EXECUTIVE SUMMARY

On behalf of Lockheed Martin Corporation, AECOM Technical Services, Inc., has prepared this groundwater monitoring report for the April 2018 groundwater sampling at the Middle River Complex in Middle River, Maryland. This report is part of the long-term groundwater and surface water monitoring program at the Middle River Complex, conducted in accordance with the approved *Groundwater and Surface Water Monitoring Work Plan* and its addenda (AECOM, 2017a, 2018a, 2018b). Groundwater was sampled from April 4–13, 2018, and June 25–26, 2018. MRC-MW77A and MRC-MW80B were inadvertently left out during the April 2018 sampling round and were sampled on December 6, 2018. The analytical results for MRC-MW77A and MRC-MW80B are presented in Revision 1 of this report.

The findings of the April ~~2018~~ and December 2018 groundwater sampling ~~and~~ analyses and groundwater level measurements for the Lockheed Martin Corporation Middle River Complex are summarized as follows:

- Groundwater measurements in the April 2018 and December 2018 groundwater sampling are consistent with previously observed groundwater elevations and observed radial groundwater-flow patterns to Dark Head Cove and Cow Pen Creek.
- The Blocks E and F Southeastern Plume, experiences some degradation of parent material into daughter products, but remains largely stable and migrating from the underground storage tank 2 source area in Block E, downgradient to Dark Head Cove.
- The Block I South of Building C Plume is stable to increasing over time, and possibly connects with the Blocks E and F, Southeastern Plume as it migrates east and south from the source area (MRC-MW60A and MRC-MW60B). Increasing trichloroethene trends observed in some monitoring wells directly downgradient of the Block I Building C Plume may be caused by the following:
    - a continued release from an unidentified source(s) beneath Building C;
    - release from source material that has sorbed onto finer-grained materials and is back-diffusing into groundwater and providing a continuing source of contamination in the area; and/or
    - injections that may have moved the contaminant mass within the subsurface.

- Increases in trichloroethene concentrations within the Block I Building C source area and increases in degradation products at wells immediately downgradient of the source area suggest the plume could be sourcing parent material at relatively the same rate as it is degrading. An increase in *cis*-1,2-dichloroethene concentrations in wells further downgradient of the Block I Building C source area indicates anaerobic reductive dechlorination is occurring. Overall, a 70 percent reduction in trichloroethene mass in active remediation areas continues to be achieved.

- Remedial injections in 2015 and 2016 in the Block G Plume near MRC-MW14B were effective in the immediate area of the injections.

- In the Block G Plume, the plume detected at upgradient well MRC-MW21B and other B-Zone wells upgradient near the Tilley building remains stable. A-Zone wells (MRC-MW21A, MRC-MW98A, and MRC-MW111A) designated to evaluate potential for vapor intrusion within the Tilley Building had detectable groundwater concentrations below vapor intrusion screening levels. In 14 rounds of vapor intrusion monitoring, the A-Zone groundwater contaminant concentrations have not resulted in vapor intrusion.

- The Block G 1,4-dioxane plume contains higher contaminant concentration levels at monitoring well (MRC-MW12A) along the shoreline and may indicate possible flow into surface water at Cow Pen Creek. Ongoing surface water monitoring of Cow Pen Creek has not detected 1,4-dioxane at concentrations above risk-based swimming screening levels; surface water results will be provided under a separate cover.

- The Block I West of Building A Plume, though stable to decreasing in most upgradient wells, is stable to increasing towards downgradient wells, particularly in the intermediate aquifer (MRC-MW120B). A deeper western groundwater investigation was performed in April and May 2018 to further delineate the plume and refine the conceptual site model. The findings of this investigation will be provided under a separate cover.

Recommendations for future remediation activities based on the results of the April and December 2018 groundwater sampling include:

- Continue annual groundwater monitoring in April 2019, including sampling of the sentinel wells as part of the three-year off-site sampling plan set up within the Middle River Complex surface water and groundwater monitoring program.

- Evaluate and optimize the sampling program within the existing well network and the possible addition of wells based on trends observed in chemical data, together with results of the plume stability analysis, to better define trichloroethene plume areas.

SECTION 1
INTRODUCTION AND OVERVIEW

On behalf of Lockheed Martin Corporation, AECOM Technical Services, Inc., has prepared this 2018 groundwater monitoring report summarizing the April and December 2018 groundwater sampling at the Middle River Complex in Middle River, Maryland. Figure 1 shows the location of the Middle River Complex. This report presents the current round of synoptic groundwater levels and analytical data for selected monitoring wells as part of the long-term groundwater and surface monitoring program at the Middle River Complex. This report summarizes the investigative activities and results of the April and December 2018 groundwater sampling, including:

- measuring synoptic groundwater levels
- monitoring well inspections and performing repairs as necessary
- managing investigation derived waste

The objectives of the monitoring program are to:

- provide a current round of groundwater level and chemical data for selected wells
- better understand the nature and extent of chemical contamination in groundwater
- evaluate trends of on-site groundwater chemical plumes
- provide supplementary site-wide groundwater analysis in support of the ongoing groundwater remedy in Blocks E, F, G, and I
- provide supplementary site-wide groundwater analysis in support of ongoing site characterization west of Building A
- provide A-level (shallow) well groundwater analysis near the Tilley Chemical Company, Inc. building to determine if chemical contamination could lead to vapor intrusion
- evaluate natural attenuation of the chemicals of concern in groundwater at the Middle River Complex

- inspect each accessible monitoring well, then conduct monitoring well repairs to preserve well integrity. This effort will be reported separately.

This report is organized into the following sections:

Section 1—Introduction: Presents the site objectives for the groundwater monitoring program.

Section 2—Site Background: Briefly describes site history, subsurface conditions, and previous investigations.

Section 3—Investigation Approach and Methodology: Presents the technical approaches to field activities and data management, and describes the field methodologies employed.

Section 4—Groundwater Monitoring Results: Presents investigation results, interpretation, and data-quality review.

Section 5—Summary and Conclusions: Summarizes the results of the current round of sampling and provides recommendations for future activities.

Section 6—References: Cites references used to compile this report.

Figures, tables, and appendices are provided as stand-alone sections following Section 6.

SECTION 2
SITE BACKGROUND

2.1 MIDDLE RIVER COMPLEX BACKGROUND

The Middle River Complex, is part of the Chesapeake Industrial Park, at 2323 Eastern Boulevard in Middle River, Maryland, approximately 11.5 miles northeast of downtown Baltimore. It consists of approximately 161 acres, including 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, a trailer and parts storage lot, and numerous grassy spaces along its perimeter. It is bounded by Eastern Boulevard (Route 150) to the north, Martin State Airport to the east, Dark Head Cove to the south, and Cow Pen Creek to the west. Figure 2 is a map showing the Middle River Complex layout.

LMC Properties, Inc., owns the Middle River Complex. LMC Properties, Inc.'s primary site activities include facility and building management and maintenance. The main tenant at the site, MRA Systems, Inc., designs, manufactures, fabricates, tests, overhauls, repairs, and maintains aeronautical structures, parts, and components for military and commercial applications. Lockheed Martin Rotary and Mission Systems, a division of Lockheed Martin Corporation, conducts engineering activities and fabricates, assembles, tests, and otherwise supports vertical-launch systems. Applied NanoStructured Solutions, LLC, a Cabot Corporation subsidiary engages in research and design of nanotechnology applications, also occupies a portion of the Middle River Complex.

2.1.1 Middle River Complex History

In 1929, the Glenn L. Martin Company (a predecessor entity of Lockheed Martin Corporation) acquired large parcels of undeveloped land in Middle River, Maryland, to manufacture aircraft for United States government and commercial clients. In the early 1960s, Glenn L. Martin Company merged with American-Marietta Company to form Martin Marietta Corporation. Around 1975, the adjacent eastern airport area (currently Martin State Airport), approximately 750 acres, was transferred to the State of Maryland. In the mid-1990s, Martin Marietta Corporation merged with Lockheed Corporation to form Lockheed Martin Corporation. Shortly

after the merger, General Electric Company entities acquired most of Lockheed Martin Corporation's aeronautical business in Middle River and MRA Systems, Inc., began operations.

2.1.2 Middle River Complex Characteristics

2.1.2.1 Current and Surrounding Land Use

The Middle River Complex is an industrial facility surrounded primarily by commercial, industrial, and residential establishments. Six facilities adjacent to the Middle River Complex make up the remaining portion of the Chesapeake Industrial Park. These include Tilley Chemical Company, Inc. (a food and pharmaceutical-chemical distributor), North American Electric, Inc. (an industrial and commercial electrical contractor), Johnson and Towers (a heavy-duty automotive and boat repair and maintenance company), Ashley Furniture (a furniture warehouse distributor), Exxon (a gasoline filling station and convenience store), and the Middle River Post Office. Residential developments are on the opposite shores of Cow Pen Creek, Dark Head Cove, Dark Head Creek, and north of Eastern Boulevard (Route 150).

2.1.2.2 Physiography

The Middle River Complex is in the Western Shore of the Coastal Plain physiographic province, which is generally characterized by low relief. The Middle River Complex's topography slopes gently, ranging from sea level to 32 feet above mean sea level (Cassell, 1977). The topography slopes from Eastern Boulevard to the southwest and south toward Cow Pen Creek and Dark Head Cove.

2.1.2.3 Hydrology

The Middle River Complex occupies the area between the junction of Cow Pen Creek and Dark Head Cove, which both discharge into Dark Head Creek, a tributary of Middle River, which is a tributary of Chesapeake Bay. The Middle River Complex is approximately 3.24 miles (17,100 feet) upstream of Chesapeake Bay.

The Middle River Complex has no surface water bodies on-site. Excluding areas immediately adjacent to Cow Pen Creek and Dark Head Cove, surface-water runoff discharges from the facility via storm drains. Lockheed Martin Corporation maintains a National Pollutant Discharge Elimination System permit (state discharge permit Number 00-DP-0298, National Pollutant Discharge Elimination System Number MD0002852), issued by the Maryland Department of the

Environment Industrial Discharge Permits Division, Water Management Administration. The permit covers storm-water discharge from the entire property, rather than from individual tenants.

2.1.2.4 Soils

Soils underlying Middle River Complex have been mapped by the United States Department of Agriculture Soil Conservation Service as Mattapex-Urban Land Complex and Sassafras-Urban Land Complex (United States Department of Agriculture, 1993). Mattapex-Urban Land soils consist of deep, well-drained, silty soils. Sassafras-Urban Land soils consist of deep, well-drained sandy soils. In both complexes, the original soil textures have been disturbed, graded over, or otherwise altered. Site characterization studies indicate that fine-grained (e.g., silt, clay), low-permeability soils with interbedded sand layers make up most soils at the Middle River Complex.

2.1.2.5 Regional Geology

Geologic mapping of Baltimore County shows that the Middle River Complex is underlain by the Potomac Group, a Cretaceous-age interbedded gravel, sand, silt, and clay unit ranging up to 800 feet thick. The Potomac Group is composed of three units: the Raritan and Patapsco Formations, the Arundel Clay, and the Patuxent Formation. The Raritan and Patapsco Formations range up to 400 feet thick and are composed of gray, brown, and red variegated silt and clay with lenses of sand and gravel. The Arundel Clay ranges from 25 to 200 feet thick and is composed of dark gray and maroon lignitic clays. The Patuxent Formation ranges up to 250 feet thick and is described as a white or light gray to orange brown, moderately sorted sand with quartz gravels, silts, and clays.

Lithologic soil logging beneath the Middle River Complex has identified a very heterogeneous stratigraphy. The underlying soils are composed of silty sands, fine-grained to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primary lithology being clay to silty clay. Areas along the waterfronts have been backfilled to their present elevation over past decades. Soils obtained from fill areas are similar in appearance and composition to soils considered to be native to the Middle River Complex.

2.1.2.6 Regional Hydrogeology

Sand and gravel zones in the unconsolidated surficial deposits at the Middle River Complex, when present, may form an unconfined or water table aquifer system (Bennett and Meyer, 1952). The water table at the Middle River Complex generally conforms to the land surface, with the highest water levels in interior land areas and the lowest at approximately surface water elevations along the shoreline. The Patuxent Formation is the most important water-bearing formation in the Baltimore area. Industrial wells in the southeastern part of the area, specifically Curtis Bay and Sparrows Point, yield 500–900 gallons per minute. In these industrialized areas, the transmissivity and storage coefficient in confined portions of the aquifer average about 50,000 gallons per day per foot and 0.00026, respectively.

The Patapsco Formation is also an important water-bearing formation in industrialized Baltimore, where it is separated by clay into a lower and an upper aquifer. Industrial wells screened in the lower aquifer yield as much as 500–750 gallons per minute, with an estimated transmissivity of 25,000 gallons per day per foot (Bennett and Meyer, 1952). The upper aquifer yields quantities of water similar to industrial wells, but likely has a higher overall transmissivity because it is thicker than the lower aquifer.

2.1.2.7 Middle River Complex Geology

Overall, investigation results indicate complex arrangements of predominantly clay, silty clay, silt, and clayey silt, with smaller, more permeable zones of silty sand and sand. Thick sequences of low permeability clay, silty clay, clayey silt, and silt were observed in the northern portion of the site from MRC-MW03 to the area between MRC-MW60 and MRC-MW94D. Lithologic data indicate a thick clay zone up to 50 feet thick underlying the surficial aquifer. Below this clay zone is a series (up to 105 feet thick) of alternating thick sand and clay beds. Underlying these alternating beds is another thick clay layer ranging up to 73 feet thick that is consistent with the expected thickness and placement of the Arundel Formation (Chapelle and Kean 1985; Vroblesky and Fleck, 1991). Below this lower clay zone are layers of silty to clayey sand and thick clay, up to 14 and 15 feet thick, respectively.

In the southwestern portion of the Middle River Complex, surficial silty sands and sandy silts are encountered in the upper several feet of subsurface soil between wells MRC-MW12 to MRC-MW56 in the northeast. A lower sandy unit 50 feet below mean sea level at MRC-MW14

appears to be contiguous with sand encountered at MRC-MW12 and MRC-MW95D to the southwest. The upper silty sand unit and the lower sand unit are separated by approximately 30-35 feet of clay and/or silt. These underlying units range up to 80 feet in combined thickness. Underlying the sand-clay sequence is a thick clay unit ranging up to 76 feet thick that contains thick sand beds. The persistence of thick clay layers confining the sand units is observed in the lower portions of all deep wells.

2.1.2.8 Middle River Complex Surficial Aquifer Hydrogeology

Groundwater at the Middle River Complex is encountered at depths ranging from above ground surface (artesian) to nearly 25 feet below ground surface. Groundwater preferentially flows to the southeast, south, and southwest, within sandy strata that extend from the central portion of the Middle River Complex to thicker sandy beds near Dark Head Cove and Cow Pen Creek (Tetra Tech, Inc., 2014a).

The lower portion of the surficial aquifer in the southeast portion of the Middle River Complex is divided by silt and silty clay at 20–30 feet below mean sea level. To the southwest, shallow groundwater flows southwest through sandy and silty material towards Cow Pen Creek. This area has approximately 13–18 feet of saturated sandy material (Tetra Tech, Inc., 2014a).

In 2005, single-well permeability tests (slug tests) were performed to determine the variability of hydraulic conductivity across the Middle River Complex. Low average hydraulic conductivities (i.e., soil permeability) were observed within shallow and intermediate wells (arithmetic means of 0.22 and 0.48 feet per day, respectively), with the lowest values in the southern portion of the Middle River Complex. Permeability values observed in the shallow and intermediate wells are consistent with lower values published for fine clean sand or sand and silt mixtures. Hydraulic conductivity values for deep wells range from 0.35 to 9.16 feet per day. The average hydraulic conductivity of the deeper wells (3.82 feet per day) is approximately 10 times the average hydraulic conductivity for the shallow and intermediate zones (Tetra Tech, Inc., 2009a).

2.2 GROUNDWATER

Groundwater at Middle River Complex is encountered at depths ranging from ground surface (artesian) to nearly 25 feet below grade. Shallow groundwater follows site topography and flows radially from the hydraulically upgradient northern portion of the Middle River Complex at

Eastern Boulevard and immediately south of Buildings A, B, and C to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek.

2.2.1 Groundwater Studies and Remedy

A risk assessment (Tetra Tech, Inc., 2006) identified trichloroethene, tetrachloroethene, vinyl chloride, benzene, and certain metals (beryllium, cobalt, nickel, and zinc) as the most significant contaminants in Middle River Complex groundwater. Chlorinated volatile organic compounds, semivolatile organic compounds, and petroleum-related hydrocarbons, as well as their degradation products, are the largest groups of organic chemicals of concern at the Middle River Complex. Chlorinated volatile organic compounds are in surficial aquifer groundwater in several areas of the facility at concentrations above the Maryland Department of the Environment groundwater standards.

Petroleum-based fuels, such as gasoline, have numerous chemical constituents. Several volatile organic compounds associated with fuels are fairly soluble in groundwater and are therefore mobile in the subsurface. The most commonly detected petroleum-related volatile organic compounds in surficial aquifer groundwater are benzene, toluene, ethylbenzene, and xylenes, and methyl *tert*-butyl ether.

The contaminant 1,4-dioxane is also a groundwater chemical of concern that has been detected above its selected screening level, and is an emerging contaminant nationwide. The Maryland Department of the Environment has not established a groundwater standard for 1,4-dioxane, so for comparison purposes the Maryland Department of the Environment have suggested using the United States Environmental Protection Agency Regional Screening Level. Since 1,4-dioxane is carcinogenic and site groundwater is not used as a drinking resource, a target risk of 10^{-6} was applied at the suggestion of the Maryland Department of the Environment. This results as a screening level of 0.46 microgram per liter (United States Environmental Protection Agency, 2018). If groundwater concentrations exceed 0.46 microgram per liter and surface water concentrations exceed the risk-based swimming screening level (30 microgram per liter), a fate and transport assessment of the plume would be performed.

Off-site groundwater monitoring wells were installed in 2010 along the shorelines of Dark Head Cove and Cow Pen Creek. The major volatile organic compounds found in the Middle River

Complex groundwater plumes (trichloroethene, *cis*-1,2-dichloroethene, vinyl chloride, and benzene) and 1,4-dioxane have not been detected in previous off-site groundwater sampling events (Tetra Tech, Inc., 2010; 2013a; 2016a). Additionally, four deep wells were installed off-site beneath the surficial aquifer (but above the Arundel Formation clay) to assess groundwater quality in the deeper aquifers. These off-site monitoring wells are sampled every three years and are scheduled to be sampled in 2019, as the last sampling event was in 2016. Several volatile and semivolatile organic compounds detections in these deep wells are below Maryland Department of the Environment groundwater standards, as observed in the 2010, 2013, and 2016 sampling rounds (Tetra Tech, Inc., 2010; 2013a; 2016a).

The groundwater response action at the Middle River Complex is implemented in accordance with an administrative consent order between the Maryland Department of the Environment and Lockheed Martin Corporation. The groundwater response action uses enhanced anaerobic *in situ* bioremediation to treat three areas exhibiting high groundwater concentrations of trichloroethene and other chlorinated solvents. The response action addresses groundwater contamination in the southeastern trichloroethene area (Block E), the southwestern trichloroethene area (Block G), and the northern trichloroethene area (Block I) (Tetra Tech, Inc., 2012e).

Construction of the groundwater treatment remedies in Blocks E, G, and I began in early summer 2013. During remedial action activities in Block E, two underground storage tanks were discovered near the foundation of former Building D. Underground storage tank 1 was nearly empty when discovered, whereas underground storage tank 2 contained high concentrations of trichloroethene. Both underground storage tanks were removed during installation of the *in situ* bioremediation system.

Subsequent investigations indicated that the mass and concentration of trichloroethene near underground storage tank 2 would not be readily addressed by *in situ* bioremediation. With Maryland Department of the Environment approval, Lockheed Martin installed a multi-phase extraction system in Block E in 2014 that removed most of the mass of trichloroethene that was present in groundwater near underground storage tank 2. The multi-phase-extraction-system operation was completed in late 2015.

Sampling for residual groundwater contamination detected a narrow trichloroethene plume extending from underground storage tank 2 to Dark Head Cove. Sampling to determine the nature and extent of contamination was completed and remediation alternatives were defined in *Middle River Complex Groundwater Remedial Action Plan Addendum Number 4* (Tetra Tech, Inc., 2018). The *Remedial Action Plan Amendment 4* was reviewed and approved by Maryland Department of the Environment at the end of July 2018.

Semi-permanent injection wells were installed to inject biological amendments into the subsurface. A tracer study was performed in Blocks G and I (May–July 2014) before the full-scale injection to determine the main injection parameters.

Two injection rounds were completed at Block G in June 2015 and February 2016. The second round included bioaugmentation with Dehalococcoides bacterial culture and was completed in early 2016. Remedial action objectives determined for these actions have been met, and two years of post-injection monitoring have been completed. The Block G injection program completion report was submitted to the Maryland Department of the Environment in October 2018.

Three injection rounds were completed in Block I, with the latest completed in September 2017. Injections in September 2017 incorporated pumping to lower the groundwater table in the injection area to control groundwater mounding, to mitigate the potential for substrate escaping through storm drains to Dark Head Cove. This change was documented in the Maryland Department of the Environment-approved *Groundwater Remedial Action Plan Addendum 4* (Tetra Tech Inc, 2018). Remedial action objectives have been achieved, and a third injection-event completion report is being prepared. Two years of post-injection monitoring are in progress. Additional details regarding Middle River Complex background and history, including details of previous environmental investigations and discussions of contaminant source areas, are in the *Middle River Complex Groundwater Remedial Action Plan* and the annual groundwater monitoring reports (Tetra Tech Inc., 2009a–b, 2012a–d, 2013a, 2014a, 2015a, 2016a-b, 2017b). Groundwater monitoring results are currently evaluated annually, except in groundwater treatment areas, for which results are evaluated more frequently.

2.2.2 Groundwater Monitoring Optimization Program

A study was conducted to optimize groundwater monitoring at the Middle River Complex (Tetra Tech, Inc., 2015b). This study provided the rationale to begin a long-term groundwater monitoring program at the Middle River Complex to assess the effectiveness of the groundwater remedy, to determine if continuing or new releases to groundwater are occurring, and to monitor conditions in areas where elevated concentrations of other constituents will be reduced through monitored natural attenuation.

The existing Middle River Complex groundwater monitoring network was evaluated in 2015 to optimize the number of wells sampled, the chemical analyses performed, and monitoring frequency. The optimization study recommended other cost reduction measures to achieve long-term-monitoring data-quality objectives, reduce sampling costs, and minimize the production and disposal of investigation derived waste. Future evaluation methods were also developed to determine if a well has statistically attained the standards governing chemicals in groundwater, and if a well can be permanently removed from the long-term monitoring program. Since 2015, several volatile organic compounds concentrations and time-based trends have been evaluated annually as part of the groundwater monitoring optimization program.

The site's monitoring program, new well-installation locations, chemical data needs, sampling frequency, sampling methods, and analysis methods will all be optimized using site-specific decision-flow logic diagrams, years of site groundwater chemical data from multiple programs, and the results of the plume-stability analysis. Chemical groups evaluated for the study will include volatile organic compounds, semivolatile organic compounds, 1,4-dioxane, perchlorate, metals, and polychlorinated biphenyls. Data needs will be assessed for the following as part of the 2019 work plan addendum:

- wells that require additional sampling to meet the minimum data criterion for long-term monitoring program evaluation (four rounds of data for volatile organic compounds and two rounds of data for other analyses)
- well data needed to assess the effectiveness of the groundwater remedies
- well data needed to evaluate the monitored natural-attenuation of untreated areas (i.e., areas not part of the groundwater remedy that have constituent concentrations above groundwater standards)

- wells to monitor for potentially unrecognized chemical releases from legacy facility operations
- reactivated or extended sampling in areas where new regulatory thresholds have been established

SECTION 3
INVESTIGATION APPROACH AND METHODOLOGY

The objectives of annual groundwater monitoring at the site are to provide a current round of synoptic groundwater level measurements and groundwater analytical data for selected monitoring wells to better understand the nature and extent of contamination. Data are used to evaluate time series trends for on-site groundwater plumes to assess continuing or new constituent releases to the aquifer, potential groundwater plumes discharging to surface water bodies, and natural attenuation of chemicals of concern in groundwater at the Middle River Complex (MRC). The results of the April 2018 groundwater monitoring are discussed in Section 4.

3.1 SYNOPTIC GROUNDWATER LEVEL MEASUREMENTS

AECOM Technical Services, Inc., (AECOM) personnel completed a synoptic round of groundwater-level measurements on April 2–4, 2018. The air- and water-tight compression caps on well casings were opened to allow venting before a depth-to-water measurement was taken, to allow air pressure and groundwater in the casings to reach equilibrium. Upon immediately opening the cap, a photoionization detector (PID) was used to measure headspace vapor in the well casing, for both health and safety reasons and to document vapor concentrations within the well casing.

Static water levels were measured using a graduated, electronic, sounding water-level meter. Artesian monitoring wells were gauged by securing a fernco coupling fitted to a polyvinyl chloride (PVC) standpipe to the inner PVC casing of the monitoring well. The water level was allowed to equilibrate in the standpipe for a period of five minutes before obtaining groundwater-level measurements.

Site personnel performed reconnaissance to identify wells that were inaccessible due to equipment storage or material obstruction, and resolved such problems using a hand-held Schonstedt metal detector and coordinating with MRC personnel. AECOM personnel also

inspected and documented the condition of monitoring wells, including the condition of the well casing, the well pad, manway, and well gasket, and the need for additional parts, such as compression caps, bolts, washers, and well locks, to be addressed in future well repairs. Results of the June 2018 monitoring-well repairs are presented in Appendix A.

The static water level was determined by lowering the meter's probe into the well until the liquid level indicator emitted an audible tone, indicating the air/water interface. The water level was read from the probe cable at the reference mark on the top of the well casing and recorded to the nearest 0.01 foot. If no reference mark was found, AECOM personnel used indelible ink and marked a line on the north side of the well casing. Water levels and the time of measurement were recorded on field forms via mobile data apps and compiled in daily field reports (DFRs). Copies of the DFRs for the event are in Appendix B. A few wells were not found or were found damaged. Those wells were located and damaged wells were repaired or abandoned.

3.2 GROUNDWATER SAMPLING AND CHEMICAL ANALYSIS

AECOM personnel sampled 128 on-site monitoring wells from April 4–13, 2018 and two wells (MRC-MW77A and MRC-MW80-B) on December 6, 2018. Wells that could not be located during the April sampling event were sampled on June 25–26, 2018. Figure 3 presents the locations of the monitoring wells sampled. Table 1 presents a complete listing of the 2018 monitoring well network, including those that could not be sampled due to inaccessibility or damage.

3.2.1 Well Purging

Monitoring wells were purged using low-flow sampling procedures (LFSP) before samples were collected. Purging was completed using peristaltic pumps fitted with dedicated, disposable Teflon®-lined tubing or submersible bladder pumps positioned in the center of each well's saturated screened interval, pumping at a flow rate of between 100 and 500 milliliters per minute. Flow rates were monitored using a graduated cylinder and stopwatch.

The purpose of LFSP is to collect groundwater samples from monitoring wells that represent ambient groundwater conditions in the aquifer. This is accomplished by setting the intake velocity of the sampling pump to a flow rate that limits drawdown inside the well. Purging is considered complete when the groundwater-purge parameters have stabilized, when three

saturated well-casing volumes have been removed, when the well has been purged dry, or after a 90-minute period, whichever occurs first. During purging, water level drawdown measurements and groundwater parameters (including pH, temperature, specific conductivity, dissolved oxygen [DO], oxidation-reduction potential [ORP], and turbidity) were collected every five minutes until one of the above criteria had been met. Purge completion parameters are defined in Table 2. These data were recorded on low-flow-purge data sheets via mobile data apps; data sheets and completed DFRs are in Appendix B.

Water-quality parameters were measured using a Horiba U-52 water-quality meter with flow cell. Upon arrival at each sampling location, and immediately after the well was opened, the headspace in monitoring wells was screened with a 3000 MiniRAE PID. All air- and water-quality monitoring equipment was calibrated and inspected daily to ensure precise and accurate measurements. All purged water was collected in United States Department of Transportation (USDOT)-approved 55-gallon steel drums. Purge water collected downgradient of underground storage tank (UST) 2 was separately drummed and managed as F001-listed hazardous waste.

3.2.2 Sample Collection and Preservation

Collected groundwater samples were immediately stored on ice in laboratory-supplied sample containers until they were picked-up by the laboratory courier. Table 3 describes quality assurance/quality control sampling requirements. Each sample container was sealed and submitted to the laboratory for analysis with a laboratory-provided chain of custody (COC) form.

3.3 LABORATORY ANALYSES

Samples from subject wells were analyzed for the following constituents (Table 1):

- volatile organic compounds (VOCs) (Method 8260C)
- 1,4-Dioxane (Method 8270D SIM)
- polychlorinated biphenyls (PCBs; Method 680), and chlorinated benzenes (Method 8260C)
- total metals (Method 6020A/7470)
- hexavalent chromium (Method 218.6)
- methane, ethane, and ethene (MEE; Microseeps® AM 20GAX)

- monitored natural attenuation parameters (Method SW846)

ALS Environmental of Middletown, Pennsylvania, performed all laboratory analyses. Ferrous iron was analyzed in the field using Hach® test kits.

3.4 DOCUMENTATION

All site activities and observations, including groundwater level measurements, well purge information, groundwater parameters, time of purging and sampling, and field observations were recorded on two of Esri's mobile applications, *Survey123* and *Collector for ArcGIS*. Completed COC forms and matrix-specific sampling log sheets were also maintained.

3.5 EQUIPMENT DECONTAMINATION

Reusable equipment (e.g., water level meter, submersible pump, water quality meter) was decontaminated before and after each use. Between each sampling location, decontamination of reusable equipment involved the following:

- Liquinox® and potable-water wash with distilled water
- distilled water rinse
- air drying

All decontamination fluids were collected for disposal in USDOT approved 55-gallon drums. Rinsate water from sampling downgradient of UST 2 in the hazardous trichloroethene (TCE) plume area was segregated from other decontamination fluids and disposed of as F001-listed hazardous waste. Disposable equipment used in groundwater sampling that did not require decontamination (e.g., bonded tubing, silicon tubing, poly sheeting, gloves) was disposed of as general refuse.

3.6 WASTE MANAGEMENT

Investigation derived waste generated by groundwater sampling consisted of purge water, rinse water, and used personal protective equipment (PPE). PPE, poly tubing, and poly sheeting were placed in industrial trash bags and disposed of as general refuse. The purge and rinse water were containerized in USDOT approved 55-gallon steel drums and temporarily staged on wooden pallets within a secondarily containerized central staging area established in Block E on the

MRC. This central staging area was used for chemical/physical characterization and to ensure proper disposal at the end of sampling. Purged groundwater and rinsate water downgradient from UST 2 within the hazardous TCE plume boundary was separately containerized in USDOT approved 55-gallon steel drums and temporality staged on-site in Block E, in a separate hazardous waste area with tertiary containment. The staging area was secured each day and was posted with appropriate signage.

Drums were labeled with relevant site information, including beginning accumulation date, description of contents, origin and generator name, and consultant contact information. These temporarily stored wastes were picked up for proper disposal on June 26, 2018. Waste characterization sampling and analysis were completed before disposal, as required by the treatment, storage, and disposal facility, Clean Harbors, Inc., in Baltimore, Maryland. These activities were approved by Lockheed Martin Corporation (Lockheed Martin). Investigative derived waste documentation are presented in Appendix C.

3.7 DATA MANAGEMENT

Laboratory data handling procedures meet the requirements set forth in the laboratory subcontract. All analytical and field data are maintained in project files, containing copies of the COC forms, sampling log forms, sampling location maps, and data quality assurance documentation.

3.7.1 Data Tracking and Control

A cradle-to-grave sample tracking system was used from the beginning to the end of sampling. The field operations leader coordinated sample tracking before field mobilization. Sample jar labels were both handwritten in the field and pre-supplied by the laboratory. Labels were reviewed to ensure their accuracy and adherence to work plan requirements. The AECOM laboratory task manager (LTM) coordinated with the analytical laboratory to ensure that they were aware of the number and type of samples and analyses to expect.

During field sampling, the field operations leader forwarded the COC forms to the LTM and the laboratory each day that samples were collected. The LTM confirmed that the COC forms provided the information required by the work plan. This allowed early detection of field errors so that adjustments could be made while the field team was mobilized. The laboratory submitted

an electronic deliverable for the sample delivery groups. When all electronic deliverables had been received from the laboratory, the LTM confirmed that the laboratory had performed all analyses requested.

3.7.2 Data Export to EESH Geographic Information System

AECOM coordinated with Lockheed Martin to load analytical data from this round into Lockheed Martin's EESH Geographic Information System enterprise database.

3.7.3 Mobile Data Collection

AECOM personnel used two of Esri's mobile applications, *Survey123* and *Collector for ArcGIS*, to optimize field personnel's ability to locate and record accurate and timely data. The applications were used to record depth to groundwater, groundwater quality, and groundwater stabilization during sampling. *Collector* also aided personnel with location services, base-map reference, and the ability to edit well information based on field observations. *Survey123* was used to create new data records and cross reference data tables to access and update well information, and to format data into a database compatible spreadsheet. Upon completion of sampling, the lead field technician synced with AECOM's *Portal for ArcGIS* for data access and processing.

3.8 DATA VALIDATION

Laboratory data were entered into the AECOM sample database and evaluated against cleanup goals. AECOM performed a manual data review of all samples. Data validation using the EarthSoft *EQuIS*™ database's *Automated Validation Assistant* tool, which performed a limited data review (evaluating data completeness, holding times, laboratory and field blank contamination, laboratory batch quality control, field duplicate precision, and detection limits), was completed concurrent with the data evaluation. This review is based on the United States Environmental Protection Agency (USEPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2017a) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2017b) and the specifics of the analytical method used.

Data validation reports are in Appendix D. Validation of these data concluded that they are acceptable for their intended uses (i.e., risk screening and risk assessment). The data qualifiers (i.e., flags) applied to the chemical results during data validation are consistent with the *National Functional Guidelines for Organic and Inorganic Superfund-Methods Data Review* (USEPA, 2017a; 2017b).

3.9 SUSTAINABILITY APPROACH

AECOM incorporated green and sustainable remediation practices into the MRC groundwater and surface water monitoring program to advance Lockheed Martin's Corporate key objectives to protect, enhance, optimize, and simplify, and to highlight the added values that sustainable practices bring. AECOM implemented sustainable approaches in all aspects of work wherever practical, and with prior approval from Lockheed Martin and the Remediation Technical Operations contractor. For the MRC monitoring program, AECOM implemented paper free electronic data collection across all aspects of the groundwater sampling program. This data collection approach, as well as the use of dedicated reusable tubing and rechargeable batteries for field instruments, reduced total waste and provided resource efficiency. Using local field staff, carpooling, and using locally sourced materials wherever possible helped reduce overall carbon emissions.

SECTION 4
GROUNDWATER MONITORING RESULTS

Section 4 presents the results and interpretations of the 2018 groundwater sampling. Results of groundwater level measurements and analytical results are tabulated and presented in this section, alongside contour maps and maps of the concentrations and distributions of chemicals of concern. A tabulated summary of all analytical data is in Appendix E. The laboratory analytical reports with chain of custody (COC) forms are in Appendix F. Monitoring well nomenclature for all wells includes the "MRC-" prefix, so all references to specific wells in Section 4 will be abbreviated to exclude the prefix (e.g., "MRC-MW102B" to "MW102B" and "MRC-SEMW-8S" to "SEMW-8S"). Plots of concentration versus time (time-series graphs) for primary and secondary chemicals of potential concern in select wells are in Appendix G. Note that time series plots were not developed for wells with only one data point.

4.1 GROUNDWATER ELEVATION DATA

Groundwater elevations for all wells gauged in the April 2018 groundwater sampling range from above ground surface (artesian) to 24.71 feet below ground surface. Groundwater elevations are summarized in Table 4. These data were used to develop groundwater-elevation contour maps of the shallow and intermediate aquifer systems found at the Middle River Complex (MRC). Contour maps are shown in Figures 4 and 5, respectively.

Groundwater elevations in the surficial aquifer range from a minimum of 13.~~05~~ 21 feet ~~above~~ below mean sea level (msl) at ~~MW37A~~ SEMW-5I (in the southern portion of Block E near Dark Head Cove) to a maximum of 31.17 feet above msl at MW58A (in the southern portion of Block I, southeast of Building A). These measured groundwater elevations are consistent with previous observations of a groundwater high in the center of the site in the southern portion of Block I, with radial flow to the southwest, south, and southeast toward surface water discharge points at Cow Pen Creek and Dark Head Cove.

4.2 GROUNDWATER ANALYTICAL RESULTS

Parameters detected from chemical analyses of samples collected during the April and December 2018 groundwater sampling are tabulated in Table 5. Validated analytical results are summarized in Appendix E. Chemical analytical results were used to generate plume maps estimating the boundaries of contaminants and their distribution within the plume footprint (referenced in their respective sections below). Logarithmic contours were used to account for widely disparate detection values across the MRC.

Analytical results are compared against current MDE groundwater standards for volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and metals (MDE, 2008). Exceedances of MDE groundwater standards are highlighted in yellow. MDE has not yet established an advisory level or standard for 1,4-dioxane in drinking water or groundwater. In lieu of a MDE standard, MDE suggested using a screening level of 0.46 microgram per liter (µg/L), calculated based on a target risk of 10^{-6} from the USEPA RSLs (USEPA, 2018). This screening level is adopted as the evaluation criterion within this report. The 2018 analytical results are organized below according to shallow and intermediate aquifers and trichloroethene (TCE) source areas.

4.2.1 Shallow Groundwater Analytical Results

4.2.1.1 Volatile Organic Compounds

VOCs were detected in ~~46~~ 47 of the ~~61~~ 62 sampled shallow aquifer wells. Detected VOCs included tetrachloroethene (PCE), TCE, and their daughter products.

4.2.1.1.1 Tetrachloroethene

PCE was detected in 11 monitoring wells and exceeded its MDE groundwater standard (5.0 µg/L) in three of those wells, with a maximum concentration detected at MW60A (81.2 µg/L) in Block I, south of Building C, associated with a slight downgradient exceedance at MW48A (11.0 µg/L). An additional exceedance was detected at MW113A (57.6 µg/L) in the southwestern portion of Block E.

4.2.1.1.2 Trichloroethene

TCE was detected in ~~37~~ 38 monitoring wells and exceeded its MDE groundwater standard (5 µg/L) in 19 of them. Maximum TCE concentrations were detected at SEMW-9S (32,800 µg/L) and at nearby well SEMW-8S (24,500 µg/L) in the southeastern portion of

Block F. Additional detections in excess of 1,000 µg/L were observed in Block I at MW96A (2,150 µg/L), west of Building A; and at MW-60A (1,920 µg/L), south of Building C. These elevated detections are associated with clusters of three to four nearby or downgradient wells that exceed the MDE standard for TCE.

Slightly elevated TCE concentrations are also detected in shallow aquifer wells in an isolated area of the western portion of Block E. Wells MW113A (23.5 µg/L) and MW114A (5.2 µg/L) both exceed the MDE groundwater standard of 5 µg/L. Additional investigations are planned in the southern portion of Blocks E and Block F to delineate the nature and extent of contamination in this area. In 2015 and 2016, the Block G plume received two rounds of remedy injections, including a bioaugmented injection in the second round, near MW14B, south of the Tilley Chemical Company, Inc. (Tilley) building. TCE concentrations are very low in this area (less than 7 µg/L).

4.2.1.1.3 cis-1,2-Dichloroethene

~~Thirty-five~~36 monitoring wells contained *cis*-1,2-DCE, and five of them exceeded the MDE groundwater standard (70 µg/L). The maximum *cis*-1,2-DCE detection was at MW96A (22,500 µg/L) in Block I, west of Building A. Additional exceedances were observed south of Building C at MW60A (571 µg/L) and MW48A (354 µg/L), and in Block F at SEMW-8S (185 µg/L) and SEMW-9S (187 µg/L).

4.2.1.1.4 Vinyl Chloride

Vinyl chloride (VC) was detected in ~~21~~ 22 monitoring wells and exceeded its MDE groundwater standard (2 µg/L) in seven of them. The maximum VC detection was observed at MW60A (80.1 µg/L), which is south of Building C in Block I. Slight VC exceedances were observed west of Building A, in Block G, and in the southwestern portion of Block E. These constituents all occur in close association with elevated TCE concentrations in Blocks E and I. Very low concentrations of VC were detected in Block G wells SWMW-4I, SWMW-3I, and SWMW-2I.

4.2.1.1.5 Other Volatile Organic Compounds

Several additional VOC detections in shallow aquifer wells were observed clustered in central and southern Block E, and in eastern downgradient wells in Block F:

- *Chlorobenzene*—Chlorobenzene was detected in 14 wells and exceeded its MDE groundwater standard (100 µg/L) in three of them, with the maximum concentration

detection at MW123A (996 µg/L) in southwestern Block E. Two additional exceedances were detected at nearby wells MW114A (373 µg/L) and MW124A (542 µg/L).

- *1,2,4-Trichlorobenzene (1,2,4-TCB)*—1,2,4-TCB was detected in 15 wells and exceeded its MDE groundwater standard (70 µg/L) in nine of them. The maximum detection was at MW43A (3,960 µg/L) in southwestern Block E. Other exceedances are clustered around MW43A and southwestern Block E.

- *1,4-Dichlorobenzene (1,4-DCB)*—1,4-DCB was detected in 15 wells. It exceeded its MDE groundwater standard (75 µg/L) in three wells in southwestern Block E. The highest detections were at MW123A and MW124A (261 and 238 µg/L, respectively).

- *1,3-Dichlorobenzene (1,3-DCB)*—1,3-DCB was detected in 10 wells. It exceeded its MDE groundwater standard (1.8 µg/L) in nine wells clustered in south and central Block E. The highest detections were at MW123A and MW124A (424 and 263 µg/L, respectively) in the southwestern portion of Block E.

- *1,2-Dichloroethane (1,2-DCA)*—1,2-DCA was detected in seven wells. It slightly exceeded its MDE groundwater standard (5 µg/L) in four of them. The exceedances were in a cluster of four wells, with a maximum at MW114A (819 µg/L) in southwestern Block E.

- *Chloroethane*—Chloroethane was detected in one well (MW12A: 15.1 µg/L) in Block G, exceeding its MDE groundwater standard (3.6 µg/L).

- *1,2-Dichloropropane (1,2-DCP)*—1,2-DCP was detected in one well (MW114A: 6.2 µg/L) in southwestern Block E, slightly exceeding its MDE groundwater standard (5 µg/L).

- *Methylene chloride*—Methylene chloride was detected in one well (SEMW-8S: 5.3 µg/L) in southeastern Block F, slightly exceeding its MDE groundwater standard (5 µg/L).

4.2.1.2 1,4-Dioxane

1,4-Dioxane was detected in 81 of 88 sampled shallow-aquifer monitoring wells and exceeded the USEPA screening level (0.46 µg/L) in 48 of them. A shallow-aquifer contour map of 1,4-dioxane concentrations is shown in Figure 6. The maximum concentration of 1,4-dioxane was detected in Block G south of the Tilley building and adjacent to Cow Pen Creek, at MW12A (140 µg/L). Surface water samples collected in June 2018 had detections of 1,4-dioxane (0.021 to 0.042 µg/L) below risk-based swimming level of 30 µg/L. 1,4-dioxane was not detected in any surface water sampling locations in Cow Pen Creek during the April 2018 sampling. Findings from the annual surface water sampling events will be provided under a separate cover.

Another cluster of wells with slight USEPA screening level exceedances was detected west of Building A, with the highest concentration at MW69A (16.8 µg/L). Slight exceedances of the USEPA screening level for 1,4-dioxane concentrations were observed in MW113A (2.6 µg/L) in southwestern Block E and south of Building C at the boundary between Blocks E and I (MW101A: 1.8 µg/L; MW25A: 1.1 µg/L). Wells sampled in Block F, eastern Block E, and northern Block I had several detections, but all were below the USEPA screening level, indicating little to no migration of 1,4-dioxane toward Dark Head Cove.

4.2.1.3 Benzene, Toluene, Ethylbenzene and Xylene

Benzene, toluene, ethylbenzene and xylene (BTEX) compounds were detected in ~~18~~ 19 of the ~~61~~ 62 shallow aquifer wells. A contour map of total BTEX concentrations in the shallow aquifer is shown in Figure 7. Benzene exceeded its MDE groundwater standard (5 µg/L) in ~~six~~ seven monitoring wells. Total xylenes were detected in ~~two~~ three wells, with no MDE groundwater-standard exceedances (10,000 µg/L). Toluene was detected in ~~five~~ six wells, with no MDE groundwater-standard exceedances (1,000 µg/L). Ethylbenzene was detected in two~~one~~ wells, with no exceedances (700 µg/L).

The highest benzene concentrations were~~as~~ detected at well MW17A (180 µg/L, total BTEX 295.5 µg/L) in the western portion of Block I, west of Building A, near the former plating shop area of Building A and at MW77A (139 µg/L, total BTEX 146.2 µg/L) in the eastern portion of Block E, west of VLS Building (Figure 7). MW77A also had exceedances of naphthalene (1.9 µg/L) and MTBE (204 µg/L) which are common fuel constituents. Historically, MW77A had lower concentrations of BTEX (12.3 µg/L in 2016 and 11 µg/L in 2017). MW77A was sampled again in April 2019 as part of the annual groundwater sampling event.

Other benzene exceedances were detected at MW124A (17.1 µg/L, total BTEX 17.91 µg/L) and MW123A (15.9 µg/L, total BTEX 16.515 µg/L) in Block E (Figure 7). Additional wells, one in northern Block I, one in Block E, and one in Block G near Cow Pen Creek (MW12A), slightly exceed the MDE groundwater standard for benzene. However, benzene was not detected in any surface water sampling locations in Cow Pen Creek during the April 2018 sampling.

4.2.1.4 Metals

Twenty-one shallow monitoring wells were sampled for total metals and hexavalent chromium. All sampled wells had detectable levels of at least three metals. Eight of these wells exhibited MDE groundwater-standard exceedances for one or more metals. Hexavalent chromium was detected in three (MW07A, 118A, and 125A) of the 15 wells for which it was sampled, but at concentrations of one to four orders of magnitude (i.e., one to four powers of 10) lower than the MDE groundwater standard (0.1 milligrams per liter [mg/L]).

Iron exceeded its MDE groundwater standard (0.3 mg/L) by two to four orders of magnitude in all four wells for which it was sampled. The maximum iron concentration was detected at MW27A (116 mg/L) in the southern portion of Block C. MDE groundwater-standard exceedances for iron in excess of 10 mg/L also occurred at nearby well MW25A (25.5 mg/L) in Block I, southwest of Building C, and at MW12A (74.2 mg/L) in Block G, close to Cow Pen Creek. Iron is often elevated in conjunction with biological activity that might be occurring in Block G.

Manganese was detected in all four of the shallow aquifer wells for which it was sampled and exceeded its MDE groundwater standard (0.05 mg/L) by two to three orders of magnitude in three of the four wells for which it was sampled. The maximum manganese concentration was detected at MW27A (41.1 mg/L) in the southern portion of Block C. MDE groundwater-standard exceedances for manganese in excess of 1 mg/L also occurred at nearby well MW25A (4.7 mg/L) and at MW12A (3.9 mg/L) in Block G.

Beryllium was detected in nine shallow aquifer wells and slightly exceeded its MDE groundwater standard (0.004 mg/L) in two of the 15 wells for which it was sampled. The maximum detected value was at MW128A (0.010 mg/L) in southwestern Block E, with the other exceedance at nearby MW130A, also in Block E. Nickel was detected in 11 of the shallow aquifer wells for which it was sampled, and slightly exceeded its MDE groundwater standard (0.073 mg/L) in one of 15 wells for which it was sampled. The maximum nickel concentration detected at the MRC was at MW128A (0.074 mg/L) in the southwestern portion of Block E.

4.2.1.5 Polychlorinated Biphenyls

Groundwater samples for PCB analysis were collected in the southwestern portion of Block E where elevated PCBs had previously been detected in soil. By agreement with the United States Environmental Protection Agency (USEPA), Method 680 was used to determine the concentrations of PCB homologs and total PCB concentrations in groundwater and surface water. PCB homologs represent the 10 "families" of congeners that contain one to 10 chlorine atoms, regardless of position on the biphenyl molecule. The method is also an effective means to account for the presence of PCBs that might not be in the form of Aroclors, or of degraded Aroclors. The analysis provides results in total PCB concentrations, instead of the sum of Aroclor concentrations.

Polychlorinated biphenyls were detected in 15 shallow aquifer monitoring wells, with the only MDE groundwater-standard exceedance for total PCBs (0.5 µg/L) detected in well MW43A (1 µg/L) at the source area under the former Building D slab in the western portion of Block E. Monochlorobiphenyls, dichlorobiphenyls, trichlorobiphenyls, tetrachlorobiphenyls, pentachlorobiphenyls, hexachlorobiphenyls, and heptachlorobiphenyls are the homologs found in the samples.

Chlorobenzene isomers are believed to be associated with transformers that were formerly in Block E. These isomers are generally associated with PCB-impacted groundwater. Groundwater standards for chlorobenzene isomers range from 1.8–600 µg/L (MDE, 2008). Although 1,2-dichlorobenzene (DCB), 1,3-DCB, and 1,4-DCB do occur in the same groundwater gradient path, there are also instances (MW74A) where they do not occur in the same groundwater path. However, most data indicate that chlorobenzene isomers do occur in the same groundwater gradient path as PCBs. Several of the chlorobenzene isomers are more soluble than PCBs, and are thus helpful in characterizing the extent of the PCB plume when they co-occur with chlorobenzenes.

4.2.2 Intermediate Groundwater Analytical Results

4.2.2.1 Volatile Organic Compounds

VOCs were detected in ~~50~~ 51 of the ~~60~~ 61 sampled intermediate-aquifer wells. Tetrachloroethene was detected in 11 monitoring wells and slightly exceeded its MDE groundwater-standard

(5 µg/L) in three of them, with a maximum concentration detected at MW21B (8.7 µg/L) in southwestern Block I, north of the Tilley building. Trichloroethene was detected in ~~46~~ 47 monitoring wells and exceeded its MDE groundwater standard (5 µg/L) in ~~35~~ 36 of them. ~~Forty-seven~~47 monitoring wells contained *cis*-1,2-DCE, exceeding its MDE groundwater standard (70 µg/L) in 13 of them. Vinyl chloride was detected in 28 monitoring wells and exceeded its MDE groundwater standard (2 µg/L) in 10 of them.

The maximum TCE detections were at MW74B (34,300 µg/L) in the southeastern portion of Block E, and at nearby well SEMW-7I (29,900 µg/L) in eastern Block F. Additional detections in excess of 1,000 µg/L were observed at MW60B (6,120 µg/L) in Block I, south of Building C; MW72B (3,390 µg/L) and MW79B (1,670 µg/L) in Block E; MW120B (1,260 µg/L) in Block I; and at SEMW-8I (1,080 µg/L) in Block F. All of these elevated detections occurred within clusters of three to seven nearby or downgradient wells with detections greater than 10 µg/L.

The maximum *cis*-1,2-DCE detection was at MW79B (2,910 µg/L) at the boundary of Blocks E and I. An additional exceedance in excess of 1,000 µg/L was observed at SEMW-8I (1,830 µg/L) in Block F, coincident with the highest TCE detections. The maximum VC detection was observed at MW81B (110 µg/L), south of Building C. An additional VC exceedance was detected in nearby downgradient well MW79B (75.1 µg/L). These constituents are closely associated with elevated TCE concentrations in Blocks E, F, and I (Table 5).

Degradation product 1,1-DCE was detected in ~~29~~ 30 sampled wells and exceeded its MDE groundwater standard (7 µg/L) in ~~13~~ 14 of them (Table 5). The maximum concentration of 1,1-DCE was observed at MW111B (261 µg/L) in Block I near the Tilley building, occurring near other 1,1-DCE detections and exceedances in downgradient wells in Block G. Additional elevated 1,1-DCE detections occur near elevated TCE concentrations in northern and eastern portion of Block I. Exceedances of the 1,1-DCE MDE groundwater standard are found almost exclusively in the intermediate aquifer. One exception is MW11A. 1,1-DCE is present in the shallow aquifer at this location with a concentration of 10.4 µg/L.

Several additional VOC detections in intermediate aquifer wells occurred in the central and southern portion of Block E and west of Building A in areas closely associated with elevated TCE concentrations:

- *Chlorobenzene*—Chlorobenzene was detected in five wells in southwestern Block E. It slightly exceeded its MDE groundwater standard (100 µg/L) at well MW124B (124 µg/L).

- *Methyl tert-butyl ether (MTBE)*—MTBE was detected in 15 wells. It slightly exceeded its MDE groundwater standard (20 µg/L) in three wells clustered to the west of Building A, with a maximum concentration detected at MW96B (29.7 µg/L).

- *1,3-DCB*—1,3-DCB was detected in two wells. It exceeded its MDE groundwater standard (1.8 µg/L) in only well 124B (57.9 µg/L), in southwestern Block E.

- *1,2-DCA*—1,2-DCA was detected in nine wells. It slightly exceeded its MDE groundwater standard (5 µg/L) at well MW125B (11.3 µg/L), in southwestern Block E.

4.2.2.2 1,4-Dioxane

1,4-Dioxane was detected in ~~35~~ 36 of ~~40~~ 41 sampled intermediate-aquifer monitoring wells, and exceeded the USEPA screening level (0.46 µg/L) in ~~20~~ 21 of them. A contour map of 1,4-dioxane in the intermediate aquifer is shown in Figure 8. The maximum concentration of 1,4-dioxane was detected near the Tilley building, just north at MW98B (118 µg/L) and to the south in Block G at MW14B (113 µg/L).

Significant exceedances in downgradient wells MW12B and MW70B (61.9 and 25.6 µg/L, respectively) indicate that the plume is migrating toward Cow Pen Creek. Surface water samples collected in June 2018 had detections of 1,4-dioxane (0.021 to 0.042 µg/L) below risk-based swimming level of 30 µg/L. 1,4-dioxane was not detected in any surface water sampling locations in Cow Pen Creek during the April 2018 sampling. Findings from the annual surface water sampling events will be provided under a separate cover.

Another exceedance was observed west of Building A in Blocks I and H, with the highest concentration detected at MW120B (21.9 µg/L). Several downgradient wells indicate that the plume is migrating west and south from the area west of Building A.

Slight exceedances of the USEPA screening level (0.46 µg/L) for 1,4-dioxane were detected at several locations along the boundary between Blocks E and I, with the highest concentration at ~~MW79B~~ MW80B (~~5~~6.9 µg/L) which is associated with the Block G 1,4-dioxane plume that is migrating towards Cow Pen Creek. Wells sampled in Block F and south of the Block E and Block I boundary area had several detections, but all were below the USEPA screening level

(0.46 µg/L), suggesting little to no migration of 1,4-dioxane through Blocks E and F to Dark Head Cove.

4.2.2.3 Benzene, Toluene, Ethylbenzene, Xylenes

Benzene, toluene, ethylbenzene, and xylenes were detected in 23 of 60 sampled intermediate-aquifer monitoring wells. A contour map for total BTEX in the intermediate aquifer is shown in Figure 9. Benzene was detected in all 23 sampled wells, and exceeded its MDE groundwater standard (5 µg/L) in nine of them. Toluene was detected in eight wells, with no MDE groundwater-standard exceedances (1,000 µg/L). Ethylbenzene was detected in five wells, with no exceedances (700 µg/L). Total xylenes were detected in six wells, with no MDE groundwater-standard exceedances (10,000 µg/L).

The highest benzene concentration was detected at well MW96B (527 µg/L) in the northern portion of Block I, west of Building A, near the former plating shop area. Other benzene exceedances were detected at nearby wells MW53B (302 µg/L), MW119B (246 µg/L), MW110B (81.4 µg/L), and MW109B (46.6 µg/L). Other benzene exceedances are clustered around Block G and the Tilley building, including MW21B (28.8 µg/L) and MW14B (23.2 µg/L). No exceedances were observed in the intermediate aquifer in the southeastern portion of the MRC.

4.2.2.4 Metals

Twenty-two intermediate-aquifer monitoring wells were sampled for total metals and hexavalent chromium. All wells sampled for total metals had detectable levels of at least three metals. Six of these wells exhibited two MDE groundwater-standard exceedances. Hexavalent chromium was not detected in any of the 13 wells for which it was sampled.

Iron exceeded its MDE groundwater standard (0.3 mg/L) in all five intermediate-aquifer wells for which it was sampled, by up to three orders of magnitude. The maximum iron concentration was detected at MW12B (61.9 mg/L) in Block G. MDE groundwater-standard exceedances for iron in excess of 10 mg/L also occurred at well MW60B (13 mg/L) in Block I, south of Building C. Slight exceedances were also detected in nearby well MW27B (1.9 mg/L) in Block I, and at MW72B (0.55 mg/L) in southeastern Block E, and MW37B (0.30 mg/L) in Block F.

Manganese exceeded its MDE groundwater standard (0.05 mg/L) in all five intermediate-aquifer wells for which it was sampled, by up to two orders of magnitude. The maximum manganese concentration was detected at MW12B (3.4 mg/L) in Block G. MDE groundwater-standard exceedances for manganese in excess of 1 mg/L also occurred at nearby well MW60B (2.1 mg/L) in Block I, south of Building C. Slight exceedances were also detected in MW37B (0.14 mg/L) in Block F, MW27B (0.13 mg/L) in southern Block C, and MW72B (0.063 mg/L) in the southeastern portion of Block E.

Beryllium was detected in eight of the 15 intermediate-aquifer wells for which it was sampled and slightly exceeded its MDE groundwater standard (0.004 mg/L) by one order of magnitude, at MW127B (0.013 mg/L) in southwestern Block E. Nickel was detected in all 15 intermediate-aquifer wells for which it was sampled, and slightly exceeded its MDE groundwater standard (0.073 mg/L) in one of these wells, at MW127B (0.086 mg/L) in Block E.

4.2.3 Polychlorinated Biphenyls

PCBs were detected in 12 intermediate-aquifer monitoring wells, with no MDE groundwater-standard (0.5 µg/L) exceedance for total PCBs. The maximum PCB homolog present in the intermediate aquifer was pentachlorobiphenyl, at MW74C (0.1 µg/L) in the southeastern portion of Block E in the vicinity of the TCE source area.

Surface water samples collected in April 2018 from Dark Head Cove had detections of PCBs, as the dichlorobiphenyl homolog group, at all 14 of the Dark Head Cove surface water sampling locations, ranging from 0.0019 to 0.0066 µg/L. Since high turbidity was not measured in the 2018 sampling event, PCB analytical detections were not associated with high turbidity, and therefore represent surface water detections.

The April 2018 polychlorinated biphenyl concentrations are below site-specific swimming standards (10 µg/L) and below Maryland ambient water quality for organisms (0.014 µg/L); however they are above Maryland ambient water quality criteria for human health consumption-of-organisms (Code of Maryland Regulations 26.08.02.03). In comparison, the detection of polychlorinated biphenyls, as the tertachlorobiphenyl group, was identified at just one location in 2017 (Tetra Tech Inc., 2017b). A fish consumption advisory is currently in effect for Middle

River, recommending consumption of no more than six meals of blue crab per month, due to polychlorinated biphenyl contamination in the area.

To further evaluate the April 2018 surface water PCB detections and potential groundwater to surface water discharge, Lockheed Martin proposed to conduct an interim limited-scope surface water sampling event in Dark Head Cove. This plan was approved by MDE on December 24, 2018. Laboratory split samples were collected in February 2019 as a set of co-located field samples at eight of the Dark Head Cove locations, which were analyzed by the two different laboratories (TestAmerica and ALS Environmental), prior to the April 2019 surface water sampling event. The objective of the interim event was to determine if procedures used by the different laboratories caused the variability between the 2017 and 2018 results or if the detections possibly represent groundwater to surface water discharge of PCBs to Dark Head Cove. Laboratory split samples were collected at a rate of 100% for PCB homolog analysis. The results of this study will be submitted to Maryland Department of the Environment (MDE) once it is available

4.2.4 Monitored Natural Attenuation Parameters

In addition to laboratory chemical analyses for contaminants of concern, analyses were also performed for natural-attenuation assessment (NAA) on 13 monitoring wells at the MRC. The NAA analyses include total alkalinity (as calcium carbonate), ammonia (as nitrogen), chloride, nitrate, orthophosphate, sulfate, total dissolved solids, total iron, total organic carbon (TOC), and dissolved gasses methane, ethane, and ethene (MEE). These parameters are summarized in Table 5. Additional NAA parameters were measured in the field.

Field measurements include groundwater pH, oxidation-reduction potential (ORP), dissolved oxygen (DO), and temperature. Field measurements were taken contemporaneously with well purging at each well sampled in the 2018 groundwater sampling. All field parameters are summarized in Appendix B. Monitoring wells were selected in each of the shallow and intermediate aquifers to evaluate NAA parameter trends. Wells were selected in Blocks E/F (one shallow, three intermediate wells), Block G (one shallow, three intermediate wells), and Block I (three shallow, two intermediate wells).

In Block E, total alkalinity increases towards downgradient wells. The upgradient wells selected were MW34A and B, mid-gradient were MW72B and MW37A, and the most downgradient well was MW37B in Block F. Overall ammonia levels are high for groundwater (0.212–0.686 mg/L), but decreases from MW72B to downgradient wells. Orthophosphate levels are very low, though dissolved phosphorus is slightly elevated in downgradient well MW37B (0.13 mg/L). Chloride, nitrate, and sulfate generally decrease towards downgradient wells. Total organic carbon in all wells is greater than 1 mg/L. Methane, ethane, and ethene are very low or not detected in all wells, though methane tends to decrease downgradient. Field and analytical data are consistent with oxidizing conditions throughout eastern Block E and Block F.

In Block G, total alkalinity increases in downgradient wells. In Block G, MW21B was selected as the upgradient well, and MW71B, MW12A, and MW12B were selected as downgradient wells. Orthophosphate was not detected in Block G wells. Ammonia was detected at slightly elevated levels in downgradient wells (0.221–0.230 mg/L). Chloride, nitrate, and sulfate levels decreased in downgradient wells.

Dissolved phosphorus was detected at trace levels in three of the four Block G wells. Total organic carbon is greater than 1 mg/L in all wells except MW21B (0.55 mg/L). Methane, ethane, and ethene generally increased from upgradient to downgradient wells. Field and analytical data are consistent with weakly reducing conditions near MW14B and MW21B, with increasingly reducing conditions occurring downgradient that are conducive to biodegradation of TCE in the area where injections were performed in Block G.

In Block I, total alkalinity is generally very low in all sampled wells. Block I wells were selected south of Building C. The most upgradient well selected was MW60B. Downgradient wells selected were MW48A, MW27B, and MW25A. Orthophosphate is very low, but ammonia is elevated in downgradient well MW27A (2.25 mg/L). Chloride, nitrate, and sulfate generally increase towards downgradient wells.

Methane, ethane, and ethene also generally increase towards downgradient Block I wells. Total organic carbon is above 1 mg/L in downgradient wells, but is low at source area well MW60B (0.47 mg/L). Field and analytical data are consistent with generally oxidizing conditions

(increased DO and positive ORP) throughout the area south and southeast of Building C in Block I.

4.2.5 TCE Plume Areas

This section focuses on TCE plume areas and associated wells. Figures 10 and 11 show the nature and extent of TCE plumes at the MRC for the shallow and intermediate aquifers, respectively. Figures 12 and 13 show the nature of the chlorinated solvent plumes from source areas (PCE/TCE) through degradation products, ending with VC for both the shallow and intermediate aquifers, respectively. Four TCE plume areas have been identified: (1) the Block I South of Building C Plume, (2) the Blocks E and F Southeastern Plume, (3) the Block G Plume, and (4) the Block I West of Building A Plume. All of these source areas can be readily identified in both the shallow and intermediate aquifers.

4.2.5.1 Block I, South of Building C Plume

The Block I South of Building C Plume, originating south of Building C near MW60A/B, was first identified during the 2013 groundwater monitoring (Tetra Tech, 2013a). The source is possibly a release from a solvent waste tank on the south end of Building C that was removed during the 2013 groundwater-remedy pre-remediation activities. However, additional upgradient sources beneath Building C from former operations might also be contributing to TCE contamination present in this area of the MRC.

In both the shallow and intermediate aquifers, the highest TCE concentrations detected within the footprint of the Block I South of Building C Plume were at MW60A (1,920 µg/L) and MW60B (6,120 µg/L), possibly indicating potential downward migration of the plume from the shallow to the intermediate aquifer. Elevated TCE concentrations are also observed to a lesser extent in nearby wells MW48A and B, MW76A and B, and MW81B. Downgradient wells (MW-79B and MW-102B) from the source area also show increased concentrations of *cis*-1,2-DCE which suggest either the plume could be sourcing parent material at a relatively same rate as it is reducing and/or injections moved the contaminant mass within the subsurface. Downgradient well MW-48A exhibited a slight decrease in *cis*-1,2-DCE concentration in 2018. Overall, a 70-percent reduction in contaminant mass continues to be achieved, as continuing monitoring shows. Post injection monitoring continues to be performed to confirm the response action performance goal of reducing TCE mass by 70-percent in active remediation areas is maintained.

Trichloroethene detections in wells MW27A (141 µg/L) and MW29A (10.6 µg/L) indicate that the plume might be migrating within the shallow aquifer toward Block E. The distribution of TCE in the intermediate aquifer is consistent with plume migration towards Block E. High concentrations of *cis*-1,2-DCE in downgradient wells [i.e., MW79B (2,910 µg/L)] might indicate that the plume is degrading before it migrates far from the source area due to bioremediation efforts upgradient, just south of Building C. However, increased TCE concentrations at MW79B (1,670 µg/L), within the historical footprint of the plume, might indicate an additional TCE source within the footprint near the boundary between Blocks E and I.

A separate occurrence of slightly elevated TCE occurs at MW25A (179 µg/L) that indicates either an alternate flow path from the source area south of Building C or a smaller isolated plume. An alternate flow path could be inferred from the groundwater contour map for the shallow aquifer. Slightly elevated TCE is also observed in intermediate well MW87B (55.9 µg/L), with no clear relationship to the Block I South of Building C Plume.

4.2.5.2 Blocks E and F, Southeastern Plume

The F001 Plume was identified during the 2008 site-wide groundwater investigation (Tetra Tech, 2009a). Figure 14 depicts a cross-section through Block E to aid the discussion in this section (Tetra Tech, ~~2017b~~2017a). The plume originates from residual contamination from a former spent-solvent UST (UST 2) that was discovered and removed during the 2013 groundwater-remedy installation in Block E (Tetra Tech, 2016a). This association led to wastes generated from certain wells within this plume being designated "F001 listed" waste. The distribution of TCE downgradient from the former source area UST 2 indicates that the narrow plume is migrating from Block E and discharging into Dark Head Cove and/or possibly migrating beneath the surface water body.

In addition, elevated TCE concentrations upgradient of the former source area UST 2 source possibly represent downstream migration of the Block I south of Building C plume (discussed below). These elevated concentrations could also have resulted from an unknown TCE release in southern Block I/northern Block E near MW27B and MW79B. In the shallow aquifer, the highest concentrations of TCE within the plume were detected in SEMW-8S (24,500 µg/L) and SEMW-9S (32,800 µg/L) in Block F. The plume is also present in the intermediate aquifer at MW74B (34,300 µg/L) and SEMW-7I (29,900 µg/L), with concentrations greater than

1,000 µg/L also present in upgradient well MW72B (3,390 µg/L), mid-gradient well EW2 (2,420 µg/L), and downgradient well EMW-8I (1,080 µg/L). The presence of elevated *cis*-1,2-DCE concentrations in downgradient intermediate wells SEMW-8I (1,080 µg/L) and EW1 (5,320 µg/L) indicates that partial TCE degradation is occurring within the intermediate aquifer downgradient from the UST 2 source area.

4.2.5.3 Block G Plume

The Block G Plume originates north of and extends southwest (downgradient) of the Tilley building. The plume potentially originates from possible solvent releases from a former 2,000-gallon waste-oil UST, near MW21B, north of the Tilley building. A former sewage treatment plant also once stood southeast of MW14B. Historically, MW14B and MW21B have been identified as representing the southwest TCE source area (Tetra Tech, 2013a, 2014a). Currently, the southwestern TCE plume is not present in the shallow aquifer, except for one slight TCE exceedance at the southern edge of the Tilley Building from MW100A (6 µg/L), below the vapor intrusion screening levels (VISL) of 22 6 µg/L. A-Zone wells (MW21A, MW98A, and MW111A) designated to evaluate potential for vapor intrusion within the Tilley Building also had groundwater concentrations below VISLs.

In the intermediate aquifer, several wells immediately north and south of the Tilley building exhibit elevated TCE concentrations. However, all concentrations detected in this region of the MRC in 2018 are below 1,000 µg/L, much lower than historical observations, due to bioremediation efforts that have attenuated TCE concentrations. Downgradient well MW14B and nearby wells in southern Block-G exhibit no exceedances for TCE, indicating that a reductive environment is still present as a result of the injections performed in this area of Block G. Relatively low concentrations of TCE-degradation products were detected in wells near the Tilley Building, suggesting little to no degradation of the plume is occurring as it migrates downgradient.

4.2.5.4 Blocks I and H, West of Building A (Shallow and Intermediate ["Deeper"] Plume)

The Western TCE Plume was identified during the 2008 site-wide groundwater investigation (Tetra Tech, 2009a). Its possible sources include a former 4,000-gallon gasoline UST (explaining the presence of benzene in this plume), or perhaps abandoned underground wastewater lines

(Tetra Tech, 2013a). The plume is also in the area of the former Marform pit and the former plating shop in Building A, where solvents were used to clean metal.

In the shallow aquifer, the highest TCE concentration detected within the footprint of the Western TCE Plume is at MW96A (2,150 µg/L). In the intermediate aquifer, the highest TCE concentration detected is at MW120B (1,260 µg/L). Very high *cis*-1,2-DCE concentrations were detected in MW96A (22,500 µg/L), which might indicate that the original source material from the waste holding tank is already degrading. However, several intermediate wells close to both the shallow and intermediate-aquifer maximum concentrations indicate that some downward and lateral migration to the west and south has occurred.

A deeper western groundwater investigation was performed in April and May 2018 to further delineate the plume and will be provided under a separate cover.

4.2.6 Volatile Organic Compound Trends

VOC concentration trend graphs are presented for select wells in Appendix G. As applicable to each historically identified plume area, PCE, TCE, and their degradation products were plotted against time on a semi-logarithmic plot in both µg/L and micromoles per liter. Wells discussed in subsequent sections are organized by their position within or near the plume footprint areas.

4.2.6.1 Blocks E and F, Southeastern Plume

Historical data were evaluated in four shallow wells (MW34A, MW37A, MW74A, and SEMW-8S) and six intermediate wells (MW37B, MW72B, MW73B, MW74B, SEMW-7I, and SEMW-8I) in Blocks E and F to discuss trends observed in the Southeastern Plume. Wells SEMW-9S/I were not included because only one round of sampling data is available for these wells. Within the shallow aquifer, upgradient wells exhibit stable to decreasing concentrations of PCE, TCE, and their daughter products, whereas downstream wells exhibit increasing trends in TCE and *cis*-1,2-DCE. In the intermediate aquifer, upgradient wells exhibit decreasing trends in TCE concentrations co-occurring with increasing *cis*-1,2-DCE. Increasing *cis*-1,2-DCE, might indicate that biodegradation of the parent material is occurring, as injections have been performed in Block E. Vinyl chloride is stable to decreasing in all wells.

4.2.6.2 Block I, South of Building C Plume

Historical data were evaluated in five shallow wells (MW25A, MW27A, MW48A, MW60A, and MW87A) and eight intermediate wells (MW27B, MW60B, MW76B, MW78B, MW79B, MW81B, MW87B, and MW102B) in Blocks I and E to discuss trends observed in the Block I, South of Building C Plume. At the plume, the source area in both aquifers exhibits stable to increasing trends for PCE, TCE, and their daughter products. Upgradient wells in the shallow aquifer also exhibit increasing TCE trends, whereas downgradient wells exhibit stable to increasing daughter product concentrations (with the exception of MW-48 showing a slight decrease in *cis*-1,2-DCE concentration in 2018). In the intermediate aquifer, wells downgradient of the source area exhibit stable to decreasing concentrations, except at the farthest downgradient well MW79B, which exhibits stable to increasing daughter product concentrations.

4.2.6.3 Block G Plume

Historical data were evaluated for five shallow wells (MW12A, MW21A, MW63A, MW98A, and MW100A) and six intermediate wells (MW12B, MW21B, MW98B, MW100B, MW111B, and SWMW-4I) in Block G, southern Block I, and on Tilley property to discuss trends observed in the Southwestern TCE Plumes. In 2015 and 2016, the Block G Plume received two rounds of remedy injections, including a bioaugmented injection in the second round, near MW14B, south of the Tilley building. The shallow aquifer wells upgradient of these injections (MW21A, MW100A) have low concentrations of PCE, TCE, and daughter products, but the upgradient intermediate wells (MW21B, MW98B, and MW100B) exhibit stable to increasing (MW111B) concentrations of these contaminants. Downgradient wells exhibit decreasing parent material concentrations, with mostly stable to increasing daughter product concentrations. MW9B and MW21B show decreasing concentrations of VC.

4.2.6.4 Block I, West of Building A Plume

Historical data were evaluated for four shallow wells (MW50A, MW53A, MW96A, and MW110A) and eight intermediate wells (MW53B, MW90B, MW109B, MW110B, MW119B, MW120B, MW121B, and MW131B) in Blocks H and I to discuss trends observed in the Block I West of Building A plume. At the Block I West of Building A plume, all shallow aquifer wells exhibit stable to decreasing concentrations of parent materials. Only upgradient well MW96A has elevated daughter product concentrations. In the intermediate aquifer, upgradient wells

exhibit elevated concentrations of parent and daughter material that are stable to increasing over time. Downgradient wells in both aquifers exhibit mostly stable to decreasing parent and daughter concentrations.

SECTION 5
SUMMARY AND CONCLUSIONS

The findings of the April 2018 groundwater sampling and analyses and groundwater level measurements for the Lockheed Martin Corporation Middle River Complex are summarized below.

5.1 GROUNDWATER ELEVATIONS

Groundwater elevations at the Middle River Complex depend on short- and long-term weather patterns and are tidally influenced upgradient of Dark Head Cove. Measurements in the April 2018 groundwater sampling are consistent with previously observed groundwater elevations and observed radial groundwater-flow patterns to Dark Head Cove and Cow Pen Creek.

5.2 GROUNDWATER QUALITY TRENDS AND FINDINGS

Groundwater time-series trend graphs indicate:

- The Blocks E and F, Southeastern Plume undergoes some degradation of parent material into daughter products, but remains largely stable and migrating from the underground storage tank 2 source area in Block E downgradient to Dark Head Cove.
- The Block I South of Building C Plume is stable to increasing over time, and may connect with the Blocks E and F, Southeastern Plume as it migrates east and south from the source area (MW60A and MW60B). Increasing trichloroethene trends observed in some monitoring wells directly downgradient of the Block I Building C may be caused by the following:
    - a continued release from an unidentified source(s) beneath Building C;
    - releases from source material that has sorbed onto finer-grained materials and is back-diffusing into groundwater and providing a continuing source of contamination in the area; and/or
    - injections that may have moved the contaminant mass within the subsurface.
- Increases in trichloroethene concentrations within the Block I Building C source area and increases in degradation products at wells immediately downgradient of the source area

suggest the plume could be sourcing parent material at a relatively same rate as it is degrading. An increase in *cis*-1,2-Dichloroethene concentrations in wells further downgradient of the Block I Building C source area indicates anaerobic reductive dechlorination is occurring. Overall a 70-percent reduction in trichloroethene mass in active remediation areas continues to be achieved. Remedial injections in 2015 and 2016 in the Block G Plume near MW14B were effective in the immediate area of the injections.

- In the Block G Plume, detections at upgradient well MW21B and near the Tilley building remains stable. A-Zone wells (MW21A, MW98A, and MW111A) designated to evaluate potential for vapor intrusion within the Tilley Building observed groundwater concentrations below VISLs. In 14 rounds of vapor intrusion monitoring, the A-Zone groundwater contaminant concentrations have not resulted in vapor intrusion.

- Block G 1,4-dioxane plume contains higher contaminant concentration levels at the monitoring well (MW12A) along the shoreline and may indicate possible flow into surface water at Cow Pen Creek. Ongoing surface water monitoring of Cow Pen Creek has not detected 1,4-dioxane at concentrations above risk-based swimming screening levels; surface water results will be provided under a separate cover.

- The Block I West of Building A Plume, though stable to decreasing in most upgradient wells, is stable to increasing towards downgradient wells, particularly in the intermediate aquifer (MW120B). A deeper western groundwater investigation was performed in April and May 2018 to further delineate the plume and refine the conceptual site model. The findings of this investigation will be provided under a separate cover.

5.3 RECOMMENDATIONS

Future sampling and delineation of plume boundaries might benefit by expanding the groundwater monitoring-well sampling program to sample additional existing downgradient and cross-gradient confining wells. Review of on-going work to characterize the plumes West of Building A and in Blocks E/F will also be performed to identify recommendations to the groundwater monitoring program. Recommendations for future remediation activities based on the results of the April 2018 groundwater sampling include:

- Continue annual groundwater monitoring in April 2019, including sampling of the sentinel wells as part of the three-year off-site sampling plan set up within the Middle River Complex surface water and groundwater monitoring program.

- Evaluate and optimize the sampling program within the existing well network and the possible addition of wells based on trends observed in chemical data, together with results of the plume stability analysis, to better define trichloroethene plume areas.

LEGEND

- Groundwater Monitoring Well
- Staff Gauge
- Tax Blocks

PCE = Tetrachloroethene
TCE = Trichloroethene
***cis*-1,2-DCE= *cis*-1,2-Dichloroethylene**
VC = vinyl chloride

J = The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the Limit of Detection (LOD).
MDL = method detection limit
ND = not detected (<MDL)
Concentrations given in micrograms per liter (µg/L)

Notes:

1 Metals analyzed for Target Analyte List (TAL) metals via Method 6020A & 7470

A/S - upper surficial aquifer well

B/I - intermediate surficial aquifer well

C - lower surficial aquifer well

PCBs - polychlorinated biphenyl(s)

MEE- methane, ethane, and ethene via AM 20GAX or equivalent

MNA - monitored natural attenuation

Notes:

1 Metals analyzed for Target Analyte List (TAL) metals via Method 6020A & 7470

A/S - upper surficial aquifer well

B/I - intermediate surficial aquifer well

C - lower surficial aquifer well

PCBs - polychlorinated biphenyl(s)

MEE- methane, ethane, and ethene via AM 20GAX or equivalent

MNA - monitored natural attenuation

Table 2
Monitoring Well Purge Completion Criteria
Lockheed Martin Corporation, Middle River Complex, Middle River, Maryland

Parameter	Completion Parameter
pH	±0.1 standard units
Temperature	± 3 percent (°C)
Specific Conductivity	± 3 percent (mS/cm)
Dissolved Oxygen (DO)	± 10 percent (mg/L)
Oxidation-Reduction Potential (ORP)	± 10 percent (mV)
Turbidity	< 10 NTU
Time	90 minutes of continuous purging
Volume	Three saturated well casing volumes, OR Well purged dry; allowed to recover 80% of initial static water level

Notes:
DO - Dissolved oxygen
ORP - oxidation-reduction potential
°C - degrees Celsius
mS/cm - milliSiemens per centimeter
mg/L - milligrams per liter
mV - millivolts
NTU - nephelometric turbidity unit

Table 3
Quality Assurance Sampling
Lockheed Martin Corporation, Middle River Complex, Middle River, Maryland

QA/QC Sample	Frequency	Method
Trip Blank	1 per cooler for VOC and chlorinated benzene analyses	Prepared by the laboratory, remains inside coolers with the same VOC samples at all times
Field Duplicate	1:20 samples for all analyses	Collected at time of sampling
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	1:20 samples for all analyses	Collected at time of sampling
Equipment Blank	1 blank for all analyses	Collected by rinsing the utilized equipment in laboratory-provided ASTM Type II deionized water and collecting the rinsate

Notes:
ASTM - American Society for Testing and Materials
MS/MSD - matrix spike/matrix spike duplicate
VOC - volatile organic compound

EXECUTIVE SUMMARY

On behalf of Lockheed Martin Corporation, AECOM Technical Services, Inc., has prepared this Monitoring Well Repair Report for the June 2018 monitoring well repair and maintenance event at the Lockheed Martin Corporation Middle River Complex in Middle River, Maryland. The objectives for the monitoring well repair program are to identify, document, and repair monitoring wells in need of bolt/washer replacements, new well pads and manways, and/or well redevelopment.

The purpose of conducting and tracking monitoring well conditions and implementing repairs is to

- maintain monitoring well integrity over time;
- prevent surface water runoff and potential contamination carried by the runoff from entering damaged wells;
- maintain groundwater sample integrity by minimizing risk of sample fouling caused by monitoring well degradation; and
- identify and remove sediment accumulation via redevelopment to ensure representative groundwater conditions for chemical analyses.

Observations of monitoring well conditions were recorded on April 2 through 6, 2018, during the annual synoptic groundwater level measurement event. Seven wells that could not be located during this event were referred to Tetra Tech, Inc. for location and necessary modification. Tetra Tech, Inc. assisted in finding seven monitoring wells, repairing one well and abandoning another, both damaged during Tetra Tech's sediment remediation program. Monitoring well repairs were conducted on June 25 through 29, 2018. On-site activities included

- replacement of hardware (e.g., bolts, washers, gaskets, locks, etc.) in 80 wells;
- replacement of manways and concrete pads in eight wells; and

- redevelopment of nine monitoring wells.

All repair and maintenance work was conducted in accordance with the 2018 Monitoring Well Repair Work Plan (AECOM, 2018) and the Remediation Contractor's ESH Handbook (Lockheed Martin Corporation, 2014).

SECTION 1
INTRODUCTION

On behalf of Lockheed Martin Corporation, AECOM Technical Services, Inc., has prepared the following Monitoring Well Repair Report for June 2018 monitoring well repair activities at the Middle River Complex in Middle River, Maryland, which is part of the Chesapeake Industrial Park, located at 2323 Eastern Boulevard in Middle River, Maryland, approximately 11.5 miles northeast of downtown Baltimore. Ongoing site investigations and environmental sampling activities at Middle River Complex have identified soil and groundwater contamination associated with historical plant activities, including detections above formal regulatory limits, or site-specific limits where regulatory limits are absent, for volatile organic compounds, polychlorinated biphenyls, metals, and 1,4-dioxane. Numerous monitoring wells have been installed on- and off-site to characterize groundwater contamination at the Middle River Complex (**Figure 1**). Over time, the conditions of some of the wells have deteriorated and required maintenance. The purpose of conducting and tracking monitoring well conditions and implementing repairs is to

- maintain monitoring well integrity over time;
- prevent surface water runoff and potential contamination carried by the runoff from entering damaged wells;
- maintain groundwater sample integrity by minimizing risk of sample fouling caused by monitoring well degradation; and
- identify and remove sediment accumulation via redevelopment to ensure representative groundwater conditions for chemical analyses.

This Monitoring Well Repair Report details observations of the conditions of on-site monitoring wells and subsequent well repair and maintenance activities. Repairs included, but were not limited to, replacing or repairing surface concrete pads, replacing missing or damaged hardware (e.g., compression plugs, bolts and washers, gaskets, well locks), and replacing manways.

This report is organized as follows:

Section 1—Introduction: Presents objectives for the monitoring well repair program.

Section 2—Site Background: Briefly describes site history and well maintenance history.

Section 3—Well Repair Field Activities: Presents the technical approaches to well repair and maintenance.

Section 4—Summary: Summarizes the result of site activities.

Section 5—References: Cites references used to compile this report.

SECTION 2
SITE BACKGROUND

2.1 MIDDLE RIVER COMPLEX BACKGROUND

The Middle River Complex (MRC) is part of the Chesapeake Industrial Park at 2323 Eastern Boulevard in Middle River, Maryland, approximately 11.5 miles northeast of downtown Baltimore. It comprises approximately 161 acres, including 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, a trailer and parts storage lot, and numerous grassy spaces along its perimeter. It is bounded by Eastern Boulevard (Route 150) to the north, Martin State Airport to the east, Dark Head Cove to the south, and Cow Pen Creek to the west. **Figure 2** is a map of the MRC site layout.

Lockheed Martin Corporate Properties, Inc., (LMCPI) owns the MRC. LMCPI's primary activities at the MRC include facility and building management and maintenance. The main tenant at the site, MRA Systems, Inc., a subsidiary of General Electric Company, designs, manufactures, fabricates, tests, overhauls, repairs, and maintains aeronautical structures, parts, and components for military and commercial applications. Lockheed Martin Rotary and Mission Systems, a division of Lockheed Martin Corporation (LMC), conducts engineering activities and fabricates, assembles, tests, and otherwise supports vertical-launch systems. Applied NanoStructured Solutions, LLC, engaging in research and design of nanotechnology applications, also occupies a portion of the MRC.

2.1.1 Middle River Complex History

In 1929, the Glenn L. Martin Company, a predecessor entity of LMC, acquired large parcels of undeveloped land in Middle River, Maryland, to manufacture aircraft for United States government and commercial clients. In the early 1960s, Glenn L. Martin Company merged with American-Marietta Company to form Martin Marietta Corporation. Around 1975, the adjacent eastern airport area (currently Martin State Airport), approximately 750 acres, was transferred to the State of Maryland. In the mid-1990s, Martin Marietta Corporation merged with Lockheed Corporation to form LMC. Shortly after the merger, General Electric Company entities acquired

most of LMC's aeronautical business in Middle River and a General Electric subsidiary, MRA Systems, Inc., began operations.

2.2 MONITORING WELL NETWORK & MAINTENANCE

2.2.1 Monitoring Well Network

Development of a permanent groundwater monitoring well network began at the MRC in 2005, after the 2003 Phase I Environmental Site Assessment and 2004 Historical Records Review (Tetra Tech, Inc. [Tetra Tech], 2009). The well network clusters around historically identified contaminant plumes that include volatile organic compounds, polychlorinated biphenyls, and 1,4-dioxane. Additional wells were installed in the years since 2005 based on subsequent soil and groundwater investigations to further delineate contaminant distributions within shallow (surficial), intermediate, and deep groundwater aquifers at the MRC. The 2018 monitoring well network is shown in **Figure 3**.

2.2.2 Monitoring Well Repair Program History

The annual well inspection and repair program began in 2011 (Tetra Tech, 2011). Well repair activities have included replacement of well hardware (bolts, washers, gaskets, well locks, etc.), well manways and covers, and concrete pads, as well as modifications to polyvinyl chloride (PVC) pipe well casing, well re-installations, and new survey of re-installed or modified monitoring wells (Tetra Tech, 2013; 2016). **Table 1** summarizes the history of monitoring well repairs since 2011.

In 2011, 30 wells were repaired, including loose grout and sediment removal and patch grouting at 20 wells (Tetra Tech, 2011). Well pads and manways were replaced at nine wells, and the PVC casing was extended at four wells (MRC-MW02A, MRC-MW60B, MRC-MW68A, and MRC-MW79B). Sediment accumulation within the PVC casing at MRC-MW56A was also removed. Additionally, MRC-MW45A was scheduled for redevelopment, but recommended for abandonment because of insufficient recharge into the well casing.

In 2012, 13 wells needed repair, including well pad and manway replacement at seven wells (Tetra Tech, 2012). Concrete filler was used to fill in minor cracks at five wells, and new hardware (bolts) was installed at one well (MRC-MW52A).

In 2013, 36 wells were repaired, including replacing bolts in 29 wells, well covers and concrete pads at six wells, and modifying the PVC casing at wells MRC-MW101A/B (Tetra Tech, 2013). The PVC casing modification involved cutting the PVC sufficiently below grade so that the well cover could fit securely on the flush-mounted manway. These wells were resurveyed by a professional surveyor after modification completion. In 2014, 16 wells were repaired, including replacing bolts at nine wells and replacing well covers and concrete pads at seven wells (Tetra Tech, 2014).

In 2014, monitoring well repair activities were completed at 18 wells, including replacing missing or damaged hardware at nine wells and replacing manways and well pads at an additional nine wells (Tetra Tech, 2014).

In 2015, repair activities were completed at 13 wells, including replacing missing or damaged hardware at four wells and replacing manways and well pads at an additional nine well locations (Tetra Tech, 2015).

In 2016, 12 wells were repaired, including replacing concrete pads at nine wells and replacing well covers at three wells (Tetra Tech, 2016). Additionally, well MRC-MW79B was replaced because of damage from on-site operational activities at the MRC. The well was resurveyed by a professional surveyor after well installation was completed.

In 2017, six well pads and manways were replaced (Tetra Tech, 2017).

SECTION 3
WELL REPAIR FIELD ACTIVITIES

The overall objective of the monitoring well repair and maintenance program at the Middle River Complex (MRC) is to support the long-term groundwater monitoring program by maintaining the operational condition of monitoring wells within the MRC's monitoring well complex. All on-site monitoring wells were inspected on April 2 through April 6, 2018, during the annual synoptic groundwater level measurement event conducted by AECOM Technical Services, Inc. (AECOM). Wells that could not be located by AECOM were identified and shared with Tetra Tech, Inc., (Tetra Tech) to be located before the start of monitoring well repair activities.

The monitoring well repair event was completed on June 25 through 29, 2018. All repair and maintenance work was conducted in accordance with the 2018 Monitoring Well Repair Work Plan (AECOM, 2018). Since monitoring well nomenclature for all wells includes the "MRC-" prefix, all references to specific wells in Section 3 will be abbreviated to exclude the prefix (e.g., "MRC-MW15A" to "MW15A" and "MRC-SEMW-3I" to "SEMW-3I"). **Table 2** summarizes the monitoring well repair activities that occurred in 2018. **Figure 4** shows the locations of wells repaired during the June 2018 Monitoring Well Repair event.

Before start of work, AECOM and Tetra Tech, coordinated the location of seven monitoring wells that were missing during the April 2018 groundwater monitoring event. AECOM located one monitoring well (MW11A) and Tetra Tech located the remaining six wells (EW-1, EW-2, MW107B/C, MW09A, MW23A, and MW16A).

3.1 UTILITY CLEARANCE AND PERMITTING

Repair work was conducted within existing wells or within existing well pad footprints and depths; therefore, no further utility clearance or permitting was required.

3.2 LOCATION OF MISSING MONITORING WELLS

Before the start of monitoring well repair activities, Tetra Tech assisted in locating wells not found during the April 2018 groundwater monitoring event. The monitoring wells and their

current status are shown in **Table 3**. Tetra Tech located and/or repaired all seven of the missing wells (EW-1, EW-2, MW16A, MW107B/C, MW09A, MW11A, and MW23A) and AECOM sampled five of those monitoring wells (EW-1, EW-2, MW107B/C, MW16A, and MW11A) in June 2018. The results of June 2018 sampling activities will be detailed in an addendum to the April 2018 Groundwater Monitoring Report.

3.3 WELL HARDWARE REPLACEMENT

Monitoring well hardware refers to the replaceable parts of the well and includes bolts, washers, O-rings, compression plugs, well locks, and manway covers. Degraded or stripped bolts and missing or broken washers were replaced with 3/8-inch-16 thread size, 1-inch long extreme-strength stainless steel flanged hex head screws and comparably sized washers. There were several monitoring wells where bolts were of a different size than stated above. In these instances, AECOM maintained the same size bolt and retapped smaller female threads to fit the bolt housing. In order ensure a watertight seal at the bolts, comparably sized rubber washer gaskets were also replaced where needed. Compression plugs were selected to fit 2-inch- and 4-inch-diameter well casings and American Lock #A31KA Key #82141 keyed locks were replaced where well locks were missing or broken. All locks are keyed to one master key for all monitoring well locations at the MRC.

In all, bolts, steel washers, and/or rubber washers were replaced at 80 monitoring wells. Manway O-rings were replaced at eight wells, well locks were replaced at four wells, and compression plugs were replaced at two wells. No manway covers were replaced without full manway and well pad replacement.

3.4 WELL PAD AND MANWAY REPLACEMENT

Monitoring well pads refer to the concrete base surrounding the embedded manway that prevents surface water from infiltrating the inner well casing. Monitoring well pads are surface completions. The manway is the protective outer cover that creates a water-tight seal around the inner polyvinyl chloride (PVC) well casing. Over time, some well pads have deteriorated and some manway covers and manways have become bent and/or cracked. Replacement well pads were constructed with high-strength Sakrete concrete with two-square-foot 2-inch x 4-inch wooden frames to a uniform minimum depth of 6 inches. Monitoring well pads were completed with a broomed finish and edged. Any cracks in the existing monitoring well pads that warrant

repair were filled with Sikaflex to maintain the structural integrity of the pad. These repairs are temporary, so these well pads will most likely need full replacement in the future. The replacement manways were 8 inches in diameter with 12-inch steel skirts.

In June 2018, eight well pads and manways were replaced and an additional six pads were caulked with Sikaflex sealant. Some wells initially identified for manway or pad replacement were removed from the repair list upon closer investigation. At MW15A, MW26A, and SWMW-1I, lids were observed to be intact. At SEMW-3I, the manway was undamaged and the flush mount cover was discovered near the well and secured to the manway with new bolts.

3.5 WELL REDEVELOPMENT

A list of monitoring wells was initially identified for redevelopment during the April 2018 annual groundwater monitoring event. These wells were verified for redevelopment during additional groundwater sampling activities in June 2018 by checking the depth-to-bottom (DTB) measurements with a water level meter (WLM).

Monitoring well redevelopment was completed on June 27 through 29, 2018, using a 2-inch or 4-inch custom-built surge block with PVC and a cut-to-fit plunger. Alternating methods of manual surging with the surge block along the entire length of the screen and surging with a submersible Mega Purger Whale Pump were used to remove sediment accumulation and break down silt bridges occurring in each well. The DTB was confirmed with a WLM immediately after purge completion and the following day. Redevelopment was considered to be complete once the measured depth to bottom was within half a foot of the recorded total well depth, the monitoring well ran dry more than four times, or purging had reached 6 hours.

In total, nine monitoring wells were redeveloped because of thick accumulations of soft sediment in excess of 1.5 feet thick when compared to the wells' total depth of record. Approximately 400 gallons of sediment-laden water was purged from all nine wells. Five of the wells (MW12A, MW70A, MW70B, MW73A, and MW77A) were purged dry at least once during redevelopment. Initial purge water in all wells was very turbid, and in three wells (MW70A, MW70B, MW12A) the WLM and Whale Pump were thickly coated in fine black sediment when removed from the well. Sediment was removed from all monitoring wells, although several wells still retained high turbidity (more than 100 nephelometric turbidity units) after cessation of development. The end goal of development was total depth restoration to each of the monitoring wells.

Well development was begun at NMW-1I; however, AECOM personnel recognized that the identified well was not typical of a monitoring well because of the presence of dedicated tubing plumbed into the side of the well casing and powdery white material caked on the inside walls of the well casing. Approximately 25 gallons of sediment-laden water were purged before the field team lead instructed to cease redevelopment at this location pending further discussion of site observations. It was later determined with the Remediation Technical Operations (RTO) that the well location may have been mislabeled, and is in fact an injection well (likely IW-2). AECOM and the RTO will confirm with Tetra Tech the appropriate location and labeling of NMW-1I for future site activities.

3.6 DOCUMENTATION

All site activities, observations, and field data were recorded on electronic field log sheets via two of Esri's mobile applications, Survey123 and Collector for ArcGIS®, and submitted in daily field reports to the RTO and LMC. Site personnel photographed site activities and final work results at locations of major repairs to demonstrate completion to specifications. **Appendix A** presents a photo log and summary of repair activities at each of the eight well pad replacement locations. **Appendix B** presents daily field notes and associated photos of site activities during the June 2018 Monitoring Well Repair event.

3.7 EQUIPMENT DECONTAMINATION

Reusable equipment (e.g., water level meter, submersible pump, surge block, and rods) were decontaminated before and after each use. Between each sampling location, decontamination involved the following:

- Liquinox® and distilled water wash
- Distilled water rinse
- Air drying

All decontamination fluids were collected for disposal in United States Department of Transportation (USDOT)-approved 55-gallon steel drums. Disposable equipment used for well development (e.g., poly tubing, poly sheeting) was disposed of as general refuse.

3.8 WASTE MANAGEMENT

Waste generated by monitoring well repair and redevelopment activities consisted of purge water, rinse water, and construction debris (well development debris, concrete, well pad fill, and asphalt). Personal protective equipment, poly tubing, and poly sheeting were placed in industrial trash bags and disposed of as general refuse in an off-site trash receptacle. The purge and rinse water were containerized in USDOT-approved 55-gallon steel drums and temporarily staged on wooden pallets within a secondarily containerized central staging area established in Block E on the MRC for chemical/physical characterization and proper disposal at the end of well repair and redevelopment activities. Purge water collected from wells at the hazardous F001 plume originating at former underground storage tank 2 (e.g., EW-1, EW-2) were accumulated in a separate drum and stored in the hazardous waste containment area. Thirteen drums of material were accumulated during June 2018 field activities.

Drums were labeled with relevant site information, including beginning accumulation date, description of contents, origin and generator name, and consultant contact information. These drums will be picked up at a later date by Clean Harbors, Inc., for proper disposal. Waste characterization sampling and analysis was completed on July 13, 2018. Once the analytical data is received from the laboratory, AECOM will proceed with obtaining profiles and then manifests from Clean Harbors, Inc., in Baltimore, Maryland. These documents will be approved by LMC before removal of drums off-site and completion of disposal.

3.9 SITE RESTORATION

On completion of monitoring well repair and well development activities, site restoration was completed. No damage was done to surrounding asphalt or grass areas at the site. The RTO and LMC were informed of completion of repair activities.

SECTION 4
SUMMARY

This Monitoring Well Repair Report summarizes and describes on-site activities to repair damaged monitoring well hardware, manways, and concrete pads in June 2018 at the Middle River Complex in Middle River, Maryland. AECOM Technical Services, Inc., and Tetra Tech, Inc., coordinated the location of six monitoring wells that were missing during the April 2018 Groundwater Monitoring event. Tetra Tech located all seven of the missing wells (EW-1, EW-2, MW16A, MW107B/C, MW09A, MW11A, and MW23A) and AECOM sampled five of those monitoring wells (EW-1, EW-2, MW107B/C, MW16A, and MW11A) in June 2018. The results of June 2018 sampling activities will be detailed in an addendum to the April 2018 Groundwater Monitoring Report.

Well repair and redevelopment activities completed by AECOM Technical Services, Inc., during the 2018 Monitoring Well Repair event included the following:

- Replacing bolts, steel washers, and rubber washer gaskets (80 wells)
- Replacing or repairing manways and concrete well pads (eight wells)
- Redevelopment of monitoring wells (nine wells)
- Replacing manway gaskets (eight wells)
- Replacing well locks (six wells)
- Replacing well compression plugs (two wells)

In addition to monitoring well repair activities, silt bridging and thick fine sediment accumulation was observed during groundwater sampling activities during the April 2018 groundwater sampling event. Nine monitoring wells were identified and redeveloped to remove sediment accumulation in well screen intervals and at the bottom of well casings. Redevelopment activities generated approximately 400 gallons of sediment-laden purge water. Redevelopment

was considered complete once the measured depth to bottom of well casing was within half a foot of the recorded total well depth, the monitoring well ran dry more than four times, or purging had reached 6 hours.

It is recommended that several of these monitoring wells (MRC-MW73A, MRC-MW54A, MRC-91A, MRC-MW87A, and MRC-MW86A) be reconditioned and redeveloped in 2019, since the purge water was still turbid after meeting the redevelopment criteria and depth of record was not reached. In addition to traditional surge block and pumping methods, alternative reconditioning methods, such as adding water to monitoring wells that repeatedly ran dry or using air lift techniques for redevelopment of monitoring wells that are heavily sediment laden, are recommended for repair activities in 2019.

AECOM Technical Services, Inc., personnel will continue to coordinate with remedial technical operations personnel (CDM Smith) and Lockheed Martin Corporation to complete annual inspections of monitoring well conditions at the Middle River Complex. Additional attention will be paid to the conditions of wells in high traffic areas that may pose significant health and safety risks to site personnel.

TD - Total Depth
in - inches
ft bgs - feet below ground surface
a - Hardware includes bolts, washers, gaskets, compression plugs, well locks
b - Includes well pad/manway replacement, manway cover replacement, crack repair, grout erosion repair
c - Completed by Tetra Tech, Inc. (June 2018)
-- = Not applicable

Table 2: Monitoring Well Repairs—June 2018
Middle River Complex

Well ID	Easting	Northing	Block	Diameter (in)	TD of Record	Measured TD (from TOC)	Rating	Initial Field Observation—April 2018	Repair/Replacement Activity—June 2018
MRC-MW02A	1472639.485	607412.069	A	2	27.0	26.98	Good	Bolts are stripped	2 bolts
MRC-MW03A	1473097.977	607778.321	B	2	14.0	13.69	Average	Asphalt cracking around well; no well pad	Fill asphalt cracks with Sikaflex sealant
MRC-MW05A	1472612.187	606827.234	I	2	34.0	33.65	Average	Missing 1 rubber and 1 metal washer	1 washer set
MRC-MW07A	1472290.156	605572	I	2	22.0	21.54	Average	No washers (rubber and metal)	2 washer sets
MRC-MW100A	1472664.712	605256.339	I	2	19.0	18.52	Average	Missing 1 rubber washer	1 rubber washer
MRC-MW103A	1473601.591	605082.812	E	2	17.0	16.00	Good	1.19' difference between TT TD and measured TD; soft/silted bottom	Well redevelopment
MRC-MW104A	1474143.363	605108.877	F	2	15.0	14.56	Average	No washers (rubber or metal)	2 washer sets
MRC-MW106B/C	1472537.618	605140.997	G	2	50.0	49.92	Poor	Cracked well pad; missing washers; bent bolt and missing bolt housing; flush mount cover O-ring missing	New well pad; manway; 3 washer sets; and 3 bolts
MRC-MW10A	1471933.286	605235.102	G	2	13.0	13.00	Poor	Cracked, rusted out manway; cracked flush mount cover; missing washers and O-ring	New well pad; manway; 2 washer sets; and 2 bolts
MRC-MW11A	147355.926	605006.565	G	2	13.0	13.00	Poor	Damaged from third-party construction activity (Found June 2018)	Restoration by Tetra Tech
MRC-MW110A	1471744.82	605944.28	H	2	22.0	21.52	Poor	Cracked and rusted flush mount cover; missing 1 set of bolts and washers; no flush mount cover rubber O-ring	Flush mount cover; 2 washer sets; and 2 bolts
MRC-MW111A	1472728.99	605391.72	I	2	15.0	14.57	Average	Missing 2 rubber washers and half of well pad	2 rubber washers and new well pad. Area will be saw cut square first; manway does not need to be replaced.
MRC-MW113A	1473538.344	605138.342	E	2	16.0	15.40	Good	Missing 1 set of washers (rubber and metal)	1 washer set
MRC-MW116A	1473190.81	606848.57	I	2	35.0	35.00	Average	No rubber washers	2 rubber washers
MRC-MW12A	1472512.697	604858.647	G	2	14.0	13.00	Poor	Well buried; cracked pad; missing bolts; 1.14' difference between TT TD and measured TD; soft/silted bottom	Well redevelopment; 2 bolts; and Sikaflex sealant
MRC-MW14A	1472576.174	605143.252	G	2	13.0	12.76	Poor	No well pad	New well pad
MRC-MW14C	1472579.874	605129.347	G	2	75.0	74.25	Average	Missing 2 rubber washers	2 rubber washers
MRC-MW15A	1472292.64	605305.957	G	2	13.0	12.79	Average	Missing 2 rubber and metal washers. Missing flush mount cover rubber O-ring	2 washer sets and flush mount cover O-ring

APPENDIX B
Daily Field Reports

Daily Report
June 25, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 80's

Hours Worked on Site: 0730-1730

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, David Brightbill, Matt Ginalick, Antonio Zarrelli, and Victoria Kirkpatrick

Revisions to previous report: None

Daily Summary:

Beginning of the surface water sampling (SWS) program, groundwater sampling (GWS) program, and Monitoring well (MW) repair program.

The following locations were sampled today:

1. MRC-SW5A1
2. MRC-SW5A2
3. MRC-SW5B
4. MRC-SW13A
5. MRC-SW16A
6. MRC-SW15A
7. MRC-SW8A
8. MRC-SW8B
9. MRC-SW6A
10. MRC-SW6B
11. MRC-SW9A
12. MRC-SW9B
13. MRC-SW7A
14. MRC-SW7B
15. MRC-SW1A
16. MRC-SW2A
17. MRC-MW11A
18. MRC-MW16A

The following MW locations were prepped today for new pads (dug out/removed existing pad and manway and installed new manway in pea gravel). Pea gravel was added to ensure proper well drainage as we noted that this was an issue in many of the wells. Manways installed were 9" diameter with 12" skirts.

1. MRC-MW08A
2. MRC-MW106B/C
3. MRC-MW10A
4. MRC-MW111A
5. MRC-MW71A
6. MRC-SEMW-1I

The following locations were repaired today (Sikaflex sealant applied):

1. MRC-MW03A
2. MRC-MW12A
3. MRC-MW50A
4. MRC-MW68A

Samples submitted to ALS Environmental on 6/25/18 via courier.

Safety Activities: Morning safety briefing and afternoon debrief
Issues to be Resolved: None
Impacts to Schedule: None
Planned Activities for 06/26/18: Continuation of GWS, SWS, and MW Repair programs
Attachments: None

AECOM

Daily Report
June 26, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 80's, Sunny

Hours Worked on Site: 0700-1715

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, David Brightbill, Matt Ginalick, Antonio Zarrelli, and Victoria Kirkpatrick

Revisions to previous report: None

Daily Summary:

Completion of the surface water sampling (SWS) program, completion of the groundwater sampling (GWS) program, and continuation of the Monitoring well (MW) repair program.

The following locations were sampled today:

1. MRC-MW107B/C
2. EW-1
3. EW-2

Please note that purge water from EW-1 and EW-2 were segregated as they are part of the F001 plume. A drum tracking sheet will be provided to the team this week. Purge water from MW107B/C was very turbid and full of debris. It appears that Tetra Tech located the well, put a manway on top of the existing manway and attached a non-flush PVC extension (surface water runoff was observed leaking down into well casing at the PVC joint), and finished the location with a pad (see attached photos).

The following MW location pads were completed today:

1. MRC-MW08A
2. MRC-MW106B/C
3. MRC-MW10A
4. MRC-MW111A
5. MRC-MW71A
6. MRC-SEMW-1I

Please note that we built pad frames out of 2x4s for the above list, used high strength Sakrete, and finished the surface completion with an edged, broom finish (see attached photo of an example).

Samples submitted to ALS Environmental on 6/26/18 via courier.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved: None

Impacts to Schedule: None

Planned Activities for 06/267/18: Continuation of MW Repair program

Attachments: Photos

Daily Report
June 27, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 80's, Cloudy, intermittent heavy rain all day

Hours Worked on Site: 0700-1730

Personnel on Site (All AECOM):

Holly Brown and Zachary Neigh

Revisions to previous report: None

Daily Summary:

Continuation of the Monitoring well (MW) repair program. Redevelopment was conducted with a mega whale pump and a 2" or 4" custom designed surge block connected to PVC. MWs were surged with both the whale pump and the surge block along the entire length of the screen.

Redevelopment was initiated or completed today on the following locations:

1. MRC-MW72B - Redevelopment complete; approximately 50 gallons of sediment laden purge water removed. Very hard well bottom and GW was purging clear at the end of development. Initial measured DTB = 33.64 ft. from TOC, final DTB = 34 ft. from TOC. Tetra Tech (TT) total depth (TD) is listed as 35' but I am certain that this is an error and the actual installed depth is 34' given the conditions measured after development (clear water and very hard bottom). Please note that purge water from MRC-MW72B was segregated as hazardous F001 waste. Purge water was very turbid.
2. MRC-MW70A - Redevelopment initiated; approximately 40 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured DTB = 9.35 ft. from TOC, TT TD = 14.0'. Extremely thick silt and clay (see attached photo) accumulation present at the bottom of the well and numerous silt bridges present in the screened interval. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was extremely turbid.
3. MRC-MW70B - Redevelopment initiated; approximately 40 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured DTB = 27.32 ft. from TOC, TT TD = 30.0'. Extremely thick silt and clay accumulation present at the bottom of the well and numerous silt bridges present in the screened interval. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was extremely turbid.

A drum tracking sheet will be provided to the team this week.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved: None

Impacts to Schedule: None

Planned Activities for 06/28/18: Continuation of MW Repair program

MIDDLE RIVER, MD

Daily Report
June 28, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 90's, Sunny

Hours Worked on Site: 0700-1730

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, Matt Ginalick, and Antonio Zarrelli

Revisions to previous report: Revision to daily report from 6/26/18. All drums (9 total) from the April sampling event were removed from the site via Clean Harbors. Manifests were signed by Mike Musheno. I will provide the team with copies once I am back in the office and have access to a scanner.

Daily Summary:

Continuation of the Monitoring well (MW) repair program. Redevelopment was conducted with a mega whale pump and a 2" or 4" custom designed surge block connected to PVC. MWs were surged with both the whale pump and the surge block along the entire length of the screen.

Redevelopment was initiated, continued, or completed today on the following locations:

1. MRC-MW70A - Redevelopment continued; approximately 30 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured depth to bottom (DTB) = 9.35 ft. from TOC, TT TD = 14.0'. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was turbid. Measured DTB at the end of the day = 12.86'
2. MRC-MW70B - Redevelopment continued; approximately 55 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured DTB = 27.32 ft. from TOC, TT TD = 30.0'. Redevelopment will be continued on this location tomorrow, well ran dry once. See attached photo of purge water. Measured DTB at the end of the day = 29.86'.
3. MRC-MW73A - Redevelopment initiated and completed; approximately 20 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 15.46 ft. from TOC, TT TD = 17.0'. Measured DTB at the end of the day = 15.98', hard bottom. Fairly certain that total well depth is 16.0', not 17.0' as the bottom was very hard. Well ran dry twice.
4. MRC-MW12A - Redevelopment initiated (see attached photo); approximately 20 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt. Initial measured depth to bottom (DTB) = 12.86 ft. from TOC, TT TD = 14.0'. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was turbid. Measured DTB at the end of the day = 12.96'
5. MRC-MW91A - Redevelopment initiated; approximately 6 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 17.66 ft. from TOC, TT TD = 20.0'. Measured DTB at the end of the day = 18.0', semi-hard bottom. Redevelopment will be continued on this location tomorrow, well ran dry twice.
6. MRC-MW86A - Redevelopment initiated; approximately 18 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 12.61 ft. from TOC, TT TD = 16.0'. Measured DTB at the end of the day = 12.8', hard bottom. Redevelopment will be continued on this location tomorrow, well ran dry twice.
7. MRC-MW87A - Redevelopment initiated; approximately 3 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 14.26 ft. from TOC, TT TD = 16.0'. Measured DTB at the end of the day = 14.34', soft bottom. Redevelopment will be continued on this location tomorrow, well ran dry twice.
8. MRC-MW77A - Redevelopment initiated and completed; approximately 20 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 15.64 ft. from TOC, TT TD = 17.0'. Measured DTB at the end of the day = 15.90', hard bottom. Fairly certain that total well depth is

16.0', not 17.0' as the bottom was very hard. Well ran dry once.

9. MRC-NMW-1I - Redevelopment initiated (see attached photos); approximately 25 gallons of sediment laden purge water removed before a call was placed to Holly, informing her that it did not seem like this was a typical MW. Upon inspection, this appears to be an injection well. Redevelopment was stopped at this time.

The following MW locations were prepped today for new pads (dug out/removed existing pad and manway, new manway installed, pea gravel added). Pea gravel was added to ensure proper well drainage as we noted that this was an issue in many of the wells. All of the existing manways removed were cemented in place for with concrete aggregate which would be why they were holding SW runoff (see attached photo). Manways installed were 9" diameter with 12" skirts.

1. MRC-MW30A
2. MRC-MW42A
3. MRC-MW71B

A drum tracking sheet will be provided to the team this week.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved: MRC-NMW-1I appears to be an active injection well (see attached photos). It has dedicated tubing plumbed into the side of the well casing and white material (baking soda like consistency) is present inside of the well. Please confirm that this is an active injection well and should not be considered a monitoring well or part of GW monitoring program. This well was not redeveloped.

Impacts to Schedule: None

Planned Activities for 06/29/18: Continuation of MW Repair program

Attachments: Photos

MIDDLE RIVER, MD

Daily Report
June 29, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 90's, Sunny

Hours Worked on Site: 0700-1700

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, Matt Ginalick, Victoria Kirkpatrick, and Antonio Zarrelli

Revisions to previous report: None

Daily Summary:

Completion of the Monitoring well (MW) repair program. Redevelopment was conducted with a mega whale pump and a 2" or 4" custom designed surge block connected to PVC. MWs were surged with both the whale pump and the surge block along the entire length of the screen.

Redevelopment was initiated, continued, and/or completed today on the following locations:

1. MRC-MW70A
2. MRC-MW70B
3. MRC-MW12A
4. MRC-MW30A
5. MRC-MW68A
6. MRC-MW93B
7. MRC-MW54A
8. MRC-MW91A
9. MRC-MW87A
10. MRC-MW86A
11. MRC-MW103A

The following MW location pads were completed today:

1. MRC-MW30A
2. MRC-MW42A
3. MRC-MW71B

Please note that we built pad frames (2' x 2') for the above list, used high strength Sakrete, and finished the surface completion with an edged, broom finish.

All other well repairs (bolts, washers, and O-rings) were made today. Upon closer inspection, MRC-MW15A, MRC-MW26A, and MRC-SWMW-1I did not have cracked lids, flush mount covers were not replaced. MRC-SEMW-3I had a flush mount cover right next to the well so we secured it in place to the manway with new bolts.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved:

1. MRC-NMW-1I appears to be an active injection well. It has dedicated tubing plumbed into the side of the well casing and white material (baking soda like consistency) is present inside of the well. Please confirm that this is an active injection well and should not be considered a monitoring well or part of

GW monitoring program. This well was not redeveloped.

2. There are 2 locations (MRC-MW29A and MRC-MW53B) where flush mount lids could not be replaced. Due to there being multiple types of manways onsite, the manufacturers of the lids needed for these two locations did not just sell lid replacements. We could purchase manways for these locations but, upon further inspection, it appears that the entire manway on these locations are partially rusted and/or cemented in and may require complete pad and manway replacement in 2019, pending LMC approval. Overall, the compression well caps and inner well casing appear to be in good condition for these locations.

AECOM

APPENDIX B
Daily Field Reports and Low-Flow Sampling Forms

Daily Report
April 2, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 50's, periods of rain

Hours Worked on Site: 0700-1730

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: N/A

Daily Summary:

Site-wide gauging of monitoring wells.

Dark Head Cove Outfall009 observed to have a sheen emanating from it. Further investigation by LMCPI occurring tomorrow.

Safety Activities: Morning safety briefing and evening debrief

Issues to be Resolved:

1. MRC-STAFF01 & 02 are destroyed. In the interim, AECOM will make a fix mark on the bulkhead to take DTW measurements from both the Cow Pen Creek and Dark Head Cove sides. Tide charts will be noted.
2. MRC-MW93A/B, MRC-MW24A, and MRC-MW94B have dumpsters over them. Holly Brown continuing to work with personnel onsite to try and get them moved.
3. MRC-MW67A is rusted shut. Holly Brown will attempt to loosen the lid with a sledge hammer today.
4. MRC-MW96A/B and MRC-MW41A had vehicles parked on them the entire day. We will try and gauge these locations today.
5. Cannot locate MRC-MW54A, MRC-MW09A, MRC-MW16A, MRC-MW131B, MRC-MW23A, MRC-MW61S, and MRC-MW122A. It appears that recent onsite construction activities may have destroyed these wells. There is recent new grading in the areas where the above wells are. Further investigation by Holly Brown will occur today.

Impacts to Schedule: None

Planned Activities for 04/03/18: Continue groundwater gauging of site monitoring wells.

Attachments: Gauging tracking table and updated gauging map

Daily Report
April 3, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 40's - 50's, periods of rain

Hours Worked on Site: 0700-1700

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: N/A

Daily Summary:

Site-wide gauging of monitoring wells.

Dark Head Cove Outfall009 observed to have no sheen emanating from it. Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing and evening debrief

Issues to be Resolved:

1. MRC-MW93A/B, MRC-MW24A, and MRC-MW94B have dumpsters over them. Holly Brown continuing to work with personnel onsite to try and get them moved. I have emailed and left voicemails for Terry Miller (LM) and Dave Brown (GE) who are facilities managers for the site in an effort to get the dumpsters moved so we can access these locations. In addition, I have spoken with Chris Keller (LM), Mike Musheno (LM), and Glen Harriel (LM) about additional POCs I may contact in regards to trying to assist with temporary dumpster relocation.
2. MRC-MW67A is rusted shut. Holly Brown spoke with a pipe fitter onsite (personal POC) and I am going to try and pry open the lid tomorrow with a small crow bar. Sledge hammer did not work today.
3. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW11A, MRC-MW12A, MRC-MW54A, MRC-MW09A, MRC-MW16A, MRC-MW61S, and MRC-MW122A. It appears that recent onsite construction activities may have destroyed these wells. There is recent new grading in the areas where the above wells are. We dug down in many areas and were able to find other wells but nothing on the list above. MRC-MW23A is just a concrete well pad at that location, no monitoring well, casing, manway, etc. are present.

Impacts to Schedule: None

Planned Activities for 04/04/18: Complete groundwater gauging of site monitoring wells and begin groundwater sampling activities.

Attachments: Gauging tracking table

Daily Report
April 4, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 50's, periods of rain, sustained winds 40 mph with gusts up to 60 mph

Hours Worked on Site: 0700-1915

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: Bulkhead inspected at 0830, 1400, and 1700 on 4/3/18. No sheen present.

Daily Summary:

Site-wide gauging of monitoring wells. Remaining wells to be gauged cannot be located or are under dumpsters. Began groundwater sampling.

The following locations were sampled today:

1. MRC-MW121A
2. MRC-MW121B
3. MRC-MW71B
4. MRC-MW14B
5. MRC-MW48A
6. MRC-MW43A
7. MRC-MW123A

Samples will be submitted to ALS Environmental on 4/5/18 via courier.

Dark Head Cove Outfall009 observed to have no sheen emanating from it at 1100 (high tide) and 1800 (low tide). Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing, stretching, and evening debrief

Issues to be Resolved:

1. MRC-MW93A/B, MRC-MW24A, and MRC-MW94B have dumpsters over them. Holly Brown continuing to work with personnel onsite to try and get them moved. Terry Miller (LM), Dave Brown (GE), Chris Keller (LM), Mike Musheno (LM), and Glen Harriel (LM) have been contacted and an inquiry made in regards to additional POCs that I may contact in regards to trying to assist with temporary dumpster relocation.
2. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, MRC-MW61S, and MRC-MW122A. It appears that recent onsite construction activities may have destroyed these wells. There is recent new grading in the areas where the above wells are. We dug down to 1' bgs within a 16' diameter circle around the GPS location and were not able to locate the locations listed above.
3. MRC-MW11A and MRC-MW23A are destroyed.

Impacts to Schedule: None

Planned Activities for 04/05/18: Complete groundwater gauging of site monitoring wells and continue groundwater sampling activities.

Attachments: Gauging tracking table

Daily Report
April 5, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 40's, winds 15-20 mph

Hours Worked on Site: 0700-1915

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: None

Daily Summary:

Site-wide groundwater sampling. Remaining wells to be gauged cannot be located or are under dumpsters. Holly Brown received a Schonstedt this evening and will be sweeping areas for wells that we could not locate on Friday 4/6 or over the weekend.

The following locations were sampled today:

1. MRC-MW70A
2. MRC-MW70B
3. MRC-MW63A
4. MRC-SWMW-4S
5. MRC-SWMW-4I
6. MRC-MW76B
7. MRC-MW76A
8. MRC-MW60A
9. MRC-MW60B
10. MRC-MW110A
11. MRC-MW110B
12. MRC-MW11B
13. MRC-MW53A
14. MRC-MW53B
15. MRC-MW44A
16. MRC-MW62A
17. MRC-MW62C
18. MRC-MW125A
19. MRC-MW125B

Samples submitted to ALS Environmental on 4/5/18 via courier.

Dark Head Cove Outfall009 observed to have no sheen emanating from it at 12pm (high tide) and 1900 (low tide). Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing, stretching, and evening debrief

Issues to be Resolved:

1. MRC-MW24A has a dumpster over it. Holly Brown continuing to work with personnel onsite to try and get it moved.
2. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MW23A. Holly Brown to investigate remaining of missing wells with a Schonstedt.
3. MRC-MW11A is destroyed.

Impacts to Schedule: None

Planned Activities for 04/05/18: Complete groundwater gauging of site monitoring wells and continue

groundwater sampling activities.

Weather: 40's – 60's

Hours Worked on Site: 0700-2015

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: None

Daily Summary:

Site-wide groundwater sampling.

The following locations were sampled today:

1. MRC-MW106B/C
2. MRC-MW21A
3. MRC-MW21B
4. MRC-MW20A
5. MRC-MW81A
6. MRC-MW81B
7. MRC-MW78B
8. MRC-MW92C
9. MRC-MW126B
10. MRC-MW126A
11. MRC-MW113A
12. MRC-MW103A
13. MRC-MW103B
14. MRC-MW90B
15. MRC-MW120A
16. MRC-MW120B
17. MRC-MW119A
18. MRC-MW119B

Samples submitted to ALS Environmental on 4/6/18 via courier.

Dark Head Cove Outfall009 observed to have no sheen emanating from it at 1245 (high tide) and 2000 (low tide). Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing, stretching, and evening debrief

Issues to be Resolved:

1. MRC-MW24A has a dumpster over it. Holly Brown continuing to work with personnel onsite to try and get it moved.
2. Cannot locate MRC-MW107B/C, MRC-MW09A, and MRC-MW16A. Holly Brown to investigate remaining wells with a Schonstedt this week.
3. Cannot locate EW-1, EW-2, and MRC-MW23A with a Schonstedt. Holly Brown spent many hours digging holes and could not locate these locations (see attached photos).
4. MRC-MW11A is destroyed.

Impacts to Schedule: None

Planned Activities for 04/09/18: Complete groundwater gauging of site monitoring wells and continue groundwater sampling activities.

Daily Report
April 7, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 50's – 60's

Hours Worked on Site: 1700 - 1830

AECOM Personnel on Site:

Holly Brown

Revisions to previous report: None

Daily Summary:

Located and coned off monitoring wells to be sampled Monday morning that are in parking spots or high traffic areas to ensure access.

Safety Activities: Safety briefing and stretching

Issues to be Resolved:

1. MRC-MW24A has a dumpster over it. Holly Brown continuing to work with personnel onsite to try and get it moved.
2. Cannot locate MRC-MW107B/C, MRC-MW09A, and MRC-MW16A. Holly Brown to investigate remaining wells with a Schonstedt this coming week.
3. Cannot locate EW-1, EW-2, and MRC-MW23A with a Schonstedt.
4. MRC-MW11A is destroyed.

Impacts to Schedule: None

Planned Activities for 04/09/18: Complete groundwater gauging of site monitoring wells and continue groundwater sampling activities.

Attachments: Gauging tracking table and photos

Daily Report
April 9, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 30's – 40's

Hours Worked on Site: 0700-1930

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: None

Daily Summary:

Site-wide groundwater sampling.

The following locations were sampled today:

1. MRC-MW87A
2. MRC-MW87B
3. MRC-MW25A
4. MRC-MW95A
5. MRC-MW41A
6. MRC-MW69A
7. MRC-MW69B
8. MRC-MW64A
9. MRC-MW117B
10. MRC-MW114A
11. MRC-MW102A
12. MRC-MW102B
13. MRC-MW101A
14. MRC-MW101B
15. MRC-MW79B
16. MRC-MW12A
17. MRC-MW12B
18. MRC-MW15A
19. MRC-MW22B

Samples submitted to ALS Environmental on 4/9/18 via courier. Sample tracking table to come, QCing the table against submitted laboratory COCs.

Dark Head Cove Outfall009 observed to have no product sheen emanating from it at 0800 (low tide) and 1800 (high tide at 1600 but contractors were doing work along the bulkhead and Holly Brown did not want to interfere). Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing, stretching, and evening debrief

Issues to be Resolved:

1. MRC-MW24A has a dumpster over it. Holly Brown continuing to work with personnel onsite to try and get it moved.
2. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MRC-MW23A with a Schonstedt on 4/6/18. Holly Brown could not locate MRC-MW107B/C, MRC-MW09A, MRC-MW16A today with a Schonstedt on 4/9/18 (see attached photos).
3. MRC-MW11A is destroyed.
4. Installation of tidal gauge(s) prior to SW sampling?
5. MRC-MW119B had <1' of water in it and went dry immediately purging at 100mL/min. Well was left to recharge but field staff were only able to grab 1 vial for VOC analysis before it went dry again. This

well calls for VOCs (2-40mL VOAs), 1,4-Dioxane (2-1L Ambers) and hexavalent chromium (1-250 mL plastic). Should we try and get additional GW from it tomorrow to at least get 2 vials for VOC analysis?
Impacts to Schedule: None
Planned Activities for 04/09/18: Complete groundwater gauging of site monitoring wells and continue groundwater sampling activities.
Attachments: Gauging tracking table and photos

Daily Report
April 12, 2018
Annual Gauging and Groundwater Sampling
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 40's – 70's, high winds in the afternoon, gusts up to 30 mph

Hours Worked on Site: 0630-1815

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: None

Daily Summary:

Site-wide groundwater sampling.

The following locations were sampled today:

1. MRC-MW96A
2. MRC-MW96B
3. MRC-MW104A
4. MRC-MW104B
5. MRC-MW122A (additional sample volume collected from well that ran dry)
6. MRC-MW119A (additional sample volume collected from well that ran dry)
7. MRC-MW73A
8. MRC-MW73B
9. MRC-MW124A
10. MRC-MW124B
11. MRC-MW34A
12. MRC-MW93A
13. MRC-MW07A
14. MRC-SWMW-1I
15. MRC- SWMW-2I
16. MRC- SWMW-3I
17. MRC-MW111A
18. MRC-MW111B
19. MRC-MW98A
20. MRC-MW98B
21. MRC-MW38B
22. MRC-MW02A

Samples submitted to ALS Environmental on 4/12/18 via courier.

Dark Head Cove Outfall009 observed to have no product sheen emanating from it at 1130 (low tide) and 1800 (high tide). Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing, stretching, safety observations/safety conversations/unsafe conditions discussed during evening debrief. In regards to the near miss reported on 4/10/18:

A field staff member noted that she tripped (no fall) over a peristaltic pump cord that was connected from her truck battery to her sampling location over the monitoring well. She took active measures to report the near miss to our local safety rep in the Germantown, MD office and onsite SSHO. Corrective measures were instituted by Holly Brown and a stop work situation was enforced for the entire sampling team. A team wide discussion was had on how to best position the pumps to reduce the potential for trips over equipment cords in addition to optimizing the sampling setup to keep the minimal amount of cords exposed in the active sampling work area (see attached photos).

Issues to be Resolved:

1. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MRC-MW23A with a Schonstedt. These wells will not be gauged or sampled.
2. MRC-MW11A is destroyed. This well will not be gauged or sampled.
3. Installation of staff gauges for Cow Pen Creek and Dark Head Cove.

Impacts to Schedule: None

Planned Activities for 04/13/18: Completion of the groundwater sampling portion of the program. F001 purge groundwater will be generated tomorrow and stored in our hazardous containment area.

Attachments: Industry Safe near miss report, email acknowledgement from Patrick McCullough, photos of sampling setup optimization to reduce slips, trips, and falls.

Hours Worked on Site: 0700-1700

AECOM Personnel on Site:

Holly Brown, Antonio Zarrelli, Adam Dec, Victoria Kirkpatrick, Zachary Neigh

Revisions to previous report: None

Daily Summary:

Completion of site-wide groundwater sampling.

The following locations were sampled today:

1. MRC-MW101A
2. MRC-MW122A
3. MRC-MW74B
4. MRC-SEMW-7I
5. MRC-MW74A
6. MRC-MW74C
7. MRC-MW122A
8. MRC-MW37C
9. MRC-MW72B
10. MRC-MW37B
11. MRC-SEMW-8I
12. MRC-SEMW-9I
13. MRC-SEMW-9S
14. MRC-MW37A
15. MRC-SEMW-8S

Samples submitted to ALS Environmental on 4/13/18 via courier.

Dark Head Cove Outfall009 observed to have no product sheen emanating from it at 0700 (high tide) and 1300 (low tide). Holly Brown will continue to inspect the area daily during both high and low tide.

Safety Activities: Morning safety briefing, stretching, safety observations/safety conversations/unsafe conditions discussed during evening debrief.

Issues to be Resolved:

1. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MRC-MW23A with a Schonstedt. These wells will not be gauged or sampled.
2. MRC-MW11A is destroyed. This well will not be gauged or sampled.
3. Installation of staff gauges for Cow Pen Creek and Dark Head Cove.

Impacts to Schedule: None

Planned Activities for 04/16/18: Begin surface water sampling in Cow Pen Creek and Dark Head Cove

Attachments: Drum tracking table

Daily Report
April 16, 2018
Surface Water Sampling - April 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 40's – 50's, heavy rain

Hours Worked on Site: 1030-1745

AECOM Personnel on Site:

Holly Brown, Zachary Neigh, David Brightbill

Revisions to previous report: None

Daily Summary:

Beginning of surface water sampling program.

The following locations were sampled today:

1. MRC-SW17A
2. MRC-SW1A
3. MRC-SW2A

Samples submitted to ALS Environmental on 4/16/18 via courier.

Dark Head Cove Outfall009 observed to have no product sheen emanating from it at 1515 (low tide). We were not present onsite to observe high tide.

Safety Activities: Morning safety briefing and evening debrief

Issues to be Resolved:

1. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MRC-MW23A with a Schonstedt. These wells will not be gauged or sampled.
2. MRC-MW11A is destroyed. This well will not be gauged or sampled.
3. Installation of staff gauges for Cow Pen Creek and Dark Head Cove.

Impacts to Schedule: None

Planned Activities for 04/17/18: Complete surface water sampling in Dark Head Cove

Attachments: None

Daily Report
April 17, 2018
Surface Water Sampling - April 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 30's – 40's, moderately windy (10-30 mph)

Hours Worked on Site: 0645-1530

AECOM Personnel on Site:

Holly Brown, Zachary Neigh, David Brightbill

Revisions to previous report: Wilson Point Park staff gauge reading of 2.9' upon departure (1530) and 2.8' upon return (1700) on 4/16. Please note that low tide was 1515 on 4/16 but due to the heavy rains overnight and in the morning in the area, the water level was significantly higher than normal during low tide.

Daily Summary:

Continuation of surface water sampling program. Staff gauge at Wilson Point Park boat ramp used to gauge water level. Staff gauge reading of 1.8' upon departure (0830) and 1.4' upon return (1500).

The following locations were sampled today:

1. MRC-SW5A1
2. MRC-SW5A2
3. MRC-SW5B
4. MRC-SW13A
5. MRC-SW15A
6. MRC-SW16A
7. MRC-SW8A
8. MRC-SW8B
9. MRC-SW6A
10. MRC-SW6B
11. MRC-SW9A
12. MRC-SW9B
13. MRC-SW7A
14. MRC-SW7B

Samples submitted to ALS Environmental on 4/17/18 via courier.

Dark Head Cove Outfall009 observed to have no product sheen emanating from it at 0930 (high tide) and 1530 (low tide).

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved:

1. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MRC-MW23A with a Schonstedt. These wells will not be gauged or sampled.
2. MRC-MW11A is destroyed. This well will not be gauged or sampled.
3. Installation of staff gauges for Cow Pen Creek and Dark Head Cove.

Impacts to Schedule: None

Planned Activities for 04/18/18: Equipment rental pickup, unused bottleware and cooler pickup, drum inspections

Annual Gauging, Groundwater Sampling, Surface Water Sampling Monitoring - April 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 50's – 60's

Hours Worked on Site: 1330 – 1530

AECOM Personnel on Site:

Holly Brown

Revisions to previous report: None

Daily Summary:

Completion of sampling program. Drum inspection, empty cooler and bottleware equipment pickup by ALS courier, and rental equipment picked up by Pine. Site demobilization (photos attached of final site appearance).

Safety Activities: Afternoon safety briefing

Issues to be Resolved:

1. Cannot locate EW-1, EW-2, MRC-MW107B/C, MRC-MW09A, MRC-MW16A, and MRC-MW23A with a Schonstedt. These wells will not be gauged or sampled.
2. MRC-MW11A is destroyed. This well will not be gauged or sampled.
3. Installation of staff gauges for Cow Pen Creek and Dark Head Cove.

Impacts to Schedule: N/A, sampling program for April 208 is complete.

Planned Activities for the week of 4/23/18: Drum Inspection

Attachments: Drum Tracking Table, Sample Tracking Table, site photos

Daily Report
June 25, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 80's

Hours Worked on Site: 0730-1730

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, David Brightbill, Matt Ginalick, Antonio Zarrelli, and Victoria Kirkpatrick

Revisions to previous report: None

Daily Summary:

Beginning of the surface water sampling (SWS) program, groundwater sampling (GWS) program, and Monitoring well (MW) repair program.

The following locations were sampled today:

1. MRC-SW5A1
2. MRC-SW5A2
3. MRC-SW5B
4. MRC-SW13A
5. MRC-SW16A
6. MRC-SW15A
7. MRC-SW8A
8. MRC-SW8B
9. MRC-SW6A
10. MRC-SW6B
11. MRC-SW9A
12. MRC-SW9B
13. MRC-SW7A
14. MRC-SW7B
15. MRC-SW1A
16. MRC-SW2A
17. MRC-MW11A
18. MRC-MW16A

The following MW locations were prepped today for new pads (dug out/removed existing pad and manway and installed new manway in pea gravel). Pea gravel was added to ensure proper well drainage as we noted that this was an issue in many of the wells. Manways installed were 9" diameter with 12" skirts.

1. MRC-MW08A
2. MRC-MW106B/C
3. MRC-MW10A
4. MRC-MW111A
5. MRC-MW71A
6. MRC-SEMW-1I

The following locations were repaired today (Sikaflex sealant applied):

1. MRC-MW03A
2. MRC-MW12A
3. MRC-MW50A
4. MRC-MW68A

Samples submitted to ALS Environmental on 6/25/18 via courier.

Safety Activities: Morning safety briefing and afternoon debrief
Issues to be Resolved: None
Impacts to Schedule: None
Planned Activities for 06/26/18: Continuation of GWS, SWS, and MW Repair programs
Attachments: None

Daily Report
June 26, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 80's, Sunny

Hours Worked on Site: 0700-1715

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, David Brightbill, Matt Ginalick, Antonio Zarrelli, and Victoria Kirkpatrick

Revisions to previous report: None

Daily Summary:

Completion of the surface water sampling (SWS) program, completion of the groundwater sampling (GWS) program, and continuation of the Monitoring well (MW) repair program.

The following locations were sampled today:

1. MRC-MW107B/C
2. EW-1
3. EW-2

Please note that purge water from EW-1 and EW-2 were segregated as they are part of the F001 plume. A drum tracking sheet will be provided to the team this week. Purge water from MW107B/C was very turbid and full of debris. It appears that Tetra Tech located the well, put a manway on top of the existing manway and attached a non-flush PVC extension (surface water runoff was observed leaking down into well casing at the PVC joint), and finished the location with a pad (see attached photos).

The following MW location pads were completed today:

1. MRC-MW08A
2. MRC-MW106B/C
3. MRC-MW10A
4. MRC-MW111A
5. MRC-MW71A
6. MRC-SEMW-1I

Please note that we built pad frames out of 2x4s for the above list, used high strength Sakrete, and finished the surface completion with an edged, broom finish (see attached photo of an example).

Samples submitted to ALS Environmental on 6/26/18 via courier.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved: None

Impacts to Schedule: None

Planned Activities for 06/267/18: Continuation of MW Repair program

Attachments: Photos

Daily Report
June 27, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 80's, Cloudy, intermittent heavy rain all day

Hours Worked on Site: 0700-1730

Personnel on Site (All AECOM):

Holly Brown and Zachary Neigh

Revisions to previous report: None

Daily Summary:

Continuation of the Monitoring well (MW) repair program. Redevelopment was conducted with a mega whale pump and a 2" or 4" custom designed surge block connected to PVC. MWs were surged with both the whale pump and the surge block along the entire length of the screen.

Redevelopment was initiated or completed today on the following locations:

1. MRC-MW72B - Redevelopment complete; approximately 50 gallons of sediment laden purge water removed. Very hard well bottom and GW was purging clear at the end of development. Initial measured DTB = 33.64 ft. from TOC, final DTB = 34 ft. from TOC. Tetra Tech (TT) total depth (TD) is listed as 35' but I am certain that this is an error and the actual installed depth is 34' given the conditions measured after development (clear water and very hard bottom). Please note that purge water from MRC-MW72B was segregated as hazardous F001 waste. Purge water was very turbid.
2. MRC-MW70A - Redevelopment initiated; approximately 40 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured DTB = 9.35 ft. from TOC, TT TD = 14.0'. Extremely thick silt and clay (see attached photo) accumulation present at the bottom of the well and numerous silt bridges present in the screened interval. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was extremely turbid.
3. MRC-MW70B - Redevelopment initiated; approximately 40 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured DTB = 27.32 ft. from TOC, TT TD = 30.0'. Extremely thick silt and clay accumulation present at the bottom of the well and numerous silt bridges present in the screened interval. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was extremely turbid.

A drum tracking sheet will be provided to the team this week.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved: None

Impacts to Schedule: None

Planned Activities for 06/28/18: Continuation of MW Repair program

Daily Report
June 28, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 90's, Sunny

Hours Worked on Site: 0700-1730

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, Matt Ginalick, and Antonio Zarrelli

Revisions to previous report: Revision to daily report from 6/26/18. All drums (9 total) from the April sampling event were removed from the site via Clean Harbors. Manifests were signed by Mike Musheno. I will provide the team with copies once I am back in the office and have access to a scanner.

Daily Summary:

Continuation of the Monitoring well (MW) repair program. Redevelopment was conducted with a mega whale pump and a 2" or 4" custom designed surge block connected to PVC. MWs were surged with both the whale pump and the surge block along the entire length of the screen.

Redevelopment was initiated, continued, or completed today on the following locations:

1. MRC-MW70A - Redevelopment continued; approximately 30 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured depth to bottom (DTB) = 9.35 ft. from TOC, TT TD = 14.0'. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was turbid. Measured DTB at the end of the day = 12.86'
2. MRC-MW70B - Redevelopment continued; approximately 55 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt and clay. Initial measured DTB = 27.32 ft. from TOC, TT TD = 30.0'. Redevelopment will be continued on this location tomorrow, well ran dry once. See attached photo of purge water. Measured DTB at the end of the day = 29.86'.
3. MRC-MW73A - Redevelopment initiated and completed; approximately 20 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 15.46 ft. from TOC, TT TD = 17.0'. Measured DTB at the end of the day = 15.98', hard bottom. Fairly certain that total well depth is 16.0', not 17.0' as the bottom was very hard. Well ran dry twice.
4. MRC-MW12A - Redevelopment initiated (see attached photo); approximately 20 gallons of sediment laden purge water removed. Soft well bottom, probe and whale pump coated in thick silt. Initial measured depth to bottom (DTB) = 12.86 ft. from TOC, TT TD = 14.0'. Redevelopment will be continued on this location tomorrow, well ran dry twice. Purge water was turbid. Measured DTB at the end of the day = 12.96'
5. MRC-MW91A - Redevelopment initiated; approximately 6 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 17.66 ft. from TOC, TT TD = 20.0'. Measured DTB at the end of the day = 18.0', semi-hard bottom. Redevelopment will be continued on this location tomorrow, well ran dry twice.
6. MRC-MW86A - Redevelopment initiated; approximately 18 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 12.61 ft. from TOC, TT TD = 16.0'. Measured DTB at the end of the day = 12.8', hard bottom. Redevelopment will be continued on this location tomorrow, well ran dry twice.
7. MRC-MW87A - Redevelopment initiated; approximately 3 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 14.26 ft. from TOC, TT TD = 16.0'. Measured DTB at the end of the day = 14.34', soft bottom. Redevelopment will be continued on this location tomorrow, well ran dry twice.
8. MRC-MW77A - Redevelopment initiated and completed; approximately 20 gallons of sediment laden purge water removed. Initial measured depth to bottom (DTB) = 15.64 ft. from TOC, TT TD = 17.0'. Measured DTB at the end of the day = 15.90', hard bottom. Fairly certain that total well depth is

16.0', not 17.0' as the bottom was very hard. Well ran dry once.

9. MRC-NMW-1I - Redevelopment initiated (see attached photos); approximately 25 gallons of sediment laden purge water removed before a call was placed to Holly, informing her that it did not seem like this was a typical MW. Upon inspection, this appears to be an injection well. Redevelopment was stopped at this time.

The following MW locations were prepped today for new pads (dug out/removed existing pad and manway, new manway installed, pea gravel added). Pea gravel was added to ensure proper well drainage as we noted that this was an issue in many of the wells. All of the existing manways removed were cemented in place for with concrete aggregate which would be why they were holding SW runoff (see attached photo). Manways installed were 9" diameter with 12" skirts.

1. MRC-MW30A
2. MRC-MW42A
3. MRC-MW71B

A drum tracking sheet will be provided to the team this week.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved: MRC-NMW-1I appears to be an active injection well (see attached photos). It has dedicated tubing plumbed into the side of the well casing and white material (baking soda like consistency) is present inside of the well. Please confirm that this is an active injection well and should not be considered a monitoring well or part of GW monitoring program. This well was not redeveloped.

Impacts to Schedule: None

Planned Activities for 06/29/18: Continuation of MW Repair program

Attachments: Photos

Daily Report
June 29, 2018
Surface Water Sampling, Monitoring Well Repairs, and Groundwater Sampling - June 2018 Event
Lockheed Martin Corporation – Middle River Complex, Middle River, MD

Weather: 90's, Sunny

Hours Worked on Site: 0700-1700

Personnel on Site (All AECOM):

Holly Brown, Zachary Neigh, Matt Ginalick, Victoria Kirkpatrick, and Antonio Zarrelli

Revisions to previous report: None

Daily Summary:

Completion of the Monitoring well (MW) repair program. Redevelopment was conducted with a mega whale pump and a 2" or 4" custom designed surge block connected to PVC. MWs were surged with both the whale pump and the surge block along the entire length of the screen.

Redevelopment was initiated, continued, and/or completed today on the following locations:

1. MRC-MW70A
2. MRC-MW70B
3. MRC-MW12A
4. MRC-MW30A
5. MRC-MW68A
6. MRC-MW93B
7. MRC-MW54A
8. MRC-MW91A
9. MRC-MW87A
10. MRC-MW86A
11. MRC-MW103A

The following MW location pads were completed today:

1. MRC-MW30A
2. MRC-MW42A
3. MRC-MW71B

Please note that we built pad frames (2' x 2') for the above list, used high strength Sakrete, and finished the surface completion with an edged, broom finish.

All other well repairs (bolts, washers, and O-rings) were made today. Upon closer inspection, MRC-MW15A, MRC-MW26A, and MRC-SWMW-1I did not have cracked lids, flush mount covers were not replaced. MRC-SEMW-3I had a flush mount cover right next to the well so we secured it in place to the manway with new bolts.

Safety Activities: Morning safety briefing and afternoon debrief

Issues to be Resolved:

1. MRC-NMW-1I appears to be an active injection well. It has dedicated tubing plumbed into the side of the well casing and white material (baking soda like consistency) is present inside of the well. Please confirm that this is an active injection well and should not be considered a monitoring well or part of

GW monitoring program. This well was not redeveloped.

2. There are 2 locations (MRC-MW29A and MRC-MW53B) where flush mount lids could not be replaced. Due to there being multiple types of manways onsite, the manufacturers of the lids needed for these two locations did not just sell lid replacements. We could purchase manways for these locations but, upon further inspection, it appears that the entire manway on these locations are partially rusted and/or cemented in and may require complete pad and manway replacement in 2019, pending LMC approval. Overall, the compression well caps and inner well casing appear to be in good condition for these locations.

LMC MRC Drum Tracking Table
Aprl 2018 GWS Event

Drum ID	Contents	Label Type	Sampled	Accumulation Date	Weekly Inspection	Condition	Contents

Sample Collection Information

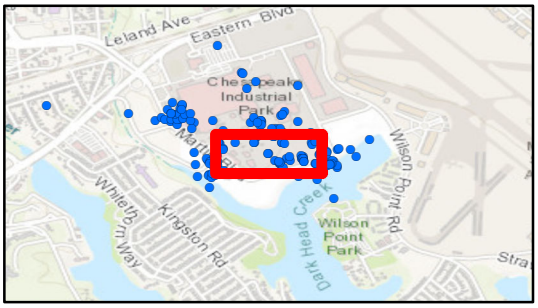
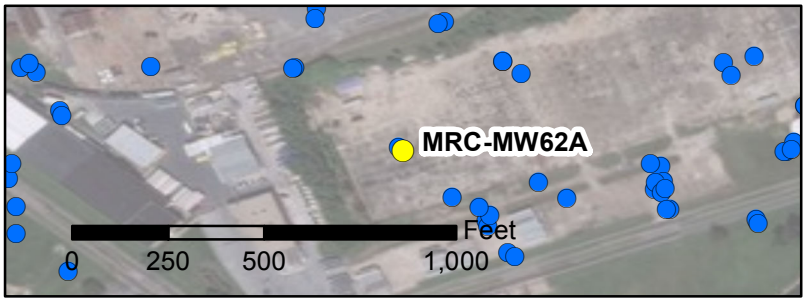
Fe @ 5.5 mg/L





Project Name: Lockheed Martin Corporation – Middle River Complex
Project Number: 60555202

Sample Location/ID: MRC-MW70B
Screen Interval: 20'-30'
Sampled By: adam.dec@aecom.com

Sampling Data

Date: 4/5/2018
Pump Method: Peristaltic

Sampled for

VOCs: Yes
1,4-Dioxane: Yes
Total Metals: No
Hexachromium: No
PCBs: No
MEE/MNA: No

Sample Collection Information

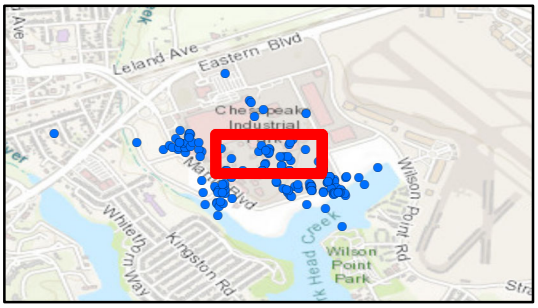
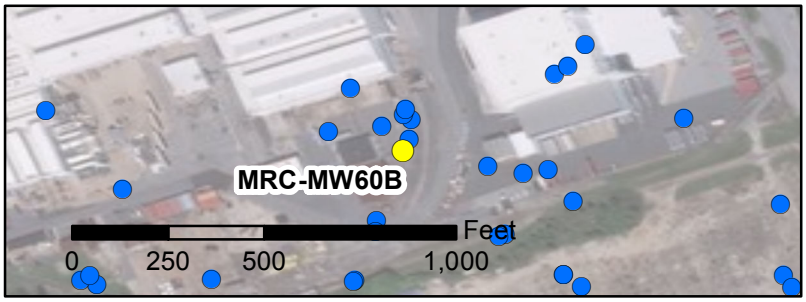
Iron precipitate formed in peristaltic tubing while pump was turned off for 60 seconds to adjust Horiba meter. Precipitate was seen in flow through cell, with visible turbidity higher than that in the tubing. Horiba cell was cleaned at 1707





Project Name: Lockheed Martin Corporation – Middle River Complex

Sample Collection Information

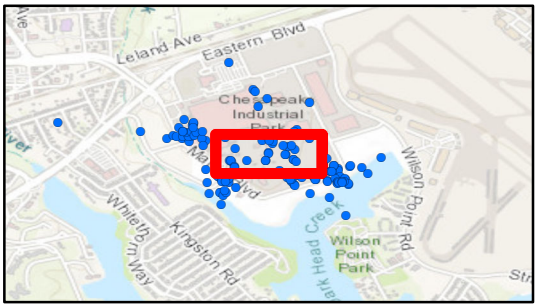
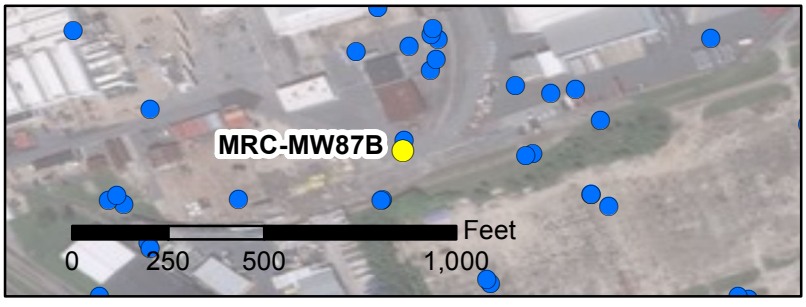
Removed TT peri tubing to use bladder pump. 1039, bladder water tubing blew out in well, rework





Project Name: Lockheed Martin Corporation – Middle River Complex
Project Number: 60555202

Sample Location/ID: MRC-MW69B
Screen Interval: 25'-40'
Sampled By: antonio.zarrelli@aecom.com

Sampling Data

Date: 4/9/2018
Pump Method: Bladder

Sampled for

VOCs: Yes
1,4-Dioxane: Yes
Total Metals: No
Hexachromium: No
PCBs: No
MEE/MNA: No

Project Number: 60555202

Sample Location/ID: MRC-MW64A
Screen Interval: 6'-16'
Sampled By: antonio.zarrelli@aecom.com

Sampling Data

Date: 4/9/2018
Pump Method: Peristaltic

Sampled for

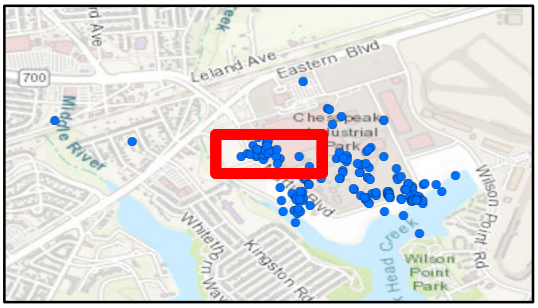
VOCs: Yes
1,4-Dioxane: No
Total Metals: No
Hexachromium: No
PCBs: No
MEE/MNA: No

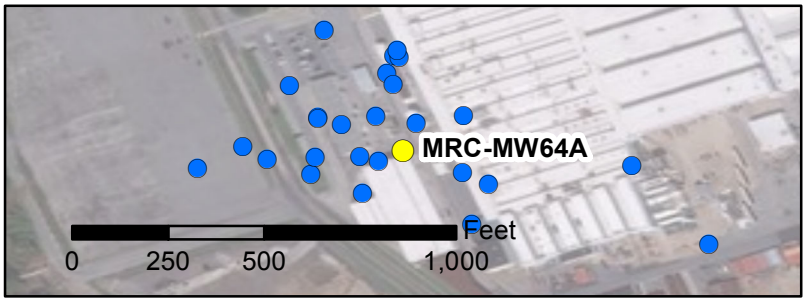
Purge Data

Time	DTW (ft. below TOC)	Purge Rate (mL/min)	V (gallons)	T (Celsius)	pH	Specific Conductivity (mS/cm)	Turbidity (NTUs)	DO (mg/L)	ORP (mV)	Salinity (ppt)
16:05	7.23	100	0.13	11.69	6.37	4.11	14.5	2.16	-104	
16:10	7.46	150	0.26	11.65	6.43	4.14	5.8	0	-117	
16:15	7.63	150	0.5	11.63	6.43	4.15	3.9	0	-120	
16:20	7.81	150	0.76	11.61	6.44	4.15	2.7	0	-123	

Sample Collection Information

Water parameters stabilized. Total drawdown 0.58'. Sample depth 12'.





Project Name: Lockheed Martin Corporation – Middle River Complex
Project Number: 60555202

Sample Location/ID: MRC-MW79B
Screen Interval: 27'-37'
Sampled By: victoria.kirkpatrick@aecom.com,holly.brown@aecom.com

Sampling Data

Date: 4/9/2018
Pump Method: Bladder

Sampled for

VOCs: Yes
1,4-Dioxane: Yes
Total Metals: No
Hexachromium: No
PCBs: No
MEE/MNA: No

Purge Data

Sample Collection Information

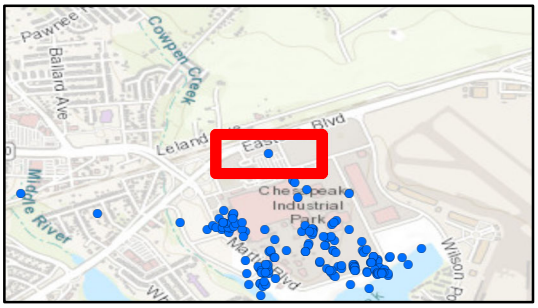
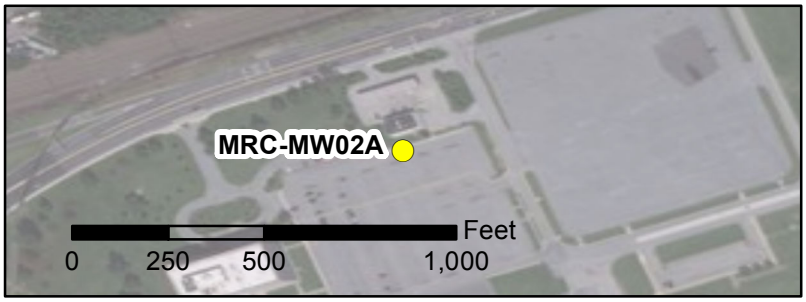
TT tubing fell down well approx 8', due to insufficient length. It was recovered and replaced.





Project Name: Lockheed Martin Corporation – Middle River Complex
Project Number: 60555202

Sample Location/ID: MRC-MW104A
Screen Interval: 5'-15'
Sampled By: antonio.zarrelli@aecom.com

Sampling Data

Date: 4/12/2018
Pump Method: Peristaltic

Sampled for

VOCs: Yes
1,4-Dioxane: No
Total Metals: No
Hexachromium: No
PCBs: No
MEE/MNA: No

Waste Identifcation and Classification Form

Remediation Project	MRC Groundwater Sampling Event	**State Generated**	MD
Description of Waste			
Generic Name	Purge water	**Solid, Liquid, Gas**	Liquid
		Additional Info.	
Date of Waste Generation	4/13/2018-6/26/18	**Ongoing (Y/N)?**	N

Description of Process Generating Waste

1 drum of hazardous purge water generated as part of the MRC Groundwater Sampling Event from Block E wells.

Listed Waste ? (Y/N)	Y	**F,K, P or U Codes**	F001

Justification for Waste Classification (attached supporting documentation)

Waste characterization sample not collected and profiled as hazardous based on location of wells in Block E from known TCE-contaminated area. Drum removed from the site June 26, 2018.

Form completed by	Aimee Schuppin
Date	6/26/2018

Waste Identifcation and Classification Form

Remediation Project	MRC Groundwater Sampling Event	**State Generated**	MD
Description of Waste			
Generic Name	Purge water	**Solid, Liquid, Gas**	Liquid
		Additional Info.	
Date of Waste Generation	4/4/2018-6/26/18	**Ongoing (Y/N)?**	N

Description of Process Generating Waste

8 drums of nonhazardous purge water generated as part of the MRC Groundwater Sampling Event.

Listed Waste ? (Y/N)	N	**F,K, P or U Codes**	NA

Justification for Waste Classification (attached supporting documentation)

Waste characterization samples collected and drums profiled as nonhazardous based on sample analysis. Drums removed from the site June 26, 2018.

Form completed by	Aimee Schuppin
Date	6/26/2018

WASTE MATERIAL PROFILE SHEET

DOES THIS WASTE CONTAIN ANY HEAVY GAUGE METAL DEBRIS OR OTHER LARGE OBJECTS (EX., METAL PLATE OR PIPING >1/4" THICK OR >12" LONG, METAL REINFORCED HOSE >12" LONG, METAL WIRE >12" LONG, METAL VALVES, PIPE FITTINGS, CONCRETE REINFORCING BAR OR PIECES OF CONCRETE >3")? YES NO

If yes, describe, including dimensions:

DOES THIS WASTE CONTAIN ANY METALS IN POWDERED OR OTHER FINELY DIVIDED FORM? YES [x] NO

DOES THIS WASTE CONTAIN OR HAS IT CONTACTED ANY OF THE FOLLOWING; ANIMAL WASTES, HUMAN BLOOD, BLOOD PRODUCTS, BODY FLUIDS, MICROBIOLOGICAL WASTE, PATHOLOGICAL WASTE, HUMAN OR ANIMAL DERIVED SERUMS OR PROTEINS OR ANY OTHER POTENTIALLY INFECTIOUS MATERIAL? YES [x] NO

I acknowledge that this waste material is neither infectious nor does it contain any organism known to be a threat to human health. This certification is based on my knowledge of the material. Select the answer below that applies:

The waste was never exposed to potentially infectious material. YES NO

Chemical disinfection or some other form of sterilization has been applied to the waste. YES NO

I ACKNOWLEDGE THAT THIS PROFILE MEETS THE CLEAN HARBORS BATTERY PACKAGING REQUIREMENTS. YES NO

I ACKNOWLEDGE THAT MY FRIABLE ASBESTOS WASTE IS DOUBLE BAGGED AND WETTED. YES NO

SPECIFY THE SOURCE CODE ASSOCIATED WITH THE WASTE. ***G44*** SPECIFY THE FORM CODE ASSOCIATED WITH THE WASTE. ***W113***

E. CONSTITUENTS

Are these values based on testing or knowledge? ☑ Knowledge ☐ Testing

If based on knowledge, please describe in detail, the rationale applied to identify and characterize the waste material. Please include reference to Material Safety Data Sheets (MSDS) when applicable. Include the chemical or trade-name represented by the MSDS, and or detailed process or operating procedures which generate the waste.

Prior knowledge

Please indicate which constituents below apply. Concentrations must be entered when applicable to assist in accurate review and expedited approval of your waste profile. Please note that the total regulated metals and other constituents sections require answers.

Lockheed Martin Hazardous Material/Waste Shipment Checklist 1 drum F001 GW

Date: 6-26-18
Project Site Name: LMC MRC
Shipping Document No.: 0095142 63 FLE

A. DESCRIPTION

A1. ✓ UN/NA Identification Number, Proper Shipping Name, Hazard Class/Division Number, Packing Group
A2. ✓ Subsidiary hazard class(es) or division number(s), if any, in parenthesis
A3. ✓ Total Quantity of Material
A4. ✓ 24-Hour Emergency Phone Number and Response Information ERG No.: Chris Yellers 301-528-3021
A5. ✓ Page of Pages, *for multiple shipping papers/EPA Manifest/Air Decs.*
A6. ✓ Shipper's Certification, *as applicable*
A7. N/A Small Quantity Exception/Dangerous Goods In Excepted Quantities/Diagnostic Specimen/Sample

B. ADDITIONAL DESCRIPTIONS - GENERAL

B1. N/A Exemptions "DOT-E-*ex.#*"
B2. N/A "Limited Quantity" (*not to exceed 66 lb gross weight*)
B3. N/A "X" or "RQ" (if RQ, Hazardous Substance Contact @ 1-800-424-8802)
B4. ✓ "Waste" for RCRA regulated material
B5. N/A "Mixture" or "Solution" - as appropriate.
B6. ✓ *(technical names), for poisons/mixtures/n.o.s./generic proper shipping names*
B7. N/A "Marine Pollutant" and constituent in ( ), *for bulk shipments only*
B8. ✓ *(hazardous substance names) per 172.101 appendix if not contained in proper shipping name*
B9. ✓ *(EPA waste identification numbers)- used to identify the hazardous substance*
B10. N/A "Poison" - *if not identified in proper shipping name or hazard class*
B11. N/A "Poison-Inhalation Hazard" & Zone A, Zone B, Zone C, or Zone D, as appropriate*
(**Note Special Provisions 1-6 and 13 in Column 7 of 172.101)*

C. MARKING FOR NON-BULK PACKAGINGS

C1. ✓ Proper Shipping Name, UN/NA Identification Number
C2. ✓ *(technical name)*
C3. ✓ *(EPA waste identification number)*
C4. N/A "RQ"
C5. N/A Exemption Packagings "DOT-E-*ex.#*"
C6. ✓ Consignee's Name & Address
C7. ✓ Net or Gross quantity for non-rad Dangerous Goods (adjacent to PSN & UN#)
C8. ✓ Ltd. Qty - PSN only *per 172.301(a)(1) or* UN ID# placed in square-on-point border *per 172.315*
C9. ✓ Package Orientation Arrows, *for liquids in inner packagings*
C10. ✓ "Inhalation Hazard", unless these words appear on the label prescribed in *172.416* or *172.429*
C11. N/A "Overpack" adjacent to proper shipping name marking [*see 173.25(a)(4)*]
C12. N/A TSCA PCB Marking (*for actual or source concentration greater than or equal to 50 ppm* *)
(* Note Potential Vehicle Marking Requirements in *40 CFR 761.40*)

D. MARKING FOR BULK PACKAGINGS (DUMP TRUCKS OR ROLL-OFFS)

D1. N/A UN/NA Identification Number on orange panel or placard or white square-on-point display configuration as prescribed by 172.302 and 172.332

E. LABELING

E1. ✓ Primary Hazard Label(s): NA 1710, Toxic Liquid (waste-TCE) 6.1 PG III (F001)
E2. N/A Subsidiary Hazard Label(s) with class/division: _____
E3. ✓ Hazardous Wastes Label(s) EPA ID # MDR000524413

F. PLACARDING

F1. 172.504 Table 1 Materials - Any Amount
F1.1. N/A Dangerous When Wet (4.3)
F1.2. N/A Poison (6.1, Inhalation Hazard, Zone A or B)* (Primary or Subsidiary _____
*(*Materials subject to the "Poison-Inhalation Hazard" notation must be placarded with a POISON INHALATION HAZARD or POISON GAS placard , as appropriate, and also placarded for any other hazard class required for that material in 172.504)*
F1.3. N/A Radioactive (7, LSA/SCO Exclusive Use Shipments)

F2. 172.504 Table 2 Materials - 1,001 lb:

Lockheed Martin Hazardous Material/Waste Shipment Checklist

G. PACKAGING

155 gal drum

G1. N/A Container Type: (Inner Pkg)
G2. ✓ Container Type: (Outer Pkg)
G3. ✓ Container Type: (Bulk Pkg)
G4. ✓ Loaded and Closed As Required

H. PAPERWORK AND MISCELLANEOUS ITEMS

H1. ✓ Shipping Paper/Hazardous Waste Manifest/Bill of Lading/Airway Bill/Shipper's Declaration
H2. N/A Instructions for Maintenance of Exclusive Use Shipments
H3. N/A Small Quantity/Excepted Quantity Statement on Package, *for 173.4 shipments* / **DGEQ** statement per *2.7.7.2* noted on Airway Bill
H4. ✓ Photograph, *if applicable*
H5. ✓ Vehicle Inspection
H6. ✓ Check Driver's Qualifications
H7. ✓ Emergency Telephone Number Notification, if required, see 172.604(b)
H8. ✓ LMC Notification Instructions

I. ADDITIONAL REQUREMENTS FOR RADIOACTIVE MATERIAL SHIPMENTS

I1. SHIPPING PAPER DESCRIPTIONS
- I1.1. N/A Radionuclide Symbol(s), *per 173.435*
- I1.2. ___ Physical & Chemical Form, *if not special form*
- I1.3. ___ Activity per Package
- I1.4 ___ Radioactive Labels
- I1.5. ___ Fissile Excepted, *if applicable*
- I1.6. ___ "Exclusive Use Shipment"

I2. MARKING FOR NON-BULK PACKAGINGS
- I2.1. ___ Gross Weight, *for radioactive material packages in excess of 110 lb*
- I2.2. ___ "Radioactive"; "Radioactive – LSA" ; "Radioactive – SCO"
- I2.3. ___ Package Certification Number, *for radioactive material packages, as appropriate*
- I2.4. ___ IP-1, IP-2, IP-3 markings
- I2.5. ___ "USA" on all IP and Type A packagings
- I2.6. ___ Packaging manufacturer marking on Type A

I3. LABELING
- I3.1. ___ Radioactive Labels
- I3.2. ___ "EMPTY" Label
- I3.3. ___ "Radioactive Material, Excepted Package" handling label

I4. PLACARDING (172.504 TABLE 1 MATERIALS - ANY AMOUNT)
- I4.1. ___ Radioactive (7, LSA/SCO Exclusive Use Shipments)

I5. PAPERWORK AND MISCELLANEOUS ITEMS
- H1. ___ Instructions for Maintenance of Exclusive Use Shipments
- H2. ___ Radioactive Excepted Package statement per *10.8.8.3.3* on Airway Bill
- H3. ___ Limited Quantity Radioactive Material *for multiple hazard limited quantity Class 7.*
- H4. ___ Health Physics Information
- H5. ✓ NRC Manifest #540 for radioactive waste shipment for land disposal.

Completed By:	**Company:**	**Date:**

Residual Waste Transportation and Disposal Contingency Plan
Lockheed Martin Middle River Complex
2323 Eastern Boulevard
Middle River, Maryland

Rejected Loads at Disposal Facility

If waste is rejected at the Lockheed Martin approved disposal facility, the following shall occur:

1. ***Immediately*** after being informed of a rejected load, the transporter (driver) ***must*** establish ***verbal contact*** with one of the below AECOM personnel ***prior*** to any further transport of the load.
   - Deputy Project Manager (DPM) Holly Brown at 301-674-3199
   - Residual Waste Coordinator (RWC) Aimee Schuppin at 434-444-0383

If Holly or Aimee are unavailable, contact:

- Project Manager (PM) Ravi Damera at 301-289-3809

After establishing verbal contact and further instruction from one of the above AECOM personnel, ***at minimum*** the following actions shall be implemented by the driver ***prior*** to leaving the disposal facility:

1. Document in Section 15 of the issued waste manifest the disposal facility's *reason* for load rejection (e.g. flash exceedance, documentation issues, facility-at-capacity, facility maintenance etc.)
2. Fill out any other required disposal facility paperwork and obtain copies
3. Ensure that existing container(s) labels and truck placards continue to be applicable to the load. Re-label and/or re-placard as appropriate.
4. Inspect load and truck (tie-downs, tires etc.)
5. After receiving transport approval from the RWC, DPM, or PM, transport the load back to the Site. Upon arrival, check-in with the AECOM DPM and submit paperwork. Place the load in an area designated by the AECOM DPM.

NOTE: After implementing the above and after *any* load is rejected by the disposal facility for *any* reason, *all* T&D operations will be immediately suspended. T&D operations will resume only *after* AECOM Residual Waste Coordinator or Project Manager approval.

Transporter Facility - Temporary Storage

If the load cannot be returned to the Site for any of the following reasons: exceedance of allowable driving hours, the Site operations closed for the day, or ***ANY*** other reason with respect to Health and Safety the following shall occur:

1. Establish ***verbal*** contact with the AECOM DPM, RWC, or PM for instruction ***prior*** to any further transport of the load
2. Only after verbal approval from AECOM DPM, RWC, or PM or, transport the load to the *Transporters Facility* for temporary storage.

Upon arrival to Transporter Facility:

1. Photograph container(s) and document load storage (e.g. on/off truck, indoors/outdoors, facility security etc.)

2. Submit all available documentation by email to AECOM DPM, RWC, or PM Transportation and Disposal – Unsafe Transportation Conditions

If unfavorable weather conditions or any other conditions exist that do not allow for the safe transport of the load during any and all phases of transportation and disposal, the following shall occur:

1. Go to a safe area (e.g. rest/truck stop) and contact AECOM DPM, RWC, or PM or for further instruction
2. If conditions improve for safe transport, contact AECOM DPM, RWC, or PM or and communicate intended designation.
3. If conditions worsen, ensure container is sealed, covered, appropriately labeled, and in good condition
   - Photograph container(s) and submit to AECOM DPM, RWC, or PM

I. Executive Summary

Data validation was performed on 100% of the groundwater and surface water field investigative samples collected from April 4th, 2018 through April 30th, 2018 at the Lockheed Martin Middle River Complex located in Middle River, Maryland. The validation was performed to a United States Environmental Protection Agency (USEPA) Region III Inorganic Level I and Organic Level I based on the specifics of the analytical methods referenced and qualified according to the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic/Inorganic (January 2017) Superfund Data Review, with the exception of blank detections which were qualified according to the USEPA Region III modifications to the National Functional Guidelines defining the use of the "B" flag.

The review was assisted through the use of an electronic data management tool that compiles batch-level quality control (QC) data submitted with the laboratory deliverables and identifies anomalies for verification and qualification by the data reviewer. This information is provided in the form of a structured workbook that includes field sample analytical results, QC sample results, batch associations, and QC criteria. Prior to validation, the quality assurance procedures applied to this process include reviewing the output for data completeness based on laboratory deliverables and chain of custody reports, verification of QC criteria based on the aforementioned data validation guidelines and project-specific Quality Assurance Project Plan (QAPP), as well as strict control of data management permissions. The resulting data validation workbooks were evaluated and validated using the AECOM automated validation assistant (AVA) tool. The specific data elements that were reviewed include:

- Holding times and sample preservation
- Blanks (Method, Trip, Field, and Equipment)
- Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- Surrogate spike results
- Field duplicates
- Laboratory duplicates
- Sensitivity

Data validation qualifiers were applied to results where a QC nonconformance required qualification per USEPA guidance. All QC anomalies were assessed for their impact on data quality in regards to precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS) as discussed in **II: PARCCS Data Quality**. A detailed list of the QC non-conformances can be found in **III: Data Validation Findings**. The associated field sample results that required qualification are listed in **IV: Qualified Field Sample Results**

II. PARCCS Data Quality

Precision

Precision is the degree of agreement among repeated measurements of the same characteristic on the same sample or on separate samples collected as close as possible in time and place. Field sampling precision is measured with the field duplicate relative percent differences; laboratory precision is measured with laboratory duplicate relative percent differences and/or laboratory control spike and matrix spike duplicate relative percent differences.

During the review, several matrix spike pairs displayed relative percent differences greater than the quality control limits. However, all associated field sample results were either non-detect or previously qualified due to matrix spike percent recovery anomalies; no data qualifying action was taken.

A limited number of field duplicate pairs displayed relative percent differences greater than the quality control limit of 35%. The positive associated field sample results and field duplicate results were qualified J,fd. These anomalies are considered minor and the qualified results should be considered usable as estimated values.

Accuracy

Accuracy is a measure of confidence in a measurement. The smaller the difference between the measurement of a parameter and its "true" or expected value, the more accurate the measurement. Accuracy in the field was monitored through the use of negative controls such as trip blanks, field blanks, and equipment blanks, along with adherence to the standard operating procedures and sampling plans. Analytical accuracy was assessed through the measurement of percent recoveries in the laboratory control spike pairs (LCS/LCSD) and the matrix spike pairs (MS/MSD).

Several method blanks, trip blanks, equipment blanks, and field blanks displayed detections greater than the method detection limit. Per the USEPA Region III guidelines on the qualification of blank detections, associated field sample results that displayed concentrations within five times of the blank detection were qualified “B”. The qualified field sample results should be considered usable as estimated values.

During the review, several MS/MSD displayed percent recoveries outside the quality control limits. The field sample results associated with positive biases were non-detect and did not require data qualifying action. The positive field sample results associated with negative biases were qualified J-,m. Non-detect results associated with percent recoveries less than the lower control limit, but greater than 20%, were qualified UJ,m. All qualified data should be considered usable as estimated values.

Several LCS/LCSD displayed percent recoveries outside the quality control limits. The field sample results associated with positive biases were non-detect and did not require data qualifying

action. The field sample results associated with negative biases were non-detect and were qualified UJ,l. These anomalies are considered minor since all percent recoveries less than the lower QC limits were greater than 10%. The qualified field sample results should be considered usable.

Representativeness

Representativeness qualitatively expresses the degree to which data accurately reflect site conditions. Factors that affect the representativeness of analytical data include appropriate sample population definitions, proper sample collection and preservation techniques, analytical holding times, use of standard analytical methods, and determination of matrix or analyte interferences.

A limited number of analyses and/or extractions were performed outside of the technical holding time but did not exceed twice the holding time (at which point non-detect sample results would have been rejected). These anomalies were considered minor, and the associated non-detect field sample results were qualified UJ,h while positive results were qualified J,h. These anomalies are considered minor and the qualified field sample results should be considered usable as estimated values.

Comparability

Comparability is the extent to which data from one study can be compared directly to either past data from the current project or data from another study. Using standardized sampling and analytical methods, units of reporting, and site selection procedures helps ensure comparability. Standard field sampling methods and current CLP analytical methods by an accredited laboratory were used in this investigation.

Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount of data expected under normal conditions. It is expected that laboratories will provide data meeting system quality control acceptance criteria for all samples tested. Project completeness is determined by evaluating the planned versus actual quantities of usable data. A total of 151 investigative field samples were validated, including 133 groundwater samples and 18 surface water samples. Additionally 14 field/equipment blanks and 2 investigation derived waste (IDW) samples were validated. Due to rejected data points associated with major anomalies, the overall data completeness was less than 100% at 99%.

Sensitivity

Sensitivity reflects the ability of the analytical method to detect analytes of interest below the level of concern. This goal is achieved by identifying the level of concern, choosing a method with appropriate method detection limits, and ensuring that the laboratory analyzes calibration

standards at or below the level of concern. The laboratory was able to achieve the lowest reporting limits based on the analytical methods employed and the variety of matrices encountered. Any analytes detected below the reporting limit and above the method detection limit were reported and qualified “J” as estimated values by the laboratory. The only field sample that displayed non-detect results at an elevated dilution factor (greater than 10 times) was MRC-MW27A, analyzed for Nitrite Nitrogen at a dilution factor of 25. This field sample result did not require qualification by the data reviewer and should be considered usable as reported.

Overall Impact on Data Usability

The bulk of the data was considered usable and met the completeness requirement outlined in the QAPP. During the course of the data validation, several minor anomalies were noted which is to be anticipated based on statistical predictability of standard analytical procedures. Several field sample results were qualified due to these minor anomalies. No major anomalies were identified over the course of data validation; therefore no field sample results were qualified as rejected. All data are considered usable, as qualified, for their intended purpose based on the data reviewed.

III. Data Validation Findings

Volatile Organic Compounds SW846-8260B	Description	Sample ID	Analyte	Value (Control Limit)
Holding Times	*No Anomalies*			
Method Blanks	**Detection > MDL**	2720310	Hexachloro-1,3-Butadiene	1.1 ug/l (1.0 ug/l)

Appendix A
Data Validation Qualifiers and Reason Codes

Data Qualifying Codes

Two types of data qualifying codes or flags are applied in the course of the data review. The data validation flags indicate data that are not usable for decision-making, more than normally biased and/or variable, or not representative of field conditions. These codes and their definitions are presented below in the hierarchy stipulated in the USEPA Contract Laboratory Program National Functional Guidelines for Organic (August 2014) Data Review and the USEPA Region III Guidelines for Organic (September 1994) for blank qualifications only.

Data Validation Flags

Flag	Interpretation
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
B	The analyte was analyzed for, but not detected at a level greater than or equal to the level of the adjusted Detection Limit (DL) for sample and method.
J+	Reported value may not be accurate or precise, but the result may be biased high.
J-	Reported value may not be accurate or precise, but the result may be biased low.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the Limit of Detection (LOD).
NJ	The analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration.
UJ	The analyte was not detected at a level greater than or equal to the adjusted DL. However, the reported adjusted DL is approximate and may be inaccurate or imprecise.
C	This qualifier applies to pesticide and Aroclor results when the identification has been confirmed by gas Chromatograph/Mass Spectrometer (GC/MS)
X	This qualifier applies to pesticide and Aroclor results when GC/MS analysis was attempted but was unsuccessful.

The other type of code used by AECOM is a “Reason Code”. The reason code indicates the type of quality control failure that led to the application of the data validation flag.

Reason Codes

Code	*Description*
a	Tracer recovery (radiochemical data only)
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bm	Missing Blank Information
c	Calibration issue
cl	Clean-up standard recovery
cp	Insufficient in growth (radiochemical data only)
cr	Chromatographic resolution
d	Reporting limit raised due to chromatographic interference
e	Ether interference
fd	Field duplicate RPDs
g	Chromatographic pattern match issue
h	Holding times
i	Internal standard areas
ii	Injection internal standard area or retention time exceedance
k	Estimated Maximum Possible Concentrations
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs (matrix duplicate, MSD, LCSD)
m	Matrix spike recovery
nb	Negative laboratory blank contamination
p	Chemical preservation issue
pe	Post Extraction Spike
q	Quantitation issue
r	Dual column RPD
rp	Re-extraction precision issue [PAHs only]

I. Executive Summary

Data validation was performed on 100% of the groundwater field investigative samples collected on June 25th, 2018 and June 26th, 2018 at the Lockheed Martin Middle River Complex located in Middle River, Maryland. The validation was performed to a United States Environmental Protection Agency (USEPA) Region III Inorganic Level I and Organic Level I based on the specifics of the analytical methods referenced and qualified according to the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic/Inorganic (January 2017) Superfund Data Review, with the exception of blank detections which were qualified according to the USEPA Region III modifications to the National Functional Guidelines defining the use of the "B" flag.

The review was assisted through the use of an electronic data management tool that compiles batch-level quality control (QC) data submitted with the laboratory deliverables and identifies anomalies for verification and qualification by the data reviewer. This information is provided in the form of a structured workbook that includes field sample analytical results, QC sample results, batch associations, and QC criteria. Prior to validation, the quality assurance procedures applied to this process include reviewing the output for data completeness based on laboratory deliverables and chain of custody reports, verification of QC criteria based on the aforementioned data validation guidelines and project-specific Quality Assurance Project Plan (QAPP), as well as strict control of data management permissions. The resulting data validation workbooks were evaluated and validated using the AECOM automated validation assistant (AVA) tool. The specific data elements that were reviewed include:

- Holding times and sample preservation
- Blanks (Method, Trip, Field, and Equipment)
- Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- Surrogate spike results
- Field duplicates
- Laboratory duplicates
- Sensitivity

Data validation qualifiers were applied to results where a QC nonconformance required qualification per USEPA guidance. All QC anomalies were assessed for their impact on data quality in regards to precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS) as discussed in **II: PARCCS Data Quality**. A detailed list of the QC non-conformances can be found in **III: Data Validation Findings**. The associated field sample results that required qualification are listed in **IV: Qualified Field Sample Results**

II. PARCCS Data Quality

Precision

Precision is the degree of agreement among repeated measurements of the same characteristic on the same sample or on separate samples collected as close as possible in time and place. Field sampling precision is measured with the field duplicate relative percent differences; laboratory precision is measured with laboratory duplicate relative percent differences and/or laboratory control spike and matrix spike duplicate relative percent differences.

During the review, several matrix spike pairs displayed relative percent differences greater than the quality control limits. However, all associated field sample results were either non-detect or previously qualified due to matrix spike percent recovery anomalies; no data qualifying action was taken.

Accuracy

Accuracy is a measure of confidence in a measurement. The smaller the difference between the measurement of a parameter and its "true" or expected value, the more accurate the measurement. Accuracy in the field was monitored through the use of negative controls such as trip blanks, field blanks, and equipment blanks, along with adherence to the standard operating procedures and sampling plans. Analytical accuracy was assessed through the measurement of percent recoveries in the laboratory control spike pairs (LCS/LCSD) and the matrix spike pairs (MS/MSD).

Several method blanks, trip blanks, equipment blanks, and field blanks displayed detections greater than the method detection limit. Per the USEPA Region III guidelines on the qualification of blank detections, associated field sample results that displayed concentrations within five times of the blank detection were qualified “B”. The qualified field sample results should be considered as estimated values.

During the review, several MS/MSD displayed percent recoveries greater than the quality control limits. The positive parent sample results associated with positive biases were qualified J+,m and should be considered as estimated values.

Several LCS/LCSD displayed percent recoveries outside the quality control limits. The positive field sample results associated with positive biases were qualified J,l and should be considered as estimated values. The field sample results associated with negative biases were non-detect and were qualified UJ,l. These anomalies are considered minor since all percent recoveries less than the lower QC limits were greater than 10%. The qualified field sample results should be considered as estimated values.

Representativeness

Representativeness qualitatively expresses the degree to which data accurately reflect site conditions. Factors that affect the representativeness of analytical data include appropriate sample population definitions, proper sample collection and preservation techniques, analytical holding times, use of standard analytical methods, and determination of matrix or analyte interferences.

Field sample EW-1 was re-extracted outside of the technical holding time during the PCB Homolog analysis due to low LCS percent recoveries. The re-extracted sample also exhibited low LCS percent recoveries. The positive re-extracted sample results were qualified J,h, while non-detects were qualified UJ,h. Qualified results from the re-extracted sample that are greater than the results of the initial analysis were recommended as reportable results in order to maintain a conservative approach in regards to potential risk. These anomalies are considered minor, and the qualified field sample results should be considered as estimated values.

Comparability

Comparability is the extent to which data from one study can be compared directly to either past data from the current project or data from another study. Using standardized sampling and analytical methods, units of reporting, and site selection procedures helps ensure comparability. Standard field sampling methods and current CLP analytical methods by an accredited laboratory were used in this investigation.

Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount of data expected under normal conditions. It is expected that laboratories will provide data meeting system quality control acceptance criteria for all samples tested. Project completeness is determined by evaluating the planned versus actual quantities of usable data. A total of 6 investigative groundwater samples were validated. Additionally, 2 trip blanks and 4 investigation derived waste (IDW) samples were validated. All QC anomalies were considered to be minor and all data points are considered usable, as qualified. Therefore, the overall data completeness is 100%.

Sensitivity

Sensitivity reflects the ability of the analytical method to detect analytes of interest below the level of concern. This goal is achieved by identifying the level of concern, choosing a method with appropriate method detection limits, and ensuring that the laboratory analyzes calibration standards at or below the level of concern. The laboratory was able to achieve the lowest reporting limits based on the analytical methods employed and the variety of matrices encountered. Any analytes detected below the reporting limit and above the method detection limit were reported and qualified “J” as estimated values by the laboratory. Several field samples

were analyzed at elevated dilutions in order to bring concentration ranges within the linear calibration range of the instrument. These field sample results did not require qualification by the data reviewer.

Overall Impact on Data Usability

The bulk of the data was considered usable and met the completeness requirement outlined in the QAPP. During the course of the data validation, several minor anomalies were noted which is to be anticipated based on statistical predictability of standard analytical procedures. Several field sample results were qualified due to these minor anomalies. No major anomalies were identified over the course of data validation; therefore no field sample results were qualified as rejected. All data are considered usable, as qualified, for their intended purpose based on the data reviewed.

III. Data Validation Findings

Volatile Organic Compounds SW846-8260B	Description	Sample ID	Analyte	Value (Control Limit)
Holding Times	*No Anomalies*			
Method Blanks	Detection > MDL	2770696	Bromomethane	0.46 ug/L (0.39 ug/L)
		2770157	Carbon Disulfide	0.32 ug/L (0.23 ug/L)

Appendix A
Data Validation Qualifiers and Reason Codes

Data Qualifying Codes

Two types of data qualifying codes or flags are applied in the course of the data review. The data validation flags indicate data that are not usable for decision-making, more than normally biased and/or variable, or not representative of field conditions. These codes and their definitions are presented below in the hierarchy stipulated in the USEPA Contract Laboratory Program National Functional Guidelines for Organic (August 2014) Data Review and the USEPA Region III Guidelines for Organic (September 1994) for blank qualifications only.

Data Validation Flags

Flag	Interpretation
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
B	The analyte was analyzed for, but not detected at a level greater than or equal to the level of the adjusted Detection Limit (DL) for sample and method.
J+	Reported value may not be accurate or precise, but the result may be biased high.
J-	Reported value may not be accurate or precise, but the result may be biased low.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the Limit of Detection (LOD).
NJ	The analysis indicates the presence of an analyte that has been “tentatively identified” and the associated numerical value represents its approximate concentration.
UJ	The analyte was not detected at a level greater than or equal to the adjusted DL. However, the reported adjusted DL is approximate and may be inaccurate or imprecise.
C	This qualifier applies to pesticide and Aroclor results when the identification has been confirmed by gas Chromatograph/Mass Spectrometer (GC/MS)
X	This qualifier applies to pesticide and Aroclor results when GC/MS analysis was attempted but was unsuccessful.

The other type of code used by AECOM is a “Reason Code”. The reason code indicates the type of quality control failure that led to the application of the data validation flag.

Reason Codes

Code	*Description*
a	Tracer recovery (radiochemical data only)
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bm	Missing Blank Information
c	Calibration issue
cl	Clean-up standard recovery
cp	Insufficient in growth (radiochemical data only)
cr	Chromatographic resolution
d	Reporting limit raised due to chromatographic interference
e	Ether interference
fd	Field duplicate RPDs
g	Chromatographic pattern match issue
h	Holding times
i	Internal standard areas
ii	Injection internal standard area or retention time exceedance
k	Estimated Maximum Possible Concentrations
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs (matrix duplicate, MSD, LCSD)
m	Matrix spike recovery
nb	Negative laboratory blank contamination
p	Chemical preservation issue
pe	Post Extraction Spike
q	Quantitation issue
r	Dual column RPD
rp	Re-extraction precision issue [PAHs only]

Certificate of Analysis

Project Name:	**2018-MIDDLE RIVER COMPLEX**	Workorder:	**2307128**
Purchase Order:	**95840ACM**	Workorder ID:	**2018-MIDDLE RIVER COMPLEX**

Dear Ms. Brown:

Enclosed are the analytical results for samples received by the laboratory on Thursday, April 5, 2018.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Mrs. Vanessa N Badman (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

ALS Spring City: 10 Riverside Drive, Spring City, PA 19475 610-948-4903

CC: Mr. Ravi Damera , Ms. Victoria Kirkpatrick , Mr. Naoum Tavantzis

This page is included as part of the Analytical Report and must be retained as a permanent record thereof.

Vanessa N. Badman

Mrs. Vanessa N Badman
Project Coordinator

SAMPLE SUMMARY

Workorder: 2307128 2018-MIDDLE RIVER COMPLEX

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
-- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
-- For microbiological analyses, the "Prepared" value is the date/time into the incurbator and the "Analyzed" value is the date/time out the incubator.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits

ANALYTICAL RESULTS

Workorder: 2307128 2018-MIDDLE RIVER COMPLEX

PARAMETER QUALIFIERS

Lab ID	#	Sample ID	Analytical Method	Analyte
2307128002	1	MRC-MW123A	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 60.4 and the control limits were 61 to 126.				
2307128002	2	MRC-MW123A	SW846 8260B	Toluene-d8
The surrogate Toluene-d8 for method SW846 8260B was outside of control limits. The % Recovery was reported as 72.9 and the control limits were 76 to 127. This result was reported at a dilution of 1.				
2307128003	1	MRC-MW48A	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 60.4 and the control limits were 61 to 126.				
2307128003	2	MRC-MW48A	S2320B-97	Alkalinity, Total
The Total Alkalinity is titrated to a pH of 4.5 and reported as mg CaCO3/L.				
2307128003	3	MRC-MW48A	8270 SIM	1,4-Dioxane
The QC sample type MS for method 8270 SIM was outside the control limits for the analyte 1,4-Dioxane. The % Recovery was reported as 18.6 and the control limits were 22 to 75.				
2307128003	4	MRC-MW48A	8270 SIM	1,4-Dioxane
The QC sample type MS for method 8270 SIM was outside the control limits for the analyte 1,4-Dioxane. The % Recovery was reported as 18.6 and the control limits were 22 to 75.				
2307128004	1	MRC-MW121A	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 60.4 and the control limits were 61 to 126.				
2307128005	1	MRC-MW121B	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 60.4 and the control limits were 61 to 126.				
2307128006	1	MRC-MW14B	SW846 8260B	1,2,4-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 57.2 and the control limits were 67 to 123.				
2307128006	2	MRC-MW14B	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 50.7 and the control limits were 61 to 126.				
2307128007	1	MRC-MW71B	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 60.4 and the control limits were 61 to 126.				
2307128007	2	MRC-MW71B	S2320B-97	Alkalinity, Total
The Total Alkalinity is titrated to a pH of 4.5 and reported as mg CaCO3/L.				
2307128008	1	Trip Blank 4	SW846 8260B	1,2,4-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 57.2 and the control limits were 67 to 123.				
2307128008	2	Trip Blank 4	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 50.7 and the control limits were 61 to 126.				
2307128009	1	Trip Blank 1	SW846 8260B	1,2,4-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 57.2 and the control limits were 67 to 123.				

ANALYTICAL RESULTS

Workorder: 2307128 2018-MIDDLE RIVER COMPLEX

2307128009	2	Trip Blank 1	SW846 8260B	1,2,3-Trichlorobenzene

The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 50.7 and the control limits were 61 to 126.

QUALITY CONTROL PARAMETER QUALIFIERS

Lab ID	#	Sample Type	Analytical Method	Analyte
2718917	1	Lab Control Standard	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 60.4 and the control limits were 61 to 126.				
2719844	2	Lab Control Standard	SW846 8260B	Methyl cyclohexane
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 132 and the control limits were 70 to 130.				
2719844	3	Lab Control Standard	SW846 8260B	Freon 113
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte Freon 113. The % Recovery was reported as 132 and the control limits were 50 to 130.				
2720311	4	Lab Control Standard	SW846 8260B	1,2,4-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,4-Trichlorobenzene. The % Recovery was reported as 57.2 and the control limits were 67 to 123.				
2720311	5	Lab Control Standard	SW846 8260B	Freon 113
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte Freon 113. The % Recovery was reported as 131 and the control limits were 50 to 130.				
2720311	6	Lab Control Standard	SW846 8260B	1,2,3-Trichlorobenzene
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte 1,2,3-Trichlorobenzene. The % Recovery was reported as 50.7 and the control limits were 61 to 126.

April 18, 2018 Service Request No:R1803127

Vanessa Badman
ALS Environmental
34 Dogwood Lane
Middletown, PA 17057

Laboratory Results for: UR115: 2307128

Dear Vanessa,

Enclosed are the results of the sample(s) submitted to our laboratory April 10, 2018
For your reference, these analyses have been assigned our service request number **R1803127.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Janice Jaeger

ALS Environmental

Client: ALS Environmental - US
Project: UR115:2307128
Sample Matrix: Water

Service Request: R1803127
Date Received: 04/10/2018

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt:

Two water samples were received for analysis at ALS Environmental on 04/10/2018. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at 6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Semivolatiles by GC/MS:

Method 680, 04/12/2018: The control limit was exceeded for one or more surrogates in the Continuing Calibration Verification (CCV). The surrogates were within acceptance limits for the associated field samples. The data quality was not significantly affected and no further corrective action was taken.

Approved by _____ Date 04/18/2018

REPORT QUALIFIERS AND DEFINITIONS

U	Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
J	Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).
B	Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
E	Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
E	Organics- Concentration has exceeded the calibration range for that specific analysis.
D	Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
*	Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.
H	Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.
#	Spike was diluted out.
+	Correlation coefficient for MSA is <0.995.
N	Inorganics- Matrix spike recovery was outside laboratory limits.
N	Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
S	Concentration has been determined using Method of Standard Additions (MSA).
W	Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
P	Concentration >40% difference between the two GC columns.
C	Confirmed by GC/MS
Q	DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).
X	See Case Narrative for discussion.
MRL LOQ	Method Reporting Limit. Also known as: Limit of Quantitation (LOQ) The lowest concentration at which the method analyte may be reliably quantified under the method conditions.
MDL	Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).
LOD	Limit of Detection. A value at or above the MDL which has been verified to be detectable.
ND	Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

ACCREDITED IN ACCORDANCE WITH nelac

Certificate of Analysis

Project Name:	**2018-MIDDLE RIVER COMPLEX**	Workorder:	**2307596**
Purchase Order:	**95840ACM**	Workorder ID:	**2018-MIDDLE RIVER COMPLEX**

Dear Ms. Brown:

Enclosed are the analytical results for samples received by the laboratory on Friday, April 6, 2018.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Mrs. Vanessa N Badman (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

SAMPLE SUMMARY

Workorder: 2307596 2018-MIDDLE RIVER COMPLEX

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
-- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
-- For microbiological analyses, the "Prepared" value is the date/time into the incurbator and the "Analyzed" value is the date/time out the incubator.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits

ANALYTICAL RESULTS

Workorder: 2307596 2018-MIDDLE RIVER COMPLEX

PARAMETER QUALIFIERS

Lab ID	#	Sample ID	Analytical Method	Analyte
2307596003	1	MRC-MW60B	S2320B-97	Alkalinity, Total
The Total Alkalinity is titrated to a pH of 4.5 and reported as mg CaCO3/L.				
2307596003	2	MRC-MW60B	EPA 300.0	Nitrite-N
Analyte was analyzed past the 48 hour holding time.				
2307596003	3	MRC-MW60B	EPA 300.0	Nitrate-N
Analyte was analyzed past the 48 hour holding time.				
2307596003	4	MRC-MW60B	S4500PE-99	Orthophosphate
Analyte was analyzed past the 48 hour holding time.

Laboratory Results for: UR115: 2307596

Dear Vanessa,

Enclosed are the results of the sample(s) submitted to our laboratory April 11, 2018
For your reference, these analyses have been assigned our service request number **R1803155.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

ALS Environmental

Client: ALS Environmental - US
Project: UR115:2307596
Sample Matrix: Water

Service Request: R1803155
Date Received: 04/11/2018

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt:

Five water samples were received for analysis at ALS Environmental on 04/11/2018. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at 6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Semivolatiles by GC/MS:

Method 680, 04/12/2018: The control limit was exceeded for one or more surrogates in the Continuing Calibration Verification (CCV). The surrogates were within acceptance limits for the associated field samples. The data quality was not significantly affected and no further corrective action was taken.

Method 680, 04/12/2018, R1803155-005: The recovery of one or more internal standards was outside control limits. There are no hits in the sample. The internal is not used to quantitate any of the target compounds.

Approved by _____ Date 04/17/2018

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

\# Spike was diluted out

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

ACCREDITED IN ACCORDANCE WITH nelac

Certificate of Analysis

Project Name:	**2018-MIDDLE RIVER COMPLEX**	Workorder:	**2307611**
Purchase Order:	**95840ACM**	Workorder ID:	**2018-MIDDLE RIVER COMPLEX**

Dear Ms. Kirkpatrick:

Enclosed are the analytical results for samples received by the laboratory on Monday, April 9, 2018.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Mrs. Vanessa N Badman (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

SAMPLE SUMMARY

Workorder: 2307611 2018-MIDDLE RIVER COMPLEX

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
-- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
-- For microbiological analyses, the "Prepared" value is the date/time into the incurbator and the "Analyzed" value is the date/time out the incubator.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits

ANALYTICAL RESULTS

Workorder: 2307611 2018-MIDDLE RIVER COMPLEX

PARAMETER QUALIFIERS

Lab ID	#	Sample ID	Analytical Method	Analyte
2307611002	1	BRC-MW126B	SW846 8260B	Bromomethane
The QC sample type MS for method SW846 8260B was outside the control limits for the analyte Bromomethane. The % Recovery was reported as 42.6 and the control limits were 45 to 148.				
2307611002	2	BRC-MW126B	SW846 8260B	Bromomethane
The QC sample type MSD for method SW846 8260B was outside the control limits for the analyte Bromomethane. The % Recovery was reported as 37.4 and the control limits were 45 to 148.				
2307611002	3	BRC-MW126B	SW846 8260B	2-Chloroethylvinyl ether
The QC sample type MS for method SW846 8260B was outside the control limits for the analyte 2-Chloroethylvinyl ether. The % Recovery was reported as 0 and the control limits were 1 to 150.				
2307611002	4	BRC-MW126B	SW846 8260B	2-Chloroethylvinyl ether
The QC sample type MSD for method SW846 8260B was outside the control limits for the analyte 2-Chloroethylvinyl ether. The % Recovery was reported as .47 and the control limits were 1 to 150.				
2307611002	5	BRC-MW126B	SW846 8260B	2-Chloroethylvinyl ether
The QC sample type MSD for method SW846 8260B was outside the control limits for the analyte 2-Chloroethylvinyl ether. The RPD was reported as 200 and the upper control limit is 40.				
2307611002	6	BRC-MW126B	SW846 8260B	Methyl cyclohexane
The QC sample type MS for method SW846 8260B was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 138 and the control limits were 70 to 130.				
2307611002	7	BRC-MW126B	SW846 8260B	Methyl cyclohexane
The QC sample type MSD for method SW846 8260B was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 142 and the control limits were 70 to 130.				
2307611008	1	MRC-MW21B	S2320B-97	Alkalinity, Total
The Total Alkalinity is titrated to a pH of 4.5 and reported as mg CaCO3/L.				
2307611008	2	MRC-MW21B	EPA 300.0	Nitrite-N
Analyte was analyzed past the 48 hour holding time.				
2307611008	3	MRC-MW21B	EPA 300.0	Nitrate-N
Analyte was analyzed past the 48 hour holding time.				
2307611008	4	MRC-MW21B	S2540C-11	Total Dissolved Solids
The RPD associated with this sample was recovered at 8%. The RPD is outside method acceptance limits of 0-5%. The results used to calculate the RPD were 296 and 272.				
2307611008	5	MRC-MW21B	S4500PE-99	Orthophosphate
Analyte was analyzed past the 48 hour holding time.				
2307611013	1	MRC-MW81B	SW846 8260B	Methyl cyclohexane
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 140 and the control limits were 70 to 130.				
2307611018	1	MRC-MW120A	SW846 8260B	Methyl cyclohexane
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 140 and the control limits were 70 to 130.				
2307611023	1	MRC-MW87B	SW846 8260B	Methyl cyclohexane
The QC sample type LCS for method SW846 8260B was outside the control limits for the analyte Methyl cyclohexane. The % Recovery was reported as 133 and the control limits were 70 to 130.

Vanessa Badman
ALS Environmental
34 Dogwood Lane
Middletown, PA 17057

Laboratory Results for: UR115: 2307611

Dear Vanessa,

Enclosed are the results of the sample(s) submitted to our laboratory April 11, 2018
For your reference, these analyses have been assigned our service request number **R1803154.**

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7472. You may also contact me via email at Janice.Jaeger@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Janice Jaeger

ALS Environmental

Client: ALS Environmental - US
Project: UR115:2307611
Sample Matrix: Water

Service Request: R1803154
Date Received: 04/11/2018

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Any parameters that are not included in the lab's NELAC accreditation are identified on a "Non-Certified Analytes" report in the Miscellaneous Forms Section of this report. Individual analytical results requiring further explanation are flagged with qualifiers and/or discussed below. The flags are explained in the Report Qualifiers and Definitions page in the Miscellaneous Forms section of this report.

Sample Receipt:

Five water samples were received for analysis at ALS Environmental on 04/11/2018. Any discrepancies noted upon initial sample inspection are noted on the cooler receipt and preservation form included in this data package. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at 6°C upon receipt at the lab except for aqueous samples designated for metals analyses, which are stored at room temperature.

Semivolatiles by GC/MS:

Method 680, 04/12/2018: The control limit was exceeded for one or more surrogates in the Continuing Calibration Verification (CCV). The surrogates were within acceptance limits for the associated field samples. The data quality was not significantly affected and no further corrective action was taken.

Approved by _____ Date 04/17/2018

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

\# Spike was diluted out

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

ACCREDITED IN ACCORDANCE WITH nelac

Rochester Lab ID # for State Certifications[1]

Florida ID # E87674	North Carolina #676	Rhode Island ID # 158
		Virginia #460167

[1] Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state or agency requirements. The test results meet requirements of the current NELAP/TNI standards or state or agency requirements, where applicable, except as noted in the case narrative. Since not all analyte/method/matrix combinations are offered for state/NELAC accreditation, this report may contain results which are not accredited. For a specific list of accredited analytes, contact the laboratory or go to https://www.alsglobal.com/locations/americas/north-america/usa/new-york/rochester-environmental

Acronyms

Certificate of Analysis

Project Name:	**2018-MIDDLE RIVER COMPLEX**	Workorder:	**2308120**
Purchase Order:	**95840ACM**	Workorder ID:	**2018-MIDDLE RIVER COMPLEX**

Dear Ms. Brown:

Enclosed are the analytical results for samples received by the laboratory on Tuesday, April 10, 2018.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Mrs. Vanessa N Badman (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

SAMPLE SUMMARY

Workorder: 2308120 2018-MIDDLE RIVER COMPLEX

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
-- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
-- For microbiological analyses, the "Prepared" value is the date/time into the incurbator and the "Analyzed" value is the date/time out the incubator.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits
