay 0 N.C.	Output Relay 0 normally closed contact	240V AC, 24V DC, 2A max Resistive Only
R0C	Relay 0 Common Output	Relay 0 common	
R0NO	Relay 0 N.O.	Output Relay 0 normally open contact	240V AC, 24V DC, 2A max General Purpose (Inductive) / Resistive
T0	Transistor Output 0	Transistor Output	24VDC = 1A max 24VDC = 0.4 Max for U.L. applications. Resistive
TC	Transistor Output Common	Transistor Output Common	
T1	Transistor Output 1	Transistor Output	24VDC = 1A max 24VDC = 0.4 Max for U.L. applications. Resistive

Refer to the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001, for PowerFlex 750-Series Option Module I/O wiring examples.

Configuration

Each digital output can be programmed to change state based on one of many different conditions. These conditions can fall into different categories.

- Drive status conditions (fault, alarm, and reverse).
- Level conditions (DC bus voltage, current, and frequency)
- Controlled by a digital input.
- Controlled by the network.
- Controlled by DeviceLogix software.

Drive Status Conditions

For PowerFlex 750-Series drives utilizing an option module, the table below shows an overview of the selectable configurations for the drive's digital output Sel parameters.

Parameter No.	Parameter Name	Description
220(1)	Digital In Sts	Status of the digital inputs resident on the main control board (Port 0).
227(1)	Dig Out Setpoint	Controls Relay or Transistor Outputs when chosen as the source. Can be used to control outputs from a communication device using DataLinks.
233(1)	RO0 Level CmpSts	Status of the level compare, and a possible source for a relay or transistor output.
720	PTP PsnRefStatus	Displays the current operating status of the Point-To-Point Position Planner in the Position Referencing.
724	Psn Reg Status	Indicates status of position control logic.
730	Homing Status	Indicates status of position control logic.
933	Start Inhibits	Indicates which condition is preventing the drive from starting or running.
935	Drive Status 1	Present operating condition of the drive.
936	Drive Status 2	Present operating condition of the drive.
937	Condition Sts 1	Status of conditions that can result in the drive taking action (faulting), based on configuration of protective functions.
945	At Limit Status	Status of dynamic conditions within the drive that are either active or a limit is being applied.
952	Fault Status A	Indicates the occurrence of conditions that have been configured as faults. These conditions are from P937 [Condition Sts 1].
953	Fault Status B	Indicates the occurrence of conditions that have been configured as faults.
959	Alarm Status A	Indicates the occurrence of conditions that have been configured as alarms. These events are from P937 [Condition Sts 1].
960	Alarm Status B	Indicates the occurrence of conditions that have been configured as alarms.
961	Type 2 Alarms	Indicates the occurrence of conditions that have been configured as alarms.
1089	PID Status	Status of the Process PI regulator.
1103(2)	Trq Prove Status	Displays the status bits for TorqProve.
1210(2)	Profile Status	Indicates status of speed profile/position indexer control logic.
1(3)(4)	Dig In Sts	Status of the digital inputs.
7(3)(4)	Dig Out Setpoint	Controls Relay or Transistor Outputs when chosen as the source. Can be used to control outputs from a communication device using DataLinks.
13(3)(4)	RO0 Level CmpSts	Status of the level compare, and a possible source for a relay or transistor output.
50(5)	DLX DigOut Sts	Provides the individual on/off status of the DLX Logic Command word bits.
51(5)	DLX DigOut Sts2	Provides the individual on/off status of the 16 DLX DOPs.

(1) PowerFlex 753 drives only.
(2) PowerFlex 755 drives only.
(3) Option modules can be used in Ports 4, 5, and 6 of PowerFlex 753 drives.
(4) Option modules can be used in Ports 4, 5, 6, 7, and 8 of PowerFlex 755 drives.
(5) Port 14: DeviceLogix software parameters.

Refer the PowerFlex 750-Series Programming Manual, publication 750-PM001, for specific parameter bit level details.

Related PowerFlex 753 selection parameter information is noted below.

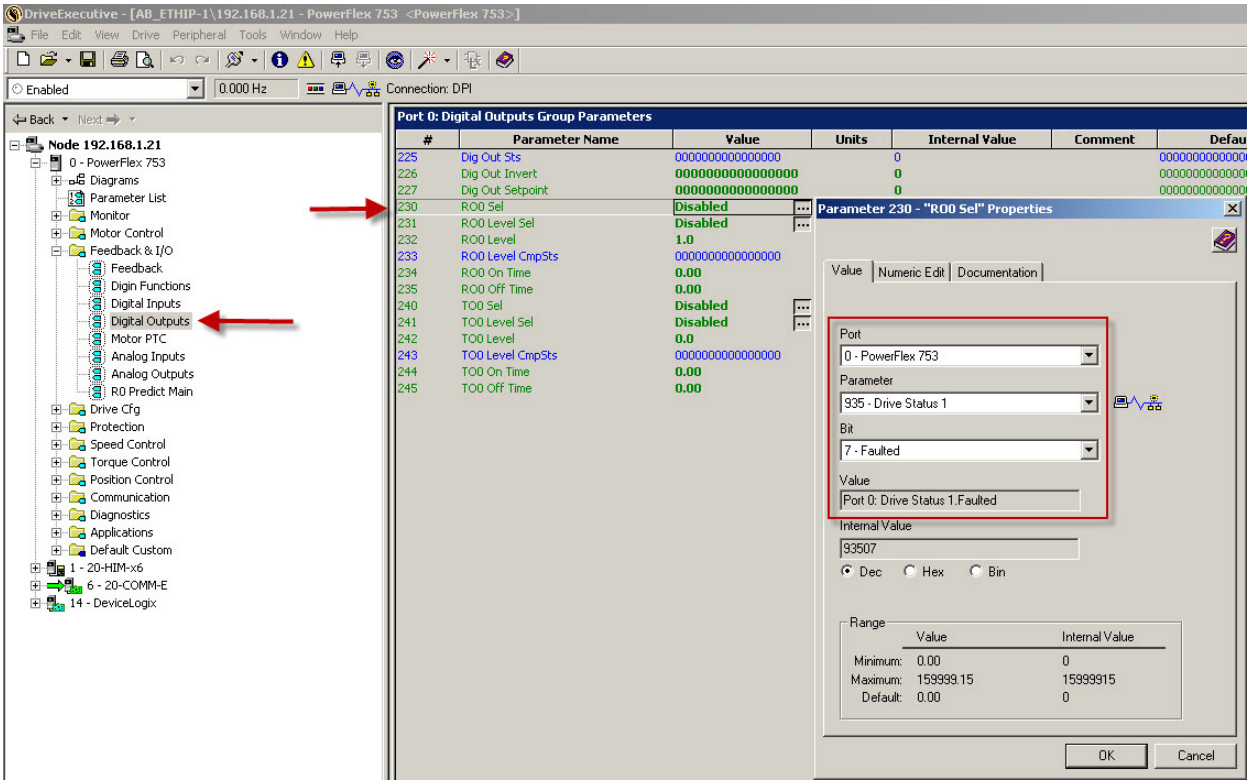
Parameter No.	Parameter Name	Description
230	R00 Sel	Selects the source that energizes the relay output.
240	T00 Sel	Selects the source that energizes the relay or transistor output.

Depending on the PowerFlex 750-Series Option Module or Modules installed in the drive, related selection parameter information is noted below.

Parameter No.	Parameter Name	Description
10	R00 Sel	Selects the source that energizes the relay output.
20	R01 Sel or T00 Sel	Selects the source that energizes the relay or transistor output.
30	T01 Sel	Selects the source that energizes the transistor output.

Example

Below is an example of a PowerFlex 753 drive's utilizing an embedded digital output Sel parameter being configured such that the output energizes when a fault is present on the drive.

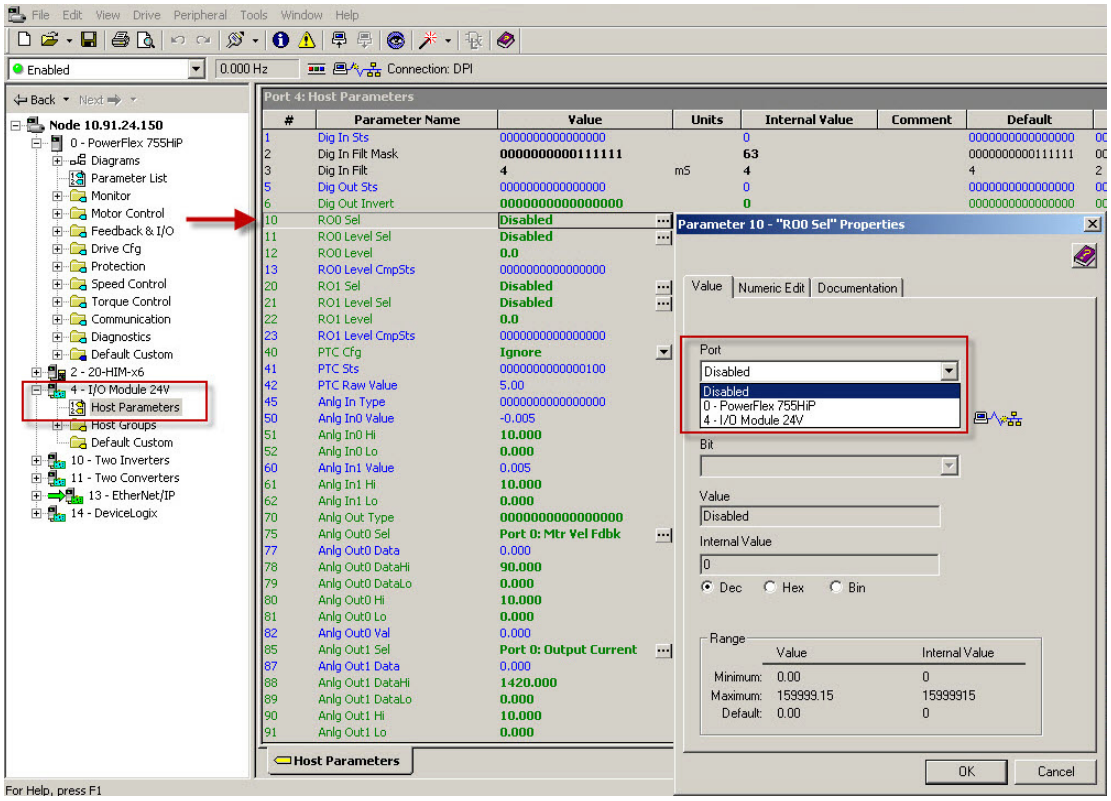


Example

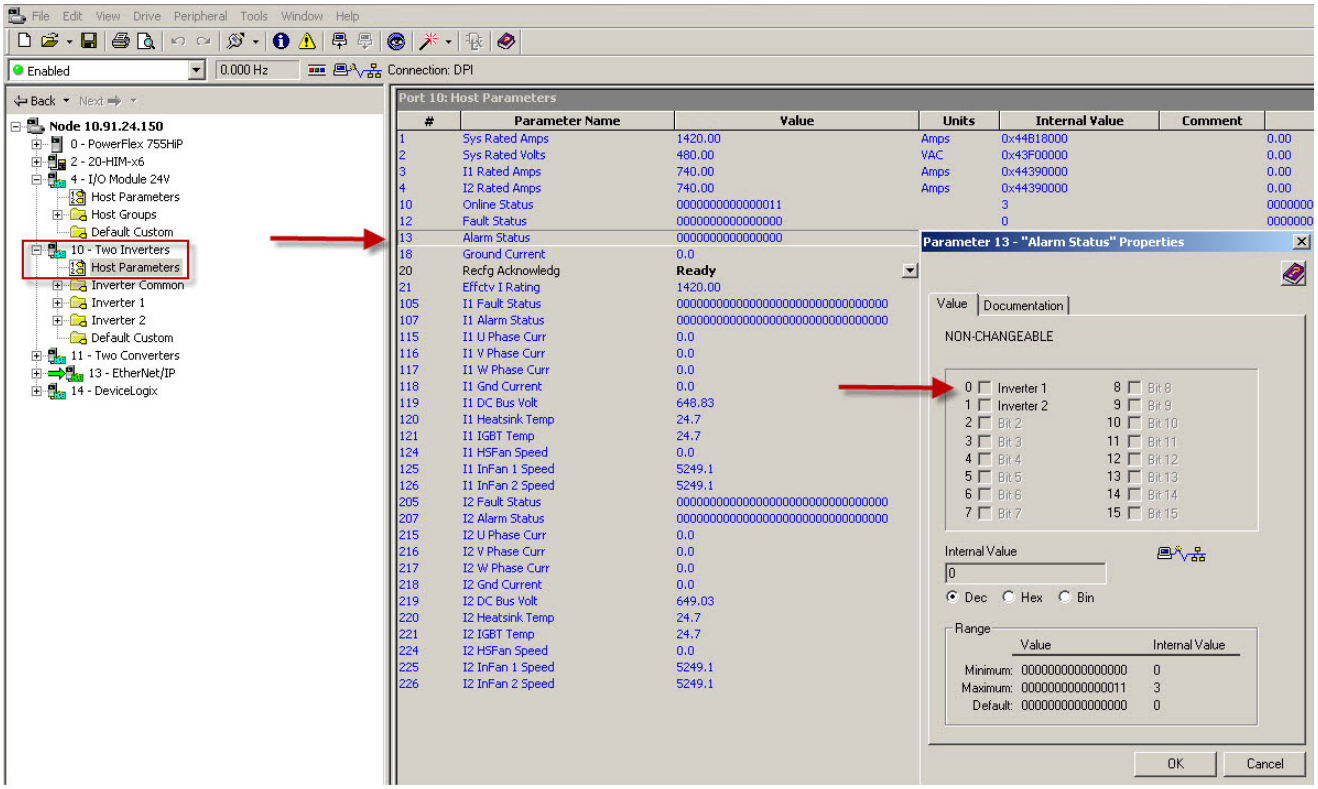
For parameters that are not configurable through the parameter properties' "Value" tab pull-down graphic user interface (GUI), you can utilize the "Numeric Edit" tab to alternatively configure the digital output for a desired function.

Below is an example of a PowerFlex 755 drive utilizing a PowerFlex 750-Series option module's digital output "Sel" parameter being configured such that the output energizes when an alarm is present on one of the drive's inverter section.

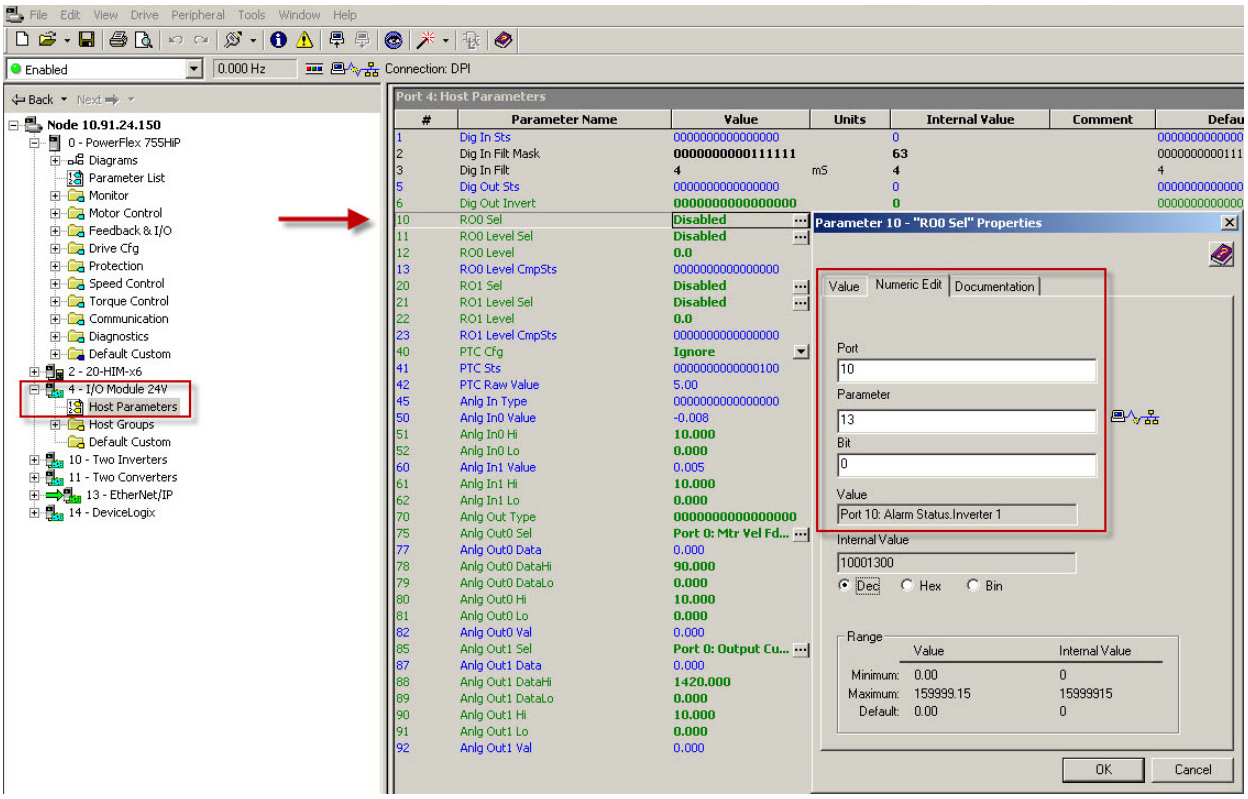
You can see below that you cannot select Port 10, Inverter section in the Value tab pull-down GUI.



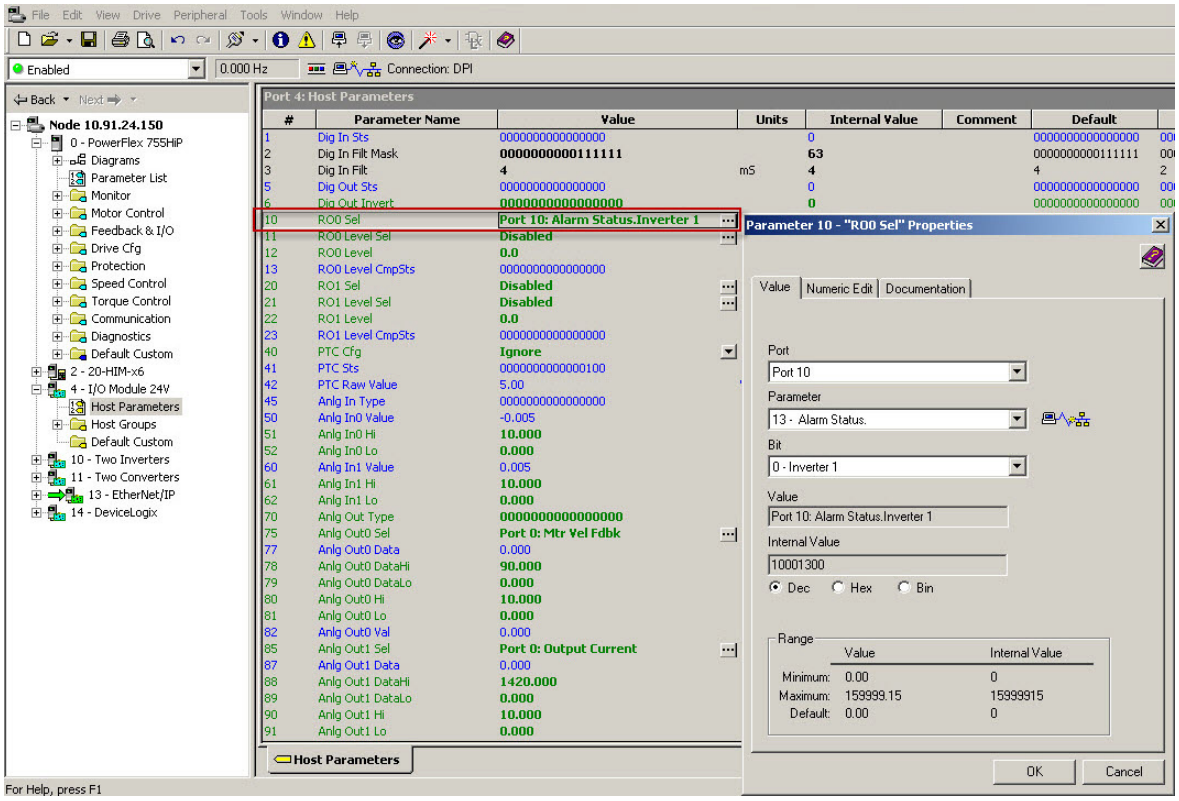
We look through the Port 10, Inverter section parameters and find that P13 [Alarm Status] Bit 0 shows if there is an active alarm on Inverter 1 section.



Within the Numeric Edit tab we can configure the digital output for the desired function. See below.



Once the parameter is configured within the Numeric Edit tab, you can Click OK, or you can go back to the Value tab to see what populates in the pull-down GUI, then Click OK.



Level Conditions

A desired level function needs to be programmed into the “Level Sel” parameter, depending on the output being used. If the value for the specified function (frequency, current, and so forth) is greater than equal to or less than the programmed limit dictated by the “Level” parameter, the output activates or deactivates depending on how the “Sel” parameter is configured.

Notice that the Level Select parameters do not have units. The drive assumes the units and the minimum/maximum values from the selected parameter function. For example, if the “Level Sel” is programmed for P943 [Drive Temp Pct], which indicates operating temperature of the drive power section (heat sink), its units are in percentage of the maximum heat sink temperature with minimum/maximum values of -200/200 percent.

For the PowerFlex 750-Series drives utilizing an Option Module, the table below shows an overview of the selectable configurations for the drive's Digital Output "Level Sel" parameters.

Parameter No.	Parameter Name	Description
1	Output Frequency	Output frequency present at terminals T1, T2, and T3 (U, V & W).
2	Commanded SpdRef	Value of the active Speed/Frequency Reference.
3	Mtr Vel Fdbk	Estimated or actual motor speed, with feedback.
4	Commanded Trq	Final torque reference value after limits and filtering are applied. Percent of motor rated
5	Torque Cur Fdbk	Based on the motor, the amount of current that is in phase with the fundamental voltage component.
6	Flux Cur Fdbk	Amount of current that is out of phase with the fundamental voltage component.
7	Output Current	The total output current present at terminals T1, T2, and T3 (U, V & W).
8	Output Voltage	Output voltage present at terminals T1, T2, and T3 (U, V & W).
9	Output Power	Output power present at terminals T1, T2, and T3 (U, V & W).
10	Output Powr Fctr	Output power factor.
11	DC Bus Volts	DC bus voltage.
13	Elapsed MWH	Accumulated output energy of the drive.
14	Elapsed kWH	Accumulated output energy of the drive.
260(1)	Anlg In0 Value	Value of the Analog input after filter, square root, and loss action.
418	Mtr OL Counts	Accumulated percentage of motor overload.
419	Mtr OL Trip Time	Displays the inverse of the motor overload time.
558	MOP Reference	Value of the MOP (Motor Operated Potentiometer) Reference to be used as a possible source for P545 and P550.
707	Load Estimate	Displays an estimated load torque value for the drive.
940	Drive OL Count	Indicates power unit overload (IT) in percentage.
943	Drive Temp Pct	Indicates operating temperature of the drive power section (heat sink) in percentage of the maximum heat sink temperature.
1090	PID Ref Meter	Present value of the PI reference signal.
1091	PID Fdbk Meter	Present value of the PI feedback signal.
1092	PID Error Meter	Present value of the PI error.
1093	PID Output Meter	Present value of the PI output.
1567(2)	FrctnComp Out	Displays the torque reference output of the Friction Compensation function.
50(3)(4)	Anlg In0 Value	Value of the Analog input after filter, square root, and loss action.
60(3)(4)	Anlg In1 Value	Value of the Analog input after filter, square root, and loss action.
90 . . . 97(5)	DLX Real Out SP1 - SP8	Eight 32-bit Real scratchpad registers for DLX program output use.

(1) PowerFlex 753 drives only.
(2) PowerFlex 755 drives only.
(3) Option modules can be used in Ports 4, 5, and 6 of PowerFlex 753 drives.
(4) Option modules can be used in Ports 4, 5, 6, 7, and 8 of PowerFlex 755 drives.
(5) Port 14: DeviceLogix software parameters

Related PowerFlex 753 drives Level Select parameter information noted below.

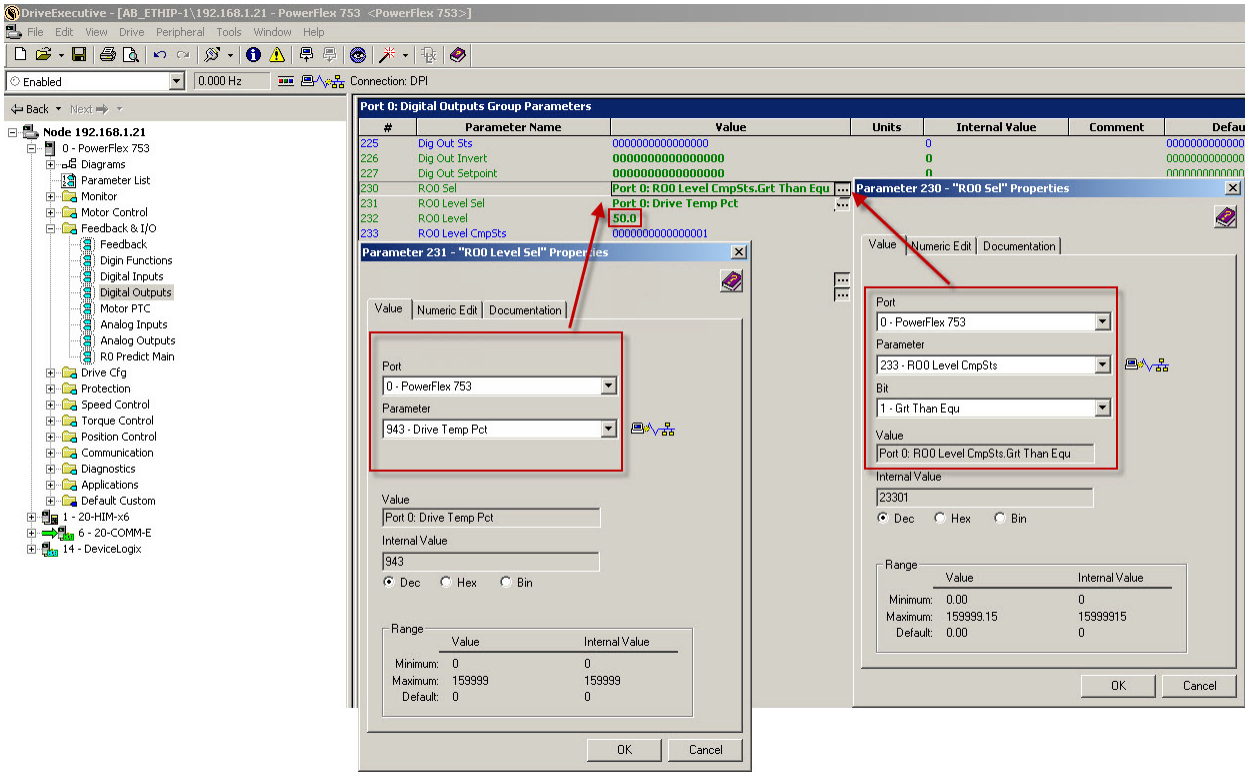
Parameter No.	Parameter Name	Description
230	R00 Sel	Selects the source that energizes the relay output.
231	R00 Level Sel	Selects the source of the level that is compared.
232	R00 Level	Sets the level compare value.
233	R00 Level CmpSts	Status of the level compare, and a possible source for a relay or transistor output.
240	T00 Sel	Selects the source that energizes the relay or transistor output.
241	T00 Level Sel	Selects the source of the level that is compared.
242	T00 Level	Sets the level compare value.
243	T00 Level CmpSts	Status of the level compare, and a possible source for the transistor output.

Depending on the PowerFlex 750-Series Option Module(s) installed in the drive, related Level Select parameter information noted below.

Parameter No.	Parameter Name	Description
10	R00 Sel	Selects the source that energizes the relay output.
11	R00 Level Sel	Selects the source of the level that is compared.
12	R00 Level	Sets the level compare value.
13	R00 Level CmpSts	Status of the level compare, and a possible source for a relay or transistor output.
20	R01 Sel or T00 Sel	Selects the source that energizes the relay or transistor output.
21	R01 Level Sel or T00 Level Sel	Selects the source of the level that is compared.
22	R01 Level or T00 Level	Sets the level compare value.
23	R01 Level CmpSts or T00 Level CmpSts	Status of the level compare, and a possible source for a relay or transistor output.
30	T01 Sel	Selects the source that energizes the transistor output.
31	T01 Level Sel	Selects the source of the level that is compared.
32	T01 Level	Sets the level compare value.

Example

Below is an example of a PowerFlex 753 drive utilizing an embedded digital output Select, Level Select and Level parameters being configured such that the output energizes when the drive's operating temperature of the drive power section (heat sink) in percentage of the maximum heat sink temperature is greater than 50 percent.

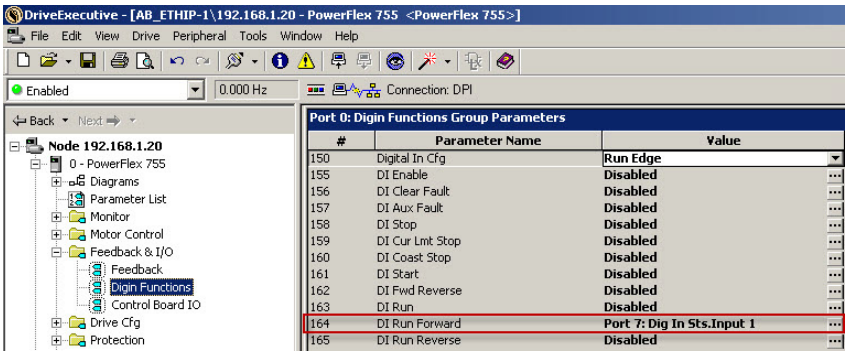


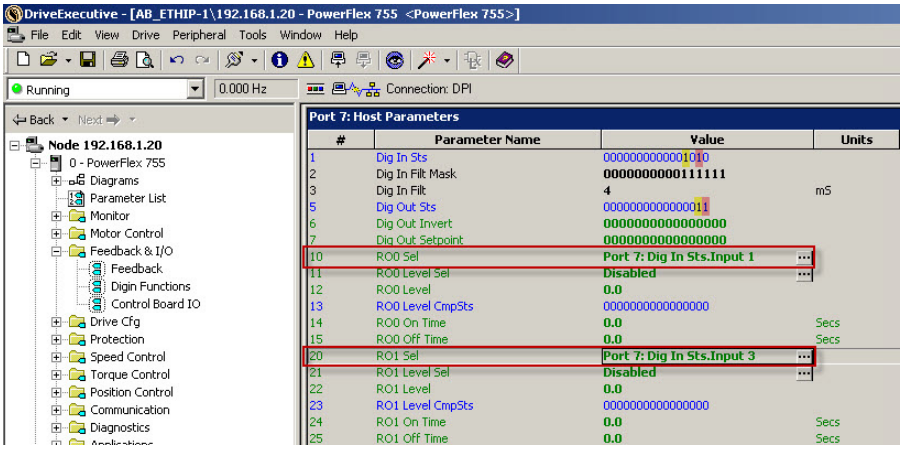
Controlled By Digital Input

A digital output can be programmed to be controlled by a digital input. For example, when the input is closed, the output is energized, and when the input is open, the output is de-energized. Note that the output is controlled by the state of the input, even if the input has been assigned a normal drive function (Start, Jog, and so forth).

Example

In this example, the drive is utilizing a 24V DC, Two Relay Option Module in Port 7. One of the drive's digital input functions, P164 [DI Run Forward] is programmed for Port 7: Digital In Sts.Input 1, with Option Module P10 [RO0 Sel] is programmed for Port 7: Dig In Sts.Input 1 and P20 [RO1 Sel] is programmed for Port 7: Dig In Sts.Input 3.





As you can see with the picture above, when the Digital Inputs 1 (pink highlight) and 3 (yellow highlight) are true (on) their respective Digital Outputs are true (on) as well.

Controlled by Network

This configuration is used when it is desired to control the digital outputs over network communication instead of a drive related function. In the case for the PowerFlex 753 embedded digital outputs, P227 [Dig Out Setpoint] is utilized and in the case for the PowerFlex 750-Series Option Module, P7 [Dig Out Setpoint] is utilized. To complete the configuration for control over a network, a datalink must be configured for the respective Digital Output Setpoint parameter.

Related PowerFlex 753 Setpoint parameter information noted below.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type

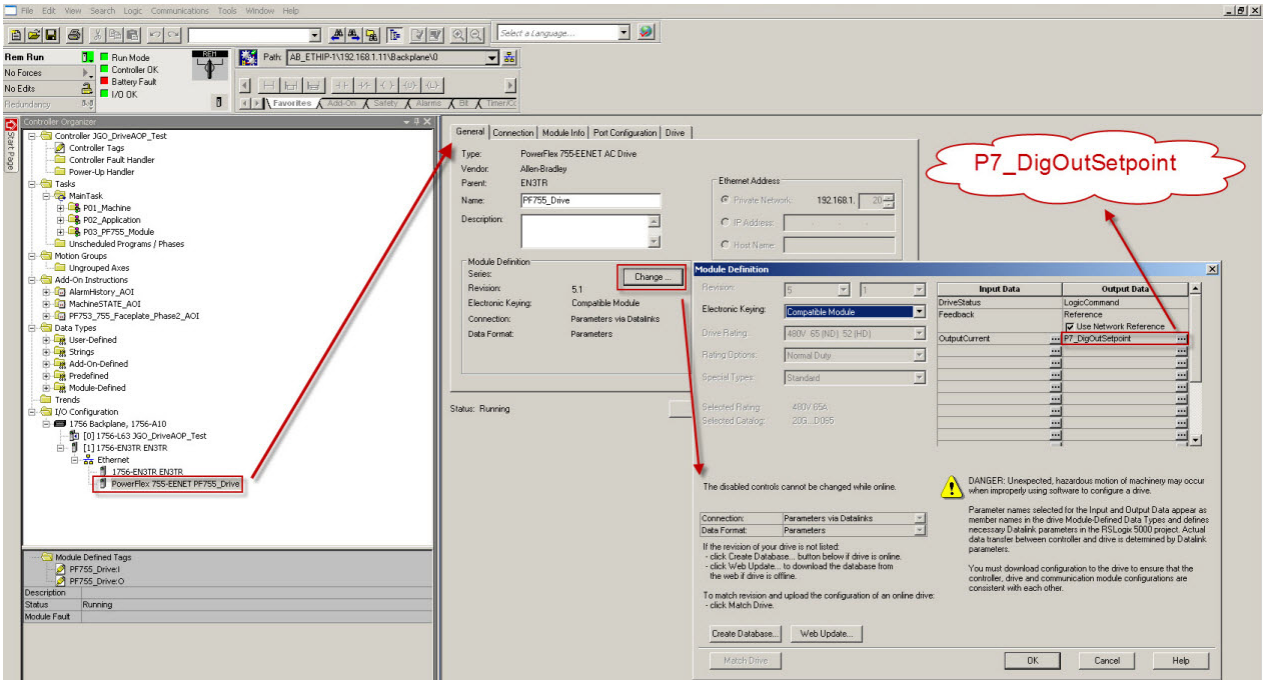
(1) Bit 1 = "Trans Out 0" for I/O Module model 20-750-2263C-1R2T
= "Relay Out 1" for I/O Module models 20-750-2262C-2R and 20-750-2262D-2R
(2) Bit 2 is only used by I/O Module 20-750-2263C-1R2T

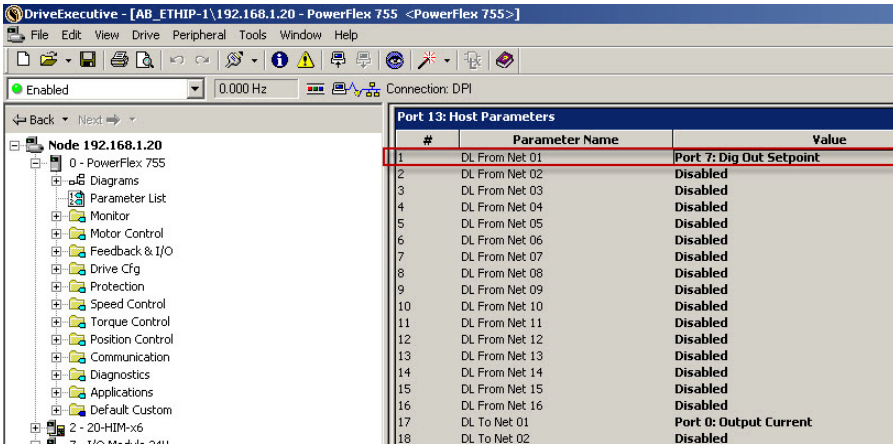
Example

For this example, our setup includes a PowerFlex 755 utilizing a 20-750-2262C-2R 24VDC I/O Option Module and a ControlLogix™ L63 processor. The drive's Option Module, P10 [RO0 Sel] is configured for Port 7: Dig Out Setpoint.Relay Out 0. We are utilizing the Logix Designer application, which includes the Drives Add-On Profiles (AOPs). This gives us the ability to communicate and control the PowerFlex 755 drive over its embedded ethernet port via a datalink P7 [Dig Out Setpoint], Relay Out 0.

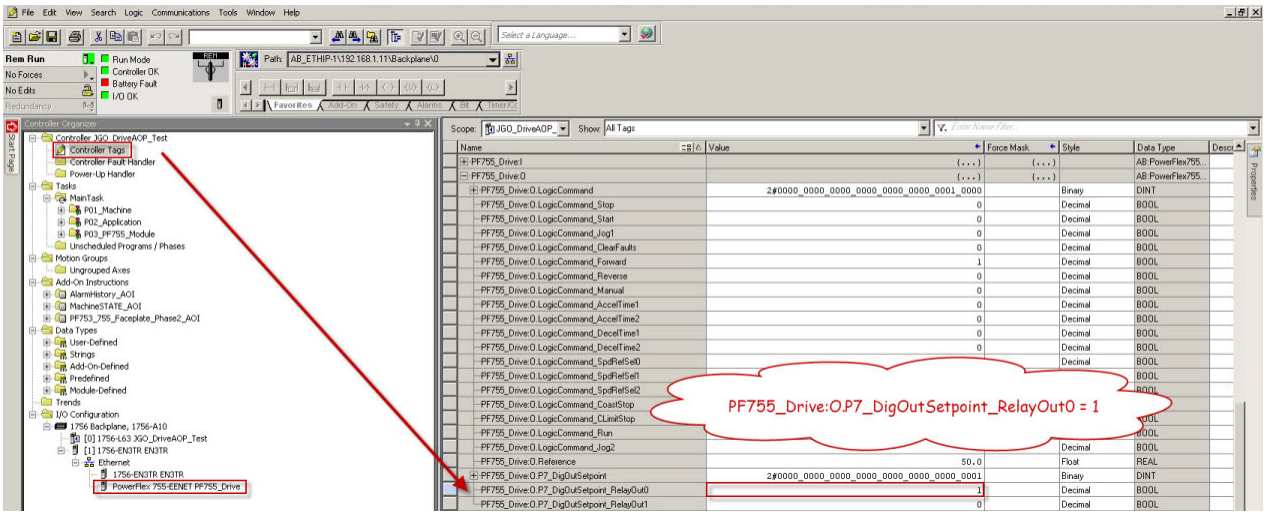
Below is a picture of the PowerFlex 755 drive Datalink configuration.



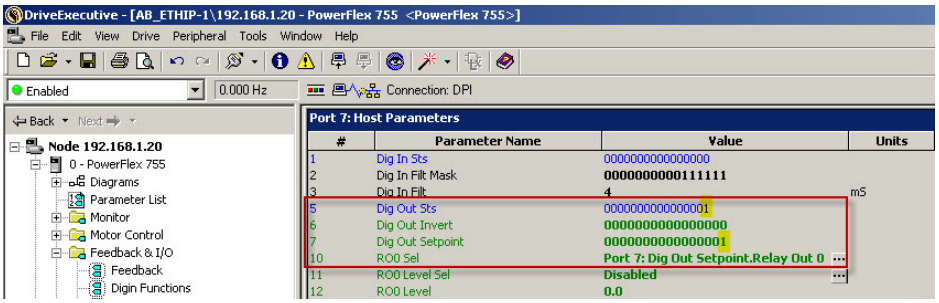
Below is a picture of the PowerFlex 755 drive Datalink configuration from DriveExecutive™.



Utilizing the Drive Add-On Profiles and a datalink, we can use the created descriptive controller tag (highlighted below) to communicate over a network to control the relay output.



The picture below shows the result of controlling the digital output over the network (yellow highlight).



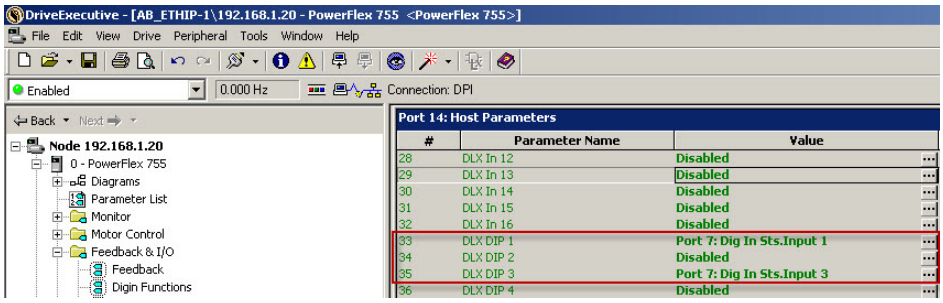
Controlled by DeviceLogix software

DeviceLogix software control technology provides you with the flexibility to customize a drive to more closely match your application needs. DeviceLogix software controls outputs and manages status information locally within the drive allowing you to operate the drive independently or complimentary to supervisory control helping to improve system performance and productivity. You can use the PowerFlex 750-Series DeviceLogix software to read inputs/write outputs and exclusively control the drive.

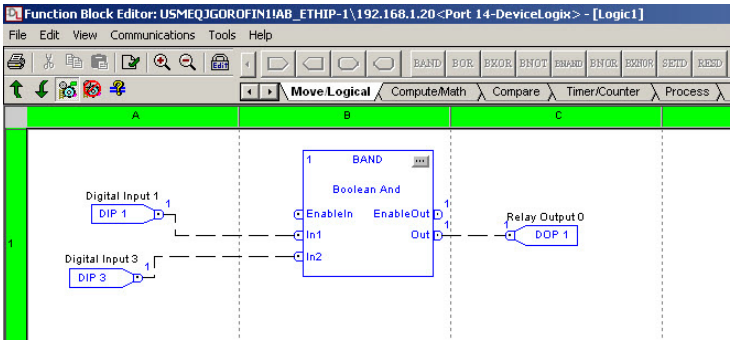
Example

In the example below, we are using two real world inputs, such as limit switches being wired into a PowerFlex 750-Series Option Module, and using a DeviceLogix software program to control a digital output.

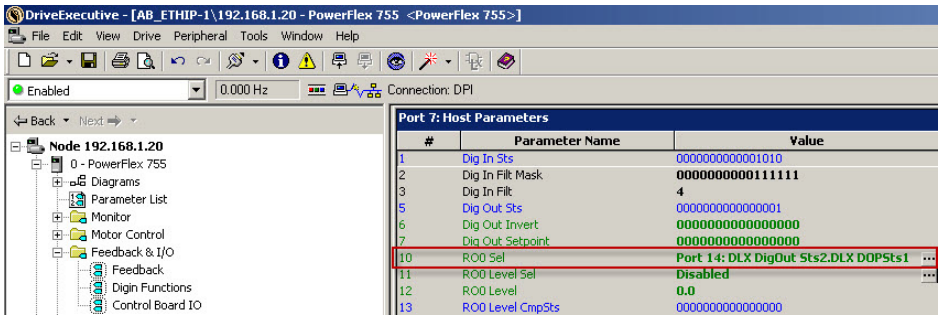
The picture below shows the DeviceLogix software Digital Input configuration. P33 [DLX DIP 1] is configured for Port 7: Dig In Sts.Input 1 and P35 [DLX DIP 3] is configured for Port 7: Dig In Sts.Input 3. This setup lets us bring in two real world inputs into DeviceLogix software.



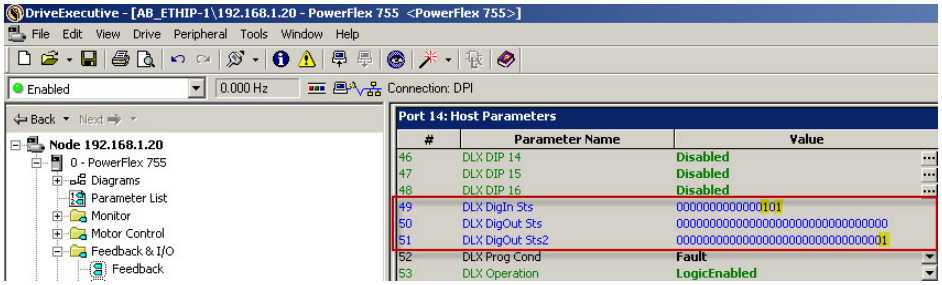
We then utilize a DeviceLogix software program so that when both Digital Input 1 and Digital Input 3 are true (on), the resultant is the DeviceLogix software Digital Output 1 (DOP 1) turns on.



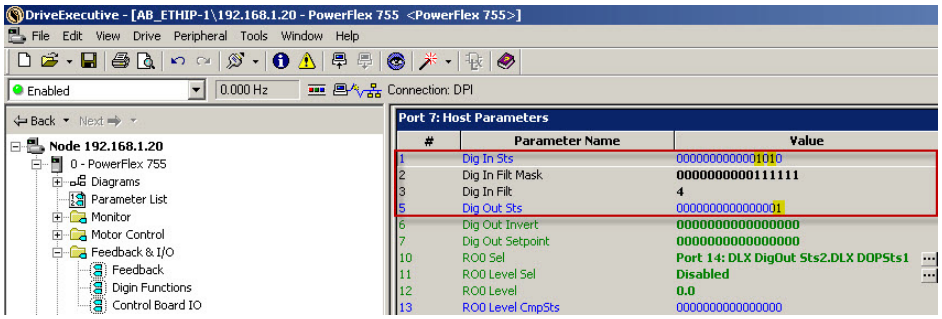
The picture below shows that the Option Module, P10 [RO0 Sel] is configured for DeviceLogix software Port 14: DLX DigOut Sts2.DLX DOPSts1. This links together the DeviceLogix software Digital Output 1 (DOP 1) to the drive's physical output, such that when the DOP 1 is high (on), the drive's Option Module relay output energizes.



The picture below shows the status of the DeviceLogix software inputs and outputs via P49 [DLX DigIn Sts] and P51 [DLX DigOut Sts2].



The picture below shows the status of the DeviceLogix software inputs and outputs via P1 [Dig In Sts] and P5 [Dig Out Sts].



Invert

There is a logical invert function associated with the PowerFlex 750-Series drive's digital outputs. For the PowerFlex 753, it is configured by P226 [Dig Out Invert], and for the PowerFlex 750-Series Option Module, it is configured by P6 [Dig Out Invert]. This invert function changes the output status bit from a zero, false state, to a one, true state, and vice versa.

This logical invert function requires power to be applied to the drive's control module for the drive's logic to be active. This can be obtained from powering up the drive's control module by either applying power to the drive's input section or from an external 24VDC being wired into the Auxiliary Power Supply Option Module.

PowerFlex 753 Invert parameter information noted below.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type
FEEDBACK & I/O	Digital Outputs	226	753 **Dig Out Invert** Digital Output Invert Inverts the selected digital output.		RO	16-bit Integer

0 = Condition False
1 = Condition True

Depending on the PowerFlex 750-Series Option Module(s) installed, Invert parameter information noted below.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type
I/O	Digital Outputs	6	**Dig Out Invert** Digital Output Invert Inverts the selected digital output.		RW	16-bit Integer

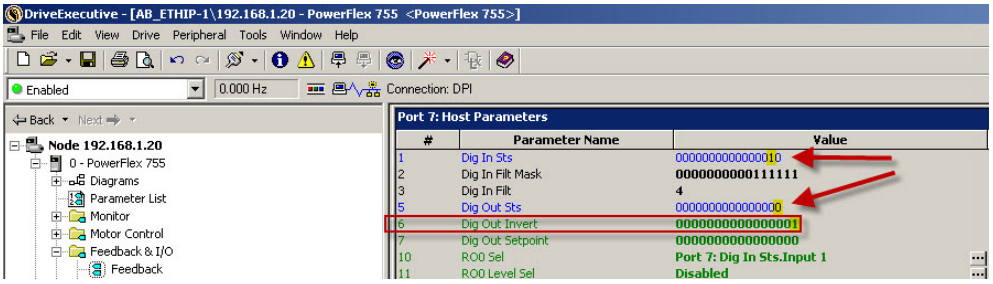
Options	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Trans Out 1 (2)	Trans Out 0 (1)	Relay Out 0
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0 = Output Not Inverted
1 = Output Inverted

(1) Bit 1 = "Trans Out 0" for I/O Module model 20-750-2263C-1R2T.
= "Relay Out 1" for I/O Module models 20-750-2262C-2R and 20-750-2262D-2R.
(2) Bit 2 is used only by I/O Module 20-750-2263C-1R2T.

Example

In this example, the drive is utilizing a 24VDC, two relay Option Module in Port 7 with P10 [RO0 Sel] is programmed for Port 7: Dig In Sts.Input 1. Notice below when the Invert bit for Relay Out 0, when the input status is true (1), the digital output status bit is false (0).



On/Off Time

Each digital output has two user-controlled timers associated with it. The On timer defines the delay time between a False-to-True transition (condition appears) on the output condition and the corresponding change in state of the digital output. The Off timer defines the delay time between a True-to-False transition (condition disappears) on the output condition and the corresponding change in the state of the digital output. Either timer can be disabled by setting the corresponding delay time to zero.

PowerFlex 753 On/Off parameters noted below.

Parameter No.	Parameter Name	Description
234	R00 On Time	Sets the "ON Delay" time for the digital outputs. This is the time between the occurrence of a condition and activation of the relay.
235	R00 Off Time	Sets the "OFF Delay" time for the digital outputs. This is the time between the disappearance of a condition and de-activation of the relay.
244	T00 On Time	Sets the "ON Delay" time for the digital outputs. This is the time between the occurrence of a condition and activation of the relay or transistor.
245	T00 Off Time	Sets the "OFF Delay" time for the digital outputs. This is the time between the disappearance of a condition and de-activation of the relay or transistor.

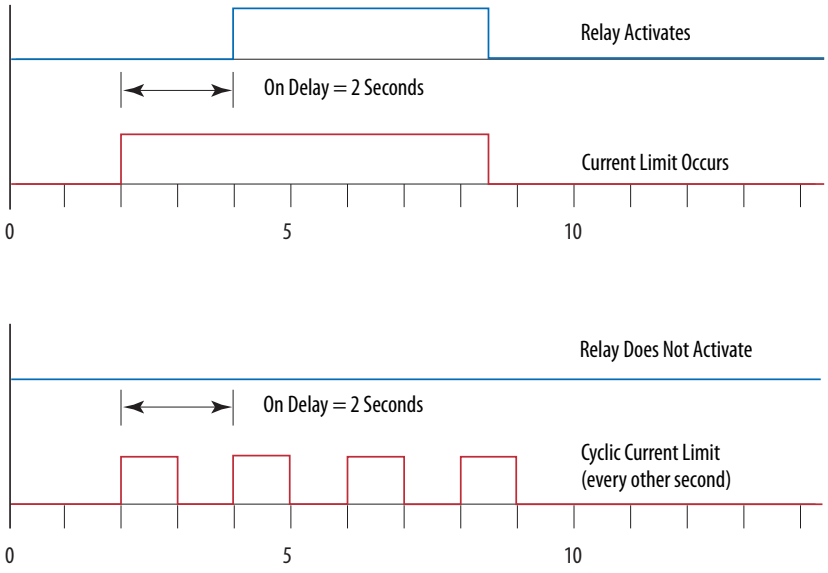
Depending on the PowerFlex 750-Series Option Module(s) installed, On/Off parameters noted below.

Parameter No.	Parameter Name	Description
14	R00 On Time	Sets the "ON Delay" time for the digital outputs. This is the time between the occurrence of a condition and activation of the relay.
15	R00 Off Time	Sets the "OFF Delay" time for the digital outputs. This is the time between the disappearance of a condition and de-activation of the relay.
24	R01 On Time or T00 On Time	Sets the "ON Delay" time for the digital outputs. This is the time between the occurrence of a condition and activation of the relay or transistor.
25	R01 Off Time or T00 Off Time	Sets the "OFF Delay" time for the digital outputs. This is the time between the disappearance of a condition and de-activation of the relay or transistor.
34	T01 On Time	Sets the "ON Delay" time for the digital outputs. This is the time between the occurrence of a condition and activation of the transistor.
35	T01 Off Time	Sets the "OFF Delay" time for the digital outputs. This is the time between the disappearance of a condition and de-activation of the transistor.

Whether a particular type of transition (False-to-True or True-to-False) on an output condition results in an energized or de-energized output depends on the output condition. If a transition on an output condition occurs and starts a timer, and the output condition goes back to its original state before the timer runs out, then the timer is aborted and the corresponding digital output does not change state.

Example

For example, in the diagram below, a digital output is configured for P935 [Drive Status 1], Bit 27 "Cur Limit," the On Time is programmed for two seconds and the Off Time is programmed for 0 seconds.



Status

The [Dig Out Sts] parameter displays the status of the digital outputs and can be used for troubleshooting the digital outputs. When the bit in associated with the digital output is on, this means that the logic in the drive is telling that digital output to turn on. When the bit associated with the digital input is off, this means that the logic in the drive is telling that digital output to turn off.

PowerFlex 753 related Status parameter information noted below.

File	Group	No.	Display Name Full Name Description	Values	Read-Write	Data Type

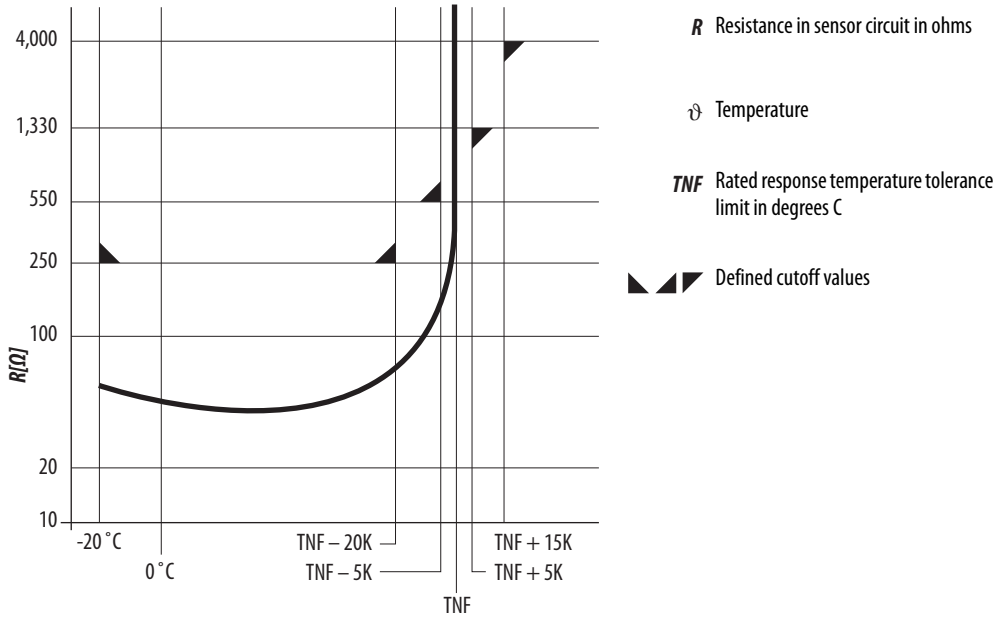
PTC Motor Thermistor Input

A PTC (Positive Temperature Coefficient) sensing device, also known as a motor thermistor, embedded in the motor windings can be monitored by the drive for motor thermal protection. The motor windings are typically equipped with three PTC sensors (one per phase) wired in series as shown in schematic below. The miniaturized sensors have a low resistance below the rated response temperature, and increase their resistance (exponentially) in the rated response temperatures range. The rated response temperature is defined by the PTC sensor. Motors with different thermal insulation classes (Class F or H) are equipped with different PTC sensors, each with its own response temperature such as 120, 130, and 140 Degrees C. Unlike the PT100 or KTY thermistors, which have a linear relation between temperature and resistance, the PTC thermistor is used for a temperature level indication rather than a direct measurement in degrees C.

Figure 13 - PTC characteristic temperature/resistance curve according to IEC-34-11-2

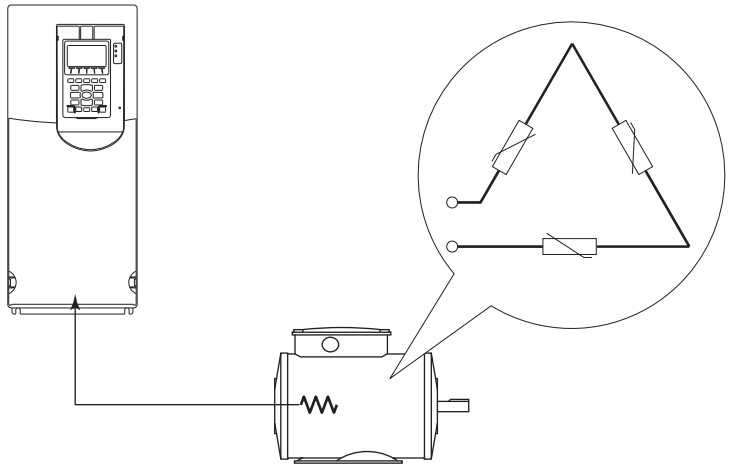


Hardware and Connection

The PTC thermistor leads are connected to the PTC+ and PTC- terminals of either the PowerFlex 753 main control board TB1 or to TB1 of one of the optional I/O cards, catalog numbers 20-750-2262C-2R, 20-750-2263C-1R2T, 20-750-2262D-2R.

PTC thermistors of ATEX certified motors connect to the ATEX option module, 20-750-ATEX, which is mounted onto one of the 11-Series I/O cards, catalog numbers 20-750-1132C-2R, 20-750-1133C-1R2T, 20-750-1132D-2R.

Figure 14 - PTC Connection



Configuration with PTC connected to PowerFlex 753 Main Control Board

Port 0: P250 [PTC Cfg] = 0 “Ignore,” 1 “Alarm,” 2 “Flt Minor,” 3 “FltCoastStop,” 4 “Flt RampStop,” or 5 “Flt CL Stop”

Status is shown in Port 0: P251 [PTC Sts]

Configuration with Optional I/O Board

Port X (I/O Module): P40 [PTC Cfg] = 0 “Ignore,” 1 “Alarm,” 2 “Flt Minor,” 3 “Flt CoastStop,” 4 “Flt RampStop,” or 5 “Flt CL Stop”

Status is shown in Port X (I/O Module): P41 [PTC Sts] and Port X (I/O Module): P42 [PTC Raw Value]

Configuration with 11-Series I/O module fitted with ATEX Option

Status is shown in Port X (I/O Module): P41 [ATEX Sts] The fault action is not configurable when the ATEX module is used.

Fault or Alarm Operation

The reaction to an increased PTC resistance depends on the respective PTC configuration, such as alarm or fault. When the ATEX module is used, the result is always fault. When the PTC resistance exceeds 3.2 kOhm a fault or alarm is triggered. The function is reset when the resistance drops below 2.2 kOhm. A short circuit is detected when the resistance value drops below 100 Ohm. If the drive was configured to fault then the fault must be cleared once the PTC function is reset (value is below threshold).

Alarms

Alarms are indications of situations that are occurring within the drive or application that are annunciated to the user. These situations can affect the drive operation or application performance. Conditions such as power loss or analog input signal loss can be detected and displayed for drive or operator action.

There are two types of alarms.

- Type 1 Alarms are conditions that do not cause the drive to trip or shut down, but, if the condition persists, it can lead to a drive fault.
- Type 2 Alarms are conditions that are caused by improper programming and prevent the drive from starting until programming is corrected. An example of a Type 2 alarm is when a start function is assigned to a digital input without a stop function also assigned to a digital input.

The Troubleshooting section of the PowerFlex 750-Series Programming Manual, publication 750-PM001, contains a list of drive-specific faults and alarms, their type of fault or alarm, and what action can be configured if applicable.

In a Control Logix program do not set P410 [Motor OL Actn] to 1 "Alarm." There is an anomaly in drives with firmware version 8.001 or earlier that prevents an overload from being asserted in P959 [Alarm Status A] and in P937 [Condition Sts 1] Bit 2 "Motor OL." Neither of these parameters are used under this circumstance to initiate any programmed alarm routine.

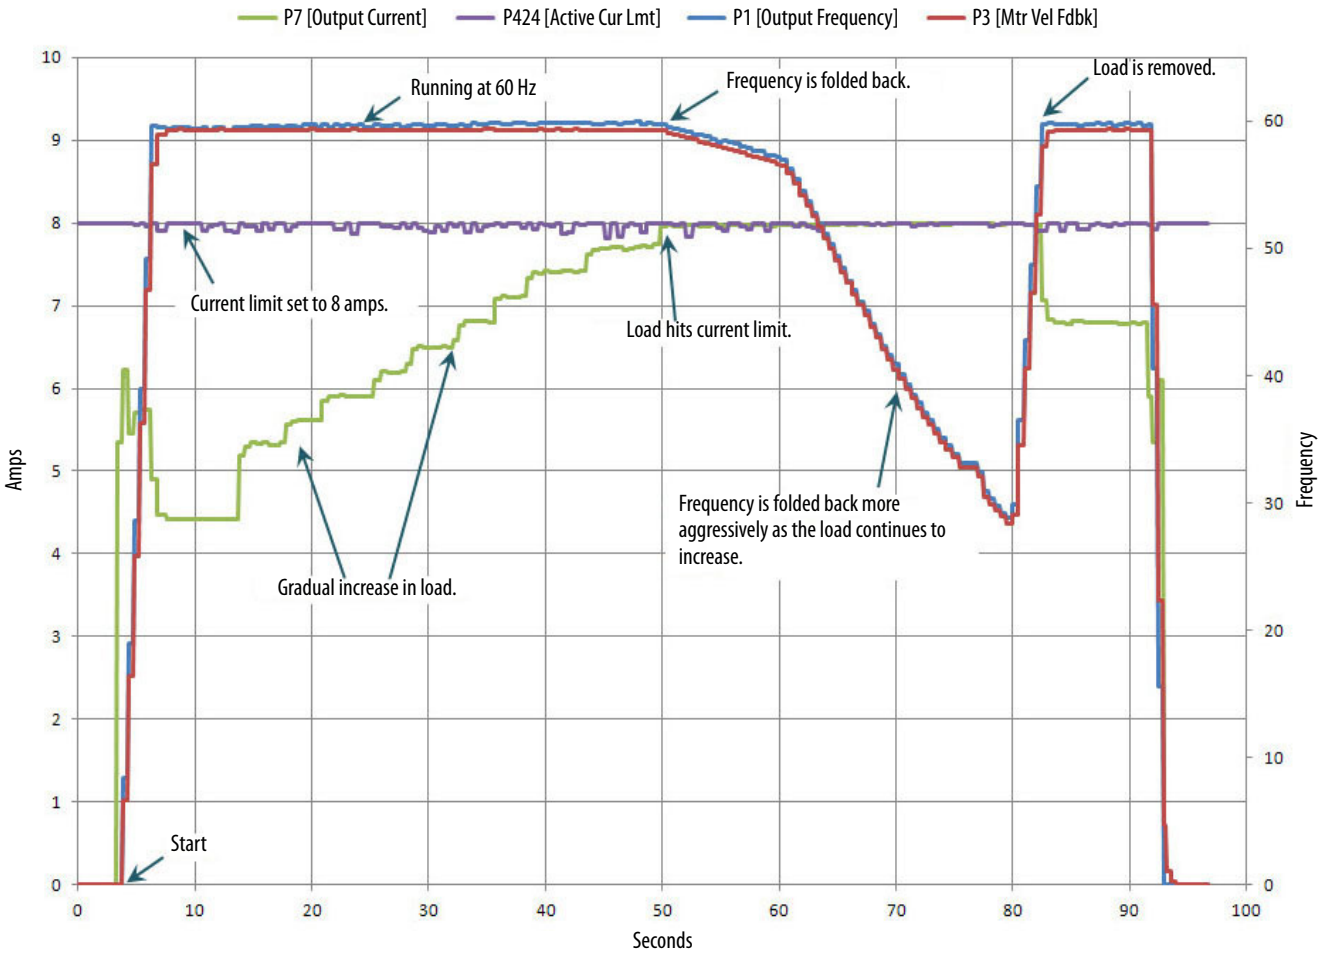
Leaving P410 [Motor OL Actn] at one of the fault settings or Flash Updating the drive to a firmware version greater than 8.001 resolves this anomaly. Instructions on Flash Updating drives are provided in drive firmware Release Notes publications.

Current Limit

There are five ways that the drive can protect itself from over current or overload situations.

Method	Description
Hardware Over Current	This is a feature that instantly faults the drive if the output current exceeds this value. The value is fixed by hardware and is typically 250% of drive rated amps. The fault code for this feature is F12 "HW OverCurrent." This feature cannot be defeated or mitigated.
Software Over Current	This protection mode occurs when peak currents do not reach the hardware over current value and are sustained long enough and high enough to damage certain drive components. If this situation occurs, the drives protection scheme causes an F36 "SW OverCurrent" fault. The point at which this fault occurs is fixed and stored in drive memory.
Software Current Limit	This is a feature that attempts to reduce current by folding back output voltage and frequency if the output current exceeds a programmable value. P422/423 [Current Limit 1/2], selected by P421 [Current Lmt Sel], are programmable up to 150% of drive rating. The reaction to exceeding this value is programmable with Shear Pin fault. Enabling this parameter creates an F61 or F62 "Shear Pin n" fault. Disabling this parameter causes the drive to use fold back to attempt load reduction.
Heat Sink Temperature Protection	The drive constantly monitors the heat sink temperature. If the temperature exceeds the drive maximum, a F8 "Heatsink OvrTemp" fault occurs. The value is fixed by hardware at a nominal value of 100 degrees C. This fault is generally not used for over current protection due to the thermal time constant of the heat sink. It is an overload protection.
Drive Overload Protection	Refer to Drive Overload on page 158.

Figure 15 - Current Limit Frequency Fold-back Examples



DC Bus Voltage/Memory

P11 [DC Bus Volts] is a measurement of the instantaneous value. P12 [DC Bus Memory] is a heavily filtered value or average bus voltage. Just after the pre-charge relay is closed during initial powerup, bus memory is set equal to bus voltage. Thereafter it is updated to the six-minute average of the instantaneous DC bus voltage.

Bus memory is used as a comparison value to sense a power loss condition. If the drive enters a power loss state, the bus memory is also used for recovery (for example pre-charge control or inertia ride through) upon return of the power source. Update of the bus memory is blocked during deceleration to prevent a false high value caused by a regenerative condition.

Drive Overload

The purpose of the drive thermal overload feature is to protect the drive's power module when operation exceeds the design limitations. This feature does not protect the motor, this is handled by the motor overload protection feature (see Motor Overload on page 168).

The drive thermal overload function utilizes two methods to protect the drive. Inverse time protection based on the average output current and a thermal manager that models the temperature of the IGBTs based on measured power module temperature and operating conditions. Each method can reduce the PWM switching frequency or reduce current limit. When rated conditions are exceeded, even after applying one of the measures mentioned above, and the load on the drive is not reduced, a F64 "Drive Overload" fault is generated. The fault detection mechanism cannot be disabled. Only the ability to fold back PWM frequency and current limit can be disabled.

The drive monitors the temperature of the power module based on a measured temperature and a thermal model of the power module. As the temperature rises and P940 [Drive OL Count] increases, the drive can lower the PWM frequency to decrease the switching losses in the power module. If the temperature continues to rise, the drive can reduce current limit to try to decrease the load. This is the factory default response, configurable by P420 [Drive OL Mode], to increasing drive temperature. If the drive temperature becomes critical, P940 [Drive OL Count] = 100%, the drive faults.

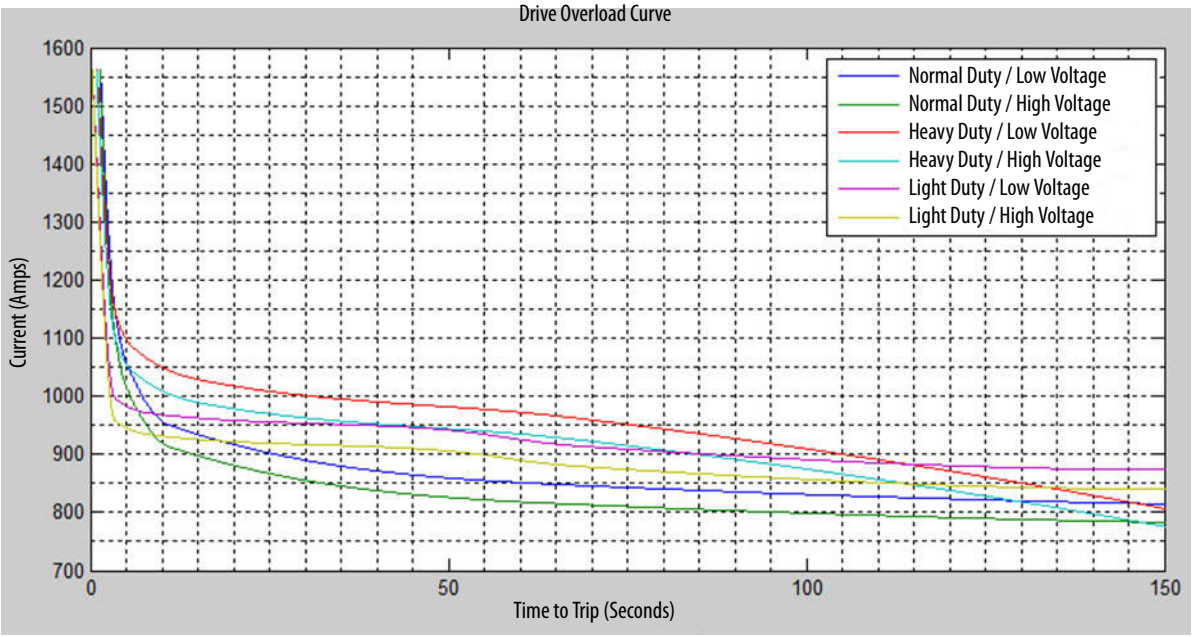
If the drive is operated in a low ambient temperature condition the drive can exceed rated levels of current before the monitored temperature becomes critical. To guard against this situation the drive thermal overload also includes an inverse time algorithm. When this scheme detects operation beyond rated limits, current limit can be reduced or a fault can be generated.

Inverse Time Protection

The following curves show an example of the boundary operations of a 20G1AxC770 drive. The curve is defined by the drive's continuous rating and the respective overload capacities. These are voltage class and duty rating dependant and are configurable by P305 [Voltage Class] and P306 [Duty Rating]. This particular example has six different overload ratings.

- Low Voltage/Normal Duty or High Voltage/Normal Duty
- Low Voltage/Heavy Duty or High Voltage/Heavy Duty
- Low Voltage/Light Duty or High Voltage/Light Duty
  Light Duty is only available to frame 8 and larger drives.

If the load on the drive exceeds the level of current as shown on one of the curves, the inverse time protection increments the overload counter. Current limit can fold back to 100% of the drive rating when the drive over load count reaches 97.35% until the 10/90 or 5/95 duty cycle has been achieved. For example, 60 seconds at 110% is followed by 9 minutes at 100%, and 3 seconds at 150% is followed by 57 seconds at 100%. With the threshold for where to take action slightly above the rated level the drive only folds back when drive ratings are exceeded. If fold back of current limit is not enabled in P940 [Drive OL Mode], an F64 "Drive Overload" fault occurs when operation exceeds the rated levels.

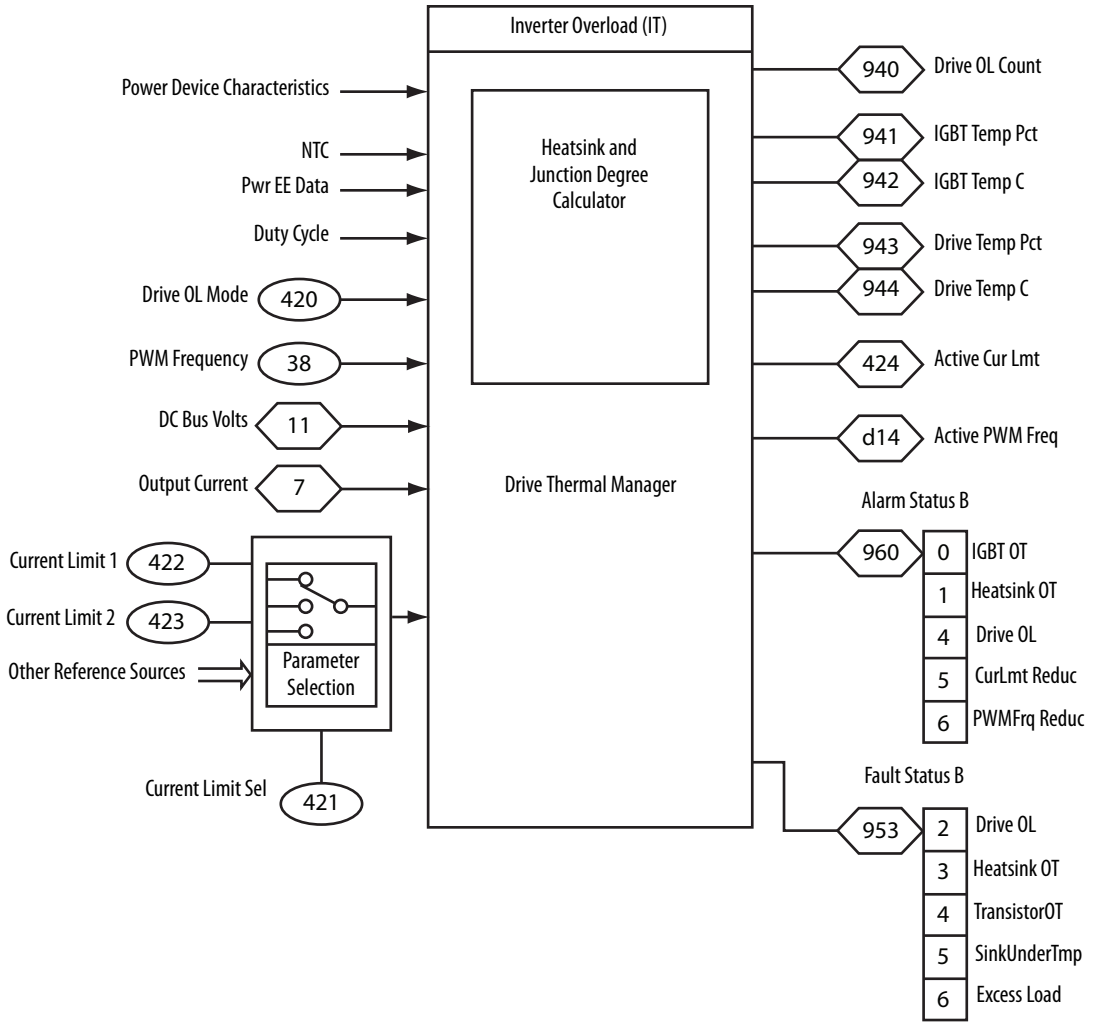


Normal Duty and Heavy Duty Operation

Applications require different amounts of overload current. Sizing a drive for Normal Duty provides 110% for 60 seconds and 150% for 3 seconds. For a heavy duty application, one larger drive rating than the motor is used and therefore provides a larger amount of overload current in comparison to the motor rating. Heavy duty sizing provides at least 150% for 60 seconds and 180% for 3 seconds. These percentages are with respect to the connected motor rating.

Thermal Manager

The thermal manager assures that the thermal ratings of the power module are not exceeded. The operation of the thermal manager can be thought of as a function block with the inputs and outputs as shown below.



The following is a generalization of the calculations done by the thermal manager. The IGBT junction temperature is calculated based on the measured

drive temperature and a temperature rise that is a function of operating conditions. When the calculated junction temperature reaches a maximum limit, the drive faults. This fault cannot be disabled. This maximum junction temperature is stored on the power board EEPROM along with other information to define the operation of the drive overload function. These values are not user adjustable. In addition to the maximum junction temperature, there are temperature thresholds that select the points at which the PWM frequency begins to fold back, and at which current limit begins to fold back. P960 [Alarm Status B] alarm bits provide status as to when the fold back points are being reached regardless of whether or not the drive is configured to fold back. Bit 6 "PWMFrq Reduc" is the alarm bit for PWM fault and is 10 °C (50 °F) below the fault level. Bit 5 "CurLmt Reduc" is the alarm bit for current limit fold back and is 5 °C (41 °F) below the fault level. The over temperature fault level is reduced when running at output frequencies lower than 5 Hz.

Configuration

P420 [Drive OL Mode] lets the user select the action to perform with increased current or drive temperature. When this parameter is set to option 0 "Disabled," the drive will not modify the PWM frequency or current limit. When set to 2 "Reduce PWM" the drive only modifies the PWM frequency. This is typically used on hoisting applications. Option 1 "Reduce CLmt" only modifies the current limit. When setting this parameter to 3 "Both-PWM 1st" the drive modifies the PWM frequency first and then the current limit, if necessary, to keep the drive from faulting with a F64 "Drive Overload" or F8 "Heatsink OvrTemp" fault.

Temperature Display

The drive temperature is measured (NTC on the heat sink) and displayed as percentage of drive thermal capacity in P943 [Drive Temp Pct] and IGBT thermal capacity in P941 [IGBT Temp Pct]. These two parameters are normalized to the thermal capacity of the drive, which is frame dependent, and displays thermal usage in percent of maximum (100% = drive Trip). The heat sink temperature, P944 [Drive Temp C], and IGBT temperature, P942 [IGBT Temp Pct], in degrees C are also provided as test points. These cannot directly be related to a trip point as the maximums are defined as a percent.

Low Speed Operation

When operation is below 5 Hz, the IGBT duty cycle is such that heat builds up more rapidly in the power device. The thermal manager increases the calculated IGBT temperature at low output frequencies and causes corrective action to take place sooner. Consult technical support when prolonged operation at low output frequencies is required so proper drive derating can be applied. Also consider that when a drive is in current limit the output frequency is reduced to try to reduce the load. This works fine for a variable torque load, but for a constant torque load reducing the output frequency does not lower the current (load). Lowering current limit on a constant torque load pushes the drive down to a region where the thermal issue becomes worse. In this situation the thermal manager increases the calculated losses in the power module to track the worst case. So if the thermal manager normally provides 150% for 3 seconds at high speeds, it can only provide 150% for one second before generating a fault at low speeds. Some applications, such as hoisting and lifting, can benefit from the disabling of current limit fold back.

Faults

Faults are events or conditions occurring within and/or outside of the drive. These events or conditions by default are considered to be of such significant magnitude that drive operation is discontinued. Faults are annunciated by the STS (Status) indicator on the drive, a HIM, communications network and/or contact outputs.

Drive Response to Faults

When a fault occurs, the fault condition is latched, requiring the user or application to perform a fault reset to clear the latched condition. The condition that caused the fault determines the user response. If the condition that caused the fault still exists after a fault reset, the drive faults again and the fault condition is latched.

- In response to a fault, the drive takes a predetermined action based on fault type. Drive response to some fault types are user configurable. With non-configurable faults the drive output is turned off and a “coast to stop” sequence occurs. The Troubleshooting section of PowerFlex 750-Series Programming Manual, publication 750-PM001, provides details on both types of faults.
- The fault code is entered into the first buffer of the fault queue (see Fault Queue below for rules).
- Additional data on the status of the drive at the time that the fault occurred is recorded. This information is always related to the most recent fault queue entry captured by P951[Last Fault Code]. When another fault occurs, this data is overwritten.

The following data/conditions are captured and latched into non-volatile drive memory.

- P952 [Fault Status A]
  P953 [Fault Status B]
  Indicates the occurrence of conditions that have been configured as faults.
- P954 [Status1 at Fault]
  P955 [Status2 at Fault]
  Captures operating conditions of the drive at the time of the fault.
- P957 [Fault Amps]
  Motor amps at the time of the fault.
- P958 [Fault Bus Volts]
  DC Bus volts at time of the fault.
- P956 [Fault Frequency]
  Output Hertz at the time of fault.
- P962 [AlarmA at Fault]
  P963 [AlarmB at Fault]
  Captures and displays P959/960 [Alarm Status A/B] at the last fault.

Fault Queue

Faults are also logged into a fault queue such that a history of the most recent fault events is retained. Each recorded event includes a fault code (with associated text) and a fault "time of occurrence." PowerFlex 750-Series drives have a 32 event queue.

The fault queue records the occurrence of each fault event that occurs while no other fault is latched. Each fault queue entry includes a fault code and a time stamp value. New fault events are not logged to the fault queue if a previous fault has already occurred, but has not yet been reset. Only faults that actually trip the drive are logged. No fault that occurs while the drive is already faulted is logged.

The fault queue is a first-in, first-out (FIFO) queue. Fault queue entry 1 is always the most-recent entry (newest). Entry 32 is always the oldest. As a new fault is logged, each existing entry is shifted by one. The previous entry 1 moves to entry 2, previous entry 2 moves to entry 3, and so on. If the queue is full when a fault occurs, the oldest entry is discarded.

The fault queue is saved in nonvolatile storage at power loss and its content retained when power is cycled.

Fault Code and Time Stamp

The fault code with descriptive text for each entry can be viewed with a HIM. Once the fault code is displayed, pressing the enter key again on the HIM displays the time stamp associated with that fault code. The time stamp is the elapsed time since the fault occurred.

When using one of the available software tools (DriveExecutive, DriveExplorer, Connected Component Workbench, or Logix Designer), the fault code, descriptive text, and time stamp are displayed simultaneously.

Resetting or Clearing a Fault

A latched fault condition can be cleared by the following methods.

- An off to on transition on a digital input configured as DI Clear Fault.
- Pressing the “CLR” soft key or Stop button on the HIM once a fault has been displayed.
- A DPI peripheral (several ways).
- Performing a reset to factory defaults via parameter write.
- Cycling power to the drive such that the control board goes through a power-up sequence.

Resetting faults clears the faulted status indication. If any fault condition still exists, the fault is re-latched and another entry made in the fault queue.

Clearing the Fault Queue

Performing a fault reset does not clear the fault queue. This can be done from a menu selection of the HIM or from a DPI command through the communications port.

Fault Configuration

The drive can be configured such that some conditions do not trip the drive.

The following is a brief list of drive configurable faults. Some of these faults are explained in more detail in their own section of this document.

Accessories such as encoder or I/O cards have additional configurable faults. Refer to the Troubleshooting section of the PowerFlex 750-Series Programming Manual, publication 750-PM001.

- P409 [Dec Inhibit Actn]
- P410 [Motor OL Actn]
- P435 [Shear Pin 1 Actn]
- P438 [Shear Pin 2 Actn]
- P444 [OutPhaseLossActn]
- P449 [Power Loss Actn]
- P462 [InPhase LossActn]
- P466 [Ground Warn Actn]
- P493 [HSFan EventActn]
- P500 [InFan EventActn]
- P506 [MtrBrngEventActn]
- P510 [MtrLubeEventActn]
- P515 [MchBrgEventActn]
- P519 [MchLubeEventActn]
- P865 [DPI Pt1 Flt Actn]
- P866 [DPI Pt2 Flt Actn]
- P867 [DPI Pt3 Flt Actn]
- P1173 [TorqAlarm TOActn]

Input Phase Loss Detection

Occasionally, three-phase power sources can fail on one phase while continuing to deliver power between the remaining 2 phases (single-phase). Operating above 50% output under this single-phase condition can damage the drive. If such a condition is likely, we recommend that Input Phase Loss Detection be enabled. The drive can be programmed to turn on an alarm bit or issue a drive fault (minor or major). The drive accomplishes this by interpreting voltage ripple on the DC bus.

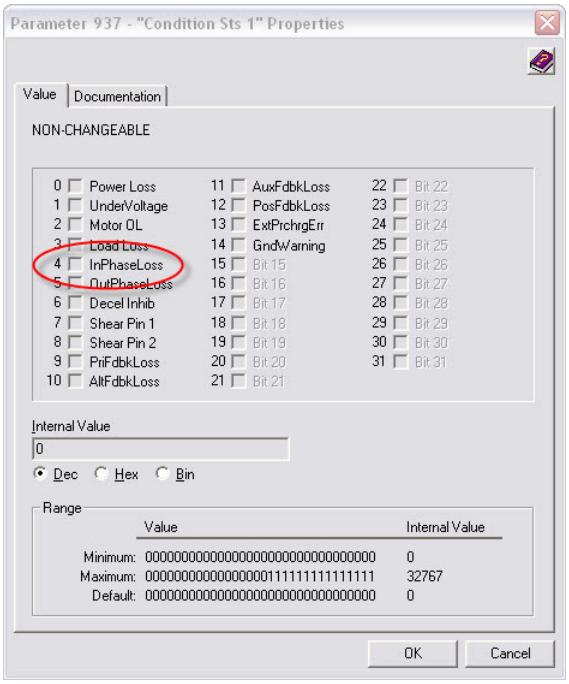
Configuring Input Phase Loss Action

P462 [InPhase LossActn]

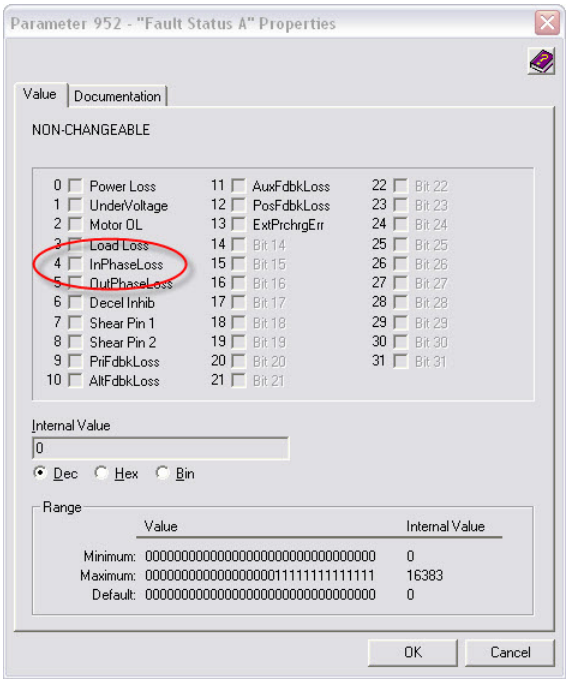
The following bits configure Input Phase Loss action:

- "Ignore" (0) – No action is taken. This can seriously degrade the drive.
- "Alarm" (1) – Type 1 alarm indicated.
- "Flt Minor" (2) – Minor fault indicated. If running, drive continues to run. Enable with P950 [Minor Flt Cfg]. If not enabled, acts like a major fault.
- "FltCoastStop" (3) – Major fault indicated. Coast to Stop.
- "Flt RampStop" (4) – Major fault indicated. Ramp to Stop.
- "Flt CL Stop" (5) – Major fault indicated. Current Limit Stop.

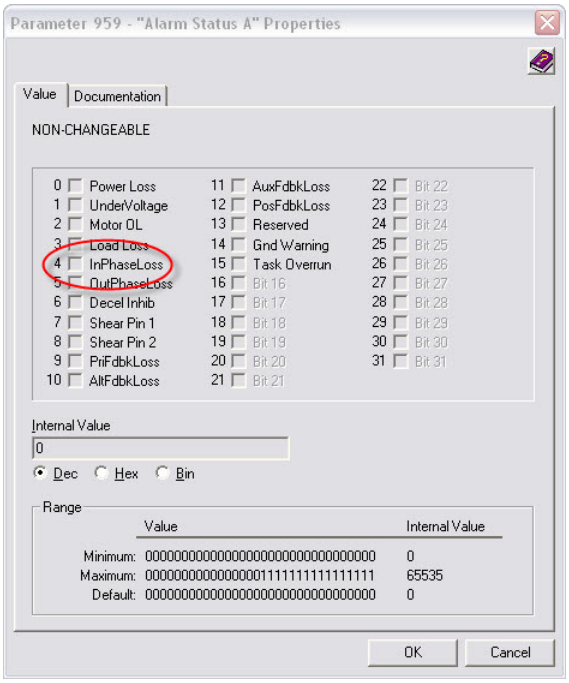
An input phase loss is indicated in P937 [Condition Sts 1] Bit 4 "InPhaseLoss."



If a fault action has been selected as a result of an input phase loss, P952 [Fault Status A] Bit 4 “InPhaseLoss” is set.



If an alarm action is selected as a result for the input phase loss, P959 [Alarm Status A] Bit 4 “InPhaseLoss” is set.



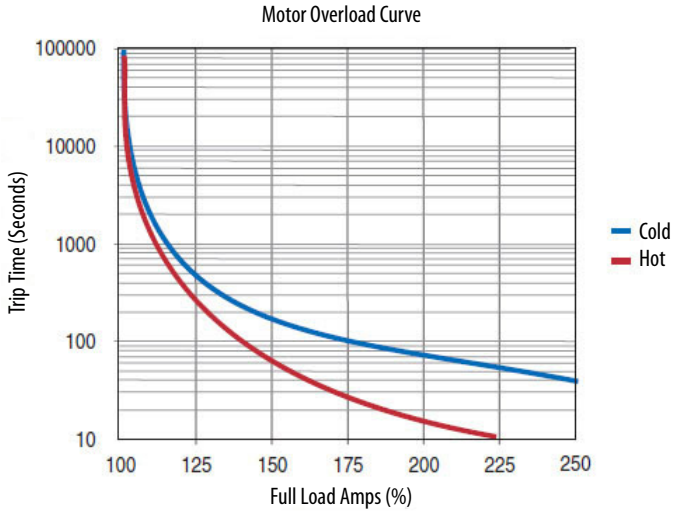
P463 [InPhase Loss Lvl]

Sets the threshold at which the DC bus voltage ripple triggers an F17 "Input Phase Loss" fault. Input phase loss is assumed when the DC bus voltage ripple exceeds the tolerance set by this parameter for a certain time period of time. Setting a larger value permits a higher bus voltage ripple without causing the drive to fault but also results in more heating in the bus capacitors shortening their life or possibly resulting in failure. The default value of 325 is equal to the expected ripple level for a full rated motor running at half load with single phase input. This is just a different way of saying that if you know you are going to run single phase, derate the drive by 50%.

Loading conditions on the motor could also have an effect on this parameter. Particularly shock loads.

Motor Overload

The motor overload protection feature uses an IT (inverse time) algorithm to model the temperature of the motor and follows the same curve as a physical class 10 overload device.



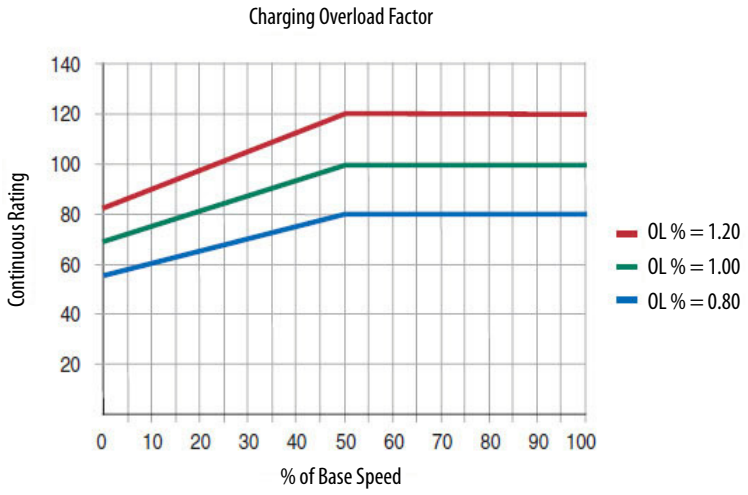
P26 [Motor NP Amps] is used by the overload feature to establish the 100% level (y axis) shown in the graph above.

Setting P410 [Motor OL Actn] to zero disables the motor thermal overload. For multiple motor applications (more than one motor connected to one drive), separate external overloads for each motor are required, and the drive's motor overload can be disabled.

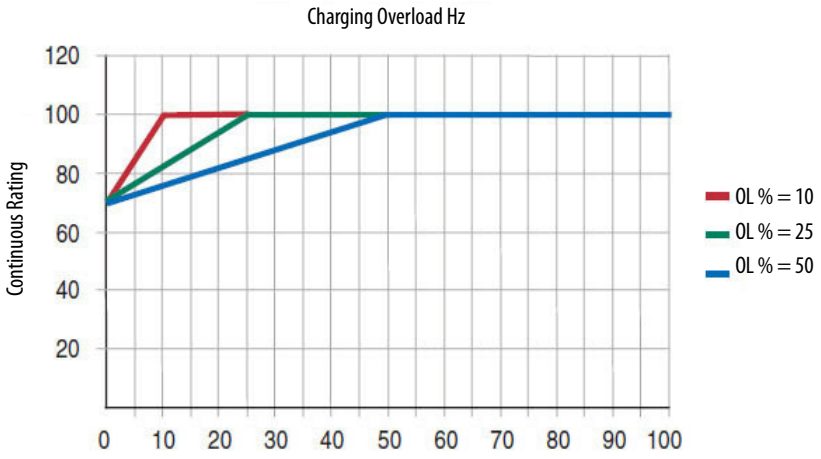
Operation of the overload is based on three parameters.

- P26 [Motor NP Amps] is the base value for motor protection.
- P413 [Mtr OL Factor] is used to adjust for the service factor of the motor. Within the drive, motor nameplate FLA is multiplied by motor overload factor to select the rated current for the motor thermal overload. This can be used to raise or lower the level of current that causes the motor thermal overload to trip without the need to adjust the motor FLA. For example, if motor nameplate FLA is 10 Amps and motor overload factor is 1.2, then motor thermal overload uses 12 Amps as 100%.

IMPORTANT Some motors have a service factor that is only for use with sine wave (non-drive) power. Check with the motor manufacturer to see if the nameplate service factor is valid or must be reduced when operated by a drive.

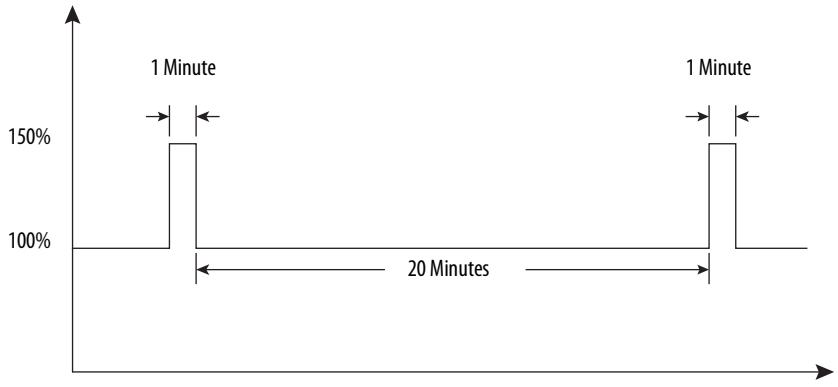


- P414 [Mtr OL Hertz] is used to further protect motors with limited speed ranges. Because many motors do not have sufficient cooling ability at lower speeds, the overload feature can be programmed to increase protection in the lower speed areas. This parameter defines the frequency where derating the motor overload capacity begins. For all settings of overload Hz other than zero, the overload capacity is reduced to 70% when output frequency is zero. During DC injection braking, the motor current can exceed 70% of FLA, but this causes the motor overload to trip sooner than when operating at base speed. At low frequencies, the limiting factor can be the drive overload rather than the motor overload.



Duty Cycle for the Motor Overload

When the motor is cold, this function enables 3 minutes at 150%. When the motor is hot, it enables 1 minute at 150%. A continuous load of 102% is allowed to avoid nuisance faults. The duty cycle of the motor overload is defined as follows. If operating continuous at 100% FLA, and the load increases to 150% FLA for 59 seconds and then returns to 100% FLA, the load must remain at 100% FLA for 20 minutes to reach steady state.



The ratio of 1:20 is the same for all durations of 150%. When operating continuous at 100%, if the load increases to 150% for 1 second the load must then return to 100% for 20 seconds before another step to 150%.

%FLA	Cold Trip Time	Hot Trip Time
105	6320	5995
110	1794	1500
115	934	667
120	619	375
125	456	240
130	357	167
135	291	122
140	244	94
145	209	94
150	180	60
155	160	50
160	142	42
165	128	36
170	115	31
175	105	27
180	96	23
185	88	21
190	82	19
195	76	17
200	70	15

IMPORTANT If the application requires high overload current for long durations (for example 150% for 60 seconds), heavy duty sizing (between drive and motor) is required.

Activating Motor Overload

To turn on Motor Overload protection, configure P410 [Motor OL Actn]. This activates the function. Default setting is 3 “FltCoastStop.” The following bits configure P410 [Motor OL Actn].

- “Ignore” (0) – No action is taken.
- “Alarm” (1) – Type 1 alarm indicated.
- “Flt Minor” (2) – Minor fault indicated. If running, drive continues to run. Enable with P950 [Minor Flt Cfg]. If not enabled, acts like a major fault.
- “FltCoastStop” (3) – Major fault indicated. Coast to Stop.
- “Flt RampStop” (4) – Major fault indicated. Ramp to Stop.
- “Flt CL Stop” (5) – Major fault indicated. Current Limit Stop.

Table 10 - Other Parameters

Parameter No.	Parameter Name	Description
411	Mtr OL at Pwr Up	Motor Overload at Power Up parameter configures the motor overload feature regarding the state of the overload counter at power up. • "Assume Cold" (0) – P418 [Mtr OL Counts] will be reset to zero the next time the drive is powered up. • "UseLastValue" (1) – The value of P418 [Mtr OL Counts] will be retained at power down and restored the next time the drive is powered up. • RealTimeClk (2) – The value of P418 [Mtr OL Counts] begins to decrease at drive power down, reflecting the cooling of the motor, and stops at drive power-up or when zero is reached. This option is only available when the real time clock is active on the drive.
412	Mtr OL Alarm Lvl	You can have the drive issue an alarm when the P418 [Mtr OL Counts] reaches a certain level. Enter this value in P412 [Mtr OL Alarm Lvl]. This alarm level is different than, and independent of, the alarm action selected by P410 [Motor OL Actn].
413	Mtr OL Factor	Motor Overload Factor parameter sets the minimum level of current (in percent or P26 [Motor NP Amps]) that causes the motor overload counter to increment. Current levels below this value decrement the overload counter. For example, a service factor of 1.15 implies continuous operation up to 115% of nameplate motor current.
414	Mtr OL Hertz	Motor Overload Hertz parameter selects the output frequency below which the motor operating current is derated (more sensitive) to account for the reduced self-cooling capability of typical motors, operating at slower speeds. For motors with extra low speed cooling capacity (for example 10:1 or blower cooled), reduce this setting to take full advantage of the motor being used.
415	Mtr OL Reset Lvl	Motor Overload Reset Level parameter sets the level that resets a motor overload condition, and lets a fault (if selected as the motor overload action) be manually reset.
416	MtrOL Reset Time	Motor Overload Reset Time parameter displays the time it takes to restart the drive after a motor overload fault has occurred and the value in P418 [Mtr OL Counts] is less than the P415 [Mtr OL Reset Lvl].
418	Mtr OL Counts	Motor Overload Counts parameter displays the accumulated percentage of motor overload. Continuously operating the motor over 100% of the motor overload setting increases this value to 100% and cause the action selected in P410 [Motor OL Actn] to be taken.
419	Mtr OL Trip Time	Motor Overload Trip Time parameter displays the inverse of the motor overload time, equal to the number of seconds before P418 [Mtr OL Counts] reaches 100%, and the motor overload action is taken.

Overspeed Limit

An overspeed condition results when the motor speed falls outside of its normal operating range. The forward motor rotation limit is P520 [Max Fwd Speed] + P524 [Overspeed Limit] and the reverse motor rotation limit is P521 [Max Rev Speed] - P524 [Overspeed Limit]. In Flux Vector Control mode or Scalar Control mode with encoder, the motor speed used is a 2msec averaged value of P131 [Active Vel Fdbk]. In Scalar Control mode without an encoder, the overspeed check uses P1 [Output Frequency]. The overspeed condition must exist for at least 16 milliseconds before it causes a fault to occur.

CIP Motion

When a PowerFlex 755 drive is running as a CIP Motion drive, then attribute 695 “Motor Overspeed User Limit” specifies the overspeed trip point directly. This attribute has units of percent of motor rated speed. So, if attribute 695 is set to 120% then the overspeed fault occurs at or above 120% rated speed.

Interior Permanent Magnet

For Interior Permanent Magnet motor control mode, an additional limit is placed on the Speed Limit + Overspeed threshold. This threshold is not allowed to exceed the setting in P1641 [IPM Max Spd] and is a +/- check. P1641 [IPM Max Spd] is set to the speed at which the motor produces the voltage limit of the drive. If the drive faults while the motor is rotating at this speed, the motor produces a voltage at the output of the drive. This voltage could damage the drive if the limit is exceeded. This limit is calculated while performing the rotate portion of the Autotune tests. For example, if P1641 calculated to be 57.82 Hz, then the overspeed limit threshold is set by the Speed Limit + Overspeed Limit parameters and the results are limited to a value of +/- 57.82 Hz.

Password

All parameter configuration settings for the drive and its connected peripherals can be protected from unauthorized access through the keypad by using a password.

When the host drive is password protected, parameter settings for the drive and its connected peripherals can be viewed but not changed until after the existing password value is entered. When attempting to edit a parameter value while logged out, the HIM prompts you for the password before allowing access.

Password protection also applies to the following.

- Drive start-up procedure
- Factory defaults
- User sets
- Copy Cat function

For detailed instructions on enabling and disabling password protection, refer to the PowerFlex 20-HIM-A6 and 20-HIM-C6S HIM (Human Interface Module) User Manual, publication 20HIM-UM001.

Real Time Clock

The PowerFlex 755 is equipped with a real-time clock with a battery backup. This enables programming of real time in the drive, and keeping that time even if the drives power is removed. This enables actual timestamps instead of runtime timestamps for faults and events. It is also used in the runtime accumulation of maintenance items such as total run time, number of times fans are running and so forth. If a battery is installed and the time values are set, time is accumulated. Approximate battery life is 4.5 years with drive unpowered, or lifetime if drive is powered.

The real time clock on the drive can be set two different ways. It can either be set from the HIM, or from DriveExecutive/DriveExplorer.

Setting the Real Time Clock via Drive HIM

1. Access the Status screen.
2. If Port 00 (Host Drive) is not shown above the ESC soft key, use the  or  key to scroll to Port 00.
3. Press the  key to display its last-viewed folder.
4. Use the  or  key to scroll to PROPERTIES folder.
5. Use the  or  key to select Set Date and Time.
6. Press the  (Enter) key to display its last-viewed folder.
7. Press the EDIT soft key to access the Set Date and Time mode screen, which highlights the present time zone line.
8. To select the time zone (set the drive to the current time zone).
   - Press the ZONES soft key to display the Select Time Zone screen.
   - Use the  or  key to select your basic time zone region (for example, Full List).
   - Press the  (Enter) key to enter your selection.
   - Use the  or  key to select your specific time zone (for example, Chicago), and press the  (Enter) key to enter it.
9. To set the date (set the drive to the current date).
   - Press the ▲ soft key to select the year in the top line, and use the numeric keys to enter the correct year.

   To delete an erroneous date (or time) entry, use the ← soft key. Also, a partial or complete date (or time) value will not update until you press the ► soft key to enter the data. You have to press the ? soft key a second time

to advance to another field or press the ESC soft key to return to the previous screen.

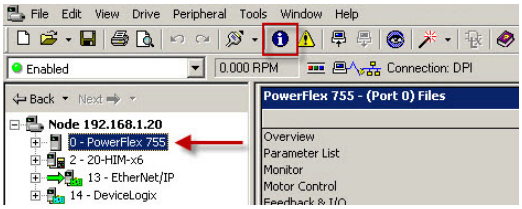
- Press the ► soft key to select the month in the top line, and use the numeric keys to enter the correct month.
- Press the ► soft key to select the day in the top line, and use the numeric keys to enter the correct day.

10. To set the time (set the drive to the current time).
    - Press the ► soft key to select the hour in the top line, and use the numeric keys to enter the correct hour.
    - Press the ► soft key to select the minutes in the top line, and use the numeric keys to enter the correct minute.
    - Press the ► soft key to select the seconds in the top line, and use the numeric keys to enter the correct seconds.
11. Press the ESC soft key to return to the previous screen.

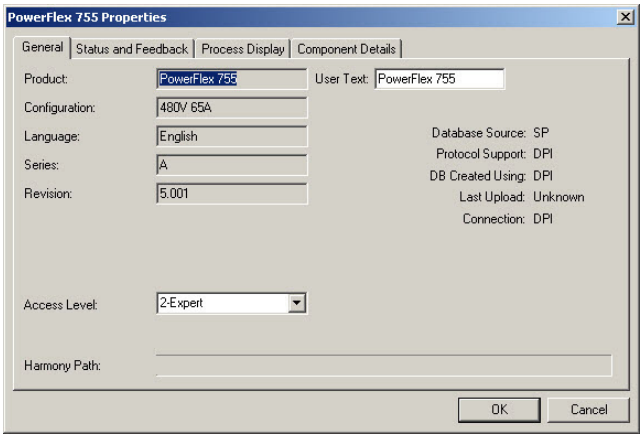
Setting the Real Time Clock via Drive Software

To set the real time clock using a software package like DriveExecutive or DriveExplorer™ software the procedure is the same.

1. First press the  at the top center of the application.

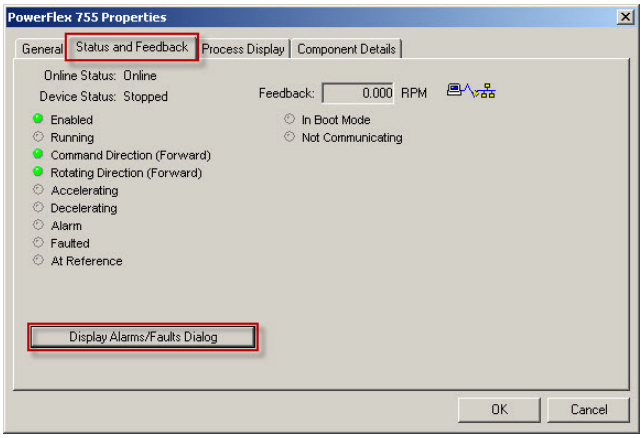


This dialog box appears.

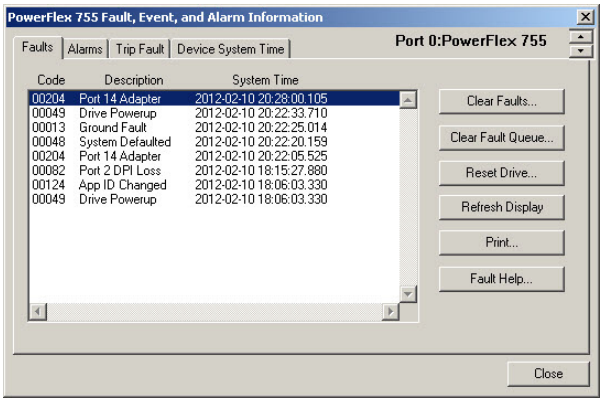


2. Click the Status and Feedback tab.

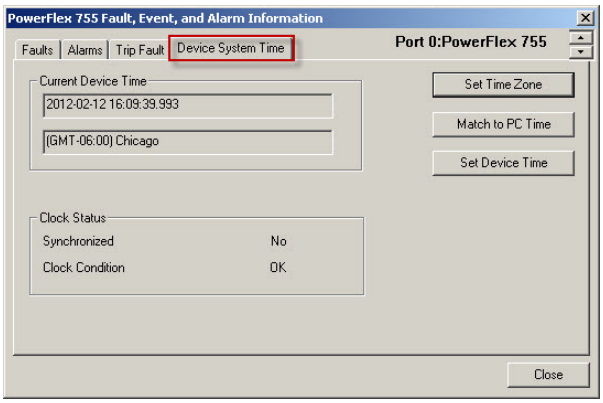
3. Click Display Alarms/Faults Dialog.



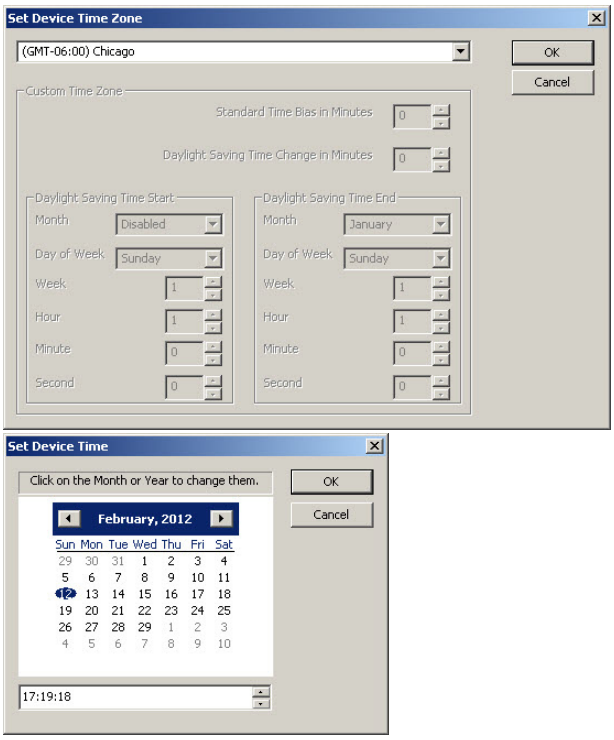
A new dialog box appears.



4. Click the Device System Time tab.



5. If necessary, change the values in the Set Time Zone and Set Device Time dialog boxes.



Installing Battery

To install the battery, first locate the main control board. The location of the main control board is in the far right location of the control POD. The main control board for the PowerFlex 753 and 755 drives are shown below.

Figure 16 - PowerFlex 753 Main Control Board

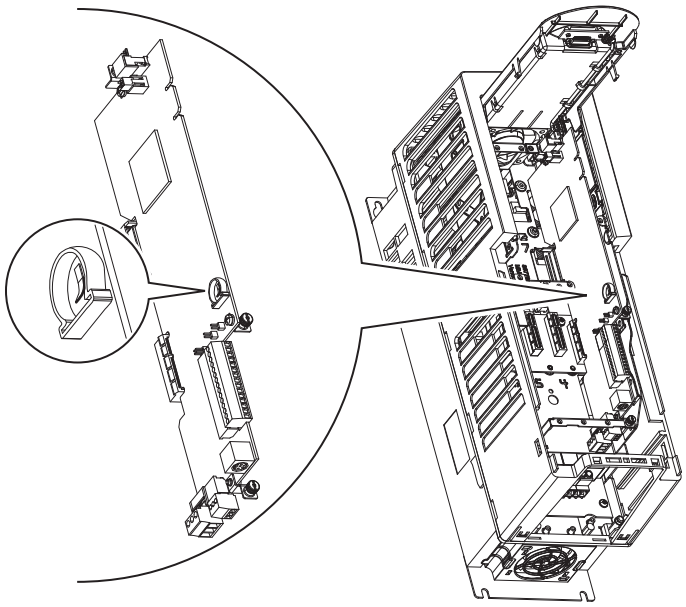


Figure 17 - PowerFlex 755 Main Control Board

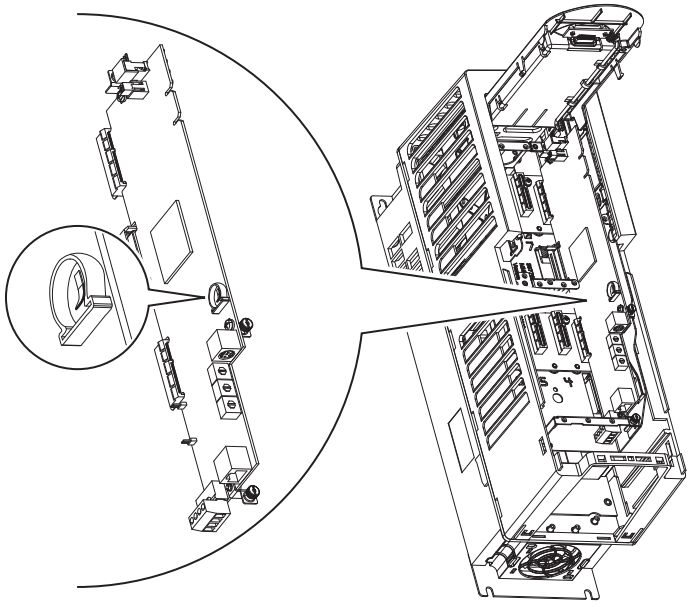
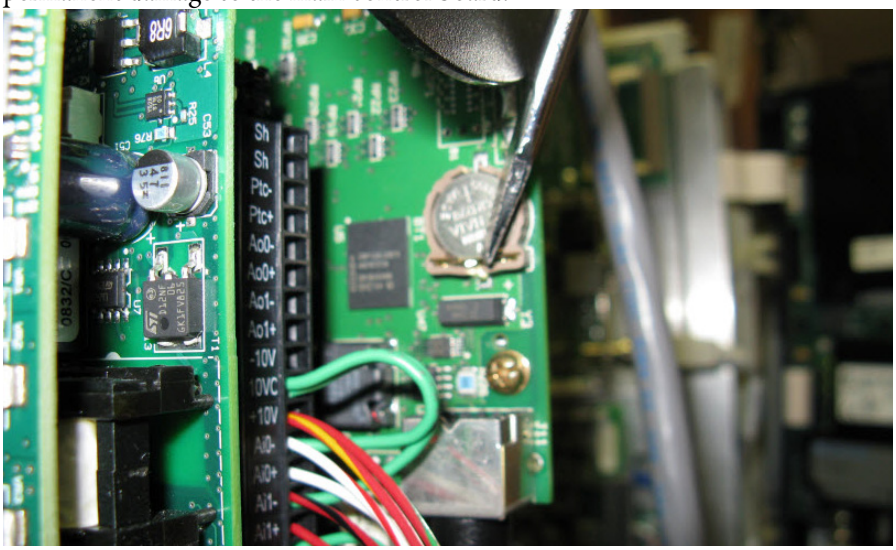


The battery is installed in pointer position 3. The battery receptacle requires a user-installed CR1220 lithium coin cell battery that provides power to the Real Time Clock. Installing a battery preserves the Real Time Clock setting in the event power to the drive is lost or cycled. Approximate battery life is 4.5 years with drive unpowered, or lifetime if drive is powered. Install the battery with "+" facing out.

Removing Battery

To remove the battery, simply use a screwdriver to press down on the metal tab going across the battery. Prying the battery out of its holder can result in permanent damage to the main control board.



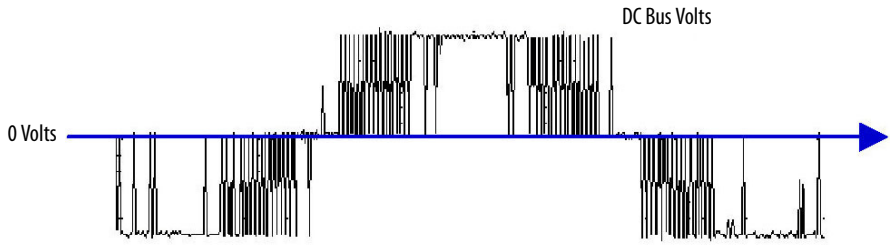
Reflected Wave

Reflected waves are a phenomenon associated with long cables and fast changes in voltage levels. They were first identified on power transmission lines that are hundreds of miles long. When the power is switched on at one end, the step in voltage travels the length of the transmission line and is reflected back to the switch. The voltage at the far end often surges to twice the initial value of the voltage. Because the voltages involved are quite high, for example 230,000V or more, a surge of 460,000V can result in a damaging arcing fault.

Adjustable speed drives, using IGBT switches that turn on and off within a few nanoseconds, experience the same phenomenon at the AC motor terminals. This can cause motor failures within months or even weeks of commissioning the motor with a drive.

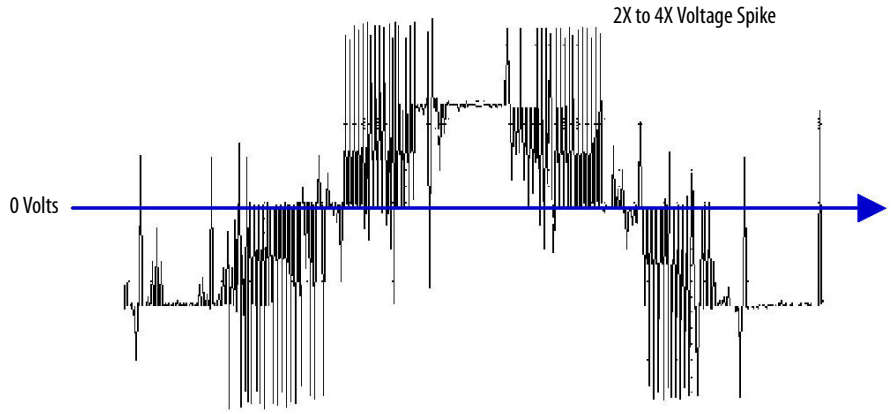
A PWM AC drive provides variable voltage and variable frequency to a motor from a DC bus voltage. It creates the sinusoidally varying voltage to the motor by continually changing the duty cycle of the IGBT switches in a pulse-width-modulated fashion. Because the motor is largely an inductive load, the current that flows is an integration of the voltage with a lagging phase angle. Figure 18 shows what the drives line-to-line output voltage looks like. The peaks of the output voltage are equal to the value of the DC bus in the drive. Only the widths and polarities change.

Figure 18 - PWM Voltage at the Drive Output Terminals

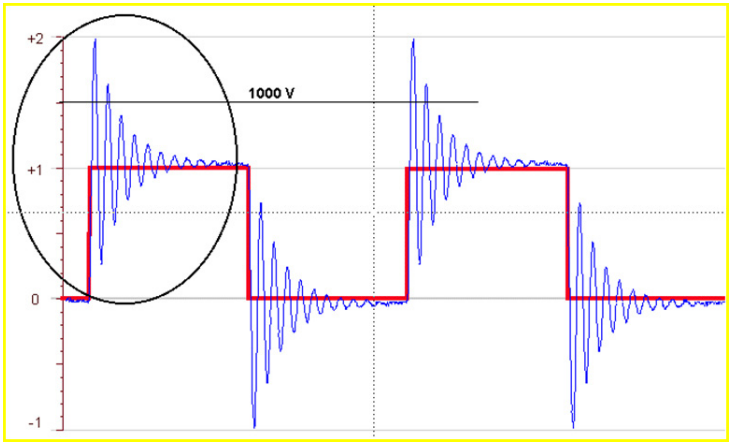


Ideally, the voltage waveform at the motor looks exactly the same as the output of the drive. However, the voltage at the motor has individual on/off pulses that make up the PWM voltage waveform along with a ringing that occurs at every switching transition. This is shown in Figure 19. The peaks of the ringing waveform can easily reach two times the peak of the voltage pulses at the drive (the DC bus voltage). After a short time, the ringing dies away and the motor sees the normal DC bus voltage level. It is this peak level of the ringing voltage that causes motor failure.

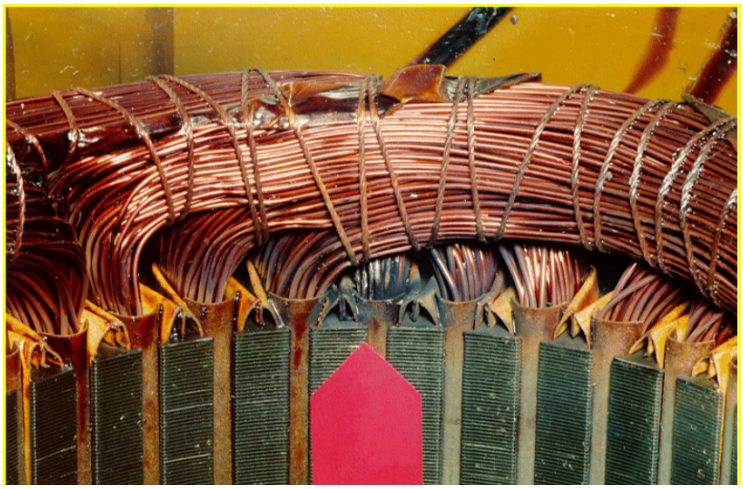
Figure 19 - PWM Voltage at the Motor Terminals



Shorten the time sweep or magnify these pulses and the ringing effect at the motor terminals can be seen.



When the voltage at the motor terminals exceeds the insulation rating of the motor, corona begins to appear. This corona deteriorates the insulation system, eventually leading to a fault to ground. Such a failure is shown below.



The level of the DC bus voltage has a direct effect on the peak level of the ringing surge voltage. If the drive operates at 230V AC, the DC bus voltage is about 310V DC and two times peak only reaches 620Vpk. This peak will not damage most motors. However, a 460V AC drive operates at 620V DC bus voltage and 1240Vpk and a 575V AC drive operates at 775V DC and 1550Vpk.

Non-inverter grade motors have insulation systems rated to 1000V and 1200V depending on their construction.

- 1000V motors are assembled without phase paper.
- 1200V motors are assembled with phase paper and slot insulation.

Non-inverter grade motors will fail if operated from a 460V or 575V drive.

There are three ways to eliminate the effects of reflected waves on motors.

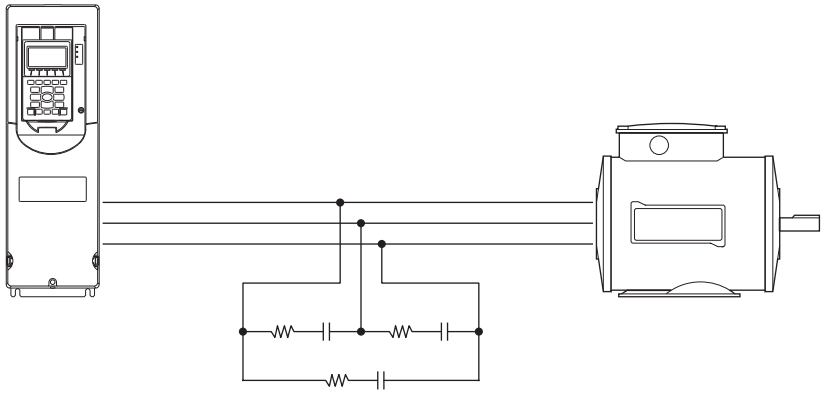
1. Match the motor surge impedance to the cable surge impedance.
2. Reduce the dv/dt.

   These methods reduce or eliminate reflected wave and surge voltage at the motor.
3. Better insulate the motor so the effects of the surge voltage will not damage the motor.

For inverter applications, NEMA updated the standard MG 1-1998, section 31 regarding motor insulation systems. An inverter duty motor needs to withstand surge voltages that are 3.1 times the rated motor voltage and rise times greater than 0.1 μs. This is 1488V for a 460V motor. to provide better protection, some motor manufacturers have started producing 1600V rated insulation for inverter grade motors. However, even if a motor can withstand 1600V surges, it can still fail if the insulation cannot hold up under rated motor temperatures.

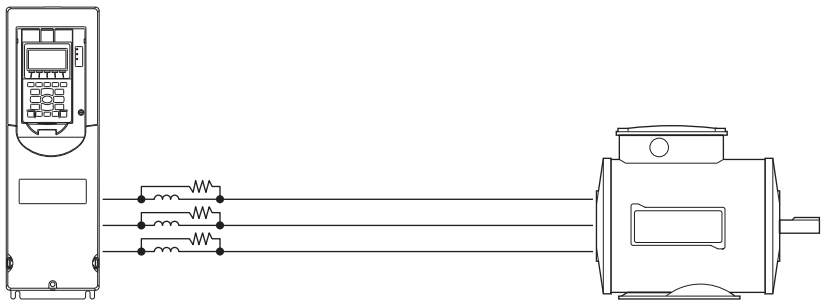
The Terminator

Is it possible to match the surge impedance of the motor to the cable? There is a device called the terminator that does this, shown in the figure below. It is an RC network at the motor that matches the load surge impedance to the cable. Figure 20 shows the surge voltages when using the terminator. The overshoot is very low, with no ringing to speak of. Due to losses, this device is good for cable lengths up to 600 ft, and for carrier frequencies less than or equal to 4 kHz. However, its key advantage is that this one device works well for any motor in the range from 0.5 to 500hp because it does not have to handle the motor current, being a parallel device.



Line Reactor

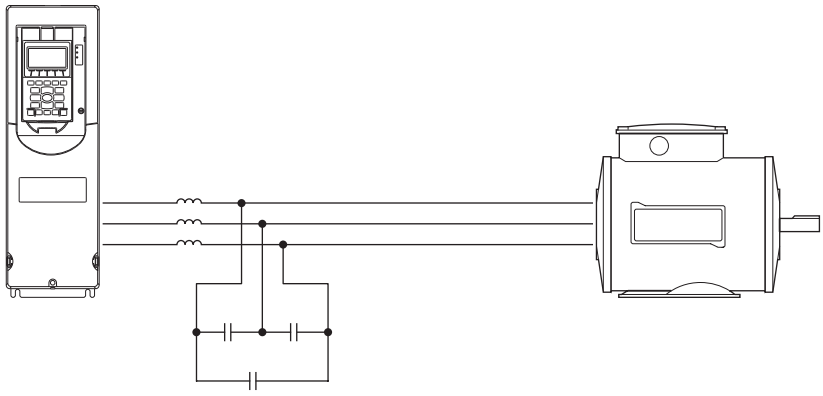
What if we go the other way, matching the surge impedance of the cable to the motor? There are several products available that do this. They all consist of the addition of a line reactor at the output of the drive. See the figure below. A 3% line reactor by itself also reduces the dV/dt, but a big disadvantage is that it reduces the voltage available to the motor by 3%. This is useful for cables up to about 600 ft. A better device is what we call a “reflected wave reduction” device where the line reactor is reduced to about 0.2%, and a resistor is placed in parallel with each of the reactors. This reduces the dV/dt and has a voltage drop of only 0.2% instead of 3%. It can be used with cables up to about 1200 ft.



A method to reduce just the dV/dt is to use shielded cable between the drive and the motor. The inherent capacitance between the lines and the shield help keep the surge voltage at 1200V up to 600 ft with PWM drives.

Sine Wave Filter

Instead of matching impedances or reducing the dV/dt of the individual pulses coming from the drive, create a filter that enables the lower fundamental frequencies to pass, and block or absorb the higher frequencies caused by the fast switching IGBTs and the carrier frequency of the PWM waveform? There are two types that are on the market today. One that consists of an LC filter and another that consists of output line reactors along with tuned LC sections.

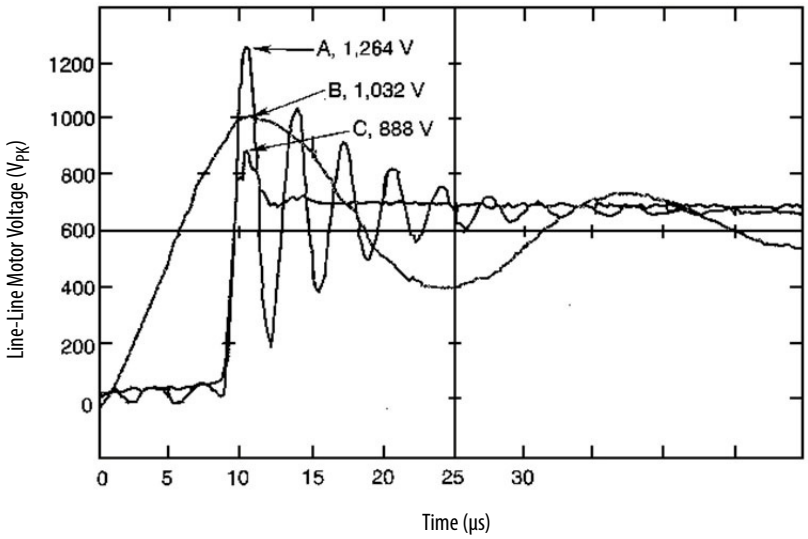


Waveforms

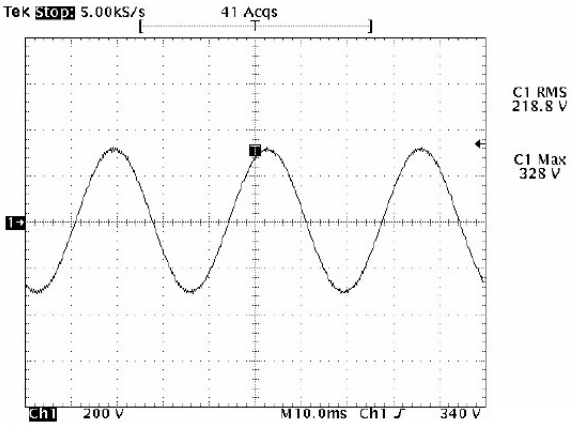
The waveforms A, B, and C in the figure below describe the different mitigations solutions shown on top of each other.

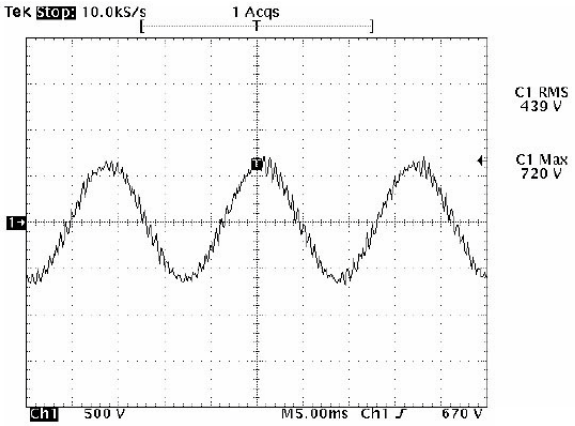
A - Unprotected motor
B - Line Reactor at the Drive
C - Terminator or RWR

Figure 20 - Waveform Comparison



Here are waveforms using a sine wave filter at 30 and 60 Hz. As you can see there are no issues with reflected wave when using a sine wave filter.





Security

The Security feature provides drive access protection.

Ports

This feature provides write access protection for individual communication ports in the drive. The HIM or communication modules with software tools can be used to change any port to read only.

A password can also be used with the HIM to prevent writing to parameters through the keypad. See Password on page 173.

The following drive peripherals can be used to control access.

- 20-HIM-A6 or 20-HIM-C6S keypads
- 20-750-*n* and 20-COMM-*n* communication options
- 20-COMM-*n* legacy communication options

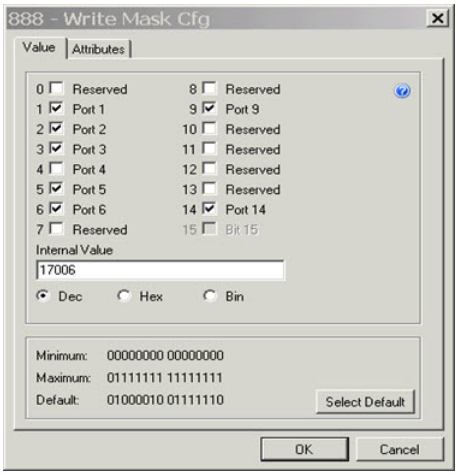
Refer to the PowerFlex 750-Series AC Drives Technical Data, publication 750-TD001 for suitability and details.

The following software tools can be used to control access.

- Connected Components Workbench™ (CCW) version 2.0 or later (freeware)
- DriveExplorer version 6.04.99 (freeware)
- DriveExecutive version 5.03 or later

By default, every DPI port in the drive is configured to allow read and write access.

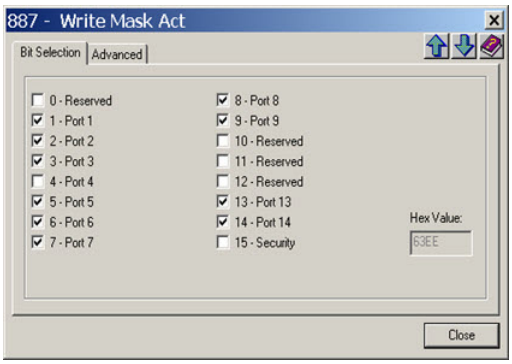
To change the write access on an individual DPI port, change the bit setting of the associated port in P888 [Write Mask Cfg]. Changing the bit value from 1 (read/write) to 0 with a HIM provides read only capability. Using software such as DriveExplorer, DriveExecutive, or CCW can also be used to turn the bit off. Below is an example of using CCW to change port 4 to read only.



Any changes to P888 [Write Mask Cfg] will not take effect until one of the following three events occur.

- Power is removed and reapplied.
- A drive reset (not reset to defaults) is performed.
- P887 [Write Mask Act] Bit 15 transitions from 1 to 0.

The status of a port's write access can be verified at P887 [Write Mask Act]. For example, to verify that write access was disabled, P887 [Write Mask Act] Bit 4 "Port 4" equals 0.



The port that is being used to make security changes (for example a network adapter connected to Port 5) can only change other ports and not itself to read only. This is to prevent the complete lockout of a drive with no future way to regain write access.

DPI (Network)

Network Security can only be activated with external software programs that have security capabilities, for example, FactoryTalk® software.

When P885 [Port Mask Act] Bit 15 "Security," P886 [Logic Mask Act] Bit 15 "Security," and P887 [Write Mask Act] Bit 15 "Security" are set to 1 "Read/Write," Network Security has been enabled by an external program like FactoryTalk and is controlling the logic mask and write mask instead of the parameter. These bits can only be enabled/disabled via the network program.

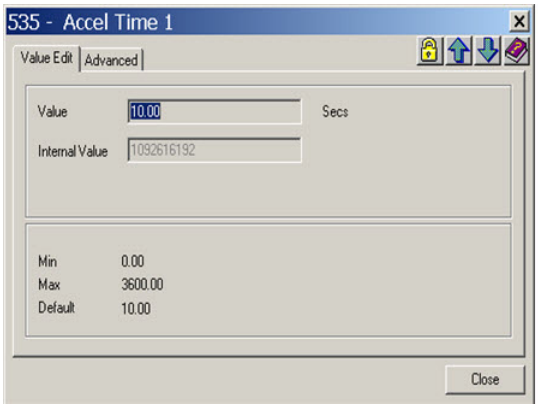
A port that is being used to communicate to the drive and set the masks or network security can only make changes to other ports and not itself. This is to prevent a complete lockout from a drive.

When the writing capabilities of ports 1, 2, or 3 have been masked, via parameter 888 [Write Mask Cfg] or Network Security, the HIM displays the following message when trying to edit a parameter.

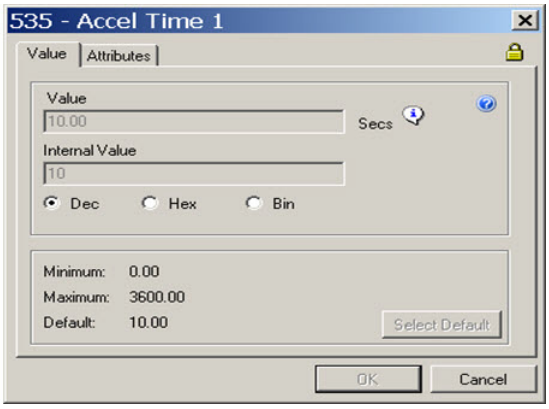
- A6-HIM: Security is enabled. Access Denied
- A3-HIM with Firmware that has Security Functionality: Security Enable. Access Denied
- A3-HIM with Firmware that does not have Security Functionality: Device State has Disabled Function

Software used to interface with the drive also indicates if the writing capabilities have been disabled by P888 [Write Mask Cfg] or Network Security, via the communication port being used.

Below are examples of parameters viewed with drive software via DriveExplorer or CCW when the connected port has been write disabled. The parameter value is grayed out and a lock is displayed.

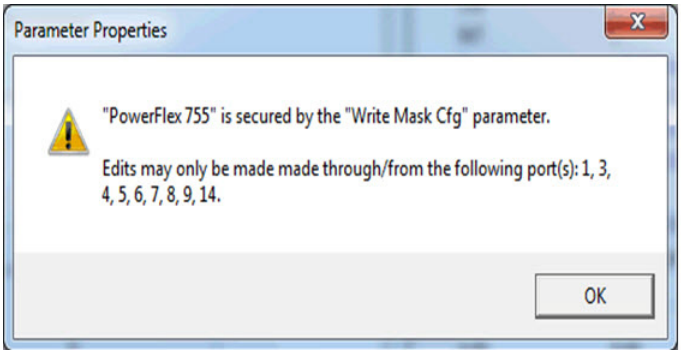


DriveExplorer



Connected Components Workbench

Attempting to edit a parameter or clicking on the lock results in one the following screens being displayed when using DriveExecutive or CCW software.



Drive Explorer

Connected Components Workbench

Shear Pin

As a default, the drive folds back when the output current exceeds the current limit level. However, the shear pin feature can be used to instantly fault the drive when output current exceeds a programmed amount. Additionally, the drive can be programmed to ignore this condition during acceleration and deceleration which often requires current that otherwise causes a shear pin fault. Also, the condition can be ignored for a programmable amount of time.

Activating Shear Pin

To turn on either Shear Pin 1 or Shear Pin 2, configure [Shear Pin *n* Actn]. This activates the function. Selection between P435 [Shear Pin 1 Actn] and P438 [Shear Pin 2 Actn], cannot be made by a digital input. These parameters can be set over a communication network. The options for each shear pin action are the same. Default for each is 0 "Ignore." The following are the settings for P435 and P438.

- "Ignore" (0) – No action is taken.
- "Alarm" (1) – Type 1 alarm indicated.
- "Flt Minor" (2) – Minor fault indicated. If running, drive continues to run. Enable with P950 [Minor Flt Cfg]. If not enabled, acts like a major fault.
- "FltCoastStop" (3) – Major fault indicated. Coast to Stop.
- "Flt RampStop" (4) – Major fault indicated. Ramp to Stop.
- "Flt CL Stop" (5) – Major fault indicated. Current Limit Stop.

Ignore During Acceleration

There are situations where a fast acceleration of the motor causes the drive to output current to the motor near or at the current limit value for shear pin and fault the drive while in acceleration. To avoid this condition set P434 [Shear Pin Cfg] Bit 0 "Shear1NoAcc" or Bit 1 "Shear2NoAcc" to 1 to ignore during acceleration.

Shear Pin Level

A shear pin level must be programmed for the drive to monitor. This level, when exceeded, starts a timer that must expire before performing the [Shear Pin *n* Actn]. This level is entered into P436 [Shear Pin 1 Level] or P439 [Shear Pin 2 Level]. The units are amps. Default is drive rated amps. Maximum is rated amps multiplied by 1.5.

Shear Pin Time

If an immediate action is to be taken, set shear pin time to 0. If the shear pin level is to be ignored for a period of time, enter that value into P437 [Shear Pin 1 Time] or P440 [Shear Pin 2 Time].

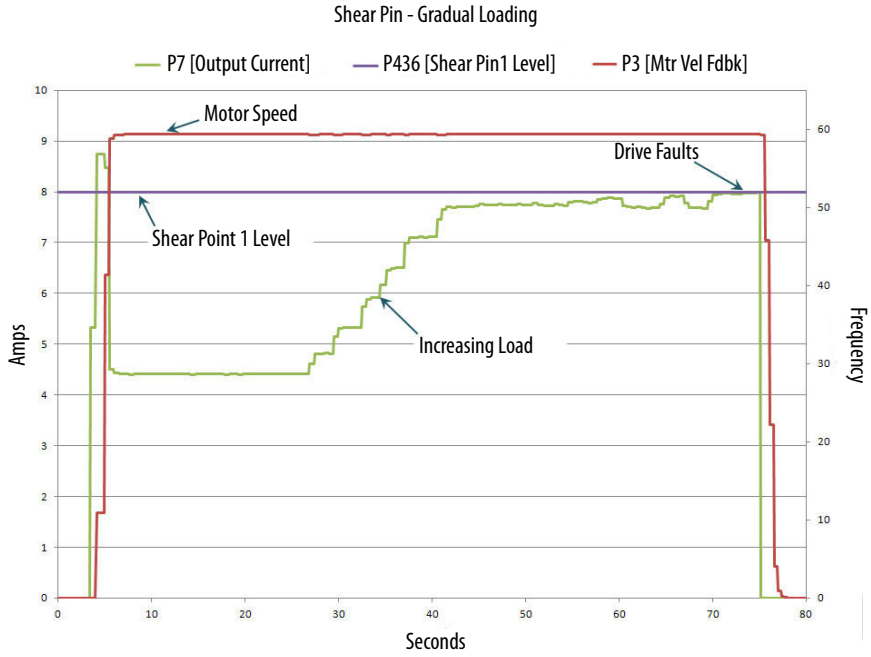
Generally, some value greater than 0 is entered in shear pin time to eliminate any faults on very short peak current spikes. Thus eliminating nuisance tripping.

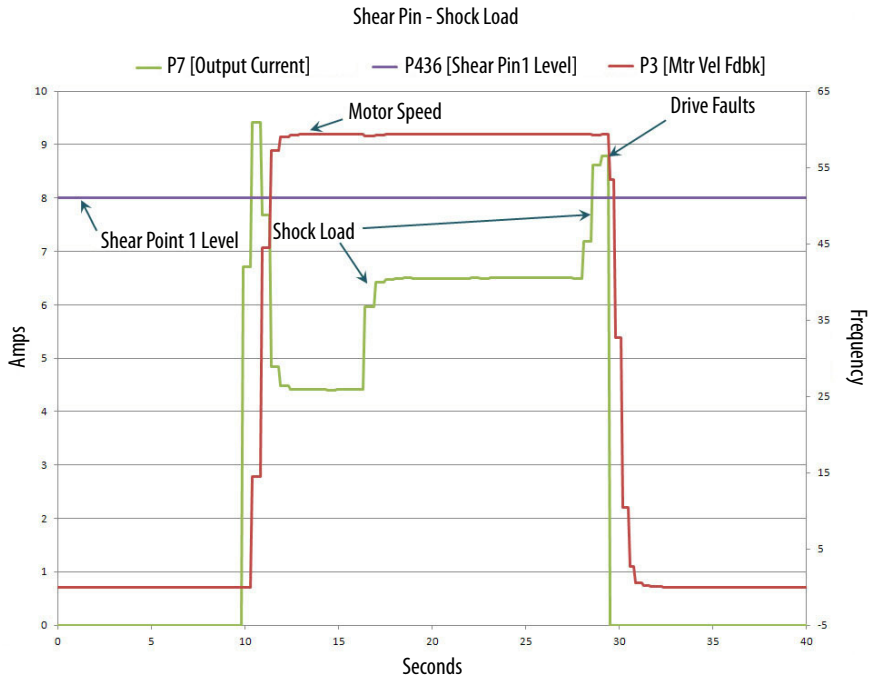
Fault Indication

A unique fault (Shear Pin 1, F61) or (Shear Pin 1, F62) is generated if the function is activated and the condition occurs.

Application Example

By programming the Shear Pin feature, the drive faults, stopping the excess torque before mechanical damage occurs.





Acceleration Fault Anomaly

It is possible for the drive to trip during acceleration on a shear pin fault even when P434 [Shear Pin Cfg] Bits 0 or 1 in are set. This occurs when the accel time is set to something very small. The firmware looks at the internal "at speed" bit to indicate when acceleration is complete. This bit could be set internally faster than what appears the motor is indicating by sight. For example, if the accel time is set to something like 0.5 seconds and P434 Bit 0 is set. The drive will most likely trip on shear pin fault.

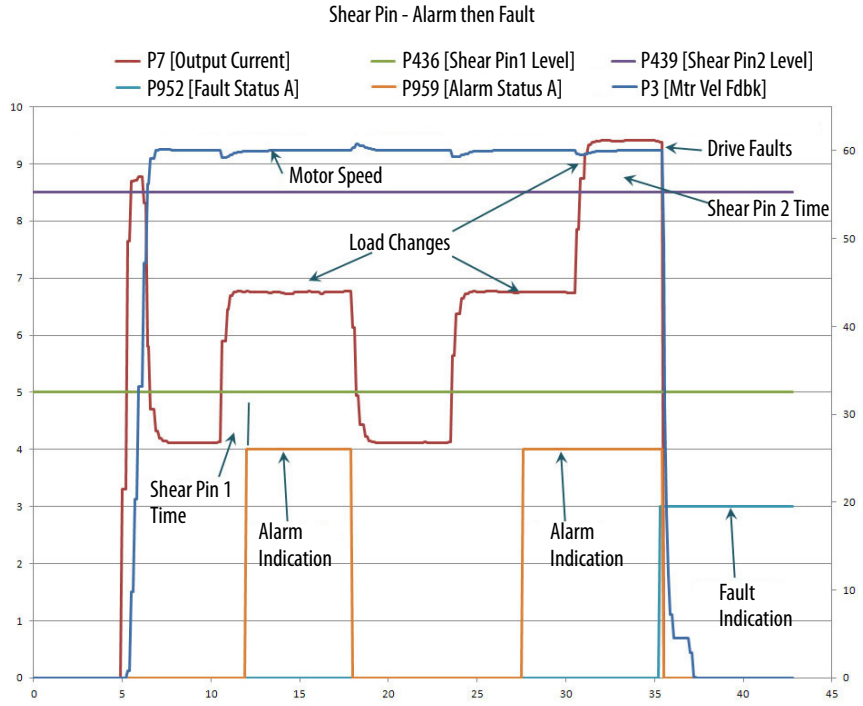
There are a couple ways to avoid this.

- Set the accel time longer. This reduces the current requirement.
- Enter a shear pin time longer than the acceleration time.

Using Both Shear Pin 1 and 2

If your application requires a notification of an impending Shear Pin fault. You can set Shear Pin 1 to give an Alarm at a certain current level, then set Shear Pin 2

to issue the actual fault at a higher current level or a slightly longer Shear Pin time.



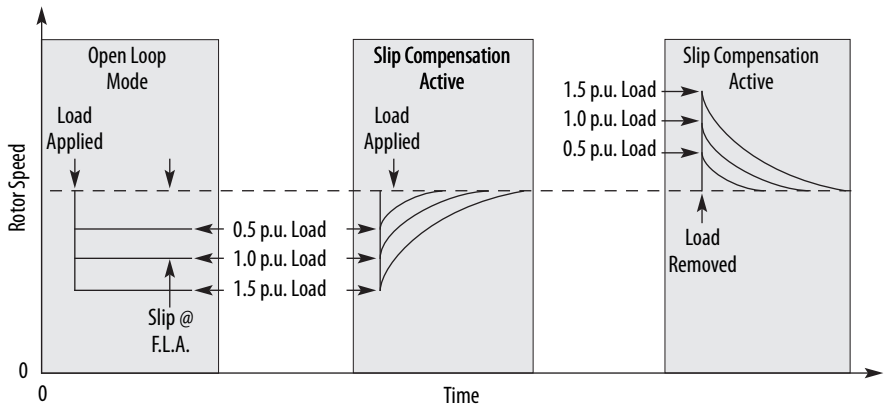
Other Points

The Shear Pin feature is not to be taken as a precise current reactionary feature. There can be as much as +/- 5% error in the current feedback signal used to determine shear point levels. Therefore it could be possible that the timer trip point is being set and reset until the entire current reference is above a setpoint.

Slip Compensation

When slip compensation mode is selected, the drive automatically adds the appropriate amount of output frequency to maintain a consistent motor speed independent of load. During drive commissioning, P621 [Slip RPM at FLA] is set based on entered motor nameplate information. This parameter can be adjusted to provide more or less compensation.

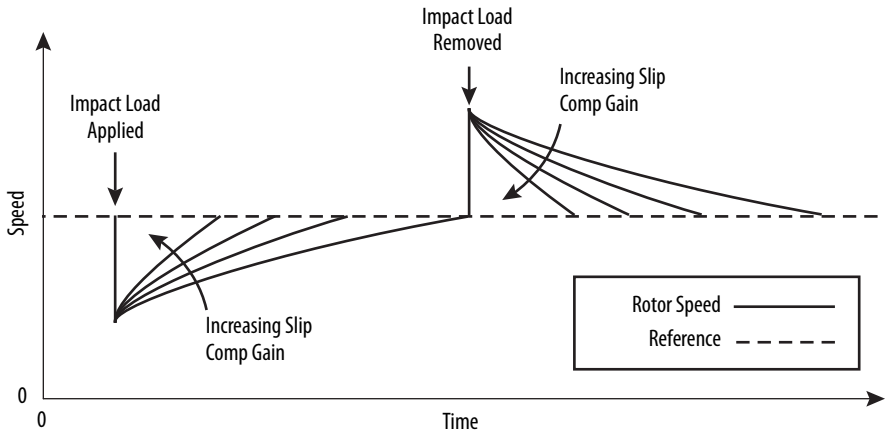
See the motor speed compensation figure below for a comparison of operation with and without slip compensation. This shows that over time, slip compensation corrects for changes in load (curved lines). In contrast, open loop operation shows that no correction is made based on load.



Internally, the drive converts the rated slip in RPM to rated slip in frequency. To more accurately determine the rated slip frequency in hertz, an estimate of flux current is necessary. This parameter is either a default value based on motor nameplate data or the autotune value. The drive scales the amount of slip compensation to the motor rated current. The amount of slip frequency added to the frequency command is then scaled by the sensed torque current (indirect measurement of the load) and displayed.

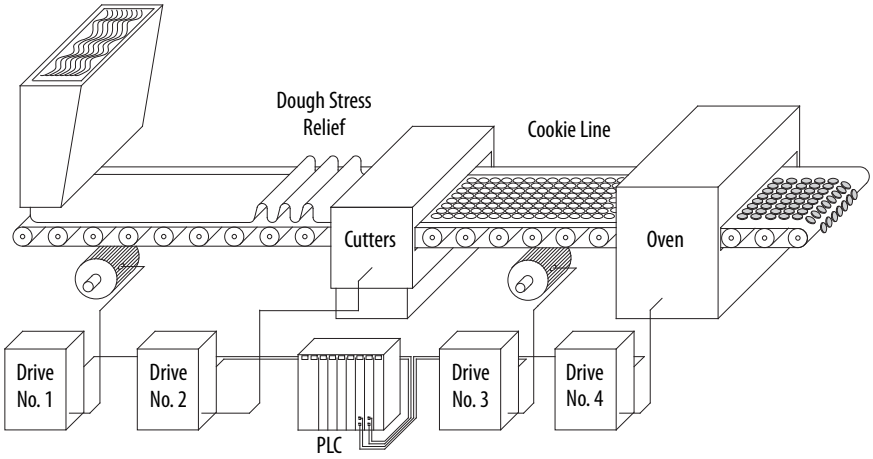
Slip compensation also affects the dynamic speed accuracy (ability to maintain speed during shock loading) as illustrated in the rotor speed response figure below. Initially, the motor is operating at some speed and no load. Some time later, an impact load is applied and the rotor speed decreases as a function of load and inertia. Finally, the impact load is removed and the rotor speed increases momentarily until the slip compensation is reduced based on the applied load.

The responsiveness to an impact load can be adjusted with P622 [Slip Comp BW]. However, too high setting can cause unstable operation and overshoot.



Baking Line Application Example

The diagram below shows a typical application for the slip compensation feature. The PLC controls the frequency reference for all four of the drives. Drive No. 1 and Drive No. 3 control the speed of the belt conveyor. Slip compensation is used to maintain the RPM independent of load changes caused by the cutter or dough feed. By maintaining the required RPM, the baking time remains constant and therefore the end product is consistent.



Slip Regulator

The slip regulator is used to compensate for temperature changes in an induction motor when FOC is used. The slip regulator uses a model of the motor to determine the desired d-axis voltage for a given operating point. A PI regulator is then used to change the drive's slip gain controlling the d-axis motor voltage. This in turn compensates for motor temperature (resistance) changes. The operation of the slip regulator is limited to regions where there is sufficient voltage (feedback or estimate) for the regulator to converge.

As default the slip regulator is enabled.

Do not disable this regulator. If you feel you need to disable this function, consult the factory for verification.

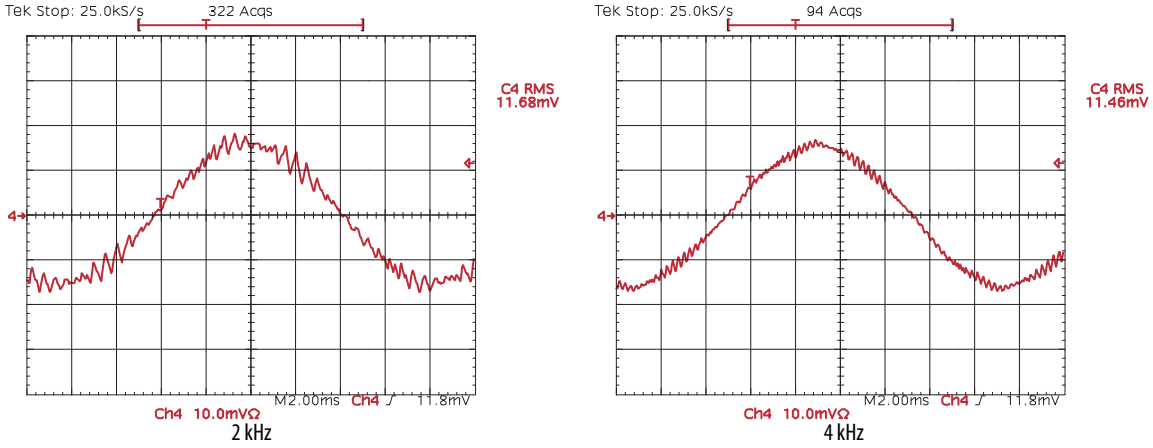
Carrier (PWM) Frequency

P38 [PWM Frequency] sets the carrier frequency at which the inverter output IGBTs (Insulated Gate Bipolar Transistors) switch. In general, use the lowest possible switching frequency that is acceptable for the particular application. An increased carrier frequency causes less motor heating and lowers the audible noise from the motor. However, it causes the IGBTs to heat up faster than by using the factory default PWM frequency of 4 kHz or 2 kHz depending on drive's the frame size. The higher switching frequency smoothes the current waveform. This reduces vibration in the motor windings and laminations reducing audible noise. This is desirable in applications where motors are installed close to control rooms or in domestic environments. See Figure 21 and note the output current at 2 kHz and 4 kHz. The smoothing of the current waveform continues 12 kHz.

The maximum carrier frequency per frame size and the derating guidelines according to PWM frequency can be found in the PowerFlex 750-Series AC Drives Technical Data, publication 750-TD001.

Figure 21 - Current at 2 kHz and 4 kHz PWM Frequency



Some undesirable effects of higher switching frequencies include higher cable charging currents, higher potential for common mode noise and an increased risk of motor winding insulation breakdown due to the reflected wave phenomenon. Refer to the Wiring and Grounding Guidelines for PWM Drives, publication DRIVES-IN001 for further information. A very large majority of all drive applications will perform adequately at 2 kHz or 4 kHz.

Some applications require a fixed minimum PWM frequency (that is, using a sine wave filter in the output of the drive). In this case, P40 [Mtr Options Cfg] Bit 9 "PWM FreqLock" should be set to prevent the drive from lowering its carrier frequency due to a drive overload condition.

Dynamic Braking

When an induction motor's rotor is turning slower than the synchronous speed set by the drive's output power; the motor is transforming electrical energy obtained from the drive into mechanical energy available at the drive shaft of the motor. This process is referred to as motoring.

When the rotor is turning faster than the synchronous speed set by the drive's output power, the motor is transforming mechanical energy available at the drive shaft of the motor into electrical energy that can be transferred back into the utility grid. This process is referred to as regeneration.

On most AC PWM drives, the AC power available from the fixed frequency utility grid is first converted into DC power by means of a diode rectifier bridge or controlled SCR bridge, before being inverted into variable frequency AC power. These diode or SCR bridges are very cost effective, but can handle power in only one direction, and that direction is the motoring direction. If the motor is regenerating, the bridge is unable to conduct the necessary negative DC current, and the DC bus voltage increases until the drive trips on a Bus Overvoltage fault.

There are bridge configurations, using either SCRs or Transistors that have the ability to transform DC regenerative electrical energy into fixed frequency utility electrical energy but are expensive. A more cost effective solution is to provide a Transistor Chopper on the DC bus of the AC PWM drive that feeds a power resistor, which transforms the regenerative electrical energy into thermal heat energy, which is dissipated into the local environment.

This process is generally called Dynamic Braking, with the Chopper Transistor and related control and components called the Chopper Module, and the power resistor called the Dynamic Brake Resistor. The entire assembly of Chopper Module with Dynamic Brake Resistor is sometime referred to as the Dynamic Brake Module.

Chopper Modules are designed to be applied in parallel if the current rating is insufficient for the application. One Chopper Module is the designated Master Chopper Module, while any other Modules are the designated Follower Modules. Two lights have been provided on the front of the enclosure to indicate Chopper Module operation – the DC Power light and the Brake On light. The DC Power light is lit when DC power has been applied to the Chopper Module. The Brake On light is lit when the Chopper Module is operating or chopping and is a flickering type of indication.

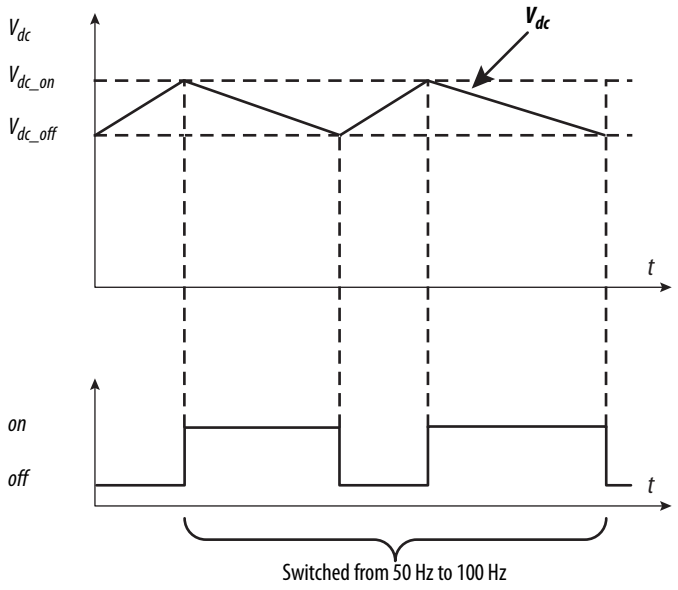
Update: As of December of 2010, Rockwell Automation no longer has a Chopper Module product as well as a Dynamic Braking Module product. The light configuration stated above was specific to the Rockwell Automation product.

How it Works

There are two different types of control for dynamic braking, hysteretic control and PWM control. Each used by themselves in a standard stand alone product has no advantage over the other. The preferred control is the PWM method when the application is common DC bus. This advantage is described below.

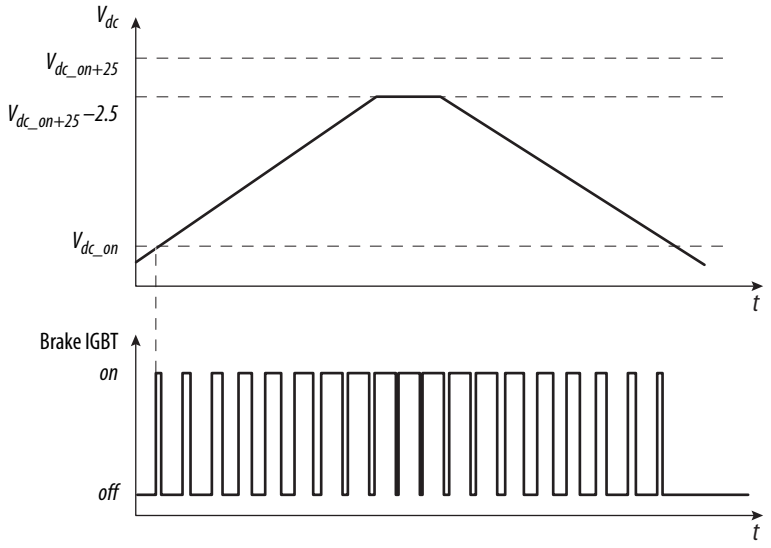
Hysteretic Control

The hysteretic method of dynamic braking uses a voltage sensing circuit to monitor the DC bus. As the DC bus voltage increases to the V_{dc_on} level the brake IGBT is turned on and is left on until the voltage drops to the V_{dc_off} level, which is not so desirable in common DC bus applications—see below. Some PowerFlex drives allow the V_{dc_off} level, [DB Threshold], to be adjusted if the application required it. Setting this level lower makes the dynamic braking more responsive but could lead to excessive DB activation.

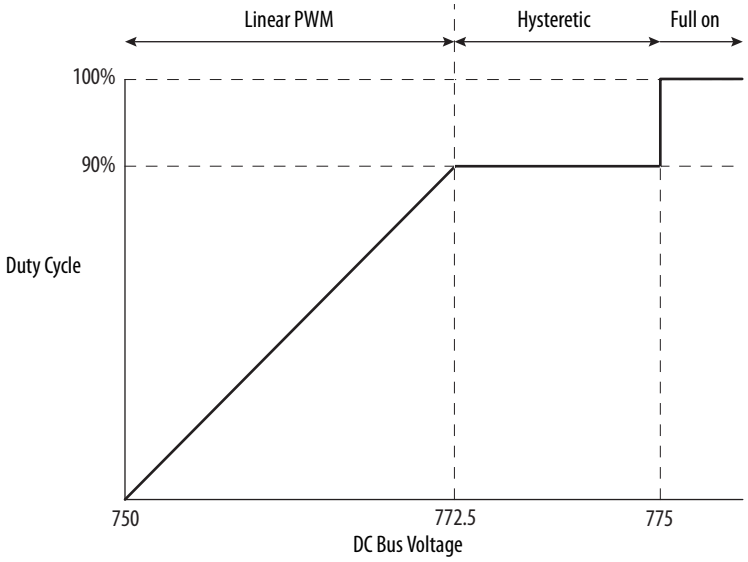


PWM Control

This type of control to operate the brake IGBT is similar to the way output voltage to the motor is controlled. As the DC bus voltage increases and hits some predetermined limit the brake IGBT is turned on/off according to a control algorithm switched at 1 kHz. This type of control virtually eliminates bus ripple. The big advantage is when this type of control is in a common bus configuration.

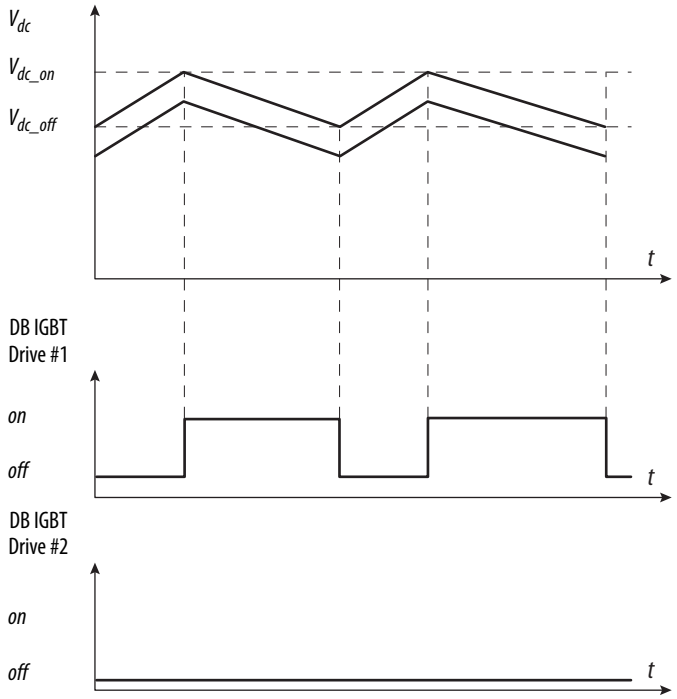


Duty Cycle

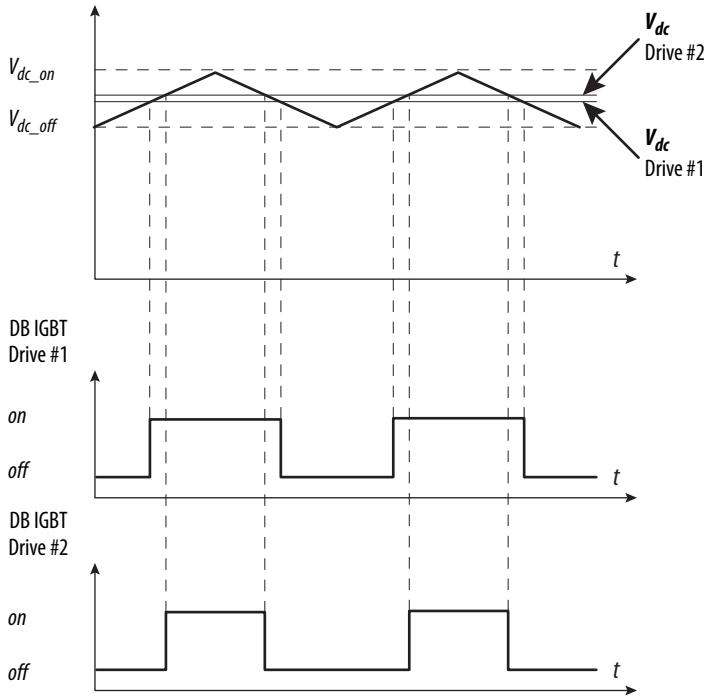


Common DC Bus Applications

In a common bus configuration when a dynamic braking resistor is installed on each drive sharing the DC bus, it's possible that the brake IGBT in some drives will not turn on, giving the impression that the drive is not functioning correctly or seeing one drive's brake IGBT failing consistently while the other drives are fine. Looking at the below diagram, it shows the DC bus level for two drives on common bus. The delta between these voltages are exaggerated for clarity. As the voltage increases, the Drive #1 IGBT turns on and decreases the voltage level before Drive #2 sees voltage high enough to be told to turn on. This results in Drive #1 doing all the dynamic braking. Now this situation could be alright as long as the minimum ohmic value for resistance is not violated and the regen event isn't so great that a single resistor can't handle the power. Of course, if there is a large regen event where the voltage continues to rise after Drive #1 has turned on, Drive #2 fires its IGBT when it reaches the voltage limit.



Here are two drives with PWM DB control on a common bus. Because one drive turns on at a certain duty cycle the bus voltage is likely to continue to rise guaranteeing that the other drive's IGBT turns on (at a different duty cycle).



How to Select A Chopper Module and Dynamic Brake Resistor

In general, the motor power rating, speed, torque, and details regarding the Regenerative mode of operation is needed to estimate what Chopper Module rating and Dynamic Brake Resistor value to use. A rule of thumb to use is that a Dynamic Brake Module can be specified when regenerative energy is dissipated on an occasional or periodic basis. When a drive is consistently operating in the Regenerative mode of operation, consider utilizing equipment that transforms the electrical energy back to the fixed frequency utility.

The peak regenerative power of the drive must be calculated to determine the maximum Ohmic value of the Dynamic Brake Resistor and to estimate the minimum current rating of the Chopper Module. The Rating of the Chopper Module is chosen from the Brake Chopper Module manual. Once the Chopper Module current rating is known, a minimum Dynamic Brake Resistance value is also known. A range of allowable Dynamic Brake Ohmic values is now known. These values exist from the minimum value set by the Chopper Transistor current rating to a maximum value set by the peak regenerative power developed by the drive to decelerate or satisfy other regenerative applications. If a Dynamic Brake Resistance value less than the minimum imposed by the choice of the Chopper Module is made and applied, damage can occur to the Chopper Transistor. If a Dynamic Brake Resistance value greater than the maximum imposed by the choice of the peak regenerative drive power is made and applied,

the drive can trip off due to transient DC bus overvoltage problems. Once the choice of the approximate Ohmic value of the Dynamic Brake Resistor is made, the wattage rating of the Dynamic Brake Resistor can be made.

The wattage rating of the Dynamic Brake Resistor is estimated by applying the knowledge of the drive motoring and regenerating modes of operation. The average power dissipation of the Regenerative mode must be estimated and the wattage of the Dynamic Brake Resistor chosen to be slightly greater than the average power dissipation of the drive. If the Dynamic Brake Resistor has a large thermodynamic heat capacity, the resistor element is able to absorb a large amount of energy without the temperature of the resistor element exceeding the operational temperature rating. Thermal time constants in the order of 50 seconds and higher satisfy the criteria of large heat capacities for these applications. If a resistor has a small heat capacity, the temperature of the resistor element could exceed the maximum temperature limits during the application of pulse power to the element and could exceed the safe temperature limits of the resistor.

The peak regenerative power can be calculated in English units (Horsepower), in The International System of Units (SI) (Watts), or in the per unit system (pu), which is dimensionless for the most part. In any event, the final number must in Watts of power to estimate Dynamic Brake Ohmic value. Calculations in this page are demonstrated in SI units.

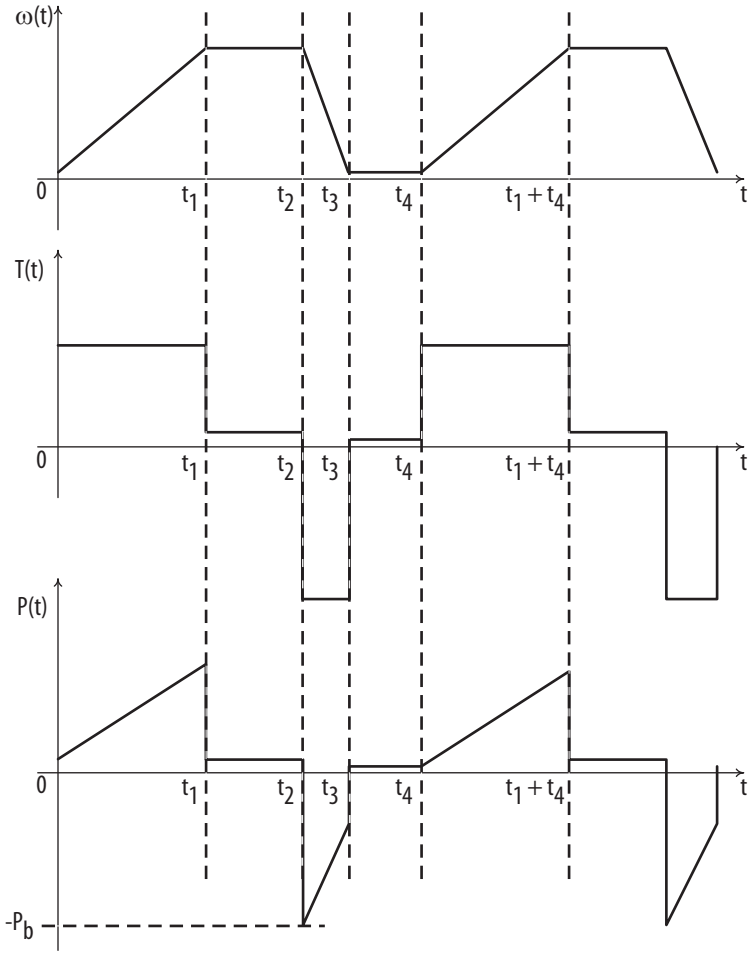
Speed, Torque, Power Profile

The following figure is a typical dynamic braking application. The top trace represents speed and is designated by the omega symbol. In the profile the motor is accelerated to some speed, it holds that speed for a period of time and is then decelerated. This deceleration is not necessarily to zero speed. The cycle is then repeated.

The middle trace represents motor torque. Torque starts out high as the motor is accelerated then drops down to maintain the commanded speed. Then the torque turns negative as the motor is decelerated. The cycle is then repeated.

The bottom trace represents motor power. Power increases as the motor speed increases. Power decreases some to maintain the commanded speed then goes

negative when deceleration starts. (this point called -Pb is the first value that needs to be calculated). The cycle is then repeated.



Dynamic Braking Module (no longer a Rockwell Automation product)

Figure 22 shows a simplified schematic of a Chopper Module with Dynamic Brake Resistor. The Chopper Module is shown connected to the positive and negative DC bus conductors of an AC PWM Drive. The two series connected Bus Caps are part of the DC bus filter of the AC Drive. The significant power components of the Chopper Module are the protective fusing, the Crowbar SCR, the Chopper Transistor (an IGBT), the Chopper Transistor Voltage Control (hysteretic voltage comparator), and a freewheel diode for the Dynamic Brake Resistor.

The protective fuse is sized to work in conjunction with the Crowbar SCR. Sensing circuitry within the Chopper Transistor Voltage Control determines if abnormal conditions exist within the Chopper Module. One of these abnormal conditions is a shorted Chopper Transistor. If this condition is sensed, the Chopper Transistor Voltage Control fires the Crowbar SCR, shorting the DC

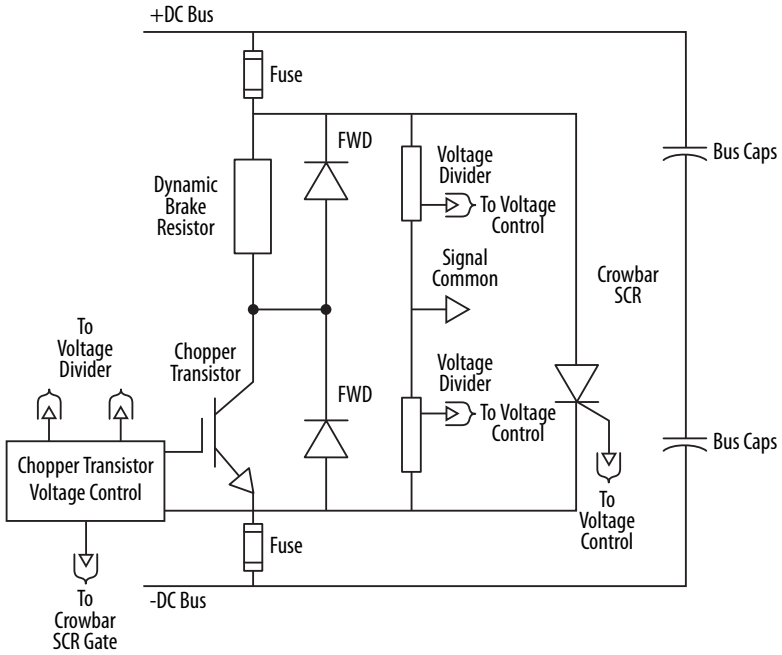
bus, and melting the fuse links. This action isolates the Chopper Module from the DC bus until the problem can be resolved.

The Chopper Transistor is an Isolated Gate Bipolar Transistor (IGBT). There are several transistor ratings that are used in the various Chopper Module ratings. The most important rating is the collector current rating of the Chopper Transistor that helps to determine the minimum Ohmic value used for the Dynamic Brake Resistor. The Chopper Transistor is either ON or OFF, connecting the Dynamic Brake Resistor to the DC bus and dissipating power, or isolating the resistor from the DC bus.

The Chopper Transistor Voltage Control regulates the voltage of the DC bus during regeneration. The average value of DC bus voltage is 375V DC (for 230V AC input), 750V DC (for 460V AC input), and 937.5V DC (for 575V AC input). The voltage dividers reduce the DC bus voltage to a low enough value that is usable in signal circuit isolation and control. The DC bus feedback voltage from the voltage dividers is compared to a reference voltage to actuate the Chopper Transistor.

The Freewheel Diode (FWD) in parallel with the Dynamic Brake Resistor enables any magnetic energy stored in the parasitic inductance of that circuit to be safely dissipated during turn off of the Chopper Transistor.

Figure 22 - Chopper Module Schematic



Sizing the Dynamic Brake Module Gather the following information.

1. The nameplate power rating of the motor in watts, kilowatts, or horsepower.
2. The nameplate speed rating of the motor in rpm or rps.

3. The motor inertia and load inertia in kilogram-meters2, or lb•ft^2.
4. The gear ratio, if a gear is present between the motor and load, GR.
5. Review the Speed, Torque Power profile of the application.

Equations used for calculating Dynamic Braking values use the following variables.

$\omega(t)$ = The motor shaft speed in Radians/second, or $\omega Rad/s = \frac{2\pi N}{60} RPM$

$N_{(t)}$ = The motor shaft speed in Revolutions Per Minute, or RPM

$T_{(t)}$ = The motor shaft torque in Newton-meters, 1.01 lb•ft - 1.355818N•m

$P_{(t)}$ = The motor shaft power in Watts, 1.0HP = 746 Watts

$-P_b$ = The motor shaft peak regenerative power in Watts

Step 1 – Determine the Total Inertia

$J_T = J_m + GR^2 \times J_L$

J_T = Total inertia reflected to the motor shaft, kilogram-meters^2, kg•m^2, or pound-feet^2, lb•ft^2

J_m = Motor inertia, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2

GR = The gear ratio for any gear between motor and load, dimentionless

J_L = Load inertia, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2 – 1 lb•ft^2 = 0.04214011 kg•m^2

Step 2 – Calculate the Peak Braking Power

$$P_b = \frac{J_T \times \omega^2}{t_3 - t_2}$$

J_T = Total inertia reflected to the motor shaft, kg•m^2

ω = rated angular rotational speed, $Rad/s = \frac{2\pi N}{60}$

N = Rated motor speed, RPM

$t_3 - t_2$ = total time of deceleration from rated speed to 0 speed, in seconds

P_b = peak braking power, watts (1.0 HP = 746 Watts)

Compare the peak braking power to that of the rated motor power, if the peak braking power is greater that 1.5 times that of the motor, the deceleration time, ($t_3 - t_2$), needs to be increased so that the drive does not go into current limit. Use 1.5 times because the drive can handle 150% current maximum for 3 seconds.

Peak power can be reduced by the losses of the motor and inverter.

Step 3 – Calculating the Maximum Dynamic Brake Resistance Value

$$R_{db1} = \frac{V_d^2}{P_b}$$

V_d = The value of DC bus voltage that the chopper module regulates at and is equal to 375V DC, 750V DC, or 937.5V DC

P_b = The peak braking power calculated in Step 2

R_{db1} = The maximum allowable value for the dynamic brake resistor

Choose a Dynamic Brake resistance value that is less than the value calculated in Step 3. If the value is greater than the calculated value, the drive can trip on DC bus overvoltage. Remember to account for resistor tolerances.

Step 4 – Choosing the correct Dynamic Brake Module

Cat. No.	Resistance	Wattage
240 Volt		
KA005	28 ohms	666 watts
KA010	13.2 ohms	1650 watts
KA050	N/A	N/A
460 Volt		
KB005	108 ohms	1500 watts
KB010	52.7 ohms	2063 watts
KB050	10.5 ohms	7000 watts
600 Volt		
KC005	108 ohms	1500 watts
KC010	52.7 ohms	2063 watts
KC050	15.8 ohms	8000 watts

In the table above, choose the correct Dynamic Brake Module based upon the resistance value being less than the maximum value of resistance calculated in Step 3. If the Dynamic Brake Resistor value of one Dynamic Brake Module is not sufficiently low, consider using up to three Dynamic Brake Modules in parallel, such that the parallel Dynamic Brake resistance is less than Rdb1 calculated in

Step 3. If the parallel combination of Dynamic Brake Modules becomes too complicated for the application, consider using a Brake Chopper Module with a separately specified Dynamic Brake Resistor.

Step 5 – Estimate average power

It is assumed that the application exhibits a periodic function of acceleration and deceleration. If $(t_3 - t_2)$ = the time in seconds necessary for deceleration from rated speed to 0 speed, and t_4 is the time in seconds before the process repeats itself, then the average duty cycle is $(t_3 - t_2)/t_4$. The power as a function of time is a linearly decreasing function from a value equal to the peak regenerative power to 0 after $(t_3 - t_2)$ seconds have elapsed. The average power regenerated over the interval of $(t_3 - t_2)$ seconds is Pb/2. The average power in watts regenerated over the period t_4 is:

$$P_{av} = \frac{(t_3 - t_2)}{t_4} \times \frac{P_b}{2}$$

P_{av} = Average dynamic brake resistor dissipation, in watts

$t_3 - t_2$ = Elapsed time to decelerate from rated speed to 0 speed, in seconds

t_4 = Total cycle time or period of process, in seconds

P_b = Peak braking power, in watts

The Dynamic Brake Resistor power rating of the Dynamic Brake Module (singly or two in parallel) that is chosen must be greater than the value calculated in Step 5. If it is not, then a Brake Chopper Module with the suitable Dynamic Brake Resistor must be specified for the application.

Step 6 – Calculate Percent Average Load

The calculation of AL is the Dynamic Brake Resistor load expressed as a percent. Pdb is the sum of the Dynamic Brake Module dissipation capacity and is obtained from the table in Step 4. This gives a data point for a line to be drawn on the curve in Figure 3. The number calculated for AL must be less than 100%. If AL is greater than 100%, an error was made in a calculation or the wrong Dynamic Brake Module was selected.

$$AL = \frac{P_{av}}{P_{db}} \times 100$$

AL = Average load in percent of Dynamic Brake Resistor

P_{av} = Average dynamic brake resistor dissipation calculated in Step 5 (Watts)

P_{db} = Steady state power dissipation capacity of resistors obtained from the table in Step 4 (Watts)

Step 7 – Calculate Percent Peak Load

The calculation of PL in percent gives the percentage of the instantaneous power dissipated by the Dynamic Brake Resistors relative to the steady state power dissipation capacity of the resistors. This gives a data point to be drawn on the curve of Figure 3. The number calculated for PL commonly falls between 300% and 600% for the Dynamic Brake Modules. A calculated number for PL of less than 100% indicates that the Dynamic Brake Resistor has a higher steady state power dissipation capacity than is necessary.

$$PL = \frac{P_b}{P_{db}} \times 100$$

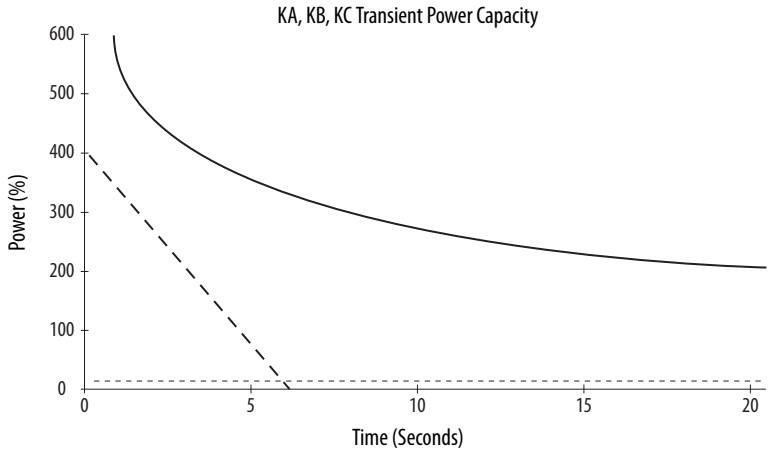
PL = Peak load in percent of Dynamic Brake Resistor

P_{av} = Peak braking power calculated in Step 2 (Watts)

P_{db} = Steady state power dissipation capacity of resistors obtained from the table in Step 4 (Watts)

Step 8 – Plot PL and AL on Curve

Draw a horizontal line equal to the value of AL (Average Load) in percent as calculated in Step 6. This value must be less than 100%. Pick a point on the vertical axis equal to the value of PL (Peak Load) in percent as calculated in Step 7. This value will be greater than 100%. Draw a vertical line at (t_3 - t_2) seconds such that the line intersects the AL line at right angles. Label the intersection Point 1. Draw a straight line from PL on the vertical axis to Point 1 on the AL line. This line is the power curve described by the motor as it decelerates to minimum speed.



If the line you drew lies to the left of the constant temperature power curve of the Dynamic Brake Resistor, then there is no application problem. If any portion of the line lies to the right of the constant temperature power curve of the Dynamic Brake Resistor, then there is an application problem. The application problem is that the Dynamic Brake Resistor is exceeding its rated temperature during the interval that the transient power curve is to the right of the resistor power curve capacity. It is prudent to parallel another Dynamic Brake Module or apply a Brake Chopper Module with a separate Dynamic Brake Resistor.

Sizing the Chopper and Resistors

Chopper and Resistors (no longer a Rockwell Automation product)

Sizing the chopper module is the same as the dynamic brake module with a couple of added steps. Because the chopper is separate from the resistors, an additional calculation for current needs to be made. Additionally a calculation for watt-seconds or joules needs to be made for resistor sizing.

Step 1 – Determine the Total Inertia

$J_T = J_m + GR^2 \times J_L$

J_T = Total inertia reflected to the motor shaft, kilogram-meters^2, kg•m^2, or pound-feet^2, lb•ft^2

J_m = motor inertia, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2

GR^2 = the gear ratio for any gear between motor and load, dimensionless

J_L = load inertia, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2 (1.0 lb•ft^2 = 0.04214011 kg•m^2)

Step 2 – Calculate the Peak Braking Power

$$P_b = \frac{J_T \times \omega^2}{t_3 - t_2}$$

J_T = Total inertia reflected to the motor shaft, kg•m^2

ω = rated angular rotational speed, $Rad/s = \frac{2\pi N}{60}$

N = Rated motor speed, RPM

$t_3 - t_2$ = total time of deceleration from the rated speed to 0 speed, seconds

P_b = peak braking power, watts (1.0HP = 746 Watts)

Compare the peak braking power to that of the rated motor power, if the peak braking power is greater that 1.5 times that of the motor, then the deceleration time, $(t_3 - t_2)$, needs to be increased so that the drive does not go into current limit. Use 1.5 times because the drive can handle 150% current maximum for 3 seconds.

Peak power can be reduced by the losses of the motor and inverter.

Step 3 – Calculating the Maximum Dynamic Brake Resistance Value

$$R_{db1} = \frac{V_d^2}{p_b}$$

V_d = The value of DC bus voltage that the chopper module regulates at and is equal to 375V DC, 750V DC, or 937.5V DC

P_b = The peak braking power calculated in Step 2

R_{db1} = The maximum allowable value for the dynamic brake resistor

The choice of the Dynamic Brake resistance value will be less than the value calculated in Step 3. If the value is greater than the calculated value, the drive can trip on DC bus overvoltage. Remember to account for resistor tolerances.

Step 4 – Choosing the Chopper Module

$$I_{dl} = \frac{V_d}{R_{dbl}}$$

I_{dl} = The minimum current flowing through the chopper module transistor

V_d = The value of DC bus voltage chosen in Step 3

R_{dbl} = The value of the dynamic brake resistor calculated in Step 3

The value of I_{d1} sets the minimum value of current rating for the Chopper Module. When the Chopper Module choice has been made, the current rating of the Module Transistor must be greater than or equal to the calculated value for I_{d1}. See the table below for rating values.

Drive Voltage (Volts AC)	Turn-On Voltage (Volts DC)	Cat. No.	Peak Transistor Current Rating (Amps)	Minimum DB Resistor Value (Ohms)
230	375	WA018	50	9.0
		WA070	200	2.3
		WA115	400	1.25
460	750	WB009	25	37
		WB035	100	9.0
		WB110	400	2.5
575	935	WC009	25	46
		WC035	75	15.5
		WC085	400	3.0

Step 5 – Determine the Minimum Resistance

Each chopper module in the table above has a minimum resistance associated with it. If a resistance lower than the value show in the table is connected to the chopper module, the brake transistor is most likely be damaged.

Step 6 – Choosing the Dynamic Brake Resistance Value

To avoid damage to this transistor and get the desired braking performance, select a resistor with a resistance between the maximum resistance calculated in Step 3 and the minimum resistance of the selected chopper module.

Step 7 – Estimating the Minimum Wattage requirements for the Dynamic Brake Resistor

It is assumed that the application exhibits a periodic function of acceleration and deceleration. If $(t_3 - t_2)$ = the time in seconds necessary for deceleration from rated speed to 0 speed, and t_4 is the time in seconds before the process repeats itself, then the average duty cycle is $(t_3 - t_2)/t_4$. The power as a function of time is a linearly decreasing function from a value equal to the peak regenerative power to 0 after $(t_3 - t_2)$ seconds have elapsed. The average power regenerated over the interval of $(t_3 - t_2)$ seconds is Pb/2. The average power in watts regenerated over the period t_4 is:

$$P_{av} = \frac{(t_3 - t_2)}{t_4} \times \frac{P_b}{2}$$

P_{av} = average dynamic brake resistor dissipation, watts

$t_3 - t_2$ = Elapsed time to decelerate from rated speed to 0 speed, seconds

t_4 = Total cycle time or period of process, seconds

P_b = Peak braking power, watts

The Dynamic Brake Resistor power rating in watts that is chosen will be equal to or greater than the value calculated in Step 7.

Step 8 – Calculate the requires Watt-Seconds (joules) for the resistor

To be sure the resistor's thermal capabilities are not violated, a calculation to determine the amount of energy dissipated into the resistor is made. This determines the amount joules the resistor must be able to absorb.

$$P_{ws} = (t_3 - t_2) \times \frac{P_b}{2}$$

P_{ws} = Required watt - seconds of the resistor

$t_3 - t_2$ = Elapsed time to decelerate from ωb speed to ω0 speed, seconds

P_b = Peak braking power, watts

Internal Brake IGBT for PowerFlex 755 Drives

Sizing Resistors for an internal DB IGBT

Sizing resistors for the internal DB IGBT Uses the same formula's as previous, and is very similar to the Chopper Module sizing.

Step 1 – Determine the Total Inertia

$$J_T = J_m + GR^2 \times J_L$$

J_T = Total inertia reflected to the motor shaft, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2

J_m = motor inertia, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2

GR = The gear ratio for any gear between motor and load, dimensionless

J_L = load inertia, kilogram-meters2, kg•m^2, or pound-feet2, lb•ft^2 (1.0 lb•ft^2 = 0.04214011 kg•m^2)

Step 2 – Calculate the Peak Braking Power

$$P_b = \frac{J_T \times \omega^2}{t_3 - t_2}$$

J_T = Total inertia reflected to the motor shaft, kg•m^2

ω = rated angular rotational speed, $Rad/s = \frac{2\pi N}{60}$

N = Rated motor speed, RPM

$t_3 - t_2$ = total time of deceleration from the rated speed to 0 speed, seconds

P_b = peak braking power, watts (1.0HP = 746 Watts)

Compare the peak braking power to that of the rated motor power, if the peak braking power is greater that 1.5 times that of the motor, then the deceleration time, ($t_3 - t_2$), needs to be increased so that the drive does not go into current limit. Use 1.5 times because the drive can handle 150% current maximum for 3 seconds.

Peak power can be reduced by the losses of the motor and inverter.

Step 3 – Calculating the Maximum Dynamic Brake Resistance Value

$$R_{db1} = \frac{V_d^2}{p_b}$$

V_d = The value of DC bus voltage that the drive regulates at and is equal to 375V DC, 750V DC, or 937.5V DC depending on input voltage

P_b = The peak braking power calculated in Step 2

R_{db1} = The maximum allowable value for the dynamic brake resistor

The choice of the Dynamic Brake resistance value will be less than the value calculated in Step 3. If the value is greater than the calculated value, the drive can trip on DC bus overvoltage. Remember to account for resistor tolerances.

Step 4 – Determine the Minimum Resistance

Each drive with an internal DB IGBT has a minimum resistance associated with it. If a resistance lower than the minimum value for a given drive is connected, the brake transistor will likely be damaged. Below is a table of minimum resistances for frame 2 through 7 PowerFlex 750-Series drives.

Frame	400V				480V			
	ND kW	Catalog Code	Min Resistance	Max DB Current	ND HP	Catalog Code	Min Resistance	Max DB Current
2	0.75	C2P1	31.6	25	1.0	D2P1	31.6	25
	1.5	C3P5	31.6	25	2.0	D3P4	31.6	25
	2.2	C5P0	31.6	25	3.0	D5P0	31.6	25
	4.0	C8P7	31.6	25	5.0	D8P0	31.6	25
	5.5	C011	31.6	25	7.5	D011	31.6	25
	7.5	C015	31.6	25	10	D014	31.6	25
	11	C022	22.6	34.9	15	D022	22.6	34.9
3	15	C030	31.6	25	20	D027	31.6	25
	18.5	C037	31.6	25	25	D034	31.6	25
	22	C043	16.6	47.6	30	D040	16.6	47.6
4	30	C060	15.8	50	40	D052	15.8	50
	37	C072	15.8	50	50	D065	15.8	50
5	37	C072	7.9	100	50	D065	7.9	100
	45	C085	7.9	100	60	D077	7.9	100
	55	C104	7.9	100	75	D096	7.9	100
6	55	C104	3.3	239.4	75	D096	3.3	239.4
	75	C140	3.3	239.4	100	D125	3.3	239.4
	90	C170	3.3	239.4	125	D156	3.3	239.4
	110	C205	3.3	239.4	150	D186	3.3	239.4
	132	C260	3.3	239.4	200	D248	3.3	239.4
7	132	C260	2.4	329	200	D248	2.4	329
	160	C302	2.4	329	250	D302	2.4	329
	200	C367	2.4	329	300	D361	2.4	329
	250	C456	1.65	478.8	350	D415	1.65	478.8
	270	C477	1.65	478.8	400	D477	1.65	478.8

Step 5 – Choosing the Dynamic Brake Resistance Value

To avoid damage to this transistor and get the desired braking performance, select a resistor with a resistance between the maximum resistance calculated in Step 3 and the minimum resistance of the drive IGBT.

Step 6 – Estimating the Minimum Wattage requirements for the Dynamic Brake Resistor

It is assumed that the application exhibits a periodic function of acceleration and deceleration. If $(t_3 - t_2)$ = the time in seconds necessary for deceleration from rated speed to 0 speed, and t_4 is the time in seconds before the process repeats itself, then the average duty cycle is $(t_3 - t_2)/t_4$. The power as a function of time is a linearly decreasing function from a value equal to the peak regenerative power to 0 after $(t_3 - t_2)$ seconds have elapsed. The average power regenerated over the interval of $(t_3 - t_2)$ seconds is Pb/2. The average power in watts regenerated over the period t_4 is:

$$P_{av} = \frac{(t_3 - t_2)}{t_4} \times \frac{P_b}{2}$$

P_{av} = Average dynamic brake resistor dissipation, in watts

$t_3 - t_2$ = Elapsed time to decelerate from rated speed to 0 speed, in seconds

t_4 = Total cycle time or period of process, in seconds

P_b = Peak braking power, in watts

The Dynamic Brake Resistor power rating in watts that is chosen will be equal to or greater than the value calculated in Step 6.

Step 7 – Calculate the requires Watt-Seconds (joules) for the resistor

To be sure the resistor's thermal capabilities are not violated, a calculation to determine the amount of energy dissipated into the resistor is made. This determines the amount joules the resistor must be able to absorb

$$P_{ws} = (t_3 - t_2) \times \frac{P_b}{2}$$

P_{ws} = Required watt - seconds of the resistor

$t_3 - t_2$ = Elapsed time to decelerate from ωb speed to ω0 speed, seconds

P_b = Peak braking power, watts

Flux Braking

Flux Braking is an independent feature from the P370/371 [Stop Mode A/B] available in PowerFlex 750-Series drives. When enabled, flux braking is active during the decel ramp of a speed change. Flux braking changes the Volts per Hertz curve ratio outputting a higher voltage, relative to the normal V/Hz curve, to the motor causing over fluxing thus reducing the speed faster than just the decel ramp alone. This feature is not intended for high inertia loads because over fluxing can cause excessive heating in the motor. Very long decel times can build heat.

Flux Braking works in all motor control modes.

Table 11 - Flux Braking Parameters

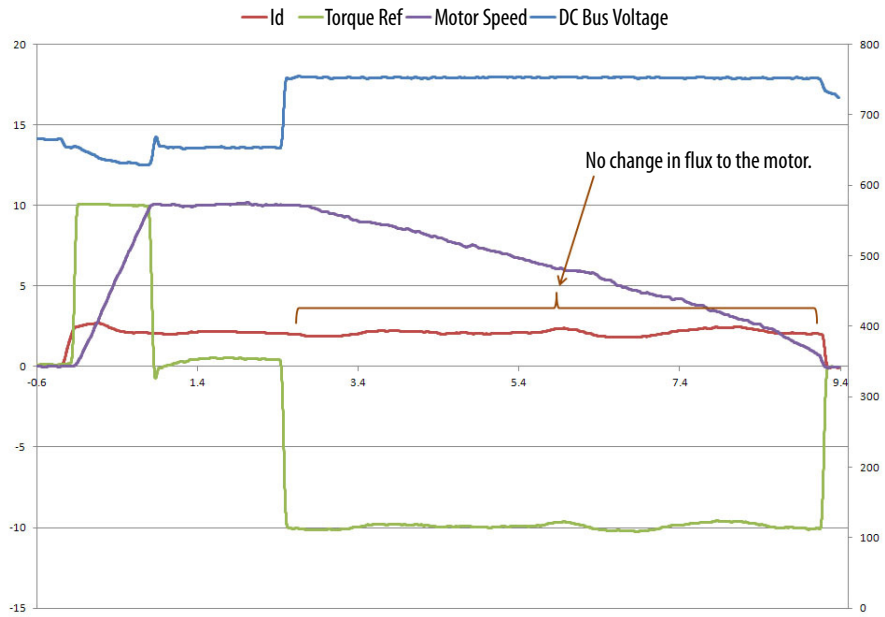
Number	Parameter Name	Min / Max	Default
388	Flux Braking En	Disabled / Enabled	Disabled
389	Flux Braking Lmt	100.00 / 250.00 %	125.00
390	Flux Braking Ki	0.0 / 1000000.0	10000.0
391	Flux Braking Kp	0.0 / 1000000.0	0.0 (Disabled)

Traces

In all of the following plots the Accel/Decel times are 0.5 s. P372/373 [Bus Reg Mode A/B] is set to option 1 “Adjust Freq.” There is a fair amount of inertia connected to the motor shaft. P370/371 [Stop Mode A/B] is set to 1 “Ramp” to stop.

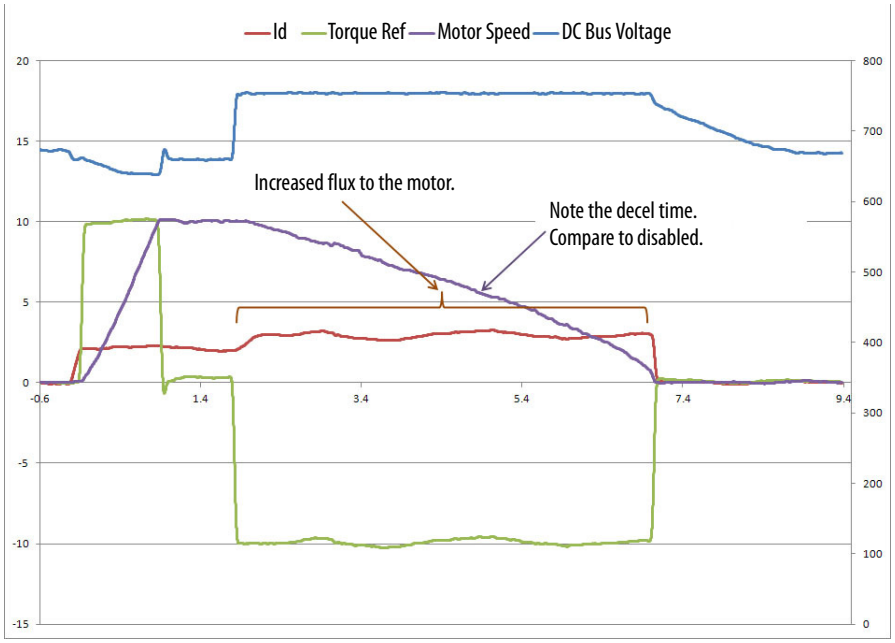
In the plot below the Flux Braking feature is disabled. Note the decel time. Here the bus regulator is controlling the stop time.

Flux Braking - Disabled



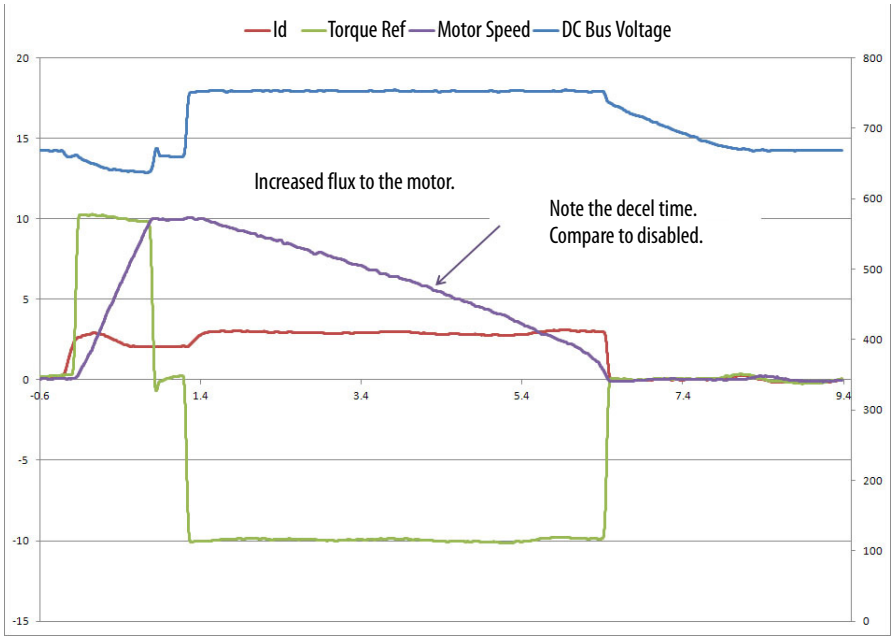
In the next plot all conditions are the same except the Flux Braking feature is enabled. Note the flux to the motor is increased and the decel time is shorter.

Flux Braking - Enabled



Finally the same test with the gains set to maximum levels. Slightly faster decel. The use of the gains vary with the connected load.

Flux Braking - Full Gains



Flux Regulator

The flux regulator is used to control and limit the overall (fundamental) voltage applied to an induction motor when FOC is used. The flux regulator controls field weakening above base speed and maintains voltage margin for a current regulator. A variation of the induction motor flux regulator is used for PM motors for operation above base speed.

As default the flux regulator is enabled. When disabled, the current regulator becomes de-tuned.

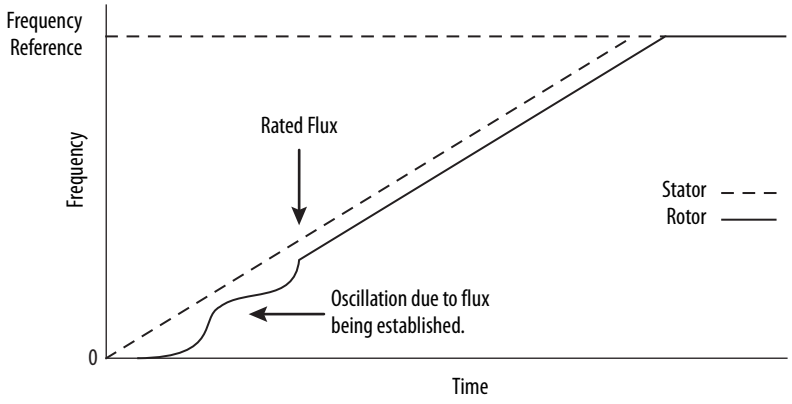
Do not disable this regulator. If you feel you need to disable this function, consult the factory for verification.

Flux Up

AC induction motors require flux to be established before controlled torque can be developed. To build flux, voltage is applied. There are two methods to flux the motor.

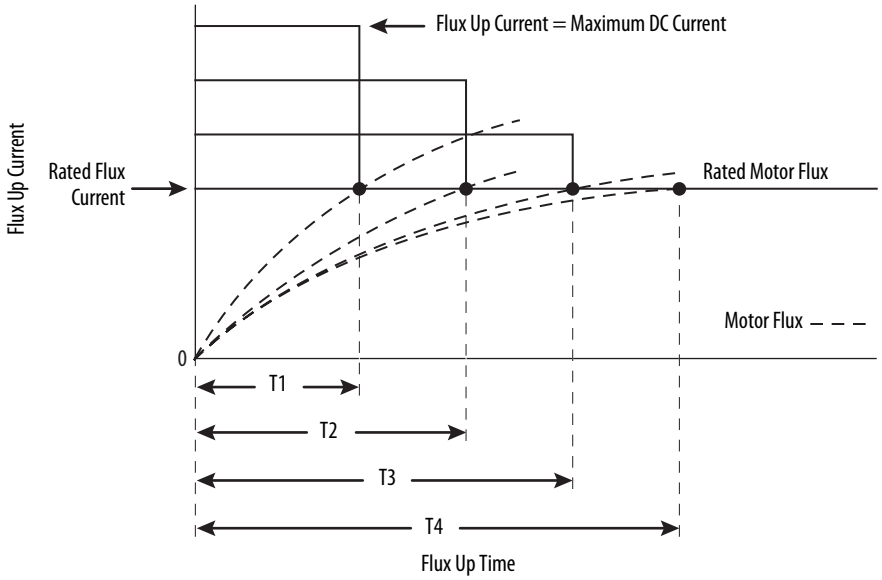
The first method is Automatic during a normal start. Flux is established as the output voltage and frequency are applied to the motor. While the flux is being established, the unpredictable nature of the developed torque can cause the rotor to oscillate even though acceleration of the load can occur. In the motor, the acceleration profile may not follow the commanded acceleration profile due to the lack of developed torque.

Figure 23 - Accel Profile during Normal Start - No Flux Up



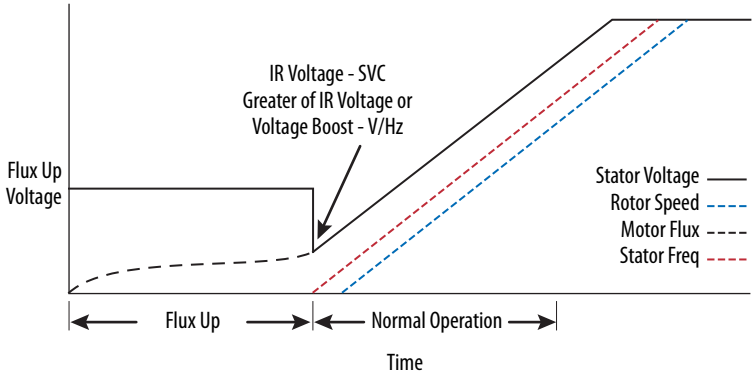
The second method is Manual. In this mode, DC current is applied to the motor so that the flux is established before rotation. The flux up time period is based on the level of flux up current and the rotor time constant of the motor. The flux up current is not user adjustable.

Figure 24 - Flux Up Current versus Flux Up Time



Once rated flux is reached in the motor, normal operation begins and the desired acceleration profile is achieved.

Rated Flux Reached



Once rated flux is reached in the motor, normal operation begins and the desired acceleration profile is achieved.

Parameters

File	Group	No.	Display Name Full Name Description	Values		Read-Write	Data Type
MOTOR CONTROL	Mtr Ctrl Options	43	**Flux Up Enable** Flux Up Enable "Manual" (0) – Flux is established for P44 [Flux Up Time] before initial acceleration. "Automatic" (1) – Flux is established for a calculated time period based on motor nameplate data before acceleration. P44 [Flux Up Time] is not used.	Default: Options:	1 = "Automatic" 0 = "Manual" 1 = "Automatic"	RW	32-bit Integer
		44	**Flux Up Time** Flux Up Time The amount of time the drive will use to try to achieve full motor stator flux. When a Start command is issued, DC current at P26 [Motor NP Amps] level is used to build stator flux before accelerating.	Units: Default: Min/Max:	Secs 0.0000 0.0000 / 5.0000	RW	Real

Applications

This function is usually associated with applications that require extended acceleration times. Out of the box, the drive is set to "Automatic" and attempts to get full motor stator flux based on motor nameplate information. In some cases the loading and ramp curve during acceleration could have an adverse affect on the drive's thermal manager. Some applications include mining conveyors or large centrifuges. This function gives you the ability to manually be sure the motor stator is fully fluxed up before acceleration by manually assigning a flux up time. It can produce a better acceleration at low frequencies without excessive current.

High Resolution Feedback

The Universal Feedback option module, PowerFlex 755 drives only, interpolates any sine/cosine signal into 1,048,576 counts per revolution.

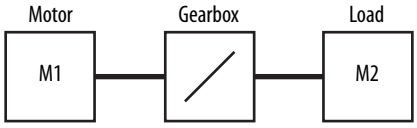
The interpolation cannot be changed. It is 1,048,576 counts per revolution regardless of the native cycles per revolution of the sine/cosine. Interpolation is modified to 24 bits when P8 [FB0 Cfg] or P38 [FB1 Cfg] Bit 1 "24-bit Resol" is set.

An acceptable sine/cosine signal is a 1 volt peak-to-peak voltage with a 2.5 volt offset. Most feedback manufactures Sick (SSI), Stegmann (Hiperface), and Heidenhain (En Dat, non en dat) meet this requirement.

Inertia Adaption

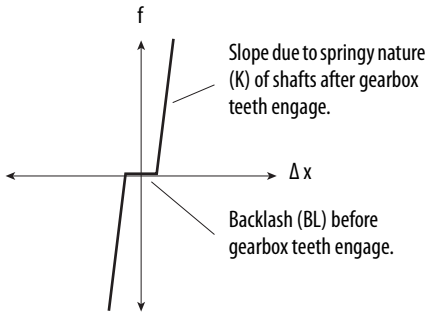
Inertia adaption is used to compensate for lost motion, which occurs when a gear box and/or a springy coupling is present. Lost Motion describes the condition in which an input to a mechanism creates no corresponding displacement at the output. This is most noticeable in systems with large inertia ratios using a gearbox or flexible couplings. The term inertia adaption refers to how this function adapts or changes the dynamic inertia seen by the speed regulator. Inertia adaption can allow an increase in the speed regulator bandwidth, normally limited by the mechanical transmission, by up to four times. This feature is only available on PowerFlex 755 drives. P35 [Motor Ctrl Mode] must be set to vector control and use a motor speed feedback device. Inertia adaption is not enabled by default.

For example, a motor connected to a gearbox is shown.



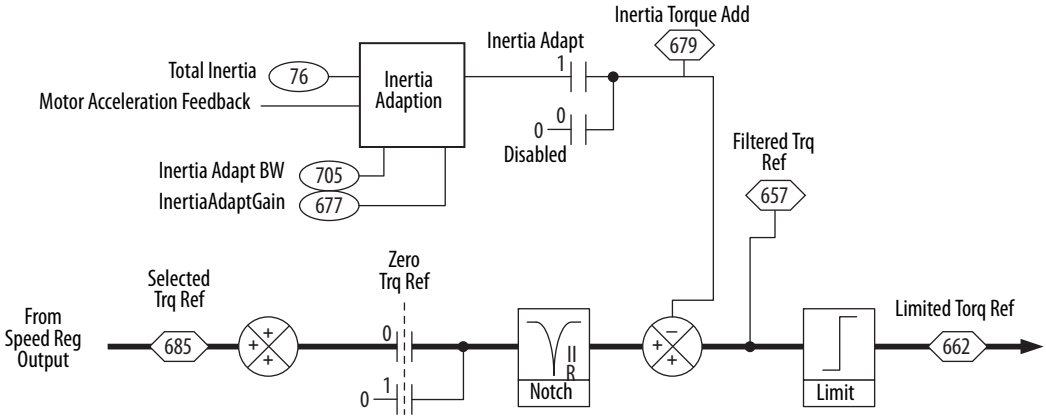
This gearbox can be represented by a spring (K) and gear backlash (BL).

When the speed of the motor increases, there is a period of time (represented by Δ x = backlash) before the teeth of the gearbox engage. After that time, there is some twisting (like a spring) in the shaft after the teeth of the gearbox engage. This lost motion causes mechanical instability and limits how high the speed regulator bandwidth can be set without causing instability. Inertia adaption detects the lost motion and a higher speed regulator bandwidth can be achieved without instability.



Configuration

Inertia adaption only works if there is valid inertia value entered in P76 [Total Inertia]. Total inertia is measured during an assisted startup procedure executed from the HIM or software wizard. The inertia tune can be executed manually by setting P70 [Autotune] to option 4 "Inertia Tune" and starting the drive.



Activate inertia adaption by setting P704 [InAdp LdObs Mode] to option 1 "InertiaAdapt." Once activated, two filters are automatically updated, P705 [Inertia Adapt BW] and P710 [InertAdptFltrBW], when P636 [Speed Reg BW] is set to a non zero value. Gradually increase P636 [Speed Reg BW] while operating the motor and load. The final speed reg bandwidth exceeds the value before inertia adaption was activated providing the system meets the criteria mentioned below.

When Inertia adaption is activated, disable the two lead-lag filters present in the speed regulator (setting OFF). These filters are in the speed feedback path P637 [SReg FB Fltr Sel] and at the output of the speed regulator P657 [SReg OutFltr Sel]. Both filters are disabled by default.

The Inertia Adaption feature can be used in conjunction with inertia compensation to minimize the acceleration torque required from the Speed Regulator.

Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, for detailed parameter explanation.

How does inertia adaption work?

- The inertia adaption algorithm uses a component of acceleration feedback to create a sort of electronic inertia.
- Electronic inertia supplements the inertia lost when the load is suddenly disconnected as through a gearbox or lost motion. In this way the velocity regulator does not see a dramatic change in inertia that is normally associated with load disconnect and potential instability.

Where is inertia adaption applied?

- Any system with an inertia ratio greater than 3:1 that is plagued by gear noise or resonance that can't achieve desired performance by ordinary tuning. (Inertia ratio is the ratio of system inertia to motor inertia.)
- Most high performance tracking or electronic line shaft systems.
- Most geared systems requiring higher bandwidths and stiffness.

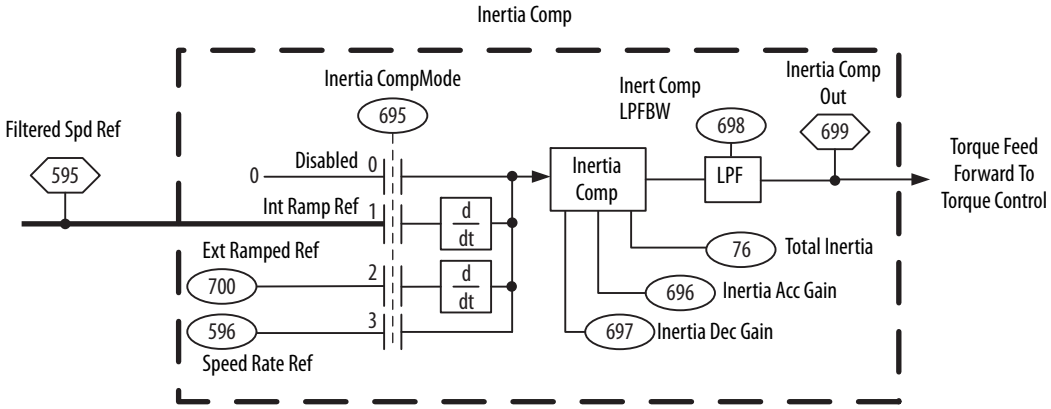
What could be a disadvantage when using inertia adaption?

- It can generate a shrill noise with rigid couplings that lack lost motion or sufficient compliance. Do not use inertia adaption in such cases.
- It can produce a low level sound emanating from the motor. This is merely the inertia adaption in action and the sound does not affect performance nor does it harm the motor.

Inertia Compensation

Inertia Compensation is active only in PowerFlex 755 drive and in Flux Vector (FV) motor control modes selected by P35 [Motor Ctrl Mode].

During speed changes, a certain level of torque to respond is required due to load inertia. That level of torque is above the torque used to run at constant speed. Inertia compensation attempts to predict the motor torque required to accelerate and decelerate an inertial load. The Inertia compensation function calculates a feed forward torque signal based on proportional acceleration or deceleration rate of change of speed input and total inertia, also known as the derivative of speed with respect to time. Then that P699 [Inertia Comp Out] signal torque can be fed forward into the torque control, becoming an available input to the P313 [Actv SpTqPs Mode] selector to be summed with P660 [SReg Output] making for smoother accelerations and decelerations, especially with high inertia loads.



- Parameter 695 [Inertia CompMode] enables the Inertia Compensation and selects possible velocity reference input sources of motor speed as follows:
- "Disabled" (0) – Inertia compensation function is disabled. P699 [Inertia Comp Out] is zero so the motor torque reference is not affected.

- "Int Ramp Ref" (1) – Inertia compensation is enabled. The function is configured to use the rate of change of P595 [Filtered Spd Ref]. This is the typical setting that should be used for inertia compensation on a stand-alone drive.
- "Ext Ramp Ref" (2) – Inertia compensation is enabled. The function is configured to use the rate of change of P700 [Ext Ramped Ref]. This setting is available for applications that supply a ramped speed reference external to the drive.
- "Spd Rate Ref" (3) – Inertia compensation is enabled. The function is configured to use the P596 [Speed Rate Ref]. This parameter should contain a value that represents the rate of change of the motor speed reference. This setting is available for applications that supply a ramped speed reference external to the drive.

Parameter 76 [Total Inertia] is calculated during the autotune and is used along with the calculated acceleration or deceleration rate to calculate the torque adder.

Parameter 696 [Inertia Acc Gain] determines the gain for the inertia compensation during acceleration. A gain of 1 results in 100% compensation.

Parameter 697 [Inertia Dec Gain] determines the gain for the inertia compensation during deceleration. A gain of 1 results in 100% compensation.

Parameter 698 [Inertia Comp LPFBW] Inertia Compensation Low Pass Filter Bandwidth. Sets the bandwidth of a low pass filter for the inertia compensation function. The output of this filter supplies P699.

Parameter 699 [Inertia Comp Out] Inertia Compensation Output. Displays the output of the inertia compensation function.

Parameter 700 [Ext Ramped Ref] External Ramped Reference. This parameter is meant for an external motor speed ramp input signal. This signal will be used by the inertia compensation function when P695 [Inertia CompMode] = 2 "Ext Ramp Ref." This parameter will be entered in units of Hz or RPM, depending on the value of P300 [Speed Units].

Parameter 596 [Speed Rate Ref] Speed Rate Reference. This parameter is shared by both the Inertia Compensation and Speed Compensation functions.

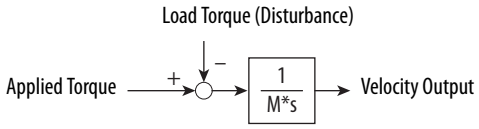
A value shared by both the Inertia Compensation and Speed Compensation functions (active only in FV motor control modes), typically supplied by an external controller that is also providing a rate limited speed reference. The Speed Rate Reference corresponds to the derivative with respect to time of the speed reference signal. Units of time are in seconds.

For example, if the controller provides a 10 second reference ramp, the controller would also supply a Speed Rate Ref value of 1 pu / 10 sec = 0.1 sec-1 while the reference is accelerating. When the reference is constant, Speed Rate Ref should be zero.

For additional illustration of the control refer to PF755 Control Block Diagrams in the PowerFlex 750-Series Programming Manual, publication 750-PM001.

Load Observer

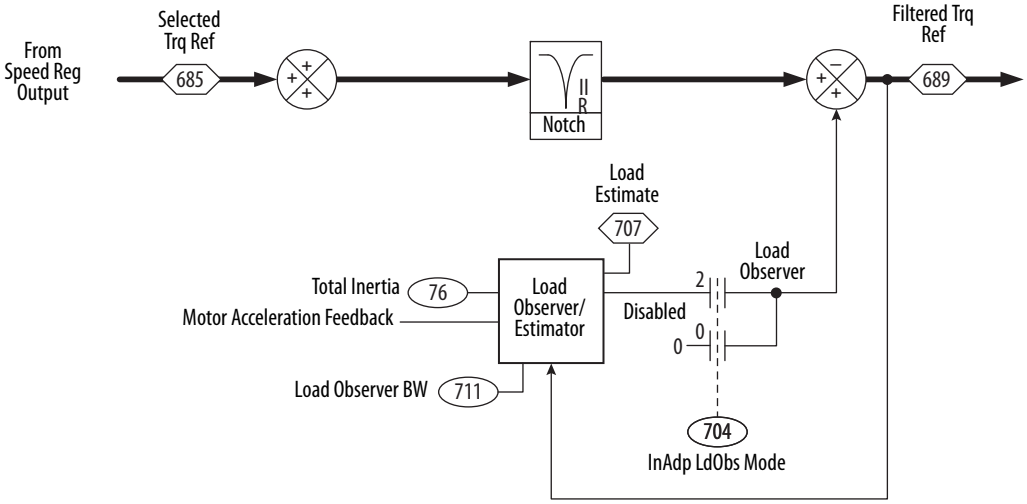
The PowerFlex 755 load observer feature compensates for and greatly reduces load disturbances and gives quicker system response. It minimizes the load torque requirements of the speed regulator. The load observer attempts to determine a load estimate value that matches the load torque present in the simplified load model. This is a simplified motor/load model.



From a control point of view, load torque is an input that is just as real as velocity reference, but lacks a parameter. Load torque is unavoidable because it is effectively torque times speed that creates the power to run a load. Considering this load model, the applied torque is the electromagnetic torque generated by the motor control and load torque is clearly shown. M is the combined motor/load mass (inertia). The applied torque must be greater than the load torque to accelerate the system.

Load torque is not a parameter and thus is not directly accessible, but it can be indirectly measured. Referring to the plant model we can directly measure the applied torque, output velocity and the inertia is generally known or calculated. This leaves load torque as the only unknown value. If we place all three known quantities in a box that we call an observer, load torque can be estimated.

As the output of the load observer is added to the output of the speed regulator the function minimizes the load torque requirement for the output of the speed regulator. Because load observer affects the torque reference and the acceleration feedback is required, this method can only be applied on P35 [Motor Ctrl Mode] Flux Vector control modes with motor feedback device. This feature is available only on PowerFlex 755 drives.



Configuration

Enable Load Observer by setting P704 [InAdp LdObs Mode] to 2 "LoadObserver." The total inertia value P76 [Total Inertia] is required for this feature. Ideally it is measured during the inertia test as part of the drive startup. The next best approach is to manually enter a reasonably close (calculated) value. In Load Observer mode, P711 [Load Observer BW] is used to set the natural frequency of a low pass filter in radians per second (R/S). Typical values for Load Observer Bandwidth range from 10 to 150 with the higher values being more responsive to disturbances but with increased system noise. There is no nominal best setting, but 40 R/S is a suggested starting point. This selection may not function well in sloppy geared systems. Unlike with Inertia Adaption, there is no automatic parameter setting associated with the Load Observer.

The Load Observer can also be used in conjunction with P695 [Inertia CompMode]. When used together, both the load torque and acceleration torque required from the speed regulator are minimized.

Where can Load Observer be used?

Load Observer can be used on systems where load disturbances are preventing a further increase in drive performance. The Load Observer can be applied to both periodic load disturbances, such as a piston pump, and random load disturbances. Load observer can be applied on systems that are not suitable for Inertia Adaption. Load Observer cannot be active at the same time as Inertia Adaption.

Motor Control Modes

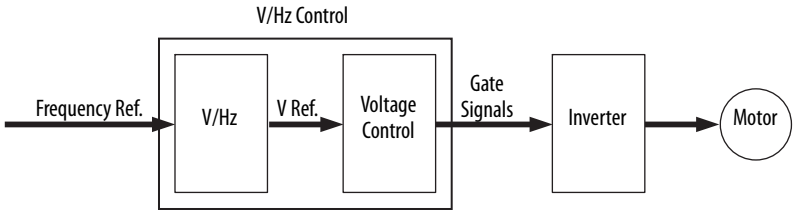
P35 [Motor Ctrl Mode] selects the output mode of the drive to match the type of motor control to use. The Default selection is a value of 1 = "Induction SV." This parameter is set during any of the assisted start up routines either via the HIM or connected software tool wizard. The parameter settings follow.

- InductionVHz (0) – Induction motor, volts per Hertz control mode. Connected to an induction motor. Used for variable torque applications with improved efficiency energy savings and variable speed constant torque applications such as conveyors. Can also be used in multi-motor or synchronous motor applications.
- Induction SV (1) – Induction motor, sensorless vector control mode. Connected to an induction motor. Used for most constant torque applications. Provides excellent starting, acceleration, and running torque.
- Induct Econ (2) – Induction motor, economize control mode. Used for additional energy savings in constant torque applications that have constant speed reduced load periods.

- Induction FV (3) – Induction motor, flux vector control mode.
  Connected to an induction motor. Used when high performance precise speed regulation and/or position control closed loop is required. Can also be configured with direct Torque Reference input. Can also be used open loop with less precision.
- PM VHz (4) – Permanent magnet motor, volts per Hertz control mode.
  Connected to a Surface Permanent Magnet motor (SPM) or Permanent Magnet Synchronous Motor (PMSM). Used for variable torque applications with improved efficiency energy savings and variable speed constant torque applications such as conveyors. Also used in multi-motor or synchronous motor open loop applications.
- PM SV (5) – Permanent magnet motor, sensorless vector control mode.
  Connected to a Surface Permanent Magnet motor (SPM) or Permanent Magnet Synchronous Motor (PMSM). Used for constant torque applications. Provides excellent starting, acceleration, and running torque.
- PM FV (6) – Permanent magnet motor, flux vector control mode.
  Connected to a Surface Permanent Magnet motor. Used when high performance precise speed regulation and/or position control closed loop is required. Can also be configured with direct Torque Reference input. Can also be used open loop with less precision.
- SyncRel VHz (7) – Synchronous Reluctance motor, volts per Hertz control mode.
  Connected to a Synchronous Reluctance motor. Used for constant torque applications with improved efficiency energy savings and variable speed applications such as conveyors. Used in multi-motor applications.
- SyncRel SV (8) – Synchronous Reluctance motor, sensorless vector control mode.
  Connected to a Synchronous Reluctance motor. Used for constant torque applications with improved efficiency energy savings and variable speed applications such as conveyors. Avoid slow speed low inertia applications that cause torque ripple effects.
- Adj VltgMode (9) – Adjustable voltage control mode.
  Independent Frequency and Voltage regulators; Fixed Frequency and Variable Voltage or Fixed Voltage and Variable Frequency. Typically used for non-motor applications such as resistive and inductive heating elements, vibration welding, power supplies, Electromagnetic stirring of molten metal and some Linear Induction Motor LIM applications.
- IPM FV (10) – Interior permanent magnet motor, flux vector control mode.
  Connected to an Interior Permanent Magnet motor. Used when high performance precise speed regulation and/or position control with closed loop feedback is required. Can also be configured with direct Torque Reference input. Can also be used open loop with less precision.

Volts/Hertz

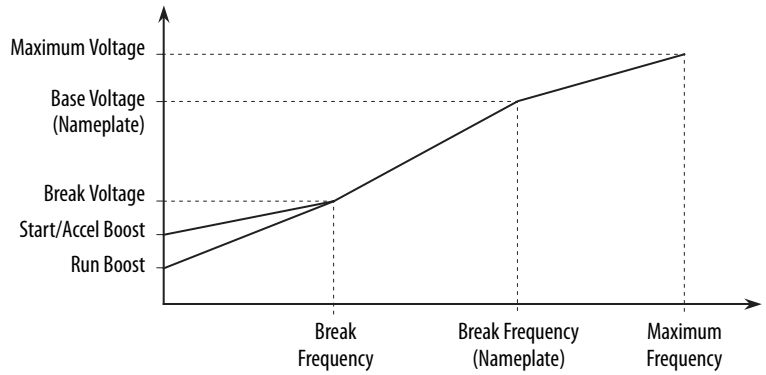
Volts/Hertz operation creates a fixed relationship between output voltage and output frequency. Volts/Hertz works the same for Permanent Magnet and SyncRel VHz as it does for induction VHz. The relationship can be defined in two ways by setting P65 [VHz Curve] to 0 "Custom V/Hz" or 1 "Fan/Pump."



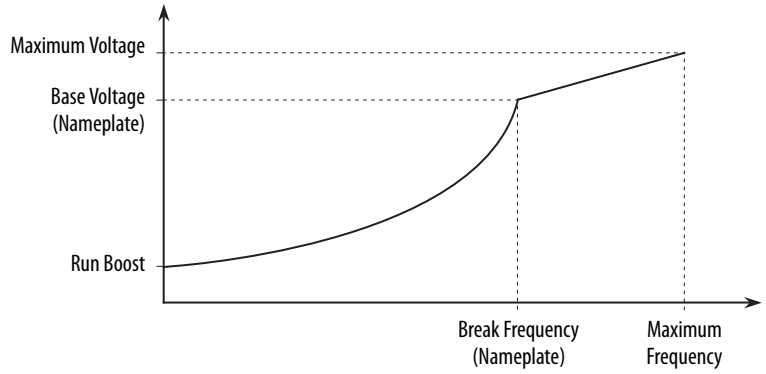
0 = "Custom V/Hz"

Custom Volts/Hertz enables a wide variety of patterns using linear segments. The default configuration is a straight line from zero to rated voltage and frequency. This is the same volts/hertz ratio that the motor sees if started across the line. As seen in the diagram below, the volts/hertz ratio can be changed to provide increased torque performance when required by programming five distinct points on the curve.

- P60 [Start Acc Boost] - Used to create additional torque for breakaway from zero speed and acceleration of heavy loads at lower speeds.
- P61 [Run Boost] - Used to create additional running torque at low speeds. The value is typically less than the required acceleration torque. The drive will lower the boost voltage to this level when running at low speeds (not accelerating). This reduces excess motor heating that could be caused if the higher start / accel boost level were used.
- P62 [Break Voltage] and P63 [Break Frequency] - Used to increase the slope of the lower portion of the Volts/Hertz curve, providing additional torque.
- P25 [Motor NP Volts] and P27 [Motor NP Hertz] - Set the upper portion of the curve to match the motor design. Marks the beginning of the constant power region.
- P36 [Maximum Voltage] and P37 [Maximum Frequency] - Slope the portion of the curve used above base speed.



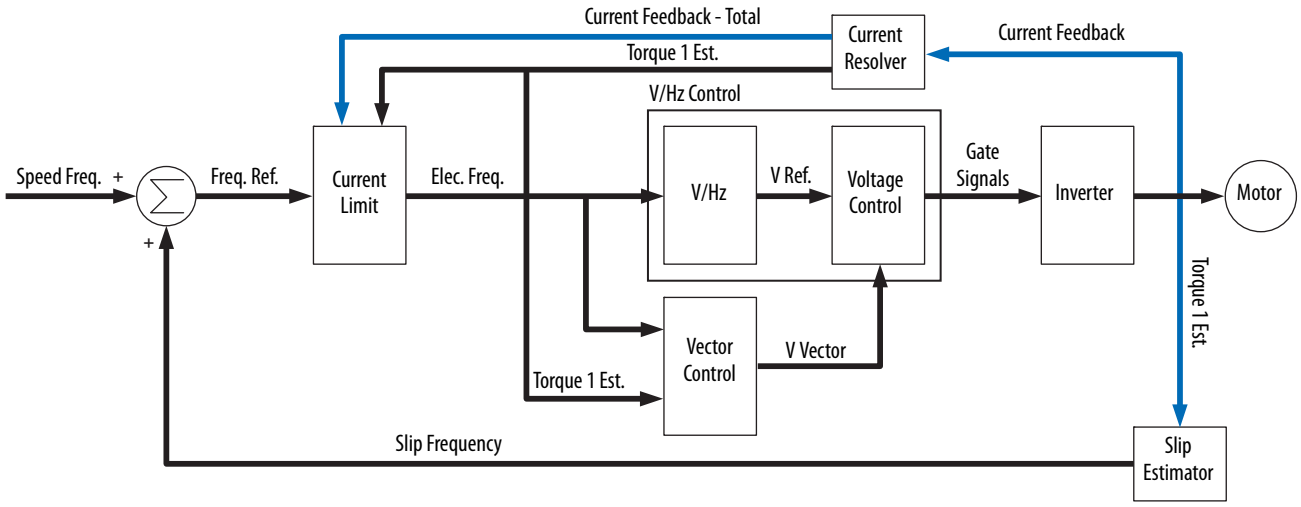
1 = "Fan/Pump"
When this option is chosen, the relationship is 1/x2. Therefore, at full frequency, full voltage is supplied. At 1/2 rated frequency, 1/4 voltage is applied. This pattern closely matches the torque requirement of a variable torque load (centrifugal fan or pump – load increases as speed increases) and offers the best energy savings for these applications.



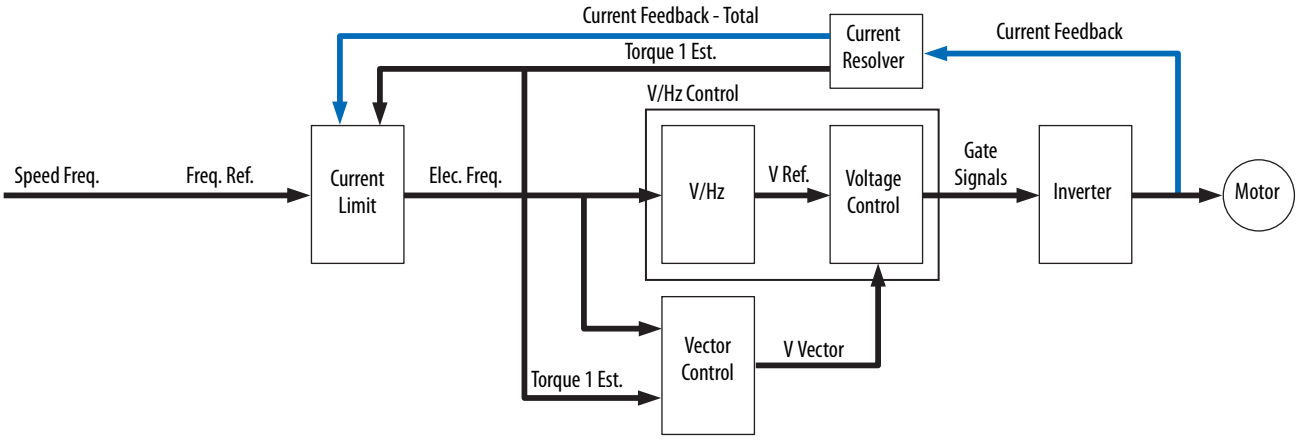
Sensorless Vector

Sensorless Vector mode uses a V/Hz core enhanced by excellent current resolution, a slip estimator, a high performance current limiter and the vector algorithms. The basic functions for SV are similar for all three motor types, induction motor, permanent magnet motor, and synchronous reluctance motor, however PM and SyncRel SV do not require Slip Frequency adjustments.

IM Sensorless Vector

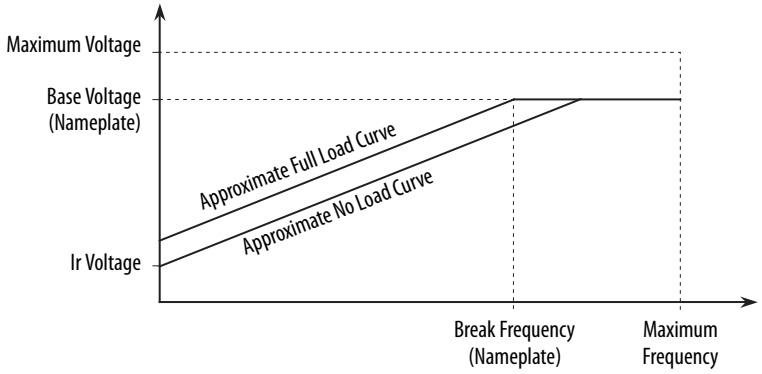


PM and SyncRel Sensorless Vector



The algorithms operate on the knowledge that motor current is the vector sum of the torque and flux producing components of current. Values can be entered to identify the motor values or an autotune routine can be run to identify the motor values (see Autotune on page 35). Sensorless vector offers better torque production and a wider speed range than V/Hz. However, it is not appropriate to use when more than one motor is connected to the same drive.

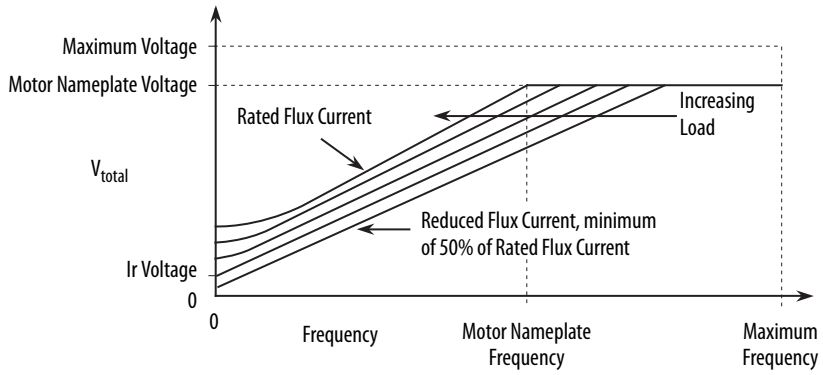
In Sensorless Vector control, the drive commands a specific amount of voltage to develop flux.



Sensorless Vector w/Economizer

Economizer mode consists of the Sensorless Vector control with an additional energy savings function. When steady state speed is achieved, the economizer becomes active and automatically adjusts the drive output voltage based on applied load. By matching output voltage to applied load, the motor efficiency is optimized. Reduced load commands a reduction in motor flux current. The flux current is reduced as long as the total drive output current does not exceed 75% of motor rated current as programmed in P26 [Motor NP Amps]. The flux current is not allowed to be less than 50% of the motor flux current as programmed in P75 [Flux Current Ref]. During acceleration and deceleration,

the economizer is inactive and Sensorless Vector motor control performs normally.



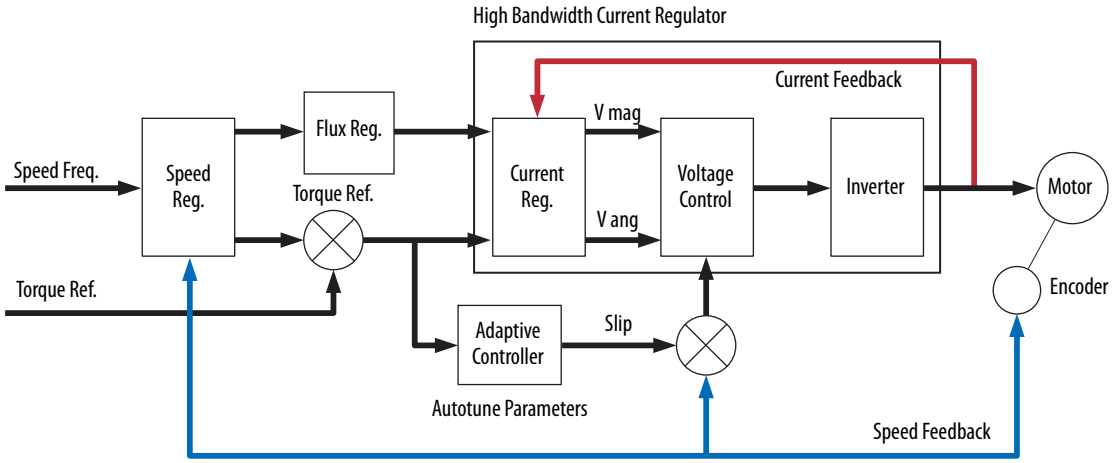
Flux Vector Control

In Flux Vector mode, the flux and torque producing currents are independently controlled and speed is indirectly controlled by a torque reference. Alternatively, the drive can control torque instead of speed in flux vector mode. In either case, this mode can be operated either with or without feedback and will provide the fastest response to load changes.

Flux Vector control is used with AC squirrel cage induction motors for high performance. Motor data and an autotune is required for correct operation in this mode (refer to Autotune on page 35 for details). In Flux Vector control, the drive takes the speed reference that is specified by the Speed Reference Selection block and compares it to the speed feedback. The speed regulator uses Proportional and Integral gains to adjust the torque reference for the motor. This torque reference attempts to operate the motor at the specified speed. The torque reference is then converted to the torque producing component of the motor current.

This type of speed regulator produces a high bandwidth response to speed command and load changes. Because Flux Vector controls the flux and torque producing currents independently, a torque reference can be sent directly instead of being generated from a speed reference via the Speed Regulator. The independent flux control also enables flux to be reduced in order to run above base motor speed.

Flux Vector



Permanent Magnet Motor Control

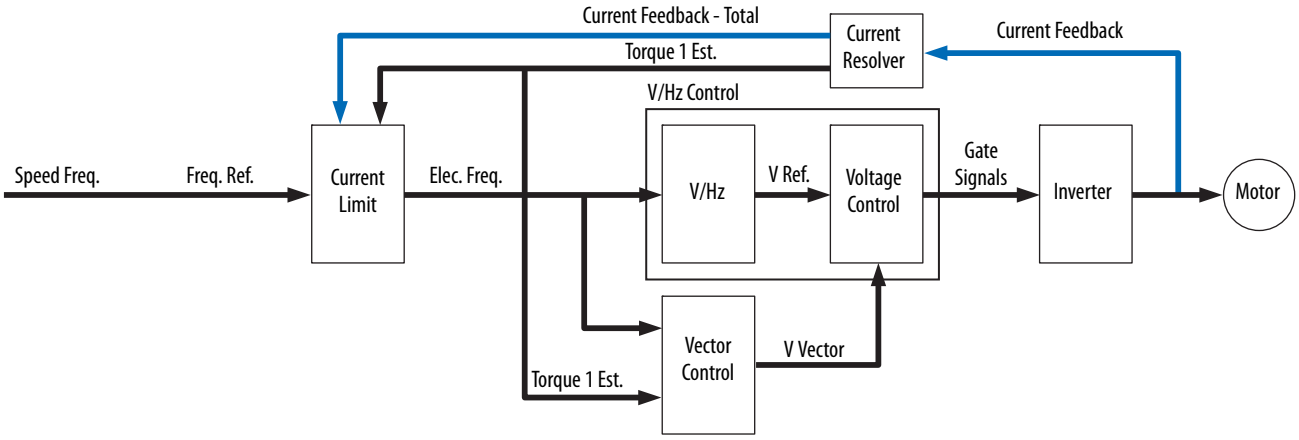
Permanent magnet motor control is selected by setting P35 [Motor Ctrl Mode] to the appropriate choices of motor type. Refer to Appendix D of the PowerFlex 750-Series Programming Manual, publication 750-PM001 for compatible list of Allen-Bradley Servo motors and resolution criteria.

Surface Permanent Magnet (SPM) motor or Permanent Magnet Synchronous Motor (PMSM) is a rotating electrical machine that has the stator phase windings and rotor permanent magnets. The air gap magnetic field is provided by these permanent magnets and hence it remains constant. The conventional DC motor commutates itself with the use of a mechanical commutator whereas SPM/PMSM needs electronic commutation for the direction control of current through the windings. Because the SPM/PMSM motors in effect have their armature coils at the stator, they need to be commutated externally with the help of an external switching circuit. A three phase PWM inverter topology is used for this purpose.

The torque is produced because the interaction of the magnetic fields causes the rotor to rotate. In permanent magnet motors, one of the magnetic fields is created by permanent magnets and the other is created by the stator coils. The maximum torque is produced when the magnetic vector of the rotor is at 90 degrees to the magnetic vector of the stator.

Motor data and an autotune are required for correct operation in this mode. Refer to Autotune on page 35 for details.

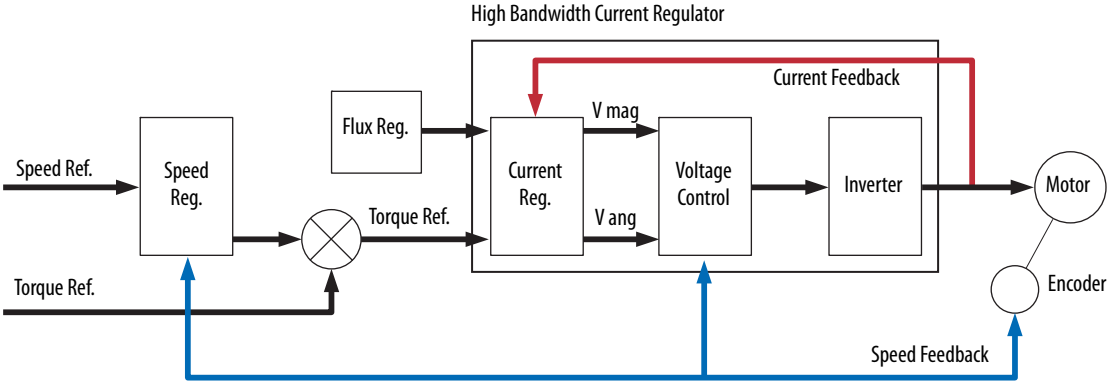
PM Sensorless Vector



PM Flux Vector Control

In flux vector mode, the flux and torque producing currents are independently controlled and speed is indirectly controlled by a torque reference. Alternatively, the drive can also control torque instead of speed in flux vector mode. In either case, this mode can be operated either with or without feedback and will provide the fastest response to load changes.

High Performance and precise control will require encoder feedback. Refer to the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001, for a list of compatible High Resolution Stegmann encoder and Heidenhain encoder feedback on the motor.

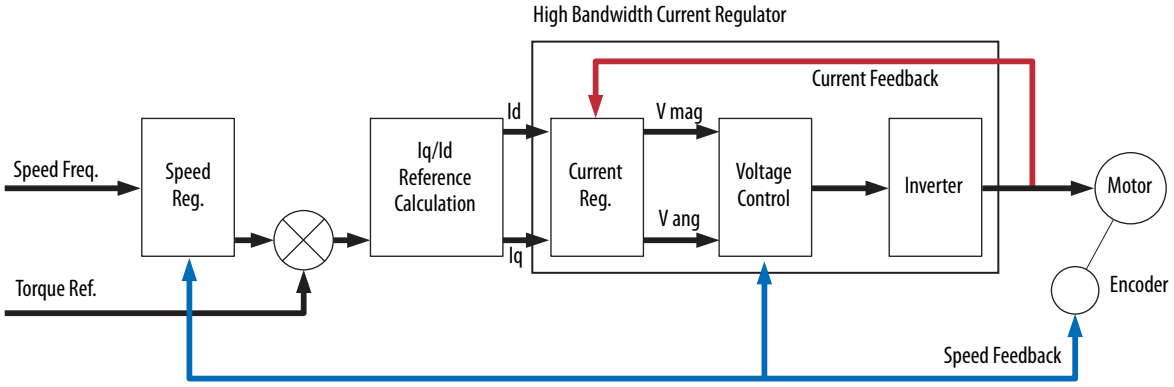


IPM Flux Vector Control

In IPM Flux Vector mode, the flux and torque producing currents continue to be independently controlled. Speed is indirectly controlled by a torque reference output command from the Speed Regulator. Alternatively, the drive can be configured to control torque instead of speed in flux vector mode. In either case, for precise control, this mode must be operated with encoder feedback in order to provide the fastest response to load changes.

The Iq/Id reference calculation block will produce optimum Iq/Id current reference that will try to establish maximum torque per amp control performance.

IPM Flux Vector



Motor Types

The following explanation and descriptions of AC motor types are condensed summaries derived from a variety of sources that focus on the history, evolution, and feature benefits of the variety of motor designs. These designs are utilized in all sectors of use and in vast variations of machinery, equipment, and processes.

The types of AC motors described here, powered by fixed utility frequency, are limited to speeds based on the number of poles and winding construction. Variable Frequency Drives (VFDs) broaden practical speed ranges of these motor types by converting utility power and applying appropriately selected VFD electronic control modes specifically matched to these unique motor type designs. Motor control modes set by P35 [Motor Ctrl Mode] are also discussed in Motor Control Modes on page 226 and the PowerFlex 750-Series Programming Manual, publication 750-PM001.

The following topics are briefly discussed in this section.

- Basics of AC Motor Design
- Induction AC Motors
- Wound-rotor AC Motors
- Multispeed AC Motors
- Synchronous AC Motors
- Permanent Magnet Motor Control
- Synchronous reluctance motors
- AC Linear Electric Motors (LIMs)

Basics of AC Motor Design

AC motors come in a variety of designs, each with functional purpose and benefits. Asynchronous and synchronous electric motors are the two main categories of AC motors.

The Induction AC motor is a common form of asynchronous motor and is basically an AC transformer with a rotating secondary. The primary winding (stator) is connected to the power source and the shorted secondary (the rotor) carries the induced secondary current. Torque is produced by the action of the rotor (secondary) currents on the air-gap flux. The synchronous motor differs greatly in design and operational characteristics, and is considered a separate class of AC motor.

AC Induction Motors

P35 [Motor Ctrl Mode] induction motor options.

- 0 = “Induction VHz”
- 1 = “Induction SV”
- 2 = “Induction Econ”
- 3 = “Induction FV”

AC Induction Motors (ACIMs) are the simplest and most rugged electric motor and consist of two basic electrical assemblies: the wound stator and the rotor assembly. The induction AC motor derives its name from currents flowing in the secondary member (rotor) that are induced by alternating currents flowing in the primary member (stator). The combined electromagnetic effects of the stator and rotor currents produce the force to create rotation.

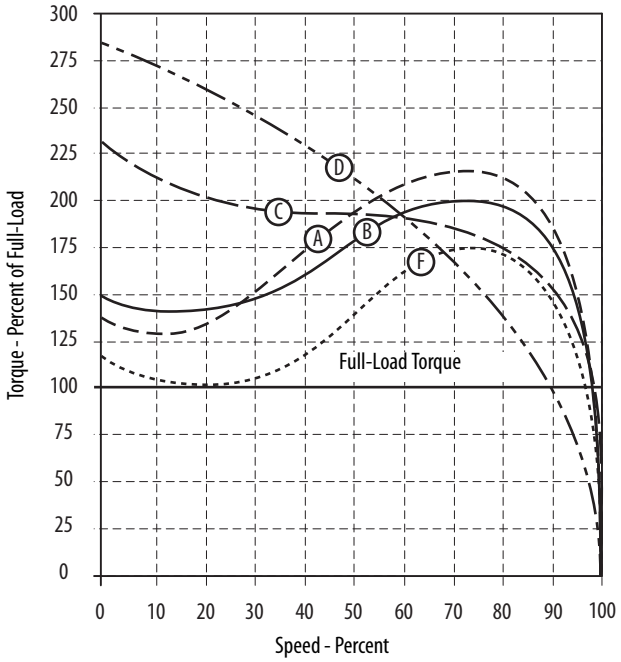
ACIMs typically feature rotors, which consist of a laminated, cylindrical iron core with slots for receiving the conductors. The most common type of rotor has cast-aluminum conductors and short-circuiting end rings. This AC motor “squirrel-cage” rotates when the moving magnetic field induces a current in the shorted conductors. The speed at which the AC motor magnetic field rotates is the synchronous speed of the AC motor and is determined by the number of poles in the stator and the frequency of the power supply: ns = 120f/p, where ns = synchronous speed, f = frequency, and p = the number of poles (that is 120*60 Hz] / 4 = 1800 RPM). To control motor speed other than the fixed utility frequency requires a VFD.

Synchronous speed is the absolute upper limit of AC motor speed. If the AC motor’s rotor turns exactly as fast as the rotating magnetic field, then no lines of force are cut by the rotor conductors, and torque is zero. When AC induction motors are running, the rotor always rotates slower than the magnetic field. The AC motor’s rotor speed is just slow enough to cause the proper amount of rotor current to flow, so that the resulting torque is sufficient to overcome windage and friction losses, and drive the load. The speed difference between the AC motor’s rotor and magnetic field, called slip, is normally referred to as a percentage of synchronous speed: s = 100 (ns - na)/ns, where s = slip, ns = synchronous speed, and na = actual speed. Or it is listed on the nameplate as a base speed (1780 RPM) at rated FLA, frequency, and based on the number of poles.

Polyphase AC Induction Motors

Polyphase squirrel-cage AC motors are basically constant-speed machines, but some degree of flexibility in operating characteristics results from modifying the rotor slot design. These variations in AC motors produce changes in torque, current, and full-load speed. Evolution and standardization have resulted in four fundamental types of AC motors.

There are five basic NEMA designs for AC motors: A, B, C, D, and F. The speed-torque curves for all five designs are shown on the following graph.



Speed - Torque Curves of NEMA A, B, C, D, and F Motors

AC Motors - Designs A and B are general-purpose AC motors with normal starting torques and currents and low slip. As shown, the characteristics of designs A and B are quite similar. The primary difference between these two designs is that the starting current for design B is limited by NEMA standards, but there is no limitation on the starting current for design A.

AC Motors - Design C have high starting torque with normal starting current and low slip. NEMA design C motor has a higher starting torque than either the A or B designs. This torque is in the vicinity of 225% of full-load torque. Design C AC motors are normally used where breakaway loads are high at starting, but which normally run at rated full load and are not subject to high overload demands after running speed has been reached.

AC Motors - Design D exhibit high slip AC motor starting torque, which is approximately 280% of full-load torque, low starting current, and low full-load speed. Because of the high slip, speed can drop when fluctuating loads are encountered. The high starting torque of the design D motor makes it

particularly suited to handle hard-to-start loads. Another useful characteristic of this motor is the sloping shape of its speed-torque curve. This lets the motor slow down during periods of peak loads, enabling any flywheel energy that has been stored by the load to be released. Typical applications include punch presses and press brakes.

AC Motors - Design F exhibit low starting torque, low starting current, and low slip. These AC motors are built to obtain low locked-rotor current. Both locked-rotor and breakdown torque are low. Normally these AC motors are used where starting torque is low and where high overloads are not imposed after running speed is reached.

In summary, we see that when matching an AC motor to the requirements of a specific load it is important to check the torque requirements of the load and the torque capabilities of the motor in addition to speed and horsepower.

At least three torque values are important:

- Starting torque
- Breakdown torque
- Full-load torque.

Wound-rotor AC Motors

P35 [Motor Ctrl Mode] induction motor options.

- 0 = “Induction VHz”
- 1 = “Induction SV”
- 3 = “Induction FV”

Squirrel-cage AC motors are relatively inflexible with regard to speed and torque characteristics, but a special wound-rotor AC motor has controllable speed and torque. Application of wound-rotor AC motors is markedly different from squirrel-cage AC motors because of the accessibility of the rotor circuit. AC motor performance characteristics are obtained by inserting different values of resistance in the rotor circuit.

Wound-rotor AC motors are generally started with secondary resistance in the rotor circuit. The AC motor resistance is sequentially reduced to permit the motor to come up to speed. Thus, AC motors can develop substantial torque while limiting locked-rotor current. This secondary AC motor resistance can be designed for continuous service to dissipate heat produced by continuous operation at reduced speed, frequent acceleration, or acceleration with a large inertia load. External resistance gives AC motors a characteristic that results in a large drop in rpm for a fairly small change in load. Reduced AC motor speed is provided down to about 50% rated speed, but efficiency is low.

Retrofitting a Wound-rotor motor with a VFD is possible by eliminating the switching and resistor control infrastructure and shorting the slip rings

connected to the rotor windings. CAUTION! Because wound-rotor motors were not originally designed for use with inverters, the dielectric strength of the motor construction cannot withstand the reflected wave voltages that can get subjected at the motor connections (1.5 to 2.5 times drive's bus voltage). Appropriate mitigation must be considered. General rule of thumb, size the VFD so that it is capable of providing continuous current at 125 to 135% of FLA of the motor, due to elimination of resistors and its design for higher starting torque.

Multispeed AC Motors

P35 [Motor Ctrl Mode] induction motor options.

- 0 = "Induction VHz"
- 1 = "Induction SV"
- 3 = "Induction FV"

Consequent-pole AC motors are designed for one speed. By physically reconnecting the leads, a 2:1 speed ratio can be obtained. Typical synchronous speeds for 60 Hz AC motors are: 3,600/1,800 rpm (2/4 pole), 1,800/900 rpm (4/8 pole), and 1,200/600 rpm (6/12 pole).

Two-winding AC motors have two separate windings that can be wound for any number of poles so that other speed ratios can be obtained. However, ratios greater than 4:1 are impractical because of AC motor size and weight.

Power output of multispeed AC motors can be proportioned to each different speed. These AC motors are designed with output horsepower capacity in accordance with one of the load characteristics.

When retrofitted with a VFD, the motor is generally wired for the speed range intended to be optimized. Autotuned per representative nameplate information and operated as a single winding single speed induction motor.

Synchronous AC Motors

P35 [Motor Ctrl Mode] induction motor options.

- 0 = "Induction VHz"

Synchronous AC motors are inherently constant-speed electric motors and they operate in absolute synchronism with line frequency. As with squirrel-cage induction AC motors, speed is determined by the number of pairs of poles and is always a ratio of the line frequency.

Synchronous AC motors are made in sizes ranging from sub-fractional self-excited units to large-horsepower, direct-current-excited AC motors. In the fractional-horsepower range, synchronous AC motors are used primarily where precise constant speed is required.

In large horsepower sizes applied to industrial loads, synchronous AC motors serve two important functions. First, AC motors provide highly efficient means of converting AC energy to mechanical power. Second, AC motors can operate at leading or unity power factor, thereby providing power-factor correction.

There are two major types of synchronous AC motors: non-excited and direct-current excited electric motors. Application of a VFD is to vary the desired synchronous speed of the machine.

Permanent Magnet Motor Control

Permanent magnet motor control is selected by setting P35 [Motor Ctrl Mode] to the appropriate choices of motor type. Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, Appendix D for compatible List of Allen-Bradley Servo motors and resolution criteria.

Surface Permanent Magnet Motor (SPM) or Permanent Magnet Synchronous Motor (PMSM)

P35 [Motor Ctrl Mode] induction motor options.

- 4 = “PM VHz”
- 5 = “PM SV”
- 6 = “PM FV”

SPM or PMSM is a rotating electrical machine that has the stator phase windings and rotor permanent magnets. The air gap magnetic field is provided by these permanent magnets therefore it remains constant.

The conventional DC motor commutates itself with the use of a mechanical commutator whereas SPM / PMSM needs electronic commutation for the direction control of current through the windings. Because the SPM/PMSM motors in effect have their armature coils at the stator, they need to be commutated externally with the help of an external switching circuit. A three phase PWM inverter (VFD) topology is used for this purpose.

The torque is produced because the interaction of the magnetic fields causes the rotor to rotate. In permanent magnet motors, one of the magnetic fields is created by permanent magnets and the other is created by the stator coils. The maximum torque is produced when the magnetic vector of the rotor is at 90 degrees to the magnetic vector of the stator.

Motor data and an autotune are required for correct operation in this mode. Refer to Autotune on page 35 for details on the autotune.

The permanent magnet synchronous motor (PMSM) can be thought of as a cross between an AC induction motor and a brushless DC motor (BLDC). They have

rotor structures similar to BLDC motors which contain permanent magnets. However, their stator structure resembles that of its ACIM cousin, where the windings are constructed in such a way as to produce a sinusoidal flux density in the air gap of the machine. As a result, they perform best when driven by sinusoidal waveforms. However, unlike their ACIM relatives, PMSM motors perform poorly with open-loop scalar V/Hz control, because there is no rotor coil to provide mechanical damping in transient conditions.

Field Oriented Control is the most popular control technique used with PMSMs. As a result, torque ripple can be extremely low, on par with that of ACIMs. PMSM motors provide higher power density for their size compared to ACIMs. This is because with an induction machine, part of the stator current is required to "induce" rotor current in order to produce rotor flux. These additional currents generate heat within the motor. In a PMSM, the rotor flux is already established by the permanent magnets on the rotor.

Most PMSMs utilize permanent magnets which are mounted on the surface of the rotor. This makes the motor appear magnetically "round," and the motor torque is the result of the reactive force between the magnets on the rotor and the electromagnets of the stator. This results in the optimum torque angle being 90 degrees, which is obtained by regulating the d-axis current to zero in a typical FOC application.

Interior Permanent Magnet Motor

P35 [Motor Ctrl Mode] induction motor options.

- 10 = "IPMn VHz"

Some PMSMs have magnets that are buried inside of the rotor structure. These motors are called Interior Permanent Magnet, or IPM motors. As a result, the radial flux is more concentrated at certain spatial angles than it is at others. This gives rise to an additional torque component called reluctance torque, which is caused by the change of motor inductance along the concentrated and non-concentrated flux paths.

This causes the optimum Field Oriented Control torque angle to be greater than 90 degrees, which requires regulating the d-axis current to be a fixed negative ratio of the q-axis current. This negative d-axis current also results in field weakening, which reduces the flux density along the d-axis, which in turn partially lowers the core losses. As a result, IPM motors boast even higher power output for a given frame size.

Motor data and an autotune are required for correct operation in this mode. Refer to Autotune on page 35 for details on the autotune.

These motors are becoming increasingly popular as traction motors in hybrid vehicles, as well as variable speed applications for appliances and HVAC. In the servo motor world more and more designs are shifting away from SPM to IPM to

take advantage of inherent advantages. In principle, there are no size limitations to IPM designs and these can be developed from small fractional horsepower to large – hundreds of Hp ratings, creating potential applications that can benefit from variable speed IPM control.

Synchronous Reluctance Motors

P35 [Motor Ctrl Mode] induction motor options.

- 7 = "SyncRel VHz"
- 8 = "SyncRel SV"

Synchronous reluctance motors have an equal number of stator and rotor poles. The projections on the rotor are arranged to introduce internal flux "barriers," holes which direct the magnetic flux along the so-called direct axis. Typical numbers of poles are 4 and 6. Following example of a 4 pole rotor and 6 pole stator.

As the rotor is operating at synchronous speed and there are no current-conducting parts in the rotor, rotor losses are minimal compared to those of an induction motor, thus potential energy savings in appropriate applications. Once started and rotating at synchronous speed, the motor can operate with sinusoidal voltage. So to start and control speed at frequencies other than utility requires a variable-frequency drive.

AC Linear Electric Motors LIMs and LSMs

P35 [Motor Ctrl Mode] induction motor options.

- 0 = "Induction VHz"
- 9 = "Adjustable Voltage"

The first linear electric motor was conceived by Wheatstone more than 100 years ago. But large air gaps and low efficiencies prevented linear electric motors from being widely used until recent advances in design and VFD controls.

Linear Induction Motors (LIMs)

In a LIM, the motor stator creates an Alternating Current (AC) field that induces currents into the reaction plate (moving element), which is typically an aluminum fin or plate. This creates eddy currents in the moving element which react with the moving field in the stator to produce thrust. LIMs typically are kept moving, avoiding holding stationary (equivalent to locked rotor) because of significant heating of the reactor plate.

A linear electric motor in concept has rotary electric motor stator cores, unrolled out over a linear path. The circular stator becomes a linear stator, being defined as a single-sided linear induction electric motor (SLIM). Likewise, if the circular stator is cut into two sections and flattened, the electric motor becomes a double-sided linear induction electric motor (DLIM). The DLIM and SLIM both require a two or three-phase stator (primary) winding and a flat metallic or conductive plate-type armature (secondary) instead of a rotor.

The moving member in a linear induction motor is typically a solid conducting plate or sheet. It does not contain coils or windings. However, a linear electric motor can also be constructed so the primary moves and the secondary remains stationary.

Linear induction motors LIMs are increasingly chosen for material-handling applications and Amusement rides because they are quieter, more reliable, and less expensive than rotary electric motors. And because linear electric motors do not drive gearboxes or rotary-to-linear conversion devices, they can be more efficient.

There are several important differences between linear and rotary electric induction motors that require understanding. Unlike rotary electric motors, the linear motor has a beginning and an end to its travel. First, the moving secondary material enters the primary (stator field) at one end of the electric motor and exits at the opposite end. Induced currents in the secondary material at the entry edge resist air-gap flux buildup. And at the exit edge, the material retards the air-gap flux decay. This results in an uneven air-gap flux distribution which contribute to challenges in sizing VFDs and optimizing set up of control frequency and voltage. VFD control uses either fixed V/Hz, or independently controlled frequency and voltage.

Linear Synchronous Motors (LSMs)

Linear Synchronous Motors (LSMs) are significantly different than Linear Induction Motors (LIMs) in the way that they produce electromotive forces or motion.

Linear Synchronous Motors (LSMs) are similar in concept with stator cores, arranged along a path for motion, rather than contained in a frame for rotary motion. But the field in a LSM moving secondary element is usually provided by permanent magnets. There are no significant currents induced. Magnets are embedded in the moving element. This does allow for more definitive position control and holding position without excessive heat generation. Generally some sort of position sensor and feedback are necessary to implement control of LSMs via VFD are necessary.

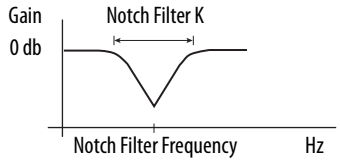
At the time of this writing there has been minimal experience applying VFDs to control Linear Synchronous Motors (LSMs). Only this short description of its construction is included.

Notch Filter

A notch filter exists in the torque reference loop to reduce mechanical resonance created by a gear train. P687 [Notch Fltr Freq] sets the center frequency for the 2 pole notch filter, and P688 [Notch Fltr Atten] sets the attenuation of the notch filter in the vector control torque reference section. Attenuation is the ratio of the notch filter input signal to its output at the P687 [Notch Fltr Freq]. An attenuation of 30 means that the notch output is 1/30th of the input at the specified frequency.

The notch filter is valid only in Flux Vector Motor Control modes (P35).

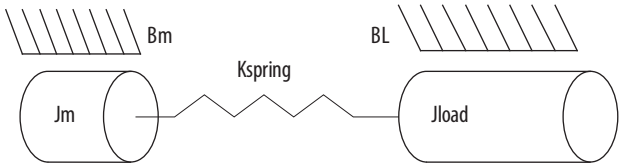
Figure 25 - Notch Filter Frequency



Example

A mechanical gear train consists of two masses (the motor and the load) and spring (mechanical coupling between the two loads).

Mechanical Gear Train



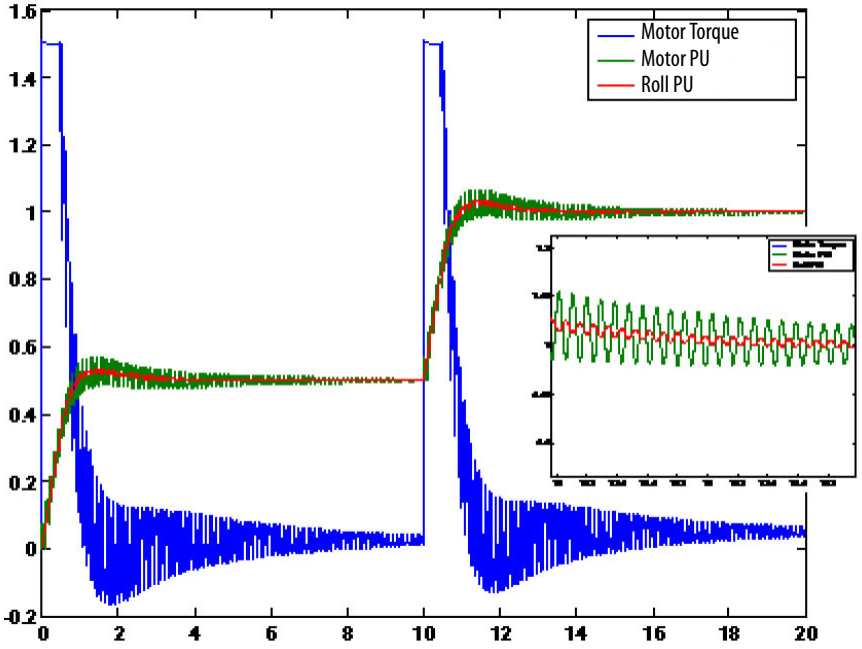
The resonant frequency is defined by the following equation:

$$ResonanceHz = \sqrt{Kspring \times \frac{(Jm + Jload)}{(Jm \times Jload)}}$$

- Jm is the motor inertia (seconds)
- Jload is the load inertia (seconds)
- Kspring is the coupling spring constant (rad2 / sec)

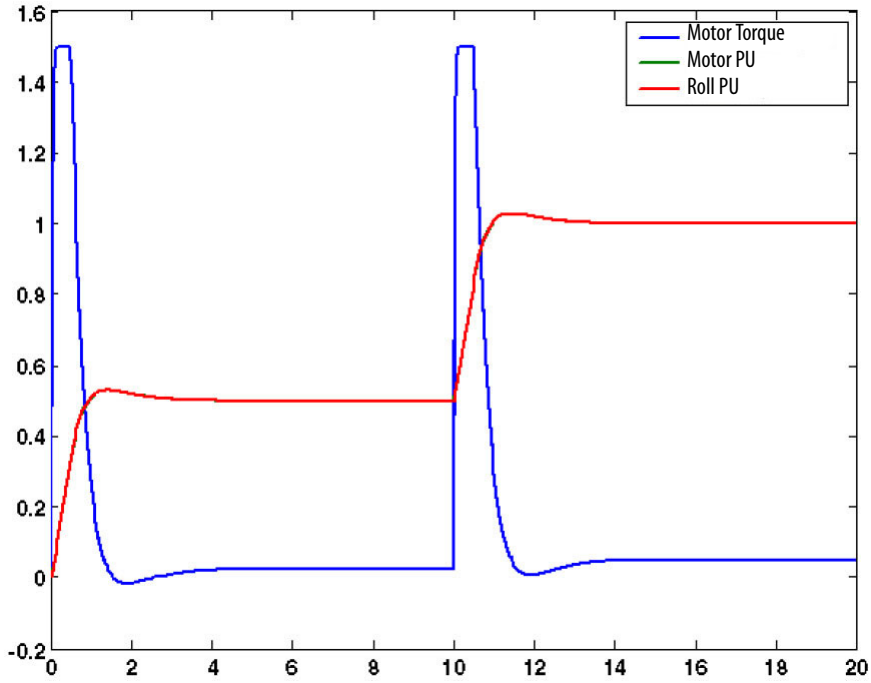
The following graph shows a two mass system with a resonant frequency of 62 radians/second (9.87 Hz). One Hertz is equal to 2p radians/second.

Figure 26 - Resonance

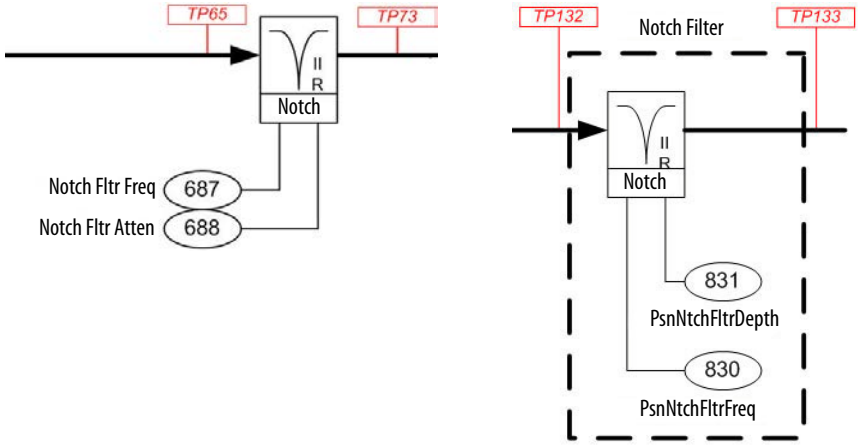


The following represents the same mechanical gear train but with [Notch Filter Freq] set to 10.

Figure 27 - 10 Hz Notch



To see the effects of the notch filter use test points T65 and T73 in torque control. T65 is before the filter and T73 after. And test point Txx (before) and Txx (after) in position control. See the partial block diagram below.



Regen Power Limit

The P426 [Regen Power Lmt] is programmed as a percentage of the rated power. The mechanical energy that is transformed into electrical power during a deceleration or overhauling load condition is clamped at this level. Without the proper limit, a bus overvoltage can occur. When using the bus regulator [Regen Power Lmt] can be left at factory default, -50%.

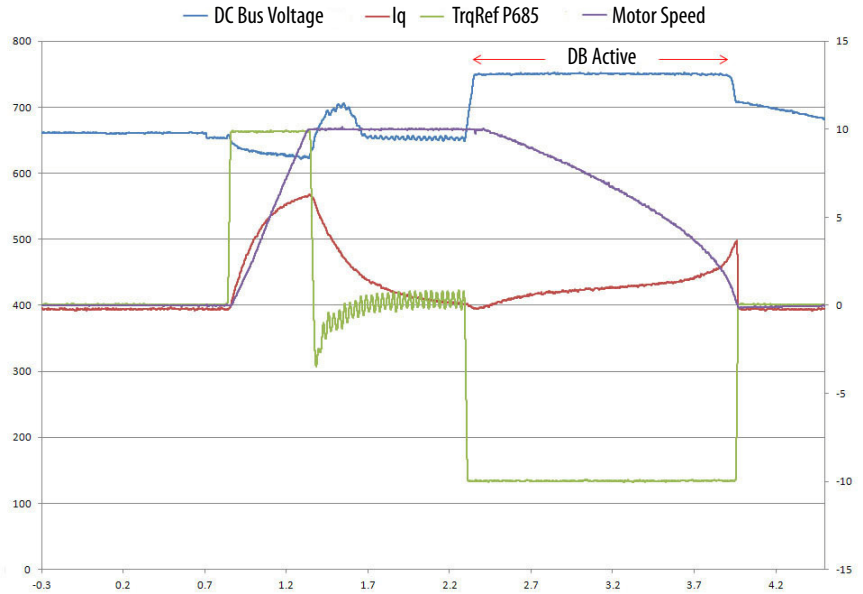
When using dynamic braking or a regenerative supply, [Regen Power Lmt] can be set to the most negative limit possible (–800%). When you have dynamic braking or regenerative supply, but want to limit the power to the dynamic brake or regenerative supply, [Regen Power Lmt] you can set a specific level. Values in this parameter are valid only in a Flux Vector mode.

The following series of plots describes the difference between changing Regen Power Limit versus changing the Negative Torque Limit. The beginning part of every plot is identical, this is the acceleration of the motor. Once the stop is commanded and deceleration begins, note the red trace in each. This represents torque current. Because power is proportional to speed, as the speed decreases, the torque current increases allowing more power to be dissipated.

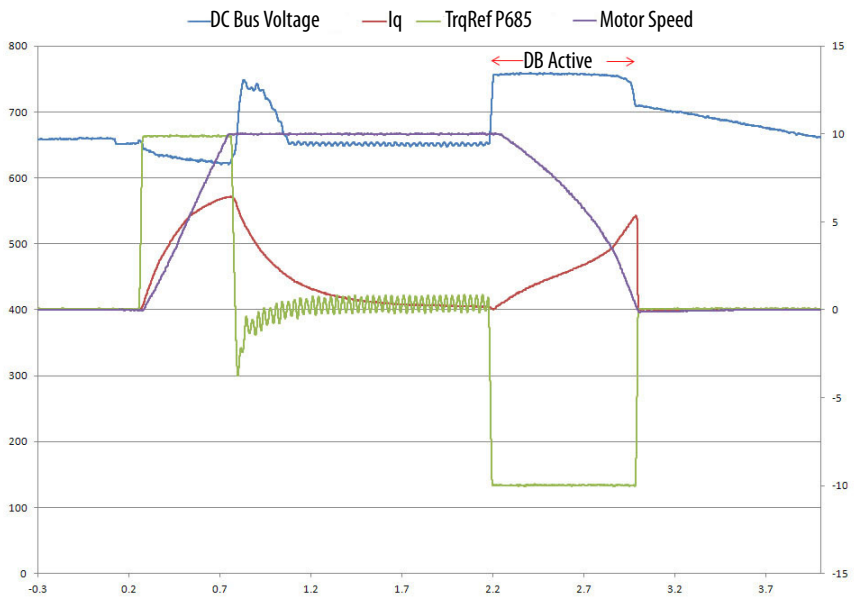
Note the speed feedback in the RPL = -20%, the slower the motor gets the faster it's brought to zero speed and the torque current increases. The higher the value in Regen Power Limit the more power is allow to pass through.

Focus on the torque current (red) trace as you scroll through the plots and note the change in the shape as the regen power limit was increase. Then see how it is clamped at a particular level when Negative Torque Limit is changed.

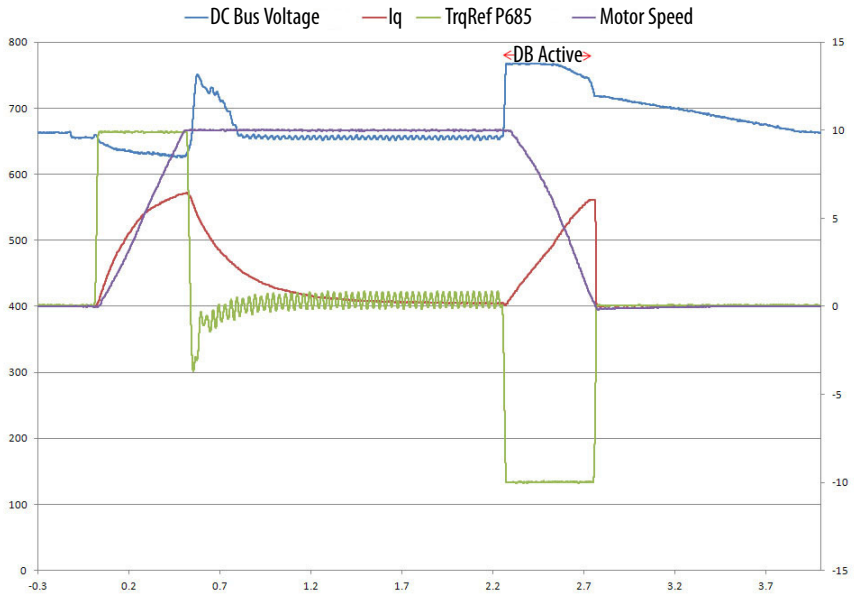
RPL = -20%



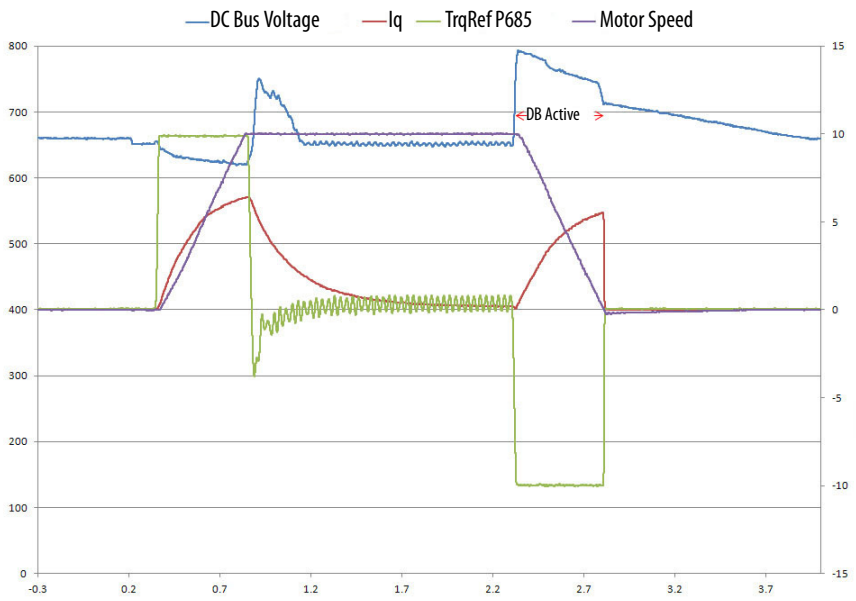
RPL = -50%



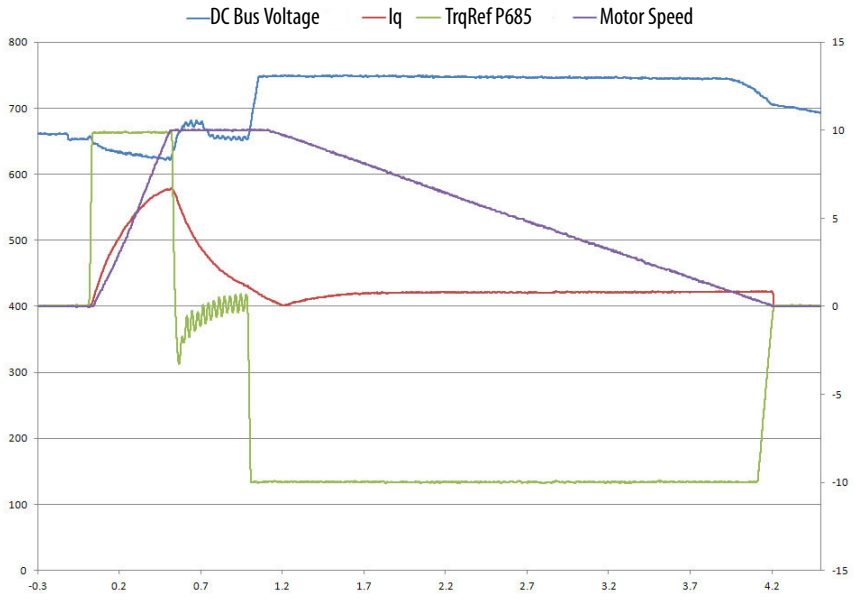
RPL = 100%



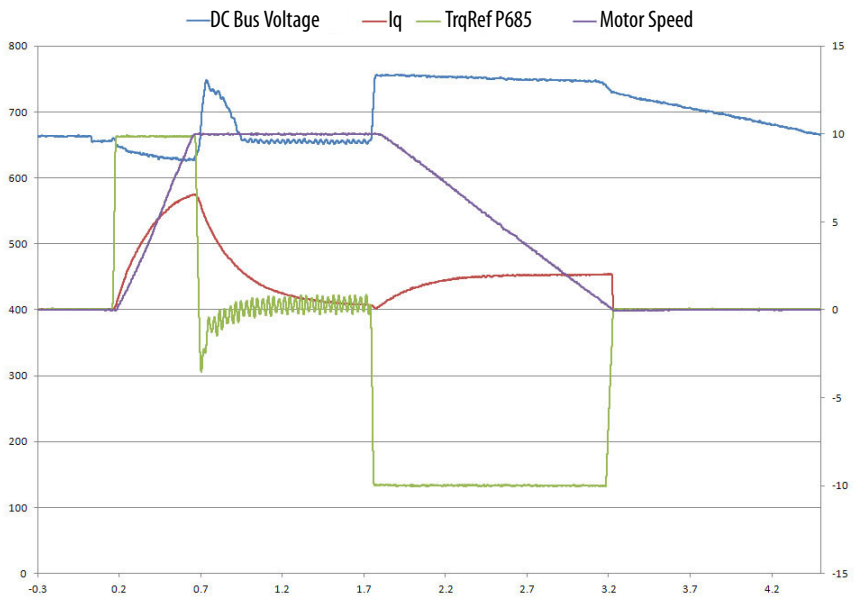
RPL = -200%



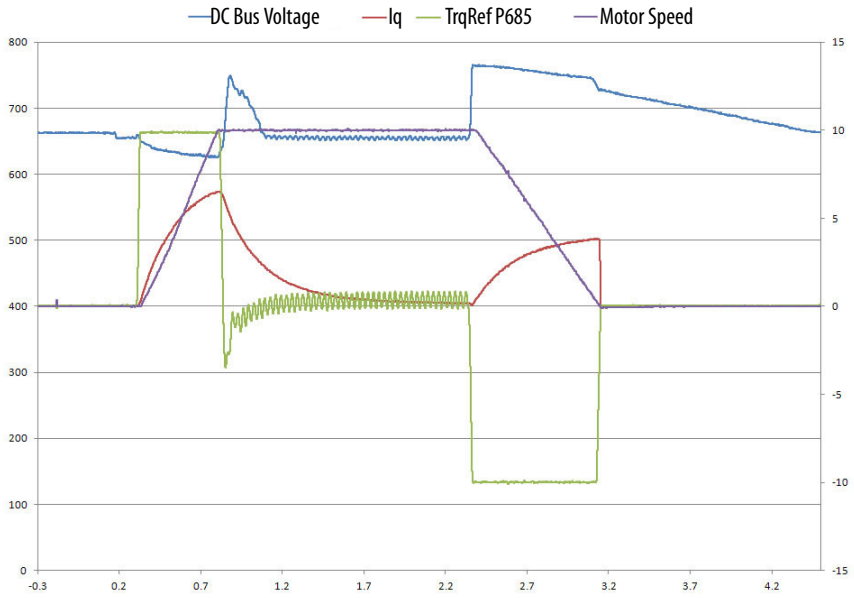
NTL = -20%



NTL = -50%



NTL = -100%

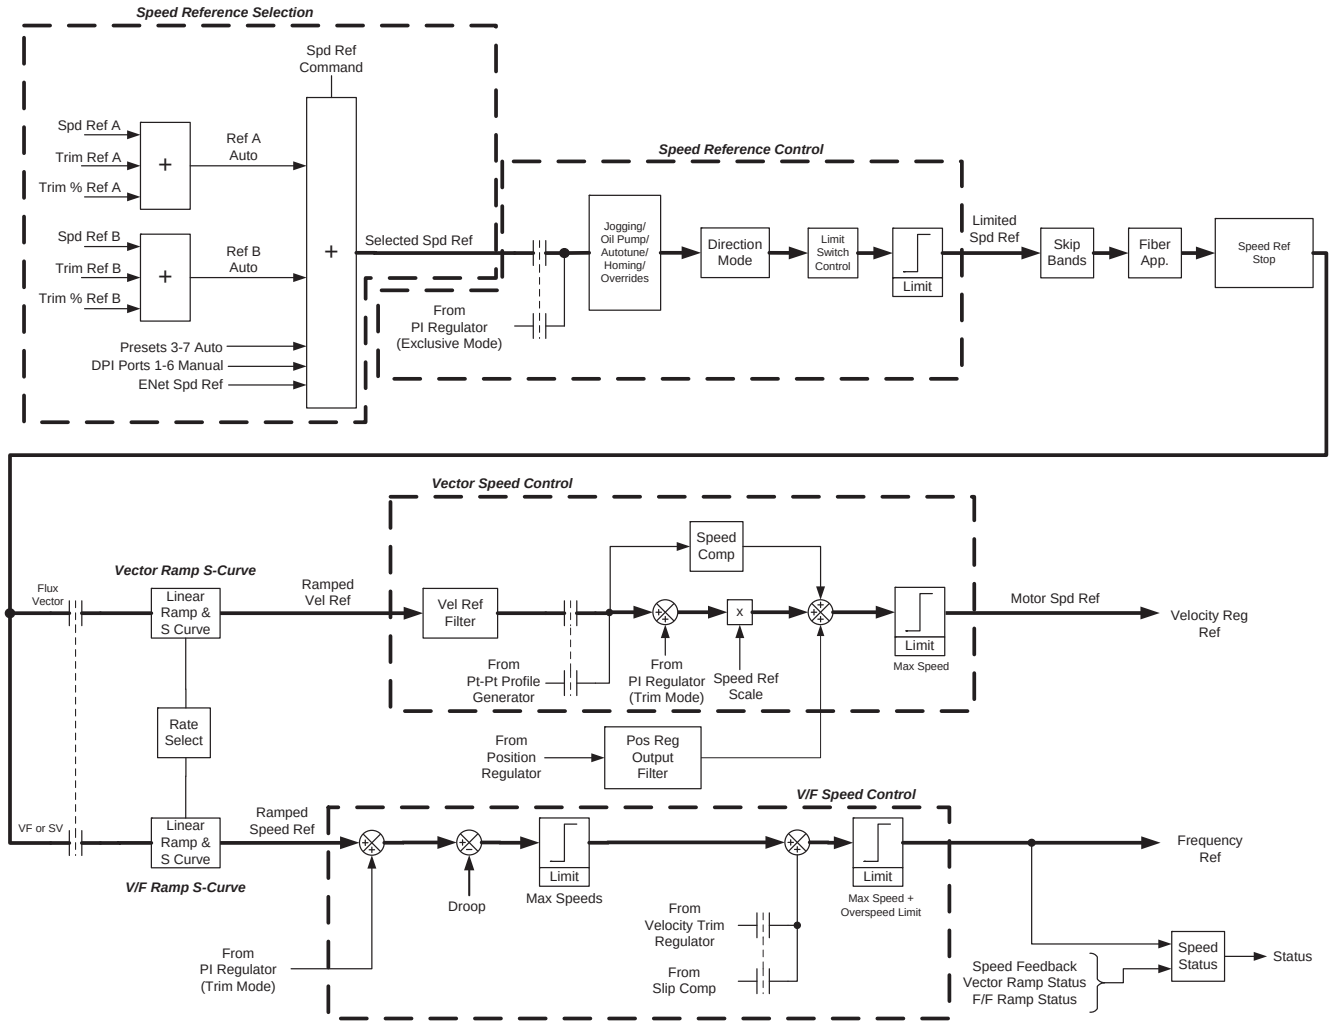


Speed Reference

The speed reference can come from a variety of sources. Some can be selected through digital inputs or via bit manipulation of the Network Logic Command Word:

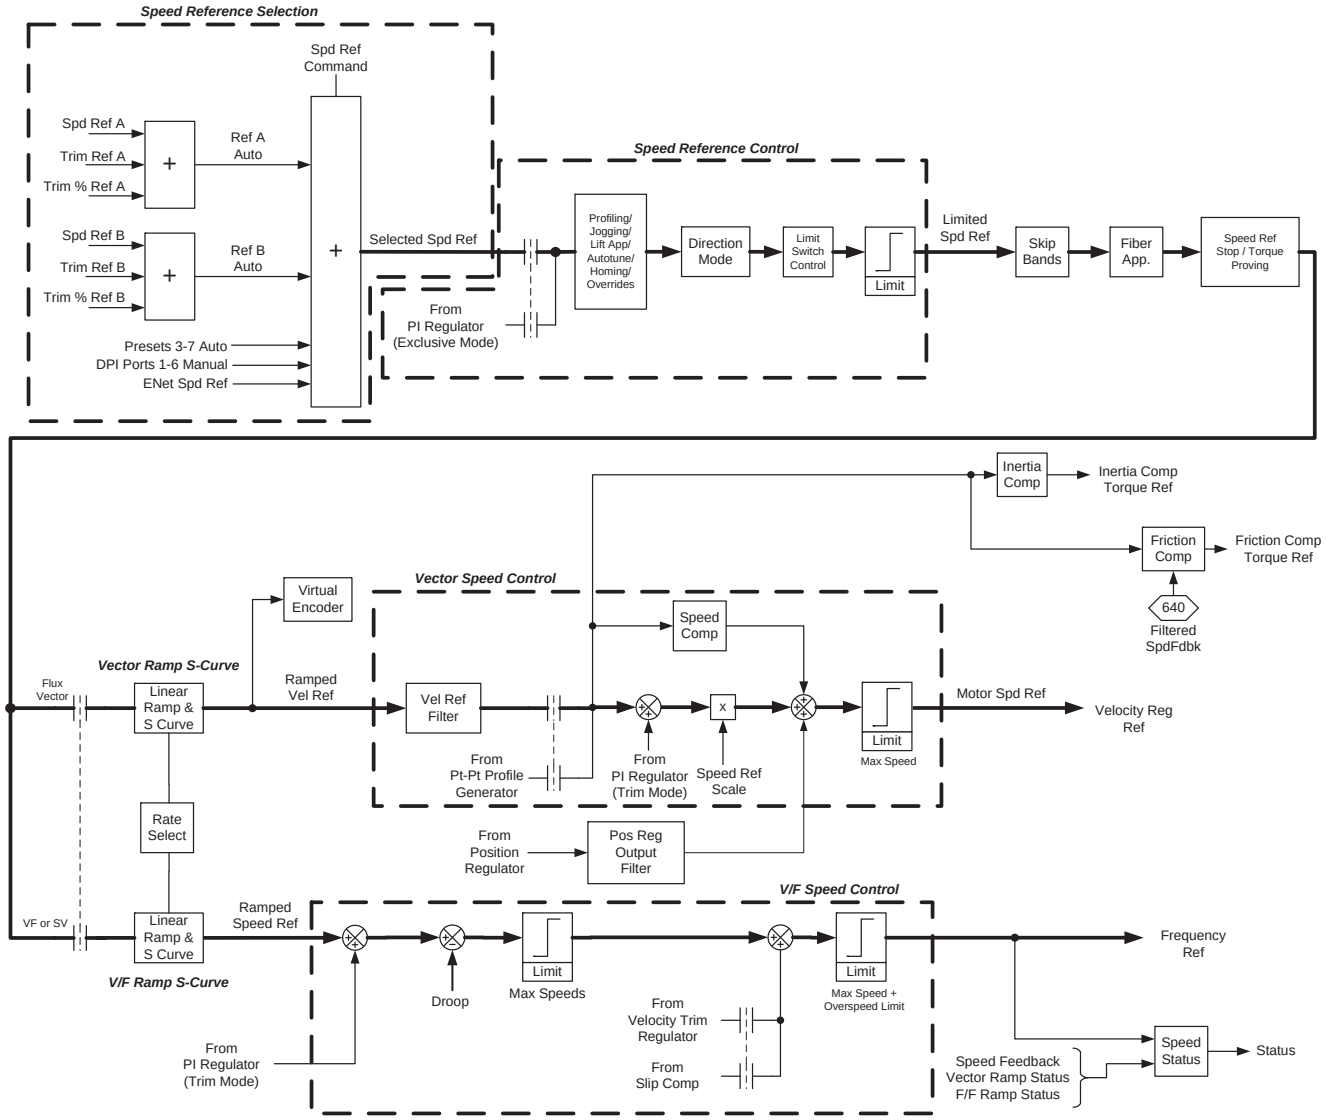
- HIM (local or remote)
- Analog Input
- Preset Speed Parameters
- Jog Speed Parameters
- Auxiliary Velocity Feedback
- Network Communication
- Process PID Loop
- MOP Reference
- DeviceLogix software

Figure 28 - PowerFlex 753 Speed Reference Selection Overview



Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, Appendix A for more details on the PowerFlex 753 Control Block Diagrams.

Figure 29 - PowerFlex 755 Speed Reference Selection Overview



Refer to the PowerFlex 750-Series Programming Manual, publication 750-PM001, Appendix A, for more details on the PowerFlex 755 Control Block Diagrams.

Network Reference

Speed Reference A is the normal speed reference used. To choose a source for this reference, make a selection in P545 [Spd Ref A Sel]. Also, when the network (Logic Command Word) is used as the speed reference, refer to the following documentation for details of operation:

- PowerFlex 750-Series AC Drives Programming Manual, 750-PM001
- PowerFlex 755 Drive Embedded EtherNet/IP Adapter User Manual, 750COM-UM001
- PowerFlex 20-750-ENETR Dual-port EtherNet/IP Option Module User Manual, 750COM-UM008
- EtherNet/IP Network Configuration User Manual, ENET-UM001

The Reference is a 32-bit REAL (floating point) piece of control data produced by the controller and consumed by the adapter. The Feedback is a 32-bit REAL (floating point) piece of status data produced by the adapter and consumed by the controller.

When using a ControlLogix controller, the 32-bit REAL Reference is always DINT 1 in the output image and the 32-bit REAL Feedback is always:

- DINT 1 in the input image when using the drive Add-On Profile.
- DINT 2 when using the Generic Profile.

For a PLC-5®, SLC™ 500 or MicroLogix™ 1100/1400 controller, the 32-bit REAL Reference word is always words 2 (Least Significant Word) and 3 (Most Significant Word) in the output image and the 32-bit REAL Feedback is always words 2 (Least Significant Word) and 3 (Most Significant Word) in the input image.

When using a drive Add-On Profile, the Reference and Feedback are automatically formatted properly and displayed as a controller tag. When using the Generic Profile, the I/O image is integer-based and the Reference and Feedback are floating point. Because of this, a COP (Copy) instruction or User Defined Data Type (UDDT) is required to correctly write values to the Reference and read values from the Feedback. Refer to the PowerFlex 755 Embedded EtherNet/IP Adapter User Manual or to the PowerFlex 20-750-ENETR Dual-port EtherNet/IP Option Module User Manual for ladder logic program examples.

When using the drive Add-On Profile, the controller tags for Reference and Feedback are automatically and properly formatted. This eliminates the need for data conversion using COP (copy) instructions or a UDDT to copy the DINT data into a REAL word.

The Reference and Feedback 32-bit REAL value represents drive speed. The scaling for the speed Reference and Feedback is dependent on drive P300 [Speed Units]. For example, if P300 is set to Hz, a 32-bit REAL Reference value of 30.0 equals a Reference of 30.0 Hz. If P300 is set to RPM, a 32-bit REAL Reference value of 1020.5 equals a Reference of 1020.5 RPM. Note that the commanded maximum speed can never exceed the value of drive P520 [Max Fwd Speed]. Table 12 shows example References and their results for a PowerFlex 755 drive that has its:

- P300 [Speed Units] set to Hz.
- P37 [Maximum Freq] set to 130 Hz.
- P520 [Max Fwd Speed] set to 60 Hz.

When P300 [Speed Units] is set to RPM, the other parameters are also in RPM.

Table 12 - PowerFlex 755 Drive Example Speed Reference/Feedback Scaling

Network Reference Value	Speed Command Value(2)	Output Speed	Network Feedback Value
130.0	130 Hz	60 Hz(3)	60.0
65.0	65 Hz	60 Hz(3)	60.0
32.5	32.5 Hz	32.5 Hz	32.5
0.0	0 Hz	0 Hz	0.0
-32.5(1)	32.5 Hz	32.5 Hz	32.5

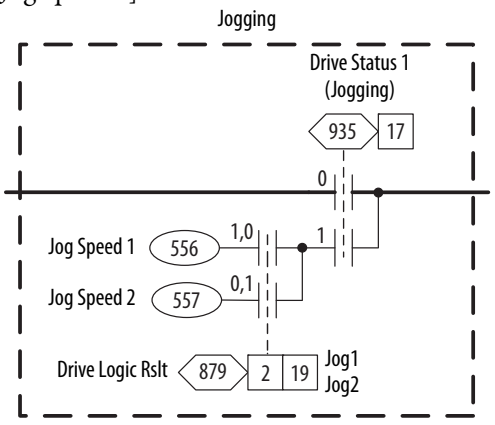
(1) The effects of values less than 0.0 depend on whether the PowerFlex 755 drive uses a Bipolar or Unipolar Direction mode. See the drive documentation for details.
(2) For this example, drive P300 [Speed Units] is set to Hz.
(3) The drive runs at 60 Hz instead of 130 Hz or 65 Hz because drive P520 [Max Fwd Speed] sets 60 Hz as the maximum speed

When a network (communication adapter) is selected as the speed reference, a 32-bit word is used as the speed reference. If P308 [Direction Mode], is set to 1 "Bipolar," the most significant bit (MSB) is used for direction control. Otherwise, the MSB is ignored.

IMPORTANT When a 20-COMM Carrier (20-750-20COMM) is used to install a 20-COMM adapter on a PowerFlex 750-Series drive, the upper word (Bits 16…31) of the Logic Command Word and Logic Status Word are not accessible. The upper word is only used and accessible on PowerFlex 750-Series communication modules (20-750-*) and the embedded EtherNet/IP on PowerFlex 755 drives.

Jog

When the drive is not running, pressing the HIM's Jog soft button or a programmed Jog digital input function or by Logic Command (sent over a communication network) causes the drive to jog at a separately programmed jog reference. This jog speed reference value is entered in P556 [Jog Speed 1] or P557 [Jog Speed 2].

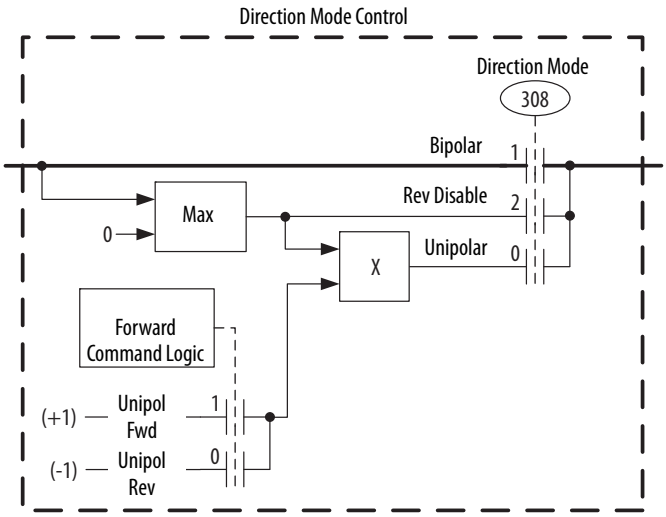


Scaling of an Analog Speed Reference

Refer to Analog Inputs on page 105.

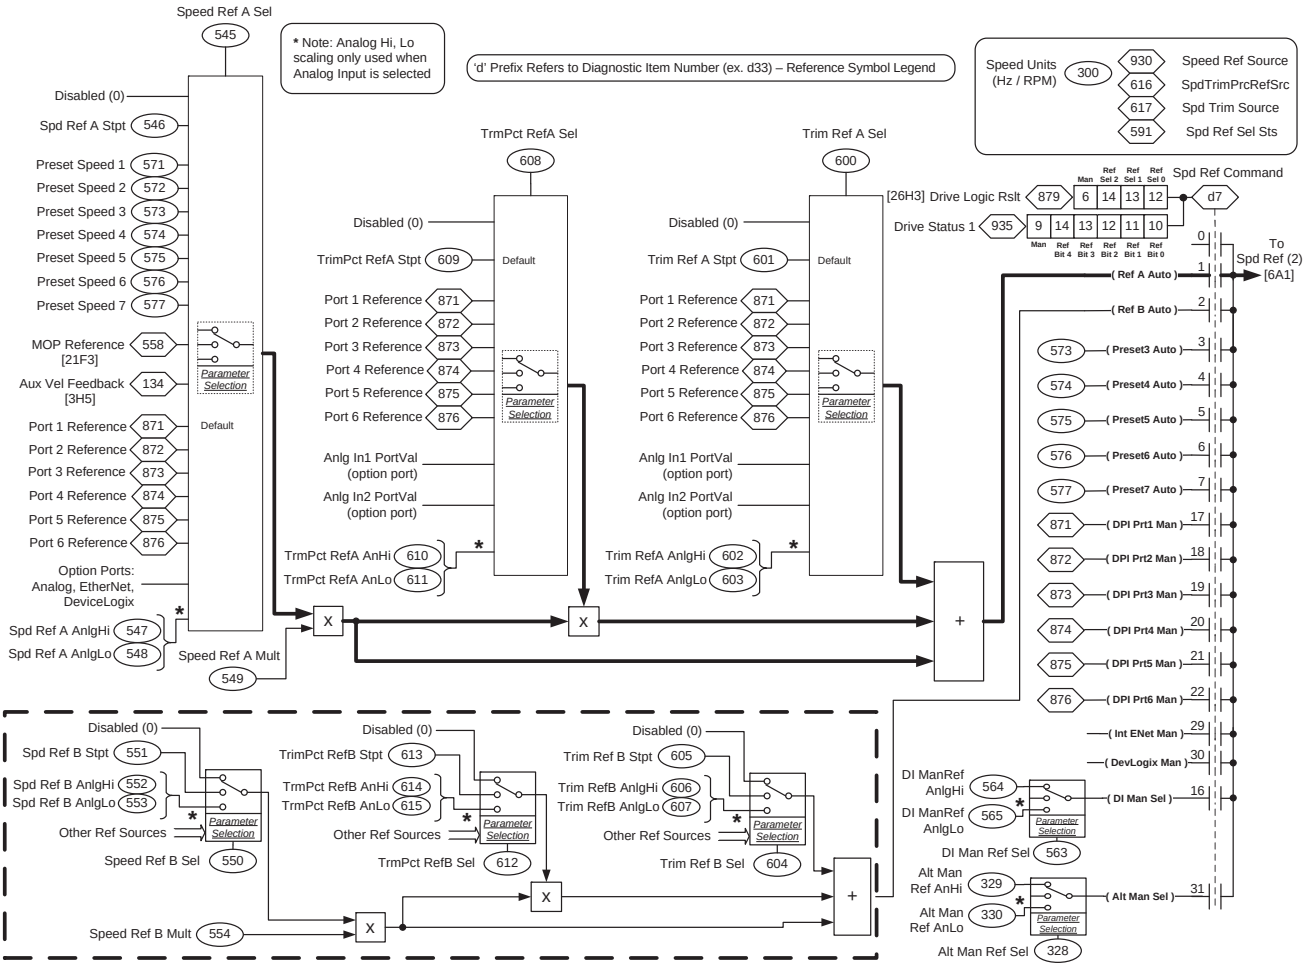
Polarity

The polarity configuration can be selected as unipolar, bipolar, or reverse disabled via P308 [Direction Mode]. When in Unipolar mode, the sign of the speed reference value (and therefore direction of motor rotation) is determined by P879 [Drive Logic Rslt] Bit 4 "Forward" and Bit 5 "Reverse." When in Bipolar mode, the sign of the speed reference value determines the direction of motor rotation. When in Reverse Disable mode, negative speed reference values are rejected and a zero speed value is used in their place.



Trim

The speed reference source, specified in P545 [Spd Ref A Sel] or P550 [Spd Ref B Sel], can be trimmed by variable amount. You have the option to trim the speed reference by a percentage of the reference and/or by a fixed amount and can dictate whether it is a positive or negative value. Refer to the PowerFlex 750-Series Trim Block Diagram below.



Example 1

The following example shows the configuration and resultant of the percent trim function:

- P545 [Spd Ref A Sel] = P546 [Spd Ref A Stpt]
- P546 [Spd Ref A Stpt] = 20.00 Hz
- P608 [TrmPct RefA Sel] = P609 [TrmPct RefA Stpt]
- P609 [TrmPct RefA Stpt] = 25%
- P2 [Commanded SpdRef] = 25.00 Hz

If the speed reference = 20 Hz and if the trim percentage = 25%, the resulting trim is 20 Hz x 25% = 5 Hz, which when added to the speed reference = 25 Hz. As the speed reference changes, the amount of trim also changes because it is a percent of the speed reference. If the trim percentage = -25%, then the resulting trim is 20 Hz x -25% = -5 Hz, the speed reference = 15 Hz.

Example 2
The following example shows the configuration and resultant of the fixed amount trim function:

- P545 [Spd Ref A Sel] = P546 [Spd Ref A Stpt]
- P546 [Spd Ref A Stpt] = 20.00 Hz
- P600 [Trim Ref A Sel] = P601 [Trim Ref A Stpt]
- P601 [Trim Ref A Stpt] = 10.00 Hz
- P2 [Commanded SpdRef] = 30.00 Hz

If the speed reference = 20 Hz, and if the trim set point = 10 Hz, the speed reference is 20 Hz + 10 Hz = 30 Hz. If the trim set point = -10 Hz, then the speed reference = 10 Hz.

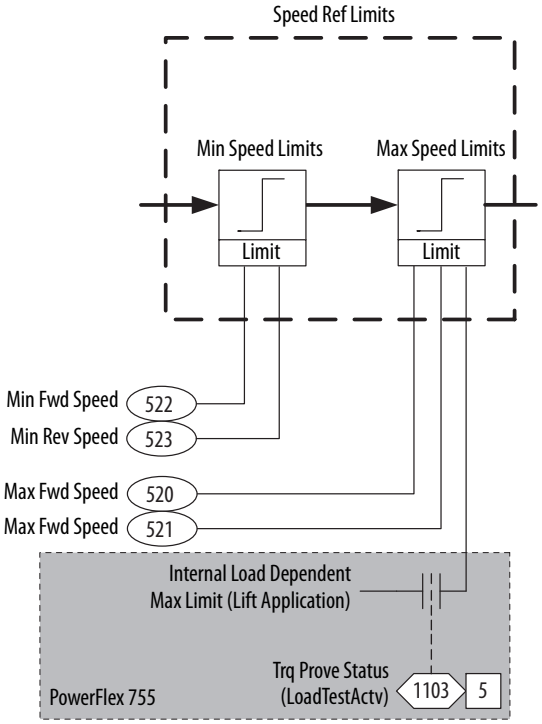
Example 3
The following example shows the configuration and resultant of utilizing both the perfect and fixed amount trim function:

- P545 [Spd Ref A Sel] = P546 [Spd Ref A Stpt]
- P546 [Spd Ref A Stpt] = 20.00 Hz
- P608 [TrmPct RefA Sel] = P609 [TrmPct RefA Stpt]
- P609 [TrmPct RefA Stpt] = 25%
- P600 [Trim Ref A Sel] = P601 [Trim Ref A Stpt]
- P601 [Trim Ref A Stpt] = 10.00 Hz
- P2 [Commanded SpdRef] = 35.00 Hz

If the speed reference = 20 Hz, and if the trim percentage = 25%, that resulting trim is 20 Hz x 25% = 5 Hz, and if the trim set point = 10 Hz, the speed reference is 20 Hz + 5 Hz + 10 Hz = 35 Hz. If the trim percentage = -25% and the trim set point = -10 Hz, then the speed reference = 5 Hz.

Min/Max Fwd/Rev Speed

Maximum and minimum speed limits are applied to the forward and reverse reference. The minimum speed limits create a band that the drive will not run continuously within, but ramps through. This is due to the forward or reverse minimum speeds, P522 [Min Fwd Speed] and P523 [Min Rev Speed] respectively. If the reference is positive and less than the Min Fwd Speed, it is set to the Min Fwd Speed minimum. If the reference is negative and greater than Min Rev Speed minimum, it is set to the Min Rev Speed minimum. If the minimum is not 0, hysteresis is applied at 0 to prevent bouncing between the Min Fwd Speed and Min Rev Speed minimums. If the reference is greater than the forward or reverse maximum speeds, P520 [Max Fwd Speed] and P521 [Max Rev Speed] respectively, the speed reference is clamped to the their respective maximum limit.

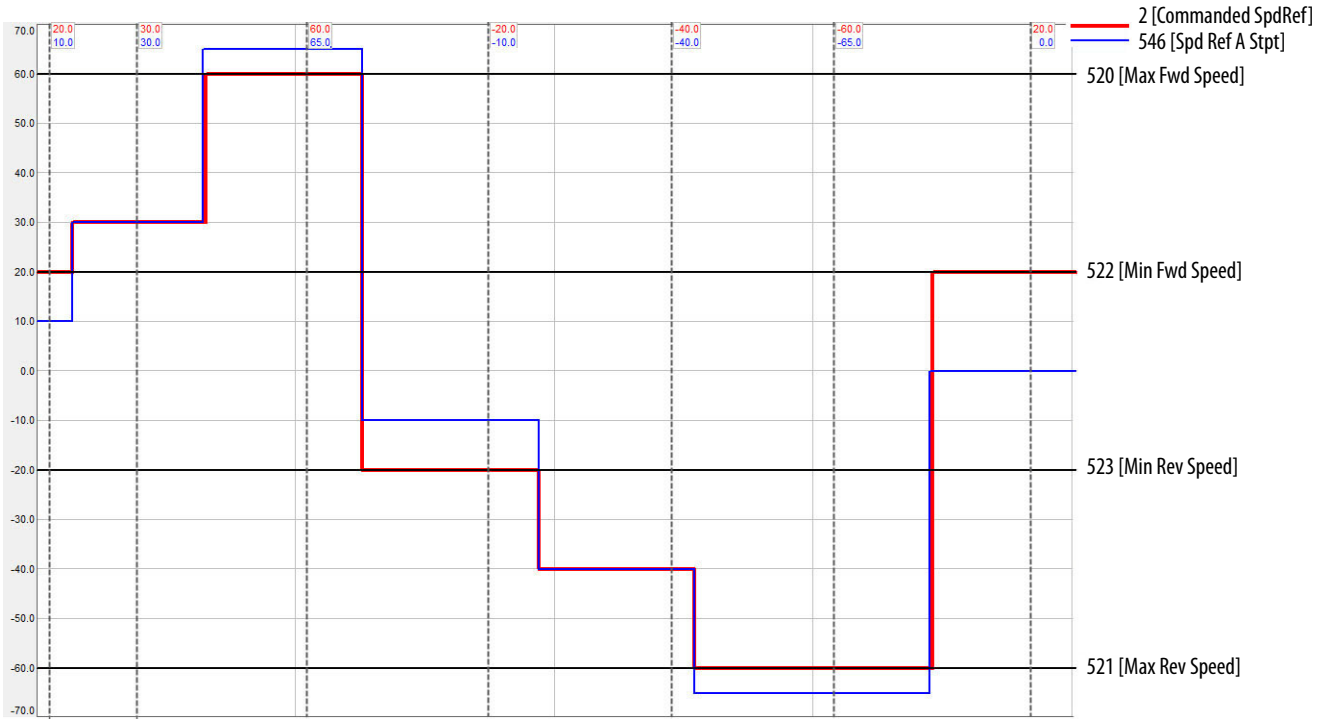


See example below:

- P520 [Max Fwd Speed] = 60 Hz
- P521 [Max Rev Speed] = -60 Hz
- P522 [Min Fwd Speed] = 20 Hz
- P523 [Min Rev Speed] = -20 Hz
- P545 [Spd Ref A Sel] = P546 [Spd Ref A Stpt]

The picture below depicts how the Min/Max Fwd/Rev Speed bands and its influence the drive. The BLUE line depicts the desired speed reference (set point)

and the RED line depicts the drive's commanded speed reference (actual). Notice there are different results, depicted by the grey dotted line, along the graph.



Maximum Frequency

P37 [Maximum Freq] defines the maximum reference frequency. The actual output frequency can be greater as a result of slip compensation and other types of regulation.

Speed Regulation

A number of parameter are used to control speed regulation.

Overall Operation for Sensorless Vector Control and Volts per Hertz Control

The drive takes the speed reference and adjusts it using a proportional and integral regulator to compensate for slip and the programmed limits.

Overall Operation for Flux Vector Control

The drive takes the speed reference that is specified by the speed reference control loop and compares it to the speed feedback. The speed regulator uses proportional and integral gains along with other advanced tuning features to adjust the torque reference that is sent to the motor. The torque reference is used to operate the motor at the specified speed. The regulator is designed for optimal bandwidth for changing speed and load. If an alternate feedback device is used with automatic tachometer switchover, the alternate values of these parameters are used.

Desired Speed Regulator Bandwidth - P636 [Speed Reg BW]

The Speed Regulator Bandwidth sets the speed loop bandwidth and determines the dynamic behavior of the speed loop. As bandwidth increases, the speed loop becomes more responsive and can track a faster changing speed reference. A change to this parameter causes an automatic update of P645 [Speed Reg Kp], P647 [Speed Reg Ki], and P644 [Spd Err Fltr BW]. To disable the automatic gain and filter update, set this parameter to a value of zero. The configuration settings for Inertia Adaption (PowerFlex 755 only) is automatically selected when this feature is enabled.

The maximum allowable value of this parameter is limited by the ratio of P646 [Spd Reg Max Kp] to P76 [Total Inertia], and the type of speed feedback source in use (encoder versus open loop). For operation following an automatic tach switchover, the bandwidth specified in P648 [Alt Speed Reg BW] is used.

Total Inertia of Motor and Load - P76 [Total Inertia]

The Total Inertia is the time in seconds for a motor coupled to its load to accelerate from zero to base speed at rated motor torque. This value is calculated during an Inertia Tune, after the motor has ramped up to speed and down and back down to zero speed. Adjusting this parameter causes the drive to calculate and change the speed regulator gains.

Speed Loop Damping - P653 [Spd Loop Damping]

Sets the damping factor of the vector speed loop's characteristic equation. Damping affects the integral gain when a non-zero bandwidth has been entered. A damping factor of 1.0 is considered critical damping. Lowering the damping produces faster load disturbance rejection, but can cause a more oscillatory response. When the speed regulator bandwidth is zero, gains are set manually and damping factor has no effect.

Integral Gain - P647 [Speed Reg Ki]

Sets the integral gain of the speed regulator (in FV Motor Control modes). This value is automatically calculated based on the bandwidth setting in P636 [Speed Reg BW], P645 [Speed Reg Kp] and P653 [Spd Loop Damping]. Integral gain can be manually adjusted by setting P636 [Speed Reg BW] to a value of zero. Integral gain has effective scaling of (per unit torque/sec) / (per unit speed).

Proportional Gain - P645 [Speed Reg Kp]

This value is automatically calculated based on the bandwidth setting in P636 [Speed Reg BW] and P76 [Total Inertia]. The proportional gain can be manually adjusted by setting P636 [Speed Reg BW] to a value of zero. Proportional gain has effective scaling of (per unit torque) / (per unit speed). The maximum allowable value of this parameter is limited by P76 [Total Inertia] and P646 [Spd Reg Max Kp].

Feed Forward Gain - P643 [SpeedReg AntiBckup]

Controls over-shoot/under-shoot in the step response of the Vector Control mode speed regulator. Over-shoot/under-shoot can be effectively eliminated with a setting of 0.3, which removes backup of the motor shaft when zero speed is reached. This parameter has no affect on the drive's response to load changes. A value of zero disables this feature.

Servo Lock Gain - P642 [Servo Lock Gain] (PowerFlex 755 only)

Sets the gain of an additional integrator in the Vector Control mode speed regulator. The effect of Servo Lock is to increase stiffness of the speed response to a load disturbance. It behaves like a position regulator with velocity feed forward, but without the pulse accuracy of a true position regulator. Gain is normally set to less than 1/3 speed regulator bandwidth, or for the desired response. A value of zero disables this feature.

Torque Reference

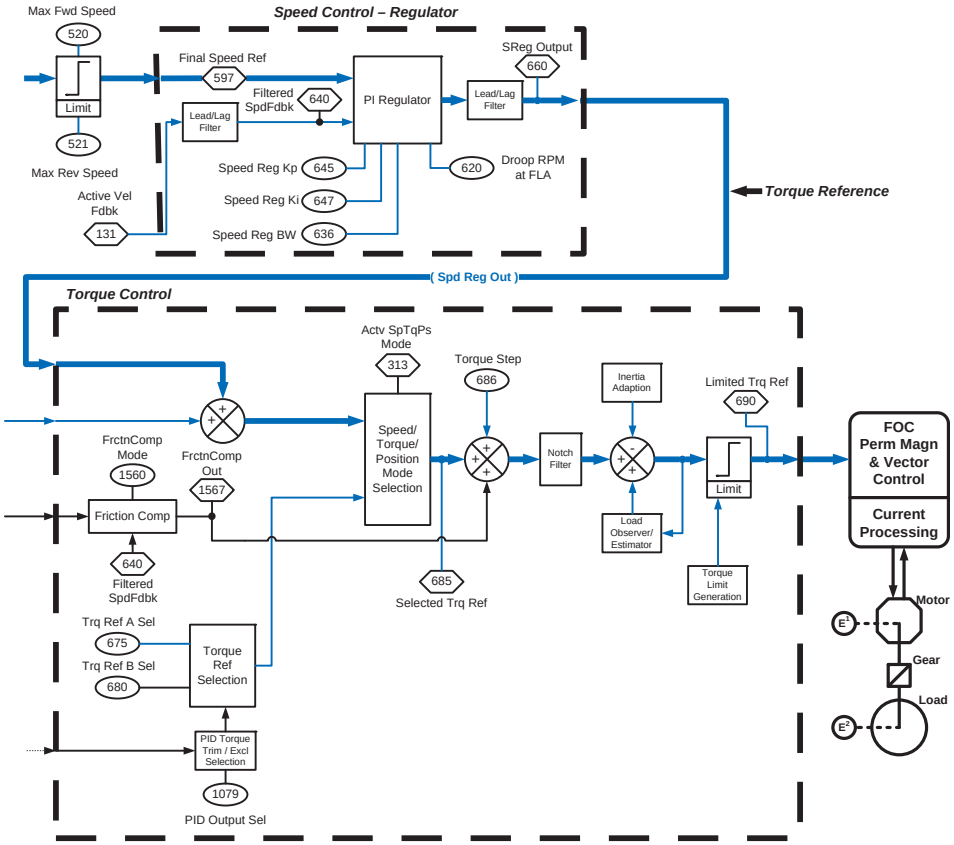
The Torque Reference is a reference value in percent that represents the rated torque development capability of the motor. During the autotune process, measurements are made to determine the motor equivalent circuit including connected impedance from drive terminals to the motor. Based on entered motor nameplate information and autotune results, the Torque Reference is established as 100% or 1 PU equal to the rated N•m (lb•ft) torque development capability of the motor at Full Load ampere rating within ±5% without encoder feedback, possibly within ±2% with encoder feedback.

True Torque control at the motor shaft can only occur when P35 [Motor Ctrl Mode] is configured for one of the Flux Vector control mode choices. Likewise, Torque Reference parameters are only active when Flux Vector control modes in P35 [Motor Ctrl Mode], options 3 "Induction FV," 6 "PM FV," and 10 "IPM FV."

Internal Torque Reference Source

The inherent Torque Reference source (default setting in any of the applicable FV Control modes only) is the output from the Speed Regulator parameter, P660 [SReg Output] in percent. As it passes through trimming and limiting functions, it ultimately becomes a commanding torque reference, P690 [Limited Trq Ref], and an input to and for the inverter Current control to output voltage and frequency to the motor and regulate torque producing vector of current accordingly. Consequently, the motor develops torque as necessary to aid the Speed Regulator to maintain minimal speed error between commanded speed and speed feedback.

Figure 30 - Torque Reference Path



There are additional internal Torque Reference sources within the drive such as from a variety of Position Regulator outputs for the motor to develop the corresponding amount of torque necessary to follow a point to point position profile, cam profile, maintain a set position or follow a Motion Planner directed profile.

The torque reference can be trimmed by Friction Compensation, Inertia Adaption, or Load Observer estimator as the application may dictate. Torque Step, an amount of torque reference step change, can be injected to simulate a load disturbance.

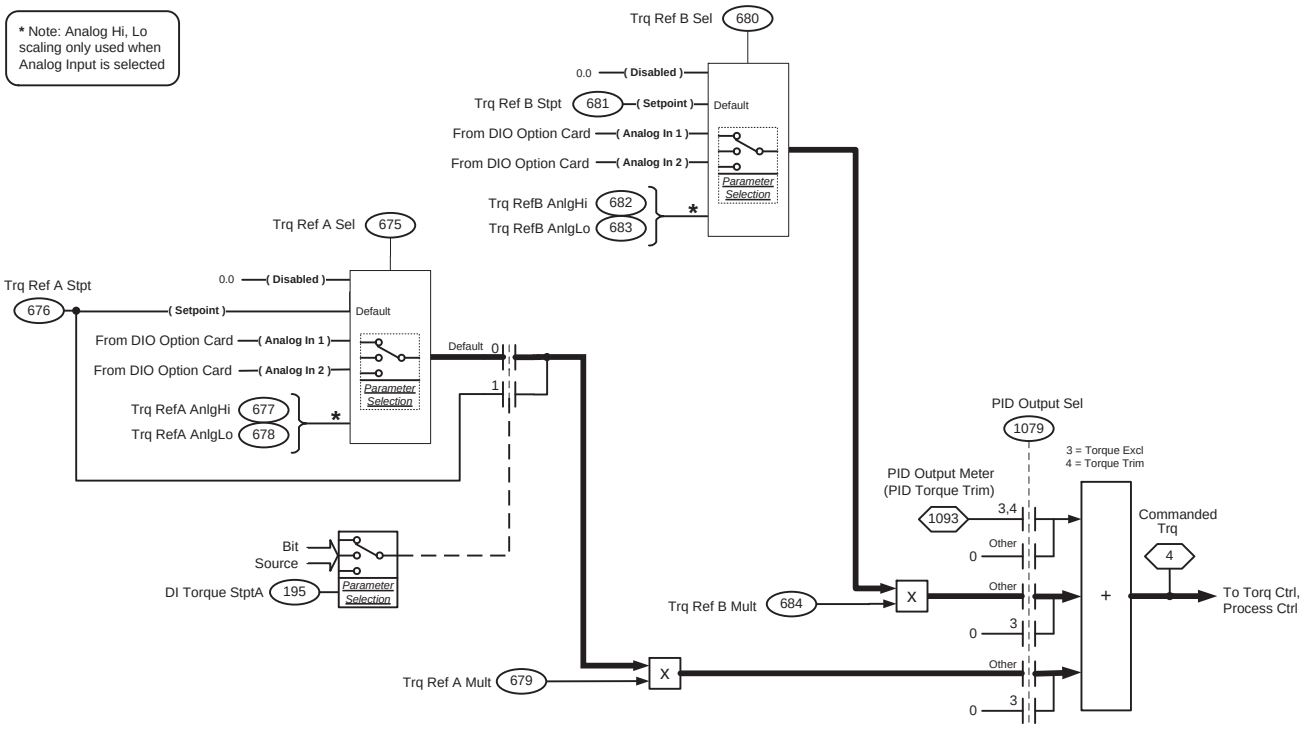
External Torque Reference Source

The Torque Reference can also be established via analog or communication media as a Setpoint reference or brought into the drive externally from a variety of sources including an independent controller or another drive (for load sharing configurations).

When the PowerFlex drive is operated in Torque mode, an alternate source of reference, generally an external signal, is directed to the Torque Control as an active torque reference. Once the scaling is complete on both P675 [Trq Ref A

Sel] and P680 [Trq Ref B Sel], the output can be summed together and along with the output of "Torque Trim," to become P4 [Commanded Trq].

Figure 31 - Torque Control - Reference Scale and Trim



For additional and expanded illustration of the Torque Control, refer to the PowerFlex 755 Control Block Diagrams starting on page 375.

The following are key parameters related to the Torque Reference control illustrated in Figure 30 and Figure 31.

P313 [Actv SpTqPs Mode] - Active Speed Torque Position Mode
Displays the Speed, Torque, Position Mode that is active, based on the dynamic selection of modes A, B, C, and D, per P309...P312 [SpdTrqPsn Mode *n*], and digital input conditions programmed via P181 [DI SpTqPs Sel 0] and P182 [DI SpTqPs Sel 1]. In some cases, such as operation in the SLAT min/max modes, the final regulation mode may be forced into Speed Regulation. Refer to the Speed, Torque, and Position mode bits in P935 [Drive Status 1] that indicate the active regulation mode of the drive when it is running.

P675 [Trq Ref A Sel] and **P680 [Trq Ref B Sel]** - Torque Reference A, B Select
Selects the source for a torque reference, used when the drive is configured to command torque according to P309...312 [SpdTrqPsn Mode *n*]. The values of the torque reference sources are added together to provide a single torque reference.

P676 [Trq Ref A Stpt] and **P681 [Trq Ref B Stpt]** - Torque Reference A, B Setpoint

A digital torque value to be used as a possible source for P675 and P680 respectively.

P677 [Trq Ref A AnlgHi] and **P682 [Trq Ref B AnlgHi]** - Torque Reference A, B Analog High
Used only when an analog input is selected as a torque reference according to P676 or P681. Sets the torque value that corresponds to [Anlg In*n* Hi] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.

P678 [Trq Ref A AnlgLo] and **P683 [Trq Ref B AnlgLo]** - Torque Reference A, B Analog Low
Used only when an analog input is selected as a torque reference according to P676 [Trq Ref A Stpt] or P681 [Trq Ref B Stpt]. Sets the torque value that corresponds to [Anlg In*n* Lo] on an I/O module or on the main control (product dependent). This establishes scaling throughout the range.

P679 [Trq Ref A Mult] and **P684 [Trq Ref B Mult]** - Torque Reference A, B Multiplier
A multiplier that is applied to the values referenced by P675 [Trq Ref A Sel] and P680 [Trq Ref B Sel] respectively. A value of 1 leaves the reference unaffected. Negative values invert the reference.

Refer to Speed Torque Position on page 266 for an explanation of Speed Torque Position mode choices for operating in various specific modes utilizing Internal and/or External torque reference sources.

Speed Torque Position

The PowerFlex 750-Series drives have the ability to have four separate Speed Torque Position modes with the following parameters:

- P309 [SpdTrqPsn Mode A]
- P310 [SpdTrqPsn Mode B]
- P311 [SpdTrqPsn Mode C]
- P312 [SpdTrqPsn Mode D]

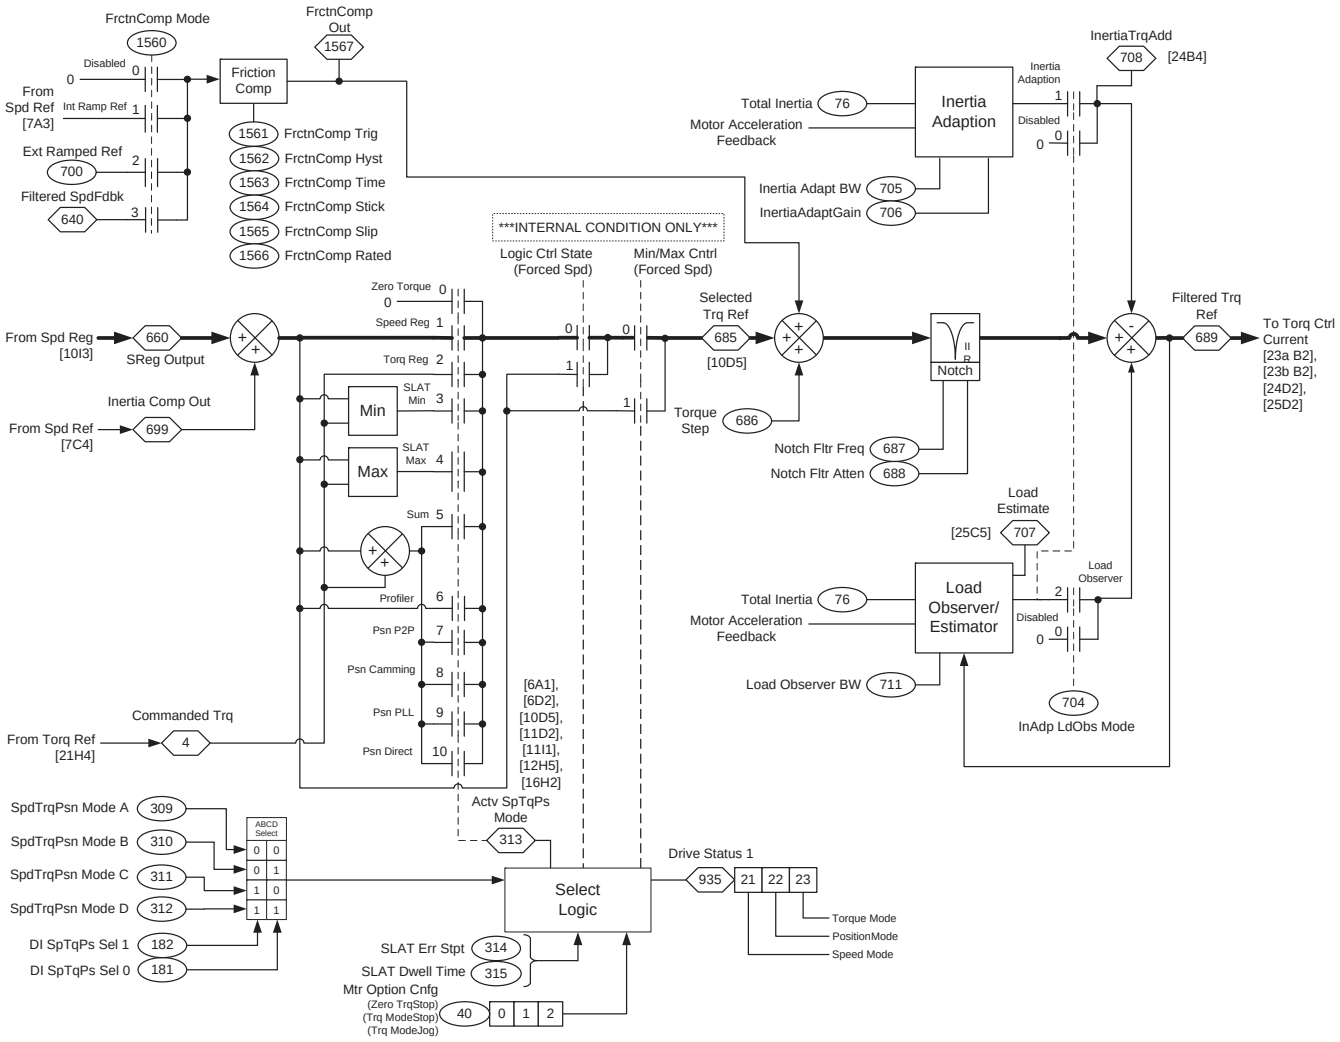
Possible selections for the above Speed/Torque/Position parameters are as follows:

- "Zero Torque" (0) – Drive operates as a torque regulator with P685 [Selected Trq Ref] forced to a constant value of zero torque.
- "Speed Reg" (1) – Drive operates as a speed regulator. P685 [Selected Trq Ref] comes from P660 [SReg Output] plus P699 [Inertia Comp Out].
- "Torque Ref" (2) – Drive operates as a torque regulator. P685 [Selected Trq Ref] comes from P4 [Commanded Trq]. Under some conditions such as jogging or performing a ramp to stop operation, the drive automatically bypasses this selection and temporarily switches to Speed Regulation mode.
- "SLAT Min" (3) – Drive operates in "Speed Limited Adjustable Torque – Minimum select" mode. This is a special mode of operation used primarily in web handling applications. The drive typically operates as a torque regulator, provided that the P4 [Commanded Trq] value is algebraically smaller in value than the speed regulator's output. The drive can automatically enter Speed Regulation mode, based on conditions within the speed regulator and the magnitude of the speed regulator's output relative to the torque reference.
- "SLAT Max" (4) – Drive operates in "Speed Limited Adjustable Torque – Maximum select" mode. This is a special mode of operation used primarily in web handling applications. The drive typically operates as a torque regulator, provided that the P4 [Commanded Trq] value is algebraically larger in value than the speed regulator's output. The drive can automatically enter Speed Regulation mode, based on conditions within the speed regulator and the magnitude of the speed regulator's output relative to the torque reference.
- "Sum" (5) – Drive operates as a speed regulator. P685 [Selected Trq Ref] comes from P660 [SReg Output] plus torque adders summed with P4 [Commanded Trq].
- "Profilier" (6) PowerFlex 755 – Drive uses the Speed Profiler / Position Indexer function. The drive operates as either a speed or position regulator. Mode of operation depends on the configuration of the Step Types in the Profiler/Indexer table.
- "Psn PTP" (7) – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Point-to-Point mode and uses its Point-to-Point position reference.

- "Psn Camming" (8) PowerFlex 755 – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Position CAM mode and uses its PCAM Planner position and speed reference.
- "Psn PLL" (9) PowerFlex 755 – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Position Phase Lock Loop mode and uses its PLL Planner position and speed reference.
- "Psn Direct" (10) – Drive operates as a position regulator. P685 [Selected Trq Ref] has the same source as in Sum mode. The position control is active in Direct mode and uses its Direct Position Reference.
- "Psn SpdlOrnt" (11) PowerFlex 755 – Drive operates in the Positioning mode to position the load side of a machine to P1582 [SO Setpoint].

These modes selections only apply to the Flux Vector control modes in P35 [Motor Ctrl Mode], options 3 "Induction FV," 6 "PM FV," and 10 "IPM FV." These parameters select between speed regulation, torque regulation, or position regulation operation of the drive. The source of P685 [Selected Trq Ref] is determined by the selection in these parameters when P181 [DI SpTqPs Sel 0] and P182 [DI SpTqPs Sel 1] have selected "Disabled" or selected bits that are logic low. In P935 [Drive Status 1], three bits are provided that indicate the Regulation mode of the drive when it is running. Bit 21 "Speed Mode" is set when the drive is running with the speed regulator active. Similarly, Bit 22 "PositionMode" and Bit 23 "Torque Mode" indicate when their respective regulation modes are active. Under some conditions, the active Torque mode can be forced into Speed mode regardless of the setting of Speed/Torque/Position. P313 [Actv SpTqPs Mode] indicates this and reflects the mode selection that is in use.

Figure 32 - PowerFlex 755 Firmware Flowchart



The following are key parameters related to the Torque Reference control illustrated in Figure 32.

P313 [Actv SpTqPs Mode] - Active Speed Torque Position Mode
Displays the Speed, Torque, Position Mode that is active, based on the dynamic selection of modes A, B, C, and D, per P309...P312 [SpdTrqPsn Mode *n*], and digital input conditions programmed via P181 [DI SpTqPs Sel 0] and P182 [DI SpTqPs Sel 1]. In some cases, such as operation in the SLAT min/max modes, the final regulation mode may be forced into Speed Regulation. Refer to the Speed, Torque, and Position mode bits in P935 [Drive Status 1] that indicate the active regulation mode of the drive when it is running.

P314 [SLAT Err Stpt] - Speed Limited Adjustable Torque, Error Setpoint
Sets the magnitude of P641 [Speed Error] at which the SLAT function will release its Forced Speed Mode signal. This condition must exist for the time specified by P315 [SLAT Dwell Time]. Once released, the drive can operate as a torque regulator, depending on the relative levels of P660 [SReg Output] and P4

[Commanded Trq]. This parameter will be entered in units of Hz or RPM, depending on the value of P300 [Speed Units].

P315 [SLAT Dwell Time] - Speed Limited Adjustable Torque, Dwell Time
Sets the time period that P641 [Speed Error] must exceed the P314 [SLAT Err Stpt] magnitude in order to return to min/max torque mode.

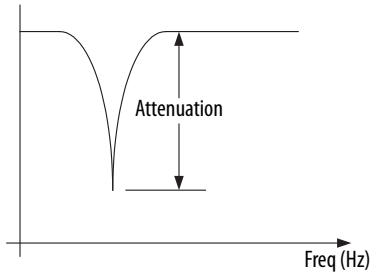
P675 [Trq Ref A Sel] and **P680 [Trq Ref B Sel]** - Torque Reference A, B Select
Selects the source for a torque reference, used when the drive is configured to command torque according to P309...312 [SpdTrqPsn Mode *n*]. The values of the torque reference sources are added together to provide a single torque reference.

P685 [Selected Trq Ref] - Selected Torque Reference
Displays the torque value of the selected torque reference (dynamic selection according to P313 [Actv SpTqPs Mode]). This value will be summed with P686 [Torque Step]. The result is then applied to the input of the notch filter located in the Vector torque reference section.

P686 [Torque Step] - Torque Step
Defines the amount of torque reference step change to simulate a load disturbance, used to test the response. This value is added to the main torque reference P685 [Selected Trq Ref], and then applied to the input of the notch filter located in the Vector control torque reference section.

P687 [Notch Fltr Freq] - Notch Filter Frequency
The center frequency for the Notch filter located in the Vector control torque reference section. To disable, set to zero.

P688 [Notch Fltr Atten] - Notch Filter Attenuation
Sets the attenuation of the notch filter located in the Vector control torque reference section. Attenuation is the ratio of the notch filter input signal to its output at the P687 [Notch Fltr Freq]. An attenuation of 30 means that the notch output is 1/30th of the input at the specified frequency.



P689 [Filtered Trq Ref] - Filtered Torque Reference
Displays the output of the notch filter defined by P687 and P688. If P704 [InAdp LdObs Mode] indicates that either the Inertia Adaption or Load Estimate functions are active, then the filtered torque reference will also be modified by these functions.

P690 [Limited Trq Ref] - Limited Torque Reference
Displays the torque reference value after filtering (P689), power limits, torque limits, and current limits have been applied. This parameter is the most effective VFD representative Torque Reference value to be monitored for motor load assessment and to be passed on to other drives for load sharing applications involving multiple drives. It represents the percent of the rated torque being developed at the motor shaft.

For additional and expanded illustration of the Torque Control, refer to the PowerFlex 755 Control Block Diagrams starting on page 375.

Speed Torque Position Modes

Zero Torque

Operation in Zero Torque mode enables the motor to be fully fluxed and ready to rotate when a speed command or torque command is given. This mode can be used for a cyclical application where throughput is a high priority. The control logic can select zero torque during the rest portion of a machine cycle instead of stopping the drive. When the cycle start occurs, instead of issuing a start to the drive, a Speed Regulator mode can be selected. The drive immediately accelerates the motor without the need for flux up time.

IMPORTANT	Zero Torque can excessively heat the motor if operated in this mode for extended periods of time. A load or flux current is still present when the drive is operating in Zero Torque mode. A motor with an extended speed range or separate cooling methods (blower) can be required.

Speed Regulation

Operating as a speed regulator is the most common and simplest mode to set up. Examples of speed regulated applications are blowers, conveyors, feeders, pumps, saws, and tools. In a speed regulated application, the speed regulator output generates the torque reference. Note that under steady state conditions the speed feedback is steady while the torque reference is a constantly adjusting signal. This is required to maintain the desired speed. In a transient state, the torque reference changes dramatically to compensate for a speed change. A short duration change in speed is the result of increasing or decreasing the load very rapidly.

For the PowerFlex 755 drive, the Inertia Compensation, Inertia Adaption, and the Friction Compensation influence the output of the speed regulator.

Torque Regulation

A torque regulated application can be described as any process requiring some tension control. An example is a winder or unwinder with material being drawn or pulled with a specific tension required. The process also requires that another

element set the speed. Configuring the drive for torque regulation requires P309 [SpdTrqPsn Mode A] to be set to 2 "Torque Ref." In addition, a reference signal must be linked to the torque reference. For example, when Analog Input 0 is used for the torque reference, P675 [Trq Ref A Sel] needs to be configured for "Anlg In0 Value."

When operating in a Torque mode, the motor current is adjusted to achieve the desired torque. If the material being wound or unwound breaks, the load decreases dramatically and the motor can potentially go into a runaway condition.

Speed Limited Adjustable Torque (SLAT) Modes

The SLAT minimum and SLAT maximum modes are for applications that require a smooth transition from a torque mode to a speed mode operation and vice versa. When operating in a Torque mode, the motor current is adjusted to achieve the desired torque. For example; web handling, center winders and center unwinders or other mechanical drive train where the drive is normally following a torque reference, but a break, disruption in flow or slippage could occur causing the need to prevent a runaway situation, which is best controlled in speed mode.

Direction of the applied torque and direction of the material movement determine whether SLAT minimum or SLAT maximum mode should be used.

SLAT Minimum

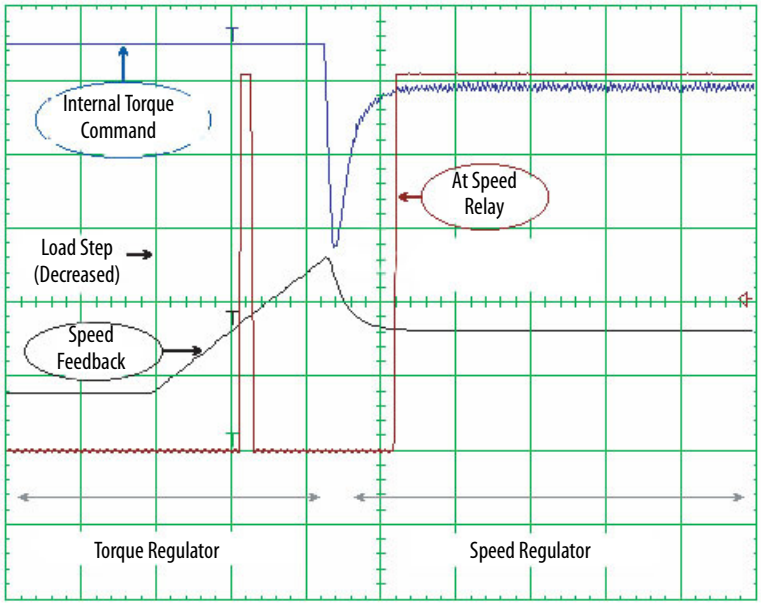
Choose SLAT minimum mode when material direction and speed reference is considered "Forward" and a positive speed reference value for the Speed Regulator. The Speed Regulator output then creates a positive Torque Reference command value.

Typically configure a positive speed reference value slightly greater than what is equivalent to maintain planned material line speed. This will in turn force the speed regulator into saturation (the speed reference is slightly above the speed feedback) commanding a "more positive" torque reference than what the torque mode torque reference value is. In this scenario the drive would follow the torque reference until there was a breakage or slippage in the application.

When the drive is following a torque reference (torque mode in SLAT minimum mode), either one of two conditions will force the drive into following the speed reference in (speed mode):

- The output of the speed regulator becomes less than the torque reference. The reaction when triggered at the very point that the torque reference value in speed mode is mathematically less than the value in torque mode, generally results in greater velocity overshoot. This is the same condition that would exist in minimum torque /speed mode without SLAT features. The following plot represents the result without using SLAT features.

Figure 33 - Minimum Torque Speed without SLAT



Or

- The speed error becomes negative (the speed feedback becomes greater than the speed reference). This would force the control into speed regulator mode, a condition called Forced Speed Mode FSM.

By forcing the drive to enter speed mode FSM, the transition occurs earlier than it would have if the reaction was triggered at the very point that the torque reference value in speed mode is mathematically less than the value in torque mode, generally resulting in less velocity overshoot.

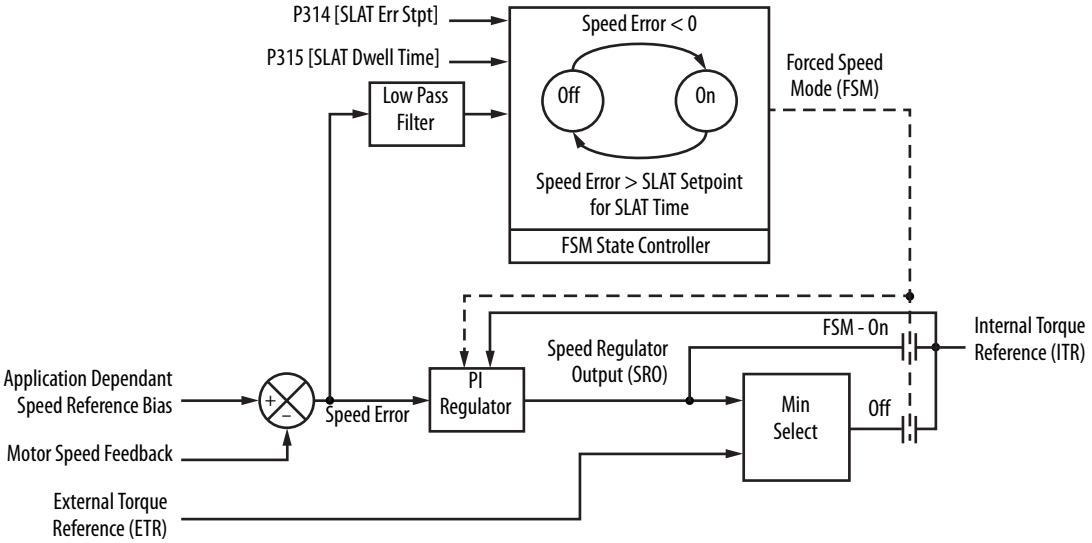
P314 [SLAT Err Stpt] and P315 [SLAT Dwell Time] allow setting some hysteresis for turning off the forced speed mode. They are set to 0 as default so that there is no hysteresis. In SLAT minimum mode, [SLAT Err Stpt] sets how much less the speed feedback should be than the speed reference before turning off the forced speed mode. The SLAT dwell time sets how long the speed error must exceed the SLAT error set point before turning off the forced speed mode.

At the time that the drive switches from torque mode to forced speed mode, the speed regulator output is loaded with the internal motor torque reference to create a smooth transition. In order for the drive to switch from speed mode back to torque mode, forced speed mode (if active) must first be turned off. Forced speed mode will turn off when the speed error is greater than the SLAT error set point for the SLAT dwell time.

With default parameter settings, this will occur when the speed error becomes positive.

When forced speed mode is off, the drive will switch back to Torque mode when the speed regulator output becomes greater than the torque reference.

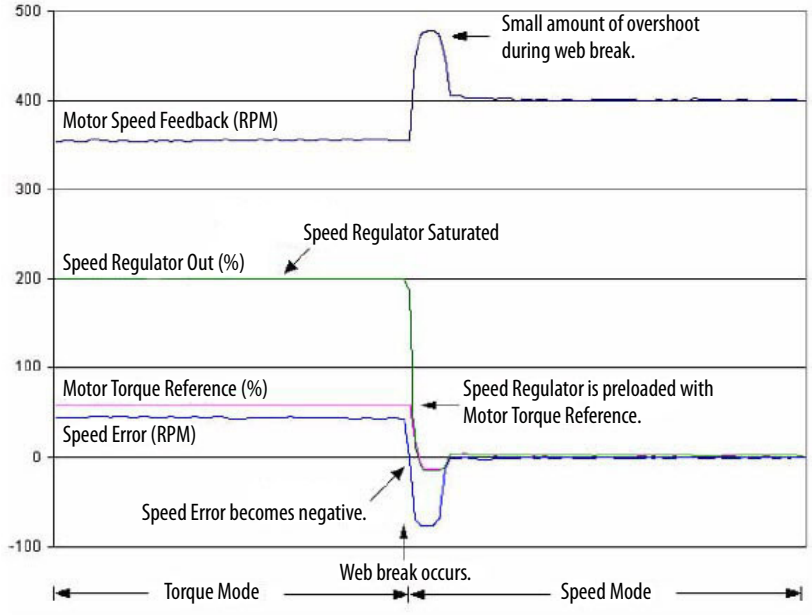
Empirically setting values P314 [SLAT Err Stpt] and P315 [SLAT Dwell Time] other than default may help create even smoother transitions.



Paper Winder Application Example

The drive is set for SLAT Minimum mode, so that the drive normally runs in Torque mode and follows P675 [Trq Ref A Sel]. [Trq Ref A Sel] comes from an external controller and is approximately 60% of motor torque during the snapshot (shown below). The speed reference, also from an external controller, is set just above the speed feedback to saturate the speed regulator while in Torque mode. The following snapshot captures what occurs in the drive during a break in the web.

Figure 34 - SLAT Min to Forced Speed Mode



SLAT Maximum Mode

Choose SLAT Maximum mode when material direction and speed reference is considered "Reverse" and a negative speed reference value for the Speed Regulator. The Speed Regulator output then creates a negative Torque Reference command value.

In SLAT Maximum mode, a speed reference is typically configured to force the speed regulator into saturation (the speed reference is slightly below the speed feedback which is equivalent to maintain planned line speed). In this scenario the drive follows the torque reference until there is breakage or slippage in the application.

In SLAT Maximum mode, the drive switches from Torque mode to Speed mode when either one of the two following conditions occur.

- The output of the speed regulator becomes more than the torque reference. This is the same condition that exists in Maximum Torque/ Speed mode without SLAT features.

  Or

- The speed error becomes positive (the speed feedback becomes less than the speed reference). This forces the control into speed regulator mode, a condition called Forced Speed Mode (FSM).

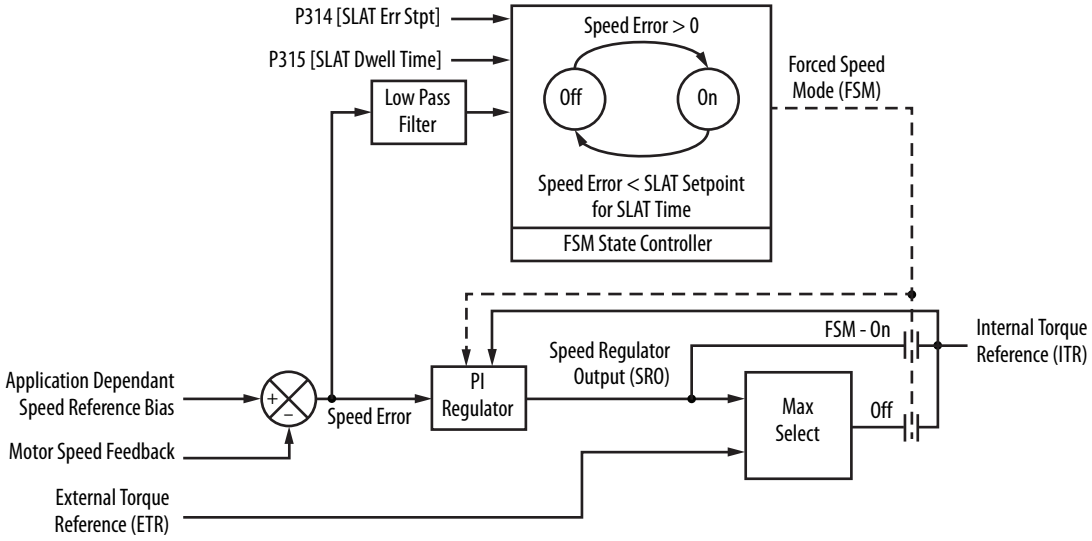
By forcing the drive to enter FSM, the transition occurs earlier than it would have if the reaction was triggered at the very point that the torque reference value in speed mode is mathematically more than the value in torque mode, generally resulting in less velocity overshoot.

P314 [SLAT Err Stpt] and P315 [SLAT Dwell Time] allow for setting some hysteresis for turning off the forced speed mode. They are set to 0 as default so that there is no hysteresis. In SLAT maximum mode, [SLAT Err Stpt] sets how much more the speed feedback (algebraically sign sensitive) should be than the speed reference before turning off the forced speed mode. [SLAT Dwell Time] sets how long the speed error must be less than the SLAT error set point before turning off the forced speed mode.

At the time that the drive switches from torque mode to speed mode the speed regulator output is loaded with the value from the torque reference to create a smooth transition.

In order for the drive to switch from speed mode back to torque mode, forced speed mode (if active) must first be turned off. FSM will turn off when the speed error is less than the SLAT error set point for the SLAT dwell time.

With default parameter settings, this will occur when the speed error becomes negative. When forced speed mode is off, the drive will switch back to torque mode when the speed regulator output becomes less than the torque reference.



Sum

Configuring the drive in this mode enables an external torque input to be summed with the torque command generated by the speed regulator. This mode requires both a speed reference and a torque reference to be linked. This mode can be used for applications that have precise speed changes with critical time constraints. If the torque requirement and timing is known for a given speed change, then the external torque input can be used to preload the integrator. The timing of the speed change and the application of an external torque command change must be coordinated for this mode to be useful. The “Sum Spd/Trq” mode will then work as a feed forward to the torque regulator.

Notes:

Drive Features

Topic	Page
Data Logging	277
Energy Savings	282
High Speed Trending	283
Position Homing	292

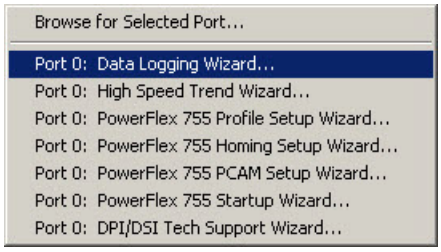
Data Logging

This wizard logs the values of up to six parameters in a single drive at a specified interval for some period of time, with the minimum sample rate one second. The information is saved as a comma delimited *.csv file for use with Microsoft Excel or any other spreadsheet program. Clicking Next lets you configure the data logger. When data logging is completed, click Finish to close the wizard. If you click Finish before the data logging is completed, only the data collected up to that point is saved in the file. You can cancel the wizard at any time by clicking Cancel or the Close icon. All logged data is lost, and the file is deleted.

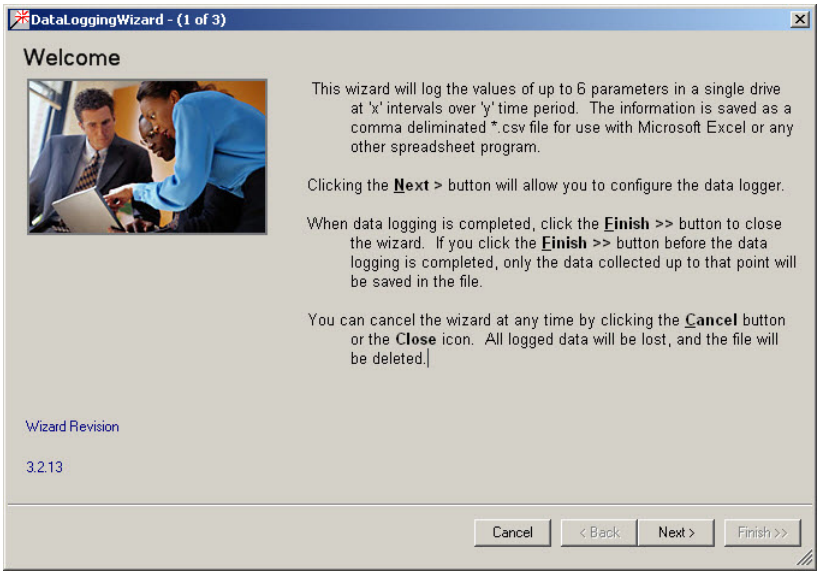
Configuration Example

1. Connect to the drive that you want to trend via DriveExecutive, DriveExplorer, Logix Designer Drive AOPs, or Connected Components Workbench software tool.
2. Click the Show Wizard icon  .

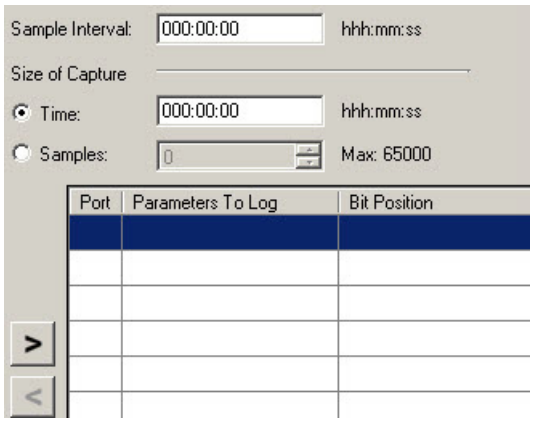
Depending if you click the wand icon or down arrow icon a particular wizard selection dialog box appears. Select the Data Logging Wizard.



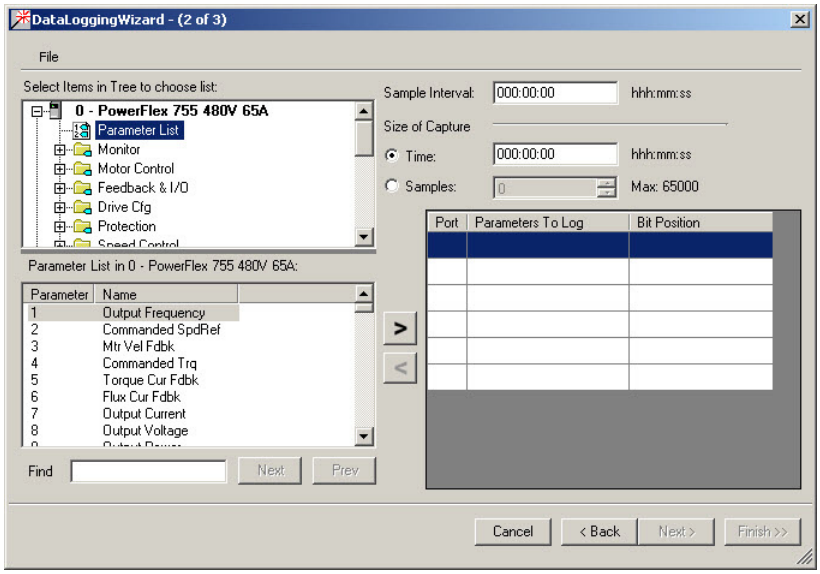
3. Once the Welcome screen loads, click Next.



The data logging wizard can be configured to log up to six parameters at a minimum sample rate of one second for a specified time or number of samples.



4. To find a parameter that you want to log, select the Port, and then scroll through the parameter lists, file folders, diagnostic items or use the find function.



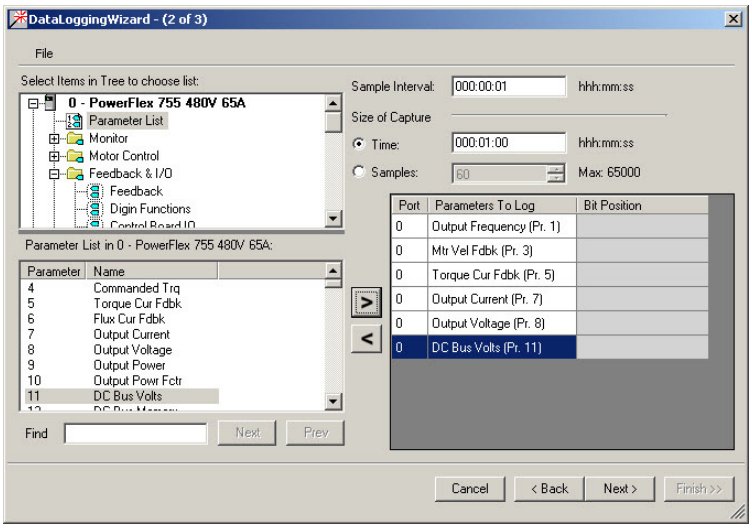
5. To add the parameter to the data log list, select the parameter on the left-side list and click the right arrow  .

   That parameter appears in the first available line entry on the right side.

6. To remove a parameter from the data log list, select the parameter on the right side and click the left arrow  .

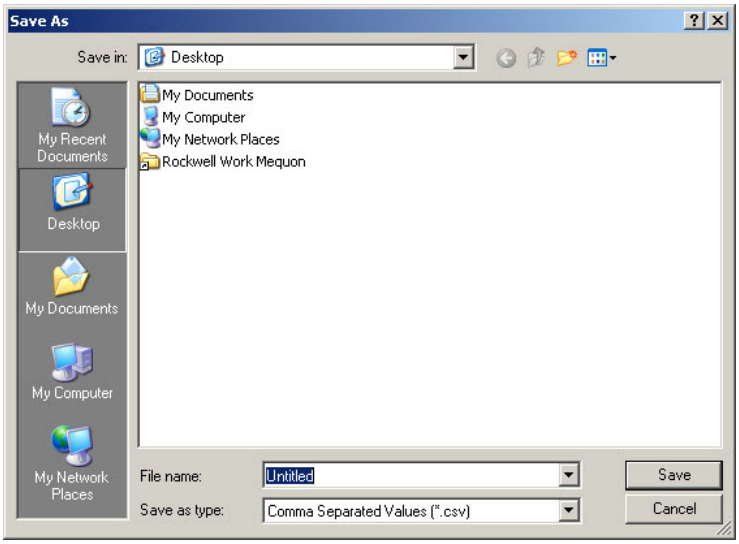
   That parameter disappears from that line entry and all subsequent entries are moved up.

In the configuration example below, the data logging wizard is configured to log six drive parameters consisting of Output Frequency, Motor Velocity Feedback, Torque Current Feedback, Output Current, Output Voltage, and DC Bus Voltage parameter values.



7. Click Next.

This prompt for a save as dialog box that saves the data log information as a comma delimited *.csv file for use with Microsoft Excel or any other spreadsheet program.



8. To start the data logging, click Save.

   As the data logging begins, a Time Left timer counts down as a blue progress bar moves to the right.

   When the data logging has finished, a Logging Complete message is displayed.

   Each column's width is adjustable.

Below is a spreadsheet example of data logged. Use a spreadsheet program to open the *.csv file.

	A	B	C	D	E	F	G	H	I	J	K

Energy Savings

Setting the motor control mode P35 [Motor Ctrl Mode] to 2 “Induct Econ” or Induction Economizer mode enables additional energy savings within the drive. To be specific, additional energy savings can be realized in constant torque applications that have constant speed reduced load periods.

Induction Economizer

Induction Economizer mode consists of the sensorless vector control with an additional energy savings function. When steady state speed is achieved, the economizer becomes active and automatically adjusts the drive output voltage based on applied load. By matching output voltage to applied load, the motor efficiency is optimized. Reduced load commands a reduction in motor flux current.

To optimize the performance of the Induction Economizer mode, adjust the following parameters:

- P47 [Econ At Ref Ki] - Integral gain that determines the response of the output voltage when the output frequency is at reference.
- P48 [Econ AccDec Ki] - Integral gain that determines the response of the output voltage when the output frequency is accelerating or decelerating to the reference setpoint.
- P49 [Econ AccDec Kp] - Proportional gain that determines the response of the output voltage when the output frequency is accelerating or decelerating to the reference setpoint.

High Speed Trending

The high speed trending wizard configures the internal trending of the drive, downloads that trend configuration to the drive, and uploads the trended data from the drive when finished. This information is saved as a comma delimited *.csv file for use with Microsoft Excel or any other spreadsheet program.

The high speed trending can be configured to trend up to eight parameters with 4096 samples for each parameter, at a minimum sample rate of 1.024 milliseconds. It can also be configured to trend up to four parameters with 1024 samples for each parameter, at a minimum sample rate of 256 microseconds. These are defined by the drive. Future drives may offer different options.

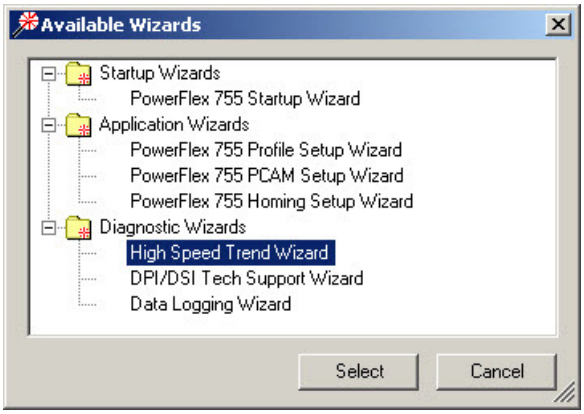
The PowerFlex 755 drives have the High Speed Trending functionality. PowerFlex 753 drives do not have the High Speed Trending functionality.

You can run only one wizard at a time.

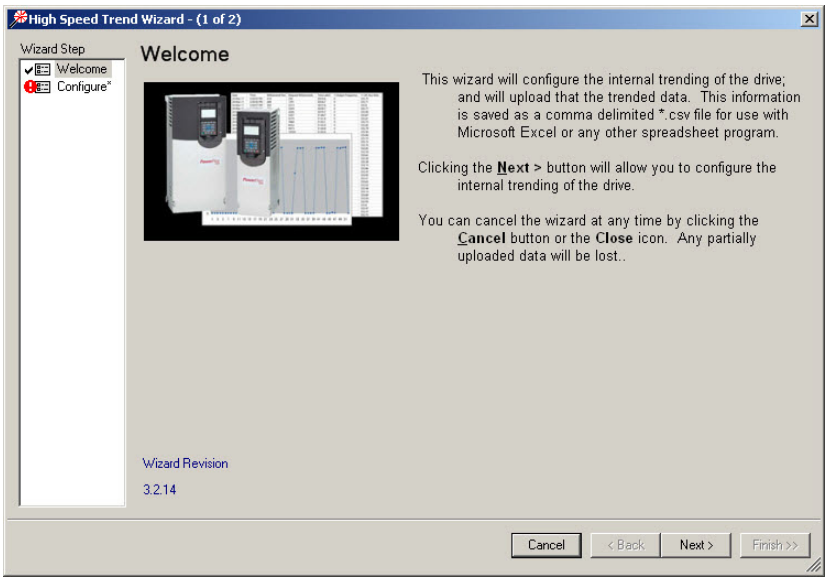
Configuration Example

1. Connect to the drive that you want to trend via DriveExecutive, DriveExplorer, Logix Designer Drive AOPs, or Connected Components Workbench software tool.
2. Click the Show Wizard icon  .

   Depending if you click the wand icon or down arrow icon a particular wizard selection dialog box appears.
3. Select the High Speed Trend Wizard.



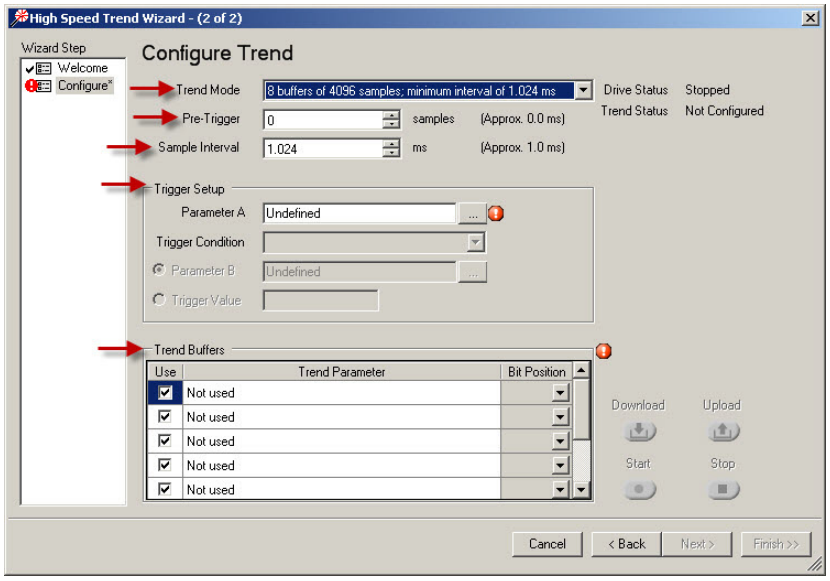
4. Once the Welcome screen loads, Click Next.



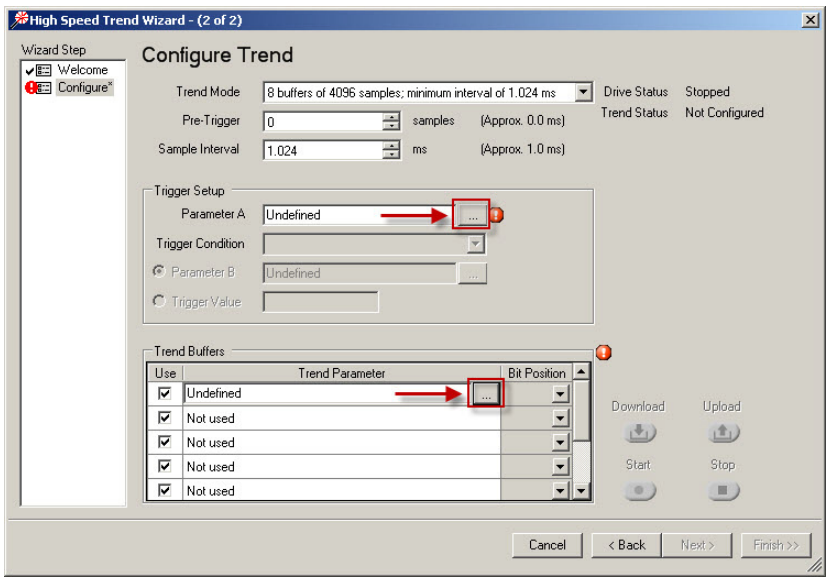
The Configure Trend window lets you customize the following high speed trend details:

- Trend Mode – dictates number of trend buffers, total number of samples, and the minimum interval sample rate.
- Pre-Trigger samples – dictates number of samples to include in the trend before the trigger.
- Sample Interval – the time interval between trend data samples.
- Trigger Setup – dictates how the data trend is triggered
  a. Comparing two parameters
  b. Comparing a parameter against a constant
  c. A test bit in a parameter

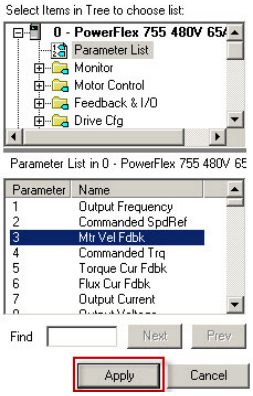
- Trend Buffers – dictates the drive and/or peripheral parameters and diagnostic items that are trended.



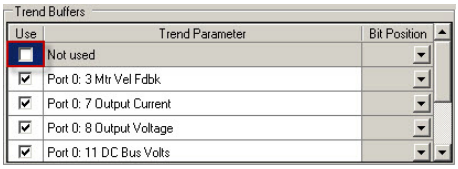
5. To configure the Trigger Setup and Trend Buffers, click the Ellipse button ... .



6. Select the parameter that you want to log by selecting the Port, and then scroll through the parameter lists, file folders, diagnostic items or use the find function and click Apply.



The best way to remove a parameter selection is to uncheck the check box in the Use column.



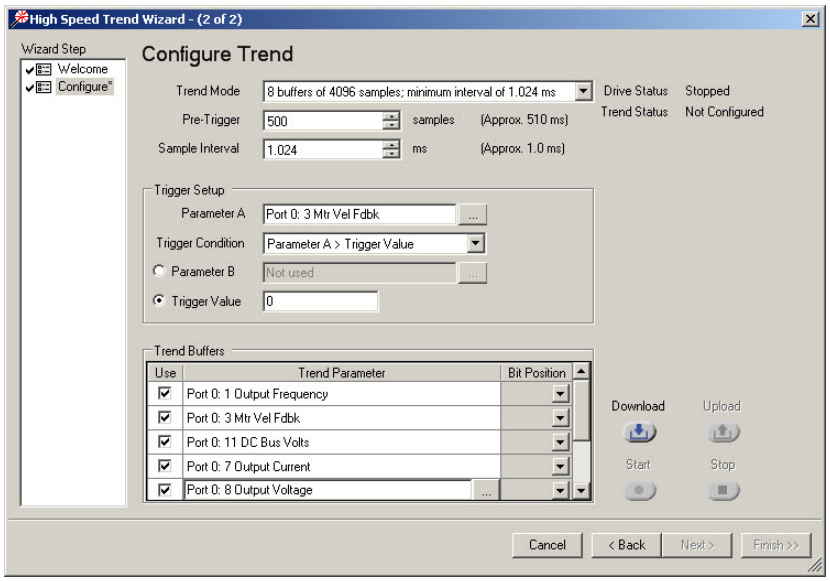
"Not used" is downloaded instead of the selected parameter. The next time you launch the wizard, that buffer has no parameter set.

In the example below, the trend buffers are configured with five drive parameters consisting of Output Frequency, Motor Velocity Feedback, DC Bus Voltage, Output Current, Output Voltage parameter values. The trend is configured for a total of 4096 samples that include 500 samples before the trigger, at a sample rate of 1.024 ms. The trigger of the high speed trend is the Motor Velocity Feedback greater than zero.

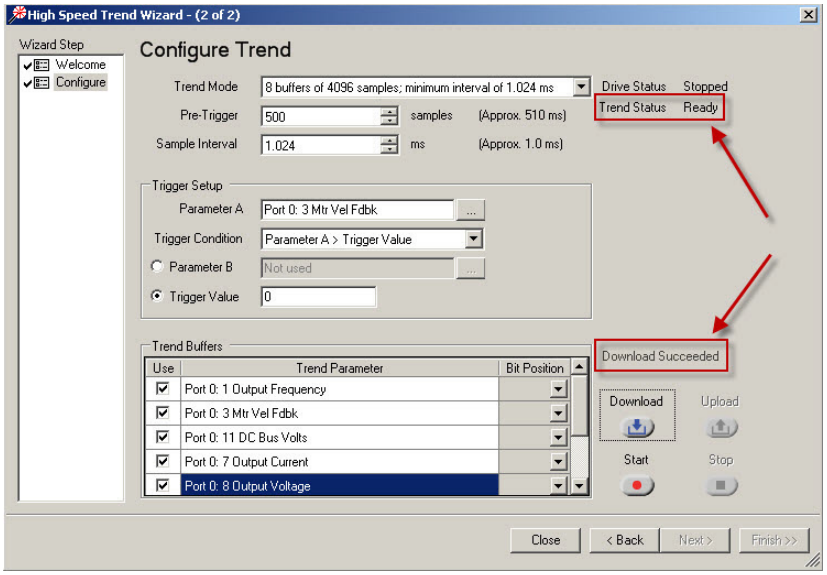
This means the following:

- The drive starts trending.
- When the motor starts rotating forward, the trend starts wrapping up.
- The drive continues trending for about 3.7 seconds to use up the remaining 3596 samples.

- The drive stops trending and is ready for uploading.



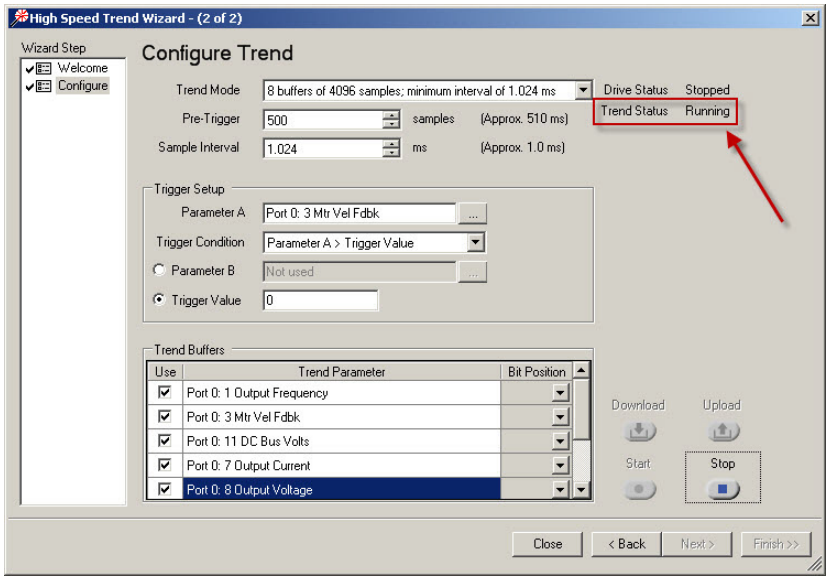
7. Click Download  once the Download Succeeded message has appeared and the Trend Status is Ready.



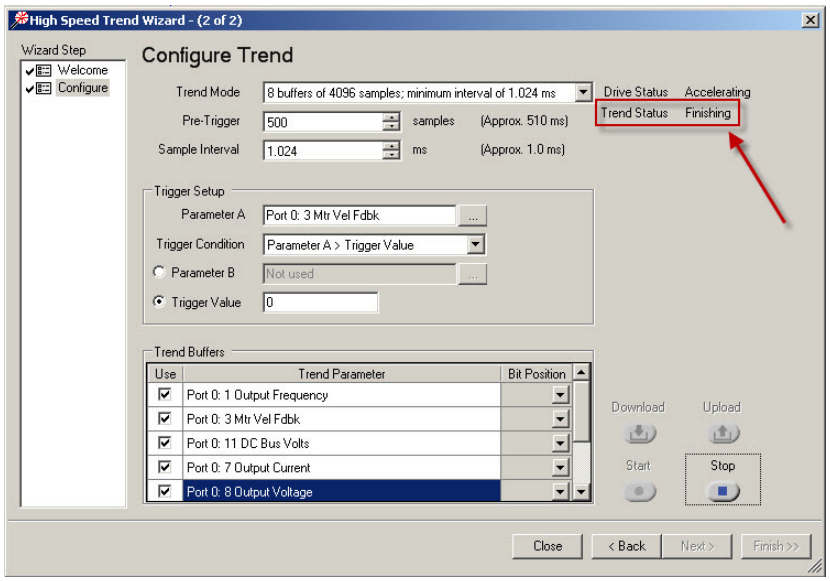
8. Click Start 

.

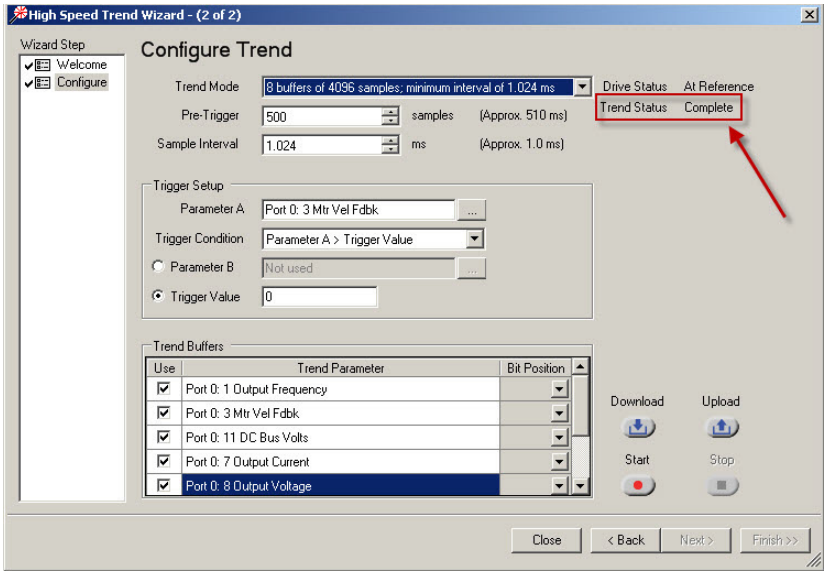
The Trend Status is Running and Download, Upload and Start buttons are unavailable.



The trending is in process when you see the Trend Status is in the Finishing state. You can stop the trend at any point in time by clicking Stop. You can then upload all of the data gathered so far.

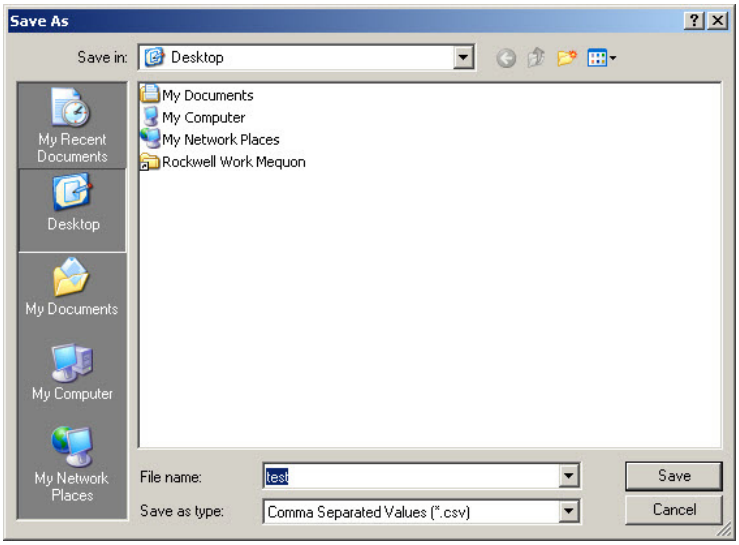


The trending has ended when the Trend Status has changed from Finishing state to the Complete state.

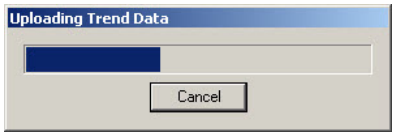


Click Upload 

. This prompts a process that uploads the trend data from the drive and saves the information as a comma delimited *.csv file for use with Microsoft Excel or any other spreadsheet program.



Click Save to start the upload trend data process.



Below is an example of trended data. Use a spreadsheet program to open the *.csv file.

	A	B	C	D	E	F

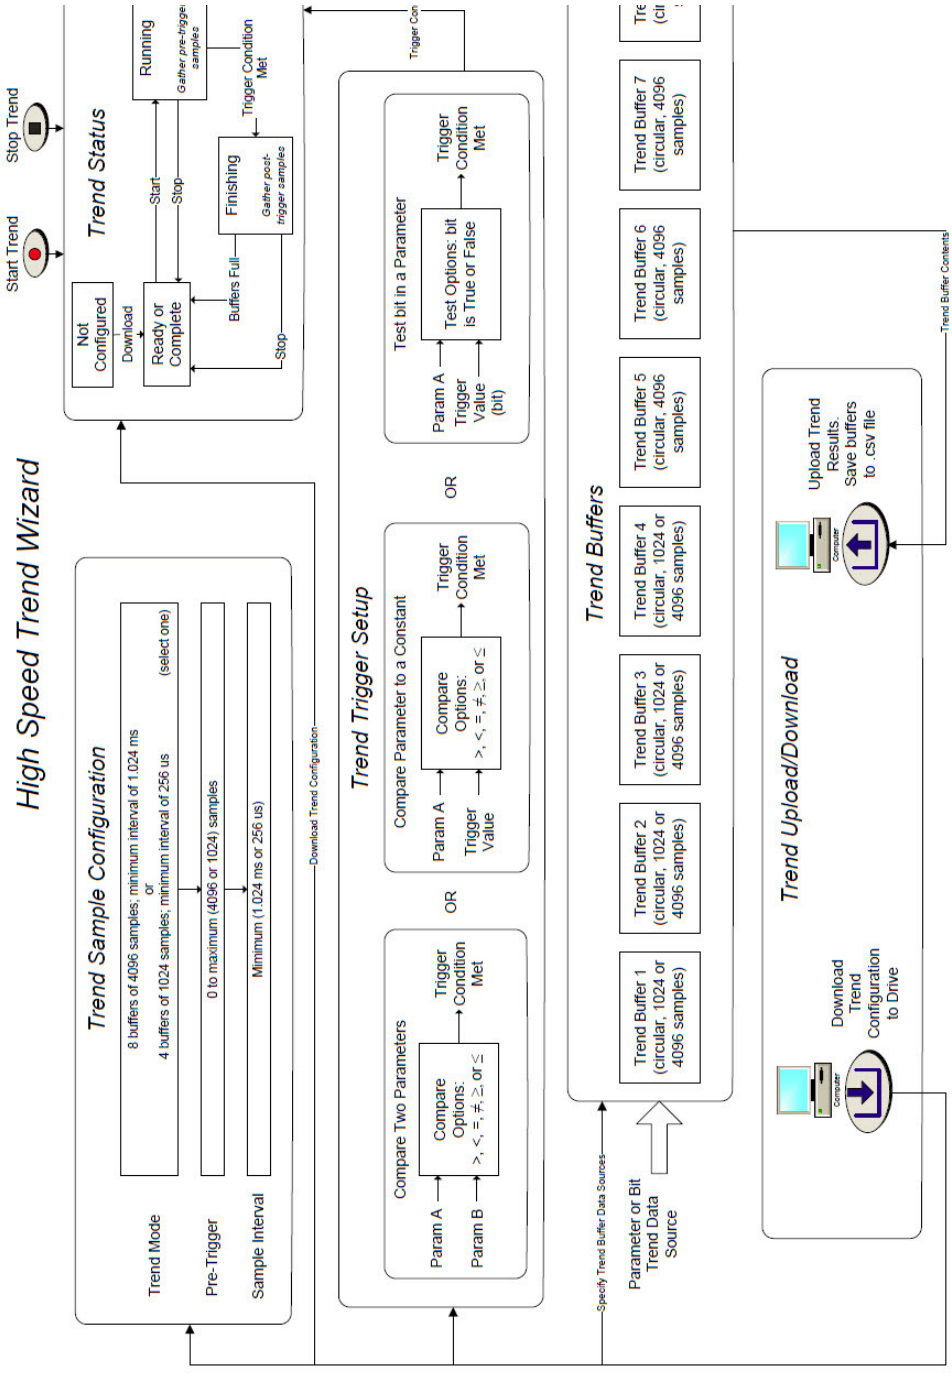
Column C here lines up with what is displayed in DriveExplorer or any other drive software tool. Column D shows the value that the drive is using internally. Column D has more accurate data, but you may not have a use for the extra precision. You cannot get the data in column D from any other wizard or software tool.

Block Diagram



Position Homing

The Homing function is a standalone function of the drive that moves the motor to a home position defined by a switch that is connected to a homing input on a feedback option module, digital input resident on the Main Control Board, or on an I/O option module if there is no feedback module. This function is typically run only once after the drive is powered up or if the drive has become lost. If a universal feedback option module is used, the homing input is part of the general Registration hardware. To perform the homing sequences that require this module, the drive has to configure the Registration function on the module itself.

If a Position Absolute move is made, it is necessary to have performed either a Find Home or a Position Redefine procedure at some time after drive powerup. Until this is done, Bit 19 "Home Not Set" in [Profile Status] remains set, preventing the profile from executing.

The Find Home state is entered from the Initialize Step state when the profile is enabled with the Find Home bit set in the Profile Command parameter. The drive performs a procedure to establish the home position. The procedure consists of a move in Speed mode at the specified Find Home Speed. A digital input is used to sense when the home position limit switch has been traversed. If there is an encoder, the registration logic is used to latch the motor position when the limit switch is reached as the home position. The Find Home function handles three possible cases; Switch and Marker, Switch only, and Marker only.

Homing Input Selection

With Feedback Device
Both the universal feedback option modules and the encoder feedback option modules provide a dedicated homing input. The homing input on the feedback module that is selected by P135[Pos Fdbk Sel] is used for homing. If the marker pulse from an encoder is used in the homing function it is also selected by P135[Pos Fdbk Sel].

Without Feedback Device
If the drive does not have a feedback module and a selection in P135[Psn Fdbk Sel] of "simulator feedback" is made the homing input that the drive uses is selected from any digital inputs residing on an attached I/O module by P734 [DI OL Home Limit]. There is no marker pulse input associated with "open loop" homing.

Homing Activation

A homing function can be selected by either a digital input or a parameter. The digital input is selected from any digital inputs residing on an attached I/O module by Find Home or Return Home. To select the homing function from a parameter set Bit 0 “Find Home” or Bit 3 “Return Home” of P731 [Homing Control]. The homing sequence can be selected regardless of the mode selected in P313 [Actv SpTqPs Mode]. If the drive has a feedback option module, a vector type control must be selected in P35 [Motor Cntl Mode] parameter. If there is no feedback option module, any type of control can be selected.

When the Find Home function is selected by either a digital input or a parameter, either Bit 1 “Home DI” or Bit 2 “Home Maker” or both must be selected in P731 [Homing Control].

When the Return Home function is selected by either a digital input or a parameter, a selection of Bit 1 “Home DI” or Bit 2 “Home Maker” of P731 [Homing Control] is ignored.

To activate a Homing function, a drive start command is required if the drive is stopped. If a drive is running, the drive must be “At Zero Speed” state when the function is selected.

Drive Stopped During Activation
If the drive is stopped, a start command to drive is required to activate a homing sequence.

Drive Started and “At Zero Speed” During Activation
If the drive has already started and “At Zero Speed” the rising edge or toggled bit activates and latches the homing sequence.

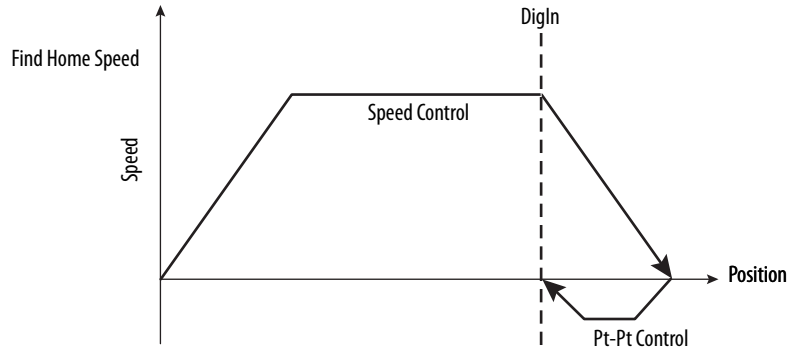
Drive Started and not “At Zero Speed” During Activation
If the drive has already started and not “At Zero Speed” the rising edge is ignored and the homing sequence will not start.

Homing to Limit Switch with Feedback

Upon activation of homing the drive starts moving in Speed Control mode, and ramp to the speed and direction set in P735 [Find Home Speed] at the rate set in P736 [Find Home Ramp]. When the limit/proximity switch is reached the “Homing Input” is set. The position count is latched and is considered the home position count. The drive then ramps to zero at the rate set in P736 [Find Home Ramp]. The drive then performs a point-to-point position move back to the home position count in speed of 1/10 of P735 [Find Home Speed]. When the motor is “At Position” and “At Zero Speed,” the homing sequence is complete.

NOT Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position and transferring position reference back to its previous source. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running holding zero velocity and transferring velocity reference back to its previous source.

Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position; the drive then transfers position reference back to its previous source once it receives a start command. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running holding zero velocity; the drive then transfers velocity reference back to its previous source once it receives a start command.

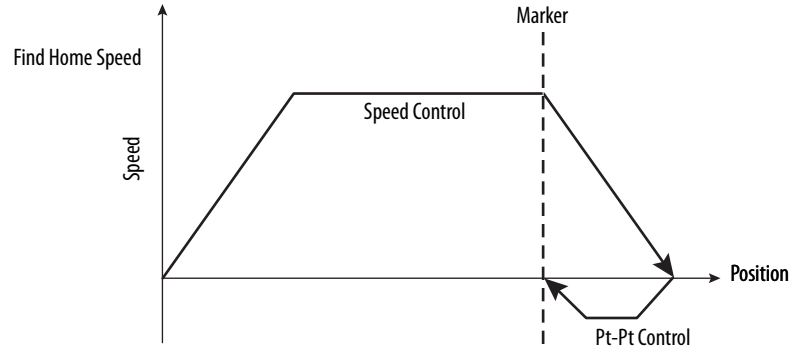


Homing to Marker Pulse with Feedback Upon activation of homing the drive starts moving in Speed Control mode, and ramps to the speed and direction set in P735 [Find Home Speed] at the rate set in P736 [Find Home Ramp]. When the Marker Pulse input is set the position count is latched and is considered the home position count after the marker pulse is reached, the drive then ramps to zero in P736 [Find Home Ramp]. The drive then performs a point-to-point position move back to the home position count in speed of 1/10 of P735 [Find Home Speed]. When the motor is "At Position" and "At Zero Speed," the homing sequence completes.

NOT Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position and transferring position reference back to its previous source. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running holding zero velocity and transferring velocity reference back to its previous source.

Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position; the drive then transfers position reference back to its previous source once it receives a start command. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running

holding zero velocity; the drive then transfers velocity reference back to its previous source once it receives a start command.



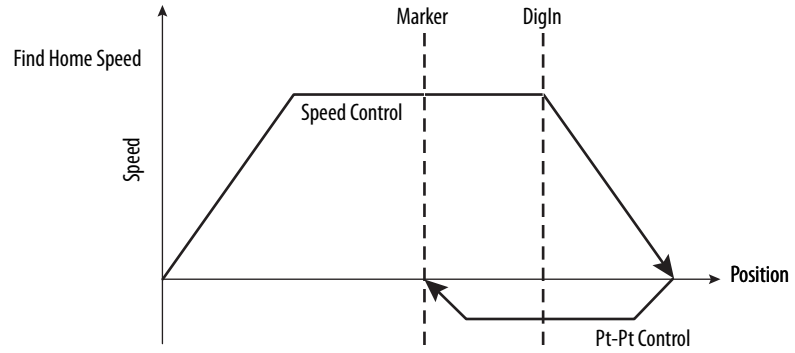
Homing to Switch and Marker Pulse with Feedback

Upon activation of homing the drive starts moving in Speed Control mode, and ramp to the speed and direction set in P735 [Find Home Speed] at the rate set in P736 [Find Home Ramp]. As the motor moves toward the limit/proximity switch, the marker pulse is triggering a register on the feedback module to latch the current position count. When the limit/proximity switch is reached the "Homing Input" is set. The last maker pulse position count that was latched prior to the "Homing Input" being set is considered the home position count. The drive then ramps to zero at the rate set in P736 [Find Home Ramp]. The drive then performs a point-to-point position move back to the home position count in speed of 1/10 of P735 [Find Home Speed]. When the motor is "At Position" and "At Zero Speed", the homing sequence completes.

NOT Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position, and transferring position reference back to its previous source. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running holding zero velocity and transferring velocity reference back to its previous source.

Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position; the drive then transfers position reference back to its previous source once it receives a start command. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running

holding zero velocity; the drive then transfers velocity reference back to its previous source once it receives a start command.



Find Home DI without Feedback Device

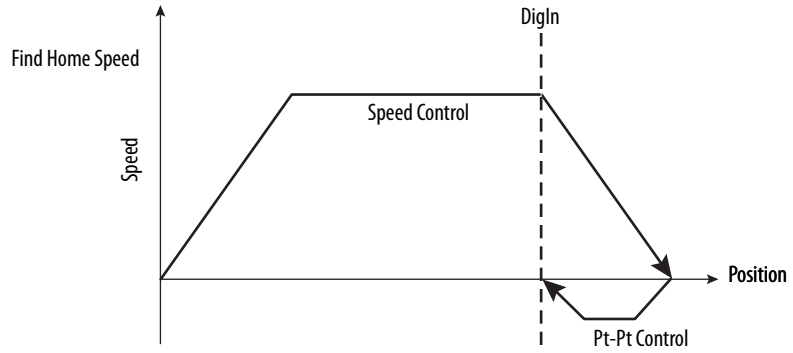
Upon activation of homing the drive starts moving in Speed Control mode, and ramp to the speed and direction set in P735 [Find Home Speed] at the rate set in P736 [Find Home Ramp]. When the limit/proximity switch is reached the "Homing Input" is set.

If P35 [Motor Ctrl Mode] = 3 "Induction FV" P847 [Psn Fdbk] count is latched and is considered the home position count. The drive then ramps to zero at the rate set in P736 [Find Home Ramp]. The drive then performs a point-to-point position move back to the home position count in speed of 1/10 of P735 [Find Home Speed]. When the motor is "At Position" and "At Zero Speed, the homing sequence completes.

NOT Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position and transferring position reference back to its previous source. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running holding zero velocity and transferring velocity reference back to its previous source.

Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position; the drive then transfers position reference back to its previous source once it receives a start command. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running

holding zero velocity; drive then transfers velocity reference back to its previous source once it receives a start command.



If P35[Motor Ctrl Mode] = 0 "Induction VHz" or 1 "Induction SV"
The drive then ramps to zero at the rate set in P736 [Find Home Ramp].

If the drive travels passed the proximity switch during decel
The drive reverses direction at a speed of 1/10 of P735 [Find Home Speed]. The drive must then receive a rising edge of the proximity switch followed by a falling edge pulse. Upon receiving the falling edge pulse the drive will decel at the rate set in P736 [Find Home Ramp]. When the motor is "At Zero Speed," the homing sequence completes.

If the drive remains on proximity switch during decel
The drive reverses direction at a speed of 1/10 of P735 [Find Home Speed]. When the falling edge of the limit/proximity switch is reached the drive will decel at rate set in P736 [Find Home Ramp]. When the motor is "At Zero Speed," the homing sequence completes.

NOT Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position and transferring position reference back to its previous source. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running holding zero velocity and transferring velocity reference back to its previous source.

Hold At Home, P731 Bit 7
If a position control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running, holding position; the drive then transfers position reference back to its previous source once it receives a start command. If velocity control type mode is selected in P313 [Actv SpTqPs Mode] the drive continues running

holding zero velocity; drive then transfers velocity reference back to its previous source once it receives a start command.

Additional Resources for Integrated Motion on the EtherNet/IP Network Information

These documents contain additional information on the Integrated Motion on the EtherNet/IP Network for PowerFlex 755 AC drive applications.

Resource	Description
PowerFlex 750-Series Drive Programming Manual, publication 750-PM001	Provides detailed information on: • I/O, control, and feedback options • Parameters and programming • Faults, alarms, and troubleshooting
PowerFlex 750-Series Drive Installation Instructions, publication 750-IN001	Provides instructions for: • Mechanical installation • Connecting incoming power, the motor, and basic I/O
PowerFlex 750-Series Drive Technical Data, publication 750-TD001	Provides detailed information on: • Drive specifications • Option specifications • Fuse and circuit breaker ratings
Integrated Motion on the Ethernet/IP Network User Manual, publication MOTION-UM003	Use this manual to configure an Integrated Motion on the Ethernet/IP network application and to start up your motion solution using the ControlLogix™ system.
Logix5000 Controllers Motion Instructions Reference Manual, publication MOTION-RM002	Provides details about the motion instructions that are available for a Logix5000 controller.
Kinetix® Motion Control Selection Guide, publication GMC-SG001	This selection guide is meant to help make initial decisions for the motion control products best suited for your system requirements. In addition, there are technical data publications with product specifications and design guide publications with selection information, specific to each drive family, to determine the accessories needed for your application. The design guides also include the recommended motor cables, performance specifications, and torque/speed (rotary) and force/velocity (linear) curves for each drive and motor/actuator combination.

You can view or download publications at http:/www.rockwellautomation.com/literature/. To order paper copies of technical documentation, contact your local Allen-Bradley distributor or Rockwell Automation sales representative.

Software Tools

Integrated Architecture Builder can be downloaded at: http://www.rockwellautomation.com/en/e-tools/configuration.html

Motion Analyzer can be downloaded at: http://motion-analyzer.com/

Coarse Update Rate

The position loop for the PowerFlex 755 drive is updated at a rate of 1.024 ms (1024 µsec). During each position loop update the drive can either read or write data to the embedded Ethernet port, but cannot do both operations during the same update. Therefore the drive can receive only new updates every other position loop update event. To read new information from the Motion Planner (that is controller), the minimum coarse update rate must be 2.5 ms or greater to be sure that no data packets are lost. If the PowerFlex 755 drive is operated at a coarse update rate of less than 2.5 ms, data packets can be lost (resulting in the drive interpolating between missed updates), and/or the drive can fault if enough data packets are missed consecutively. Rockwell Automation recommends a minimum coarse update rate of 3 ms for the PowerFlex 755 drive.

Control Modes for PowerFlex 755 Drives Operating on the Integrated Motion on the EtherNet/IP Network

Integrated Motion on the EtherNet/IP network is a feature available with firmware revision 2.xxx and later for PowerFlex 755 drives. This feature provides a common user experience as with Kinetix 6500 drives when used with Logix controllers, revision 19 and later, on the EtherNet/IP network:

- The same motion profile provides a common configuration experience. The PowerFlex 755 drive uses the Motion Properties/Axis Properties and the same motion attributes as the Kinetix 6500 drive.
- The same motion instructions provide a common programming experience.

Refer to the Integrated Motion on EtherNet/IP appendix in the PowerFlex 750-Series Programming Manual, publication 750-PM001, for more information.

Motion Drive Start (MDS) Instruction

For information regarding the MDS instruction, refer to the Logix5000 Controllers Motion Instructions Reference Manual, publication MOTION-RM002.

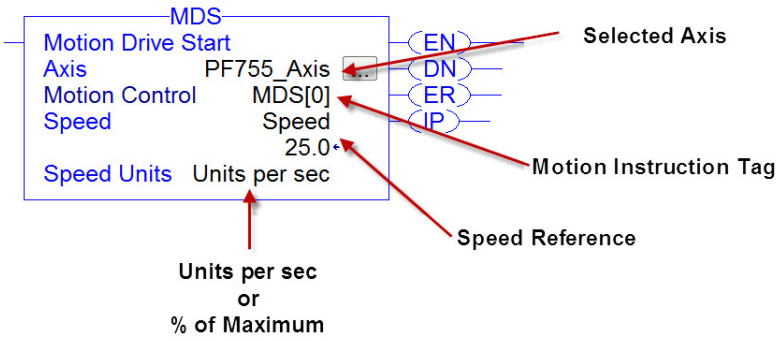
For the PowerFlex 755 drive, the MDS instruction is valid only when the axis configuration is set to one of these control modes:

- Frequency Control
- Velocity Loop
- Torque Loop

The MDS instruction is not valid when the axis configuration is set to Position Loop.

Motion Drive Start Instruction Configuration

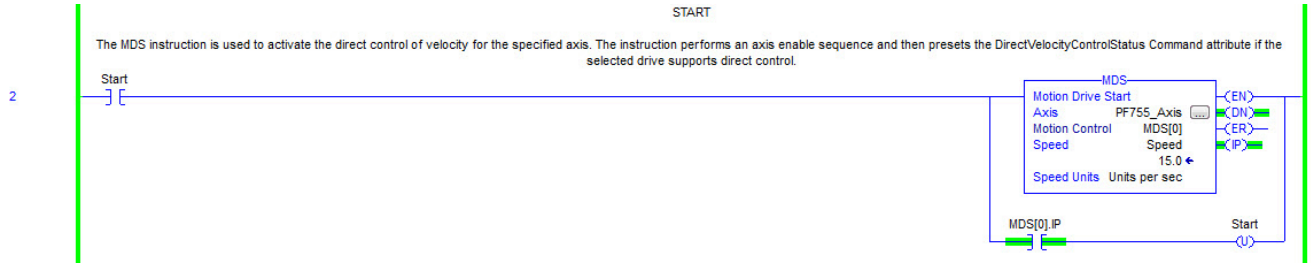
The MDS instruction is configured in a similar fashion to most motion instructions, as seen in this example.



The MDS instruction is similar to a Motion Axis Jog (MAJ) instruction, however the MDS instruction does not set the acceleration/deceleration rates. The acceleration rate is dynamically set by the ramp attributes configured in a Set System Value (SSV) instruction. See Ramp Attributes on page 304. Note that PF755_Axis was configured for revolutions. Therefore, the speed units are revs/sec.

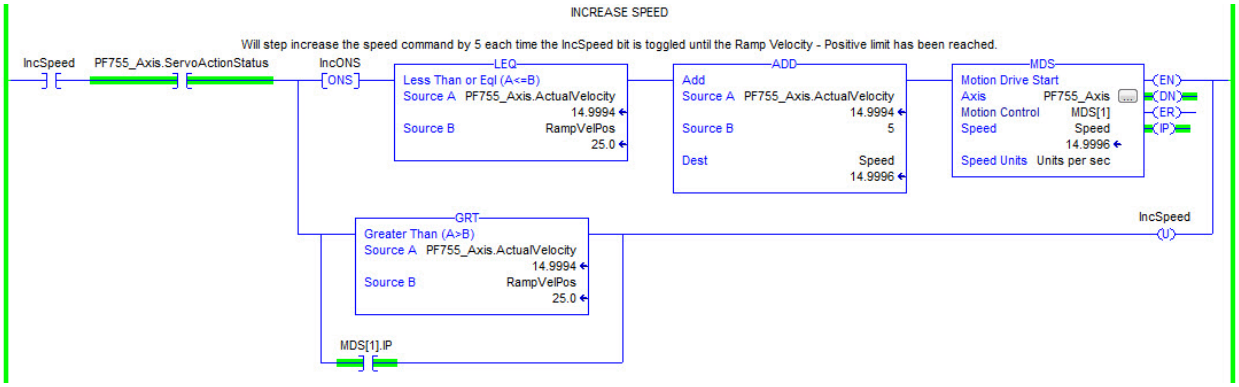
Motion Drive Start (MDS) Sample Code

Start



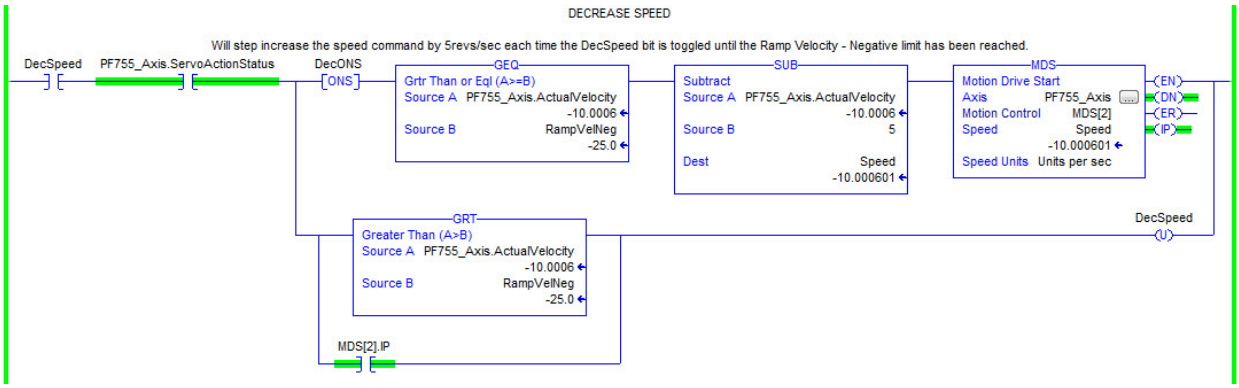
Increase Speed

The speed is changed by updating the speed reference and then re-executing the MDS instruction.



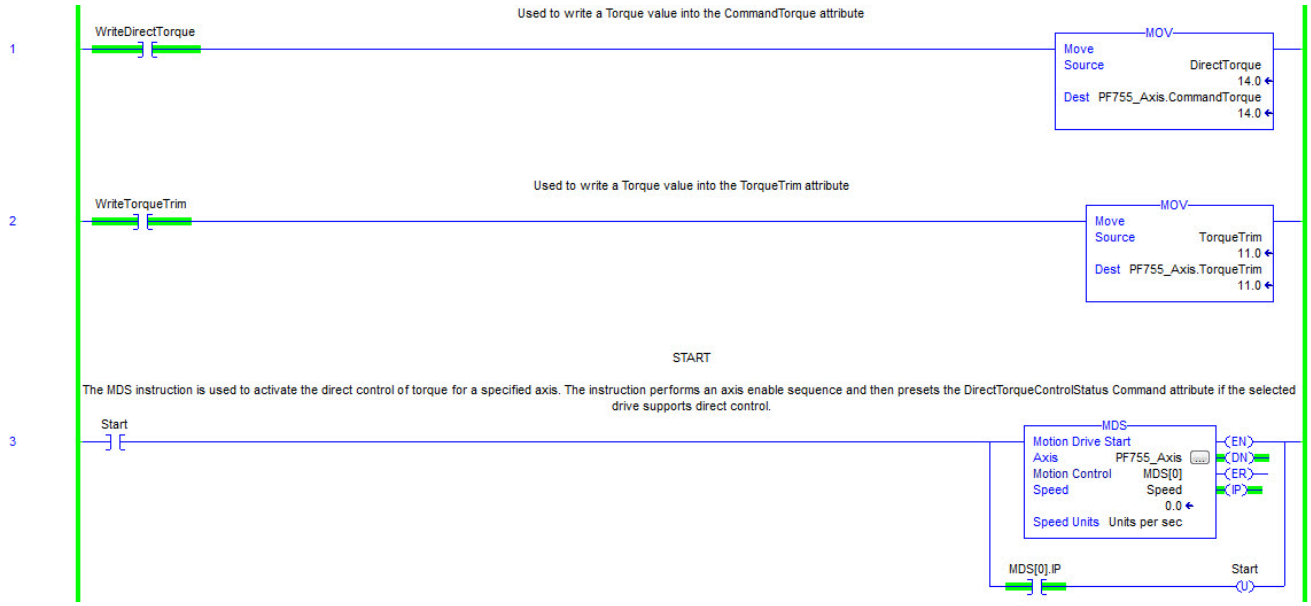
Decrease Speed

The speed is changed by updating the speed reference and then re-executing the MDS instruction.



Torque Mode

When the axis configuration is in Torque Loop, the Speed attribute within the MDS instruction is not used to command the speed of the drive. The speed is determined by the amount of torque specified in the CommandTorque and/or TorqueTrim attributes.



IMPORTANT You must command zero torque in the CommandTorque and TorqueTrim attributes before you use the Motion Axis Stop (MAS) instruction to stop a specific motion process on an axis or to stop the axis completely. To use the MAS instruction, you must set Change Decel to No. Otherwise an instruction error can occur. The deceleration rate is set based on the Ramp Deceleration attribute. The Motion Servo Off (MSF) instruction is used to deactivate the drive output for the specified axis and to deactivate the axis' servo loop. If you execute an MSF instruction while the axis is moving, the axis coasts to an uncontrolled stop.

Ramp Attributes

The MDS instruction is validated if the Integrated Motion on EtherNet/IP drive device supports the following five ramp attributes:

- RampAcceleration
- RampDeceleration
- RampVelocity - Positive
- RampVelocity - Negative
- RampJerk - Control

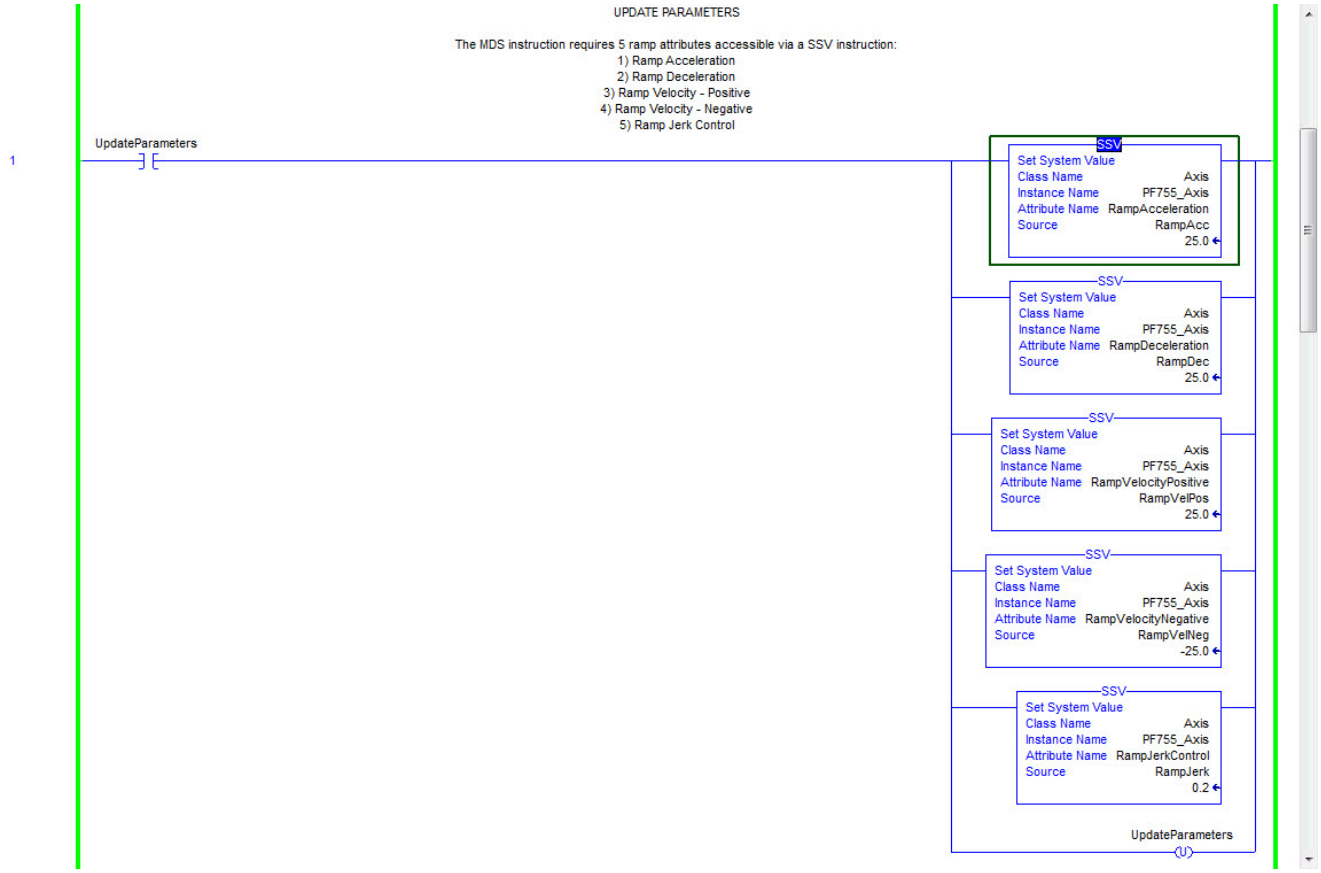
These ramp attributes are available only when the PowerFlex 755 drive axis configuration is set to Frequency Control or Velocity Loop. These ramp attributes are **not** available when the axis configuration is set to Torque Loop or Position Loop.

This table provides a cross reference between the PowerFlex 755 Integrated Motion on the EtherNet/IP Network Motion Ramp Attributes and the corresponding drive parameters.

Ramp Attribute	Drive Parameter
RampAcceleration	P535 [Accel Time 1]
RampDeceleration	P537 [Decel Time]
RampVelocity - Positive	P520 [Max Fwd Speed]
RampVelocity - Negative	P521 [Max Rev Speed]
RampJerk - Control	P540 [S Curve Accel] P541 [S Curve Decel]

Ramp Attribute Sample Code

The Ramp Attributes listed in the previous section are accessible via a Set System Value (SSV) instruction, as shown in this example:

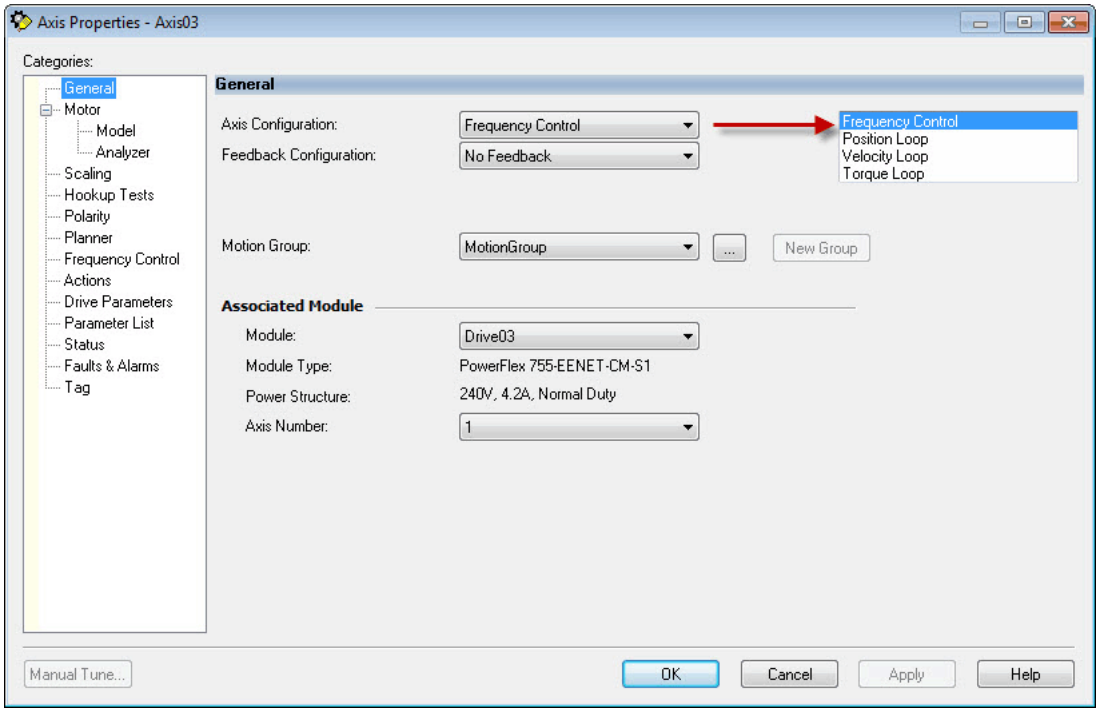


Position Mode, Velocity Mode, and Torque Mode Comparison

The PowerFlex 755 supports the following axis configurations:

- Frequency Control with No Feedback
- Position Loop with Motor Feedback, Dual Feedback or Dual Integral Feedback
- Velocity Loop with Motor Feedback or No Feedback
- Torque Loop with Motor Feedback

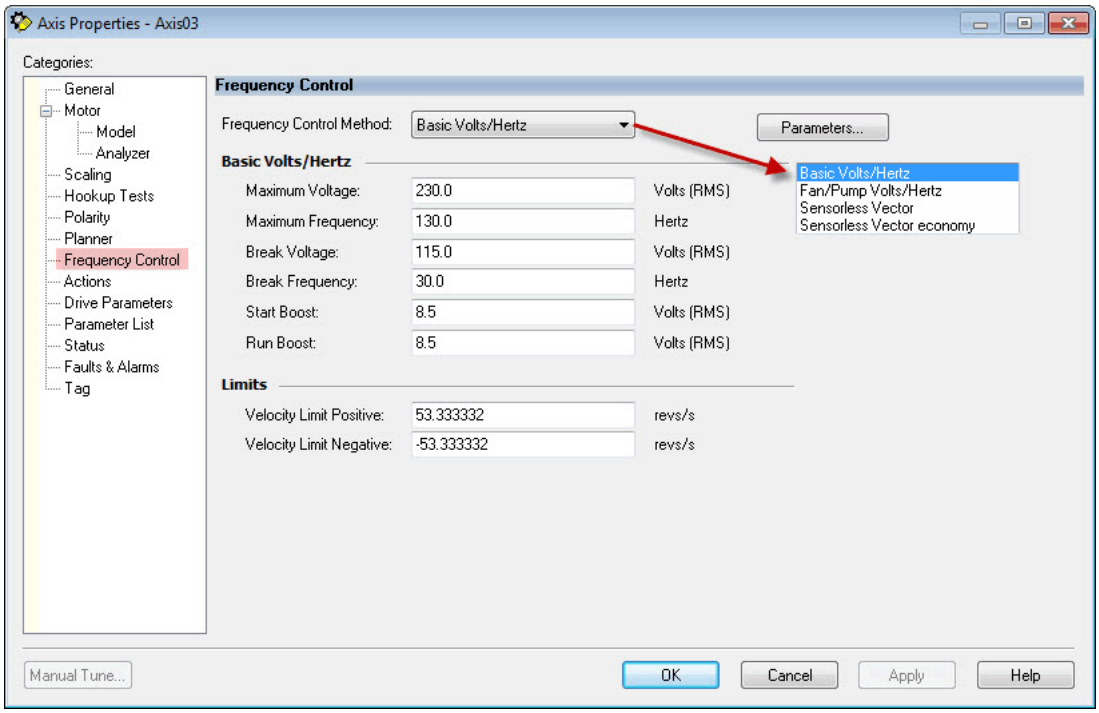
The selection options of the axis configuration within the Logix Designer application, Axis Properties, General tab are shown here.



When the axis configuration is set to Frequency Control, you can select one of the following control methods that best suits the application:

- Basic Volts/Hertz
- Fan/Pump Volts/Hertz
- Sensorless Vector
- Induction FV

The selection options of the axis configuration within the Logix Designer application Axis Properties, Frequency Control tab are shown here.



This table contains the possible axis configurations and corresponding control modes of the PowerFlex 755 drive on the Integrated Motion on the EtherNet/IP Network.

Axis Configuration	P35 [Motor Ctrl Mode]	P65 [VHz Curve]
Frequency Control:		
Basic Volts/Hertz	InductionVHz	Custom V/Hz
Fan/Pump Volts/Hertz	InductionVHz	Fan/Pump
Sensorless Vector	Induction SV	Custom V/Hz
Sensorless Vector economy	Induct Econ	Custom V/Hz
Position Loop	Induction FV	Custom V/Hz
Velocity Loop	Induction FV	Custom V/Hz
Torque Loop	Induction FV	Custom V/Hz

For more detailed examples on PowerFlex 755 axis configurations, refer to the Axis Configuration Examples for the PowerFlex 755 Drive chapter in the Integrated Motion on the Ethernet/IP Network Configuration and Startup User Manual, publication MOTION-UM003.

Frequency Only

For information on the specific Frequency Control details, see the Motion Instructions and Integrated Motion Control Modes appendix in the Logix5000 Controllers Motion Instructions Reference Manual, publication MOTION-RM002.

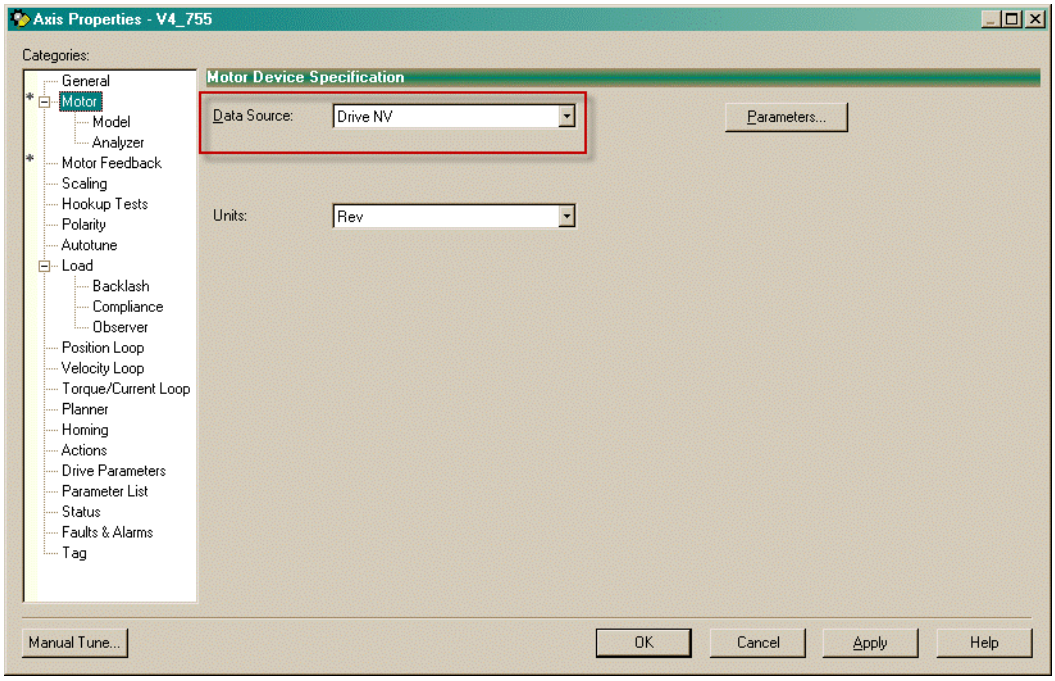
Drive Nonvolatile (NV) Memory for Permanent Magnet Motor Configuration

A Kinetix drive can automatically read configuration data in a permanent magnet motor/encoder's nonvolatile memory, whereas the motor/encoder configuration data must be manually entered and tuned in a PowerFlex 755 drive when configuring the drive and a permanent magnet motor for operation on the Integrated Motion on the EtherNet/IP Network.

The Drive NV option (shown in the screen example below) lets you start up a PowerFlex 755 drive and permanent magnet motor using the motor/encoder data that is entered and stored in the drive's nonvolatile memory. This is useful for a drive running in standalone mode that is being converted to operation on an Integrated Motion on the EtherNet/IP Network.

Use these settings to configure the drive module:

- Verify that the correct motor/encoder data is present in the drive.
- In the Axis Properties for the drive module, select the Motor category, and from the Data Source pull-down menu, choose Drive NV.
- Verify that the feedback selection in the appropriate drive parameter matches the selection in the Motor Feedback category for the axis.

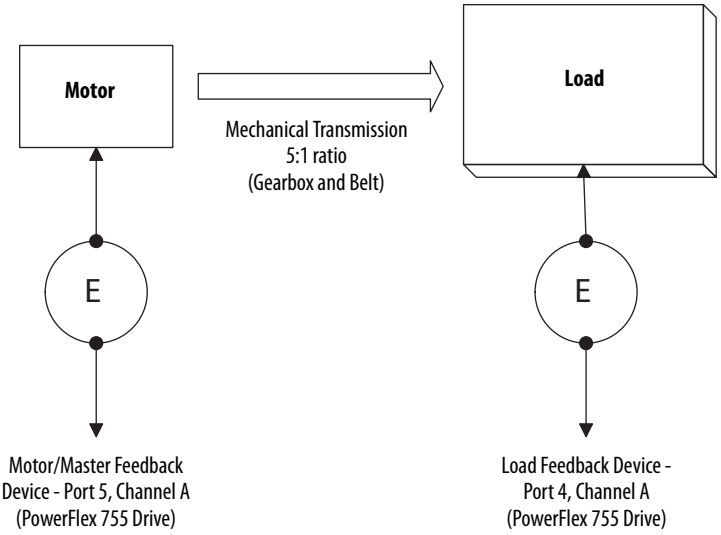


Dual Loop Control

This section explains how to configure a dual loop feedback application by using Integrated Motion on the EtherNet/IP Network for a PowerFlex 755 drive.

Dual Loop Application Description

A dual loop control application uses two encoders, one mounted on the motor (typical), and one mounted on the load (as depicted in this block diagram). The two encoders are connected to the PowerFlex 755 drive via separate feedback option modules, one installed in port 5, and another installed in port 4.

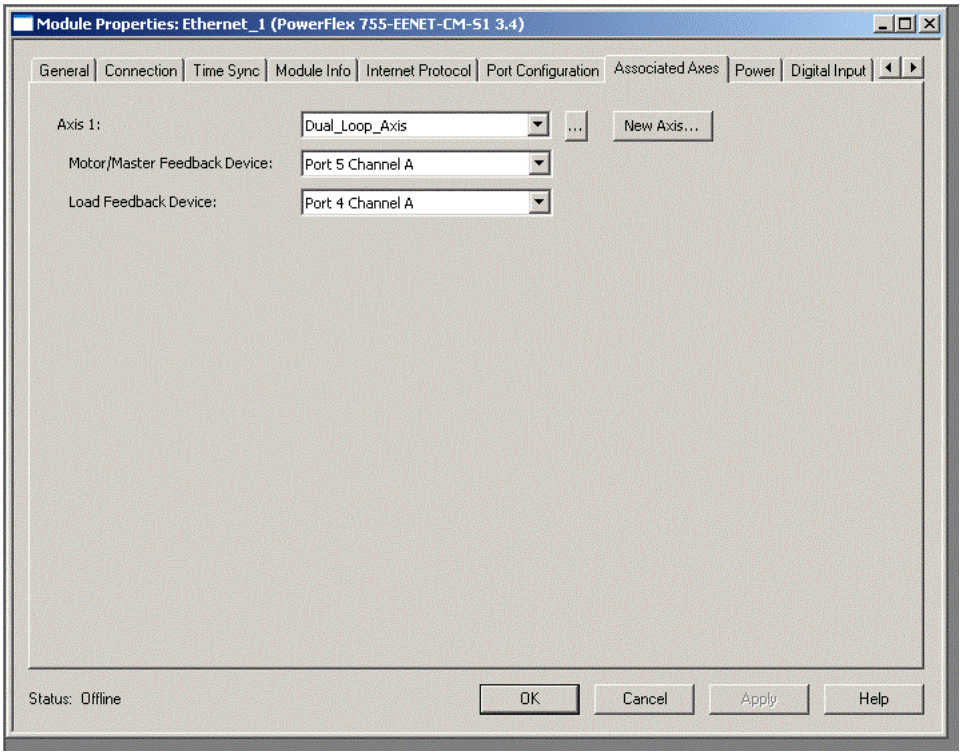


Dual Loop Control Configuration

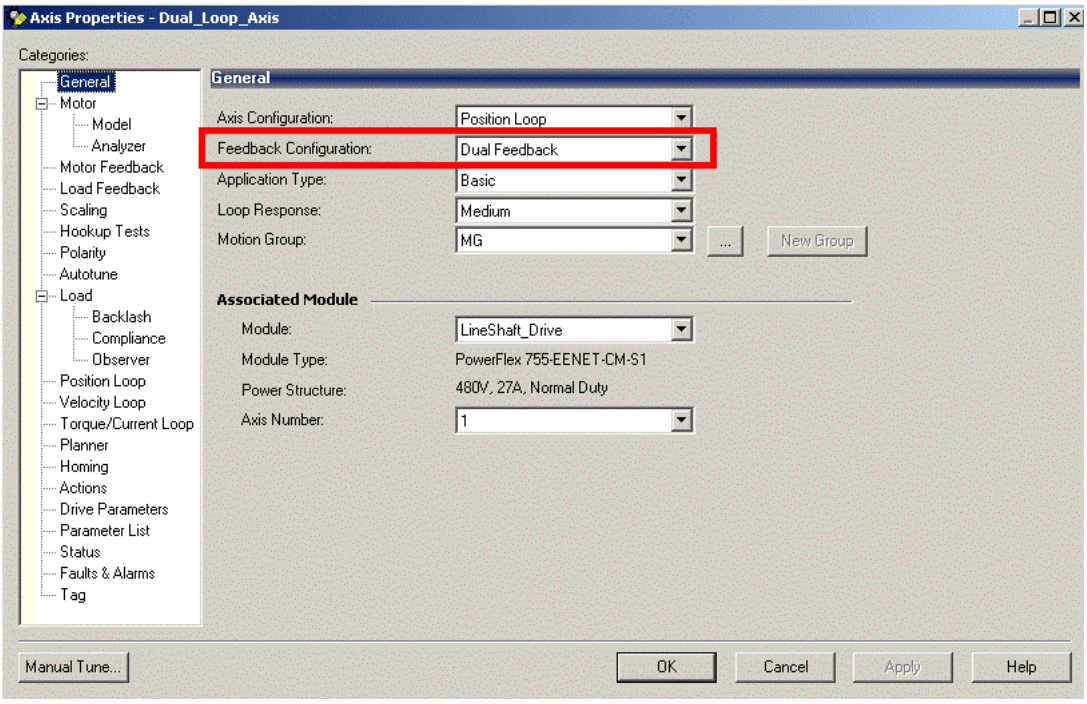
These steps assume that you have created an axis for the PowerFlex 755 drive in the Motion group and added a new PowerFlex 755 drive module in the Logix Designer application. See the Integrated Motion on the EtherNet/IP Network Configuration and Startup User Manual, publication MOTION-UM003, for complete procedures. Follow these steps to configure the dual loop control (encoder) axis.

1. Create a feedback axis in the Motion group for the encoders (Dual_Loop_Axis in this example).

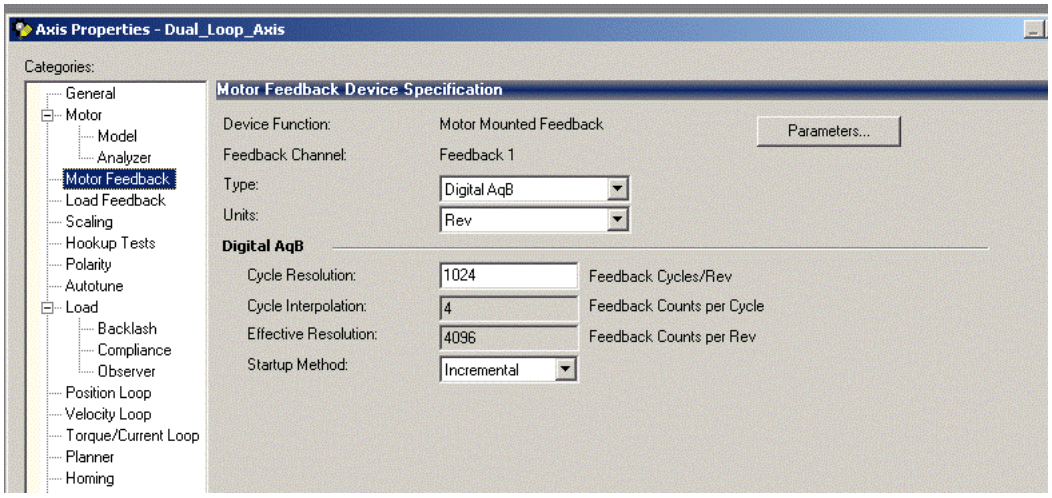
2. Open the PowerFlex 755 drive module and click the Associated Axis tab.
3. From the Axis 1 pull-down menu, choose the feedback axis you created (Dual_Loop_Axis in this example).
4. From the Motor/Master Feedback Device pull-down menu, choose Port 5 Channel A.
5. From the Load Feedback Device pull-down menu, choose Port 4 Channel A.
6. Click OK.



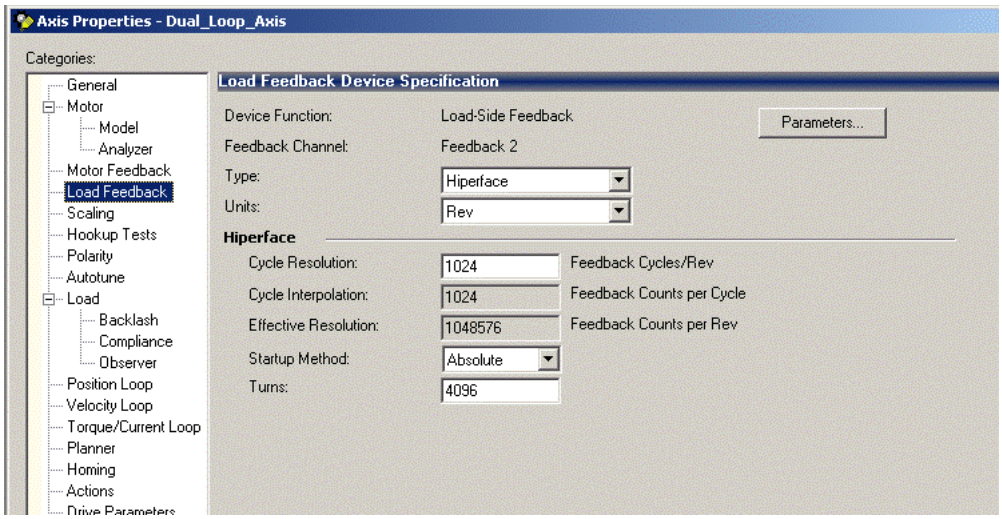
7. Open the Axis Properties for the feedback axis (Dual_Loop_Axis).
8. From the Feedback Configuration pull-down menu, choose Dual Feedback to allow the axis object to accept feedback from two sources.



9. Select the Motor Feedback category.
10. From the Type pull-down menu, choose the appropriate motor feedback.
11. In the Cycle Resolution box, type the appropriate value for your device.
12. From the Startup Method pull-down menu, choose the appropriate value for your device.



13. Select the Load Feedback category.
14. From the Type pull-down menu, choose the appropriate load feedback device.
15. From the Units pull-down menu, choose the appropriate value.
16. In the Cycle Resolution box, type the appropriate value for your device.
17. From the Startup Method pull-down menu, choose the appropriate value for your device.
18. In the Turns box, type the appropriate value for your device.

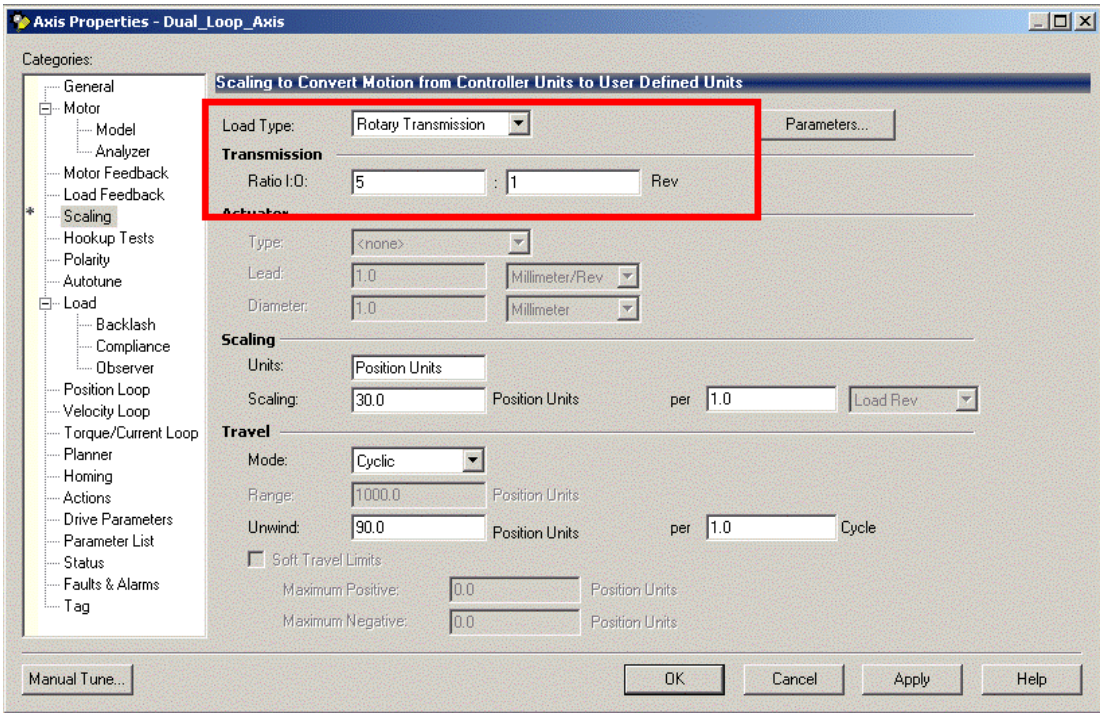


19. Select the Scaling category.
20. From the Load Type pull-down menu, choose the appropriate value for your device.

    This example uses a Rotary Transmission.
21. In the Transmission Ratio boxes, type the appropriate values for your device.

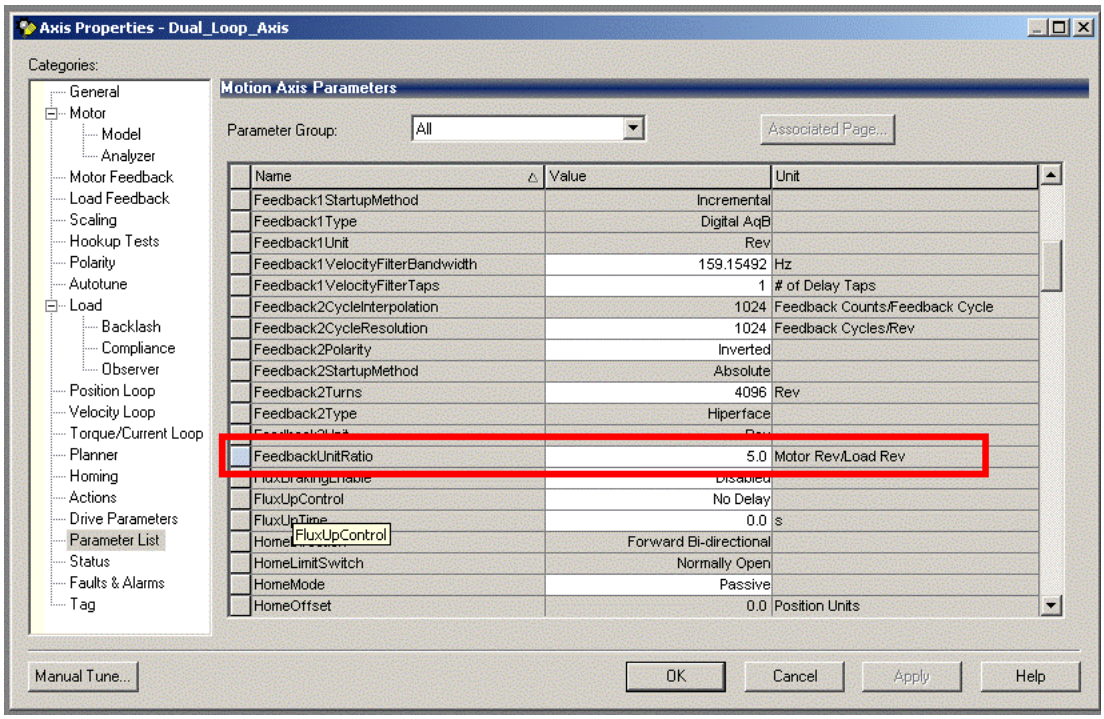
    This example uses a ratio of 5:1.
22. In the Scaling Units box, type the appropriate value for your device.
23. In the Scaling Position Units box, type the appropriate value for your device.

    This example uses 30 position units for every 1.0 load encoder revolution on a rotary axis (for example a dial), that unwinds to zero position after 90 units accumulate.



The velocity loop is controlled by the motor encoder feedback. Because a mechanical transmission exists between the motor and load side, the scaling units are potentially different between the two encoders.

24. To verify that the Motor to Load ratio is correct, select the Parameter List category.
25. View the value of the FeedbackUnitRatio parameter. In this example the ratio is 5:1, or 5 motor encoder revolutions to per load encoder revolution.



If the velocity loop is not performing well, that is, not following the command and not accelerating or decelerating properly, verify that this ratio is correct.

26. Continue by tuning this axis.

Dual-Port EtherNet/IP Option Module (ETAP)

The Dual-Port EtherNet/IP option module has two modes of operation, Adapter mode (default) and Tap mode.

Operation Mode Selection

The Tap mode is intended for use with PowerFlex 755 drives and uses the ENET3 (DEVICE) port as a connection point to transfer Integrated Motion on the EtherNet/IP Network data to the PowerFlex 755 drive's embedded EtherNet/IP adapter. The operation mode is selected by using the Operating Mode jumper (J4). For more information about setting the Operating Mode jumper, see the PowerFlex 20-750-ENETR Dual-Port EtherNet/IP Option Module User Manual, publication 750COM-UM008.

IP Address Assignment

If the PowerFlex 755 drive is connected to a Stratix 6000™ or Stratix 8000 managed Ethernet switch and the drive is set for BOOTP mode, the "dynamic IP address assignment by port" (Stratix 6000) or "DHCP persistence" (Stratix 8000) feature sets the IP address for the drive. For more details, see the Stratix 6000 Ethernet Managed Switch User Manual, publication 1783-UM001, or the Stratix 8000 and Stratix 8300™ Ethernet Managed Switches User Manual, publication 1783-UM003.

Option Module Placement

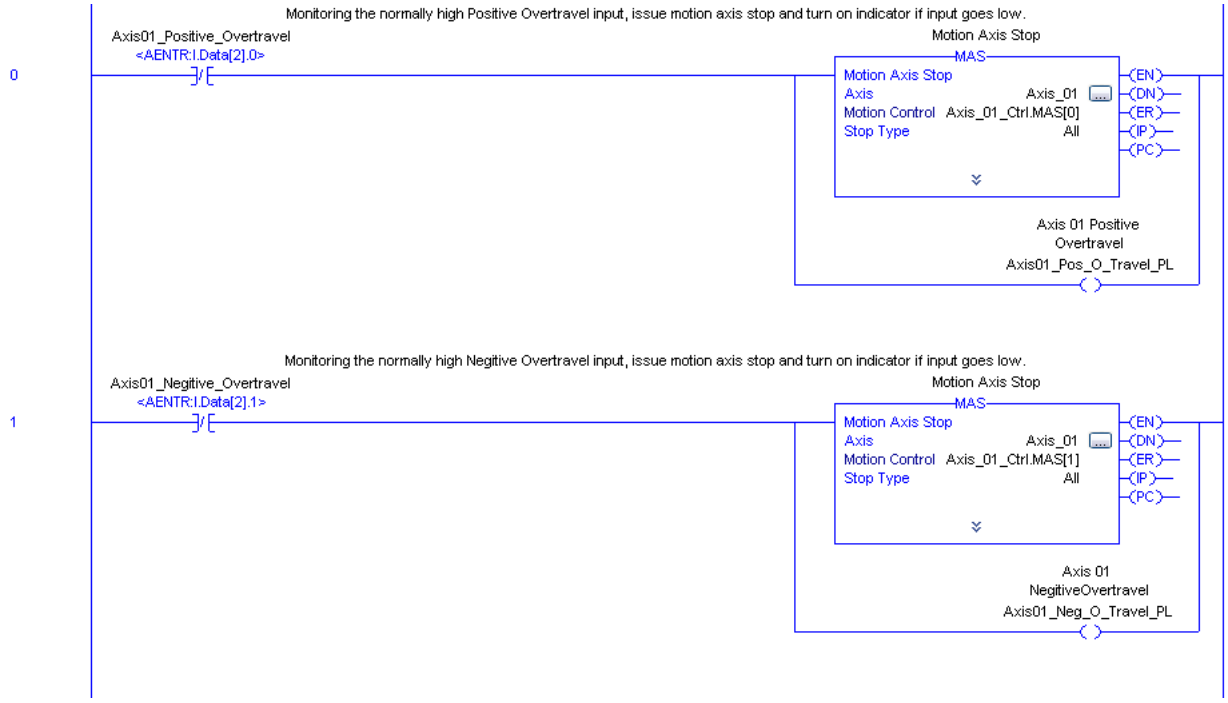
Install the Dual-Port EtherNet/IP option module in Port 4 or 5 of the PowerFlex 755 drive control pod. (When operating in Tap mode, drive Port 6 cannot be used.)

Hardware Over Travel Considerations

When a PowerFlex 755 drive is configured for Integrated Motion on the EtherNet/IP Network none of the I/O option modules are supported. Therefore, inputs associated with over-travel limits must be wired into controller input modules and then control must be programmed in the Logix Controller.

Operation of this control is accomplished by programming the controller to monitor the over travel limits via digital inputs and setting the desired action when over travel limits are exceeded. Possible actions include (but not limited to), setting an alarm, stopping the motion planner, stopping the drive, or performing a shutdown function.

The sample ladder logic code below depicts a possible solution for performing hardware over travel control (the code is an example only and is not the only solution for monitoring hardware over travel limits). Each individual application determines the requirements for the necessary hardware over travel control. This example monitors digital inputs and issues a motion axis stop if either input goes false and generates an output indicator that could be used to annunciate the stop.



Integrated Motion on EtherNet/IP Instance to PowerFlex 755 Drive Parameter Cross-Reference

This section cross-references the Logix Designer Module Properties and Axis Properties instance to the corresponding PowerFlex 755 drive parameter. See the PowerFlex 755 Standard and Safety Drive Module Optional Attributes appendix in this manual for details on optional attributes and the corresponding control mode functionality supported by a PowerFlex 755 drive module.

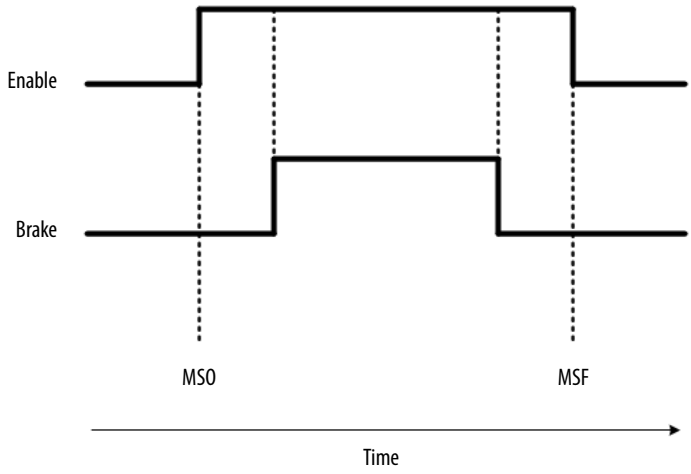
Motor Brake Control

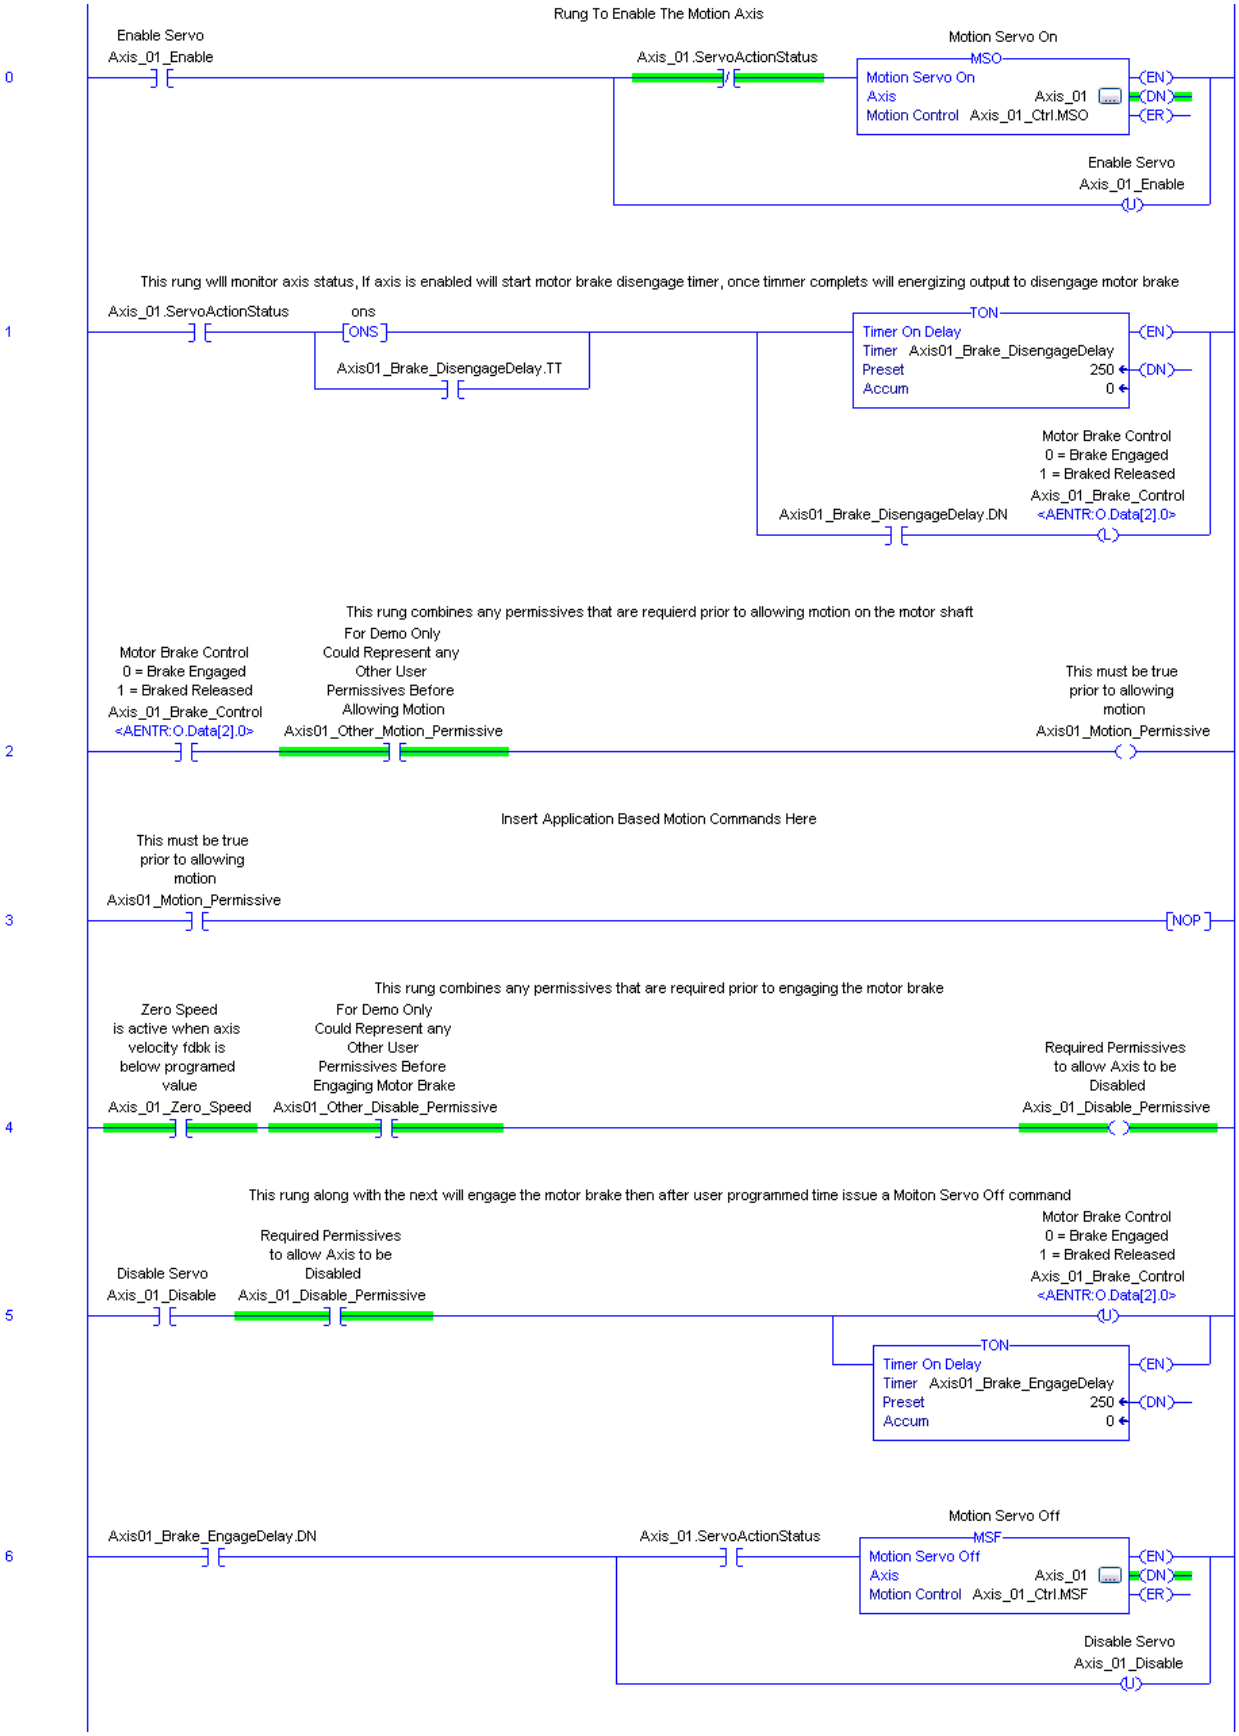
When a PowerFlex 755 drive is configured for Integrated Motion on the EtherNet/IP Network none of the I/O option modules are supported. Normal means of having the drive control the brake and utilizing drive's I/O are not supported. Motor brake control must be user-configured in the Logix controller. The basic functionality involved is to enable the drive using an MSO instruction, verify that the drive is enabled, and then apply power to disengage the motor brake. The specific motor used and the application often dictates a time delay between when the drive is enabled and the brake is disengaged. A very similar sequence is followed with disabling the drive using an MSF instruction. In this case the brake is engaged, and after a user-configured amount of time, the drive is disabled. Figure 35 depicts this operation.

Figure 35 - Timing Diagram

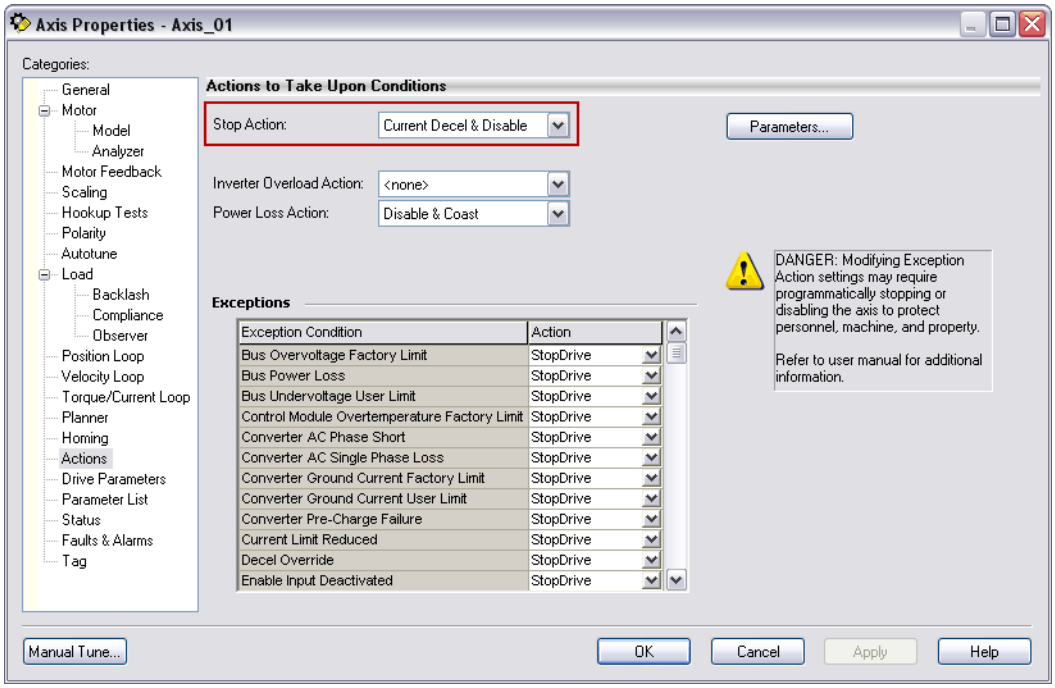


The sample ladder logic code in Figure 36 on page 339 depicts a possible solution for performing brake control (the code is an example only and is not the only solution for performing brake control). Each individual application determines the requirements for the necessary brake control.

Figure 36 - Sample Motor Brake Code



Along with normal modes of machine operation it is important to engage the brake in the event of a fault. Fault status can be monitored in the Logix code and the brake can be engaged in the event of a fault. Knowing what the configured Stop Action is helps determine when to engage the brake in the event of a fault. Application considerations can also be factored into this decision. This stop action is configured on the Axis Properties / Actions screen (as shown in this example).



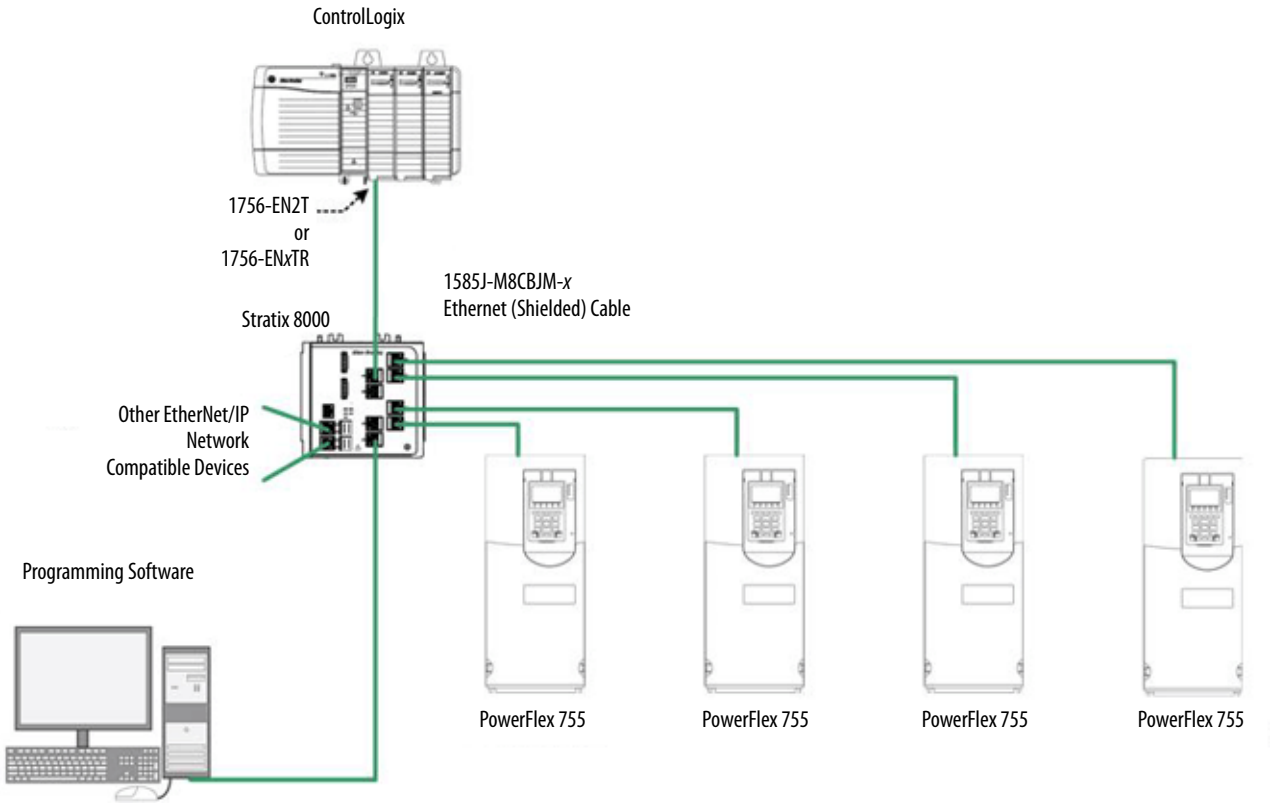
Network Topologies

This topic provides examples of network topologies that can be used when implementing an Integrated Motion on EtherNet/IP Network application by using on of the following programming software applications.

- RSLogix 5000, version 19 and later
- Studio 5000 environment, version 21 and later

Star Topology

A switch-level star configuration is a traditional Ethernet network layout where devices are connected to a centralized network switch, point-to-point. The star configuration is most effective when the devices are near a central network switch. In a star network topology, all traffic that traverses the network (that is, device-to-device) must pass through the central switch.



It is recommended that a managed switch with a transparent and/or boundary clock, plus QoS and IGMP protocol support be used for this Network topology.

Although the ControlLogix is illustrated, the CompactLogix controller could also be used.

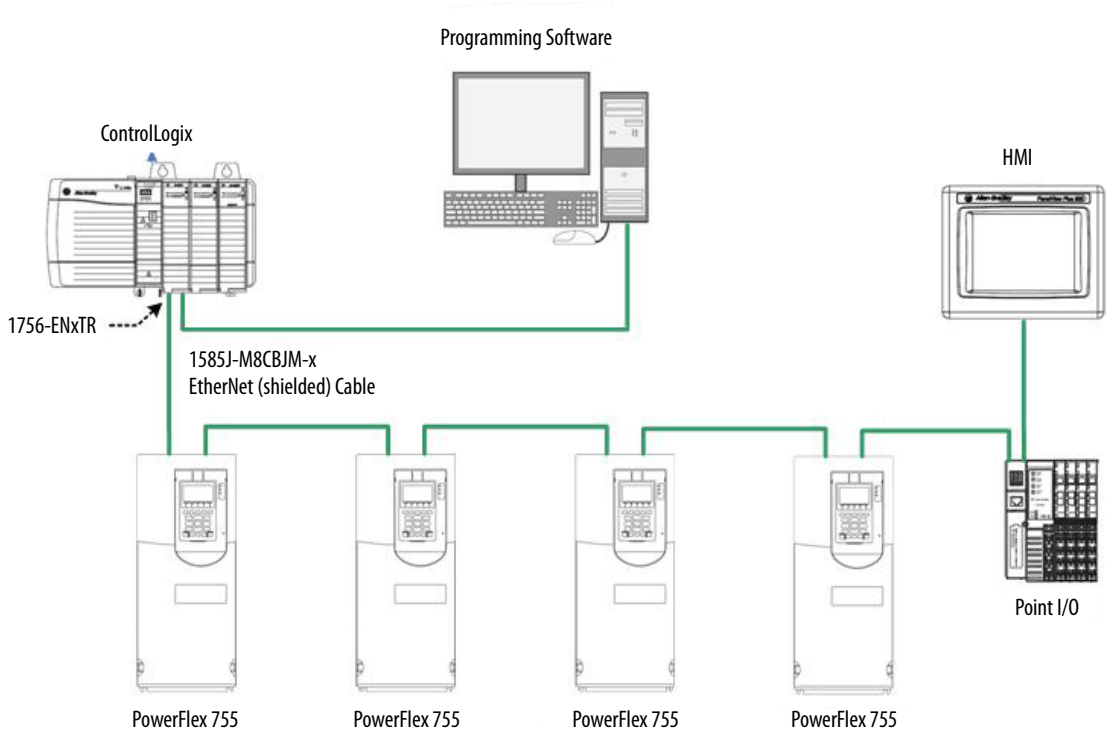
Advantages/Disadvantages

The advantage of a star network is that if a point-to-point connection is lost to an end device, the rest of the network remains operational.

The primary disadvantage of a star topology is that all end devices must typically be connected back to a central location, which increases the amount of cable infrastructure that is required and also increases the number of available ports required by the central switch leading to a higher cost per node solution.

Linear Topology

In a linear topology, the devices are linked together via a two port embedded switch or through an EtherNet/IP network tap (1783-ETAP), instead of being connected back to a centralized network switch.



Either a Dual Port EtherNet/IP Option Module or an EtherNet/IP network tap (1783-ETAP) is required for this network topology (this diagram illustrates an application using the dual port option card). For more information about applying a Dual Port EtherNet/IP Option Module, see the PowerFlex 20-750-ENETR Dual-Port EtherNet/IP Option Module User Manual, publication 750COM-UM008.

Although the ControlLogix controller is illustrated, the CompactLogix controller could also be used.

Advantages/Disadvantages

The advantages of a linear network include the following:

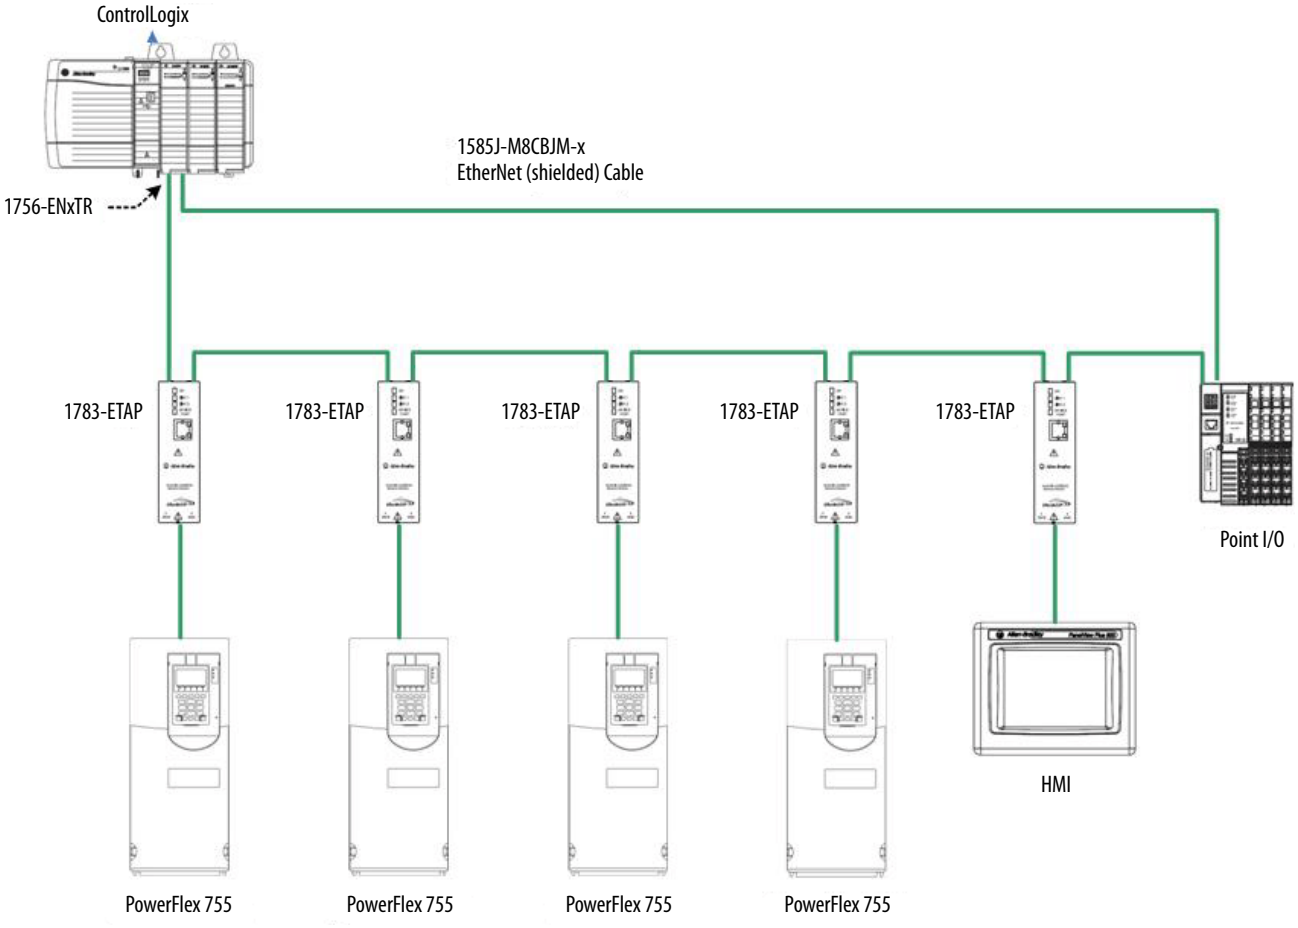
- The topology simplifies installation by eliminating long cable runs back to a centralized switch.
- The network can be extended over a longer distance because individual cable segments can be up to 100m.

- The network supports up to 50 mixed devices per line.

The primary disadvantage of a linear topology is that a connection loss or link failure disconnects all downstream devices as well. To counter this disadvantage a ring topology could be employed.

Ring Topology

A ring topology, or device-level ring (DLR), is implemented in a similar fashion to linear topology. However, an extra connection is made from the last device on the line to the first, closing the loop or ring. It is crucial to configure the Ring Supervisor before connecting your linear topology into a ring topology.



Either a Dual Port EtherNet/IP Option Module or an Ethernet/IP network tap (1783-ETAP) is required for this network topology (this diagram illustrates an application using ETAPs). For more information about applying a Dual Port EtherNet/IP Option Module, see the PowerFlex 20-750-ENETR Dual-Port EtherNet/IP Option Module User Manual, publication 750COM-UM008.

Although the ControlLogix is illustrated, the CompactLogix controller could also be used.

Advantages/Disadvantages

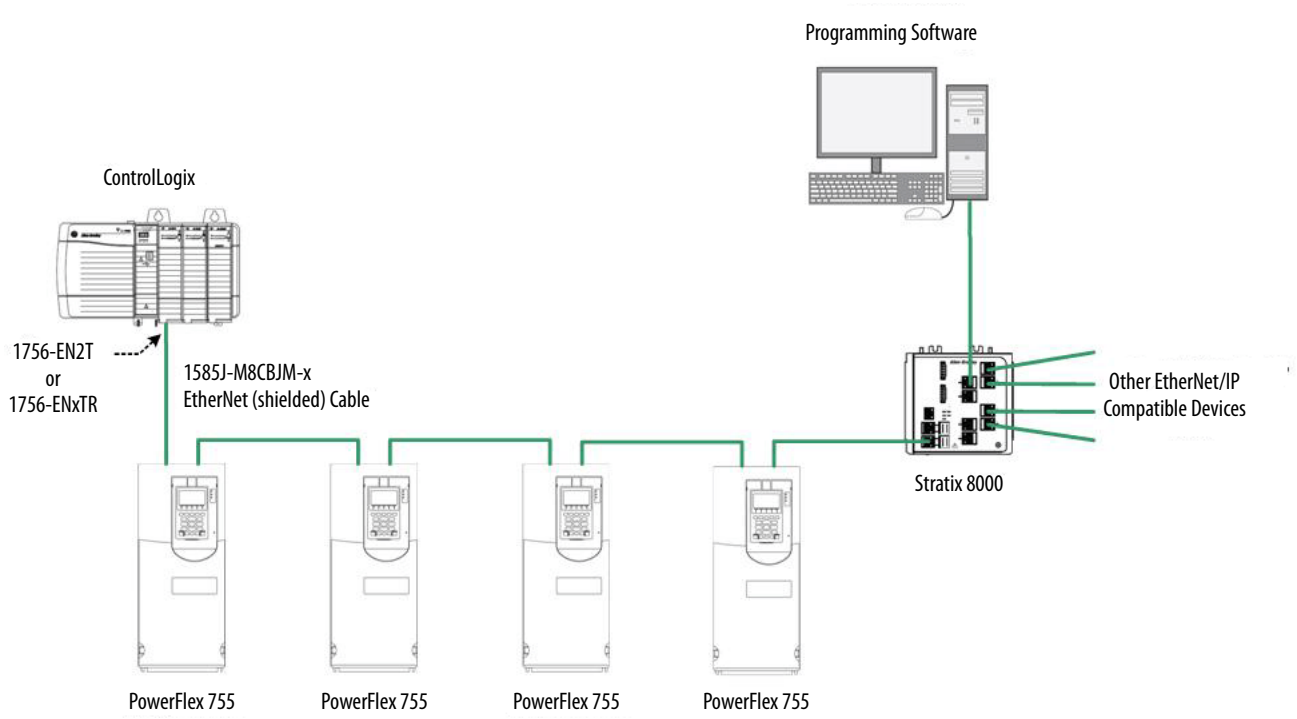
The advantages of a ring network include the following:

- Simple installation
- Resilience to a single point of failure (cable break or device failure)
- Fast recover time from a single point of failure

The primary disadvantage of a ring topology is an additional setup (for example, active ring supervisor) as compared to a linear or star network topology.

Linear/Star Topology

Network switches can be added to the end of the line, creating a linear/star topology. Ethernet devices that do not have embedded switch technology can be connected in a star topology off of the switch.

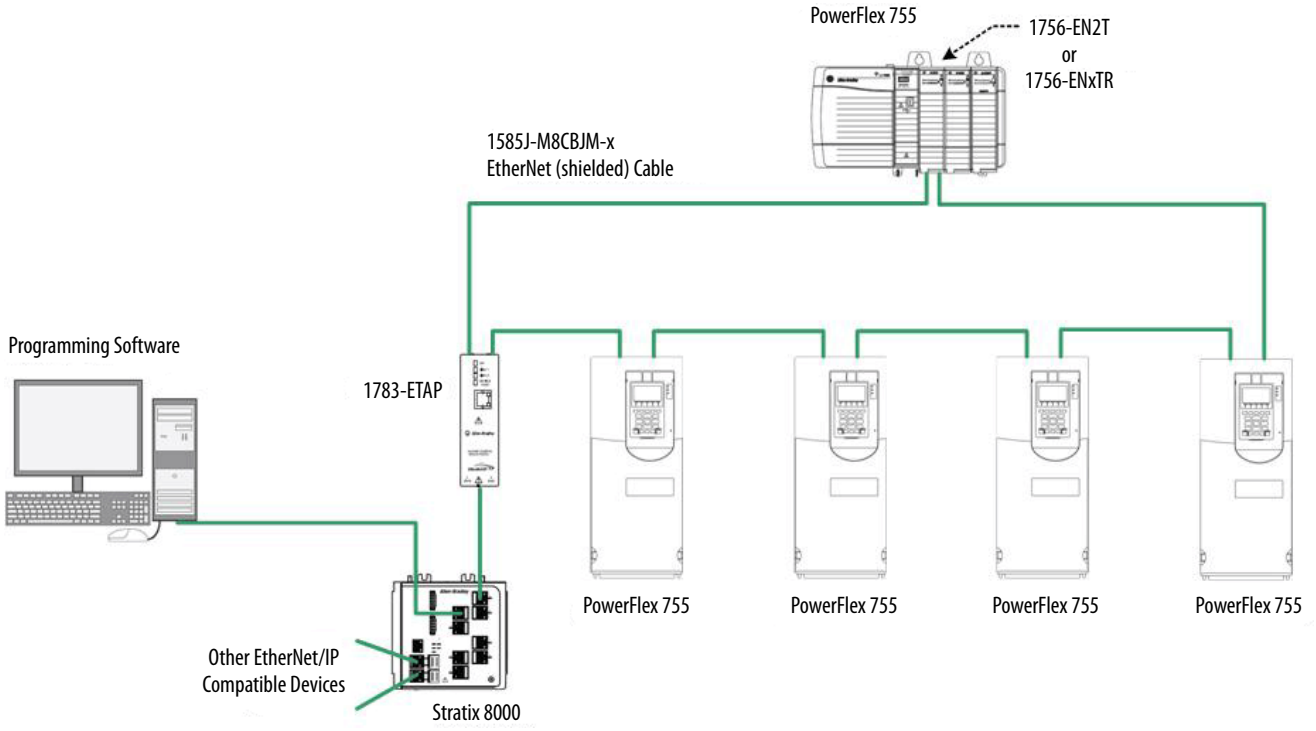


It is recommended that a managed switch with a transparent and/or boundary clock, plus QoS and IGMP protocol support be used for this Network topology.

Although the ControlLogix controller is illustrated, the CompactLogix controller could also be used.

Ring/Star Topology

Network switches can also be connected into a DLR via an Ethernet/IP tap, creating a ring/star topology.



It is recommended that a managed switch with a transparent and/or boundary clock, plus QoS and IGMP protocol support be used for this Network topology.

Although the ControlLogix controller is illustrated, the CompactLogix controller could also be used.

PowerFlex 755 and Kinetix 7000 Drive Overload Rating Comparison for Permanent Magnet Motor Operation

The PowerFlex 755 drive can be configured for a normal duty or heavy duty operation. The heavy duty rating has a lower continuous current rating and therefore can produce more current during an overload.

Duty Rating	0 Hz	100%	110%	150%	180%
Normal	50%	100%	One minute	3 seconds	Not applicable
Heavy	65%	75% of normal duty	–	One minute of normal duty	3 seconds of normal duty

The Kinetix 7000 drive overload capability is specific for each power structure. However, the Kinetix 7000 can produce 100% current at 0 Hz.

With permanent magnet motors, the torque is directly proportional to the current. Therefore, the overload ratings of the drive to which the motor is connected provides the torque overload capability of the motor.

PowerFlex 755 Drive Option Module Configuration and Restrictions

When the PowerFlex 755 drive is configured for an Integrated Motion on the EtherNet/IP Network application, only specific option modules are supported, and in some cases, the port in which the option module is installed in the control pod is restricted.

IMPORTANT The PowerFlex 750-Series I/O option modules (20-750-2262C-2R, 20-750-2263C-1R2T, 20-750-2262D-2R) must not be used with the Integrated Motion on the EtherNet/IP Network.

Supported Modules		Valid Port Installation Location
Cat. No.	**Option Module Name**	
20-750-S	Safe Torque Off	6
20-750-S1	Safe Speed Monitor	6
20-750-ENC	Single Incremental Encoder	4…8
20-750-DENC	Dual Incremental Encoder	4…8
20-750-UFB	Universal Feedback	4…6
20-750-APS	Auxiliary Power Supply	8
20-750-ENETR	Dual-Port Ethernet/IP	4 and 5

If an unsupported option module is installed, the drive stops responding and the HIM displays “CONFIGURING.”

Safety Option Modules (20-750-S, 20-750-S1)

This restriction and configuration setting must be used when using either of these safety option modules with the Integrated Motion on the EtherNet/IP Network:

- The option modules must be installed in port 6 of the drive control pod only.
- The specific drive module and option catalog number must be selected when adding the drive to the I/O tree in the project. For example, when adding a PowerFlex 755 drive with a Safe Speed Monitor option module, choose 755-EENET-CM-S1.

Feedback Option Modules (20-750-ENC, 20-750-DENC, and 20-750-UFB)

Follow the same installation and configuration instructions provided in the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

Auxiliary Power Supply Option Module (20-750-APS)

Follow the same installation and configuration instructions provided in the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

Dual-Port EtherNet/IP Option Module (20-750-ENETR)

Follow the same installation and configuration instructions provided in the PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

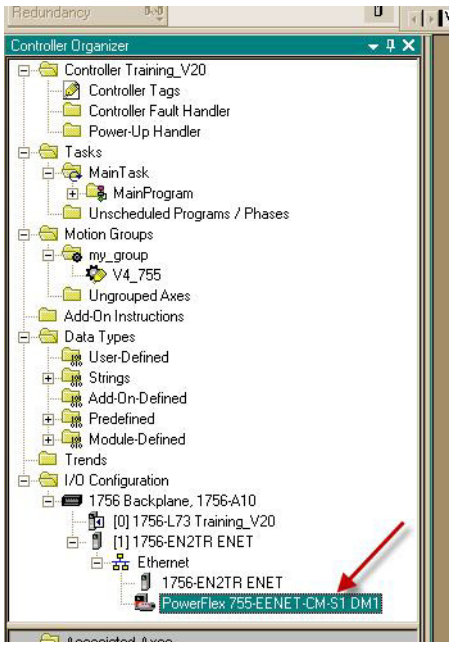
Regenerative/Braking Resistor

When using a PowerFlex 755 drive with a dynamic brake (shunt regulator) in an Integrated Motion on the Ethernet/IP network the dynamic brake must be set up as part of the I/O connection of the PowerFlex 755 embedded Ethernet/IP module (EENET-CM-*xx*) properties. Failure to set up the dynamic brake correctly could lead to mechanical damage of the machine. Dynamic brake (shunt) resistor sizing is not covered in this document. For more information on resistor sizing, see the Drives Engineering Handbook, publication DEH-1300-10.

I/O Configuration for a Dynamic Brake (shunt regulator)

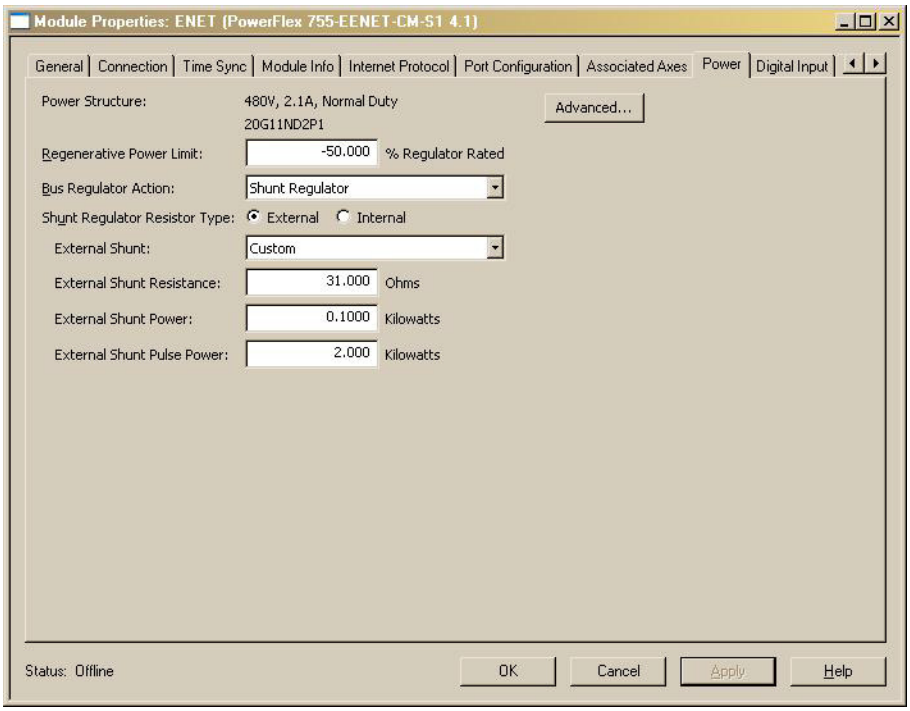
Follow these steps to configure a dynamic brake (shunt regulator) for a PowerFlex 755 drive in the Logix Designer application.

1. In the I/O Configuration, double-click the PowerFlex 755-EENET-CM-*xx* module and select Properties.



The Module Properties dialog box appears.

2. Click the Power tab and configure the appropriate boxes according to your application.



Regenerative Power Limit	The amount of energy that the drive allows during regeneration. If an external regenerative power supply or shunt (dynamic brake) resistor is used, it is recommended that this value be set to -200.0%. **Important:** If this value is set too low, the ability of the drive to stop a motor is limited.
Bus Regulator Action	• Disabled - This selection disables the drive's internal DC bus voltage regulation feature. Select this option if there is an external regenerative brake or regenerative line supply connected to the drive DC bus. • Shunt Regulator - This selection is used when either an external shunt resistor is connected to the drive or the internal IGBT is controlling the power dissipation to the resistor (the type of shunt resistor is selected below). • Adjustable Frequency - This selection let the drive either change the torque limits or ramp rate of the velocity to control the DC bus voltage. This option is not recommended for positioning applications because it overrides the velocity and the system can overshoot or may not stop. • Shunt then Adjustable Frequency - This selection lets the Shunt resistor absorb as much energy as it is designed for, then transitions to adjustable frequency control if the limit of the resistor has been reached. • Adjustable Frequency then Shunt - This selection enables adjustable frequency control of the DC bus. If adjustable frequency control cannot maintain the DC bus within limits, the shunt resistor is activated.
Shunt Regulator Resistor Type	Select the type of resistor connected to the drive. Internal resistors include 20-750-DB1-D1 or 20-750-DB1-D2 for frames 1 and 2 drives, respectively. External identifies that a user-selected resistor is used.
External Shunt	When using an external shunt resistor select "Custom."

External Shunt Resistance	Enter the resistance of the external resistor connected to the drive terminal block connections, BR1 and BR2. Verify that the resistance is equal to or greater than the minimum resistance for the drive capabilities. See "Minimum Dynamic Brake Resistance" in the PowerFlex 750-Series AC Drives Technical Data, publication 750-TD001.
External Shunt Power	Enter the continuous power dissipation rating (kW) of the external resistor. Failure to specify the correct value can cause the drive to either stop sending energy to the resistor prematurely or overheat the resistor. For example, if an 800 W rated resistor is installed, enter 0.8 in this field.
External Shunt Pulse Power	The Watt-Second or Joules rating (kW) of the resistor. This is the amount of energy that the resistor can withstand for one second to reach the maximum temperature. Failure to specify the correct value can cause the drive to either stop sending energy to the resistor prematurely or overheat the resistor.

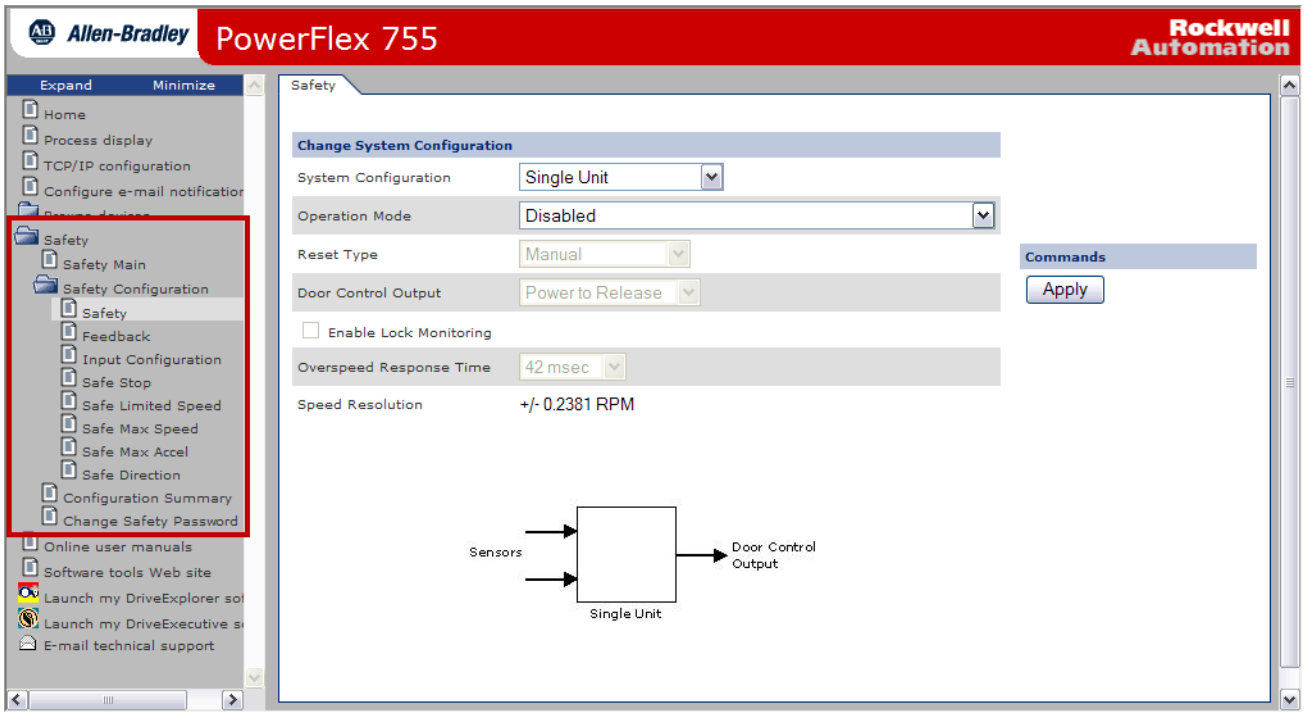
3. Click OK.

Safe Speed Monitor Option Module (20-750-S1) Configuration

When a PowerFlex 755 drive is configured for Integrated Motion on the EtherNet/IP Network the configuration of the Safe Speed Monitor functions are accomplished via a web page.

Configuring the Safe Speed Functions

The Safe Speed Monitor module web page differs from the Embedded EtherNet/IP adapter (port 13) web page that is enabled by setting adapter parameter P52 [Web Enable] to 1 “Enabled.” The Safe Speed Monitor module web page is not accessible until the drive has established a network connection to a Logix processor and the Integrated Motion on the EtherNet/IP Network connection has been established. The web page is then accessed by entering the IP address of the drive into a web browser (for example, http://192.168.1.20/). Currently, safety configuration settings cannot be saved in the drive or downloaded to other drives.

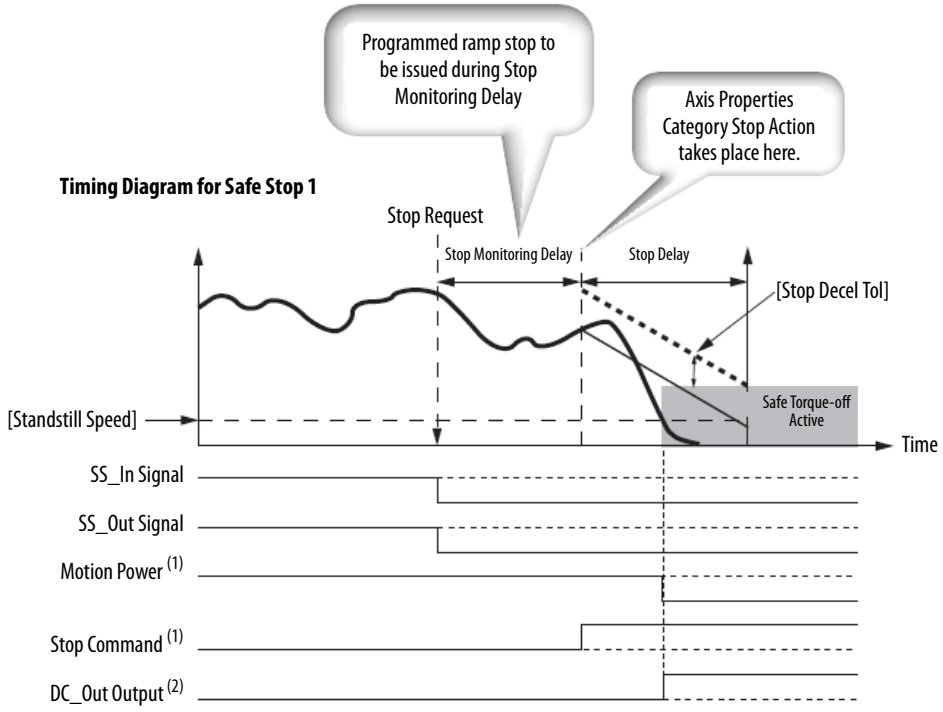


TIP The Safe Speed Monitor module parameters are not currently part of the Logix platform and therefore, are not overwritten when a drive establishes a Integrated Motion on the EtherNet/IP Network connection. Therefore, it is possible to program the Safe Speed Monitor functions with configuration software (for example, Connected Components Workbench) or a HIM before a network connection is established. This lets you save the safety configuration in the software application or HIM. Configuration of the safety functions can be accomplished in one of the following ways:

- Program the Safe Speed Monitor functions and then download the program that includes the drive parameters to the Logix controller and establish the network connection.
- Inhibit the drive in the Logix I/O tree and program the Safe Speed Monitor functions.
- Disconnect the network cable between the drive and the controller and program the Safe Speed Monitor functions.

Configuring the Stop Command

While there are different selections when operating the drive and Safe Speed Monitor option module in Standard mode versus the Integrated Motion on the EtherNet/IP Network mode, the equivalent functions operate the same. In the Integrated Motion on the EtherNet/IP Network mode of operation, the Stop Command is programmed in the Actions Category of the Module Properties dialog box. It is important to realize that there is no option to have a ramped stop selected here; only current limit and motor brake options are available. These selections do not ensure that a consistent ramp is implemented each time. If a repeatable ramped stop is desired, then the user can program a Stop Monitor Delay as a part of the Safe Speed Monitor configuration and then monitor the Safe Speed inputs from the controller and issue a ramped stop prior to the safety core issuing the Stop Command signal (as shown in this diagram).



(1) This signal is internal between the safety option module and the drive.
(2) The DC_Out output is shown configured as Power to Release.

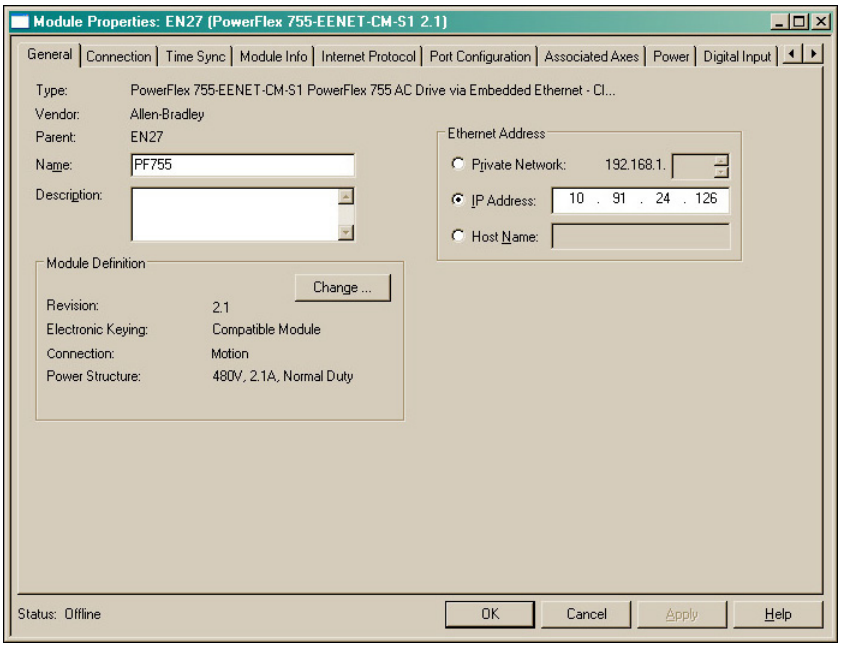
Speed Limited Adjustable Torque (SLAT)

This topic describes how to configure a PowerFlex® 755 AC drive with embedded Ethernet/IP for Speed Limited Adjustable Torque (SLAT) operation using an Integrated Motion on the Ethernet/IP network in Logix Designer application. For more information on SLAT refer to the following publications:

- See Speed Limited Adjustable Torque (SLAT) Min Mode and SLAT Max Mode in the PowerFlex 700S AC Drives with Phase II Control Reference Manual, publication PFLEX-RM003.
- See Slat Configuration in the Integrated Motion on the Ethernet/IP Network Reference Manual, publication MOTION-RM003.

Add a PowerFlex 755 Drive Module to Your Project

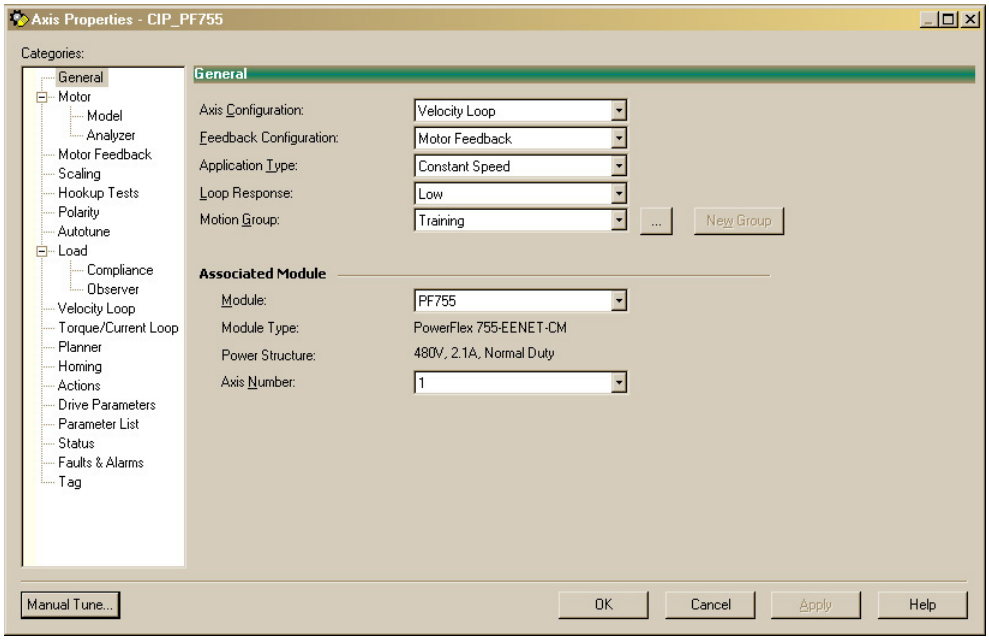
See the Integrated Motion on the Ethernet/IP Network Configuration and Startup User Manual, publication MOTION-UM003, for specific instructions on adding a PowerFlex 755 with embedded Ethernet/IP drive module to your project. An example Module Properties dialog box for a PowerFlex 755 with embedded Ethernet/IP is shown here.



Create and Configure an Axis for the PowerFlex 755 Drive

1. See the Integrated Motion on the Ethernet/IP Network Configuration and Startup User Manual, publication MOTION-UM003, for specific instructions on creating and configuring the axis for the PowerFlex 755 drive.

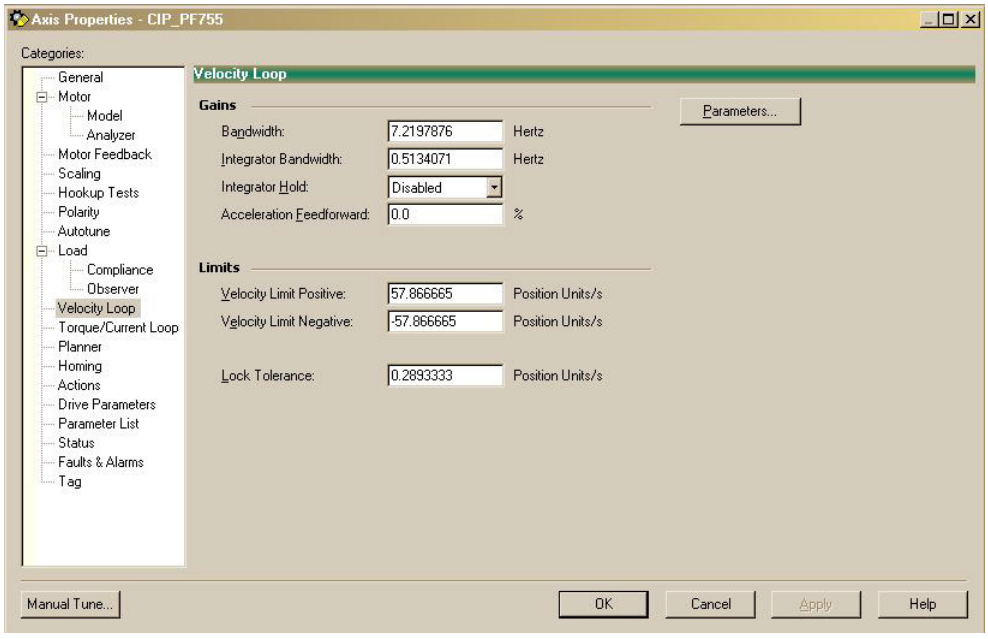
2. In the General dialog, from the Axis Configuration pull-down menu, choose Velocity Loop.



3. Select the Velocity Loop category.

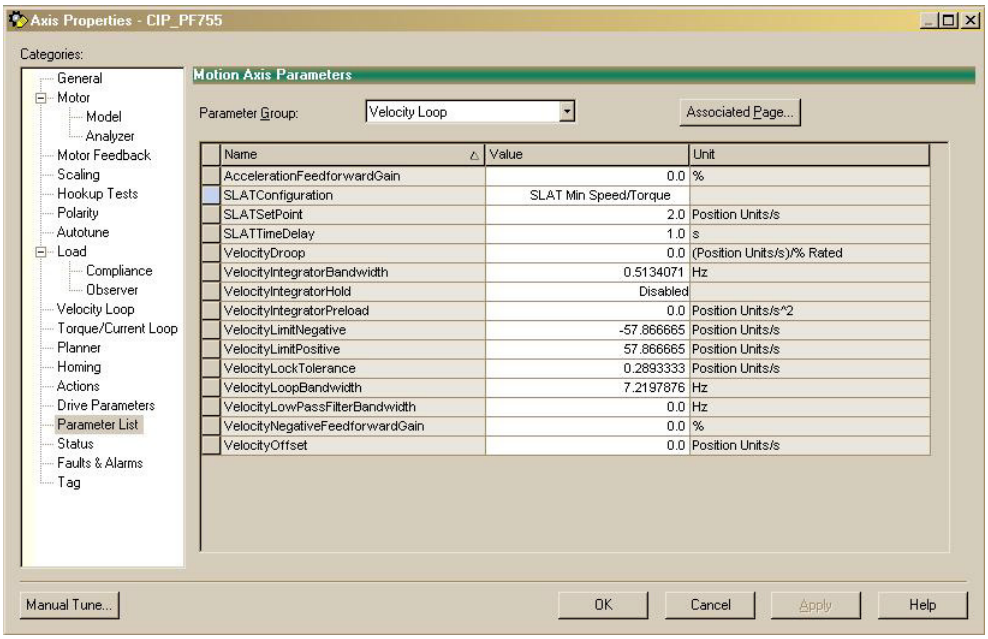
   The Velocity Loop dialog box appears.

4. Click Parameters.



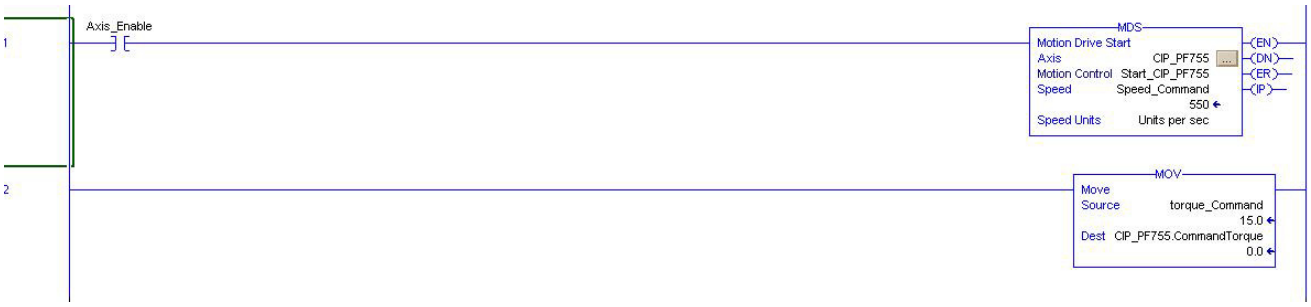
The Motion Axis Parameters dialog box appears.

5. Configure the SLAT parameters. See Slat Configuration in the Integrated Motion on the Ethernet/IP Network Reference Manual, publication MOTION-RM003, for a complete list and descriptions of the SLAT parameters.



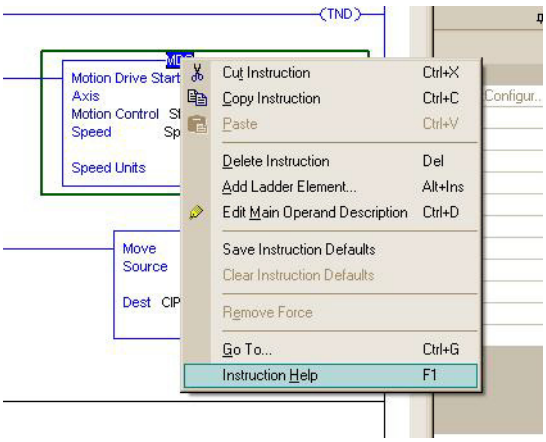
Program Commands

When using SLAT with Integrated Motion on the Ethernet/IP network you must start the PowerFlex 755 drive with the MDS instruction as shown below. The Speed reference is sent in the MDS instruction. Also, the torque command is sent to "AxisTag.CommandTorque." To make changes to the speed reference you need to re-trigger the MDS instruction.



To use the Motion Axis Stop (MAS) instruction, you must set Change Decel to "No." Otherwise an instruction error occurs. The deceleration rate is set based on the Ramp Deceleration attribute.

To view help for the MDS instructions, right-click MDS in the function block and choose Instruction Help, or select the instruction and press F1. Additionally, see "Speed Limited Adjustable Torque (SLAT) Min Mode and SLAT Max Mode" in the PowerFlex 700S AC Drives with Phase II Control, Reference Manual, publication PFLEX-RM003.

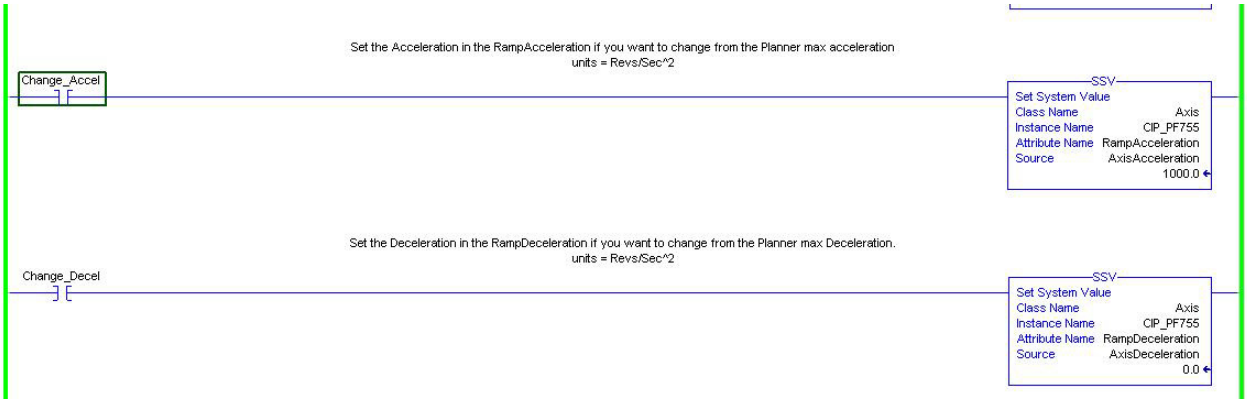


Changing the Accel/Decel Times for the MDS Instruction

If you are using the MDS instruction, the drive accelerates and decelerates at the planner Max Acceleration and Deceleration values. To set the "RampAcceleration" and "RampDeceleration" you need to use SSV instructions to change the ramp rates. Below is an example of the SSV instructions:

- Set the RampAcceleration / RampDeceleration attribute to "x" revs/sec^2
- Class Name = Axis
- Instance Name = "Axis Name"
- Attribute Name = RampAcceleration/RampDeceleration
- Source = Tag for value

Example: Velocity (Speed) command is 30 revs/sec and you want to reach that speed from zero in 6.5 seconds. Ramp Acceleration needs to be set to 4.615 revs/sec^2.



Supported Motors

The PowerFlex 755 can be used with a variety of both induction and permanent magnet (PM) motors.

AC Induction Motors

An AC induction motor uses slip between the rotor and the stator to create torque. Some motor manufacturers specify the synchronous speed instead of slip speed on the motor nameplate. For example, a 4 pole, 60 hertz motor has a synchronous speed of 1800 rpm. The drive algorithm cannot use the synchronous speed, it needs the slip rpm. The slip rpm is the rotor speed when the stator is at rated frequency and the motor is at full load. The rotor slips behind the stator to create the torque. For a 4 pole, 60 hertz motor the slip rpm range is 1700...1790 rpm. If the nameplate is showing synchronous speed (in our example 1800 rpm), please contact the motor manufactures to receive the slip rpm.

Some AC motors have two voltage ratings, a high voltage and a low voltage. Follow the motor manufacture's wiring diagram to correctly wire the motor for the proper voltage.

All motor manufactures provide an electrical specification including an electrical model equivalent. If you believe that the PowerFlex drive family is not producing the correct motor torque, please contact the motor manufacturer to receive the electrical specification prior to contacting Rockwell Automation Technical Support.

This list contains the name of manufacturers that produce motors that are recommended for use with PowerFlex 755 drives.

Manufacturer	Notes
Baldor Electric Company	Work well with PowerFlex 755 drives.
Baumuller	Work well with PowerFlex 755 drives.
Elin	Work well with PowerFlex 755 drives.
Electrical Apparatus Company (EAC)	Induction motors work well with PowerFlex 755 drives.
Lenze	Some Lenze motors have been stamped with synchronous speed versus slip speed. Please contact Lenze to get the slip speed.
Marathon Electric	Work well with PowerFlex 755 drives. Marathon stamps all pertinent information on their nameplate including electrical model equivalent.
Reliance	RPM AC motors are used in industry and work well with PowerFlex 755 drives.
Reuland Electric Company, Inc.	Work well with PowerFlex 755 drives. Reuland stamps the motor with synchronous speed and then supplies the slip frequency. You must calculate the slip frequency in rpm and then subtract the slip rpm from the synchronous speed to get the slip speed. Before contacting Rockwell Automation Technical Support, please obtain the electrical specification sent with the motor.
Rockwell Automation	8720 and HPK motors work well with PowerFlex 755 drives. See the appropriate motor manual for the proper nameplate voltage.
SEW-EURODRIVE	SEW-EURODRIVE gear motors are widely used in industry and work well with PowerFlex 755 drives. Some of the older motors were stamped with synchronous speed versus slip speed. Please contact SEWS if the motor is stamped with synchronous speed. If you are using an SEW motor with an integral brake, please verify that the brake is properly suppressed for noise.

Manufacturer	Notes
WEG Electric Corp.	WEG motors can have a start winding and a run winding. Always wire the drive to the run winding.
Wittenstein	Work well with PowerFlex 755 drives.
Wound rotor manufacturers	Wound Rotors work with PowerFlex 755 drives. You must short the external resistors when using these motors.

Permanent Magnet Motors

Most permanent magnet motors are compatible with the PowerFlex 755 drive. You must obtain the motor manufacturer's specification for the motor prior to contacting Rockwell Automation Technical Support.

PowerFlex 755 drives cannot accept a resolver. Therefore, the motors must have either a pulse encoder or absolute feedback device (for example, SSI, Heidenhain, Stegmann/Sick hyperface).

This list contains the name of manufacturers that produce motors that are recommended for use with PowerFlex 755 drives.

Manufacturer	Notes
Baldor Electric Company	Work well with PowerFlex 755 drives. Verify that you are using either the Surface Mount (SM) or Interior Mounted (IPM) motors and select the appropriate control algorithm.
KollMorgan	Work well with PowerFlex 755 drives.
Oswald Electric Motors	
PowerTec	Work well with PowerFlex 755 drives, but cannot use resolver feedback.
Rockwell Automation	MPL, MPM, and RDB motors work well with PowerFlex drives. Use Heidenhain feedback for RDB motors.

Compatible HPK Motors

The following table contains a list of specifications for Bulletin HPK-Series™ high-power asynchronous motors that are compatible with PowerFlex 750-Series drives. This information is provided to help configure PowerFlex 750-Series drives with the appropriate motor data.

Cat. No.	Base Speed	KW	Volts	Amps	Hz	Torque (N•m)	Peak Torque (N•m)	Peak Amps	IM Amps	R1	R2	X1	X2	Xm

Third-Party Permanent Magnet Motors

The PowerFlex 755 drive can support third-party permanent magnet motors without the need of custom profiles. However, the motor nameplate information sometimes needs to be modified. Rockwell Automation Technical Support requires the following information to assist you in modifying the motor data for use with the drive. Please complete the following tables and email the information to Rockwell Automation Technical Support at: support@drives.ra.rockwell.com.

Table 27 - Permanent Magnet Motor Specifications and Evaluation

Motor Manufacturer

System Tuning

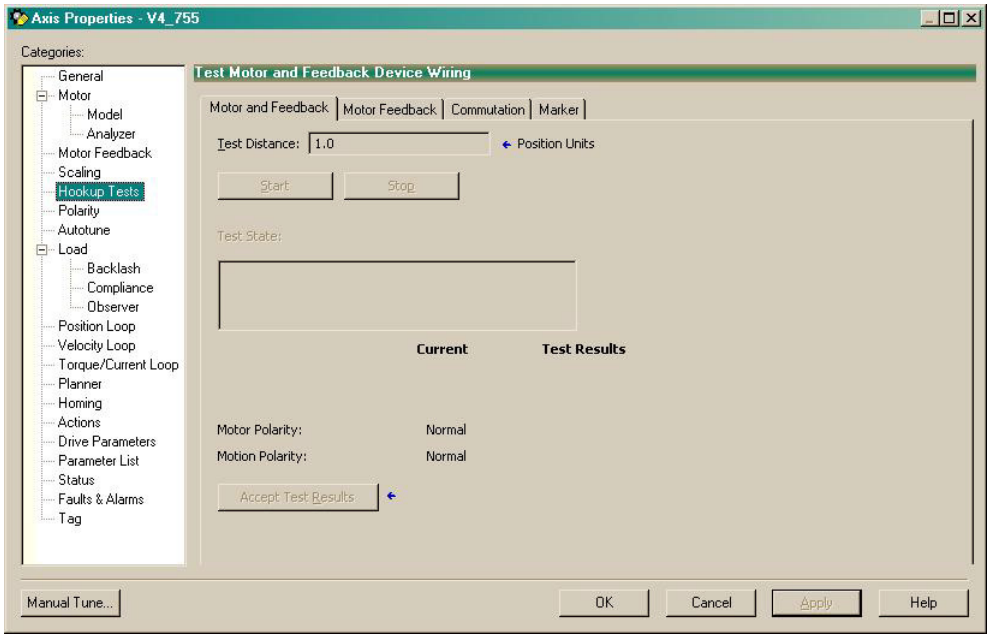
When using the Integrated Motion on the Ethernet/IP Network connection with the PowerFlex 755 drive, the tuning of the motion system is accomplished via the Logix Designer application. This topic describes the axis hookup tests, motor tests, and autotuning of the motion system required to measure the system inertia. Manual tuning of the axis is also described in this section:

- For additional information on axis attributes and the Control Modes and Methods, see the Integrated Motion on the Ethernet/IP Network Reference Manual, publication MOTION-RM003.
- For start-up assistance of a Integrated Motion on the EtherNet/IP Network Axis, see the Integrated Motion on the Ethernet/IP Network Configuration and Startup User Manual, publication MOTION-UM003.

This topic assumes that you have completed all the steps necessary to configure the drive module.

Axis Hookup Tests

The axis Hookup tests are the first tests to run when autotuning an axis. If you are using a permanent magnet motor in your application, the Commutation test must be run first, as part of the Hookup tests.



Motor and Feedback: This test is used to run the motor and verify the correct direction of rotation, and also tests the motor feedback for the proper direction:

- The Test Distance value can be defined to be sure that the system does not rotate too far.
- Click Start to initiate the test. The test completes and prompts you to verify that the motor rotation direction was correct.

- When the test has been completed, click Accept Test Results to save the results.

Motor Feedback: This test is used to test the polarity of the motor feedback:

- Click Start and manually rotate the motor in the positive direction for the distance indicated in the Test Distance box.
- When the test has been completed, click Accept Test Results to save the results.

Commutation: When using a permanent magnet motor, this test must be run first. The Commutation test is used to measure the commutation offset angle for the permanent magnet motor.

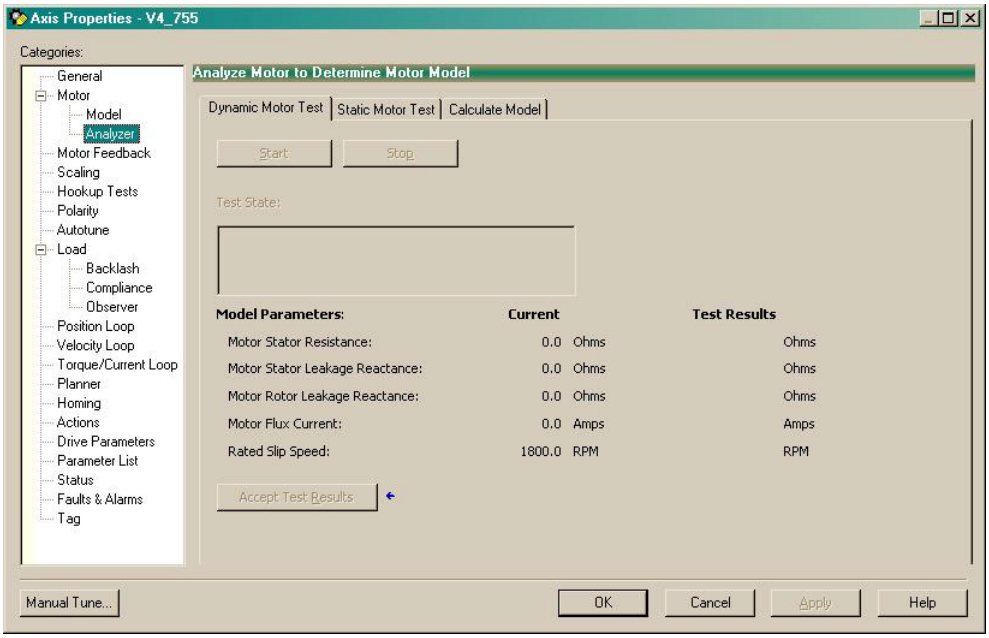
- When the test has been completed, click Accept Test Results to save the results.
- Use the resulting Controller Offset value.

Marker: This test is used to check for the marker pulse on an incremental encoder:

- Click Start and manually move the motor until a marker pulse is detected.
- When the marker pulse is detected the test stops. Click Accept Test Results to save the results.

Motor Analyzer

The Motor Analyzer category offers three choices for calculating or measuring motor electrical data.



Dynamic Motor Test: This test is the most accurate test method to determine the motor model parameters. When this test is run the Resistance and Reactance

are measured then the motor is rotated to measure the flux current of the Induction motor. The Rated Slip frequency is also calculated:

- This test is best run with the motor disconnected from the load as the motor spins for some time and there are no travel limits.
- When the test has been completed, click Accept Test Results to save the results.

Static Motor Test: This test is used if the motor cannot rotate freely or is already coupled to the load. When this test is run the Resistance and Reactance are measured then the flux current of the motor is calculated. The Rated Slip frequency is also calculated:

- The motor will not turn during this test.
- When the test has been completed, click Accept Test Results to save the results.

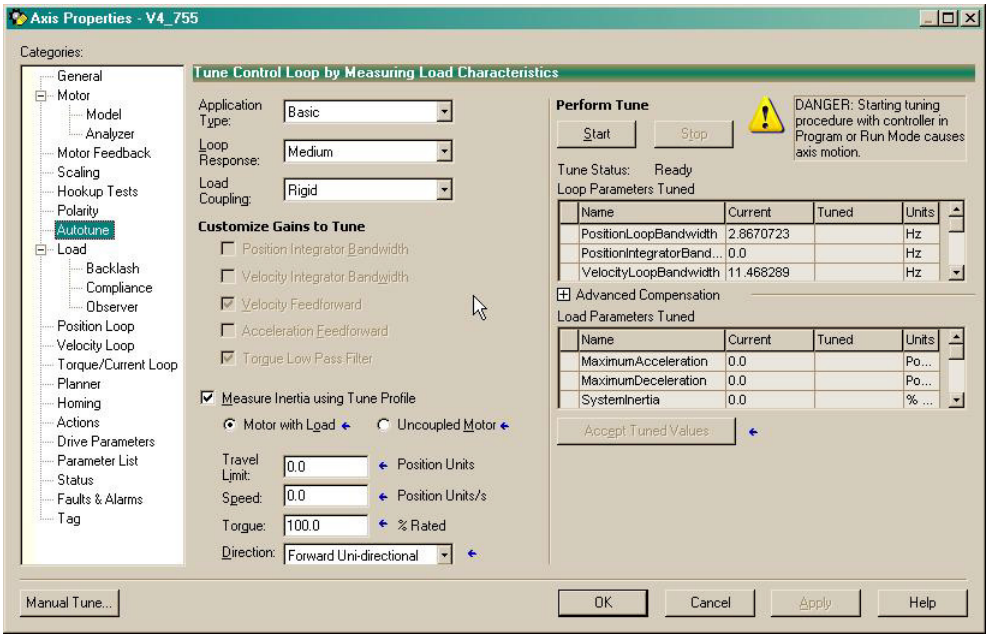
Calculate Model: This method calculates the Resistance, Reactance, and Flux Current of the motor from basic model parameters and the motor parameters data. No measurements are taken when using this calculation:

- Click Start to start the calculation.
- When the test has been completed, click Accept Test Results to save the results.

Autotune (inertia test)

The Autotune category measures the system inertia and calculates system bandwidth tuning numbers. This table summarizes the application type tuning defaults. An "X" indicates that the system value is selected by default and that the Velocity and Acceleration Feedforward values are set to 100%.

Application Type	System Value						
	Position Loop Bandwidth	Position Integrator Bandwidth	Velocity Loop Bandwidth	Velocity Integrator Bandwidth	Integrator Hold	Velocity Feedforward	Acceleration Feedforward
Custom: (Advanced tuning)	X		X				
Basic: (Default tuning parameters)	X		X				
Tracking: (Winding/unwinding, flying shear, and web control applications)	X		X	X		X	X
Point-to-Point: (Pick-and-place, packaging, cut-to-length)	X	X	X		X		
Constant Speed: (Conveyors, line shaft, crank)	X		X	X		X	



Application Type: Specify the type of motion control application to be tuned:

- **Custom:** This option lets you select the type of gains to use in the system. You can individually select gains to be used with the check boxes that display below Customize Gains to Tune heading.
- **Basic:** This selection is used for applications where following error and final position is not critical. Basic tuning gains include Position Loop proportional and Velocity Loop proportional.
- **Tracking:** This selection provides the most aggressive tuning. It is used to keep following error to a minimum and applies to both Velocity Feedforward and Acceleration Feedforward. This tuning selection uses Position Loop proportional, Velocity Loop proportional, and Velocity Loop integral.
- **Point to Point:** This selection is used for applications that use a move-to-position and do not need to include a following error. Tuning gains for this selection include Position Loop proportional, Position Loop integral, and Velocity Loop proportional.
- **Constant Speed**: This selection is used for constant speed applications. It is designed to keep velocity error to a minimum. It applies both Velocity Feedforward and uses Position Loop proportional, Velocity Loop proportional and Velocity Loop integral.

Loop Response: The Loop Response attribute is used to determine the responsiveness of the control loops. Specifically, the Loop Response attribute is used to determine the value for the Damping Factor (Z) used in calculating individual gain values:

- High = 0.8
- Medium = 1.0
- Low = 1.5

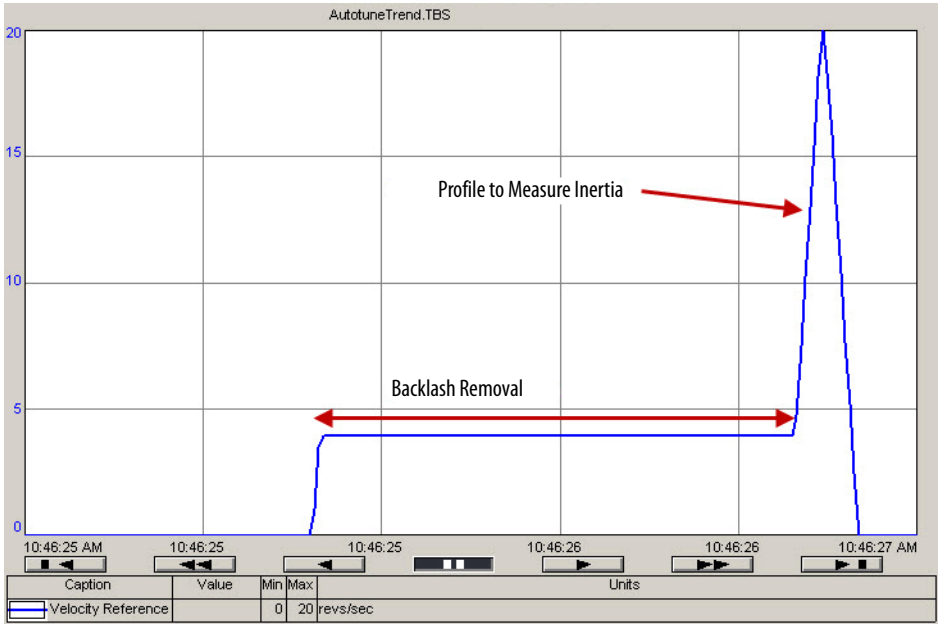
Load Coupling: The Load Coupling attribute is used to determine how the loop gains are de-rated based on the Load Ratio.

In high performance applications with relatively low Load Ratio values or rigid mechanics, typically Rigid is selected. The gains are not de-rated.

For applications with relatively high Load Ratios and compliant mechanics, Compliant is selected. The autotune algorithm divides the nominal loop bandwidth values by a factor of the Load Ratio + 1.

Measure Inertia using Tune Profile: Check this box to calculate the inertia tuned values as part of the autotune. The Inertia Test results are shown in the Inertia Tuned grid control (bottom right of the dialog box) when the test completes.

When Measure Inertia using Tune Profile is selected as a part of the Autotune test, the PowerFlex 755 drive first jogs or rotates the motor in a single direction to remove any backlash present in the system (as depicted in the chart below). After the backlash has been removed, the "bump" profile is then applied to measure the system inertia (system acceleration). Note that systems with a mechanical restriction or travel limit may not complete the Autotune test.



- **Motor with Load:** Choose this selection to calculate tuning values based on the load inertia. If selected, the load inertia is measured and then applied to the Total Inertia attribute or Total Mass attribute. The Load Ratio is also updated.

- **Uncoupled Motor:** Choose this selection to calculate tuning values based on the motor inertia. If selected, the motor inertia is measured during the test and is stored in the Rotary Motor Inertia attribute.

- **Travel Limit:** Enter a value that specifies the maximum distance to travel for the selected tune operation when the system has a limited travel distance. If the tuning test cannot complete within the distance specified the tune fails and faults the axis.

- **Speed:** Enter a value that specifies the speed of the tune operation. A speed that translates to a minimum of 25% of the motor nameplate RPM is recommended.

- **Torque:** Enter a value in the range of 0...300 that specifies the torque value to be applied to the tune operation. The default value is 100.

- **Direction:** Choose the direction of the move for the tune operation. The available values include:

  - Forward Unidirectional (default)
  - Reverse Unidirectional
  - Forward Bi-Directional
  - Reverse Bi-Directional

Run the Autotune

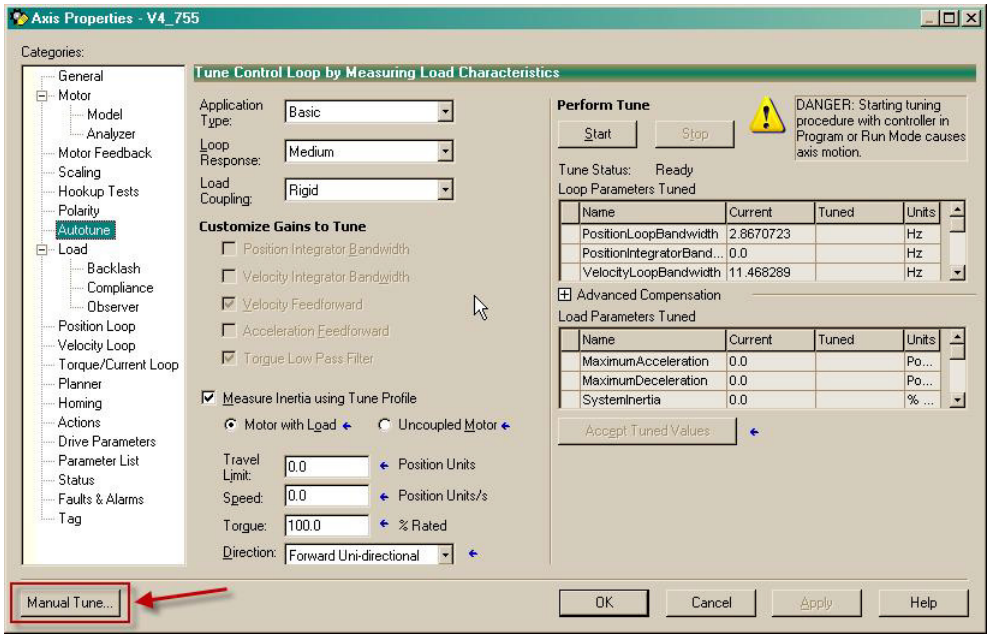
To start the autotune procedure, click Start:

- When the Measure Inertia using Tune Profile check box is selected, the request to start a tune is issued to the controller.
- Any pending edits in this dialog box need to be applied before you start the test. If you have pending edits, a message box appears informing you that pending edits are applied prior to executing the test. Click Yes to apply the pending edits. If you choose No, the test is not be executed.
- Clicking Start issues a Motion Direct command to the controller, which causes any parameters used by the motion direct command to validate before starting the test.
- If the Motion Direct command does not execute due to an error condition, an error message appears and the Test State returns to the Ready state.
- Click Stop to terminate an autotune operation that was started from a source other than Start on this Autotune dialog box. When an Autotune is started from Start on this dialog box, Stop is unavailable.

When the autotune has completed, click Accept Tuned Values to accept the tuning results and before you can change any tuning categories.

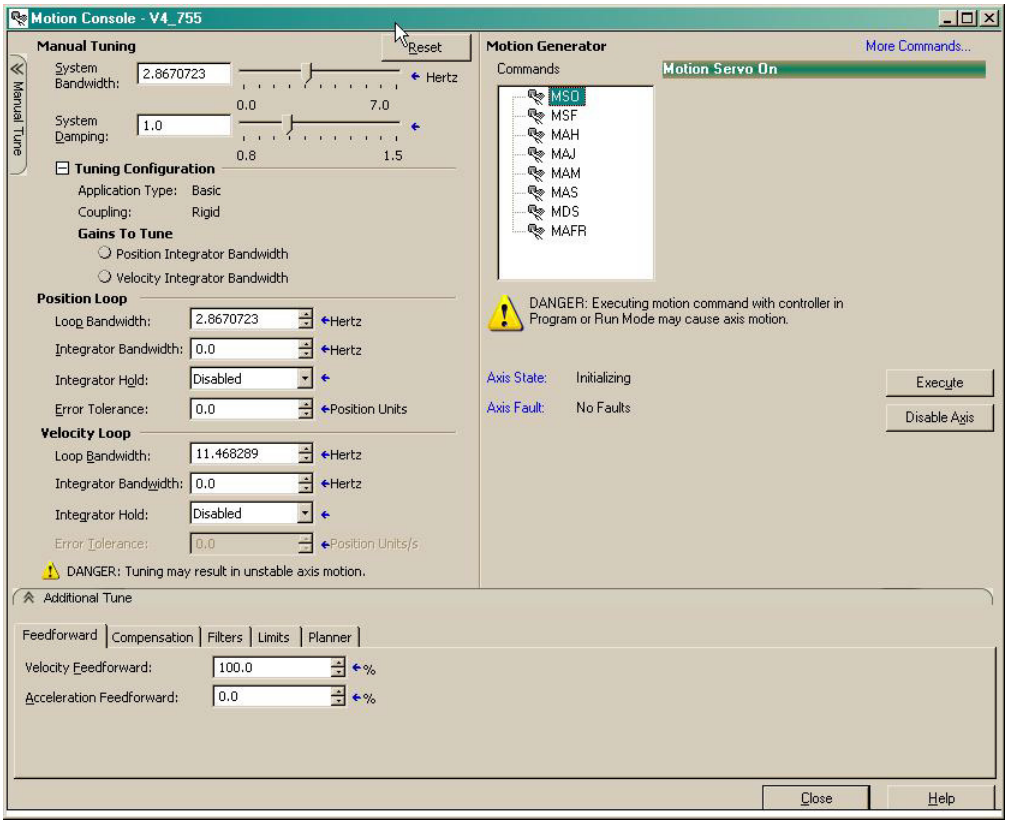
Manual Tune

The Integrated Motion on the Ethernet/IP network axis includes a method for manual tuning the axis gains. Clicking Manual Tune (as indicated in the example here) opens the Manual Tuning window.



Manual Tuning Window

Tuning gains are measured in Hertz in the Integrated Motion on the Ethernet/IP network connection compared to the radians/second in the stand alone drive. 6.283185 Rad/Sec = 1 Hz.



The Manual Tuning window contains three sections:

Manual Tuning Section: This section lets you customize the configuration of system tuning. The following two selections can be made:

- **System Bandwidth:** Changing this value adjusts the Position Loop and Velocity Loop response. The value selected in this field changes the Application Type selection in the Autotune window. Therefore, care must be taken to NOT change this value after the individual gains have been manually configured.

- **System Dampening:** Changing this value adjusts both the Dampening factor and System Bandwidth values. Lowering the System Dampening factor dramatically increases the System Bandwidth. Care must be taken when changing this value to avoid machine damage. It is recommended that small incremental adjustments be made to the System Dampening while evaluating the overall system response. This value changes the Application Type selection in the Autotune window. Therefore, care must be taken to NOT change this value after the individual gains have been manually configured.

- **Position Loop:** You can manually adjust the Loop Bandwidth, Integrator Bandwidth, Integrator Hold and Error Tolerance values.

- **Velocity Loop:** You can manually adjust the Loop Bandwidth, Integrator Bandwidth, Integrator Hold, and Error tolerance (when used as a Velocity Loop) values.

Motion Generator Section: The Motion Generator is a subset of the Motion Direct commands that lets you control the axis motion for tuning.

Additional Tune Section: This section enables adjustment of multiple settings of the axis properties:

- **Feedforward Tab:** Lets you adjust the Velocity Feedforward percentage and Acceleration Feedforward percentage.

- **Compensation Tab:** Lets you adjust the System Inertia percentage and Torque Offset percentage.

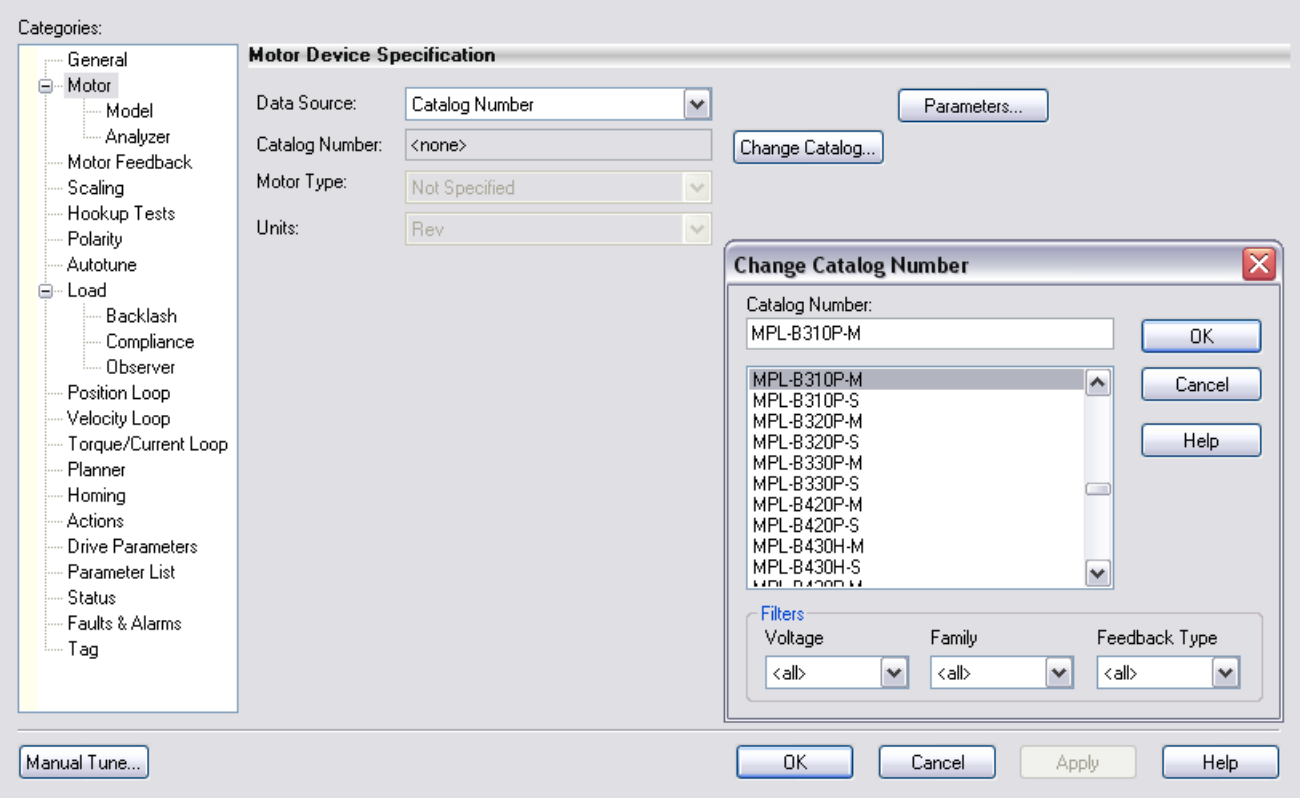
- **Filters Tab:** Lets you adjust the Torque Low Pass Filter Bandwidth and Torque Notch Filter Frequency.

- **Limits Tab:** Lets you adjust the Peak Torque Limit Positive / Negative percentages and Velocity Limit Positive / Negative Units per Second values.

- **Planner Tab:** Lets you adjust the Maximum Speed, Maximum Acceleration, Maximum Deceleration, Maximum Acceleration Jerk, and Maximum Deceleration Jerk values.

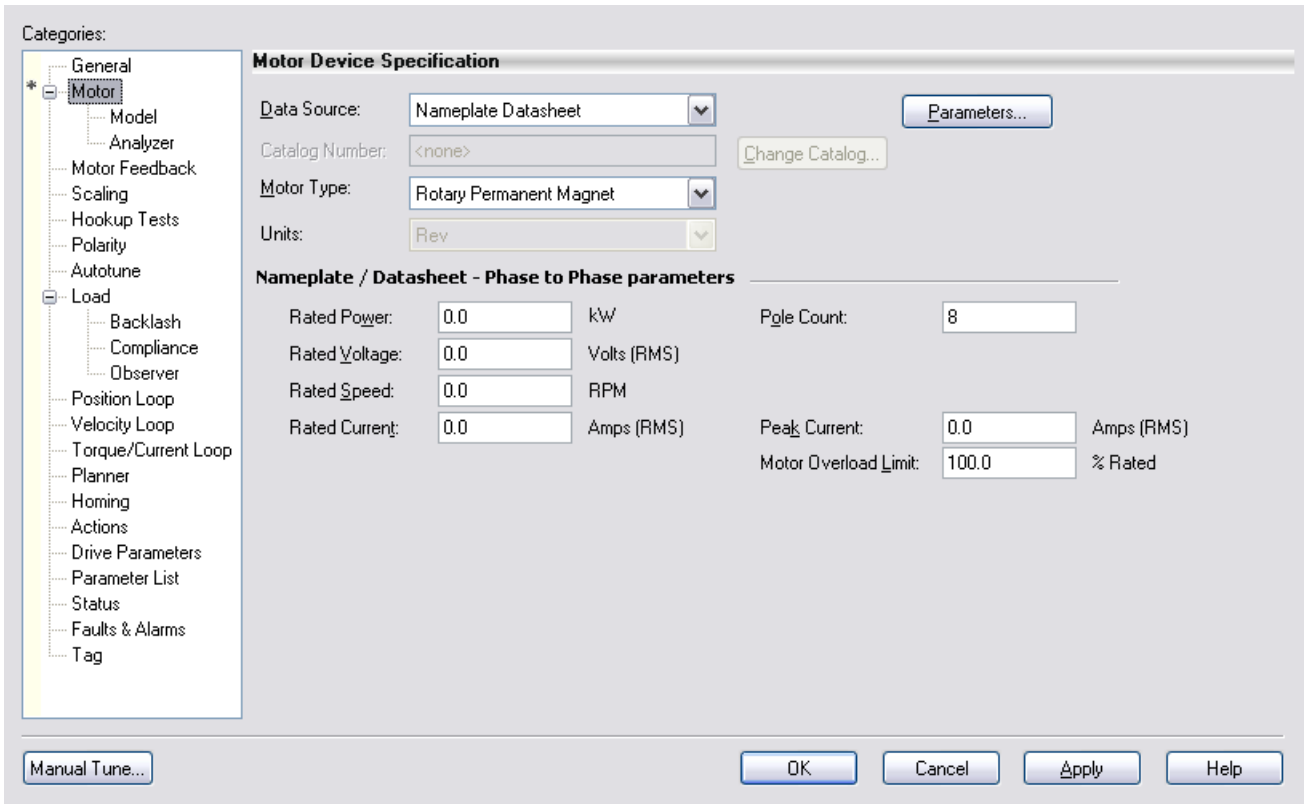
Using an Incremental Encoder with an MP*x* Motor

The PowerFlex 755 drive supports incremental encoder feedback when using a Rockwell Automation MP*x* motor. However, the Motor Device Specification category in the Axis Properties configuration for the Logix Designer application does not currently support MP-Series™ motors with incremental feedback catalog numbers, as shown below. Only MP-Series motors with the suffix –M (Stegmann Multi-turn Absolute), or –S (Single Turn Absolute) motors are supported.



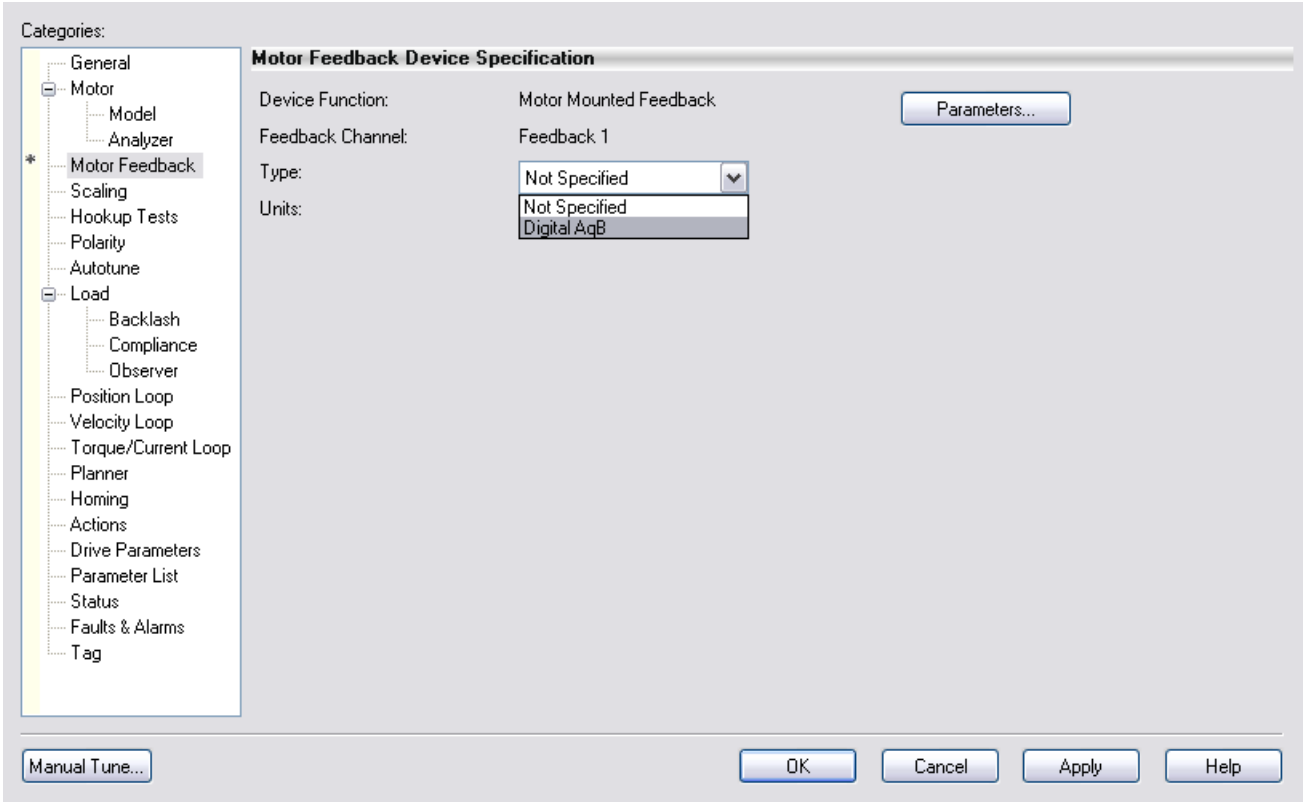
To configure a PowerFlex 755 drive with an MP*x* motor equipped with incremental encoder feedback, the MP*x* motor must be set up as a third-party motor. Follow these steps to configure an MP*x* motor with incremental encoder feedback for use with a PowerFlex 755 drive using the Integrated Motion on the EtherNet/IP Network.

1. In the Axis Properties dialog box for the drive, select these options (as shown below):
   - From the Data Source pull-down menu, choose Nameplate Datasheet.
   - From the Motor Type pull-down menu, choose Rotary Permanent Magnet.
2. You must manually enter the Nameplate / Datasheet – Phase to Phase parameters information. See Appendix D - Permanent Magnet Motors in the PowerFlex 750-Series Programming Manual, publication 750-PM001, for a list of motor nameplate specification data.



TIP If you do not have a Programming Manual readily available, from the Data Source pull-down menu, choose Catalog Number. Then, from the Motor Type pull-down menu, choose the equivalent motor with the -M (Stegmann Multi-turn Absolute) device. The Logix Designer application populates the Nameplate / Datasheet – Phase to Phase parameters information with the data that is stored in the database. Record this information for reference. Then, change the Data Source selection to "Nameplate Datasheet." The configuration is transferred to the new selection. The motor data is the same regardless of the selected feedback device.

3. Select the Motor Feedback category.
4. From the Type pull-down menu, choose Digital AqB.



5. Click OK to save your configuration.

PowerFlex 755 Integrated Motion on the EtherNet/IP Network Block Diagrams

The block diagrams in this section highlight the Integrated Motion on the Ethernet/IP Network attributes and path used in PowerFlex 755 drives control. When viewed in electronic format (PDF), or when printed in color, the standard drive control attributes and path appear in blue and the Integrated Motion on the EtherNet/IP Network attributes appear in black and the path appears in black and uses heavier line weights.

PowerFlex 755 Standard and Safety Drive Module Optional Attributes

The following table specifies what optional attribute and corresponding control mode functionality is supported by a PowerFlex 755 drive module when using the Logix Designer application.

Y = The attribute/enum/bit is supported

N = The attribute/enum/bit is **not** supported

R = The attribute is required

Control Modes

- N = No Control Mode
- F = Frequency Control Mode
- P = Position Control Mode
- V = Velocity Control Mode
- T = Torque Control Mode

For more information on the Control Modes, see Integrated Motion on the Ethernet/IP Network Reference Manual, publication MOTION-RM003.

The Integrated Motion on the Ethernet/IP Network Reference Manual provides a programmer with details about the Integrated Motion on the Ethernet/IP Network Control Modes, Control Methods, and AXIS_CIP_DRIVE Attributes.

Table 29 - Conditional Implementation Key

Key	Description
AOP	Special device specific semantics needed from AOP
Co	Controller only attribute (controller attribute that resides only in controller)
C/D	Yes = The attribute is replicated in the drive
CScale	Motion Scaling Configuration set to Controller Scaling
Derived	Implementation rules follow another attribute
Dr	Drive replicated attribute (controller attribute that is replicated in drive)
Drive Scaling	Drive device supports drive scaling functionality
DScale	Motion Scaling Configuration set to Drive Scaling
E21	EnDat 2.1® (feedback type)
E22	EnDat 2.2® (feedback type)
E	Encoder-based control, a feedback device is present
!E	Encoderless or sensorless control, a feedback device in not present
HI	Hiperface® (feedback type)

Table 29 - Conditional Implementation Key

Key	Description
IM	Rotary or Linear Induction Motor (motor type)
Linear Absolute	Feedback Unit - meter; Feedback n Startup Method- absolute
Linear Motor	Linear PM motor or Linear Induction motor (motor type)
LT	LDT or Linear Displacement Transducer (feedback type)
NV	Motor NV or Drive NV (motor data source)
0-Bits	Optional bits associated with bit mapped attribute
0-Enum	Optional enumerations associated with attribute
PM	Rotary or Linear Permanent Magnet motor (motor type)
Rotary Absolute	Feedback Unit - rev; Feedback n Startup Method- absolute
Rotary Motor	Rotary PM motor or Rotary Induction motor (motor type)
SC	Sine/Cosine (feedback type)
SL	Stahl SSI (feedback type)
SS	SSI (feedback type)
TM	Tamagawa (feedback type)
TP	Digital Parallel (feedback type)
TT	Digital AqB (feedback type)

Rockwell Automation Support

Rockwell Automation provides technical information on the Web to assist you in using its products. At http://www.rockwellautomation.com/support you can find technical and application notes, sample code, and links to software service packs. You can also visit our Support Center at https://rockwellautomation.custhelp.com/ for software updates, support chats and forums, technical information, FAQs, and to sign up for product notification updates.

In addition, we offer multiple support programs for installation, configuration, and troubleshooting. For more information, contact your local distributor or Rockwell Automation representative, or visit http://www.rockwellautomation.com/services/online-phone.

Installation Assistance

If you experience a problem within the first 24 hours of installation, review the information that is contained in this manual. You can contact Customer Support for initial help in getting your product up and running.

United States or Canada	1.440.646.3434
Outside United States or Canada	Use the Worldwide Locator at http://www.rockwellautomation.com/rockwellautomation/support/overview.page, or contact your local Rockwell Automation representative.

New Product Satisfaction Return

Rockwell Automation tests all of its products to help ensure that they are fully operational when shipped from the manufacturing facility. However, if your product is not functioning and needs to be returned, follow these procedures.

United States	Contact your distributor. You must provide a Customer Support case number (call the phone number above to obtain one) to your distributor to complete the return process.
Outside United States	Please contact your local Rockwell Automation representative for the return procedure.

Documentation Feedback

Your comments will help us serve your documentation needs better. If you have any suggestions on how to improve this document, complete this form, publication RA-DU002, available at http://www.rockwellautomation.com/literature/.

Rockwell Automation maintains current product environmental information on its website at http://www.rockwellautomation.com/rockwellautomation/about-us/sustainability-ethics/product-environmental-compliance.page.

dV/dt OUTPUT FILTER

Peak voltages on a 480 V system can reach 1,600 V, and on a 600 V system can reach 2,100 V. These high peak voltages will cause a rapid breakdown of motor insulation, leading to motor failure. The V1K dV/dt filter is an output device that prevents voltage spikes from variable frequency drives (VFD) from exceeding 1,000 V. The V1K minimizes these voltage wave amplitudes and slows the rate of voltage increases.

Reflective Wave Phenomenon

Voltage wave reflection is a function of the voltage rise time (dV/dt) and the length of the motor cables. If the impedance on either end of the cable run does not match, the voltage pulses will be reflected back in the direction from which it arrived. As these reflected waves encounter other waves, their values add, causing higher peak voltage. As wire length or carrier frequency increases, the overshoot peak voltage also increases. V1K dV/dt filter reduces these peak voltages to prevent damage to motors and cables.

Features of V1K Filter

- Limits voltage spikes to below 1,000 V for applications with lead lengths up to 1,000 ft
- Reduces motor heating, noise and vibration.
- Prevents motor failure with protection against motor insulation breakdown.
- Reduces Common Mode by a minimum of 30%.
- Improves system productivity by increasing motor bearing life
- 240 - 600 VAC system compatibility
- 2 - 750 Amps range
- Heavy Duty model available for higher carrier frequency (6 kHz)

Typical VFD/Motor Applications

- Submersible pumps
- Wastewater pumping stations
- HVAC cooling systems
- Process automation facilities
- Agriculture irrigation systems

c UL us LISTED

MADE IN THE UNITED STATES OF AMERICA

Technical Specifications

Voltage Ratings	2 - 750 Amps; 208 - 600 VAC
Carrier Frequency	2 - 4 kHz (consult TCI for applications over 8 kHz if the cable lengths exceed 400 feet)
Insulation Rating	600 V Class
Insulation Class	Class H (180° C) or Class R (220° C)
Efficiency	≥ 98%
Lead Length	Up to 1,000 ft (consult factory for applications above 1,000 feet)
Fundamental Frequency	0 - 60 Hz (derating for applications over 60 - 120 Hz fundamental if the cable lengths exceed 400 feet. Consult TCI)
Environmental Conditions	
Ambient Temperature	Enclosed: 40° C (104° F)
Operating Altitude	2,000 m (6,600 ft) Derating necessary above 2,000 m
Reference Technical Standards	
Agency Approvals	cULus Listed
Enclosure Options	Open, UL Type 1, UL Type 3R
Warranty	One year of useful service, not to exceed 18 months from date of shipment.

NOTE: The V1K is classified as an UL508 Auxiliary Device, not an industrial control panel. Under UL and NFPA/NEC guidelines, an SCCR rating or marking is not required.

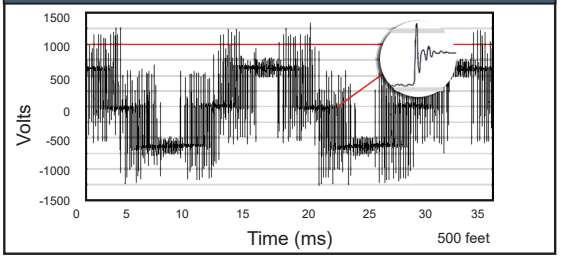
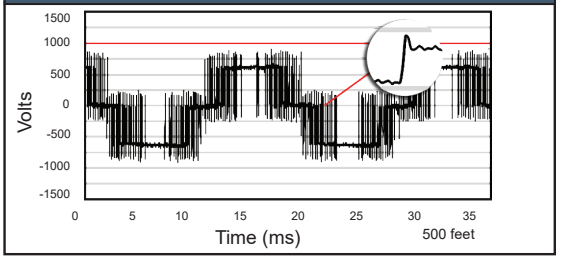
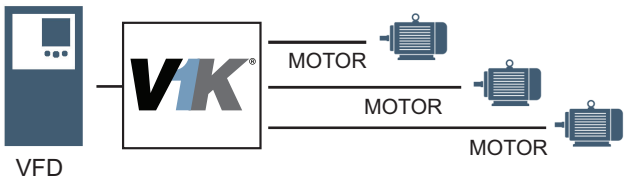
Voltage Without V1K



Voltage With V1K



Multiple Motor Application



Please see web site for configuration guidelines.

Performance Guarantee *- Properly sized and applied, TCI guarantees that the V1K will limit motor terminal peak input voltage to 150% of the bus voltage with a wire lead length of 1,000 feet and a carrier frequency of 4 kHz. Maximum lead length and carrier frequency can vary depending on wire lead type. If a properly selected, installed and loaded V1K filter fails to meet the guaranteed performance levels, TCI will provide the necessary components or replacement filter at no additional charge. TCI does not take responsibility for additional installation or removal costs to include, but not limited to, replacement of third party equipment. Please see TCI's website for minimum requirements.*

Conductor cross section AWG/kcmil max	10
Conductor cross section stranded, with ferrule without plastic sleeve min.	0.14 mm²
Conductor cross section stranded, with ferrule without plastic sleeve max.	4 mm²
Conductor cross section stranded, with ferrule with plastic sleeve min.	0.14 mm²
Conductor cross section stranded, with ferrule with plastic sleeve max.	4 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, min.	0.5 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, max.	1 mm²
Connection method	Spring-cage connection

Stripping length	10 mm
Internal cylindrical gage	A4

Certificates / Approvals

Certification	ABS, BV, CB, CSA, CUL, DNV, GL, GOST, KR, LR, NK, UL, VDE-PZI
Certification Ex:	IECEx, KEMA-EX

Accessories

Item	Designation	Description
Assembly		
3030721	ATP-ST 4	Partition plate, Length: 61 mm, Width: 2 mm, Height: 42 mm, Color: gray
3022218	CLIPFIX 35	Snap-on end bracket, for 35 mm NS 35/7.5 or NS 35/15 DIN rail, can be fitted with Zack strip ZB 8 and ZB 8/27, terminal strip marker KLM 2 and KLM, width: 9.5 mm, color: gray
3022276	CLIPFIX 35-5	Snap-on end bracket, for NS 35/7.5 or NS 35/15 DIN rail, can be fitted with Zack strip ZB 5 and ZBF 5, terminal strip marker KLM 2 and KLM, parking facility for FBS...5, FBS...6, KSS 5, KSS 6, width: 5,15 mm, color: gray
3030420	D-ST 4	End cover, Length: 56 mm, Width: 2.2 mm, Height: 36.5 mm, Color: gray
3036738	DP PS-6	Spacer plate, Color: red
1201442	E/UK	End clamp, for assembly on NS 32 or NS 35/7.5 DIN rail
0801762	NS 35/ 7,5 CU UNPERF 2000MM	DIN rail, material: Copper, unperforated, height 7.5 mm, width 35 mm, length: 2 m
0801733	NS 35/ 7,5 PERF 2000MM	DIN rail, material: steel galvanized and passivated with a thick layer, perforated, height 7.5 mm, width 35 mm, length: 2000 mm
0801681	NS 35/ 7,5 UNPERF 2000MM	DIN rail, material: Steel, unperforated, height 7.5 mm, width 35 mm, length: 2 m
1201756	NS 35/15 AL UNPERF 2000MM	DIN rail, deep drawn, high profile, unperforated, 1.5 mm thick, material: aluminum, height 15 mm, width 35 mm, length 2000 mm
1201895	NS 35/15 CU UNPERF 2000MM	DIN rail, material: Copper, unperforated, 1.5 mm thick, height 15 mm, width 35 mm, length: 2 m

STTB 4

Order No.: 3031429

Extract from the online catalog

http://eshop.phoenixcontact.de/phoenix/treeViewClick.do?UID=3031429

Double-level spring-cage terminal block, Cross section: 0.08 mm² - 6 mm², AWG: 28 - 10, Connection type: Spring-cage connection, Width: 6.2 mm, Color: gray, Mounting type: NS 35/7.5, NS 35/15

Product notes

WEEE/RoHS-compliant since: 01/01/2003

Commercial data	
GTIN (EAN)	4 017918 186920
sales group	A632
Pack	50 pcs.
Customs tariff	85369010
Catalog page information	Page 167 (CL1-2011)

Technical data

General

Number of levels	2
Number of connections	4
Color	gray

Insulating material	PA
Inflammability class acc. to UL 94	V0

Dimensions

Width	6.2 mm
Length	83.5 mm
Height NS 35/7.5	47.5 mm
Height NS 35/15	55 mm

Technical data

Rated surge voltage	6 kV
Pollution degree	3
Surge voltage category	III
Insulating material group	I
Connection in acc. with standard	IEC 60947-7-1
Nominal current I_N	30 A (with 4 mm² conductor cross section)
Nominal voltage U_N	500 V

Connection data

Conductor cross section solid min.	0.08 mm²
Conductor cross section solid max.	6 mm²
Conductor cross section stranded min.	0.08 mm²
Conductor cross section stranded max.	4 mm²
Conductor cross section AWG/kcmil min.	28
Conductor cross section AWG/kcmil max	10
Conductor cross section stranded, with ferrule without plastic sleeve min.	0.14 mm²
Conductor cross section stranded, with ferrule without plastic sleeve max.	4 mm²
Conductor cross section stranded, with ferrule with plastic sleeve min.	0.14 mm²
Conductor cross section stranded, with ferrule with plastic sleeve max.	4 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, min.	0.5 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, max.	1 mm²
Connection method	Spring-cage connection
Stripping length	10 mm

Internal cylindrical gage	A4

Certificates / Approvals

Certification	ABS, BV, CB, CSA, CUL, DNV, GL, GOST, KR, LR, NK, UL, VDE-PZI

Spring cage ground terminal block - ST 4-PE - 3031380

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Spring cage ground terminal block, connection method: Spring-cage connection, number of connections: 2, cross section:0.08 mm² - 6 mm², AWG: 28 - 10, width: 6.2 mm, color: green-yellow, mounting type: NS 35/7,5, NS 35/15

Key Commercial Data

Packing unit	1 STK
GTIN	4 017918 186852
GTIN	4017918186852
Weight per Piece (excluding packing)	12.800 g
Custom tariff number	85369010
Country of origin	Germany

Technical data

General

Number of levels	1
Number of connections	2
Potentials	1
Nominal cross section	4 mm²
Color	green-yellow
Insulating material	PA
Flammability rating according to UL 94	V0
Area of application	Railway industry
	Machine building
	Plant engineering

Spring cage ground terminal block - ST 4-PE - 3031380

Technical data

General

	Process industry
Rated surge voltage	8 kV
Degree of pollution	3
Overvoltage category	III
Insulating material group	I
Open side panel	Yes
Shock protection test specification	DIN EN 50274 (VDE 0660-514):2002-11
Back of the hand protection	guaranteed
Finger protection	guaranteed
Oscillation, broadband noise test result	Test passed
Test specification, oscillation, broadband noise	DIN EN 50155 (VDE 0115-200):2008-03
Test spectrum	Service life test category 2, bogie-mounted
Test frequency	f_1 = 5 Hz to f_2 = 250 Hz
ASD level	6.12 $(m/s^2)^2$/Hz
Acceleration	3.12 g
Test duration per axis	5 h
Test directions	X-, Y- and Z-axis
Shock test result	Test passed
Test specification, shock test	DIN EN 50155 (VDE 0115-200):2008-03
Shock form	Half-sine
Acceleration	30g
Shock duration	18 ms
Number of shocks per direction	3
Test directions	X-, Y- and Z-axis (pos. and neg.)
Relative insulation material temperature index (Elec., UL 746 B)	130 °C
Temperature index of insulation material (DIN EN 60216-1 (VDE 0304-21))	125 °C
Static insulating material application in cold	-60 °C
Behavior in fire for rail vehicles (DIN 5510-2)	Test passed
Flame test method (DIN EN 60695-11-10)	V0
Oxygen index (DIN EN ISO 4589-2)	>32 %
NF F16-101, NF F10-102 Class I	2
NF F16-101, NF F10-102 Class F	2
Surface flammability NFPA 130 (ASTM E 162)	passed
Specific optical density of smoke NFPA 130 (ASTM E 662)	passed
Smoke gas toxicity NFPA 130 (SMP 800C)	passed
Calorimetric heat release NFPA 130 (ASTM E 1354)	27,5 MJ/kg
Fire protection for rail vehicles (DIN EN 45545-2) R22	HL 1 - HL 3

Spring cage ground terminal block - ST 4-PE - 3031380

Technical data

General

Fire protection for rail vehicles (DIN EN 45545-2) R23	HL 1 - HL 3
Fire protection for rail vehicles (DIN EN 45545-2) R24	HL 1 - HL 3
Fire protection for rail vehicles (DIN EN 45545-2) R26	HL 1 - HL 3

Dimensions

Width	6.2 mm
End cover width	2.2 mm
Length	56 mm
Height NS 35/7,5	36.5 mm
Height NS 35/15	44 mm

Connection data

Note	Please observe the current carrying capacity of the DIN rails.
Connection method	Spring-cage connection
Connection in acc. with standard	IEC 60947-7-2
Conductor cross section solid min.	0.08 mm²
Conductor cross section solid max.	6 mm²
Conductor cross section AWG min.	28
Conductor cross section AWG max.	10
Conductor cross section flexible min.	0.08 mm²
Conductor cross section flexible max.	4 mm²
Min. AWG conductor cross section, flexible	28
Max. AWG conductor cross section, flexible	12
Conductor cross section flexible, with ferrule without plastic sleeve min.	0.14 mm²
Conductor cross section flexible, with ferrule without plastic sleeve max.	4 mm²
Conductor cross section flexible, with ferrule with plastic sleeve min.	0.14 mm²
Conductor cross section flexible, with ferrule with plastic sleeve max.	4 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, min.	0.5 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, max.	1 mm²
Connection in acc. with standard	IEC/EN 60079-7
Conductor cross section solid min.	0.08 mm²
Conductor cross section solid max.	6 mm²
Conductor cross section AWG min.	28
Conductor cross section AWG max.	10
Conductor cross section flexible min.	0.08 mm²
Conductor cross section flexible max.	4 mm²
Stripping length	8 mm ... 10 mm

DIN rail perforated - NS 35/ 7,5 PERF 2000MM - 0801733

DIN rail, material: steel galvanized and passivated with a thick layer, perforated, height 7.5 mm, width 35 mm, length: 2000 mm

Fuse modular terminal block - ST 4-HESI (6,3X32) - 3036385

Please be informed that the data shown in this PDF Document is generated from our Online Catalog. Please find the complete data in the user's documentation. Our General Terms of Use for Downloads are valid (http://phoenixcontact.com/download)

Lever-type fuse terminal block, black, for 6.3 x 32 mm G fuse inserts

Product Features

- An extremely compact design
- Test connection on both sides in safety lever

Key Commercial Data

Packing unit	1 pc
Weight per Piece (excluding packing)	26.63 g
Custom tariff number	85369085
Country of origin	Poland

Technical data

General

Number of levels	1
Number of connections	2
Nominal cross section	4 mm²
Color	black
Insulating material	PA
Flammability rating according to UL 94	V0
Fuse	G / 6,3 x 32
Fuse type	Glass / ceramics / ...
Rated surge voltage	6 kV
Degree of pollution	3
Overvoltage category	III
Insulating material group	I

Fuse modular terminal block - ST 4-HESI (6,3X32) - 3036385

Technical data

General

Maximum power dissipation	max. 1.6 W (With single arrangement of the fuse terminal block in the event of overload)
Maximum current with single arrangement	10 A
Connection in acc. with standard	IEC 60947-7-3
Maximum load current	10 A (the current is determined by the fuse used)
Nominal current I_N	10 A
Nominal voltage U_N	400 V
Open side panel	No
Shock protection test specification	DIN EN 50274 (VDE 0660-514):2002-11
Back of the hand protection	guaranteed
Finger protection	guaranteed
Oscillation, broadband noise test result	Test passed
Test specification, oscillation, broadband noise	DIN EN 50155 (VDE 0115-200):2008-03
Test spectrum	Service life test category 1, class B, body mounted
Test frequency	f_1 = 5 Hz to f_2 = 150 Hz
ASD level	0.964 $(m/s^2)^2/Hz$
Acceleration	0.58 g
Test duration per axis	5 h
Test directions	X-, Y- and Z-axis
Shock test result	Test passed
Test specification, shock test	DIN EN 50155 (VDE 0115-200):2008-03
Shock form	Half-sine
Acceleration	5 g
Shock duration	30 ms
Number of shocks per direction	3
Test directions	X-, Y- and Z-axis (pos. and neg.)
Relative insulation material temperature index (Elec., UL 746 B)	130 °C

Height NS 35/15	62 mm

Technical data

Rated surge voltage	4 kV
Pollution degree	3
Surge voltage category	III
Insulating material group	I
Connection in acc. with standard	IEC 60947-7-1 / IEC 60947-7-2
Nominal current I_N	24 A
Nominal voltage U_N	250 V (the voltage is determined by the component used)

Connection data

Conductor cross section solid min.	0.2 mm²
Conductor cross section solid max.	4 mm²
Conductor cross section stranded min.	0.2 mm²
Conductor cross section stranded max.	2.5 mm²
Conductor cross section AWG/kcmil min.	24
Conductor cross section AWG/kcmil max	12
Conductor cross section stranded, with ferrule without plastic sleeve min.	0.25 mm²
Conductor cross section stranded, with ferrule without plastic sleeve max.	2.5 mm²
Conductor cross section stranded, with ferrule with plastic sleeve min.	0.25 mm²
Conductor cross section stranded, with ferrule with plastic sleeve max.	2.5 mm²
2 conductors with same cross section, solid min.	0.2 mm²
2 conductors with same cross section, solid max.	1 mm²
2 conductors with same cross section, stranded min.	0.2 mm²
2 conductors with same cross section, stranded max.	1 mm²

2 conductors with same cross section, stranded, ferrules without plastic sleeve, min.	0.25 mm²
2 conductors with same cross section, stranded, ferrules without plastic sleeve, max.	1 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, min.	0.5 mm²
2 conductors with same cross section, stranded, TWIN ferrules with plastic sleeve, max.	1 mm²
Cross-section with insertion bridge, solid max.	4 mm²
Cross-section with insertion bridge, stranded max.	2.5 mm²
Connection method	Screw connection
Stripping length	8 mm
Internal cylindrical gage	A3
Screw thread	M3
Tightening torque, min	0.5 Nm
Tightening torque max	0.6 Nm

Edison Power Distribution Blocks

Short-Circuit Current Rated Power Distribution Blocks

We offer distinctly different styles of short-circuit current rated Power Distribution Blocks and Terminal Blocks to match different application needs.

1) Enclosed style or Open style
2) UL1953 Listed power distribution blocks or UL1059 Recognized terminal blocks, that have different minimum spacing requirements.

The table below can assist in the selection of the correct series for your application requirements.

Why are these important?

Assembly short-circuit current ratings (SCCRs) are now required in the 2005 NEC® and UL508A Listed industrial control panels.

Marking the SCCR on:

- Industrial Control Panels (NEC® 409.110)
- Industrial Machinery Electrical Panels (NEC® 670.3(A))
- HVAC equipment (NEC® 440.4(B)

The above sections are now required by the National Electrical Code. Power Distribution Blocks or Terminal Blocks not marked with an SCCR are typically one of the weakest links and may limit an assembly to no more than 10 kA SCCR per Table SB4.1 UL508A. The EPDB series and HPB series Power Distribution Blocks have increased spacing required where used in feeder circuits in equipment listed to UL508A. The PB series UL1059 Terminal Blocks must be evaluated for proper spacing. Also, for building wiring systems, the EPDB series and HPB series power distribution blocks can be used to meet the 2005 NEC® requirements in section 376.56(B) for power distribution blocks in wireways.

Edison Power Distribution Blocks Selection Guide*

Series	UL	† Enclosed	High SCCR**	Spacing*** 1" Air 2" Surface	Industrial Control Panels UL 508A Branch Circuit	Industrial Control Panels UL 508A Feeder Circuit	HVAC UL 1995	Wireways NEC® 376.56(B) (Requires UL 1953)

HPB	UL 1953 Listed Power Distribution Blocks	No****	Yes	Yes	Yes	Yes	Yes	Yes (with optional cover)
PB	UL 1059 Recognized Terminal Blocks	No****	Yes	No*****	Yes	No*****	Yes	No

† IP-20 finger-safe under specific conditions.
**Refer to specific UL standards and NEC sections for a complete application guide.*
***When protected by proper fuse class with maximum ampere rating specified or smaller. This does not apply to PB40, PB51 and PB71 series.*
****See Minimum Space Requirements for Equipment table below.*
*****Optional covers are available. They are not IP-20 rated, but do provide additional protection against direct contact with Live Parts.*
******Exception: Yes, if single pole units installed with proper spacings.*

Minimum Space Requirements for Equipment

UL Standard	Spacing Between Live Parts of Opposite Polarity		Spacing Between Live Parts and Grounded Parts or Enclosures, Through Air and Over Surface @ 600V
	Through Air @ 600V	Over Surface @ 600V	
508A Feeder Circuits, Table 10.2	1"	2"	1"
508A Branch Circuits, Table 10.1	3/8"	1/2"	1/2"
UL 1995 HVAC	3/8"	1/2"	1/2"
Note: Refer to specific UL standards for complete spacing details.			

HPB Series Edison Open-Style Power Distribution Blocks

Open-style power distribution blocks for cable termination

Edison open-style power distribution blocks are a convenient way to manage your power distribution needs. They are engineered to maintain a high SCCR rating of 200kA with copper conductors making these distribution blocks the ideal solution to today's power circuit wiring needs.

Features

- Suitable for industrial control panel applications requiring high SCCR ratings
- Suitable for installation in wireways (with optional cover, per NEC 376.56 (B))
- Has minimum spacing requirements at 600VAC/DC of at least 1in (25.4 mm) through air and 2in (50.8 mm) over surface which meets UL 1953 requirements
- Used in UL508A panels
- Meets UL508A requirements and can be used in feeder and branch circuit applications
- Tin-plated aluminum connectors suitable for copper conductors
- Available safety covers for greater protection (purchase separately)
- Suitable for both factory and field wiring
- Panel mounting

Ratings

- Ampere ratings up to 310A
- 600VAC or VDC
- Short Circuit Current Rating (SCCR) up to 200kA with proper fusing See short circuit rating data table.
- Flammability: UL 94V0
- Temperature rating: -4°F to 248°F (-20°C to 120°C) with a relative humidity not exceeding 85%.

Agency Approvals

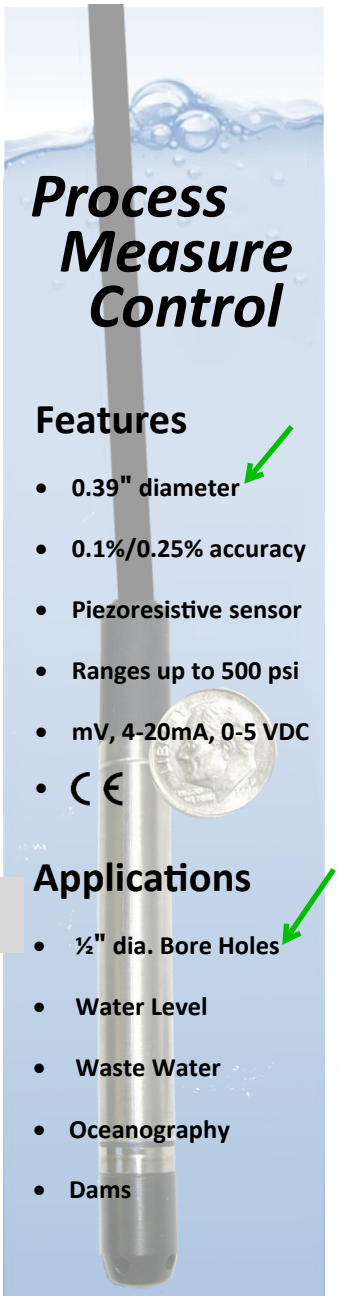
Depth and Level Pressure Transmitter
Miniature MTM3000 Series

The Miniature MTM3000 Series submersible transmitters are specifically designed for depth and level measurements of groundwater, wastewater and sea water where space is very limited. The housing diameter of 0.39 inches offers the user an ideal high performance level measurement in small diameter, i.e. 1/2" monitoring wells, stand pipes and bore holes. The titanium construction and integral polyurethane cable provide a reliable long term solution for these difficult-to-measure applications. Kevlar is used as a cable reinforcement to avoid any elongation, particularly when long lengths of cable are required for deep wells. Long term stability of typically ±0.1% per year also contributes toward a maintenance-free installation.

An in-line converter is available which is generally positioned above the water line but becomes integral with the transducer to provide either 4-20 mA, or 0-5 VDC output. PMC also offers a range of 1" diameter dataloggers which can be supplied in-line or at the well head for continuous monitoring.

An extensive range of accessories is available . See details on back page.



Process Measure Control

Features

- **0.39" diameter**
- **0.1%/0.25% accuracy**
- **Piezoresistive sensor**
- **Ranges up to 500 psi**
- **mV, 4-20mA, 0-5 VDC**
- CE

Applications

- **½" dia. Bore Holes**
- **Water Level**
- **Waste Water**
- **Oceanography**
- **Dams**

Technical Specifications

Full Scale Ranges (Zero Based)	Any range from 0-10 to 0-500 psig, & 0-10 to 0-500 psia Available in any engineering units, such as psi, Pa, in H2O, Bar, etc.
Accuracy	±0.1% FS or ±0.25% FS available. Includes non-linearity, hysteresis, repeatability . *Note: ±0.1% not generally available with mV output*
Overpressure	3 x range
Operating Temperature Range	25° to 125°F (-4° to +50°C)
Compensated Temperature Range	30° to 85°F (-2° to +30°C)
Temperature Effects (Compensated)	±1.5% total for 25° to 125° F, over 50 psi FS ±2% total for 25° to 125° F, up to 50 psi FS
Long Term Stability	0.1% FS per year for pressure ranges > 30 psi FS Prorated for ranges below 30 psi FS under standard conditions
Electrical (4 wire bridge)	Supply Voltage: 1-15VDC Output Signal: 5mV/V typical, ratiometric with supply Input Impedance: >10k ohm Bridge resistance: 3k ohm typical
Electrical (4-20 mA and VDC) with In-Line Converter - Fig 1	4-20 mA (2 wire) from 9-33 VDC supply 0-5 or 0-10 VDC (3wire) from 15-30 VDC supply
Intrinsically Safe Approvals	Reference VL 3000/4000 - consult factory
Cable	Polyurethane molded, vented with Kevlar, 6 conductors
Housing	Titanium standard with 5-year corrosion warranty For *316L Stainless Steel contact the factory*
Weight (excluding cable)	1 oz. (excluding cable)

PMC Engineering adopts a continuous development program which sometimes necessitates specification changes without notice

Model Construction	Depth Cone 0.39"	3
Housing Material	316L Stainless Steel-*contact factory*	1
	Titanium - 5 year corrosion warranty	2
Electrical Connection	Polyurethane molded cable	1
Cable length must be specified at the time of ordering. If ordering converter (fig.1) two lengths must be specified. Sensor to converter/converter to termination.		
Electrical Configuration	Millivolt uncompensated	0
	Millivolt compensated	1
	Volts, specify 0-5 or 0-10 (fig.1)	2
	4-20 mA (fig.1)	3

Example Ordering Format: MTM3213 - 40psig - 0.1% - 90/10' cable

Related Products

The VersaLine **VL3000** and **VL4000** offer similar performance with 1" and 3/4" diameter housings respectively. The **VL2000** provides an open face construction avoiding clogging or sludge build up in wastewater and similar applications. PMC manufactures a wide range of other level transmitters including flush designs for use in water and wastewater management, food and beverage, pulp and paper, and pharmaceutical applications. Please refer to appropriate data sheets.

For Zero Maintenance

In order to reduce on site maintenance PMC has developed the MP 11 Moisture Protection Reference Volume. For vented gauge transmitters this provides a total isolation to the atmosphere by using a custom bladder while maintaining the high performance of the transmitter. This changes volume with Barometric pressure. Totally maintenance free. Please specify MP 11.

General Sensor Performance Details

Accuracy: ±0.1%FS (BSL) or ±0.25%FS (BSL)

Operating Temperature: 25° to +125°F (-4° to +50°C)

Compensated Temperature: 30° to 85°F (-2° to +30°C)

Full Scale Ranges: 0-10 to 0-500 psig & psia

Installation Instructions

Below are the installation instructions for the MTM3000 Series of Submersible Depth & Level Transmitters. Please read this document before starting installation.

1. **A black vinyl transit sleeve prevents dirt and fluid going into the electrical cable terminations and specifically prevents humid air or water from entering the vent tube. Remove the sleeve only when connecting the sensor to the system.**

It is extremely important to protect the vent tube from humid conditions which can result in the vent tube becoming blocked. The factory purges the vent tube with nitrogen prior to fitting the cap.

Note: The sensor receives barometric pressure changes through the internal vent tube.

2. **The MTM3000 Transmitter electrical supply voltage must be between 9-33 Vdc, measured at the transmitter connections.**

   Calculate the minimum supply voltage as follows:

   VMin = VS - (0.02 x RL)

   where: VS = Supply voltage

   RL = Total loop resistance in ohms

3. **The cable is considered an integral part of the sensor. The length has been specified by the buyer. Splicing of the cable is not recommended especially if the splice is below the water level. Reducing the length may be possible but extreme care needs to be taken with the vent tube (see item 1 above). **Consult factory prior to reducing cable length.***

4. **Occasionally, the MTM3000 Series is installed with a sink weight which is suitable for sitting on the tank/well bottom and keeping the sensor above sludge. Instructions for attaching the sink weight can be found on page 3 of this manual.**

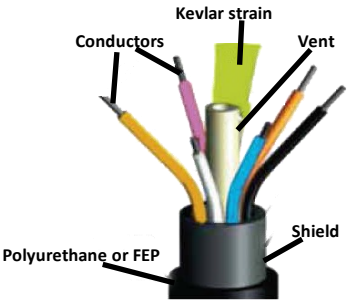

Fig. 4 - Cable Connections

5. **The polyurethane sheathed cable (see fig. 4) incorporates a Kevlar strain relief which has more than 200lbs breaking strength and will not stretch. Therefore, it is acceptable even with the sink weight fitted to lower the sensor into the fluid until it reaches the point where the measurements are to be made from. If the sink weight is fitted and the sensor is to rest on the bottom of a tank/well then the cable only needs to be fixed above the surface. If the sensor is to be positioned above the bottom then it is preferable to attach it to a fixed object to avoid movement especially when agitators are nearby.**

   PMC offers the CH 10 cable hanger to support the sensor and cable at the surface - see page 4.

6. ***It is important that the cable is terminated within an enclosure that maintains clean, dry air environment.*** **PMC can supply and recommends the Termination Enclosure TE-11 which provides electrical terminations and MP-11 Moisture Protection Reference Volume into a single box for zero maintenance. See page 5.**

7. **After connecting the wires, visually inspect the top of the nylon vent tube to make sure it is clean and not blocked or damaged.**

8. **Clamp the cable and attach at the datum reference point with a clamping device. Make sure that there is no cable movement and no damage of the internal nylon vent tube in the cable structure.**

   Note: The maximum bend radius for the polyurethane cable is 1½" if bent more sharply the reference tube in the cable may kink causing measurement errors.

9. **Switch on the power supply and make sure that an applicable output signal from the sensor is received by the signal conditioning system.**

Calibration

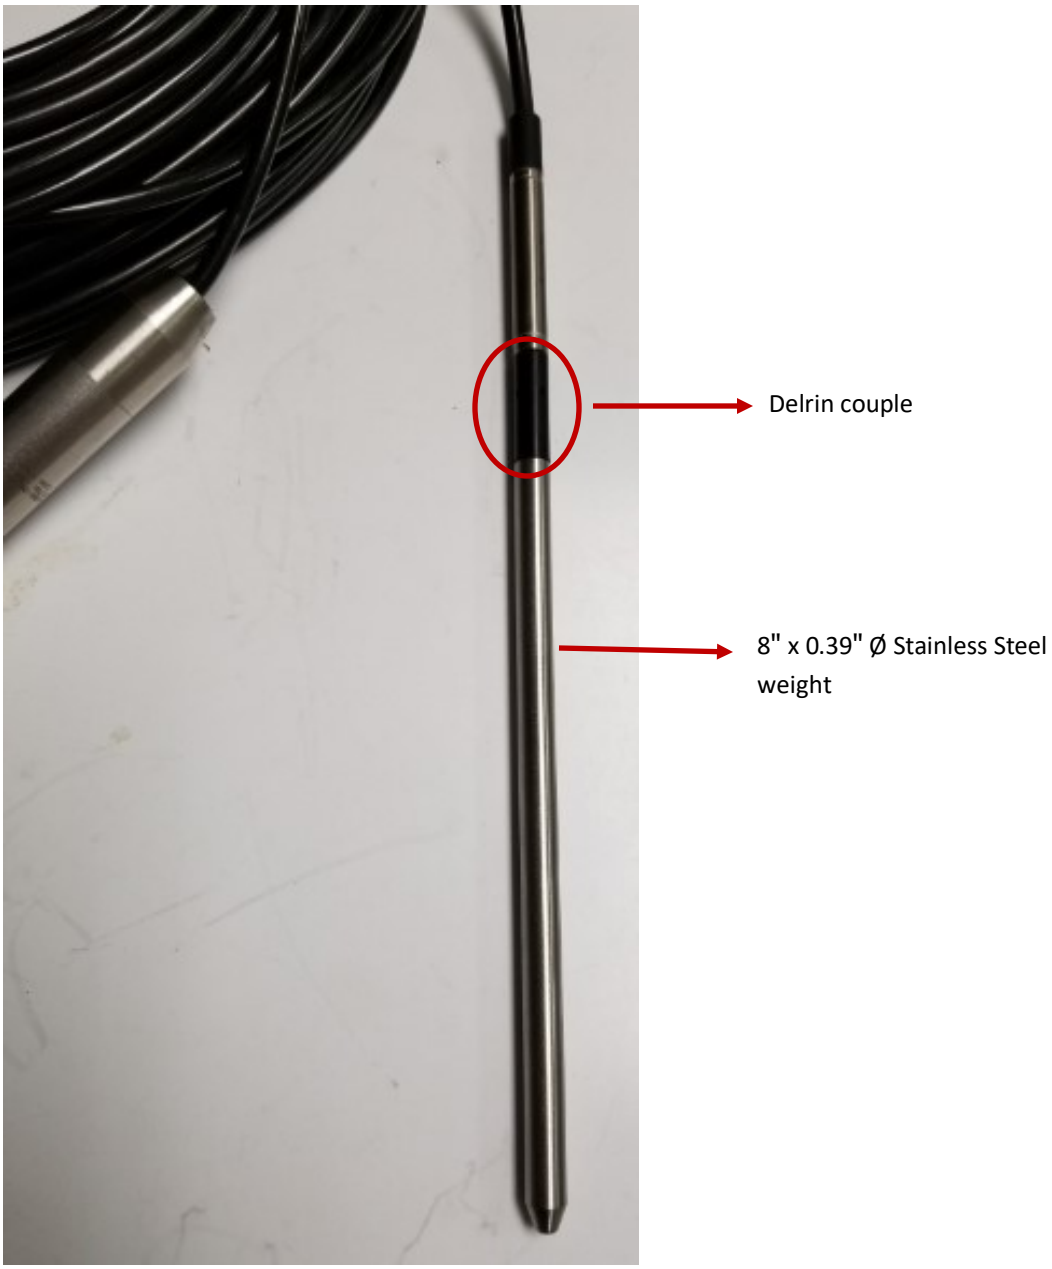
This sensor was originally factory calibrated and then permanently sealed. Therefore, no adjustments to the sensor can be made. The long term stability (drift) of the sensor is ~0.1%/year (in typical conditions). This means that if the sensor is shipped as a 0.1% static accurate device, after year one the accuracy will have drifted to ~0.2%, after year 2 it will have drifted to ~0.3% and so on. PMC can evaluate this sensor to ensure its performance is within the expected range. While there is no adjustment on the sensor itself, knowing the sensors drift allows you to program offsets in your SCADA control to "Calibrate" the system.

Accessories

See the following pages for our wide range of accessories and variants.

Sink Weight MTM3000 Installation Instructions

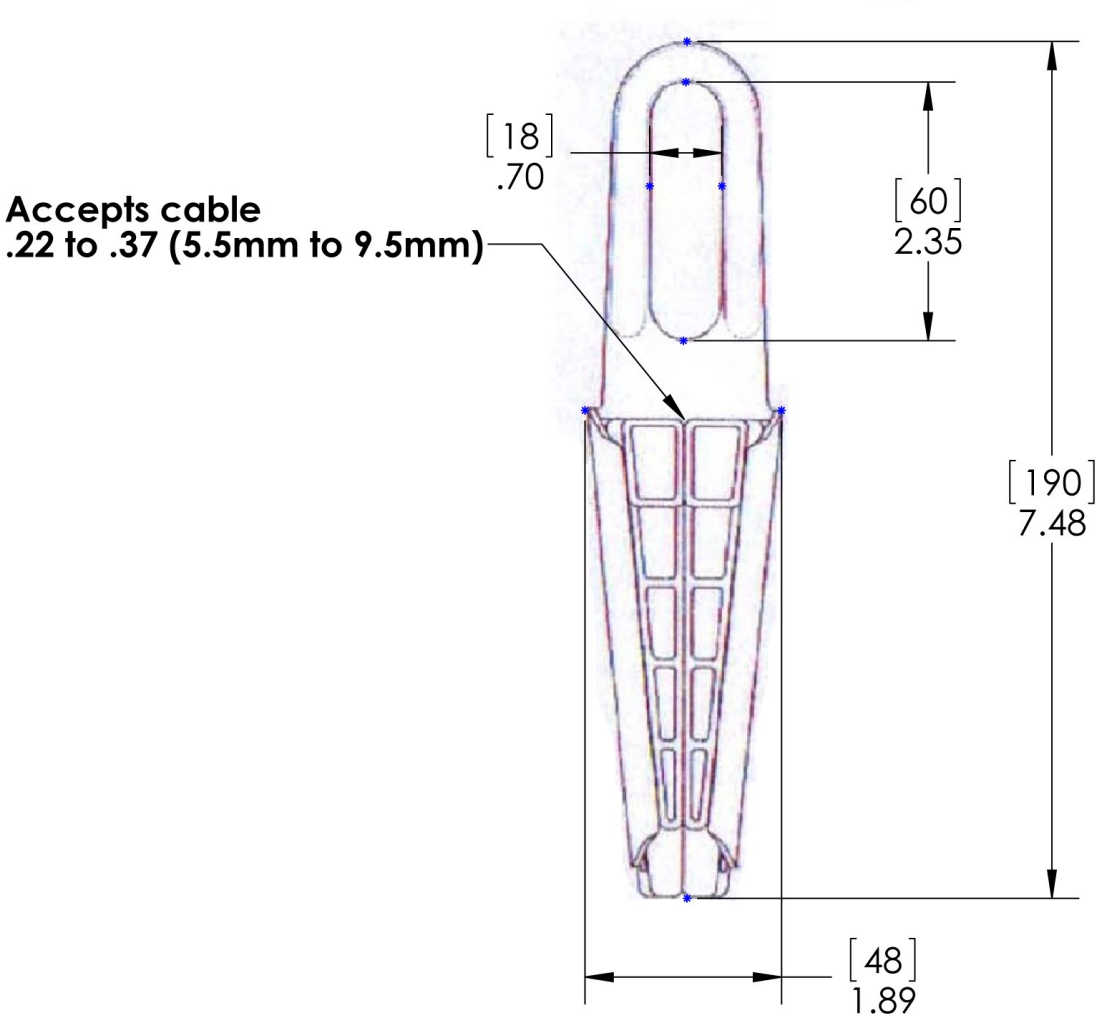
The design uses a Delrin couple to attach the roughly 8” long x 0.390 diameter Stainless Steel weight to the end of the titanium sensor. The Delrin acts to isolate the two metals. The device would roughly double the total weight, which in reality would still be much less than 1-pound.



Cable Hanger CH-10 Installation Instructions

The CH-10 cable hanger is designed to be positioned at any point along the cable supporting PMC depth/level transmitters. The polycarbonate inserts should be pulled to their widest point. The cable then is placed within the inserts. When the cable is pulled it will be gripped by the inserts and provide the strength to hold up to 200lbs. PMC also offers a Stainless Steel version.

Note: It may be necessary to tap on the insert to achieve the grip.

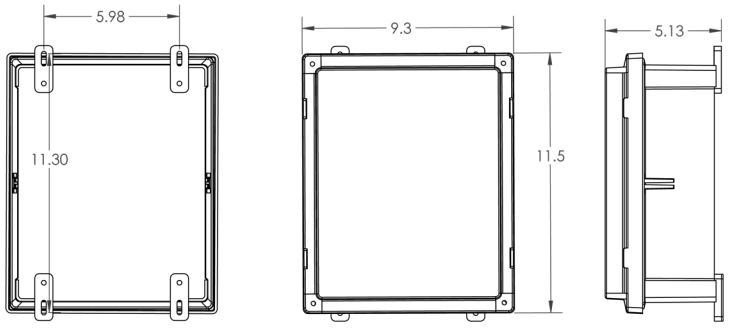


TE-11 Installation Instructions

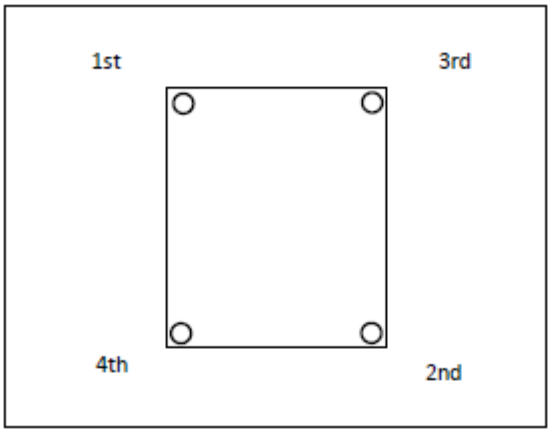
The TE-11 is a low maintenance termination enclosure for connecting to a pressure sensor in the field or an uncontrolled industrial environment. With the TE-11 the sensor cable is connected to a DIN terminal strip and the reference tube is connected to the MP-11 inside the enclosure.

Installation

1. **Determine the best location near the sensor for mounting the TE-11.**
2. **If the TE-11 is outdoors or in a location where it will get sprayed with water then the enclosure must be mounted with the cable glands and vent facing down.**
3. **Mount the TE-11 using the mounting lugs protruding from the back of the enclosure.**



4. **Remove the lid of the TE-11 and feed the extension lead through the cable gland on the right. Please note to accommodate a variety of customer cables there is a clear tube installed in the cable gland. If your cable is too large to fit into the clear tube then remove and install the cable into just the cable gland. (cable diameter range .150-.300 with clear tube, .230-.546 without clear tube)**
5. **Attach the extension leads to the appropriate DIN terminal connections.**
6. **Feed the sensor cable through the cable gland on the left and attach the sensor leads to the appropriate DIN terminal connections.**
7. **Use the supplied flexible tubing and join the reference tube in the sensor cable to the barbed fitting on the MP-11 inside the enclosure.**
8. **After the cables are in place tighten both cable glands until the cables are tight and do not move.**
9. **It is recommended that you seal both the end of the sensor cable and the extension lead with some RTV. This will reduce the internal volume of the TE-11 and keep external air/humidity from coming in through the extension lead.**
10. **To help reduce contact corrosion there is a desiccant module (DM-10) supplied that fits behind the nameplate on the TE-11 lid. Remove the DM-10 from the package and install into the TE-11 lid with the DM-10 window aligned with the hole in the nameplate. (see fig. 1) Because there should be very little exchange of air in the TE-11 the DM-10 should last a minimum of 12 months in typical environments.(DM-10 window changes from blue to pink). (see fig. 2) Contact PMC for replacement DM-10 as required.**
11. **Once everything is installed place the lid on the enclosure and tighten into place. Do not tighten each screw completely in. Tighten each screw approximately half of the way in and alternate corners. (See following page) Now go back and tighten each screw all the way and again alternate corners.**



12. The TE-11 installation is now complete.

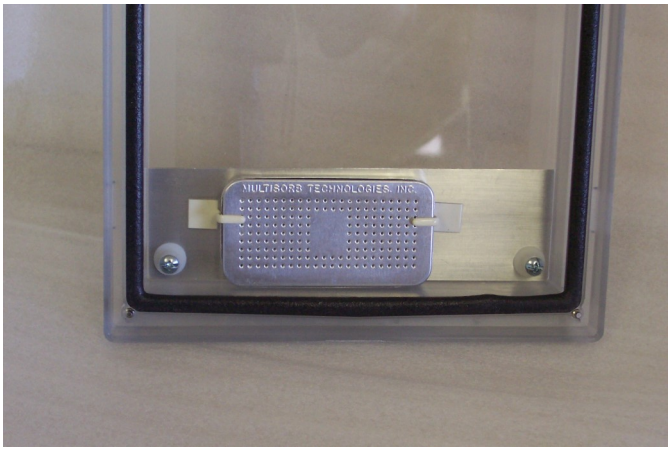


Fig. 1 – DM-10 installed in TE-11 lid.

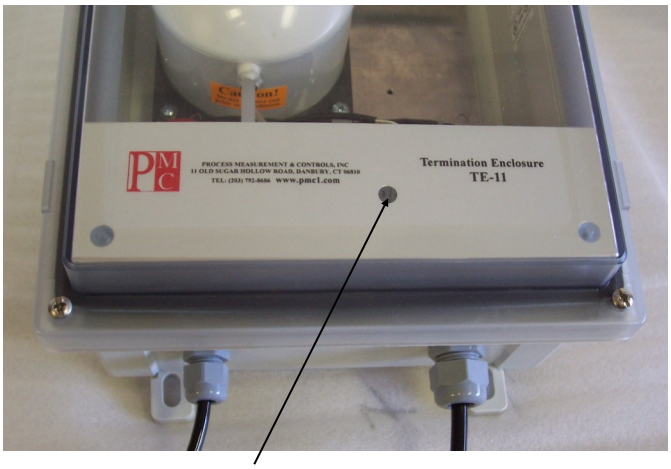

Fig. 2 - DM-10 indicator window

Installation Instructions
Surge Protector DLU & DLU2

Line Connection
The DLU (1-pair) or DLU2 (2-pair) surge protector must be linked in series on the line to be protected (see diagram) by screw terminal in input and output.
Gauge wire : from 0.2 to 1.5 mm²

Bonding network connection
Minimum gauge of the Earth wire : 1,5mm².

Box fitting
On symmetrical 35 mm DIN rail (EN 50022).

Housing Material
Yellow polycarbonate UL94V-0

Installation recommendation

Basic rules
- The way line/equipment has to be respected (see diagram)
- Imperative connection to the bonding network
- Proper selection of the protection model has adapted to the type of protected line.
- Physical seperation between protected wires and non protected wires in order to limit couplings.

Earth connection
- Minimum gauge of the earth connection cable : 1.5 mm²
- The length of this wire (between surge protection and bonding bar) must be shorter as possible (< 0.50 m).
