Subject: Transmittal of the Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation, Round 24 February 2018 Monitoring Report
Lockheed Martin Corporation; Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Carroll:

For your review please find enclosed two hard copies with a CD of the above-referenced document. This document presents the data for the first round of indoor-air-quality and sub-slab-vapor monitoring for calendar year 2018 at Lockheed Martin's Middle River Complex in Middle River, Maryland.

If possible, we respectfully request to receive MDE's comments by October 3, 2018.

Please let me know if you have any questions. My office phone is (301) 548-2209.

Sincerely,

Thomas D. Blackman
Project Lead, Environmental Remediation

SECTION 1
INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) has prepared this report on behalf of Lockheed Martin Corporation (Lockheed Martin) to document the first round of indoor air (IA) and sub-slab vapor (SV) monitoring for calendar year 2018 at the Lockheed Martin Middle River Complex (MRC) in Middle River, Maryland. This report contains the Round 24 (February 2018) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems originally installed at the Middle River Complex in 2008: one beneath the Building A plating shop and the other beneath the southern portion of the Building C basement. This monitoring is part of an ongoing investigation to evaluate whether volatile organic compounds (VOCs) in sub-slab vapors (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air at Middle River Complex facilities. The first monitoring round for calendar year 2018 continues investigations previously described in the reports listed in Table 1-1.

This report is organized into the following sections:

- Section 2—Round 24 Indoor-Air-Quality and Vapor-Intrusion Investigation: Briefly summarizes previous investigations and interim measures and describes the sampling methodology used for the current investigation round.
- Section 3—Round 24 Results: Presents the results of the February 2018 investigation.
- Section 4—Sub-Slab-Depressurization-System Data Analysis: Summarizes the operation and monitoring of the sub-slab-depressurization (SSD)-systems in Buildings A and C for the reporting period from October 1 to March 31, 2018.
- Section 5—Conclusions and Recommendations: Presents conclusions based on the Round 24 sampling results.
- Section 6—References: Lists the references used in this report.

Tables, figures, and appendices are at the end of the report body following Section 6.

SECTION 2
ROUND 24 INDOOR-AIR-QUALITY AND VAPOR-INTRUSION INVESTIGATION

This section briefly summarizes previous investigations and interim measures and describes the sampling methodology used in the current investigation round.

2.1 PREVIOUS INVESTIGATIONS AND INTERIM MEASURES

The indoor air (IA) and sub-slab vapor (SV) investigation described herein was designed to evaluate whether volatile organic compounds (VOCs) associated with soil and groundwater contamination at the site might be moving into IA at Middle River Complex (MRC) facilities. Tetra Tech, Inc. (Tetra Tech) industrial hygienists chose the initial sampling locations for Buildings A, B, and C during a 2006 site reconnaissance. Additional sampling locations were selected during the program based on previous IA and SV monitoring results (Tetra Tech, 2017d).

Although IA results are predominantly less than risk-based screening levels after the first three rounds of sampling in February and December 2006 and April 2007 (with one trichloroethene [TCE] exceedance in 109 samples[1]), two sub-slab depressurization (SSD) vapor intrusion mitigation systems (one beneath the Building A plating shop and the other beneath the southern portion of the Building C basement) were originally installed at the MRC in 2008 (Tetra Tech, 2008d), based on elevated SV concentrations detected beneath the buildings. The Building A SSD system (SSDS) was expanded in 2010 (Tetra Tech, 2010c), in 2016 (Tetra Tech, 2016d), and again in 2017 (Tetra Tech, 2017g) after elevated SV concentrations were detected at additional locations.

[1]One TCE concentration (36 micrograms per cubic meter [µg/m^3]) out of 109 total samples (including duplicates) exceeded the screening level at the time of sampling (18 µg/m^3). The exceedance was observed in the duplicate sample of a field-duplicate pair; TCE was not detected in the corresponding parent sample. Since then, the screening level has been reduced to 8.8 µg/m^3; even so, that result would still have been the only exceedance.

A site-specific TCE screening-level of 35 µg/m^3 for indoor air has been derived for the Building A basement based on limited exposure potential in the basement. This screening level has received approval from the Maryland Department of the Environment (MDE) in July 2017. However, the site-specific screening level for the basement does not represent a final risk-based indoor air cleanup criterion.

The Building C SSDS was expanded in 2012 (Tetra Tech, 2012c) and 2013 (Tetra Tech, 2013c). Subsequent rounds of IA sampling support that contaminant concentrations in IA on the main floors resulting from vapor intrusion (VI) are being controlled by the SSDSs.

However, recent investigations in Building A and the Building A basement have identified elevated TCE concentrations in SV, water (groundwater and water in sumps), and in basement IA. Subsequent VI investigations in Building A and the Building A basement from 2014–2017 include:

(a.) portable gas-chromatograph/mass-spectrometer (GC/MS) surveys of IA and sub-slab air from within floor features (e.g., sumps, drains) (Tetra Tech, 2014b, 2016b)

(b.) installation of three portable air-filtration units in January 2015 in the Building A basement to mitigate TCE exceedances in indoor air (Tetra Tech, 2016d)

(c.) installation and sampling of additional Vapor Pin™ vapor monitoring points (VMPs), including seven in the eastern wall of Building A basement, two in the Building A basement floor, and one beneath the main floor of Building A (Tetra Tech, 2016b)

(d.) collection of air and water samples from select floor features (i.e., sumps, drains) in Building A basement (Tetra Tech, 2016b, 2016c)

(e.) a continuous air-monitoring survey of SV and breathing-zone indoor air locations in the Building A basement over two months (February 24 to April 21, 2017) (Tetra Tech, 2017b)

(f.) a test to see what effect covering select floor features (e.g., sumps, drains) that had exhibited the highest TCE concentrations had on IA concentrations in the basement (Tetra Tech, 2017b)

Elevated TCE concentrations detected in air within, and above, select floor features (e.g., sumps) in the Building A basement led to the installation, as an interim measure, of three additional air-purifying filters (for a total of six) in the basement in May 2017 to target floor features that have shown elevated TCE concentrations (Tetra Tech, 2018b). The continuous air-monitoring survey also identified significant sources of IA contamination in the basement at sumps associated with abandoned and/or removed heaters (Tetra Tech, 2017b). In addition to the new air-purifying filters, additional activities were completed in the summer of 2017 in Building A and its basement to address the elevated VOC results from several recent investigations. A closed-circuit television (CCTV) camera survey of floor features in the Building A basement, including the sumps in existing and former heating rooms, the air-duct network that runs behind the eastern basement

wall, the storm-drain line that runs north/south under the basement floor, and the smaller floor drains, was conducted to determine their condition, identify possible breaches, and better understand their direction and design.

In 2016 (Tetra Tech, 2016b) and March 2017 (Round 22), sampling location SV-175-A (Figure 2-2) on the Building A basement floor had the highest TCE concentrations (460,000 and 650,000 micrograms per cubic meter [µg/m^{3}], respectively). The maximum August 2017 (Round 23) SV TCE concentration (21,000 µg/m^{3}) was also detected at location SV-175-A. Location SV-175-A was removed from the sampling list and not sampled in February 2018 (Round 24) due to the consistently elevated TCE concentrations detected during previous sampling. High TCE SV concentrations were also noted at two locations in the eastern wall of the Building A basement during 2016 (Tetra Tech, 2016b), three locations in the eastern wall of the Building A basement in 2017 (in both the March [Round 22] and August [Round 23] sampling), and at two locations in the eastern wall of the Building A basement in February 2018 (Round 24). A pilot test evaluated the feasibility of extracting vapors from within the basement duct system at former heater room A-9/sump HRS5 (located immediately adjacent to SV-175-A, where the highest TCE concentrations have been detected historically) using the existing SSDS (Tetra Tech, 2018b). The pilot test was successful, HRS5 was left connected to the SSDS, and the system continues to extract vapor from this sealed sump.

Last, a FROG 4000™ gas-chromatograph/photoionization detector (GC/PID) survey of the main floor of Building A assessed whether TCE detected in indoor air near the basement sumps was migrating up through air ducts connected to the sumps, and through the floor air-vents, to the main floor of Building A. TCE detections ranging from 6.1 to 19.3 parts per billion (ppb) were recorded in samples collected from inside the vents and in indoor air above the vents; therefore, in September 2017 all floor air-vents on the main floor (regardless of screening results) were sealed using a vapor barrier and bolt-down steel plate to close off this exposure pathway and prevent migration of TCE vapor from the basement. A subsequent FROG 4000™ survey in October 2017 verified the integrity of the seals at the 42 air-vent locations and confirmed the absence of TCE in indoor air near the vents. No TCE was detected in any sample collected; all results were non-detect (ND) (Tetra Tech, 2018c).

The sampling plan for Round 24 was based on historical detections, information obtained during site reconnaissance, and a review of historical information and reports. IA and SV samples were collected from Buildings A, B, and C during Round 24 sampling. Relevant guidance from the United States Environmental Protection Agency [USEPA] (USEPA, 1996, 2004, 2012, and 2015) and the Maryland Department of the Environment [MDE] (MDE, 2006) was used to develop the investigation methodology.

2.2 INVESTIGATION PROCEDURES

IA and SV sampling within Buildings A, B, and C was done in accordance with the work plan (Tetra Tech, 2017d). Background outdoor air samples were collected from the same sampling locations as had been used for Round 23 (Figure 2-1). Not all existing monitoring points inside the subject buildings were sampled during Round 24. As in previous rounds, samples were selectively collected in or adjacent to areas where contaminants had been detected previously, or in areas where contaminants are currently suspected of being present.

TCE has been targeted as a primary chemical of concern (COC); it has a history of use at the site, has been detected in groundwater and soil gas, can be toxic to human health at low concentrations, and is mobile in the environment. Historical sampling locations and the sub-slab VMPs sampled in Buildings A, B, and C during this round are shown in Figures 2-2, 2-3, and 2-4, respectively. IA sampling locations were co-located with most of the monitored SV sampling locations to evaluate IA and any possible relationship between SV and IA.

Round 24 sampling was performed on February 20–21, 2018. Seventy-two samples (and eight duplicates) were collected using Summa® canisters as follows:

- four background ambient-air samples were collected at the same locations used in the previous round
- 35 IA samples (and four duplicates) from Buildings A, B, and C:
  - 15 IA samples (and two duplicates) from Building A
  - two IA samples from Building B
  - 18 IA samples (and two duplicates) from Building C

- 33 SV samples (and three duplicates) from Buildings A, B, and C:
  - 16 SV samples (and two duplicates) from Building A
  - two SV samples from Building B
  - 15 SV samples (and one duplicate) from Building C
- The "-A," "-B," and "-C" suffixes in the sampling location designations correspond with Buildings A, B, and C, respectively.

Before sampling, the tubing for each VMP was purged of atmospheric air, allowing SV to enter the probe and tubing. Purging was performed by attaching the sample tubing to a low-flow sampling pump set to an approximate flow rate of 200 cubic centimeters per minute to minimize the potential mobilization of SV that could bias the sample. One to three volumes (i.e., the volume of the sample probe and tube) were purged to ensure that collected samples were representative of SV conditions.

Each SV sample was collected over one hour and each IA sample was collected over a period of eight hours using preconditioned Summa® canisters to ensure subsurface equilibration and avoid high negative pressure that might mobilize SV and bias the results. These specially treated, stainless steel, one-liter canisters were equipped with in-line particulate filters and integral controllers to control the rate of filling during sampling. SV samples were collected through Teflon® tubing attached to the stainless-steel Vapor Pins® or vapor implants. Each sampling location was routinely inspected during the sampling period to ensure appropriate operation of sampling devices, sample integrity, and to document conditions within the area that might affect results.

Samples were collected by opening the valve on the canister, which allowed air to enter the canister at the rate set by the controller (one liter canister over a period of one hour [SV] and over a period of eight hours [IA]). Controllers were calibrated in the laboratory and shipped to the field with a sufficient flow rate that would maintain the necessary vacuum pressure in the Summa® canister for the one-hour and eight-hour sampling intervals. Samples were collected and analyzed for VOCs by TO-15. SV samples were collected in accordance with standard operating procedures developed by the USEPA Environmental Response Team for soil vapor sampling (USEPA, 1996), and methodologies developed by the USEPA Office of Research and Development (USEPA, 2004).

After sampling had been completed, each canister was closed and sent to an off-site laboratory (TestAmerica, Inc. in Knoxville, Tennessee) under proper chain of custody procedures. No issues (e.g., no faulty regulators or Summa® canisters) were encountered while sampling, and all samples had sufficient volume for analysis.

Five IA samples from Building C (144-C, 145-C, 146-C, 150-C, and 152-C) were collected in the machine shop of the Lockheed Martin Rotary and Mission Systems (RMS) (formerly the Lockheed Martin Mission Systems & Training [MST] mechanical prototype laboratory [MPL]). Monitoring continues in this area, because TCE was detected in IA at a concentration greater than its screening level during Round 15 (August 2013). The five sampling locations that provide data for possible worker-exposure areas within the MPL are:

- 144-C: machine shop area
- 145-C: cubicle area
- 146-C: kitchen area
- 150-C: kitchen area
- 152-C: machine shop area

Five SV samples (three in the eastern wall of the Building A basement [170-A, 171-A and 173-A], one in the Building A basement floor [174-A], and one beneath the main floor of Building A [168-A], were collected during Round 24 to target possible TCE sources, including a former underground storage tank and vapor degreasers associated with former plating shop operations.

The SSD systems in the Building C basement area and the Building A plating shop were shut down approximately 24 hours before sampling began. The SSD systems were restarted within one hour after sampling had been completed in Buildings A and C; this is consistent with previous monitoring episodes. The following observations were recorded during the February 2018 sampling:

- Mean outdoor ambient temperature during the sampling period was 54 degrees Fahrenheit (°F) on February 20, 2018 and 64°F on February 21, 2018. Barometric pressure decreased during the sampling period, from 30.39 inches of mercury (in. Hg) to 30.29 in. Hg. Wind direction on February 20 and February 21, 2018 was from the southeast, and average wind speed ranged from calm to 12 miles per hour (mph). Skies were mostly cloudy and overcast on February 20 and February 21, 2018.
- No precipitation (rain) was recorded on February 20 and February 21, 2018.

- Water was present in the flush-mounted vault (shallow subsurface groundwater accumulation) at sampling locations SV-076-A, SV-121-B, and SV-140B, so no samples could be collected. Alternate samples were collected at nearby locations SV-095-A, SV-101-B, and SV-100-B, respectively.

- IA and SV samples from 118-A were collected in the bond-layup room (Building A production floor), where a positive-pressure air-conditioning system was operating.

- Sampling location 015-A is in the former plating shop area (Building A production floor). After the sampling round in August 2015, the area had undergone construction and redevelopment. A new floor has been installed and this area is now an extension of the bond-layup room. IA and SV samples from 015-A were collected in this newly expanded bond-layup room (former plating shop), where a positive-pressure air-conditioning system was operating.

- Sampling locations 018-A, 093-A, 116-A, and 138-A were collected in the Building A basement. Select samples from the basement were added to the sampling program due to the ongoing TCE VI investigation. These include three additional locations in the eastern wall (170-A, 171-A, and 173-A) and one in the floor (174-A).

- The air-purifying units in the Building A basement were operating when samples were collected.

- The sample from 168-A was collected near the location of a former vapor degreaser on the main floor of Building A. Nearby construction (breaking up the floor with a jackhammer) was underway during sampling; however, floor to ceiling plastic sheeting isolated the construction area.

- A large industrial fan was operating near the sampling location 076-A during sampling.

- IA and SV samples at 001-C and 004-C were collected approximately 70 feet from a bay door to the outside that was opened intermittently.

- Samples IA-144-C through IA-146-C, IA-150-C, and IA-152-C were collected in a positive-pressure, air-conditioned room (the RMS MPL machine shop).

- Building A is a one-story building, except for a basement corridor under an open-air loading dock on its western side. Roof vents approximately 50 feet above the work floor were open in Building A during Round 24 sampling. The large doors at the loading docks on the western side of the building were also open to allow carts, forklifts, personnel, and equipment to pass. Increased ventilation associated with open doors and roof vents might have affected concentrations in samples collected on the first floor of Building A. No personnel or other activities were observed in the Building A basement.

- The bay doors across the southern end of Building B were closed during sampling. The automatic bay door at the southeastern corner of Building B was opened and closed quickly

to allow carts and equipment to pass. The opening of the bay door might affect concentrations in samples collected from the southernmost sampling locations (IA-100-B and IA-101-B). Open roof vents were also observed in Building B during sampling.

- The Building C basement is generally accessed via two automatic rolling doors on its eastern and southern sides. These doors open and close quickly to allow carts and forklifts to pass. The automatic rolling door approximately 40 feet east of sampling location 141-C was opened and closed intermittently during the day. The bay doors at the southern and southeastern sides of the Building C basement were open during the sampling period. This might have influenced IA concentrations in the samples collected from locations 001-C and 004-C.

- The most personnel and greatest activity were observed at the MRC in Building B, in locations from the thrust-reverser assembly area in the southern portion of the building to the machining area in its central portion. Less activity was observed in Building A, where activity was generally focused in the expanded bond-layup room (former plating shop area) and autoclave areas, and in the parts and assembly areas. No activity was observed in the southern portion of Building C. Light activity (three people) was observed in the machine shop area in Building C basement.

- The southern end of the Building C basement is now vacant, having been cleared of workstations and equipment by MRA Systems, Inc. (MRAS). Some materials are being temporarily stored in this area.

- The pressure gauges on most Summa® canisters responded instantaneously upon opening the valve by dropping to between -26 and -30 in. Hg. Three pressure gauges (SV-075-A, IA-018-A, and IA-141-C) had beginning pressures of -24 in. Hg. The readings on pressure gauges of most Summa® canisters were between 0 and -4 in. Hg when sampling was complete. The pressure gauge for IA-018-A showed an end pressure of -20 in. Hg and the pressure gauge for IA-126-C showed an end pressure of -6.5 in. Hg. Despite these varied pressure readings, all regulators operated properly, and adequate volumes for analysis were collected in all Summa® canisters. Pressure readings for each Summa® canister are recorded on the chain of custody forms (Appendix A).

Samples were analyzed for the current target-compound list, last amended on February 12, 2012:

- 1,1,1-trichloroethane (1,1,1-TCA)
- 1,1,2-trichloroethane (1,1,2-TCA)
- 1,1-dichloroethane (1,1-DCA)
- 1,1-dichloroethene (1,1-DCE)
- 1,2,3-trimethylbenzene (1,2,3-TMB)
- 1,2,4-trichlorobenzene
- 1,2,4-trimethylbenzene (1,2,4-TMB)
- *cis*-1,2-dichloroethene (*cis*-1,2-DCE)
- dichlorodifluoromethane
- ethylbenzene
- methylene chloride
- methyl-tertiary-butyl ether (MTBE)
- naphthalene
- tetrachloroethene (PCE)

- 1,2-dichloroethane (1,2-DCA)
- 1,3,5-trimethylbenzene (1,3,5-TMB)
- benzene
- carbon tetrachloride
- chlorodifluoromethane (Freon 22)
- chloroform
- toluene
- *trans*-1,2-dichloroethene (*trans*-1,2-DCE)
- trichloroethene (TCE)
- vinyl chloride (VC)
- xylenes (total)

All samples collected during Round 24 were submitted to TestAmerica in Knoxville, Tennessee for analysis via GC/MS using cryogenic concentration (as described in Sections 9 and 10 of USEPA Method [Toxic Organic-15] TO-15 [USEPA, 1999]). This method was used because of its low detection limit (in the parts-per-billion by volume range), and because it can quantify all VOCs of concern. TestAmerica is certified in USEPA Method TO-15 analysis and meets all quality assurance/quality control requirements specified in the TO-15 methodology.

All samples were stored at ambient temperatures and shipped to the laboratory via overnight carrier. All samples were submitted and analyzed within the method's specified 30-day holding time. All appropriate chain of custody documentation was completed for each sample (see Appendix A). A table listing TestAmerica's method detection limits is in Appendix B; Appendix C contains the laboratory analytical reports. Data-validation reports and supporting documentation are in Appendix D.

Validated analytical data were qualified in accordance with USEPA *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2017a). Attaching data qualifiers to analytical results signifies a quality-control noncompliance. During Round 24, the following data qualifiers were applied to data after validation if applicable:

- *J*—indicates an estimated result below the reporting limit or an estimated result greater than the reporting limit with a quality control nonconformance.
- *U*—indicates the chemical was not detected at the numerical detection limit (i.e., the sample-specific quantitation limit).
- UJ—indicates the chemical was not detected at the (estimated) numerical detection limit (i.e., the sample-specific quantitation limit).

No results were rejected during data validation.

SECTION 3
ROUND 24 RESULTS

All analytical results for indoor air (IA) and background (ambient air) samples were compared to screening levels for industrial air; these levels are based on United States Environmental Protection Agency (USEPA) *Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites* (USEPA, 2017b). Screening the chemicals of concern (COC) uses the lower of the carcinogenic (*ca*) or noncarcinogenic (*nc*) values. Carcinogenic values are based on a 1×10^{-5} (i.e., a one-in-100,000 probability) excess cancer-risk, whereas the noncarcinogenic values are based on a hazard quotient of 1 (i.e., the "no adverse effect" level).

These risk benchmarks were selected in accordance with Maryland Department of the Environment (MDE) requirements. Analytical results were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits.

Sub-slab vapor (SV) sampling results were compared to SV screening values derived in accordance with the methods discussed in USEPA's *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to Indoor Air* (USEPA, 2015), and were calculated by dividing indoor-air (IA) screening levels by a conservative attenuation factor (AF) of 0.03. The AF represents the adjustment applied to IA screening levels to account for concentration reductions due to diffusive, advective, and/or other attenuating mechanisms as vapor migrates from the sub-slab to IA. Simply stated, SV is expected to dilute upon movement into IA; the AF is the ratio of the IA concentration to its SV concentration under a conservative vapor-intrusion (VI) scenario. The recommended AF in the 2015 USEPA guidance results in higher SV screening values than those used for sampling rounds before August 2012, when an earlier USEPA AF of 0.1 was used. USEPA further acknowledges that applying the AF of 0.03 to industrial buildings is conservative (i.e., more protective of human health and the environment), because the

value was developed based on residential VI studies and does not account for industrial buildings that generally have thicker building slabs and stronger heating/ventilation/air-conditioning (HVAC) systems than residential homes.

3.1 ROUND 24 DATA ANALYSIS

The sampling-round designation (R24) is not included when identifying samples or sampling locations in the following text or tables, because all data discussed in this section are from Round 24. For example, an IA sample collected from vapor monitoring point (VMP) 076 (e.g., sample IA-076-A-R24) is referred to as "076-A." If comparisons are made to specific samples from previous sampling rounds, they will be identified as such in the text or by using the round-designation suffix (e.g., R06 for Round 6).

Descriptive statistics for Round 24 IA and SV samples are shown in Tables 3-1 and 3-2, respectively. Summary statistics for trichloroethene (TCE) and naphthalene in IA over time are shown in Tables 3-3 and 3-4, respectively. Figures 3-1, 3-2, and 3-3 show Round 24 exceedances in Buildings A, B, and C, respectively. The following chemicals were detected in Round 24 IA and/or SV samples at concentrations exceeding their respective MDE industrial risk-management benchmarks:

- IA—naphthalene
- SV—1,1-dichloroethane (1,1-DCA), naphthalene, TCE, and vinyl chloride (VC)

Building A—Tables 3-5 and 3-6 present the Building A IA and SV results, respectively. Locations with exceedances are shown in Figure 3-1. Naphthalene in IA exceeded its screening level (3.6 micrograms per cubic meter [µg/m^3]) at location 018-A (in the basement), with concentrations of 5.7 µg/m^3 and 4.8 µg/m^3 in the parent and duplicate samples, respectively. Note that location 018-A is within the radius of influence of the SSDS, as shown in Figure 3-1, indicating that the presence of naphthalene in IA is likely due to IA sources. Naphthalene was detected in three of 16 Building A SV samples, at locations 075-A (84 µg/m^3), 081-A (4.8*J* µg/m^3), and 116-A (1.4*J* µg/m^3), but at concentrations less than the SV screening level (120 µg/m^3). No other IA concentrations exceeded screening levels during Round 24.

TCE has periodically been detected in IA in the Building A basement at concentrations greater than its IA screening level (8.8 µg/m^3), beginning with Round 15, but has not exceeded the Building A basement-specific screening level of 35 µg/m^3 that MDE approved in 2017. The basement screening-level was developed to account for reduced exposure potential in the basement, as compared to the main floor of Building A. Access to the basement is controlled by management and signage. TCE was detected in IA at all four Round 24 Building A basement sampling locations (018-A, 093-A, 138-A, and 174-A), but at concentrations less than its screening level (2.1 and 2.5 µg/m^3 [parent and duplicate samples], 3.4 µg/m^3, 2.2 µg/m^3, and 2.7 µg/m^3, respectively). This is the second sampling round since vapor extraction began at the HRS5 sump. This sump has been identified as the primary contributor of TCE impacts to indoor air in the Building A basement. Vapor is now being extracted there continuously under normal SSDS operating conditions; however, per sampling protocol, the SSDS was temporarily shut down for approximately 24 hours before starting IA and SV sampling and restarted immediately after sampling had been completed. Likewise, Round 24 TCE concentrations in first-floor Building A IA samples did not exceed screening levels.

SV TCE exceeded its screening level (293 µg/m^3) at five locations (118-A, 136-A, 168-A, 171-A, and 173-A) in the central portion of Building A within or near the radii of influence of the SSD systems. TCE SV exceedances were also observed at two of the same locations (118-A and 136-A) during several recent sampling rounds (e.g., Rounds 18 through 23). Round 24 SV concentrations at locations 118-A and 136-A are similar to SV concentrations detected at these locations during Round 23. TCE concentrations at SV 118-A in Rounds 19, 20, 21, 22, 23, and 24 (900 µg/m^3, 2,300 µg/m^3, 890 µg/m^3, 2,000 µg/m^3, 690 µg/m^3, and 1,500 µg/m^3) are all considerably less by approximately one order of magnitude (i.e., a power of 10) than the concentration detected at this location in Round 18 (13,100 µg/m^3). TCE concentrations at SV 136-A in Rounds 21, 22, 23, and 24 (850 µg/m^3, 300 µg/m^3, 790 µg/m^3, and 380 µg/m^3, respectively) have decreased by a factor of approximately 100 since the SSDS was expanded to this location in 2016, after a reported TCE-vapor concentration of 35,000 µg/m^3 during Round 20. Sampling location 168-A was added in Round 22. SV TCE concentrations at this location exceeded the screening level in Rounds 22 through 24 (22,000 µg/m^3, 8,300 and 7,900 µg/m^3 for original and duplicate, and 1,300 µg/m^3), respectively, but notably decreased over time.

Sampling locations 171-A, and 173-A were added in Round 22. Sampling locations 171-A and 171-3 are in the eastern wall of the Building A basement. SV TCE concentrations at these locations exceeded the screening level in Rounds 22 through 24. SV TCE concentrations did not exceed the screening level at locations 170-A and 174-A during Round 24 sampling, but exceedances were detected there during Rounds 22 and 23; these locations were also added in Round 22 in the Building A basement. No other SV concentrations exceeded screening levels during Round 24.

SV detections of ethylbenzene (6,300 µg/m^3) and total xylenes (19,000 µg/m^3) at location 139-A during Round 23 (the previous round) exceeded their respective screening levels (1,633 µg/m^3 and 14,667 µg/m^3). Round 23 SV detections of ethylbenzene and total xylenes at the remaining SV locations in Building A were at least two orders of magnitude less than the concentrations detected at 139-A. SV concentrations of ethylbenzene and total xylenes at location 139-A have not exceeded their respective screening levels during recent sampling rounds before Round 23 (e.g., Rounds 20 through 22); however, historical exceedances of these VOCs have been noted in Building A, with the most recent occurring in Round 11 for both ethylbenzene and total xylenes (at location 107-A, which was sampled for SV during Rounds 10 through 13). Per the work plan, location 139-A was not sampled during Round 24 because of the lack of exceedances during Rounds 20 through 22. All SV detections of ethylbenzene and total xylenes were less than their screening levels during Round 24, including those at nearby location 079-A, the closest location to 139-A that was sampled during Round 24.

Building B—Tables 3-7 and 3-8 present Building B IA and SV results, respectively. No IA or SV exceedances were noted in Building B during Round 24. Sampling locations within Building B are shown in Figure 3-2. Similarly, no exceedances were noted in Building B IA or SV samples during Rounds 19 through 23. During Round 18, only one slight exceedance of naphthalene was noted in Building B IA, and this concentration only marginally exceeds its screening level. No exceedances were noted in Building B IA or in SV samples during Round 17.

Building C—Tables 3-9 and 3-10 present Building C IA and SV results, respectively. No IA exceedances were detected in Round 24 samples. TCE was not detected in any IA samples. TCE exceedances in SV were noted for five locations (Figure 3-3): 060-C (400 µg/m^3), 102-C (1,500 µg/m^3), 126-C (540 µg/m^3), 133-C (2,000 µg/m^3), and 141-C (310 µg/m^3). The SV

TCE concentrations at 102-C and 126-C also exceeded the screening level during Rounds 22 and 23. SV TCE exceedances were detected at locations 001-C and 113-C during Round 21, but not during Rounds 22 through 24. SV TCE exceedances at location 152-C were noted during Rounds 22 and 23, but not during Round 24.

A VC exceedance (2,700 µg/m^3) above its screening level (933 µg/m^3) was also detected at 126-C. VC exceedances were also noted in SV at location 126-C during Round 18 (1,310 µg/m^3), Round 19 (16,000 µg/m^3), Round 20 (3,100 µg/m^3), Round 21 (5,000 µg/m^3), Round 22 (2,600*J* µg/m^3), and Round 23 (3,300 µg/m^3). The locations of TCE SV exceedances in Building C during Round 24 are sporadic, and do not follow an observable spatial pattern. However, VC exceedances in SV have consistently been observed at location 126-C during recent sampling rounds (i.e., in Rounds 12–24). In addition to the screening level exceedances discussed above, SV exceedances of 1,1-DCA (5,600 µg/m^3) and naphthalene (180*J* µg/m^3) were also detected at 102-C during Round 24 (screening levels are 2,567 and 120 µg/m^3, respectively). These exceedances are similar to those noted at location 102-C (5,900 µg/m^3 for 1,1-DCA, and 180 µg/m^3 for naphthalene) during Round 23. SV exceedances of 1,1-DCA (3,900 µg/m^3) and naphthalene (310 µg/m^3) at 102-C also occurred during Round 22, but not during Round 21.

During Round 24, IA and SV concentrations of tetrachloroethene (PCE) did not exceed screening levels. During Round 18, an IA exceedance of PCE was detected (870 µg/m^3, as compared to its IA screening level of 180 µg/m^3) in a resample (collected because the TCE concentration approached but did not exceed the screening level in the parent sample), but that was not the case in the parent sample collected at location 149-C during Round 18. Before Round 18, PCE had never been detected in IA or SV in Building C. Additionally, IA and SV concentrations of PCE detected in Rounds 19 through 23 did not exceed screening levels. In most SV samples collected over the course of these investigations from locations at and near location 149-C, concentrations of PCE are typically below detection limits. The preponderance of evidence suggests that the elevated PCE concentration at location 149-C during Round 18 is anomalous, and possibly attributable to some IA source rather than to VI.

3.2 BACKGROUND AMBIENT-AIR SAMPLES

Outdoor-air-quality (i.e., background) samples provide baseline concentrations for COC that can be compared to interior concentrations. Comparison to background indicates whether chemicals detected in IA are more likely associated with an exterior (i.e., background) or interior source (e.g., chemicals used in the workplace, or with past spills of chemicals absorbed to above-slab building materials, or sub-slab sources). Analytical results for Round 24 ambient (background) air samples are shown in Table 3-11. Figure 2-1 shows the background sampling locations used for Round 24; these locations are sufficiently far from site operations to avoid any possible site influence.

Table 3-12 lists chemicals detected in background samples and compares IA concentrations to the maximum detected background concentration. Nearly all chemicals detected in background samples were also detected in IA samples; the only exception is 1,1-DCA, which was detected in ambient air but not in indoor air. All background concentrations are below their respective screening criteria. Table 3-12 evaluates whether chemical concentrations detected in IA are possibly due to interior sources, or if they simply reflect background conditions, using the following logic:

- When IA concentrations are equal to or less than background concentrations, IA concentrations likely reflect background conditions.
- When IA concentrations are greater than background concentrations and/or sub-slab concentrations, other interior sources are possibly contributing to IA concentrations.
- The presence of chlorinated degradation-products in IA samples (at concentrations less than those detected in SV samples), but not in background samples, suggests that sub-slab sources might contribute to these IA concentrations.

In Round 24, only IA concentrations of naphthalene at location 018-A (in both parent and duplicate samples) exceed the MDE risk-management benchmark. This location is within the Building A SSDS radius of influence, indicating that the presence of naphthalene in IA is likely due to IA sources. Naphthalene was not detected in background samples, and only one of its SV concentrations, detected in Building C and not Building A, is greater than the VI screening level.

Round 24 IA concentrations of other COC exceeding their respective screening levels in SV samples (i.e., 1,1-DCA, TCE, and VC) were either not detected, or were less than their screening levels. Naphthalene and VC were not detected in background samples, indicating that any concentrations of these chemicals detected in IA are likely not attributable to background. 1,1-DCA and TCE were detected in background samples at maximum concentrations of 3.2 µg/m^3 and 0.72 µg/m^3, respectively. The maximum IA concentration of TCE was 3.4 µg/m^3, and five of seven TCE concentrations detected in IA exceed the maximum background concentration of TCE, indicating that SV and other interior sources are possibly contributing to TCE IA results. 1,1-DCA was not detected in any IA sample, indicating IA concentrations were not influenced by background concentrations.

The IA concentrations for all remaining SV contaminants are less than screening levels; their IA concentrations span a range above and below background concentrations. As presented in Table 3-12, chemicals with most of their indoor air detections below background (carbon tetrachloride, chloroform, dichlorodifluoromethane, 1,1-DCE, ethylbenzene, methylene chloride, toluene, and total xylenes) are likely influenced by ambient background contaminant sources. The remaining IA contaminants might be due to IA sources, and/or ambient background conditions; in any case, all remaining IA contaminants are below screening levels in Round 24.

SECTION 4
SUB-SLAB-DEPRESSURIZATION-SYSTEM DATA ANALYSIS

This section summarizes the operation and monitoring of the sub-slab-depressurization (SSD) systems (SSDS) in Buildings A and C for the reporting period from October 1, 2017 to March 31, 2018. A detailed account of these activities is in the April 24, 2018, remedial action progress report (Appendix E). The location and layout of the SSD systems, and associated sub-slab-vapor (SV) extraction points and vapor monitoring points (VMPs), are shown in Figures 1, 2, and 4 of Appendix E. This section discusses SV sampling results, extraction points, system influent, vacuum influence, and SSDS performance.

4.1 SUB-SLAB-VAPOR MONITORING POINTS

Tables 4-1 and 4-2 summarize the concentrations of target volatile organic compounds (VOCs) detected at SV monitoring points to date in the Building A lay-up room (former plating shop on the main floor), basement, and eastern area (on main floor), and in the Building C basement, respectively.

4.1.1 Building A

SV samples collected to date near the Building A SSDS are listed in Table 4-3. VMPs 015-A and 018-A (on the main floor of Building A); 078-A, 079-A and 136-A (on the eastern area of Building A); and 093-A and 116-A (in the basement of Building A) were sampled in February 2018 (see Figure 2 in Appendix E). VMPs 015-A (on the main floor of Building A) and 018-A (in the basement) have been scoped to be sampled regularly as part of the facility-wide semiannual sub-slab and indoor-air monitoring program (see Figure 2 in Appendix E). However, VMP 018-A has not been sampled since February 2014, because water regularly collects in its flush-mounted vault.

Both 015-A and 018-A are within the measured SSDS radius of influence. The highest sub-slab SV trichloroethene (TCE) concentrations were detected at VMPs 015-A, 018-A, 079-A, and 136-A, before and after the SSDS began operation, are shown in Table 4-4. The concentrations detected at these VMPs in February 2018 are one to three orders of magnitude (i.e., 10 to 1,000 times) lower than the concentrations detected before the Building A SSDS began operation.

While a significant decline has been observed at 015-A, overall TCE concentrations continue to fluctuate over time. For example, TCE was detected at an estimated 2.3 micrograms per cubic meter ($\mu g/m^3$) in February 2017, at 51.5 $\mu g/m^3$ in August 2017, and at 6.3 $\mu g/m^3$ in February 2018 (Figure 4-1). VOC-impacted groundwater likely provides a continuing source of VOCs in soil vapor at 015-A. Similar fluctuations have also occurred at 018-A, between August 2011 and February 2014. Sub-slab vapor concentrations of TCE vary with rainfall, based on results from the continuous air-monitoring study, changes in water levels, and changes in barometric pressure.

VMPs 079-A and 136-A are near extraction points installed during the system expansion completed in April 2016. The February 2018 results show that these locations have had more than a 90% decrease in total VOCs since the SSDS was expanded. Figure 4-2 shows that the August 2017 results at these two points are higher than both the February 2017 and February 2018 results, due to what appears to be seasonal fluctuation.

VMP 168-A is near the system extraction point SSD-39-A, installed during the third-phase of system expansion completed in July 2017. This location showed VOC concentration decreases in February 2018 (1,300 $\mu g/m^3$ TCE) as compared to August 2017 (8,100 $\mu g/m^3$ TCE) and February 2017 (22,000 $\mu g/m^3$ TCE, detected before third-phase expansion). Concentrations observed after SSDS startup were generally lower than concentrations detected before the system began operation. VOC reductions at 018-A (in the basement) might be more limited than those experienced at main floor VMPs, because the shallow groundwater table (typically less than one foot below the basement slab) possibly impedes vapor flow.

4.1.2 Building C

SV samples collected to date near the Building C SSD system are listed in Table 4-5. These points are within 100 feet of the Building C SSD-system extraction points in the basement; most[2] are within the vacuum influence of SSD-system operations. VMPs 001-C, SSD-4-C (in the southern basement area) and 060-C, 088-C, 113-C, 126-C, 133-C, 141-C, 149-C, 152-C, 153-C, and 155-C (in the mid-basement area) were sampled in February 2018 (see Figure 4 in Appendix E).

The highest TCE concentrations were observed at VMPs near the SSD system before it began operation. The most recent concentrations (sampled during SSD system operation) are summarized in Table 4-6. The February 2018 TCE concentrations are lower than the concentrations measured before SSD-system startup. Compared to the concentrations measured in the previous semiannual event (August 2017), VMPs 001-C, SSD-4-C, 113-C, 126-C, 149-C, 153-C, and 155-C have similar TCE concentrations; TCE at location 152-C is lower than the concentration detected during the last semiannual event (210 µg/m^3 compared to 1,400 µg/m^3; see Table 4-2 and Figure 4-3), whereas 133-C and 141-C have higher TCE concentrations than the most recent sampling events in September 2014 and August 2015, respectively.

Concentrations of vinyl chloride (VC) observed at 126-C have also decreased since the SSD-system expansion (see Figure 4-4), but, as shown on Figure 4-4, VC concentrations in sub-slab vapor at 126-C have varied over time (the VC concentrations in August 2017 and February 2018 were 3,300 µg/m^3 and 2,700 µg/m^3). The reason for these fluctuations is difficult to determine, but might possibly be due to seasonal fluctuation (see 2015, 2016, 2017, and 2018 results in Figure 4-4). VC has not been detected in SSDS influent samples or in groundwater samples collected in March 2017 from a nearby well pair (MW-88A/B).

4.2 SUB-SLAB-VAPOR EXTRACTION POINTS

The Building A and Building C sub-slab-vapor extraction points are not sampled as part of the semiannual monitoring program, because the combined influent for the Building A system is sampled monthly, and the Building C system is sampled every two months. Figure 2 in Appendix E shows the Building A extraction points (North, South, Basement North, and Basement South),

[2]Locations 001-C, SSD-4-C, 060-C, 113-C, 127-C, 133-C, 135-C, 149-C, 152-C, 153-C, 155-C, and 156-C

horizontal extraction laterals, extraction pipe from basement sump HRS-5, and vertical extraction points in Building A (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, SSD-38-A, and SSD-39-A). Figure 4 in Appendix E shows the vertical extraction points in Building C: SSD-21-C, SSD-23-C, SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C.

4.3 VACUUM INFLUENCE

Induced vacuum levels over time for sub-slab VMPs in the targeted areas are shown on the following figures in Appendix E: Figure 6 (Building A lay-up room and basement), Figure 7 (Building A eastern area), Figure 8 (Building C southern basement area), and Figure 9 (Building C mid-basement area). Representative vacuum measurements from the March 20, 2018 monitoring are indicated on plan views on Figures 10, 11, 12, and 13 of Appendix E. Vacuum influence associated with SSDS VMPs is checked biweekly. The target vacuum is 0.01 inches of water column or greater. As indicated in the April 2018 progress report (Appendix E), extraction trenches near the Building A lay-up room induce a vacuum equal to or greater than 0.01-inches water column over an approximately 5,900-square-foot area; this area encompasses all SV monitoring points that had elevated VOC concentrations before system startup. The trenches in the Building A basement induce a vacuum over an approximately 2,500-square-foot area that encompasses the four VMPs used to measure the SSDS induced vacuum in the basement. The extraction wells in the eastern area of Building A induce a vacuum over an approximately 6,100-square-foot-area, and encompass nine of 17 VMPs used to measure the SSDS induced vacuum in that area. Extraction point SSD-39-A in the western area of Building A is inducing vacuum at one of two nearby VMPs; the associated area of induced vacuum influence is approximately 1,100 square feet.

The Building C basement wells induce vacuum influence over an approximately 4,900-square-foot area in the southern end of the basement, whereas the extraction wells in the mid-basement area induce vacuum influence over an approximately 28,000-square-foot area. In the mid-basement, 13 of 20 monitoring points are within the target area shown to have vacuum influence. Vacuum influence has not been observed at the northern end of the mid-basement area; possible reasons include high groundwater levels, subsurface preferential pathways, short-circuiting, and/or

blockages. However, total VOC concentrations at VMP 126-C (outside the area of demonstrated vacuum influence) have decreased by more than 85% since the system was expanded in May 2013.

4.4 INFLUENT-VAPOR SAMPLES

Influent-vapor samples are collected monthly to monitor the Building A SSDS operation, and once every two months to monitor the Building C SSDS operation. VOC concentrations at the granular activated-carbon (GAC) influent, midpoint (after the lead drum), and effluent (after the second drum) points are monitored to determine when the midpoint concentration reaches 50% of the influent; when the 50% breakthrough is reached, or at Tetra Tech's discretion with concurrence from Lockheed Martin Corporation (Lockheed Martin), the lead GAC drum is changed out. These samples also allow monitoring of influent-concentration trends over time. Samples were collected directly from all three sampling ports of both SSD systems by connecting a clean one-liter Summa® canister (batch certified) to the Teflon® tubing of each sampling port and opening the valve for approximately one minute. The samples were submitted to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee for VOC analysis using United States Environmental Protection Agency (USEPA) Toxic Organic Method (TO-15).

Tables 4-7A and 4-7B summarize the influent-vapor concentrations of target VOCs in samples over time (from system startup in March 2008 through March 2018). These results are displayed graphically on Figures 14 and 15 in Appendix E. Tables 4-7A and 4-7B provide average influent concentrations for the current (October 2017–March 2018) and previous (April-September 2017) reporting periods. The six-month average-influent (total) VOC concentrations in Building A and Building C during the current reporting period (1,616 µg/m^3 for Building A and 76 µg/m^3 for Building C) are similar to those observed during the previous semiannual reporting period (1,565 µg/m^3 for Building A and 81 µg/m^3 for Building C). Overall, influent VOC concentrations for both SSD-systems have been relatively stable or slowly decreasing since 2009 (see Figures 14 and 15 in Appendix E).

The goal of the SSD systems is to maintain a negative pressure below the slab (relative to the room space), thus minimizing VOC migration from the sub-slab soil into indoor air. VOC-mass removal occurs while vapor is drawn out to maintain the vacuum. VOC removal rates for SSDS influent-mass in Building A range from 0.04 to 0.06 pounds per day (lbs/day); these rates are practically

the same as the removal rates observed in the previous semiannual reporting period (0.04–0.07 lbs/day).

The Building A system has removed nine pounds (lbs) of VOCs during this reporting period, 9.3 lbs in the previous reporting period, and 170 lbs since system startup in March 2008. The VOC removal rate in Building C during the current reporting period was also the same as the rate during the previous semiannual reporting period, approximately 0.001 pounds per month (lbs/month). The Building C SSDS has removed 0.23 lbs of VOCs this reporting period, 0.24 lbs in the previous reporting period, and 11.8 lbs since system startup in March 2008.

4.5 SYSTEM PERFORMANCE

In general, flow rates and induced vacuums for the SSD systems are performing as designed, except for a lack of induced vacuum near SSD-136-A in the eastern area of Building A, and near SSD-29-C and SSD-34-C in the northern portion of the mid-basement area of Building C. We will continue to monitor system-induced vacuum performance; however, some localized areas are likely to remain not amenable to induced vacuum, due to the heterogeneous structure of subsurface soil and water accumulation in the subsurface of old structures. The induced-vacuum influence of the Building A system is at least 0.05 inches water column over 5,900 square-feet on the main floor (encompassing the lay-up room), 2,500 square-feet in the basement, and 7,100 square-feet in the northern and eastern areas. The induced-vacuum influence of the Building C SSDS is at least 0.05 inches water column and extends over an approximately 4,900 square-foot area in the southern basement and over approximately 31,000 square-feet in the mid-basement area.

SECTION 5
CONCLUSIONS

5.1 CONCLUSIONS

Tetra Tech, Inc. (Tetra Tech) has completed Round 24 of vapor-intrusion (VI) monitoring (the first of two scheduled in 2018) in Buildings A, B, and C at the Middle River Complex (MRC) (owned by LMC Properties, Inc.) in Middle River, Maryland. This ongoing investigation seeks to evaluate whether volatile organic compounds (VOCs) in sub-slab vapor (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air (IA) at the Middle River Complex facilities. The data set is composed of indoor-air and sub-slab-vapor (SV) samples collected in February 2018. Ambient air samples were also collected at four outdoor background locations around the perimeter of the Middle River Complex. All data were validated to ensure compliance with analytical method requirements.

Indoor air (IA) data were compared to risk-based screening levels for industrial air set at the 1×10^{-5} (i.e., one-in-100,000 probability) risk level for carcinogens, or at a hazard quotient of 1 for noncarcinogens (as published in the United States Environmental Protection Agency [USEPA] *Regional Screening Levels for Chemical Contaminants at Superfund Sites* [USEPA, 2017b]). For samples collected in the Building A basement only, indoor air levels of trichloroethene (TCE) were compared to a Maryland Department of the Environment-approved basement-specific screening level of 35 micrograms per cubic meter ($\mu g/m^3$), based on the limited exposure potential for workers entering the basement. Indoor air samples were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits. SV data were compared to screening values derived using methods described in *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to*

Indoor Air (USEPA, 2015) by applying an attenuation factor of 0.03 to the indoor-air screening-values.

Historically, trichloroethene and naphthalene have been the prevalent contaminants of concern in indoor air at this site; however, in Round 24, trichloroethene was not detected in indoor air in Buildings B or C but was detected below its screening level in indoor air in Building A (see plan view in Figure 5-1). The reduced trichloroethene indoor air concentrations in the Building A basement are attributable to sealing and extracting vapors from basement sump HRS5; this sump was connected to the Building A sub-slab-depressurization system in June 2017. Trichloroethene was detected in seven of 35 indoor air samples collected during Round 24.

Naphthalene was detected in indoor air at a concentration above its screening level at one location in Building A (018-A), in both the parent and duplicate sample. This location is within the system's radius of influence, indicating that these detections likely derive from indoor sources. Location 018-A was the sole naphthalene detection in indoor air in Round 24; it was not detected in indoor air in Buildings B or C.

5.1.1 Building A

Basement

- Trichloroethene was detected in indoor air at all four Building A basement sampling locations, but at concentrations less than its basement-specific screening level (35 µg/m^3), derived to account for reduced potential exposure in the basement, and less than the industrial worker screening level (8.8 µg/m^3). Historical indoor-air trichloroethene concentrations in the Building A basement have never exceeded the basement-specific screening level, but have exceeded the industrial screening level. Trichloroethene was detected in vapor samples collected from the basement wall at locations 171-A and 173-A at concentrations greater than the sub-slab-vapor screening level. Direct measurement of air above the sumps and of air trapped in the covered sumps indicates that the sumps and drains in the Building A basement are the sources of the trichloroethene.

- Naphthalene was detected in indoor air at Building A basement sampling location 018-A (5.7 µg/m^3) at a level marginally greater than its screening level (3.6 µg/m^3). However, it was only detected in one basement sub-slab vapor sampling location (116-A) at a concentration of 1.4*J* µg/m^3, less than its screening level of 120 µg/m^3. The low-level sub-slab vapor concentration of naphthalene and its absence in ambient air samples suggest that it is likely due to indoor air sources.

Main floor

- Trichloroethene was detected in sub-slab vapor at locations 118-A (1500 µg/m^3), 136-A (380 µg/m^3), and 168-A (1300 µg/m^3) at concentrations greater than the screening level (293 µg/m^3). These sampling locations are within or near the radii of influence of the sub-slab depressurization systems. Indoor air concentrations of trichloroethene on the main floor of Building A were all less than the screening level.

The sub-slab-depressurization system in Building A appears to be operating as designed and appears to be effectively mitigating sub-slab-vapor intrusion from known source areas of sub-slab-vapor contamination, in concert with the indoor-air filtration units and control of vapor emissions from the sumps. Contaminants are constantly removed from soil vapor during system operation, and indoor air concentrations in the main part of Building A (excluding the basement) rarely exceed screening values. Filter cartridges are changed-out quarterly; no other maintenance is required.

Although basement occupancy is restricted and screening levels related to restricted occupancy are not exceeded, this area will continue to be monitored as the sub-slab-depressurization system continues to operate. Figures 5-2A, 5-2B, and 5-2C display the Round 24 sub-slab-vapor and indoor-air exceedances from the basement and first-floor sampling locations in Building A. Direct measurement of air above the sumps and of air trapped in the covered sumps indicates that the sumps and drains in the Building A basement are the trichloroethene sources.

5.1.2 Building B

No exceedances were noted in the Building B indoor air or sub-slab-vapor samples during Round 24. The most recent exceedance of the indoor air screening level was during Round 18 (February 2015).

5.1.3 Building C

Trichloroethene was not detected in any indoor air samples collected from Building C during Round 24. However, sub-slab vapor exceedances of trichloroethene were detected at five locations in Building C during Round 24, with concentrations of these exceedances ranging from 310 µg/m^3 to 2,000 µg/m^3. The Round 24 exceedances in sub-slab vapor are consistent with those observed in other recent sampling rounds (e.g., Rounds 21 through 23).

Vinyl chloride was detected in sub-slab vapor at location 126-C at a concentration (2,700 µg/m^3) greater than its screening level (933 µg/m^3). Concentrations of vinyl chloride in sub-slab vapor at 126-C have decreased since the sub-slab depressurization system expansion, but have fluctuated over time. Vinyl chloride has not been detected in groundwater near 126-C, nor in indoor air, despite the presence of trichloroethene in groundwater at concentrations up to 1,500 micrograms per liter (µg/L).

Sub-slab-vapor concentrations of 1,1-dichloroethane (5,600 µg/m^3) and naphthalene (180*J* µg/m^3) also exceeded their screening levels (2,567 and 120 µg/m^3, respectively) at location 102-C during Round 24. Sub-slab-vapor concentrations of 1,1-dichloroethane and naphthalene exceeded their screening levels at location 102-C during other recent sampling rounds (e.g., Rounds 17, 18, 20, 22, and 23). In general, sub-slab-vapor concentrations of volatile organic compounds have decreased in the southern basement area (SSD-4-C) of Building C since system startup in March 2008. Vapor monitoring points (060-C, 088-C, 113-C, 126-C, 133-C, and 135-C) in the mid-basement area also show lower concentrations, as compared to results before system expansion in May 2013.

The absence of any exceedances of indoor air screening levels for any compound suggests that vapor intrusion is likely not occurring. The sub-slab-depressurization system in Building C appears to be operating as designed, and appears to be effectively mitigating sub-slab-vapor intrusion from known source areas of sub-slab-vapor contamination. Figures 5-3A and 5-3B show sub-slab-vapor and indoor-air concentrations of 1,1-dichororethane, naphthalene, trichloroethene, and vinyl chloride in Building C.

A shaded maximum background value indicates that the maximum detected value from the site data exceeds the maximum background value.

A bolded chemical name indicates that its concentration exceeds background and the industrial air RSL based on an HQ of 0.1 or an ILCR of 1×10^{-6} (i.e., one-tenth of screening value listed).

A bolded/shaded chemical name indicates that its concentration exceeds background and the industrial air RSL based on an HQ of 1 or an ILCR of 1×10^{-5} (i.e., the screening value presented).

Footnotes:

1 - Sample and duplicate are considered two separate samples when determining the minimum and maximum concentrations but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding screening criteria.

2 - Values presented are sample-specific quantitation limits.

3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.

4 - Exceedance counts are based on detected results only.

5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November 2017. RSLs for carcinogens were adjusted to be based on a lifetime cancer risk of 1E-05. RSLs for noncarcinogens were not adjusted and represent a hazard quotient (HQ) of 1.

6 - Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit (PEL).

Definitions:

ca = screening value based on 1×10^{-5} carcinogenic risk

HQ - hazard quotient

ILCR - incremental lifetime cancer risk

J - estimated value

µg/m^3 - micrograms per cubic meter

N = National Institute for Occupational Safety and Health Recommended Exposure Limit

NA - not applicable/not available

nc = noncarcinogenic screening values based on noncarcinogenic hazard quotient = 1

ND - not detected

OSHA - Occupational Safety and Health Administration

PEL - permissable exposure limit

RSL - regional screening level

USEPA - United States Environmental Protection Agency

A bolded chemical name indicates that its concentration exceeds the industrial air RSL divided by 0.03 based on an HQ of 0.1 or an ILCR of 1×10^{-6} (i.e., one-tenth the screening value presented).

A bolded/shaded chemical name indicates that its concentration exceeds the industrial air RSL divided by 0.03 based on an HQ of 1 or an ILCR of 1×10^{-5} (i.e., the screening value presented).

Footnotes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations, but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding criteria.

2 - Values presented are sample-specific quantitation limits.

3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.

4 - Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor 0.03, and correspond to a target cancer risk level of 1.0E-05 or a hazard quotient (HQ) of 1.

5 - Exceedance counts are based on detected results only.

Definitions:

-- = no criterion available
ca = screening value based on carcinogenic effects
HQ = hazard quotient
ILCR = incremental lifetime cancer risk
J = estimated value
NA = not available
nc = screening value based on noncarcinogenic effects
RSL = regional screening level

TABLE 3-3

SUMMARY STATISTICS FOR TRICHLOROETHENE CONCENTRATIONS IN INDOOR AIR

All results are in µg/m^3.

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the non-carcinogenic industrial air regional screening level corresponding to HQ = 1 (USEPA, November 2017).

(6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.

(7) The maximum detected concentration of 36 µg/m^3 was detected in a duplicate sample, and the corresponding original sample concentration of 0.75 µg/m^3 is considerably less than the maximum concentration. Resampling at the same location found concentrations that were closer to the original sample concentration.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are less than three detections; therefore, a UCL is not presented.

(10) There are no trichloroethene results for the Building C first floor from the February 2018 sampling event.

Definitions:

HQ - hazard quotient

J - estimated value

µg/m^3 - micrograms per cubic meter

NA - not applicable/not available

UCL - upper confidence limit

USEPA - United States Environmental Protection Agency

All results are in µg/m^3.

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the carcinogenic industrial air regional screening level corresponding to 1×10^{-5} risk level (USEPA, November 2017).

(6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.

(7) There are less than three detections; therefore, a UCL is not presented.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are no naphthalene results for the Building C first floor from historical or February 2018 sampling events.

Definitions:

HQ - hazard quotient

ILCR - incremental lifetime cancer risk

J - estimated value

µg/m^3 - micrograms per cubic meter

UCL - upper confidence limit

USEPA - United States Environmental Protection Agency

A benchmark of 3.6 µg/m^3 corresponds to ILCR = 1×10^{-5}.

USEPA = United States Environmental Protection Agency

A = American Council of Governmental Industrial Hygenists Theshold Limit Value

N = National Institute for Occupational Safety and Health Recommended Exposure Limit

RSLs= Regional Screening Levels

1 - This location is in the basement. The TCE screening level for basement samples is 35 ug/m^3 based on reduced exposure potential in the basen
The screening level was approved by MDE in 2017.

Notes: All sample concentrations are in micrograms per cubic meter ($\mu g/m^3$)
Shaded cells indicate a concentration greater than risk-based screening level.
$\mu g/m^3$ = micrograms per cubic meter
-- = not available
J = estimated value
U = nondetect
UJ = non-detected value is estimated
ca = screening value based on carcinogenic effects
nc = screening value based on noncarcinogenic effects
(1) Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor of 0.03, and correspond to a target cancer risk level of 1×10^{-5}.

TRICHLOROETHENE	0.72	3.4	7	2	0	5
TOTAL XYLENES	8.9	14	32	28	1	3

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration, but are considered one sample when determining the number of samples with detects and the number of samples less than, equal to, or greater than background.

(2) If one sample in a duplicate pair was greater/equal to background and the other sample in the duplicate pair was less than background, the maximum detected concentration in the field duplicate pair was used to represent the field duplicate pair.

There are a total of four background samples and 35 indoor air samples for Round 24.

ND - Not detected

Notes:
Data presented in this table is from sub-slab vapor samples.
VOC = volatile organic compound
SSDS = sub-slab depressurization system
µg/m^3 = micrograms per cubic meter
- = not detected (below reporting limit)
N/A = compound not reported
N/S = not sampled
J = estimated value
J+ = estimated value, may be biased high
K = value is biased high
NS = not sampled
N/A = sampling data for this location not previously included in this table

Notes:
Data presented in this table is from sub-slab vapor samples.
µg/m^3 = micrograms per cubic meter
- = not detected (below reporting limit)
DL = diluted analysis
NA = compound not reported
NS = not sampled
NA = compound not reported
K = value is biased high
L = value is biased low
VOC = volatile organic compound
SSDS = sub-slab depressurization system

Notes:
- —point(s) not sampled.
N/A—point may have been sampled but the results were not applicable to the SSD-system.
Points with an “SSD” designation were installed and are monitored for the SSD-system.
Points without the SSD designation are used for the vapor-intrusion monitoring program.

TABLE 4-4

TRICHLOROETHENE CONCENTRATIONS BEFORE AND DURING SSDS OPERATION, BUILDING A LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND

Vapor Monitoring Point	Before SSD-system operation*		During SSD-system operation (most recent concentration)	
	Date	Sub-Slab Vapor Concentration ($\mu g/m^3$)	Date	Sub-Slab Vapor Concentration ($\mu g/m^3$)
015-A	April 2007	326,000	February 2018	6.3
018-A	August 2010	64,000	February 2014	174
079-A	February 2016	3,500	February 2018	96
136-A	February 2016	35,300	February 2018	380

Notes:

*SSD-system startup for the main floor of Building A (015-A) was in March 2008, for the Building A basement (018-A) in October 2010, and April 2016 for the Building A eastern area (079-A and 136-A).

$\mu g/m^3$—microgram(s) per cubic meter air

SSD—sub-slab depressurization

Notes:
- —point(s) not sampled.
N/A—point may have been sampled but the results were not applicable to the SSD-system
Points with an "SSD" designation were installed and are monitored for the SSD-system
Points without the SSD designation are used for the vapor-intrusion monitoring program

TABLE 4-6

TRICHLOROETHENE CONCENTRATIONS BEFORE AND DURING SSDS OPERATION, BUILDING C LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND

Vapor Monitoring Point	Before SSD-system operation*		During SSD-system operation (most recent concentration)	
	Date	Sub-Slab Vapor Concentration ($\mu g/m^3$)	Date	Sub-Slab Vapor Concentration ($\mu g/m^3$)
SOUTHERN BASEMENT AREA*				
001-C	March 2006	19,200	February 2018	200
SSD-4-C	December 2006	28,300	February 2018	69
MID-BASEMENT AREA*				
060‑C	August 2011	12,000	February 2018	400
088‑C	February 2012	3,800	February 2018	37
113‑C	February 2013	16,000 J	February 2018	150
126‑C	August 2012	5,800 J	February 2018	540
127-C	Not Sampled		September 2014	410
133‑C	February 2013	60,000	February 2018	2,000
141-C	Not Sampled		February 2018	310
149-C	Not Sampled		February 2018	5.7
152-C	Not Sampled		February 2018	210
153-C	Not Sampled		February 2018	6.3
155-C	Not Sampled		February 2018	1.1

Notes:

*SSD-system startup in the south end of the Building C basement was in March 2008.

**SSD-system startup in the mid-basement area of Building C was in May 2013.

$\mu g/m^3$—microgram(s) per cubic meter air

J—estimated value

SSD—sub-slab depressurization

SSD - sub-slab depressurization
SV - soil vapor
D - duplicate
J - estimated value
NA - not applicable (compound not analyzed/reported)
-- - non-detect (below detection limit); not included in total VOC calculation
* value reported is for total xylenes
B - compound was found in the blank and sample

IA-DUP02-C-24		

OVERVIEW

The sample set for LMC – MRC, SDG 140-10788-1, consists of twenty-two (22) indoor air (IA) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: IA-153-C-24 (original) / IA-DUP01-C-24 (duplicate); IA-149-C-24 (original) / IA-DUP02-C-24 (duplicate).

The samples were collected by Tetra Tech on February 20, 2018, and analyzed by TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, chromatographic resolution, compound identification, compound quantitation, field duplicate precision, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The following analyte was detected in the method blanks at the following maximum concentration:

Analyte	Maximum Concentration	Action Level
1,1,1-Trichloroethane	0.123 ug/m^3 (1)	3.075 ug/m^3

1 – Maximum concentration detected in method blank associated with preparation batch 140-18439 affecting samples IA-100-B-24, IA-101-B-24, IA-126-C-24, IA-145-C-24, IA-146-C-24, IA-149-C-24, and IA-DUP02-C-24.

An action level of 5x the maximum concentration was used to evaluate sample data for blank contamination. Also, because samples are diluted approximately 5x as compared to the method blank, this 5x dilution factor was also applied to calculate the action level. Additional sample-specific dilution factors, if applicable, were also considered in applying

the action level. Detected concentrations of 1,1,1-trichloroethane in the associated samples that were less than the action level were qualified as non-detected (U) due to method blank contamination.

- Detected results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

EXECUTIVE SUMMARY

Laboratory Performance: Two 1,1,1-trichloroethane results were qualified as non-detected due to method blank contamination.

Other Factors Affecting Data Quality: Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-10788-1

Receipt
The samples were received on 2/23/2018 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: Middle River, MD

TestAmerica Job ID: 140-10788-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	✓			☐ **Containers, Broken**
2. Were ambient air containers received intact?			✓	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			✓	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			✓	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	✓			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	✓			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	✓			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	✓			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	✓			☐ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	✓			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	✓			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	✓			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	✓			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			✓	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			✓	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			✓	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			✓	☐ Project missing info

Comments/Actions Taken

* sample TA-101-R-24 in 10788 and TA-100-R-24 in in 11764.

Labeling Verified by: **Date:**

Overview

The sample set for LMC - MRC, SDG 140-10789-1 consisted of seventeen (17) indoor air samples. All samples were analyzed for select Volatile Organic Compounds (VOC). Two field duplicate sample pairs were included in this SDG: IA-018-A-24 / IA-DUP01-A-24 and IA-079-A-24/IA-DUP02-A-24.

The samples were collected by Tetra Tech on February 21, 2018 and analyzed by TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times/sample preservation, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike results, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- Field duplicate imprecision (difference >2x reporting limit) was noted for benzene, toluene, and total xylenes in field duplicate pair IA-079-A-24/IA-DUP02-A-24. Results for these parameters were qualified as estimated in samples IA-079-A-24 and IA-DUP02-A-24.

- Detected results reported below the Reporting Limit (RL) limit but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

All internal standard areas were within ±40% of the standard.

The surrogate spike compound and Laboratory Control Sample (LCS) had Percent Recoveries (%Rs) within the quality control limits.

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

All sample canisters opened to the approximately -30 psig (-29 psig) and finished at approximately 0 psig.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: None.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Review" (January 2017) and EPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Results as Reported by the Laboratory

FORM I
AIR - GC/MS VOA ORGANICS ANALYSIS DATA SHEET

Lab Name: TestAmerica Knoxville | Job No.: 140-10789-1

SDG No.:

Client Sample ID: IA-138-A-24 | Lab Sample ID: 140-10789-1

Matrix: Air | Lab File ID: RB27P101.D

Analysis Method: TO 15 LL | Date Collected: 02/21/2018 16:30

Sample wt/vol: 100(mL) | Date Analyzed: 02/27/2018 14:45

Soil Aliquot Vol: | Dilution Factor: 1

Soil Extract Vol.: | GC Column: RTX-5 ID: 0.32(mm)

% Moisture: | Level: (low/med) Low

Analysis Batch No.: 18442 | Units: ppb v/v

Support Documentation

Job Narrative
140-10789-1

Receipt
The samples were received on 2/23/2018 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Air - GC/MS VOA

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			/	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	/			☐ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:_____			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Overview

The sample set for LMC - MRC, SDG 140-10790-1 consisted of nineteen (19) soil vapor air samples. All samples were analyzed for select Volatile Organic Compounds (VOC). Three field duplicate sample pairs were included in this SDG: SV-116-A-24/SV-DUP01-A-24, SV-079-A-24/SV-DUP02-A-24, and SV-149-C-24/SV-DUP02-C-24. Sample SV-149-C-24 was included in SDG 140-10791-1.

The samples were collected by Tetra Tech on February 20 and 21, 2018 and analyzed by TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times/sample preservation, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike results, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The continuing calibration performed on 02/28/18 at 10:49 had a Percent Difference (%D) for 1,2,4-trichlorobenzene and naphthalene, which exceeded the 30% quality control limit affecting samples in analysis batch 18437. The non-detected results reported for these compounds in the affected samples were qualified as estimated, (UJ), respectively.

- The continuing calibration performed on 03/05/2018 at 10:17 had a %D for 1,2,4-trichlorobenzene, which exceeded the 30% quality control limit affecting samples in analysis batch 18533. The non-detected results reported for this compound in the affected samples were qualified as estimated, (UJ), respectively.

- Methylene chloride was detected in laboratory method blanks at the following maximum concentrations:

Compound	Maximum Concentration	Action Level
Methylene Chloride(1)	0.149 ppb	1.49 ppb
Methylene Chloride(1)	0.519 ug/m^3	5.19 ug/m^3

1 Concentration in method blank affecting samples in batch 18437.

An action level of 10X the maximum contaminant level for the common laboratory contaminant has been used to evaluate sample data for blank contamination. Dilution factor, if applicable, was taken into consideration when evaluating for blank contamination. Detected results for methylene chloride less than the blank action level were qualified as nondetect (U).

- Field duplicate imprecision (difference > 2x reporting limit) was noted for 1,2,3-trimethylbenzene in field duplicate pair SV-079-A-24/SV-DUP02-A-24. Detected results for 1,2,3-trimethylbenzene were qualified as estimated (J) in samples SV-079-A-24 and SV-DUP02-A-24.

- Detected results reported below the Reporting Limit (RL) limit but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

All internal standard areas were within ±40% of the standard.

The surrogate spike compound and Laboratory Control Sample (LCS) had Percent Recoveries (%Rs) within the quality control limits.

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

All sample canisters opened to the approximately -30 psig (-29 psig) and finished at approximately 0 psig.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: Continuing calibration noncompliance was noted for 1,2,4-trichlorobenzene and naphthalene. Methylene chloride was detected in a laboratory method blank.

Other Factors Affecting Data Quality: Results below the RL were estimated. Field duplicate imprecision was noted for 1,2,3-trimethylbenzene.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Review" (January 2017) and EPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-10790-1

Receipt
The samples were received on 2/23/2018 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-18437 exhibited % difference of > 30% for 1,2,4-trichlorobenzene and naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

The continuing calibration verification (CCV) associated with batch 140-18533 exhibited % difference of > 30% for the following analyte(s) 1,2,4-Trichlorobenzene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: Middle River, MD

TestAmerica Job ID: 140-10790-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:** _____

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			/	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	/			☐ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:_____			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Comments/Actions Taken

Summa Canister Dilution Worksheet

Client: Tetra Tech, Inc.

Job No.: 140-10790-1

Lab Sample ID	Canister Volume (L)	Preadjusted Pressure ("Hg)	Preadjusted Pressure (atm)	Preadjusted Volume (L)	Adjusted Pressure (psig)	Adjusted Pressure (atm)	Adjusted Volume (L)	Initial Volume (mL)	Dilution Factor	Final Dilution Factor	Date	Analyst
140-10790-2	1	-4.9	0.84	0.84	34.7	3.36	3.36		4.02	4.02	03/01/18 13:31	Barlozhetskaya, Anna F
140-10790-10	1	-2.5	0.92	0.92	31.4	3.14	3.14		3.42	3.42	03/01/18 11:44	Barlozhetskaya, Anna F
140-10790-11	1	-2.4	0.92	0.92	31.0	3.11	3.11		3.38	3.38	03/01/18 11:43	Barlozhetskaya, Anna F

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg

Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig

Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)

14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

VOC

Initial Calibration 1/30/2018

OVERVIEW

The sample set for LMC – MRC, SDG 140-10791-1, consists of nineteen (19) soil vapor (SV) and ambient air (BCK) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are associated with this SDG: SV-153-C-24 (original) / SV-DUP01-C-24 (duplicate) and SV-149-C-24 (original) / SV-DUP02-C-24 (duplicate; included in SDG 140-10790-1).

The samples were collected by Tetra Tech on February 20 and 21, 2018, and analyzed by TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, chromatographic resolution, compound identification, compound quantitation, field duplicate precision, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The VOC continuing calibration performed on 02/28/18 at 10:44 on instrument MJ had percent differences (%Ds) that were greater than the 30% quality control limit for 1,2,4-trichlorobenzene and naphthalene. All samples were associated with this calibration. Detected and non-detected results for these analytes were qualified as estimated (J and UJ, respectively) in all samples.

- The following analyte was detected in the method blanks at the following maximum concentration:

Analyte	Maximum Concentration	> or < Reporting Limit (RL)
1,1,1-Trichloroethane	0.0243 ug/m^3 (1)	< RL

1 – Maximum concentration detected in method blank associated with preparation batch 140-18440 affecting all samples.

Detected concentrations of 1,1,1-trichloroethane in the associated samples that were less than the RL were qualified as non-detected (U) due to method blank contamination. No action was necessary for detected results that were greater than the RL.

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

In sample SV-102-C-24, the following compounds exceeded the instrument calibration range: 1,1,1-trichloroethane, 1,1-dichloroethane, 1,1-dichloroethene, ethylbenzene, and trichloroethene. Sample SV-102-C-24 was reanalyzed at a dilution factor of 4.03 (20 ml aliquot), and the aforementioned analytes were reported from the dilution.

In sample SV-133-C-24, the result for trichloroethene exceeded the instrument calibration range. Sample SV-133-C-24 was reanalyzed using an aliquot of 11 ml and the result for trichloroethene was reported from the reanalysis.

EXECUTIVE SUMMARY

Laboratory Performance: Detected and non-detected results for 1,2,4-trichlorobenzene and naphthalene were qualified due to calibration noncompliance. Some 1,1,1-trichloroethane results were qualified as non-detected due to method blank contamination.

Other Factors Affecting Data Quality: Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-10791-1

Receipt
The samples were received on 2/23/2018 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-18440 exhibited % difference of > 30% for 1,2,4-trichlorobenzene and naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: Middle River, MD

TestAmerica Job ID: 140-10791-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number: 10791**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			/	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	/			☐ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

FORM VIII TO 15 LL

Summa Canister Dilution Worksheet

Client: Tetra Tech, Inc.

Job No.: 140-10791-1

Lab Sample ID	Canister Volume (L)	Preadjusted Pressure ("Hg)	Preadjusted Pressure (atm)	Preadjusted Volume (L)	Adjusted Pressure (psig)	Adjusted Pressure (atm)	Adjusted Volume (L)	Initial Volume (mL)	Dilution Factor	Final Dilution Factor	Date	Analyst
140-10791-3	1	-5.3	0.82	0.82	34.0	3.31	3.31		4.03	4.03	02/28/18 18:16	Barlozhetskaya, Anna F

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg

Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig

Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)

14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

SUBJECT: **ORGANIC DATA VALIDATION – VOC**
LOCKHEED MARTIN CORPORATION (LMC) – MIDDLE RIVER COMPLEX (MRC)
SAMPLE DELIVERY GROUP (SDG) 140-10792-1

SAMPLES: 12 / Air / VOC

SV-075-A-24	SV-095-A-24	SV-168-A-24
SV-178-MB-2	SV-179-MB-2	SV-180-MB-2
SV-181-MB-2	SV-182-MB-2	SV-184-MB-2
SV-185-MB-2	SV-186-MB-2	SV-187-MB-2

OVERVIEW

The sample set for LMC – MRC, SDG 140-10792-1, consists of twelve (12) soil vapor (SV) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). No field duplicate pairs are included in this SDG.

The samples were collected by Tetra Tech on February 21, 2018, and analyzed by TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, laboratory control sample results, surrogate recoveries, internal standard areas, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- Detected results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The laboratory case narrative indicates that a sample SV-183-MB-2 was received by the laboratory but was not listed on the chain of custody. The case narrative notes that the sample was not analyzed, as per client instructions.

In samples SV-181-MB-2 and SV-182-MB-2, the analyte 1,1-dichloroethane exceeded the instrument calibration range during the original analysis. Samples SV-181-MB-2 and SV-182-MB-2 were reanalyzed at a dilution factors of 5 and 10, respectively, and the laboratory reported the result for 1,1-dichloroethane from the reanalysis.

EXECUTIVE SUMMARY

Laboratory Performance: None.

Other Factors Affecting Data Quality: Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Appendix A

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Appendix C

Support Documentation

Job Narrative
140-10792-1

Receipt
The samples were received on 2/23/2018 at 10:30 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions
Sample SV-183-MB-2 (140-10792-13) was received by the lab, but it was not listed on the Chain-of-Custody (COC). The client confirmed this sample was not to be analyzed.

Air - GC/MS VOA - Method TO-15 LL
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☒ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			/	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☒ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	/			☐ **Sample Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Comments/Actions Taken

8. sample SV-183-MB-2 was received, but is not listed on the COC.

SECTION 1
INTRODUCTION

1.1 SITE LOCATION AND BACKGROUND INFORMATION

This report documents the monitoring activities completed from October 1, 2017 to March 31, 2018 [the 39th and 40th quarters of operation] for the sub-slab depressurization systems operating in the Building A lay-up room (former plating shop), eastern area, and basement, and the Building C basement of the Lockheed Martin Corporation Middle River Complex in Middle River, Maryland. The locations of the systems' influence are shown on Figure 1. These remedial systems control (by creating a vacuum) and remove volatile organic compounds from sub-slab vapor, thus preventing their migration into indoor air. The systems are operated in accordance with the operation, maintenance, and monitoring manuals for the Building A and Building C systems (Tetra Tech, Inc., 2017a and 2014, respectively).

1.2 DESCRIPTION OF SUB-SLAB DEPRESSURIZATION SYSTEMS

1.2.1 Building A System

The sub-slab depressurization system in Building A includes the following soil vapor extraction points (Figure 2):

- Two (2) horizontal soil vapor extraction laterals in the lay-up room (North and South)
- Two (2) laterals in the basement (Basement North and Basement South)
- Six (6) vertical soil vapor extraction points (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, SSD-38-A, and SSD-39-A)
- Extraction piping connected to basement sump HRS-5

The soil vapor extraction points serve as conduits for drawing vapor from beneath the building slab and from a covered sump in the basement, thus mitigating vapor intrusion into indoor air. Sub-slab vapors are pulled through the extraction points, vapor-extraction manifold, and

"pre-blower" moisture separator using a single 10-horsepower regenerative blower. The blower is mounted on a skid along with the pre-blower moisture separator, a heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). The extracted vapors are cooled as they are pushed through the heat exchanger. Following the heat exchanger, the vapors enter the post-blower moisture separator where entrained condensate droplets are removed to reduce saturation and pressure buildup in the vapor-phase carbon drums. The extracted vapors are then filtered to remove volatile organic compounds using four 400-pound granular activated-carbon drums, in two-by-two configuration (two parallel trains of two drums in series)1. Vapors are discharged to the atmosphere via an exhaust stack that extends above the roof of the building. Figure 3 shows the process and instrumentation diagram for the Building A sub-slab depressurization system.

The Building A system is also equipped with one drain for each of the granular activated-carbon drums and three pipe sumps (PS-1-A [near SSD-37-A], PS-2-A [near SSD-34-A], and PS-3-A [in the basement]) and one exhaust stack sump. The pipe sumps are installed at low points to allow accumulation and manual drainage of condensation in the pipe. In addition, two freestanding drain stacks located adjacent to the south side of the system's equipment skid are available for use in winter months to drain condensate in the vapor entering the two trains of granular activated-carbon drums.

Six IQAir® GC™ Series-GC VOC indoor-air filters also operate in the basement of Building A near vapor monitoring points (VMPs) 093-A, 093 A-X, and 138-A, in response to elevated trichloroethene (TCE) concentrations in the indoor air. The filters were installed south of the sub-slab depressurization system extraction laterals in January 2015 (designated AF-N, AF-M, and AF-S) and May 2017 (designated AF-NX, AF-MX, and AF-SX), and are continuously operated to filter 300 standard cubic feet per minute (SCFM) of air. Each filter consists of a high-efficiency particulate air pre-filter, a granular activated-carbon filter, and a post-filter sleeve (collectively referred to as "filter elements"). The pre-filter (GC™ HyperHEPA® Pre-Filter H11 [S]) weighs three pounds; it removes coarse, fine, and ultra-fine dust particles and protects subsequent filters.

1 Originally, vapor treatment consisted of one train of two 400-pound carbon drums; the two-by-two configuration was completed in February 2017 to decrease pressure, increase flow of the system, and better capture VOCs; details are in Section 2.4.

The granular activated-carbon filter (GC VOC filter cartridge set) removes volatile organic compounds from indoor air; it is comprised of four granular activated-carbon cartridges, collectively weighing nine pounds. The post-filter sleeve (GC™ post-filter sleeve set) is placed over the granular activated-carbon cartridges, and removes any remaining fine and ultra-fine particulate matter.

1.2.2 Building C System

The sub-slab depressurization system in the Building C basement consists of 11 vertical soil vapor extraction points: two in the southern-basement area (SSD-21-C and SSD-23-C) and nine in the mid-basement area (SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C); see Figure 4. These extraction points serve as conduits for drawing vapor from beneath the building slab, thus creating a vacuum under the floor slab preventing vapor intrusion into indoor air. The vapors are pulled through the extraction points using a single 7.5-horsepower regenerative blower that is mounted on a skid along with a moisture separator, heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). Following extraction, the vapors enter the first moisture separator (MS-1) where entrained condensate droplets are removed to reduce fouling of the vapor lines and saturation of the granular activated-carbon. The extracted vapors are cooled as they are pushed through the heat exchanger; any remaining extracted condensate droplets are removed via a second moisture separator (MS-2) [separate from the blower skid] before being treated. The vapors are treated by passing through two 400-pound granular activated-carbon drums and one 600-pound potassium permanganate-impregnated zeolite drum (to remove residual vinyl chloride), in-series, before being discharged to the atmosphere via an exhaust stack that extends above the roof of the building (Figure 5).

The Building C system is also equipped with one drain for each granular activated-carbon and potassium permanganate-impregnated zeolite drum, five pipe sumps (PS-1 [near SSD-25-C and column N26], PS-2 [near SSD-30-C and column N26], PS-3 [near SSD-27-C and column O20], PS-4 [near SSD-32-C and column R19], and PS-5 [near SSD-29-C and column V12]), and one exhaust stack sump. The sumps are installed at low points to allow drainage of condensation in the pipe.

Sound generated by the blower and heat exchanger is controlled by a sound-deadening enclosure that surrounds the blower skid of the Building C system. This enclosure has overlapping soundproof curtains supported on a wooden frame; its plywood roof is lined with one-inch-thick foam board. A vent on the side of the enclosure and a duct extending from the heat exchanger to the ceiling of the enclosure facilitate airflow and prevent the system from overheating.

SECTION 2
SITE ACTIVITIES

2.1 BIWEEKLY SYSTEM CHECKS

Biweekly system checks were conducted to monitor the performance of the sub-slab depressurization (SSD) systems and to make necessary adjustments to optimize effectiveness. System checks were conducted between October 1, 2017 and March 31, 2018 (the 39th and 40th quarters of operation) on the dates listed below.

- October 5, 2017
- October 18, 2017
- November 1, 2017
- November 17, 2017
- December 12, 2017
- December 28, 2017
- January 8, 2018
- January 23, 2018
- February 8, 2018
- February 23, 2018
- March 8, 2018
- March 20, 2018

Biweekly system checks were conducted in accordance with the latest operation, maintenance, and monitoring (OM&M) manuals (Tetra Tech, Inc. [Tetra Tech], 2017a and 2014), and included general system monitoring vacuum influence monitoring, and any necessary adjustments to extraction laterals and wells. Biweekly system checks forms are in Appendix A.

2.1.1 General System Monitoring

Gauge readings on the blower skid were checked, and the vacuum and velocity at each extraction lateral/well were measured during each general system monitoring check. The condition of system components was also checked, and moisture separators/sumps were emptied as necessary. The following specific tasks were performed during general system monitoring:

1. Recorded:
    a. vacuum at pre-air filter

b. vacuum at post-air filter
c. pressure at post-blower
d. temperature at post-blower
e. temperature at post-heat exchanger
f. system flow
g. time counter display
h. vacuum from each extraction lateral/well
i. velocity from each extraction lateral/well
j. vacuum from each vapor monitoring point (VMP)

2. Checked the following for damage, leaks, and/or signs of heat stress:
    a. system components
    b. granular activated-carbon (GAC) drums
    c. potassium permanganate-impregnated zeolite (PPZ) drum (Building C only)
    d. GAC and PPZ fittings and flexible hoses

3. Checked the following for condensate, and drained, as necessary:
    a. moisture separators
    b. pipe sumps
    c. exhaust stack sumps
    d. GAC and PPZ drains

4. Confirmed that zip-ties on the GAC- and PPZ-drum cam locks were present and secure

5. Confirmed that the ambient air valve was closed

6. Confirmed that the vacuum relief valve was closed

7. Noted any adjustments to extraction laterals/wells

8. Checked that flow, pressure, and vacuum gauges fell to zero, and that temperature gauges fell, when systems were turned off

9. Checked each of the Building A IQAir® GC™ Series-GC indoor air filters to:
    a. verify filter was on
    b. verify fan was running
    c. check control panel for filter-life status
    d. document any signs of tampering

Approximately 465 gallons of water were drained from the Building A system during the reporting period. To accommodate the volume of water removed from Building A, ten additional visits were performed to drain the system of water during this reporting period. Approximately two gallons of

water were drained from the Building C exhaust stack sump during the reporting period.

2.1.2 Vacuum Influence Monitoring

The objective for the SSD systems is to maintain a vacuum of at least 0.01 inches water column (WC) in the targeted areas. The vacuum influence (differential sub-slab vapor vacuum versus indoor air) at sub-slab VMPs was monitored using a dual-port2 manometer (Fieldpiece Instruments, Inc. model SDMN5). This instrument was used to identify sub-slab-air short-circuiting or other problems (indicated by a significant drop in vacuum at one or more VMPs), and to determine each system's area of influence. Short-circuiting was not identified at the Building A or Building C SSD systems during this reporting period. Figures 6 to 9 show induced vacuum over time; Figures 10 to 13 show induced vacuum influence contours on plan views using induced vacuum readings from March 20, 2018.

Vacuum influence in the Building A target areas consistently3 exceeded the vacuum influence objective (0.01 inches WC) during the reporting period in the following monitoring points:

- At seven of eight VMPs in the layup room (SSD-12-A-X, SSD-11-A-X, SSD-13-A-X, SSD-2-A-X, 015-A-X, SSD-16-A-X, and SSD-3-A-X) with vacuums ranging from 0.16 to 3.94 inches WC (see Figure 10)
- At all four VMPs in the Building A basement (SSD-19-A, SSD-20-A, SSD-21-A, and SSD-22-A) with vacuums ranging from 0.01 to 0.80 inches WC (see Figure 10)
- At one of two VMPs in the western area of Building A (168-A) with vacuums ranging from 0.56 to 0.84 inches WC (see Figure 10)
- At nine of 17 VMPs in the eastern area of Building A (165-A, 166-A, 167-A, 117-A, 164-A, 136-A-S, 136-A, 161-A, and 160-A) with vacuums ranging from 0.01 to 3.74 inches WC (see Figure 11)

Negative vacuum (pressure) readings were measured at VMP 163-A in the eastern area of Building A during most biweekly system checks, indicating higher pressure in the sub-slab than in the indoor air. Induced vacuum has not been observed at 079-A, 119-A, 121-B, 162-A, 136-A-N,

2 Only one port is used for monitoring vacuum influence; the second port is used to measure static pressure.

3 Exceeded vacuum monitoring objective of 0.01 inches water column at more than half of the biweekly system checks.

188-A. This could possibly be due to the greater distance to the nearest extraction point for 119-A and 121-B. The reason for the lack of vacuum influence at 079-A, 162-A, 136-A-N, 163-A, and 188-A is not clear but could be related to subsurface preferential pathways and heterogeneity.

Vacuum influence in the Building C target areas consistently exceeded the vacuum influence objective (0.01 inches WC) during the reporting period in the following monitoring points:

- At six of seven VMPs in the southern-basement area (001-C, SSD-2-C, SSD-3-C, SSD-25-C, SSD-24-C, and SSD-22-C) with vacuums ranging from 0.01 to 1.10 inches WC (see Figure 12)
- At 13 of 20 VMPs in the mid-basement area (159-C, 135-C, 113-C, 156-C, 151-C, 149-C, 127-C, 152-C, 155-C, 133-C, 154-C, 158-C, and 153-C) with vacuums ranging from 0.01 to 3.62 inches WC (see Figure 13)

Negative vacuum4 (pressure) readings were measured during some of the monitoring events at SSD-2-C, SSD-25-C, and 141-C. VMP SSD-4-C could not be accessed for monitoring as it was covered by equipment moved to that area for storage in late September 2016.

Vacuum Summary

Induced vacuum measurements indicate that the systems are performing as designed, except near extraction point SSD-36-A in the eastern area of Building A and near extraction points SSD-29-C and SSD-34-C, as seen by the lack of vacuum influence at VMP 126-C, in the northern end of the Building C mid-basement area. The sub-slab vapor extraction laterals in the Building A lay-up room induce a vacuum influence over an approximately 5,900-square foot area, and consistently encompass five of six VMPs that had elevated volatile organic compound (VOC) concentrations before system start-up. The extraction laterals in the Building A basement induce a vacuum influence over an approximately 2,500-square foot area, and consistently encompass all four VMPs that measure the system's induced vacuum in the basement (Figure 10). The vertical extraction points in the northern and eastern areas of Building A induce a vacuum influence over an approximately 7,100-square foot area, and consistently encompass nine of 17 VMPs (Figure 11). The extraction point SSD-39A in the western area of Building A is inducing vacuum

4 Negative vacuum readings indicate higher pressure in the sub-slab than in the indoor air, which may be related to subsurface heterogeneity or preferential pathways.

at one of two nearby VMPs; the area of induced vacuum is approximately 1,100-square feet (Figure 10).

In Building C, the sub-slab vapor extraction points in the southern-basement area induce a vacuum influence over an approximately 4,900-square foot area, with six of seven VMPs showing consistent influence (Figure 12). Extraction points in the mid-basement area induce a vacuum influence over an approximately 31,000-square foot area, with 13 of 20 VMPs showing consistent influence (Figure 13). Vacuum influence at the northern end of the mid-basement area has not been apparent during monitoring; possible reasons include high groundwater levels, subsurface preferential pathways, short-circuiting, and/or blockages. However, VOC concentrations at VMP 126-C, at the northern end, have decreased by approximately 89 percent (%) since the system was expanded in May 2013.

2.1.3 Adjustments to Extraction Points

Vapor flow from the sub-slab soil vapor extraction points was adjusted during the reporting period as follows:

- December 14, 2017: After high pressure alarm from Building-C, extraction point SSD-31-C was closed to 20% to lower system pressure.
- January 6, 2018: After high pressure alarm from Building-C, extraction point SSD-29-C was closed to 40% to lower system pressure.

2.2 VAPOR SAMPLING

Grab vapor samples were collected monthly at Building A and every other month at Building C during the reporting period. Samples were collected from each SSD system at the influent, mid-GAC (between lead and lag vessels), and effluent positions of the treatment drums. Samples were collected from the Building A SSD system on October 4, November 8, and December 4, 2017 and January 9, February 9, and March 8, 2018. Samples were collected from the Building C SSD system on November 8, 2017 and January 9 and March 8, 2018. Samples were collected directly from each sampling port using the following steps:

- A piece of Teflon® tubing was connected to the sampling port.

- A clean, one-liter Summa® canister under vacuum was connected to the tubing, and the canister valve was opened until the canister gauge reached zero or stopped falling (approximately one minute).
