Overview

The sample set for Lockheed – MSA Groundwater, SDG 240-36343-1 consists of twelve (12) aqueous environmental samples. All samples were analyzed for total and dissolved metals.

The samples were collected by Tetra Tech on April 17, 18, 21, and 22, 2014 and analyzed by Test America (North Canton). All analyses were conducted in accordance with SW-846 Methods 6020A and 7470A analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, ICP/MS tuning, initial/continuing calibrations, laboratory method blank results, matrix spike/matrix spike duplicate results, blank spike/blank spike duplicate results, internal standard recoveries, ICP interference results, laboratory duplicate results, ICP serial dilution results, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. No action was taken on this basis because all results were greater than the action level.

- The recovery of the internal standard terbium (127%) was slightly greater than the upper quality control limit of 125% in sample MSA MW-49D-041714 analyzed on 4/24/14 @ 14:51. Barium was affected by this noncompliance and was qualified as estimated, (J).

- Positive results less than the reporting limit (RL) were qualified as estimated, (J), due to uncertainty near the detection limit.

Notes

The total and dissolved samples MSA-DMW-5S-041814 and MSA-MW-49D-041714 were diluted due to sample matrix interference for several metals. This accounts for the elevated detection limit for the nondetected metals.

Executive Summary

Laboratory Performance: Blank contamination resulted in the qualification of metals data. Barium was qualified in one sample for a slightly high internal standard recovery for terbium.

Other Factors Affecting Data Quality: Positive results less than the reporting limit (RL) were qualified as estimated, due to uncertainty near the detection limit.

The data for these analyses were reviewed with reference to USEPA National Functional Guidelines for Inorganic Data Validation (January 2010). The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MSA GW 2014

Report Number: 240-36343-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 552.2 Haloacetic Acids analysis was performed at the TestAmerica Savannah Laboratory. The 6850 Perchlorate analysis was performed at the TestAmerica Sacramento Laboratory. The Radiological analysis was performed at the TestAmerica Richland Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

MSA-MW-27D-050114

Overview

The sample set for Lockheed MSA, SDG 240-36857-1, consisted of three (3) aqueous samples. All samples were analyzed for volatile organic compounds (VOCs), 1,4-dioxane, and for total and dissolved metals as listed above. Two (2) aqueous samples were analyzed for total petroleum hydrocarbons (TPH) TPH C06-C10 & TPH C10-C32, as listed above. One (1) aqueous sample was analyzed for perchlorate as listed above. No field duplicate sample pairs were included in the sample delivery group (SDG).

The samples were collected by Tetra Tech on May 1, 2014 and analyzed by TestAmerica Laboratories, Inc., North Canton and Sacramento for all analyses. All analyses were conducted in accordance with EPA SW-846 Methods 8260C for VOCs, 8270C for SVOCs, 8015B for TPH C06-C10 & TPH C10-C32, 6850 for perchlorate, 6020A for metals, and 7470A for mercury, analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, ICP/MS tuning, initial/continuing calibrations, blank results, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate results, surrogate spike recoveries, internal standard recoveries, chromatographic resolution, ICP interference results, laboratory duplicate results, ICP serial dilution results, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major Problems

- All VOC samples had detected silanol compound VOCs in the tentatively identified compound (TIC) results.
  Actions: The sample silanol related compound results were qualified rejected (R), as they were considered present due to analytical column bleed.

Minor Problems

- Detected results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

- The following VOC contaminant was detected in the method blank MB 240-130437/6 affecting sample MSA-DMW-6S-050114.

Analytes	Maximum Concentration	Action Level
Carbon disulfide [(1)]	0.342 µg/l	1.7 µg/l

An action level of five times the maximum level for carbon disulfide was used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The sample positive sample result was less than the action level and was qualified non-detected, (U), for blank contamination.

- The VOC continuing calibration verification (CCV) percent differences (%Ds) were greater than the 20% quality control limit for dibromomethane, 1,2,4-trimethylbenzene, sec-butylbenzene, 4-isopropyltoluene, n-butylbenzene, and 1,2,3-trimethylbenzene for instrument A3UX12 on 05/13/14 @ 09:39 and @ 10:27.
  Affected Sample: MSA-DMW-6S-050114
  Action: The sample non-detected aforementioned analyte results were qualified estimated, (UJ).

- The VOC CCV %Ds were greater than the 20% quality control limit for trichlorofluoromethane, carbon tetrachloride, 1,2-dichloroethane, bromodichloromethane, trans-1,3-dichloropropene, 2-hexanone, chlorodibromomethane, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, naphthalene, and 1,2,3-trichlorobenzene for instrument A3UX15 on 05/06/14 @ 09:34.
  Affected Samples: MSA-DMW-1S-050114 and MSA-MW-27D-050114
  Action: The sample non-detected aforementioned analyte results were qualified estimated, (UJ).

- TPH C06-C10 was detected in the method blank MB 240-129818 affecting samples MSA-DMW-1S-050114 and MSA-DMW-6S-050114.

Analytes	Maximum Conc.	Action Level
TPH C06-C10	25.6 µg/l	128 µg/l

An action level of five times the maximum level for TPH C06-C10 was used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive sample results less than the action level were qualified non-detected, (U), for blank contamination.

- The perchlorate ion ratio for the sample MSA-MW-27D-050114 was outside the acceptable range for confirmation of perchlorate and the detected result was quantified at an Estimated Maximum Possible Concentration (EMPC).
  Action: The sample perchlorate result was qualified estimated, (J).

- The following contaminants were detected in the preparation or calibration blanks at the following maximum concentrations:

Analyte	Maximum Conc. µg/l	Action Level µg/l
Antimony [1]	0.141	0.705
Arsenic [1]	0.198	0.990
Barium [1]	1.44	7.20
Beryllium [1]	0.115	0.575
Cadmium [1]	0.061	0.305
Chromium [1]	0.167	0.835
Cobalt [1]	0.133	0.665
Copper [1]	0.820	4.10
Iron [1]	21.5	107.5
Lead [1]	0.154	0.770
Manganese [1]	0.429	2.145
Nickel [1]	0.224	1.12
Silver [1]	0.045	0.225
Thallium [1]	0.770	3.85

[1] Maximum concentration found in continuing calibration blanks (CCB) and the method blank affecting all total and dissolved metal samples.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors were taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified non-detected, (U), for blank contamination.

- The interfering analyte iron was present in the total and dissolved samples MSA-DMW-6S-050114 at concentrations comparable to the concentration of iron in the interference check sample (ICS) solution. Chromium and nickel were present in the ICS solution at a concentration that exceeded the absolute value of the instrument detection limit (IDL). Interference effects exist for nickel in the dissolved metal MSA-DMW-6S-050114 and chromium for the total metal sample MSA-DMW-6S-050114. The detected result reported for nickel in the dissolved metals for sample MSA-DMW-6S-050114 was qualified as estimated, (J). The detected result reported for chromium in the total metals for sample MSA-DMW-6S-050114 was qualified as estimated, (J).

Notes

The VOC laboratory control sample (LCS) percent recovery (%R) was greater than the quality control limit for trans-1,3-dichloropropene for sample for batch 240-129443. No action was required because all results were nondetected.

The VOC LCS %R was greater than the quality control limit for dibromomethane for sample for batch 240-130437. No action was required because the result for dibromomethane was nondetected.

EXECUTIVE SUMMARY

Laboratory Performance Issues: VOC, TPH C06-C10, and metal sample results were qualified non-detected for blank contamination. VOC sample results were qualified for CCV %D non-compliances.

Other Factors Affecting Data Quality: Detected results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J). A sample detected perchlorate result was qualified

as an EMPC. Detected metal sample results were qualified for an interfering analyte. VOC silanol compound TIC results were rejected as due to column bleed.

The data for these analyses were reviewed with reference to EPA SW-846 Methods 8260C, 8270C, 8015B, 6850, 6020, 7470A, the USEPA National Functional Guidelines for Organic Data Validation (June 2008), and the USEPA National Functional Guidelines for Inorganic Data Validation (January 2010).

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MSA GW 2014

Report Number: 240-36857-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6850 Perchlorate analysis was performed at TestAmerica Sacramento. The Alpha Rad 224, 226 + Radium 228 was performed at TestAmerica Richland.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

Overview

The sample set for LMC-MSA – Groundwater, SDG 240-36857-1 consists of two (2) aqueous environmental samples. The two (2) samples were analyzed for total radium (alpha) and radium-228. No field duplicate pairs were included within this Sample Delivery Group (SDG).

The samples were collected by Tetra Tech, Inc. May 1, 2014 and analyzed by Test America – Richland. Analyses were conducted using EPA methods 903.0 and 904.0.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, sample preservation and holding times, continuing calibration verification results, background results, laboratory method blank results, laboratory control sample recoveries, laboratory duplicate results, yield recoveries and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems

No major problems were identified.

Minor Problems

- Activities reported below the Reporting Limit (RL) and above the Method Decision Limit (MDL) were qualified as estimated, (J).

Notes

The uncertainty for the sample results are reported at 2–sigma (95% confidence). The EDD does not contain the uncertainty result.

Total radium (alpha emitting) is a combination of radium-223, radium-224, and radium-226.

Executive Summary

Laboratory Performance: None.

Other Factors Affecting Data Quality: Activities reported below the RL were qualified as estimated.

The text of this report has been formulated to address only those areas affecting data quality.

CASE NARRATIVE

I. Introduction

On May 13, 2014, two water samples were received at TestAmerica's Richland laboratory for radiochemical analysis. Upon receipt, the samples were assigned the TestAmerica identification number as described on the cover page of the Analytical Data Package report form. The samples were assigned to Lot Number J4E130444.

II. Sample Receipt

The samples were received in good condition, the custody seals were in tact, signed and dated.

III. Analytical Results/Methodology

The analytical results for this report are presented by laboratory sample ID. Each set of data includes sample identification information; analytical results and the appropriate associated statistical uncertainties.

The analyses requested were:

Gas Proportional Counting
Radium-228 by method RL-RA-001 (EPA 904.0)
Total Alpha Radium (Ra-226) by method RL-RA-002 (EPA 903.0)

IV. Quality Control

The analytical result for each analysis performed includes a minimum of one laboratory control sample (LCS), and one reagent blank sample analysis. Any exceptions have been noted in the "Comments" section.

V. Comments

Radium-228 Analysis:
The LCS, batch blank, sample and sample duplicate results are within acceptance limits.

Total Alpha Radium (Ra-226) Analysis:
The LCS, batch blank, sample and sample duplicate results are within acceptance limits.

I certify that this Certificate of Analysis is in compliance with the SOW and/or NELAC, both technically and for completeness, for other than the conditions detailed above. The Laboratory Manager or a designee, as verified by the following signature has authorized release of the data contained in this hard copy data package.

Uncertainty Estimation

TestAmerica Richland has adopted the internationally accepted approach to estimating uncertainties described in "NIST Technical Note 1297, 1994 Edition". The approach, "Law of Propagation of Errors", involves the identification of all variables in an analytical method which are used to derive a result. These variables are related to the analytical result (R) by some functional relationship, R = constants * f(x,y,z,...). The components (x,y,z) are evaluated to determine their contribution to the overall method uncertainty. The individual component uncertainties (u_i) are then combined using a statistical model that provides the most probable overall uncertainty value. All component uncertainties are categorized as type A, evaluated by statistical methods, or type B, evaluated by other means. Uncertainties not included in the components, such as sample homogeneity, are combined with the component uncertainty as the square root of the sum-of-the-squares of the individual uncertainties. The uncertainty associated with the derived result is the combined uncertainty (u_c) multiplied by the coverage factor (1,2, or 3).

When three or more sample replicates are used to derive the analytical result, the type A uncertainty is the standard deviation of the mean value (S/?n), where S is the standard deviation of the derived results. The type B uncertainties are all other random or non-random components that are not included in the standard deviation.

The derivation of the general "Law of Propagation of Errors" equations and specific example are available on request.

Report Definitions

Action Lev	An agreed upon activity level used to trigger some action when the final result is greater than or equal to the Action Level. Often the Action Level is related to the Decision Limit.
Batch	The QC preparation batch number that relates laboratory samples to QC samples that were prepared and analyzed together.
Bias	Defined by the equation (Result/Expected)-1 as defined by ANSI N13.30.
COC No	Chain of Custody Number assigned by the Client or TestAmerica.
Count Error (#s)	Poisson counting statistics of the gross sample count and background. The uncertainty is absolute and in the same units as the result. For Liquid Scintillation Counting (LSC) the batch blank count is the background.
Total Uncert (#s) ***u_c - Combined Uncertainty.***	All known uncertainties associated with the preparation and analysis of the sample are propagated to give a measure of the uncertainty associated with the result, ***u_c the combined uncertainty***. The uncertainty is absolute and in the same units as the result.
(#s), Coverage Factor	The coverage factor defines the width of the confidence interval, 1, 2 or 3 standard deviations.
CRDL (RL)	Contractual Required Detection Limit as defined in the Client's Statement Of Work or TestAmerica "default" nominal detection limit. Often referred to the reporting level (RL)
Lc	Decision Level based on instrument background or blank, adjusted by the Efficiency, Chemical Yield, and Volume associated with the sample. The Type I error probability is approximately 5%. Lc=(1.645 * Sqrt(2*(BkgrndCnt/BkgrndCntMin)/SCntMin)) * (ConvFct/(Eff*Yld*Abn*Vol) * IngrFct). For LSC methods the batch blank is used as a measure of the background variability. Lc cannot be calculated when the background count is zero.
Lot-Sample No	The number assigned by the LIMS software to track samples received on the same day for a given client. The sample number is a sequential number assigned to each sample in the Lot.
MDC|MDA	Detection Level based on instrument background or blank, adjusted by the Efficiency, Chemical Yield, and Volume with a Type I and II error probability of approximately 5%. MDC = (4.65 * Sqrt((BkgrndCnt/BkgrndCntMin)/SCntMin) + 2.71/SCntMin) * (ConvFct/(Eff * Yld * Abn * Vol) * IngrFct). For LSC methods the batch blank is used as a measure of the background variability.
Primary Detector	The instrument identifier associated with the analysis of the sample aliquot.
Ratio U-234/U-238	The U-234 result divided by the U-238 result. The U-234/U-238 ratio for natural uranium in NIST SRM 4321C is 1.038.
Rst/MDC	Ratio of the Result to the MDC. A value greater than 1 may indicate activity above background at a high level of confidence. Caution should be used when applying this factor and it should be used in concert with the qualifiers associated with the result.
Rst/TotUcert	Ratio of the Result to the Total Uncertainty. If the uncertainty has a coverage factor of 2 a value greater than 1 may indicate activity above background at approximately the 95% level of confidence assuming a two-sided confidence interval. Caution should be used when applying this factor and it should be used in concert with the qualifiers associated with the result.
Report DB No	Sample Identifier used by the report system. The number is based upon the first five digits of the **Work Order** Number.
RER	The equation Replicate Error Ratio = (S-D)/[sqrt($TPUs^2$ + $TPUd^2$)] as defined by ICPT BOA where S is the original sample result, D is the result of the duplicate, TPUs is the total uncertainty of the original sample and TPUd is the total uncertainty of the duplicate sample.
SDG	Sample Delivery Group Number assigned by the Client or assigned by TestAmerica upon sample receipt.
Sum Rpt Alpha Spec Rst(s)	The sum of the reported alpha spec results for tests derived from the same sample excluding duplicate result where the results are in the same units.
Work Order	The LIMS software assign test specific identifier.
Yield	The recovery of the tracer added to the sample such as Pu-242 used to trace a Pu-239/40 method.

SUBJECT: **INORGANIC DATA VALIDATION – DISSOLVED HEXAVALENT CHROMIUM**
MARTIN STATE AIRPORT (MSA)
SAMPLE DELIVERY GROUP (SDG) R1403920

Overview

The sample set for Lockheed – MSA, SDG R1403920 consists of three (3) aqueous environmental samples. All samples were analyzed for dissolved hexavalent chromium.

The samples were collected by Tetra Tech on May 27, 2014 and analyzed by ALS Group. All analyses were conducted in accordance with EPA Method 218.6 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, laboratory control sample results, chromatographic resolution, analyte quantitation, and detection limits. Areas of concern are listed below. Areas of concern are listed below.

Major

- No concerns were noted.

Minor

- Sample MSA-MW-30D-052714 was analyzed approximately two hours outside the 24 hour holding time. The detected result reported for hexavalent chromium was qualified as estimated, (J).

Executive Summary

Laboratory Performance: One sample result was qualified due to a hold time noncompliance.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to USEPA National Functional Guidelines for Inorganic Data Validation (January 2010). The text of this report has been formulated to address only those problem areas affecting data quality.

Enclosed are the results of the sample(s) submitted to our laboratory on May 28, 2014. For your reference, these analyses have been assigned our service request number **R1403920**.

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and ALS Environmental is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report. The measurement uncertainty of the results included in this report is within that expected when using the prescribed method(s) for analysis of these samples, and represented by Laboratory Control Sample control limits. Any events, such as QC failures, which may add to the uncertainty are explained in the report narrative.

Please contact me if you have any questions. My extension is 7473. You may also contact me via email at Deb.Patton@alsglobal.com.

Respectfully submitted,

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1403920
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	5/28/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 5/27/14 and received at ALS in good condition at a cooler temperature of 0.0°C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Three water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Sample MSA-MW-30D-052714 (R1403920-001) was analyzed outside of the client requested 24 hours holding time but within method specified holding time of 28 days. All samples were analyzed on the same day they were received.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Overview

The sample set for Lockheed- MSA, SDGs R1402294 and R1402229, consists of five (5) aqueous environmental samples analyzed for hexavalent chromium. No field duplicate pairs were included within this SDG.

The samples were collected on March 31, 2014 and April 2, 2014 and analyzed by ALS Environmental. Analyses followed EPA 218.6 analytical and reporting protocols.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, laboratory control sample recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Minor

- The 24 hour hold time was exceeded for samples MSA-MW33I-033114, MSA-MW46D-040214, MSA-MW46I-040214 and MSA-MW46S-040214. The detected and nondetected hexavalent chromium results were qualified as estimated (J-) and (UJ), respectively.

Notes

The samples were preserved upon receipt at the laboratory to a pH of 9.3-9.7 and stored in a refrigerator at 1-6° C.

Executive Summary

Laboratory Performance: Hold time was exceeded in the analyses of several samples.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to USEPA National Functional Guidelines for Inorganic Data Validation (January 2010). The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402294
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/3/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/3/14 and received at ALS in good condition at a cooler temperature of 2.3 °C as noted on the cooler receipt and preservation check form. The samples were immediately preserved to a pH of 9.3 – 9.7 and stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. All samples were lab filtered.

Hexavalent Chromium Analysis – 218.6

Three water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Samples were analyzed several hours outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/1/14 and received at ALS in good condition at a cooler temperature of 2.0 °C as noted on the cooler receipt and preservation check form. The samples were immediately preserved to a pH of 9.3 – 9.7 and stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. Sample MSA-MW33I-033114 (R1402229-001) was received at a pH>9.7. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. All samples were lab filtered.

Hexavalent Chromium Analysis – 218.6

Two water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Sample MSA-MW33I-033114 (R1402229-001) was analyzed several hours outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

Overview

The sample set for Lockheed- MSA, SDGs R1402294 and R1402229, consists of five (5) aqueous environmental samples analyzed for hexavalent chromium. No field duplicate pairs were included within this SDG.

The samples were collected on March 31, 2014 and April 2, 2014 and analyzed by ALS Environmental. Analyses followed EPA 218.6 analytical and reporting protocols.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, laboratory control sample recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Minor

- The 24 hour hold time was exceeded for samples MSA-MW33I-033114, MSA-MW46D-040214, MSA-MW46I-040214 and MSA-MW46S-040214. The detected and nondetected hexavalent chromium results were qualified as estimated (J-) and (UJ), respectively.

Notes

The samples were preserved upon receipt at the laboratory to a pH of 9.3-9.7 and stored in a refrigerator at 1-6° C.

Executive Summary

Laboratory Performance: Hold time was exceeded in the analyses of several samples.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to USEPA National Functional Guidelines for Inorganic Data Validation (January 2010). The text of this report has been formulated to address only those problem areas affecting data quality.

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/3/14 and received at ALS in good condition at a cooler temperature of 2.3 °C as noted on the cooler receipt and preservation check form. The samples were immediately preserved to a pH of 9.3 – 9.7 and stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. All samples were lab filtered.

Hexavalent Chromium Analysis – 218.6

Three water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Samples were analyzed several hours outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

CASE NARRATIVE

Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/1/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/1/14 and received at ALS in good condition at a cooler temperature of 2.0 °C as noted on the cooler receipt and preservation check form. The samples were immediately preserved to a pH of 9.3 – 9.7 and stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. Sample MSA-MW33I-033114 (R1402229-001) was received at a pH>9.7. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. All samples were lab filtered.

Hexavalent Chromium Analysis – 218.6

Two water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Sample MSA-MW33I-033114 (R1402229-001) was analyzed several hours outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

Overview

The sample set for Lockheed- MSA, SDGs R1402349 and R1402465, consists of four (4) aqueous environmental samples analyzed for hexavalent chromium. No field duplicate pairs were included within this SDG.

The samples were collected on April 3 and 8, 2014 and analyzed by ALS Environmental. Analyses followed EPA 218.6 analytical and reporting protocols.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, laboratory control sample recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Minor

- The 24 hour hold time was exceeded for samples MSA-MW17D-040814 (1 hour) and MSA-MW47S-040314 (half hour). The nondetected hexavalent chromium results were qualified as estimated (UJ).

Notes

Nondetected results were reported to the reporting limit.

Executive Summary

Laboratory Performance: Hold time was exceeded in the analyses of samples MSA-MW17D-040814 and MSA-MW47S-040314.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to USEPA National Functional Guidelines for Inorganic Data Validation (January 2010). The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402349
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/4/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/3/14 and received at ALS in good condition at a cooler temperature of 2.7 °C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Two water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Sample MSA-MW47S-040314 (R1402349-001) was analyzed thirty minutes outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

Overview

The sample set for LMC – MSA, SDGs R1402523, R1402603, & R1402679 consisted of nine (9) aqueous environmental samples. All nine (9) aqueous samples were analyzed for hexavalent chromium. No field duplicate pair was included in the sample delivery group (SDG).

The samples were collected by Tetra Tech, Inc. on April 9, 10, and 14, 2014 and analyzed by ALS Environmental. All analyses were conducted in accordance with EPA Method 218.6 analytical and reporting protocols.

The data contained in these SDGs were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, laboratory control sample results, chromatographic resolution, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were noted.

Minor

- All of the samples with the exception of sample MSA-MW-50I-041414 and MSA-MW-48D-040914 were analyzed outside the 24 hour holding time but analyzed the samples within 30 hours of sample collection. The detected and non-detected results reported for hexavalent chromium in the affected samples were qualified as estimated, (J) and (UJ), respectively.

Notes

The Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses performed on sample MSA-MW-48S-041014 from SDG R102603 had a Percent Recovery (%R) for hexavalent chromium above the 110% quality control limit. No action was taken in the associated samples because the MS %R and Laboratory Control Sample (LCS) %R were acceptable.

All samples were preserved to a pH of 9.1-9.6 within 24 hours.

All samples were analyzed at a 2X dilution with the exception of samples, MSA-MW-48D-040914 and MSA-MW-48I-040914, which were analyzed at a 50X dilution.

Executive Summary

Laboratory Performance: The 24 hour holding time specified in EPA Method 218.6 was exceeded for all but one sample.

Other Factors Affecting Data Quality: The MSD %R was slightly high.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review" (January 2010) and EPA Method 218.6. The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402523
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/10/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/9/14 and received at ALS in good condition at a cooler temperature of 1.3 °C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Three water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Samples were analyzed outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature. _____

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402603
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/11/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/10/14 and received at ALS in good condition at a cooler temperature of 3.0 °C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Four water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Samples were analyzed outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

Site QC was not requested but was analyzed on sample MSA-MW-48S-041014 (R1402603-001). The Duplicate Matrix Spike was outside of the control limits high and has been flagged with a "+".

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402679
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/15/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/14/14 and received at ALS in good condition at a cooler temperature of 3.2 °C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Two water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Sample MSA-MW-50S-041414 (R1402679-001) was analyzed outside of the client requested 24 hours holding time. Samples were analyzed the same day as sample receipt and within the method specified holding time.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature. Nath

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

Overview

The sample set for LMC – MSA, SDGs R1402731, R1402789, R1402881, & R1403172 consisted of ten (10) aqueous environmental samples. All ten (10) aqueous samples were analyzed for hexavalent chromium. No field duplicate pair was included in the sample delivery group (SDG).

The samples were collected by Tetra Tech, Inc. on April 16, 17, 22, and May 1, 2014 and analyzed by ALS Environmental. All analyses were conducted in accordance with EPA Method 218.6 analytical and reporting protocols.

The data contained in these SDGs were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, laboratory control sample results, chromatographic resolution, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

- The 24 hour holding time for samples MSA-DMW-8I-041614, MSA-MW-50D-041614, MSA-MW-51I-041614, MSA-MW-51S-041614, MSA-MW-49D-041714, MSA-MW-51D-041714, and MSA-DMW-3S (SDGs R1402731, R1402789, & R1402881) were exceeded. The samples were collected on 04/16, 17, and 22/2014 but were not analyzed until 05/02/2014. The laboratory properly preserved the samples upon receipt and used the wastewater 28 day holding time. However, it is the opinion of the data validator that these groundwater samples are not wastewater; therefore, the 28 holding time does not apply. The detected and non-detected results reported for hexavalent chromium in the aforementioned samples were qualified as estimated, biased low, (J-), and rejected, (UR), respectively.

Minor

- The samples contained in SDG R1403172 (MSA-DMW-1S-050114, MSA-DMW-6S-050114, and MSA-MW-27S-050114) were analyzed outside the 24 hour holding time but the laboratory analyzed the samples within 30 hours of sample collection. The detected results reported for hexavalent chromium were qualified as estimated, biased low, (J). The non-detected results were qualified as estimated, (UJ).

Notes

All samples were preserved to a pH of 9.1-9.6 within 24 hours, with the exception of sample MSA-DMW-3S which was preserved approximately 32 hours after sample collection. No action was taken.

All samples were analyzed at a 2X dilution with the exception of sample, MSA-MW-51S-041614, which was analyzed at a 20X dilution.

Executive Summary

Laboratory Performance: The 24 hour holding time specified in EPA Method 218.6 was exceeded for all samples.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Review" (January 2010) and EPA Method 218.6. The text of this report has been formulated to address only those areas affecting data quality.

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/16/14 and received at ALS in good condition at a cooler temperature of 0.0°C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Four water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Samples were analyzed outside of the client requested 24 hours holding time but within method specified holding time of 28 days.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402789
Project:	MSA Ground Water	**Project Number:**	112IC04793
Sample Matrix:	Water	**Date Received:**	4/18/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/17/14 and received at ALS in good condition at a cooler temperatures between 1.2-3.2°C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Two water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: Samples were analyzed outside of the client requested 24 hours holding time but within method specified holding time of 28 days.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature._____

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1402881
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	4/23/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 4/22/14 and received at ALS in good condition at a cooler temperature of 2.3°C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

One water sample was analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: The sample was analyzed outside of the client requested 24 hours holding time but within method specified holding time of 28 days.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature._____

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.

CASE NARRATIVE

Client:	Tetra Tech NUS, Inc.	**Service Request No.:**	R1403172
Project:	MSA Ground Water	**Project Number:**	112IC06183
Sample Matrix:	Water	**Date Received:**	5/2/14

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier IV deliverables. When appropriate to the method, method blank and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 5/1/14 and received at ALS in good condition at a cooler temperature of 0.6°C as noted on the cooler receipt and preservation check form. The sample preservation was checked upon receipt and samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CLP Batching sheets for a cross-reference between Client ID and ALS Job # and analyses requested. Sample ID were changed per client request to match bottle ID's.

Hexavalent Chromium Analysis – 218.6

Three water samples were analyzed for Dissolved CR+6 by EPA method 218.6, low level. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

Note: The samples were analyzed outside of the client requested 24 hours holding time but within method specified holding time of 28 days. All samples were analyzed on the same day they were received.

All the initial and continuing calibration criteria of 95 – 105 % were met.

The Blank Spike (LCS) recovery was within QC limits.

The Laboratory Blank associated with these samples was free of contamination.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

REPORT QUALIFIERS AND DEFINITIONS

U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.

J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Arclors).

B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.

E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.

E Organics- Concentration has exceeded the calibration range for that specific analysis.

D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.

* Indicates that a quality control parameter has exceeded laboratory limits. Under the "Notes" column of the Form I, this qualifier denotes analysis was performed out of Holding Time.

H Analysis was performed out of hold time for tests that have an "immediate" hold time criteria.

Spike was diluted out.

\+ Correlation coefficient for MSA is <0.995.

N Inorganics- Matrix spike recovery was outside laboratory limits.

N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.

S Concentration has been determined using Method of Standard Additions (MSA).

W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.

P Concentration >40% (25% for CLP) difference between the two GC columns.

C Confirmed by GC/MS

Q DoD reports: indicates a pesticide/Aroclor is not confirmed (≥100% Difference between two GC columns).

X See Case Narrative for discussion.

MRL Method Reporting Limit. Also known as:
LOQ Limit of Quantitation (LOQ)
The lowest concentration at which the method analyte may be reliably quantified under the method conditions.

MDL Method Detection Limit. A statistical value derived from a study designed to provide the lowest concentration that will be detected 99% of the time. Values between the MDL and MRL are estimated (see J qualifier).

LOD Limit of Detection. A value at or above the MDL which has been verified to be detectable.

ND Non-Detect. Analyte was not detected at the concentration listed. Same as U qualifier.
