OVERVIEW

The sample set for LMC – MRC, SDG 140-16367-1, consists of nineteen (19) indoor air (IA) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: IA-018-A-27 / IA-DUP3-A-27 and IA-079-A-27 / IA-DUP4-A-27.

The samples were collected by Tetra Tech on August 15, 2019 and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 08/19/19 at 11:10 on instrument MG had a percent difference (%D) for vinyl chloride that was greater than the 30% quality control limit. Samples IA-018-A-27, IA-DUP3-A-27, IA-138-A-27, IA-081-A-27, IA-079-A-27, IA-118-A-27, IA-015-A-27, IA-117-A-27, IA-078-A-27, IA-136-A-27, IA-076-A-27, and IA-168-A-27 were associated with this calibration. Non-detected results for vinyl chloride were qualified as estimated (UJ) in the affected samples.

- The following contaminants were detected in the method blanks at the following maximum concentrations:

Analyte	Maximum Concentration	< or > Reporting Limit (RL)
Methylene chloride	0.745 ug/m^3(1)	< RL
Methylene chloride	0.604 ug/m^3(2)	< RL

Methylene chloride	0.570 ug/m$^{3(3)}$	< RL

1 – Maximum concentration detected in method blank associated with batch 140-32704 affecting samples IA-018-A-27, IA-DUP3-A-27, IA-138-A-27, IA-081-A-27, IA-079-A-27, IA-118-A-27, IA-015-A-27, IA-117-A-27, IA-078-A-27, IA-136-A-27, IA-076-A-27, and IA-168-A-27.
2 – Maximum concentration detected in method blank associated with batch 140-32829 affecting samples IA-174-A-27, IA-DUP4-A-27, and IA-093-A-27.
3 – Maximum concentration detected in method blank associated with batch 140-32744 affecting samples IA-075-A-27, IA-021-A-27, IA-100-B-27, and IA-101-B-27.

Detected results less than the RL in the associated samples were qualified as non-detected (U). Detections greater than the RL for methylene chloride were qualified as estimated, (J) as potential laboratory but not definitive contamination.

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The data reviewer observed that the method detection limit for naphthalene was higher than the reporting limit on the sample form Is. No action was noted but this item is noted for completeness.

Sample IA-138-A-27 was analyzed at a dilution factor of 2.04.

The laboratory control sample (LCS) associated with batch 140-32704 had a percent recovery (%R) that was greater than the laboratory quality control limits for vinyl chloride. Samples IA-018-A-27, IA-DUP3-A-27, IA-138-A-27, IA-081-A-27, IA-079-A-27, IA-118-A-27, IA-015-A-27, IA-117-A-27, IA-078-A-27, IA-136-A-27, IA-076-A-27, and IA-168-A-27 were associated with this LCS. No qualification was necessary because vinyl chloride results were non-detected in the associated samples.

EXECUTIVE SUMMARY

Laboratory Performance: Some VOC results were qualified due to calibration noncompliance. Several results were qualified as non-detected due to laboratory method blank contamination.

Other Factors Affecting Data Quality: Several results were qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Receipt
The samples were received on 8/17/2019 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by Eurofins TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-32704 exhibited % difference of > 30% for Vinyl chloride; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Vinyl chloride recovered outside control limits for the LCS associated with analytical batch 140-32704. This is not indicative of a systematic control problem because this was random marginal exceedances. Qualified results have been reported.

Sample IA-075-A-27 (140-16367-16) was diluted due to the abundance of non-target analytes. Elevated reporting limits (RLs) are provided.

Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

OVERVIEW

The sample set for LMC – MRC, SDG 140-16369-1, consists of twenty-four (24) indoor air (IA) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: IA-102-C-27 / IA-DUP1-C-27 and IA-088-C-27 / IA-DUP2-C-27.

The samples were collected by Tetra Tech on August 14, 2019 and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 08/19/19 at 10:15 on instrument MJ had percent differences (%Ds) for 1,2-dichloroethane and naphthalene that were greater than the 30% quality control limit. Samples IA-155-C-27, IA-133-C-27, IA-153-C-27, IA-060-C-27, IA-152-C-27, IA-144-C-27, and IA-145-C-27 were associated with this calibration. Non-detected results for 1,2-dichloroethane and naphthalene were qualified as estimated (UJ) in the associated samples.

- The continuing calibration performed on 08/23/19 at 10:44 on instrument MR had a %D for dichlorodifluoromethane that was greater than the 30% quality control limit. Samples IA-126-C-27, IA-113-C-27, IA-088-C-27, IA-142-C-27, and IA-149-C-27 were associated with this calibration. Detected results for dichlorodifluoromethane were qualified as estimated (J) in the associated samples.

- The following contaminants were detected in the method blanks at the following maximum concentrations:

Analyte	Maximum Concentration	< or > Reporting Limit (RL)
Methylene chloride	0.604 ug/m$^{3(1)}$	< RL
Methylene chloride	0.570 ug/m$^{3(2)}$	< RL
Methylene chloride	0.555 ug/m$^{3(3)}$	< RL

1 – Maximum concentration detected in method blank associated with batch 140-32829 affecting sample IA-DUP2-C-27.
2 – Maximum concentration detected in method blank associated with batch 140-32744 affecting samples IA-BCK-4-27, IA-BCK-2-27, IA-BCK-1-27, IA-BCK-3-27, IA-001-C-27, IA-004-C-27, IA-102-C-27, and IA-DUP1-C-27.
3 – Maximum concentration detected in method blank associated with batch 140-32868 affecting samples IA-126-C-27, IA-113-C-27, IA-088-C-27, IA-142-C-27, and IA-149-C-27.

Detected results less than the RL in the associated samples were qualified as non-detected (U). Detections greater than the RL for methylene chloride were qualified as estimated, (J) as potential laboratory but not definitive contamination.

- The laboratory control sample (LCS) associated with batch 140-32312 had a percent recovery (%R) that was less than the laboratory quality control limits for 1,2-dichloroethane. Samples IA-155-C-27, IA-133-C-27, IA-153-C-27, IA-060-C-27, IA-152-C-27, IA-144-C-27, and IA-145-C-27 were associated with this LCS. Non-detected results for 1,2-dichloroethane were qualified as estimated (UJ) in the associated samples.

- The laboratory qualified results for chlorodifluoromethane in samples IA-133-C-27, IA-144-C-27, IA-146-C-27, IA-150-C-27, IA-152-C-27, and IA-153-C-27 with a "CI" qualifier. According to the laboratory report, this qualifier indicates that the peak identified by the data system exhibited chromatographic interference that could not be resolved, and there is reason to suspect there may be a high bias. These results were qualified as estimated (J) on this basis.

- The field duplicate pair samples IA-088-C-27 / IA-DUP2-C-27 had a relative percent differences (RPDs) that were greater than the 50% quality control limit for chlorodifluoromethane and methylene chloride. The detected results for these analytes in samples IA-088-C-27 and IA-DUP2-C-27 were qualified as estimated (J).

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

The data reviewer observed that the method detection limit for naphthalene was higher than the reporting limit on the sample form Is. No action was noted but this item is noted for completeness. All naphthalene results were nondetected.

Non-detected results were reported to the MDL.

The following samples were analyzed at a dilution factors greater than 1:

Sample	Dilution Factor
IA-060-C-27	1.55
IA-088-C-27	1.53
IA-113-C-27	1.45
IA-126-C-27	2.87
IA-142-C-27	1.89
IA-149-C-27	1.67
IA-BCK-2-27	1.64

EXECUTIVE SUMMARY

Laboratory Performance: Some VOC results were qualified due to calibration noncompliance. Several results were qualified as non-detected due to laboratory method blank contamination. Several results were qualified due to LCS noncompliance. Some results for one analyte were qualified due to chromatographic interference noted by the laboratory.

Other Factors Affecting Data Quality: Several results in one pair of field duplicate samples were qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Receipt
The samples were received on 8/17/2019 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by Eurofins TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-32312 exhibited % difference of > 30% for 1,2-Dichloroethane and Naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Analyte 1,2-Dichloroethane recovered outside control limits for the LCS associated with analytical batch 140-32312. This is not indicative of a systematic control problem because this was random marginal exceedances. Qualified results have been reported.

The continuing calibration verification (CCV) associated with batch 140-32868 exhibited % difference of > 30% for Dichlorodifluoromethane; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Can Certification Comments
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
B	Compound was found in the blank and sample.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

OVERVIEW

The sample set for LMC – MRC, SDG 140-16376-1, consists of seventeen (17) soil vapor (SV) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: SV-102-C-27 / SV-DUP1-C-27 and SV-088-C-27 / SV-DUP02-C-27.

The samples were collected by Tetra Tech on August 14, 2019 and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 08/23/19 at 10:44 on instrument MR had a percent difference (%D) for dichlorodifluoromethane that was greater than the 30% quality control limit. Samples SV-153-C-27, SV-149-C-27, and SV-126-C-27 were associated with this calibration. The detected and non-detected results for dichlorodifluoromethane in the associated samples were qualified as estimated (J and UJ, respectively).

- The following contaminant was detected in the method blanks at the following maximum concentrations:

Analyte	Maximum Concentration	< or > Reporting Limit (RL)
Methylene chloride	0.718 ug/m$^{3(1)}$	< RL
Methylene chloride	1.06 ug/m$^{3(2)}$	< RL

Methylene chloride	0.557 ug/m$^{3(3)}$	< RL
Methylene chloride	0.555 ug/m$^{3(4)}$	< RL
Methylene chloride	0.785 ug/m$^{3(5)}$	< RL

1 – Maximum concentration detected in method blank associated with batch 140-32777 affecting sample SV-102-C-27.
2 – Maximum concentration detected in method blank associated with batch 140-32985 affecting samples SV-133-C-27 and SV-126-C-27.
3 – Maximum concentration detected in method blank associated with batch 140-32745 affecting samples SV-001-C-27, SV-004-C-27, SV-DUP1-C-27, SV-155-C-27, SV-060-C-27, SV-150-C-27, SV-152-C-27, SV-141-C-27, SV-113-C-27, SV-088-C-27, SV-DUP02-C-27, and SV-142-C-27.
4 – Maximum concentration detected in method blank associated with batch 140-32868 affecting samples SV-153-C-27 and SV-149-C-27.
5 – Maximum concentration detected in method blank associated with batch 140-32956. No methylene chloride results selected for validation were associated with this batch.

Detected results for methylene chloride less than the RL in the associated samples were qualified as non-detected (U). Detections greater than the RL for methylene chloride were qualified as estimated, (J) as potential laboratory but not definitive contamination.

- The laboratory qualified the result for chlorodifluoromethane in sample SV-150-C-27 with a "CI" qualifier. According to the laboratory report, this qualifier indicates that the peak identified by the data system exhibited chromatographic interference that could not be resolved, and there is reason to suspect there may be a high bias. This result was qualified as estimated (J) on this basis.

- The field duplicate pair samples SV-102-C-27 / SV-DUP1-C-27 had relative percent differences (RPDs) that were greater than the quality control limit of 50% for 1,1-dichloroethene, ethylbenzene, and total xylenes. The detected results for this analyte were qualified as estimated (J) in samples SV-102-C-27 and SV-DUP1-C-27.

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

The data reviewer observed that the method detection limit for naphthalene was higher than the reporting limit on the sample form Is. No action was noted but this item is noted for completeness. All naphthalene results were nondetected.

Non-detected results were reported to the MDL.

The following results exceeded the instrument calibration range: trichloroethene in samples SV-060-C-27 and SV-141-C-27, methylene chloride in sample SV-126-C-27, vinyl chloride in sample SV-149-C-27, and 1,1-dichloroethane in sample SV-DUP1-C-27. The laboratory reanalyzed these samples, and the aforementioned results from the reanalyses were selected for validation.

The following samples/analytes were analyzed at a dilution factors greater than 1:

Sample	Analyte(s)	Dilution Factor
SV-060-C-27	Trichloroethene	5.03
SV-102-C-27	All	3.73
SV-126-C-27	All	1.52
SV-141-C-27	Trichloroethene	1.47
SV-149-C-27	All	4.15
SV-153-C-27	All	1.76
SV-DUP1-C-27	1,1-Dichloroethane	3.53

The GC/MS tuning form associated with analysis batch 140-32956 had a relative abundance that was outside of the control limits shown. According to the laboratory case narrative report, although the BFB is flagged as outside control limits for TO-14, the results are within limits for TO-15, which is required for this project. No results were qualified on this basis.

EXECUTIVE SUMMARY

Laboratory Performance: Several results were qualified due to calibration noncompliance. Some results were qualified as non-detected due to laboratory method blank contamination. One result was qualified due to chromatographic interference noted by the laboratory.

Other Factors Affecting Data Quality: Results for several analytes in one pair of field duplicate samples were qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Job Narrative

Receipt
The samples were received on 8/17/2019 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by Eurofins TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-32868 exhibited % difference of > 30% for Dichlorodifluoromethane; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Although the BFB is flagged as outside control limits for TO-14 on batch 140-32956, the results are within limits for TO-15, which is required for this project.

Can Certification Comments
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg

Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig

Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)

14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

OVERVIEW

The sample set for LMC – MRC, SDG 140-16377-1, consists of twenty (20) soil vapor (SV) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: SV-116-A-27 / SV-DUP03-A-27 and SV-079-A-27 / SV-DUP04-A-27.

The samples were collected by Tetra Tech on August 15, 2019 and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 08/23/19 at 10:44 on instrument MR had a percent difference (%D) for dichlorodifluoromethane that was greater than the 30% quality control limit. Sample SV-DUP03-A-27 was associated with this calibration. The detected result for dichlorodifluoromethane in sample SV-DUP03-A-27 was qualified as estimated (J).

- The following contaminants were detected in the method blanks at the following maximum concentrations:

Analyte	Maximum Concentration	< or > Reporting Limit (RL)
Methylene chloride	0.604 ug/m$^{3(1)}$	< RL
Methylene chloride	1.06 ug/m$^{3(2)}$	< RL
Methylene chloride	0.555 ug/m$^{3(3)}$	< RL

1 – Maximum concentration detected in method blank associated with batch 140-32829 affecting samples SV-173-A-27, SV-171-A-27, SV-138-A-27, SV-174-A-27, SV-093-A-27, and SV-170-A-27.
2 – Maximum concentration detected in method blank associated with batch 140-32985; however, no methylene chloride results selected for validation were associated with this batch.
3 – Maximum concentration detected in method blank associated with batch 140-32868 affecting sample SV-DUP03-A-27.

Detected results for methylene chloride less than the RL in the associated samples were qualified as non-detected (U). Detections greater than the RL for methylene chloride were qualified as estimated, (J) as potential laboratory but not definitive contamination.

- The laboratory qualified the result for chlorodifluoromethane in sample SV-015-A-27 with a "CI" qualifier. According to the laboratory report, this qualifier indicates that the peak identified by the data system exhibited chromatographic interference that could not be resolved, and there is reason to suspect there may be a high bias. This result was qualified as estimated (J) on this basis.

- The field duplicate pair samples SV-116-A-27 / SV-DUP03-A-27 had a difference that was greater than the quality control limit of 2x the RL for methylene chloride. The detected results for this analyte were qualified as estimated (J) in samples SV-116-A-27 and SV-DUP03-A-27.

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

The data reviewer observed that the method detection limit for naphthalene was higher than the reporting limit on the sample form Is. No action was noted but this item is noted for completeness. All naphthalene results were nondetected.

Non-detected results were reported to the MDL.

Trichloroethene results in samples SV-118-A-27, SV-136-A-27, SV-173-A-27, and SV-174-A-27 exceeded the instrument calibration range. The laboratory reanalyzed these samples, and the trichloroethene results from the reanalyses were selected for validation.

The following samples/analytes were analyzed at a dilution factors greater than 1:

Sample	Analyte(s)	Dilution Factor
SV-173-A-27	Trichloroethene	3.64
SV-174-A-27	All	3.72

EXECUTIVE SUMMARY

Laboratory Performance: One VOC result was qualified due to calibration noncompliance. Several results were qualified as non-detected due to laboratory method blank contamination. One result was qualified due to chromatographic interference noted by the laboratory.

Other Factors Affecting Data Quality: Results for one analyte in one pair of field duplicate samples were qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as

estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.
