VOC	volatile organic compound

Section 1
Introduction

This report summarizes groundwater sampling procedures and chemical results for the 2012 sampling at the Dump Road Area (DRA) of Martin State Airport (MSA) in Middle River, Maryland. Figure 1-1 shows the locations of Martin State Airport and the Dump Road Area, where the monitoring wells sampled are located. Tetra Tech, Inc. (Tetra Tech) prepared this report on behalf of Lockheed Martin Corporation (Lockheed Martin) in accordance with the *Martin State Airport 2012 Groundwater Monitoring Work Plan* (Tetra Tech, Inc., 2012a). Sampling objectives are to:

- provide a current round of groundwater data for selected monitoring wells
- better understand the nature and extent of contamination in groundwater
- evaluate time trends of on-site groundwater plumes
- evaluate the natural attenuation of the chemicals of concern in groundwater at Martin State Airport
- evaluate interaction between shallow groundwater and Frog Mortar Creek
- provide information to update the modeling of shallow groundwater flow patterns and discharge to Frog Mortar Creek
- address the Maryland Department of Environment's (MDE's) request for multi-level sampling of selected wells with long screen intervals
- compare low-flow sampling results and those obtained using passive diffusion bags (PDBs) that could be employed in future sampling efforts

These data, in conjunction with previously collected site data, will update the numerical modeling of shallow groundwater flow patterns and subsequent discharge to Frog Mortar Creek, and to provide the scientific and engineering basis to select and implement a cost effective and state-approved site remedial alternative.

Groundwater samples were chemically analyzed for volatile organic compounds (VOCs), 1,4-dioxane, total and dissolved metals, and perchlorate (a propellant constituent). Selected groundwater samples were also analyzed for total petroleum hydrocarbon (TPH) diesel-range organics (DRO), TPH gasoline-range organics (GRO), radium-228, total radium, haloacetic acids, cyclotrimethylene trinitramine (also known as Royal Demolition Explosive [RDX]), and natural attenuation assessment (NAA) parameters. The report below is organized as follows:

Section 2—Site Overview: Briefly describes site and subsurface conditions observed in the field during previous investigations, including regional and site-specific geology and hydrogeology, as determined from site soil borings and available scientific literature.

Section 3—Investigation Approach and Methodology: Presents the technical approach to the groundwater monitoring and describes the field methodology employed for the study.

Section 4—Results: Presents the investigation results.

Section 5—Summary: Summarizes the investigation findings.

Section 6—References: Cites references used to compile this report.

Section 2
Site Overview

2.1 MARTIN STATE AIRPORT BACKGROUND

Martin State Airport (MSA) is at 701 Wilson Point Road in Middle River, Maryland. It is bounded by Frog Mortar Creek to the east and Stansbury Creek to the west (Figure 2-1). Both creeks join Chesapeake Bay south of the airport. The Dump Road Area (DRA) under investigation is in the southeastern portion of MSA, bounded by Frog Mortar Creek to the east and the main airport runway to the west.

Environmental investigations of MSA began in the mid-1980s, when the Maryland Department of the Environment (MDE) conducted site inspections related to stored drums and a reported chemical dump. In 1989, MDE conducted a preliminary assessment (PA) of MSA that identified fill areas and ponds, the latter of which were reportedly used to dispose of spent battery acid, acid-type strippers, and other acidic solutions in the 1930s through the 1960s. Detailed investigations of the DRA began after July 1991, when the Maryland Aviation Administration (MAA) encountered four buried drums adjacent to Taxiway Tango during trenching to install an electrical cable. Discovery of these drums led to investigation of the surrounding area for possible soil and groundwater contamination, as required by MDE in its letters of January 6, 1992 and January 14, 1997 to MAA (MDE, 1992; 1997).

2.2 REGIONAL GEOLOGIC AND HYDROGEOLOGIC CONDITIONS

MSA is in the western shore of the Coastal Plain physiographic province. Regional and local studies (Vroblesky and Fleck, 1991; Chapelle, 1985) indicate that MSA lies on the Patapsco geologic formation. This formation consists of complex and interbedded mixtures of gray, brown, and red sands, silts, and clays, originating from sediment deposition in a low coastal plain traversed by low-gradient meandering streams. Below the Patapsco Formation lies a regionally

extensive, thick, clay confining unit known as the Arundel Formation, a massive, impermeable unit underlying the site and surrounding area.

The Arundel Formation outcrops northwest of the site and dips and thickens to the southeast, extending as far east as Cambridge, Maryland, where it is more than 600 feet thick. Regional lithologic information indicates that the Arundel Formation may be as much as 100–150 feet thick at MSA (Vroblesky and Fleck, 1991; Chapelle, 1985). The formation most likely acts as an impermeable barrier to the downward movement of any constituents found in the surficial aquifer. Southwest of MSA, the base of the Arundel Formation (where it lies upon the top surface of the deeper Patuxent Formation) has been mapped at 170–300 feet below mean sea level (msl) (Vroblesky and Fleck, 1991; Chapelle, 1985). These regional studies indicate that the base of the Arundel Formation may occur at 250–300 feet below msl. Consequently, the depth to the base of the Arundel Formation may range from 270–320 feet below ground surface (bgs) at MSA.

The Patuxent Formation, a multi-aquifer unit, comprises various interbedded layers of sand, silt, and clay, with abrupt changes of deposited material types over short distances. Permeable, sand-rich units range from bounded sand sheets to isolated sand bodies (Glaser, 1969). In the MSA area, groundwater flows to the south and southwest, in response to industrial wells withdrawing water southwest and west of the site (Chapelle, 1985; Curtin, 2006).

2.3 MARTIN STATE AIRPORT SUBSURFACE CONDITIONS

At MSA, numerous shallow and deep soil borings have been advanced to collect soil samples for lithologic information and chemical analyses. A fence diagram of the site geology is shown in Figure 2-2. Previous site studies indicate that the subsurface geology at MSA consists of highly heterogeneous mixtures of unconsolidated sediments of gravels, sands, silts, and clays. A layer of fill consisting of heterogeneous sands, silts, and clays overlies native soils.

Boring logs for groundwater monitoring wells MW-5, DMW-7S, and MW-7 indicate that a heterogeneous mixture of clay, silt, and some silty sand predominates to a depth of approximately 25 feet bgs (five feet below msl), which is underlain by poorly graded fine sand, with occasional silt lenses, to a depth of approximately 32–42 feet bgs (11–21 feet below msl). At groundwater monitoring wells DMW-7S and MW-7, silt and clay predominate from 32 to 39 feet deep (11–19 feet below msl). At well MW-5, the geology consists predominantly of

poorly graded, fine sand to 42 feet bgs (19 feet below msl) at its termination point. (Refer to Section 3 for groundwater monitoring well locations.)

Groundwater monitoring wells are screened in the surficial aquifer system (the Patapsco Formation) at different elevations to provide hydrologic and chemical data across the entire water bearing zone. For data evaluation and correlation, the aquifer is divided into upper, intermediate, and lower surficial aquifer zones. Twenty-seven groundwater monitoring wells (DMW-lS through DMW-11S, MW-3 through MW-7, MW-15S through MW-18S, MW-20S, MW-23S through MW-26S, RW-1S, and OW-1S) are screened in the upper surficial aquifer, which is the portion of the surficial aquifer from the ground surface to approximately 15 feet below msl.

Generally, the upper surficial aquifer consists of fill that occurs in the uppermost 10–20 feet bgs, with native soils beneath the fill materials. Locally (i.e., DMW-7S and MW-7), an eight-foot thick low-permeability zone (i.e., an aquiclude) lies between the upper surficial aquifer and the intermediate surficial aquifer. The aquiclude restricts groundwater flow and retards contaminant movement between the upper and intermediate surficial aquifer zones in some areas of the site. However, the low-permeability zone is localized and limited in extent; it was not encountered at MW-5, thus providing a direct pathway for migration to deeper zones from surface released chlorinated solvents.

Twenty-nine groundwater monitoring wells (DMW-1A, DMW-2A, MW-1, MW-2, DMW-3I through DMW-11I, MW-14I through MW-26I, MW-28I, RW-1I, and OW-1I) are screened in the intermediate surficial aquifer, between 15–45 feet below msl. Twenty groundwater monitoring wells (DMW-1B, DMW-2B, DMW-3D through DMW-9D, MW-14D through MW-23D, and MW-26D) are screened in the lower surficial aquifer, from approximately 45–73 feet below msl. At approximately 45 feet below msl, a thin clay aquitard lies between the intermediate and lower surficial aquifers.

Four wells (MW-27D, MW-29D, MW-30D, and MW-31D) are screened in deep confined aquifers underlying the lower surficial aquifer. The deep well logs indicate that alternating sand and silt aquifers and clay aquitards lie beneath the lower surficial aquifer. Lithologic data from the four deep wells indicate six to 40 feet of clay beneath the lower surficial aquifer. Beneath this clay bed is a series of alternating sand and clay layers, with top surfaces at approximately

120-130 feet below msl (sand), 140–160 feet below msl (clay), 190 feet below msl (sand), 197-205 feet below msl (clay), and 245 feet below msl (sand at MW-29D only).

A series of alternating sand and silt aquifers and clay aquitards was encountered beneath the lower surficial aquifer. Permeability tests on the aquitard clays indicate low vertical permeabilities, ranging from 2.2×10^{-08} to 13×10^{-08} centimeters per second. A single well, directional, heat pulse technique successfully estimated groundwater flow directions at groundwater monitoring wells MW-27D and MW-29D. These results were used to locate downgradient groundwater monitoring wells MW-30D and MW-31D. Groundwater in the deep confined aquifers flows in a southeasterly direction, from MW-27D through MW-31D, toward MW-29D. Groundwater elevations for groundwater monitoring wells MW-28I and MW-27D indicate an upward hydraulic gradient of 0.0035.

2.4 DESCRIPTION OF HISTORICAL AREAS OF CONCERN

MAA conducted several investigations at the southeast portion of MSA from 1992 to 1996. These include a geophysical survey of Taxiway Tango (Handex, 1992), a preliminary site investigation of Taxiway Tango (Maryland Environmental Service [MES], 1994), a confirmation investigation of Taxiway Tango (MES, 1995), and an expanded investigation of Taxiway Tango (MES, 1996). Frog Mortar Creek was first investigated by MAA in 1998. These investigations identified four areas of concern (Figure 2-3):

1) *Taxiway Tango Median Anomaly Area*—After four buried drums were removed in 1991, a geophysical survey was conducted throughout the area adjacent to Taxiway Tango. Several anomalous zones were identified as possibly containing buried metal.

2) *Drum Area*—Several drums were uncovered when surface vegetation was cleared during a 1996 site investigation.

3) *Two ponds*—Historical records indicate that acids may have been discharged at the present location of these ponds (approximately 450 feet and 600 feet northeast of Taxiway Tango, respectively) sometime during the 1930s through the 1960s. (A third pond is shown in the area on a U.S. Geological Survey topographic map [photo-revised in 1985] used for the PA, but MDE could not locate a third pond during the 1989 site visits. This third pond was not identified as part of the MAA studies that identified these four areas of concern.)

4) *Petroleum Hydrocarbon Area*—Petroleum hydrocarbons were encountered while drilling a soil boring during a 1996 site investigation. The Petroleum Hydrocarbon Area is approximately 200 feet west of the ponds.

These four areas became the focus of subsequent studies when chemical constituent impacts to soil, pond sediment, and groundwater became apparent.

Trichloroethene (TCE) and TCE-degradation daughter products were detected throughout the investigation area, with the highest concentrations appearing in the upper and intermediate surficial aquifer. At MSA, previously detected concentrations of TCE range from 0.5 to more than 100,000 micrograms per liter (µg/L). 1,4-dioxane, typically co-located with chlorinated solvents, is also considered a chemical of concern. TCE-degradation daughter products (e.g., dichloroethene [DCE], vinyl chloride [VC], etc.) are typically co-located with TCE at MSA.

2.5 LOCKHEED MARTIN INVESTIGATIONS

From 1999 to 2010, Lockheed Martin conducted a remedial investigation (RI) (Tetra Tech, 2012b) and a supplemental RI (Tetra Tech, 2011a) to further delineate the extent of soil, groundwater, and pond sediment chemical contamination indicated by the earlier studies. Through geophysical surveys, membrane interface probes (MIPs), test pits, soil borings, and chemical analyses of soil and pond sediment samples, the RI identified large areas of buried fill and debris, and surface and subsurface soil contamination in and around the buried fill material and in pond sediment. Buried fill and debris were estimated to be present over approximately 25 acres of the DRA.

Numerous additional investigations have been conducted by Lockheed Martin at the DRA from 2010 to the present. Studies of Frog Mortar Creek are not provided in this report because Frog Mortar Creek is being addressed under a separate investigational program. Lockheed Martin is also conducting environmental investigations at the Strawberry Point, Greater Strawberry Point, and Main Terminal areas of MSA (Figure 2-1). These areas are on the western side of the airport runway. The following summarizes DRA studies conducted by Lockheed Martin:

- ***March 1999: initial groundwater monitoring well sampling—***Lockheed Martin first evaluated the site in March 1999, sampling six existing groundwater monitoring wells (MW-1 through MW-6) to obtain updated chemical data on groundwater quality, elevation, and flow direction at the southeast portion of MSA (see Figure 2-4 for the locations of wells MW-1 through MW-6). TCE, *cis*-1,2-dichloroethene (*cis*-1,2-DCE), and VC were detected in select monitoring wells at concentrations exceeding the State of Maryland drinking water maximum contaminant levels (MCLs) and United States Environmental Protection Agency (USEPA) National Primary Drinking Water MCLs. A detailed description of the groundwater sampling program is in the May 1999 *Final*

Groundwater Monitoring Well Surveying and Sampling Report (Tetra Tech, 1999). Elevated concentrations of volatile organic compounds (VOCs) in the existing monitoring wells led to further investigation of the site to identify possible chemical source areas.

- ***March–May 2000: source identification and assessment program—***The second investigation was a source identification and assessment program. MAA had previously identified four specific areas as possible historical sources of released chemicals. Each of these areas of potential concern was investigated through a combination of excavations, localized trenching, drilling of soil borings, and sampling and laboratory analyses of soil, sediments, and groundwater. VOCs, petroleum hydrocarbons, and metals were detected in soil and groundwater during this investigation. VC is the only VOC detected above its USEPA Region 3 risk-based concentration (used by MDE for screening purposes) for industrial soil. Some VOCs were also detected in groundwater at levels above groundwater standards. The investigation results are documented in the September 2000 *Final Source Identification and Assessment Report* (Tetra Tech, 2000). The investigation identified VOCs in excess of published cleanup criteria; chemicals in groundwater were therefore delineated.

- ***December 2001–December 2002: partial chemical delineation and initial modeling—*** The third investigation further delineated the lateral extent of chemicals in near surface groundwater at the four source areas of concern. In addition, deep multi-level monitoring wells (DMW-1A/B and DMW-2A/B; see Figure 2-4) were installed at two locations to characterize site geology and the vertical extent of groundwater contamination. The deep groundwater monitoring wells were installed where the highest concentrations of TCE and VC had been detected during the shallow groundwater investigation. A summary of these activities is provided below and is documented in the December 2002 *Final Chemical Delineation and Groundwater Modeling Report* (Tetra Tech, 2002). Data collected during the groundwater investigation indicate that VOCs (primarily *cis*-1,2-DCE, TCE, and VC) and metals (primarily cadmium*)* were in groundwater above groundwater standards. The lateral and vertical distributions of chemicals in groundwater were not delineated during this phase of the investigation.

- ***July 2003–March 2004: data gap investigation and groundwater modeling—***The fourth investigation aimed to further delineate and characterize the chemical plumes at the site and model groundwater. Nine additional multi-level monitoring wells (DMW-3 through DMW-11), three shallow groundwater-monitoring wells (DMW-1S, DMW-2S, and MW-7), and four temporary groundwater monitoring wells (TT-11 through TT-14) were installed at the site (see Figure 2-4). The lateral and vertical distributions of chemical concentrations in groundwater indicate three possible source areas at the site, contributing to three primary groundwater plumes. These source areas and plumes are:

    - *Plume 1,* originating from the Drum Area

    - *Plume 2,* originating from the Petroleum Hydrocarbon and Pond 1 Area

    - *Plume 3,* originating from the Taxiway Tango median area

Three chlorinated VOCs (*cis*-1,2-DCE, TCE, and VC) and cadmium were reported at elevated concentrations during this investigation. The distribution of VOCs in groundwater suggests dechlorination of TCE to its daughter-products *cis*-1,2-DCE and VC. The plumes are migrating along the downgradient groundwater flow path from west to east toward Frog Mortar Creek. Although these three plumes represent the primary source areas, the chemicals have commingled to form a single contiguous area of groundwater contamination in the eastern portion of the site approaching Frog Mortar Creek.

Site-specific information was used to develop a conceptual model, including regional setting, soil lithology, aquifer characteristics, and historical and current chemical concentration data. Numerical modeling predicted groundwater flow and chemical migration in the investigation area. Summaries of the investigation and modeling are documented in the May 2004 *Final Data Gap Investigation and Modeling Report* (Tetra Tech, 2004a).

- ***2003–2004 quarterly groundwater monitoring—***Quarterly groundwater sampling was conducted for the DRA wells in September and December 2003, and in March, June, September, and December 2004. The September 2003 results are included in the *Final Data Gap Investigation and Groundwater Modeling Report* (Tetra Tech, 2004a). The results for the remaining quarterly rounds are summarized in five quarterly sampling reports (Tetra Tech, 2004b–e and 2005a).

  - In each of the first two rounds, 38 permanent wells and four temporary wells were purged and sampled using dedicated bladder pumps. The wells sampled include MW-1 through MW-7, DMW-1A/B through DMW-11S/I (see Figure 2-4). Temporary wells TT-11 through TT-14 were also sampled using low-flow peristaltic pumps. The temporary "TT" wells were not sampled after the December 2003 round. The September 2003 "baseline" samples were analyzed for VOCs, semivolatile organic compounds (SVOCs), pesticides, total metals, and dissolved metals. Subsequent rounds included VOC and metals analyses, but SVOC samples were collected only for wells with SVOCs detected in the earlier round. Pesticides were not analyzed after September 2003 because no pesticides were detected in the September 2003 round. Perchlorate was added for the wells sampled in September 2004 and for three of the wells sampled in December 2004. Thirteen wells were sampled in each of the September and December 2004 rounds. During each of these five rounds, several wells were sampled for bio-parameters consisting of nitrate, sulfate, and ferric iron.

  - Concentration contour maps for TCE, *cis*-1,2-DCE, and VC in the upper, intermediate, and lower surficial aquifer zones, and time-series trends of several wells, were generated for the reports. These quarterly sampling results are generally consistent with the September 2003 "baseline" results. Notable variations include TCE concentrations decreasing substantially at DMW-1B after the first round, and TCE decreasing from 60,000 to 20,000 µg/L at MW-5 from 1996 to 2002. TCE concentrations at MW-3 also decreased from 1995 to 2004. At several downgradient perimeter wells (e.g., DMW-2A, DMW-4S, DMW-4D), increasing TCE trends were observed until December 2003, followed by an upward spike in March 2004 (June 2004 for DMW-4S), with a subsequent return to pre-spike levels.

- ***2005 groundwater user survey—***A private potable well survey for the area around MSA (Tetra Tech, 2005b) was conducted in 2005 and repeated and updated in 2010 (Tetra Tech, 2012c). The surveys had the following objectives:

  - review relevant records and other documentation regarding historical and current public and private groundwater users in the area
  - obtain current aerial photographs of MSA and environs to identify any wells
  - evaluate plume migration from the site to the closest potable well location
  - complete a field verification study of wells identified in the records review

  The survey area was divided into three regions for field reconnaissance; survey elements include:

  - reviewing MDE and Baltimore County records to identify wells drilled and/or abandoned, to determine current well uses, and to locate well construction information and any groundwater sampling data available
  - identifying areas in the survey area with municipal potable water
  - obtaining and reviewing aerial photographs and topographic maps to identify historical and current well locations
  - flying over the site to take current aerial photographs of neighborhoods east of the site
  - summarizing pertinent regulations and policies concerning permitting, compliance, and operating requirements for private and public groundwater users in the survey area
  - performing field reconnaissance to verify the status of the wells identified in the public records and document searches (specified above), and to locate additional wells that might be in the area. All wells identified in public records were checked in the field; however, wells east of Frog Mortar Creek were the main focus.

  The study findings are as follows:

  - Most user survey area residences and businesses around MSA are supplied by Baltimore County public water. Three reservoirs (Loch Raven, Pretty Boy, and Liberty) in the central, northern, and western parts of the county are surface water impoundments for the public water supply. Water from these reservoirs is piped to the City of Baltimore reservoir, which serves the survey area. Only a limited number of private potable wells appear to be in use.
  - Data from off-site well logs indicate that most wells are screened in the Patapsco formation. Depths for these wells range from 57 to 140 feet below the ground surface. South of Eastern Boulevard, wells extending into the Patuxent Formation generally range in depth from 176 to 224 feet. North of Eastern Boulevard, two wells in the

survey area (ranging in depth from 105 to 135 feet) are described as being screened in the Patuxent Formation.

- Eighty-four wells in the survey area were documented as possibly being in use. The study indicated that most of these wells are likely associated with properties that have been connected to public water, so these wells may no longer exist. Properties (with records of wells) that apparently had not been connected to public water are located beyond public lines at the ends of roads or peninsulas.

- The former well at 3301 Edwards Lane (i.e., the closest well to the site) is no longer used for drinking water since the property was supplied by public water. Other locations in this area, such as the residence at 800 Middle Road, the Brigadoon Marine Facility, and houses on Claire's Lane, likely have water supply wells. Residences to the north, on Bengies Road, Bourque Avenue, Hillpine Road, and Gladway Road, are not supplied by public water. Residences to the west at the end of Punte Road and Weber Avenue are likewise beyond the area supplied by public water. Most other residences with well records on file, lying east of Frog Mortar Creek and west of Middle River, are likely connected to public water. The survey findings suggest that no potable wells are now in use near the site. The 3301 Edwards Lane well is the closest potable well to the site; however, it is no longer used and has reportedly been abandoned.

- ***2005 additional soil and sediment sampling—***At MDE's request, additional soil samples were collected from Taxiway Tango excavations in areas where elevated total chromium (e.g., 9,300 milligrams per kilogram [mg/kg]) levels had been detected in previous soil samples at Excavation 2. Twelve soil samples (six from a one-foot depth and six from a four-foot depth) were collected in May 2005 and analyzed for total chromium and hexavalent chromium (Tetra Tech, 2005c). Four pond sediment samples were also collected from Pond 1 to supplement previous sediment chemical data collected from this area of the site. The pond sediment samples were analyzed for VOCs, SVOCs, metals, polychlorinated biphenyls (PCBs), hexavalent chromium, and simultaneously extracted metals/acid volatile sulfides. Samples were collected to complete human health and ecological risk assessments for the site.

  Relative to total chromium concentrations, hexavalent chromium was detected at low concentrations in six samples, with concentrations ranging from 0.36 to 1.4 mg/kg. Five of the six hexavalent chromium detections were in the one-foot samples. Three sediment samples had low to moderate concentrations of VOCs, SVOCs, metals, and PCBs. TCE was detected at a concentration of 270,000 µg/kg in EP1-SD5. High concentrations of benzene (215 µg/kg), toluene (350,000 µg/kg), ethylbenzene (30,400 µg/kg), and xylenes (86,500 µg/kg) were also detected in EP1-SD5. Hexavalent chromium was not detected in any pond sediment samples.

- ***August 2006: groundwater monitoring—*** Groundwater samples were collected from 36 wells in August 2006 to provide a then current round of water quality data for the DRA. The wells sampled include MW-2 through MW-6, and DMW-1A/B through DMW-11S/I (Figure 2-4). The temporary "TT" wells were not sampled in 2006. Samples were analyzed for VOC, 1,4-dioxane, perchlorate, total and dissolved metals, and hexavalent

chromium. Additionally, DMW-3S and DMW-9S were analyzed for SVOCs. Sampling results indicate that concentrations of chlorinated VOCs (cVOCs) exceed MDE's groundwater standards throughout a large portion of the investigation area, and at multiple depths. The maximum TCE concentration observed in a 2006 monitoring well sample was 41,000 µg/L, reported for upper surficial aquifer well DMW-11S. 1,4-dioxane and perchlorate were detected in 34 and 17 groundwater samples, respectively. Hexavalent chromium was not detected in these samples. Low concentrations of several SVOCs were detected at DMW-3S and DMW-9S. The results of this investigation were not presented in a report but are included in the site database.

- ***Fall/winter 2007: additional on-site soil and groundwater characterization***—Additional on-site soil and groundwater characterization in September 2007 further delineated and characterized the chemical plumes and provided data supporting the evaluation of remedial alternatives. The program included advancing 52 membrane interface probe/cone penetrometer tests (MIP/CPT) and installing and subsequently sampling 12 new and multi-level (nested) surficial aquifer groundwater monitoring wells. Thirty-one monitoring wells were installed, including shallow, intermediate, and deep monitoring wells (see Figure 2-5). The screens of the nested wells were installed at three separate depth intervals of approximately 30, 50, and 80 feet bgs. Two shallow and two intermediate wells were installed as recovery and observation wells in support of aquifer hydraulics testing.

  The existing and newly installed nested wells were sampled for target contaminants analysis. MIP/CPT screening provided a vertical profile of electric conductivity and VOCs in subsurface soils and groundwater, and identified the source areas of contamination. The overall objectives of these field activities were to characterize the subsurface soil in the vadose and saturated zones, delineate the lateral boundaries of contamination in soil and groundwater, and delineate the vertical extent of contamination in soil and groundwater.

  The study also used electromagnetic and gamma surveys to identify anomalies in the subsurface that could represent buried waste and any possible contaminant source(s). Test pits were excavated at locations identified by the geophysical survey as being either anomalous or non-anomalous, to determine depth of fill, visually identify buried debris, and collect soil samples for laboratory analysis. A summary of this investigation is provided below and documented in the June 2008 *Soils and Groundwater Data Report* (Tetra Tech, 2008):

  - Elevated electron capture device (ECD) responses indicate chlorinated aliphatic hydrocarbons (CAHs) at 19 of the 52 MIP locations. The contamination appears bounded on the north, south, and west. Significant shallow vadose zone soil contamination was observed at two locations (MIP-57 and MIP-58) between Taxiway Tango and the runway.

  - Soil and groundwater samples collected from the direct push technology (DPT) sampling locations confirm CAHs in those borings exhibiting elevated ECD response. The maximum TCE concentration in soil was 7,680 micrograms per kilogram (µg/kg), at MIP-58 (10 feet bgs). Soil samples from a limited number of locations minimally

exceed MDE residential soil standards. The maximum concentration of TCE in groundwater was 68,600 µg/L (at MIP-28, 34–36 feet bgs). A range of other CAHs and petroleum hydrocarbons were also detected in these samples.

- Groundwater was found to flow generally northeast, toward Frog Mortar Creek.

- VOCs (CAHs and petroleum hydrocarbons), metals, and 1,4-dioxane are present throughout a large portion of the investigation area, at multiple depths, and at high concentrations.

- The maximum TCE concentration observed in a monitoring well sample is 41,400 µg/L (DMW-11I). TCE contamination extends north to an area north of Pond 2, south to DMW-7I, and west to the area between Taxiway Tango and the runway. The contamination appears delineated, except for the area north–northwest of MW-15 and MW-26 and south of MW-19 (Figure 2-5).

- The maximum 1,4-dioxane concentration observed in a monitoring well sample is 1,800 µg/L (DMW-3S). Most of the 1,4-dioxane contamination appears isolated to the central portion of the site, extending north to MW-18, south to DMW-7, and west to DMW-9.

- The maximum perchlorate concentration observed in a monitoring well sample is 8 µg/L (DMW-7I); perchlorate in groundwater is generally confined to the area southeast of Pond 2. Groundwater samples from new monitoring wells were not analyzed for perchlorate.

- A wide range of metals exceeds MDE standards at locations throughout the site. Exceedances were observed for arsenic, barium, beryllium, cadmium, chromium, lead, nickel, selenium, vanadium, and zinc.

- The geophysical investigation found suspected waste over approximately 19 acres of the site. Including areas inaccessible to the investigation, but suspected of containing waste (e.g., the areas of Ponds #1 and #2 and east of the ponds), the area suspected of containing waste is estimated at approximately 25 acres. The investigation appears to have delineated the extent of the waste in all directions.

- The test pit excavations confirm the presence of waste that had been identified by the geophysical survey. Soil sampling associated with the test pits shows SVOCs, PCBs, and metals concentrations above MDE residential standards in many of the test pits excavated in the waste areas. Lesser concentrations of these contaminants are also found in areas not containing waste.

- ***June 2008–January 2009: deep groundwater investigation—***This investigation sought to determine whether VOCs detected in surficial aquifer groundwater at MSA have migrated vertically through clay-rich sediments to the next underlying aquifer. Four groundwater monitoring wells were installed into a confined aquifer lying beneath the groundwater contamination previously characterized in the surficial aquifer at MSA. A shallow well (MW-28I) was also installed in the surficial aquifer at a hydraulically upgradient location near well MW-27D (see Figure 2-5). As part of this investigation,

groundwater levels were measured in the newly installed groundwater monitoring wells to determine groundwater flow direction in the deeper confined aquifer. Groundwater samples were collected for chemical analyses to assess VOCs. The following summarizes the investigation and its findings (Tetra Tech, 2009a):

- Four deep soil borings were advanced to depths of 218–268 feet bgs. A fifth boring for an intermediate surficial aquifer well was advanced to a depth of 50 feet. Continuous soil coring was used at each borehole to record lithologic descriptions. Four clay/soil samples from deep borings were collected for geotechnical analyses.

- A series of alternating sand and silt aquifers and clay aquitards were encountered beneath the lower surficial aquifer, beginning at approximately 100 feet bgs. Permeability tests on the underlying clay indicate low vertical permeabilities of 2.2×10^{-08} to 13×10^{-08} centimeters per second.

- A single well, directional, heat pulse technique successfully estimated groundwater flow directions at groundwater monitoring wells MW-27D and MW-29D. Results of these tests were used to identify drilling locations for downgradient groundwater monitoring wells MW-30D and MW-31D (see Figure 2-5). Groundwater levels recorded in January 2009 show that these wells are hydraulically downgradient of VOC contamination in the lower surficial aquifer.

- Five two-inch-diameter monitoring wells were installed to monitor groundwater quality and levels in the intermediate surficial aquifer and the deep confined aquifers beneath the lower surficial aquifer. Well bottom completion depths range from 50 to 207 feet bgs. Groundwater samples were collected and analyzed for VOCs, SVOCs, and metals.

- Groundwater in the deep confined aquifer was found to flow southeasterly from MW-27D toward MW-29D through MW-31D. Investigators determined that contaminants possibly introduced into the lower confined aquifer from the lower surficial aquifer (i.e., in the area of groundwater monitoring wells DMW-1B, DMW-8D, and DMW-4D) could be monitored effectively by downgradient groundwater-monitoring wells MW-29D, MW-30D, and MW-31D. Groundwater elevations for groundwater monitoring wells MW-28I and MW-27D indicate an upward hydraulic gradient of 0.0035 feet per feet.

- TCE, DCE, and VC were detected in the groundwater sample from newly installed intermediate surficial aquifer well MW-28I at concentrations exceeding drinking water MCLs and MDE groundwater standards. MW-28I was installed at a depth of 50 feet bgs at a location northeast and hydraulically upgradient of the areas where (historically) high concentrations of TCE have occurred.

- VOC-degradation products, cVOCs, and 1,4-dioxane detected in the lower surficial aquifer groundwater across the site were not detected in the deep well groundwater samples. VOCs and SVOCs reported for the deep well samples are either common laboratory contaminants or constituents of petroleum fuels. Concentrations of the VOCs and SVOCs detected are less than MCLs and MDE groundwater standards.

- ***August–September 2008: groundwater monitoring—***The 2008 monitoring provided a then current round of groundwater data for older existing groundwater monitoring wells, and a second round of groundwater data for newly installed monitoring wells at MSA. These data describe then current groundwater quality conditions at the facility that support evaluation of time based trends of groundwater contaminants, and evaluation of remedial actions in subsequent studies. Groundwater samples were chemically analyzed for cVOCs, 1,4-dioxane, metals, and several water quality indicators. The following summarizes the August–October 2008 groundwater sampling and analyses (Tetra Tech, 2009b):

    - Groundwater flow in the upper, intermediate, and lower surficial aquifer zones is generally northeast toward Frog Mortar Creek. However, data indicate local variations in the hydrology of the intermediate and lower surficial aquifer zones that cause divergent flow north toward the Maryland Air National Guard (MDANG) property and south toward the southern end of the MSA peninsula.

    - Concentrations of cVOCs exceed MDE groundwater standards throughout a large portion of the investigation area and at multiple depths. The maximum TCE concentration observed in a then current monitoring well sample is 29,000 µg/L, reported for upper surficial aquifer well DMW-11S. Multiple VOC sources at the site resulted in VOC-contaminated groundwater extending to areas north of Pond 2, south to DMW-6I and DMW-7I, and west to the area between Taxiway Tango and the runway.

    - Chlorinated VOCs were detected at concentrations exceeding MDE's groundwater standards in samples from monitoring wells then recently installed north and east of Pond 2 and south of pre-existing groundwater monitoring wells.

    - Concentrations of cVOCs in groundwater had decreased substantially as compared to the 2004 chemical results for MSA. The TCE concentration reduction for 2008, and high concentrations of its chemical daughter products *cis*-1,2-DCE, VC, and chloroform, indicate that TCE-degradation is occurring at the site.

    - VOC contamination was not fully delineated north–northwest of well clusters MW-14, MW-17, and MW-28; east of well clusters MW-14, MW-18, DMW-3, DMW-2, DMW-4, and DMW-5; west of DMW-11S; and south of well clusters MW-19 and MW-24.

    - 1,4-Dioxane was detected primarily in groundwater samples from the upper and intermediate surficial-aquifer zones. 1,4-dioxane was co-located in areas containing the highest concentrations of cVOCs and was detected in samples collected primarily near Pond 1 and the area east of Pond 1. The highest concentrations of 1,4-dioxane are 590 µg/L at well MW-16S (northwest of Pond 2) and 490 µg/L at well DMW-2A (east of Pond 1 near Frog Mortar Creek).

    - Concentrations of 12 metals exceeded groundwater standards in one or more groundwater samples. Concentrations of manganese and iron most frequently exceed standards (89% and 79% of samples, respectively), with their maximum

concentrations exceeding standards by more than a factor of 100 (i.e., two orders of magnitude). Concentrations of cadmium exceed the standard in 20% of samples, with the maximum concentration exceeding the groundwater standard by more than two orders of magnitude. The greatest concentrations of cadmium are co-located with high levels of VOCs in the intermediate surficial aquifer, at groundwater monitoring wells DMW-1A, DMW-2A, DMW-8I, and DMW-3I south and east of Pond 1. Concentrations of metals such as chromium, hexavalent chromium, lead, mercury, and zinc exceed standards in less than 10% of samples, ranging from one exceedance each for mercury and zinc to five exceedances for lead. Dissolved lead and mercury concentrations do not exceed standards.

- ***August 2009 additional well installation—***Three new two-level well clusters (MW-32S/I, MW-33S/I, and MW-34S/I) were installed at the DRA site in August 2009 (see Figure 2-5) to further characterize the horizontal and vertical extent of groundwater contamination in the northern, northwestern, and southern portions of the site, where the boundaries of VOC contamination had not been delineated. The installed wells include three upper zone wells and three intermediate zone wells. These wells were installed as nested wells in a single borehole. Drilling, well installation, and well development followed procedures discussed previously for the 2007 well installation program.

- ***August–September 2009: groundwater monitoring—***The 2009 monitoring provided a new round of groundwater data for older existing groundwater monitoring wells and newly installed wells. These data describe then current groundwater quality conditions at the facility and were used in subsequent studies to evaluate time based groundwater contaminant trends and remedial actions. Groundwater samples were chemically analyzed for cVOCs, 1,4-dioxane, metals, and several water quality indicators. The following summarizes the August–September 2009 groundwater sampling and analyses (Tetra Tech, 2010a):

  - Groundwater in the upper, intermediate, and lower surficial aquifer zones was generally found to flow northeast toward Frog Mortar Creek. However, local variations in the hydrogeology of the upper, intermediate, and lower surficial aquifer zones provide divergent flow north and northwest, and south toward the southern end of the MSA peninsula.

  - Concentrations of cVOCs exceed MDE groundwater standards throughout a large portion of the investigation area and at multiple depths. The maximum TCE concentration observed in a then current monitoring well sample is 36,000 µg/L, reported for upper surficial aquifer well DMW-11S. Multiple VOC sources at the site have resulted in VOC-contaminated groundwater extending to areas north of Pond 2, south to DMW-6I and DMW-7I, and west to the area between Taxiway Tango and the runway.

  - cVOCs were detected at concentrations exceeding MDE groundwater standards in samples from monitoring wells MW-33S and MW-34I, recently installed northwest of Pond 2. TCE was not detected in two new wells installed south of the Drum Area plume (wells MW-32S and MW-32I).

- Concentrations of cVOCs in groundwater are consistent with the 2008 results and decreased substantially as compared to the 2004 chemical results for MSA. The TCE concentration reduction observed in 2009, and the high concentrations of the chemical daughter products *cis*-1,2-DCE, VC, and chloroform, indicate that TCE-degradation is occurring at the site.

- VOC contamination had not been fully delineated west and northwest of well MW-15 and MW-33; north of well clusters MW-14 and MW-17; east of well clusters MW-14, MW-18, DMW-3, DMW-2, DMW-4, and DMW-5; and west of DMW-11S.

- 1,4-Dioxane was detected primarily in groundwater samples from the upper and intermediate surficial-aquifer zones. 1,4-Dioxane was co-located in areas containing the highest concentrations of chlorinated VOCs, detected primarily near Pond 1 and the area east of Pond 1. The highest concentrations of 1,4-dioxane are 1,100 µg/L at well DMW-3I (east of Pond 1 near Frog Mortar Creek) and 790 µg/L at well MW-16S (north of Pond 2).

- Concentrations of 11 metals exceed groundwater standards in one or more groundwater samples. Concentrations of manganese and iron exceed standards most frequently, with the maximum concentrations exceeding standards by more than a factor of 100. Concentrations of cadmium exceed the standard in nearly 20% of samples, with the maximum concentration exceeding the groundwater standard by more than two orders of magnitude. Concentrations of metals such as chromium, lead, mercury, and selenium exceed standards in less than 10% of samples, ranging from one exceedance for selenium to three for lead. Dissolved lead and mercury concentrations do not exceed standards.

- ***2010 remedial investigation report*—**An RI completed in early 2010 (Tetra Tech, 2012b) evaluated the nature and extent of soil and groundwater contamination, assessed the fate and transport of contaminants in soil and groundwater, and presented a human health risk assessment (HHRA) and an ecological risk assessment (ERA). The RI is based on physical and chemical data for soil collected from 2000 to 2009 and groundwater chemical data from 2007 to 2009. The RI findings are summarized below:

  - Chemical analyses of numerous soil samples and several pond sediment samples indicate VOCs, SVOCs, PCBs, and several metals in soil and pond bottom sediment at concentrations exceeding USEPA human health and ecological risk-based screening levels and MDE soil cleanup standards. The primary VOCs detected in soil and pond sediment samples are TCE, TCE-degradation products (such as *cis*-1,2-DCE and VC), and benzene, toluene, ethylbenzene, and xylenes (BTEX). SVOCs detected in soil and sediment includes polycyclic aromatic hydrocarbons (PAHs). A subset of the 19 metals detected in soil and pond sediment at the site includes antimony, arsenic, cadmium, copper, chromium, lead, mercury, nickel, and zinc.

  - Groundwater samples collected in 2007–2009 were analyzed for VOCs, 1,4-dioxane, perchlorate, total and dissolved metals, and hexavalent chromium. Upper surficial aquifer wells were analyzed in 2009 for total petroleum hydrocarbon (TPH)-diesel-range organics (DRO) and TPH-gasoline-range organics (GRO).

Selected wells were analyzed for natural attenuation assessment (NAA) parameters such as alkalinity, chemical oxygen demand, dissolved gasses (methane, ethane, ethene, hydrogen, oxygen, and carbon dioxide), anions, total organic carbon, etc. Approximately 200 groundwater samples were collected between 2007 and 2009 from the upper, intermediate, and lower surficial aquifer and deep confined aquifer.

- Concentrations of cVOCs (such as TCE and *cis*-1,2-DCE) exceed federal and MDE groundwater standards throughout a large portion of the investigation area and at multiple depths. Multiple VOC sources at the site have resulted in VOC-contaminated groundwater extending west to the airport runway, north to well MW-34 (north of Pond 2), east near the Frog Mortar Creek shoreline at wells MW-14, DMW-5, and south to well MW-24 (Figure 2-5).

- Concentrations of cVOCs in groundwater generally decreased as compared to the 2004 MSA chemical results. The reduction in TCE concentrations and the high concentrations of the chemical daughter products *cis*-1,2-DCE, VC, and ethene indicate that TCE-degradation has occurred at the site and may continue.

- 1,4-Dioxane was detected primarily in groundwater samples from the upper and intermediate surficial aquifer zones. 1,4-Dioxane is generally co-located in areas containing the highest concentrations of cVOCs, which occur primarily near Pond 1 and the area east.

- Concentrations of cadmium exceed the standard in 20% of the samples. The greatest concentrations of cadmium are associated with high levels of VOCs in the intermediate surficial aquifer at wells DMW-1A, DMW-2A, DMW-8I, and DMW-3I, south and east of Pond 1.

- BTEX was detected less frequently and at lower concentrations (with respect to groundwater standards) than were the chlorinated aromatic hydrocarbons. Well DMW-9S, near the Petroleum Hydrocarbon Area, had the greatest concentrations of BTEX.

- In 2009, groundwater samples from the upper surficial aquifer were analyzed for TPH-DRO, which had been detected in more than half of the samples. Its greatest concentration was reported for well MW-20S, in the upper surficial aquifer south of the Petroleum Hydrocarbon Area. TPH-GRO was detected in nearly all groundwater samples. The highest GRO concentration was reported in well DMW-9S, south of the Petroleum Hydrocarbon Area, and screened in the upper surficial aquifer. Substantially lower concentrations of TPH-DRO and TPH-GRO were reported for wells at the Drum Area Plume and Taxiway Tango plume area.

- Groundwater modeling supported development of remedial alternatives to address VOC and 1,4-dioxane contamination in groundwater. These remedial alternatives focused on controlling and capturing contaminated groundwater at the site. Additional simulations examined the effects of placing injection and extraction wells in the plumes' high concentration zones.

- An HHRA produced in accordance with USEPA and MDE guidelines evaluated risk to potential human receptors under current and likely future land uses. The HHRA considered receptor exposure under non-residential (e.g., industrial, recreational) and residential land use scenarios. The predominant chemicals of potential concern (COPC) for human health resulting from evaluation of the direct contact exposure scenarios are reported as cVOCs (in soils, groundwater, sediments), BTEX (in soils and groundwater), substituted benzene compounds (in soils and groundwater), PAHs (in soils and sediments), and several heavy metals (e.g., cadmium, lead, copper, chromium, nickel). Only one chemical was detected in surface water, and no COPC for surface water were selected in the HHRA. Risks associated with trespasser exposures to surface water were not quantitatively evaluated in this HHRA. Groundwater was not and is not currently used as a source of potable or industrial water at the site, nor is such use likely in the future. The groundwater user survey also indicated the possibility of wells near MSA, but these wells, if they exist, would be upgradient of MSA.

- An ERA produced in accordance with USEPA guidelines evaluated risk to potential ecological receptors in surface soil, sediment, and groundwater (evaluated as surface water). The central area of the site northwest of Pond 1 appears to be the area of largest ecological risk, based on then current sampling data. The ERA identified surface soil ecological COPC for invertebrates and plants, including TCE, *cis*-1,2-DCE, antimony, chromium, copper, manganese, molybdenum, and zinc. PAHs are COPC only for soil invertebrates, whereas cadmium, lead, nickel, and selenium are considered COPC only for plants. VOCs, PAHs, PCBs, and several metals are considered COPC for Pond 1 sediment. Evaluation of surface soil identified several metals (mercury, cadmium, lead, and molybdenum) as risks to wildlife (e.g., quails, shrews, robins).

- ***2010 off-site piezometer installation—***In March 2010, six off-site piezometers were installed on two privately owned properties at 3300–3301 Edwards Lane on the Bowleys Quarters peninsula, east of the DRA and on the eastern shoreline of Frog Mortar Creek (see Figure 2-5; Tetra Tech, 2010c). Groundwater levels in these six piezometers and three DRA wells, as well as creek levels in Frog Mortar Creek, were monitored and recorded for one month. The results of this study were used to better understand off-site groundwater characteristics, including the extent to which the surficial aquifer at those monitoring points is tidally influenced, and to identify vertical hydraulic gradients and their relationship to DRA groundwater characteristics. These data were used to model DRA groundwater. The following summarizes the off-site piezometer investigation:

  - The piezometers were screened at depths of approximately five- to 15-feet (shallow zone), 29–39 feet (intermediate zone) and 42–52 or 46–56 feet (deep zone) below grade. Screened intervals for the piezometers were set at elevations nearly equivalent to wells installed in the eastern portion of the DRA. Piezometer locations and casing elevations were surveyed by a Maryland-licensed surveying firm.

  - The six newly installed piezometers and three DRA wells (DMW-4S, DMW-4I, and DMW-4D) were fitted with electronic water level data loggers to record water level data. A data logger was also placed in a locked, perforated, steel standpipe installed at 3300–3301 Edwards Lane to record creek levels during the same period. A barometric

pressure data logger was also installed in well DMW-8S at the DRA to record fluctuations during the monitoring period.

- Groundwater levels, surface water levels, and barometric pressure were recorded for one month from June 2–4 to July 6, 2010. The study results indicate that groundwater levels in the surficial aquifer are influenced by both tides and barometric pressure.

- ***July 2010: groundwater monitoring—***The July 2010 monitoring provided a new round of groundwater data for older groundwater monitoring wells and newly installed wells. These data describe then current groundwater quality conditions at the facility and were used in support of evaluating time based groundwater contaminant trends and to evaluate remedial actions in subsequent studies. Groundwater samples were chemically analyzed for chlorinated VOCs, 1,4-dioxane, metals, and several water quality indicators. The following summarizes the findings of the July 2010 groundwater and surface water sampling and analyses (Tetra Tech, 2010b):

  - Groundwater in the upper, intermediate, and lower surficial aquifer zones was found to flow northeast toward Frog Mortar Creek.

  - Concentrations of cVOCs exceed MDE groundwater standards throughout a large portion of the investigation area and at multiple depths. The maximum TCE concentration observed in a then current monitoring well sample was 36,000 µg/L, reported for upper surficial aquifer well DMW-11S. Multiple VOC sources at the site have resulted in VOC-contaminated groundwater extending to areas north of Pond 2, south to DMW-6I and DMW-7I, and west to the area between Taxiway Tango and the airport runway.

  - Concentrations of cVOCs in groundwater are consistent with the 2009 results. Time-series plots of VOCs in source areas and downgradient locations indicate a general decrease in VOC concentrations since the early 2000s. VOC concentrations in the source area for the Taxiway Tango Median Area plume (DMW-11S) remained steady or had increased slightly since 2003.

  - At six wells where groundwater samples were analyzed for natural attenuation parameters, evidence of anaerobic reductive dechlorination is indicated by the TCE-breakdown product *cis*-1,2-DCE, VC, methane, and ethene, and elevated chloride concentrations. These data indicate that complete dechlorination may have been readily occurring in the upper and intermediate surficial aquifer zones at the DRA. However, lower relative concentrations of VC, methane, ethene, low groundwater pH, and high oxidation reduction potential (ORP) indicate that slow or incomplete reductive dechlorination of lower order cVOCs may have been occurring in the lower surficial aquifer zone.

  - VOC groundwater contamination was found at concentrations greater than groundwater standards at then currently delineated areas to the north (wells MW-14I, MW-15S/I, MW-16S/I, MW-17I, and MW-28I), east (wells MW-14I, MW-18I/S, DMW-3S/I, DMW-4S/I/D, and DMW-5S/I), and west (wells MW-24I, DMW-11S,

and MW-33S). See Figure 2-5 for well locations. Additional investigation is proceeding in areas to the north and west.

- Sampling results for wells DMW-6I/D and MW-32S/I indicate that the VOC groundwater contamination is bounded along the southern portion of the site.

- The SVOC 1,4-dioxane was primarily detected in groundwater samples from the upper and intermediate surficial aquifer zones. 1,4-Dioxane is co-located in areas containing the highest concentrations of cVOCs, primarily near Pond 1 and the area to the east. The highest concentrations of 1,4-dioxane are detected east of Pond 1 near Frog Mortar Creek at wells DMW-2A (590 µg/L), DMW-3S (480 µg/L), and DMW-3I (390 µg/L). 1,4-Dioxane was detected at a concentration of 1.8 µg/L at Frog Mortar Creek in surface water sample SW38, nearest the DRA.

- TPH-DRO was detected in 70% of the 2010 upper surficial aquifer groundwater samples at concentrations ranging from 78 to 2,000 µg/L (averaging 473 µg/L). TPH-GRO was detected in slightly more than half (59%) of the 2010 upper surficial aquifer groundwater samples at concentrations ranging from 34 to 55,000 µg/L (averaging 4,349 µg/L). Most DRO and GRO concentrations exceed the MDE criterion of 47 µg/L. The greatest concentrations of DRO and GRO were detected in well DMW-9S in the Petroleum Hydrocarbon and Pond 1 Area. Substantially lower concentrations of TPH-DRO and TPH-GRO were reported for groundwater in the Drum Area and Taxiway Tango Median Area.

- Perchlorate and the explosive cyclotrimethylene trinitramine (also known as Royal Demolition Explosive [RDX]) were not detected in DRA groundwater samples.

- Concentrations of 11 metals exceeded groundwater standards in one or more groundwater samples. Concentrations of iron and manganese most frequently exceed standards, with the maximum concentrations of these two metals exceeding standards by more than a factor of 100. Concentrations of cadmium exceeded the standard in nearly 20% of the samples, with the maximum concentration (833 µg/L) exceeding the groundwater standard by more than two orders of magnitude. Arsenic, beryllium, nickel, and vanadium concentrations exceeded the standards; the maximum concentration of vanadium is less than two orders of magnitude more than the MDE groundwater standard, and the maximum levels of arsenic and nickel are less than 10 times the standards. Concentrations of the metals chromium, lead, mercury, and selenium exceeded standards in less than 10% of samples, ranging from four exceedances for chromium to one exceedance each for selenium and mercury. Dissolved lead and mercury concentrations from filtered samples did not exceed standards.

- Radium-228 and combined radium-226/228 concentrations exceeded MDE's groundwater standard in samples at intermediate and deep surficial aquifer wells. Radium-228 concentrations exceeded the groundwater standard of 5 picoCuries per liter (pCi/L) in samples from wells DMW-3I (7.53 pCi/L), DMW-6I (11.6 pCi/L), and DMW-6D (7.82 pCi/L). The combined radium-226/228 concentration in the sample from well DMW-3D (6.30 pCi/L) also exceeded the MDE groundwater standard. The

combined radium-226/228 concentrations in samples from wells DMW-3I, DMW-6I, and DMW-6D that exceeded the MDE groundwater standard are 8.264, 12.046, and 9.53 pCi/L, respectively. Concentrations of radium-226, radium-228, or combined radium-226/228, did not exceed the MDE groundwater standard in samples from the upper surficial aquifer (MW-3, DMW-6S, MW-16S), deep confined aquifer (MW-27D and MW-29D), or the third well sampled in the intermediate surficial aquifer (MW-16I).

- ***May–June 2011: groundwater monitoring—***Groundwater sampling of 65 DRA wells was conducted in May–June 2011 (Tetra Tech, 2012d). Groundwater was sampled to provide a then current round of groundwater quality data for selected monitoring wells, to evaluate time based trends of on-site groundwater plumes, and to evaluate the natural attenuation of the chemicals of concern in groundwater at the site. Samples were chemically analyzed for VOCs, 1,4-dioxane, total and dissolved metals, perchlorate (a propellant constituent), and field water-quality indicators. Selected groundwater samples were also analyzed for TPH-DRO, TPH-GRO, radium-224, radium-226, radium-228, haloacetic acids, and NAA parameters.

    - Data results are consistent with those of 2010. Concentrations of cVOCs, benzene, 1,4-dioxane, metals, TPH-DRO, and TPH-GRO exceeded MDE groundwater standards or other groundwater criteria (the California action level for 1,4-dioxane was used in the absence of an MDE action level) throughout a large portion of the investigation area, and at multiple depths.

    - Hexavalent chromium was detected in only three samples, at concentrations below the MDE groundwater standard of 2.6 µg/L. Haloacetic acids were not detected in the three groundwater samples analyzed. Concentrations of radium-226 in all samples analyzed are less than its groundwater standard. Radium-228 and combined radium-226/228 concentrations exceeded the groundwater standard in one sample each from the intermediate and deep surficial-aquifer at wells DMW-6I and DMW-6D (see Figure 2-5).

- ***June–July 2011 investigation of the Dump Road and Runway Areas of MSA—***This round of monitoring sought to identify contaminants in six newly installed monitoring wells MW-30I and MW-35S through MW-39S at MSA (see Figure 2-5 for well locations). Groundwater samples were collected from six newly installed monitoring wells and analyzed for VOCs, SVOCs, PCBs, total metals, TPH-DRO, and TPH-GRO. Two wells (MW-30I and MW-39S) had TCE, VC, and naphthalene concentrations in excess of MDE screening criteria. TPH-DRO were detected at newly installed groundwater monitoring well MW-39S at a concentration (3,000 µg/L) exceeding its MDE groundwater standard by more than a factor of 60. Detected TPH-DRO concentrations also exceeded the MDE standard in groundwater samples from MW-35S and MW-37S. The GRO concentration detected in MW-30I also exceeds its MDE groundwater standard.

Lockheed Martin received comments from MDE in a letter dated August 4, 2011 regarding MSA Dump Road Area reports. In these comments, MDE requested the use of passive diffusion bags

(PDBs) rather than low-flow pumps when sampling older wells or wells with 10-foot well screens. MDE believes the use of PDBs under these conditions will more accurately characterize the vertical distribution of concentrations in the cVOC plumes. Accordingly, Lockheed Martin agreed to consider the use of PDBs in future sampling events.

However, during a follow-up conversation with Mr. Brian Dietz of MDE on March 22, 2012, Tetra Tech and CDM Smith discussed an alternative approach to addressing MDE's comment. This approach includes using the existing dedicated bladder pumps in monitoring wells MW-4 and MW-5 (Figures 2-4 and 2-5) to collect samples from three distinct depth intervals per well, followed by deployment and collection of PDBs across the same intervals. This will allow Lockheed Martin to acquire data comparing collection techniques (passive diffusion bags vs. low flow pump sampling) and aid in the decision regarding the use of PDBs in future sampling events. Mr. Dietz agreed with this approach.

Section 3
Investigation Approach and Methodology

This report summarizes the 2012 Dump Road Area (DRA) groundwater sampling program, which included synoptic groundwater level measurements and groundwater sampling for chemical analyses. The 2012 groundwater round augments data obtained from the 2003 to 2011 DRA groundwater level measurements and sampling.

3.1 SYNOPTIC GROUNDWATER LEVEL MEASUREMENTS

A synoptic round of water level measurements was conducted on April 16, 2012. Static water levels were measured using a graduated electronic sounding water level meter. The static water level was determined by lowering the meter's probe into the well until the liquid level indicator emitted an audible tone, indicating the air/water interface. The water level was read from the probe cable and recorded to the nearest 0.01 foot as the depth to water, relative to the top of the well casing. Groundwater level measurement sheets are in Appendix A.

3.2 GROUNDWATER SAMPLING

Groundwater samples were collected from 72 wells at the DRA site in April–August 2012. Additionally, groundwater samples were collected using passive diffusion bags (PDBs) at different depths to compare with the low flow-sampling results for two wells with long well screens. Wells sampled during this round are listed in Table 3-1 and shown in Figure 3-1. The following sections outline well purging, sampling, and analytical procedures.

Well purging—Monitoring wells were purged using low-flow purging techniques before sample collection. Groundwater was purged using a peristaltic pump fitted with dedicated, disposable Teflon®-lined tubing, or by using a submersible pump positioned in the center of the well's saturated screen. The pumping rate during purging ranged between 100–300 milliliters per minute (mL/min) and was constantly measured using a graduated cylinder. The purge rate was adjusted

(but not allowed to fall below 100 mL/min) to minimize groundwater drawdown from the initial static water level.

During groundwater purging, water level drawdown measurements and groundwater parameters (including pH [a measure of acidity and alkalinity], temperature, specific conductance, dissolved oxygen [DO], oxidation reduction potential [ORP], and turbidity) were collected every five to 10 minutes until purging was complete. Data were recorded in the appropriate site-specific logbook and on low flow purge data sheets. Water quality parameters were measured using an inline water quality meter. Turbidity readings were collected using a separate turbidity meter.

Purging was considered complete when the monitored water quality parameters stabilized, when three saturated well-casing volumes had been removed, or when the well had been purged dry. Stabilization was considered achieved when three consecutive readings, taken at five minute intervals, were within ±0.1 standard units for pH, ±3% for specific conductance and temperature, ±10% for DO and ORP, and less than 10 nephelometric turbidity units (NTUs) for turbidity. If the monitoring well was purged dry, the water level in the well was allowed to recover a minimum of 80% of its initial static water level before groundwater sampling. Well purging and sample record sheets are in Appendix B. All purged water was collected in U.S. Department of Transportation (USDOT)-approved 55-gallon steel drums, which were properly labeled and staged at a location approved by the Maryland Air National Guard (MDANG) and Lockheed Martin Corporation (Lockheed Martin).

Sample collection—Monitoring wells were sampled after purging using the same dedicated tubing or submersible pump as had been used during purging. Groundwater samples were collected using low-flow sampling protocols at the same pumping rate as had been used during well purging. Groundwater was pumped directly into the appropriate sample containers (including all volatile organic compound [VOC] samples), or into a certified-clean disposable container (supplied by the laboratory), which was then used to pour the collected water directly into the appropriate sample containers.

Additional sampling of monitoring wells MW-4 and MW-5—In response to the Maryland Department of the Environment's (MDE's) request to collect depth-discrete samples from two monitoring wells with long screen intervals, wells MW-4 and MW-5 were sampled for VOCs with low-flow purge and sampling methods at three different depths using the previously installed

dedicated bladder pumps. The three depth intervals for sampling included the bottom third of the screen interval, the midpoint of the screen interval, and the top third of the screen interval. Based on the reported location of the deployed bladder pumps near the bottom of the screened interval, the first sample was collected in a manner to replicate previous sampling efforts (i.e., the pump was not moved). After collecting the deepest sample, the bladder pump was slowly raised to the midpoint of the well screen to collect the second sample. The third low-flow sample was collected after moving the bladder pump to the upper third of the screened interval.

At each depth, sufficient purging was conducted with minimal drawdown to obtain stabilized water quality parameters in the field. Following the low-flow sampling at wells MW-4 and MW-5, passive diffusion bags (PDBs) were installed at the same three depths sampled via the low-flow methods. The PDBs were retrieved after a minimum of two weeks equilibration time, and water from each PDB was placed in sample containers and sent to an off-site laboratory for VOC analysis.

3.3 LABORATORY ANALYSES

Groundwater samples were collected and later analyzed at an off-site laboratory using the following methods (see Table 3-1 for details):

- VOCs plus tentatively identified compounds (TICs) Freon 22 (chlorodifluoromethane) and Freon 113 by U.S. Environmental Protection Agency (USEPA) Method 8260C (72 monitoring wells)
- two additional VOC samples from wells MW-4 and MW-5 collected via low-flow pumping in response to an MDE request for depth discrete sampling
- three additional VOC samples from wells MW-4 and MW-5 collected via PDBs for a total of six PDB VOC samples, in response to an MDE request for depth discrete sampling and PDB sampling
- 1,4-dioxane by USEPA Method 8270C SIM (72 monitoring wells)
- total and dissolved Priority Pollutant metals by USEPA Methods 6020B and 7470A (7470A used for mercury) (72 monitoring wells)
- hexavalent chromium by USEPA Method 218.6 (71 monitoring wells)
- perchlorate by USEPA SW846 Method 314 (72 monitoring wells)

- haloacetic acids by USEPA Method 552.1-552.4—three monitoring wells (DMW-2S, DMW-3S, and DMW-5S) screened in the upper surficial aquifer near Frog Mortar Creek

- total petroleum hydrocarbon (TPH)-diesel-range organics (DRO) and TPH-gasoline-range organics (TPH-GRO) by SW846 Method 8015B—31 monitoring wells screened in the upper surficial aquifer

- radium-228 and total radium by method RL-RA-001—11 monitoring wells: three wells each screened in the upper, intermediate, and deep surficial aquifer zones, and two wells screened in the deep confined aquifer

- cyclotrimethylene trinitramine (also known as Royal Demolition Explosive [RDX])—nine upper surficial aquifer monitoring wells

- natural attenuation assessment (NAA) parameters by USEPA SW846 protocols—six groundwater samples analyzed for the following NAA parameters: alkalinity, ammonia, nitrogen, total chloride, dissolved organic carbon, nitrate, nitrite, orthophosphate, sulfate, total dissolved solids, total calcium, total iron, total magnesium, total manganese, total potassium, and total sodium

- six groundwater samples for dissolved gases methane, ethane, and ethene analyzed using Microseeps® AM 20GAX protocols

Samples were analyzed by TestAmerica, Inc. of North Canton, Ohio. Hexavalent chromium was analyzed by Columbia Analytical Services of Rochester, New York. No duplicates were collected during this investigation due to acceptable analytical precision and accuracy in previous sampling rounds. Trip-blank samples were analyzed for VOCs for quality assurance and quality control purposes. Trip blanks were submitted at a rate of one per cooler of VOCs per day. Matrix spike/matrix spike duplicate samples were collected and analyzed on a 1:20 basis. A table listing the chemical results of all samples is in Appendix C. Sampling chemical results are discussed in Section 4.

3.4 DOCUMENTATION

A master site logbook was maintained as an overall record of field activities. Sample documentation consists of completed chain of custody (COC) reports and matrix specific sample log sheets. The COC report is a standardized form summarizing and documenting pertinent sample information such as sample identification and type, matrix, date and time of collection, preservation, and requested analyses. Sample custody procedures document sample acquisition and integrity. COC reports are in the data validation reports in Appendix D.

3.5 EQUIPMENT DECONTAMINATION

Reusable equipment (e.g., water level meter) was decontaminated before and after each use. Small, reusable equipment was decontaminated as follows:

- Liquinox® and potable water wash
- potable water rinse
- distilled water rinse
- air drying
- collecting decontamination solutions for disposal

Decontamination rinsate was transferred to 55-gallon drums staged at a facility-approved location. Dedicated and/or disposable equipment was used for groundwater purging and sampling and did not require decontamination.

3.6 WASTE MANAGEMENT

Investigation-derived waste (IDW) consisting of decontamination rinsate water, monitoring well purge water, and personal protective equipment (PPE) was generated during groundwater characterization. PPE was brushed off, placed in trash bags, and disposed of in a facility trash receptacle. Dedicated and disposable equipment was also rinsed off and disposed of in a facility trash receptacle. Well purge water was collected and stored in USDOT-approved 55-gallon drums. All drums were properly labeled and logged on a drum inventory form. The drums were profiled and removed from the site as nonhazardous waste. Waste forms and bills of lading are in Appendix E.

3.7 GENERAL SAMPLING PROCEDURES, NOMENCLATURE, AND HANDLING

A master site logbook was maintained at the site as an overall record of field activities. Each sample received a unique sample identification consisting of the site location, well number, and a six-digit sampling date. For example, a groundwater sample collected on April 25, 2012 from monitoring well MSA-DMW-1A was labeled "MSA-DMW1A-042512." Trip blanks (TB) were labeled with a "TB" prefix followed by a six-digit submittal date (e.g., TB-042512). Field related

sample handling considerations include selection of sample containers, preservatives, allowable holding times, and requested analyses.

Proper custody procedures were followed throughout all phases of sample collection and handling. COC protocols were used throughout sample handling to document the integrity of sample containers. Such protocols demonstrate that the samples were handled and transferred in a manner that would prevent or detect tampering.

Empty sample containers were released under signature from the laboratory and accepted under signature by the sampler or other individual responsible for maintaining custody until the sample containers were transferred to the sampling team. Groundwater samples were collected in these containers, released under signature from the sampling team, and then accepted under signature by the laboratory. Transport containers returning to the laboratory were sealed with strapping tape and a tamper resistant custody seal. The custody seal shows the signature of the individual releasing the transport container, along with the date and time.

3.8 DATA VALIDATION

Data validation involves having a party independent from the laboratory review data provided by the laboratory to ensure that specific criteria were met. These criteria concern specifications that are not sample dependent; they specify performance requirements that should be fully under a laboratory's control. For data analyses of organic chemicals, specific validation areas include blanks, performance evaluation standard materials, and instrument performance checks. For data analyses involving inorganic chemicals, specific validation areas include blanks, calibration standards, calibration verification standards, laboratory control standards, and interference check standards. The analytical laboratory supplies the chemical data as hard-copy reports and electronic databases.

Once the investigation was complete, chemical data were validated by Tetra Tech, Inc. (Tetra Tech) in accordance with established USEPA protocols to assess the reliability and accuracy of the data. This review was based on the USEPA Region 3 modifications to the *National Functional Guidelines for Data Review* (USEPA, 1993 and 1994) and the specifics of the analytical method used. Data validation reports are in Appendix D (on compact disc).

Collectively, these data are acceptable for their intended use, except for data that have been qualified as unreliable. These qualifier flags appear in the chemical results tables in Section 4 and Appendix C. For this validation, the following data qualifiers (i.e., flags) were applied to the chemical results presented in this report:

B The analyte was not detected substantially above the level reported in the laboratory or field blank (i.e., the result is considered an artifact of the laboratory analysis and is not considered a site contaminant).

U Not detected. The analyte is considered not detected at the reported value.

J The analyte is considered present in the sample. However, the value is estimated and may not be accurate or precise.

K The analyte is considered present in the sample. However, the value is biased high and the actual value is expected to be lower than the reported value.

L The analyte is considered present in the sample. However, the value is biased low and the actual value is expected to be higher than the reported value.

NJ The analyte has been tentatively identified. This qualifier indicates presumptive evidence of a compound. Special methods may be required to confirm its presence or absence in future sampling efforts.

UR The result is considered qualitatively or quantitatively unreliable.

UJ The analyte was not detected. However, the quantitation or detection limit may be inaccurate or imprecise.

UL The analyte was not detected. However, the quantitation or detection limit is likely greater than the reported value.

Common laboratory or field contaminants may occasionally be detected in the samples. Analysis of quality control blanks and other internal laboratory blanks (e.g., method blanks, etc.) helps determine the significance of the analytical results versus possible laboratory or field contaminants. Common laboratory contaminants for VOCs include acetone, methylene chloride, and 2-butanone. According to the *National Functional Guidelines*, any compound other than common laboratory contaminants that is detected in both the sample and an associated blank must be qualified (i.e., "*B*" flag) when the sample concentration is less than five times the blank concentration.

In this investigation, for the common laboratory contaminants listed above, results were qualified with a "*B*" flag when the sample concentration was less than 10 times the blank concentration. In addition to the common laboratory blanks listed above, in many instances several common metals were reported as blank contamination. Qualified results are in the chemical tables in Section 4 and Appendices C and D.

Section 4
Results

This section presents the groundwater elevation data and chemical analytical results for the 2012 groundwater sampling and analysis program at the Dump Road Area (DRA) of Martin State Airport (MSA) in Middle River, Maryland. Sixty-eight upper, intermediate, and lower surficial aquifer monitoring wells and four deep confined aquifer monitoring wells were sampled in this round. These results were screened against the Maryland Department of the Environment's (MDE's) current groundwater standards (MDE, 2008) and other state standards/criteria where MDE has not established standards.

At present, MDE has not established an advisory level or standard for 1,4-dioxane in drinking water or groundwater. Several states (e.g., California, Colorado, Connecticut, Florida, Maine, Massachusetts, Michigan, and North Carolina) have established drinking water standards or action levels for 1,4-dioxane. These values range from California's action level of 3 micrograms per liter (µg/L) to Michigan's drinking water standard of 85 µg/L (U.S. Environmental Protection Agency [USEPA], 2006 and 2009). USEPA has also published a risk-based preliminary remedial goal of 6.1 µg/L for 1,4-dioxane in tap water (USEPA, 2011). In this report, the current advisory level or standard that is most protective of human health is used as a comparison criterion to evaluate groundwater concentrations of 1,4-dioxane at the Dump Road Area (DRA) site. Therefore, the California Department of Health Services advisory level of 3 µg/L for 1,4-dioxane is used herein as the groundwater screening level for 1,4-dioxane.

4.1 GROUNDWATER LEVEL DATA

Table 4-1 presents the April 2012 groundwater level measurements and computed groundwater elevations for the DRA wells sampled. Figures 4-1 through 4-3 show the April 2012 groundwater-elevation contour maps for the upper, intermediate, and lower surficial aquifer zones, respectively. Figure 4-4 shows a groundwater elevation contour map for the deep confined aquifer zone. As presented in Table 4-1, static groundwater levels measured in these groundwater monitoring wells are reported at depths measured from the top of the well casings. Accounting

for well casing stick up for the aboveground well casing risers, and well stick down for flush mounted well designs, depth to groundwater ranges from approximately five to 19 feet below grade in each of the upper, intermediate, and lower surficial aquifer wells. Shallow groundwater is encountered in the western part of the site near the airport runway; deeper groundwater is found in the eastern portion of the site.

As shown in Figures 4-1 through 4-3, groundwater in the upper, intermediate, and lower surficial aquifer generally flows east–northeast from the runway and taxiway to Frog Mortar Creek. Elevated groundwater at DMW-3S and MW-39S (Figure 4-1) indicates local groundwater mounding east and northeast of Pond 1. Wells DMW-3S and MW-39S are installed in a clay-rich zone above the more permeable sands where the surrounding wells are installed. Therefore, groundwater levels in these wells may reflect localized perched groundwater in this portion of the DRA. Groundwater in the deep confined aquifer (Figure 4-4) flows southeast. The southeasterly flow in the deep confined aquifer is consistent with previous rounds of groundwater level data collected for these wells, except for the 2011 levels that indicated an easterly flow.

4.2 GROUNDWATER CHEMICAL DATA

Groundwater samples were collected from 72 wells in 2012 to evaluate the horizontal and vertical extent of contamination and contaminant trends at the DRA, and to evaluate the use of passive diffusion bag (PDB) samplers. Analytical results and validated data are in Appendices C and D, respectively. Validated groundwater chemical data were used to generate a statistical summary table (Table 4-2), showing only those chemical analytes detected in the 2012 DRA groundwater samples and, for each analytical group, listing them from most to least frequently detected. Table C-1 in Appendix C is similar to Table 4-2, but it summarizes both detected and non-detected results. For wells MW-4 and MW-5, sampling results for only the deepest low-flow samples are included in Table 4-2, which is consistent with summary tables for previous sampling rounds. The results of the additional low-flow samples and PDB samples for MW-4 and MW-5 are provided in a separate section below.

A positive detections (or “hits”) table was also generated from these data (Table 4-3). Gray shading in Table 4-3 indicates results exceeding MDE groundwater standards or the California advisory level of 3 µg/L for 1,4-dioxane. Table C-2 in Appendix C presents all analytical data,

including non-detects. Data validation reports and chain of custody forms are on compact disc (CD) in Appendix D. The following sections discuss the results of the groundwater chemical analyses.

4.2.1 VOCs

Table 4-2 shows that a wide range of volatile organic compounds (VOCs) was detected in groundwater. Tables 4-2 and 4-3 show that *cis*-1,2-dichloroethene (*cis*-1,2-DCE), trichloroethene (TCE), and vinyl chloride (VC) are the most frequently detected VOCs in groundwater; these chlorinated VOCs (cVOCs) were detected in 67%, 64%, and 60% of the samples collected, respectively. The maximum detected concentrations of TCE (16,000 micrograms per liter [µg/L]), *cis*-1,2-DCE (27,000 µg/L), and VC (11,000 µg/L) are several orders of magnitude greater than their groundwater standards of 5 µg/L, 70 µg/L, and 2 µg/L, respectively. Petroleum-related VOCs (such as benzene, toluene, ethylbenzene, and xylenes [BTEX]) were detected less frequently in 3% (ethylbenzene) to 31% (benzene) of samples, and at lower concentrations relative to their groundwater standards than the cVOCs (e.g., maximum benzene at 280 µg/L with a standard of 5 µg/L).

The 2012 results for the three predominant cVOCs in groundwater are shown in Figures 4-5, 4-6, and 4-7 for the upper, intermediate, and lower surficial aquifer zones, respectively. Concentrations of benzene detected in groundwater for all wells sampled are shown in Figure 4-8. Benzene is shown on Figure 4-8 because it is the most frequently detected petroleum VOC in groundwater at the DRA. *cis*-1,2-DCE, VC, and BTEX were not detected in the deep confined aquifer zone (i.e., wells MW-27D, MW-29D, MW-30D, and MW-31D); therefore, these VOCs for the deep confined aquifer wells are not shown in a figure herein. At deep confined aquifer well MW-29D, TCE was detected at a low concentration of 0.47 µg/L, which is below the groundwater standard of 5 µg/L.

Results of the current round of sampling and analyses confirm those of previous groundwater sampling rounds, with some variations in contaminant concentrations. The lateral and vertical distributions of cVOC concentrations in groundwater (as shown in Figures 4-5 through 4-7) indicate several source areas at the site contributing to three primary groundwater plumes and various smaller or lower concentration plumes, as discussed in Section 2. These plumes include

the Drum Area plume, the Petroleum Hydrocarbon and Pond 1 Area plume, and the Taxiway Tango Median Area plume (see Figure 2-1 for locations of these areas).

4.2.1.1 Drum Area Plume

This VOC plume is in the southern portion of the site between wells MW-2/MW-19, MW-5/DMW-7, and DMW-4, DMW-5, and DMW-6. In the areas of MW-2/MW-19, MW-5/DMW-7, and DMW-5, the greatest concentrations of VOCs are reported for the upper surficial aquifer wells, which have one or more of the three primary cVOCs (TCE, *cis*-1,2-DCE, and VC) in excess of groundwater standards (see Figures 4-5 through 4-7 and Table 4-2). Well DMW-7S typically has had the highest historical total concentration of the three cVOCs found in this area (e.g., 33,400 µg/L in 2007). In 2012, well DMW-7S had a TCE concentration of 4,700 µg/L, and the highest total cVOC concentration (21,900 µg/L) detected in the Drum Area.

The three primary VOCs were also detected in the intermediate surficial aquifer wells (Figure 4-6) at concentrations generally less than in the upper surficial aquifer wells and at levels exceeding groundwater standards. One exception to this is well DMW-4I, where the concentrations of the three cVOCs in the intermediate surficial aquifer are two to 56 times greater than those of the upper surficial aquifer. Historically, VOC concentrations detected in the lower surficial aquifer wells are generally lower and less widespread than in the intermediate surficial aquifer zone in this area. An exception to this is DMW-4D, where TCE was detected at a concentration of 4,700 µg/L (Figure 4-7), which is slightly greater than the TCE concentration detected at intermediate surficial aquifer well DMW-4I (4,100 µg/L); these results are comparable to TCE concentrations reported for several wells in the upper surficial aquifer in this area.

As shown in Table 4-2 and Figures 4-5 through 4-7, TCE concentrations detected in the Drum Area plume range from 0.57 µg/L at DMW-6S to 7,500 µg/L at DMW-5S. For *cis*-1,2-DCE, concentrations detected in the Drum Area plume range from 1.4 µg/L at DMW-6S to 15,000 µg/L at DMW-7S. Concentrations of VC detected in the Drum Area plume range from 6.6 µg/L at DMW-5I to 2,200 µg/L at DMW-7S (Figures 4-5 and 4-6). Benzene was detected at intermediate surficial aquifer well MW-19I (0.74 µg/L) at a concentration less than the MDE groundwater standard of 5 µg/L (Figure 4-8).

4.2.1.2 Petroleum Hydrocarbon and Pond 1 Area Plume

This VOC plume is in the central portion of the site in the area of well DMW-9 and Pond 1 (Figures 4-5 through 4-7). The downgradient wells for this plume extend eastward to Frog Mortar Creek to well clusters DMW-2 and DMW-3. Contamination at well cluster DMW-4 is likely caused by the overlap of the Petroleum Hydrocarbon and Pond 1 Area plume and the Drum Area plume. In the Petroleum Hydrocarbon and Pond 1 Area plume, the greatest concentrations of VOCs are reported for the intermediate surficial aquifer wells (Figures 4-5 through 4-7; Table 4-2), where most wells have concentrations of TCE, *cis*-1,2-DCE, and VC in excess of groundwater standards. However, some of the higher concentrations of *cis*-1,2-DCE (4,400 µg/L), and VC (11,000 µg/L) detected in this plume area are at well DMW-9S, in the upper surficial aquifer zone. TCE was detected at high concentrations in wells DMW-9S, DMW-9I, and DMW-9D (120 µg/L, 1,000 µg/L, and 2,500 µg/L, respectively) in comparison to surrounding wells in the Petroleum Hydrocarbon Area.

TCE was reported at concentrations in excess of the MDE groundwater standard at several wells north and west of Pond 2. This includes concentrations of TCE ranging from 50 to 830 µg/L reported for wells MW-14I through MW-17I (Figure 4-6). Detected concentrations of *cis*-1,2-DCE and VC at MW-34S/I, and TCE concentrations at MW-33S, MW-15S, and MW-15I, suggest an extension of this contaminant plume northwest of wells DMW-9S/I/D. Results from wells MW-14I, MW-16I, and MW-17I (Figure 4-6) indicate that VOC contamination at concentrations exceeding groundwater standards likely extends north beneath the Maryland Air National Guard Armory area.

As shown in Figure 4-8, the maximum benzene concentration for the DRA was detected in the Petroleum Hydrocarbon and Pond 1 Area plume at well DMW-9S (280 µg/L); this concentration is more than 50 times higher than the groundwater standard of 5 µg/L. Other wells in this area with benzene exceedances are MW-20S (23 µg/L), DMW-9I (21 µg/L), MW-26S (18 µg/L), MW-14I (12 µg/L), DMW-9D (11 µg/L), MW-16S (8.9 µg/L), and MW-28I (8 µg/L). Benzene was not detected in wells DMW-2S, DMW-2A, DMW-3S/I/D, and MW-18S/I, all east and hydraulically downgradient of DMW-9S/I/D.

4.2.1.3 Taxiway Tango Median Area Plume

The Taxiway Tango Median Area plume is in the western portion of the site in the upper surficial aquifer, near well DMW-11S (Figures 4-5 through 4-7; Table 4-2). The downgradient extent of this plume appears both horizontally and vertically limited. However, the upgradient boundary of this area of TCE contamination had been undetermined until 2011, when new wells (MW-37S and MW-38S) were installed southwest of DMW-11S in June 2011.

In 2012, TCE, *cis*-1,2-DCE, and VC are reported at well DMW-11S at concentrations of 16,000 µg/L, 27,000 µg/L, and 4,200 µg/L, respectively (Figure 4-5). The TCE and *cis*-1,2-DCE concentrations are lower than the 2004 concentrations of these contaminants (52,000 µg/L and 53,000 µg/L for TCE and *cis*-1,2-DCE, respectively); however, the VC concentration of 4,200 µg/L is nearly double its 2004 concentration of 2,400 µg/L. These results indicate that natural attenuation is occurring in this area of the DRA. Only trace to low concentrations of *cis*-1,2-DCE and VC (below MDE groundwater standards) are reported in the intermediate well DMW-11I in this area (Figure 4-6). However, a TCE concentration of 19 µg/L detected in this well indicates a substantial increase from previous rounds, when TCE concentrations were typically less than 1 µg/L. At MW-3 (the closest well downgradient of DMW-11S), concentrations of TCE and VC also decreased from 2004 to 2012: concentrations in 2004 of TCE (100 µg/L) and VC (2,400 µg/L) have decreased significantly in 2012 (to 5.4 µg/L and 14 µg/L, respectively). Only a trace concentration of TCE (0.24 µg/L) was detected at MW-22D (Figure 4-7), which is the lower surficial aquifer well co-located as a cluster with MW-3.

As shown in Figure 4-8, the maximum benzene concentration for the Taxiway Tango Median Area was detected at well DMW-1B (16 µg/L); this concentration is three times greater than the groundwater standard of 5 µg/L. Benzene was also detected at wells MW-23S (2.5 µg/L) and MW-24S (0.17 µg/L), but at concentrations below its groundwater standard (Figure 4-8). Benzene was not detected at MW-3, MW-36S, MW-25S/I, DMW-11S/I, MW-22D, MW-37S, MW-38S, MW-24I, MW-30I, and DMW-1A. MW-22I and MW-23I were not sampled this round because prior sampling results indicate VOCs at concentrations below groundwater standards.

4.2.1.4 Deep Confined Aquifer Wells

Results for the first set of groundwater samples collected in 2008 from the deep confined aquifer wells (wells MW-27D, MW-29D, MW-30D, and MW-31D) indicated trace concentrations of

BTEX less than groundwater standards. However, TCE, *cis*-1,2-DCE, VC, and other cVOCs were not detected in the 2008 samples. The deep wells were resampled in 2009 and 2010. BTEX, TCE, *cis*-1,2-DCE, VC, and other cVOCs were not detected in the 2009 and 2010 deep well samples. The 2011 sampling results confirm those of 2009 and 2010. In 2011, BTEX, TCE, *cis*-1,2-DCE, VC, and other VOCs were not detected in the deep confined aquifer wells MW-27D, MW-30D, MW-29D, and MW-31D. TCE was detected in 2012 at a trace concentration of 0.47 µg/L at MW-29D (Figure 4-7 and Table 4-3).

4.2.1.5 Concentration Trends for Primary Chlorinated VOCs

Figures 4-9 through 4-14 are long-term time-series plots of TCE, *cis*-1,2-DCE, and VC for 14 selected wells. These wells represent conditions for the Drum Area plume (Figures 4-9, 4-10, and 4-13; wells DMW-7S, MW-5, DMW-7I, DMW-7D, DMW-4I, DMW-4D, and DMW-5S), the Petroleum Hydrocarbon and Pond 1 Area plume (Figures 4-11 and 4-14; wells DMW-9S, DMW-9I, DMW-9D, DMW-3S, and DMW-3I), the Taxiway Tango Median Area plume (Figure 4-12; DMW-11S), and an area of high VOC concentrations south of Pond 1 (Figure 4-12; DMW-1A).

As shown in Figure 4-9, source area concentrations of TCE and *cis*-1,2-DCE for the Drum Area plume (wells DMW-7S and MW-5) decreased substantially from 2004 to 2006–2007. TCE increased sharply at DMW-7S from 2006 to 2007 and at MW-5 from 2007 to 2008. At DMW-7S, the 2012 results indicate decreased TCE and *cis*-1,2-DCE concentrations. At MW-5, TCE fluctuated below 100 µg/L, and *cis*-1,2-DCE increased slightly from 2007 to 2012. VC concentrations at MW-5 increased somewhat over the monitoring period, in response to the degradation of *cis*-1,2-DCE, as indicated by the decreasing *cis*-12-DCE concentrations over time. At MW-5, concentrations of TCE (the parent VOC) declined from levels as high as 35,000 µg/L (in 2004) to concentrations near the standard (5 µg/L) in 2007 through 2010 (i.e., 8.9 µg/L in 2007, and it was not detected in 2009–2010 using a detection limit of 11 µg/L). In 2012, TCE was again not detected at MW-5.

Likewise, in well DMW-7S, TCE concentrations decreased from more than 35,000 µg/L in 2004 to less than 10,000 µg/L in 2007. The concentration of TCE at MW-5 increased from not detected in 2009–2010 (detection limit of 11 µg/L) to 51 µg/L in 2011, and was not detected in 2012 (TCE was not detected in any of the three 2012 vertical profile low-flow pumping samples

or the three PDB samples collected at three depths). Concentrations of *cis*-1,2-DCE decreased in both wells from the early 2000s to 2006–2007; however, concentrations increased to near the 2005 level at DMW-7S in late 2007, while concentrations remained relatively stable at MW-5. VC concentrations have been relatively stable at DMW-7S throughout the early monitoring period 2003–2007. At DMW-7S, in 2012 VC was detected at a high concentration indicating more complete biodegradation of higher to lower chain cVOCs than was observed in 2007 and before. At well MW-5, overall VC concentrations have slightly increased.

Figure 4-10 shows moderately consistent cVOC concentrations at wells DMW-7I and DMW-7D, located in the Drum Area intermediate and lower surficial aquifer zones. VOC concentrations at DMW-7I decreased steadily after the first sampling round from September 2003 to June 2004. Concentrations of all three cVOCs increased steadily from 2006 to 2008, and reached concentrations similar to (but slightly greater than) the second and third quarterly rounds in December 2004 and March 2005. Increasing TCE concentrations observed at DMW-7I over the monitoring period never reached the maximum TCE concentration of 670 µg/L reported in the first round (September 2003). As shown in Figure 4-10, TCE was detected at 1 µg/L at DMW-7D during the first sampling round in September 2003. Chlorinated VOCs were not detected again at DMW-7D until 2006, TCE and *cis*-1,2-DCE were detected at low concentrations (less than 1 µg/L) from 2006 to 2008. VC was not detected at DMW-7D over the monitoring period.

As shown in Figure 4-11, wells in the cVOC source area for the Petroleum Hydrocarbon and Pond 1 Area (wells DMW9-S, DMW-9I, DMW-9D) generally show reductions in the concentrations of cVOCs since the 2003–2004 sampling rounds. One exception is an overall increase in VC concentrations at DMW-9S from 2004 to 2009, indicating increased biodegradation of *cis*-1,2-DCE at this VOC source area. From 2009 to 2012, VC concentrations at DMW-9S decreased steadily from 56,000 µg/L in 2009 to 11,000 µg/L in 2012. Additionally, TCE concentrations stabilized at DMW-9I from 2008 to 2011, but then increased 43% from 700 µg/L in 2011 to 1,000 µg/L in 2012. Overall, *cis*-1,2-DCE and VC trends at DMW-9S show an inverse relationship, indicating shorter term decreases in *cis*-1,2-DCE as it degrades, thereby increasing concentrations of VC.

At well DMW-11S (Figure 4-12), in the shallow source area of the Taxiway Tango Median Area plume, concentrations of TCE, *cis*-1,2-DCE, and VC have fluctuated but have generally

increased or remained somewhat constant from 2006 to 2010. TCE and *cis*-1,2-DCE at DMW-11S decreased to historically low concentrations in 2011–2012. At DMW-1A, where the maximum TCE concentration was greater than 10,000 µg/L in 2004, VOC concentrations have fluctuated, but a general decrease has occurred over time; in 2012, the TCE concentration at this well was 2,300 µg/L.

As shown in Figures 4-13 and 4-14, TCE concentrations in wells along the eastern site boundary (DMW-5S, DMW-3S/I, and DMW-4I/D) have fluctuated over time but generally decreased by less than an order of magnitude (less than a factor of 10). After an initial upward spiking of TCE concentrations in 2003–2004 at wells DMW-3S/I, DMW-4I, and DMW-5S, TCE concentrations decreased considerably in 2004. TCE concentrations then rebounded upward to approximately 50% of its initial (i.e., 2004) concentration in most of these wells in 2005 and 2006. Since the rebound peak in 2006, TCE concentrations have decreased steadily at DMW-4I (until 2012, when TCE increased), have decreased slightly at DMW-3I since 2009, and have fluctuated at approximately 5,000 µg/L (±1,000 µg/L) since 2004 at DMW-4D. At DMW-5S, TCE concentrations decreased by 50% from 2004 to 2007 but increased steadily after that, doubling from 5,000 to 10,000 µg/L between 2007 and 2010, and then decreased gradually in 2011–2012. Concentrations of *cis*-1,2-DCE and VC have fluctuated but have generally decreased or remained somewhat constant from 2006 to 2012 with the exception of well DMW-4D where *cis*-1,2-DCE doubled and well DMW-4I where VC increased by a factor of 25 between 2006 and 2012.

4.2.1.6 Natural Attenuation Assessment Parameters

In addition to the standard analyses for VOCs and BTEX, the laboratory also analyzed six groundwater samples for several natural attenuation assessment (NAA) parameters. These additional laboratory analyses include alkalinity, ammonia, chloride, dissolved organic carbon, nitrate, nitrite, orthophosphate, sulfate, total dissolved solids, calcium, iron, magnesium, manganese, potassium, sodium, and analysis for the dissolved gasses ethane, ethene, and methane. NAA parameters were also measured in the field. Field measurements include groundwater pH (a measure of acidity or alkalinity), oxidation reduction potential (ORP), dissolved oxygen (DO), and temperature. Ferrous iron was measured in the field using portable test kits. These results are in Table 4-4 and are briefly discussed in this report.

Groundwater samples for NAA parameters were collected from three wells in the upper surficial aquifer zone (DMW-9S, DMW-11S, and MW-18S), two wells in the intermediate surficial aquifer zone (DMW-9I and MW-18I), and one well in the lower surficial aquifer zone (DMW-9D). These wells are in VOC source areas (DMW-9S/I/D and DMW-11S) and a downgradient area with high parent-VOC concentrations (MW-18S/I). Well locations and major cVOC concentrations are shown in Figures 4-5 through 4-7.

As shown in Table 4-4, TCE is the primary parent cVOC at these wells. Tetrachloroethene was not detected in any of the six wells, and carbon tetrachloride was detected only at DMW-9I, at a low concentration (41 µg/L). Another parent solvent (1,1,1-trichloroethane) has been infrequently detected at the DRA at low concentrations in this and in past rounds (e.g., 130 µg/L at DMW-7S in 2012; 59 µg/L, 40 µg/L and 68 µg/L at DMW-4I in 2012, 2011 and 2009, respectively). However, 1,1,1-trichloroethane was not detected in the wells analyzed for NAA parameters. The NAA analyses, in combination with the time-series trend analyses in the previous section, evaluate whether anaerobic reductive dechlorination of cVOCs is occurring at the site and whether site conditions could be enhanced by adding electron donor and/or pH adjustments to stimulate anaerobic reductive dechlorination as part of the remedial alternatives evaluation.

Anaerobic reductive dechlorination is evident at the site, as shown by detection of the TCE breakdown product *cis*-1,2-DCE. The *cis*-1,2-DCE also appears to be degrading readily in the upper and intermediate zones, as indicated by the VC found at wells DMW-9S/I, DMW-11S, and MW-18S/I. Further, ethene concentrations greater than or near 10 µg/L at five of six wells, and elevated chloride concentrations at wells DMW-9S/I and MW-18S/I, indicate that complete mineralization of VOC contaminants is likely occurring at these locations. Methane concentrations at these wells also indicate anaerobic conditions. The presence of BTEX at DMW-9S and DMW-11S provides a carbon source that would be expected to enhance biodegradation of cVOCs at the Petroleum Hydrocarbon and Pond 1 Area plume, and to a lesser extent, the Taxiway Tango plume area.

Other NAA parameters indicate favorable conditions for reductive dechlorination in the upper and intermediate surficial aquifer zones in the areas sampled. High methane concentrations (greater than 500 µg/L) were detected at DMW-9S and DMW-9I; methane at DMW-11S (at

470 µg/L) is slightly under the favorable assessment criterion. The high methane concentrations at these locations indicate that fermentation is occurring, and that the potential for complete anaerobic dechlorination exists. Ferrous iron and nitrate concentrations at all wells, and groundwater pH levels for five of the wells (all but DMW-9D), indicate favorable conditions for degradation at the site. However, high ORP, high DO, high sulfate, and low temperatures at most locations may inhibit dechlorination reactions.

Concentrations of VC and ethene at DMW-9D also indicate breakdown of cVOC contaminants in the lower surficial aquifer zone, but the lower concentrations of VC and ethene relative to their higher chain VOCs suggest that slow or incomplete reductive dechlorination may be occurring there. The lower potential for reductive dechlorination in the lower surficial aquifer zone is also indicated by relatively low chloride, alkalinity, low pH and temperature, and high ORP and DO.

4.2.1.7 Tentatively Identified Compounds

Analysis of VOCs may sometimes indicate additional organic compounds not on the standard USEPA VOC *Target Compound List*. These additional compounds are shown as peaks on the chromatogram generated by the laboratory analysis. The laboratory attempts to identify the highest peaks using a computerized search of a library containing chemical mass spectra. When the mass spectra match, to a specific degree, the compound or general class of compounds is named and termed a tentatively identified compound (TIC). The assigned identity is, in most cases, highly uncertain. When no match can be made, the peak is labeled as an unknown TIC. No further evaluation is possible without identifying the chemical class of compounds to which it may belong. Soil and sediment samples typically contain the greatest number of TICs because soil and sediment can be composed of many complex organic compounds. However, groundwater and surface water samples can also contain a variety of TICs.

Tables 4-2 and 4-3 summarize the VOC TICs reported for the groundwater samples. (Table 4-2 does not include TICs for all PDB samplers and for shallow low-flow samples from MW-4 and MW-5; Table 4-3 includes TICS for these samples.) Appendix C lists the reported TICs by sample identifier and by the TIC name. More than 20 TICs were detected in the VOC samples collected for the 2012 investigation. TICs for this study are reported with the “NJ” data qualifier, indicating that these compounds are presumptively present but their exact identity is questionable. Furthermore, the concentrations reported for TICs are semi-quantitative. TICs were

detected infrequently, with any single TIC detected in only one sample or at most in 13 samples (Table 4-2). Most TICs were detected at low to trace concentrations. Cyclohexane and diethyl ether, two of the TICs detected, are solvents commonly used in laboratory analyses.

4.2.1.8 Low-Flow and Passive Diffusion Bag Samples

Table 4-5 shows the results of the low-flow purge and PDB samplers for wells MW-4 and MW-5. The relative percent differences (RPD) are shown for each VOC for the samples collected at the three depths in each well. Low-flow purge and PDB samples were collected near the top of each well screen, the midpoint of each well screen, and bottom of each well screen to evaluate potential vertical contaminant distributions that can occur when formation materials of varying permeability are screened or when long well screens are used.

The results in Table 4-5 generally indicate comparable results for detected VOCs at the three sampling depths in each well, and between samples collected via low-flow purging and the PDB samplers. TCE was not detected in any of the low-flow and PDB samples from MW-4 and MW-5. Low concentrations of benzene and several cVOCs were detected in the MW-4 samples for both methods. Higher concentrations of *cis*-1,2-DCE and VC were detected in MW-5 than in MW-4. Acetone and 2-butanone are common laboratory contaminants and were not used in the comparison.

All low-flow samples and the PDB-midpoint and screen bottom samples indicate similar concentrations at the various sampling depth interval in each well, and do not indicate substantial vertical profiling of VOCs at either well. However, VOC concentrations in the screen top PDB samples from MW-4 and MW-5 were consistently lower than the low-flow samples collected at the same depth, and were consistently lower than both deeper low-flow and PDB samples. At MW-4, the PDB-midpoint and bottom samples show VOC concentrations two to six times higher than the screen-top sample. At MW-5, concentrations of *cis*-1,2-DCE and VC for the midpoint and bottom samples were 1.3–2.3 times greater than the PDB screen-top sample. Similar constituent concentrations for the low-flow screen-top samples and deeper samples may be due to mixing of the water column and homogenization of chemical constituents in the screened interval when purging.

For the screen-top samples, the low-flow samples generally provide higher VOC concentrations that the PDB samples. However, for the midpoint and bottom samples from both wells, the PDB

samples generally provided VOC concentrations up to 70% higher than the low-flow samples collected. The low-flow and PDB results compare more favorably for higher VOC concentrations, as shown by generally lower RPDs for *cis*-1,2-DCE, trans-1,2-dichloroethene, and for VC at MW-5.

4.2.2 1,4-Dioxane

As shown in Table 4-2, 1,4-dioxane was detected in more than half (56%) of the 2012 groundwater samples, at concentrations ranging from 0.6 to 300 µg/L. The average 1,4-dioxane concentration detected is 53.6 µg/L. As shown in Figure 4-15, the highest concentrations occur primarily in the upper and intermediate surficial aquifer zones, with the highest concentrations occurring east of Pond 1 (DMW-2A at 300 µg/L and DMW-3I at 230 µg/L), west of Pond 1 (MW-20S at 240 µg/L and DMW-9I at 150 µg/L), and in the northernmost portion of the site (MW-16S at 210 µg/L). Substantially lower concentrations of 1,4-dioxane were reported for wells at the Drum Area plume (ranging from 1.3 to 89 µg/L at wells MW-6, DMW-5I, MW-5, MW-19I, DMW-5S, DMW-4S/I/D, and DMW-7S), and at the Taxiway Tango Median Area plume (1.9 to 93 µg/L at DMW-1S, MW-23S, MW-3, MW-11S, DMW-1B, and DMW-1A). 1,4-Dioxane was not detected in the deep confined aquifer groundwater samples (MW-27D, MW-29D, MW-30D, and MW-31D).

Concentrations of 1,4-dioxane in high concentration areas have generally decreased from 2009 to 2012. The greatest decrease is at well DMW-1A, where the 2009 concentration of 490 µg/L decreased to 91 µg/L in 2010; it remained steady in 2011 (93 µg/L) and then decreased again in 2012 (68 µg/L). At DMW-2A, the 1,4-dioxane concentration has decreased from 890 µg/L (2009) to 590 µg/L (2010) to 420 µg/L (2011) to 300 µg/L (2012). Substantial decreases in concentrations of 1,4-dioxane have also occurred at DMW-3I (from 1,100 µg/L [2009] to 390 µg/L [2010] to 300 µg/L [2011] to 230 µg/L [2012] and at MW-16S (from 790 µg/L [2009] to 330 µg/L [2010] to 220 µg/L [2011] to 210 µg/L [2012]).

1,4-Dioxane was also detected in lower surficial aquifer groundwater samples in an area co-located with the highest concentrations of VOCs. 1,4-Dioxane was detected south and southwest of Pond 1 along the VOC-plume longitudinal axis extending eastward from well DMW-1B (38 µg/L) to wells DMW-8D (47 µg/L) and DMW-4D (29 µg/L). The greatest concentration of 1,4-dioxane in this area is at well DMW-1B (68 µg/L). Well DMW-1A appears

to be near or in the source area for 1,4-dioxane in this area. 1,4-Dioxane was not detected in the lower surficial aquifer wells north and northwest of Pond 2, or in the lower surficial aquifer wells in the Taxiway Tango Median Area plume (e.g., MW-22D and MW-23D), and only at DMW-4D (29 µg/L) in the Drum Area plume. DMW-5D was not sampled in 2012, but 1,4-dioxane was not detected there in the 2007 and 2008 samples.

4.2.3 Metals

Table 4-2 summarizes detections of total metals (analysis of unfiltered groundwater samples) and dissolved metals (analysis of filtered groundwater samples). Table 4-6 summarizes metals concentrations that exceed MDE groundwater standards. As shown in Table 4-6, concentrations of 10 metals exceed groundwater standards in one or more groundwater samples.

As shown in Table 4-6, concentrations of total iron, total manganese, vanadium, arsenic, nickel, and cadmium exceed standards most frequently, with the maximum concentrations of total iron, total manganese, vanadium, and cadmium exceeding the standards by more than one order of magnitude. The maximum nickel concentrations (total and dissolved) exceed the standard by a factor of nearly eight. Concentrations of vanadium exceed the standard in 14.1–32.4% of the dissolved/total samples, with the maximum concentration of 210 µg/L exceeding the groundwater standard by more than one order of magnitude at well MW-24S.

Dissolved cadmium exceeds its standard in 16.9% (12 samples) of all samples, whereas dissolved nickel exceeds its standard in 23.9% (17 samples) of all samples. Figure 4-16 shows the maximum of the dissolved (filtered) and total (unfiltered) exceedances for cadmium, nickel, and vanadium. The greatest concentrations of cadmium (72–1,100 µg/L) are associated with high levels of VOCs in the surficial aquifer at wells DMW-1A (maximum of 1,100 µg/L), DMW-1B, DMW-8I, DMW-8D, DMW-2A, DMW-2S, MW-18I, and DMW-3I, all south and east of Pond 1.

Concentrations of metals such as beryllium, chromium, selenium, and zinc exceed the standards in 12% or less of the samples, ranging from one exceedance each for selenium and zinc to eight exceedances for beryllium. Dissolved chromium and dissolved zinc concentrations do not exceed the standards. No exceedances of hexavalent chromium were found out of 71 samples (well MW-36S was not sampled for hexavalent chromium due to an inadvertent field error). In the deep confined aquifer wells (MW-27D, MW-29D, MW-30D, and MW-31D), the only sample

with an exceedance was from MW-31D, where total vanadium was detected above its standard (Table 4-3). However, the vanadium concentration in the filtered sample from MW-31D did not exceed the standard.

4.2.4 Petroleum Hydrocarbons

As shown in Table 4-2, total petroleum hydrocarbon diesel-range organics (TPH-DRO) were detected in 22% of the 2012 upper surficial aquifer groundwater samples, at concentrations ranging from 240 to 4,400 µg/L. TPH-gasoline-range organics (TPH-GRO) were detected in 50% of the 2012 upper surficial aquifer groundwater samples, at concentrations ranging from 32 to 24,000 µg/L. Results for TPH-DRO and TPH-GRO are shown in Figure 4-17. A number of TPH-DRO results were flagged with a "*B*" data qualifier in the validation process, indicating the presence of TPH-DRO in the laboratory blanks. The *B*-qualified results are not considered detections, are not included in the statistical analyses of "detected" samples, and are not shown in Figure 4-17.

The average of the TPH-DRO detections is 1,514 µg/L, with the greatest concentration reported for well MW-20S (4,400 µg/L) east of Pond 1 and southeast of the main portion of the Petroleum Hydrocarbon Area (well DMW-9S/I/D area). The average TPH-GRO concentration is 3,969 µg/L; the highest concentrations are reported for well DMW-11S (24,000 µg/L) in the upper surficial aquifer of the Taxiway Tango Median Area plume, and DMW-9S (19,000 µg/L) in the upper surficial aquifer of the Petroleum Hydrocarbon Area. Substantially lower concentrations of TPH-GRO are reported for wells at the Drum Area plume (TPH-GRO of 7,500 µg/L at well DMW-7S) and east of Pond 1 (TPH-GRO of 2,200 µg/L at well DMW-2S).

4.2.5 Perchlorate, Haloacetic Acids, and RDX

As shown in Table 4-2, all 72 groundwater samples were analyzed for perchlorate. Haloacetic acids were analyzed in three upper surficial aquifer samples (DMW-2S, DMW-3S, and DMW-5S). These three wells are in areas of high VOC concentrations in the upper surficial aquifer and in areas of the DRA fill. These wells are also near Frog Mortar Creek, which would indicate that concentrations of these analytes are possibly entering the creek via groundwater. Cyclotrimethylene trinitramine (also known as royal demolition explosive [RDX]) was analyzed in 10 groundwater samples collected from upper surficial aquifer monitoring wells distributed throughout the site. Wells analyzed for RDX include those with high concentrations of VOCs

near source areas, those at downgradient locations (DMW-9S, MW-4, MW-20S, MW-5, DMW-3S, and DMW-18S), those along the current northern boundary of the DRA near the Maryland Air National Guard (MDANG) armory (MW-15S, MW-16S, and MW-17S), and between Pond 1 and the Drum Area VOC source areas (DMW-8S).

Perchlorate was detected in 14 groundwater samples at concentrations ranging from 0.11 to 4.6 µg/L. Perchlorate was detected in samples from wells located along the eastern perimeter of the DRA (DMW-18I, DMW-2S, DMW-2A, DMW-4I/D, DMW-5S, and DMW-6D), along the northern perimeter of the DRA (MW-15I/D, MW-16D, and MW-17I), and near the southern perimeter of the DRA (MW-24I). Only the maximum perchlorate concentration of 4.6 µg/L at well DMW-4D exceeds the MDE groundwater standard of 2.6 µg/L. The second highest perchlorate concentration (1.3 µg/L at DMW-4I) is 50% of the standard. Excluding the two highest levels, perchlorate concentrations in the remaining 12 samples range from 0.11 to 0.72 µg/L, which are well below the groundwater standard.

Contrary to prior results, perchlorate was detected in two deep confined aquifer groundwater samples (MW-29D and MW-30D) at a concentration of 0.12 µg/L in each. Previously, perchlorate had been detected in only three surficial-aquifer wells during the 2011 sampling episode, and was not detected in 2010. Haloacetic acids (three groundwater samples analyzed) and RDX (nine groundwater samples analyzed) were not detected in the 2012 samples.

4.2.6 Radium-228 and Total Radium

As shown in Table 4-2, radium-228 and total radium were detected in eight of 11 groundwater samples. Total radium concentrations range from 0.283 to 15.4 picocuries per liter (pCi/L). The average of the detected surficial aquifer radium-228 concentrations is 4.9 pCi/L (2.7 pCi/L if non-detects are included), with the greatest concentration reported in well DMW-6I (15.4 pCi/L), in the intermediate surficial aquifer in the southeastern part of the site.

Concentrations of radium-228 for DMW-3I (9.06 pCi/L), DMW-6I (15.4 pCi/L), and DMW-6D (9.16 pCi/L) exceed the groundwater standard of 5 pCi/L. Total radium concentrations in samples from wells DMW-6I (15.4 pCi/L) and DMW-6D (8.84 pCi/L) also exceed the groundwater standard. The radium-228 results for DMW-6I and DMW-6D are similar to the 2011 results for these wells (DMW-6I at 11.8 pCi/L, and DMW-6D at 7.58 pCi/L).

Concentrations of radium-228 and total radium do not exceed the groundwater standard in samples collected from the upper surficial aquifer (MW-3, DMW-6S, DMW-16S), other sampled locations of the intermediate and lower surficial aquifer (DMW-3D, MW-16I, and MW-16D), and the deep confined aquifer (MW-27D, and MW-29D).

Footnotes:

1 Does not include TICs reported for shallow samples from MW-4 and MW-5 or TICS reported in samples collected using passive diffusion bag samplers. See Tables 4-3 and Table C-2 (Appendix C) for TICs from shallow MW-4/MW-5 low-flow samples and all diffusion bag samples.

For non-detects, 1/2 sample quantitation limit was used as a proxy concentration.

1/2 the detection limit was used for B qualified data.

NA - Not applicable, there are an insufficient number of samples to calculate statistics.

ug/L - micrograms per liter

mg/L - milligrams per liter

J - estimated value

NJ - tentatively identified compound

pci/L - picocuries per liter

TIC - tentatively identified compounds

PH (STANDARD UNITS)	5 - 9	4.50	5.63	6.12	5.66	5.39	6.33
OXIDATION-REDUCTION POTENTIAL (mV)	<50 (reduction possible) or <-100 (reduction likely)	233	118	30	81	49	-46
DISSOLVED OXYGEN (MG/L; FIELD METER)	<0.5	1.95	1.63	2.36	1.64	0.66	2.37
TEMPERATURE (DEGREES CELCIUS)	>20	13.50	14.52	13.75	16.31	13.57	13.20

-- - Not detected.
J - Positive result is considered estimated as a result of technical noncompliance.
mg/L - milligrams per liter
mV - milliVolts
J - Positive result is considered estimated as a result of technical noncompliance.
B - Blank contamination.

DCE = dichloroethene
PCE = tetrachloroethene
TCA = trichloroethane
Shaded cell indicates result meets favorable degradation criterion.

Footnotes:

-- = The chemical was not analyzed or no value was available.

Data Qualifiers:

Blank (i.e., no qualifier) = the chemical was detected.

> = The chemical was detected.

J = The chemical was detected but the concentration reported is an estimated value.

U = The chemical was not detected.

< = The chemical was not detected.

R = The chemical was rejected.

SODIUM	NA	NA	NA	590000	NA	NA	NA

1 Maryland Department of the Environment Soil and Groundwater Standards, Interim Final 2.1, June 2008.

2 Total number of samples is 72 for listed analytes except calcium, iron, magnesium, manganese, silicon dioxide, sodium, and potassium (which is 6) and hexavalent chromium. Total number of hexavalent chromium samples is 71.

3 The letter U indicates that the metal was not detected at the detection limit concentration shown left of the letter. For thallium, the range of non-detect concentrations is shown.

ug/L - micrograms per liter (i.e. parts per billion)

NA = Not analyzed (used for metals result columns) or no standard available (used for MDE standard column)

Nickel standard= 73 ug/l
Vanadium standard= 3.7 ug/l

For wells sampled, only concentrations exceeding the standards are shown. The maximum of either the total and dissolved metal concentrations is shown.

Result in red indicates total metal concentration is shown. Result in black indicates dissolved metal concentration is shown. Result in blue indicates total and dissolved concentrations are equal.

(Not Sampled) - Indicates well not sampled if symbol is obscured for this well.

Section 5
Summary

The following summarizes the findings of the 2012 groundwater sampling and analysis program for the Dump Road Area (DRA) of Martin State Airport (MSA) in Middle River, Maryland:

- Groundwater in the upper, intermediate, and lower surficial aquifer zones flows east and northeast to Frog Mortar Creek.

- Concentrations of chlorinated volatile organic compounds (cVOCs) exceed Maryland Department of the Environment (MDE) groundwater standards throughout a large portion of the investigation area, and at multiple depths. The two highest trichloroethene (TCE) concentrations observed in the current sampling episode are 16,000 micrograms per liter (µg/L) and 11,000 micrograms per liter, reported for upper surficial aquifer wells DMW-11S (Taxiway Tango Median Area) and DMW-2A/DMW-18I (eastern part of the site near Frog Mortar Creek). Multiple volatile organic compound (VOC) sources at the site have resulted in volatile organic compound plumes in groundwater extending to areas north of Pond 2, south to wells DMW-6I and DMW-7I, and west to the area between Taxiway Tango and the airport runway.

- Concentrations of chlorinated volatile organic compounds in groundwater are consistent with the 2011 results. Time-series plots of volatile organic compounds in source areas and downgradient locations indicate a general decrease in volatile organic compound concentrations since monitoring began in the early 2000s. Volatile organic compound concentrations in the source area for the Taxiway Tango Median Area plume (well DMW-11S) had remained steady until 2010, but then decreased from the 2010 concentrations by more than 50% to historical lows for trichloroethene and *cis*-1,2-dichloroethene (*cis*-1,2-DCE) in 2011 and 2012.

- At six wells where groundwater samples were analyzed for natural attenuation assessment parameters, anaerobic reductive dechlorination is evidenced by the presence of the trichloroethene breakdown product *cis*-1,2-dichloroethene. Vinyl chloride, methane, ethene, and elevated chloride concentrations indicate that complete dechlorination may be readily occurring in the upper and intermediate surficial aquifer zones at the Dump Road Area site. However, lower relative concentrations of vinyl chloride, methane, and ethene, low groundwater pH, and high oxidation reduction potential indicate that slow or incomplete reductive dechlorination of lower order chlorinated volatile organic compounds may be occurring in the lower surficial aquifer zone.

- Volatile organic compound groundwater contamination is present at concentrations greater than groundwater standards at currently delineated areas to the north (wells MW-14I, MW-15S/I, MW-16S/I, MW-17I, and MW-28I), east (wells MW-14I,

MW-18I/S, DMW-3S/I, DMW-4S/I/D, and DMW-5S/I), and west (wells MW-24I, DMW-11S, and MW-33S). The Dump Road Area Source Areas Investigation was completed in 2012 which will provide additional supplemental data in a separate report.

- At wells MW-4 and MW-5, low-flow purge and passive diffusion bag (PDB) samples were collected near the top of each well screen, from the midpoint of each well screen, and from the bottom of each well screen to evaluate possible vertical contaminant distributions that can occur when formation materials of varying permeability are screened or when long well screens are used. These sampling results are generally comparable for detected volatile organic compounds at the three sampling depths in each well, and between samples collected via low-flow purging and the bag samplers. Low-flow samples and the bag midpoint and screen bottom samples do not indicate substantial vertical profiling of volatile organic compounds at either well. However, volatile organic compound concentrations in the screen top bag samples were consistently lower than the low-flow samples collected at the same depth, and were consistently lower than both the deeper low-flow and bag samples. For the top of screen samples, the pumping samples generally provided higher volatile organic compound concentrations than the bag samples. However, for the midpoint and bottom samples, the pumping samples generally provided lower concentrations than the bag samples. The low-flow and bag results compare more favorably for higher volatile organic compound concentrations.

- The semivolatile organic compound (SVOC) 1,4-dioxane was detected primarily in groundwater samples collected from the upper and intermediate surficial aquifer zones. 1,4-Dioxane is co-located in areas containing the highest concentrations of chlorinated volatile organic compounds (primarily near Pond 1 and the area east). Highest concentrations of 1,4-dioxane are east of Pond 1 near Frog Mortar Creek at wells DMW-2A (300 micrograms per liter) and DMW-3I (230 micrograms per liter), and west of Pond 1 at wells MW-20S (240 micrograms per liter) and DMW-9I (150 micrograms per liter).

- Concentrations of 10 metals exceed groundwater standards in one or more surficial aquifer groundwater samples. Total iron, total manganese, vanadium, arsenic, cadmium, nickel, and cadmium exceed standards most frequently. Maximum concentrations of iron, manganese, vanadium, and cadmium exceed the Maryland Department of the Environment groundwater standards by more than one order of magnitude. The maximum concentrations for both total and dissolved nickel exceed its groundwater standard by a factor of nearly eight. The highest concentrations of cadmium are co-located with high levels of volatile organic compounds in the surficial aquifer at wells DMW-1A (maximum of 1,100 micrograms per liter), DMW-1B, DMW-8I, DMW-8D, DMW-2A, DMW-2S, MW-18I, and DMW-3I, all of which are south and east of Pond 1.

- Hexavalent chromium was detected in only eight of 71 groundwater samples, with a maximum concentration of 0.547 micrograms per liter. Its concentrations do not exceed the Maryland Department of the Environment groundwater standard.

- In the deep confined aquifer wells (MW-27D, MW-29D, MW-30D, and MW-31D), only total vanadium at MW-31D exceeds the Maryland Department of the Environment groundwater standards. The dissolved (i.e., filtered) vanadium concentration at this well does not exceed the standard.

- Total petroleum hydrocarbon (TPH) diesel-range organics (DRO) and gasoline-range organics (GRO) were detected in 22% and 50% of the 2012 upper surficial aquifer groundwater samples, respectively. Most concentrations exceed the Maryland Department of the Environment groundwater standard of 47 micrograms per liter. The highest diesel-range organic and gasoline-range organic concentrations were detected in wells DMW-11S (diesel-range organics) and DMW-9S (gasoline-range organics), in the Taxiway Tango Median Area and Petroleum Hydrocarbon and Pond 1 Area, respectively. Substantially lower concentrations of diesel-range organics and gasoline-range organics were reported for groundwater in the Drum Area.

- Perchlorate was detected in 14 groundwater samples. However, only one of these concentrations (4.6 micrograms per liter at DMW-4I) exceeds the Maryland Department of the Environment groundwater standard of 2.6 micrograms per liter. Haloacetic acids and cyclotrimethylene trinitramine (also known as Royal Demolition Explosive [RDX]) were not detected in the three and nine groundwater samples analyzed, respectively, for these compounds.

- Radium-228 and total radium were detected in eight of 11 groundwater samples. Radium-228 concentrations exceed the groundwater standard in one sample each from the intermediate surficial aquifer at wells DMW-3I and DMW-6I, and the deep surficial aquifer well at DMW-6D. The total radium concentrations for wells DMW-6I and DMW-6D also exceed the groundwater standard.

- Concentrations of radium-228 and total radium do not exceed the groundwater standard in samples collected from upper surficial aquifer (wells MW-3, DMW-6S, MW-16S), other sampled locations of the intermediate and lower surficial-aquifer (DMW-3D, MW-16I, and MW-16D), and the deep confined aquifer (wells MW-27D, and MW-29D).

2/Aqueous/GRO/DRO

MSA-MW15S-041812	MSA-MW38S-041812

Overview

The sample set for Martin State Airport Groundwater Sampling, SDG 240-10350-1 consists of four (4) aqueous environmental samples and one trip blank. All samples were analyzed for volatile organic compounds (VOCs). Four (4) aqueous environmental samples were analyzed for 1,4-dioxane in the semivolatile organic compound (SVOC) SIM fraction. Two (2) aqueous environmental samples; MSA-MW15S-041812 and MSA-MW38S-041812 were analyzed for gasoline range organics (GRO) and diesel range organics (DRO). GRO is listed on the form 1s and EDD as total petroleum hydrocarbons (TPH) (C6-C10) and DRO as TPH (C10-C32). There are no field duplicate pairs included in this SDG.

The samples were collected on April 18, 2012 and analyzed by Test America Laboratories, Inc. Volatile organic compound analyses were conducted in accordance to SW-846 Method 8260B. The analyses for 1,4-dioxane followed SW-846 Method 8270C in Selective Ion Monitoring SIM mode. GRO and DRO analyses followed SW-846 Method 8015B.

Summary

The data contained in this SDG were validated with regard to the following parameters: data completeness, system performance, holding times, GC/MS tuning, initial / continuing calibrations, laboratory method blank results, surrogate spike/internal standard recoveries, laboratory control sample results, matrix spike/matrix spike duplicate results, compound identification, compound quantitation, and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems

- In the volatile initial calibration of instrument A3UX10 on April 9, 2012 and the continuing calibrations on April 27, 2012 @ 9:48, tert-butyl alcohol and vinyl acetate had relative retention factors (RRFs) less than the 0.05 quality control limit. The nondetected tert-butyl alcohol and vinyl acetate results were qualified

as rejected (UR) in the affected samples MSA-MW15I-041812, MSA-MW15S-041812, MSA-MW38SS-041812 and TB-041812.

- In the volatile initial calibration of instrument A3UX16 on April 29, 2012 and the continuing calibration on April 30, 2012 @ 11:50, tert-butyl alcohol had a RRF less than the 0.05 quality control limit. In addition, the continuing calibration on April 30, 2012 had a RF for vinyl acetate less than the 0.05 quality control limit. The nondetected vinyl acetate and tert-butyl alcohol results were qualified as rejected (UR) in the affected sample MSA-MW15D-041812.

- The matrix spike/ matrix spike duplicate (MS/MSD) percent recoveries (%Rs) of 2-chloroethyl vinyl ether was 0% in sample MSA-MW15D-041812. The nondetected 2-chloroethyl vinyl ether was qualified as rejected (UR).

Minor Problems

- GRO was detected in the laboratory method blank 240-41320/6 affecting all samples.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
GRO	26.5	132.5

An action level of 5X the maximum concentration level has been used in order to evaluate sample data for blank contamination. Positive results less than the action level were qualified (B) as a result of blank contamination. Sample aliquot and dilution factors were taken into account in validation of the data.

- TICs were qualified as presumptively present (NJ) in sample MSA-MW15D-041812.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) for the organic analyses were qualified as estimated, (J).

Notes

The continuing calibration percent differences (%Ds) for several target analytes were greater than the 20% quality control limit but less than 50% on April 27, 2012 @ 9:48 on instrument A3UX10. The analytes were 1,1,2-trichlorotrifluoroethane, tert-butyl alcohol, 4-methyl-2-pentanone, 2-hexanone, bromoform, n-butylbenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, naphthalene and 1,2,3-trichlorobenzene. No action was taken on the nondetected results of the aforementioned analytes in the affected samples MSA-MW15I-041812, MSA-MW15S-041812, MSA-MW38SS-041812 and TB-041812.

Contamination was detected in the VOC laboratory method blank associated with batch 240-42171/5 analyzed on April 30, 2012 @ 12:59 on instrument A3UX16.

Contaminant	Maximum Concentration (ug/L)
1,2,3-trichlorobenzene	0.288
Methylcyclohexane (TIC)	0.197

No action was taken on the nondetected 1,2,3-trichlorobenzene result in sample MSA-MW15D-041812.

The laboratory control sample (LCS) percent recovery (%R) of tert-butyl alcohol was less than the lower quality control limit in batch 240-41857/4. No action was taken on the nondetected tert-butyl alcohol results in the affected samples which were qualified as rejected due to a more severe noncompliance.

The relative percent difference (RPD) for tert-butyl ether was greater than the quality control limit in sample MSA-MW15D-041812. No action was taken because the MS/MSD %Rs were within quality control limits. In addition, the nondetected tert-butyl ether result was qualified as rejected due to a more severe noncompliance.

The (MS) %R of tert-butyl alcohol was less than the lower quality control limit in sample 240-10494-C-3. The matrix spike duplicate (MSD) %R and relative percent difference (RPD) were within quality control limits. No action was taken.

The following sample was diluted in the VOC fraction resulting in elevated reporting limits.

Sample	Dilution Factor
MSA-MW15I-041812	20X

Nondetected results were reported to the MDL.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Tert-butyl alcohol and vinyl acetate had RRFs less than quality control limits in the initial and continuing calibrations. GRO was detected in the laboratory method blank.

Other Factors Affecting Data Quality: TICs were detected in sample MSA-MW15D-041812.

The data for these analyses were reviewed with reference to the Region III EPA Functional Guidelines for Organic Data Validation (9/94).The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:
Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is less than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed

Support Documentation

CASE NARRATIVE

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Project: MSA Groundwater Sampling

Report Number: 240-10350-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6850 Perchlorate analysis was performed at the TestAmerica West Sacramento Laboratory.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/19/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.4 and 2.6 C.

VOLATILE ORGANIC COMPOUNDS (GC MS)

Samples TB-041812 (240-10350-1), MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for volatile organic compounds (GC MS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 04/27/2012 and 04/30/2012.

1,2,3-Trichlorobenzene was detected in method blank MB 240-42171/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample (LCS) for batch 41857 exceeded control limits for tert-Butyl alcohol. This has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

2-Chloroethyl vinyl ether failed the recovery criteria low for the MS/MSD of sample MSA-MW15D-041812 (240-10350-5) in batch 240-42171. tert-Butyl alcohol exceeded the rpd limit.

Sample MSA-MW15I-041812 (240-10350-4)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for analytical batch 41857 exceeded control criteria for several compounds. The samples associated with this CCV were not detected for the affected analytes. A low level CCV, at the reporting limit, was analyzed and the affected compounds were detected; therefore the data is is reportable per the facility Standard operating Procedure (SOP).

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and

MSA-MW15D-041812 (240-10350-5) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/20/2012 and analyzed on 04/23/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 40937, 8270.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)

Samples MSA-MW15S-041812 (240-10350-2) and MSA-MW38S-041812 (240-10350-3) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 04/24/2012.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-41320/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)

Samples MSA-MW15S-041812 (240-10350-2) and MSA-MW38S-041812 (240-10350-3) were analyzed for diesel range organics (DRO) in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 04/25/2012 and analyzed on 04/26/2012.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batches 41067 and 41524, 8015.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICPMS)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/23/2012 and analyzed on 04/24/2012.

Several analytes were detected in method blank MB 240-41173/1-B at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/23/2012 and 04/24/2012 and analyzed on 04/24/2012 and 04/25/2012.

Several analytes were detected in method blank MB 240-41295/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

FORM V
GC/MS VOA INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: TestAmerica Canton Job No.: 240-10350-1

SDG No.:

Lab File ID: BFB3643.D BFB Injection Date: 04/09/2012

Instrument ID: A3UX10 BFB Injection Time: 10:15

Analysis Batch No.: 39613

M/E	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE	
50	15.0 - 40.0 % of mass 95	18.7	
75	30.0 - 60.0 % of mass 95	48.5	
95	Base Peak, 100% relative abundance	100.0	
96	5.0 - 9.0 % of mass 95	6.9	
173	Less than 2.0 % of mass 174	0.0	(0.0)1
174	50.0 - 120.00 % of mass 95	74.4	
175	5.0 - 9.0 % of mass 174	5.3	(7.1)1
176	95.0 - 101.0 % of mass 174	71.7	(96.3)1
177	5.0 - 9.0 % of mass 176	5.0	(7.0)2

1-Value is % mass 174 2-Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS AND STANDARDS:

Overview

The sample set for Martin State Airport - Groundwater, SDG 240-10350-1, consists of four (4) aqueous environmental samples. No field duplicate pairs were included within this SDG.

All samples were analyzed for perchlorate and select total and dissolved metals including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, tungsten, vanadium and zinc. The samples were collected by Tetra Tech on April 18, 2012 and analyzed by TestAmerica. Metals analyses were conducted using SW-846 method 6020A. Mercury analyses were conducted using SW-846 method 7470A. Perchlorate analyses were conducted using SW-846 method 6850.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, MS tuning, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike/matrix spike duplicate recoveries, ICP serial dilution results, internal standard recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems

None.

Minor Problems

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Molybdenum[1]	0.883 ug/L	4.415 ug/L
Thallium[1]	0.537 ug/L	2.685 ug/L
Tungsten[1]	0.632 ug/L	3.16 ug/L
Cobalt[2]	0.0770 ug/L	0.385 ug/L
Molybdenum[2]	0.449 ug/L	2.245 ug/L
Thallium[2]	0.702 ug/L	3.51 ug/L
Tungsten[2]	0.584 ug/L	2.92 ug/L
Barium[3]	0.964 ug/L	4.82 ug/L
Copper[3]	0.703 ug/L	3.515 ug/L
Zinc[3]	4.00 ug/L	20.0 ug/L
Barium[4]	0.953 ug/L	4.765 ug/L
Copper[4]	0.750 ug/L	3.75 ug/L
Zinc[4]	14.1 ug/L	70.5 ug/L

(1) Maximum concentration present in a method blank affecting all samples except MSA-MW15S-041812 (total).
(2) Maximum concentration present in a method blank affecting sample MSA-MW15S-041812 (total).
(3) Maximum concentration present in a total preparation blank.
(4) Maximum concentration present in a dissolved preparation blank.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive results less than the blank action level reported for copper, molybdenum, thallium, tungsten and zinc were qualified "B" as a result of laboratory blank contamination.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated, "J".

Notes

Nondetected results are reported to the method detection limits.

The contract required detection limit (CRDL) percent recoveries for copper, nickel, silver and thallium on 04/24/2012 and 04/25/2012 were > 110% quality control limit affecting all samples. However, no validation actions were required as all sample results were either > 2X CRDL, nondetects or were qualified as a result of blank contamination.

Executive Summary

Laboratory Performance: Several contaminants were present in the laboratory method / preparation blanks.

Other Factors Affecting Data Quality: Positive results reported below the RL but above the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993 and the Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994).

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is less than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed

APPENDIX C
SUPPORT DOCUMENTATION

CASE NARRATIVE

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Project: MSA Groundwater Sampling

Report Number: 240-10350-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6850 Perchlorate analysis was performed at the TestAmerica West Sacramento Laboratory.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/19/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.4 and 2.6 C.

VOLATILE ORGANIC COMPOUNDS (GC MS)

Samples TB-041812 (240-10350-1), MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for volatile organic compounds (GC MS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 04/27/2012 and 04/30/2012.

1,2,3-Trichlorobenzene was detected in method blank MB 240-42171/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample (LCS) for batch 41857 exceeded control limits for tert-Butyl alcohol. This has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

2-Chloroethyl vinyl ether failed the recovery criteria low for the MS/MSD of sample MSA-MW15D-041812 (240-10350-5) in batch 240-42171. tert-Butyl alcohol exceeded the rpd limit.

Sample MSA-MW15I-041812 (240-10350-4)[20X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for analytical batch 41857 exceeded control criteria for several compounds. The samples associated with this CCV were not detected for the affected analytes. A low level CCV, at the reporting limit, was analyzed and the affected compounds were detected; therefore the data is is reportable per the facility Standard operating Procedure (SOP).

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and

MSA-MW15D-041812 (240-10350-5) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/20/2012 and analyzed on 04/23/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 40937, 8270.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)

Samples MSA-MW15S-041812 (240-10350-2) and MSA-MW38S-041812 (240-10350-3) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 04/24/2012.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-41320/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)

Samples MSA-MW15S-041812 (240-10350-2) and MSA-MW38S-041812 (240-10350-3) were analyzed for diesel range organics (DRO) in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 04/25/2012 and analyzed on 04/26/2012.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batches 41067 and 41524, 8015.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICPMS)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/23/2012 and analyzed on 04/24/2012.

Several analytes were detected in method blank MB 240-41173/1-B at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/23/2012 and 04/24/2012 and analyzed on 04/24/2012 and 04/25/2012.

Several analytes were detected in method blank MB 240-41295/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MSA-MW15S-041812 (240-10350-2), MSA-MW38S-041812 (240-10350-3), MSA-MW15I-041812 (240-10350-4) and MSA-MW15D-041812 (240-10350-5) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

METHOD SUMMARY

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Job Number: 240-10350-1

Description	Lab Location	Method	Preparation Method
Matrix Water			
Volatile Organic Compounds by GC/MS	TAL NC	SW846 8260C	
Purge and Trap	TAL NC		SW846 5030C
Semivolatile Organic Compounds (GC/MS)	TAL NC	SW846 8270C	
Liquid-Liquid Extraction (Continuous)	TAL NC		SW846 3520C
Gasoline Range Organics - (GC)	TAL NC	SW846 8015B	
Purge and Trap	TAL NC		SW846 5030B
Diesel Range Organics (DRO) (GC)	TAL NC	SW846 8015B	
Liquid-Liquid Extraction (Continuous)	TAL NC		SW846 3520C
Metals (ICP/MS)	TAL NC	SW846 6020	
Preparation, Total Recoverable or Dissolved Metals	TAL NC		SW846 3005A
Metals (ICP/MS)	TAL NC	SW846 6020	
Preparation, Total Recoverable or Dissolved Metals	TAL NC		SW846 3005A
Sample Filtration, Field			FIELD_FLTRD
Mercury (CVAA)	TAL NC	SW846 7470A	
Preparation, Mercury	TAL NC		SW846 7470A
Mercury (CVAA)	TAL NC	SW846 7470A	
Preparation, Mercury	TAL NC		SW846 7470A
Sample Filtration, Field			FIELD_FLTRD
General Sub Contract Method	TAL WSC	Subcontract

Case Narrative

TestAmerica West Sacramento Project Number G2D230413

WATER, 6850, Perchlorate
Sample(s): 1, 1MS, 1MSD, 2, 3, 4
In accordance with the requirements of Method 6850, both a Laboratory Control Sample (LCS) and a Synthetic Matrix Check Sample (SMCS) were analyzed with the associated samples. Both are reported on the LCS data evaluation and recovery reports, and are differentiated from one another by their workorder number:

LCS: MR8L91AC
SMCS: MR8L91AD

There were no other anomalies associated with this project.

Sample Summary

TestAmerica West Sacramento Project Number G2D230413

WO#	Sample #	Client Sample ID	Sampling Date	Received Date
MR5QT	1	MSA-MW15S-041812	4/18/2012 11:40 AM	4/20/2012 09:00 AM
MR5QX	2	MSA-MW38S-041812	4/18/2012 11:55 AM	4/20/2012 09:00 AM
MR5Q1	3	MSA-MW151-041812	4/18/2012 02:16 PM	4/20/2012 09:00 AM
MR5Q4	4	MSA-MW15D-041812	4/18/2012 03:35 PM	4/20/2012 09:00 AM

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

ANALYTICAL METHODS SUMMARY

G2D230413

PARAMETER	ANALYTICAL METHOD
Perchlorate by 6850	SW846 6850

Overview

The sample set for Martin State Airport Groundwater Sampling, SDG 240-10391-1 consists of five (5) aqueous environmental samples and one trip blank. All samples were analyzed for volatile organic compounds (VOCs). Five (5) aqueous environmental samples were analyzed for 1,4-dioxane in the semivolatile organic compound (SVOC) SIM fraction and perchlorate. Two (2) aqueous environmental samples; MSA-MW34S-041912 and MSA-MW39S-041912 were analyzed for gasoline range organics (GRO) and diesel range organics (DRO). GRO is listed on the form 1s and EDD as total petroleum hydrocarbons (TPH) (C6-C10) and DRO as TPH (C10-C32). One (1) aqueous environmental sample, MSA-MW15S-041812, was analyzed for the explosive (EXP), RDX. There are no field duplicate pairs included in this SDG.

The samples were collected on April 18 and 19, 2012 and analyzed by Test America Laboratories, Inc. Volatile organic compound analyses were conducted in accordance to SW-846 Method 8260B. The analyses for 1,4-dioxane followed SW-846 Method 8270C in Selective Ion Monitoring SIM mode. GRO and DRO analyses followed SW-846 Method 8015B. The analyses for RDX and perchlorate were conducted using SW-846 Methods 8330 and 6850, respectively.

Summary

The data contained in this SDG were validated with regard to the following parameters: data completeness, system performance, holding times, GC/MS tuning, initial / continuing calibrations, laboratory method blank results, surrogate spike/internal standard recoveries, laboratory control sample results, matrix spike/matrix spike duplicate results, compound identification, compound quantitation, and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems

- In the volatile initial calibration of instrument A3UX10 on April 9, 2012 and the continuing calibrations on April 27, 2012 @ 9:48, tert-butyl alcohol and vinyl acetate had relative retention factors (RRFs) less than the 0.05 quality control limit. The nondetected tert-butyl alcohol and vinyl acetate results were qualified as rejected (UR) in the affected samples MSA-MW19D-041912, MSA-MW19I-041912, MSA-MW34I-041912, MSA-MW34S-041912 and TB-041912.

- In the volatile initial calibration of instrument A3UX16 on April 29, 2012 and the continuing calibration on April 30, 2012 @ 11:50, tert-butyl alcohol had a RRF less than the 0.05 quality control limit. In addition, the continuing calibration on April 30, 2012 had a RF for vinyl acetate less than the 0.05 quality control limit. The nondetected vinyl acetate and tert-butyl alcohol results were qualified as rejected (UR) in the affected sample MSA-MW39S-041912.

Minor Problems

- GRO was detected in the laboratory method blank 240-41320/6 affecting all samples.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
GRO	26.5	132.5

An action level of 5X the maximum concentration level has been used in order to evaluate sample data for blank contamination. Positive results less than the action level were qualified (B) as a result of blank contamination. Sample aliquot and dilution factors were taken into account in validation of the data.

- TICs were qualified as presumptively present (NJ) in samples MSA-MW34I-041912 and MSA-MW39S-041912.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) for the organic analyses were qualified as estimated, (J).

Notes

The continuing calibration percent differences (%Ds) for several target analytes were greater than the 20% quality control limit but less than 50% on April 27, 2012 @ 9:48 on instrument A3UX10. The analytes were 1,1,2-trichlorotrifluoroethane, tert-butyl alcohol, 4-methyl-2-pentanone, 2-hexanone, bromoform, n-butylbenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, naphthalene and 1,2,3-trichlorobenzene. No action was taken on the nondetected results of the aforementioned analytes in the affected samples MSA-MW19D-041912, MSA-MW19I-041912, MSA-MW34I-041912, MSA-MW34S-041912 and TB-041912.

Contamination was detected in the VOC laboratory method blank associated with batch 240-42171/5 analyzed on April 30, 2012 @ 12:59 on instrument A3UX16.

Contaminant	Maximum Concentration (ug/L)
1,2,3-trichlorobenzene	0.288
Methylcyclohexane (TIC)	0.197

No action was taken on the nondetected 1,2,3-trichlorobenzene result in sample MSA-MW39S-041912.

The laboratory control sample (LCS) percent recovery (%R) of tert-butyl alcohol was less than the lower quality control limit in batch 240-41857/4. No action was taken on the nondetected tert-butyl alcohol results in the affected samples which were qualified as rejected due to a more severe noncompliance.

The matrix spike (MS) %R of tert-butyl alcohol was less than the lower quality control limit in sample 240-10350-A-5. The matrix spike duplicate (MSD) %R and relative percent difference (RPD) were within quality control limits. No action was taken.

The MS/MSD %Rs of 2-chloroethyl vinyl ether were 0% in sample 240-10350-A-5. No action was taken since this was not a sample included in this SDG.

The following sample was diluted in the VOC fraction resulting in elevated reporting limits.

Sample	Dilution Factor
MSA-MW19I-041912	5X

Nondetected results were reported to the MDL.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Tert-butyl alcohol and vinyl acetate had RRFs less than quality control limits in the initial and continuing calibrations. GRO was detected in the laboratory method blank.

Other Factors Affecting Data Quality: TICs were detected in several samples.

The data for these analyses were reviewed with reference to the Region III EPA Functional Guidelines for Organic Data Validation (9/94).The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:
Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is less than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed

Support Documentation

CASE NARRATIVE

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Project: MSA Groundwater Sampling

Report Number: 240-10391-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6850 Perchlorate and RDX Explosives analysis was performed at the TestAmerica West Sacramento Laboratory.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/20/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.2 and 2.8 C.

No tests were marked on the COC for the following samples: MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7). After consultation with the client, the samples were logged and analyzed for the tests according to the bottles received.

VOLATILE ORGANIC COMPOUNDS (GC MS)

Samples TB-041912 (240-10391-2), MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for volatile organic compounds (GC MS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 04/27/2012 and 04/30/2012.

1,2,3-Trichlorobenzene was detected in method blank MB 240-42171/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample (LCS) for batch 41857 exceeded control limits for tert-Butyl Alcohol. This has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Samples MSA-MW19I-041912 (240-10391-4)[5X] and MSA-MW34I-041912 (240-10391-6)[1.43X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for analytical batch 41857 exceeded control criteria for multiple compounds. The samples associated with this CCV were not detected for the affected analytes. A low level CCV, at the reporting limit, was analyzed and the affected compounds were detected; therefore the data is reportable per the facility Standard Operating Procedure (SOP).

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/23/2012 and analyzed on 04/25/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)

Samples MSA-MW34S-041912 (240-10391-5) and MSA-MW39S-041912 (240-10391-7) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 04/24/2012.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-41320/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)

Samples MSA-MW34S-041912 (240-10391-5) and MSA-MW39S-041912 (240-10391-7) were analyzed for diesel range organics (DRO) in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 04/25/2012 and analyzed on 04/26/2012.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 41524.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICPMS)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012.

No difficulties were encountered during the metals analyses. All quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012.

Several analytes were detected in method blank MB 240-41326/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TestAmerica North Canton Sample Receipt Form/Narrative Login # : 10391

Client Tetra Tech Inc. Site Name _____ By: [signature] (Signature)

Cooler Received on 4/20/12 Opened on 4/20/12

FedEx: 1st Grd Exp UPS FAS Stetson Client Drop Off TestAmerica Courier Other _____

TestAmerica Cooler # _____ Foam Box Client Cooler Box Other _____

Packing material used: Bubble Wrap Foam Plastic Bag None Other _____

COOLANT: Wet Ice Blue Ice Dry Ice Water None

1. Cooler temperature upon receipt
   - IR GUN# 1 (CF -2°C) Observed Sample Temp._____°C Corrected Sample Temp._____°C
   - IR GUN# 4G (CF -1°C) Observed Sample Temp._____°C Corrected Sample Temp._____°C
   - IR GUN# 5G (CF -1°C) Observed Sample Temp._____°C Corrected Sample Temp._____°C
   - IR GUN# 6Y (CF -2°C) Observed Sample Temp._____°C Corrected Sample Temp._____°C

   ☒ Multiple on Back

2. Were custody seals on the outside of the cooler(s)? If Yes Quantity_____ Yes No
   - -Were custody seals on the outside of the cooler(s) signed & dated? Yes No NA
   - -Were custody seals on the bottle(s)? Yes No
3. Shippers' packing slip attached to the cooler(s)? Yes No
4. Did custody papers accompany the sample(s)? Yes No
5. Were the custody papers relinquished & signed in the appropriate place? Yes No
6. Did all bottles arrive in good condition (Unbroken)? Yes No
7. Could all bottle labels be reconciled with the COC? Yes No
8. Were correct bottle(s) used for the test(s) indicated? Yes No
9. Sufficient quantity received to perform indicated analyses? Yes No
10. Were sample(s) at the correct pH upon receipt? Yes No NA
11. Were VOAs on the COC? Yes No
12. Were air bubbles >6 mm in any VOA vials? Yes No NA
13. Was a trip blank present in the cooler(s)? Yes No

Contacted PM PTO Date 4-20-12 by [initials] via Verbal Voice Mail Other

Concerning #14

14. CHAIN OF CUSTODY & SAMPLE DISCREPANCIES

No tests marked for MW34S, MW34I, MW39S.
Received volume to run all tests listed on COC except RDX.

Rec'd GRO+DRO Volume for MW34S + MW39S will log, not listed on COC

15. SAMPLE CONDITION

Sample(s) _____ were received after the recommended holding time had expired.

Sample(s) _____ were received in a broken container.

Sample(s) _____ were received with bubble >6 mm in diameter. (Notify PM)

SOP: NC-SOP-5 Sample Receiving 05/10/2012

N:\QAQC\NARRATIVE\TestAmerica\Cooler Receipt TestAmerica\COOLER_TestAmerica_Rev 83_032612 jcs.doc

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in Sample Receiving to meet recommended pH level(s). Nitric Acid Lot# 110410-HNO3; Sulfuric Acid Lot# 041911-H2SO4; Sodium Hydroxide Lot# 121809 - NaOH; Hydrochloric Acid Lot# 041911-HCl; Sodium Hydroxide and Zinc Acetate Lot# 100108-(CH3COO)2ZN/NaOH. What time was preservative added to sample(s)? _____

Client ID	pH	Date	Initials
MW19D	<2	4/20/12	JM
MW19I	<2		
MW24S	<2		
MW34I	<2		
MW39S	<2		

Cooler #	Observed Sample Temp. °C	Corrected Sample Temp. °C	IR #	Coolant
461	3.2	2.8	4G	Ice
Client Cooler	3.8	2.8

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

METHOD SUMMARY

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Job Number: 240-10391-1

Description	Lab Location	Method	Preparation Method
Matrix Water			
Volatile Organic Compounds by GC/MS	TAL NC	SW846 8260C	
Purge and Trap	TAL NC		SW846 5030C
Semivolatile Organic Compounds (GC/MS)	TAL NC	SW846 8270C

FORM V
GC/MS VOA INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: TestAmerica Canton Job No.: 240-10391-1

SDG No.:

Lab File ID: BFB3643.D BFB Injection Date: 04/09/2012

Instrument ID: A3UX10 BFB Injection Time: 10:15

Analysis Batch No.: 39613

M/E	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE	
50	15.0 - 40.0 % of mass 95	18.7	
75	30.0 - 60.0 % of mass 95	48.5	
95	Base Peak, 100% relative abundance	100.0	
96	5.0 - 9.0 % of mass 95	6.9	
173	Less than 2.0 % of mass 174	0.0	(0.0)1
174	50.0 - 120.00 % of mass 95	74.4	
175	5.0 - 9.0 % of mass 174	5.3	(7.1)1
176	95.0 - 101.0 % of mass 174	71.7	(96.3)1
177	5.0 - 9.0 % of mass 176	5.0	(7.0)2

1-Value is % mass 174 2-Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS AND STANDARDS:

CLIENT SAMPLE ID	LAB SAMPLE ID	LAB FILE ID	DATE ANALYZED	TIME ANALYZED

Case Narrative

TestAmerica West Sacramento Project Number G2D240430

WATER, 8330/8330A, RDX
Sample(s): 1
There was insufficient sample volume to prepare a matrix spike/matrix spike duplicate (MS/MSD) pair with this batch.

WATER, 6850, Perchlorate
Sample(s): 2, 3, 4, 5, 6
In accordance with the requirements of Method 6850, both a Laboratory Control Sample (LCS) and a Synthetic Matrix Check Sample (SMCS) were analyzed with the associated samples. Both are reported on the LCS data evaluation and recovery reports, and are differentiated from one another by their workorder number:

LCS: MR8L91AC
SMCS: MR8L91AD

There were no other anomalies associated with this project.

Sample Summary

TestAmerica West Sacramento Project Number G2D240430

WO#	Sample #	Client Sample ID	Sampling Date	Received Date
MR6HL	1	MSA-MW15S-041812	4/18/2012 11:40 AM	4/24/2012 09:00 AM

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

ANALYTICAL METHODS SUMMARY

GC/HPLC ICAL Checklist

Instrument ID: LC10 ICAL ID: 04192012C Method: 8330A/B

Analytes Included in curve (with dates): 8330 All + NG, PETN, 3,5DNA + EGDN

A. Included Sections of ICAL	Analyst	Reviewer	N/A
1. ICAL Summary included (for both columns if applicable).	✓	✓	
2. ICAL Runlog included.	✓	✓	
3. ICAL's are in chronological order.	✓	✓	
4. PEM meets requirements and is included for 8081.			✓
5. Alkane Marker included for 8015 TPH.			✓
6. ICAL Raw Data included for all analytes.	✓	✓	
B. ICAL Summary			
1. All analytes meet %RSD or linear regression requirements	✓	✓	
2. ICAL meets requirements stated in SOP.	✓	✓	
2. Any levels dropped are reviewed and appropriate.			✓
3. All analytes in ICAL are in the ICAL summary.	✓	✓	
4. RFs are calculated correctly. Perform Manual calculation.	✓	✓	
C. ICAL Analysis			
1. Manual Integrations reviewed and appropriate.			✓
2. All peaks correctly identified.	✓	✓	
3. No analytes have saturated peaks.	✓	✓	
4. RT windows set correctly (8015 TPH).			✓
5. ICV meets requirements and is run after the ICAL.	✓	✓	
6. Standards used in ICAL are current.	✓	✓	
7. ICAL is copied to source method.	✓	✓	

Curve Valid for:	Yes	No	Criteria
Standard SOP	✓		RSD ≤20%, r≥ 0.995 (intercept <1/2RL for 8081,8082, NQ, 8310) and (<RL for 8330) and r>0.990 (intercept <RL for 8015), ICV≤15%, PEM ≤15%
DOD QSM V3	✓		RSD ≤20%, r≥ 0.995, ICV≤20%, PEM ≤15%
AFCEE 3.1	✓		RSD ≤20%, r≥ 0.995, ICV≤15%, PEM ≤15%
AFCEE 4.0	✓		RSD ≤20%, r≥ 0.995, ICV≤20% (8081, 8082, 8015) and ICV≤25% (8330,8310), PEM ≤15%

Analyst: Robyn Thoman Date: 4/20/12

Reviewer: J Nichols Date: 4/23/12

Comments:
MRL for EGDN was analyzed after samples had already been analyzed. As CCVs were passing + S/N was greater than 5:1 on 100% and on RL limit analyzed after samples there is no further action.

LOCKHEED-MSA
SDG 240-10391-1

SAMPLES: 5/Waters/

MSA-MW19D-041912	MSA-MW19I-041912
MSA-MW34I-041912	MSA-MW34S-041912
MSA-MW39S-041912	

Overview

The sample set for Lockheed MSA, SDG 240-10391-1, consists of five (5) aqueous environmental samples. This SDG contained no field duplicate pairs.

All samples were analyzed for total and dissolved metals. The samples were collected by Tetra Tech on April 19th, 2012 and analyzed by TestAmerica. Metals analyses were conducted using method 6020A. Mercury analyses were conducted using method 7470A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, laboratory control sample recoveries, matrix spike recoveries, laboratory duplicate results, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems-

- None.

Minor Problems-

- The following contaminants were detected in preparation and calibration blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Barium [1]	0.71 ug/L	3.55 ug/L
Copper [1]	0.57 ug/L	2.85 ug/L
Lead [1]	0.29 ug/L	1.45 ug/L
Zinc [1]	2.83 ug/L	14.15 ug/L
Antimony [2]	0.16 ug/L	0.8 ug/L
Cobalt [2]	0.059 ug/L	0.29 ug/L
Molybdenum [2]	0.51 ug/L	2.55 ug/L
Thallium [2]	0.83 ug/L	4.15 ug/L
Tungsten [2]	0.74 ug/L	3.7 ug/L

(1) Maximum concentration found in a preparation blank affecting sample in 41326.
(2) Maximum concentration found in a calibration blank affecting samples analyzed on 4/25/12.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) for blank contamination.

- The CRDL standard analyzed on 4/25/12 had a percent recovery > 110% for copper, nickel, silver, and thallium. All samples were affected. Positive nickel results < 2X CRDL were qualified as either biased high (K).

Notes

Positive results greater than MDL but less than the RL were qualified as estimated (J).

COCs omitted instructions to analyze the following samples for metals: MSA-MW34I-041912, MSA-MW34S-041912, and MSA-MW39S-041912. Samples were collected and were properly preserved. No action was required.

Executive Summary

Laboratory Performance: CRDL standard non-compliances resulted in the qualification of sample results. Preparation and calibration blank contamination resulted on the qualification of sample results.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the Region III modifications to the National Functional Guidelines for Inorganic Data Validation (April 1993).

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's r < 0.995
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient r < 0.995
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

APPENDIX C

SUPPORT DOCUMENTATION

CASE NARRATIVE

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Project: MSA Groundwater Sampling

Report Number: 240-10391-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6850 Perchlorate and RDX Explosives analysis was performed at the TestAmerica West Sacramento Laboratory.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/20/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.2 and 2.8 C.

No tests were marked on the COC for the following samples: MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7). After consultation with the client, the samples were logged and analyzed for the tests according to the bottles received.

VOLATILE ORGANIC COMPOUNDS (GC MS)

Samples TB-041912 (240-10391-2), MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for volatile organic compounds (GC MS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 04/27/2012 and 04/30/2012.

1,2,3-Trichlorobenzene was detected in method blank MB 240-42171/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample (LCS) for batch 41857 exceeded control limits for tert-Butyl Alcohol. This has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Samples MSA-MW19I-041912 (240-10391-4)[5X] and MSA-MW34I-041912 (240-10391-6)[1.43X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for analytical batch 41857 exceeded control criteria for multiple compounds. The samples associated with this CCV were not detected for the affected analytes. A low level CCV, at the reporting limit, was analyzed and the affected compounds were detected; therefore the data is reportable per the facility Standard Operating Procedure (SOP).

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/23/2012 and analyzed on 04/25/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)

Samples MSA-MW34S-041912 (240-10391-5) and MSA-MW39S-041912 (240-10391-7) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 04/24/2012.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-41320/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)

Samples MSA-MW34S-041912 (240-10391-5) and MSA-MW39S-041912 (240-10391-7) were analyzed for diesel range organics (DRO) in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 04/25/2012 and analyzed on 04/26/2012.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 41524.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICPMS)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012.

No difficulties were encountered during the metals analyses. All quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012.

Several analytes were detected in method blank MB 240-41326/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MSA-MW19D-041912 (240-10391-3), MSA-MW19I-041912 (240-10391-4), MSA-MW34S-041912 (240-10391-5), MSA-MW34I-041912 (240-10391-6) and MSA-MW39S-041912 (240-10391-7) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012 and 04/26/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

2. Were custody seals on the outside of the cooler(s)? If Yes Quantity _____	Yes	(No)
-Were custody seals on the outside of the cooler(s) signed & dated?	Yes No	(NA)
-Were custody seals on the bottle(s)?	Yes	(No)
3. Shippers' packing slip attached to the cooler(s)?	(Yes)	No
4. Did custody papers accompany the sample(s)?	(Yes)	No
5. Were the custody papers relinquished & signed in the appropriate place?	(Yes)	No
6. Did all bottles arrive in good condition (Unbroken)?	(Yes)	No
7. Could all bottle labels be reconciled with the COC?	(Yes)	No
8. Were correct bottle(s) used for the test(s) indicated?	(Yes)	No
9. Sufficient quantity received to perform indicated analyses?	(Yes)	No
10. Were sample(s) at the correct pH upon receipt?	(Yes)	No NA
11. Were VOAs on the COC?	(Yes)	No
12. Were air bubbles >6 mm in any VOA vials?	Yes	(No) NA
13. Was a trip blank present in the cooler(s)?	(Yes)	No

Contacted PM PTO Date 4-20-12 by _____ via (Verbal) Voice Mail Other

Concerning #14

14. CHAIN OF CUSTODY & SAMPLE DISCREPANCIES

No tests marked for MW34S, MW34I, MW39S.
Received volume to run all tests listed on COC except RDX.

Rec'd GRO+DRO Volume for MW34S + MW39S will log, not listed on COC

15. SAMPLE CONDITION

Sample(s) _____ were received after the recommended holding time had expired.

Sample(s) _____ were received in a broken container.

Sample(s) _____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in Sample Receiving to meet recommended pH level(s). Nitric Acid Lot# 110410-HNO3; Sulfuric Acid Lot# 041911-H2SO4; Sodium Hydroxide Lot# 121809 - NaOH; Hydrochloric Acid Lot# 041911-HCl; Sodium Hydroxide and Zinc Acetate Lot# 100108-(CH3COO)2ZN/NaOH. What time was preservative added to sample(s)? _____

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Overview

The sample set for Martin State Airport Groundwater Sampling, SDG 240-10494-1 consists of six (6) aqueous environmental samples and one trip blank. All samples were analyzed for volatile organic compounds (VOCs). Six (6) aqueous environmental samples were analyzed for 1,4-dioxane in the semivolatile organic compound (SVOC) SIM fraction and perchlorate. Three (3) aqueous environmental samples; MSA-MW17S-042012, MSA-MW20S-042012 and MSA-MW35S-042012 were analyzed for gasoline range organics (GRO) and diesel range organics (DRO). GRO is listed on the form 1s and EDD as total petroleum hydrocarbons (TPH) (C6-C10) and DRO as TPH (C10-C32). Two (2) aqueous environmental samples, MSA-MW17S-042012 and MSA-MW20S-042012, were also analyzed for the explosive (EXP), RDX. There are no field duplicate pairs included in this SDG.

The samples were collected on April 20, 2012 and analyzed by Test America Laboratories, Inc. Volatile organic compound analyses were conducted in accordance to SW-846 Method 8260B. The analyses for 1,4-dioxane followed SW-846 Method 8270C in Selective Ion Monitoring SIM mode. GRO and DRO analyses followed SW-846 Method 8015B. The analyses for RDX followed SW-846 Method 8330 and perchlorate Method 6850 reporting protocol.

Summary

The data contained in this SDG were validated with regard to the following parameters: data completeness, system performance, holding times, GC/MS tuning, initial / continuing calibrations, laboratory method blank results, surrogate spike/internal standard recoveries, laboratory control sample results, matrix spike/matrix spike duplicate results, compound identification, compound quantitation, and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems

- In the volatile initial calibration of instrument A3UX10 on April 9, 2012 and the continuing calibrations on April 27, 2012 @ 9:48, tert-butyl alcohol and vinyl acetate had relative retention factors (RRFs) less than the 0.05 quality control limit. The nondetected tert-butyl alcohol and vinyl acetate results were qualified as rejected (UR) in the affected samples MSA-MW17I-042012, MSA-MW17S-042012, MSA-MW20I-042012, MSA-MW20S-042012, MSA-MW35S-042012 and TB-042012.

- In the volatile initial calibration of instrument A3UX16 on April 29, 2012 and the continuing calibration on April 30, 2012 @ 11:50, tert-butyl alcohol had a RRF less than the 0.05 quality control limit. In addition, the continuing calibration on April 30, 2012 had a RF for vinyl acetate less than the 0.05 quality control limit. The nondetected vinyl acetate and tert-butyl alcohol results were qualified as rejected (UR) in the affected sample MSA-MW20D-042012.

- The tentatively identified compound (TIC), silanol, was qualified as rejected (R) in sample MSA-MW20D-042012.This compound is indicative of column bleed.

Minor Problems

- GRO was detected in the laboratory method blank 240-41736/6 affecting all samples.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
GRO	35.8	179.0

An action level of 5X the maximum concentration level has been used in order to evaluate sample data for blank contamination. Positive results less than the action level were qualified (B) as a result of blank contamination. Sample aliquot and dilution factors were taken into account in validation of the data.

- TICs were qualified as presumptively present (NJ) in samples MSA-MW20D-040212, MSA-MW35S-042012 and MSA-MW20S-042012.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) for the organic analyses were qualified as estimated, (J).

Notes

The continuing calibration percent differences (%Ds) for several target analytes were greater than the 20% quality control limit but less than 50% on April 27, 2012 @ 9:48 on instrument A3UX10. The analytes were 1,1,2-trichlorotrifluoroethane, tert-butyl alcohol, 4-methyl-2-pentanone, 2-hexanone, bromoform, n-butylbenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, naphthalene and 1,2,3-trichlorobenzene. No action was taken on the nondetected results of the aforementioned analytes in the affected samples MSA-MW17I-042012, MSA-MW17S-042012, MSA-MW20D-042012, MSA-MW20I-042012, MSA-MW20S-042012, MSA-MW35S-042012 and TB-042012.

Contamination was detected in the VOC laboratory method blank associated with batch 240-42171/5 analyzed on April 30, 2012 @ 12:59 on instrument A3UX16.

Contaminant	Maximum Concentration (ug/L)
1,2,3-trichlorobenzene	0.288

No action was taken on the nondetecetd 1,2,3-trichlorobenzene result in sample MSA-MW20D-042012.

The laboratory control sample (LCS) percent recovery (%R) of tert-butyl alcohol was less than the lower quality control limit in batch 240-41857/4. No action was taken on the nondetected tert-butyl alcohol results in the affected samples which were qualified as rejected due to a more severe noncompliance.

The matrix spike (MS) %R of tert-butyl alcohol was less than the lower quality control limit in sample MSA-MW20S-042012. The matrix spike duplicate (MSD) %R and relative percent difference (RPD) were within quality control limits. No action was taken.

The following samples were diluted in the VOC and SVOC SIM fractions resulting in elevated reporting limits.

Sample	Dilution Factor
MSA-MW17I-042012	33.33X
MSA-MW20I-042012	20X
MSA-MW20S-042012	66.66X (VOC), 5x (SVOC, GRO)

Nondetected results were reported to the MDL.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Tert-butyl alcohol and vinyl acetate had RRFs less than quality control limits in the initial and continuing calibrations. GRO was detected in the laboratory method blank.

Other Factors Affecting Data Quality: TICs were qualified as either rejected or estimated in several samples.

The data for these analyses were reviewed with reference to the Region III EPA Functional Guidelines for Organic Data Validation (9/94).

The text of this report has been formulated to address only those problem areas affecting data quality.

Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is less than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed

Support Documentation

CASE NARRATIVE

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Project: MSA Groundwater Sampling

Report Number: 240-10494-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6850 Perchlorate and RDX Explosive analysis were performed at the TestAmerica West Sacramento Laboratory.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 04/21/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.4, 1.6 and 1.8 C.

VOLATILE ORGANIC COMPOUNDS (GC MS)

Samples TB-042012 (240-10494-1), MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3), MSA-MW20I-042012 (240-10494-4), MSA-MW17S-042012 (240-10494-5), MSA-MW17I-042012 (240-10494-6) and MSA-MW20D-042012 (240-10494-7) were analyzed for volatile organic compounds (GC MS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 04/27/2012 and 04/30/2012.

1,2,3-Trichlorobenzene was detected in method blank MB 240-42171/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample (LCS) for batch 41857 exceeded control limits for tert-Butyl alcohol . This has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Several analytes failed the recovery criteria low for the MS/MSD of sample MSA-MW20S-042012 (240-10494-3) in batch 240-41857.

Refer to the QC report for details.

Samples MSA-MW20S-042012 (240-10494-3)[66.67X], MSA-MW20I-042012 (240-10494-4)[20X] and MSA-MW17I-042012 (240-10494-6)[33.33X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for analytical batch 41857 exceeded control criteria for several compounds. The samples associated with this CCV were not detected for the affected analytes. A low level CCV, at the reporting limit, was analyzed and the affected compounds were detected; therefore the data is reportable per the facility Standard Operating Procedure (SOP).

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3), MSA-MW20I-042012 (240-10494-4), MSA-MW17S-042012 (240-10494-5), MSA-MW17I-042012 (240-10494-6) and MSA-MW20D-042012 (240-10494-7) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 04/24/2012 and 04/25/2012 and analyzed on 04/26/2012, 04/27/2012 and 04/30/2012.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 41464.

Sample MSA-MW20S-042012 (240-10494-3)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)
Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3) and MSA-MW17S-042012 (240-10494-5) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 04/26/2012.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-41736/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

Sample MSA-MW20S-042012 (240-10494-3)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)
Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3) and MSA-MW17S-042012 (240-10494-5) were analyzed for diesel range organics (DRO) in accordance with EPA SW-846 Method 8015B - DRO. The samples were prepared on 04/24/2012 and analyzed on 04/26/2012.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 41325.

No difficulties were encountered during the DRO analyses. All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICPMS)
Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3), MSA-MW20I-042012 (240-10494-4), MSA-MW17S-042012 (240-10494-5), MSA-MW17I-042012 (240-10494-6) and MSA-MW20D-042012 (240-10494-7) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012.

No difficulties were encountered during the metals analyses. All quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)
Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3), MSA-MW20I-042012 (240-10494-4), MSA-MW17S-042012 (240-10494-5), MSA-MW17I-042012 (240-10494-6) and MSA-MW20D-042012 (240-10494-7) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/24/2012 and analyzed on 04/25/2012.

Several analytes were detected in method blank MB 240-41326/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Several analytes were detected in method blank MB 240-41366/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3), MSA-MW20I-042012 (240-10494-4), MSA-MW17S-042012 (240-10494-5), MSA-MW17I-042012 (240-10494-6) and MSA-MW20D-042012 (240-10494-7) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/26/2012 and 04/27/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MSA-MW35S-042012 (240-10494-2), MSA-MW20S-042012 (240-10494-3), MSA-MW20I-042012 (240-10494-4), MSA-MW17S-042012 (240-10494-5), MSA-MW17I-042012 (240-10494-6) and MSA-MW20D-042012 (240-10494-7) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/24/2012 and analyzed on 04/26/2012 and 04/27/2012.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Case Narrative

TestAmerica West Sacramento Project Number G2D240431

General Comments
One of the ambers for sample MSA-MW17S-042012 was received broken.

WATER, 8330/8330A, RDX
Sample(s): 2, 4
There was insufficient sample volume to prepare a matrix spike/matrix spike duplicate (MS/MSD) pair with this batch.

WATER, 6850, Perchlorate
Sample(s): 1, 2, 3, 4, 5, 6
In accordance with the requirements of Method 6850, both a Laboratory Control Sample (LCS) and a Synthetic Matrix Check Sample (SMCS) were analyzed with the associated samples. Both are reported on the LCS data evaluation and recovery reports, and are differentiated from one another by their workorder number:

LCS: MR8L91AC
SMCS: MR8L91AD

There were no other anomalies associated with this project.

Sample Summary

TestAmerica West Sacramento Project Number G2D240431

WO#	Sample #	Client Sample ID	Sampling Date	Received Date
MR6HT	1	MSA-MW35S-042012	4/20/2012 09:55 AM	4/24/2012 09:00 AM

MR6H2	6	MSA-MW20D-042012	4/20/2012 01:42 PM	4/24/2012 09:00 AM

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

ANALYTICAL METHODS SUMMARY

G2D240431

PARAMETER	ANALYTICAL METHOD
Nitroaromatics and Nitramines by HPLC	SW846 8330/8330A
Perchlorate by 6850	SW846 6850

GC/HPLC ICAL Checklist

Instrument ID: LC10 ICAL ID: 04192012C Method: 8330A/B

Analytes Included in curve (with dates): 8330 All + NG, PETN, 35DNA+EGDN

A. Included Sections of ICAL	Analyst	Reviewer	N/A
1. ICAL Summary included (for both columns if applicable).	✓	✓	
2. ICAL Runlog included.	✓	✓	
3. ICAL's are in chronological order.	✓	✓	
4. PEM meets requirements and is included for 8081.			✓
5. Alkane Marker included for 8015 TPH			✓
6. ICAL Raw Data included for all analytes.	✓	✓	
B. ICAL Summary			
1. All analytes meet %RSD or linear regression requirements	✓	✓	
2. ICAL meets requirements stated in SOP.	✓	✓	
2. Any levels dropped are reviewed and appropriate.			✓
3. All analytes in ICAL are in the ICAL summary.	✓	✓	
4. RFs are calculated correctly. Perform Manual calculation.	✓	✓	
C. ICAL Analysis			
1. Manual Integrations reviewed and appropriate.			✓
2. All peaks correctly identified.	✓	✓	
3. No analytes have saturated peaks.	✓	✓	
4. RT windows set correctly (8015 TPH).			✓
5. ICV meets requirements and is run after the ICAL.	✓	✓	
6. Standards used in ICAL are current.	✓	✓	
7. ICAL is copied to source method.	✓	✓	

Curve Valid for:	Yes	No	Criteria
Standard SOP	✓		RSD ≤20%, r≥ 0.995 (intercept <1/2RL for 8081,8082, NQ, 8310) and (<RL for 8330) and r>0.990 (intercept <RL for 8015), ICV≤15%, PEM ≤15%
DOD QSM V3	✓		RSD ≤20%, r≥ 0.995, ICV≤20%, PEM ≤15%
AFCEE 3.1	✓		RSD ≤20%, r≥ 0.995, ICV≤15%, PEM ≤15%
AFCEE 4.0	✓		RSD ≤20%, r≥ 0.995, ICV≤20% (8081, 8082, 8015) and ICV≤25% (8330,8310), PEM ≤15%

Analyst: Robyn Thomas Date: 4/20/12

Reviewer: J. Schaefer Date: 4/23/12

Comments:
MRL for EGDN was analyzed after samples had already been analyzed. As RPDs were passing + S/N was greater than 5:1 on 10RL and on RL that analyzed after samples there is no further action.

I. VOC; Sample MSA-MW35S-042012; cis-1,2-dichloroethene

$$\frac{249772}{153141} * \frac{10 ug/L}{0.2548} = 6.4 ug/L$$

II. SVOC; Sample MSA-MW35S-042012; 1,4-dioxane

$$\frac{30710}{71312} * \frac{4 ng/uL}{1.0480} * \frac{2mL}{1020mL} * 1000 = 3.2 ug/L$$

III. GRO, Sample MSA-MW20S-042012;

$$\frac{134332010}{299875.299} * 5 = 2239.8 ug/L$$

IV. DRO; Sample

$$\frac{25991222}{157952.561} * \frac{5mL}{1050mL} * 1000 = 783.6 ug/L$$

V. Perchlorate - see attached

Overview

The sample set for Lockheed MSA, SDG 240-10494-1, consists of six (6) aqueous environmental samples and one trip blank. This SDG contained no field duplicate pairs.

All samples were analyzed for total and dissolved metals. The samples were collected by Tetra Tech on April 20th, 2012 and analyzed by TestAmerica. Metals analyses were conducted using methods 6020A. Mercury analyses were conducted using method 7470A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, MS tuning, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, ICP internal standard recoveries, laboratory control sample recoveries, matrix spike recoveries, laboratory duplicate results, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems-

- None.

Minor Problems-

- The following contaminants were detected in preparation and calibration blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Barium [1]	0.72 ug/L	3.6 ug/L
Copper [1]	0.57 ug/L	2.85 ug/L
Lead [1]	0.29 ug/L	1.45 ug/L
Molybdenum [1]	0.29 ug/L	1.45 ug/L
Thallium [1]	0.38 ug/L	1.9 ug/L
Zinc [1]	2.83 ug/L	14.1 ug/L
Barium [2]	1.16 ug/L	5.8 ug/L
Copper [2]	0.71 ug/L	3.55 ug/L

Molybdenum [2]	0.14 ug/L	0.7 ug/L
Thallium [2]	0.27 ug/L	1.35 ug/L
Zinc [2]	8.88 ug/L	44.4 ug/L
Antimony [3]	0.16 ug/L	0.8 ug/L
Cobalt [3]	0.077 ug/L	0.35 ug/L
Molybdenum [3]	0.47 ug/L	2.35 ug/L
Thallium [3]	0.82 ug/L	4.1 ug/L
Tungsten [3]	0.68 ug/L	3.4 ug/L

[1] Maximum concentration found in a preparation blank affecting sample in 41326.
[2] Maximum concentration found in a preparation blank affecting sample in 41366.
[3] Maximum concentration found in a calibration blank affecting samples analyzed on 4/25/12.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) for blank contamination.

- The CRDL standard analyzed on 4/25/12 had a percent recovery > 110% for copper, nickel, silver, and thallium. All samples were affected. Positive nickel results < 2X CRDL were qualified as estimated (J) due to conflicting directional bias.

- Total and dissolved samples MSA-MW17S-042012, MSA-MW20I-042012, and MSA-MW20S-042012 had a percent recovery < 65% for internal standard lithium. Positive beryllium results were qualified as estimated (J) and non-detected results were qualified as estimated (UJ).

Notes

Positive results greater than MDL but less than the RL were qualified as estimated (J).

Executive Summary

Laboratory Performance: CRDL standard non-compliances resulted in the qualification of sample results. Preparation and calibration blank contamination resulted on the qualification of sample results.

Other Factors Affecting Data Quality: Internal standard non-compliances for lithium resulted in the qualification of several beryllium results.

The data for these analyses were reviewed with reference to the Region III modifications to the National Functional Guidelines for Inorganic Data Validation (April 1993).

Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient $r < 0.995$
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

APPENDIX B

RESULTS AS REPORTED BY THE LABORATORY

Client: Tetra Tech, Inc formerly Tetra Tech NUS

Job Number: 240-10494-1

Client Sample ID: **MSA-MW17I-042012**

Lab Sample ID: 240-10494-6
Client Matrix: Water

Date Sampled: 04/20/2012 1325
Date Received: 04/21/2012 0930

6020 Metals (ICP/MS)-Total Recoverable

Analysis Method:	6020	Analysis Batch:	240-41639	Instrument ID:	I8
Prep Method:	3005A	Prep Batch:	240-41366	Lab File ID:	I8042512A.csv
Dilution:	1.0			Initial Weight/Volume:	50 mL
Analysis Date:	04/25/2012 1513			Final Weight/Volume:	50 mL
Prep Date:	04/24/2012 1116				

Analyte	Result (ug/L)	Qualifier	MDL	RL
Antimony	2.0	U	0.13	2.0
Arsenic	6.1		0.40	5.0
Barium	11	B	0.19	5.0
Beryllium	1.0	U	0.20	1.0
Cadmium	1.0	U	0.13	1.0
Chromium	2.0	U	0.71	2.0
Cobalt	16		0.058	1.0
Copper	1.1	J B	0.29	2.0
Lead	0.28	J	0.18	1.0
Molybdenum	0.13	J B	0.093	10
Nickel	22		0.20	2.0
Selenium	5.0	U	0.57	5.0
Silver	1.0	U	0.080	1.0
