AMERICAN-MARIETTA COMPANY AND CONSOLIDATED SUBSIDIARIES
NOTES TO FINANCIAL STATEMENTS

Note A—Principles of Consolidation:

In accordance with the policy consistently followed, the consolidated financial statements include on a consolidated basis the accounts of the domestic and Canadian subsidiaries of American-Marietta Company.

Results of operations of companies acquired during the five years and six months covered by the statements of income have been included therein from dates of acquisition, except as to companies merged during the years 1956 to 1960 which were treated for accounting purposes as "poolings of interests," the results of operations of which have been included for all periods and the accumlated earnings accounts of which have been combined with the statements of accumulated earnings of the consolidated companies from the beginning of the periods.

The Company's equity in the underlying net assets of the consolidated subsidiaries as shown by their books exceeded the carrying amount (cost) of the Company's investments therein by $6,676,522 at November 30, 1960, and $7,458,153 at May 31, 1961. The disposition of this difference in the consolidated financial statements was as follows:

	May 31 1961	November 30 1960
Undistributed earnings of the consolidated subsidiaries since acquisition, included in "accumulated earnings used in the business"	$10,360,993	$9,626,640
Cost of investments in excess of amounts ascribed to net tangible assets acquired, included in "intangibles arising upon acquisition of companies"	2,902,840	2,950,118
	$ 7,458,153	$6,676,522

The investments in and advances to foreign (except Canadian) subsidiaries are stated at cost (November 30, 1960—$1,486,649; May 31, 1961—$1,356,938) plus the Company's equity (November 30, 1960—$1,424,994; May 31, 1961—$1,831,750) in accumulated earnings of the subsidiaries. The statements of consolidated income and accumulated earnings have been adjusted to reflect in applicable prior fiscal years the Company's equity in the earnings of the foreign subsidiaries.

Note B—Federal Income Tax:

Federal income tax returns as originally filed by the Company and subsidiaries for the fiscal years 1957 to 1959 reflected percentage depletion allowances for cement and limestone products computed generally in accordance with the principle established in the Dragon Cement Company case.

In 1960, the United States Supreme Court rendered a decision which adversely affected the Company's position with respect to the use of the liberalized percentage depletion method established in prior lower court decisions. Also, in 1960, amendments to the Internal Revenue Code were enacted, requiring a new method for taxable years beginning after December 31, 1960, and permitting taxpayers to elect to recompute percentage depletion deductions for all unsettled prior years by this method. The Company made the election and provision has been made in the accompanying financial statements for the resultant additional tax and interest thereon applicable to prior years.

Note C—Long-Term Debt:

Long-term debt consisted of the following obligations:

Notes payable to insurance companies and banks:

Interest Rate	Maturity	Amount May 31 1961	Amount November 30 1960
4⅜%	August 1, 1978	$25,000,000	$25,000,000
5½%	June 1, 1980	15,000,000	15,000,000
5½%	December 1, 1980	10,000,000	10,000,000
5⅜%	December 1, 1978	9,260,000	9,630,000
4¼%	April 15, 1964	4,500,000	4,500,000
4¾%	December 20, 1971	1,610,000	1,720,000
5¼%	June 1, 1973	1,480,000	1,605,000
4¼%	June 1, 1967	1,080,000	1,320,000
Other indebtedness		955,576	1,069,789
	TOTAL	$68,885,576	$69,844,789

Payments required in the year ending November 30, 1961 (after May 31, 1961) and in the next five fiscal years with respect to long-term debt are as follows: 1961, $1,160,635; 1962, $2,251,792; 1963, $2,926,691; 1964, $7,402,888; 1965, $2,888,952; 1966, $2,822,600.

The terms of the notes payable to insurance companies and banks set forth certain minimum requirements as to consolidated working capital and place restrictions on the payments of cash dividends (other than on Preferred Shares) and purchases or retirements of capital shares. Under the consolidated working capital requirements, the most restrictive of the debt provisions, payments which may be made in respect of cash dividends on Common Shares and for the acquisition of capital shares were limited to approximately $23,000,000 at November 30, 1960 and $14,000,000 at May 31, 1961.

Note D—Capital Shares:

No dividends may be declared or paid on any Class B Common Share in any year unless an equal amount plus $2 a share is paid for that year on the Common Shares. Dividends in excess of $2 a share may be paid on the Common Shares regardless of whether any are paid on Class B Common Shares.

Under the Articles of Incorporation, Class B Common Shares are convertible into Common Shares on a share-for-share basis, with certain limitations. However, holders of substantially all of the Class B Common Shares have entered into an agreement deferring their conversion rights so that 278,023 shares were eligible for conversion as of May 31, 1961, with not to exceed 62,500 additional shares becoming eligible for conversion during each six months cumulatively from July 1, 1961, to January 1, 1970, at which latter date the restrictions terminate.

Holders of Preferred Stock are entitled in liquidation to, and the stock is callable at, $105 a share plus dividends. Provisions of the Articles of Incorporation relating to a sinking fund for the redemption of Preferred Shares require a noncumulative annual payment equal to 3% of consolidated net income for the preceding fiscal year in excess of dividends on such shares, or, if less, 2% of the largest aggregate par value of Preferred Shares outstanding at any time prior to the close of the preceding fiscal year. A sinking fund payment of approximately $430,000 is required to be made prior to November 30, 1961. At November 30, 1960, 16,248 Preferred Shares, and at May 31, 1961, 14,621 Preferred Shares were held in the treasury by the Company, which shares may be used, in lieu of cash, to meet sinking fund requirements.

Note E—Inventories:

The amounts of inventories used in the determination of cost of products sold for the period covered by the statements of income were as follows:

December 1, 1955	$28,745,252
November 30, 1956	38,854,133
November 30, 1957	43,358,883
November 30, 1958	46,954,141
November 30, 1959	59,439,051
November 30, 1960	60,808,475
May 31, 1960	68,857,311
May 31, 1961	69,577,416

The inventories at these dates were priced on the basis of the lower of cost (principally first-in, first-out method) or market (replacement cost or estimated net realizable amount, whichever was appropriate).

At November 30, 1960, the inventories consisted of $37,338,021 finished and in-process products and $23,470,454 raw materials and supplies. It was not practicable to segregate amounts for inventories as between finished and in-process products and raw materials and supplies at May 31, 1961.

Note F—Policies Regarding Depreciation, Depletion, Amortization, Maintenance, and Repairs:

The Company and consolidated subsidiaries have provided for depreciation (generally straight-line method) on a basis calculated to amortize the cost of the various classes of depreciable assets over their estimated useful lives.

The estimated useful lives of the principal classifications of depreciable properties follow:

Buildings and improvements:	
Principally	20 to 40 years
Other	5 to 50 years
Machinery and equipment:	
Principally	7 to 20 years
Other	3 to 33⅓ years
Furniture and fixtures	5 to 20 years
Automobiles and trucks	3 to 5 years

Depletion of limestone and other deposits was computed on a unit rate of production basis applied to the cost of individual properties. Amounts so determined were less than percentage depletion allowances claimed for income tax purposes.

Maintenance and repairs, and expenditures for renewals and betterments not calculated to extend the useful lives or materially increase the productivity of the properties affected, were charged to costs and expenses as incurred. Other renewals and betterments were capitalized. Generally, at the time of sale or abandonment of equipment or building units, the applicable amounts of costs and accumulated depreciation were eliminated from the accounts and the net carrying amounts less proceeds of disposal were charged or credited to income.

Amounts of intangibles arising upon acquisition of companies, representing cost of investments in excess of amounts ascribed to net tangible assets acquired, are being amortized on a straight-line basis over forty years as to approximately 60% of the total and over twenty years as to the remainder.

Note G—Retirement Plans:

The Company and certain subsidiaries have contributory and noncontributory retirement plans, terminable at the option of the companies, for salaried employees. Other retirement plans have been established on behalf of hourly-paid employees.

The estimated annual cost of the plans, based upon present participation, is approximately $2,500,000. Unfunded past service costs were estimated to be approximately $8,000,000 at May 31, 1961.

Note H—Federal Trade Commission Proceedings:

Reference should be made to the paragraph captioned "Federal Trade Commission Proceedings," included in the section "Business and Properties of American-Marietta" elsewhere in this Proxy Statement, for information concerning a Federal Trade Commission complaint pending against the Company.

Note J—Retirement of 5% Cumulative Preferred Shares:

On August 3, 1961, the Board of Directors authorized the officers and the Executive Committee to take such action as may be necessary or desirable in order to redeem the outstanding 5% Cumulative Preferred Shares of the Company prior to October 9, 1961. The redemption price of the Preferred Shares is $105 per share. The long-term debt restrictions referred to in Note C have been waived with respect to such redemption.

AGREEMENT OF CONSOLIDATION

AGREEMENT dated as of August 1, 1961, between AMERICAN-MARIETTA COMPANY ("A-M"), an Illinois corporation, and THE MARTIN COMPANY ("Martin"), a Maryland corporation, such corporations being hereinafter called the "Constituent Companies."

1. Consolidation

Upon the terms and subject to the conditions hereinafter stated, A-M and Martin will be consolidated into a new Maryland corporation to be known as Martin-Marietta Corporation and hereinafter called the "Consolidated Company." Proposed Articles and Plan of Consolidation complying with the requirements of the Maryland Corporation Law and the Illinois Business Corporation Act are attached as Exhibit A to this Agreement and are hereinafter referred to as the "Articles."

2. Retirement and Conversion of Stock

Before the consolidation, A-M will retire its 5% Cumulative Preferred Shares. In the consolidation the then stock of the Constituent Companies will be converted into stock of the Consolidated Company provided for in the Articles as follows:

Each Share of Each Class of Stock of the Constituent Companies Shown Below	Shall be	The Number of Shares of Stock of the Consolidated Company Shown Below
A-M Stock:		
All Class B Common Shares, $2 par value, outstanding at the effective date	Converted into	380,000 shares of 4½% Cumulative Preferred Stock, $100 par value
Each Common Share, $2 par value	Converted into	1 share of Common Stock, $1 par value
Martin Stock:		
Each Share of Common Stock without par value	Converted into	1.3 shares of the aforesaid Common Stock
Each Warrant to purchase a Current Stock Unit now consisting of 2.10 shares of the aforesaid Common Stock	Shall entitle the holder to purchase	a Current Stock Unit consisting of 2.73 shares of the aforesaid Common Stock

3. Procedure:

This Agreement has been approved by the boards of directors of the Constituent Companies. The A-M Board, by vote of a majority of its members, has approved the Articles as a plan of consolidation under the Illinois Business Corporation Act and has directed that the plan be submitted to a vote at a special meeting of shareholders to be held October 9, 1961. The Martin Board has adopted a resolution declaring that the proposed consolidation is advisable upon the terms and conditions set forth in the Articles as required by the Maryland Corporation Law and has directed that the Articles be submitted for action thereon at a special meeting of the Martin stockholders also to be held October 9, 1961.

If the Articles receive the favorable vote of the holders of two-thirds of the outstanding A-M Common Shares and Class B Common Shares voting together and as separate classes at the A-M meeting and the holders of a majority of the outstanding shares of Martin stock at the Martin meeting, then, on the closing date established under paragraph 4 hereof, articles of consolidation embodying the Articles in substantially the form attached hereto will be delivered to the Secretary of State of Illinois as provided by Illinois law and the Articles in substantially the form attached hereto will be filed with the Department of Assessments and Taxation of Maryland as provided by Maryland law. The consolida-

tion will be effective upon the issuance of a certificate of consolidation by the Secretary of State of Illinois and the acceptance of the Articles for record by the Department of Assessments and Taxation of Maryland, and shall thereupon be deemed to have been in effect as of the first day of the month in which it becomes effective.

The effectuation of the consolidation will not cause any interruption of the business of either Constituent Company. Officers and employees of each Constituent Company on the day on which the consolidation becomes effective will thereupon become employees of corresponding divisions of the Consolidated Company.

4. Closing Date and Closing

The closing date has been initially established as October 10, 1961, but may be postponed up to one week by either Constituent Company if it is unable to satisfy the conditions of the other Company's obligation on that date and may also be postponed in one or more postponements to a date not later than December 31, 1961, by mutual agreements of the boards of directors of both Companies. On the closing date a closing will be held at Baltimore National Bank, Baltimore, Md., at 10:00 A. M., local time, at which the Constituent Companies will exchange opinions of counsel and other documents required to satisfy the conditions of their obligations. Arrangements will be made for the concurrent filing of the Articles in Illinois and Maryland immediately following closing.

5. Proxy Material, Representations and Warranties

Each of the Constituent Companies has supplied to the other for inclusion in the other's proxy statement the information, including financial statements, called for by the rules of the Securities and Exchange Commission applicable to Martin. Each of the Constituent Companies represents and warrants that the proxy information supplied by it is an accurate description of its business and property and does not contain any material misstatement of fact or omit to state any material fact necessary to make the statements therein not misleading; that the financial statements included therein were prepared in conformity with generally accepted accounting principles applied on a consistent basis and present fairly the results of operations and financial position of the Company in question for the periods and at the dates shown; and that the Company has no material liabilities, contingent or otherwise, not disclosed in the proxy information and financial statements supplied by it. In addition, each Constituent Company represents and warrants that

(a) the Company and (in the case of A-M) each of its active subsidiaries is a corporation validly organized and existing in good standing under the laws of the jurisdiction of its incorporation and duly qualified to do business in all states or countries where it owns or leases real property of material importance to its business, maintains a substantial inventory or conducts manufacturing operations;

(b) the Company or (in the case of A-M) one of its subsidiaries has good and marketable title to all assets reflected in the balance sheet included in the proxy information submitted by it except assets disposed of since the balance sheet date in the ordinary course of business and holds such assets free of liens, encumbrances and adverse claims other than (i) those shown on the balance sheet; (ii) such encumbrances as result from taxes not yet due; (iii) easements, rights of way and other minor encumbrances which in the aggregate do not impair the use of the assets in the business; (iv) the Company and (in the case of A-M) each of its active subsidiaries has properly prepared and filed all required tax returns and paid the amounts shown due thereon (except, in the case of Martin, certain state taxes the applicability of which has not been finally determined), the provisions for federal income taxes in the financial statements submitted in its proxy material are adequate to cover such taxes (whether or not disputed), and its federal income tax returns have been examined by the Internal Revenue Service through 1955 in the case of A-M and 1957 in the case of Martin and no deficiency resulting from such examinations has been proposed which has not been paid or settled;

(c) since the date of the balance sheet of the Company included in its proxy material there has been no material adverse change in the business, properties or financial condition of the Company (including, in the case of A-M, the Company and its subsidiaries, considered as a whole), and no material change in its assets or liabilities other than in the ordinary course of business, and

since that date the Company has not (A) issued, sold or purchased any shares of its capital stock or any options, warrants or rights to purchase any such shares (except, in the case of Martin, shares issued upon exercise of options and warrants outstanding on the balance sheet date and options granted under its restricted stock option plans subsequent to such date as shown in its proxy material) or (B) paid or declared any dividend or made any distribution to its stockholders except as set forth in the schedule of dividends in subparagraph (d) below, and neither the Company nor (in the case of A-M) any of its subsidiaries has (C) incurred or agreed to incur any long-term indebtedness for borrowed money, or (D) mortgaged or pledged any of its assets or contracted to do so, or (E) sold or disposed of any material assets or contracted to do so other than in the ordinary course of business, or (F) incurred any material liability or commitment or entered into any material transaction except in the ordinary course of business or in relation to this Agreement, or (G) made any substantial change in the manner of conducting its business; and

(d) between the date hereof and the date when the consolidation actually becomes effective, neither of the Constituent Companies will take any action of the kinds specified in clauses (A) through (G) of subparagraph (c) above without the concurrence of the other, except that (i) A-M may retire its 5% Cumulative Preferred Shares and issue additional Common Shares upon conversion of Class B Common Shares provided that an equal number of Common Shares are surrendered as a capital contribution so that there is no net increase in the number of A-M Common Shares outstanding, (ii) Martin may issue options for a number not to exceed 5,000 shares of its Common Stock under its 1958 Stock Option Plan, and (iii) the dividends listed below may be paid:

A-M dividends:

(a) Regular $1.25 per Preferred Share on or about August 1, 1961

(b) Regular $.25 per Common Share on or about August 1, 1961

(c) Special $.17 per Common Share on or about October 1, 1961 to cover extra two months between A-M's regular dividend date of August 1 and the Consolidated Company's proposed first dividend date of approximately December 31, 1961

Martin dividends:

(a) Regular $.25 per share at end of September 1961.

6. Examinations by Constituent Companies

Before the closing date each Constituent Company may examine the properties and records of the other Constituent Company and (in case of A-M) its subsidiaries (except as such examination may be restricted for security reasons) to determine the accuracy of the other Company's representations and warranties, and each Constituent Company will cause its officers and employees to cooperate in such examination and disclose pertinent and unrestricted information. If for any reason the consolidation does not become effective, information obtained through such examination shall be retained in confidence.

7. Conditions of Constituent Companies' Obligations

The obligation of each Constituent Company to execute and deliver the Articles and make the consolidation effective is subject to the approval of stockholders of both Constituent Companies specified in paragraph 3 and to the satisfaction in all material respects of the following conditions at or before closing; provided, however, that the board of directors of either Company, in its discretion, may waive the failure of the other Company to fulfill any of the conditions set forth below:

(a) The Company's examination shall not have disclosed any inaccuracy in the other Company's representations and warranties set forth in paragraph 5, such representations and warranties shall be correct on and as of the closing date, and the Company shall have received a certificate of the President or a Vice President of the other Company to that effect;

(b) The other Company shall not have defaulted in any obligation hereunder required to be performed by it before closing;

(c) The Company shall have received an opinion of counsel for the other Company (Ballard, Spahr, Andrews & Ingersoll, Philadelphia, Pa. being counsel for A-M, and Miles & Stockbridge, Baltimore, Md. being counsel for Martin) to the effect that:

(i) the Company represented by such counsel and (in the case of A-M) each of its domestic and Canadian subsidiaries holding material property or contributing materially to income (if any) is a duly organized corporation existing in good standing under the laws of its jurisdiction of incorporation with corporate power to own its properties and conduct its business as now conducted and is qualified to transact business and in good standing in jurisdictions where it owns or leases real property of material importance to its business, maintains a substantial inventory or conducts manufacturing operations, and the stock of each such subsidiary owned by its parent is validly issued, fully paid and non-assessable. [In giving such opinion with respect to A-M subsidiaries, Ballard, Spahr, Andrews & Ingersoll may rely on opinions of counsel for such subsidiaries.]

(ii) such counsel does not know or have reason to believe that there is any pending or threatened litigation, proceeding or investigation not disclosed in the proxy information supplied by the Company represented by such counsel which might result in a material adverse change in the business, properties or financial condition of such Company (including, in the case of A-M, the Company and its subsidiaries, considered as a whole), or which questions the validity of this Agreement or the consolidation to be effected hereunder.

(iii) the Company represented by such counsel has full power and authority to become party to the consolidation to be effected hereunder; such consolidation will not be a breach of, or result in a default or any accelerated liability under, such Company's charter or any indenture, loan agreement, pension trust, government contract, or other instrument by which such Company is bound on the closing date; all corporate and other proceedings required to be taken by such Company to authorize this Agreement and the consolidation have been validly taken; and no filing with or consent of any governmental or other authority is required in connection with the consolidation other than the listing of the Consolidated Company's stock and warrants on the appropriate stock exchanges and registration thereof under the Securities Exchange Act of 1934, and such listing and registration will become effective on notice of the effectiveness of the consolidation; and

(iv) the vote of stockholders of the Company represented by such counsel provided for in paragraph 3 operates to authorize the consolidation as far as such Company is concerned and binds all such Company's stockholders except for the statutory right of dissenters to receive the appraised value of their shares.

In giving the foregoing opinion Ballard, Spahr, Andrews & Ingersoll may rely as to Illinois law on the opinion of Illinois counsel satisfactory to them and to Miles & Stockbridge;

(d) At the closing date there shall be no litigation pending or threatened in which an injunction is or may be sought against the consolidation;

(e) The Company shall have received satisfactory assurances that no person deemed to be in control of either of the Constituent Companies within the meaning of the Securities Act of 1933, as amended and the Rules thereunder will make distribution to the public of securities of the Consolidated Company received by him in the consolidation without registration thereof under said Act, except as permitted by paragraph (d) of Rule 133 under said Act.

(f) All proceedings and documents in connection with this Agreement and the consolidation shall have been approved by counsel for the Company in question.

8. Management of Consolidated Company

The directors of the Consolidated Company shall be as set forth in the Articles hereto attached. It is the present intention of the parties that George M. Bunker will be elected President and chief executive officer of the Consolidated Company and that Grover M. Hermann will be elected Chairman of the Board.

9. Termination

This Agreement shall terminate automatically if closing is not held on or before December 31, 1961. Either of the Constituent Companies, by resolution of its board of directors, may terminate this Agree-

ment if the conditions required to be fulfilled by the other Company as specified in paragraph 7 are not satisfied on the closing day. The two Constituent Companies, each acting by its board of directors, may also terminate this Agreement and abandon the consolidation by mutual consent at any time before the consolidation becomes effective. In the event of any termination under this paragraph, neither of the Constituent Companies will have any liability to the other in connection with this Agreement for costs expenses, loss of anticipated profits or otherwise.

10. Issuance of Stock Certificates of the Consolidated Company

After the consolidation becomes effective, holders of certificates for shares of stock of the Constituent Companies will be entitled to receive in exchange therefor certificates for the shares of stock of the Consolidated Company into which their shares of the Constituent Companies have been converted, except that holders of certificates for shares of Martin Common Stock will not be entitled to receive certificates for fractional shares of the Consolidated Company's Common Stock. Arrangements will be made for the matching and combination or the purchase and sale of fractional interests in respect of Martin certificates surrendered for exchange within 60 days after the consolidation becomes effective.

11. Miscellaneous

(a) Each Constituent Company represents that it has not dealt with any broker in connection with this Agreement or the consolidation contemplated hereunder and that, insofar as is known to its management, no broker or other person is entitled to or claiming any commission or finder's fee in connection therewith.

(b) Neither Constituent Company may assign its rights hereunder and nothing herein contained shall confer any rights on any person not a party hereto.

(c) Notices in connection with this Agreement will be sufficiently delivered if delivered or mailed to A-M at 101 East Ontario Street, Chicago 11, Illinois, with a copy to John F. Donoho, Vice President, at 80 Pine Street, New York 5, New York; and to Martin at Friendship International Airport, Maryland, Attention: W. L. Lucas, Secretary, with a copy to Clarence Miles, Esq., Miles & Stockbridge, 10 Light Street, Baltimore 2, Maryland.

(d) This Agreement supersedes all previous negotiations and contains the entire understanding between the parties. It may be modified only in writing signed by the party against which the modification is asserted.

IN WITNESS WHEREOF the Constituent Companies have caused this Agreement to be signed in their names by the Chairmen of their respective Boards of Directors, each thereunto duly authorized, and their corporate seals to be affixed hereto and duly attested.

ARTICLES AND PLAN OF CONSOLIDATION
CONSOLIDATING
THE MARTIN COMPANY AND AMERICAN-MARIETTA COMPANY
TO FORM
MARTIN-MARIETTA CORPORATION

Articles and Plan of Consolidation, entered into this .....day of ....., 19...., between The Martin Company, a Maryland corporation, and American-Marietta Company, an Illinois corporation.

ARTICLE I

The corporations which are parties to these Articles and Plan of Consolidation are The Martin Company (hereinafter called "Martin"), a corporation, having capital stock, organized and existing under the laws of the State of Maryland, and American-Marietta Company (hereinafter called "A-M"), a corporation, having capital stock, organized and existing under the laws of the State of Illinois. Martin and A-M have agreed, pursuant to requisite authority, to consolidate and thereby form a new corporation. The terms and conditions of the consolidation and the mode of carrying the same into effect shall be as herein set forth.

ARTICLE II

The name of the new corporation, resulting from the said consolidation, shall be "Martin-Marietta Corporation" (hereinafter called "Corporation"), and shall be formed under the laws of the State of Maryland.

ARTICLE III

Martin was incorporated on December 5, 1928, under the general statutes of the State of Maryland authorizing the formation of corporations. A-M was incorporated on September 12, 1930, under the general statutes of the State of Illinois, authorizing the formation of business corporations. A-M is qualified to do business in the State of Maryland, having so qualified on November 28, 1955.

ARTICLE IV

The charter of the Corporation shall be as stated in this ARTICLE IV:

FIRST: **Name.** The name of the corporation (which is hereinafter called "Corporation") is Martin-Marietta Corporation.

SECOND: **Period of Duration.** The period of duration of the Corporation is perpetual.

THIRD: **Purposes, Objects and Powers.** The purposes for which the Corporation is formed and the business or objects to be carried on and promoted by it are as follows:

Clause (1). To engage in and carry on the business of creating, developing, manufacturing, testing, transporting and making ready for use all kinds of missiles, electronics, electronic devices and substances, spacecraft, defense equipment and systems, and nuclear reactors and devices, and modifying, repairing, altering, licensing, buying, selling and dealing in all such articles and other property of every kind and character used in connection therewith.

Clause (2). To engage in and carry on the business of manufacturing, repairing altering, using, licensing, buying, selling and dealing in and with vehicles of all kinds, engines, motors, machinery, in-

struments, parts, equipment, appliances, devices, articles and materials of all kinds for use on or in connection therewith and the manufacture thereof.

Clause (3). To manufacture, buy, sell and deal in and with limestone, lime, concrete, concrete admixtures, cement, magnesite, brick, tile, refractories, asphalt, mortar, and products thereof; pipes, tubes, conduits and fittings, building materials and products thereof; chemicals; paints, pigments, coatings, finishes, resins and adhesives; shot, grit and metal powders; agricultural, road building, pipe laying, pulverizing, dust collecting and other machinery and equipment; mops, polishes, cleaners and waxes; and any and all other similar or related products.

Clause (4). To engage in and carry on the business of importing, exporting, manufacturing, producing, buying, selling and otherwise dealing in and with, goods, wares, and merchandise of every class and description.

Clause (5). To engage in and carry on any other business which may conveniently be conducted in conjunction with any of the business of the Corporation.

Clause (6). To buy, quarry, mine, grow, manufacture, process, own, invest in, sell, mortgage, pledge, lease, assign, transfer or otherwise deal in or with goods, wares, merchandise, supplies, materials, trees, crops, minerals, parts, machinery, equipment, products and other personal property of every kind, class and description.

Clause (7). To purchase, lease, hire or otherwise acquire, hold, own, develop, improve and dispose of, and to aid and subscribe toward the acquisition, development or improvement of real and personal property and rights and privileges therein, suitable or convenient for any of the business of the Corporation.

Clause (8). To purchase, lease, hire or otherwise acquire, hold, own, construct, erect, improve, manage and operate, and to aid and subscribe toward the acquisition, construction or improvement of, plants, mills, factories, works, buildings, machinery, equipment and facilities and any other property or appliances which may appertain to or be useful in the conduct of any of the business of the Corporation.

Clause (9). To acquire all or any part of the good will, rights, property and business of any person, firm, association or corporation heretofore or hereafter engaged in any business similar to any business which the Corporation has the power to conduct, and to hold, utilize, enjoy and in any manner dispose of, the whole or any part of the rights, property and business so acquired, and to assume in connection therewith any liabilities of any such person, firm, association or corporation.

Clause (10). To apply for, obtain, purchase, or otherwise acquire, any patents, copyrights, licenses, trade marks, trade names, rights, processes, formulas, and the like, which may seem capable of being used for any of the purposes of the Corporation; and to use, exercise, develop, grant licenses in respect of, sell and otherwise turn to account, the same.

Clause (11). To acquire by purchase, subscription or otherwise, and to hold, sell, assign, transfer, exchange, lease, mortgage, pledge, or otherwise dispose of, any shares of stock of, or voting trust certificates for any shares of stock of, or any bonds or other securities or evidences of indebtedness issued or created by, any other corporation or association, organized under the laws of the State of Maryland or of any other state, territory, district, colony or dependency of the United States of America, or of any foreign country; and while the owner or holder of any such shares of stock, voting trust certificates, bonds, or other obligations, to possess and exercise in respect thereof any and all the rights, powers, and privileges of individual holders, including the right to vote on any shares of stock so held or owned; and upon a distribution of the assets or a division of the profits of the Corporation, to distribute any such shares of stock, voting trust certificates, bonds or other obligations, or the proceeds thereof, among the stockholders of the Corporation.

Clause (12). To issue shares of its stock of any class, in the manner permitted by law, to raise money for any of the purposes of the Corporation, or in payment for property purchased, or for any other lawful consideration.

Clause (13). To borrow or raise money for any of the purposes of the Corporation and to issue bonds, debentures, notes or other obligations of any nature, and in any manner permitted by law, for money so borrowed or in payment for property purchased, or for any other lawful consideration, and to secure the payment thereof and of the interest thereon, by mortgage upon, or pledge or conveyance or assignment in trust of, the whole or any part of the property of the Corporation, real or personal,

including contract rights, whether at the time owned or thereafter acquired, and to sell, pledge, discount or otherwise dispose of such bonds, notes or other obligations of the Corporation for its corporate purposes.

Clause (14). To aid in any manner any corporation or association, any bonds, or other securities or evidences of indebtedness of which, or shares of stock in which, are held by or for the Corporation, or in which, or in the welfare of which, the Corporation shall have any interest, and to do any acts or things designed to protect, preserve, improve, or enhance the value of, any such bonds or other securities or evidences of indebtedness, or such shares of stock, or any property of the Corporation.

Clause (15). To guarantee the payment of dividends upon any shares of stock of, or the performance of any contract by, any other corporation or association and to endorse or otherwise guarantee the payment of the principal and interest, or either, of any bonds, debentures, notes, securities, or other evidences of indebtedness created or issued by any other corporation or association.

Clause (16). To carry out all or any part of the foregoing objects as principal, factor, agent, contractor, or otherwise, either alone or through or in conjunction with any person, firm, association or corporation, and in any part of the world, and, in carrying on its business and for the purpose of attaining or furthering any of its objects and purposes, to make and perform any contracts and to do any acts and things, and to exercise any powers suitable, convenient or proper for the accomplishment of any of the purposes herein enumerated or incidental to the powers herein specified, or which at any time may appear conducive to or expedient for the accomplishment of any of such purposes.

Clause (17). To carry out all or any part of the aforesaid purposes, and to conduct its business in all or any of its branches in any or all states, territories, districts, colonies and dependencies of the United States of America and in foreign countries; and to maintain offices and agencies in any or all states, territories, districts, colonies and dependencies of the United States of America and in foreign countries.

It is the intention that the objects and purposes specified in the foregoing clauses of this subdivision THIRD shall not, unless otherwise specified herein, be in any wise limited or restricted by reference to, or inference from, the terms of any other clause of this or any other article in this charter, but that the objects and purposes specified in each of the clauses of this subdivision THIRD shall be regarded as independent objects and purposes. It is also the intention that said clauses be construed both as purposes and powers; and generally, that the Corporation shall be authorized to exercise and enjoy all other powers, rights, privileges granted to, or conferred upon, corporations of this character, by the laws of the State of Maryland, and the enumeration of certain powers as herein specified is not intended as exclusive of, or as a waiver of, any of the powers, rights or privileges granted or conferred by the laws of said state now or hereinafter in force.

FOURTH: **Principal Office and Resident Agent.** The post office address of the place in which the principal office of the Corporation in the State of Maryland is located is 10 Light Street, Baltimore, Maryland. The Resident Agent of the Corporation is Clarence W. Miles, whose post office address is 10 Light Street, Baltimore, Maryland; said Resident Agent is a citizen of the State of Maryland and actually resides therein.*

FIFTH: **Directors.** The number of Directors of the Corporation shall be eighteen (18), which number may be increased or decreased pursuant to the By-Laws of the Corporation but which never shall be less than five (5); and the names of the directors who shall act until their successors are duly chosen and qualified are: **

William B. Bergen	Leigh R. Gignilliat, Jr.	Clarence W. Miles	Alexander B. Royce
George M. Bunker	Grover M. Hermann	John E. Parker	Duncan M. Spencer
William A. Burns	H. N. Huntzicker	Robert E. Pflaumer	John L. Sullivan
William J. Cabaniss	J. Clifford Knochel	Everett H. Pixley	
John F. Donoho	Ray L. Oughton	W. Trent Ragland, Jr.	

* Differs from form of Articles and Plan of Consolidation attached to executed Agreement of Consolidation in that addresses in FOURTH have been changed.

** Differs from form of Articles and Plan of Consolidation attached to executed Agreement of Consolidation, in that one substitution has been made in the persons listed in FIFTH.

SIXTH: **Authorized Shares of Stock.** The total number of shares of stock of all classes which the Corporation has authority to issue is 40,380,000 shares, divided into 380,000 shares of 4½% Cumulative Preferred Stock of the par value of $100 per share and 40,000,000 shares of Common Stock of the par value of $1 per share. The aggregate par value of all shares having par value of all classes is $78,000,000.

A description of each class with the preferences, conversion and other rights, voting powers, restrictions, limitations as to dividends and qualifications of each class is as follows:

4½% Cumulative Preferred Stock

1. *Dividends.*

The holders of 4½% Cumulative Preferred Stock (hereinafter called "Preferred Stock") shall be entitled to receive, when and as declared by the Board of Directors, dividends at the rate of 4½% of the par value thereof per year, and no more. Such dividends shall be cumulative from the first day of the month in which the Corporation comes into existence and shall be payable quarterly on the first days of January, April, July and October in each year. The Corporation shall not declare or pay any dividend or make any distribution on the Common Stock or on any other class of stock, ranking as to dividends or assets subordinate to the Preferred Stock, other than dividends and distributions (herein called "unrestricted stock dividends and distributions") paid or made solely in Common Stock or another class of stock of the Corporation ranking as to dividends and assets subordinate to the Preferred Stock, and neither the Corporation nor any subsidiary of the Corporation shall make any payment or apply any of its assets to purchase or redeem any Common Stock or any other class of stock of the Corporation ranking as to dividends or assets on a parity with or subordinate to the Preferred Stock, unless at the time dividends for all past quarterly dividend periods and the then current quarterly dividend period on all outstanding shares of Preferred Stock have been paid, or declared and set aside for payment, in full and unless, after giving effect to such action, the sum of

(a) the aggregate amounts declared and paid or payable as dividends or distribution (other than unrestricted stock dividends and distributions) on all shares of stock of all classes of the Corporation subsequent to the date on which it came into existence; plus

(b) the excess of the aggregate amounts applied to ,or set apart for, the purchase or redemption of shares of Common Stock or any other class of stock of the Corporation ranking as to dividends or assets subordinate to the Preferred Stock subsequent to the date on which the Corporation came into existence over the net cash proceeds or fair value (as determined by the Corporation's board of directors) of property received by the Corporation subsequent to that date as consideration for the issuance or delivery of Common Stock or any other class of stock of the Corporation ranking as to dividends and assets subordinate to the Preferred Stock

will not exceed the consolidated net income (determined in accordance with generally accepted accounting principles) of the Corporation and its subsidiaries (if any) subsequent to November 30, 1961 plus $45,000,000.

2. *Liquidation.*

In the event of voluntary or involuntary liquidation, dissolution or winding up of the Corporation, the holders of Preferred Stock shall be entitled to receive in cash from the assets of the Corporation (whether capital or surplus), prior to any payment to the holders of Common Stock or of any other class of stock of the Corporation ranking as to assets subordinate to the Preferred Stock, the sum of $100 for each share thereof, plus an amount equal to accrued and unpaid dividends thereon computed to the date at which payment thereof is made available (whether or not earned or declared), plus, if the liquidation, dissolution or winding up is voluntary, a premium of $5 per share. A consolidation or merger to which the Corporation shall be a party shall not be deemed a liquidation of the Corporation within the meaning of this paragraph.

3. *Redemption and Purchase.*

The Corporation may, at its option, redeem all, but not less than all, the shares of Preferred Stock outstanding at any time after October 1, 1964, at a price equal to $105 per share plus an amount equal to accrued and unpaid dividends thereon computed to the date fixed for redemption (whether or not earned or declared). Notice of such redemption shall be given to the holders of record of the Preferred Stock by mailing such notice at least 30 and not more than 60 days before the redemption date to such holders at their addresses appearing on the books of the Corporation. The Corporation, upon mailing such notice or irrevocably authorizing the bank or trust company hereinafter mentioned to mail the same, may deposit an amount equal to the redemption price with a bank or trust company in Chicago, Illinois having a combined capital and surplus reported in its last published report in excess of $5,000,000 to be held in trust for payment to the holders of Preferred Stock at any time after such deposit. Upon such deposit, or if no deposit is made, then from and after the date fixed for redemption (unless the Corporation shall default in paying the redemption price), the Preferred Stock shall cease to be outstanding and the holders thereof shall cease to be stockholders with respect thereto. All shares of Preferred Stock redeemed or purchased by the Corporation, whether through the sinking fund hereinafter provided for or otherwise, shall be cancelled and shall not be reissued.

4. *Voting Rights.*

The holders of shares of the Preferred Stock shall have no right to vote and shall not be entitled to notice of any meeting of stockholders of the Corporation or to participate in such meeting, except as required by law or as herein otherwise expressly provided. If at any time the Corporation shall have failed (a) to pay, or declare and set apart for payment, dividends on the Preferred Stock and such default (whether or not in respect of consecutive dividends) shall be in an aggregate amount equal to four quarterly dividends on all outstanding shares of Preferred Stock, or (b) to set aside or apply, when required, the sinking fund hereinafter provided for, then in any such event, the number of directors of the Corporation shall forthwith be automatically increased by the smallest number that will be not less than one-third of the total number of directors after giving effect to such increase. The holders of Preferred Stock shall have the right, voting as a class, to elect such additional directors at a special meeting of the holders of Preferred Stock, which shall be called by the Secretary of the Corporation upon demand of the holders of 10% or more of the outstanding shares thereof, and at each subsequent annual meeting of stockholders of the Corporation until such time as dividends payable for all past quarterly dividend periods and the then current quarterly dividend period on all outstanding shares of Preferred Stock shall have been paid, or declared and set apart for payment, in full, and the Corporation shall have set aside an amount equal to all arrearages in the sinking fund and applied the same to the redemption of Preferred Stock as provided in paragraph 7, at which time the terms of the additional directors elected by the holders of Preferred Stock shall terminate, the number of directors shall be correspondingly reduced, and the voting rights of the holders of Preferred Stock shall cease, subject to revesting in the event of each additional default in payment of dividends in an amount equal to four quarterly dividends or in setting aside or applying the sinking fund as aforesaid.

5. *Action by the Corporation Requiring Approval of Preferred Stock.*

The Corporation shall not, without the affirmative vote or written consent of the holders of at least two-thirds of the then outstanding shares of Preferred Stock:

(1) By charter amendment or in a merger or consolidation or in any other manner: (a) increase the number of authorized or outstanding shares of Preferred Stock, or (b) decrease the par value of shares of Preferred Stock, or (c) effect an exchange or reclassification of any outstanding shares of Preferred Stock, or a cancellation of any of such shares except upon purchase or redemption thereof, or (d) change the designations, preferences, qualifications, limitations, restrictions or special or relative rights of the Preferred Stock, or (e) change the outstanding shares of Preferred Stock into the same or a different number of shares of any other class of stock, or (f) create any shares of stock of any other class, or any obligations, exchangeable for or convertible into shares of Preferred Stock, or (g) create or authorize or permit to

be outstanding any kind of stock, or any obligations or other securities exchangeable for or convertible into any kind of stock, having rights or preferences prior or superior to, or on a parity with, the Preferred Stock, or increase the rights or preferences of any class of stock having rights or preferences prior or superior to, or on a parity with, the Preferred Stock, or (h) cancel or otherwise affect dividends on the Preferred Stock which have accrued but have not been paid, or

(2) Issue or sell any shares of Preferred Stock (including shares acquired through the sinking fund) or of any class of stock ranking as to dividends or assets prior to or on a parity with the Preferred Stock or in any other manner increase the number of outstanding shares of Preferred Stock or of any class of stock ranking as to dividends or assets prior thereto or on a parity therewith.

6. *Merger or Consolidation.*

In the event of any merger or consolidation of the Corporation any holder of Preferred Stock shall be entitled to receive payment in cash of the amount to which he would then be entitled upon a voluntary liquidation of the Corporation unless by the terms of the merger or consolidation he is entitled to shares or securities (which may be his shares of Preferred Stock) of the corporation resulting from the merger or consolidation which have a relative position and priority and rights and preferences as to other classes of capital stock of such corporation at least equal to those of the Preferred Stock immediately before the merger or consolidation.

7. *Sinking Fund.*

So long as any shares of Preferred Stock are outstanding, the Corporation shall, not later than October 1 in 1962 and in each year thereafter, set aside as a sinking fund for retirement of the Preferred Stock the amount of $1,150,000; provided, however, that the Corporation may credit against such amount the par value of any shares of Preferred Stock theretofore acquired by it otherwise than through the sinking fund and not previously used as the basis for such a credit, and provided further that the Corporation may omit provision for the sinking fund in any year with written consent of the holders of all shares of Preferred Stock then outstanding. The Corporation shall not declare or pay any dividend or make any distributions on the Common Stock or any other class of stock ranking as to dividends or assets subordinate to the Preferred Stock other than unrestricted stock dividends and distributions, and neither the Corporation nor any subsidiary of the Corporation shall make any payment or apply any of its assets to purchase or redeem any Preferred Stock (other than through the sinking fund) or any Common Stock or any other class of stock of the Corporation ranking as to dividends or assets on parity with or subordinate to the Preferred Stock, at a time when the Corporation is in default in respect of the sinking fund herein provided for.

The Corporation shall apply the sinking fund within 45 days after the setting aside thereof to the redemption of Preferred Stock at a sinking fund redemption price equal to the par value thereof plus an amount equal to accrued and unpaid dividends computed to the date fixed for redemption (whether or not earned or declared). The shares of Preferred Stock to be redeemed through the sinking fund shall be selected by lot or other equitable method; provided, however, that the holder of any share so selected shall have the right, by written notice given to the Corporation prior to the redemption date, to substitute for redemption any other share of Preferred Stock held of record by him on the redemption date; and further provided that the Corporation may, with the written consent of the holders of all shares of Preferred Stock then outstanding, redeem through the sinking fund shares of Preferred Stock which prior to the redemption date are surrendered to it for such redemption without regard to the method or equity of the selection thereof. The procedure for giving notice of redemption and the effect of depositing the redemption price shall be the same in the case of sinking fund redemptions under this paragraph as in the case of an optional redemption under paragraph 3.

Common Stock

Each outstanding share of Common Stock shall be entitled to one vote on each matter submitted to a vote at a meeting of stockholders. In all elections for directors every holder of Common Stock

shall have the right to vote, in person or by proxy, the shares owned of record by him, for as many persons as there are directors to be elected and for whose election he has a right to vote, but he shall have no right to cumulative voting.

SEVENTH: **Provisions Defining, Limiting and Regulating Powers.** The following provisions are hereby adopted for the purpose of defining, limiting and regulating the powers of the Corporation and the Directors and Stockholders, subject, however, to the provisions, conditions and restrictions set forth in subdivision SIXTH hereof:

Clause (1). The Board of Directors of the Corporation is hereby empowered to authorize the issuance from time to time of shares of its stock of any class, whether now or hereafter authorized, and securities convertible into shares of its stock of any class, whether now or hereafter authorized, for such considerations as said Board of Directors may deem advisable, subject to such limitations and restrictions, if any, as may be set forth in the by-laws of the Corporation.

Clause (2). No holders of shares of stock of the Corporation of any class shall have any preemptive or other right to subscribe for or purchase any part of any new or additional issue of stock of any class or of securities convertible into stock of any class, whether now or hereafter authorized or whether issued for money, for a consideration other than money or by way of dividend.

Clause (3). The Board of Directors shall have the power, from time to time, to determine whether any, and if any, what part, of the surplus of the Corporation shall be declared in dividends and paid to the stockholders; and to direct and determine the use and disposition of any of such surplus. The Board of Directors may in its discretion use and apply any of such surplus in purchasing or acquiring any of the shares of the stock of the Corporation, or any of its bonds or other evidences of indebtedness, to such extent and in such manner and upon such lawful terms as the Board of Directors shall deem expedient.

Clause (4). The Corporation reserves the right to make from time to time any amendments of its charter which may now or hereafter be authorized by law, including but not restricted to, any amendments changing the terms of any class of its stock by classification, reclassification or otherwise.

Clause (5). Notwithstanding any provision of law requiring any action to be taken or authorized by the affirmative vote of the holders of a designated proportion of the shares of stock of the Corporation, or to be otherwise taken or authorized by vote of the stockholders, such action shall be effective and valid, except as otherwise required by provisions of this charter relating to the Preferred Stock, if taken or authorized by the affirmative vote, at a meeting, of the holders of a majority of the total number of shares outstanding and entitled to vote thereon.

EIGHTH: **By-Laws.** The Board of Directors shall have the power, at any regular or special meeting thereof, to make and adopt by-laws, or to amend, alter or repeal any by-laws of the Corporation. The by-laws may contain any provision for the regulation and management of the affairs of the Corporation not inconsistent with law or the provisions of this charter.

NINTH: **Inspection of Records by Stockholders.** The Board of Directors shall have power to determine from time to time whether and to what extent and at what times and places and under what conditions and regulations the books, records, accounts, and documents of the Corporation, or any of them, shall be open to the inspection of stockholders, except as otherwise provided by law or by the by-laws; and, except as so provided no stockholders shall have any right to inspect any book, record, account or document of the Corporation unless authorized so to do by resolution of the Board of Directors.

TENTH: **Compensation of Members of Board of Directors and Committees thereof.** The Board of Directors in its discretion may allow, in and by the by-laws of the Corporation or by resolution, the payment of expenses, if any, to members for attendance at each regular or special meeting of the Board of Directors or of any committee thereof, and the payment of reasonable compensation to such members for their services as members of the Board of Directors, or any committee thereof, and shall fix the basis and conditions upon which such expenses and compensation shall be paid. Any member of the Board of Directors or of a committee thereof, also may serve the Corporation in any other capacity and receive compensation therefor in any form.

ELEVENTH: **Indemnification of Officers and Directors.** Each director and each officer of the Corporation, and his heirs, executors and administrators shall be indemnified by the Corporation against all costs and expenses reasonably incurred by him for advice or assistance concerning, or in connection with the defense of, any civil, criminal, administrative, or other claim, action, suit or proceeding in which he may become involved, or with which he may be threatened, by reason of his being, or having been, a director or officer of the Corporation or by reason of his serving or having served any corporation, trust, committee, firm or other organization as director, officer, employee, trustee, member or otherwise at the request of the Corporation, whether or not he continues to be a director or officer at the time of incurring such costs or expenses, except costs and expenses incurred in relation to matters as to which such director or officer shall have been derelict in the performance of his duty as such director or officer.

For the purposes of this subdivision ELEVENTH, a director or officer shall conclusively be deemed not to have been derelict in the performance of his duty as such director or officer

(a) in a matter which shall have been the subject of a claim, suit, action or proceeding to which he was a party disposed of by adjudication on the merits, unless he shall have been finally adjudged in such claim, action, suit or proceeding to have been derelict in the performance of his duty as such director or officer, or

(b) in a matter not falling within (a) next preceding if either all disinterested members of the Board of Directors or a committee of disinterested stockholders of the Corporation (excluding therefrom any director or officer) selected as hereinafter provided, shall determine that he is not derelict.

The selection of the committee of stockholders provided above may be made by unanimous action of the disinterested directors or, if there be no disinterested director or directors, by the chief executive officer of the Corporation, provided that not less than three (3) stockholders shall be selected in any case. A director or stockholder shall be deemed disinterested in a matter if he has no interest therein other than as a director or stockholder of the Corporation, as the case may be. The foregoing shall not constitute exclusive tests as to dereliction and no determination as to dereliction shall be questioned on the ground that it is made otherwise than as provided above. The Corporation may pay the fees and expenses of the stockholders or directors, as the case may be, incurred in connection with making a determination as above provided.

The foregoing indemnification shall include reimbursement of all costs and expenses reasonably incurred in settling any such claim, action, suit or proceeding or in satisfaction of any related judgment, fine or penalty, when the so doing appears to be for the best interests of the Corporation, and shall be in addition to any rights to which any director or officer may otherwise be entitled as a matter of law or otherwise.

TWELFTH: **Informal Action by Board of Directors or Committees thereof.** Any action required or permitted to be taken at any meeting of the Board of Directors, or of any committee thereof, may be taken without a meeting, if a written consent to such action is signed by all members of the Board or of such committee, as the case may be, and such written consent is filed with the minutes of proceedings of the Board or committee.

ARTICLE V

A. The total number of shares of all classes which Martin has authority to issue is 12,000,000 shares of Common Stock without par value.

B. The total number of shares of all classes which A-M has authority to issue is 29,200,000 divided into two classes as follows:

25,000,000 Common Shares of the par value of $2 per share; and

4,200,000 Class B Common Shares of the par value of $2 per share.

The aggregate par value of all such shares is $58,400,000.

ARTICLE VI

Upon the effective date of the consolidation, the authorized Capital Stock of the Corporation shall be 40,380,000 shares divided into 380,000 shares of 4½% Cumulative Preferred Stock of the par value of $100 per share and 40,000,000 shares of Common Stock of the par value of $1 per share. As a result of the consolidation, the Common Stock of Martin and the Common Shares of A-M issued and outstanding on the effective date of the consolidation will be converted into like stock of the Corporation; the Class B Common Shares of A-M issued and outstanding on the effective date of the consolidation will be converted into 380,000 shares of 4½% Cumulative Preferred Stock of the par value of $100 per share; and the holders of the warrants of Martin issued and outstanding on the effective date of the consolidation will be entitled to purchase shares of Common Stock of the Corporation of the par value of $1 per share for each warrant so held, all as hereinafter more specifically set forth:

A. As to the stock and warrants of Martin:

1. Each share of Common Stock, without par value, shall be converted into 1.3 shares of Common Stock of the Corporation, of the par value of $1 per share; provided, however, that holders of certificates of Martin's Common Stock will not be entitled to receive certificates for fractional shares of the Common Stock of the Corporation.

2. Each warrant to purchase a Current Stock Unit, now consisting of 2.10 shares of the said Common Stock of Martin, without par value, shall entitle the holder thereof to purchase a Current Stock Unit consisting of 2.73 shares of Common Stock of the Corporation, of the par value of $1 per share.

B. As to the stock of A-M:

1. The Class B Common Shares outstanding on the effective date of the consolidation shall be converted into 380,000 shares of 4½% Cumulative Preferred Stock of the Corporation of the par value of $100 per share.

2. Each Common Share shall be converted into one share of Common Stock of the Corporation, of the par value of $1 per share.

Except as hereinabove set forth no other consideration shall be paid, transferred or issued by the Corporation for shares of Common Stock and warrants of Martin or for shares of A-M.

ARTICLE VII

The principal office of Martin in the State of Maryland is located in Baltimore County. The principal office of A-M in the State of Maryland is located in Baltimore City, (not located in any county). Martin owns property, the title to which could be affected by the recording of an instrument among the land records in the following counties of the State of Maryland: Baltimore County and Anne Arundel County. A-M owns property, the title to which could be affected by the recording of an instrument among the land records, in the following counties of the State of Maryland: Allegany County, Howard County and Washington County, and in Baltimore City (not located in any county).

ARTICLE VIII

The Articles and Plan of Consolidation were duly advised by the Board of Directors and approved by the stockholders of Martin in the manner and by the vote required by the laws of the State of Maryland and by the charter of Martin.

ARTICLE IX

The Articles and Plan of Consolidation were duly advised, authorized and approved in the manner

and by the vote required by the charter of A-M and by the laws of the State of Illinois, under which A-M was organized.

ARTICLE X

Upon the effective date of the consolidation:

A. The separate existences of Martin and A-M shall cease.

B. All the property, rights, privileges, powers and franchises of Martin and of A-M, of whatever nature and description, of a public as well as of a private nature, shall be transferred to, vest in and devolve upon the Corporation without further act or deed; and all property, rights, privileges, powers and franchises, and all and every other interest of Martin and of A-M shall be thereafter as effectually the property of the Corporation as they were of Martin and of A-M.

ARTICLE XI

On and after the effective date of the consolidation:

A. All debts, obligations, liabilities and duties of Martin and of A-M shall thenceforth attach to the Corporation, and may be enforced against it to the same extent as if said debts, obligations, liabilities and duties had been incurred or contracted by it; and any claim existing or action or proceeding pending by or against either Martin or A-M may be prosecuted to judgment or decree as if the consolidation had not taken place, or the Corporation, upon the motion of the Corporation or of any party, may be substituted as a party in place of Martin or A-M, as the case may be, and any such judgment or decree against Martin or A-M shall constitute a lien upon the property of the Corporation;

B. The title to any real estate shall not revert or be in any way impaired by reason of the consolidation, but all rights of creditors and all liens upon any property of Martin or A-M shall be preserved unimpaired. Nothwithstanding the provisions of Article X hereof, confirmatory deeds, assignments or other like instruments, when deemed desirable to evidence such transfer, vesting or devolution of any property, right, privilege or franchise, may at any time, or from time to time, be made and delivered in the name of Martin or A-M, as the case may be, by the last acting officers thereof, or by the corresponding officers of the Corporation.

ARTICLE XII

Anything herein contained to the contrary notwithstanding, the proposed consolidation herein set forth may be abandoned at any time prior to the effective date of consolidation, (i) by either Martin or A-M, by resolution of its Board of Directors, if the conditions of that Company's obligations, as set forth in the Agreement of Consolidation between the two companies dated as of August 1, 1961, are not satisfied, or (ii) by Martin and A-M, each acting by its Board of Directors, by mutual consent, for any reason; and the proposed consolidation shall be deemed abandoned if the closing provided for in said Agreement of Consolidation is not held on or before December 31, 1961.

ARTICLE XIII

The consolidation referred to herein shall become effective upon the issuance of a certificate of consolidation by the Secretary of State of the State of Illinois and the acceptance of the Articles and Plan of Consolidation for record by the Department of Assessments and Taxation of the State of Maryland.

The corporations party to these Articles and Plan of Consolidation have agreed that, notwithstanding the effective date as hereinabove established, the consolidation, if and when effective under the laws of the States of Maryland and Illinois, shall be effective for accounting purposes only as of the opening of business on October 1, 1961. Appropriate property, financial, accounting, statistical and other corporate records of Martin, A-M and the Corporation shall be adjusted or made, as the case may be, to reflect such effects of the consolidation as of October 1, 1961.

IN WITNESS WHEREOF, Martin and A-M, the parties to the consolidation, have caused these Articles and Plan of Consolidation to be signed in their respective corporate names and on their behalf by their respective President or Vice-President and their respective corporate seals to be hereunto affixed and attested by their respective Secretaries or Assistant-Secretaries, the day and year first above written.

Gentlemen:

Pursuant to the Atomic Energy Act of 1954 and Section 40.21 of the Code of Federal Regulations, Title 10 - Atomic Energy, Chapter 1, Part 40 - Control of Source Material, you are hereby licensed to receive possession of and title to, at the above stated location, one hundred thousand (100,000) pounds of thorium magnesium alloy containing not more than 4% thorium for fabrication in accordance with the procedures described in your letter of December 1, 1958.

You are further licensed to transfer and deliver possession of and title to refined source material to any person licensed by the Atomic Energy Commission, within the limits of his license.

As a condition of this license, you are required to maintain records of your inventories, receipts and transfers of refined source material.

This license is subject to all the provisions of the Atomic Energy Act of 1954 now or hereafter in effect and to all valid rules and regulations of the U. S. Atomic Energy Commission, including 10 CFR 20, "Standards For Protection Against Radiation."

Neither this license nor any right under this license shall be assigned or otherwise transferred in violation of the provisions of the Atomic Energy Act of 1954.

This license shall expire September 30, 1961.

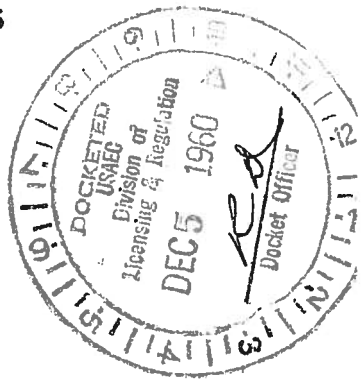
THE MARTIN COMPANY

Baltimore 3, Maryland

December 1, 1960
Mail Number W722

Refer to: NMC-135



Director
Division of Licensing & Regulation
U. S. Atomic Energy Commission
Washington 25, D. C.

Attention: Mr. J. C. Delaney,
Chief, Nuclear Materials
Licensing Branch

Gentlemen:

Reference is made to our Special Nuclear Material License SNM-53 as amended, which authorizes Martin to receive and store five hundred (500) kilograms of U-235 contained in uranium as UO_2 and metal. We request to further amend this license to add storage facilities in addition to the Vault described in our License Application dated December 12, 1957, as follows:

1) In order to store feed material and finished products (fuel elements) a storage area has been established for contract material in a munitions bunker area located on Martin property. This area has been approved by the New York Operations Office. Enclosure 1 gives a detailed description of the facility, quantity and type of material to be stored and a procedure for the Administrative Control.

2) As a result of the expanded fuel element fabrication work at the Martin Company, we require an area to store scrap and waste Special Nuclear and By-Product material prior to shipment to a reprocessor. Enclosure 2 gives a detail description of the facility, quantity and type of material to be stored and a procedure for the Administrative Control.

We are also submitting a request to the New York Operations Office for approval of this facility.

Please direct any questions concerning these facilities to Mr. W. W. Wachtl, Chairman Nuclear Material Control

A/72

I certify that the statements made in this letter and enclosures are true, complete and correct to the best of my knowledge and belief and are made in good faith.

Very truly yours,

THE MARTIN COMPANY

J. V. Loppert,
Licensing Officer
Nuclear Division

WW/JVL/plm

FILE NO. [illegible]

File G

Nuclear Feed Material and Finished Product Storage Area

The Nuclear Feed Material and Finished Product Storage Area is located on Martin property in the Revetment Area which was previously a munitions bunker. As shown on the attached photograph this Revetment Area consists of eight bunkers. Each bunker cell measures 13' x 15' x 11' high. (See attached sketch.)

It is planned that up to three of the bunker cells will be utilized for nuclear storage. A small amount of explosive material including emergency flares, jet starter cartridges, fuse chord, small arm ammunition is currently being stored in the remaining bunkers. The area is separately fenced and locked within the Martin property periphery fence. A flood light system has been installed for security purposes. An ADT Alarm system will be located on each access door.

This area will provide storage for up to seventy-five (75) kilograms of contained U-235 per bunker depending upon storage container limitations. Both License and Contract SS Materials will be stored including feed material in shipping birdcages and finished products in approved shipping containers. Feed materials will be stored as required prior to production storage in the Manufacturing Vault. Finished fuel elements will be stored prior to shipment to other contractors. The storage of these materials will be in accordan with criteria presented in TID-7019, TID-7016 and Title 10 Code of Federal Regulations Part 70 and 71. It is not planned to include a radiation alarm system for the following reasons:

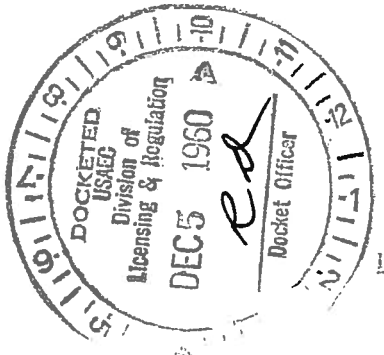
1. Remoteness of location and shield properties of the storage rooms.

2. Special administrative control exercised, restricting access.

3. Limited variety of SS material storage.

All packaging for shipment is controlled to insure compliance with Title 10 Parts 20, 70 and 71 Code of Federal Regulations and ICC Regulations (including Bureau of Explosives Permits when necessary).

Administrative Control of this area will be maintained according to the attached procedure entitled "Regulations and Control for Revetment Storage Area".



DOCKETED USAEC Division of Licensing & Regulation DEC 5 1960 Docket Officer

Revetment Storage Area

REGULATIONS FOR CONTROL OF REVETMENT STORAGE AREA

The following procedures are to be followed for transfer of nuclear material within the storage area, periodic inventories, and any emergencies occurring at the storage location.

1. General

The specific purpose of the area is to provide storage for Special Nuclear Material. Control of the area has been delegated to the Accountability Representative who will physically control all access to the area. The combination for the 3-way lock will be kept by the Accountability Representative. The following personnel should be contacted in this order for admittance: (Line supervision control)

R. L. Metzger (Accountability Representative)
Ext. 9725
Badge No. 1170-82304

W. W. Wechtl (Chairman, Nuclear Materials Control Committee) - Ext. 8203
Badge No. 1170-83724

J. V. Loppert (Operations Manager) Ext. 8281
Badge No. 1170-82060

Visits include once-a-month inventories and periodic transfer of material.

2. Storage and Transfer of Material

Physical movement will be preceded by application to the Accountability Representative. The Accountability Representative will review all applications for movement of SS material within the area with the Nuclear Materials Control Committee, consisting of Health Physics, Criticality, Security, Accountability and Waste Control.

The Accountability Representative will be in attendance for all movement of mater within the area. He will obtain a key to the Revetment periphery fence from the Security Department and all transfers of nuclear materials to this area will require that the shipment be accompanied by a Martin guard escort in a radio car. On all visits, Health Physics personnel will be in attendance, with portable radiation monitoring equipment. Prior to entry the area is surveyed, and any movement of material is monitored.

3. Inventory

Inventory of nuclear materials in the Magazine will be made at least on a monthly basis. The Accountability Representative will perform the inventory. Inventory will be conducted in accordance with procedures as stated in Nuclear Procedures Control Manual MND-1069, revised July 1959. MBA books will be maintained in the Vault Annex.

4. Emergency Procedures

In the event of any emergency occurring at the location, the following departments should be contacted:

Security Department - Ext. 280, 730
Health Physics Dept. - Ext. 9517, 9518

70-58
File Cy

Nuclear Waste Storage Area

The Nuclear Materials Scrap Storage Area is to be located on Martin property on the south side of "D" Building and within the periphery security fence (see attached sketch). The area will consist of five thousand (5000) square feet of the present concrete pad and will be contained in a regular chain link fence, six feet high. An eight foot gate will be centered on the north side and will be secured by a chain and padlock.

Scrap SS and By-product solutions and solid compounds will be stored in a 55-gallon steel drum or equivalent. Burnable low level wastes if to be shipped away for disposal will be bailed and packed in containers and protected from the weather by water-proof coverings.

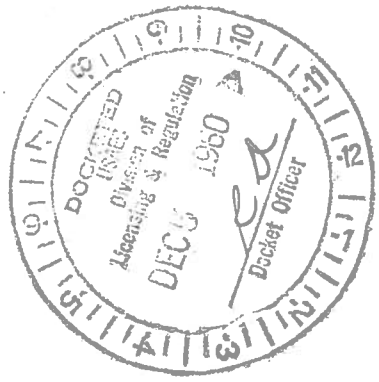
Storage of waste will be in accordance with criteria presented in TID-7019, TID-7016 and Title 10 Code of Federal Regulations Parts 20 and 70. The area will provide storage for up to one hundred (100) kilograms of contained U-235.

Both License and Contract SS material and By-product as scrap will be stored prior to shipment to other contractors for recovery or disposal purposes. Scrap will be segregated by project and type clearly labeled on each storage drum.

All waste packaging for shipment is checked to insure compliance with regulations in Title 10, Parts 20 and 71, Code of Federal Regulations and ICC Regulations (including Bureau of Explosives Permits when necessary.)

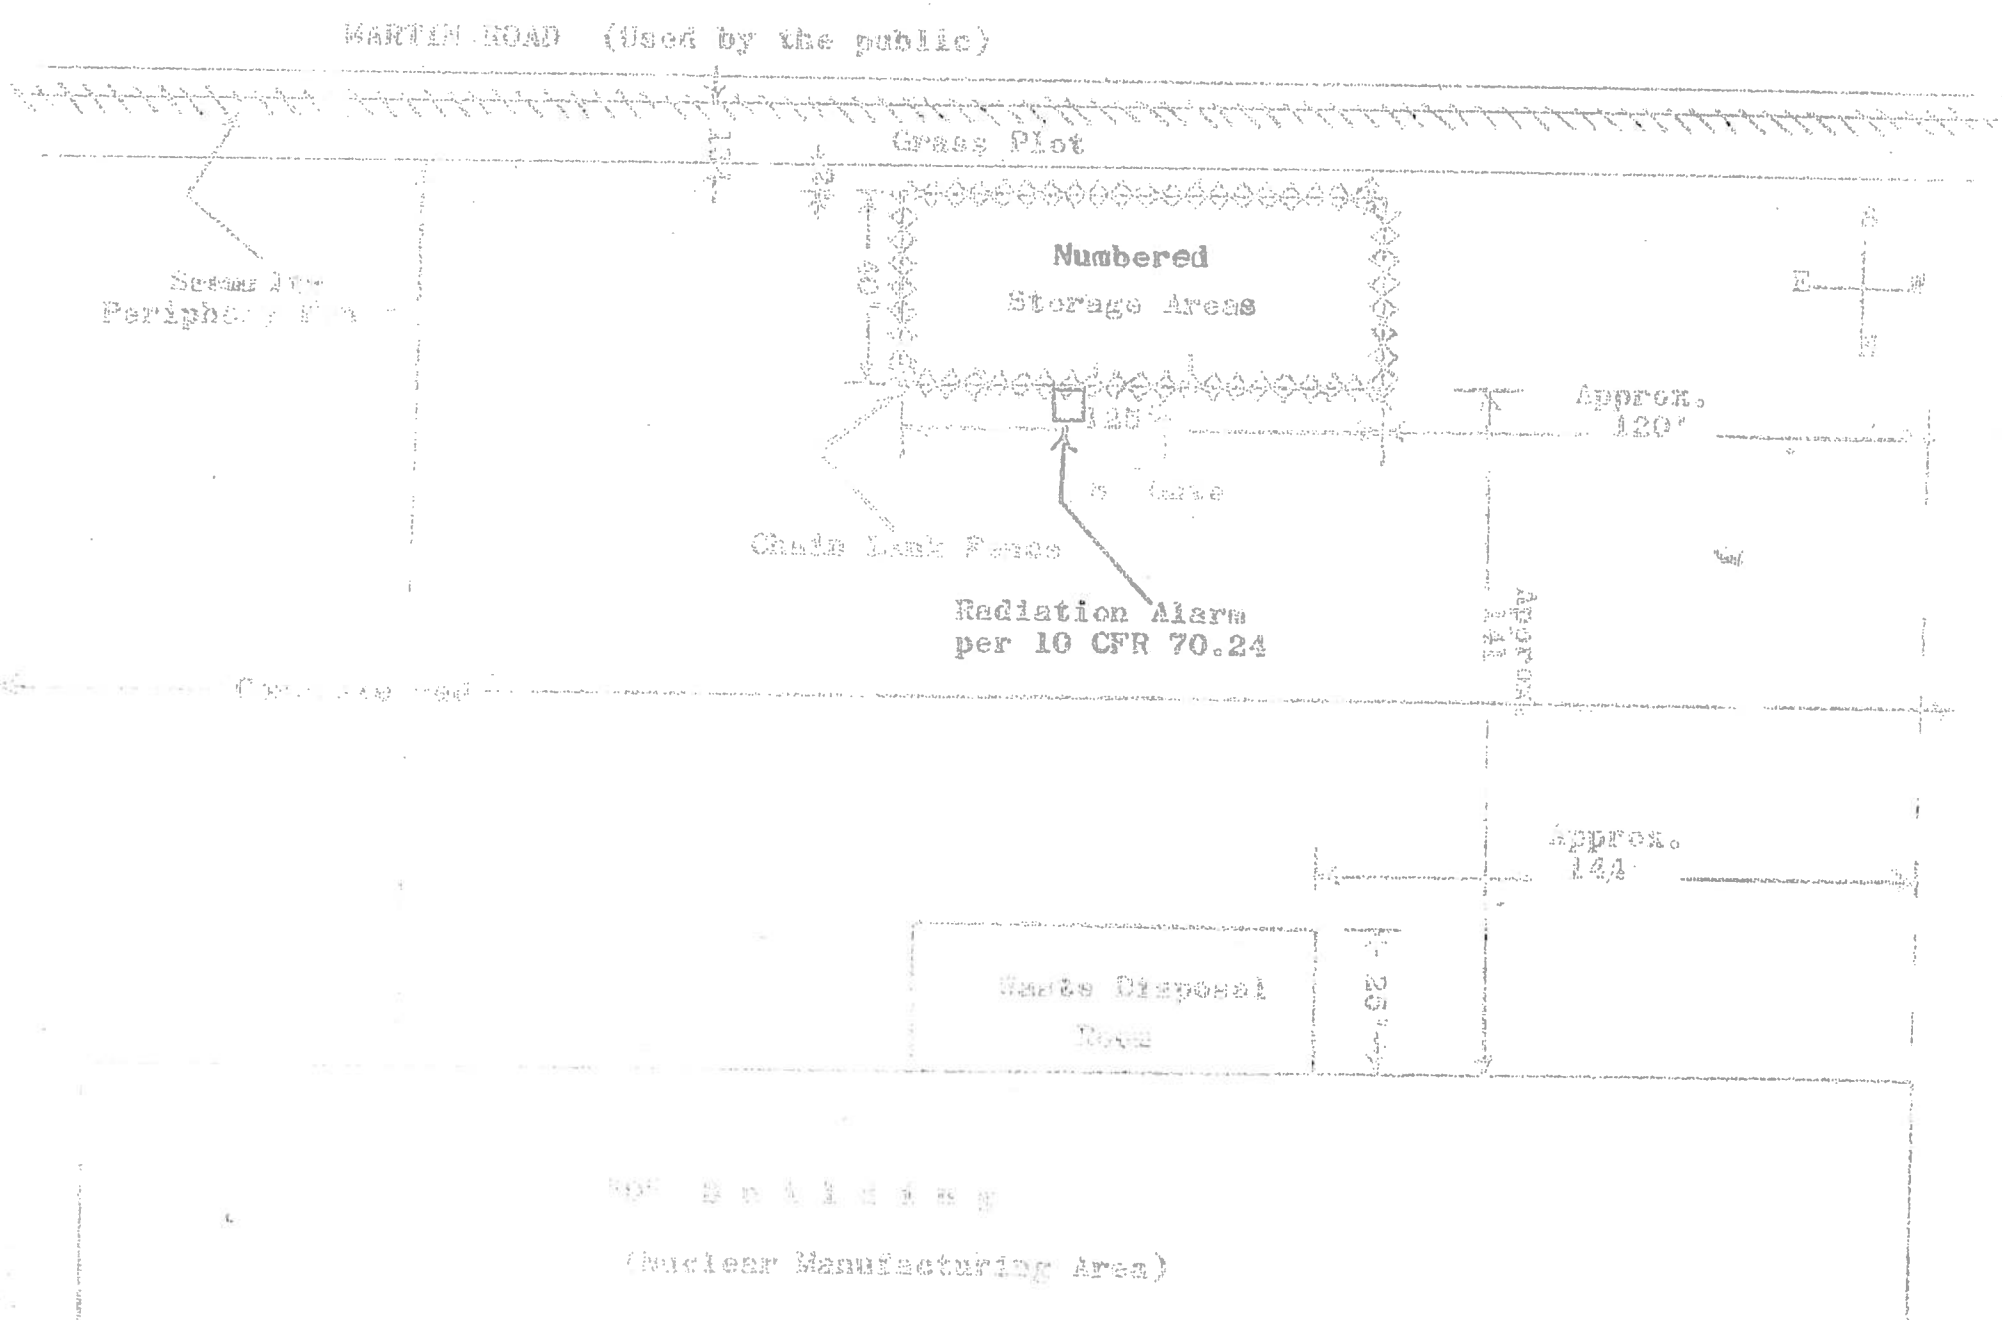
Storage of SS materials and quantities will be restricted to fall within the definitions and limits of Inaccessible and/or Workable forms. This facility will be added to the regular guard clock patrol assuring observation at least once each hour.

Administrative control of this storage area will be maintained according to the attached procedure entitled "Regulations for Control of Waste Storage Area".



Enclosure 2

PROPOSED NUCLEAR WASTE STORAGE AREA



REGULATIONS FOR CONTROL OF WASTE STORAGE AREA

The following procedures are to be followed for transfer of nuclear material within the storage area, periodic inventories, and any emergencies occurring at the storage location.

1. General

The specific purpose of the area is to provide storage for Special Nuclear and By-Product material waste. Control of the area has been delegated to the Accountability Representative who will physically control all access to the area. The combination for the 3-way lock will be kept by the Accountability Representative. The following personnel should be contacted in this order for admittance: (Line supervision control)

R. L. Metzger (Accountability Representative) Ext. 9725
Badge No. 1170-82304

W. W. Wachtl (Chairman, Nuclear Materials Control Committee) Ext. 8203
Badge No. 1170-83724

J. V. Loppert (Operations Manager) Ext. 8281
Badge No. 1170-82060

2. Storage and Transfer of Materials

Physical movement will be preceded by application to the Accountability Representative. The Accountability Representative will review all applications for movement of SS or By Product material within the area with the Nuclear Materials Control Committee, consisting of Health Physics, Criticality, Security, Accountability and Waste Control. Regulatory measures include control of material by type, quantity and segregation in the area by numbered sub-areas.

3. Inventory

Inventory will be conducted in accordance with procedures as stated in Nuclear Procedures Control Manual MND-1069, revised July 1959. MBA books will be maintained by the Waste Control chemist.

4. Emergency Procedures

In the event of any emergency occurring at the location the following departments should be contacted:

Security Department, Ext. 280, 730
Health Physics, Ext. 9517, 9518

Clifford K. Beck, Assistant Director
Nuclear Facilities Safety

THE MARTIN COMPANY - December 1, 1960 - Docket 70-58

Please refer to your December 5, 1960 memorandum, forwarding the subject application for review.

The Martin Company wishes to convert several munitions bunker cells into special nuclear material storage vaults. The new area has already been approved for this purpose by the New York Operations Office, and we have no objection to this site.

However, we wish clarification of several phases of the Martin application, as follow:

1. The application merely states that up to 75 kg of contained U-235 will be stored in each of three bunkers, and in accordance with safety guides and regulations. However, in order to complete our evaluation, we must have detailed information on the nuclear material to be stored, to include quantity, physical description, storage geometry, moderator content, etc. The applicant must further demonstrate the critical safety of such materials, as regards both the individual units and the storage arrays of such units, by specific references to reliable data, nuclear safety guides, or by calculation.

2. Martin states that a radiation alarm system will not be installed in the proposed vault area, in view of remoteness of location, shield properties, and other considerations. From examination of a photograph of the facility, it is evident that the bunkers are vented and are located adjacent to a populated area and a waterway. For both the safety of the community and personnel who may be within the bunkers, we feel that detection chambers should be placed within each of the bunkers and connected to an alarm system.

3. In addition to the bunker-vault storage area, Martin proposes an outdoor, fence-enclosed concrete storage pad for scrap nuclear materials. A sketch of this area shows it to be within 15 to 20 feet of a public road. Martin merely states that it wishes to store up to 100 kg of U-235 scrap in 55-gallon drums, in accordance with safety guides and regulations. Again,

(continued)

Memorandum

TO : Joseph Delaney, Chief
Nuclear Materials Branch

DATE: FEB 1 1961

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch CDL

SUBJECT: THE MARTIN COMPANY - December 1, 1960

Please refer to my memorandum of January 12, 1961, on the above subject. Subsequent to that date, Mr. W. W. Wachtl, Chairman of the Martin Company's Nuclear Materials Control Committee, visited us to further discuss their application. To confirm the position we took at that meeting, we suggest that the following be included in your reply to the Martin application:

"In order to continue the review of your application, the following information is required concerning your proposal to convert an ammunition bunker to a nuclear materials and finished product storage area:

"(1) A description of special nuclear materials to be stored in the bunker, with as much detail as possible. This description should include the chemical and physical state of the materials (eg., UO_2 powder, apparent density 3.2 grams/cm^3); their isotopic content (eg., 93% U-235); moderator content or ratio (eg., 0.1% H_2O, or H/U-235 < 2); data pertaining to other materials which may be present or intermingled (eg., aluminum alloyed with uranium to the extent of 20% U-80% Al by weight); and geometry of individual pieces (eg., ½" pellets, 3" x 24" x 0.020" plates, etc.).

"(2) A description of the individual storage units of special nuclear material, their containers, and birdcages. This should include, for each type of unit, mass and other pertinent data for special nuclear material, and container and birdcage dimensions and structural details.

"(3) The number of individual storage units described in (2) above that comprise an array, and their spacing or arrangement within the array. Further, the number and arrangement of such arrays within the bunker.

"(4) Justification, from the viewpoint of critical safety, of both the individual storage units described in (2) and the arrays described in (3), while taking into account whether or not accidental moderation by flooding is credible.

(continued)

A177

This justification should cite applicable criteria for critical safety (such as mass or volume control) and an evaluation of how the proposed storage procedures will satisfy such criteria.

"(5) Despite the fact that the bunkers are well shielded by earth and concrete, and will be under the close surveillance of your Accountability Representative, we feel that a radiation monitor alarm system should be provided, for the safety of personnel who may be in the area. Further, since the bunkers are vented and located on a waterway, the public safety is also involved.

"With regard to the nuclear waste storage area proposed in your application, the same type of information described in items (1) through (4) above is required. In addition, justification of nuclear safety should take into account the consequences of an inadvertent criticality at your selected site, which is in proximity to a public thoroughfare.

"We recognize that it is often difficult to provide descriptions, such as those we have outlined in items (1) through (4), when the nature of materials to be stored will be largely determined by activities now unforeseen. However, if the safety criteria were clearly delineated over a reasonable range, it is quite possible that a variety of materials or arrangements could be justified."

OPTIONAL FORM NO. 10
5010-104

UNITED STATES GOVERNMENT

Memorandum

TO : Joseph Delancy, Chief
Nuclear Materials Branch

DATE: FEB 17 '61

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch CDL

SUBJECT: THE MARTIN COMPANY - January 17, 1961 - Docket 70-58

Please refer to your memorandum of January 30, 1961, forwarding the subject application for review.

The Martin Company proposes to fabricate uranium-aluminum alloy fuel plates. In all identified manufacturing areas, they have invoked mass limitation as the means for prevention of criticality. The masses in any one such area would be safe even in the event they were arranged in the most reactive configuration, water moderated and reflected.

We therefore have no objection to this application.

DATE: February 20, 1961

FROM : J. J. Lane

SUBJECT: MARTIN COMPANY APPLICATION DATED JANUARY 17, 1961, FOR AMENDMENT TO LICENSE SNM-53 - DOCKET NO. 70-58

LJL:JJL

ANALYSIS AND FINDINGS

By application dated January 17, 1961, Martin Company requests amendment to License SNM-53 to authorize an increased U-235 limit in the melt and ingot processes during fabrication of U-Al fuel plates.

Based on our review of the information submitted by the applicant, it is hereby determined that their license SNM-53 may be amended to authorize an increase in the U-235 quantity during melt and ingot processing steps.

UNITED STATES
ATOMIC ENERGY COMMISSION

SPECIAL NUCLEAR MATERIAL LICENSE

Pursuant to the Atomic Energy Act of 1954 and Title 10, Code of Federal Regulations, Chapter 1, Part 70, "Special Nuclear Material Regulations," a license is hereby issued authorizing the licensee to receive and possess the special nuclear material designated below; to use such special nuclear material for the purpose(s) and at the place(s) designated below; and to transfer such material to persons authorized to receive it in accordance with the regulations in said Part. This license shall be deemed to contain the conditions specified in Section 70.32(a) of said regulations, and is subject to all applicable rules, regulations, and orders of the Atomic Energy Commission now or hereafter in effect and to any conditions specified below.

Licensee

1. Name The Martin Company

2. Address Baltimore 3, Maryland

[illegible]

3. License No.

[illegible], as amended

4. Expiration Date

April [illegible], 1963

5. Docket No.

70-58

6. Special Nuclear Material

Uranium enriched in the U-235 isotope, and plutonium

7. Maximum quantity of special nuclear material which licensee may possess at any one time under this license [illegible] kgs U-235 contained in uranium enriched in the U-235 isotope as UO_2 and metal, 160 grams Pu-239 as an encapsulated Pu-Be neutron source, and .7 milligrams Pu-239 as a Pu-alpha source.

8. Authorized use In accordance with the procedures described in the licensee's applications dated Oct. 11 and Oct. 26, 1956; applications executed Dec. 6, 1957, and Jan. 15, 1958; procedures filed Dec. 16, 1958; applications dated March 23, June 17, 1960; and Jan. 17, 1961, [illegible]

9. Quantity of special nuclear material allocated to licensee pursuant to Section 70.31(b) of said part

None herein allocated

CONDITIONS

10. Unless otherwise specified, the authorized place of use is the licensee's address stated in Item 2 above.

Place of use: Licensee's Middle River Plant, Maryland

For the U. S. ATOMIC ENERGY COMMISSION

Date of issuance [illegible] 2/24/61

Subject: Source Material License C-4283

Gentlemen:

Pursuant to the provisions of Section 40-26 of The Code of Federal Regulations, Title 10 - Atomic Energy, Chapter 1, Part 40, The Martin Company requests that the subject license be revised to increase the amount of Thorium-Magnesium Alloy (containing not more than 4% Thorium) from 100,000 pounds to 150,000 pounds. It is further requested that the expiration date be extended from September 30, 1961 to September 30, 1962.

Gentlemen:

Receipt is acknowledged of your request of March 9, 1961, for an amendment to License C-4283.

Enclosed is a copy each of AEC Regulations 10 CFR 20 and 10 CFR 40 entitled "Standards for Protection Against Radiation" and "Licensing of Source Material", respectively. Compliance with Part 20 is made a condition of all material licenses issued by the Commission.

In addition to the information you have submitted, we require the following information which should be submitted in letter form, in quadruplicate. (1) The maximum quantity of source material you wish to possess at any one time. (2) A detailed description of the activities you will perform. (3) The procedures you intend to employ in safeguarding employees against dust and contamination exposure through the escape of radioactive materials in the use of such material. (4) A general description of the types of instruments you have available to perform necessary health and safety surveys and the surveys that will be conducted. (5) If waste products are anticipated, the volume and concentration of radioactive materials and the method by which you intend to dispose of this waste.

Very truly yours,

J. C. Delaney
Chief, Nuclear Materials Branch

Division of Licensing & Regulation
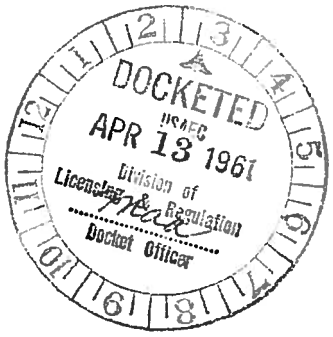
Docket Officer



U. S. Atomic Energy Commission
Division of Licensing & Regulation
Washington 25, D. C.

Attention: Mr. J. C. Delaney,
Chief Materials Section
Licensing Branch

Subject: Source Material License C-4283

Reference: a) USAEC Letter 40-3296 L & R:ND dated March 31, 1961

b) Martin Letter LSS-4 dated March 9, 1961

Gentlemen:

In accordance with reference (a) we submit additional information for your use in consideration of the requests stated in reference (b) concerning the subject license.

Reference (b) requests a limitation of procurement quantity at 150,000 pounds. The Martin Company has, since inception of the subject license procured 100,000 pounds of Thorium-Magnesium alloy in various sheet stock sizes. A review of our perpetual inventory records indicate that there are approximately 10,000 pounds of material currently in Stores. This material in various sheet stock sizes has been procured for use as outer skins for Titan I Missiles. This material will also be required for use in Research and Development for missile applications.

Martin Procurement is currently holding unplaced Purchase Requisitions totaling 6600 pounds. No attempt has been made to inventory the Work-In-Process or Finished Product in Storage. Such an inventory would be extremely difficult to obtain, due to the vast manufacturing, assembly and storage areas existing at the Martin Company. We estimate that 15,000 pounds of material is in process and in finished product. A summary of material in possession or to be ordered is as follows:

A/83

O.K.
D.F.H.

Nick - refer them to Section 23.103 in your cover letter

In Inventory	10,000 pounds
Unplaced Purchase Requisitions	6,600 pounds
Work in-process and finished product (estimated)	15,000 pounds
Total	31,600 pounds

Answers to your specific questions 1-5 are as follows:

1. On the basis of the new requirement for possession limits a possession limit of 100,000 pounds is requested.

2. Activities to be performed:

   a. Shearing
   b. Drilling
   c. Forming

      1) Bend on brake
      2) Hydroform press
      3) Stretch form
      4) Marform
      5) Drop hammer form
      6) Punch press

   d. Machining

      1) Skin milling
      2) Routing

   e. Burring and Grinding

      1) Belt sander

   f. Cleaning

      1) Vapor degreasing - Trichlorethylene
      2) Alkaline cleaner
      3) Rinse
      4) Chromic acid pickle

   g. Assembly

      1) Rivet
      2) Shielded Heli-arc welding

h. Protective coating

1) Dichromate treatment
2) Zinc chromate primer
3) Enamel

3. Procedures for personal safety are attached as Appendix 1.

4. A description of survey equipment is attached as Appendix 2.

5. Waste products consisting of chips, clippings, dust, offal, etc., is accumulated up to 3000 pounds maximum. Waste is stored in a secured area and is sold to a licensed scrap dealer. Disposal occurs at 6 to 10 months intervals. Solution samples are submitted periodically for Health Physics analysis. Concentration has been low enough to permit disposal into the sanitary sewer system.

Internal control of Magnesium-Thorium is described in Martin Baltimore Product Procedure Number OP-B4.104, attached as Appendix 3.

Should you have any further questions, please do not hesitate to contact us.

Very truly yours,

THE MARTIN COMPANY

J. V. Loppert,
Licensing Officer
Nuclear Division

Appendix 1

MAGNESIUM-THORIUM HANDLING PROCEDURES - HEALTH PHYSICS ASPECTS

1. Health Physics will inspect and report specifically on any new process or location involving this material.

2. Injuries involving this material will receive immediate attention of the Medical Department (as should all injuries) with notice to Health Physics and special effort to remove splinters, etc.

3. Standard procedures will be used in any operation to confine and remove dust, filings, etc. This is necessary because of the fire hazard of the magnesium and to prevent the accumulation of even these small amounts of radioactive material.

4. In general, the welding of Magnesium-Thorium will require respiratory protection or a well designed local exhaust.

5. The local ventilation provided for pickling baths, etc. will suffice in general for protection against radioactive material from these baths. Respirators are relatively ineffective against chemical vapors.

Appendix 2

HEALTH PHYSICS SURVEY INSTRUMENTS

Listed below are descriptions of the types of instruments available to perform necessary health and safety surveys and the surveys to be performed.

Instrument	Radiation Detected	Manufacturer	Type	Use
G.M. Survey Meter	Beta-Gamma	Nuclear-Chicago Model No. 2612	Geiger Muller	General Survey
G.M. Survey Meter	Beta-Gamma	Eberline Model E-500B	Geiger Muller	General Survey
Scaler-Detector	Beta-Gamma	Tracerlab Model No. 1000	Geiger Muller	Counting Smears & Air Samples
Scaler-Detector	Alpha	TMC & NRD Detector	Scintillator	Counting Smears & Air Samples
Alpha Survey Meter	Alpha	Eberline PAC-1SA	Scintillator	General Survey
Alpha Survey Meter	Alpha	Eberline PAC-3G	Gas Proportional	General Survey
Air Sampler	-	Gast	Air Pump	Collection of Air Samples

Surveys are conducted at storage locations and work areas to measure radiation levels and levels of surface and air contamination to employees in the vicinity.

☒ PRODUCT PROCEDURE	ISSUED 9-15-60
	PAGE 1 OF 2

SUBJECT: MATERIALS, MAGNESIUM-THORIUM - CONTROL OF

REMARKS This procedure establishes the method of handling and processing alloys of Magnesium-Thorium containing 4% or less Thorium.

This procedure establishes that:

1. Materiel & Procurement shall purchase and identify Magnesium-Thorium material upon receipt and shall store and maintain a record by weight of all material purchased, in stock, and issued.
2. Manufacturing shall control all Magnesium-Thorium in process through the use of colored and stenciled Shop Order folders, color coding material, special notes, and instructions on the Process Planning Sheets, special handling of offal and work in process, special disposition of scrap and color identification spots on finished parts.
3. Quality shall inspect incoming material, check identification and notify Conservation whenever Magnesium-Thorium scrap is generated as a result of rejected material or parts.
4. Health Physics shall monitor the handling, storage, manufacturing operations and scrap disposition of Magnesium-Thorium to ensure the safety of personnel and proper handling of material.

Atomic Energy Commission approval of this procedure has been obtained by the Legal Department.

Additional copies of this Product Procedure may be obtained by calling Extension 9295 or 9327.

D. J. Desandro
Management Studies

Reference: Standard Process - P75007

PROCEDURE

I Materiel & Procurement

A Specify in the purchase of all Magnesium-Thorium materials that material must be so designated and that all shipping papers must be marked with the net weight of the material.

B All Magnesium-Thorium material in STORES must be properly designated and may not be mixed with other types of materials.

C Keep stock records on all orders, receipts, and issues, returns and excess materials.

D Initiate Inventory Schedules or Excess Lists on obsolete, canceled, and terminated raw sheet stock.

II Manufacturing Planning

A Flag all primary data sheets where there are detail parts to be made from Magnesium-Thorium.

B Mark each page of the Process Planning Sheets in bold letters - "MAGNESIUM-THORIUM".

C Provide the following note in first step of the process plan:

"After each operation that requires removing material such as cuttings, chips, or residual remnant material, clean machine and floor thoroughly and put all cuttings, chips, and residual material in designated Magnesium-Thorium container. All offal 8" x 10" or larger is to be returned to STORES."

D Include in the process plan a step requiring that all completed parts be identified with a Magnesium-Thorium identification spot.

III Production Control

A Provide special colored and stenciled Shop Order folders marked "MAGNESIUM-THORIUM" to identify detail parts that are to be made from Magnesium-Thorium alloy.

III (Cont'd)

B Deliver Magnesium-Thorium materials with the color coded Magnesium-Thorium folder to DETAIL MANUFACTURING.

C Have all parts moved as an integral package - do not permit losses of material due to rejections, split folders, or other reasons.

D Process rework or scrap on details and assemblies resulting from Engineering design changes to maintain segregation of material.

E Initiate Inventory Schedules or Excess Lists on obsolete, canceled, and terminated parts in process and completed assemblies.

IV Factory

A Handle Magnesium-Thorium in accordance with instructions in the process plan, Safety Bulletins, and instructions of the Health Physics representative.

B Account for all material and parts as finished parts, rejected parts, scrap, or offal.

C Return offal 8" x 10" or larger to STORES.

V Conservation

A Provide containers for Magnesium-Thorium material, cuttings, trimmings, clippings, and floor sweepings.

B Store Magnesium-Thorium material until sufficient quantity is available for shipment to a designated scrap dealer.

C Package the Magnesium-Thorium in containers to ensure against loss.

D Weigh all scrap and maintain a record of the weight of scrap sold.

NOTE: All rejected parts, scrap, offal, or surplus materials will be kept separate from other materials and will be disposed of only to a licensed scrap dealer in accordance with normal excess and scrap disposition procedure.

VI Quality

A Inspect incoming material and assure that the required Magnesium-thorium material is received and identified.

B Any Magnesium-Thorium required for test purposes must be disposed of in Magnesium-Thorium scrap containers.

C Notify CONSERVATION whenever scrap is generated as a result of rejected material or parts, indicating the contract number involved.

VII Health Physics - Safety

A Monitor the handling of Magnesium-Thorium as required to assure that prescribed safety measures are followed and that no health hazards exist. In particular, monitor all operations involving welding, grinding, polishing, etc., to ensure that no harmful fumes or dusts are present in work areas.

B Periodically monitor scrap metal containers as required, to prevent accidental mixing of Magnesium-Thorium with other materials.

DATE: AUG 4

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch CDL

SUBJECT: MARTIN CO. APPLICATION DATED JULY 20, 1961, FOR AMENDMENT OF SNM-53 (70-58)

Please refer to your memorandum of July 31, 1961, regarding the subject application.

The Martin Company requests amendment of their special nuclear materials license to permit processing of highly enriched uranium oxide powder to a spherical form. They propose to employ mass control, based on optimum moderation (300g UO_2 limit), for all operations excepting their drying ovens where limited moderation is assumed (600g limit). The total operation will be limited to less than 4000g of UO_2 material in process at one time. These procedures are satisfactory for prevention of nuclear criticality.

Gentlemen:

The Martin Company is in the late stages of concluding arrangements for consolidation with the American-Marietta Company to form a new corporation to be known as Martin-Marietta Corporation. The new corporation will be incorporated under the laws of the State of Maryland and its address will be Box 988, Baltimore 3, Maryland. We request that you grant authority for the transfer of the above described licenses from The Martin Company to the Martin-Marietta Corporation.

The stock of the new company will be listed on the New York Stock Exchange and the predominant ownership and control will be by American citizens.

It is expected that the consolidation will be effective on October 10, shortly after which time you will receive the request from the new corporation to receive the licenses. The existing operations will continue unchanged in the name of the new corporation. The health and safety requirements, the nature of the operations, and the general management of the programs for which the licenses were issued will be in no way effected by the consolidation. I am enclosing herewith, three copies of the Proxy Statement which has been issued to all stockholders which, in effect, confirms this fact. I refer you to pages 20 through 22 for information as to the officers

A/90

and directors and advise you that they are all citizens of the United States. I also refer you to page 13 and succeeding pages for the proforma combined summary balance sheet giving effect of the consolidation and other financial information.

We shall appreciate your prompt consideration of this request for permission to transfer the licenses.

Very truly yours,

W. L. Lucas
Secretary

JTE/ab

Gentlemen:

Reference is made to The Martin Company's letter of October 10, 1961 requesting your consent to the transfer of the licenses described above from The Martin Company to Martin-Marietta Corporation.

You are advised that the consolidation described in the above referenced letter has been accomplished and your assent to the previously requested transfer is now requested in the name of Martin-Marietta Corporation.

Very truly yours,

W. L. Lucas
Secretary and Treasurer

UNITED STATES GOVERNMENT

Memorandum

TO : Files

FROM : Frances K. Durkan
Criticality Evaluation Br.

DATE: March 23, 1962

SUBJECT: VISIT FROM THE MARTIN COMPANY TO DISCUSS AMENDMENT OF LICENSE SNM-53 (DOCKET 70-58)

Participants: The Martin Company - Bill Wachtl and Ed Scicchitano
DL&R: Dr. Charles D. Luke, Bill Layfield, Frances Durkan

Reference: LICENSE REPORT MND-2603, dtd 7/18/61

The Martin Company outlined their proposed operating procedure changes involved in the fabrication of spherical uranium dioxide sintered powder. Only two steps in the process flow will be affected.

Formerly, the two intermediate process steps were as follows:

1) A 300 gram batch of UO_2 material is transferred to the spheridizing apparatus and manufactured into spherical UO_2 powder;

2) After manufacturing, the spherical powder is washed in a 3" diameter stainless steel pipe with approximately six liters of water cycled through an inline filter and then the holdup water, removed in a centrifugal filter.

The operating procedure approved for these steps in the process flow specified that one batch of 300 grams must be completely through the manufacturing, washing and filtering steps and the whole system cleaned before another batch could be processed.

In the interest of economy and production, The Martin Company wishes to incorporate the following operational procedure change as a license amendment:

Transferral of UO_2 to spheridizing and washing apparatus (extended to include two spray wash towers, an absolute air filter, an 8 1/2" x 12" water filter, 3 1/2" x 8" water trap, 4 3/4" x 42" heat exchanger, and two pumps) in 100 gram lots of 300 gram batches. The total feed not to exceed 1400 grams between wash down of apparatus and filter change. Experience has shown an 80% yield from each 100 g lot of UO_2 introduced into the apparatus with the 20% residue

A194

distributed between the absolute air filter and the water filter, the former collecting slightly more of the residue.

The Martin Company suggested establishing the H_2O filter as the determining unit. Administrative control would restrict the accumulation of UO_2 residue to not more than 280 grams before clean-up. This 280 g maximum corresponds to a total of 1400 grams of feed material assuming the H_2O filter accumulates the total 20% residue from each 100 g lot of feed material. Strict administrative control will be enforced as regards the absolute air filter which in reality is accumulating slightly more than half of the residue from each 100 g of UO_2 lot introduced into the apparatus. The middle filter of the 3-tier absolute air filter will be removed along with the water filter when the control sheets indicate a 280 gram UO_2 residue accumulation in the H_2O filter. The absolute air filter which has a 500 gram accumulation capacity becomes ineffective when saturated (point at which H_2O filter record indicates a 280 gram accumulation) and must be removed for drying, hence, a double check on administrative controls is inherent. The air filter may be reused after drying until its useful life has expired (point at which its total accumulation = 500 g UO_2). The air filter accumulation will be accurately recorded by calculating the difference between feed introduced and amount of residue collected on water filter. When the control sheets indicate 500 g UO_2 accumulation, the air filter will be replaced.

The schedule proposed by Martin will insure that no more than 370 g fully enriched oxide (300 g U-235) can be accumulated with water in any piece of the equipment (limit is 500 g for air filter - see above). The following table will illustrate the operating schedule:

	Feed Addition	Product*	Accumulated Collection in Water Filter
	300 g	240 g	60
	300	240	120
	200	160	160
	200	160	200
	100	80	220
	100	80	240
	100	80	260
	100	80	280 **
Total	1400 g	1120 g	

* Remove after each feed addition.

** At this point, shut down and clean out all equipment, since another 100 g feed may go into water filter and exceed 370 UO_2 limit. Dry and weigh water filter elements and get exact weight. Get U-235 in air filter by difference. 500 g limit on air filter.

SUBJECT: MARTIN MARIETTA CORPORATION APPLICATION DATED MARCH 22, 1962 - DOCKET NO. 70-58

We have reviewed the subject application requesting approval of a process change in connection with the manufacture of spherical uranium dioxide powder.

We agree with applicant that the revised process will be safe from accidental criticality if carried out in accordance with the plans set forth in the application. No more than 370 grams of UO_2 to be collected in the wet system and no more than 600 grams of uranium dioxide will accumulate in the absolute air filter system.

We recommend approval of the application.

SUBJECT: AMENDMENT TO LICENSE SNM-53 FOR SHIPMENT OF URANIUM DIOXIDE STAINLESS STEEL CLAD FUEL PLATES TO ROME, ITALY - MAY 8, 1962 - DOCKET 70-58

Ref: DLR:FKD

Reference: (1) Report, MND-2789 dtd May 7, 1962
(2) Dwg., No. 1883-342

In response to your memorandum of May 11, 1962, we have reviewed the subject application.

The Martin Marietta Corporation proposes to ship to Comitato Nazionale Per L'Energia Nucleare, fuel plates which are UO_2 stainless steel cermet stainless steel clad. The plates consist of approximately 22 weight percent UO_2 enriched to 89.85 ± .15 weight percent U-235. It is planned to pack 75 of the described fuel plates (3.06 kgs U-235) in each of the 14 containers required for the total shipment of 1,000 fuel plates (41.8 kgs U-235).

The shipping containers will be made from 55-gallon, 18 gauge steel drums. The fuel container will consist of 4" I.D. Schedule 40 pipe, 44" in length centered in the drum thus insuring a 9" spacing between the fuel container and the drum wall. Structural integrity and stress analysis have been referred to Mr. Chris Beck for evaluation.

The shipping container and shipping procedures are considered safe in accordance with the recommended nuclear safety limits given in Table IV and Figure 23 of TID-7016, Rev. 1.

The fuel plates will be loaded in the shipping container at the Martin Marietta Corp., Baltimore, Maryland and to guarantee against commingling, shipment will be via exclusive-use of a common carrier van to Idlewild Airport where the fuel will then be transferred and shipped via Alitalia Airlines to Rome, Italy.

(Continued)

A/100

We have no objection to the shipping container and shipping procedures as proposed. However, prior AEC approval must be obtained for future shipments other than the one described herein.

UNITED STATES GOVERNMENT

Memorandum

TO : Donald A. Nussbaumer, Chief
Source & Special Nuclear Materials Br.

DATE: June 14, 1962

FROM : Frances K. Kirkham for
Charles D. Luke, Chief
Criticality Evaluation Br.

SUBJECT: MARTIN MARIETTA CORP. APPLICATION TO AMEND LICENSE SNM-53 TO INCREASE MASS LIMITS OF ENRICHED URANIUM DIOXIDE POWER IN BLENDING OPERATION FROM 800 GRAMS U-235 TO 3.5 KGS CONTAINED U-235. MAY 3, 1962 - DOCKET 70-58

Ref: DLR:FKD

Reference: (1) Report MND-2603 dtd 7/18/61
(2) Ltr fm Martin Marietta to USAEC-DLR dtd 5/3/62
(3) Report MND-2788 dtd 5/2/62

In response to your memorandum of May 8, 1962, we have reviewed the subject application (references 2 and 3).

The Martin Marietta Corporation requires a larger blended batch (3.5 kgs contained U-235 in the form of highly enriched uranium dioxide power) for reasons of (1) accuracy in sampling, and (2) maintenance of specified particle distribution prior to breakdown from outside vendor birdcage to permissible storage limits.

The blending will be accomplished in the manufacturing area in ventilated hoods and no other special nuclear material will be present in this area during the sequence of the blending process. The elbow blender is an L-shaped construction, 3 3/4" in diameter. The wall thickness of the 8" long, stainless steel tubular arms, is 1/16".

In view of the fact that the 3 1/4" diameter blender has a total capacity limit of approximately 2.2 liters, the process is considered safe and within the nuclear safety limits of Figures 2 and 3 of TID-7016, Rev. 1. In addition, 3.5 kgs of contained U-235 in the form of compounds or mixtures is a safe mass with $2 < \frac{H}{X} < 20$, according to Table IV of TID-7016, Rev. 1. Assuming limited moderation, the resultant $\frac{H}{X}$ ratio is less than 20 for the subject material.

We recommend approval of the subject application as proposed.

SHIPMENT OF FUEL PLATES TO ROME, ITALY, LETTER FROM MARTIN-MARIETTA CORP. DATED AUGUST 17, 1962

We have reviewed the subject letter from W. W. Wachtl of Martin Marietta Corp. concerning the proposed shipment of 1,000 fuel plates to Rome, Italy.

Shipment from Martin Marietta in Baltimore to Port of Embarkation has been approved under license SNM-53. These procedures, as amended by TWX of September 6, 1962, cover the packaging of 1,000 fuel plates in 17 containers with a maximum of 62 plates per container. The shipping container consists of a 4" I.D. 'Schedule 40' pipe, 44" in length, centered in a 55-gallon, 18 gauge steel drum. Subsequent to Mr. Chris Beck's evaluation, this container has been judged to meet AEC structural requirements. A single exclusive-use truck shipment had previously been approved for the subject transport to the Port of Embarkation. This approval was subsequently modified to permit multiple shipments by exclusive-use truck to enable Martin Marietta Corp. to deliver the 17 containers at the staggered rate of 9 containers one week, and the remaining 8 containers approximately one week later. For air transport to Rome, Italy one shipment from Martin Marietta will be further subdivided such that the total 17 containers will constitute 4 separate plane shipments.

We see no objection to the mode of transfer proposed, provided the Italians exercise supervision over the transport procedures to assure that the 4 subject shipments will not be commingled with other special nuclear material shipments during transport or at points of transshipment or delivery.

R. Handler, Enforcement Branch
Division of Licensing and Regulation

MARTIN-MARIETTA COMPANY
BALTIMORE, MARYLAND

B. Cavanaugh, CO, notified the writer October 9, 1962 of the following occurrence:

Region I, CO, was informed by Martin-Marietta Company, Baltimore, Maryland that its film badge supplier reported a badge reading in excess of 100 rem for a Dr. McKerney of the Metalgraphic Laboratory for the 13 week period just ended. The report from the film badge supplier indicated that the exposure was probably due to beta radiation or soft X-ray. According to the licensee, McKerney does not work in or have access to any area in which there is radiation that could cause such a reading on the film badge. It is the licensee's feeling that the exposure was caused by storing the film badge in a desk drawer with several enriched uranium samples. Martin-Marietta plans to conduct some experiments with the uranium specimens and other film badges to compare exposed film. Region I will await results of the licensee's experiment before taking any action on the matter. Examination of Dr. McKerney's blood indicated no abnormality. The employee concerned is working and feels no ill effects.

UNITED STATES GOVERNMENT

Memorandum

TO : Donald A. Nussbaumer, Chief
Source & Special Nuclear Materials Br.

DATE: November 23, 1962

FROM : Charles D. Luke, Chief
Criticality Evaluation Br. 602

SUBJECT: MARTIN-MARIETTA CO. AUGUST 17, 1962 APPLICATION REQUESTING AMENDMENT TO SNM-53 - FRESH PM-3A SHIPPING PROCEDURES - DOCKET 70-58

Ref: DLR:FKD

The applicant requests authorization to ship and receive two central core fuel bundles of the PM-3A Reactor.

The shipping container consists of a 3 1/2" Schedule 40 stainless steel pipe, 38" in length, centered in a 55-gallon, 18"gauge steel drum. Shipment of one fresh bundle of PM-3A fuel elements (93.2 w/o U-235 in UO_2 stainless steel cermet) will be transferred by exclusive use truck from Andrews Air Force Base to the Martin Company. After reworking, this bundle will be returned to Andrews Air Force Base and the second central fuel bundle will be shipped in an identical manner, round trip.

In view of the fact that the total U-235 per shipment will not exceed 602 grams U-235 in solid form, we are in agreement with the applicant that the shipment does not present a nuclear safety hazard. You may want Mr. Christian Beck to look over the design of this fuel bundle container, but we see no reason for requiring that this particular single shipping container meet the 30' drop test specifications.

APPLICATION FOR BYPRODUCT MATERIAL LICENSE

Form approved.
Budget Bureau No. 38-R027.4.

INSTRUCTIONS.—Complete Items 1 through 16 if this is an initial application. If application is for renewal of a license, complete only Items 1 through 7 and indicate new information or changes in the program as requested in Items 8 through 15. Use supplemental sheets where necessary. Item 16 must be completed on all applications. Mail three copies to: U. S. Atomic Energy Commission, Washington 25, D. C. Attention: Isotopes Branch, Division of Licensing and Regulation. Upon approval of this application, the applicant will receive an AEC Byproduct Material License. An AEC Byproduct Material License is issued in accordance with the general requirements contained in Title 10, Code of Federal Regulations, Part 30 and the Licensee is subject to Title 10, Code of Federal Regulations, Part 20.

1. (a) NAME AND STREET ADDRESS OF APPLICANT. *(Institution, firm, hospital, person, etc.)*

Martin-Marietta Corporation
Nuclear Division
Baltimore 3, Maryland

(b) STREET ADDRESS(ES) AT WHICH BYPRODUCT MATERIAL WILL BE USED. *(If different from 1 (a).)*

Middle River Plant
Middle River, Maryland

2. DEPARTMENT TO USE BYPRODUCT MATERIAL

Nuclear Components Department

3. PREVIOUS LICENSE NUMBER(S). *(If this is an application for renewal of a license, please indicate and give number.)*

Renewal of Byproduct Material License
No. 19-1398-19

4. INDIVIDUAL USER(S). *(Name and title of individual(s) who will use or directly supervise use of byproduct material. Give training and experience in Items 8 and 9.)*

C. E. Hollens
Glenn Schaeffer

5. RADIATION PROTECTION OFFICER *(Name of person designated as radiation protection officer if other than individual user. Attach resume of his training and experience as in Items 8 and 9.)*

Richard H. Boutelle

6. (a) BYPRODUCT MATERIAL. *(Elements and mass number of each.)*

A. Iridium 192

B. Cobalt 60

C. Thulium 170

D. Strontium-Yttrium 90

E. Any byproduct material between Atomic Nos. 3 and 83 inclusive

(b) CHEMICAL AND/OR PHYSICAL FORM AND MAXIMUM NUMBER OF MILLICURIES OF EACH CHEMICAL AND/OR PHYSICAL FORM THAT YOU WILL POSSESS AT ANY ONE TIME. *(If sealed source(s), also state name of manufacturer, model number, number of sources and maximum activity per source.)*

Sealed sources (Technical Operations Model A-424-1
Four sources not to exceed 50 curies each. Total 200 c.

Sealed Sources (Technical Operations Model A-424-2
Two sources not to exceed 10 curies each. Total 20 c.

Sealed Sources (Technical Operation Type A
120 curies, not to exceed 60 curies per source.

Sealed Sources (Tracerlab Model RA-2 or Model S-1)
300 millicuries, not to exceed 150 millicuries per source.

Irridiated tool tips and irridiated Hastelloy C
2 curies total

DUPLICATED
FOR DIV. OF COMPLIANCE

7. DESCRIBE PURPOSE FOR WHICH BYPRODUCT MATERIAL WILL BE USED. *(If byproduct material is for human use, Supplement A (Form AEC-313a) must be completed in lieu of this item. If byproduct material is in the form of a sealed source, include the make and model number of the storage container and/or device in which the source will be stored and/or used.)*

A. To be used in Technical Operations Models 412 or 498 exposure device for industrial radiography and in Technical Operations Model 414 source changer for source replacement and storage.

B. To be used in Technical Operations Model 402 exposure device for industrial radiography, and in Technical Operations Model 416 source changer for source replacement & storage.

C. To be used for instrument calibration, research and development, and industrial radiography.

D. To be used for instrument calibration and research and development programs.

E. To be used for laboratory studies of wear and corrosion.

MARTIN COMPANY

HPP-1 REVISION A JJB
August 28, 1962

GENERAL PROCEDURES FOR LEAK TESTING SEALED RADIATION SOURCES

I. Purpose

Sealed radiation sources are leak tested for the purpose of detecting faulty or damaged source encapsulation which would allow release of radioactive material to the environment thereby creating a hazard to working personnel and possibly the public.

II. Sealed Sources Utilized in Remotely Operated Radiographic Devices

A. General

The sources included in this section are all sealed radiography sources incorporated in remotely operated radiographic equipment.

B. Procedure

1. At the time of the initial survey of a new radiographic exposure device, the Health Physicist will designate the nearest accessible area(s) which makes intimate contact with the source. This appropriate measuring point(s) shall be used thereafter as the location to be inspected by the wipe technique.
2. Wipes shall be taken using a cotton swab attached to a wooden stick, ("Q-Tip"). The swab shall be dipped in acetone or alcohol prior to wiping the area(s).
3. The swab shall be placed in an envelope and taken to the Health Physics Laboratory for counting.
4. The dry swab shall be counted using a thin window geiger-mueller or gas flow proportional counter and associated scaler. The counter shall be sufficiently sensitive to detect contamination levels far less than those specified in 10 CFR 31.105.

DUPLICATED

5. Results of all radiographic source leak tests shall be recorded in the Health Physics Monthly Source Inventory Log in units of microcuries and maintained for future reference. In the event that activity is measured, its significance will be noted and a recommended course of action will be followed. If the activity measured equals or exceeds the limits specified in the Commission regulations, the source will immediately be removed from service and sealed in a container to prevent the spread of contamination. As soon as practicable, the leaking source will be decontaminated and repaired or disposed of in accordance with 10 CFR 20.301 and 31.105.

C. Hazards and Precautions

The main hazard associated with leak testing these sources is the possibility of the surveyor's hand becoming contaminated. Immediately after performing the test and sealing the swab in the envelopes provided, the person shall monitor his hands and thoroughly wash them, if necessary.

D. Test Frequency

All sources shall be leak tested upon delivery to the Plant. Thereafter, they shall be leak tested with a frequency depending upon utilization. The more frequently a source is used, the more frequently it shall be tested. However, all sources shall be tested at least once every six month and at any time at the request of a user. The testing frequency shall be determined by the Health Physicist.

DUPLICATED

E. Sensitivity

The test described above will detect down to 10^{-5}uc on a cotton swab.

F. Pertinent Experience of Personnel Performing Leak Testing

All Health Physics Personnel having demonstrated proficiency in the use and operation of all types of health physics survey and counting equipment and completed a minimum of 6 months on-the-job training will be assigned the task of leak testing radiation sources. Although some personnel have specialties within the scope of the health physics operations, every man must be able to perform all of the tasks required. This is done in order to establish a desirable degree of flexibility within the Health Physics Section. All leak testing will be performed under the Supervision of the Chief, Health Physics Section.

III. Sealed Sources Utilised in a Gamma Pool Facility

A. General

The sources included in this section are all sealed sources utilized in a pool type irradiator.

B. Procedure

1. a. Circulate the pool water using the circulation pump for 30 minutes prior to sampling in order to obtain a representative sample. Obtain a one (1) liter sample, after mixing, for analysis.

b. Alternate method for obtaining a representative sample in the event of power or pump failure, obtain three one (1) liter samples from the following depths:

(1) 4 feet below the pool surface.

DUPLICATED FOR DIV. OF COMPLIANCE

(2) 8 feet below the pool surface.

(3) directly above the source configuration

Mix the three samples together and pour off a one (1) liter composite sample for analysis.

2. Place the liter sample in a poly bag.

3. Take several smears on the floor area adjacent to the sampling location.

4. Transport both the liquid and smear samples to the Health Physics Laboratory for analysis.

5. Transfer the pool sample to an evaporation vessel, add 2 milliliters of 1 N-HNO_3 and evaporate same down to approximately 50 ml. Transfer the 50 ml volume to a smaller vessel, rinse the large vessel thoroughly with demineralized water ($\leq$ 10 ml) and continue the evaporation to 5 ml. Transfer the 5 ml sample to a counting planchet, rinse the evaporation vessel to insure complete transfer ($\leq$ 2 ml) and evaporate to dryness.

6. The evaporated sample shall be counted using a thin window geiger-mueller or gas flow proportional counter and associated scaler. The counter shall be sufficiently sensitive to detect contamination levels far less than those specified in 10 CFR 20.303.

7. The results of all leak tests shall be recorded in the Gamma Pool Shield Water Log in units of microcuries per milliliter and maintained as permanent records for future reference. The results of previous analyses shall be compared with the present sample analysis to determine continued source integrity allowing for the fluctuations caused by the deionizer or addition of new

DUPLICATED

sources. The Health Physicist shall be notified in the event that the activity measured approaches 1/10 the limit specified in 10 CFR 20.303. If the activity measured exceeds the limit specified in the Commission regulations, the sources will be isolated one at a time and analyses will be performed to determine which source has ruptured. As soon as the faulty source has been identified, it will be removed from service and sealed in a container to prevent further spread of contamination. The leaking source will either be decontaminated and repaired by persons specifically authorized to do so by the Commission or it shall be disposed of in accordance with 10 CFR 20.301.

C. Hazards and Precautions

The main hazard associated with leak testing these source is the possibility of the surveyor's hand becoming contaminated while sampling. Care shall be exercised not to drip pool water on the floor adjacent to the pool facility. Immediately after obtaining the sample and placing it in the poly bag, the surveyor shall monitor his hands and thoroughly wash them, if necessary.

D. Test Frequency

The Gamma Pool Shield Water shall be analyzed at least once every six months. Additional analyses are conducted on a schedule consistent with sound radiological safety practices to ensure protection against radiation.

DUPLICATED
FOR DIV. OF COMPLIANCE

IV. Sealed Sources Utilized in a Shielded Gamma Irradiator for Dry Sample Irradiation.

A. General

The sources included in this section are all sealed sources utilized in a shielded dry irradiator.

B. Procedure

1. At the time of the initial survey of a new gamma irradiator, the Health Physicist will designate the nearest accessible area (s) which makes intimate contact with the source. This appropriate measuring point(s) shall be used thereafter as the location(s) to be inspected by the wipe technique.
2. Wipes shall be taken using a cotton swab attached to a wooden stick ("Q-Tip"). The swab shall be dipped in acetone or alcohol prior to wiping the area(s).
3. The swab shall be placed in an envelope and taken to the Health Physics Laboratory for counting.
4. The dry swab shall be counted using a thin window geiger-mueller or gas flow proportional counter and associated scaler. The counter shall be sufficiently sensitive to detect contamination levels far less than those specified by the Commission.
5. Results of all dry irradiator source leak tests shall be recorded in the Health Physics Source Inventory Log in units of microcuries and maintained as permanent records for future reference. In the event that activity is measured, its significance will be noted and compared with previous test results to determine source integrity. If the activity measured equals or exceeds

DUPLICATED

the limit specified by the Commission, the source will immediately be removed from service and sealed in a container to prevent the spread of contamination. As soon as practicable, the leaking source will be decontaminated and repaired by persons specifically authorized to do so by the Commission or disposed of in accordance with 10 CFR 20.301.

C. Hazards and Precautions

The main hazard associated with leak testing these sources is the possibility of the surveyor's hand becoming contaminated. The person performing the test shall monitor his hands and thoroughly wash them, if necessary, immediately after performing the test and sealing the swab in the envelope.

D. Test Frequency

The shielded gamma dry irradiator assembly(s) shall be leak tested at least once every six months. Additional analyses are conducted on a schedule consistent with sound radiological safety practices to ensure protection against radiation.

V. Sealed Sources Utilized for Instrument Calibration, Reactor Startup, Density Gauging, Space Experimental Studies and Thermo-Electric Devices.

A. General

The sources included in this section are all licensed alpha, beta gamma and neutron sources used for instrument calibration, reactor startup, density gauging, space radiation simulation studies and thermo-electric devices.

B. Procedure

1. The Health Physicist will designate the area(s) on the source or the nearest accessible area(s) which makes intimate contact with the source at the time of the initial survey of a new source, or shield assembly containing a new source. The designated measuring point(s) shall be used thereafter as the location(s) to be inspected by the wipe technique.
2. Wipes shall be taken using either a Q-Tip dipped in acetone or a dry 4.25 cm chemical filter paper attached on an extension rod, if necessary.
3. The Q-Tip or filter paper shall be placed in an envelope and taken to the Health Physics Laboratory for counting.
4. The wipe(s) shall be counted using a thin window geiger-mueller or gas flow proportional counter and associated scaler. The counter shall be sufficiently sensitive to detect contamination levels far less than those specified by the Commission.
5. The results of all source leak tests shall be recorded in the Health Physics Source Inventory Log in units of microcuries and maintained as permanent records for future reference. In the event that activity is measured, its significance will be noted and compared with previous test results to determine source integrity. If the activity measured equals or exceeds the limits specified by the Commission, the source will immediately be removed from service and sealed in a container to prevent the spread of contamination. As soon as practicable, the leaking source will be decontaminated and repaired by persons specifically authorized to do so by the Commission, or

DECLASSIFIED
OR DIV. OF COMPLIANCE

disposed of in accordance with 10 CFR 20.301.

C. Hazards and Precautions

The main hazards associated with leak testing these sources is the potential exposure and possibility of the surveyor's hand becoming contaminated. The person performing the test shall exercise care to minimize his exposure and shall monitor his hands and thoroughly wash them, if necessary, immediately after performing the test and sealing the wipes in the envelope.

D. Test Frequency

All licensed sources shall be leak tested at least once every six months. Additional leak tests are conducted on a schedule consistent with sound radiological safety practices to ensure protection against radiation.

TRANSMITTAL OF TYPE "B" INVESTIGATION REPORT

CO:I:JRR

Transmitted herewith is the investigation report of a Type "B" incident:

MARTIN-MARIETTA CORPORATION
Baltimore, Maryland

License No. SNM-53

All Martin personnel interviewed emphasized that they considered all references to the spheroidizing operation as proprietary information. For this reason, we are recommending that the entire report and the exhibits be considered "company confidential" inasmuch as there are references to this operation throughout the entire report.

This report has been classified as a Type "B" incident, however, we feel that this is subject to interpretation (i.e., that it is possibly a Type "A" incident) inasmuch as the use of the spheroidizing equipment was lost for more than one week.

We concur with licensee personnel that the explosion was probably caused by a build-up of acetylene gas in the system. Please note that the licensee's corrective action, as indicated in paragraph 36 of the report details, includes purging the system with air before ignition of the acetylene gun and turning off the acetylene and oxygen tank valves after a shut down.

As indicated in paragraph 7 of the report details, three referenced documents (MND 2603, MND 2603B and MND 2603C) describe the spheroidizing process. However, none of these documents contains a hazards evaluation relating to the actual spheroidizing of the UO_2 powder with burning acetylene gas. Inasmuch as the license comes up for renewal on 4/30/63, we believe that L&R may wish to consider requesting a hazards evaluation from the licensee, in view of this incident. Please note that an inspection of SNM-53 will be conducted on 4/30/63 by Mr. R. Chitwood of Compliance, Headquarters. Mr. D. Nussbaumer of L&R has been advised of this inspection.

A1108

Licensee personnel were advised of the provisions of 20.405(a). Boutelle said that he intended to comply with this requirement. As of the date of this memo, however, no report has been received by this office.

Please note that we are not citing the licensee for 20.201(b) for failure to determine if there was any release of UO_2 through the stack. As indicated in paragraph 30 of the report details, the force of the explosion displaced the filters and Boutelle indicated that he would take a smear survey on the stack side of the final filters in an effort to determine if there had been any release of UO_2. In a telephonic conversation on 4/1/63, Boutelle said that the survey was completed and that the results would be sent to this office. As of the date of this memo, however, these results have not been received. The licensee's air evaluation procedures will be reviewed during the next inspection.

The results of the investigation were discussed with Dr. Ralph D. Bennett, Vice President of the Martin-Marietta Corporation. Bennett confirmed that a constant stack monitor had been ordered and would be installed as soon as it was received. Bennett expressed concern that the explosion had occurred and added that he hoped that the corrective action would preclude any recurrences.

UNITED STATES GOVERNMENT

Memorandum

TO : Eber R. Price, Assistant Director
Division of Licensing and Regulation

DATE: APR 19 1963

FROM : Leo Dubinski, Assistant Director for Materials
Division of Compliance

SUBJECT: MARTIN-MARIETTA CORPORATION, BALTIMORE, MARYLAND - LICENSE NO. SNM-53 - TYPE B INCIDENT (EXPLOSION)

CO:EGO

On March 19, 1963, we transmitted to LR a copy of a TWX, dated March 18, 1963, as received from Region I, Division of Compliance. This communication related that an explosion involving highly enriched uranium oxide powder had occurred at the licensee's facility on March 17, 1963.

Attached is a copy of an investigation report, dated April 16, 1963, from Region I, with regard to this incident. The report sets forth the details in connection with the explosion and shows this occurrence probably resulted from a build-up of acetylene gas in the system used to spheroidize highly enriched uranium oxide powder. There were no injuries to personnel, although one employee was contaminated, and clean-up action was accomplished in this respect. There was contamination of the immediate area and this was decontaminated. Damage is estimated to range from $4,000.00 to $7,000.00.

Region I has classified this as a Type B incident, but points out that it could be interpreted as a Type A incident. The extended shutdown of the equipment involved more than seven days, due to need for certain new parts unrelated to radioactive materials, and we concur in the category of Type B. Please note that the entire report is classed as "Company Confidential".

For your information.

CDL

SUBJECT: MARTIN COMPANY, DOCKET 70-58, APPLICATION DATED MARCH 29, 1963

SYMBOL: DLR:TGM

As requested by your memorandum dated March 29, 1963, we have reviewed the subject application which provided procedures to be followed in using a "work box" both for storage of fuel at a processing location and also as a storage container in the in-process storage area.

We have concluded that the procedures described are adequate to prevent a condition of accidental criticality for fuel material which contain uranium fully enriched in U-235 isotope as UO_2 stainless steel rolled cermets.

The applicant should be advised that fuel materials which differ in enrichment or chemical and physical form than that described in the subject application must be covered by a request for license amendment including a complete description of fuel material and a nuclear safety analysis.

SUBJECT: MARTIN COMPANY, DOCKET 70-58, APPLICATION DATED JUNE 7, 1963

SYMBOL: DLR:TGM

We have reviewed the subject application requesting use of approximately 50 in-process storage racks, each with a two box capacity. These boxes are to contain up to 1100 grams of U-235 per box in the form of UO_2 (93%). The UO_2 comprises 16.5 weight percent of the total UO_2 SS rolled cermet.

The applicant has demonstrated through interaction calculations that the in-process racks will be safe even if four racks are pushed together and if each box is filled with water. We agree and recommend your approval of the proposed procedures.

DATE: July 1, 1963

FROM : Richard H. Odegaarden
Criticality Evaluation Branch, DLR

SUBJECT: MARTIN COMPANY - SHIPPING CONTAINER FOR PATHFINDER FUEL ELEMENTS DOCKET 70-58, JUNE 25, 1963

A meeting was held at Bethesda on the subject license amendment application on June 25, 1963. Messrs. C. W. Keller and John Wachter of Martin Company, and Messrs. Christian Beck. R. L. Layfield, and R. H. Odegaarden of AEC-DLR participated in the discussion.

The shipping container consists of a 5 inch steel pipe centrally positioned in a 22.5 inch diameter container. The container wall is fabricated of modified 18 gauge, 55 gallon drums, and the overall length of the container is 90 inches.

The 5 inch inner container contains 14 tube-in-tube fuel elements, each fuel element containing 10 w/o UO_2 (120 g U-235/element and 1680 g U-235/container). The applicant calculated a multiplication factor of 0.43 for each shipping container.

The applicant stated for 6 containers in a close packed array, the solid angle is 2.5 steradians. This would permit each container to have a multiplication factor of 0.65. The applicant's calculation was well below this.

The applicant assumed a homogeneous system for his calculations. I pointed out to the applicant that a hetrogeneous system can be more reactive than a homogeneous system, but because of the 5 inch inner container, I saw no criticality problem.

Mr. Christian Beck was asked to comment on the structural integrity of the container to ascertain that it will meet the 30 foot drop test. He recommended that the supports which extend radially every 12.8 inches be rotated 45 degrees from each adjacent set to increase the container's resistance to crushing. The steel channel, which now runs the full length of the container, could be welded in one foot lengths to the container wall for each radial support to keep its weight down.

A/114

The inner container is closed at one end by reinforced 18 gauge steel. Mr. Beck recommended that this end cap be increased to 1/4 inch steel. He was not positive the 18 gauge outer container would meet the fracture requirements. The applicant seemed reluctant to go to 16 gauge steel drums. Mr. Beck thought the 18 gauge container might meet our requirements, but desired to examine the modified container which they agreed to submit.

I pointed out to the applicant that they should submit procedures to prevent commingling of this material with all other special nuclear material during shipment, transshipment and delivery. I stated what our requirements are and referred them to Part 71.66.

FROM : T. G. McCreless, Jr., Acting Chief
Criticality Evaluation Branch, DLR

SUBJECT: MARTIN COMPANY, DOCKET 70-58, APPLICATION DATED JUNE 24, 1963

We have reviewed the subject application requesting use of shipping containers intended for the shipment of Pathfinder fuel elements. No more than 6 containers will be in any one shipment. Each container is designed to hold a maximum of 14 Pathfinder superheater fuel elements. Each element contains approximately 120 grams of U-235.

The applicant has stated that shipments will be made by railway express or exclusive van. We can not conclude that the use of railway express will prevent commingling with other special nuclear material unless written certification as described in Section 71.66(a)(3) is obtained from a responsible agent acting for the Railway Express Agency.

The applicant has, however, demonstrated through interaction calculations that 12 such containers in a planar array are safe. We agree and recommend approval of the proposed procedures subject to our above comments on the use of railway express and the adequacy of the structural integrity.

TO : Donald A. Nussbaumer, Chief
Source & Special Nuclear Materials Branch, DLR

DATE: July 19, 1963

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch, DLR

SUBJECT: MARTIN COMPANY, DOCKET NO. 70-58, APPLICATION FOR RENEWAL DATED MARCH 28, 1963

SYMBOL: DLR:TCM

We have reviewed the subject application and have concluded that there is insufficient information to determine the adequacy of the applicant's procedures to prevent a condition of accidental criticality.

In order that we may continue our analysis, the following additional information is required:

1. Sufficient information has not been presented to verify the U-235 work area mass limits as established by the applicant in Table IV B-1D. Examples of information required which have not been included are percentage void fraction, moderation control and reflector description used in the calculation. In addition, there is apparent discrepancy between the use of some of the basic formulae and subsequent steps followed, as well as confusion as to the numbering of steps. Therefore, we require the applicant clarify the steps followed in the use of the basic formulae. Finally, we request submission of representative calculations and the derived curves of mass versus fuel density and volume percent of fuel.

2. "Work area" as described by the applicant is not sufficiently definitive to assure nuclear safety. As an example, a cubic array of an unsafe number of units may be formed and still adhere to the applicant's definition of work area. Therefore, we request the applicant re-evaluate this term and provide a definition which will assure nuclear safety. It would be helpful to our nuclear safety analysis if the various work areas were identified in plan drawings.

A/114

3. Procedures for preventing unsafe U-235 concentrations during chemical cleaning, pickling and any other operations in which U-235 may go in solution, and the associated nuclear safety analysis.

4. The information delineated in paragraphs IV, 1, 2, 4, 6, 7, 8, 9 and V.5, of "Information to be Contained in an Application for Renewal of a Special Nuclear Material License . . .". Also included should be an engineering assessment confirming the integrity of the packaging based on calculations, accident experience or results of testing programs.

5. The description of the storage areas and vaults as presented by the applicant is not sufficiently clear and in some instances inconsistant. The maximum permissible number of units in cubic array as shown in Table VI - 1, page 33, does not agree with any of the generally accepted limits for cubic arrays. Therefore, we require a more detailed description and nuclear safety analysis of each storage area and vault including the information delineated in paragraph II 2.B of "Information to be Contained . . . ".

6. The information delineated in paragraph II 2(e) of "Information to be Contained . . .".

7. The procedures for handling and storage of the requested 2 kgs of plutonium and 500 grams of U-233.

8. Apparently contract operations are to be conducted in the same facility. Therefore, we request that the applicant include the information on combined operations in accordance with paragraph III of "Information to be Contained . . . " .

9. Finally, we suggest that you send the applicant a copy of "Information to be Contained . . .", and ask him to revise the subject application including, for example, the information on receiving shipments requested in paragraph II - 2.

Subject: Proposed Title 10 Code of Federal Part 71, Paragraph 71.66 - Class III Transportation Procedures

Reference: (a) Martin Letter to Donald A. Nussbaumer dated 25 June 1963 Acc-200, Proposed Amendment Number 19 to Special Nuclear Material License No. 53

Gentlemen:

In connection with the shipment of Pathfinder fuel elements from Baltimore to Sioux Falls, South Dakota as described in our proposed Amendment No. 19 to SNM-53, reference (a), we have considered the three basic shipping criteria outlined in the subject paragraph. Our review from cost and shipping schedule standpoints determined that shipment by exclusive use of vehicle or under courier escort was not feasible.

We contacted REA Express, and requested that they determine their ability to comply with the proposed Criteria in subparagraph a-3 of paragraph 71.66. A copy of their reply is enclosed. It is evident that there is a slight misunderstanding on the part of REA Express with regard to licensed inspectors and we will clarify this point with them.

The only basic difficulty for compliance with the Criteria in subparagraph a-3 is the requirement prohibiting intermediate unloading enroute. As outlined in the schedule from REA Express, transfers would be required at Baltimore, Washington and Chicago for the Limited Carload Shipments which we will require to expeditiously transfer the fuel. We plan to obtain individual shipment certification from REA that commingling with other special nuclear material or explosives will not occur.

Attn: Mr. L. [illegible] Altenburger, [illegible] Mgr.
Material - Procurement Dept.

Dear Sir:

In reference to our recent telephone conversation concerning subject matter.

We are able to furnish you adequate transportation from Baltimore to Sioux Falls, South Dakota, both as an LCL shipment and carload shipment. The only difficulty we would encounter would be on the LCL movement, where you state that the Atomic Energy Commission requires one vehicle to transport this material from origin to destination, and a licensed inspector to supervise the loading.

LCL shipments to the above mentioned point require at least three transfers, namely: Baltimore, Washington and Chicago. Also, we have no licensed inspectors to supervise this loading, even if the one van move was dropped by the Atomic Energy Commission.

As for the carload shipment, we would place a car at your facilities for loading and inspection at your licensed inspector. The car would then move to destination without any difficulty.

We are attaching herewith a schedule for both the carload and LCL shipments, and would be pleased to handle this business for you, either as a carload movement or LCL, if the Atomic Energy Commission will drop the requirements on LCL shipments.

Yours truly,

A. V. Augustine
General Agent

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch, DLR

SUBJECT: MARTIN COMPANY, DOCKET NO. 70-58, LETTER DATED JULY 30, 1963

SYMBOL: DLR:TGM

We have reviewed the subject letter and attachment thereto and have determined that the letter from REA Express is not adequate evidence of compliance with the provisions of sub-paragraph 71.66(a)(3).

We would, however, re-evaluate the proposed LCL shipment provided that Martin Company obtain and submit for our review a written certificate from REA Express describing the general route to be followed and specifying that:

> "The Martin Company shipment will not be placed in any vehicle containing other special nuclear material, or flammable or explosive cargo, nor at any time during loading, transhipment or delivery closer than 20 feet from such material."

The written certificate from REA Express should include the administrative procedures to insure that the requirements are communicated to and understood by the personnel involved on all carriers and at all terminals, and that there will be a person on every carrier and at every terminal responsible for assuring that the shipment is controlled in accordance with the above certificate.

Martin Company proposes that each shipment comprise a maximum of six packages, each 22.5 inches diameter x 90 inches long and containing 14 fuel elements. We have determined that the six packages would be safe in any arrangement under accident conditions (10% reduction in any edge-to-edge spacing of the inner containers).

We believe the solid angle calculations of Martin Company are in error because of the improper equation on p. B 3. Consequently, we request that Martin Company recompute the maximum number of damaged containers in an array. We will be pleased to assist the applicant in this determination.

DATE: December 11, 1963

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch, DLR CDL

SUBJECT: THE MARTIN COMPANY, MEETING TO DISCUSS MARCH 28, 1963 RENEWAL APPLICATION, DOCKET NO. 70-58

SYMBOL: DLR:FKD

On December 5, we met with Mr. Charles Keller of Martin Company to discuss the March 28, 1963 renewal application. Our review of this application dated July 19, 1963, concluded that insufficient information had been supplied, and specified the required additional information. We suggest that the points raised in our July 19 memorandum be confirmed in writing to the applicant, with the following additions to our July 19 memorandum:

Add on to paragraph 1 - "We suggest presentation of the limits by categories, e.g., enrichment (0-5, 5-10, 10-20, 85-93), physical form of material (oxide, pellets, metal), etc., in order to permit authorization of a wide range of operating parameters."

Add on to paragraph 3 - ". . ., taking into consideration the reactivity of materials being treated, when immersed in solutions containing U-235."

Insert in paragraph 7 after procedures ". . . and nuclear safety analyses . . .".

At the close of the meeting, we offered our assistance to Martin's new nuclear safety man, Charles Osmir, as regards presentation of calculative techniques derived in conjunction with Martin's experimental background with super-heat type elements.

Nuclear Division
Baltimore 3, Maryland

Attention: Mr. R. D. Bennett
Vice President
Your reference: LSN-23

Gentlemen:

This refers to the discussion on December 3, 1963, between your Mr. Charles Keller and Miss F. K. Durkan and Mr. K. E. Lauterbach of this Division, regarding your application dated March 28, 1963 for renewal of License No. SNM-53. As a result of this discussion, we understand that you will re-submit this application to provide additional information, including the following:

1. A detailed description of all processes conducted under this license involving uranium enriched in the U-235 isotope, U-233 and plutonium.

2. The specific locations at which each of the special nuclear materials will be received, handled, used, or stored.

3. Further description and identification of the plutonium and U-233 including source specifications, chemical and physical form, isotopic content and the maximum quantity of each material to be possessed at any time.

4. Technical qualifications of personnel who will have health and safety responsibility for the use of licensed material.

5. Handling and shielding devices for using and storing plutonium neutron sources and U-233.

6. A detailed description (including a plan view) of the ventilating system for the control of airborne radioactivity in each process area, including the specifications of glove boxes and hoods, building exhaust fans, dust collecting and air cleaning systems and air discharge stacks.

OFFICE ▶

A1123

7. A description of the air sampling program to determine the concentrations of airborne radioactivity in work areas and effluents, including the locations at which air samples are taken, the frequency of such surveys and instrumentation used.

8. Procedures for controlling surface contamination, including the method of preventing the spread of contamination to unrestricted areas and procedures for decontamination of floors and equipment.

9. Procedures and equipment for surveying the work area for fixed and removable radioactive contamination, the locations and frequency of such surveys and the contamination criteria which will be applied.

10. A description in further detail of the types and quantities of radioactive waste, the methods of collection and storage, and procedures for ultimate disposal, including procedures for determining concentrations of radioactive material released to unrestricted areas.

11. An evaluation of the effects of fire, explosion and other accidents and the probability of release of radiation or radioactive material as a result of such accidents.

12. Confirmation that all special nuclear material held under the authority of this license will be isolated from other special nuclear material in accordance with the provisions of Section III of the Renewal Application Guide, copy enclosed.

13. A nuclear safety analysis of procedures for receiving special nuclear material in the facility and inspecting the shipment on receipt, including the information contained in Section II, B, 1 of the Renewal Application Guide.

14. Further information on the parameters used to calculate mass limits in Table IV-B-1d, including percent enrichment, physical form of material, percent void fraction, moderation control and reflector description. We suggest presentation of the data y categories, e.g. percent enrichment (0-5, 5-10, 10-20, 85-93), physical form of material (oxide, pellets, metal, etc.). Also please clarify the steps followed in the use of basic formula and submit your derived curves, including representative calculations, for mass versus fuel density and volume percent of fuel.

15. Clarification of the definition of "work area" and "operational work area" in terms of the quantity of material assigned to these

areas. Include also plan drawings showing the locations of the various work areas.

16. Procedures for preventing unsafe U-235 concentrations during pickling, cleaning and other operations in which U-235 may be dissolved, and a nuclear safety analysis taking into consideration the reactivity of materials being treated when immersed in solutions containing U-235.

17. The information on shipment of special nuclear material contained in Section IV of the enclosed Renewal Application Guide, and an engineering appraisal of your shipping containers demonstrating that they meet the structural integrity criteria of Section V.

18. A more detailed description and nuclear safety analysis of each storage area and vault, including the information contained in Section II, B, 2 of the enclosure.

19. A further description of the moniter alarm system including the information in Section II, B, 5 of the enclosed Renewal Application Guide.

20. A description of the procedures for handling and storing pyrophoric special nuclear materials.

Subject: Proposed Amendment Number 20 to Special
Nuclear Material License No. 53

Enclosure: (1) Shipment of excess uranium bearing
material for reprocessing (6 copies)

Gentlemen:

See Reports File

We submit as Enclosure (1) our application to amend the Martin Marietta Special Nuclear Material License No. 53. This submission describes the proposed shipping containers and shipping methods to be utilized in the shipment of excess uranium bearing material to an off-site facility for uranium recovery processing. We have negotiated with Davison Chemical Company, Erwin, Tennessee for processing of uranium contained in air filters and shipment is desired as soon as possible. We have selected Mason Dixon for the shipment, by exclusive use of van, of the filters. The routing from Baltimore as supplied by Mason Dixon will be as follows:

U.S. Route 40 to Frederick, Maryland
U.S. Route 340 to U.S. Route 11
U.S. Route 11 to Erwin, Tennessee (Destination)

Approval for shipment of the filters by the method described in the enclosure is requested as soon as possible. Since the quantity of other types of excess material has not been finalized at this time, we will submit additional shipping information as the quantities and shipping arrangements become firm.

Very truly yours,

FOR

Re: Applications for Byproduct Material, Licenses #19-1398-19 and #19-1398-27

Gentlemen:

It is requested that License No. 19-1398-27 be combined with License No. 19-1398-19, thereby, eliminating License No. 19-1398-27 since both of these radiographic programs are similar.

Pursuant to a recent telephone conversation with Mr. W. Haddington of your branch; the following additional information is submitted to correct and/or amplify the information contained in our Application for Renewal of Byproduct Material Licenses No. 19-1398-19 and No. 19-1398-27 dated 23 January 1964.

1. All radiation detection instruments used in the radiographic program will be checked at two or more points on each scale.

2. Please change all references to paragraph V.E.3 in the Submittal to V.E.2.

3. Presentation of the training program described in Item VI B of the submittal will normally require 40 hours to complete. However, this requirement could be changed depending upon the individual's ability, experience, educational background and attitude.

4. Retraining sessions will be conducted periodically. The need, frequency and formality of these sessions will be determined by Health Physics surveillance of radiographers on-the-job performance and changes in operating and emergency procedures, radiographic equipment, radiation detection instrumentation, regulatory requirements and radiographic sites.

DUPLICATE FOR DEPT. OF COMMERCE

A/125

5. The Health Physics Section is responsible for inspecting radiographic operations. These inspections are conducted regularly to monitor radiographers performance to assure compliance with operating and emergency procedures, license provisions, Commission Regulations, and to provide increased assurance that unsafe practices or conditions do not develop. The frequency of these inspections will be governed by conditions such as; degree of source utilization, location of the radiographic site in relation to personnel occupancy adjacent to the site, source strength, degree of shielding or collimation, ease of controlling the exclusion area.

6. Please change answer a. of question #17 on page 27 of our submittal to read: "Leave the radiographic site only after properly securing the radiographic source."

7. Please change question and answer #19 on page 27 to read:

   "What is the title of the Federal Regulation dealing only with radiography?

   Ans. 10CFR31- Radiation Safety Requirements for Radiographic Operations."

Should any additional information be required, please contact me at AC 301, 687-3800, Ext. 9517.

Very truly yours,

Richard J. Brisson

Subject: Allocation of Enriched Uranium

Gentlemen:

Please establish an allocation for 5000 kgs of approximately 5% enriched Uranium to be used by Martin Marietta in the fabrication of the 10,000 K W Floating Nuclear Power Plant designated MH-1A. This allocation is equivalent to 250 kgs U-235. The fabrication will be performed under the Martin Marietta Corporation Special Nuclear Material License Number 53 in accordance with Lease Number 144 with the AEC, under prime Contract DA-36-109-ENG-7454 with the U. S. Army, Corps of Engineers.

Conversion of UF_6 to UO_2 and subsequent pellet fabrication, which is scheduled for April, 1964, will be performed by a vendor yet to be selected by Martin.

It is the sole purpose of this letter to establish an allocation for the U-235 at this time to assure that proper authorizations are in effect for the withdrawal of the UF_6 when it is needed in April. If you require any further substantiation of these requirements, please contact Captain R. A. Farmer at the address shown below.

SUMMARY OF CALL:

Requested info on the status of their application dated Feb 14, 1964 to ship air filters containing 22 kg U-235.

Also, since the large air filters will not fit into 110 gal drums, Mr. Keller asked us to consider packaging these filters (each containing < 300 gms U-235) in ICC approved wooden boxes.

March 6, 1964

Mr. Keller informed me that the container for the large filters will be made of steel.

SUBJECT: NOTICE OF LICENSE EXPIRATION

Gentlemen:

Notice is given that Source Material License Number SFB-187 expires on Aptil 30, 1964.

If you desire to continue your program using source material(s), an application for renewal of the license should be filed with this office. It is to your advantage to file such an application at least thirty (30) days before the expiration date of your existing license. The application should be submitted using Form AEC-2, enclosed, in accordance with the instructions provided with the form. Your program will then be covered by your existing license until action is taken on your application for license renewal. (Title 10, Code of Federal Regulations, Part 40, Section 40.43(b)). If an application is received less than 30 days prior to the expiration date of your license and cannot be processed before your existing license expires, this could result in your possessing source material without a valid license.

If you do not wish to renew your license, please complete the enclosed form "Certification of Status of Source Material Activities Under United States Atomic Energy Commission Source Material License Number SFB-187", and return it to this office.

If you have obtained an amendment which has extended the expiration date of the above license or if a new license has been issued which supersedes the above license, please disregard this notice.

This notice of your license expiration is sent for your convenience and it should not be interpreted that similar notices will be sent in the future. The responsibility for timely submission of an application for license renewal remains with the licensee.

Very truly yours,

FROM : Charles D. Luke, Chief
Criticality Branch, DML

SUBJECT: THE MARTIN COMPANY, DOCKET NO. 70-58, SUPPLEMENTARY INFORMATION DATED MARCH 20, 1964

SYMBOL: DML:TGM

We have reviewed the subject information which supplements The Martin Company application of February 14, 1964, for the shipment of air filters containing enriched uranium oxide.

Subject to the approval of the tie-downs by Christian Beck, we have no further objection to the proposed shipment. However, we do feel that the applicant should be advised that the calculations for determining geometric buckling were in error. The filter dimensions must be increased by two times the 3cm extrapolation distance. As a result, the proper k_{eff} for a bare moderated filter is considerably greater than Martin's 0.455. We suggest that k_{eff} be computed in accordance with DP-532. On the other hand, Martin was overly conservative in applying the solid angle criterion. We suggest determining a solid angle between actual filters and not between the total packages as Martin has evidently done.

FROM : Charles D. Luke, Chief
Criticality Branch, DML

SUBJECT: THE MARTIN COMPANY, DOCKET NO. 70-58, APPLICATION DATED APRIL 1, 1964

SYMBOL: DML:TGM

We have reviewed the subject application for amendment of Special Nuclear Material License No. SNM-53 to authorize the fabrication of a nuclear core of tubular design employing $U(5\%)O_2$ pellets and have the following comments:

1. We request information to demonstrate that each incoming shipment will be placed in an array no more reactive than as received and will be isolated from every other array of special nuclear material by:

   a. A distance of 12'; or

   b. The greater distance across an orthographic projection or either array or a plane perpendicular to a line joining their centers, whichever is greater; or

   c. Eight inches of full density (140 lb/cu ft) concrete. Where concrete of less density is used, thickness must be increased proportionately.

   We also request a description of procedures for identifying, isolating, and handling wet or damaged packages.

2. We request a description and nuclear safety analysis of procedures to assure that unsafe concentrations of U-235 in solution are not accumulated during cleaning operations.

In addition, we feel that the applicant should be advised of the following:

"Figures 14, 15 and 16 of TID-7016, Rev. 1, which pertain to lattices of slightly enriched uranium rods are considered non-conservative and a proposed revision is currently under consideration. The revised values are lower than the safe diameter and thickness quoted in your application. However, with allowance for the reduced reactivity of the oxide rod lattices, as compared with metal rods, we agree that the values established in your application are adequate."

Memorandum

TO : Donald A. Nussbaumer, Chief
Source & Special Nuclear Materials Branch, ML

DATE: June 22, 1964

FROM : Charles D. Luke, Chief
Criticality Branch, ML

SUBJECT: MARTIN COMPANY, DOCKET NO. 70-58

During the visit of Messrs. R. L. Layfield and R. H. Odegaarden to NFS, Erwin, Tennessee, last Thursday and Friday, NFS commented upon a shipment of filters recently received from Martin. Their comments included:

1. A question concerning the ability of the shoring to withstand the one-hour fire test. This shoring was required to assure spacing and a planar array of packages on the vehicle.

2. The eight large filters contained a total of 5 kg U-235 corresponding to an average of something over 600 grams in each filter. We approved the nuclear safety of the shipment based on a maximum U-235 content of 300 grams per filter. Of course, if the U-235 were not uniformly distributed among the eight large filters, one or more of the filters would each have contained more than 600 g U-235.

We suggest a discussion of this problem in order to determine what further action on our part is required.

A/142

To: Files

From: K.E.L

Subject: Memo to DAN dated June 22, 1964 from C.D. Luke regarding shipment of U-235 containing air filters from Martin Co. to Erwin Tenn.

1. The wood shoring in this shipment consisted of 4x4" and 2x4 members, nailed to the floor of the truck; with steel tie-downs over the tops of the shipping containers. In view of the size of the shoring and the method of tie down, it appears that the shoring would withstand a one hour fire, at least as well as the wooden floor of the truck.

2. The licensee requested authorization to ship eight (8) drums each containing one medium size filter (maximum 870 gms U-235/filter, calculated) and thirteen (13) metal containers each containing one large filter (maximum 300 gms U-235/filter, estimated). Since NFS reported that 8 filters contained over 600 gms U-235 each, it is possible that they incorrectly identified the filters in question as the large filters. Further information would be required in order to confirm this point.

Since there is no evidence indicating that licens

A1143

conditions were violated, or that the equipment as performed invalid a criticality risk, I suggest that the matter be dropped.

Attention: Mr. Kenneth Lauterbach

Subject: Proposed Amendment No. 22 to Martin Marietta Special Nuclear Material License No. 53.

Gentlemen:

With the change in policy by the AEC to establish all health and safety aspects of special nuclear material processing under license, we request license approval for several processing steps previously approved by the New York Operations Office of the AEC through the feasibility report mechanism. These steps will be included in our overall SNM-53 renewal, but prior approval is required to permit fabrication of preliminary nuclear components for the Argonne Advanced Research Reactor. The steps include coating, tube extrusion, and hydrostatic pressing, which will be discussed in this submission.

Since we consider these steps basic and straightforward, approval by July 24th is desired.

Very truly yours,

C W Keller

COATING OF URANIUM OXIDES

To provide a more homogeneous fuel matrix, highly enriched spherical uranium oxides are coated with various metals, such as stainless steel, tungsten, molybdenum, and others dependent on the final application of the matrix. The coating of the primary uranium oxides also improves bonding qualities in connection with the fabrication of completed fuel components.

Coating is accomplished through spraying the uranium oxide in a revolving drum contained in a separate exhaust hood fabricated for this purpose. The picture and drawing of the installation show the details of the operation. Spray apparatus, located outside the revolving drum, is used to introduce the metal powder for coating of the uranium oxide contained in the drum. Exhaust draft is such to prevent escape of the uranium oxide through the opening of the drum and to minimize removal of material to the exhaust ductwork. An adequate filter system, as depicted in the drawing, prevents any escape of coated particles. Uranium balance between uncoated and coated material has shown insignificant uranium loss to the exhaust system.

A mass limit of 800 gms U-235 which corresponds to approximately 950 gms of UO_2 has been established for the coating operation. Thorough removal of all coated material shall be made between processing batches of 800 gms U-235 and it is Martin line responsibility to assure that inadvertent mixing with other powder does not occur. This responsibility is also supported by strict material control by Martin Nuclear Materials Management. It shall be the responsibility of Martin Nuclear Materials Management to assure that coated material has been removed from the coating drum, prior to issuing additional material for coating. This will normally be defined by return of coated material to the vault, prior to issuing additional starting material. There is no internal sprinkling system installed in the general work area to provide inadvertent flooding of the coating hood, which is separated from other processing hoods by a minimum of two feet. Final composition of coated material will usually not exceed 50% uranium oxide in coated powder.

Attention: Mr. Lyall Johnson

Subject: By Product Material License No. 19-1398-20

Gentlemen:

We request that Martin-Marietta By Product Material License No. 19-1398-20 be amended to permit the measuring of basic spectrum derived from radioactive decay of several radioisotopes and are enclosing a description of the procedures which will be used for this work.

Very truly yours,

C W Keller

A DIVISION
MARTI
MARIET

PROPOSED AMENDMENT TO

BY PRODUCT MATERIAL LICENSE 19-1398-20

Use of Radioisotopes:

1. To define and measure the basic spectrum derived from the radioactive decay of radioisotopes.

2. Measure the attenuation of the radiations resulting from radioactive decay by varying thicknesses of shielding type materials.

By Product Materials and Quantities to be Used:

Isotope	Amount	Form
Curium-244	5 mc	Electrodeposited isotope on planchet
Polonium-210	0.06 mc	Electrodeposited or evaporated isotope on planchet
Cesium-137	0.03 mc	Electrodeposited or evaporated isotope on planchet
Promethium-147	0.02 mc	Electrodeposited or evaporated isotope on planchet

Users:

1. M. Kniedler

2. V. Truscello

Place at Which By Product Material Will be Utilized:

Martin-Marietta Corporation, Middle River Plant, Middle River, Maryland. The experimentation will be perfromed primarily in the radioisotopes laboratory previously described in April 4, 1960 submission in connection with By Product License No. 19-1938-20. An updated drawing of the laboratory is included with this submission.

General Procedures:

Prepared sources will be received from off site facilities if available. If preparation at Martin is necessary, useful counting sources will be prepared by electroplating or evaporation of the radioisotopes on appropriate planchets or platinum disks.

Electroplating procedures will be similar to those described in Radioisotopes Techniques by Overman and Clark, Page 194-195. Evaporation techniques similar to those described in Radioisotope Techniques by Overman and Clark, Chapter 5, Page 191.

Unpackaging of all sources or solutions received from off site facilities shall be under the strict surveillance of the Martin Health Physics Section. Primary source containers shall be stored in a secondary metal container in a ventilated facility when not in use. All source preparation at Martin shall be in a hood equipped with an absolute filter, except Curium which will be prepared within an absolute filter equipped glove box. Prepared sources will be checked by Health Physics for removable contamination, and cleaned as required prior to removing them from the preparation area to the counting room. Preparation areas will be decontaminated as required to preclude the transfer of contamination to the laboratory. All transfers of sources from the laboratory to the counting area will be accomplished by use of a closed container. When not in use the sources will be stored in a closed container in a hood ventilated through an absolute type filter. The laboratory facility is equipped with operating area radiation monitors, alpha-beta air particulate monitor and fire detection devices which are connected to a central alarm system.

Health Physics:

Mr. Richard J. Brisson, Supervisor, Health Physics Section is the designated Radiation Protection Officer for the Martin Company. The basic function of the Health Physics Section including related Health Physics information was supplied in the April 4, 1960 submission in connection with By Product Material License No. 19-1398-20 with specific reference to Supplemental Sheets Nos. 1, 2, 3 and 4. Health Physics shall instruct laboratory personnel regarding the precautions to be taken during operations involving the handling of radioactive solutions and sources and shall monitor for alpha, beta, gamma and neutron radiations during source preparation, decontamination, and waste removal. Air samples shall be collected from the laboratory and the laboratory exhaust system and analyzed for alpha and beta radioactivity during the operations.

Radioactive Waste Disposal:

Solid radioactive waste generated during source preparation shall be removed utilizing standard bag out methods. Liquid wastes will be poured into an absorbing media and handled as solids. The waste shall be sealed in a plastic bag and placed in a closed I.C.C. approved waste container for ultimate disposal at an approved disposal site.

NRC Reviewer:	David F. Limroth, Stephen W. Holmes		

Review Abstract: License No. SNM-00053 authorized the possession of special nuclear material in Building D at Middle River, Maryland and at Timonium, Maryland. The report of a final survey of Building D in 1970 indicates that some contamination remained in drains and on surfaces. The building was demolished following that survey. In 1982 Region I staff concluded that the site met the current criteria for release for unrestricted use. The results of a NRC site visit and survey on November 3, 1994 indicate that the site is suitable for unrestricted use.

Licensee, NRC, and Maryland State surveys indicate that the Timonium site is suitable for unrestricted use.

Recommendations: NONE

Summary: License No. SNM-00053 authorized possession and use of up to 1,000 kilograms of uranium enriched in U-235 as UO_2 and metal and 160 grams of plutonium in the form of a plutonium-beryllium source. Licensed activities included fuel element development and fabrication at the Middle River facility. On September 23, 1969 License No. SNM-01150 was issued pursuant to an amendment to License No. SNM-00053 to permit the transfer and use of up to 100 grams of U-235, at any enrichment and in any chemical form, for research and development activity, and 171 grams of Pu-235 for neutron and alpha instrument calibration sources, from the Middle River facility to the Timonium facility. Concurrently, SNM-00053 was amended in its entirety to authorize the storage of U-235 in the form of contamination in Building D at Middle River. License No. SNM-00053 (Teledyne-Isotopes) was terminated May 26, 1970. There is no termination or confirmatory survey for License No. SNM-01150.

A/291

March 10, 1995

Information from various docket files indicates that a variety of activities with large amounts of byproduct, source, and special nuclear material were authorized at Building D at the Middle River facility. Activities with licensed material at Building D ceased prior to 1970. License No. SNM-1192 was issued to Martin-Marietta on May 22, 1970 and authorized the decontamination of the Martin-Marietta, Middle River, Maryland facility. License No. SNM-1192 has the same Docket No. (70-58) as License No. SNM-53 and all records for License Nos. SNM-1192 and SNM-01150 are contained in the docket file for License No. SNM-53. Apparently only Building D was decontaminated under License No. SNM-1192. Building D was decontaminated from June to September 1970 and a final survey report provided to the AEC with a letter dated September 22, 1970. The final survey report states that a total of 29 μCi of U-235 remained in five drains which were to be were sealed with concrete; one small area of fixed Sr-90 contamination (0.5 mrad/hr) also remained. The building was demolished after the survey, leaving only the concrete pad. Region I staff reviewed the available documentation in 1982 and concluded in Combined Inspection Report Nos. 40-3296/82-01 and 40-2308/82-01 that the site met NRC criteria for unrestricted use.

An NRC site visit and survey was performed on November 3, 1994 to assure that the site meets current NRC guidelines for release for unrestricted use. Buildings C and D at the Middle River facility and Buildings KJ and KC at the Martin State Airport were surveyed. The results of the surveys indicate no radiation or contamination levels above background in any of the buildings surveyed, including the concrete pad remaining from Building D. The contaminated drains discussed in the final survey report regarding Building D were not located, although a number of openings in the pad which had been filled with concrete were identified. Therefore, it seems apparent that the drains identified as contaminated during the final survey were plugged with concrete, as proposed by the licensee. Based on the fact that no radiation or contamination levels above background were detected, it seems unlikely that U-235 contamination in the drains, if present, is a significant hazard. Therefore, the site is suitable for unrestricted use.

Licensee letter dated March 25, 1975 documents a survey of the Timonium site consisting of 67 wipes and a portable instrument alpha/beta/gamma survey of "all areas that had been subject to use of radioactive materials" which identified no residual contamination. An NRC letter dated April 15, 1975 of an inspection to confirm disposition of license material under License No. SNM-0849 and an examination of the licensees contamination survey reported that "no items of noncompliance were observed". The State of Maryland terminated License MD-05-014-01 (formerly USNRC License No. 19-01398-34) covering the whole site after performing a confirmatory survey on July 19, 1993 of the licensee's termination survey of June 8 and 9, 1993. The site is suitable for unrestricted use.

RE: Radioactive Material License Number MD-05-014-01

Dear Mr. Vogt:

On July 19, 1993 the Maryland Department of the Environment's Radiological Health Program completed a confirmatory radiological close-out survey of your facility which is authorized under the above referenced license and located at 110 W. Timonium Road in Timonium, Maryland.

Results of this survey indicate that this facility meets the Department's requirements for future unrestricted use. Should there be any questions concerning this letter, please contact Mr. Raymond Manley or me, at (410) 631-3301.

Sincerely,

Raymond E. Manley Jr.

RE: Results of Radiological Survey of Teledyne Facility
Located at 110 W. Timonium Road, Timonium, MD

Dear Mr. Vogt:

At the request of your firm, I performed a third party independent radiological survey of the Teledyne facility located at 110 W. Timonium Road, Timonium, MD on June 8th and 9th, 1993.

The extensive direct radiation measurements made at the facility with field instrumentation and analysis of the numerous swipe samples by sensitive laboratory instrumentation confirm that no licensed radioactive materials are detectable above the ambient background level. This being the case, the facility has met the free release criteria as described in NRC Regulatory Guide 1.86, Table I by a wide margin of safety and is therefor suitable for occupation by another leaseholder.

This facility close-out survey was authorized by Teledyne Energy Systems under purchase order 28900 dated May 27, 1993.

All instrumentation used was calibrated under the program authorized by the State of Maryland Department of the Environment license # MD-33-021-01.

I hereby state that I am a Heath Physicist Certified by the American Board of Health Physics with extensive experience in the area of industrial facility contamination assessment and decontamination and am therefor adequately qualified to perform this building close-out survey.

Sincerely,

Joseph W Moon, CHP

CLOSE-OUT RADIOLOGICAL SURVEY OF THE TELEDYNE ENERGY SYSTEMS FACILITY AT 110 W. TIMONIUM ROAD, TIMONIUM, MD 21093

1.0 HISTORICAL PERSPECTIVE AND APPROACH

Only two radionuclides were historically present at the facility. These radionuclides were strontium-90 (Sr-90) and plutonium-238 (Pu-238). Sr-90 was received at the facility already loaded into thermo-electric devices to be performance tested. The actual sealed sources in these devices were never removed from the devices. Pu-238 was received only as sealed sources under Department of Energy (DOE) authorization for loading into thermo-electric devices. The loading of these sources was performed within a glove box containment structure with full radiological control practices applied. At the time these operations were terminated, the containment was shipped to Mound Laboratory. The former Pu-238 containment filtration/exhaust system was renovated to fit a new "glove box" when the old containment structure was removed. At that time all filtration elements were exchanged. The areas of the building where Pu-238 activities had been conducted were surveyed by Teledyne Energy Systems personnel and were found to be free of contamination. All of the thermo-electric devices of both types have been transferred to end users and none remain at the facility.

The licensed radioactive material retained on site consists of sealed sources used for the calibration of radiological survey instrumentation, and a variety of check sources used for the same purpose under the existing license. The integrity of these sources is assured under the licensee's source inventory control program and all of these sources will be either disposed of or transferred to another licensee prior to vacating the current building. With regard to the remaining licensed sources, the scope of this survey has only addressed the possibility of facility contamination around the source storage locations as identified by the facility Radiation Safety Officer. There are various articles (2% thoria welding rods and items composed of magnesium-thoria metal) at the facility containing various amounts of naturally occurring thorium that is not subject to licensed regulation (< 5% thoria) but are nevertheless radioactive. Each of these articles has been identified and will be removed prior to vacating the premises. The close-out survey verified that each of these articles effectively contained the naturally occurring activity such that there is not a possibility that residual radioactive material will remain in the facility when these articles are removed.

It was impractical to dismantle the piping of the old Pu-238 containment exhaust system as it was still in use at the time of the survey. The internal surfaces of this piping were not included in the scope of this survey. Although unlikely considering that only sealed sources were handled, the internal surfaces of this piping below the High Efficiency Particulate Absorber (HEPA) filters are still potentially contaminated. These sections of the piping will be isolated disassembled and removed prior to vacating the premises.

The approach taken for this close-out survey did not assume credit for anticipated conditions but was conducted as though contamination was expected to be present at some detectable level. The scope of the final close-out survey encompassed the entire facility and not just those areas where radioactive sources were handled.

2.0 SELECTION OF SURVEY INSTRUMENTATION

The instrumentation used for this survey was selected specifically for its capacity to detect the radionuclides historically handled at the facility (Pu-238, and Sr-90) but was also suitable to detect naturally occurring thoria compounds. All instrumentation used was calibrated under the program authorized by the State of Maryland Department of the Environment license # MD-33-021-01. Each field survey instrument was source checked both prior to and following use to assure they were properly functioning during the survey. Background readings for each of the instruments used were also determined and recorded. The following is a listing of the field survey instrumentation used to perform this survey.

- Alpha: Ludlum 50 cm^2 zinc-sulfide detector (Model 43-1 Serial Number 020791) attached to a Ludlum count rate meter (Model 3 Serial Number 91842). Calibration Date: 6/3/93
  Efficiency for Pu-238 5.5 MeV alpha - 33% determined by calibration with Am-241 (5.49 MeV)
  Sensitivity: 60 dpm/100 cm^2 fixed contamination
  10 dpm/100 cm^2 loose surface on 300 cm^2 swipe
  Reg. Guide 1.86 Criteria: 200 dpm/100 cm^2 ave. fixed
  300 dpm/100 cm^2 max. fixed
  20 dpm/100 cm^2 loose surface

- Beta/Gamma Bicron Surveyor count rate meter (Serial Number AHS-A198A) with standard 17 cm^2 GM Pancake Probe detector (Serial Number 2081)
  Calibration Date: 5/18/93
  Efficiency for Sr/Y-90 Beta particles - 46%
  Sensitivity (@ equilibrium): 10 dpm/ probe area (60 dpm/100 cm^2)
  Reg. Guide 1.86 Criteria: 5000 dpm/100 cm^2 fixed
  1000 dpm/100 cm^2 loose surface

- Gamma Background Victoreen Pressurized Ion Chamber (Model 450 P/Serial Number 583)
  Calibration Date: 2/24/93
  Sensitivity: 10 μR/hr nominal
  Reg. Guide 1.86 Criteria: None

Remote instrumentation used for swipe analysis in off site laboratory

(RSO, Inc., Laurel, MD)

- Liquid Scintillation counter set-up for Am-241 alpha Beckman LS-6000
  Sensitivity: 50 dpm/swipe area

- Gas Flow Proportional counter (Baird Atomic Model SSC-3)
  10 minute counts (nominal efficiency 46% for Thorium-230 alpha 2 pi geometry)
  Sensitivity: < 10 dpm/swipe area

3.0 SURVEY PLAN

The basis of the survey plan was determined by the nature of operations at the facility. A semi-biased survey was warranted since only sealed sources were handled at the facility with full source inventory and contamination controls in place during operations.

Prior to the initiation of the survey, instrument operability checks (e.g. battery checks and source checks where appropriate) were performed and instrument background readings were made in an area not suspected to be affected by former facility operations.

The criteria used for determining suitability for unrestricted use is that specified in Nuclear Regulatory Commission Regulatory Guide 1.86 unless otherwise specified by the concerned regulatory authorities.

3.1 Preliminary Survey

A preliminary survey was performed and was focused on the areas most likely to contain radioactive contamination from licensed operations conducted at the facility. The purpose of this focus was to determine at an early stage of the survey work the worse case radiological conditions that would be encountered at the facility should any residual radioactivity be detected. The preliminary survey entailed a detailed survey of seven designated "Radioactive Material areas" areas (R.A.M.) identified by the facility Radiation Safety Officer (Mr. John Vogt). In addition, the scope of the preliminary survey included a moderately conservative assessment of the entire former source security control area (the effective Radiological Control Area).

The nature of the seven designated R.A.M. was described as follows:

Area 1 White Room - A room used for the preparation of device subassemblies. Some radioactive Material is known to have been in this room and therefor it was designated as a primary survey area.

Area 2 — Pu-238 Device Assembly Area (Submarine Room) - The Pu-238 sealed sources were loaded into the thermo electric devices inside a containment structure known as the "submarine" located in the room. The containment was maintained under negative pressure by a ventilation system having HEPA filters in line prior to the roof discharge vents. Access and contamination controls were in place during these operations.

Area 3 — Facility Security Vault - The vault located in the administrative area contains a triply contained vessel containing approximately 740 grams of thoria. The container was opened and the integrity of the internal packaging was verified. The area was surveyed solely due to the presence of this material currently in the vault.

Area 4 — Pu-238 Source Storage Area - This area was controlled under heavy security during operations and contained all Pu-238 sealed sources not yet assembled into devices. The area is currently in use as a high security storage area and also contains the 1 mCi Radium source used for instrument calibration.

Area 5 — Pu-238 Source Testing and Measurement Area - This area is basically a floor space designated for the use of testing and measurement of the Assembled devices. The devices were lifted from a pedestal by and overhead crane where they were tested and measured while suspended above the floor.

Area 6 — Strontium Device Testing Area - This area is a sunken truck bay with a roll-up door access to the east end of the facility. The assembled Strontium devices were placed in the truck bay, tested and then repackaged for shipment all in the same area. No strontium containing devices were ever disassembled at the facility.

Area 7 — Source Storage Locker - This area is a locked file cabinet containing various check sources for use with the facility radiation detection instrumentation.

If the results of the preliminary detailed surveys in the seven designated R.A.M. areas and the conservative survey of the remainder of the former source security area did not indicate the presence of residual radioactive material, there would be little probability that the rest of the facility would have been adversely affected by the licensed operations. The survey plan for the rest of the facility would only be cursory in nature with several direct measurements and smears being assessed by field counting in each room or general activity area. The measurements taken in these areas would be focused on high traffic areas where it is likely that contamination, if spread to other sections of the facility, would be present in detectable quantities (see section on survey techniques).

The general plan for those areas designated as RAM locations include an initial gamma background rate measurement followed by local instrument background determinations for the other survey instruments. A detector window integrity test for the zinc sulfide α instrument would the be performed by holding the detector up to a source of fluorescent light. An increase in the background rate would indicate a loss of window integrity and the use of the instrument.

Randomly selected locations on horizontal and vertical surfaces in the rooms with areas of 100 cm^2 would then be measured directly with field instrumentation. At each location where the initial direct measurement is in excess of the background level, the measurement will be recorded. A swipe of each area would then be made to assess the levels of loose contamination on the surface. These swipes would be set aside for a period of 4 hours to allow for the decay of naturally occurring radionuclides (e.g. Radon progeny). After the decay period each swipe would be measured for alpha and beta contamination in a location that is not expected to have been affected by facility operations. A direct measurement of the surface would be made after the swipe was obtained to assess the level of fixed contamination at the location. If the results of any of the surveys presented evidence of unanticipated contamination above the surface contamination release guidelines (NRC Reg. Guide 1.86 criteria) at any of the measured locations, this would be an indication that further assessment would be required to allow a statistical characterization of the areas containing detectable activity. Swipes of the areas would be counted in either a proportional counter (set up for the detection of alpha particle emissions after a minimum decay period of 24 hours) or a liquid scintillation counter set up for the measurement of Pu-238 α emissions. Some portion of the population of swipes taken would be assessed by the proportional counter and some taken near the same locations will be assessed by liquid scintillation counting as a qualitative cross check of instrument reliability. Whereas the sensitivity of the hand held α detector is greater than that of either of the two laboratory instruments, the measurement of large area swipes (not a suitable media for assessment in the lab counters) using this field instrument was considered to be an acceptable alternative to exhaustive swipe collection and analysis if no measurable α activity could be found by direct measurements. Even in the case that no detectable activity would be discovered by field instrumentation on large area swipes, a suitable number of swipes will be analyzed by the laboratory instrumentation to document the status of the targeted R.A.M. areas.

If any of the "RAM" areas were found to be contaminated, a full survey would be performed to characterize the area and any affected adjacent areas until the full extent of the contamination could be determined. If no detectable contamination was found in the "RAM" areas the survey of the adjacent room will focus on common traffic patterns for personnel carrying radioactive material.

Following the surveys instrument operability checks will be repeated to demonstrate operability at the end of the survey.

3.2 Contingencies and Extended Survey Work

The nature and extent of any additional survey work required (characterization) would only be apparent when the results of the preliminary survey are known.

If long-lived alpha contamination was detected at the facility, provisions for the assessment of samples by alpha spectroscopy could be made to positively identify the contaminant as Plutonium-238.

Extended survey work necessary for the characterization of the contamination in the facility would be performed along the guidelines provided by the Nuclear Regulatory Commission. This type of survey was recommended (NUREG/CR 2082 1981) to document that a facility can be released to perform operations not involving the use of radioactive material and would require a much more extensive framework of area mapping and characterization. This extensive type of survey is meant to be used to document the effectiveness of a decontamination effort when it is known that a facility was at one time contaminated. The focus of the preliminary survey is to demonstrate that the facility has never been contaminated with the material it was licensed to handle.

Areas above any suspended ceilings and inside ventilation duct work would need to be assessed should any unanticipated contamination be found. Access to these areas and other normally inaccessible areas of the facility would be required in this unlikely circumstance.

4.0 SURVEY RESULTS AND SPECIALIZED SURVEY TECHNIQUES

The extensive direct radiation measurements made at the facility with field instrumentation and analysis of the numerous swipe samples by sensitive laboratory instrumentation confirm that no licensed radioactive materials are detectable above the ambient background level. This being the case, the facility has met the free release criteria as described in NRC Regulatory Guide 1.86, Table I by a wide margin of safety and is therefore suitable for occupation by another leaseholder.

Standard radiological survey techniques were employed to avoid cross contamination of swipe samples and to make direct measurements of surface activity (< 0.5" from surface without contact). Initially, small area tack cloth swipes (300 cm^2) of the targeted R.A.M. were taken and measured for both α and β/γ with the field instrumentation to assess the status of an area. These small area swipes would be appropriate in the event an area was found to be contaminated requiring detailed characterization of the distribution of activity on room surfaces. When no detectable radioactive material was found by direct measurements or on the small area tack cloth swipes, large area swipes (> 500 cm^2) were taken of the areas. In all cases these large area swipes were also found to be free of any detectable radioactive material.

The process of collection and analysis of large numbers of swipes (for area characterization) on media suitable for analysis by proportional counter and by liquid scintillation counting in this situation seemed pointless. A suitable number of these type of swipes were then taken in each area to verify the findings of the field instrument assessments and to provide a representative number of measurements of each area to allow an assessment of the radiological conditions in the unlikely event that the field instrument readings were faulty. All of these swipe samples were also measured for detectable α and β/γ activity prior to being sent to the laboratory for analysis. None of these swipe samples contained any activity detectable with the field instrumentation.

Other survey techniques employed for this survey involved measurements of locations in the facility where radioactive materials if present would have been concentrated. Specifically, drain traps, subfloor piping recesses, surfaces above suspended ceilings, room air exhaust duct work and associated air filtration support members were surveyed. In addition, work station vacuum cleaners, grime accumulations on old fan blade shields, and fume hood exhaust plenums were measured as areas where if loose surface contamination by licensed radioactive material had been present at any time it would be unlikely that these areas would have been affected by subsequent decontamination efforts. No evidence of residual licensed radioactive material was found in any of these locations

The majority of the floor surface of the former source security area including the workshop, shipping and receiving areas, tool cribs and material storage areas was unsealed concrete. Tack cloth was used to acquire large area swipes on these surfaces. No detectable activity either α or β/γ were detected on any of these swipes. On this type of surface, loose surface activity, if present, would have accumulated in corners and in cracks and crevices in the flooring. Extraction of some of this material from crevices and direct measurement of this material with field instruments would reveal the presence of historical facility contamination if it had been present. No evidence of licensed radioactive material was found in the crud residue excavated from these recesses or on any of the direct measurements made along these crevices.

The horizontal and vertical surfaces of all laboratories where radioactive material was present during facility operations were assessed by direct measurements and by swipe samples for the presence of residual activity. Where new surfaces had been applied since the cessation of radiological operations , the original surfaces were sought out and assessed. No evidence of residual licensed radioactive material was found in any of these measurements.

In the administrative areas of the facility, measurements of large area tack cloth swipes taken along major foot traffic patterns and in the relatively inaccessible areas below the stairwells did not indicate the presence of any residual contamination. Direct measurements of the areas along the bases of the walls and in corners where routine cleaning efforts were noticeably ineffective were also found to be free of residual

radioactive material. In areas where carpeting was installed, direct measurements of high traffic areas indicated by carpet wear, accumulations of sticky grime embedded into carpet fibers, and lower door closure recesses were assessed with no positive indications found.

None of the direct measurements of gamma background made with the pressurized ion chamber in any part of the facility (administrative or security areas) were in excess of 25 μR/hr with most of the measurements falling within the 10 to 20 μR/hr range.

The attached survey maps detail the survey work done in the six primary designated R.A.M. areas. On the maps of areas 1 and 2, the locations where the small area tack cloth wipes were taken are not indicated as they would unnecessarily clutter the diagram and interfere with the documentation of the locations where the proportional and liquid scintillation counter swipes were taken. No small area tack cloth swipes were taken in area 5 where large area swipes were used for the initial assessment. No map is attached for area 7 due to the small area involved. No fixed or loose surface activity was detected on any of the surfaces adjacent to this area (current source storage locker).

Joe Moon
J. Stewart Bland Associates, Inc.
133 Defense Highway, Suite 208
Annapolis, MD 21401

Dear Mr. Moon,

Thank you for choosing RSO, Inc. to provide you with radioanalytical services. The results for the 110 samples you recently delivered to our laboratory are summarized below.

The 100 paper wipes were analyzed using a Beckman LS6000 Liquid Scintillation Counter (LSC). The counter was properly calibrated and standardized to identify the alpha emissions of Pu-238. The minimum detectable activity for this analysis was 50 disintegrations per minute (DPM). None of the 100 wipes exceeded 50 DPM.

The 10 adhesive backed wipes were analyzed using a Baird-Atomic Gas Flow Proportional Counter (GFPC). This analysis is not isotope specific, the measurement is for gross alpha activity only. The MDA for this instrument was 2.8 DPM. None of the 10 wipes exceeded 2.8 DPM.

If you have any questions about this report or our analysis protocol, please call me. Thank you again for choosing RSO, Inc.

Respectfully,

Myke Beard

Radiography Sources

Mr. W. O. Miller
Division of Licensing and Regulation
U. S. Atomic Energy Commission
Washington 25, D. C.

Dear Bill:

Enclosed please find two copies each of the following manuals:

MND 2078 - "A General Outline of the Martin Health Physics Program"

MND 2109 - "Health Physics Procedures During the Use of Radiography Sources"

Manual 2078 is intended as an official outline of our Health Physics Program. It will serve as a guide for all of our projects that involve materials or equipment that emit ionizing radiation. You will note that the manual has been approved by the responsible managers. We believe this manual gives a good picture of our program here.

Manual 2109 is the one you requested several months ago. We incorporated several suggestions by some of your people as well as those received from various Martin personnel. We certainly hope this fulfills your request.

I appreciate your many helpful suggestions during the past two years. If you are down Oak Ridge way be sure to stop by to see me.

Sincerely yours,

THE MARTIN COMPANY

HEALTH PHYSICS PROCEDURES

DURING THE USE OF

RADIOGRAPHY SOURCES

Prepared by Paul R. Guinn
Paul R. Guinn
Chief, Health Physics

MND 2109

AUGUST 1959

DUPLICATED
FOR DIVISION

HEALTH PHYSICS PROCEDURES
during the use of
RADIOGRAPHY SOURCES

I Introduction

This manual contains a general outline of the controls necessary to provide maximum protection to personnel during the use of radiography sources and to assure compliance with all Federal, State and local laws pertaining to the use of radioactive materials. All personnel using radiography sources shall be cognizant of the contents of this manual and comply fully with all provisions.*

*Other manuals which may be consulted for additional information are MND 2078 "A General Outline of the Martin Health Physics Program" and MND 2108 "Health Physics Handbook for the Radioisotopes Facility".

II General Information

A. Individuals Responsible for use of Sealed Sources

George Samos

C. E. Hollens

B. Name of the Person Directly Responsible for Over-all Radiation Protection

~~Paul R. Quinn~~ Richard H Bartelle

C. Instructions of Personnel

All personnel handling radioactive materials shall be instructed as to the hazards of ionizing radiation and the procedures to follow to prevent overexposures. Each person shall be instructed to maintain total body exposures within the permissible limits of 5 rems per year. All work with radioactive materials shall be under the supervision of experienced personnel who are expected to instruct less experienced personnel on the job as to safe handling procedures. At periodic intervals Health Physics will meet with personnel to discuss handling procedures, emergency procedures, and other topics pertaining to radiation protection.

III Security of Sources During Use and Storage

During the use and storage of sources maximum precautions must be taken to assure that only authorized personnel have access to the sources.

A. Storage

1. Radioactive materials, including sealed sources, must never be left unattended in an unlocked room, vault, or cell, except as approved by Health Physics. Access to these areas is by permission of the responsible supervisor or a Martin Health Physicist.

2. Under normal conditions sources are stored in a specially designed shielded room in the Radioisotopes Laboratory which is locked during off-duty hours. Another door through which access to the storage room is gained is also locked during off duty hours.

3. All areas containing radioactive materials, including sealed sources, are clearly identified by magenta and yellow radiation and/or radioactive material signs.

B. In Use

During the use of radiography sources, qualified personnel are in attendance except where it is possible to perform the work in a locked room where unauthorized personnel would not be able to gain entrance without approval. During open air radiography (i.e. work outside the Radioisotopes Laboratory) a responsible person shall be present at all times.

IV Exposure Equipment and Safe Handling Procedures

Exposure equipment is available which makes it possible to use radiography sources with a minimum of exposure to personnel.

A. Description

The exposure equipment used in "open air" radiography consists of a Model 412-Iridium 192 and a Model 402-Co 60 projector mechanism as manufactured by the Technical Operations Company. Attachment 1 and 2 are operational manuals for these projectors.

B. Open Air Radiography

(1) The Responsible Supervisor, in the area in which radiography work is to be conducted, is notified of the location, time and date the work is to be performed.

(2) The equipment is moved into position and the two cables are attached.

(3) The source cable is placed in the desired position and all except operating personnel are moved to a distance of 50 feet or more from the source.

(4) The Health Physics representative stands with the operator who operates the crank mechanism which moves the source through the cable to the desired exposure point. At this point the flashing light on the control box should be in operation.

(5) With the source in the desired position the Health Physics representative makes a quick radiation survey of all work areas to determine what areas, if any, exceed an average of 2 mr/hr. After the Health Physics survey, the operator turns the crank which moves the source back into the container. At this point the flashing light should not be showing. As an added precaution, the Health Physics representative always walks along the cable to the exposure point to determine that the source has, in fact, been returned to the shielded container. No deviation is permitted from this procedure.

(6) All areas above an average of 2 mr/hr are now roped off and tagged. Personnel are also placed in positions to observe the entire radiography area. This is to prevent anyone from entering the roped off area while the source is "out". It should be emphasized that all personnel entering an area where the radiation levels exceed 2 milliroentgens per hour must wear a film badge.

(7) With the area roped off and the cables in position, the photographic film is mounted in position for the first shot.

(8) During radiography work the operators and the Health Physics representative wear film badges, two pocket chambers and a self-reading dosimeter. The latter is checked frequently during the operations.

On special occasions sealed sources may be used without benefit of a remote handling device. In work of this kind the source would be handled with a remote tool of sufficient length to insure that personnel would not receive an over-exposure. Careful monitoring of the radiation levels and, in some instances, adjustments of working times are made to prevent over-exposures.

C. Radiography in the Radioisotopes Laboratory

(1) The same procedures are followed as in "open air" work with the exception that a Health Physics representative will "spot check" the work instead of being continuously present.

(2) The crank mechanism is activated at the entrance to the specially shielded room. At this point the operator is shielded by approximately 23" of concrete. (See Attachment No. 4.)

(3) A Nuclear Chicago Laboratory Monitor with visual and audible indicator is in operation in the laboratory at the entrance to the shielded room. This serves as a warning to personnel whenever the source is out of the shield and is also used to monitor for personal contamination.

(4) A chain with a sign reading: "CAUTION: RADIATION AREA - NO ADMITTANCE" is placed across the entrance door whenever a source is "out" in the specially shielded room. This sign also contains the magenta and yellow radiation symbol.

(5) A remote monitoring system is installed in the Nuclear facilities. One detector unit, complete with warning light and buzzer is located in the Radioisotopes Laboratory. The light and buzzer are activated when the gamma radiation levels exceed 10 mr/hr. The light is mounted above the door into the shielded room.

(6) All radiography work is performed within the area outlined by painted lines on the floor in the specially shielded room. Health Physics surveys show that radiography work performed within the area outlined by the painted lines on the floor does not result in a radiation level exceeding 1 mr/hr in adjacent areas where other personnel are working. The latter was determined by placing a 3 curie cobalt 60 source in the specially shielded room and then making measurements of the radiation levels in all adjacent areas.

(7) After each "shot" the crank mechanism is activated to return the source to the container. At this point the operator enters the shielded room with a "Cutie Pie" to insure that the source has in fact been returned to the shield.

V Use of Radiation Survey Equipment

All personnel engaged in radiography operations are required to familiarize themselves with the use and operation of various types of radiation survey equipment by studying the Instrument Handbooks and by personal instructions from experienced personnel, usually a Health Physicist. The Martin Radioisotopes Laboratory has the following instruments permanently assigned to the facility:

1 - Nuclear Chicago "cutie pie" - reads up to 2.5 r/hr

1 - Nuclear Chicago Survey Meter -- reads up to 20 mr/hr.

2 - Nuclear Chicago Laboratory Monitors - read up to 20 mr/hr.

In addition to the above, Health Physics has numerous types of survey instruments as well as air samplers and counters available for use.

VI Survey and Restriction of Radiographic Areas

Areas in which sources are used are thoroughly monitored to assure that exposures to personnel do not exceed permissible levels.

A. Permanent Radiography Area

At the present time the Radioisotope Laboratory is sufficiently shielded to handle up to 5 curies of CO 60. This was verified by measuring the radiation levels in the areas adjacent to the Radioisotopes Laboratory while a 3 curie Cobalt 60 source was mounted in various locations in the specially shielded room. By referring to the attached diagram covering this survey (Attachment No. 4) it will be observed that in all unrestricted areas (i.e. areas in which personnel do not normally wear film badges) the radiation levels did not exceed 1 mr/hr.

As previously mentioned, during the time that a radiography source is "out" in the specially shielded room, a chain must be placed across the entrance door with a sign reading: "CAUTION: RADIATION AREA - NO ADMITTANCE". The door to the specially shielded room and the main entrance door to the facility are both locked whenever facility personnel are absent. A gamma detector with warning light and buzzer are also installed.

B. Source Changing Procedure

Sources are usually changed by means of source changing devices such as the "Model 414 Iridium 192 Source Changer" (See Attachment 3) as manufactured by the Technical Operations Company. This also serves as a shipping container. The source is replaced remotely without exposing personnel to radiation above permissible limits. If necessary to change sources by other methods, Health Physics approval is required.

C. Temporary Radiography Area

Whenever radiography sources are used outside the permanent radiography area they may be stored temporarily in a locked room provided Health Physics has determined that no serious health hazard would result and that the sources would not be disturbed by unqualified personnel. Radiography sources are used at the Martin Middle River Plant, and on rare occasions at Cape Canaveral, Florida. All storage containers are tagged with radiation warning signs.

D. Leak Testing of Sealed Sources

All sealed sources (except as approved by the AEC) are leak tested each 30 days. This consists of rubbing the surface of the source capsule with a filter disc (smear) and counting in a gas-flow proportional counter. Leaking sources will be sealed in a suitable container and held for decay or returned to the manufacturer for encapsulation.

VII Personnel Monitoring Equipment

All personnel engaged in radiography work are required to wear a film badge and two pocket chambers. Personnel temporarily assigned to work in the radiography areas and personnel who will observe radiography work in areas exceeding an average of 2 milliroentgen per hour will also wear a film badge and two pocket chambers. Personnel who perform the actual radiography work are also required to wear a self-reading dosimeter which is read several times during the radiography operations.

A. Determination of Exposure Totals

Pocket chambers are read daily while film badges are developed routinely each thirteen weeks but will also be developed and read anytime one or more of the following conditions exist:

(1) The two pocket chambers both read "off scale".

(2) The two pocket chambers are damaged or lost.

(3) During any given week that the daily pocket chamber totals reach 100 milliroentogens or more.

(4) At anytime during the 13 week period that the daily pocket chamber totals reaches 500 milliroentogens or more.

(5) Personnel are involved in a significant incident such as a spill, air contamination, high radiation level, etc.

Permanent records are maintained of radiation exposures and resumes are submitted to all individuals annually as required by the U. S. Atomic Energy Commission.

B. Visitor Monitoring

Visitors* to the Radioisotopes Laboratory are required to wear film badges and pocket chambers when entering any area where the radiation levels exceed 2 milliroentogens per hour and/or where an exposure in excess of 100 millirems is likely to be received in any seven consecutive days.

*For the purposes of this manual a visitor is defined as anyone not permanently assigned to work in the Radioisotppes Laboratory.

VIII Transportation of Sources to Field Locations

Radiography sources are moved within the Martin Middle River Plant in approved source containers. These are usually the same shielded containers in which the sources were originally shipped from the supplier. Generally, the radiation levels do not exceed 20 mr/hr on the surface of the container. However, each container has a radiation sign attached with the radiation level reading and a statement of the contents of the container.

Sources transported from the Martin Middle River Plant are packaged and labeled to comply with all ICC Regulations. The radiation levels on the surface of the containers must not exceed 200 milliroentgens per hour at contact and/or 10 milliroentgens per hour at one meter. All source containers are monitored by Health Physics before removal from the Plant. Generally, the containers will be carried to Cape Canaveral, Florida in a company owned plane. However, it may be necessary in the future to send the source via air or railway express. Upon arrival, the sources are picked up by Martin Baltimore radiography personnel.

The sources in transport would be under surveillance of Martin personnel and/or Air-Railway Express personnel and will be shipped in full compliance with all ICC regulations. The sources will be stored in a locked room or vault at the temporary radiography site.

IX Radiation Surveys

The Martin Health Physics Section has the responsibility for monitoring all areas where radioactive materials are used or stored to evaluate the radiation hazards present. Permanent records are maintained of survey results.

A. Survey Methods

(1) The air in all work areas is sampled periodically as deemed necessary by Health Physics, to determine the air concentration in microcuries per milliliter of air. This is accomplished by means of small portable air samplers and/or continuous air monitors.

(2) Radiation surveys are conducted in all areas on a routine schedule to determine the external radiation levels. This is accomplished by means of portable type instruments and fixed monitoring systems.

(3) "Smear" surveys are conducted in all work areas to determine the levels of surface contamination. "Smears" are made on floors, equipment, table tops, etc. and counted in sensitive counters.

(4) Corrective measures must be taken, as directed by Health Physics, to eliminate sources of air contamination, surface contamination and/or direct radiation readings above permissible limits.

B. Posting of Radiation and/or Radioactive Material Areas

All areas in which radioactive materials are used or stored will be posted with a radiation warning sign in accordance with the following:

(1) A radiation symbol and sign with the words: CAUTION-RADIOACTIVE MATERIALS. This sign is used in all low radiation level areas.

(2) A radiation symbol and sign with the words: CAUTION-RADIATION AREA. This sign is used in areas where a dose in excess of 5 mrem/hr or 100 mrem in 5 consecutive days could be received.

(3) A radiation symbol and sign with words: CAUTION: HIGH RADIATION AREA. This sign is used in areas where a dose could be received in excess of 100 mrem/hr.

X Emergency Procedures

The following is a brief outline of procedures to follow in the event of emergencies involving radiography sources. It is an absolute requirement that Health Physics be notified immediately of all emergencies involving radioactive materials.

A. Persons to be Notified of Emergencies

1. Richard H. Boutelle LYric 2-9874 Baltimore, Md.
2. George Samos - VA 5-8756 - " "
3. C. E. Hollens - Franklin 4-4735 " "

B. Procedures

1. Fires

(a) Remove all people from vicinity of the source.

(b) Take radiation level readings to determine whether fire fighters can safely approach vicinity of source. Avoid breathing of smoke or fumes. Use extreme caution to avoid exposing personnel to radioactive fumes or dusts.

(c) After fire is out, approach source with survey instrument to determine that source container is undamaged. If container is damaged, secure a replacement.

(d) Investigate to determine whether personnel may have exceeded exposure limits.

2. Damaged container:

(a) Remove all personnel from the vicinity of the source container.

(b) Make survey of area to determine whether source is still in the container. If not, find source and rope off area and keep personnel away from the source.

(c) Determine if source is damaged. If it appears that source is damaged make a survey to determine if contamination is present in the area. Be especially careful to avoid spreading of contamination.

(d) Secure a suitable source container and replace source by means of remote handling tool. Place contaminated equipment, soil, etc. (if any) in containers.

(e) Investigate to determine whether personnel may have exceeded exposure limits.

3. Lost Source (Plant Area)

(a) Evacuate all people from all areas in which source was used or through which source was moved.

(b) Make an immediate survey to find source by walking through all areas with a survey instrument.

(c) If this fails, notify plant security to alert all personnel immediately that source is missing.

(d) After source is located, immediately isolate the site, move container to site and replace source.

(e) Check area for contamination.

(f) Investigate to determine whether personnel may have exceeded exposure limits.

4. Lost Source - Off Plant

(a) If high level source, notify local police and health department to aid in finding source.

(b) Use radiation survey instrument to attempt to find source. Carefully check all areas in which source was used.

(c) When found, place source in container and determine possible exposure level to personnel. If necessary, initiate immediate medical attention.

(d) Check area in which source was found for contamination.

5. Source Out of Container - Exposure Device Will Not Return Source To Shield.

(a) Keep personnel away from source until plan of action is determined.

(b) Use long pipe or extension to attempt to shake source loose by tapping on cable.

(c) If above fails, disconnect cap on end of cable and shield "hot" spot on cable in which source is lodged. Use flexible wire in attempt to push source back into the container.

(d) If above fails, disconnect cable from source container and attempt to shake source loose.

(e) If above fails, transport to a shielded area in which source can be removed by cutting cable.

(f) Determine if source is damaged. If so, place in proper container for return to supplier to be re-encapsulated. Monitor all areas for contamination.

XI Compliance with Federal Regulations

All work involving radioactive materials, including sealed radiography sources, will be conducted in full compliance with all sections of Title 10, Part 20 of the Code of Federal Regulations.

A. Waste Disposal

Disposal of all radioactive wastes are conducted in full compliance with all Federal, State and local regulations.

B. Reporting of Incidents

AEC will be notified of any significant incident or loss of licensed materials as required in Title 10, Part 20, Code of Federal Regulations.

OPERATION MANUAL FOR

MODEL 402 GAMMA RAY PROJECTOR

TECHNICAL OPERATIONS INCORPORATED
SOUTH AVENUE · BURLINGTON · MASSACHUSETTS
TELEPHONE BURLINGTON 7-2261

OPERATION MANUAL FOR

MODEL 402

GAMMA RAY PROJECTOR

NOTE

Do NOT attempt to set up or operate this machine without reading this Operation Manual.

DESCRIPTION

The Technical Operations' Model 402 Gamma Ray Projector consists of three basic assemblies:

1. The cabinet contains a lead filled steel shell to shield the gamma ray emitting source and provides storage space for the control cable, source tube and control unit. Wheels and lifting eyes are provided for easy transport. The door of the cabinet has a lock to prevent unauthorized use.

2. The control unit consists of a source cable control unit and a battery-operated electrical signal system to indicate source position. It is connected to the source storage shield with three parallel cables. One is an electrical cable connected to the source position switches. The other two are housings for the flexible cable. The flexible cable engages a hobbed wheel in the control unit and is actuated by rotating a crank.

3. The source tube is a flexible metallic hose consisting of three sections. One section (7 feet) is attached to the source storage shield. Two extension sections may be coupled to this to extend the range of the source from the cabinet to 21 feet. The source position switch (Part No. 40205) is used on the extreme end of the source tube. This source position switch must be used in all machine applications. It contains electrical contacts which are closed when the source is correctly positioned within it. Refer to Figure 1 to identify the parts of this unit and to Figure 2 which is a schematic diagram of the Gamma Ray Projector.

UNCRATING

The unit is shipped in a wooden crate on skids. Remove the crating and lift the unit off the skid.

Open the door of the cabinet. Keys will be found with the packing slip. Remove the packing material and the control unit. Examine carefully for any damage that may have occurred in shipment. Check material against packing

list. Use Figure 1 of this Manual to identify parts. Any shortages or damaged material should be reported to Technical Operations immediately.

PREPARATION FOR USE

This unit is shipped with the source tube removed and a shipping plug is installed in its place. This shipping plug is fastened in place with two screws and sealed with a tamperproof seal. To prepare the unit for use, first remove the source control unit from the cabinet. The shipping plug should then be removed by cutting the wire of the tamperproof seal and removing the two bolts which hold it in place. Install the flanged source tube over the exit tube of the shield in place of the shipping plug. Socket head cap screws and wrench are provided. Couple to this first section of source tube one or two source tubes as required. Affix the source position switch to the end of the source tube and connect the source position switch lead (red wire) at the switch, at each source tube section junction and at the shield. Test this by pulling the tip of the source position switch. This closes the contacts in the switch and should cause the "ON" light on the control unit to flash.

Do not operate the unit without the source tube or without the source position switch in place. Failure to observe this may permit the source and source cable to be completely ejected from the unit.

OPERATION

Do not attempt to operate this machine without a radiation measuring instrument. We recommend a gamma survey meter of the ionization chamber type that has a full scale range of at least 500 MR/HR. Geiger counters are, as a rule, unsatisfactory for this purpose.

Place the cabinet conveniently near the radiograph location. Place the conical tip of the source position switch at the position the source should occupy during exposure. The source position switch should be clamped or supported in this position so that it cannot move during exposure. Locate the control box as far from the cabinet as is practicable. Easiest operation will be obtained if the

connecting cables and source tube are laid in straight lines without twist or with the longest practicable radius bends.

The source is actuated by turning the crank in a counter clockwise direction. Turn steadily at about 60 R. P. M. If undue resistance is encountered, reverse direction of cranking until the unit operates smoothly. DO NOT FORCE THE CRANK.

When the source reaches the source position switch, it enters the tip of the switch, pushing it outward and indicating that the unit is "ON". An "OPEN" indication means that the source has started to leave the safely stored position. "SAFE" indication means that the source is fully retracted within the storage container.

When the exposure is completed, retract the source by turning the crank clockwise until indication of safe storage is obtained.

The operator should use a survey meter or other rate indicating devices to measure the radiation when the unit is "ON" or in "OPEN" position.

Normally the radiation level 25 feet from the unshielded, exposed source will be about 22 milliroentgens per hour per curie of cobalt 60.

Absorbing or scattering materials will affect this reading. It may be necessary for the operator to move away from the unit when exposures are made so as not to exceed the maximum prescribed operating dose of 300 milliroentgens per week.

The operating dose should be determined by a personnel monitoring film badge or pocket dosimeter.

MAINTENANCE

The Technical Operations' Model 402 Gamma Ray Projector is designed to operate with a minimum of maintenance. Regular inspection of the unit for signs of damage to the connecting cables and source tube is recommended. Do not attempt to operate the unit if cables or tubes should become crushed or cut.

LUBRICATION

The Model 402 Gamma Ray Projector has been lubricated with a Texaco uni-temperature grease. Should further lubrication be necessary, use either the uni-temperature grease or a three-in-one spray oil. DO NOT USE GRAPHITE.

INDICATOR CIRCUIT

The indicator circuit is shown in Figure 3. It consists of a battery power supply and a relaxation oscillator circuit that causes the indicator lights to flash approximately twice per second. This type of circuit requires very little power and batteries should last about one year. The batteries may fail sooner if the unit is used in extreme cold. Replacement batteries (Burgess XX45 or equivalent) are available at all radio stores.

The lamps (type NE-51) are also available at most radio and appliance stores. Batteries may be changed by removing the cover of the control box located beneath the handle. See Figure 4. Note position of the batteries and their connections before removing. The replacement batteries should be placed in the same position. NOTE: Avoid touching the battery terminals as a moderate shock hazard exists.

SAFETY

Do not attempt to operate the unit without adequate distance from the exposed source to areas where personnel have access. Determine, with a survey meter of the ionization chamber type, the areas that must be denied during exposures. Personnel should not be exposed to fields greater than 7-1/2 mr/hr on a continuous basis (40 hour week) OR more than 300 mr in a week.

Typical radiation rates from a 4 curie cobalt 60 source are given below. These figures are for a source exposed in open space and do not include the reinforcing effect of scattering or the diminishing effect of absorbers that may be noticed when walls or structures are near the source.

Distance from Source	Radiation in MR/HR
5 feet	2200
10 feet	560
25 feet	88
50 feet	22

Personnel using the equipment or working near it should wear a film badge to provide a continual record of the radiation they receive.

"Pocket Dosimeters" allow exposed personnel to read at any time the total dose received.

The film badge service and monitoring instruments are described in the general catalog of Technical Operations, Incorporated.

WARRANTY

Technical Operations guarantees this equipment to be free of defects in material and workmanship for a period of one year from the date the equipment was received.

In the event the equipment described above proves, during the guarantee period, to be defective in material or workmanship Technical Operations will undertake to repair or replace the parts which prove defective.

Technical Operations does not assume any liability or responsibility for usage of the Cobalt 60. Any use of the Cobalt 60 other than that described in the Atomic Energy Commission Authorization Form 374 is forbidden without specific Atomic Energy Commission authorization.

SHIPPING INSTRUCTIONS

If unit is shipped by carrier subject to Interstate Commerce Commission, it must have the shipping plug installed and be crated. The outside of the container should be labelled "RADIOACTIVE MATERIAL" and be plainly marked "BUREAU OF EXPLOSIVES PERMIT NO. 143".

I. DESCRIPTION

A. General

The Model 412 Panoramic Gamma Ray Projector is an advanced isotope handling unit developed to provide safe storage and accurate remote positioning of industrial radiographic sources.

Designed for use with Iridium 192 sources, the Model 412 features maximum operator protection, together with unusual flexibility of application. In use, the equipment positions the radioactive source at the end of a long, flexible tube, where its 360° (panoramic) radiation pattern may be used to full advantage, either for multiple specimen work or for circumferential exposure techniques. Positive mechanical control of the source and visual indication of its location is maintained at all times.

The relatively light weight of the equipment (when stored in its compact cabinet it is easily carried by two men) plus a battery-operated indicator system, make the Model 412 well-suited for field work as well as for permanent and semi-permanent installation. Provisions for safe replacement of the source in the field by the user make it unnecessary to return the unit periodically to the manufacturer for this purpose.

B. Specifications

1. Source Data
   a. Isotope: Iridium 192
   b. Source Dimensions: 1/8" dia. x 1/8" long
   c. Maximum Source Strength: 50 curies
   d. Shielding: Adequate to limit surface radiation to 2 milliroentgens per hour per curie.

2. Operating Specifications
   a. Maximum distance, Source Shield to Control Unit: 25 ft.
   b. Distance, Source Shield to exposure position: 7, 14 or 21 ft.
   c. Source Position Reproducibility: ± 1/16"

3. Physical Specifications

   a. Weight

      1) Source Shield, Control Unit and Control Cable: 145 lbs.

      2) Complete equipment, packed in storage cabinet: 205 lbs.

      3) Shipping Weight: 258 lbs.

   b. Dimensions

      (Storage Cabinet): 34" long x 12" high x 17" deep

C. Equipment Supplied

1. Source Shield with Control Unit (complete with batteries) and Control Cable.
2. Three 7-foot Source Tube sections (Part No. A-40209).
3. Source Switch (Part No. 40205).
4. Clamp (Part No. 40201-7).
5. Clamp Holder (Part No. 40201-8).
6. Tripod Stand. (Part No. 40201-9).

D. Accessory Equipment (available on order)

1. Iridium 192 Sources

Catalog Number	Strength
RS-1	1 curie
RS-2	2 curies
RS-4	4 curies
RS-10	10 curies
RS-20	20 curies
RS-40	40 curies

2. Dose Rate Meter (Victoreen Model 592). Ranges: 0-10, 0-100, 0-1000 mr/hr.
3. Dosimeter (Victoreen Model 541A). Range: 0-200 mr/hr.
4. Dosimeter Charger (Victoreen Model 561A).
5. Film Badge Service (T.O. No. FB-20).
6. Exposure Calculator (Catalog No. 426).

E. Construction Details

The Model 412 Gamma Ray Projector consists of three basic assemblies:

1. The Source Shield is a welded shell of 1/4" steel, containing approximately 115 lbs of lead. A curved channel through the center of the shield, which may be sealed by a metal plug for shipment or storage, houses the radioactive source. When the source is fully retracted into the shield it actuates a microswitch which causes the "SAFE" lamp on the control panel to flash. Built-in connectors at each end of the unit provide for attaching the Source and Control Tubes and electric cable.

2. The Control Assembly consists of a Control Unit and a 25 ft. composite control cable. The Control Unit contains the batteries and circuitry for the signal system which indicates source position. A hand-operated crank on one side of the unit permits the operator to move the source from the shield to its exposure position and back, from a remote position.

The Control Cable consists of three parallel sections. One is an electric cable which connects the signal circuit to the source position switches. The other two serve as housings for the flexible Drive Cable which, when actuated by a hobbed wheel connected to the hand crank, mechanically positions the source.

Three neon lamps, mounted on the top of the unit, flash to indicate whether the source is safely stored in the shield ("SAFE"), is in transit through the Source Tube ("OPEN"), or is in exposure position ("ON").

3. The Source Tube is a flexible, metallic hose consisting of one, two or three 7-foot sections, through which the source is moved by the Drive Cable. One end of the tube is connected to the Source Shield. At the other end is connected the Source Switch. When the source enters this switch, at the end of its travel, it closes a set of contacts which cause the "ON" lamp to flash at the Control Unit, indicating that the exact exposure position has been reached. (CAUTION: At no time should this equipment be operated without the Source Switch attached, or with more than three sections (21 ft.) of Source Tube connected to the shield.)

Parallel with each section of the Source Tube is an electric cable which serves to connect the Source Switch to the signal circuit.

II. OPERATING INSTRUCTIONS

A. Unpacking

The Model 412 Gamma Ray Projector is shipped in a wooden crate. After inspection for external signs of possible damage in shipment, the crate should be opened and the locked storage cabinet removed. Keys for the padlock will be found in an envelope taped to the storage cabinet cover. NOTE: The cabinet should be unlocked only by authorized personnel, trained in the handling of radioactive isotopes.

Unfasten the canvas securing straps and remove the Control Unit and the Control and Source Tubes, extending the latter to their full length. Remove the Source Shield. Examine all items carefully for any damage that may have occurred in shipment. Check the material included against the packing list, Using Figure 1 of this manual to identify parts. Any shortages or damage should be reported to Technical Operations immediately.

B. Preparation for Use

Locate the Source Shield at the desired distance from the specimens to be radiographed. Remove the shipping plug by cutting the seal wire and unscrewing the plug from the connector. Attach one section of the Source Tube in place of the plug, and add one or two additional sections if needed. The red signal cables should be connected together at each junction, and to the Source Switch and Source Shield at either end.

Attach the Source Switch to the end of the last section. The Control Unit should be located at the maximum distance (25 ft.) from the Source Shield, with the Control Tubes laid out as straight as possible. (Too many bends or a bend of small radius in either Control or Source Tubes may restrict the movement of the Drive Cable). Where practicable, it is recommended that the operator and Control Unit be located behind a protective shield, such as a concrete wall.

Mount the Source Switch firmly (using the tripod stand and clamp, or a permanent mounting jig) with the tip of the switch in the exact exposure position.

As soon as the signal cables are connected, the "SAFE" lamp on the Control Unit should begin flashing. The operation of the "ON" lamp should be checked at this point by pulling outward on the Source Switch tip.

C. Operating Procedure

(NOTE: This equipment should be operated only when monitored by a suitable radiation measuring instrument, in accordance with standard isotope handling practice. Technical Operations recommends a gamma survey meter of the ionization chamber type, having a full-scale range of at least 500 mr/hr. Geiger Counters are, as a rule, unsatisfactory for this purpose).

Turn the hand crank steadily in a counter-clockwise direction to move the source out of the Source Shield toward the exposure position. If undue resistance is encountered, reverse direction of cranking until the unit operates smoothly. DO NOT FORCE THE CRANK. If, after several reversals, cranking is still difficult, return the source to the "SAFE" position (by cranking clockwise) and check the Source Tube and Control Cables for bends which may be too sharp.

When the source leaves the "SAFE" position in the Shield, the "OPEN" lamp flashes on the Control Unit. This lamp continues to flash until the source enters the tip of the Source Switch. As it reaches exposure position, the "ON" lamp will begin to flash.

The operator should monitor the activity with a survey meter at all times when the source is in "OPEN" or "ON" position. Normally the radiation level at a distance of 25 feet from the exposed source will be about 9.2 milliroentgens per hour per curie of Iridium 192, although absorption or scattering effects of nearby materials may affect this value. It may be necessary for the operator to move away from the Control Unit while exposures are being made, to avoid exceeding the maximum prescribed dose of 300 mr/week.

The exposure time required for a given specimen will be a function of the specimen material and thickness, the source-to-film distance, and the strength of the source in curies. The time may be computed (when the exposure factor is known) by the relation,

$$\text{Exposure time (minutes)} = \frac{\text{exposure factor} \times (\text{source-to-film dist.})^2}{\text{strength of source (millicuries)}}$$

where the source strength may be estimated from the Iridium 192 decay curve (Fig. 5). For rapid, convenient calculation of exposure time, Technical Operations offers a slide-rule-type calculator for radiography with Iridium 192 sources.

When the exposure is completed, retract the source by turning the crank clockwise until "SAFE" storage is indicated.

III. MAINTENANCE

A. General

The Model 412 is designed to operate with a minimum of maintenance. Regular inspection is recommended for signs of damage to the Control Cables and Source Tube. Do not attempt to operate the equipment if cables or tubes should become crushed or cut.

B. Source Replacement

The equipment is designed so that the source replacement may be safely accomplished by the user in the field. By arrangement with Technical Operations, renewal sources will be shipped, either at regular intervals (dictated by the half-life of the source) or on individual order.

Shipment of renewal sources is made in a specially-designed shielded container. This container has two separate source pockets, one containing the renewal source and the other empty. The old source is simply cranked through the Model 412's Source Tube into the empty pocket and decoupled from the Drive Tube (in accordance with instructions furnished with the container). The new source is coupled in its place and retracted into the Source Shield.

C. Lubrication

Lubricate the inside of each Source Tube section, as needed with no more than a pinch of dry graphite. Do not use oil or grease, which may break down into corrosive or tar-like compounds in the presence of the strong radiation field around the source. No other lubrication is required.

D. Signal Circuit

The Signal Circuit consists of a battery power supply and a relaxation oscillator circuit which causes the indicator lights to flash approximately twice a second. This type of circuit requires very little power, and batteries should last for about a year. Replacement batteries (Burgess XX45 or equivalent) are available at all radio stores.

The neon indicator lamps (type NE-51) are also available at most radio and appliance stores.

Access to the batteries may be obtained by removing the Control Unit cover, located beneath the handle. (See Fig. 4). Before removing the batteries, note their relative positions and the locations of the connecting leads. The new batteries should be replaced in an identical manner. (Note: avoid touching the battery terminals, as a moderate shock hazard exists.)

IV. SAFETY

The Model 412 is designed to afford the operator maximum protection from radiation. However, normal precautions, consistent with accepted isotope handling practices, must be observed at all times in operating this equipment.

1. Every precaution should be taken to insure adequate distance between the exposed source and areas accessible to personnel. Prohibited areas should be determined with a survey meter, and should be plainly marked.

2. Personnel should not be exposed to fields greater than 7-12 mr/hr on continuous basis (40-hour week) OR more than 300 mr in any one week.

3. Personnel using the equipment or working near it should wear a film badge to provide a permanent, running record of the radiation dosage received.

4. Pocket Dosimeters, which allow exposed personnel to read, at any time, the total dose received, are also recommended.

WARRANTY

The product is guaranteed by us to be free from defects of manufacture subject to the following:- Our responsibility under this warranty is limited solely to replacement of any or all defective parts for a period of one year after delivery. This warranty does not apply if the defect has been produced through misuse, alteration or abnormal conditions of operation. The warranty is limited solely to the workmanship and materials in the product and shall not extend in any way to the uses to which it may be put or as to its suitability for such uses.

WAIVER

By accepting delivery of the product, you agree that we shall not be liable to you or anyone claiming through you with respect to any claims for injuries alleged to be due to the use of the product. We sell the product on the condition that we shall not be liable for any claims for injuries alleged to be due to the use of the product whether or not such use is in accordance with instructions given by or referred to by us.

VI. SHIPPING INSTRUCTIONS

If this equipment is to be shipped by a carrier subject to Interstate Commerce Commission, it must have the shipping plug installed and must be crated. The outside of the container should be labelled "RADIOACTIVE MATERIAL" and be plainly marked "I.C.C. 55". Standard shipping labels are available for this purpose and it is recommended that they be used. The container or shield holding the source must be securely locked.

IMPORTANT

Observe these precautions when changing sources.

1. NEVER attempt to release coupling with any tool other than the release tool furnished. Release tool fits the grooves of the connector. Hold the release tool so that the index finger can press the connector against the release tool as shown in the illustration.
2. If the connector is clogged with dirt the spring may not engage the groove in the mating part. Clean, if necessary, with gasoline or carbon tetrachloride.
3. *When source and connector are engaged be sure spring of connector has dropped into groove of the mating part.* Test for proper engagement by pulling between source assembly and connector.

   CAUTION Do not allow source assembly to be withdrawn more than ½ inch from the storage container while testing for proper engagement.

Form AEC-313
(5-58)

ATOMIC ENERGY COMMISSION

APPLICATION FOR BYPRODUCT MATERIAL LICENSE

19-1398-19

Form approved.
Budget Bureau No. 38-R027.3.

INSTRUCTIONS.—Complete Items 1 through 16 if this is an initial application. If application is for renewal of a license, complete only Items 1 through 7 and indicate new information or changes in the program as requested in Items 8 through 15. Use supplemental sheets where necessary. Item 16 must be completed on all applications. Mail three copies to: U. S. Atomic Energy Commission, Washington 25, D. C. Attention: Isotopes Branch, Division of Licensing and Regulation. Upon approval of this application, the applicant will receive an AEC Byproduct Material License. An AEC Byproduct Material License is issued in accordance with the general requirements contained in Title 10, Code of Federal Regulations, Part 30 and the Licensee is subject to Title 10, Code of Federal Regulations, Part 20.

1. (a) NAME AND STREET ADDRESS OF APPLICANT. (Institution, firm, hospital, person, etc.)

THE MARTIN COMPANY
Baltimore 3, Maryland

Attn: Mr. R. G. Macaulay
Licensing Officer

(b) STREET ADDRESS(ES) AT WHICH BYPRODUCT MATERIAL WILL BE USED. (If different from 1 (a).)

Middle River Plant
Middle River, Maryland

2. DEPARTMENT TO USE BYPRODUCT MATERIAL

Isotope Power Department
Nuclear Division
The Martin Company

3. PREVIOUS LICENSE NUMBER(S). (If this is an application for renewal of a license, please indicate and give number.)

Twelve Byproduct Material Licenses are currently in effect.

4. INDIVIDUAL USER(S). (Name and title of individual(s) who will use or directly supervise use of byproduct material. Give training and experience in Items 8 and 9.)

Canie E. Hollens
Engineer

5. RADIATION PROTECTION OFFICER (Name of person designated as radiation protection officer if other than individual user. Attach resume of his training and experience as in Items 8 and 9.)

Paul R. Guinn - See Resume Submitted With Martin Application Dtd. 11/13/57
Re: License No. 19-1398-9, Amend. No. 2

6. (a) BYPRODUCT MATERIAL. (Elements and mass number of each.)

Any byproduct material having Atomic Number between 3 and 83, inclusive.

(b) CHEMICAL AND/OR PHYSICAL FORM AND MAXIMUM NUMBER OF MILLICURIES OF EACH CHEMICAL AND/OR PHYSICAL FORM THAT YOU WILL POSSESS AT ANY ONE TIME. (If sealed source(s), also state name of manufacturer, model number, number of sources and maximum activity per source.)

A maximum of 15 grams of irradiated Hastelloy C - 500 millocuries (See attachment for composition of Hastelloy C).

7. DESCRIBE PURPOSE FOR WHICH BYPRODUCT MATERIAL WILL BE USED. (If byproduct material is for "human use," supplement A (Form AEC-313a) must be completed in lieu of this item. If byproduct material is in the form of a sealed source, include the make and model number of the storage container and/or device in which the source will be stored and/or used.)

15 grams of Hastelloy C (consisting of three pieces @ approximately 4½ grams and one piece @ .1455 grams) will be shipped to Brookhaven National Laboratory, there to be irradiated in a reactor for a period of approximately nine days. After a cooling period of about fourteen days, the pieces will be returned to The Martin Company in a 2 inch lead pig. The pieces thus irradiated will then beimmerged in beakers containing sea water in order to study the effects of corrosion on Hastelloy C.

Gentlemen:

Reference is made to our special Nuclear Material License SNM-53 as amended. We desire to further amend this license in order that we can proceed to ship uranium-aluminum type fuel elements to the Universities of California and Washington. For your information we have enclosed a write-up describing our proposed shipping plan and have included drawings of the proposed shipping container.

I certify that the statements made in this letter and referenced enclosures are true, complete and correct to the best of my knowledge and belief and are made in good faith.

Very truly yours,

THE MARTIN COMPANY

File 9.

PROCEDURE FOR SHIPPING URANIUM-ALUMINUM FUEL ELEMENTS

AMENDMENT TO MARTIN LICENSE SNM-5

The shipment to the Universities of California and Washington will consist of 24 each, 11 plate fuel assemblies. Each fuel plate, whether in the assembly or separate, will contain 13.2 ± 1.0 grams of U235 as 93+% enriched uranium metal in a uranium-aluminum alloy. Therefore, the 11 plate assemblies will each contain a maximum of 156 grams of U235.

Each shipment will consist of four 11 plate assemblies in the proposed container. The nominal U235 in each shipping container is 581 grams. Based on the tolerance the maximum would be 624 grams.

The shipping containers will be made from 55 gallon steel drums. The four contained fuel elements will be packed in a wooden box and located in the center of the drum by wooden separators as shown in the attached drawings. Each element measures 2.85 x 2.44 x 26 inches long. Each element will be completely enclosed by corrugated cardboard and the four elements will be packed in a central box which measures 6" x 7" 28" long allowing for ½" of insulation the fuel portions measure 5.4" x 6.25" x 24". The rigid plywood supports will maintain a 4" space between the fuel elements and the top and bottom of the shipping container. The space between the box and the side of the 55 gallon drum is 8" and 8½" respectively as shown on the attached drawings.

With the space that the shipping container maintains internally, and the quantity of fuel contained in the 4 elements, multiple containers can be placed against each other in any arrangement and will be sub-critical even under flooding conditions. Since each delivery is limited to 24 elements and the delivery dates are spaced by several months, the maximum number of containers that can be shipped at any one time is six. Since the shipping containers are constructed of steel they provide good resistance to fire and wreckage.

INTER-DEPARTMENT COMMUNICATION

April 18, 1960

To: W. Wachtl

From: E Scicchitano

Subject: AMF Storage Box Nuclear Calculations-Summary of Results

---

I. Multiplication Factor

A. 6.25" X 5.4" X 24" box containing 4-11 plate assemblies.

		$\mathcal{K}_{eff}$
1)	Dry	.01
2)	Wet	.40
3)	Wet with ∞ water reflector	.64

B. 55 gal. drum

		$\mathcal{K}_{eff}$
1)	Infinite array of homogeneous mixture	.40
2)	Infinite array of homogeneous with double loading (by mistake)	[illegible]

Multiplication factor calculations were based on three group diffusion theory calculations. The distributions of the materials within the box and drum were assumed to be homogeneous

II. Interaction Calcuations*

		Ω(Steradians)
A.	3 X 2 array of 6.25" X 5.4" X 27" boxes in 55 gal. drums. (24 cm.)	1.4

* Ref. I TID 7019-Guide to Shipment of U235 Enriched Uranium Material
Page 74 Appendix 4

Conclusions

As seen from results in I above, the shipping containers are safe under flooded conditions.

From results of interaction calculations (II above) and Appendix 5 in Ref. I, the shipping containers are still safe.

Subject: Special Nuclear Material License SNM-53, Amendment

Gentlemen:

On July 20, 1961 and August 31, 1961 we submitted an amendment to add the process, description and SS material flow chart for fabrication of a uranium fuel form not previously described. This submission was in the form of a report, number MND-2603 and was approved by the AEC September 13, 1961.

We wish to further amend this process by revising a portion of MND-2603. The revision is described in the attached License Report MND-2603C, dated March 21, 1962.

I certify that the statements made in this letter are true, complete and correct, to the best of my knowledge and belief, and are made in good faith.

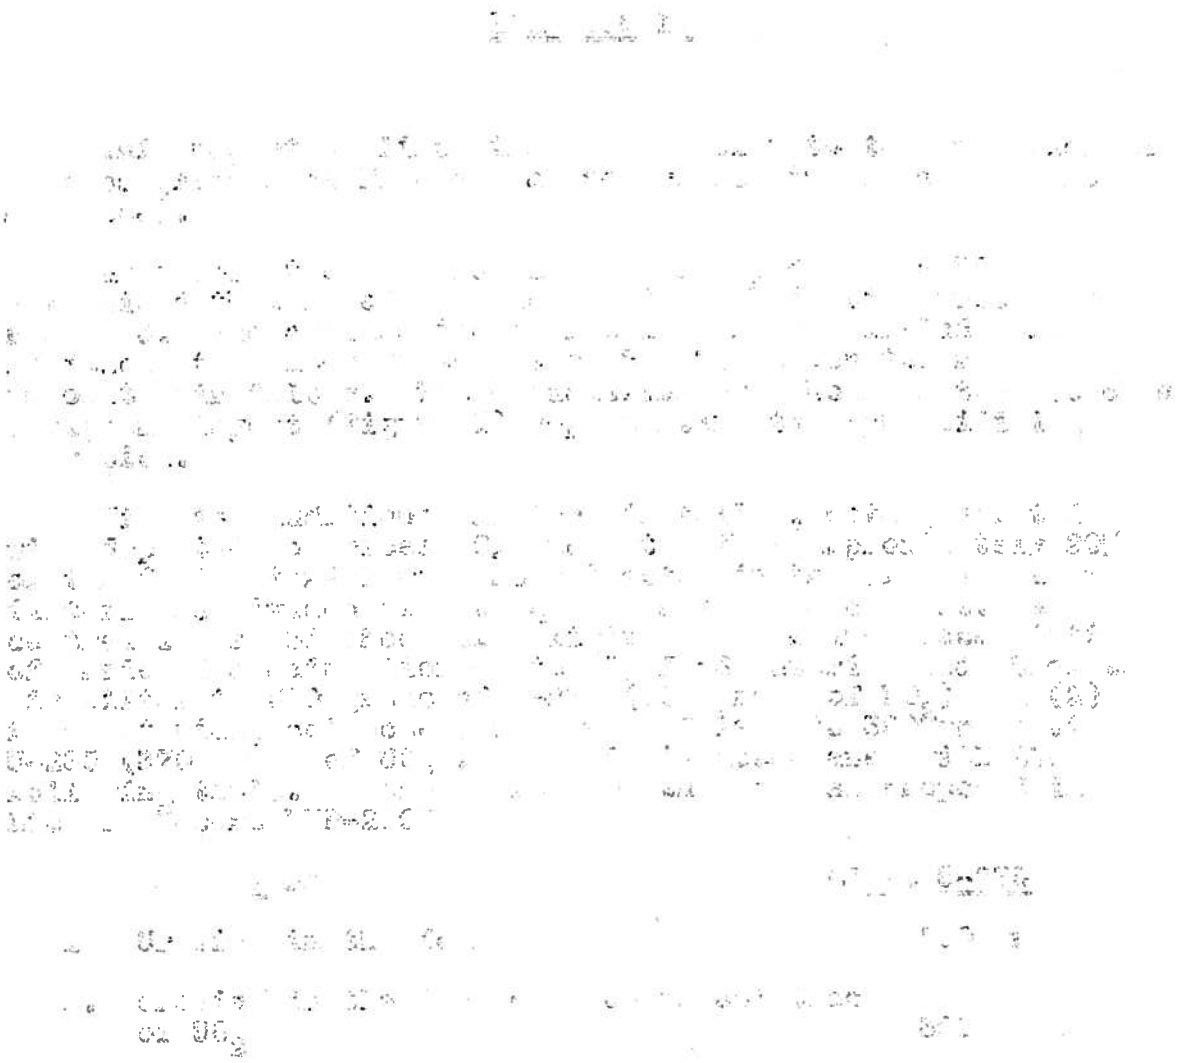
NUCLEAR NAVAL SAFETY CONTROLS

FOR FABRICATION OF

SPHERICAL URANIUM DIOXIDE POWDER

MARCH 21, 1962

3184



PROCESS CONTROL FOR AREA [illegible]

1. All water and air filters are dried 24 hours at 120°F prior to installation. Filters are weighed, identified and weights recorded.

2. For spheroidization a lot will consist of 100 grams. Three (3) lots or 300 grams will comprise one batch.

3. At the start of each run a new data sheet is attached to the hood [illegible] (See attached Figure I). A run commences after new water and air filters are installed, the system has been flushed and any total fuel accounting is made.

4. After a 300 gram batch is spheroidized in 100 gram lots the product is removed from the collector. Each lot is entered on the data sheet.

5. A balance is made whereby the total material removed from the collecting unit is weighed and deducted from the feed input. The difference is assigned to "In System". (See Form No. NA-[illegible])

6. Steps 4 and 5 are repeated until the assigned "In System" accumulation plus 300 grams of UO_2 is greater than 370 grams of UO_2.

7. The batch size will then be reduced to two (or one) 100 gram lots such that the assigned "In System" accumulation plus the new batch is less than 370 grams of UO_2.

8. Step 7 is repeated until the "In System" accumulation of UO_2 plus 100 grams of UO_2 is greater than 370 grams of UO_2. Then the water and air filters are removed from the system, dried and weighed.

9. The entire system is washed down and the UO_2 collected is dried and weighed.

10. A total fuel balance is made.

11. After drying air filters are stored. If UO_2 in the air filters is less than 200 grams UO_2 per three filter group they may be reused for later runs.

12. When an individual air filter reaches 100 grams it is dried, weighed, and stored for reprocessing.

13. Water filters are dried, weighed, and stored for reprocessing.

14. An example run [illegible] 80% yield is shown on the data sheet in Figure III.

Subject: Supplement to License Report MND-2789

Gentlemen:

Reference is made to our Special Nuclear Material License SNM-53 as amended. We submitted a request to further amend this license on May 8, 1962 in our letter LSN-17. We wish to supplement this application by transmitting copies of the container design, drawing number 1883-342 dated April 4th and fuel element shipping container stress analysis as referenced in our application.

As indicated in our application for amendment we had submitted an application for a Bureau of Explosives Permit on the proposed shipping containers and have received this permit, number BE-1411.

ANALYSIS
OF

FUEL ELEMENT SHIPPING CONTAINER ANALYSIS

THE FOLLOWING ANALYSIS IS MADE FOR A 55 GAL DRUM SHIPPING CONTAINER TO BE USED IN TRANSPORTING FUEL ELEMENTS. THE OIL DRUM ITSELF IS USED AS A SPACER TO INSURE THAT [illegible] SPACING OF RADIOACTIVE MATERIAL IS MAINTAINED DURING SHIPMENT. THE DRUM IS REINFORCED ON TOP AND BOTTOM WITH 1/8" STEEL PLATE WELDED AROUND THE CIRCUMFERENCE OF THE DRUM. THE FUEL ELEMENTS ARE CONTAINED WITHIN A SCHEDULE [illegible] WELDED TO THE 1/8" [illegible] AT BOTH THE TOP AND BOTTOM OF THE DRUM AND [illegible] CALLY LOCATED AROUND THE AXIS OF THE DRUM.

THE LOAD TO BE ANALYZED IS A SIDE LOAD ON THE DRUM IN A FLAT SURFACE. DUE TO THE [illegible] INVOLVED IN DETERMINING IMPACT STRESSES AND CORNER DROPS, THE CALCULATIONS UTILIZE STATIC LOADS TO DETERMINE ALLOWABLE LOADINGS.

ASSUMPTIONS

1. THAT THE LOAD IS TAKEN IN A THIN PLATE TYPE COLUMN 1/8" THICK X 4" WIDE X 15" LONG WHICH HAS SOME EDGE CONSTRAINT DUE TO THE FACT THAT THE PLATE IS WELDED TO THE DRUM.
2. THAT THE WEIGHT OF THE COMPLETE ASSEMBLY IS APPROXIMATELY 200 POUNDS.

(b)(4)

OPTIONAL FORM NO. 10
5010-104

UNITED STATES GOVERNMENT

Memorandum

TO : Donald A. Nussbaumer, Chief
Source and Special Nuclear Materials Branch
DL&R

DATE: June 4, 1962

FROM : Alexander E. Aikens, Jr., Chief
Process Evaluation Branch, DL&R

SUBJECT: SUPPLEMENT TO LICENSE REPORT HED-2789 - DOCKET 70-53

In accordance with your request we have reviewed the structural integrity of subject shipping container, and have the following comments:

a. The strength of the shipping package does not meet the proposed requirement (May 24, 1962 Draft of Part 71) of a 30 foot drop with no more than 10% reduction in the minimum spacing as measured from the outside of the inner container to the outside of the outer container.

b. The above requirement means in subject case that only a 1" deformation of the 55 gallon drum may be allowed. The strength of the outer container must, for the 1" deformation, be equal to an impact force of (b)(4) s, assuming uniform resistance during deformation. As the main body of the drum is only able to resist an impact force of about (b)(4) s (based on the 200# weight of the package), the ends of the drum must be able to take the brunt of the (b)(4) s impact. The buckling strength of the 4" x 1/8" spider frames at top and bottom is calculated to be about (b)(4) s. If the thickness of these 1/8" bars were increased to 3/16", the total buckling strength would be increased to about (b)(4) s. Also, in order to avoid excessive deformation between the spider bars (i.e., in case of impact in that area), it is suggested that a solid 3/16" plate be used between inner and outer container, instead of the spider frame.

c. Reference is made to an apparent discrepancy in the size shown for the 55 gallon drum. The standard 55 gallon drums have an inside diameter of 22-1/2", whereas the 55 gallon drum shown on the applicant's drawings shows an apparent diameter of close to 30".

OPTIONAL FORM NO. 10
5010-104

UNITED STATES GOVERNMENT

Memorandum

TO : Donald M. Nussbaumer, Chief
Source and Special Nuclear Materials Branch, DL&R

DATE: June 7, 1962

FROM : Alexander E. Aikens, Jr., Chief
Process Evaluation Branch, DL&R

SUBJECT: SUPPLEMENT TO LICENSE REPORT MND-2789 - DOCKET 70-58

Reference is made to our June 4, 1962 memorandum with comments regarding structural integrity of subject shipping container. Chris Beck's telephone conversation on June 6 with Mr. Wachtl of Martin-Marietta Corporation satisfactorily cleared up the design details we questioned.

We find that the design complies with the (b)(4) impact requirement. We also find that with some minor strengthening (such as increasing the thickness of the 1/8" end plates to a 3/16" thickness), the design will satisfy the 30 ft. drop test requirement as specified in the May 24, 1962 Draft of Part 71.

OPTIONAL FORM NO. 10
5010-104

UNITED STATES GOVERNMENT

Memorandum

TO : Donald A. Nussbaumer, Chief, Source and Special Nuclear Materials Branch, DLMA
Attn: J. C. Delaney

DATE: September 20, 1962

FROM : Christian Loch, Staff Engineer - Structural
Fuels Processing Branch, DLMA

SUBJECT: [illegible] APPLICATION OF AUGUST 29, 1962, FOR APPROVAL OF SHIPPING PROCEDURES (70-5)

I have reviewed the data presented and offer the following comments:

a. It is suggested that the drum be strengthened to be capable of resisting a 30 foot drop on the side without exceeding the required 10% reduction in the minimum spacing.

b. The applicant has not furnished any analysis data to back up his contention that the impact forces from 30 foot drop would be less than (b)(4) Ex This and other assumptions made in their analysis should be substantiated, preferably by tests.

Attention: Mr. [illegible]. Wachtl
Contracts Manager

Gentlemen:

Pursuant to 10 CFR 71, you are hereby authorized under License SNM-53 to ship at any one time one PM-3A central core bundle in accordance with the procedures and conditions described in your request of August 29, 1962.

The granting of this authorization does not imply a determination by AEC that the package you propose to ship will withstand a thirty foot fall on a flat unyielding surface with no more than a 10% reduction in the minimum spacing measured from the outside of the inner container to the outside of the outer container. We find no basis in your request for the assumption that the impact forces from a thirty foot drop would not be greater than (b)(4) s. We believe this and other assumptions made in your analysis E-4 should be substantiated, preferably by tests, in the event you would want approval in the future for shipments involving greater quantities of U-235, more than a single container, or by other than exclusive use vehicle.

Materials Branch

Subject: Additional Information for
Amendment No. 18 to SNM-53

Enclosure: (1) Nuclear Safety Evaluation

Gentlemen:

As you will recall, we recently submitted our application for Amendment No. 18 to SNM-53 to obtain approval for use of storage racks and boxes both during manufacturing operations and for an in-process storage area. In discussions with Mr. John Lane of your office, it was determined that your criticality review included evaluation of only one rack with two storage boxes in the entire manufacturing area.. Actually, we plan to use approximately 50 racks. Individual racks with capacity for 2 boxes will be located at the various machine locations throughout the fabrication area.

Our criticality engineer has just completed additional calculations to show that safety is assured even if 4 completely filled racks are placed as close as physically possible. To complete your analysis, we are furnishing this additional data as Enclosure (1).

Since placement of the racks in close proximity would not permit easy access to the fabricated pieces, any utilization of the racks in this manner is not a logical utilization in a manufacturing process. Space considerations prohibit any such occurrence at the machine locations.

DOCKETED
USAEC
Division of
Licensing & Regulation

Docket Officer

ACKNOWLEDGED

THE AEROSPACE DIVISION OF MARTIN MARIETTA

Refer to:
ACC-190

May 17, 1963

Further, each box is considered a work area which, under our basic criticality philosophy, will be separated from any other box or work area by a distance of two feet. Administrative control will assure that this spacing is maintained.

Since utilization of the boxes and racks is becoming a critical item in our fabrication of Pathfinder fuel, approval is requested as soon as possible.

Very truly yours,

C. W. Keller

Docket No. 70-58

5/17/63 L&R File Copy

NUCLEAR SAFETY EVALUATION

The method used to evaluate safety of an array of storage racks and boxes shown in Fig. 1 is that recommended in TID-7016, "Nuclear Safety Guide", 1961. The multiplication factor of the most reactive container in an array is plotted against the total fractional solid angle (Ωf) of the container in the array. The two are related by Fig. 26 of TID-7016 in which a combination of k and Ωf producing a point below the curve indicates a safe array while a point located above the line indicates an unsafe combination.

DOCKETED
USAEC
Division of
Licensing & Regulation
MAY 20 1963
Docket Officer

The multiplication factors and interaction calculations are summarized below in tabular form. These data are plotted on Fig. 2.

The calculations for k eff and interaction calculations for the array shown in Fig. 1 are also presented.

The data shown in Fig. 2 indicates that at least four and probably five racks can be merged under the optimum conditions for criticality without producing a criticality hazard.

SUMMARY OF k eff AND Ω f CALCULATIONS

Item No.	U-235	k eff	Ωf	
				Short Containers
1	670	.592*	.271	Total Ωf for containers (2), (3), (4), (5) and (6)
2	670	.642*	.138	Total Ωf for containers (2), (5), and (6)
3	670	.772*	.013	Total Ωf for container (5).
				Long Containers
4	1210	.527*	.271	Total Ωf for containers (2), (3), (4), (5), and (6)
5	1210	.527*	.213	Total Ωf for containers (2), (5), and (6).
6	1210	.527*	.013	Total Ωf for container (5).

*Only largest value of k eff and other lower values represent safe condition.

Page 8 redacted for the following reason:

(b)(4)

Calculation of K eff

The container configuration, shown below, consists of two standard in-process boxes contiguous on their long side. The container dimensions then become 5-7/16" x 14-1/2" x (45-7/8" or 81-3/8"). The two lengths represent short and long containers. The system is considered to be homogeneous.

(b)(4)

Ex 4

The method of analysis used is identical to that presented in Amendment #18. The total U-235 weight is 2000 grams. Each fuel element consists of 14.5 w/o UO_2 and 83.5 w/o SS.

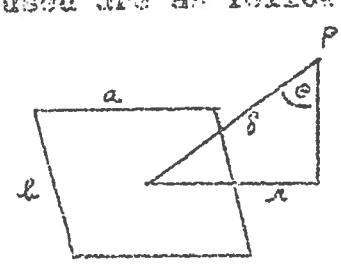
The H/U ratios and corresponding multiplication factors are as follows:

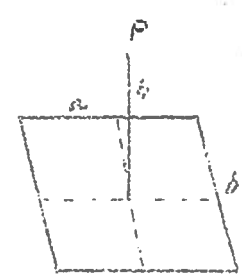
H/U	K eff	Short Container
679	.642	when full
340	.398	when 1/2 full
226	.130	when 1/3 full
		Long Container
1218	.527	when full
609	.299	when 1/2 full
406	.182	when 1/3 full

Solid Angle Calculation

The array considered is shown in Fig. 1 and is the product of six racks. Container (1) is taken as the most central and the solid angle subtended by containers (2), (3), (4), (5) and (6) determined. The equations used are as follows

Planes





$\Omega = (\pi h/\rho^2)\cos\theta$

$\Omega = 4\sin^{-1}\dfrac{(a/2)(b/2)}{\sqrt{(a/2)^2+h^2}\sqrt{(b/2)^2+h^2}}$

The fractional solid angles subtended at container (1) by the other containers are shown in the following table for both long and short containers.

Container No.	Fractional Solid Angle (Ωf)	
		Short Container
2	.068	
3	.058	
4	.041	
5	.053	
6	.041	
		Long Container
2	.073	
3	.073	
4	.072	
5	.069	
6	.072

UNITED STATES GOVERNMENT

Memorandum

TO : Donald A. Nussbaumer, Chief, Source and Special Nuclear Materials Branch, DLR

DATE: JUL 3 0 1963

FROM : Christian Beck, Staff Engineer - Structural Fuels Processing Branch, DLR

SUBJECT: MARTIN CO. SHIPPING CONTAINER FOR PATHFINDER FUEL

DLR-FPB-CB

ATTN: R. L. Layfield

I have reviewed the revised design of subject shipping container and found that the strengthening of the design, as suggested at the June 25th meeting, has been taken care of. The only comment I have concerns the structural analysis (Appendix A) in Martin Co.'s report, dated June 24, 1963. The analysis is based on a combination of the structural requirements of both Part 71 and 72. The (b)(4) Ex 4 loading as specified in Part 72 has nothing to do with subject design, which should be based entirely on the requirements specified in Part 71.

Attention: Mr. Robert Layfield

Subject: Proposed Amendment Number 19 to Special Nuclear Material License No. 53

Reference: (a) Martin letter ACC-200 to Donald A. Nussbaumer, Chief, Source and Special Nuclear Materials Branch, dated June 25, 1963

In the reference letter we initiated our request for AEC approval for shipment of Pathfinder fuel assemblies from the Martin site in Baltimore to the Northern States Power Company facility in Sioux Falls, North Dakota. Shippage in the shipping schedule and determination of method of shipment have delayed submission of additional information to you.

We have now negotiated with the Tri State Motor Transit Company of Joplin, Missouri for exclusive use of van shipments. Enclosed is the routing which they will use.

We plan to ship no more than 10 shipping containers each containing 14 fuel assemblies, in any one shipment. Spacing in a 40 foot van will accommodate the ten containers on the floor of the van in a two wide by five long arrangement. Exclusive use of van shipments for less than ten containers may be made. Present planning calls for the initial shipment in mid-November, with another in December, and two in February - March 1964.

We have completed fabrication of twenty (20) shipping containers with pallets for use in shipping both finished product as well as reject tubular material for subsequent uranium recovery. Enclosed is the criticality evaluation for the most reactive array of seven containers with consideration of a 10% deformation criteria. Evaluation has also been made for a planar array of twenty-four (24) containers which is shown to be safe from a criticality standpoint. Since the proposed shipment will be made under controlled array conditions and will contain a maximum of ten (10) containers, nuclear safety is assured.

We regret the delay in supplying you additional information. We trust that your evaluation can now be completed and a timely approval granted for the proposed Amendment No. 19 to Special Nuclear Material license No. 53.

Very truly yours,

C. W. Keller

ATTACHMENT NO. 1

Criticality Evaluation

Proposed Shipment of Pathfinder Fuel Assemblies

This submittal presents supplementary information for the proposed Amendment No. 19 to Special Nuclear Material License No. 53.

Interaction Calculations: -

Two interaction calculations were performed, namely;

1. Evaluation of seven containers in the most reactive array.

2. Evaluation of a 24 container planar array.

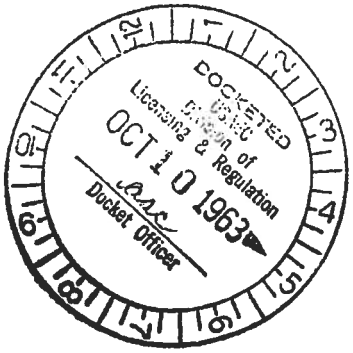
Figure 1 depicts the axial view of a planar array of the shipping container. The plot of the multiplication factor, k eff. for a single container and the total fractional solid angle, Ωf, is shown in Figure 2. The value of k eff, 0.425, was determined in the original evaluation.

The following discussion outlines the methods used in the calculations utilizing the 10% deformation criteria.

Dimensions:

Undeformed container diameter	= 22.5"
Central pipe diameter	= 5.0"
Separation diameter	= 17.5"
10% deformation	= 1.75"
Modified separation diameter	= 15.75"
Modified container diameter	= 20.75"

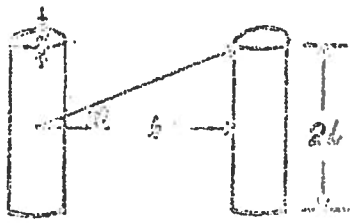
The separation distances shown in Figure 1 are based on the modified container diameter.



ATTACHMENT D-1, 1 (Continued)

The fractional solid angle, Ω_f, was computed by means of the relationship

$$\Omega_f = \frac{dl}{2\pi h \sqrt{h^2 + l^2}}$$



where: d = pipe diameter = 5 inches

l = half the length of the active fuel element = 36 inches

h = separation distance, inches.

Ω_f (Control 7 containers) = .3338

Ω_f (24 containers) = .3760

Gentlemen:

Re: (Renewal of Byproduct Material
License No. 19-1398-19)

Transmitted herewith are three (3) copies of an application for renewal of Byproduct Material License No. 19-1398-19.

All byproduct material previously authorized and possessed under 6 C and E of the expiring license have been disposed of; these radioactive materials were packaged in approved containers and shipped in compliance with I.C.C. regulations to Oak Ridge for land burial.

All byproduct material previously possessed under 6 D of the expiring license is currently authorized and possessed under license 19-1398-9.

Should any additional information be required, please contact me at AC 301, 687-3800, Ext. 9517.

Very truly yours,

Richard J. Brisson

(9-62)

UNITED STATES ATOMIC ENERGY COMMISSION

APPLICATION FOR BYPRODUCT MATERIAL LICENSE— USE OF SEALED SOURCES IN RADIOGRAPHY

Form approved.
Budget Bureau No. 38-R137

SEE ATTACHED FORM AEC-313R INSTRUCTIONS—USE SUPPLEMENTAL SHEET WHERE NECESSARY

BE SURE ALL ITEMS ARE COMPLETED AND THAT ALL NECESSARY ATTACHMENTS ARE FURNISHED. IF ANY PORTION OF THE APPLICATION IS NOT APPLICABLE SPECIFICALLY SO STATE. DEFICIENT OR INCOMPLETE APPLICATIONS MAY BE RETURNED WITHOUT CONSIDERATION.

1(a) NAME AND ADDRESS OF APPLICANT

Martin Marietta Corporation
Baltimore 3, Maryland

2. PREVIOUS LICENSE NUMBER(S) *(Indicate if application is for renewal or amendment of an existing byproduct material license.)*

19-1398-19 (renewal)

1(b) APPLICANT IS: An individual ☐ A partnership ☐ A Corporation ☒ An Unincorporated Association ☐ Other ☐ If applicant is other than an individual, the applicable section on the reverse side must be completed.

3. LOCATION(S) WHERE SEALED SOURCES WILL BE USED AND/OR STORED. *(If use will be made in states other than named in 1(a), they should be listed here.)*

Middle River Plant
Middle River, Md.

4. SEALED SOURCES TO BE USED IN RADIOGRAPHY

	BYPRODUCT MATERIAL (Element and Mass No.)	SOURCE MODEL NUMBER	NAME OF MANUFACTURER	MAXIMUM ACTIVITY PER SOURCE	NUMBER OF SOURCES
A.	Ir 192	A-424-1	Technical Ops.	50 c	4
B.	Co 60	A-424-2	Tech Operations	10 c	2
C.					

5. RADIOGRAPHIC EXPOSURE DEVICES AND/OR STORAGE CONTAINERS TO BE USED WITH SOURCES LISTED ABOVE

	MODEL NUMBER	NAME OF MANUFACTURER (If custom made, attach complete design specification.)
A.	Model 412 or 498, Model 414 Storage	Technical Operations Co.
B.	Model 402, Model 416 Storage	Technical Operations Co.
C.		

6. THE FOLLOWING INFORMATION IS ATTACHED AS A PART OF THIS APPLICATION: *(Check appropriate blocks and attach information called for in the instructions with this form.)*

FORM AEC-313R (9-62)

LEGAL STRUCTURE OF APPLICANT

If applicant is a corporation, complete Items 8 through 11; if applicant is a partnership, complete Items 12 through 14; if applicant is an unincorporated association or a legal entity other than a partnership or corporation, complete Items 15 and 16. Attach separate sheets where space provided proves inadequate.

CORPORATION

8. STOCK OF APPLICANT CORPORATION

NO. OF SHARES AUTHORIZED	NO. OF SHARES ISSUED	NO. OF SHARES SUBSCRIBED	TOTAL NUMBER OF:	
			(a) Stockholders	(b) Subscribers
40,000,000 c.s.	21,488,239 (as of 11-30-63)	none	87,500	none

9. Is applicant corporation directly or indirectly controlled by another corporation or other legal entity? ..... YES ☐ ..... NO ☒

If answer is "YES" give name and address of other corporation or other legal entity and describe how such control exists and the extent thereof.

10. (a) Identify by name and address any individual, corporation, or other legal entity (1) owning 10 percent or more of the stock of applicant corporation issued and outstanding or (2) subscribing to 10 percent or more of the authorized but unissued stock of the corporation. None

(b) Identify by name and address all officers and directors of the corporation.

(See attached sheet)

11. Identify the State, District, Territory, or possession under the laws of which the applicant is incorporated.

Maryland

PARTNERSHIP

12. Name and address of each individual or legal entity owning a partnership interest in the applicant.

13. State the percent of ownership of the applicant partnership held by each of the individuals or legal entities listed in Item 12.

14. Identify the State, District, Territory, or possession under the laws of which the applicant partnership is organized.

OTHER

15. Describe the nature of the applicant and identify the State, District, Territory, or possession under the laws of which it is organized.

16. State the total number of members or persons holding an ownership in the applicant, identify each by name and address, and indicate the ownership interest thereof.

I. Description of Radiographic Facilities

A. Shielded Facility

The Martin Company Radiography Facility is located adjacent to the southwest corner of "D" Building at ground level. (Fig. 1, Plan view of Martin Complex)* The facility abuts a machine shop on the north wall and an earth hillside on the west wall. The south wall is adjacent to a locked fenced truckwell used for moving equipment in and out of the facility. The east wall adjoins a laboratory, an office and film processing area. (Fig. 2, Radiography Facility) Personnel entry into the facility is through a door from the laboratory through a mazed hall. A six-inch thick steel door locked from the inside is located on the south wall facing the truckwell. Access to the facility roof from the earth hillside on the westside is controlled by a fence and locked gate. The keys to these locks are controlled by the Senior Radiographer. The walls of the Radiography Facility are 24 inches of poured concrete. The north wall abutting the "D" Building Machine Shop benefits from an additional 10" of poured concrete making up the foundation support for "D" Building. The shielded facility roof is constructed of 6" thick poured concrete. An 18" wide, 12" thick strip is provided along the westside of the roof to reduce radiation streaming to the adjacent hillside. A right angle maze of 24" concrete at the entrance hall to the shielded room prevents direct streaming of radiation to the laboratory-office area.

1. Area Security Safeguards.

   a. An area radiation monitor-alarm is installed inside the facility with a slave unit located outside above the personnel entrance. During radiographic exposure operations, the radiation above a preset level activates an audible (bell) and visual (red light) alarm system when the facility door is opened, thus warning the personnel of the presence of radiation.

56944

* All figures attached at the end of this document.

b. Locks - A special high integrity locking system has been established to control access to the radiographic facility, areas adjacent to this facility, radiographic sources and source storage area (s). This system consists of multi-combinated interchangeable core locks. Keys issued to allow facility access will not permit access to radiographic sources, etc.

All keys and spare lock cores are maintained, inventoried and issued (signature required) by the Chief, Health Physics Section. No keys are issued without the specific direction of the Senior Radiographer. In the event a key is lost, the lock core can be changed promptly, thereby re-establishing absolute control.

c. Signs in conformance with 10 CFR 20 are posted on the gates of the fenced truckwell, roof of the facility and upon the personnel entry door.

d. Position of Operator Relative to Source Exposure Point - When a radiographic exposure is conducted, the source holder and source cable are positioned inside the shielded facility and the source cranking mechanism and cable are threaded through the mazed hall to the laboratory area and the source is cranked out from this position.

B. Open Air Radiography

On occasion, it may be necessary to perform radiographic operations outside of the shielded radiographic facility. In cases of Open Air Radiography, the following shall apply:

1. The radiographer shall consult with Health Physics to review the radiographic location.
2. Personnel performing the operation at a new location, shall be reinstructed concerning proper safeguards and control of the operation.

3. When required, Health Physics shall assist in conducting initial radiation surveys of the radiographic site. The source will be exposed in the position most likely to reflect the highest radiation levels. Ropes and signs shall be adjusted in order to establish the restricted area.
4. The method for source surveillance and control during periods of non-use shall be clearly indicated to all personnel involved.
5. Martin Company Security and Fire Protection personnel shall be informed of the area where work is to be performed, their participation, if required, and the nature of the hazard in the event of emergency.
6. A restricted area as defined in 10 CFR 20 shall be established around the radiographic exposure site. This zone shall be clearly posted with ropes and/or other barricades and radiation signs. Radiography personnel shall maintain visual surveillance during each source exposure to exclude unauthorized personnel from the area.

II. Radiation Detection Instruments

The following list represents some of the radiation detection instruments available at Martin Company for use during isotopic radiographic operations:

Manufacturer	Model No.	Radiations Detected	Range, mr/hr	No. Available	Use
Victoreen Inst. Co.	592	Gamma, X-ray	0-1000	3	Operational surveys
Victoreen Inst. Co.	740	Gamma, Beta X-ray	0-10,000	1	"
Eberline Inst. Co.	E-500B	Gamma, X-ray	0-2000	4	"
Victoreen Inst. Co.	CDV-715	Gamma, X-ray	10-500,000	6	Emergency

56944

56944

III. Calibration of Instruments

The Health Physics Section shall perform the calibration of the portable instruments used for detecting and measuring radiation during radiographic operations. Calibration shall be performed at least once every three months or oftener as required. Dkt. Note: Instrument calibration is authorized under Lic. No. 19-1558-5 WEK.

A. Procedure:

The following procedures shall apply:

1. A curve of radiation versus distance from the Health Physics calibration source should be consulted prior to using the source for calibrating radiation detection instruments. If this curve is not readily available, a curve may be generated in accordance with the following:

   a. Obtain latest source strength in curies from source inventory information in the Health Physics Office.

   b. The following information may be used to calculate radiation levels in R/hr at one foot distance.

      Cobalt 60 - Multiply source strength in curies by 14.

      Cesuim 137 - Multiply source strength in curies by 3.3.

      Iriduim 192 - Multiply source strength in curies by 5.9.

      Radium 226 - Multiply source strength in curies by 9.0.

   c. When the radiation output has been determined at one foot from a source (or any other known distance) the inverse square law for reduction of radiation intensity may be used to determine the intensity at any desired distance from the source. The inverse square law states that radiation intensity from a point source varies inversely as the square of the distance from the source:

$$\frac{I}{I_o} = \frac{(d_o)^2}{(d)^2}$$

Where I_o is the radiation intensity at distance d_o from the source, and I is the radiation intensity at distance d, from the source. This formula shows that doubling the distance decreases the intensity by a factor of four; increasing the distance by a factor of three, reduces the radiation intensity to one-ninth of its value, etc.

d. Plot a curve of source radiation level versus distance from the source on graph paper.

2. Check the calculated values by exposing a Condenser "R" meter chamber of appropriate energy range at the various distances from the source and plot this information on the same graph.

Note: The Condenser "R" meter has been calibrated by the National Bureau of Standards and is used as a secondary calibration standard.

3. Compare the curve generated from the Condenser "R" meter chamber readings versus distance to the curve of the calculated values.

4. Calibrate the instruments by placing them at various distances from the source in order to get meter readings on all scales. Adjust the appropriate calibration potentiometer to correct the meter reading when the reading varies more than ± 20% from the values obtained from the calibration curve.

5. If the instrument cannot be adjusted in order for the readings to fall within this range, it shall be submitted to the Instrument Shop for repairs.

6. Attach a calibration tag to the instrument and record the calibration information on the appropriate instrument data card located in the Health Physics Office.

IV. Personnel Monitoring Equipment

A. Film Badge and Dosimeter Description

All isotopic radiography personnel shall wear the film badge supplied by the Health Physics Section (presently Martin Co. is utilizing film badges provided by Health Physics Services, Inc., Baltimore, Maryland) and a self-reading dosimeter (Bendix Model 862, 866 or equivalent) or two pocket chambers (non self-reading type Victoreen, Model 362) while performing radiographic operations.

B. General Instructions

Dosimeters shall be read and the reading recorded daily on the gamma radiography data sheet. Film badges shall be processed immediately after noting off-scale or unusual dosimeter readings. Film badge results shall be maintained by Health Physics.

V. Operating and Emergency Procedures

A. Operating Instructions for Use of Personnel Monitoring Equipment

1. Dosimeters:

a. Dosimeters are available through Health Physics. These dosimeters measure the amount of gamma and x-ray radiation received up to 200 mr (Model 862), or 500 mr (Model 866).

b. All radiography personnel shall wear a self-reading dosimeter or two non-self readers at all times while conducting radiography.

c. Dosimeters are delicate instruments, and should be treated as such. Jarring or dropping the dosimeter may cause a high reading. Furthermore excessive humidity may also cause a high reading. Immediately notify your supervisor and/or Health Physics if you suspect malfunction of your dosimeter.

d. If a dosimeter should go off-scale, stop work and immediately notify your supervisor and Health Physics. This condition will be thoroughly investigated by Health Physics.

e. All dosimeters shall be charged daily at the start of each shift. At the end of each shift the radiographer in charge shall read the self reading dosimeter. If non-self reading dosimeters were worn, they shall be read in the Health Physics Office. All dosimeter readings shall be recorded on the Gamma Radiography Data Sheet.

2. Operating Instructions for Dosimeter Chargers: (Self-reading dosimeters)

a. Insert dosimeter into charging socket.

b. Hold dosimeter in contact (pressure required against spring).

c. Turn knob or adjust pulsing lever to set dosimeter to zero. (follow instructions on the charger).

d. Remove dosimeter from charger and check hairline position by looking through dosimeter at a source of light.

3. Film Badges

Film badges shall be worn during working hours. These badges are issued by Health Physics and changed on a periodic schedule prescribed by the Health Physics Section. If a Film Badge is lost, damaged or misplaced, the Health Physics Section shall be notified immediately before radiographic operations continue. A new badge will be assigned and an investigation will be conducted to ascertain the radiation exposure the badge received up until the time it was lost, damaged or misplaced.

4. Placement of Film Badges and Dosimeters

Personnel film badges and dosimeters shall be worn affixed to that portion of the body that is most likely to receive the highest radiation exposure.

B. Operating procedures for Ir 192, Model 412, 498 and Co 60, Model 402 projectors in the Shielded Facility, Southwest Corner "D" Building

1. Film badges and dosimeters shall be worn at all times while conducting radiography as per paragraph V. A.

2. Turn survey instrument on, allow at least 1 minute warm-up time, then check zero. If instrument does not function properly, or has not been calibrated within the last 3 months, secure another one from Health Physics that is calibrated and functioning properly.

3. Check the radiation detector slave unit mounted above the door to the shielded room. If the amber light is on, there is a malfunction in the circuitry. If the red light is on, the radiation level in the room is greater than normal background*. In either case, don't enter the room, notify Health Physics.

4. If there is no indication of radiation or malfunction on the detector slave unit, unlock the door and enter the facility carrying an operating survey instrument. If the reading on the instrument does not exceed normal background, it can be assumed it is safe to enter.

5. Survey the projector that is to be used to confirm the location of the radioactive source and note the maximum reading for future reference. (Radiation levels should not exceed the maximum level as posted by Health Physics on the radiation tag attached to the projector.)

6. Remove the cables and cranking device from storage and thread them through the entrance maze, taking care that the cables are not kinked or twisted.

7. Make the radiographic set-up on item (s) to be radiographed, using lead collimator when appropriate. Make sure that the source cable is free from sharp bends and is securely fastened in the exposure position.

8. (a) On the Ir 192, Model 412, 498 projectors, unlock the padlock and unscrew the retaining nut while observing the survey instrument to assure that the source has not moved from its shielded position. Attach the source cable to the projector by turning the nut on the projector counter-clockwise.

* Normal background radiation level, just inside the room at Location A (Fig. 3) is generally less than 2 mr/hr.

(b) On the CO 60, Model 402 projector, it is necessary to unlock the cabinet before the cables can be removed. The retaining plug is held in place by two bolts which have to be removed and the source cable can then be fastened by two Allen head bolts.

9. Take the survey instrument and leave the area via the entrance maze, hook the chain with radiation sign across the entrance to the shielded facility.

10. Expose the source by turning the crank counter-clockwise, lay crank assembly inside the door at location B (refer to Fig. 3). Close and lock the door.

11. Survey outside of the building to determine that the radiation is 2 mr* or less in any given hour at the boundary of the restricted area. This survey must be made each time the position of the source is changed in the room.

12. After the desired exposure time, return the source to the projector by turning the crank clockwise.

13. Check the detector slave unit over the entrance door to determine that the radiation has returned to normal background. (If the radiation level has not returned to normal, this could be an indication that the source has not returned to its shielded position.)

14. Open the door, remove the chain and cautiously enter the room carrying an operating survey meter.

* Note 1: The Commissions Regulations pertaining to permissible levels of radiation in unrestricted areas, as set forth in Section 20.105 (b) of Part 20, are 2 millirem in any one hour or 100 millirem in any seven consecutive days. It should be noted, therefore that the regulations do not limit radiation dose rates to a maximum of 2 mr/hr, but permit higher dose rates providing that the total quantity of radiation in any unrestricted area during any one hour does not exceed 2 millirem; and during any seven consecutive days does not exceed 100 millirem.

a. If radiation is no greater than normal background, proceed to the projector and monitor it, taking note that the reading is the same as it was on the initial survey. Survey the source cable from the projector to the cable termination to ensure that the entire source has returned to the projector.

b. If the radiation level is greater than normal background, immediately lock the personnel entry door and notify Health Physics.

15. All projectors shall be monitored and locked, in addition all shielded facility doors shall be locked unless the radiographer can maintain visual surveillance and control access.

16. A log shall be kept of each exposure in accordance with the data required on sample form, Fig. #4.

C. "Open Air" radiography using Cobalt 60, Projector Model 402 or Ir 192 Projectors, Model 412 or 498.

1. Film badges and dosimeters shall be worn at all times while conducting radiography in accordance with paragraph V. A.

2. Notify Health Physics prior to operation giving the following information:

a. Job location

b. Starting time

c. Radioactive source to be used

d. Number of personnel to be utilized to control access to the radiographic site.

Note: Health Physics and the Senior Radiographer shall judge the adequacy of the number of personnel utilized to control the restricted area.

3. Turn survey meter on and allow at least 1 minute warm-up time, check the zero, if the instrument does not function properly, or has not been calibrated within the last 3 months, obtain another one from Health Physics that is calibrated and is functioning properly.

4. Check the detector slave unit over the door to the shielded room. If the amber light is on, it indicates a malfunction in the circuitry, if the red light is on, the radiation level is above normal background. In either case, don't enter the room, notify Health Physics.

5. If there is no indication of radiation or malfunction on the detector slave unit, unlock the door and cautiously enter the room with survey meter on. If the reading on the instrument does not exceed normal background, it can be assumed it is safe to enter.

6. Survey the projector to be used to confirm the location of the radioactive source, note the maximum reading for future reference. (Radiation levels should not exceed the maximum level as posted by Health Physics on the radiation tag attached to the projector.)

7. Take all necessary items to be used, i.e., radiation rope and signs, film packs, timer, log book containing gamma radiography data sheets, nomenclature and a minimum of 2 calibrated, operable survey instruments.

8. (a) The Ir 192 projectors will normally be transportated to the radiographic site by the radiographic personnel.

   (b) If the CO 60 projector is to be used, it will be necessary to call in-plant transportation, precautions as stated in paragraph V. G. shall be followed.

9. In case of an accident in transportation of the radioactive source, the procedures in paragraph V. H.5 shall be followed.

10. Immediately upon arrival of the projector at the radiographic site, it shall be surveyed to determine if damage occurred during transportation.

11. It is the radiographer's responsibility to notify the area supervisor and call the Security Dispatcher, Ext. 280 and give the radiographic location and approximate length of time the area will be restricted.

12. By calculations, determine the approximate dimensions of the area to be restricted. Refer to chart in paragraph V. E.3.

13. Rope off this area and hang radiation signs on it in such a manner that they can be easily read outside the restricted area.

14. Evacuate the area of all unauthorized and/or unmonitored personnel.

15. Make the radiographic set-up, taking advantagesof all possible shielding i.e., collimators, heavy equipment, etc. Do not place the film on the part to be radiographed at this time.

16. Unwind crank assembly and straighten the cables.

17. Unlock the projector and unscrew the retaining plug.

18. If Ir 192 projectors are being used, connect source cable by turning the large nut on the projector counter-clockwise. If CO 60 projector is being used, the cabinet must be unlocked to gain access to the crank assembly. Two bolts must be removed from the retaining plug. The source cable is held in place by two Allen head bolts.

19. The set-up should be made in such a manner that the crank assembly is the maximum distance possible from the exposed source, also taking advantage of any local shielding.

20. Post personnel at strategic points on the restricted area boundaries to control access to the area.

21. Make sure the area is evacuated of unauthorized and/or unmonitored personnel.

22. Expose the source by turning crank counter-clockwise. Place an operating survey meter near the operator. Note the dose rate to the operator.

23. After the source is in the exposed position, survey and adjust restricted area to confirm with paragraph V. E.3 and record the survey including a sketch of the area on the back side of the Gamma Radiography Data Sheet. (Fig. 4)

24. Return the source to the projector by turning crank clockwise, monitor projector and source cable, radiation level should be the same as the initial survey on the projector.

25. In case the source did not return to the projector, maintain control of the area and initiate the emergency procedures set forth in paragraph V. H. 2d.

26. When the source has been returned to the projector, place the film on part to be radiographed.

27. Conduct radiographic exposure and return the source to the projector as previously described in 24 and 25 above.

28. The radiographer is always responsible for maintaining control and surveillance of the restricted area.

29. In the event that unauthorized personnel insist upon entering the restricted area during source exposure, the source is to be immediately returned to its shielded container. The individual's name and badge number shall be taken and his supervisor notified.

30. In the event that an unauthorized person enters the restricted area during source exposure, immediately obtain the individual's name and clock number, and notify Health Physics.

31. The projector is never, under any circumstances, to be left unattended while unlocked. If the radiographer must leave the area, the projector must be locked, monitored and secured in accordance with 10CFR31.

32. Upon completion of the radiography or at the end of a working shift, the projector shall be locked, monitored and secured as above.

33. The supervisor of the area and the Security Dispatcher, Ext. 280 shall be notified of the status of the area.

34. Rope and radiation signs shall be removed when the projector is removed from the radiographic site.

35. The projector shall be stored in the shielded facility located southwest corner "D" Building, or other storage facility established in compliance with the applicable sections of 10CFR20, 31. Notify Health Physics and Security Dispatcher (Ext. 280) if stored in a facility other than the shielded facility.

36. Complete the final survey required and sign the Gamma Radiography Data Sheet. (Fig. 4)

D. Changing the Radiographic Sources

Upon receiving a new radiographic source, the following shall apply:

1. Do not open the source container.
2. Place the new source storage container/changing device in the shielded facility.
3. Notify Health Physics.
4. Health Physics shall monitor during the removal of the metal seal and the four bolts holding the cover of the source changer in place.
5. Lift cover and remove the manufacturer's instructions which includes source changing procedures, source specification sheet, decay curve and leak test results. Monitor the interior for the presence of surface contamination.
6. If the container is contaminated, Health Physics shall prescribe the appropriate course of action.
7. When cleared by Health Physics, follow the manufacturer's procedure for changing the source.
8. After completing the change, the projector shall be locked and monitored.
9. Health Physics shall supply and attach to the projector a tag containing information pertinent to the source, i.e., source strength, maximum radiation level and date.
10. Enter this survey data in the radiographic log book.

11. The changer/storage container containing the decayed source shall be monitored and a tag with all pertinent data attached to the chamber holding the source.

12. Replace the cover, tighten the four bolts, seal container with wire/lead seal and prepare for return to manufacturer. (Health Physics shall survey and place appropriate ICC shipping label on container prior to shipment)

E. Instructions for Posting and Restricting Radiographic Areas

1. Radiation Areas

Radiation Areas are those areas which contain radiation levels such that a person continuously present in the area could receive an exposure in excess of 5 millirem in any one hour. Radiation areas must be posted with signs bearing the radiation caution symbol and the words "CAUTION RADIATION AREA." Use these signs to mark the perimeter of the restricted area.

2. Restricted Area

A restricted area is that area into which the radiographer must control access for purposes of radiation safety. This restriction must be extended to include those areas containing radiation levels such that a person continuously present in the area could receive an exposure in excess of 2 millirem in any one hour. Normally, the perimeter of the restricted area would be at the 2 mr/hr* isodose line, but for exposure of short duration, the following charts may be used to determine the distance from the source to the perimeter of the restricted area. The chart may be used for Cobalt 60 sources of five and ten curies strength and for Iridium 192 sources of twenty, thirty, forty and fifty curies strength. If the source strength is between those given in the table, use the higher source strength.

* Refer to Note 1, Page 9.

Cobalt 60

5 Curies Strength			10 Curies Strength		
Exposure Time In Any One Hour	Distance From Perimeter of Restricted Area	mr/hr Level	Exposure Time In Any One Hour	Distance From Perimeter of Restricted Area	mr/hr Level
60 min.	190 ft.	2 mr/hr	60 min.	270 ft.	2 mr/hr
30 min.	135 ft.	4 mr/hr	30 min.	190 ft.	4 mr/hr
10 min.	80 ft.	12 mr/hr	10 min.	110 ft.	12 mr/hr
5 min.	60 ft.	24 mr/hr	5 min.	80 ft.	24 mr/hr

Iridium 192

20 Curies Strength			30 Curies Strength		
Exposure Time In Any One Hour	Distance From Perimeter of Restricted Area	mr/hr Level	Exposure Time In Any One Hour	Distance From Perimeter of Restricted Area	mr/hr Level
60 min.	245 ft.	2 mr/hr	60 min.	300 ft.	2 mr/hr
30 min.	170 ft.	4 mr/hr	30 min.	210 ft.	4 mr/hr
10 min.	100 ft.	12 mr/hr	10 min.	120 ft.	12 mr/hr
5 min.	70 ft.	24 mr/hr	5 min.	85 ft.	24 mr/hr

Iridium 192

40 Curies Strength			50 Curies Strength		
Exposure Time In Any One Hour	Distance From Perimeter of Restricted Area	mr/hr Level	Exposure Time In Any One Hour	Distance From Perimeter of Restricted Area	mr/hr Level
60 min.	345 ft.	2 mr/hr	60 min.	385 ft.	2 mr/hr
30 min.	245 ft.	4 mr/hr	30 min.	280 ft.	4 mr/hr
10 min.	145 ft.	12 mr/hr	10 min.	160 ft.	12 mr/hr
5 min.	100 ft.	24 mr/hr	5 min.	110 ft.	24 mr/hr

F. Physical Radiation Surveys

1. Physical radiation survey during exposure period

   a. Determine from calculations of source strength the restricted area required.

   b. Rope off and post this area as required.

   c. Expose source as outlined in Part A or B of these procedures.

   d. Survey boundaries determined in Part (a) above using survey meter.

   e. Make adjustments to boundary as necessary to maintain readings at 2 mr/hr* or less, or as otherwise authorized by paragraph V. E.3 of the procedures for exposures of short duration.

   f. A record of these surveys must be maintained and should contain sketches and instrument readings, and explanatory notes if area was restricted to other than the 2 mr/hr* isodose line.

   g. If more than one exposure is taken in the same identical position, it is not necessary that the restricted area be resurveyed. Information as to the number of exposures and total exposure time in any one hour should be included on the Gamma Radiography Data Sheet. (Fig. 4)

2. Physical radiation survey of projector after completion of exposures.

   a. Return source to projector.

   b. Approach projector with operating survey meter and monitor the surface of the projector and source cable to determine the radiation levels. (Radiation level should not exceed the maximum reading posted on the Health Physics Radiation Tag)

   c. After determining that the source is in a safe condition, lock the projector.

3. Physical radiation survey prior to storage of projector after last exposure.

* Refer to Note 1, Page 9.

a. After determining from radiation survey, that source is in a safe condition in the projector, screw in safety plugs and lock projector.

b. Return projector to storage area.

c. Resurvey projector and record on the Gamma Radiography Data Sheet. (Fig. 4)

G. Movement of radiographic projectors, in-plant locations

1. Projector shall be surveyed by a radiographer, using an operating, calibrated, survey meter, prior to removal from any storage area.

2. No projector shall be moved unless all safety plugs are inserted, and projector is locked.

3. In-plant transportation will be accomplished under the supervision of a radiographer utilizing company vehicles clearly marked with the radiation caution symbol and the words "CAUTION RADIOACTIVE MATERIAL."

4. Call plant transportation to have projector moved to radiographic site, as required and instruct the driver regarding safety precautions.

5. In case of an accident involving in-plant transportation of radiographic projectors, the emergency procedures specified in V. H.5 should be followed.

H. Emergency Procedure for Radiographic Personnel

1. In the event of a plant emergency, such as a fire or an accident in an area where radiography is being conducted, immediately do the following:

a. Return source to the shielded position in the projector.

b. Perform physical radiation survey of the projector to assure that the source is in the shielded position.

c. Remove source cables and insert safety plugs. Lock projector.

d. Remove projector from danger area and if possible return to storage area.

e. Notify Health Physics.

f. If a radiographic projector cannot be removed from a danger area, do the following:

(1) Set up a restricted area if not already established as specified in V. E.3.

(2) Notify Security Dispatcher, Ext. 280 and request Health Physics assistance.

(3) Health Physics in conjunction with radiography supervision shall determine further course of action.

2. In the event of an accident involving a radiographic projector, such as a falling object hitting the projector or controls, immediately do the following:

a. Return source to shielded position in the projector if possible. Conduct a physical radiation survey to assure that the source is fully shielded and lock the projector.

b. Immediately notify Health Physics and supervision.

c. Do not use the projector until supervision and Health Physics have made an inspection and authorized continued use of the equipment.

d. In the event the source cannot be returned to the projector, immediately do the following:

(1) Set up and post a restricted area (if not already established).

(2) Do not allow unauthorized entry into this area.

(3) Notify Security Dispatcher, Ext. 280 and request Health Physics assistance.

3. In the event of incident involving the exposure of un-monitored personnel to radiation, immediately do the following:

a. Set up and maintain a restricted area (if not already established).

b. Record names and clock numbers of un-monitored personnel involved.

c. Notify your supervisor and Health Physics.

d. Supervisor and Health Physics shall investigate the incident.

e. Health Physics shall determine the course of action and shall notify the appropriate regulatory agency (s).

4. In the event of loss of source:

   a. Notify Security Dispatcher, Ext 280 and request Health Physics assistance.

   b. The following shall be performed by Health Physics and the radiographer:

      (1) Obtain all information on the last known location of the source.

      (2) Monitor the suspect location to locate the source, and replace it in a shielded container as soon as possible.

      (3) Check un-monitored personnel and handle as in paragraph 3 above.

      (4) Health Physics shall notify the appropriate regulatory agency (s).

5. Vehicular accident involving in-plant transportation of radiographic projectors.

   a. Upon notification of an accident involving the in-plant transportation of radiographic projectors, the following procedures shall be followed:

      (1) Restrict the area of the accident.

      (2) Notify Health Physics.

      (3) Use an operating calibrated survey meter to ascertain whether the source is in a safe condition within the projector.

         (a) If the source is safely within the projector and the vehicle is operable, continue to move the projector to radiographic site.

         (b) If source has become separated from the projector, follow instructions in paragraph V. H.2 or V. H.4 above.

6. Notification and reports of incidents to A. E. C.

   a. Health Physics shall notify the AEC in accordance with the current applicable regulations.

VI. Training Program

A. Conduct of Training Program

The Training Program shall be conducted by Martin Company Education Section under the direct supervision of the Chief, Health Physics in conjunction with radiography supervisory personnel.

B. Description of Radiography Training Program

1. Fundamentals of Radiation
   a. Atomic Structure
   b. Ionization
   c. Radioactivity - Radioisotopes
2. Characteristics of Gamma Radiation
   a. The Curie
   b. Specific Activity
   c. Half Life
   d. Energies of Gamma Radiation
3. Units of Radiation Dose
   a. The Roentgen (R)
   b. The RAD (Radiation Absorbed Dose)
   c. The REM (Roentgen Equivalent Man)
   d. Dose and Dose Rate
4. Detection and Measurement of Radiation
   a. Portable Instruments (Typical)
      (1) Basic Operating Principles
      (2) Calibration
      (3) Limitations
   b. Fixed Monitoring System
      (1) Basic Operating Principle
      (2) Alarm Function

c. Personnel Monitoring Devices

(1) Film Badge

(2) Dosimeters (self-reading)

(3) Pocket Chambers

5. Levels of Radiation from Common Gamma Sources

a. Cobalt 60

b. Iridium 192

c. Thulium 170

d. Cesium 137

e. Radium

6. Methods of Controlling Radiation Exposure

a. Time

b. Distance

(1) Inverse Square Law

c. Shielding

(1) Half value, Tenth value layers

(2) Material - Lead, Iron, Concrete

(3) Collimation

d. Use of Nomographs

7. Exposure of Radiation

a. Atomic Energy Commission Regulations

(1) Part 20 Requirements

(2) Part 30 Requirements

(3) Part 31 Requirements

b. Maximum Permissible Doses

c. Chronic Radiation Exposure

d. Acute Radiation Exposure

(1) Biological Effects

(2) Degree of Injury

8. Radiographic Facilities

   a. Description of Martin Shielded Facility

   b. Open Air or Field Radiography Sites

      (1) Distance

      (2) Local Shielding (Collimators)

      (3) Posting

      (4) Surveillance

      (5) Unauthorized Entry

   c. Source Control

      (1) In Use

      (2) Not In Use - Storage

9. Radiographic Equipment to be Used

   a. Martin Company Radiographic Exposure Devices

      (1) Description

      (2) Operating Principles

      (3) Practical Training

   b. Control Procedures

10. Emergency Procedures

   a. Emergency Call List

   b. Typical Emergency Conditions

      (1) Source Stuck Outside Container

      (2) Damaged Cable

      (3) Lost Source

      (4) Shielding - Time - Distance

11. Final Examination

In lieu of conducting the previously outlined program, personnel may attend Picker Radiography School or an equivalent training school. Upon completion of the Training School Program, additional training on Martin Co. equipment

would be provided and such personnel must demonstrate competence in handling the equipment in addition to successfully completing a written and/or oral examination.

All radiographers must continue to maintain and periodically demonstrate a thorough familiarity with Radiographic Equipment, Operating and Emergency procedures and current applicable Federal Regulations supplied through the Health Physics Section.

C. Samples of typical examination Questions and Answers

1. What is ionization?

   Ans. The process or the result of any process by which a neutral atom or molecule acquires either a positive or a negative charge.

2. Define the term "half-life". What are the half-lives of Co^{60} and Ir^{192}?

   Ans. The time required for a radioisotope to lose 50% of its activity.

   Co^{60} Half-life 5.3 yrs.

   Ir^{192} Half-life - 74 days

3. Define a Curie.

   Ans. The quantity of a radioactive nuclide disintegrating at a rate of 3.7×10^{10} atoms per second.

4. Explain the difference between dose and dose rate.

   Ans. Dose Rate - The measure of radiation dose delivered per unit time, i.e., mr/hr.

   Dose - The radiation delivered to the specific area of interest.

5. What is meant by "chronic exposure?"

   Ans. Low doses of radiation received over long periods of time.

6. What are the three (3) means of controlling external radiation dose?

   Ans. Time, Distance and Shielding

7. What is meant by the term "Half Value Layer" and what are the half value layers of lead for Co^{60} and Ir^{192}?

   Ans. The thickness of material which will reduce the radiation by one

half its original intensity.

Co^{60} Lead HVL = 1/2 inch

Ir^{192} Lead HVL = 1/6 inch

8. What is the purpose of a collimator?

Ans. To reduce radiation scattering and focus the radiation to a single area.

9. What is the normal allowable annual dose of ionizing radiation to the whole body or critical organs permitted by Federal Regulations?

Ans. 5 REM/yr.

10. What is the Martin Company emergency dose limit?

Ans. 25 REM whole body.

11. Assume a person is exposed to a very high dose rate from a Co^{60} or Ir - 192 source.

a. Can this person become radioactive?

Ans. No

b. Can this person become contaminated?

Ans. No, unless the sealed source has ruptured.

c. When the source is no longer present, is ionization from gammas still taking place in his body?

Ans. No

12. List several advantages and disadvanteges of film badges and dosimeters?

Ans. Film Badge Advantages - a. Lasting record of exposure

b. Measures total cumulative exposure

c. Can be used to differentiate between types of radiations

d. Not shock sensitive

Disadvantages - a. Film subject to environmental and external damage. (fading, fogging, etc.)

b. Must wait for processing to get dose results.

c. Energy dependent.

d. Orientation of film during exposure is a problem.

Ans. Dosimeter Advantages - a. May be used (self-reader) to keep track of exposure during operation.

b. Can be recharged as required.

c. May be used to measure dose rate in extreme emergency condition.

Disadvantages - a. Energy dependent (generally gamma only)

b. Can be accidently discharged.

c. Off scale total exposure cannot be determined.

13. Noticeable blood changes occur at what general levels of acute radiation exposure?

Ans. 25 to 50 REM.

14. Who must be notified by the radiographer prior to making "Open Air" exposures, and what information is given?

Ans. a. Health Physics, Security, Area Supervision

b. Source to be used and type of operation

c. Starting time

d. Precautions

e. Length of time to complete operation

15. Each radiation survey instrument shall be calibrated at intervals not to exceed what time period?

Ans. 3 months

16. What is the general course of action you would follow if a source became stuck out at the end of the source tube after a routine exposure?

Ans. a. Attempt to crank the source back to its shield.

b. Notify Health Physics and radiography supervision.

c. Maintain surveillance over the area until assistance arrives.

d. Carefully shield the exposed source with available shielding, i.e., earth, concrete block, sand bags, lead, etc.

e. Carefully disconnect source tube at the projector and attempt to loosen source by wriggling the drive cable.

17. What is the procedure required when a radiographer loses a film badge during a shift?

Ans. a. Leave the radiographic site.

b. Notify Health Physics.

c. Obtain a new film badge.

18. Who has the responsibility for securely locking the source container and performing the final survey on the projector and where is this information recorded?

Ans. The Radiographer - final survey on Gamma Radiography Data Sheet.

19. What is the title of the Federal Regulations governing use of radiography sources?

Ans. Title 10, Part 31.

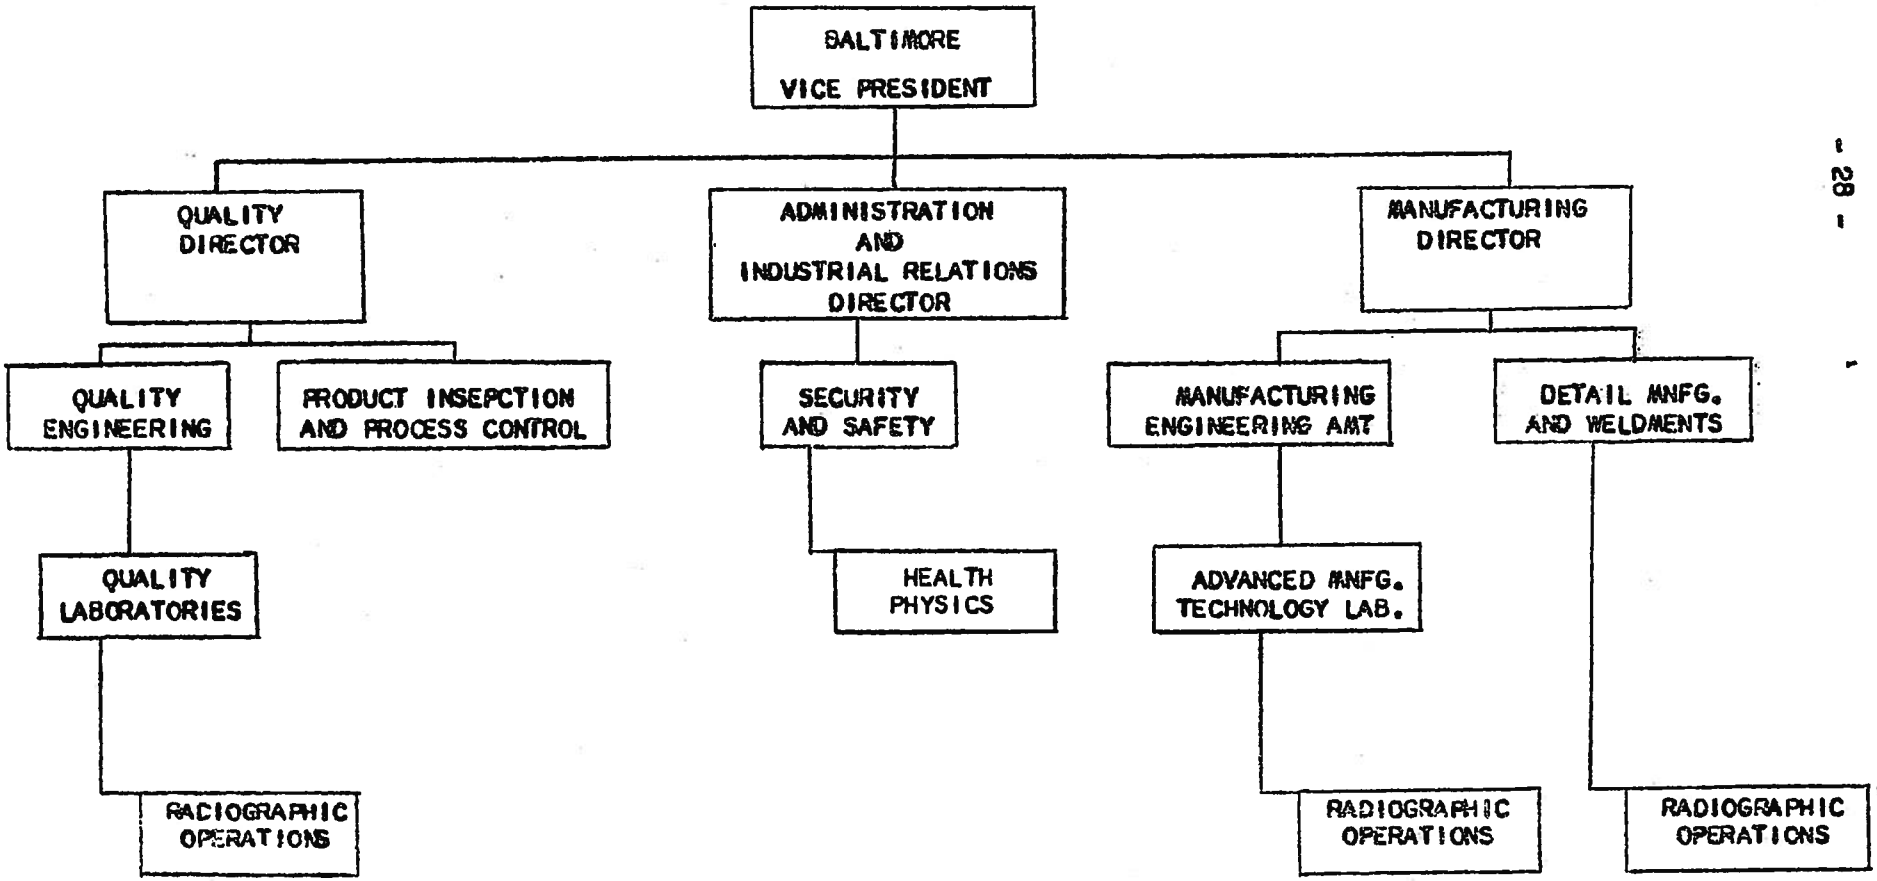
20. What is the LD - 50 Dose?

Ans. 400 R whole body.

VII. Description of Overall Organization Structure and Internal Inspection System.

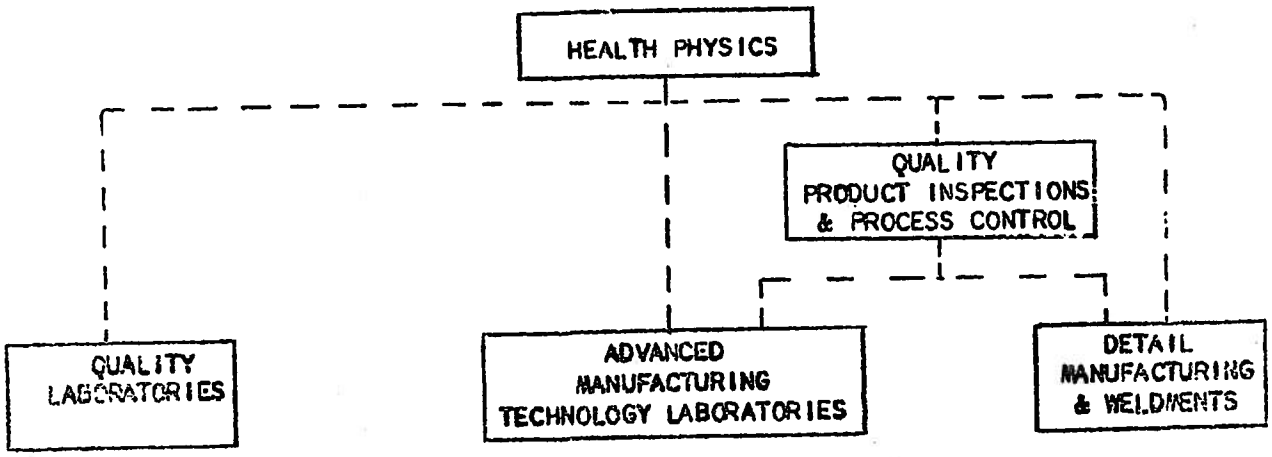
A. Organizational Structure

The following diagram shows the organizational relationships as they affect radiographic operations conducted by the Baltimore Divisions of the Martin-Marietta Corporation.



B. Internal Inspection System

The following diagram shows the management system established to control the potential hazard resulting from radiographic operation.



1. The Chief, Health Physics Section is responsible for the development and conduct of an effective radiological safety program. He is delegated the authority for this program through several official company organizational documents.

   (a) Operating Instruction No. ER-0-0-83 entitled - Health and Safety Administration.

   This document provides for the establishment and surveillance of radiological safety practices and procedures. It also provides that the Chief, Health Physics Section represent the Director, Administration and Industrial Relation on radiological safety matters with Government agencies.

   (b) Procedure No. OP-84.107 entitled - Control of Radioactive Isotope Materials

   This document establishes that the Chief, Health Physics Section shall review and approve Byproduct Material purchase requests and the plans for the use of these materials to assure that employees are properly educated to handle equipment and/or work in areas where radioactive materials are used; monitor employees handling such materials and the controlled area in which they work to assure compliance with radiological safety requirements; obtain governmental approvals authorizing purchase, use transfer and disposal of such materials; check all incoming and outgoing shipments of radioactive material to ensure compliance with Federal and State regulations. Radioactive materials shall only be used in controlled areas by personnel who have been approved to handle such materials by the Chief, Health Physics Section.

2. The Chief, Quality Laboratories supervises the development of non-destructive testing techniques. He is responsible for the safe conduct of radiographic operations in accordance with company procedures and other regulatory requirements.

3. The Chief, Advanced Manufacturing Technology Laboratories supervises the developmental testing of new manufacturing techniques. He is responsible for the safe conduct of radiographic operations in accordance with company procedures and other regulatory requirements.

4. The Superintendent, Weldments supervises the production and radiography of manufactured items. He is responsible for the safe conduct of radiographic operations in accordance with company procedures and other regulatory requirements.

5. Personnel representatives from the Quality Products Inspection and Process Control Department inspect to assure that radiographic operations within manufacturing are conducted only by certified radiographers.

UNITED STATES GOVERNMENT

Memorandum

TO : Donald A. Nussbaumer, Chief
Source & Special Nuclear Materials Branch, DLR

DATE: February 28, 1964

FROM : Charles D. Luke, Chief
Criticality Evaluation Branch, DLR

SUBJECT: THE MARTIN COMPANY, SHIPMENT OF URANIUM BEARING EXCESS MATERIAL FROM MARTIN-MARIETTA CORPORATION, DOCKET NO. 70-58, AMENDMENT NO. 20, DATED FEBRUARY 14, 1964

REFERENCES: (1) 2/17/64 Meeting, Bethesda, Charles Keller and DLR personnel
(2) 2/25/64 Telecon with Charles Keller and K. E. Lauterbach, DLR
(3) 2/26/64 Telecon with Charles Keller and K. E. Lauterbach, R. L. Stevenson and C. D. Luke

SYMBOL: DLR:RLS

Martin-Marietta proposes to ship air filters containing enriched uranium oxide to Davison Chemical at Erwin, Tennessee. The filters would be packaged in 55 gallon drums and wooden boxes and shipped with exclusive use of the van in a single shipment. (The proposed amendment described other waste materials and containers that have not been considered in this evaluation.)

Based upon our review of the application, we see no objection to that part of the shipment comprising 25 drums of small filters subject to the proviso that each 55-gallon drum containing 20 filters will contain no more than a total of 800 grams U-235. If the drum is to contain less than 20 filters then the 800 gram limit must be scaled down proportionately.

Martin Company proposed (Ref. 1) that the large filters be packaged in 110 gallon steel drums to which we had no objection. However, the large filters would not fit the 110 gallon drums and Martin (Ref. 2) proposed to package the large filters in wooden boxes. In order to permit our nuclear safety analysis of this modification, we request that Martin analyze the hazards, taking into consideration the effects of accidental impact, fire and wetting. The safety analysis should evaluate carefully any possible re-orientation of the uranium resulting from the series of accident conditions. If the large filters were packaged in steel drums, we would see no objection to shipment of these filters and can see no credible likelihood of hazards due to neutron interaction between 13 packages of the large filters and 25 packages of the small filters.

The medium size filters, packed one to a 55 gallon drum and each containing a maximum of 870 grams U-235, represent a serious problem and we are unable to agree with the applicant as to the safety of the eight packages. We do not agree with his assumed multiplication factor for a unit and we are convinced that further information is required on the structural integrity of the placement of these packages on the vehicle, inasmuch as nuclear safety of this part of the shipment is based on spacing being maintained between the eight packages. We request that the applicant include in his nuclear safety analysis the assumption that water would leak into each drum thoroughly wetting the filters, but that the accident would not necessarily involve complete flooding to the extent of isolating one unit from another. The applicant should compute by acceptable procedure the value of k_{eff} for the filter with all voids filled with water and assuming no reflector. He may use this k_{eff} to obtain the corresponding maximum solid angle, and space the eight packages so as not to exceed this solid angle. From the standpoint of neutron interaction with the other two types of packages on the vehicle, we would consider it acceptable if the medium filters were shored in one end of the vehicle, the large filters shored in the center and the small filters in the other end. Both this shoring and the fixment of the medium size filter packages should be designed to maintain separations in the event of credible accident. We feel that this would involve design taking into consideration a force of (b)(4) Ex4 Martin should be informed that we would be pleased to assist them in any way we can. I told Mr. Keller that Mr. Christian Beck would review the structural integrity and would be pleased to lend his assistance on this particular aspect of the problem.

Mr. Keller stated that one of his associates would telephone us next Monday afternoon, March 2, but I suggest that you refer the results of our present review, as outlined above, to Martin at the earliest opportunity.

cc: C. Beck, DLR

OPTIONAL FORM NO. 10
5010-104

UNITED STATES GOVERNMENT

Memorandum

TO : Files

DATE: March 9, 1964

FROM : R. L. Stevenson
Criticality Evaluation Branch
Division of Licensing and Regulation

SUBJECT: TELECON WITH C. W. KELLER AND W. OSMYER OF MARTIN-MARIETTA CORPORATION OF MARCH 2, 1964, REGARDING SHIPMENT OF AIR FILTERS VIA MOTOR TRUCK FROM BALTIMORE, MARYLAND, TO ERWIN, TENNESSEE

The applicant was informed that his proposed Amendment No. 20 to SNM License No. SNM-53 should consider the following:

1. Shoring of containers on the truck should be adequate to withstand an impact causing a (b)(4) deceleration.

2. The total mass of U-235 in a 55-gallon drum of small filters should not exceed 800 grams and should be scaled down as the number of filters per drum is reduced from 20.

3. The medium size filters, at a maximum 870 grams U-235 per drum, should be spaced according to the k_{eff}-omega criterion with k_{eff} calculated based on water soaking of filters but without water between filters or drums.

4. The analysis of the hazards of shipping large filters, if these are packed in wooden boxes instead of metal drums, should be based on a possible impact, fire, and wetting.

5. The preferred over-all arrangement would be that in which the large filters in metal drums separate the drums of small filters from the drums of medium filters.

Attention: Mr. C. A. Keller
Nuclear Materials Manager
Your reference: ACC-260

Gentlemen:

This refers to your application dated February 14, 1964, for amendment of License SNM-53 to authorize shipment of air filters containing uranium to the Davison Chemical Company. In order to continue our review of your application we require the following information:

1. Confirmation that each of the drums containing 20 small (8" x 8" x 6") filters will contain no more than a total of 800 grams of U-235. If any drum is to contain less than 20 filters, please confirm that 800 gram limit will be reduced proportionately.

2. Further description of the packaging of the filters including the gauge of the 55 gallon drums, the design of the container for the large (24" x 24" x 12") filters and the average weight of container and contents for the small, medium and large filters.

3. With reference to the containers for the medium size filters (18" x 18" x 6") please provide calculations of the K_{eff} for the filter with all voids filled with water and assuming no reflector. Submit also the proposed spacing of the eight containers demonstrating that the maximum solid angle corresponding to the K_{eff} will not be exceeded.

Doc. Rm.
Suppl
Br. & Div. rfs
Compliance

4. Your method of securing the drums to the floor of the vehicle to withstand a horizontal impact force of (b)(4) s acting at the center of gravity of the package without significant reduction in spacing between the drums. Ex 4

Gentlemen:

We are happy to supply the additional information requested in your March 12, 1964 letter, in order that you may complete your review and authorize shipment of air filters to Davison Chemical Company for uranium recovery. Our discussion will follow the format of your letter.

We trust that this additional information will permit you to authorize shipment of the filters in the very near future.

DOCKET NO. 70-58

L&R File Copy

ADDITIONAL INFORMATION TO PROPOSED AMENDMENT NO. 20 TO SPECIAL NUCLEAR MATERIAL LICENSE NO. 53

1. Packaging of Filters

In the packaging of the small (8" x 8" x 6") filters, no more than twenty filters, containing a maximum of 600 gms U-235, will be packaged in any one 55 gallon drum. Preliminary packing has indicated that a maximum of 16 filters can be packed orderly in a drum. The following proportionate U-235 limits shall apply for drums containing less than 20 filters:

16 filters per drum	600 gms U-235
14 filters per drum	[illegible] gms U-235
12 filters per drum	[illegible] gms U-235

The filters will also be packed such that no drum will contain only filters with the higher concentrations of U-235.

2. Calculation of Shipping Containers

The following calculation describes the shipping containers to be used in the shipment of the air filters. A [illegible] of the [illegible] containers for the 24" x 24" x 12" [illegible] is included.

[illegible]	Container	Number	Average Total Weight	
[illegible]	[illegible] gal. drum	[illegible]	[illegible]	LBS.
[illegible]	[illegible] gal. drum	[illegible]	[illegible]	LBS.
[illegible]	[illegible]	16 container [illegible] lid	[illegible]	LBS

3. [illegible] Calculation [illegible] Filter [illegible]

For the [illegible] diffusion method of calculating steady [illegible] conditions, the standard effective multiplication factor ([illegible]) is given by:

$$P = \frac{k_0 C^{-B^2 \tau}}{1 + L^2 B^2} \qquad \text{(Reference 1)} \qquad (1)$$

DOCKETED
USAEC
LICENSING & REGULATION
MAR 20 1964
DOCKET OFFICER

However, when ordinary water is the moderator, the spatial distribution of neutrons cannot be described by a simple exponential of the form e^{-Bzt}. Therefore, the following equation must be used:

$$K_{eff} = \frac{K_{\infty}}{(1+L^2B^2)\,(1+L_1^2B^2)\,(1+L_2^2B^2)\,(1+L_3^2B^2)\,(1+L_4^2B^2)} \qquad (2)$$

(Reference 2)

Where: K_{∞} = epfn, four factor equation

L_{∞} = 2.3[illegible] cm, diffusion length for thermal neutrons
($L^2 = \frac{[illegible]}{[illegible]}$ where [illegible] or [illegible] for [illegible])
(Reference 3)

L_1 = [illegible] cm

L_2 = [illegible] cm — Experimental spatial distribution for fast neutrons in ordinary water.

L_3 = 2.[illegible] cm

L_4 = 1.00 cm — (Reference 2)

B^2 = Geometric Buckling factor

The buckling for an 18" x 18" x 6" filter is given as follows:

$$B^2 = \left(\frac{\pi}{[illegible]}\right)^2 + \left(\frac{\pi}{[illegible]}\right)^2 + \left(\frac{\pi}{[illegible]}\right)^2 \qquad (3)$$

[illegible] in centimeters.

[illegible] $= 0.0[illegible]$ cm^{-2}

[illegible] (2) reduces to:

[illegible]

where,

e = 1.0 (fast fission factor)

p = 1.0 (Resonance Escape)

n = 2.1 (Fast Fission Neutrons)

f = 1.0 (Thermal Utilization - The maximum of 1.0 has been chosen for conservation in the final determination of [illegible])

Therefore:

$$\text{Eff} = \frac{2.1}{[illegible]} = 0.[illegible]$$

Conclusion:

[illegible]

[illegible]

[illegible]

[illegible]

[illegible]

[illegible]

[illegible]

[illegible]

[illegible]

4. Methods of Shoring:

We have recently negotiated with Tri State Motor Transit Company of Joplin, Missouri to obtain their specialized equipment for this shipment. The routing will be the same as that in our original submission.

To prevent shifting of the containers while in transit, wood blocking will be secured to the bed of the truck. The blocking will be installed in a manner to prevent shifting of the containers in all directions. 4 x 4 longitudinal blocking and 2 x 4 cross blocking will be installed between each container and/or group of like containers. To provide additional restraint, top hold-down blocking will be installed. Metal banding will be employed to secure the top hold-down. The truck is equipped with 42 tie-down fittings of 5000 lbs. capacity each. The metal banding will be attached to the tie-down and tensioned. For maximum safety, all restraining devices will be attached to the bed of the truck. As an additional safety measure, a wood bulk-head will be installed between the radiro nine fifters and the lamp fifters, as indicated on the drawing.

Subject: Proposed Amendment No. 21 to Martin Marietta
Special Nuclear Material License No. 53

Enclosure: (1) Proposed Amendment No. 21 to SNM-53
(six (6) copies)

Gentlemen:

We submit as Enclosure (1) our application to amend the Martin Marietta Special Nuclear Material License No. 53. This submission describes the fabrication steps and control criteria to be employed in the fabrication of a nuclear core of tubular design employing approximately 5% enriched uranium dioxide pellets. Immediate application will be for the MH-1A Floating Nuclear Power Plant. We intend to include this amendment as part of the overall revision of our Special Nuclear Material License No. 53, but are submitting this amendment at this time, because of delays encountered in editing our license revision.

You have recently approved an allocation of 250kgs U-235 for the MH-1A fabrication and we will appreciate receiving your approval of this proposed amendment by April 24, 1964.

Very truly yours,

C W Keller

Completed fuel elements will be stored in the nuclear storage area in the D Building. Since safe geometry is the controlling factor for individual elements, a maximum total solid angle of 1.0 steradians is required. Vertical storage of the elements on five foot centers will be maintained by Martin Nuclear Materials Management, which has jurisdiction over the storage area. Calculation of the storage array is presented in Figure 3.

Attention: Mr. Donald A. Nussbaumer, Chief,
Source and Special Nuclear Materials Branch

Subject: Proposed Amendment No. 21 to Special Nuclear Material License No. 53.

Gentlemen:

Thank you very much for your prompt attention to our April 1, 1964 application for proposed amendment no. 21 to Special Nuclear Material License Number 53. Mr. Lauterbach's efforts are especially appreciated. In reply to your April 20, 1964 letter we are supplying the additional information in the order of your request.

1. The U-235 loading for the MF-1A Core and spares will approximate 160 kgs U-235. We request authorization for possession of a maximum of 200 kgs U-235 to permit possession of excess pellets which may be required for replacement of rejected material.

2. Receipt of an incoming shipment of special nuclear material is the responsibility of Martin Nuclear Materials Management. After appropriate survey by Health Physics to ascertain any contamination or radiation levels, bulk receipts of special nuclear material are stored within the boundaries of a storage bay as indicated on the enclosed drawing of the nuclear storage area. The storage area is under the jurisdiction of Martin Nuclear Materials Management which verifies uranium quantities and controls spacing requirements. This

A DIVISION OF MARTIN MARIETTA

2288

procedure will be in effect for the MI-1A program and material will be stored in a planar array, if possible, but in no case in an array more reactive than as received.

3. Inspection of containers and their condition is performed in connection with receipt of special nuclear material described in point number 2. Containers whose integrity appears questionable are isolated and appropriate health physics action is taken. Nuclear safety analysis is performed if deemed necessary.

4. Cleaning operations indicated in the process flow are of completed fuel tubes and no direct contact of fuel with the cleaning media is anticipated. Identity and accountability of tubes will be maintained by immersion of the tubes into the cleaning media by utilization of a wire type basket.

Source and Special Nuclear Materials Branch

Subject: Information for Shipment of Uranium bearing solutions.

Reference: Shipment of Uranium Bearing Excess Material from Martin Marietta Corporation (Proposed Amendment No. 20 to SNM-53)

Gentlemen:

In our letter of February 14, 1964, we transmitted the reference document which, in general, described the Martin plans for shipment of excess uranium bearing material to a recovery site. Since that time an approved shipment of uranium bearing air filters has been accomplished. We are now submitting detailed shipping information for uranium bearing solutions. Shipment will be made to Erwin, Tennessee via the following route:

U.S. Route 40 to Frederick, Maryland
U.S. Route 340 to U.S. Route 11
U.S. Route 11 to Erwin, Tennessee (Destination)

General Discussion -

The solution, which results from fabrication activity including pickling and cleaning operations, approximates 20,000 liters and is contained in polyethlene lined 55 gallon drums. Inventory of solution on hand as of May 1, 1964 is shown in the following table:

No. of 55 Gallon Drums	Type of Solution	Percent Acid Content	Grams of Uranium in solution
9	Water	none	1939
4	Perchloric Acid and Water	16%	680
43	Nitric Acid and Water	14%	8285
37	Sulfuric Acid and Water	18%	3395

Compliance K.E.K.
& PDR

B/22

ACKNOWLEDGED
A DIVISION OF
MARTIN MARIETTA

Minor additional quantities will be generated during the completion of the program.

Containers.-

The detail of the polyethlene lined 55 gallon drum shipping container consists of a specification 2S polyethlene liner in an 18 gauge 55 gallon drum as shown in the attached drawing. Although all containers are considered in sound condition, a thorough inspection of each individual drum will be performed by Martin Nuclear Materials Management to further insure drum integrity prior to shipment.

Method of Shipment.-

Each filled container which weighs approximately 500-600 pounds will be banded to an individual pallet and placed within the shipping van as depicted in the attached drawing. Tie down of the entire shipment within the van is also shown. Stacking of drums will not be permitted and shipment of the solution previously indicated on inventory will be made by exclusive use of a van. Two such shipments are anticipated. Smaller residual quantities resulting during the completion of the program which will not constitute a van load will be included with other type material in order that exclusive use of a van may be economically employed. Shipment of all solutions is expected within a six month period.

Hazard Evaluation.-

(1) Criticality

The uranium content of each drum has been established by chemical analysis and no individual drum contains more than 350 gms of U-235. U-235 content in the drums ranges from 2-350 grams distributed as follows:

2-100 gms	U-235	34
100-200	"	27
200-300	"	20
300-350	"	12

Since each 55 gallon drum contains no more than 350 gms U-235 in solution the moderator to fuel atom ratio has been calculated to be 17,900.

Referencing Figure 1 of TID-7016, Rev. 1, "Nuclear Safety Guide" shows that moderator to fuel ratios greater than 2,000 cannot achieve criticality. Therefore, these solutions are approximately a factor of 9 overmoderated.

In addition the overall uranium concentration in the approximate 20,000 liters is less than 1 gram U-235 per liter of solution an always safe condition. Also a severe rupture of several drums by some unpredicted accident during transport would only spread the solution over the truck bed in a slab array too thin to support a nuclear chain reaction.

(2) Chemical Hazard

Recent inspection of polyethlene liners which have been used for storage of similar acid solutions over a period of two years has shown compatability of the solution with the polyethlene liner. Acid solution inspected after storage has been clear and no settling of uranium sludge has been evident. A recent shipment of similar solution in this type container was approved and made without incident at the direction of the AEC.

We have submitted similar information to the Bureau of Explosives and would appreciate receiving approval in order that shipment may be made during the week of May 25, 1964.

Attention: Mr. Kenneth Lauterbach

Subject: Drop Test of Shipping Container - Proposed Amendment No. 21 to SNM-53

Gentlemen:

As a result of our discussion in Bethesda on August 20, 1964 we have conducted a drop test for the container designated A in support of our request for shipment approval for loaded tubular elements containing approximately 5% enriched UO_2 pellets. We selected Container A since it represents the container having the lesser structural strength of the two containers proposed for this shipment. All calculations have been based on the drop test results for Container A. A steel rod weighing approximately 75 pounds and filling the inner 40 schedule pipe was used to simulate the loading of the container with fuel. The first drop was made to provide a side impact on the shipping container from a height of 30 feet measured to the bottom of the drum. The diameter of the drum prior to the drop was 22.75 inches and a deformation of 3.25 inches was determined after the drop. Since the container remained intact another drop on the top was performed in the same manner with the same container. Except for an approximate 2½ inch protrusion from the bottom of the drum no significant deformation was produced.

Our nuclear safety calculation, considering a cubic array of the deformed containers, was performed using the dimensions resulting from the drop test. Since this calculation has shown that the most reactive array of the deformed containers will not produce criticality, we request that your approval of this shipment be made without a requirement for shoring as described in our August 14, 1964 submission. Fuel is ready for shipment at Nuclear Fuel Services and we request immediate approval for shipment of the tubular elements.

DOCKET NO. 71-58

Nuclear Safety Evaluation

Discussion

Nuclear safety calculations have been completed for the MH-1A shipping container using the dimensions obtained from the 30-foot drop test. The container consists of a 4-inch inside diameter pipe centered in a 55 gallon drum. The maximum deformation of the diameter was 3.25 inches.

The calculations were based on a 19.5 inch center-to-center drum spacing for the most reactive array assuming that the shipping containers were stacked two high as shown in the solid angle calculations.

The calculations assumed that:

(1) each container contained a maximum of 27 fuel tubes which limited the U-235 content to 1.11 kilograms

(2) the active fuel region was a 4 inch cylinder 40 inches in length*, and

(3) the container was flooded with water

The effective multiplication factor for the most reactive unit in the array was 0.35. A unit consisted of shipping containers stacked two high.

Conclusions

The total allowable solid angle is equal to 9-10 k_{eff} or 5.5 steradians. The total calculated solid angle was 4.7 steradians for the previously described array. Therefore, the use of the shipping containers described in this letter presents no potential hazards from the nuclear safety standpoint.

*The 4-inch diameter center pipe is actually 42 inches long. However, the active fuel is actually 36 inches long with a 2 inch end-cap welded onto each fuel tube.

DOCKET 70-54

File Copy

U. S. Atomic Energy Commission
Division of Material Licensing -
Washington, D. C. 20545

Attention: Mr. Kenneth Lauterbach

Subject: Additional Information for Amendment No. 21 to SNM-53

Gentlemen:

In our August 4 and 19, 1964 letters to you we described the process and control criteria to be used in the fabrication of a nuclear core of tubular design employing slightly enriched uranium oxide pellets. These criteria were approved by your telegram dated August 28, 1964.

Anticipating possible production bottlenecks in several of the operations, the Martin Manufacturing Department has requested that we obtain AEC approval for increased limits in several of the previously approved process steps. We have also included several additional steps which have been added in the processing. Changes in this submission from previous submissions are appropriately indicated in the flow chart and in the nuclear safety evaluation.

Since the approved possession limit of 127 kgs U-235 includes only the quantity which will be contained in the fabricated core, we request that this limit be increased to 175 kgs U-235 to provide proper approval for excess fuel which may be required. This increase in U-235 limit does not affect the overall possession limit for the Martin Marietta facility under SNM-53.

To afford proper coordination of the revised limits in the processing schedule, we will appreciate receiving your approval by September 23, 1964.

Very truly yours,

C W Keller

U. S. GOVERNMENT PRINTING OFFICE 16—62761-3

EXTRUSION OF TUBULAR COMPONENT

Tubular nuclear components can be formed by either forming a tube from a flat plate or through direct extrusion of a tube by pressure. In the formation of a tube by extrusion, nuclear safety is governed by the diameter of the extrusion dye. An always safe five inch diameter shall be maintained for any extrusion. Normally, the always safe diameter will not exceed that of a 1½ inch diameter tubular component. A limit of 800 gms U-235 has been established, as the batch limit for extrusion, which is based on an always safe mass, which during extrusion, will comply with an always safe diameter configuration.

HYDROSTATIC PRESSING

To densify the tubular component, resulting from extrusion or a cermet plate, a hydrostatic pressing operation is employed. The component is assembled in appropriate framework and enclosed in a rubber capsule, prior to the pressing operation.

Nuclear safety is defined by the always safe 2½ inch inner diameter of the hydrostatic press. A maximum limit of 2000 gms U-235 has been established for the operation. The hydrostatic fluid is a mixture of a special oil and kerosene. The maximum internal volume of the press with 2½ inch diameter and 40 inch length is calculated to approximate 197 cubic inches or 3.2 liters. The quantity of fluid used will, of course, always be less than the 3.2 liters dependent on the number of components being pressed. The following sketch details the hydrostatic press and shows a typical placement of tubes in the press.

Attention: Mr. Donald A. Nussbaumer, Chief
Source and Special Nuclear Materials Branch

Subject: Cancellation of License No. SNM-849, Docket 70-908

Gentlemen:

The requirement for Teledyne Isotopes' Timonium, Maryland facility to retain a Special Nuclear Materials license has been critically evaluated. As a result of this evaluation, the decision has been made to terminate our SNM-849 license. Currently, three amendments to the license cover four items and these items will be discussed individually so that the rationale behind our conclusion can be presented.

1. Amendment 05, dated October 19, 1970, Items 6C, 7C and 8C covering 100 micrograms of elemental plutonium counter standards. Four counter standards are involved. The total activity is 6.5×10^{-8} Ci, considerably less than a licenseable quantity. The counter standards were never required to be on the license.

2. Amendment 05, dated October 19, 1970, Items 6E, 7E and 8E covering 100 grams of contained U-235, any enrichment, any form. The initial purpose was Research and Development as defined in 10 CFR 70.4 (j) and a later purpose was to demonstrate the capability of a thermal ionization source mass spectrometer which we manufacture for domestic and international sale. Currently, it is planned to do the calibration and demonstration of this device at the purchaser's facility because the RF noise in our own facility precludes that activity. We currently have no U-235 in house for this purppse. Regarding the R&D activity with U-235, none is currently underway and none is contemplated.

3. Amendment 10, dated June 6, 1974, Items 6F, 7F and 8F covering 100 micrograms of plutonium, any form. The purpose was to calibrate and demonstrate the mass spectrometer discussed in the previous paragraph. This activity cannot be accomplished because of the reason presented previously. We currently have no plutonium in house for this purpose.

3541

4. Amendment 12, dated November 1, 1974, Items 6G, 7G and 8G covering 300 grams total plutonium enriched in the isotope Pu-238 in seven sealed sources. This program is now concluded and we currently have no sealed source in house.

A comprehensive radiation survey has been made at the Teledyne Isotopes facility at 110 West Timonium Road, Timonium, Maryland. The survey consisted of a general portable instrument monitor supplemented by an extensive wipe test survey.

Instrumentation for the survey included:

Eberline E500B	Geiger Counter
Eberline PAC-1SA	Alpha Scintillation Meter
Eberline SAC-2	Scintillation Alpha Counter
NMC PCC-10A	Internal Proportional Counter

All areas that had been subjected to the use of radioactive materials were initially checked for contamination with the portable instruments, i.e., the E500B and PAC-1SA. All results of this survey were negative - no contamination was detected by the use of portable instruments.

The wipe test technique utilized for this survey consisted of smearing a dry filter paper over an area of approximately 100 cm^2 and counting the wipe in both the SAC-2 and the PCC-10A for alpha and beta/gamma activity, respectively. The SAC-2 operates with 35% efficiency and a background of $\sim$ 4 counts/minute. The PCC-10A operates with 50% efficiency and a background of $\sim$62 counts/minute. Efficiency and background readings were taken on both counters prior to counting the wipes and after the wipe counting had been concluded.

A total of 67 wipes were taken at various locations throughout the entire facility, concentrating on those areas where radioactive materials had been present. Results of this survey indicated minimal removable surface contamination. The maximum net results were less than 10 d/m/100 cm^2 for both alpha and beta/gamma activity from any one wipe. The details of this comprehensive survey are recorded in our permanent Health Physics Log.

The cancellation of our SNM-849 license is, of course, contingent upon approval of our survey results by the Division of Fuel Cycle and Material Safety and the Office of Inspection and Enforcement. Please let me know if further information is required.

Sincerely,

TELEDYNE ENERGY SYSTEMS

Ms. Joanne Brooks
Environmental Specialist
Maryland Aviation Administration
3rd Floor Terminal Building
P.O. Box 8760
BWI Airport, Maryland 21240

SUBJECT: NRC REGION I INSPECTION NO. 94-001

Dear Ms. Brooks:

As Stephen Holmes of my staff discussed with you by telephone on October 20, 1994, the Nuclear Regulatory Commission (NRC) has been reviewing records to ensure that facilities, where activities were authorized by Atomic Energy Commission (AEC) and NRC licenses that have been terminated, are suitable for release for unrestricted use in accordance with current NRC guidelines. As you may be aware, the NRC and its predecessor, the AEC, issue licenses that authorize the use of various radioactive materials.

A contractor for the NRC, Oak Ridge National Laboratory (ORNL), initially reviewed each terminated license file and scored it according to a system designed to identify facilities that require additional review by the NRC staff. In general, files that indicate that radioactive material may have been used at particular facilities, but which do not include adequate final survey records for those facilities, are identified for additional review. The review by ORNL identified License Nos. 19-01398-20, 19-01398-32, SNM-11, SNM-53, SNM-849, SNM-907, SNM-1192 and STB-187 as files describing sites that require additional review. These licenses were issued to Martin-Marietta, Isotopes, Inc., and Ebasco and authorized activities at the Martin-Marietta Middle River Facility and the Martin State Airport. The Region I staff reviewed these files and determined that additional action was necessary since the information in the files did not provide sufficient detail to conclude that Buildings C, D, KJ and KC meet current guidelines for release for unrestricted use.

OFFICIAL RECORD COPY

RETURN ORIGINAL TO
REGION 1

IE 07

On November 3, 1994, Mr. Holmes and Mr. Ray Manley of the Maryland Department of the Environment conducted an inspection at the Martin-Marietta Middle River Facility and Martin State Airport to determine whether radioactive contamination remains at those facilities as a result of activities previously authorized by these licensees. The findings of this inspection were discussed with a member of Mr. Jake West's staff, Glen Peregoy, at the conclusion of the inspection. The inspection report is enclosed with this letter.

As described in the enclosed report, the inspectors conducted a survey of each of the facilities and contacted and interviewed current and former employees of the licensees noted above. No radiation levels above background were identified at any of the sites. Only one building (C), in which only sealed sources were used, is presently being utilized. Another building (D) had been demolished and now only a concrete pad remains. The two remaining buildings (KJ and KC), on the Martin State Airport, have been abandoned and are scheduled for demolition pending remediation of asbestos and funding. Based on these facts and the findings described in the enclosed report, we plan no further action on these sites. They are suitable for unrestricted use.

In accordance with Section 2.790 of the NRC's "Rules of Practice," Part 2, Title 10, Code of Federal Regulations, a copy of this letter and the enclosed report will be placed in the Public Document Room. We will also provide copies to representatives of the State of Maryland.

No reply to this letter is required. Your cooperation with us is appreciated. If you have any questions, please contact Stephen Holmes at (610) 337-5390 or me at (610) 337-5252.

Sincerely,

Baltimore, MD

Inspection Conducted: November 3, 1994

Inspector: Stephen W. Holmes, Radiation Specialist — 01/23/95 date

Approved by: John D. Kinneman, Chief
Site Decommissioning Section — 1/23/95 date

Inspection Summary: Closeout Verification Inspection No. 94-001.

Areas Inspected: Announced, inspection and survey of Buildings C and D at the Martin-Marietta Middle River facility and Buildings KJ and KC at the Martin State Airport.

Results: No radiation levels above background were detected and no indication of contamination was found in any of the buildings. Based on information obtained from NRC files, Martin-Marietta and Raytheon (formerly EBASCO) employees and former employees, statements from the present owners, and the inspectors' surveys, these facilities are suitable for unrestricted use.

2.0 Background

2.1 General

As part of a program to ensure that facilities where activities authorized by AEC and NRC licenses that have been terminated were suitable for release for unrestricted use as specified in current NRC criteria, the docket files for License Nos. 19-01398-20, 19-01398-32, SNM-11, SNM-53, SNM-849, SNM-907, SNM-1192, and STB-187 were reviewed. Based on information in the files, the radiological status of four buildings could not be determined with certainty. These are Buildings C, D, on the Martin Marietta Corporation Middle River Facility and KJ (critical facility), and KC (radioisotope laboratory) on the Martin State Airport. Therefore, an onsite inspection was conducted. Prior to the on-site inspection, available records pertaining to the licensing, operation, and decommissioning of the activities in and around these buildings were reviewed by the inspector. Additionally, the inspector contacted two persons who had direct contact with these sites during actual operations or decommissioning: Mr. Thomas A. Flynn, Jr. the Project Manager of the 1965 "dismantling" of the Liquid Fluidized Bed Reactor (LFBR) at Building KC and Mr. Richard Brisson, a former employee of both Martin-Marietta, and Isotopes, Inc. Information obtained from these sources is documented in pertinent sections of this report.

2.2 Building D

Building D was located at the Martin-Marietta's Middle River, Maryland facility which is also called Chesapeake Park. Under License Nos. 19-01398-32, SNM-11, SNM-53, SNM-1192 and STB-187 a wide range of byproduct, source and special nuclear material were used in connection with various research and development activities in addition to work under government contracts. The facility was decontaminated in late 1970 under License No. SNM-1192, the license terminated, and the building subsequently demolished, leaving only the concrete basement floor/pad. An NRC inquiry regarding the site in June 1982 concluded that the site met the then current criteria for unrestricted use (Report Nos. 040-

03296/82-01 and 040-02308/82-011). However, there was no indication that a verification of the licensee's commitment to seal five contaminated drains with concrete was made.

2.3 Building C

Building C, also located at the Middle River site, was to have been used under License No. SNM-849 for operations involving encapsulated Pu-238 in conjunction with SNAP reactors and testing of fuel capsules and radioisotope generators containing Pu-238. This was reported to have occurred in the Environmental Test and Large Vacuum Chamber Laboratories. The building, which was being used as a warehouse at the time of this inspection, is a very large hanger type structure with a corresponding large basement. No records were available regarding the location of the laboratories within the building nor were any records of a termination or confirmatory survey of the facility available. Mr. Brisson stated that, to the best of his knowledge, only environmental and physical testing of the fueled SNAP and other radioisotope generators was performed in Building C and that no unsealed radioisotopes were used there. Additionally, he stated that the laboratories were located in the basement at the south west corner of the building and occupied an area no larger than 100' x 150' or 5 support pillars by 6 support pillars.

2.4 Building KJ

License No. 19-01398-20 was issued to Martin-Marietta for processing of Am-241 and Cm-242 in Building KJ which was designated the Radioisotope Laboratory and is located on the Martin State Airport property referred to as Strawberry Point, on a dirt access road off Strawberry Point Road, 330' S.W. of Building KC. This type of work had been previously performed in Building "D". The license was transferred to Isotopes, Inc. without a change in license number or location of work. In late 1969, Isotopes, Inc. requested termination of the license, simply stating that all radioactive material possessed under the license had been disposed of in accordance with 10 CFR 20 by transfer to a company authorized to receive the licensed material. The AEC terminated the license without comment. No record of a termination or confirmatory survey is in the docket file. Mr. Brisson stated that production processing did not occur in Building KJ and that only small source (μCi amounts of Am-241, no Cm-242) developmental operations to verify the chemistry were performed in the building. He and one other member of the Isotopes, Inc. staff performed the final cleanup and survey of the facility, including the removal and disposal of the HEPA filters. According to his memory, the survey demonstrating that the facility was ready for unconditional release was sent to the AEC contracting office on Hudson St., N.Y., N.Y.

2.5 Building KC

Building KC, the Critical Test Facility, was located 330' North East of Building KJ. The Martin-Marietta LFBR was situated in one of the building's three "test cells". Under License No. SNM-53 completed MH-1A fuel assemblies were stored in the test cells. License No. SNM-907 was issued to Ebasco Services, Inc. in 1965 for dismantling and removing the LFBR. The license included a provision to provide records of a post removal survey to the AEC's New York Operations Office and to Martin Marietta. Although a pre-dismantling survey was performed, no records of the required post removal survey could be found in the docket file. However, it was noted in the file that the LFBR never achieved criticality. Mr. Flynn stated that meticulous care was taken during the dismantling to prevent the spread of any contamination. Further, he stated that an AEC Inspector/Health Physicist from the New York Field Office/Laboratory was on site, oversaw the final survey, and signed the final report that asserted the dismantling of the LFBR had not added to or increased the contamination from the levels measured before the operation. Mr. Brisson confirmed that Ebasco's work produced no contamination throughout the rest of the building. Mr. Brisson also stated that his group decontaminated the underground LFBR water dump/holding tank by sandblasting the insides and disposing of the residue at a licensed burial site.

3.0 Instruments Used in Survey

During the survey three instruments were used, an Eberline PRM-6 with a 1" scintillator probe and a Ludlum Micro R meter Model 19 were used by the state inspector while a Ludlum Micro R meter Model 12 was used by the NRC inspector. The meters were calibrated, functional, and would detect gamma emitters of low energy and with good sensitivity. Based on the isotopes in question, these instrument were appropriate for this survey.

4.0 Survey Results

4.1 General

On November 3, 1994 surveys of each building/site were performed jointly by the NRC and State of Maryland inspectors. The inspectors surveyed each facility thoroughly and kept each other informed as to the results. The surveys were performed with the Micro R meters held at 0.5 meters above the surface with a forward movement of about 1.0 meters per second. In addition to Mr. Smith, who accompanied the inspectors to each site, Mr. Peregoy was present during the surveys of Buildings KC and KJ on the Martin State Airport property.

4.2 Building D

The Building D site was being use to store trailers under contract with the Army. The site consisted of a large concrete pad, the leftover basement floor of the old building. The pad had numerous cracks, holes, and was very weathered after two decades of exposure to the elements.

The inspectors surveyed the concrete pad along parallel lines 5 meters apart, paying attention to drains, clean-outs, and holes in the pad. In addition to measurements taken at drains and clean-outs, surface contact readings were also taken at approximately 10 meter intervals. Numerous sealed/filled in drains/clean-outs/penetrations/holes in the pad were located. Although a few places were found where a hole in the pad had been filled with concrete, it could not be determined if these were any of the drains referred to in the closeout survey. Martin Marietta staff stated that the rubble from the demolition of the building was the responsibility of the contractor and was removed and believed to have been disposed of in a landfill. No detectable radiation levels above background (5μR/hr) were found. No development or other use of the site is planned by Martin Marietta.

4.3 Building C

The Building C area where the old Environmental Test and Large Vacuum Chamber Laboratories were located is now warehouse space and a large empty room. With the exception of the support columns, no original walls, floors, ceiling, or ducts are left. The inspectors surveyed the area along parallel lines at 5 meter intervals with surface contact measurements every 5 meters and at drains and original concrete support columns. No radiation levels above background (5μR/hr) were detected.

4.4 Building KC

Building KC is at the end of a dirt access road off Strawberry Point road just east of the eastern most taxi way. The property was purchased in toto by the State of Maryland in 1975 and although the building was used in the past for storage, it has been abandoned and left open to the elements for the past ten to fifteen years. The site was completely abandoned, overgrown, exposed to the elements (of the three "test cells" only the one where the LFBR had been housed still had it's outer doors). The inspectors performed a walk-through survey of all three cells, the entrance way and connecting halls. Surface contact measurements were performed randomly throughout the building. The office/control room area was not entered due to the cluttered condition of and the layer of asbestos ceiling tiles covering the floor. No radiation levels above background were detected. Although an attempt was made to locate the underground dump/hold-up tank described by Mr. Brisson, the inspectors were unable to locate the tank or any indication that it had been removed. Based on discussion with Martin-Marietta and Martin State Airport personnel, it is believed that the tank was abandoned in place after the decontamination described in Section 2.5. The planning representative of Maryland Aviation stated that the building had been scheduled for demolition after remediation of the asbestos, but the plans were delayed due to finances. He stated that the building would be razed and the rubble disposed of as normal waste.

4.5 Building KJ

Building KJ is 300' S.W. of building KC along the dirt access road. The

site was also completely abandoned, overgrown, exposed to the elements. The doors into the laboratory and, mechanical equipment room and office were ajar leaving the interior open to the outside. The inside was littered with "junk", leaves, bird and animal droppings, and dirt. A fair number of 100 lb. bags of "solidified" lime were present, as the building had been use for storage by the State of Maryland in the past. Rusted laboratory furniture and discarded fire extinguishers also littered the floor. The stainless steel ventilation duct-work and the laboratory hoods were still present less the duct-work section that had contained the HEPA filters. The inspectors surveyed the remains as well as possible given the state of the building. No radiation levels above background were detected. The planning representative of Maryland Aviation stated that the building, just like Building KC, had been scheduled for demolition after remediation of the asbestos, but the demolition was delayed due to finances. He stated that the building would be razed and the rubble disposed of as normal waste.

5.0 Conclusions

No radiation levels above background were detected and no indication of contamination was found in any of the buildings. Based on information obtained from NRC files, Martin-Marietta and Raytheon (formerly EBASCO) employees and former employees, statements from present owners, and the inspectors' surveys, these facilities are suitable for unrestricted use.

6.0 Exit Interview

The inspector met with the Martin-Marietta and Maryland Department of the Environment representatives listed in Section 1.0 of this report and discussed the scope and findings of this inspection. They acknowledged the inspection findings and the statements documented in this report. Messrs. Flynn and Brisson were contacted by telephone and also confirmed their statements in this report.

SUBJECT: NRC REGION I INSPECTION NO. 94-001

Dear Mr. Alcarese:

As Stephen Holmes of my staff discussed with you by telephone on October 20, 1994, the Nuclear Regulatory Commission (NRC) has been reviewing records to ensure that facilities, where activities were authorized by Atomic Energy Commission (AEC) and NRC licenses that have been terminated, are suitable for release for unrestricted use in accordance with current NRC guidelines. As you may be aware, the NRC and its predecessor, the AEC, issue licenses that authorize the use of various radioactive materials.

A contractor for the NRC, Oak Ridge National Laboratory (ORNL), initially reviewed each terminated license file and scored it according to a system designed to identify facilities that require additional review by the NRC staff. In general, files that indicate that radioactive material may have been used at particular facilities, but which do not include adequate final survey records for those facilities, are identified for our additional review. The review by ORNL identified License Nos. 19-01398-20, 19-01398-32, SNM-11, SNM-53, SNM-849, SNM-907, SNM-1192 and STB-187 as files describing sites that require additional review. These licenses were issued to Martin-Marietta, Isotopes, Inc. and Ebasco and authorized activities at the Martin-Marietta Middle River Facility and the Martin State Airport. The Region I staff reviewed these files and determined that additional action was necessary since the information in the files did not provide sufficient detail to conclude that Buildings C, D, KJ and KC meet current guidelines for release for unrestricted use.

On November 3, 1994, Mr. Holmes and Mr. Ray Manley of the Maryland Department of the Environment conducted an inspection at the Martin-Marietta Middle River Facility and Martin State Airport to determine whether radioactive contamination remains at the facility as a result of activities previously authorized by these licensees to Martin-Marietta, Isotopes, Inc., and Ebasco.

APPENDIX D—
MARYLAND DEPARTMENT OF THE ENVIRONMENT RECORDS

State of Maryland
Department of Health and Mental Hygiene
Office of Environmental Programs
201 West Preston Street, Baltimore, Maryland 21201

Report of Observations

Type of Inspection/Observations: _____ Date 85/02/13

Facility Name: Glenn L. Martin State Airport, Box 1, 701 Wilson Point Road, Balto Md 21220

Remarks: John Beazley, Barry Chambers, Valer. Doyle, and Mike Griffen met with J. Leonard Wood and Jake West at the Martin State Airport office on Feb 13 at 1300hrs J. Leonard Wood is the Martin State Airport manager. John Beazley, Barry Chambers, Valeri Doyle, and Mike Griffen accompanied Leonard Wood on a tour of the Facility. [redacted] Tech Sgt. Charles Smith of the Air Guard accompanied us when touring the facility east of the air strip.

From the beach along Frog Motar Creek, concrete rubble, corrugated steel pipe, and a couple of drums were observed in the side of the Fill. Indiscriminate dumping was observed at this site in the past as noted in the inspection report of Sept 16, 1981 by James Curtis from this office.

West of the airstrip several areas of dumping were observed. A deer carcass, cylinders of refrigerant, assorted junk, and rubble were observed. Thirty nine drums were observed by the KJ building; some, but not all, of the drums were empty. One empty drum, denatured ethanol, had a 'Tilly Chemical' label. Drums were observed in the fill area near the KJ building, again demonstrating the indiscriminate waste handling practices at this facility. Photographs were taken by Barry Chambers during this survey.

Mr Griffen discussed the ground water contamination with Mr. Wood and informed Mr. Wood that the airport will have to contract out for surveying and analysis regarding the ground water contamination. Since the Maryland Environmental Service handles the sampling required in the airport's NPDES permit and operates the waste treatment plant at the airport, the recommendation that MES be used as consultant was made.

Mr. Chambers recommends that this site be put on a remedial clean up list such as the State Superfund list and/or the Federal Superfund list.

TO JK From MQ Date 2.7.85

Subject GLENN L. MARTIN STATE AIRPORT

PHONE CONVERSATION WITH TECH. SGT. C. SMITH, WARFIELD AIR NATIONAL GUARD.

SGT. SMITH HAS LOCATED DESIGN PLANS, CIRCA 1958, FOR A "NEW" ACID PIT (UNLINED, OF COURSE) TO REPLACE ANOTHER ONE THAT WAS "REAL BAD". THE "REAL BAD" ONE WAS CLOSER TO FROG MORTAR CREEK THAN THE 4 ON OUR PLAN COPY AND WAS BULLDOZED IN BY THE AIR NATIONAL GUARD WHEN THEY CONSTRUCTED THE NEW ONE.

INFORMATIONALLY, THE MUNITIONS TESTING PIT WAS ALSO CONSTRUCTED BY THE AIR NATIONAL GUARD (CIRCA 1958) AS WAS THE TAXIWAY.

ONE FINAL TIDBIT: ALL LEFTOVER BOMBS WERE DEACTIVATED (REALLY?) AND DUMPED INTO A HOLE AT THE BOTTOM OF FROG MORTAR CREEK.

Frank we need your section's/assistance in establishing and implementing a sampling plan for:

1. Groundwater Sampling (Two contaminated wells on site).
2. Four (maybe 5) unlined pits - referred to as "Acid Pits" by plans and Maryland Air National Guard Employees.
3. Two known areas of landfill activity (Dredge Spoils, etc.)
4. One area of munitions dumping into Frog Mortar Creek.

We have the permission/cooperation of both the State Aviation Administration (Leonard Wood - 391-9500) as property owner, and the Maryland Air National Guard (Tech. Sgt. Charles Smith - 687-6270 ext. 428) as tenant.

PT/jj

Have OWNERS of site do work per our NORMAL PROCEDURES. Get them UNDER A CONSENT ORDER/AGREEMENT re DUNDALK MARINE TERMINAL.

MEMORANDUM

Copies { Mr. Dave Healy
Mr. John Beazley

Thru: Mr. John Koontz

TO Mr. Frank Henderson From Mr. Paul Thompson Date 2/26/85

Subject Glenn L. Martin State Airport, Baltimore County

Staff investigation of this site indicates improper waste disposal practice.

These include:

1. acid and waste oil disposal pits (at least 4)
2. landfilling (indiscriminate)
3. explosives disposal (deactivated bombs, we're told!) into dredge holes in Frog Mortar Creek.

Private labs show trace organic (L 1-ppb range) contamination of two potable wells on site, yet sampling does not substantiate this.

Therefore, this site should be added to your next published list of sites for future assessment and/or investigation.

Dear Ms. Stephens,

This email is to request a search and retrieval of specific MDE Hazardous and Solid Waste division archived records under the Public Information Act. The subject request was also submitted to MDE's Radiological Health division and Colleen Williams referred my request to you. Tetra Tech is conducting environmental due diligence research for a property in Middle River, Maryland on behalf of a former property owner. The property was located on a former dirt road at the current Martin State Airport, 701 Wilson Point Road, Middle River, Baltimore County, Maryland.

The property of interest may be identified by the above address (Martin State Airport) in MDE records, or listed by name under former tenants of two nuclear fuel research facilities which previously operated at said location between 1957 and 1966, approximately. Former tenant names include Martin Company, Ebasco, Raytheon, Radioisotopes, Inc, and Isotopes, Inc. The facilities were known as the Martin Critical Facility, or Critical Test Facility, and the Radioisotope Lab. After termination of Nuclear Regulatory Commission (NRC) Licenses (est. 1965-1970), these buildings were abandoned for several years before being demolished around 2000 by the State of Maryland (Maryland Aviation Administration). In 1989, while the buildings were still present, MDE was involved in a joint inspection of the facilities with NRC to help determine suitability for unrestricted use. Tetra Tech reviewed a State of Maryland report (report MD-304, "A Preliminary Assessment of Martin State Airport, Middle River, Maryland") prepared by the Maryland Hazardous and Solid Waste Management Administration (MDE/HSWMA) and dated March 1989, which contains reference to two memoranda: (1) Memo dated March 30, 1989 from MDE/HSWMA to the Hazardous Waste Enforcement Division, concerning materials in storage in the abandoned, above-referenced buildings; and (2) Memo dated March 31, 1989 from MDE/HSWMA to the MDE Toxic, Environmental Science and Health, Center for Radiological Health concerning lack of records of past generation and disposal of hazardous and radioactive waste from these facilities. By this PIA request, we are making specific request for these memoranda, any related correspondence or files, and information on the final disposition of these files. We also request any records you may have concerning the demolition of these facilities around 2000.

We sincerely appreciate your assistance with this request. I can be contacted at the number below for more information or with any questions.

Sincerely,

Amy McGivney

Dear Ms McGivney,

The Maryland Department of the Environment (MDE) received your recent request for information under the Public Information Act (PIA). After a thorough search of all available information, the MDE Air & Radiation Management Administration found no records responsive to your request.

I suggest that you submit your request for information to Maria Stephens in MDE's Land Administration, since that is the group that oversees Hazardous and Solid Waste. No charges were incurred.

Thank you,

Colleen Donnelly Williams

Report of Observations

Type of Inspection/Observations: RCRA Date 7/2/91

Facility Name: Martin State Airport

Remarks: Received report 7/1/91 thru LUST/UST regarding drums that were uncovered during a trenching operation parallel to the main runway (north side). This trench appears to run through an old fill area. A wide variety of debris was evident including what appeared to be zinc chromate paint. A field test with BPC (& this material indicated high levels of chrome present. The location of this material was approx. 58 yards east from the west end of the trench (Howard Eastern Ave). The contractor requested clearance to backfill the trench with clean fill material. MSA was advised to remove all visibly contaminated / suspect material from the trench and the adjacent areas. This material must be containerized, managed, and disposed of in accordance with applicable laws and regulations. Samples of suspected CHB were taken and split with MAA. EP TOX metals will be run. MAA must further submit to MDE/HSWMA a plan to assess the extent of contamination in this area.

Generators/TSD Facilities

EPA ID Number: MD0083501023

TELEPHONE: 301-687-6270

Owner/Operator MD AIR NAT'L GUARD Facility Name _____

Address 2701 EASTERN BLVD. BALTO. MD Zip 21220

Description of Work Activity EQUIPMENT MAINTENANCE, PAINTING ACTIVITIES

I. Generators

A. Description (10.51.03.01-.03)

1) Does the Facility generate or has it accumulated those quantities of hazardous waste described in 10.51.02.05 C.? _____Yes, _____No.
2) Has the facility obtained an EPA identification number? ✓Yes, _____No.
3) Describe the amount of waste generated. (day, week or month) VARIABLE
4) Under which category is the waste(s)? ✓Ignitable _____Reactive _____Corrosive _____EP Toxic ✓RCRA Listed

B. Manifest (10.51.03.04)

1) Is Maryland manifest system in operation for off-site shipment? ✓Yes, _____No.
2) Is TSD Facility to receive DHS identified by ✓Name, ✓Address, ✓EPA ID Number?
3) Is alternate facility identified? _____Yes, ✓No.
4) Is generator identified by ✓Name, ✓Address, ✓Telephone Number, ✓MD/EPA ID Number?
5) Is each transporter identified by ✓Name, ✓EPA ID Number, ✓Maryland Certification Number?
6) Is waste property described? ✓Yes, _____No.
7) Is shipment date marked? ✓Yes, _____No.
8) Is quantity of waste described by ✓Unit of Weight, ✓Volume?
9) Are containers to be loaded identified by ✓Type, ✓Number?
10) Is proper certification noted and signed by generator? ✓Yes, _____No.
11) Are adequate copies available for operator, transporter and TSD? ✓Yes, _____No.

C. Pre-Transport Requirements (10.51.03.05)

1) Is each container marked with date accumulation began? ✓Yes, _____No. If yes, has any waste been stored over 90 days? ✓Yes, _____No. How much 17 ALREADY OVER 90 DAYS, SOME DRUMS WILL BE SOON
2) Are containers in good condition? ✓Yes, _____No. If no, explain _____
3) Are containers properly labeled? ✓Yes, _____No.
4) Does generator have approved emergency contingency plan? _____Yes, ✓No.

SEE COMMENTS

D. Recordkeeping and Reporting (10.51.03.06)

1) Does the generator have: copies of all signed manifests from the previous three years? ✓Yes, _____No; copies of each Annual Report and Exception Report? ✓Yes, _____No.
2) Does the generator retain, for a period of three years, all wastes analyses? ✓Yes, _____No.
3) Has the generator filed Exception Reports as required by 10.51.03.06 C? _____Yes, N/A No.

II. Treatment, Storage, Disposal (TSD)

A. Site characterization (10.51.05.02)

1) Facility Type

_____Thermal Treatment
_____Recycling/Recovery
_____Waste Oil
_____Chemical Treatment
_____Physical Treatment
_____Open Pile
_____Surface Impoundment
_____Drums
_____Above Ground Tank(s)
_____Biological Treatment
_____Land Treatment
_____Incineration
_____Landfill Operation
_____Below Ground Tanks
_____Other _____

2) Does facility generate DHS? _____Yes, _____No.
3) Does facility have waste analysis plan? _____Yes, _____No. If yes, are the procedures of that plan being followed? _____Yes, _____No.
4) Can facility personnel identify DHS being handled? _____Yes, _____No.
5) Can facility personnel confirm that DHS received equal those on manifest form? _____Yes, _____No.
6) Is there a 24-Hour surveillance system to monitor active portion of facility? _____Yes, _____No. If No, is there an artificial or natural boundary? _____Yes, _____No. Is there a means to control entry? _____Yes, _____No. Is there a restricted access sign posted? _____Yes, _____No.
7) Does facility have: _____emergency equipment inspection log, _____written schedule for inspections, _____security devices, operating & structural prevention equipment?
8) Have facility personnel completed classroom/on-site training? ✓Yes, _____No. Are records maintained of: ✓Job titles/names of employees ✓Job descriptions, ✓Type/amount of continuing training?
9) Are general requirements for Ignitable, Reactive or Incompatible Wastes as required in 10.51.05.02 H addressed? _____Yes, _____No.

B. Preparedness and Prevention (10.51.05.03)

1) Facility has the following equipment? ✓Internal communication/alarm system for on-site personnel, ✓device for summoning emergency assistance, ✓adequate fire control equipment, water, & suppression chemicals, ✓list of aforementioned equipment.
2) Does facility have adequate area for emergency movement? ✓Yes, _____No.

C. Contingency Plan and Emergency Procedures (10.51.05.04)

1) Does facility have an approved contingency plan for: _____Personnel to implement emergency procedures to fire, explosions, and unplanned releases to air, soil and water? _____Responding emergency units to provide assistance during emergency situations? _____A list of emergency equipment needed to cope with situation?
2) Are emergency response coordinators listed by name, address, & phone number? _____Yes, _____No.
3) Is there an evacuation plan if recommended? _____Yes, _____No.
4) Are emergency coordinators available on twenty-four hour basis? _____Yes, _____No.

D. Manifest System, Recordkeeping, and Reporting (10.51.05.05)

Facility has a written operating record which contains the following information:

1) _____description & quantity of DHS received.
2) _____method & date of DHS treatment, storage, or disposal.
3) _____location & quantity at each DHS location in facility.
4) _____detailed records & results of waste analysis & treatability tests performed.
5) _____detailed operating summary reports.
6) _____description of emergency incidents that required implementation of contingency plan.
7) _____records & results of inspections of emergency equipment, TSD systems & hazardous waste areas.
8) Has facility retained, for at least 3 years, copies of all manifests? _____Yes, _____No.

FILE COPY ONLY

E. Groundwater Monitoring (10.51.05.06)

1) Has facility implemented a groundwater monitoring program? _____Yes, _____No, _____N/A.
2) Are samples from the groundwater monitoring system being analyzed according to the groundwater sampling and analyses plan? _____Yes, _____No.
3) Is this plan set up in accordance with 10.51.05.06 C? _____Yes, _____No.
4) Has groundwater quality assessment program been prepared? _____Yes, _____No.
5) Are proper groundwater sampling and analyses records kept? _____Yes, _____No.
6) Are the necessary reports on groundwater monitoring information being forwarded to the Secretary? _____Yes, _____No.
7) Do the reports match the facility records? _____Yes, _____No.

F. Closure, Post-closure, and Financial Requirement (10.51.05.07 & .08)

1) Does the facility have an approved closure plan that meets the financial requirements? _____Yes, _____No.
2) For surface impoundments, land treatment, and landfills, does the facility have an approved post-closure plan that meets the financial requirements? _____Yes, _____No.
3) Does facility maintain liability insurance? _____Yes, _____No.

G. Container Management (10.51.05.09)

1) Are all containers: (a)__✓__ in good condition, i.e., no signs of leakage, corrosion, or any other deterioration/deformation; (b)__✓__ lined or made of compatible material such that hazardous wastes placed into them will not result in reaction or corrosion; (c)__✓__ sealed during storage.
2) Are storage areas for hazardous waste containers inspected by owner/operator at least once a week? ✓ Yes, _____No.
3) Is an inspection log maintained? ✓ Yes, _____No.
4) Are containers holding ignitable or reactive waste located at least 50 feet from the facility's property line? ✓ Yes, _____No.
5) Are incompatible wastes placed in separate containers? _____Yes, N/A No.
6) Are storage containers holding hazardous wastes which are incompatible with nearby materials stored in containers, tanks, piles, or surface impoundments separated by dikes, berms, walls, or other devices? _____Yes, N/A No.

H. Tanks (10.51.05.10)

1) Are all tanks in good condition, i.e., no signs of leakage, corrosion, or any other deterioration: _____Yes, _____No.
2) Are uncovered tanks operated to ensure a minimum of two feet of freeboard? _____Yes, _____No.
   If not, is tank equipped with a containment structure (e.g., dike or trench), a drainage control system, or a diversion structure (e.g., standby tank) with a capacity that equals or exceeds the volume of top 2 ft. of the tank? _____Yes, _____No.
3) Are tanks with continuous inflow of hazardous waste equipped with a means to stop this inflow (e.g., waste feed cut-off system or by-pass to a standby tank)? _____Yes, _____No.
4) Are waste analyses conducted or written documentation obtained before placing a substantially different hazardous waste into tank used for storage or treatment? _____Yes, _____No.
5) Are daily inspections conducted for discharge control equipment (e.g., by-pass systems, waste feed cut-off systems and drainage systems)? _____Yes, _____No.
6) Is data gathered from monitoring equipment (e.g., pressure and temperature gauges) at least once each operating day? _____Yes, _____No.
7) Is the level of waste in the tank checked at least once each operating day? _____Yes, _____No.
8) Is (are) the tank(s) inspected weekly to detect corrosion or leaking of fixtures or seams? _____Yes, _____No.
9) Are the results of these inspections recorded in an inspection log or summary? _____Yes _____No.
10) Are ignitable or reactive wastes stored in tanks? _____Yes, _____No. If yes:
    a) Is the waste treated, rendered, or mixed before or immediately after placement in the tank so that the resulting waste, mixture, or dissolution of materials no longer meets the definition of ignitable or reactive wastes under Parts 261.21 or 261.23 of the RCRA Regulations? _____Yes, _____No.
    b) Is waste stored or treated in such a way that it is protected from material or conditions which may cause the waste to ignite or react? _____Yes, _____No.
    c) Is owner/operator of a facility which treats or stores ignitable or reactive wastes in covered tanks in compliance with the National Fire Protection Association's (NEPA's) buffer zone requirements for tanks contained in tables 2-1 through 2-6 of the "Flammable and Combustible Code—1977"? _____Yes, _____No.

I. Surface Impoundments (10.51.05.11)

1) Is two feet of freeboard maintained in the surface impoundment? _____Yes, _____No.
2) Do all earthen dikes have protective covers (e.g., grass, shale or rock) to minimize wind and water erosion and to preserve dike structural integrity? _____Yes, _____No.
3) Are waste analyses conducted or written documentation obtained before placing a substantially different hazardous waste into a surface impoundment used for storage or treatment? _____Yes, _____No.
4) Is the freeboard level inspected daily? _____Yes, _____No.
5) Is the surface impoundment, including dikes and vegetation, inspected weekly to detect leaks, deterioration, or failures in the impoundment? _____Yes, _____No.
6) Are the results of these inspections recorded in an inspection log or summary? _____Yes, _____No.
7) Are ignitable or reactive wastes stored in a surface impoundment? _____Yes, _____No. If yes:
   a) Is the waste treated, rendered, or mixed before or immediately after placement in the impoundment so that the resulting waste, mixture or dissolution of material no longer meets the definition of ignitable or reactive waste under Parts 261.21 or 261.23 of the RCRA Regulations? _____Yes, _____No.
   b) Are incompatible wastes segregated in separate surface impoundments so that spontaneous reactions are avoided? _____Yes, _____No.

J. Waste Pile (10.51.05.12)

1) Is wind dispersal of the pile controlled? _____Yes, _____No, _____Not Needed.
2) Are additions to the pile being analyzed prior to adding them to the pile? _____Yes, _____No.
3) Is hazardous waste leachate or runoff collected? _____Yes, _____No. Is the pile protected from precipitation and run-on? _____Yes, _____No.
4) Are ignitible or reactive wastes protected from materials or conditions that might cause it to ignite or react? _____Yes, _____No, _____N/A.
5) Are incompatible wastes hauled in a manner as to assure separation? _____Yes, _____No, _____N/A.

K. Land Treatment (10.51.05.13)

1) Will the use of land treatment result in the waste being less hazardous or non-hazardous? _____Yes, _____No.
2) Is run-on diverted away from the active portion of the facility? _____Yes, _____No. Is run-off from the active portion of the facility collected? _____Yes, _____No.
3) Has the proper waste analyses been peformed? _____Yes, _____No.
4) If food chain crops are to be grown on the active portion of the facility has the necessary documentation required been provided? _____Yes, _____No.
5) Has the owner/operator written and implemented an unsaturated zone monitoring plan? _____Yes, _____No.
6) Have the additional requirements for a closure and post-closure plan been addressed? _____Yes, _____No.
7) Are ignitable or reactive wastes immediately incorporated into the soil? _____Yes, _____No.
8) Are incompatible wastes hauled according to 10.51.05.13 I? _____Yes, _____No.

L. Landfills (10.51.05.14)

1) Is run-on diverted away from the facility's active portions? _____Yes, _____No.
2) Is run-off collected from the landfill's active portions? _____Yes, _____No.
3) Has a hazardous waste determination been made on the run-off? (Identification and Listing of Hazardous Waste) _____Yes, _____No.
4) Is the landfill managed so as to control wind dispersal? _____Yes, _____No.

FILE COPY ONLY

5) Are the following items maintained in the operating record: _____on a map, the exact location and dimensions, including depth, of each cell with respect to permanently surveyed benchmarks? _____contents of each cell and approximate location of each hazardous waste type within the cell?
6) Are bulk, non-containerized or waste containing free liquids placed in the landfill? _____Yes, _____No. If yes: _____ is a leachate collection system available to remove leachate?, and _____is the liquid stabilized or treated physically or chemically prior to disposal?
7) Are empty containers crushed flat or shredded before burial in the landfill? _____Yes, _____No.
8) Are containers holding liquid wastes (or waste containing free liquids placed in the landfill? _____Yes, _____No. If yes, describe containers on comments below.
9) Are ignitable or reactive wastes placed in a landfill? _____Yes, _____No. If yes: _____Is the waste treated, rendered, or mixed before or immediately after placement in the landfill so that the resulting waste, mixture, or dissolution of material no longer meets the definition of ignitable or reactive waste? _____Are incompatible wastes segregated in different landfill cells?

M. Incinerator/Thermal Treatment (10.51.05.15 & .16)

1) Prior to burning waste not previously incinerated or thermally processed, does the operator conduct waste analysis for the following:
_____heating value of the waste;
_____halogen content and sulfur in the waste;
_____concentrations of lead and mercury unless documented data is available which show these elements not to be present?
2) Are instruments related to combustion and emission control monitored at least every 15 minutes? _____Yes, _____No.
3) Is the stack plume observed visually at least hourly for color and opacity? _____Yes, _____No, _____N/A.
4) Is the incinerator or thermal process and associated equipment inspected daily for leaks, spills and fugitive emissions? _____Yes, _____No.
5) Is all of the above information documented in the facility's operating record? _____Yes, _____No.

N. Chemical, Physical and Biological Treatment (10.51.05.17)

1) Are all treatment processes or equipment in good condition, i.e., no signs of leakage, corrosion or any other deterioration? _____Yes, _____No.
2) Are treatment processes or equipment with continuous inflow of hazardous waste equipped with a means to stop the inflow? (e.g., waste feed cutoff system or bypass system to a standby containment device) _____Yes, _____No.
3) Are waste analyses performed or written documentation obtained before placing a substantially different hazardous waste into treatment processes or equipment? _____Yes, _____No.
4) Is this information recorded in the facility's operating record? _____Yes, _____No.
5) Are daily inspections conducted for discharge control equipment (e.g., bypass systems, waste feed cutoff systems, drainage systems and pressure relief systems)? _____Yes, _____No.
6) Is data gathered from monitoring equipment (e.g., pressure and temperature gauges) daily? _____Yes, _____No.
7) Are construction materials of the treatment process or equipment and the immediate surrounding area inspected weekly for signs of leakage, corrosion or any other deterioration? _____Yes, _____No.
8) Are the results of these inspections recorded in an inspection log or summary? _____Yes, _____No.
9) Are ignitable or reactive wastes placed in a treatment process? _____Yes, _____No. If yes:
_____Are wastes treated, rendered, or mixed before or immediately after placement in the treatment process or equipment so that the resulting waste, mixture, or dissolution of material no longer meets the definition of ignitable or reactive wastes under Section 261.21 or 261.23 of the RCRA Regulations?
_____Are wastes treated in such a way that they are protected from any material or conditions which may cause the waste to ignite or react?
10) Are incompatible wastes kept from being placed in the same treatment process or equipment? _____Yes, _____No.

O. Permit Requirements (10.51.07)

1) Does the facility have a DHS permit for its activity? _____Yes, _____No.
If no, has the facility submitted an application for a DHS permit? _____Yes, _____No.
2) List any special Permit requirements that are not in full compliance.

Comments: SINCE THE FIRST OF THE YEAR THE FOLLOWING WASTE HAS BEEN SHIPPED BY MANIFEST BY HAZ MAT ENVIRONMENTAL TO CHEMICAL WASTE MANAGEMENT.

Report of Observations

Type of Inspection/Observations: ROUTINE Date 9/11/85

Facility Name: MD NAT'L GUARD

Remarks:

WASTE ADHESIVE COMBUSTIBLE LIQ. UN1133 IDM 400P
NYA 2269197 8-15-85
WASTE PAINT ENAMEL FLAM. LIQ. UN1263 2DM 106
17 DRUMS PRESENTLY IN STORAGE OVER 90 DAYS. A PROBLEM IN CONTRACTING A DISPOSAL COMPANY IS THE REASON FOR EXCEEDING THE 90 DAY LIMIT. THE DRUMS WILL BE REMOVED BY THE SECOND WEEK IN OCTOBER. THE DRUMS ARE, HOWEVER, PROPERLY SEALED, LABELED AND SECURED.

THE AREA BEING USED FOR STORAGE OF WASTES DOES NOT MEET REQUIREMENTS FOR CONTAINMENT. PLANS TO COMPLY WITH THE REGULATIONS SHOULD BE MADE BY THE TIME OF THE NEXT QUARTERLY INSPECTION.

A CONTINGENCY PLAN SHOULD ALSO BE COMPLETED BY THE TIME OF NEXT INSPECTION. THE SPCC PLAN IS A PLAN FOR HANDLING WASTE OILS AND IS NOT SUFFICIENT UNLESS IT SPECIFICALLY ADDRESSES HAZARDOUS WASTE.

ANNUALLY AN AUXILIARY SQUAD IS TRAINED IN FIRE SAFETY, CONTINGENCY, EXPLOSION ETC.. QUATERLY, A MANAGEMENT MEETING FOR HAZARDOUS MATERIALS HANDLING IS CONDUCTED

Observer: VALERIE DOYLE Person Interviewed: SCOTT KEARBY

MEMORANDUM

Copies

TO File **From** John Beazley JB **Date** June 27, 1985

Subject Glenn L. Martin State Airport - Air National Guard Baltimore County

Laboratory analysis of the water samples collected February 21, 1985 at the two wells in question at the Glenn L. Martin Air Port - Air National Guard, revealed no purgeable aromatics nor purgeable halocarbons These water samples were collected at first flush and after running the water to flush the lines and draw from the wells. The analysis of water samples collected February 8, 1985, also, revealed no purgeable halocarbons nor purgeable aromatics. This is inconsistant with the sample analysis performed by a private laboratory for the Air Guard, which showed ethylbenzene, benzene, chlorobenzene, and ethylene chloride in low levels. The analysis of samples collected by this department do not indicate any contamination of the groundwater.

A memorandum dated February 26, 1985 from Paul Thompson to Frank Henderson transfered the file to Mr. Henderson to added to his list for future assessment and/or investigation.

MEMORANDUM

Copies { Mr. Dave Healy
Mr. John Beazley

Thru: Mr. John Koontz

TO Mr. Frank Henderson From Mr. Paul Thompson Paul Date 2/26/85

Subject Glenn L. Martin State Airport, Baltimore County

Staff investigation of this site indicates improper waste disposal practice.

These include:

1. acid and waste oil disposal pits (at least 4)
2. landfilling (indiscriminate)
3. explosives disposal (deactivated bombs, we're told!) into dredge holes in Frog Mortar Creek.

Private labs show trace organic (L 1-ppb range) contamination of two potable wells on site, yet sampling does not substantiate this. ?

Therefore, ? this site should be added to your next published list of sites for future assessment and/or investigation.

Report of Observations

Type of Inspection/Observations: _____ Date 85, 02, 13

Facility Name: Glenn L. Martin State Airport, Box 1, 701 Wilson Point Road, Balto Md 21220

Remarks: John Beazley, Barry Chambers, Valer. Doyle, and Mike Griffen met with J. Leonard Wood and Jake West at the Martin State Airport office on Feb 13 at 1300hrs J. Leonard Wood is the Martin State Airport manager. John Beazley, Barry Chambers, Valeri Doyle, and Mike Griffen accompanied Leonard Wood on a tour of the Facility. [redacted] Tech Sgt. Charles Smith of the Air Guard accompanied us when touring the facility east of the air strip.

From the beach along Frog Mater Creek, concrete rubble, corrugated steel pipe, and a couple of drums were observed in the side of the Fill. Indiscriminate dumping was observed at this site in the past as noted in the inspection report of Sept 16, 1981 by James Curtis from this office.

West of the airstrip several areas of dumping were observed. Adeer carcass, cylinders of refrigerant, aborted junk, and rubble were observed. Thirty nine drums were observed by the KJ building; some, but not all, of the drums were empty. One empty drum, denatured ethanol, had a 'Tilly Chemical' label. Drums were observed in the fill area near the KJ building, again demonstrating the indiscriminate waste handling practices at this facility. Photographs were taken by Barry Chambers during this survey.

Mr Griffen discussed the ground water contamination with Mr. Wood and informed Mr. Wood that the airport will have to contract out for surveying and analysis regarding the ground water contamination. Since the Maryland Environmental Service handles the sampling required in the airports NPDES permit and operates the waste treatment plant at the airport, the recommendation that MES be used as consultant was made.

Mr. Chambers recommends that this site be put on a remedial clean up list such as the State Superfund list and/or the Federal Superfund List.

Paul T — John N Koontz

TO ~~Mr. Frank Henderson~~ via ~~Mr. John Koontz~~ From ~~Mr. Paul Thompson~~ PT Date 2/7/85

Subject Glenn L. Martin State Airport

Frank we need your section's/assistance in establishing and implementing a sampling plan for:

1. Groundwater Sampling (Two contaminated wells on site).
2. Four (maybe 5) unlined pits - referred to as "Acid Pits" by plans and Maryland Air National Guard Employees.
3. Two known areas of landfill activity (Dredge Spoils, etc.)
4. One area of munitions dumping into Frog Mortar Creek.

We have the permission/cooperation of both the State Aviation Administration (Leonard Wood - 391-9500) as property owner, and the Maryland Air National Guard (Tech. Sgt. Charles Smith - 687-6270 ext. 428) as tenant.

PT/jj

Have OWNERS of site do work per our NORMAL procedures. Get them UNDER A CONSENT ORDER/AGREEMENT re DUNDALK MARINE Terminal.

Mike,

BACK TO You.

P

STATE OF MARYLAND • DEPARTMENT OF HEALTH AND MENTAL HYGIENE

MEMORANDUM

Copies

TO JK From MQ Date 4.7.85

Subject GLENN L. MARTIN STATE AIRPORT

PHONE CONVERSATION WITH TECH. SGT. C. SMITH, WARFIELD ANG NATIONAL GUARD.

SGT. SMITH HAS LOCATED DESIGN PLANS, CIRCA 1958, FOR A "NEW" ACID PIT (UNLINED, OF COURSE) TO REPLACE ANOTHER ONE THAT WAS "REAL BAD". THE "REAL BAD" ONE WAS CLOSER TO FROG MORTAR CREEK THAN THE 4 ON OUR PLAN COPY AND WAS BULLDOZED IN BY THE AIR NATIONAL GUARD WHEN THEY CONSTRUCTED THE NEW ONE.

INFORMATIONALLY, THE MUNITIONS TESTING PIT WAS ALSO CONSTRUCTED BY THE AIR NATIONAL GUARD (CIRCA 1958) AS WAS THE TAXIWAY.

ONE FINAL TIDBIT: ALL LEFTOVER BOMBS WERE DEACTIVATED (REALLY?) AND DUMPED INTO A HOLE AT THE BOTTOM OF FROG MORTAR CREEK.

COLUMBUS, OHIO 43215

REPLY REFER TO DPDR-CRH (Ms. Davis-Hoover/(AV)850-2171/lar) 30 JAN 1985

SUBJECT: Material/Waste Designation Conflicts With States of New Jersey, Missouri, and Maryland

TO: DPDS-H

1. References:

a. New Jersey Department of Environmental Protection, Division of Waste Management, Notice of Violation ID No. 84-10-19-33, dated 2 Nov 84, and applicable responses (Encl 1).

b. Notice of violation pursuant to requirements of the Missouri Hazardous Waste Management Law, Rules and Regulations Numbered 00123, dated 29 Oct 84, and applicable responses (Encl 2).

c. Department of Health and Industrial Hygiene (Maryland) site complaints numbered SC-0-85-217 and SC-0-85-185 dated 4 Dec 84 and 16 Nov 84, respectively, and applicable responses (Encl 3).

2. Referenced violations indicate that several states have asked for clarification by DPDS regarding policy on receiving generator turn-ins of regulated hazardous property as material (with the exception of predetermined waste).

3. DPDR-CRH has met numerous times with subject states to explain this policy. We have further explained that if RTD/S are unsuccessful the DPDO then declares the item a waste and requests removal via service contract. However, referenced violations indicate that conflict still exists over our material/waste designations.

4. Enforcement officials from subject states have requested that our headquarters submit written material/waste designation policy for approval or denial. Please provide subject states with written policy clarification as requested in referenced violations. Addresses and POCs are as follows:

a. New Jersey (Affected DPDOs: Lakehurst and Bayonne; OSBs: McGuire and Dover, NJ)

Bureau Chief
New Jersey Department of Environmental Protection
Division of Waste Management
Bureau of Compliance and Enforcement
R.D. 1, Route 70
Vincentown, NJ 08088

30 JAN

b. Missouri (Affected DPDOs: Whiteman and Leonard Wood)

Chief, Enforcement and Superfund Section
Waste Management Program
P.O. Box 1368
Jefferson City, MO 65102

c. Maryland (Affected DPDOs: Brandywine, Meade, and Aberdeen; OSB: Patuxent River)

Lou Martino, Chief
Hazardous Waste Division
Office of Environmental Programs
O'Conor Building, Second Floor
201 West Preston Street
Baltimore, MD 21201

5. It is important that DPDS and State regulators reach a mutual understanding on definitions of hazardous material and hazardous waste in order for DPDR-CRH to assist DPDOs in complying with State inspectors regulatory interpretations.

6. Please inform DPDR-CRH of your anticipated completion schedule by 1 Mar 85. POC is Wendy Davis-Hoover, or Carrie Groves Reed, (AV)850-2171.

NOTICE OF VIOLATION

ID NO. 84-10-19-35 DATE 11/2/84

NAME OF FACILITY Naval Air Engineering Center

LOCATION OF FACILITY Lakehurst

NAME OF OPERATOR Jim Gardner for Capt. Frank Boyce

You are hereby NOTIFIED that during my inspection of your facility on the above date, the following violation(s) of the Solid Waste Management Act, (N.J.S.A. 13:1E-1 et seq.) and Regulations (N.J.A.C. 7:26-1 et seq.) promulgated thereunder and/or the Spill Compensation and Control Act, (N.J.S.A. 58:10-23.11 et seq.) and Regulations (N.J.A.C. 7:1E-1 et seq.) promulgated thereunder were observed. These violation(s) have been recorded as part of the permanent enforcement history of your facility.

DESCRIPTION OF VIOLATION Disch. of H_2SO_4 (cleaned up)

[illegible]

Illegal disposal of Haz. waste (incineration of [illegible]

at training center for fire [illegible] training)

Remedial action to correct these violations must be initiated immediately and be completed by

30. Within fifteen (15) days of receipt of this Notice of Violation, you shall submit in writing, to the investigator issuing this notice at the above address, the corrective measures you have taken to attain compliance. The issuance of this document serves as notice to you that a violation has occurred and does not preclude the State of New Jersey, or any of its agencies from initiating further administrative or legal action, or from assessing penalties, with respect to this or other violations. Violations of these regulations are punishable by penalties of $25,000 per violation.

10 DEC 1984

IN REPLY REFER TO DPDO-XPN

6 December 1984

SUBJECT: NJDEP Violation received by NAEC Lakehurst

TO: DPDR-CRH
W. Davis-Hoover

1. Reference: (a) NAEC letter dated 11/9/84 (Enclosure (1))
(b) NJDEP Violation ID NO 84-10-19-35 (Enclosure (2))
(c) NAEC Message R262055Z Nov. 84 (Enclosure (3))
(d) DPDO Conversation Record (Enclosure (4))
(e) DTID N68335-4279-0012 (Enclosure (5))

2. Subject violation is listed as violation 2 on enclosure (1) and again in enclosure (2). The DTID involved (enclosure 5) indicates receipt at 5 October 84 and removal by DPDS service contract DLA-200-84-C-0059 on 16 November 84. This item was on DPDO records for a period of 42 calandar days.

3. The problem in this matter stems from various interpretations of NJDEP and DoD regulations. NAEC Environmental Personnel consider all hazardous material a waste the moment it is no longer required for their use. They consider this mandatory in light of NJDEP regulations which state "Hazardous materials are to be considered wastes when they are no longer needed for their intended purpose". (See enclosure (4))

4. In light of these requirements by the State of New Jersey, NAEC has requested the DPDO to take immediate steps to accept accountability upon notification and place items directly for A&D.

5. Please note that no other generator has yet been sited for this type violation but there is growing concern amoung station environmentalists.

6. Since all generators of DPDO Lakehurst including the DPDO itself are governed by NJDEP regulations it is requested that corrective actions by taken by appropriate authorities to resolve this matter with the State of New Jersey.

Joanne L. Reitemeyer

DEPARTMENT OF THE NAVY

NAVAL AIR ENGINEERING CENTER

LAKEHURST, N. J. 08733

IN REPLY REFER TO
5090
1823

09 NOV 1984

New Jersey Department of Environmental Protection
Division of Waste Management
Mr. Mike Tompkins, Investigator
Bureau of Compliance and Enforcement
R.D. 1, Route 70
Vincentown, New Jersey 08088

Subj: NOTICE OF VIOLATION, I.D. NO. 84-10-19-35

Following an inspection of the Naval Air Engineering Center (NAVAIRENGCEN) on 02 November 1984, a "Notice of Violation" was issued by the Division of Waste Management covering three violations.

The remedial action being taken by the Center for each of the violations is as follows:

VIOLATION 1 - ACID SPILL CLEANUP

On 19 October 1984 the Center had a spill of approximately 800 gallons of sulfuric acid. The spill site has been cleaned up without the contamination reaching the groundwater. Approximately 36 tons of acid contaminated soil have been removed from the site and are ready for disposal. The disposal contractor, O. H. Materials, has notified the Center that the material is scheduled for shipment during the week of 19 November 1984 to Fondessy Enterprises Landfill in Oregon, Ohio for final disposal. You will be notified when the material leaves the Center.

[redacted]

The hazardous waste in question is being temporarily stored under the NAVAIRENGCEN's EPA Hazardous Waste Permit. The material is in the custody of the Defense Logistics Agency (DLA) which is an entity of the Department of Defense seperate from the Navy.

[redacted]

VIOLATION 3 - COMBUSTION OF WASTE OIL FOR RECOVERY OF HEAT ENERGY

The NAVAIRENGCEN has a permit from the Division of Environmental Quality which allows open burning at a permanent fire fighting training area located at the Center. Contaminated aircraft fuel (JP-5 Jet Fuel) is burned at the school during training exercises. Small amounts of waste crankcase and lubricating oils are sometimes mixed with the contaminated aircraft fuel. We do not believe this to be a violation of New Jersey Regulations.

5090
1823

Subj: NOTICE OF VIOLATION, I.D. NO. 04-10-19-35

Recently adopted amendments to N.J.A.C. 7:26-1 ET SEQ permit the combustion of hazardous waste for the recovery of heat energy when performed at the site where the wastes are generated. These amendments became effective on 17 January 1984 (DEP Docket No. 059-82-11).

Based on the above, we request that the Division of Waste Management withdraw Violation 3.

If there are any questions or further information is required, please contact me at telephone (201) 323-2612.

Sincerely,

JAMES A. GARDNER, P.E.
Supervisory Environmental Engineer
Public Works Department
By direction of the Commanding Officer

TIME: 9:00 AM
DATE: 29 NOV. 84

TYPE: ☐ VISIT ☐ CONFERENCE ☑ TELEPHONE ☐ INCOMING ☑ OUTGOING

Location of Visit/Conference:

NAME OF PERSON(S) CONTACTED OR IN CONTACT WITH YOU	ORGANIZATION (Office, dept., bureau, etc.)	TELEPHONE NO.
Mr. Curt Whitford	NJ DEP. ENV. PROT	AC 609 292-6842

ROUTING: NAME/SYMBOL | INT

SUBJECT: STORAGE OF HAZARDOUS WASTES LONGER THAN 90 DAYS.

NJ VIOLATION ID NO 84-10-19-35

SUMMARY: Mr. Whitford stated that under N.J. State Regulations hazardous materials are considered waste when they are no longer needed for their intended purpose.

I explained that even though the item may be purchased at a specific site for a specific purpose, the intended purpose is for use within the DoD and until the DoD declares no further use the item is not considered waste by DoD.

Mr. Whitford conceded that we may have a grey area subject to interpretation. I questioned how the state of N.J. could possibly issue a fine based on a grey area.

Mr. Whitford requested a letter be sent to his Bureau Chief, SHIRLEE SCHIFFMAN, explaining the above and requesting resolution.

Report of Observations

Type of Inspection/Observations: CDS Storage Date 12/4/84

Facility Name: Defense Logistics Agency/Defense Property Disposal Office (Aberdeen Prov. Ground, Bd. 2

Remarks: Representatives: Mr. Gerald Laughman, DPDO
Mr. John Shafer, DPDO
Mr. Mike Griffen, Waste Management Admin.
Mr. Harold L. Oye, Jr., WMA

Purpose of this inspection and meeting came about as a follow-up to an inspection at Maryland Air National Guard at Martin's Airport in Baltimore County on November 16, 1984. During that inspection, reference was made that the DPDO at Aberdeen Proving Ground had accountability for CDS generated at Martin's Airport Md. Air National Guard facility. Communication between this office (WMA) and DPDO led to this day's meeting and inspection.

Initially the meeting focused on definition of solid waste and hazardous waste as defined by COMAR 10.51 (Hazardous Waste Regulations) and the recyclable or re-use nature of same. DPDO is charged by the U.S. Department of Defense with the responsibility of accounting for material generated by a facility that is considered no longer useful or useable by various operations at the facility and with re-sale or re-use prior to disposal if a buyer or user can be found. Items include equipment, desks, and hazardous materials (solvents, paints, miscellaneous photograph developer, herbicides). These hazardous materials may have expired shelf lives or by facility regulation, may no longer be used by the particular operation. By definition under COMAR 10.51.02.06 these hazardous materials meet the Special Requirements for Hazardous Waste which is Used, Re-used, Recycled, or Reclaimed and Residues from Emptied Drums.

In the case of these materials which are defined by the hazardous waste characteristics of ignitability, reactivity or EP Toxicity, those wastes, if

Observer: _____ Person Interviewed: _____

State of Maryland
Department of Health and Mental Hygiene
Office of Environmental Programs
201 West Preston Street, Baltimore, Maryland 21201

Report of Observations

Type of Inspection/Observations: Date 12/4/84

Facility Name: DPDO, Aberdeen Proving Ground.

Remarks: re-used, recycled or reclaimed, are not subject to regulation under COMAR 10.51.03 - 10.51.05. (See COMAR 10.51.02.06 A. However, the hazardous wastes which are listed in Regulations 10.51.02.14 - .17 are subject to those requirements with respect to transportation or storage as found in COMAR 10.51.02.06 B.

Note: Before any material is considered a hazardous waste it must be a solid waste. It is this writer's interpretation, with advice of legal counsel from Md. AAG's office, that the materials in DPDO custody are hazardous wastes as seen under COMAR 10.51.02.B(1): "Has served its original intended use and sometimes is discarded" - can be interpreted as served its period of usefulness.

A tour of 4 warehouses on APG, Buildings 3559, 3560, 3506 and 3511, has found a variety of materials. In particular, in building 3560, 6 drums of 1,1,1-Trichloroethane, and some what appears to be ten 55lb bags of a herbicide. Other items include miscellaneous paints, possible corrosives, ignitables. Most items meet the characteristic hazardous waste criteria, i.e. corrosive, ignitable, EP Toxic or reactive. The 1,1,1-TE is listed, U226. The herbicide is unknown.

As such, the requirements for storage of recyclable materials as found in COMAR 10.51-02.06 B must be met. Site complaint SC-0-85-217 is being issued.

Due to the unique nature of this DPDO activity this writer feels that a meeting is indicated in order to identify positions with regard to compliance with the hazardous waste regulations in the State of Maryland.

A copy of this report was left with Mr. Baughman.

IN REPLY REFER TO: DPDO-XPF (C. G. Baughman/2235/scs) 6 December 1984

SUBJECT: DPDO Site Complaint by Maryland EPA

TO: DPDR-CRH
Environmental Branch

1. References:

a. Site complaint, #SC-0-85-185, dated 11/16/84, Enclosure 1.

b. Site complaint, #SC-0-85-217, dated 12/4/84, Enclosure 2.

c. State of Maryland, Office of Environmental Programs, Report of Observations, dated 12/4/84, Enclosure 3.

d. Phonecon to Mr. Dan Bowell from C. Gerald Baughman on 4 Dec 1984.

2. A meeting was held on 4 Dec 1984, attended by Mr. Harold Dye and Mr. Mike Griffin of Maryland Office of Environmental Programs and Mr. C. Gerald Baughman and Mr. John Shafer of DPDO Aberdeen.

3. Mr. Shafer asked Mr. Dye how the material (new/unused original package) relates to the State of Maryland Regulations. Mr. Dye informed us that the interpretation of the State Atty. General's Office was that any hazardous material (HM) which is turned in to the DPDO is considered a hazardous waste (HW). Even with the intent to RTD and Sales, these items would not revert back to HM status until a customer accepts or a buyer accepts these items. Per the state, intent of the original generator (Army, agency, activity, etc.) to discard or turn in their chemical substance/material causes these items to be considered Hazardous Wastes and should be placed in conforming storage. Items where "shelf life" has expired are considered HW because the manufacturer has guaranteed this product only to the life of these items.

4. Identification of these items are checked with the Table of Hazardous Wastes (40 CFR 261:33). If an item is listed in these tables it is considered a HW even if the item is unused and must be placed in conforming storage. If an item is not contained in this table, but meets the definition of a Characteristic Waste, COMAR 10:51-03 through 05 does not apply until these items are placed on a delivery order for removal under our Requirements Contract.

5. Maryland Air National Guard - Citation was made due to non-compliance by both the Air Guard and the DPDO - the "owners" of the waste for storage beyond

90 days. It was stated that the Air Guard must abide by these Regulations (COMAR) whether a small generator or a permitted generator. According to the State people, the DPDO was cited since we had accountability and were the owners of the waste. DoD/DLA/DPDS/DPDR needs to address this issue. I would like to know if DPDOs can or should be cited for violations such as spills, leaks, etc. for property that we do not have physical custody of but accountability only.

6. After the meeting, a site visit to the DPDO's four warehouses, Bldgs. 3558/3560 (receiving/storage) and Bldgs. 3506/3511 (sales) was conducted, during which the state people saw several items which we were calling "Material" that was going through R/T/D or Sales, that they said was a waste. Specifically, one item was 1,1,1-Trichloroethane, un-used, NSN - 6810-00-551-1487, 6 Dr, 55 gal. which we had in Bldg. 3560, on sale 27-5085, item 40. We learned later that this item sold for $68 per drum. Since the state calls this a waste, they said we should not have it and that it should be in conforming storage at the HW storage site at Edgewood. If this is true, then we, the DPDO may as well forget trying to sell any unused, listed, hazardous chemicals because storage in the HW storage facility will not allow easy management of the R/T/D or Sale program, nor can potential buyers inspect the property in that building.

7. This interpretation by the State of Maryland as to what is a waste and when it becomes a waste is in conflict with what the DPDO has been told, is the DoD/DPDS position. Clarification is requested, with specific procedures to follow for unused hazardous chemicals that have high R/T/D or Sales potential.

8. Also, per last paragraph of enclosure 3, Mr. Dye would like a meeting with at least DPDR-CRH personnel. I feel that DPDS representative(s) should also attend since this problem could occur at other DPDOs CONUS wide and at least at the other two Maryland DPDOs.

NOTICE OF VIOLATION

ID NO. 84-10-19-35 DATE 11/2/84

NAME OF FACILITY Naval Air Engineering Center

LOCATION OF FACILITY Lakehurst

NAME OF OPERATOR Jim Gardner for Capt. Frank Royce

You are hereby NOTIFIED that during my inspection of your facility on the above date, the following violation(s) of the Solid Waste Management Act, (N.J.S.A. 13:1E-1 et seq.) and Regulations (N.J.A.C. 7:26-1 et seq.) promulgated thereunder and/or the Spill Compensation and Control Act, (N.J.S.A. 58:10-23.11 et seq.) and Regulations (N.J.A.C. 7:1E-1 et seq.) promulgated thereunder were observed. These violation(s) have been recorded as part of the permanent enforcement history of your facility.

DESCRIPTION OF VIOLATION Disch. of H_2SO_4 (cleaned up)

[illegible] (cleaned [illegible])

Illegal disposal of NAB waste (incineration of [illegible] at training center for fire extinguishing training)

Remedial action to correct these violations must be initiated immediately and be completed by

30. Within fifteen (15) days of receipt of this Notice of Violation, you shall submit in writing, to the investigator issuing this notice at the above address, the corrective measures you have taken to attain compliance. The issuance of this document serves as notice to you that a violation has occurred and does not preclude the State of New Jersey, or any of its agencies from initiating further administrative or legal action, or from assessing penalties, with respect to this or other violations. Violations of these regulations are punishable by penalties of $25,000 per violation.

IN REPLY REFER TO DPDO-XPN

6 December 1984

SUBJECT: NJDEP Violation received by NAEC Lakehurst

TO: DPDR-CRH
W. Davis-Hoover

1. Reference: (a) NAEC letter dated 11/9/84 (Enclosure (1))
(b) NJDEP Violation ID NO 84-10-19-35 (Enclosure (2))
(c) NAEC Message R262055Z Nov. 84 (Enclosure (3))
(d) DPDO Conversation Record (Enclosure (4))
(e) DTID N68335-4279-0012 (Enclosure (5))

2. Subject violation is listed as violation 2 on enclosure (1) and again in enclosure (2). The DTID involved (enclosure 5) indicates receipt at 5 October 84 and removal by DPDS service contract DLA-200-84-C-0059 on 16 November 84. This item was on DPDO records for a period of 42 calandar days.

3. The problem in this matter stems from various interpretations of NJDEP and DoD regulations. NAEC Environmental Personnel consider all hazardous material a waste the moment it is no longer required for their use. They consider this mandatory in light of NJDEP regulations which state "Hazardous materials are to be considered wastes when they are no longer needed for their intended purpose". (See enclosure (4))

4. In light of these requirements by the State of New Jersey, NAEC has requested the DPDO to take immediate steps to accept accountability upon notification and place items directly for A&D.

5. Please note that no other generator has yet been sited for this type violation but there is growing concern amoung station environmentalists.

6. Since all generators of DPDO Lakehurst including the DPDO itself are governed by NJDEP regulations it is requested that corrective actions by taken by appropriate authorities to resolve this matter with the State of New Jersey.

MEMO TO : Rich Steimle

FROM : Jim Lyko

RE : Re-use/Recycling/Reclamation of Hazardous Wastes

Below are a few of my thoughts on the broad issue of the exclusion from regulation of hazardous wastes which are re-used, recycled, or reclaimed. Perhaps these points can serve as a rough agenda for the June 21 meeting on this subject.

I. What are the requirements in the agency's present regulation (COMAR 10.51.02.06)?

A. Subsection A creates a broad exclusion from regulation for all wastes being accumulated, stored, or treated before beneficial use or re-use or legitimate recycling or reclamation, but the exclusion is subject to subsection B.

B. Subsection B, in turn, brings back into the regulatory system listed hazardous wastes (i.e., those listed in regulations .14 through .17, as well as mixtures containing a listed hazardous waste), to the extent of virtually complete regulation of the transportation and storage of these hazardous wastes prior to their being used, re-used, recycled, or reclaimed.

-- Analysis:

(i) Wastes which are hazardous by virtue of exhibiting one of the four characteristics are totally exempt from regulation if intended for beneficial use or re-use or legitimate recycling/reclamation, unless the waste is also hazardous by virtue of containing a listed hazardous waste.

(ii) Wastes (including waste oil) which contain even minute amounts of a listed hazardous waste are subject to the hazardous waste transportation and storage requirements (such as use of the manifest system and the obtaining of storage permits), regardless of whether they are intended for beneficial re-use or legitimate recycling.

II. Evaluation of Maryland's Current Policy.

A. Are Maryland's present regulatory requirements, as described above, sound public policy?

B. Is the Agency willing to accept the permitting and enforcement burdens imposed by even-handed adherence to the present regulations?

III. If the answer to either question A. or B. in item #2 above is "no," define the regulatory policy Maryland wishes to establish regarding re-use/recycling/reclamation of hazardous waste, applying appropriate principles, such as those set forth below.

* * * * *

PRINCIPLES

1. Hazardous waste, regardless of its end use, poses significant health and environmental hazards. Thus, the same standards should govern all transportation and storage of hazardous wastes, regardless of whether the waste is destined for disposal or for re-use/recycling/reclamation.

-- Corollary: Entirely excluding from regulation hazardous wastes which are re-used/recycled creates a major loophole; e.g., if no manifest is required for such wastes, there is no way of ensuring that wastes intended for re-use/recycling are in fact delivered to the intended destination.

2. While there is a need to balance (i) the requirement to properly manage hazardous wastes, against (ii) the objective of promoting re-use/recycling, if a balance cannot be achieved, the overriding consideration must be on ensuring the safe handling of hazardous wastes.

3. The regulation of waste mixtures which contain a percentage of hazardous waste must not impose on both the agency and the regulated industries burdens which are clearly out of proportion to the health and environmental danger posed by the particular waste mixtures.

4. Agency policies, to be enforceable, must be expressed as clear, unambiguous, objective standards pursuant to which a reasonable person can know how to pattern his conduct.

5. Enforcement of regulations must be consistent and even-handed.

GLENN L. MARTIN STATE AIRPORT

STATUS: AS OF 1630 hrs., 1.31.85.

① AFFECTED AREAS OF MD. AIR NATIONAL GUARD (WANG) POST PLACED ON BOTTLED WATER FOR DRINKING PURPOSES. N.A. MAJOR PORTIONS OF POST ON CITY WATER.

② SITE STILL UNDER INVESTIGATION OF HISTORY.

CURRENT ACTIVITY (1.30, 31, 85):

① OBTAINED SAMPLE RESULT COPIES FROM 8.28.84 / 11.27.84 SAMPLING FROM WANG.

② OBTAINED TOPOGRAPHIC PROFILE (1982 SURVEY) OF GLENN L. MARTIN STATE AIRPORT AND WANG PROPERTY FROM WANG. THIS MAP INDICATES LANDFILL AREAS; FOUR (4) PITS, PONDS, LAGOONS OF NOTE.

③ OBTAINED SAMPLING PERMISSION FOR WELLS FROM WANG AND FOR PITS, PONDS, LAGOONS FROM STATE AVIATION ADMINISTRATION.

④ OBTAINED "FALL LINE" INFORMATION AND GENERAL GROUND-WATER FLOW PATTERNS OF AREA FROM STAFF HYDRO-GEOLOGIST, TOM BETTENDORF.

⑤ OBTAINED LIAISON/CONTACTS AS FOLLOWS:

- MARTIN MARIETTA AEROSPACE - JOSEPH ALCARESE - 338-7130
- CHESAPEAKE PARK, INC. — JIM WAGNER - MIKE KELLY
- STATE AVIATION ADMINISTRATION — LEONARD WOOD - 391-9400
- (GLENN L. MARTIN STATE AIRPORT) — JAKE WEST
- WARFIELD AIR NATIONAL GUARD (WANG) — TECH. SGT. CHARLES SMITH - 687-6270; CAPT. SCOTT A. KEARBY

FUTURE ACTIONS: ① DEVELOP AND IMPLEMENT SURFACE SAMPLING PROGRAM ON SITE WITH SUPPORT SERVICES DIVISION.

② CONTACT BALT. CO. PERSONNEL RE: [A] OTHER WELLS IN AREA (SAMPLING?). [B] PAST LANDFILLING ON SITE (PERMITS?). [C] WELL INSTALLATIONS (1982) ON SITE.

TALK TO PAUL S. ↑

③ CONTACT JIMMY'S WASTE OIL, PIKESVILLE, RE: 1960'S CUTTING OILS, etc. REMOVAL.

④ CONTACT DGS (FORMERLY MARTIN MARIETTA - ASSEMBLY DIVISION) RE: 5-8 STORIES UNDERGROUND BUILDINGS, CONCRETE SUMPS, etc.

⑤ CONTACT INSECTICIDE PLANT IN CHESAPEAKE PARK RE: RECENT INCIDENTS, IF ANY.

Report of Observations

Type of Inspection/Observations: GROUNDWATER INVESTIGATION Date 1/24/85

Facility Name: MARYLAND AIR NATIONAL GUARD - GLENN L MARTIN STATE AIRPORT

Remarks:

TOURED AREAS OF MARYLAND AIR NATIONAL GUARD LEASED FROM THE STATE AVIATION ADMINISTRATION AND SEVERAL ADJACENT AREAS INCLUDING:

(1) TWO POND AREAS (SAA PROPERTY), ONE OF WHICH IS BELIEVED TO BE AN ACID PIT IN USE IN THE 1950's AND 1960's AND APPEARS UNLINED.

(2) A LANDFILLED AREA (SAA PROPERTY) ALONG FROG MORTAR CREEK AT THE SOUTHEASTERN EDGE OF THE PROPERTY.

(3) A MUNITIONS STORAGE AREA (ANG PROPERTY) WHICH HAS A 198' WELL WHICH SHOWED TRACES OF BENZENE, ETHYL BENZENE, TETRACHLOROETHYLENE, METHYLENE CHLORIDE. THIS AREA HAS TWO 550 GALLON FUEL OIL STORAGE TANKS (ONE UNDERGROUND, ONE ABOVE GROUND) WITH NO LEAKAGE PROBLEMS KNOWN — INSTALLED IN 1982. WELL IS A DRINKING WATER SOURCE.

(4) AN EQUIPMENT SHOP, STORAGE BUILDING (ANG PROPERTY — "KO" BUILDING) WHICH HAS A WELL SERVING THE BUILDING FOR SANITARY PURPOSES ONLY.

(5) A STORAGE BUILDING (ANG PROPERTY - BUILDING #5040) OUTSIDE OF WHICH IS THE HAZARDOUS WASTE STORAGE AREA. TWO OF THE DRUMS STORED THERE (55 GALLON CAP.) WERE PAINT THINNER/WATER MIXTURES WHICH HAD SWELLED THE TOPS AND BOTTOMS OF BOTH DRUMS ALLOWING CONTENTS TO LEAK. THESE WILL BE OVERPACKED WHILE AWAITING SHIPMENT (ACCUMULATION DATE = 12.4.84) TO AN APPROVED TSD FACILITY. SEVERAL (3) OF REMAINING DRUMS IN STORAGE AREA WERE UNLABELED PENDING SAMPLE RESULTS FROM LAB ANALYSIS.

Remarks: Edgar L. Martin Airport
Balt. Co., Md.

Spoke with Capt. Kearby (687-6210, ext 224) re: self-reported spill details.

A stripping vat in a block enclosure used to remove paint from aircraft wheels began deteriorating due to age. A leak from the bottom of the vat was discovered today. All spillage, ≈ 20 gallons, was contained on the pavement beneath the vat. "Sorb-all" absorbent was used to clean up the spillage. The cleaned up material and the remaining ≈ 45 gallons in the vat were pumped out into a drum for proper removal by personnel from the Aberdeen Proving Ground where all CHS materials are removed for disposal.

Time: 1030-1100

Name of facility or area ivestigated:
Md. Air National Guard - Martin Airport
Balto. Co DP-1413

Persons contacted (include title):
Sr. A. Gessner - Civil Engineer dept.

Citizen report: (name & title):

Statement of Findings:
I examined the oil-water separator which collects runway runoff. There was no oil in the separator and it appeared to be well maintained. The separator discharges to a drainage ditch.
SRA Gessner advised me to contact Lt. Col. Shero concerning the discharge permit application. (He was not available today)
Called Col. Shero 3/23 - Advised him to submit D.P. appl. for ANG or jointly with Martin Airport.

-and-

Mr. John M. Porter, Manager
State Aviation Administration
Glenn L. Martin State Airport
Post Office Box 1
Middle River, Maryland 21220

Dear Sirs:

On September 16, 1981, a representative of the Waste Management Administration examined an open dump area located on the east side of the Glenn L. Martin State Airport adjacent to Frog Mortar Creek. This inspection revealed that demolition debris, construction debris, brush, trash, and tires have been disposed at this open dumping operation.

In addition, a review of the Administration's files indicates that you have not obtained a Refuse Disposal Permit for this site.

Accordingly, the Office of Environmental Programs has issued the enclosed Order.

If you have any questions regarding this matter, please communicate with Mr. Paul G. Thompson, Acting Regional Chief, Waste Management Administration at 301-383-6650.

Sincerely yours,

William M. Eichbaum
Assistant Secretary for
Environmental Programs

The Honorable Adele Wilzack
Secretary - Department of
Health and Mental Hygiene
5th Floor - 201 W. Preston Street
Baltimore, Maryland 21201

Dear Secretary Wilzack:

The Military Department, State of Maryland, generates various hazardous waste materials at its approximately 35 armories, installations and facilities located throughout the State. While the amount of waste generated is relatively small, because of the geographical spread of our various facilities, we are faced with a significant problem associated with the collection, segregation, transportation, storage and final disposal of such materials.

In view of the State mission of the National Guard, which is to provide for the protection of the lives and property of the residents of the State in the event of an emergency, the Military Department is acutely aware of its responsibilities in this area. As such, we are desirous of developing and implementing a comprehensive program which will assure proper protection of our environment. To do so, we will need the advice, guidance, cooperation and assistance of your department.

My environmental specialist, Lieutenant David Williams, has been in contact with various members of your staff who have informally agreed to help us in this matter.

This letter is for the purpose of formally requesting your personal support as well as the support of your department in this effort.

If you have any questions or desire further information, please contact me at any time.

Respectfully,

Warren D. Hodges

Dear General Hodges:

Thank you for your letter of December 12, 1984 regarding Maryland's Military Department's storage and handling of hazardous waste.

I have requested Mr. Arthur N. Caple of the Waste Management Administration's Hazardous Inspection team to maintain contact with Lieutenant Williams and work closely with your Department to assist you in developing and implementing the comprehensive program you mentioned.

Please be assured of my support for your Department in their effort to handle hazardous wastes in a proper manner.

Sincerely,

Baltimore, Maryland 21201

This is an update on our actions in response to subject site complaint.

1. A copy of the site complaint and request for immediate removal of the HW was sent to the Defense Property Disposal Office on 19 November 1984. A copy of the letter was forwarded to your office.

2. DPDO has informed me that the HW pickup will take place between 10-12 December 1984. We have requested written confirmation and a copy of the message is attached.

3. On 4 December 1984 the contractor made a site visit to inspect and sample the HW scheduled for pickup.

If you have any questions please contact me at 687-6270, extension 222.

Report of Observations

Type of Inspection/Observations: CHS Storage Date 12/4/84

Facility Name: Defense Logistics Agency/Defense Property Disposal Office/Aberdeen Proving Ground, Md. 21005

Remarks: Representatives: Mr. Gerald Baughman, DPDO
Mr. John Shafer, DPDO
Mr. Mike Griffen, Waste Management Admin.
Mr. Harold L. Oye, Jr., WMA

Purpose of this inspection and meeting came about as a follow-up to an inspection at Maryland Air National Guard at Martin's Airport in Baltimore County on November 16, 1984. During that inspection, reference was made that the DPDO at Aberdeen Proving Ground had accountability for CHS generated at Martin's Airport Md. Air National Guard facility. Communication between this office (WMA) and DPDO led to this day's meeting and inspection.

Initially, the meeting focused on definition of solid waste and Hazardous waste as defined by COMAR 10.51 (Hazardous Waste Regulations) and the re-cyclable or re-use nature of same. DPDO is charged by the U.S. Department of Defense with the responsibility of accounting for material generated by a facility that is considered no longer useful or useable by various operations at the facility and with re-sale or re-use prior to disposal, if a buyer or user can be found. Items include equipment, desks, and hazardous materials (solvents, paints, miscellaneous photographic developers, herbicides). These hazardous materials may have expired shelf lives or by facility regulation, may no longer be used by the particular operation. By definition under COMAR 10.51.02.06, these hazardous materials meet the Special Requirements for Hazardous Waste Which is Used, Re-used, Recycled, or Reclaimed, and Residues from Emptied Drums.

In the case of those materials which are defined by the hazardous waste characteristics of ignitability, corrosivity, reactivity or EP Toxicity, those wastes, if

Report of Observations

Type of Inspection/Observations: _____ Date 12, 4, 84

Facility Name: DPDO, Aberdeen Proving Ground.

Remarks: re-used, recycled or reclaimed, are not subject to regulation under COMAR 10.51.03 - 10.51.05. (See COMAR 10.51.02.06 A. However, ~~the~~ hazardous wastes which are listed in Regulations 10.51.02.14 - .17 are subject to those requirements with respect to transportation or storage as found in COMAR 10.51.02.06 B.

[Note: Before any material is considered a hazardous waste it must be a solid waste. It is this writer's interpretation, with advice of legal counsel from Md. AAG's office, that the materials in DPDO custody are hazardous wastes as seen under COMAR 10.51.02 B(2): "Has served its original intended use and sometimes is discarded" - can be interpreted as served its period of usefulness.

A tour of 4 warehouses on APG, Buildings 3558, 3560, 3506 and 3511, has found a variety of materials. In particular, in building 3560, 6 drums of 1,1,1-Trichloroethane, and ~~of~~ what appears to be ten 55lb bags of a herbicide. Other items include miscellaneous paints, possible corrosives, ignitables. Most items meet the characteristic hazardous waste criteria, i.e. corrosive, ignitable, EP Toxic or reactive. The 1,1,1-TCE is listed, U226. The herbicide is unknown.

As such, the requirements for storage of recyclable materials as found in COMAR 10.51.02.06 B must be met. Site complaint SC-0-85-217 is being issued.

Due to the unique nature of this DPDO activity, this writer feels that a meeting is indicated in order to identify positions with regard to compliance with the hazardous waste regulations in the State of Maryland.

A copy of this report was left with Mr. Baughman.

19 November 1984

SUBJECT: Hazardous Waste Site Complaint

TO: ~~DCE~~ Glenn 19Nov84
Air Commander
DPDO
IN TURN

1. As a result of a site visit to the Maryland Air National Guard Base, Glenn L. Martin State Airport, 16 November 1984, by the State Department of Mental Health and Hygiene the Defense Property Disposal Office and the Maryland Air National Guard have been jointly issued a site complaint for storage of hazardous waste greater than 90 days without the required permit (see attached site complaint SC-0-85-185).

2. On 10 August 1984 the MdANG requested removal of this HW (see attached letter). On 19 October 1984 John Shafer accepted this material in place. As of 19 November 1984, subject HW is still on site.

3. **Request immediate removal of this material.** Please note the "show cure" date on the site complaint is 15 December 1984.

Art, as a result of the joint inspection of this facility by Butch Dye and myself on Friday, 11-16-84, it appears that if this facility can transfer (albeit on paper) all of its CHS to DPDO-Aberdeen while the material remains at the Air National Guard facility, then this site needs a TSD facility permit for DPDO.

11/19/84

Butch, what happens next as a result of your visit?

Report of Observations

Type of Inspection/Observations: CHS spill Date 11/16/84

Facility Name: Maryland Air National Guard

Remarks: 2701 Eastern Blvd.
Martin State Airport
Baltimore Md. 21220
687-6290 ext. 222

This writer and Harold L. Dye of Maryland Waste Management Administration met Capt. Scott Kerby and T-SGT. Chuck Smith on site to investigate reported spill of ≈20 gallons paint stripper.

At ≈1000 hrs. on 11.15.84 representatives of the base fire company noticed a leak in the underside seam of the heated bath used to strip/degrease aircraft equipment. Sorbent material was immediately used to arrest flow of spillage. Spilled material and remaining material in vat was placed in two 55 gal. drums and removed to secured drum storage area.

Spilled material was adequately cleaned up and material was confined to macadam parking area which remained impervious to spillage.

Site complaint #SC-0-85-185 issued for storage of hazardous wastes in excess of 90 days and generator storage requirements for containers.

Current and upcoming COMAR regulations discussed and copies will be delivered to this site.

ATTN. OF: DEE

16 November 1984

SUBJECT: Spill Incident Report

TO: Maryland State Department of Health and Mental Hygiene
ANGSC/DEV
J. Leonard Wood, Airport Manager
MDNG-DI (Lt Williams)

1. Place: Maryland Air National Guard
Martin State Airport
2701 Eastern Blvd.
Baltimore, MD 21220

2. Date: 15 NOV 84

3. Time: 1000 HRS

4. Amount and Type of Material: Approximately 20 gallons of paint remover, FSN 8010-01-040-1059 (see MSDS attached).

5. Circumstances: The MDANG operates a paint stripping facility to remove paint from wheels and other metal aircraft parts. The facility consists of a stripping vat enclosed in a shed. A seam on the bottom of the paint stripping vat had deteriorated with age and the seam split, leaking the paint stripper onto the pavement.

6. Containment, Removal and Cleanup Operations: (See attached spill incident log.) The spill was completely contained on the pavement and absorbed with SORBOL. The SORBOL spill residue was placed into 55 gallon drums. Personnel performing clean up operations were equipped with respirators, coveralls and rubber gloves. The spill residue will be diposed of as a hazardous waste through the Defense Property Disposal Office, Aberdeen Proving Ground, Maryland.

7. Follow Up Action: The paint stripping vat has been removed from service and will be cleaned of all sludges and residual paint remover and turned into DPDO. Two new stripping vats have been on hand since July, 1984 and the design of a facility to house them is 95% complete with construction planned for Spring, 1985.

8. If additional information is needed, please contact me at (301) 687-6270, ext 222.

SPILL INCIDENT LOG

1. 15 NOV 84 1000 — The Fire Department discovered paint remover (NSN 8010-01-040-1059, MFG: TURCO) leaking from the wheel stripping vat near bldg 1050. Members of the Fire Department immediately diked the puddle on the pavement with SORBOL and notified TSGT C. Smith, BioEnviromental Tech. Paint remover was contained on pavement (approx 6" asphalt). Estimated quantity of spill was 20 gallons.

2. 15 NOV 84 1000 — TSGT Smith notified the 175 CAM/FMS supervisors, SMS Swegon and SMS Pennington.

3. 15 NOV 84 1050 — TSGT Smith notified Civil Engineering.

4. 15 NOV 84 1016 — CE personnel dispatched as spill control team.

5. 15 NOV 84 1030 — CE spill team assembled on site, began gathering required equipment.

6. 15 NOV 84 1130 — Capt Kearby notified Debbie Ford, State Department of Health and Mental Hygiene.

7. 15 NOV 84 1132 — Capt Kearby notified MDNG-DI, 5th Regiment Armory (Lt Williams was not in).

8. 15 NOV 84 1219 — Clean up operations complete. All SORBOL spill residue packed into 55 gallon drums.

9. 15 NOV 84 1225 — LtCol Shero notified Command Post/Ops of incident and status.

10. 15 NOV 84 1450 — Capt Kearby received call from Michael Griffen, State Department of Mental Health and Hygiene, asking for further details about the spill incident.

* SECRETARY OF HEALTH AND MENTAL HYGIENE

* OFFICE OF ENVIRONMENTAL PROGRAMS
201 West Preston Street
Baltimore, Maryland 21201

C-O-82-066

COMPLAINT AND ORDER

Whereas, the State of Maryland, Department of Health and Mental Hygiene, Office of Environmental Programs, pursuant to the powers, duties and responsibilities vested in and imposed upon the Secretary of Health and Mental Hygiene, by the provisions of Article 43, Section 1F, 388, 391 and 394, Annotated Code of Maryland, has conducted an inspection at the Glenn L. Martin State Airport located in Middle River, Baltimore County, and

Whereas, the Office of Environmental Programs pursuant to its inspection has determined that the State Aviation Administration is disposing of solid waste, in an open dump, consisting of demolition debris, wood, brush, trash and construction debris at the above-mentioned property, and

Whereas, the State Aviation Administration has failed to obtain a valid Refuse Disposal Permit from the Office of Environmental Programs for said disposal operation, and

Whereas, the above-cited conditions, caused by the State Aviation Administration constitute a violation of Article 43, Section 394(a) and COMAR 10.17.11.03(B).

Therefore, it is this _____day of _____, 1981, ORDERED by the Assistant Secretary for Environmental Programs

that the State Aviation Administration shall:

1) Cease and desist further refuse disposal activity at the aforementioned site unless authorized by a valid Refuse Disposal Permit;

2) By _____, 1981, remove and properly dispose of all refuse accumulated at the aforementioned site, to a permitted sanitary landfill.

This Order may be appealed in accordance with the Administrative Procedure Act, Article 41, Section 244, et seq., Annotated Code of Maryland, by filing within 10 days of receipt of this Order, a Notice of Intent to Appeal and a Request for Hearing, if desired, with the Chief Hearing Officer, William O. Jensen, Jr., 201 West Preston Street, Baltimore, Maryland 21201. The notice of appeal shall contain any ground upon which you contend that the Order is unlawful, unreasonable or unnecessary for protection of the public health or welfare.

_____
DATED

William M. Eichbaum
Assistant Secretary for
Environmental Programs

Approved as to form and legal sufficiency this 2nd day of October, 1981.

Mr. Andy Hagan
Northrup Grumman Support Services Group
701 Wilson Point Road, Box 4
Baltimore, MD 21220

Dear Mr. Hagan:

Enclosed is Maryland General Scrap Tire Collection Facility License No. **2010-RGC-08019**, which authorizes the accumulation of **no more than fifty (50)** scrap tires at any one time at 701 Wilson Point Road, Box 4, in Baltimore, Baltimore County, as specified in your application of July 13, 2010.

To operate this facility, and to avoid a violation of this license, please have all scrap tire haulers who remove scrap tires from this facility (current or planned) show you their current Maryland license prior to providing services. Also, you should verify that the site to which your scrap tires are being taken is a facility licensed or approved by the Maryland Department of the Environment (the "Department") by obtaining their license number. In addition, if you are currently hauling your own scrap tires or intend to do so in the future, you must also have a Scrap Tire Hauler License.

Please note that this license is subject to the enclosed terms and conditions. This license may be appealed by filing a written request for a hearing within thirty (30) days of receipt of this license. The request should be addressed to Mr. Horacio Tablada, Director, Land Management Administration, at the Department's address. You will subsequently be contacted regarding a hearing date. All license hearings will be conducted in accordance with the Administrative Procedure Act. If no appeal is received within the specified time period, this will constitute acceptance of the terms and conditions of this license.

For further information, please contact Ms. Linda Gustafson, Scrap Tire Unit at (410) 537-3143.

Sincerely,

Hilary D. Miller

General Scrap Tire Collection Facility License
Number: 2010-RGC-08019

ISSUE DATE: October 22, 2010
EXPIRATION DATE: No Expiration Date

LICENSEE: Northrup Grumman Support Services Group

LOCATION: 701 Wilson Point Road, Box 4, Baltimore, MD 21220

AUTHORIZING: The accumulation of **no more than fifty (50)** scrap tires at any one time, and as specified in your application of July 13, 2010.

This license is issued pursuant to the provisions of Title 9 of the Environment Article, Annotated Code of Maryland, and regulations promulgated thereunder, and are subject to the attached terms and conditions, and compliance with all applicable laws and regulations.

Horacio Tablada, Director
Land Management Administration

LICENSE CONDITIONS:

1. The licensee may only accumulate **no more than fifty (50)** scrap tires at any one time at this facility, as specified in this facility's General Scrap Tire Collection Facility License Application. If there are any discrepancies between this license and the application, the terms and conditions of this license will take precedence.

2. Only scrap tire haulers licensed by Maryland Department of the Environment (the "Department") shall be used to transfer scrap tires.

3. Scrap tires shall only be transferred to the primary or secondary scrap tire collection facilities, scrap tire recycling facilities, or other facilities licensed or approved by the Department.

4. The licensee shall not operate this facility in a manner likely to:

   a. Create a nuisance;

   b. Be conducive to insect and rodent infestation;

   c. Cause a discharge of any constituents derived from scrap tires into the air unless otherwise permitted by the Department;

   d. Cause a discharge of any constituents derived from scrap tires into waters of this State unless otherwise permitted by the Department;

   e. Impair the quality of the environment; or

   f. Create other hazards to the public health, safety, or comfort as may be determined by the Department.

5. The following fire protection standards shall be followed:

   a. Combustibles shall not be stored in the area where scrap tires are being collected; and

   b. Potential ignition sources such as cutting, welding, and heating devices, open fires, etc., shall be prohibited in the scrap tire collection area.

6. The licensee shall inform the Department in writing within 30 days following a business name change, change in ownership or form of business organization, or any other change that affects the license.

7. The licensee shall maintain, for a period of three (3) years, records of all scrap tires entering or exiting this facility. The records shall include, at a minimum, the following information:

   a. The total type and quantity of scrap tires, by number or weight, that were received or generated at this facility;

   b. The total type and quantity of scrap tires, by number or weight, that were transferred from this facility;

c. The total type and quantity of scrap tires, by number or weight, that remained at this facility;

d. The name and identification number of each hauler transferring scrap tires from this facility. The type and quantity of scrap tires must be identified (by number or weight) for each transaction, including tires separated and removed for retreading. The destination of the scrap tires transported by each hauler must also be maintained; and

e. The semi-annual reports specified in General Condition 8.

8. The licensee shall submit to the Department a semi-annual report containing the information described in General Condition 7. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period.

9. This licensee shall not be transferred to new owners unless the following conditions are met:

a. A written request for the transfer is submitted to the Department. The request shall indicate the reason for the requested transfer and be signed by the individuals holding and seeking the license;

b. The new owner shall complete a General Scrap Tire Collection Facility License Application. The completed application shall be submitted with the request; and

c. The Department determines that the proposed transfer of the license would not affect present or future compliance with State or federal laws and regulations.

10. If the licensee discovers through any means, including notification by the Department, that noncompliance with a condition of the license has occurred, the licensee shall immediately take all necessary steps to eliminate the condition of noncompliance and to minimize the adverse impact on public health, safety, welfare, or the environment

11. If the licensee discovers that a noncompliance with a condition of the license has affected the public health, safety, welfare, or the environment, the licensee shall immediately notify the Department at (410) 537-3315.

12. If a person who does not possess a Scrap Tire Hauler License, and who is not exempted under Code of Maryland Regulations (COMAR) 26.04.08.04A(2), attempts to deposit scrap tires at the facility covered by this license, the licensee shall refuse to accept the scrap tires offered by the said person, and shall notify the Department within one week of occurrence, the person's name, license plate number and state of issuance for the vehicle used to haul scrap tires. A person is exempted under COMAR 26.04.08.04A(2) if the person transports not more than five (5) scrap tires annually.

13. This license may be suspended or revoked upon a final, unreviewable determination that the licensee lacks, or is in violation of, any federal, State or local approval necessary to conduct the activity authorized by this license.

Mr. Dan Franco
Northrop Grumman Systems Corporation
701 Wilson Point Road, Box 4
Baltimore MD 21220

Dear Mr. Franco:

Enclosed is the Maryland General Scrap Tire Collection Facility License No. **2003-RGC-05734**, which authorizes the accumulation of **no more than fifty (50)** scrap tires at any one time at 701 Wilson Point Road, Martin State Airport, Hangar 5 in Baltimore County, as specified in your application of September 26, 2003.

To operate this facility, and to avoid violation of this license, please have all scrap tire haulers who remove scrap tires from this facility (current or planned) show you their current Maryland license prior to providing services. Also, you should verify that the site to which your scrap tires are being taken is a facility licensed or approved by the Maryland Department of the Environment (the "Department") by obtaining their license number. In addition, if you are currently hauling your own scrap tires or intend to do so in the future, you must also have a Scrap Tire Hauler License.

Please note that this license is subject to the enclosed terms and conditions. This license may be appealed by filing a written request for a hearing within thirty (30) days of receipt of this license. The request should be addressed to Mr. Jonas A. Jacobson, Director, Waste Management Administration, at the Department's address. You will subsequently be contacted regarding a hearing date. All license hearings will be conducted in accordance with the Administrative Procedure Act. If no appeal is received within the specified time period, this will constitute acceptance of the terms and conditions of this license.

General Scrap Tire Collection Facility License

No. 2003-RGC-05734

ISSUE DATE: October 27, 2003 ***(NO EXPIRATION DATE)***

Issued to: Northrop Grumman Systems Corporation

Authorizing: the accumulation of **no more than fifty (50)** scrap tires at any one time, and as specified in your application of September 26, 2003

At: 701 Wilson Point Road, Martin State Airport, Hangar 5, Baltimore County, MD 21220.

This license is issued pursuant to the provisions of Title 9 of the Environment Article, Annotated Code of Maryland, and regulations promulgated thereunder, and is subject to the attached terms and conditions, and compliance with all applicable laws and regulations

Edward M. Dexter, Administrator
Solid Waste Program

Jonas A. Jacobson, Director
Waste Management Administration

LICENSE CONDITIONS:

1. The licensee may only accumulate **no more than fifty (50)** scrap tires at any one time at this facility, as specified in this facility's General Scrap Tire Collection Facility License Application. If there are any discrepancies between this license and the application, the terms and conditions of this license will take precedence.

2. Only scrap tire haulers licensed by Maryland Department of the Environment (the "Department") shall be used to transfer scrap tires.

3. The licensee shall comply with all applicable State, local government, and federal laws and regulations.

4. Scrap tires shall only be transferred to the primary or secondary scrap tire collection facilities, scrap tire recycling facilities, or other facilities licensed or approved by the Department.

5. If the licensee discovers through any means, including notification by the Department, that noncompliance with a condition of the license has occurred, the licensee shall immediately take all necessary steps to eliminate the condition of noncompliance and to minimize the adverse impact on public health, safety, welfare, or the environment.

6. If the licensee discovers that a noncompliance with a condition of the license has affected the public health, safety, welfare, or the environment, the licensee shall immediately notify the Department at (410) 537-3315.

7. The licensee shall inform the Department in writing within 30 days following a business name change, change in ownership or form of business organization, or any other change that affects the license.

8. If a person who does not possess a Scrap Tire Hauler License, and who is not exempted under Code of Maryland Regulations (COMAR) 26.04.08.04A(2), attempts to deposit scrap tires at the facility covered by this license, the licensee shall refuse to accept the scrap tires offered by the said person, and shall notify the Department within one week of occurrence, the person's name, license plate number and state of issuance for the vehicle used to haul scrap tires. A person is exempted under COMAR 26.04.08.04A(2) if the person transports not more than five (5) scrap tires annually.

9. The licensee shall not operate this facility in a manner likely to:

   a. create a nuisance;

   b. be conducive to insect and rodent infestation;

   c. cause a discharge of any constituents derived from scrap tires into the air unless otherwise permitted by the Department;

   d. cause a discharge of any constituents derived from scrap tires into waters of this State unless otherwise permitted by the Department;

   e. impair the quality of the environment; or

   f. create other hazards to the public health, safety, or comfort as may be determined by the Department.

10. The licensee shall maintain, for a period of three (3) years, records of all scrap tires entering or exiting this facility. The records shall include, at a minimum, the following information:

    a. the total type and quantity of scrap tires, by number or weight, that were received or generated at this facility;

    b. the total type and quantity of scrap tires, by number or weight, that were transferred from this facility;

    c. the total type and quantity of scrap tires, by number or weight, that remained at this facility;

    d. the name and identification number of each hauler transferring scrap tires from this facility. The type and quantity of scrap tires must be identified (by number or weight) for each transaction, including tires separated and removed for retreading. The destination of the scrap tires transported by each hauler must also be maintained; and

    e. the semi-annual reports specified in General Condition 11.

11. The licensee shall submit to the Department a semi-annual report containing the information described in General Condition 10. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period. The reports shall be submitted on copies of the form attached to this license or be in this format and contain the information described in General Condition 10.

12. This license shall not be transferred to new owners unless the following conditions are met:

    a. a written request for the transfer is submitted to the Department. The request shall indicate the reason for the requested transfer and be signed by the individuals holding and seeking the license;

    b. the new owner shall complete a General Scrap Tire Collection Facility License Application. The completed application shall be submitted with the request; and

    c. the Department determines that the proposed transfer of the license would not affect present or future compliance with State or federal laws and regulations.

13. The following fire protection standards shall be followed:

    a. combustibles shall not be stored in the area where scrap tires are being collected; and

    b. potential ignition sources such as cutting, welding, and heating devices, open fires, etc., shall be prohibited in the scrap tire collection area.

14. Nothing in this license authorizes the establishment or the operation of this facility when in violation of any local, State, or federal laws and regulations.

INSTRUCTIONS FOR COMPLETING REPORT

SECTION 1:

1. Check the box indicating the source of the scrap tires collected at your facility.
2. If you checked "Your Facility" or "Customers", you do not need to complete SECTION 3.
3. If you checked "Other", you must complete SECTION 3.
4. Proceed to SECTION 2.

SECTION 2:

1. List the name and license number of the scrap tire hauler who removed scrap tires from your facility.
2. List the type of scrap tires removed.
3. List the place of where the hauler took the scrap tires. ***This is very important!*** *Be sure the hauler tells you where your scrap tires are being delivered and the Maryland scrap tire license/approval number of that destination.* If the scrap tires are being delivered to an out-of-state facility, list the name and address of this facility.
4. List by quantity or tons how many scrap tires were removed from your facility.
5. If no scrap tires were hauled from your facility, write **"None"** or **"0"** in the TOTAL Scrap Tire Quantity box.

SECTION 3:

1. List where the scrap tires came from:
   - A. If from haulers, please list the haulers' names and their Maryland Scrap Tire Hauler License numbers in the appropriate boxes.
   - B. If from individuals hauling less than 5 scrap tires, please write **"Private"** in the **Source** column; and **"None"** in the **License Number** boxes. If you receive scrap tires from many individuals, group them as a single entry.
   - C. If the scrap tires are generated from your business, write **"Company"** in the **Source** column, and your license number in the **License Number** column.
2. List the type of scrap tires (i.e. passenger, truck) collected at your facility.
3. List by quantity or tons how many scrap tires were collected at your facility.
4. If no scrap tires were collected during this period, write **"None"** or **"0"** in the TOTAL Scrap Tire Quantity box.

SIGNATURE:

You must sign your name, print your name, and date the report at the bottom of the front page of this report.

Hi Valerie,

Thank you for your help over the phone.

I would like to cancel the General Scrap Tire Collection facility license No 2009-RGC-07711 as we only have one collection point for both hangars. Please amend 2010-RGC-08019 License to read hangar 2 as this is where we store our tires.

I have attached both tire collection forms. If there is any more information you need from me or I if I need to correct the forms please let me know and I will do so.

Again thank you for your help

Valerie Norman - name change to Northrop Grumman licenses

From: Abigail W. Pascual
To: Valerie Norman
Date: 7/20/2012 1:11 PM
Subject: name change to Northrop Grumman licenses

Hi Val,

Linda Bellmyer (410-238-5601) from Northrop Grumman called today. She said the contact names had changed for 2009-RGC-07711 and 2010-RGC-08019 to "Douglas Klevisha". I made the changes in Tyrus, but not in Tempo. Please make sure Tony makes those changes.

She also asked if they needed both licenses since they were both at the same facility. They are issued to 2 different hangars. She also said the one for "Middle River Integration Center" (2010-RGC-08019) needed a name change because it's not called that anymore. I told her I'd have you call her to go over whether to cancel one license or keep both and to do the name change to the facility name (I think the owner name is fine).

Please give have Tony make the changes and please call Ms. Bellmyer regarding the other issues. Thanks! -- Abby

Hi Theresa,
Please send the letter to my attention at: Maryland Department of the Environment, Technical Services and Operations Program, 1800 Washington Boulevard, Suite 610, Baltimore, MD 21230. When we get the letter, we will pull the file and make the changes. If we have a problem, we will contact you and work with you to resolve the issue. Thank you for contacting me about this issue - I appreciate your cooperation and your efforts to keep MDE up to date on the status of your facility. --Abby

Hi Abigail:

Northrop Grumman currently has a Maryland General Scrap Tire Collection Facility License No. 2003-RGC-05721. When we got this permit we were accumulating scrap tires in a dumpster located behind our East Building. We have moved the dumpster to a location next to our West Building. The dumpster is still located at the same physical address 7323 Aviation Boulevard, Linthicum, Anne Arundel County, MD 21090. I have prepared a letter to send to MDE regarding the change in location and I want to make sure I send it to the correct contact and address. Can you please

let me know who and where I need to send this letter.

Any help that you can provide will be greatly appreciated.

Thanks and have a great day-

Theresa B. Myers

WAS Enforcement Penalty Change Authorization Form

This form should be filled out when a penalty amount is decreased or increased from the original amount.

Name of case: **Northrop Grumman California Systems (2003-RGC-05734)**

Case number: **NOV-WAS-09-ST-180**

Program: **Scrap Tires**
Background: (_____)

The assessed penalty amount of $**500** was reduced / increased to $**0** for the following reason.

(one must be X'd)

☐ 1. New factual information obtained after penalty action taken;

☐ 2. New legal information obtained after penalty action taken;

☐ 3. Projected costs of litigation (filing fees, staff time, expert assistance, unavailability of staff to address higher priority issues) exceeds initial penalty amount or deterrence value of penalty sought;

☒ 4. Other reason that does not fall under category 1, 2, or 3, with a brief summary of the reason for the reduction (e.g. SEPs).
Explanation: **Licensee stated that they had sent the report via certified mail to MDE in January 2009, but MDE has no record of receiving it until May 13, 2009. MDE's records indicate that the July-December 2008 report was received in January 2009, instead of the missing July-December 2007 report. MDE sent Reminder Notice, Final Notice, then NOV. Licensee has since instituted a monthly tracking system to prevent submitting late reports in the future.**

If financial hardship is a principle base of penalty reduction, have tax returns been provided? Y ☐ N ☐

Program Approved By: _____ AG Approved By: _____
(Required if reason 3 solely selected and/or assessed penalty was over $5,000)

MEMORANDUM

Maryland Department of the Environment
Waste Management Administration
Project Management Section

To: Horacio Tablada

Thru: Ed Dexter

From: Abby Pascual

Date: June 3, 2009

Subject: Request to cancel $500 NOV penalty

- We issued a $500 NOV on May 8, 2009 to Northrop Grumman California Systems for failing to submit the July-December 2007 semi-annual scrap tire report for scrap tire general collection facility license 2003-RGC-05734.
- We sent a Reminder Notice by regular mail on August 28, 2008.
- We sent a Final Notice by regular mail on December 24, 2008.
- They submitted the missing semi-annual report on May 13, 2009.

Northrop Grumman sent us a letter requesting that we waive the $500 NOV penalty. They claim to have sent the report via certified mail to MDE in January 2009, but MDE has no record of receiving the report until May 13, 2009. Our records indicate that they submitted the July-December 2008 report in January 2009 instead of the missing July-December 2007 report. I have attached the letter to this memo for your review and decision on waiver of the penalty.

Please call me at x3334 if you have any questions. Thank you.

Abby

Solid Waste Program
1800 Washington Boulevard, Suite 605
Baltimore Md 21230-1719

RE: NOV-WAS-09-ST-180

Dear Mr. Tablada:

On May 8th 2009, the Maryland Department of Environment (MDE) issued a Notice of Violation (NOV) to Northrop Grumman Systems Corporation's facility (Northrop Grumman) at 701 Wilson Point Road in Baltimore, Maryland, advising the company that it was in violation of its Scrap Tire License No. 2003RGC05734 and the Code of Maryland Regulations (COMAR) 26.04.08 regarding failure to submit a Semi-Annual Scrap Tire Collection Facility Report for the reporting period of July 1st to December 31st 2007.

Northrop Grumman is disputing this NOV and requests that the NOV be rescinded since the requested report was already submitted to MDE on January 27, 2009, via certified mail. The report was originally signed on January 25, 2008, but was not submitted until January 27, 2009, due to an oversight. To correct this problem and to avoid any future issues, we are now using a monthly tracking system.

In addition, upon receipt of the NOV I contacted MDE and spoke to Bernice Henson about the fact that the report had already been submitted to MDE. Bernice Henson requested that we send the NOV, another copy of the missing scrap tire report and the certified mail receipt for that report to the attention of Valerie Norman for her review. To this date, we have not received a response back from Ms. Norman.

Please let me know if you need additional information related to this matter and our request that the NOV be rescinded. I can be reached at (410) 391-1445, Extension #3445, if you have any questions.

Thank you for your attention to this matter.

Semi-Annual Scrap Tire Collection Facility Report

Please Note: It is very important that you submit a semi-annual report even if you did not collect, generate or haul any scrap tires during the reporting period. Please print.

REPORTING PERIOD: July 1 – December 31, 2007
DUE ON OR BEFORE February 1, 2008

Licensee's Name: Northrop Grumman *Scrap Tire Collection Facility License No.:* 2003-RGC-05734

Licensee's Mailing Address: 701 Wilson Point Rd Box 4

City: Baltimore *County:* Baltimore *State:* MD *Zip:* 21220

Facility's Name: Martin State Airport *Facility's Contact Person Name:* Steve Reinker

Facility's Location Address: 701 Wilson Point Rd. Hangar 5

City: Baltimore *County:* Baltimore *State:* MD *Zip:* 21220

Telephone No.: (410) 391 - 1445 *Facsimile No.:* (410) 391 - 6695

INSTRUCTIONS FOR COMPLETING TABLES ON REVERSE SIDE

TABLE 1:

1. List where the scrap tires came from:
   A. If from haulers, please list the hauler's names and their Maryland Scrap Tire Hauler License Numbers in the appropriate boxes.
   B. If from individuals hauling less than 5 scrap tires, please write **Private** in the **Source** column; and **None** in the **License Number** boxes. If you receive scrap tires from many individuals, group them as a single entry.
   C. If the scrap tires are generated from your business, write **Company** in the **Source** column, and your license number in the **License Number** column.
2. List the type of scrap tires (i.e. passenger, truck) collected at your facility. This can be reported as quantity of scrap tires or tonnage.
3. If no scrap tires were received during this period, write **None** received across the table.

TABLE 2:

1. List the name and license number of the scrap tire hauler who removed scrap tires from your facility.
2. List the type of scrap tires removed by quantity or tons.
3. List the place of where the hauler took the scrap tires. ***This is very important!*** *Be sure the hauler tells you where your scrap tires are being delivered and the Maryland scrap tire license/approval number of that destination.* If the scrap tires are being delivered to an out-of-state facility, list the name and address of this facility.
4. If no scrap tires were hauled from your facility, write **No** scrap tires hauled.

By signing this report, I the license holder or duly authorized representative, do solemnly affirm under the penalties of perjury that the contents of this report are true to the best of my knowledge, information, and belief. I hereby authorize the representative of the Department to have access to the site for inspection and to record information relating to this license at any reasonable time.

Certified Mail Provides:

- A mailing receipt
- A unique identifier for your mailpiece
- A record of delivery kept by the Postal Service for two years

Important Reminders:

- Certified Mail may ONLY be combined with First-Class Mail® or Priority Mail®.
- Certified Mail is *not* available for any class of international mail.
- NO INSURANCE COVERAGE IS PROVIDED with Certified Mail. For valuables, please consider Insured or Registered Mail.
- For an additional fee, a *Return Receipt* may be requested to provide proof of delivery. To obtain Return Receipt service, please complete and attach a Return Receipt (PS Form 3811) to the article and add applicable postage to cover the fee. Endorse mailpiece "Return Receipt Requested". To receive a fee waiver for a duplicate return receipt, a USPS® postmark on your Certified Mail receipt is required.
- For an additional fee, delivery may be restricted to the addressee or addressee's authorized agent. Advise the clerk or mark the mailpiece with the endorsement *"Restricted Delivery"*.
- If a postmark on the Certified Mail receipt is desired, please present the article at the post office for postmarking. If a postmark on the Certified Mail receipt is not needed, detach and affix label with postage and mail.

IMPORTANT: Save this receipt and present it when making an inquiry.

PS Form 3800, August 2006 *(Reverse)* PSN 7530-02-000-9047

SENDER: COMPLETE THIS SECTION

- Complete items 1, 2, and 3. Also complete item 4 if Restricted Delivery is desired.
- Print your name and address on the reverse so that we can return the card to you.
- Attach this card to the back of the mailpiece, or on the front if space permits.

NORTHROP GRUMMAN SYSTEMS CORP
C/O STEVE REINKER
701 WILSON POINT RD
BALTIMORE MD 21220

RE: **NOV-WAS-09-ST-180**

Dear Licensee:

A review of the Waste Management Administration's records indicates that NORTHROP GRUMMAN SYSTEMS CORP has failed to submit a semi-annual report summarizing the scrap tire transactions for the time period from **July 1, to December 31, 2007.** This report is required by your scrap tire license No. **2003RGC05734.** Failure to submit the semi-annual report is a violation of your license and the Code of Maryland Regulations (COMAR) 26.04.08 regarding scrap tire management.

Maryland's system of regulating scrap tires was designed to ensure that scrap tires are being recycled to the maximum extent possible, and to prevent their open dumping. With this goal in mind, the regulations require that scrap tires be hauled only by licensed haulers, to licensed or approved collection facilities. The record keeping and reporting requirements for haulers and collection facilities are an essential part of the system. Maintaining written records of legitimate scrap tire transactions reduces the chances that scrap tires will be illegally dumped. Failure to maintain the required records and submit the semi-annual reports undermines this important part of the regulatory system.

This Administration sent you a reminder notice with a report form enclosed, stating that the semi-annual report must be filled out and returned. More recently, the Administration sent you a final notice that your semi-annual report was overdue, and gave you fifteen (15) additional days to submit the report. To date, we have not received it. This Notice of Violation is your third written notice that the semi-annual report must be submitted.

p.2
May 14 09 08:44a

RECEIVED
MAY 18 2009
COMPLIANCE AND PROJECT
MANAGEMENT DIVISION

The Administration is willing to settle this matter in return for a settlement payment of $500.00 and submittal of the missing semi-annual report. If you choose to settle this matter, please send a check for $500.00 payable to the Maryland Clean Water Fund within the next twenty (20) days to:

Maryland Clean Water Fund
Maryland Department of the Environment
P.O. Box 1417
Baltimore, MD 21203-1417

State law allows the Maryland Department of the Environment to seek civil penalties in the amount of $10,000 per violation per day for violations of scrap tire regulations or license requirements. The missing semi-annual report should be sent to:

Maryland Department of the Environment
Solid Waste Program
1800 Washington Boulevard, Suite 605
Baltimore MD 21230-1719

To ensure that your payment is properly credited, please write the reference NOV number on your check, and return a copy of this letter with your payment. If you elect to settle this matter, you will not be admitting any of the allegations stated herein.

If you fail to settle by submitting the required report and the above payment, this matter may be referred to the Office of the Attorney General for further enforcement action. Such enforcement action may include a penalty, an order, and/or the suspension or revocation of your scrap tire license. Any subsequent violations would subject you to additional enforcement action. Therefore, you are advised to maintain compliance with applicable Maryland regulations and licenses. Please direct any questions or comments in this matter to Ms. Abigail Pascual, Head, Project Management Section at (410) 537-3315.

Sincerely,

Horacio Tablada, Director
Waste Management Administration

A. APPLICANT INFORMATION

1. **Applicant's Status:** ☐ Federal ☐ State ☐ Local Government (County/City) ☐ Individual ☐ Partnership ☒ Corporation ☐ Other: _____

2. **Applicant's Legal Name:** Northrop Grumman Systems Corporation
   (This is the name of the business/entity to which the license will be issued. It need not be the same as the facility name.)

3. **Registration with the Maryland Department of Assessments and Taxation (SDAT) ID Number:** 05776586
   (Please note that a business/entity must be registered to do business in Maryland before a license can be issued. The business/entity's information provided in this application must match the information in the SDAT register.)

4. **Applicant's Mailing Address:** 701 Wilson Point Road; Box 4

   Baltimore (City) | Baltimore (County) | MD (State) | 21220 (Zip Code)

5. **Applicant's Telephone No.:** (410) 391 - 1445 **Facsimile No.:** (410) 391 - 6695

6. **Emergency Contact Name and Title:** Steve Reinker; Logistics Analyst
   (This person must be reachable at the emergency number given during non-working hours.)

7. **Emergency Telephone Number:** (410) 420 - 9177

B. FACILITY INFORMATION

1. **Facility Name:** Northrop Grumman - California Microwave Systems

2. **Facility's Location Address:** 701 Wilson Point Road; Martin State Airport; Hangar 5

   Baltimore (City) | Baltimore (County) | MD (State) | 21220 (Zip Code)

3. **Facility Telephone Number:** (410) 391 - 1445 **Facsimile No.:** (410) 391 - 6695

4. **Property Owner's Name:** Maryland Aviation Administration

5. **Property Owner's Address:** 701 Wilson Point Road; Box 1

   Baltimore (City) | Baltimore (County) | MD (State) | 21220 (Zip Code)

6. Property Owner's Telephone Number: (410) 682 - 8800

7. Briefly describe the manner in which scrap tires are being accumulated at your facility.

Airplane tire change out. The tires are stored in a hangar equipped with sprinklers.

8. Average quantity of scrap tires projected to be on site at this facility at any given time:

Please check one: ☐ 1 to 10 ☐ 11 to 20 ☒ 21 to 30 ☐ 31 to 40 ☐ 41 to 50

9. Type and maximum quantity of scrap tires that can be accepted at this facility on a daily basis:

Please specify the quantity: ____ Passengers Cars/Light Trucks ____ Trucks ✓ Others

10. Provide the following information about the scrap tire hauler who will be picking up scrap tires from this facility. If you haul your own tires, please provide your information:

i. Scrap Tire Hauler Name: Waste - Tron of Maryland

ii. Scrap Tire Hauler License No.: 2000 - RTH -04670 Expiration Date: 06 / 21 / 2005

11. Provide the following information about the scrap tire facility where your scrap tires will be delivered:

i. Scrap Tire Facility Name: Waste - Tron of Maryland

ii. Scrap Tire Collection Facility License No.: 2000 - ~~RTH -04670~~ RGC-04669 Expiration Date: 06 / 21 / 2005

C. COMPLIANCE WITH THE WORKER'S COMPENSATION ACT

Proof of workers' compensation coverage is required under Section 1-202 of the Environment Article, Annotated Code of Maryland. Please complete the following:

1. Are you a holder of a Certificate of Compliance issued by the Maryland Workers Compensation Commission?
☐ YES ☒ NO
If yes, please submit a copy of this Certificate with this application.

2. If no, please submit the number of a workers compensation insurance policy or binder.

Workers Compensation Insurance Policy Number: RMWC 3323595
Workers Compensation Insurance Binder Number: _____

D. SIGNATURES

FINAL NOTICE

December 24, 2008

Dear Scrap Tire Licensee:

The Solid Waste Program of the Maryland Department of the Environment (the "Department") **has not received a semi-annual report** for your scrap tire license(s) for the period of **July 1 – December 31, 2007** due on **February 1, 2008**. Your license(s) information is provided on the label in the designated block directly to the right. Please complete the enclosed semi-annual report form for the period specified and submit it to the Department.

NORTHROP GRUMMAN SYSTEMS CORP
C/O STEVE REINKER
701 WILSON POINT RD
BALTIMORE MD 21220
2003RGC05734 325

Please note that Scrap Tire Regulations require licensees' to maintain scrap tire activity records and submit reports to the Department by February 1 and August 1 of each year. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period.

Please be advised, you are currently in violation of your scrap tire license(s). By this notice, the Department is providing you a **last chance** to submit these reports and to be in compliance with this license condition. Failure to submit this information within 15 days of receipt of this notice will result in the Department evaluating further enforcement options to bring your facility into compliance. If you have already sent the report, please *re-submit* a copy of the report along with this letter to the Department so we can clear your record.

Thank you for your cooperation. If you need assistance in completing this form please call Ms. Valerie Norman, Administrative Specialist, at (410) 537-3315.

Sincerely,

Abigail W. Pascual, Head
Project Management Section

REMINDER NOTICE

August 28, 2008

Dear Scrap Tire Licensee:

The Solid Waste Program of the Maryland Department of the Environment (the "Department") **has not received a semi-annual report** for your scrap tire license(s) for the period of **July 1 – December 31, 2007** due on **February 1, 2008**. Your license(s) number(s) are provided on the label in the designated block directly to the right. Please complete the enclosed semi-annual report form for the period specified and submit it to the Department.

NORTHROP GRUMMAN SYSTEMS CORP
C/O STEVE REINKER
701 WILSON POINT RD
BALTIMORE MD 21220
2003RGC05734 325

Please note that Scrap Tire Regulations require licensees' to maintain scrap tire activity records and submit reports to the Department by February 1 and August 1 of each year. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period.

Please be advised, you are currently in violation of your scrap tire license(s). By this notice, the Department is providing you an opportunity to submit this report and come into compliance with this license condition. Failure to submit this information within 15 days of receipt of this notice will result in the Department evaluating further enforcement options to bring your facility into compliance. If you have already submitted the report and this letter was sent to you by mistake, please send a copy of the report along with this letter to the Department so we can clear your record.

Thank you for your cooperation. If you need assistance in completing this form please call Ms. Valerie Norman, Administrative Specialist, at (410) 537-3315.

Sincerely,,

Abigail W. Pascual, Head
Project Management Section

Semi-Annual Scrap Tire Collection Facility Report

*Please Note: It is very important that you submit a semi-annual report even if you did not collect, generate or haul any scrap tires during the reporting period. Please print.

REPORTING PERIOD: January 1 – June 30, 2008
DUE ON OR BEFORE August 1, 2008

Licensee's Name: Northrop Grumman Scrap Tire Collection Facility License No.: 2003-RGC-05734
Licensee's Mailing Address: 701 Wilson Point Rd, Box 4
City: Baltimore County: Baltimore State: MD Zip: 21220
Facility's Name: Martin State Airport Facility's Contact Person Name: Steve Reinker
Facility's Location Address: 701 Wilson Point Rd., Hangar 5
City: Baltimore County: Baltimore State: MD Zip: 21220
Telephone No.: (410) 391 - 1445 Facsimile No.: (410) 391 - 6695

INSTRUCTIONS FOR COMPLETING TABLES ON REVERSE SIDE

TABLE 1:

1. List where the scrap tires came from:
   A. If from haulers, please list the hauler's names and their Maryland Scrap Tire Hauler License Numbers in the appropriate boxes.
   B. If from individuals hauling less than 5 scrap tires, please write **Private** in the **Source** column; and **None** in the **License Number** boxes. If you receive scrap tires from many individuals, group them as a single entry.
   C. If the scrap tires are generated from your business, write **Company** in the **Source** column, and your license number in the **License Number** column.
2. List the type of scrap tires (i.e. passenger, truck) collected at your facility. This can be reported as quantity of scrap tires or tonnage.
3. If no scrap tires were received during this period, write **None** received across the table.

TABLE 2:

1. List the name and license number of the scrap tire hauler who removed scrap tires from your facility.
2. List the type of scrap tires removed by quantity or tons.
3. List the place of where the hauler took the scrap tires. ***This is very important!*** *Be sure the hauler tells you where your scrap tires are being delivered and the Maryland scrap tire license/approval number of that destination.* If the scrap tires are being delivered to an out-of-state facility, list the name and address of this facility.
4. If no scrap tires were hauled from your facility, write **No** scrap tires hauled.

By signing this report, I the license holder or duly authorized representative, do solemnly affirm under the penalties of perjury that the contents of this report are true to the best of my knowledge, information, and belief. I hereby authorize the representative of the Department to have access to the site for inspection and to record information relating to this license at any reasonable time.

SEMI-ANNUAL SCRAP TIRE COLLECTION FACILITY REPORT

Please print

*** Please Note: It is very important that you submit a semi-annual report even if you did not collect, generate or haul any scrap tires during the reporting period.**

REPORTING PERIOD — January 1 – June 30, 2004
DUE ON OR BEFORE August 1, 2004

YOUR BUSINESS'S SCRAP TIRE COLLECTION FACILITY LICENSE NUMBER: 2003-RGC-05734

FACILITY NAME: NG-CMS-MSA FACILITY OWNER: Maryland Aviation Admin.

FACILITY MAILING ADDRESS: 701 Wilson Point Rd, Martin State Airport, Hangar 5, Baltimore, MD 21220

FACILITY LOCATION: Same

TELEPHONE: 410-391-1445

INSTRUCTIONS FOR COMPLETING TABLES ON REVERSE SIDE

TABLE 1:

1. List where the tires came from.
   - A. If from Hauler, list the haulers name and MDE License number in the appropriate boxes.
   - B. If from individuals hauling less than 5 tire/year, write a Private in the Source column; and None in the License Number boxes. If you receive tires from many individuals, group them as a single entry.
   - C. If the tires are generated from your business, write Company in the Source column, and your license number in the License Number column.
2. List the type of tires (i.e. passenger, truck) collected at your facility. This can be reported as quantity of tires or tonnage.
3. If no tires were received during this period, write ☐None Received across the table.

TABLE 2:

1. List the name and MDE License number of the hauler who removed tires from your facility.
2. List the type of tires removed by quantity or tons.
3. List where the hauler took the tires. *This is very important! Be sure the hauler tells you where your tires are being delivered and the MDE license/approval number of that destination.* If the tires are being delivered to an out-of-state facility, list the name and address of this facility.
4. If no tires were hauled from your facility, write No tires hauled

I certify, to the best of my knowledge, that the semi-annual operational information provided on this form and any attached documents, are accurate and based upon actual records maintained as required by the conditions of the Scrap Tire Facility License. These semi-annual operational records will be made available to the MDE for auditing purposes, if requested.

Dear Mr. Franco:

The Maryland Department of the Environment (the "Department") acknowledges the receipt of your new application for a General Scrap Tire Collection Facility License, dated September 26, 2003. The standard application review time for a completed application of this type is 45 to 60 days.

The Department is in the process of reviewing your application and will contact you if additional information is required. The Department will notify you in writing of its decision when the processing of your application is completed.

For document control purposes, the Department has assigned the following number: 05734. Please include this number when writing to us regarding your application. If you have any questions regarding this matter, please feel free to call me at (410) 537-3315.

Sincerely,

Riyaz A. Kazi, Project Manager

S Form 3811, August 2001 Domestic Return Receipt 102595-02-M-1540

ndicates that
emi-annual report
l, to December 31, 2007. Failure to submit the
land Regulations

sure that scrap tires are
pen dumping. With this
licensed haulers, to
rting requirements for
intaining written records
will be illegally dumped.
Failure to maintain the required records and submit the semi-annual reports undermines this important part of the regulatory system.

This Administration sent you a reminder notice with a report form enclosed, stating that the semi-annual report must be filled out and returned. More recently, the Administration sent you a final notice that your semi-annual report was overdue, and gave you fifteen (15) additional days to submit the report. To date, we have not received it. This Notice of Violation is your third written notice that the semi-annual report must be submitted.

The Administration is willing to settle this matter in return for a settlement payment of $500.00 and submittal of the missing semi-annual report. If you choose to settle this matter, please send a check for $500.00 payable to the Maryland Clean Water Fund within the next twenty (20) days to:

Maryland Clean Water Fund
Maryland Department of the Environment
P.O. Box 1417
Baltimore MD 21203-1417

State law allows the Maryland Department of the Environment to seek civil penalties in the amount of $10,000 per violation per day for violations of scrap tire regulations or license requirements. The missing semi-annual report should be sent to:

Maryland Department of the Environment
Solid Waste Program
1800 Washington Boulevard, Suite 605
Baltimore MD 21230-1719

To ensure that your payment is properly credited, please write the reference NOV number on your check, and return a copy of this letter with your payment. If you elect to settle this matter, you will not be admitting any of the allegations stated herein.

If you fail to settle by submitting the required report and the above payment, this matter may be referred to the Office of the Attorney General for further enforcement action. Such enforcement action may include a penalty, an order, and/or the suspension or revocation of your scrap tire license. Any subsequent violations would subject you to additional enforcement action. Therefore, you are advised to maintain compliance with applicable Maryland regulations and licenses. Please direct any questions or comments in this matter to Ms. Abigail Pascual, Head, Project Management Section at (410) 537-3315.

Sincerely,

Horacio Tablada, Director
Waste Management Administration

NOTICE OF VIOLATION

May 8, 2009

RTIFIED MAIL
urn Receipt Requested

RTHROP GRUMMAN SYSTEMS CORP
STEVE REINKER
WILSON POINT RD
TIMORE MD 21220

NOV-WAS-09-ST-180

Licensee:

A review of the Waste Management Administration's records indicates that THROP GRUMMAN SYSTEMS CORP has failed to submit a semi-annual report narizing the scrap tire transactions for the time period from **July 1, to December 31, 2007.** report is required by your scrap tire license No. **2003RGC05734.** Failure to submit the annual report is a violation of your license and the Code of Maryland Regulations AR) 26.04.08 regarding scrap tire management.

Maryland's system of regulating scrap tires was designed to ensure that scrap tires are recycled to the maximum extent possible, and to prevent their open dumping. With this n mind, the regulations require that scrap tires be hauled only by licensed haulers, to ed or approved collection facilities. The record keeping and reporting requirements for s and collection facilities are an essential part of the system. Maintaining written records itimate scrap tire transactions reduces the chances that scrap tires will be illegally dumped. e to maintain the required records and submit the semi-annual reports undermines this tant part of the regulatory system.

This Administration sent you a reminder notice with a report form enclosed, stating that ni-annual report must be filled out and returned. More recently, the Administration sent inal notice that your semi-annual report was overdue, and gave you fifteen (15) additional submit the report. To date, we have not received it. This Notice of Violation is your ritten notice that the semi-annual report must be submitted.

Mr. Melvin J. Hoefler
Maryland Aviation Administration
Martin State Airport
701 Wilson Point Road, Box 1
Middle River MD 21220

Dear Mr. Hoefler:

Enclosed is Maryland Scrap Tire Hauler License No. **2008-RTH-07322**, which authorizes the transportation of scrap tires in the State of Maryland to or from scrap tire facilities licensed or approved by the Maryland Department of the Environment (the "Department"), as specified in your application of November 28, 2008.

To avoid violation of this license, please have your clients show you their current Maryland Scrap Tire License prior to providing services. Also, you should verify that the site to which your scrap tires are being taken is a facility licensed or approved by the Department by obtaining their license number. If you collect tires at your own location, you must also have a current Maryland Scrap Tire License.

Please note that this license is subject to the enclosed terms and conditions. This license may be appealed by filing a written request for a hearing within thirty (30) days of receipt of this license. The request should be addressed to Mr. Horacio Tablada, Director, Waste Management Administration, at the Department's address. You will subsequently be contacted regarding a hearing date. All license hearings will be conducted in accordance with the Administrative Procedure Act. If no appeal is received within the specified time period, this constitutes acceptance of the terms and conditions of this license.

For further information, please contact Mr. Kaveh Hosseinzadeh, Head, Solid Waste Facilities Section at (410) 537-3315.

Sincerely,

Edward M. Dexter

Scrap Tire Hauler License

No. 2008-RTH-07322

ISSUE DATE: February 5, 2009

EXPIRATION DATE: February 4, 2014
IDENTIFICATION No.: 08H07322

Issued to: Maryland Aviation Administration

At: 701 Wilson Point Road, Box 1, Middle River, Baltimore County, MD 21220.

Authorizing: the transportation of scrap tires in the State of Maryland to or from scrap tire facilities licensed or approved by the Maryland Department of the Environment, and as specified in your application of November 28, 2008.

This license is issued pursuant to the provisions of Title 9 of the Environment Article, Annotated Code of Maryland, and regulations promulgated thereunder, and is subject to the attached terms and conditions, and compliance with all applicable laws and regulations.

Edward M. Dexter, Administrator
Solid Waste Program

Horacio Tablada, Director
Waste Management Administration

LICENSE CONDITIONS:

A. Transportation:

1. The licensee may transport scrap tires only as specified in the licensee's Scrap Tire Hauler License Application and its supporting documentations. If there are any discrepancies between this license and the application, the terms and conditions of this license will take precedence.

2. The licensee may only transport scrap tires to or from scrap tire facilities licensed or approved by the Department and as listed in licensee's Scrap Tire Hauler Application. A licensed or approved scrap tire facility includes an existing site that stores, collects, recycles, incinerates to recover energy, or otherwise processes scrap tires.

3. The licensee may only transport scrap tires from cleanup sites, as designated by the Department to scrap tire facilities licensed or approved by the Department. A licensed or approved scrap tire facility includes an existing site that stores, collects, recycles, incinerates to recover energy, or otherwise processes scrap tires.

4. The licensee may only transport scrap tires from scrap tire facilities licensed or approved by the Department, which include existing sites that store, collect, recycle, incinerate to recover energy, or otherwise processes scrap tires, to out of state licensed or approved scrap tire facilities.

5. The licensee shall not transport scrap tires in a manner likely to:

   a. create a nuisance;

   b. impair the quality of the environment; or

   c. create other hazards to the public health, safety, or comfort as may be determined by the Department.

6. The licensee shall transport scrap tires only in the vehicles identified with an asterisk on the list appended to this license as Attachment I.

B. Landfilling Prohibited:

1. Scrap tires shall not be disposed of in this State's landfills.

2. Scrap tires may be transported to a sanitary landfill after January 1, 1994 if the landfill accepts scrap tires for purposes other than disposal and has received a scrap tire facility license/approval from the Department.

3. Scrap tires shall not be disposed of in an open dump.

C. Hauler Identification:

The licensee shall display the scrap tire hauler identification (ID) number issued by the Department on all vehicles used to transport scrap tires, including rental vehicles. The ID number shall be displayed on the front driver and passenger side doors of each vehicle. Each character of this ID number shall be a minimum of three (3) inches in height and legible at all times.

D. Change of Vehicles:

The licensee shall inform the Department within thirty (30) days of any change in the vehicles used, including rental vehicles, change in license plate number, or ownership of any vehicle identified in the licensee's Scrap Tire Hauler License Application and its accompanied materials. The licensee shall notify the Department in the event that any previously approved vehicle is deleted from the fleet.

E. Record Keeping:

The licensee shall maintain, for a period of three (3) years, records of all scrap tires collected, transported and deposited by the licensee. These records shall document each load of scrap tires that has been collected, transported and deposited during daily operations. The records shall include, at a minimum, the following information:

1. The total type and quantity in number or weight of scrap tires, including processed portions, for each transaction that were transported by the licensee;

2. The identification and location of each person, entity or facility from which the scrap tires were collected. Specify the total type and quantity in number or weight of scrap tires, including processed portions, for each transaction that were collected by the licensee; and

3. The identification and location of each person, entity or facility where the collected scrap tires were deposited. Specify the total type and quantity of scrap tires in number or weight, including processed portions, for each transaction that were deposited by the licensee.

F. Reporting:

The licensee shall submit to the Department a semiannual report. Each report shall summarize the records required by the Record Keeping Condition of this license. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period. Each report shall be submitted on the attached form provided by the Department.

G. Availability of Reports:

Except for information determined to be confidential under Section 10-617(d) of the State Government Article, Annotated Code of Maryland, all documents submitted to the Department pursuant to the record keeping and reporting requirements set forth in this license shall be available for public inspection at the Department's offices.

H. Application for Renewal:

At least ninety (90) days before the expiration date of this license, the licensee shall submit a renewal application for a license or notify the Department of the intent to cease operating by the expiration date of this license. The licensee whose license has expired following submission to the Department of a timely and complete renewal application, may continue to conduct the authorized activity until the Department takes final action on the application if the Department determines that:

1. The licensee is in compliance with the terms and conditions of the expired license; and

2. The Department, through no fault of the person seeking a license, has not taken final action on the application on or before the expiration date of the license.

I. Modification:

1. The Department may modify any term or condition of this license if the modification is needed to reflect changes in local, State or federal laws or regulations applicable to this type of operation. Any modification shall also be made, as appropriate, to other documents, which are part of this license.

2. The Department may modify this license if any violation of a term or condition of this license or any applicable law or regulation has occurred.

3. The Department may modify this license upon receipt of a written request from the licensee stating the reasons for the proposed modification and provides supporting documentation.

4. The Department may modify this license upon receipt of a written request for approval to add additional vehicles, which have not been previously approved for use, provided that such modification is requested within thirty (30) days following commencement of the use of any additional vehicle(s).

5. The Department may modify this license upon receipt of a written request from the licensee for approval to transport scrap tires from additional scrap tire facilities not approved by this license.

J. Transfer of License:

This license may be transferred to new owners if the following conditions are met:

1. Before any change in the ownership, a written request for the transfer of the license shall be submitted to the Department for review and approval. The request for transfer shall state the reason(s) for the requested transfer, and shall be signed by the licensee and the new owner. The request shall also include a completed Scrap Tire License Application signed by the new owner; and

2. The Department determines that the proposed transfer of the license would not affect present or future compliance with local, State, or federal laws and regulations.

K. Suspension or Revocation:

In accordance with Section 9-262 of the Environment Article and Title 10 of the State Government Article, the Department may suspend, revoke, or modify this license, if the Department finds that:

1. The application contained false or inaccurate information;

2. There has been a substantial deviation from:

   a. the documents accepted by the Department as part of this license application;

   b. any requirement established by the Department;

   c. a representative of the Department has been denied entry to any area in which activities regulated by this license are conducted or to any documents required to be maintained by this license;

   d. there is or has been a violation of the terms and conditions of the license or any applicable State law or regulation; or

   e. there is any other good cause.

L. Right of Entry:

The licensee shall allow the Department's authorized representatives, at reasonable times and upon presentation of credentials:

1. To enter any site(s) where records required by this license are maintained;

2. To have access to and copy any and all records required to be maintained by this license;

3. To inspect any equipment or process used in connection with the activities regulated by this license;

4. To inspect any facility, system or vehicle used in connection with the activities regulated by this license; and

5. To obtain photographic documentation, collect samples, or any other information pertinent to the activities regulated by this license.

M. Compliance:

1. The licensee shall comply with the terms and conditions of this license, and with all applicable local, State and federal laws and regulations.

2. If for any reason the licensee cannot comply or is unable to comply with this license or with any applicable local, State, or federal laws and regulations, the licensee shall notify the Department at (410) 537-3315 on the same day or on the next working day, following any noncompliance. Within five (5) working days after this notification, the licensee shall provide the Department with the following information in writing:

   a. description of the noncompliance, including date, time, and type of noncompliance;

   b. cause of the noncompliance;

   c. anticipated time the noncompliance is expected to continue or if such condition has been corrected;

   d. steps taken by the licensee to correct the noncompliance; and

   e. steps to be taken by the licensee to prevent recurrence of the noncompliance.

3. If the licensee discovers through any means, including notification by the Department, that a noncompliance with any condition of the license has occurred, the licensee shall immediately take all necessary steps to eliminate the condition of noncompliance and to minimize the adverse impact on public health, safety, welfare, or the environment.

4. If the licensee discovers that a noncompliance with any condition of the license has affected the public health, safety, welfare, or the environment, the licensee shall immediately notify the Department.

N. Civil and Criminal Liability:

Nothing in this license shall be construed to preclude the institution of any legal action nor relieve the licensee from civil or criminal responsibilities and/or penalties for non-compliance with Title 9 of the Environment Article, Annotated Code of Maryland, or any local, State, federal, or other State laws or regulations.

O. Property Rights:

The issuance of this license does not intend to convey any property rights in either real or personal property, or any exclusive privilege or franchise, nor does it authorize any injury to private property or any invasion of personal rights, nor any infringement of local, State, or federal laws or regulations.

P. Severability:

If any provision of this license shall be held invalid for any reason, the remaining provisions shall remain in full force and effect, and such invalid provision shall be considered severed and deleted from this license.

Q. Signatory Requirements:

All applications, request for modifications or transfer, renewal requests, reports, or information submitted to the Department shall be signed and verified in accordance with Section 1-201 of the Environment Article, Annotated Code of Maryland, by the licensee or authorized representative of the licensee as being true.

Mr. Melvin J. Hoefler
Maryland Aviation Administration
Martin State Airport
701 Wilson Point Road, Box 1
Middle River MD 21220

Dear Mr. Hoefler:

Enclosed is Maryland General Scrap Tire Collection Facility License No. **2008-RGC-07321**, which authorizes the accumulation of **no more than fifty (50)** scrap tires at any one time at Martin State Airport, 701 Wilson Point Road, Box 1 in Middle River, Baltimore County as specified in your application of November 28, 2008.

To operate this facility, and to avoid a violation of this license, please have all scrap tire haulers who remove scrap tires from this facility (current or planned) show you their current Maryland license prior to providing services. Also, you should verify that the site to which your scrap tires are being taken is a facility licensed or approved by the Maryland Department of the Environment (the "Department") by obtaining their license number. In addition, if you are currently hauling your own scrap tires or intend to do so in the future, you must also have a Scrap Tire Hauler License.

Please note that this license is subject to the enclosed terms and conditions. This license may be appealed by filing a written request for a hearing within thirty (30) days of receipt of this license. The request should be addressed to Mr. Horacio Tablada, Director, Waste Management Administration, at the Department's address. You will subsequently be contacted regarding a hearing date. All license hearings will be conducted in accordance with the Administrative Procedure Act. If no appeal is received within the specified time period, this will constitute acceptance of the terms and conditions of this license.

For further information, please contact Mr. Kaveh Hosseinzadeh, Head, Solid Waste Facility Section at (410) 537-3315.

Sincerely,

Edward M. Dexter, Administrator
Solid Waste Program

General Scrap Tire Collection Facility License

No. 2008-RGC-07321

ISSUE DATE: February 5, 2009 ***(NO EXPIRATION DATE)***

Issued to: Maryland Aviation Administration

Authorizing: the accumulation of **no more than fifty (50)** scrap tires at any one time, and as specified in your application of November 28, 2008.

At: Martin State Airport, 701 Wilson Point Road, Box 1, Middle River, Baltimore County, MD 20220.

This license is issued pursuant to the provisions of Title 9 of the Environment Article, Annotated Code of Maryland, and regulations promulgated thereunder, and is subject to the attached terms and conditions, and compliance with all applicable laws and regulations.

Edward M. Dexter, Administrator
Solid Waste Program

Horacio Tablada, Director
Waste Management Administration

LICENSE CONDITIONS:

1. The licensee may only accumulate **no more than fifty (50)** scrap tires at any one time at this facility, as specified in this facility's General Scrap Tire Collection Facility License Application. If there are any discrepancies between this license and the application, the terms and conditions of this license will take precedence.

2. Only scrap tire haulers licensed by Maryland Department of the Environment (the "Department") shall be used to transfer scrap tires.

3. The licensee shall comply with all applicable State, local government, and federal laws and regulations.

4. Scrap tires shall only be transferred to the primary or secondary scrap tire collection facilities, scrap tire recycling facilities, or other facilities licensed or approved by the Department.

5. If the licensee discovers through any means, including notification by the Department, that noncompliance with a condition of the license has occurred, the licensee shall immediately take all necessary steps to eliminate the condition of noncompliance and to minimize the adverse impact on public health, safety, welfare, or the environment.

6. If the licensee discovers that a noncompliance with a condition of the license has affected the public health, safety, welfare, or the environment, the licensee shall immediately notify the Department at (410) 537-3315.

7. The licensee shall inform the Department in writing within 30 days following a business name change, change in ownership or form of business organization, or any other change that affects the license.

8. If a person who does not possess a Scrap Tire Hauler License, and who is not exempted under Code of Maryland Regulations (COMAR) 26.04.08.04A(2), attempts to deposit scrap tires at the facility covered by this license, the licensee shall refuse to accept the scrap tires offered by the said person, and shall notify the Department within one week of occurrence, the person's name, license plate number and state of issuance for the vehicle used to haul scrap tires. A person is exempted under COMAR 26.04.08.04A(2) if the person transports not more than five (5) scrap tires annually.

9. The licensee shall not operate this facility in a manner likely to:

   a. create a nuisance;

   b. be conducive to insect and rodent infestation;

   c. cause a discharge of any constituents derived from scrap tires into the air unless otherwise permitted by the Department;

   d. cause a discharge of any constituents derived from scrap tires into waters of this State unless otherwise permitted by the Department;

   e. impair the quality of the environment; or

   f. create other hazards to the public health, safety, or comfort as may be determined by the Department.

10. The licensee shall maintain, for a period of three (3) years, records of all scrap tires entering or exiting this facility. The records shall include, at a minimum, the following information:

    a. the total type and quantity of scrap tires, by number or weight, that were received or generated at this facility;

    b. the total type and quantity of scrap tires, by number or weight, that were transferred from this facility;

    c. the total type and quantity of scrap tires, by number or weight, that remained at this facility;

    d. the name and identification number of each hauler transferring scrap tires from this facility. The type and quantity of scrap tires must be identified (by number or weight) for each transaction, including tires separated and removed for retreading. The destination of the scrap tires transported by each hauler must also be maintained; and

    e. the semi-annual reports specified in General Condition 11.

11. The licensee shall submit to the Department a semi-annual report containing the information described in General Condition 10. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period. The reports shall be submitted on copies of the form attached to this license or be in this format and contain the information described in General Condition 10.

12. This license shall not be transferred to new owners unless the following conditions are met:

    a. a written request for the transfer is submitted to the Department. The request shall indicate the reason for the requested transfer and be signed by the individuals holding and seeking the license;

    b. the new owner shall complete a General Scrap Tire Collection Facility License Application. The completed application shall be submitted with the request; and

    c. the Department determines that the proposed transfer of the license would not affect present or future compliance with State or federal laws and regulations.

13. The following fire protection standards shall be followed:

    a. combustibles shall not be stored in the area where scrap tires are being collected; and

    b. potential ignition sources such as cutting, welding, and heating devices, open fires, etc., shall be prohibited in the scrap tire collection area.

14. Nothing in this license authorizes the establishment or the operation of this facility when in violation of any local, State, or federal laws and regulations.

Valerie Norman - name change to Northrop Grumman licenses

From: Abigail W. Pascual
To: Valerie Norman
Date: 7/20/2012 1:11 PM
Subject: name change to Northrop Grumman licenses

Hi Val,

Linda Bellmyer (410-238-5601) from Northrop Grumman called today. She said the contact names had changed for 2009-RGC-07711 and 2010-RGC-08019 to "Douglas Klevisha". I made the changes in Tyrus, but not in Tempo. Please make sure Tony makes those changes.

She also asked if they needed both licenses since they were both at the same facility. They are issued to 2 different hangars. She also said the one for "Middle River Integration Center" (2010-RGC-08019) needed a name change because it's not called that anymore. I told her I'd have you call her to go over whether to cancel one license or keep both and to do the name change to the facility name (I think the owner name is fine).

Please give have Tony make the changes and please call Ms. Bellmyer regarding the other issues. Thanks! -- Abby

INSTRUCTIONS FOR COMPLETING REPORT

SECTION 1:

1. Check the box indicating the source of the scrap tires collected at your facility.
2. If you checked "Your Facility" or "Customers", you do not need to complete SECTION 3.
3. If you checked "Other", you must complete SECTION 3.
4. Proceed to SECTION 2.

SECTION 2:

1. List the name and license number of the scrap tire hauler who removed scrap tires from your facility.
2. List the type of scrap tires removed.
3. List the place of where the hauler took the scrap tires. ***This is very important!*** *Be sure the hauler tells you where your scrap tires are being delivered and the Maryland scrap tire license/approval number of that destination.* If the scrap tires are being delivered to an out-of-state facility, list the name and address of this facility.
4. List by quantity or tons how many scrap tires were removed from your facility.
5. If no scrap tires were hauled from your facility, write **"None"** or **"0"** in the TOTAL Scrap Tire Quantity box.

SECTION 3:

1. List where the scrap tires came from:
   - A. If from haulers, please list the haulers' names and their Maryland Scrap Tire Hauler License numbers in the appropriate boxes.
   - B. If from individuals hauling less than 5 scrap tires, please write **"Private"** in the **Source** column; and **"None"** in the **License Number** boxes. If you receive scrap tires from many individuals, group them as a single entry.
   - C. If the scrap tires are generated from your business, write **"Company"** in the **Source** column, and your license number in the **License Number** column.
2. List the type of scrap tires (i.e. passenger, truck) collected at your facility.
3. List by quantity or tons how many scrap tires were collected at your facility.
4. If no scrap tires were collected during this period, write **"None"** or **"0"** in the TOTAL Scrap Tire Quantity box.

SIGNATURE:

You must sign your name, print your name, and date the report at the bottom of the front page of this report.

Hi Valerie,

Thank you for your help over the phone.

I would like to cancel the General Scrap Tire Collection facility license No 2009-RGC-07711 as we only have one collection point for both hangars. Please amend 2010-RGC-08019 License to read hangar 2 as this is where we store our tires.

I have attached both tire collection forms. If there is any more information you need from me or I if I need to correct the forms please let me know and I will do so.

Again thank you for your help

Mr. Dan Franco
Northrop Grumman Technical Services, Inc.
701 Wilson Point Road, Box 82
Middle River MD 21220

Dear Mr. Franco:

Enclosed is Maryland General Scrap Tire Collection Facility License No. **2009-RGC-07711**, which authorizes the accumulation of **no more than fifty (50)** scrap tires at any one time at 701 Wilson Point Road in Middle River, Baltimore County, as specified in your application of October 5, 2009.

To operate this facility, and to avoid a violation of this license, please have all scrap tire haulers who remove scrap tires from this facility (current or planned) show you their current Maryland license prior to providing services. Also, you should verify that the site to which your scrap tires are being taken is a facility licensed or approved by the Maryland Department of the Environment (the "Department") by obtaining their license number. In addition, if you are currently hauling your own scrap tires or intend to do so in the future, you must also have a Scrap Tire Hauler License.

Please note that this license is subject to the enclosed terms and conditions. This license may be appealed by filing a written request for a hearing within thirty (30) days of receipt of this license. The request should be addressed to Mr. Horacio Tablada, Director, Land Management Administration, at the Department's address. You will subsequently be contacted regarding a hearing date. All license hearings will be conducted in accordance with the Administrative Procedure Act. If no appeal is received within the specified time period, this will constitute acceptance of the terms and conditions of this license.

For further information, please contact Mr. Jeffry Parker, Project Manager at (410) 537-3315.

Sincerely,

Edward M. Dexter, Administrator
Solid Waste Program

General Scrap Tire Collection Facility License

No. 2009-RGC-07711

ISSUE DATE: November 23, 2009 ***(NO EXPIRATION DATE)***

Issued to: Northrop Grumman Technical Services, Inc.

Authorizing: the accumulation of **no more than fifty (50)** scrap tires at any one time, and as specified in your application of October 5, 2009

At: 701 Wilson Point Road, Middle River, Baltimore County, MD 21220

This license is issued pursuant to the provisions of Title 9 of the Environment Article, Annotated Code of Maryland, and regulations promulgated thereunder, and is subject to the attached terms and conditions, and compliance with all applicable laws and regulations.

Edward M. Dexter, Administrator
Solid Waste Program

Horacio Tablada, Director
Land Management Administration

LICENSE CONDITIONS:

1. The licensee may only accumulate **no more than fifty (50)** scrap tires at any one time at this facility, as specified in this facility's General Scrap Tire Collection Facility License Application. If there are any discrepancies between this license and the application, the terms and conditions of this license will take precedence.

2. Only scrap tire haulers licensed by Maryland Department of the Environment (the "Department") shall be used to transfer scrap tires.

3. Scrap tires shall only be transferred to the primary or secondary scrap tire collection facilities, scrap tire recycling facilities, or other facilities licensed or approved by the Department.

4. The licensee shall not operate this facility in a manner likely to:

   a. Create a nuisance;

   b. Be conducive to insect and rodent infestation;

   c. Cause a discharge of any constituents derived from scrap tires into the air unless otherwise permitted by the Department;

   d. Cause a discharge of any constituents derived from scrap tires into waters of this State unless otherwise permitted by the Department;

   e. Impair the quality of the environment; or

   f. Create other hazards to the public health, safety, or comfort as may be determined by the Department.

5. The following fire protection standards shall be followed:

   a. Combustibles shall not be stored in the area where scrap tires are being collected; and

   b. Potential ignition sources such as cutting, welding, and heating devices, open fires, etc., shall be prohibited in the scrap tire collection area.

6. The licensee shall inform the Department in writing within 30 days following a business name change, change in ownership or form of business organization, or any other change that affects the license.

7. The licensee shall maintain, for a period of three (3) years, records of all scrap tires entering or exiting this facility. The records shall include, at a minimum, the following information:

   a. The total type and quantity of scrap tires, by number or weight, that were received or generated at this facility;

   b. The total type and quantity of scrap tires, by number or weight, that were transferred from this facility;

c. The total type and quantity of scrap tires, by number or weight, that remained at this facility;

d. The name and identification number of each hauler transferring scrap tires from this facility. The type and quantity of scrap tires must be identified (by number or weight) for each transaction, including tires separated and removed for retreading. The destination of the scrap tires transported by each hauler must also be maintained; and

e. The semi-annual reports specified in General Condition 8.

8. The licensee shall submit to the Department a semi-annual report containing the information described in General Condition 7. A report for the period of January through June of each year is due no later than August 1 following the reporting period. A report for the period of July through December of each year is due no later than February 1 following the reporting period. The reports shall be submitted on copies of the form attached to this license or be in this format and contain the information described in General Condition 7.

9. This licensee shall not be transferred to new owners unless the following conditions are met:

a. A written request for the transfer is submitted to the Department. The request shall indicate the reason for the requested transfer and be signed by the individuals holding and seeking the license;

b. The new owner shall complete a General Scrap Tire Collection Facility License Application. The completed application shall be submitted with the request; and

c. The Department determines that the proposed transfer of the license would not affect present or future compliance with State or federal laws and regulations.

10. If the licensee discovers through any means, including notification by the Department, that noncompliance with a condition of the license has occurred, the licensee shall immediately take all necessary steps to eliminate the condition of noncompliance and to minimize the adverse impact on public health, safety, welfare, or the environment

11. If the licensee discovers that a noncompliance with a condition of the license has affected the public health, safety, welfare, or the environment, the licensee shall immediately notify the Department at (410) 537-3315.

12. If a person who does not possess a Scrap Tire Hauler License, and who is not exempted under Code of Maryland Regulations (COMAR) 26.04.08.04A(2), attempts to deposit scrap tires at the facility covered by this license, the licensee shall refuse to accept the scrap tires offered by the said person, and shall notify the Department within one week of occurrence, the person's name, license plate number and state of issuance for the vehicle used to haul scrap tires. A person is exempted under COMAR 26.04.08.04A(2) if the person transports not more than five (5) scrap tires annually.

13. This license may be suspended or revoked upon a final, unreviewable determination that the licensee lacks, or is in violation of, any federal, State or local approval necessary to conduct the activity authorized by this license.

Terminal Building, Lower Level, Pier A
P.O. Box 8766
Baltimore/Washington International Airport, Maryland 21240

Midfield terminal Complex Development, Phase I
at
Martin State Airport

CONTRACT NUMBER: MAA-CO-97-019

ADDENDUM NUMBER 1

PRE-BID MEETING DATE:	April 15, 1998
ADDENDUM DATE:	April 27, 1998
BID DATE:	May 12, 1998

IMPORTANT: Bidders must acknowledge the receipt of this Addendum on the Bid Forms, page BF-18, stating the Addendum Number. Additionally, Bidders must acknowledge purchase of the Standard Provisions by volume and date on page BF-18.

Minutes of Meeting

The meeting agenda was distributed and an attendance list was circulated for signatures. The agenda and individuals/firms in attendance at the pre-bid/site inspection meeting are included as an attachment in this addendum.

I. Introduction

1. The meeting was chaired by Mr. Emory Carrigan of the MAA. Mr. Carrigan welcomed the attendees and gave a brief overview of the project.

II. Administrative

Ms. Suzette Moore of the MAA reviewed administrative items.

1. Sealed bids must be received at the Office of Planning and Engineering of the Maryland Aviation Administration, lower level, Pier A, Baltimore/Washington international Airport, no later than 11:00 am, on May 12, 1998.

2. Plans and specifications for this Project can be purchased at $150.00 per set.

3. The Standard Provisions are a one-time purchase (which can be used in all MAA projects) at a cost of $30.00 per set.

4. The Bid Proposal must include the Bid Guaranty, otherwise it will be rejected. The Bid Guaranty/Bid Bond is a minimum 5% of the bid price for projects over One Hundred Thousand Dollars ($100,000.00).

5. All Bid Forms must be fully executed. The Bid Package must also include the following:

   a. Bid/Proposal Affidavit (Section 2)
   b. MBE Utilization Affidavit (Section 3)
   c. Subcontractor Utilization Affidavit (Section 4)
   d. Bid Proposal and Bid Tabulation Forms (Section 5)

6. All bidders must list both unit price and total price on the Bid Tabulation Forms for all items. Use the revised Bid Tabulation Forms issued in the Addendum.

7. Total Bid Price must be listed in numerical form and words on pages BF-67A through BF-70A.

8. The Minutes of this meeting will be issued as Addendum No. 1. The bidder must fill out Bid Form page BF-18 acknowledging receipt of all Addenda and the Standard Provisions.

9. The MBE goal for this project is 16%. All MBE's must be certified by MDOT at the time of contract award.

III. General Provisions (GP)/Special Provisions (SP)

Ms. Jackie Schonowski of the MAA stated the following:

1. All MAA projects will be constructed in accordance with MAA General and Special Provisions including Interim Standard Provision Addenda for Construction Contracts and specific Technical Provisions.

IV. Project Description

1. Mr. Tee Sombatpium of TAMS Consultants, Inc. informed the attendees that there would be some revisions made to the Plans and Specifications, to be issued as an Addendum to the bid package. Items that will effect the bid price are as follows:

   a. Bid Item 104.1 Maintenance of Traffic (Pages BF-20, BF-31, BF-42, BF-53): has been deleted from this contract.

   b. Bid Item 108.2 Miscellaneous Construction Items Allowance: has fixed allowance prices as follows:

      i. Bid Item 108.2 for Base project (Page BF-21): $175,000.00
      ii. Bid Item 108.2 for Add Alternate 1 (Page BF-32): $85,000.00
      iii. Bid Item 108.2 for Add Alternate 2 (Page BF-43): $85,000.00
      iv. Bid Item 108.2 for Add Alternate 3 (Page BF-54): $170,000.00

   c. Bid Item D-751.5 Storm Drainage Inlet Type 4: Bid Quantity is changed to read as follows:

      i. Bid Item D-751.5 for Base Project (Page BF-29): 1 Each
      ii. Bid Item D-751.5 for Add Alternate 1 (Page BF-40): 0 Each
      iii. Bid Item D-751.5 for Add Alternate 2 (Page BF-51): 0 Each
      iv. Bid Item D-751.5 for Add Alternate 3 (Page BF-62): 0 Each

   d. Bid Item 308.3 Super Silt Fence (Pages BF-21, BF-32, BF-43, BF-54): Unit of quantity is changed to Linear Feet.

2. The following Technical Specification pages are missing in some sets of the Bid Package:

   a. Page 16195-5
   b. Page 16321-1 and Page 16321-2

   These missing pages will be issued in the Addendum.

3. Technical Specification Section 02080 Asbestos Removal has two pages with similar page number (Page 29). Clarification will be provided in the Addendum.

V. Project Schedule/Performance

1. The project duration, excluding winter shut down, is as follows:

Base Project:	230 calendar days from NTP
Base Project+Add Alternate 1:	260 calendar days from NTP
Base Project+Add Alternate 2:	260 calendar days from NTP
Base Project+Add Alternate 3:	275 calendar days from NTP

With the exception of grading and paving, the Contractor will be allowed to continue working through the winter shutdown, if work is not weather sensitive.

VI. Site Inspection

The meeting adjourned after a site visit by attendees.

VII. Questions and Answers

Inquiries were addressed in the meeting as follows:

Q. The general notes on Sheet G-03 state that the haul roads and staging area are to be discussed at the pre-bid meeting. Where are these locations?
A. See Sheet G-03 for haul road and staging area.

Q. The plans state that the contractor is to store all equipment in the staging area. Will the contractors be allowed to store any equipment or materials onsite?
A. If the contractor wants to store anything onsite, it must conform to the applicable FAA circulars and he must obtain permission from MAA.

Q. Plan Sheet C-15 does not clearly show what portion of work is labeled as "Not Included in This Contract". Can this be verified?
A. Any necessary clarifications will be included in the addendum.The scope of work are as follows:

Base Project: Base Project includes demolition work including asbestos removal and building demolition; removal of the existing stockpile; constructing Pond 1; wetland mitigation; constructing access road; installing site utilities (domestic and fire suppression supply, electrical, communication, drainage, sanitation, gas, fiber optic); abandoning the existing sewage treatment plant at the Strawberry Point Ramp and constructing a new line to bring raw sewage to the

Midfield facility; constructing fire protection pumping facility including a 500,000 gallon water tank. Gas, electrical equipment and cable will be installed by Baltimore Gas and Electric Company under direct contract with the winning bidder. Limit of work is shown on the Plans.

Add Alternative 1: Add Alternate 1 work includes constructing Ponds 3A and 3B, including grading and associated drainage structures; constructing Skytech taxiway, apron, parking lot and access road.

Add Alternate 2: Add Alternate 2 work includes constructing Ponds 3A and 3B, including grading and associated drainage structures; constructing Lockheed-Martin taxiway, apron, parking lot and access road.

Add Alternate 3: Combination of Add Alternates 1 and 2.

Q. Can the unit price for one alternate vary with those of another alternative because of the difference in quantity between alternatives?
A. No. However, MAA will look further into how the different alternatives are handled in order to ensure fairness.

Q. When will all the contractors receive the Wetland Mitigation Plans?
A. These plans will be issued as an Addendum prior to bid and will be included in the Base Project.

Q. The specifications state that the MBE lists must be turned in with the Bid. Can contractors provided these lists within 10 days after the bid, as is the norm?
A. Yes. The MBE list is not required until 10 days after the Notice of Recommended Award is issued. However, MAA will accept the list with the Bid if the contractors have them ready.

Q. Will the contractors be required to obtain any permits?
A. MAA will obtain the necessary permits for the work. However, any permits related to a specific construction activity, i.e., oversized haul permit, will be the responsibility of the contractor.

Q. The plans state that waste concrete may be placed in embankment areas. Will this is allowed?
A. No. Waste concrete will not be allowed in embankment areas. This language will be changed in the addendum.

Q. Some specification pages are either missing or out of order in some books. How can the contractors obtain a complete set of specifications?
A. Contractors should notify MAA opf any missing pages. These pages will be included in Addendum(s).

Q. Will it be required to provide stone bedding for all drainage pipe and will this be considered incidental to the pipe?

A. Yes. All drainage pipe must have stone bedding, and it will not be paid for separately. This will be clarified in the Addendum.

Q. Specifications page 101-2, Paragraph "E" -- typo.

A. Will be corrected in the Addendum.

Q. Specification page D-752-3, Section 3.1.C -- typo.

A. Will be corrected in the Addendum.

Q. The note on sheet D-01 does not clearly state what types of hazardous materials are expected to be encountered.

A. Asbestos is the only hazardous materials which are anticipated to be encountered. There may be slight traces of lead paint found in old buildings such as these.

Q. Sheet 22 calls for the pump station to be abandoned. Should this be demolished and removed?

A. The bid documents call for the pump station to be abandoned. MAA will determine if it should be demolished.

Q. Will there be access to the site after today and before the bid opening?

A. Yes. Access will be allowed, but contractors must call the airport manager first to arrange visits.

Q. What is the utility allowance amount?

A. The utility allowance will be established by MAA, and is shown on the revised Bid Forms. Only the successful bidder will then have to contact BG&E for the utility work.

Q. What is the contract duration and sequence of construction?

A. The number of working days, the sequence of construction, and milestones have been established, and they are stated in the Contract Documents.

Q. Will another contractor be building one or both of the new hangars during this contract?

A. Yes, this possibility exists. The Plans do not state specifically which of the hangars, but include a statement about other contractors working within the construction zone.

Q. The plans call for a winter shutdown. Can any work be performed during this time period?

A. The contractor may request to work during the shutdown, and MAA will allow work to be performed provided that the work is not weather-sensitive, in MAA's sole opinion.

Q. Will the cut/fills balance over the site or will the contractor be required to haul embankment from off-site?

A. No, the site will not balance. It is anticipated that there will be excess material which will have to be hauled away, but it is not anticipated that any additional fill will be required from off-site.

REVISIONS ADDITIONS AND DELETIONS TO THE CONTRACT DOCUMENTS

Technical Provisions

PART I GENERAL INFORMATION

Section GI-1.08 Special Construction Requirements

1. Article A. Time Restrictions:

   a. Fourth line: after "...will be granted", delete "or denied".
   b. Last line: revise "...regardless of the closure requested." to read "...regardless of the closure hours requested."

2. Article C. Staging Areas:

   a. First paragraph, 3rd. Line: change "seven days" to "21 days".
   b. First paragraph, last line: after "...originated by", delete "the MAA or".
   c. Fourth paragraph: revised to read "The Contractor shall maintain at all times all of his staging and work areas clean and clear of trash, debris, etc., in accordance with the Safety Requirements During Construction Notes shown on the Contract Drawing Sheet G-03.

3. Article D. Contract Duration: delete last sentence.

4. Article E. Liquidated Damages:

   a. First sentence, 1st. line: after "...work on", delete "or before".
   b. First sentence, 3th. line: change "below." to "above.".

5. Article O. Project Milestones: first line, first sentence: revise to read as follows: " The Contractor shall perform all work in Stages as shown on the Contract Drawings Sheets A-01 through A-07."

PART I TECHNICAL SPECIFICATIONS

Item 100 Demolition and Removal

1. Article 2.1: seventh line: revise "...objectionable materials which cannot be used..." to read "...objectionable materials cannot be used in backfill, and shall be ...".
2. Article 5.2: Pay Item 100-10: change "Larger than 48" Diameter" to "54" Diameter".

Item 101 Clearing and Grubbing

1. Article 2.1.D: delete the first sentence.
2. Article 2.1.E.: third line: change "Item 0000" to "Item 2080".
3. Article 3.2: delete "Type II: Over eighteen (18) inches butt diameter".
4. Article 4.2: last two lines: change Pay Item "P-151.1" to "101.1"; change Pay Item "P-151.2" to "101.2".

Item 1000 Pre-Engineer Metal Building

1. Article 1.1: fourth line: before "fire sprinkler system", add "unit heater".
2. Article 5.1: fifth line: before "fire sprinkler system", add "unit heater".

Section 02080 Asbestos Removal

Replace both duplicate Page 29 with revised Page 29A, attached.

Section 15000 Pumphouse Equipment, Pipe, and Fittings

Article 3.7.A.2: first line: after "personnel", add "for a minimum period of 24 hours".

Section 16195 Labeling and Identification

Insert page 16195-5 - attached (this page was omitted in some technical specification sets)

Item 16321 Pole Mount Transformer

Insert complete section, Pages 16321-1 and 16321-2, attached (this section was omitted in some technical specification sets)

Item 16900 General Instrumentation

Article 1.2.A: third line: after "...alarm panel,", revised to read:"pumphouse fire alarm panel and dfiesel fuel level...".

Item D-751 Manholes, Catch Basins, and Inlet

Article 1.3: after last line, add the following:
"Type IV Inlets and manholes capable of supporting aircraft loads. See drawing Sheet U-17 for details."

Item D-752 Miscellaneous Drainage Structures

Article 3.1.C.: last line: revise to read: "shall be incidental and included in all applicable pay items where dewatering is required."

Item T-905 Topsoiling

Insert page T905-1 and T905-2 (these pages were omitted in some technical specification sets).

PART III SPECIAL PROVISIONS FORMS

Replace Pages SP-10 through SP-13 with revised Pages SP-10A through SP-13A, attached.

PART VI BID FORMS

Replace Pages BF-20 to BF-67 with Pages BF-20A to BF-70A, attached.

Contract Plans

Sheet G-03 : Added General Note No. 16. See attachment G-03A.

Sheet G-04 : Revised Summary of Estimated Quantities Table. See attachment G-04A.

Sheet G-08 : Revised Plan and Notes. See Attachment G-08A. Reduced sized print of this sheet is also attached for clarity.

Sheet G-09 : Revised Plan and Notes. See Attachment G-09A. Reduced sized print of this sheet is also attached for clarity.

Sheet G-10 : Revised Plan and Note. See Attachment G-10A. Reduced sized print of this sheet is also attached for clarity.

Sheet G-11 : Revised Plan and Note. See Attachment G-11A. Reduced sized print of this sheet is also attached for clarity.

Sheet A-02 : Revised Note. See attachment A-02A.

Sheet D-02 : Revised Plan and Note. See Attachments D-02A, and D-02B.

Sheet C-03 : Revised grading plan for Pond 3B. See Attachment C-03A.

Sheet C-07 : Modified for clarity. See the attached reduced size print of Sheet C-07.

Sheet C-11 : Added Pond Classification, and revised Note. See Attachment C-11A.

Sheet C-14 : Added Pond Classification,revised grading Plan and Note. See Attachment C-14A, C-14B, and C-14C.

Sheet C-15 : Modified for clarity. See the attached reduced size print of Sheet C-15.

Sheet C-21 : Shows limit of work. See Attachment C-21A.

Sheet C-22 : Added SMH descriptions. See Attachment C-22A.

Sheet P-05 : Clarified dimension for Typical Access Road Section. See Attachment P-05A.

Sheet U-01 : Added Note. See Attachment U-01A.

Sheet U-03 : Revised Plans for clarity. See Attachment U-03A, and U-03B.

Sheet U-16 : Typographical error corrected. See Attachment U-16A.

Sheet U-17 : Revised Drainage Sructure descriptions. See Attachments U-17A and U-17B.

Sheet U-18A: Added lable for clarity.Plans for clarity. See Attachment U-18A-A.

Sheet E-09 : Revised Detail. See Attachment E-09A.

Sheet R-02 : Revised Sediment Basin Data Table, Ponds and grading contours shown. See the attached reduced size print of Sheet R-02.

Sheet R-03 : Pond and grading contours shown. See the atached reduced size print of Sheet R-03.

Sheet R-04 : Ttypographical errors corrected. See the attached reduced size print of Sheet R-04.

Sheet R-05 : Typographical errors corrected. See the attached reduced size print of Sheet R-05.

Response to written inquiries

Responses to the attached written inquiries from IA Construction Corporation, dated April 16, 1998, are as follows:

1. Other than the designated storage area shown on the Plans, materials and equipment can be stored on site except on the Lockheed-Martin and Skytech building areas. Permission for additional storage area must be requested through the airport manager.

2. New Bid Tabulation Forms are provided in Addendum 1.

3. See revised Sheets G-08 through G-11 for clarification of the scope of work for each alternate. Sheets C-04 and C-16 are NIC. Sheets C-07 and C-15 are revised (see the attached reduced size prints).

4. Time will stop during a winter shut down period, to be issued solely by MAA. However, the Contractor may be allowed to work in this period provided that the work is not weather sensitive, in MAA's sole opinion.

5. MAA has determined that the unit price of the same items must be the same for each alternate.

6. Wetland Mitigation is included in the Base Project. Bid Tabulation Forms incorporating additional items for Wetland Mitigation are included in this Addendum. Plans and specifications will be provided by MAA in Addendum 2.

7. The MBE list is not required until 10 days after the Notice of Recommended Award is issued. MBE's must be certified by MDOT by the contract award time.

8. Permits to br e obtained by Contractors include haul route, dumping, utility crossing State/County Roads, temporary power, communication and sanitary.

9. See revision included in this Addendum.

10. Demolished concrete must be legally disposed of by the Contractor off the airport site.

11. See revised page included in this Addendum.

12. There will be more excavation than embankment for this project. Surplus must be disposed of off sthe airport site by the Contractor. Borrow material is not required.

13. Missing pages T-905-1 and 2 are included in this Addendum.

14. Stone bedding is required for all storm drain pipe, see pipe bedding detail shown on Sheet U-17. Stone bedding is incidental to the linear foot items.

15. See revised page included in this Addendum.

16. The taxiway safety and object free areas are shown on the revised drawing Sheets G-08 through G-11 included in this Addendum.

17. There are no limits on the number of taxiway closures. However, prior to permission for each closure must be granted by the airport manager 48 hours in advance.

18. No other hazardous material was found in the existing buildings.

Responses to the attached written inquiries from Pott & Callahan, Inc. are as follows:

1. See revised drawing Sheets G-08 through G-11, included in this Addendum, for the scope/limit of work for the Base Project and each alternate. For each work area, see R-Series drawings for limit of disturbance.

2. The Contractor should first familiarize himself with each bid alternate shown on Sheets G-08 through G-11, and then follow the rest of the contract drawings to execute the work.

3. The existing stockpile and sediment trap are shown on survey (T-series), demolition (D-series) and civil (C-series) drawings. These works are part of Bid Item P-152.4.

4. No. Excavation quantities exceed embankments. Surplus material spoils must be disposed of off the airport site by the Contractor.

Responses to the attached written inquiries from Ben Field Electric, dated April 23, 1998, are as follows:

1. Padmounted switchgear, distribution transformers, and cabling are to be provided and installed by BG&E to BG&E Standardsrequirements. This work is part of Bid Item 16000.1.

2. Unit heater and ventilation system for the pumphouse are part of Bid Item 1000.1.

3. Item 16900.1 is to include only the autodialer system. The local alarm components are to be included with Item 427.1 - Oil/Water Separator, and Item 1300.9 - Sanitary Sewer Pump Station respectively.

4. The pumphouse fire alarm system is part of Item 16900.1 - General Instrumentation.

5. Yes. The sewage pumping station shall be pre-wired, and shall have overcurrent protection (circuit breaker or fuse) at the point of connection for electric power.

6. Sheet E-06 show which poles are not-in-contract, or to be included in the bid alternates. For Add Alternate 2 (Pole Nos. 6A through 11), the Contractor is to terminate the luminaire wiring (wires from luminaire) at the base of Poles 6A through 11. All other luminaire wiring is to be connected to circuits from Panel P-1 at the fire pumphouse.

7. Use schedule 80 PVC for direct buried conduit.

8. There are four (4) sanitary sewer pump stations for this project. See Sheets C-06, C-21 and C-22.

9. This is a State project on State property. Inspection will be provided by MAA and their Construction management Consultant.

10. The Contractor is responsible for obtaining a 3ϕ, 4-wire 480Y/277V (200 max. Amp.) Electrical services from BG&E in accordance with BG&E requirements. This work is to be included under Item 16000-1. BG&E will provide the meter and meter socket for this type of service.

11. The Contractor is required to coordinate with the telephone company, and provide all necessary incidentals for the Telephone Termination Cabinet.

Attention: Suzette Moore

RE: Martin State Airport Midfield Terminal Complex Site Development
MAA-CO-97-019

Dear Suzette,

The following are the questions that we had asked at the pre bid meeting of April 15,1998.

1) Please clarify exactly where we are allowed to store materials and equipment at locations other than the designated staging area.
2) What is acceptable for entry in the bid forms for the items that have a zero bid quantity?
3) Several sheets in the contract plans include work that is not included in this contract. Some of these sheets are not clear as to what is not included. Some examples are C-04, C-07, C-15 and C-16. Please clarify.
4) Page GI-7 of the specifications discusses the contract time and the exclusion of a winter shutdown. Does this mean that even though this is a calendar day project, time will stop for a winter shutdown? Who will determine when this time begins and ends? May any work be performed during this shutdown?
5) The specs require that the same items in different alternates must have the same unit price. The unit price for many items of work may vary greatly depending on the proposed quantity. We request that we be allowed the option to bid same items at different unit prices.
6) Page GI-8 discusses the issuance of wetland mitigation plans. Will these plans be issued prior to the bid opening? Will this work be part of the base bid?
7) Page GI-7 states that the MBE package will be submitted at the time of bid. Is this correct?
8) Item 10 page 10-2 section 10-3 #3.3 states that the contractor is to obtain the required permits for the project. Exactly which permits are we to obtain?
9) Item 101 page 101-2 section 101-2 2.1 E states "Item 0000". Please clarify.
10) Please clarify what we are supposed to do with any demolished concrete on the project. Page 101-1 – 2.1D, page 100-1 – 2.3 and page 206-1 – 2.4 seem to conflict each other on this issue.
11) My specification book includes two different page 29 in section 02080 Asbestos Removal. Please clarify.

IA Construction, Area 6
PO Box 210
White Marsh, MD 21162
Tel. (410) 335-0391
Fax (410) 335-6242

12) Please clarify Item P-152 Excavation and Embankment section 152-2 2.2 B. There is no grading table in the plans. Does the site balance? If not is there an on site disposal area? Should there be a contingent borrow item?
13) My spec book is missing pages T-905-1 and T-905-2.
14) Item D-701 section 701-3 3.2 A. 1. Discusses the use of stone bedding under storm drain pipe. Is stone bedding to be used under all storm drain pipe? Is this work incidental to the linear foot items?
15) Item D-752 section 752-3 3.1 C states "Item xxxxx". Please clarify.
16) The exact location of the taxiway safety area and taxiway object free area during construction is not indicated anywhere on the contract plans. Please clarify.
17) Are there any limits on the number of taxiway closures?
18) A note on sheet D-01 says, "remove asbestos and other hazardous materials from existing buildings". The specifications only the possibility and procedures for asbestos removal. What other hazardous materials can we expect to find on site?

Please contact me if you have any questions.

Sincerely,

John Kelble

Re: Midfield Terminal Complex Site Development, Phase I
MAA-CO-97-019

Gentleman:

The following are several questions regarding the above referenced project:

1 - On drawing E-05, the "Proposed Midfield Power Distribution" riser indicates two S & C Padmounted Switchgears and three transformers, are we to furnish and install the above mentioned material? If so, please provide correct kva sizing and specifications for the medium voltage transformers and indicate what bid items are to be utilized.

2 - On drawing E-10, the Fire Pump heating and ventilation equipment schedule is indicating catalog numbers. Are we to assume that this equipment is part of the "1000.1-Pre-Engineered Metal Building", since the ventilation fan is specified and the unit heater is not specified in that particular specification?

3 - On drawing E-08, the "Proposed Tank High Level Alarm Panels", indicates several alarm panels for the sewage lift stations and oil/sperator tanks, are we to assume that this is part of "16900.1-General Instrumentation" or is this part of the "427.111/Water Separator" and "1300-Sanitary Sewage Pump Station System" since there is a float sensor and control panel dialers in each of these specifications?

4 - On drawing U-14, the Pumphouse Fire Alarm diagram indicates a fire alarm system, where is the bid item for the fire alarm system and what trade is responsible for the furnishing and installation? Is it going to be bid under item "1000.1 - Pre-Engineered Metal Building" or under "16900.1-General Instrumentation"?

5 - The sewage pumping stations have a power connection, are we to assume that all disconnects, starters, level switches, generator and alarms will be prewired by the "1300.9-Sanitary Sewage Pump Station" contractor, and the electrical contractor will come to a one point connection for the alarm and power connections?

6 - On drawing E-06, the "Parking & Access Road Area Lighting Luminaire Schedule", please explain note number one in more detail. There seems to be a confusion on the scope of work for these poles, since some of the poles are not-in-contract.

(continued)

April 23, 1998

Maryland Aviation Administration

Attn: Ms. Suzette Moore

Re: Midfield Terminal Complex Site Development, Phase I
MAA-CO-97-019

---

7 - On drawing E-09, the "Direct Buried Conduit Trench Detail", indicates schedule 80 pvc conduit, but in the specifications item "L-110" it indicates schedule 40 pvc conduit. Which one is correct?

8 - In the bid forms, the bid item number "1300.3-Sanitary Sewer Pump Station" indicates a quantity of four pump stations, but on on the drawings there are only three. Please indicate where the extra pumping station is located.

9 - Does this project require pulling an electrical permit from either the local jurisdiction or a independent inspection organization acceptable to MAA?

10 - Who is responsible for the watt-hour meter and CT cabinet at the Pumphouse?

11 - Is there a requirement to supply a plywood backboard and punch-down blocks in the Telephone Termination Cabinet? If so please specify all requirements.

Thank You.
Benfield Electric Co., Inc.

final payment. Final payment will not be made until this certification is executed.

PART 4 METHOD OF MEASUREMENT

4.1 There will be no direct measurement for payment of the work specified in this Item. Work under this Item will be paid for on a lump sum basis as specified in Section 5.1 below.

PART 5 BASIS OF PAYMENT

5.1 Payment will be made at the contract lump sum price for asbestos removal. This price shall be full compensation for all materials, equipment, labor, and incidentals necessary to complete the item in accordance with the plans and the provisions of this Item.

Payment will be made under:

Item 2080.1 Asbestos Removal -- lump sum

END OF ITEM 2080

where labeling is specified elsewhere. For panelboards, provide framed, typed circuit schedules with explicit description and identification of items controlled by each individual breaker.

N. Install labels at locations indicated and at locations for best convenience of viewing without interference with operation and maintenance of equipment.

O. Underground Electrical Line Identification: During trench backfilling for exterior underground power and telephone conduits, install continuous underground plastic line marker, located directly above conduit at 6 to 8 inches below finished grade. Where multiple power conduits installed in common trench, do not exceed an overall width of 16 inches; install a single line marker.

16195-4 COMPENSATION

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work item of this Item by lump sum.

4.2 BASIS OF PAYMENT

A. Payment for the work of this Item will be included as part of the payment item listed below.

B. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

4.3 PAYMENT ITEM

Item 16195.1 Labeling and Identification -- lump sum

END OF ITEM 16195

ITEM 16321 POLE MOUNT TRANSFORMER

16321-1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

B. Requirements of the following Items apply:

1. Basic Electrical Requirements.
2. Basic Electrical Materials and Methods.

1.2 SUMMARY

A. This item includes 60 hertz, oil insulated, self-cooled, pole mount distribution transformers.

1.3 SUBMITTALS

A. General: Submit the following in accordance with Standard Provisions.

B. Product data for each type transformer and component specified.

C. Shop drawings from manufacturers of transformers including dimensioned plans, sections, and elevations. Show tabulations of installed devices, major features, and voltage rating. Include the following:

1. Enclosure type with details.
2. Current ratings.
3. Features, characteristics, ratings, and factory settings of devices and auxiliary components.

D. Qualification data for field-testing organization certificates, signed by the Contractor, certifying that the organization complies with the requirements specified in Quality Assurance below. Include list of completed projects with project names, addresses, and names of Engineer and Owner plus basic organization qualifications data.

E. Report of field tests and observations certified by the testing organization.

1.4 QUALITY ASSURANCE

A. Listing and Labeling: Provide products specified in this Section that are listed and labeled.

1. The terms "listed" and "labeled" shall be defined as they are in the National Electrical Code, Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

C. Electrical Standard: Components and installation shall comply with ANSI and NEMA material standards and local electric utility installation guidelines.

16321-2 PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the Work include, but are not limited to, the following:

1. General Electric Co.
2. Cooper Power Systems.
3. Kuhlman Corporation.
4. Howard Industries.

2.2 POLE MOUNT TRANSFORMERS

A. General: ANSI Design, Conventional dual high voltage bushings.

B. Insulation Class:

1. High voltage BIL: 95 kV.
2. Low voltage BIL: 30 kV.

C. Ratings: 13.2kV- 120/240V, single phase, 10kVA.

D. Voltage Taps: Two 2½ percent above and below.

16321-3 EXECUTION

3.1 INSTALLATION

A. Install transformers and associated wiring in accordance with MAA, BG&E, and ANSI C2 - National Electrical Safety Code.

B. Furnish primary lightning arresters, and fused cutouts as required.

C. Furnish equipment grounds in accordance with Specification Item 16450.

16321-4 COMPENSATION

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work item of this Item by the unit.

4.2 BASIS OF PAYMENT

A. Payment for the work of this Item will be included as part of the payment item listed below.

B. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

4.3 PAYMENT ITEM

Payment for this work will be made under:

Item 16321.1 Pole Mount Transformers -- Per Each

END OF ITEM 16321

ITEM T-905 TOPSOILING

905-1 DESCRIPTION

1.1 This item shall consist of preparing the ground surface for topsoil application, removing topsoil from stockpiled topsoil resulting from stripping operations performed under Item P-152, and placing and spreading the topsoil on prepared areas in accordance with this specification at the locations shown on the plans or as directed by the Engineer. This item shall include furnishing and installing erosion control netting on prepared surfaces inside stormwater management basins as shown on the plans.

1.2 The quantity of topsoil work required under this Item shall be limited to the quantity required to cover the surfaces of the proposed stormwater management basins as shown on the plans. The approximate quantity required to accomplish this is shown on the plans. The Contractor shall be responsible for verifying the actual quantity of topsoil required from the grades and sections shown on the plans. Any topsoil remaining after the completion of this work, or topsoil stripped in excess of the quantity required shall, at MAA's option, remain the property of MAA, and the Contractor shall be entitled to no additional compensation under this Item.

905-2 MATERIALS

2.1 TOPSOIL:

Topsoil shall be the surface layer of soil with no admixture of refuse or any material toxic to plant growth, and it shall be reasonably free from subsoil and stumps, roots, brush, stones (2 inches or more in diameter), clay lumps or similar objects. Brush and other vegetation which will not be incorporated with the soil during handling operations shall be cut and removed. Ordinary sods and herbaceous growth such as grass and weeds are not to be removed but shall be thoroughly broken up and intermixed with the soil during handling operations. The topsoil or soil mixture, unless otherwise specified or approved, shall have a pH range of approximately 5.5 pH to 7.6 pH, when tested in accordance with the methods of testing of the association of official agricultural chemists in effect on the date of invitation of bids. The organic content shall be not less than 3% nor more than 20% as determined by the wet-combustion method (chromic acid reduction). there shall be not less than 20% nor more than 80% of the material passing the 200 mesh (0.075 mm) sieve as determined by the wash test in accordance with ASTM C 117. Natural topsoil may be amended by the Contractor with approved materials and methods to meet the above specifications.

2.2 INSPECTION AND TESTS:

The topsoil shall be inspected to determine if the stripped material meets the requirements specified and to determine the depth to which stripping will be permitted. At this time, the Contractor may be required to take representative soil samples from several locations within the area under consideration and to the proposed stripping depths, for testing purposes as specified in 905-2.1.

2.3 EROSION CONTROL NETTING:

Erosion control netting shall be of the type specified on the plans and shall meet the requirements of the 1994 Standards and Specifications for Erosion and Sediment Control, Maryland Department of the Environment.

905-3 CONSTRUCTION METHODS

3.1 GENERAL:

A. Areas to be topsoiled shall be shown on the plans. If topsoil is available on the site, the location of the stockpiles or areas to be stripped of topsoil and the stripping depths shall be shown on the plans.

B. Suitable equipment necessary for proper preparation and treatment of the ground and for the handling and placing of all required materials shall be on hand, in good condition, and approved by the Engineer before the various operations are started.

3.2 PREPARING THE GROUND SURFACE:

A. Immediately prior to dumping and spreading the topsoil on any area, the surface shall be loosened by discs or spike-tooth harrows, or by other means approved by the Engineer, to a minimum depth of 2 inches (50 mm) to facilitate bonding of the topsoil to the covered subgrade soil. The surface of the area to be topsoiled shall be cleared of all stones larger than 2 inches (50 mm) in any diameter and all litter or other material which may be detrimental to proper bonding, the rise of capillary moisture, or the proper growth of the desired planting. Limited areas, as shown on the plans, which are too compact to respond to these operations shall receive special scarification.

B. Grades on the area to be topsoiled, which have been established by others as shown on the plans, shall be maintained in a true and even condition. Where grades have not been established, the areas shall be smooth-graded and the surface left at the prescribed grades in an even and properly compacted condition to prevent, insofar as practical, the formation of low places or pockets where water will stand.

3.3 OBTAINING TOPSOIL:

A. Prior to the stripping of topsoil from designated areas, any vegetation, briars, stumps and large roots, rubbish or stones found on such areas, which may interfere with subsequent operations, shall be removed using methods approved by the Engineer. Heavy sod or other cover, which cannot be incorporated into the topsoil by discing or other means shall be removed. When suitable topsoil is available on the site, the Contractor shall remove this material from the designated areas and to the depth as directed by the Engineer. The topsoil shall be spread on areas already tilled and smooth-graded, or stockpiled in areas approved by the Engineer. Any topsoil stockpiled by the Contractor shall be rehandled and placed without additional compensation. Any topsoil that has been stockpiled on the site by others, and is required for topsoiling purposes, shall be removed and placed by the Contractor. The sites of all stockpiles and areas adjacent thereto which have been disturbed by the Contractor shall be graded if required and put into a condition acceptable for seeding.

B. When suitable topsoil is secured off the airport site, the Contractor shall locate and obtain the supply, subject to the approval of the Engineer. The Contractor shall notify the Engineer sufficiently in advance of operations in order that necessary measurements and tests can be made. The Contractor shall remove the topsoil from approved areas and to the depth as directed. The topsoil shall be hauled to the site of the work and placed for spreading, or spread as required. Any topsoil hauled to the site of the work and stockpiled shall be rehandled and placed without additional compensation.

3.4 PLACING TOPSOIL:

A. The topsoil shall be evenly spread on the prepared areas to a uniform depth of 2 inches (50 mm) after compaction, unless otherwise shown on the plans or stated in the special provisions. Spreading shall not be done when the ground or topsoil is frozen, excessively wet, or otherwise in a condition detrimental to the work. Spreading shall be carried on so that turfing operations can proceed with a minimum of soil preparation or tilling.

10. EXISTING AIRFIELD LIGHTING SYSTEMS – INTERRUPTION TO EXISTING AIRFIELD LIGHTING SYSTEMS NOT INCLUDED IN THIS PROJECT SHALL NOT BE PERMITTED. ALL AIRFIELD LIGHTING CIRCUITS AFFECTED BY THIS PROJECT SHALL BE TEMPORARILY MAINTAINED BY THE CONTRACTOR DURING OPERATIONAL PERIODS IN ACCORDANCE WITH THE SPECIFICATIONS AND/OR AS DIRECTED BY THE ENGINEER.

11. PORTABLE FLOODLIGHTING – THE CONTRACTOR SHALL PROVIDE PORTABLE FLOODLIGHTING AS REQUIRED FOR CONSTRUCTION OPERATIONS. THE CONTRACTOR SHALL PROVIDE SUFFICIENT UNITS SO THAT ALL WORK AREAS ARE ILLUMINATED TO A LEVEL OF FIVE (5) HORIZONTAL FOOT CANDLES. THE LIGHTING LEVEL SHALL BE CALCULATED AND MEASURED IN ACCORDANCE WITH THE CURRENT STANDARD OF THE ILLUMINATION ENGINEERING SOCIETY. COORDINATE THE USE OF FLOODLIGHTING WITH THE CONTROL TOWER TO ENSURE LIGHT DOES NOT COMPROMISE THE CONTROL TOWER'S VISIBILITY, OR CREATE CONFUSION FOR THE PILOTS.

12. THE CONTRACTOR SHALL OBTAIN ALL PERMITS AND LICENSES REQUIRED FOR FOR THE PROJECT'S WORK AT HIS OWN EXPENSE.

13. EXISTING TOPOGRAPHIC FIELD SURVEYS FOR THIS PROJECT AREA WERE PERFORMED BY A. MORTON THOMAS AND ASSOCIATES, INC. IN 1997.

14. THE CONTROLS ON THIS PROJECT ARE TIED TO :
HORIZONTAL: MARYLAND COORDINATE SYSTEM.
VERTICAL: NATIONAL GEODETIC VERTICAL DATUM 1929.

15. FOR WETLAND MITIGATION PLANS AND SPECIFICATIONS, SEE WETLAND MITIGATION PLAN AND SPECIFICATION SETS BY URS GREINER, INC. UNDER SEPARATE COVER.

16. FOR LIMIT OF BASE PROJECT, AND EACH ALTERNATE, THE CONTRACTOR IS REQUIRED TO FOLLOW SHEETS G–08 THROUGH G–11, D–01 THROUGH D–06, ALL A–SERIES, AND ALL C–SERIES SHEETS.

BASE PROJECT

1. SITE CLEARING AND GRUBBING, INCLUDING REMOVAL OF HAZARDOUS MATERIALS, DEMOLITION OF EXISTING BUILDINGS, AND REMOVAL OF THE EXISTING SOIL STOCKPILE.

2. CONSTRUCT PROPOSED ACCESS ROAD.

3. INSTALL UTILITY SERVICES AS FOLLOWS:

   A. WATER (FOR DOMESTIC AND FIRE SUPPRESSION SYSTEMS)
   B. SANITARY SEWER
   C. ELECTRIC.
   D. COMMUNICATIONS.
   E. GAS MAIN.
   F. CABLE TELEVISION.

1

4. CONSTRUCT POND 1.

5. CONSTRUCT WATER TANK AND PUMP HOUSE EQUIPMENT FOR FIRE SUPPRESSION SYSTEM.

6. CONSTRUCT STORM DRAINAGE SYSTEM BETWEEN ACCESS ROAD AND POND 1.

7. CONSTRUCT WETLANDS MITIGATION AREA (SEE WETLAND MITIGATION PLANS ATTACHED).

1

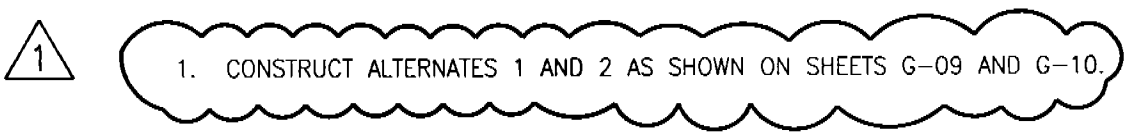
ADD ALTERNATE 1

1. CONSTRUCT SKYTECH APRON, TAXIWAY L, ACCESS ROAD EXTENSION, PARKING LOT, AND ASSOCIATED ELECTRICAL APPURTENANCES.
2. CONSTRUCT PONDS 3A AND 3B.
3. CONSTRUCT STORM DRAINAGE SYSTEM BETWEEN APRON AND POND 3A. INSTALL OIL/WATER SEPARATOR AND ASSOCIATED STRUCTURES AT SKYTECH APRON ONLY. GRADE REMAINING AREAS 1 AND 2 WITHIN LIMIT OF WORK SHOWN AND INSTALL REMAINING STORM DRAINAGE SYSTEM.
4. CONSTRUCT STORM DRAINAGE SYSTEM FOR SKYTECH PARKING LOT.

ADD ALTERNATE 2

1. CONSTRUCT LOCKHEED-MARTIN APRON, TAXIWAY J, ACCESS ROAD EXTENSION, PARKING LOT, AND ASSOCIATED ELECTRICAL APPURTENANCES.
2. CONSTRUCT PONDS 3A AND 3B.
3. CONSTRUCT STORM DRAINAGE SYSTEM FOR APRON AND POND 3A. INSTALL OIL/WATER SEPARATOR AND ASSOCIATED STRUCTURES AT LOCKHEED-MARTIN APRON ONLY. GRADE REMAINING AREAS 2 AND 3 WITHIN LIMIT OF WORK SHOWN AND INSTALL REMAINING STORM DRAINAGE SYSTEM.
4. CONSTRUCT STORM DRAINAGE SYSTEM FOR LOCKHEED-MARTIN PARKING LOT.

ADD ALTERNATE 3



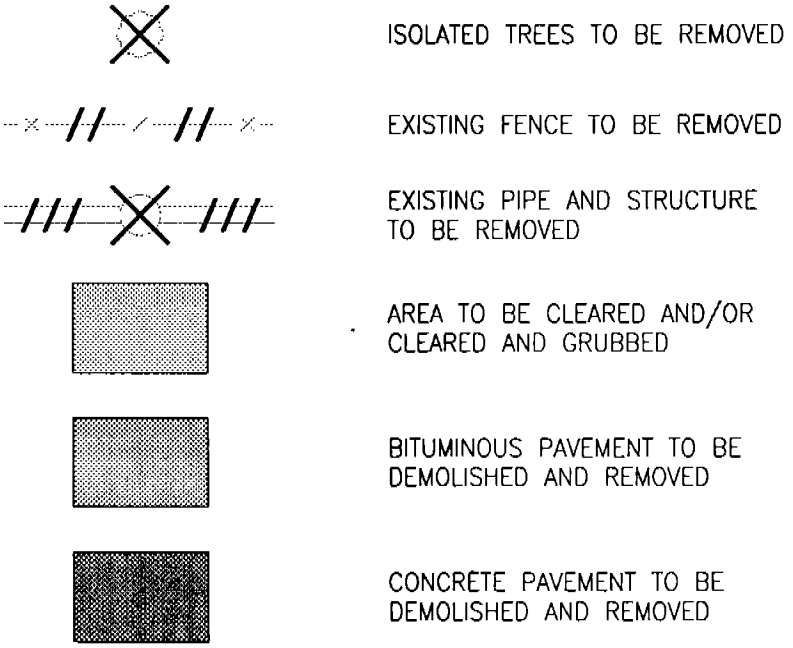
STAGE 2 CONSTRUCTION

1. CLEAR/CRUB REMAINDER OF SITE.
2. ESTABLISH PERIMETER EROSION AND SEDIMENT CONTROLS FOR STAGE 2 WORK AREA.
3. EXCAVATE PONDS 3A/3B, STRUCTURES, SET UP AS SEDIMENT BASIN (PER SHEET R-02)
4. VERIFY LOCATIONS OF EXISTING UTILITY, AND LOCATE UTILITIES TO BE REMOVED AND/OR ABANDONED.
5. DEMOLISH AND REMOVE REMAINDER OF ASPHALT AND CONCRETE PAVEMENT ACCESS SITE.
6. REPLACE MANHOLE ON EXISTING 48" TRUNK DRAINAGE LINE (SEE SHEETS D-02 AND C-01) (ADD ALTERNATE 1 ONLY).
7. CONTINUE REMOVAL AND DISPOSAL OF SOIL STOCKPILE.
8. CONSTRUCT SKYTECH PARKING LOT UP TO AND INCLUDING BITUMINOUS BASE COURSE.

1

9. SEE SAFETY REQUIREMENT DURING CONSTRUCTION NOTE (B) (2), SHEET G-02, FOR WORK ADJACENT TO ACTIVE TAXIWAY.

DEMOLITION LEGEND



DEMOLITION NOTES

1. THE SIZE AND LOCATION OF THE EXISTING PIPE AND STRUCTURES SHOWN IS APPROXIMATE ONLY. THE CONTRACTOR SHALL LOCATE THE EXISTING PIPE AND STRUCTURES BETWEEN THE INLET AND OUTFALL SHOWN ON SHEET D-04. THESE LOCATIONS SHALL BE MADE KNOWN TO THE ENGINEER BEFORE WORK IN THE VICINITY MAY BEGIN.

2. EXISTING BITUMINOUS SURFACE MAY BE REMOVED BY COLD MILLING OR OTHER MEANS APPROVED BY THE ENGINEER. DEMOLITION OF AIRFIELD PAVEMENTS SHALL BE CLOSELY COORDINATED WITH FINAL PAVING TO FOLLOW.

3. THE EXTENT OF THE EXISTING WATER SYSTEM SHOWN ON SHEET D-02 IS NOT KNOWN. THIS SYSTEM IS ASSUMED TO BE ABANDONED AND WILL BE REMOVED. COSTS FOR PIPE AND STRUCTURE REMOVAL WILL BE PAID FOR ON A UNIT PRICE BASIS AS SPECIFIED IN ITEM 100.

△1

4. EXISTING FACILITIES WITHIN THE LIMITS OF WORK WHICH ARE NOT SPECIFICALLY SHOWN TO BE ALTERED OR REMOVED SHALL REMAIN IN SERVICE AND UNDAMAGED THROUGH THE DURATION OF THE CONTRACT. WHERE THE DISPOSITION OF EXISTING FACILITIES IS UNCLEAR, OR FACILITIES ARE NOT SHOWN ON THESE PLANS ARE ENCOUNTERED, THE CONTRACTOR SHALL NOTIFY THE ENGINEER AND OBTAIN DIRECTION BEFORE PROCEEDING WITH WORK AFFECTING THE FACILITIES.

Site Development, Phase I
at
Martin State Airport
Contract No. MAA-CO-~~98-003~~ 97-019

ADDENDUM NUMBER 2

IMPORTANT: Bidders must acknowledge receipt of this Addendum on the Bid Proposal, Section 5, Page BF.18 stating the Addendum Number.

Addendum Date: April 27, 1998

Bid Date: May 12, 1998 at 11:00 a.m. local time

REVISIONS TO TECHNICAL PROVISIONS, CONTRACT PLANS AND BID FORMS

GENERAL

1. Wetland mitigation work is being added to the Contract. The Bid Forms issued as part of Addendum No. 1 include the wetland mitigation items. The Plan Sheets and revisions to Technical provisions are part of this Addendum No. 2.

2. Add the following new drawings to Paragraph G-1.09 List of Drawings:

WM-1	Wetland Mitigation Grading Plan
WM-2	Wetland Mitigation Illustrative Site Sections
WM-3	Wetland Mitigation Soil Borings
WM-4	Wetland Mitigation Erosion and Sediment Control Plan
WM-5	Wetland Mitigation Erosion and Sediment Control Details
WM-6	Wetland Mitigation Erosion and Sediment Control Details
WM-7	Wetland Mitigation Planting Plan

WM-8	Wetland Mitigation Planting Details and Schedules
WM-9	Wetland Mitigation Planting Details
WM-10	Wetland Mitigation Planting Details and Schedules

These new Sheets are attached to this Addendum No. 2

REVISIONS TO TECHNICAL SPECIFICATIONS

1. Add the following to the end of the Table of Contents:

Item 705	Permanent Seeding and Mulching, Wetland Mitigation Area	705-1-705-8
Item 710	Planting Trees and Shrubs	710-1-710-10
Item 711	Planting Wetland Vegetation	711-1-711-5

These new Technical Specifications are attached to this Addendum No. 2.

2. Item 101 Clearing and Grubbing

Add the following under 101-4.2:

"Item 101.3	Clearing and Grubbing, Wetland Mitigation Area -- per acre"
"Item 101.4	Clearing Isolated Trees, Type I, Wetland Mitigation Area -- each"

3. Item 108 Mobilization/Demobilization

Add the following under 108-3.5:

"Item 108.3 Mobilization/ Demobilization, Wetland Mitigation Area -- lump sum"

4. Item 109 Temporary Construction Items

Add the following under 109-5.1:

"Item 109.2 Temporary Construction Items, Wetland Mitigation Area -- lump sum"

5. Item 308 Erosion and Sediment Control

Add the following:

"308-2.3 TURBIDITY CURTAIN.

a. Barriers should be a bright color (yellow or "international" orange are recommended).

b. The curtain fabric must meet the following minimum requirements:

PHYSICAL PROPERTIES OF TURBIDITY CURTAIN FABRIC

Physical Property	Requirement
Thickness, mils	45
Weight/oz./sq. yd.	22
Grab Tensile Strength, lbs.	300
UV Inhibitor	Must be included

c. Seams in the fabric shall be either vulcanized welded or sewn, and shall develop the full strength of the fabric.

d. Flotation devices shall be flexible, buoyant units contained in an individual floatation sleeve or collar attached to the curtain. Buoyancy provided by the floatation units shall be sufficient to support the weight of the curtain and maintain a freeboard of at least 3 inches above the water surface level.

e. Load lines must be fabricated into the bottom of all floating turbidity curtains. Load lines shall be fabricated into the top of the fabric. The top load line shall consist of woven webbing or vinyl-sheathed steel cable and shall have a break strength in excess of 10,000 pounds. The supplemental (bottom) load line shall consist of a chain incorporated into the bottom hem of the curtain of sufficient weight to serve as ballast to hold the curtain in a vertical position. Additional anchorage shall be provided as necessary. The load lines shall have suitable connecting devices which develop the full breaking strength for connecting to load lines in adjacent sections.

f. External anchors shall be bottom anchors.

g. Bottom anchors must be sufficient to hold the curtain in the same position relative to the bottom of the watercourse without interfering with the action of the curtain. The anchor may dig into the bottom (grappling hook, plow or fluke-type) or may be weighted (mushroom type) and should be attached to a floating anchor buoy via an anchor line. The anchor line would then run from the buoy to the top load line of the curtain. These lines must contain enough slack to allow the buoy and curtain to float freely with tidal changes without pulling the buoy or curtain down and must be checked regularly to make sure they do not become entangled with debris. Anchor spacing will vary with

current velocity and potential wind and wave action; manufacturer's recommendations should be followed.

6. Item 308 Erosion and Sediment Control

Add the following:

"308-3.5 TURBIDITY CURTAIN.

a. The Contractor shall set all the curtain anchor points. Care must be taken to ensure that anchor points are of sufficient holding power to retain the curtain under the existing current conditions, prior to putting the furled curtain into the water. Anchor buoys shall be employed on all anchors to prevent the current from submerging the floatation at the anchor points. The Contractor shall provide anchors on both sides of the curtain. When the anchors are secure, the Contractor shall secure the furled curtain to the upstream anchor point and then sequentially attach to each next downstream anchor point until the entire curtain is in position. At this point and before unfurling, the "lay" of the curtain should be assessed and any necessary adjustments made to the anchors. Finally, when the location is ascertained to be as desired, the furling lines should be cut to allow the skirt to drop.

b. The Contractor shall attach anchor lines to the floatation device, not to the bottom of the curtain. The anchoring line attached to the floatation device on the downstream side will provide support for the curtain. Attaching the anchors to the bottom of the curtain could cause premature failure of the curtain due to the stresses imparted on the middle section of the curtain.

c. **Removal.** The Contractor shall exercise care to protect the skirt from damage as the turbidity curtain is removed from the water. The site selected to bring the curtain ashore shall be free of sharp rocks, debris, etc. so as to minimize damage when hauling the curtain over the area. In no case shall the Contractor haul the curtain across areas recently planted with wetland mitigation. If the curtain has a deep skirt, it can be further protected by running a small boat along its length with crew installing furling lines before attempting to remove the curtain from the water.

d. **Maintenance.** The Contractor shall be responsible for maintenance of the filter curtain for the duration of the project in order to ensure the continuous protection of the water course. Should repairs to the geotextile fabric become necessary, the Contractor shall use a repair kit available from the manufacturer. Manufacturer's instructions shall be closely followed to ensure the adequacy of the repair. When the curtain is no longer required as determined by the inspector, the curtain and related components shall be removed in such a manner as to minimize turbidity. Remaining sediment shall be

sufficiently settled before removing the curtain. Sediment may be removed and the original depth (or plan elevation) restored. Any spoils must be taken to upland area and be stabilized.

The Contractor shall set all the curtain anchor points. Care must be taken to ensure that anchor points are of sufficient holding power to retain the curtain under the existing current conditions, prior to putting the furled curtain into the water. Anchor buoys shall be employed on all anchors to prevent the current from submerging the floatation at the anchor points. The Contractor shall provide anchors on both sides of the curtain. When the anchors are secure, the Contractor shall secure the furled curtain to the upstream anchor point and then sequentially attach to each next downstream anchor point until the entire curtain is in position. At this point and before unfurling, the "lay" of the curtain should be assessed and any necessary adjustments made to the anchors. Finally, when the location is ascertained to be as desired, the furling lines should be cut to allow the skirt to drop.

b. The Contractor shall attach anchor lines to the floatation device, not to the bottom of the curtain. The anchoring line attached to the floatation device on the downstream side will provide support for the curtain. Attaching the anchors to the bottom of the curtain could cause premature failure of the curtain due to the stresses imparted on the middle section of the curtain.

c. **Removal.** The Contractor shall exercise to protect the skirt from damage as the turbidity curtain is removed from the water. The site selected to bring the curtain ashore shall be free of sharp rocks, debris, etc. so as to minimize damage when hauling the curtain over the area. In no case shall the Contractor haul the curtain across areas recently planted with wetland mitigation. If the curtain has a deep skirt, it can be further protected by running a small boat along its length with crew installing furling lines before attempting to remove the curtain from the water.

d. **Maintenance.** The Contractor shall be responsible for maintenance of the filter curtain for the duration of the project in order to ensure the continuous protection of the water course. Should repairs to the geotextile fabric become necessary, the Contractor shall use a repair kit available from the manufacturer. Manufacturer's instructions shall be closely followed to ensure the adequacy of the repair. When the curtain is no longer required as determined by the inspector, the curtain and related components shall be removed in such a manner as to minimize turbidity. Remaining sediment shall be sufficiently settled before removing the curtain. Sediment may be removed and the original depth (or plan elevation) restored. Any spoils must be taken to upland area and be stabilized.

7. Item 308 Erosion and Sediment Control

Add the following:

"308-4.2 Turbidity curtain will be measured at the contract unit price per linear foot installed in accordance with the plans and specifications of this item and accepted by the Engineer."

8. Item 308 Erosion and Sediment Control

Add the following under 308-5.1:

"Item 308.13 Class I Rip Rap Spillway Protection, Wetland Mitigation Area -- per square yard"

"Item 308.14 Stabilized Construction Entrance, Wetland Mitigation Area -- per square yard"

"Item 308.15 Super Silt Fence, Wetland Mitigation Area -- per linear foot"

"Item 308.16 Temporary Seeding and Mulching, Wetland Mitigation Area -- per acre"

9. Item 308 Erosion and Sediment Control

Add the following:

"308-5.2 Payment for turbidity curtain shall be made at the contract unit price per linear foot of turbidity curtain installed. The price shall be full compensation for furnishing all materials and for all preparation, installation, and removal of the turbidity curtain or completion of the work, and for all labor, equipment, tools, and incidentals necessary to complete the work.

Payment will be made under:

308-5.17 Turbidity Curtain, Wetland Mitigation Area–per linear foot"

10. Item P-152 Excavation and Embankment

Add the following under P-152-4.3:

"Item P-152.5 Stripping, Wetland Mitigation Area -- per cubic yard"

"Item P-152.6 Unclassified Excavation -- per cubic yard"

11. Item T-905 Topsoiling

Add the following under T-905-5.2:

"Item T-905.3 Topsoiling, Six Inch Depth, Wetland Mitigation Area -- per cubic yard"

REVISIONS TO BID FORMS

The Bid Forms issued as part of Addendum No. 1 include the wetland mitigation items and the quantities remain unchanged.

Item 710	Planting Trees and Shrubs	710-1- 710-10
Item 711	Planting Wetland Vegetation	711-1 - 711-5

END OF ADDENDUM NO. 2

ITEM 705 PERMANENT SEEDING AND MULCHING, WETLAND MITIGATION AREA

DESCRIPTION

705-1.1 This item shall consist of soil preparation, seeding, fertilizing, mulching, and liming the areas as shown on the plans or as directed by the Engineer in accordance with these Specifications and Section 705 of the MSHA Standard Specifications.

MATERIALS

705-2.1 SEEDS.

a. Wetland Seed Mix. The kinds of seed furnished shall be in accordance with Section 920.04 of the MSHA Standard Specifications. Seed must comply with the Maryland Seed Law, Agricultural Article of the Annotated Code of Maryland.

b. Seed shall be furnished in standard containers with the seed name, lot number, net weight, percentages of purity and of germination and hard seed, and percentage of maximum weed seed content clearly marked. The Contractor shall furnish the Engineer duplicate signed copies of a statement by the vendor certifying that each lot of seed has been tested by a recognized laboratory for seed testing within six months of date of delivery. This statement shall include: name and address of laboratory, date of test, lot number and the results of tests as to name, percentages of purity and of germination, and percentage of weed content for the seed furnished.

c. The percentage of weight of pure seed present shall be the freedom of such agriculture seeds from inert matter and from other seeds distinguishable by their appearance.

d. The percentage of germination shown for agriculture seed shall be actual sprouts and shall not include hard seeds unless specifically permitted.

e. Seed for wetland mitigation area (Wetland Seed Mix) shall meet the following requirements:

	Purity Not Less Than Percent	Minimum Percent Germination Including Hard Seed	Percent of Mix
Redtop (*Agrostis alba*)	92	80	40
Switchgrass (*Panicum virgatum*)	90	80	60
Total	–	--	100

705-2.2 MULCHING MATERIAL. Acceptable mulch shall be the materials listed below or any approved locally available material that is similar to those specified. Mulch materials, which contain matured seed of species which would volunteer and be detrimental to the proposed overseeding, or to surrounding farm land, will not be acceptable. Straw or other mulch material which is fresh and/or excessively brittle, or which is in such an advanced stage of decomposition as to smother or retard the planted grass, will not be acceptable.

a. Straw. Straw shall be the threshed plant residue of oats, wheat, barley, rye, or rice from which grain has been removed.

b. Manufactured Mulch. Cellulose-fiber or wood-pulp mulch shall be products commercially available for use in spray applications.

Within two weeks prior to the installation of the mulch, the Engineer shall be notified of sources and quantities of mulch materials available and the Contractor shall furnish him with representative samples of the materials to be used. These samples may be used as standards with the approval of the Engineer and any materials brought on the site which do not meet these standards shall be rejected.

705-2.3 LIME. Lime shall be ground limestone containing not less than 85 percent of total carbonates and shall be ground to such fineness that 90 percent will pass through a No. 20 mesh sieve and 50 percent will pass through a No. 100 mesh sieve. Coarser material will be acceptable, providing the rates of application are increased to provide not less than the minimum quantities specified on the basis of the two sieve requirements above. Dolomitic lime or a high magnesium lime shall contain at least 10 percent of magnesium oxide. Lime shall be applied at the rate of 3,500 pounds per acre or other amount as recommended by soil testing by an approved agricultural testing laboratory.

705-2.4 FERTILIZER. Fertilizer shall be standard commercial fertilizers supplied separately or in mixtures containing the percentages of total nitrogen, available phosphoric acid, and water-

soluble potash. They shall be applied at the rate and to the depth specified herein, and shall meet the specified requirements of all State and Federal regulations and to the standards of the Association of Official Agricultural Chemists. Commercial fertilizer shall be furnished in standard containers with name, weight, and guaranteed analysis of contents clearly marked thereon. No cyanamide compounds or hydrated lime shall be permitted in mixed fertilizers. Fertilizers failing to meet the specified analysis may be used as determined by the Engineer providing sufficient materials are applied to comply with the specified nutrients per unit of measure without additional cost to the Owner.

The fertilizers may be supplied in one of the following forms:

a. A dry, free-flowing fertilizer suitable for application by a common fertilizer spreader;

b. A finely-ground fertilizer soluble in water, suitable for application by power sprayers, or

c. A granular or pellet form suitable for application by blower equipment.

Fertilizers shall be 10-10-10 commercial fertilizer and spread at the rate recommended by an approved agricultural testing laboratory, or lacking such tests, fertilizer shall be applied at the rate of 400 pounds per acre.

705-2.5 SEEDING SEASONS. No seeding shall be done on frozen ground or when the temperature is 32 degrees F (0 degrees C) or lower. If the time required for completing any of the operations necessary under this item, within the specified planting season or any authorized extensions thereof, extends beyond the Contract period, then such time will be charged against the Contract time; and liquidated damages will be enforced with respect to this portion of work. Seeding seasons shall be as follows:

a. Regular Seeding Season - March 1 to May 15 and August 1 to October 20, inclusive.

b. Summer Seeding Season - May 16 to July 31, inclusive.

c. Late Fall Seeding Season - October 21 to November 20, inclusive.

CONSTRUCTION METHODS

705-3.1 GENERAL. Lime and fertilizer shall be applied to all areas receiving seed. Seed shall be applied to all graded or disturbed areas unless otherwise indicated on the plans or specifications.

705-3.2 ADVANCE PREPARATION AND CLEANUP. After grading of areas has been completed and before applying fertilizer and ground limestone, areas to be seeded shall be raked or otherwise cleared of stones larger than 2 inches in any diameter, sticks, stumps, and other debris which might interfere with sowing of seed, growth of grasses, or subsequent maintenance of grass-covered areas. If any damage by erosion or other causes has occurred after the completion of grading and before beginning the application of fertilizer and ground limestone, the Contractor shall repair such damage. This may include filling gullies, smoothing irregularities, and repairing other incidental damage.

An area to be seeded shall be considered a satisfactory seedbed without additional treatment if it has recently been thoroughly loosened and worked to a depth of not less than 4 inches as a result of grading operations and, if immediately prior to seeding, the top 3 inches of soil is loose, friable, reasonably free from large clods, rocks, large roots, or other undesirable matter, and shaped to the required grade. For slope areas steeper than 3:1 (three horizontal to one vertical) the subsoil shall be loose to a depth of 1-inch.

After tillage, the lime and fertilizer shall be applied within 48 hours thereafter. The seeding mixture shall be applied within 48 hours after application of lime and fertilizer. Immediately after seeding, the areas shall again be lightly tilled with the disk harrow to a controlled depth of approximately 1 inch. The light tillage operation shall be followed by one pass with a cultipacker to firm the seeded areas.

705-3.3 SEEDING RATES. Seeding rates for Wetland Seed Mix shall be as follows:

Material	Lb. Per 1,000 Ft.^{2} (Kg/100m^2)	Lb. Per Acre (Kg/ha)
Redtop (*Agrostis alba*)	.05 (.02)	2.20 (2.05)
Switchgrass (*Panicum virgatum*)	.23 (.09)	10.0 (9.33)
Wet Seed Mix Total	.28 (.11)	12.20 (11.38)

705-3.4 DRY APPLICATION METHOD.

a. Liming. Lime shall be applied separately and prior to the application of any fertilizer or seed and only on seedbeds which have previously been prepared as described above. The lime shall then be worked into the top 3 inches of soil after which the seedbed shall again be properly graded and dressed to a smooth finish.

b. Fertilizing. Following advance preparations and cleanup, and liming if required, fertilizer shall be uniformly spread at the rate which will provide not less than the minimum quantity stated in Section 705-2.4.

c. Seeding. Grass seed shall be sown at the rate specified herein immediately after fertilizing, and the fertilizer and seed shall be lightly raked to a depth of 1 inch for newly graded and disturbed areas. When seeding is required at other than the inclusive dates March 1 to May 15 and August 1 to October 20, a suitable cover crop approved by the Engineer shall be sown in addition to the specified seed mixture by the same methods required for grass seeding.

d. Rolling. After the seed has been properly covered, the seedbed shall be immediately compacted by means of a cultipacker or an approved lawnroller, weighing 50 to 200 pounds per foot of width.

705-3.5 WET APPLICATION METHOD.

a. General. The Contractor may elect to apply seed and fertilizer (and lime, if required) by spraying them on the previously prepared seedbed in the form of an aqueous mixture and by using the methods and equipment described herein. The rates of application shall be as specified in Paragraphs 2.1 through 2.3.

b. Spraying Equipment. The spraying equipment shall have a container or water tank equipped with a liquid level gauge calibrated to read in increments not larger than 50 gallons over the entire range of the tank capacity, mounted so as to be visible to the nozzle operator. The container or tank shall also be equipped with a mechanical power-driven agitator capable of keeping all the solids in the mixture in complete suspension at all times until used.

c. The unit shall also be equipped with a pressure pump capable of delivering 100 gallons per minute at a pressure of 100 pounds per square inch. The pump shall be mounted in a line which will recirculate the mixture through the tank whenever it is not being sprayed from the nozzle. All pump passages and pipe lines shall be capable of providing clearance for 5/8-inch solids. The power unit for the pump and agitator shall have controls mounted so as to be accessible to the nozzle operator. There shall be an indicating pressure gauge connected and mounted immediately at the back of the nozzle.

d. The nozzle pipe shall be mounted on an elevated supporting stand in such a manner that it can be rotated through 360 degrees horizontally and inclined vertically from at least 20 degrees below to at least 60 degrees above the horizontal. There shall be a quick-acting, three-way control valve connecting the recirculating line to the nozzle pipe and mounted so that the nozzle operator can control and regulate the amount of flow of mixture be supplied so that mixtures may be properly sprayed over distance varying from 20 feet to 100 feet. One shall be a close-range ribbon nozzle,

one a medium-range ribbon nozzle, and one a long-range jet nozzle. For ease of removal and cleaning, all nozzles shall be connected to the nozzle pipe by means of quick-release couplings.

e. In order to reach areas inaccessible to the regular equipment, an extension hose at least 50 feet in length shall be provided to which the nozzles may be connected.

f. **Mixtures.** Lime shall be applied separately in the quantity specified, prior to the fertilizing and seeding operations. Not more than 220 pounds of lime shall be added to and mixed with each 100 gallons of water. Seed and fertilizer shall be mixed together in the relative proportions specified, but not more than a total of 220 pounds of these combined solids shall be added to and mixed with each 100 gallons of water.

g. All water used shall be obtained from fresh water sources and shall be free from injurious chemicals and other toxic substances harmful to plant life. Brackish water shall not be used at any time. The Contractor shall identify to the Engineer all sources of water at least two weeks prior to use. The Engineer may take samples of the water at the source or from the tank at any time and have a laboratory test the samples for chemical and saline content. The Contractor shall not use any water from any source which is disapproved by the Engineer following such tests.

h. All mixtures shall be constantly agitated from the time they are mixed until they are finally applied to the seedbed. All such mixtures shall be used within two hours from the time they were mixed or they shall be wasted and disposed of at locations acceptable to the Engineer.

i. **Spraying.** Lime shall be sprayed only upon previously prepared seedbeds. After the applied lime mixture has dried, the lime shall be worked into the top 3 inches, after which the seedbed shall again be properly graded and dressed to a smooth finish.

j. Mixtures of seed and fertilizer shall only be sprayed upon previously prepared seedbeds on which the lime, if required, shall already have been worked in. The mixtures shall be applied by means of a high-pressure spray which shall always be directed upward into the air so that the mixtures will fall to the ground like rain in a uniform spray. Nozzles or sprays shall never be directed toward the ground in such a manner as might produce erosion or runoff.

k. Particular care shall be exercised to insure that the application is made uniformly and at the prescribed rate and to guard against misses and overlapped areas. Proper predetermined quantities of the mixture in accordance with specifications shall be used to cover specified sections of known area. Checks on the rate and uniformity of application may be made by observing the degree of wetting of the ground or by distributing test sheets of paper or pans over the area at intervals and observing the quantity of material deposited thereon.

l. On surfaces which are to be mulched as indicated by the plans or designated by the Engineer, seed and fertilizer applied by the spray method need not be raked into the soil or rolled. However, on surfaces on which mulch is not to be used, the raking and rolling operations will be required after the soil has dried.

705-3.6 MAINTENANCE OF SEEDED AREAS. The Contractor shall protect seeded areas against traffic or other use by warning signs or barricades, as approved by the Engineer. Surfaces gullied or otherwise damaged following seeding shall be repaired by regrading and reseeding as directed. The Contractor shall mow, water as directed, and otherwise maintain seeded areas in a satisfactory condition until final inspection and acceptance of the work.

It will be required that the Contractor establish a good stand of grass of uniform color and density to the satisfaction of the Engineer. If at the time when the contract has been otherwise completed it is not possible to make an adequate determination of the color, density, and uniformity of such stand of grass, payment for the unaccepted portions of the areas seeded out of season will be withheld until such time as these requirements have been met.

705-3.7 MULCHING. Before spreading mulch, all large clods, stumps, stones, brush, roots, and other foreign material shall be removed from the area to be mulched. Mulch shall be applied immediately after seeding. The spreading of the mulch may be by hand methods, blower, or other mechanical methods, provided a uniform covering is obtained.

Mulch material shall be furnished, hauled, and evenly applied on the areas shown on the plans or designated by the Engineer. Straw or hay shall be spread over the surface to a uniform thickness at the rate of 2 to 3 tons per acre to provide a loose depth of not less than 1-1/2 inches nor more than 3 inches. Cellulose-fiber or wood-pulp mulch shall be applied at the rate of 1,500 pounds (dry weight) per acre. Mulch may be blown on the slopes and the use of cutters in the equipment for this purpose will be permitted to the extent that at least 95 percent of the mulch in place on the slope shall be 6 inches or more in length. When mulches applied by the blowing method are cut, the loose depth in place shall be not less than 1 inch nor more than 2 inches.

705-3.8 SECURING MULCH. The mulch shall be held in place by light discing, a very thin covering of topsoil, small brush, pins, stakes, wire mesh, or other adhesive material approved by the Engineer. Where mulches have been secured by adhesive material, it will not be permissible to walk on the slopes after the binder has been applied. The Contractor is warned that in the application of adhesive material he must take every precaution to guard against damaging or disfiguring structures or property on or adjacent to the areas worked and that he will be held responsible for any such damage resulting from his operations.

If the "Peg and String" method is used, the mulch shall be secured by the use of stakes or wire pins driven into the ground on 5-foot centers or less. Binder twine shall be strung between adjacent stakes

in straight lines and crisscrossed diagonally over the mulch, after which the stakes shall be firmly driven nearly flush to the ground to draw the twine down tight onto the mulch.

705-3.9 CARE AND REPAIR OF MULCH. The Contractor shall care for the mulched areas until final acceptance of the project. Such care shall consist of providing protection against traffic or other use by placing warning signs, as approved by the Engineer, and erecting any barricades that may be shown on the plans before or immediately after mulching has been completed on the designated areas.

The Contractor shall be required to repair or replace any mulching that is defective or becomes damaged until the project is finally accepted. When, in the judgment of the Engineer, such defects or damages are the result of poor workmanship or failure to meet the requirements of the specifications, the cost of the necessary repairs or replacement shall be borne by the Contractor.

METHOD OF MEASUREMENT

705-4.1 The quantity of seeding and mulching to be paid shall be measured by the number of square yards, measured on the ground surface, completed and accepted.

BASIS OF PAYMENT

705-5.1 The quantity for Seeding and Mulching Wetland Seed Mix on the Proposal Form, will be paid for at the unit price bid per square yard, which price and payment shall be full compensation for furnishing and placing all material and for all labor, equipment, tools, and incidentals necessary to complete the work prescribed in this item.

Payment will be made under:

Item 705.1 Permanent Seeding and Mulching, Wetland Mitigation Area--per square yard

END OF ITEM 705

ITEM 710 PLANTING TREES AND SHRUBS

DESCRIPTION

710-1.1 This work shall consist of furnishing, planting, and fertilizing of trees and shrubs, and all planting operations necessary to complete the work as specified, as shown on the plans and/or as directed by the Engineer.

710-1.2 QUALITY ASSURANCE.

a. Installer Qualifications. The Contractor shall engage an experienced Installer who has completed landscaping work similar in material, design, and extent to that indicated for this Project and who has a record of successful tree and shrub establishment.

b. The Contractor shall provide quantity, size, genus, species, and variety of trees and shrubs indicated on the plans and in these Specifications, complying with applicable requirements of ANSI Z60.1 "American Standard for Nursery Stock" and Section 920 of the MSHA Standard Specifications for Construction and Materials.

c. Topsoil Analysis. The Contractor shall furnish a soil analysis made by a qualified independent soil-testing agency stating percentages of organic matter, inorganic matter (silt, clay, and sand), deleterious material, pH, and mineral and plant-nutrient content of topsoil.

(1) Report suitability of topsoil for growth of applicable planting material. State recommended quantities of nitrogen, phosphorus, and potash nutrients and any limestone, aluminum sulfate, or other soil amendments to be added to produce a satisfactory topsoil.

d. Measurements. The Contractor shall measure trees and shrubs according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches above ground for trees up to 4-inch caliper size, and 12 inches above ground for larger sizes. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip-to-tip.

e. Observation. Engineer may observe trees and shrubs either at place of growth or at site before planting for compliance with requirements for genus, species, variety, size and quality. Engineer retains right to observe trees and shrubs further for size and condition of balls and root systems, insects, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. The Contractor shall immediately remove all rejected trees or shrubs from the site.

710-1.3 DELIVERY, STORAGE, AND HANDLING. The Contractor shall deliver freshly dug trees and shrubs. Do not prune before delivery, except as approved by Engineer. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy natural shape. Provide protective covering during delivery. Do not drop trees and shrubs during delivery.

Handle balled and burlapped stock by the root ball.

Deliver trees and shrubs after preparations for planting have been completed and install immediately. If planting is delayed more than 6 hours after delivery, set trees and shrubs in shade, protect from weather and mechanical damage, and keep roots moist.

a. Do not remove container-grown stock from containers before time of planting.

b. Water root systems of trees and shrubs stored on site with a fine-mist spray. Water as often as necessary to maintain root systems in a moist condition.

710-1.4 PLANTING SCHEDULE. The Contractor shall coordinate planting of trees and shrubs in accordance with Schedule for Planting from Section 710.01.01 of the MSHA Standard Specifications.

	Deciduous Material			Evergreen Material		
Season	Balled and Burlapped and Bare Root	Container Grown	Seedling Stock	Balled and Burlapped	Container Grown	Seedling Stock
Spring	3/1 to 4/30	3/1 to 6/15	3/15 to 4/15	3/15 to 4/30	3/15 to 6/15	3/15 to 4/15
Fall	10/15 to 12/15	8/15 to 12/15	—	9/1 to 11/15	8/15 to 11/15	10/1 to 10/31

No container grown plant material shall be planted if not acclimated to the current weather conditions. No planting will be allowed out of season without written permission of the Engineer.

710-1.5 WARRANTY.

a. General Warranty. The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

b. Special Warranty. The Contractor shall warrant living trees and shrubs for a period of one year after date of Substantial Completion, against defects including death and unsatisfactory growth, as specified under Section 710.03.06 of the MSHA Standard Specifications.

c. The Contractor shall remove and replace dead trees and shrubs immediately unless required to plant in the succeeding planting season.

d. The Contractor shall remove and replace trees and shrubs that are more than 25 percent dead or in an unhealthy condition at the end of the warranty period.

710-1.6 MAINTENANCE. The Contractor shall maintain trees and shrubs by pruning, cultivating, watering, weeding, fertilizing, restoring planting saucers, tightening and repairing stakes and guy supports, and resetting to proper grades or vertical position, as required to establish healthy, viable plantings in strict accordance with Section 710.03.06(b) of the MSHA Standard Specifications. Spray as required to keep trees and shrubs free of insects and disease.

MATERIALS

710-2.1 TREE AND SHRUB MATERIAL.

a. General. Unless otherwise indicated, the Contractor shall furnish nursery-grown trees and shrubs conforming to ANSI Z60.1, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

b. Grade. The Contractor shall provide trees and shrubs of sizes and grades conforming to ANSI Z60.1 for type of trees and shrubs required. Trees and shrubs of a larger size may be used if acceptable to Engineer, with a proportionate increase in size of roots or balls.

c. The Contractor shall label at least 1 tree and 1 shrub of each variety and caliper with a securely attached, waterproof tag bearing legible designation of botanical and common name.

710-2.2 SHADE AND FLOWERING TREES.

a. Shade Trees. Single-stem trees with straight trunk, well-balanced crown, and intact leader, of height and caliper indicated, conforming to ANSI Z60.1 and Section 920.07 of the MSHA Standard Specifications for type of trees required.

b. Small Trees. Small upright or spreading type, branched or pruned naturally according to species and type, and with relationship of caliper, height, and branching recommended by

ANSI Z60.1, and conforming to Section 920.07 of the MSHA Standard Specifications. Stem form shall be single stemmed.

c. The Contractor shall provide balled and burlapped trees in accordance with Section 920.07 of the MSHA Standard Specifications.

(1) Container-grown trees will be acceptable in lieu of balled and burlapped trees subject to meeting ANSI Z60.1 limitations for container stock.

710-2.3 DECIDUOUS SHRUBS.

a. **Form and Size.** Deciduous shrubs with not less than the minimum number of canes required by and measured according to ANSI Z60.1 for type, shape, and height of shrub.

b. The Contractor shall provide balled and burlapped deciduous shrubs in accordance with Section 920.07 of the MSHA Standard Specifications.

(1) Container-grown deciduous shrubs will be acceptable in lieu of balled and burlapped deciduous shrubs subject to meeting ANSI Z60.1 limitations for container stock.

710-2.4 TOPSOIL. Topsoil used in the planting soil mix shall be as specified in Section 920.01 of the MSHA Standard Specifications and as follows: ASTM D 5268, fertile, friable, naturally loamy, pH range of 5.5 to 7.6, 4 percent organic material minimum, free of stones 2 inches (50 mm) or larger in any dimension, and other extraneous materials harmful to plant growth.

710-2.5 SOIL AMENDMENTS.

a. **Lime.** Lime shall be as specified in Section 920.02 of the MSHA Standard Specifications and as follows: ASTM C 602, Class T, agricultural limestone containing a minimum 85 percent calcium carbonate equivalent, with a minimum 99 percent passing a No. 8 sieve and a minimum 75 percent passing a No. 60 sieve.

(1) Provide lime in the form of dolomitic limestone.

b. **Peat Humus.** Peat humus shall be as specified in Section 920.08.02 of the MSHA Standard Specifications and as follows: finely divided or granular texture, with a pH range of 6 to 7.5, composed of partially decomposed moss peat (other than sphagnum), peat humus, or reed-sedge peat.

c. **Manure.** Manure shall be as specified in Section 920.08.04 of the MSHA Standard Specifications, and as follows: well-rotted, unleached stable or cattle manure containing not more

than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.

d. Herbicides. Herbicides shall be as specified in Section 920.08.07 of the MSHA Standard Specifications. Herbicides shall be EPA registered and approved for use in wetlands and shall be of the type recommended by the manufacturer for control of the pest species in question.

e. Insecticides. Insecticides shall be as specified in Section 920.08.06 of the MSHA Standard Specifications.

f. Water. Water shall be as specified in Section 920.08.01 of the MSHA Standard Specifications, and as follows: potable.

710-2.6 FERTILIZER. Commercial fertilizer shall be as specified in Section 920.03 of the MSHA Standard Specifications and as follows: commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea-form, phosphorous, and potassium in the following composition:

a. Composition. Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.

710-2.7 MULCHES. Organic mulch shall be as specified in Section 920.05 of the MSHA Standard Specifications and as follows: free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:

a. Type. Shredded hardwood.

b. Type. Ground or shredded bark.

c. Type. Wood and bark chips.

710-2.8 STAKES AND GUYS.

a. Upright and Guy Stakes. Upright and guy stakes shall be as specified in Section 920.08.09 of the MSHA Standard Specifications and as follows: rough-sawn, sound, new hardwood, redwood, or pressure-preservative-treated softwood, free of knots, holes, cross grain, and other defects, 2 by 2 inches by length indicated, pointed at one end.

b. Guy Wire. Guy wire shall be as specified in Section 920.08.11 of the MSHA Standard Specifications and as follows: ASTM A 641, Class 1, galvanized-steel wire, 2-strand, twisted, 0.106 inch in diameter.

c. **Hose Chafing Guard.** Hose chafing guard shall be as specified in Section 920.08.14 of the MSHA Standard Specifications and as follows: reinforced rubber or plastic hose at least 5/8 inch in diameter, black, cut to lengths required to protect tree trunks from damage.

d. **Flags.** Standard surveyor's plastic flagging tape, white, 6 inches long.

710-2.9 MISCELLANEOUS MATERIALS.

a. **Antidesiccant.** Antidesiccant shall be as specified in Section 920.08.19 of the MSHA Standard Specifications and as follows: water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's instructions.

b. **Trunk-Wrap Tape.** Trunk-wrap tape shall be as specified in Section 920.08.17 of the MSHA Standard Specifications (clean new burlap) or as follows: two layers of crinkled paper cemented together with bituminous material, 4-inch wide minimum, with stretch factor of 33 percent.

CONSTRUCTION METHODS

710-3.1 EXAMINATION. The Contractor shall examine areas to receive trees and shrubs for compliance with requirements and for conditions affecting performance of work of this Section. Do not proceed with installation until unsatisfactory conditions have been corrected.

710-3.2 PREPARATION. The Contractor shall lay out individual tree and shrub locations and areas for multiple plantings in accordance with Section 710.03.02(a) of the MSHA Standard Specifications and as follows: stake locations, outline areas, adjust locations when requested, and obtain Engineer's acceptance of layout before planting. Make minor adjustments as may be required.

The Contractor shall prepare planting beds in accordance with Section 710.03.02(b) of the MSHA Standard Specifications.

710-3.3 PLANTING SOIL PREPARATION. The Contractor shall prepare planting soil in accordance with Section 710.03.02(c) of the MSHA Standard Specifications. Planting soil, planting soil mix, and soil mix backfill for planting are terms which are synonymous with one another, and may be used interchangeably.

Before mixing, clean topsoil of roots, plants, sod, stones, clay lumps, and other extraneous materials harmful to plant growth.

Mix soil amendments and fertilizers with topsoil at rates indicated in the soil report. Delay mixing fertilizer if planting does not follow placing of planting soil within a few days.

710-3.4 EXCAVATION.

a. Pits and Trenches. The Contractor shall prepare pits and trenches in accordance with Section 710.03.02(d) of the MSHA Standard Specifications and as follows: excavate with vertical sides and with bottom of excavation slightly raised at center to assist drainage. Loosen hard subsoil in bottom of excavation.

b. Dispose of subsoil removed from landscape excavations. Do not mix with planting soil or use as backfill.

c. Obstructions. Notify Engineer if unexpected obstructions detrimental to trees or shrubs are encountered in excavations.

(1) Hardpan Layer. Drill 6-inch diameter holes into free-draining strata or to a depth of 10 feet, whichever is less, and backfill with free-draining material.

d. Drainage. Notify Engineer if subsoil conditions evidence unexpected water seepage or retention in tree or shrub pits.

710-3.5 PLANTING TREES AND SHRUBS. The Contractor shall perform all planting in accordance with Section 710.03.03 of the MSHA Standard Specifications. Set balled and burlapped stock plumb and in center of pit or trench with top of ball in relation to adjacent finish grades as indicated on the planting details.

a. Place stock on setting layer of compacted planting soil.

b. Remove burlap and wire baskets from tops of balls and partially from sides, but do not remove from under balls. Remove pallets, if any, before setting. Do not use planting stock if ball is cracked or broken before or during planting operation.

c. Place backfill around ball in layers, tamping to settle backfill and eliminate voids and air pockets. When pit is approximately 1/2 backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing and tamping final layer of backfill.

Set container-grown stock plumb and in center of pit or trench with top of ball in relation to adjacent finish grades as indicated on the planting details.

a. Carefully remove containers so as not to damage root balls.

b. Place stock on setting layer of compacted planting soil.

c. Place backfill around ball in layers, tamping to settle backfill and eliminate voids and air pockets. When pit is approximately 1/2 backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing and tamping final layer of backfill.

Dish and tamp top of backfill to form a 3-inch high mound around the rim of the pit. Do not cover top of root ball with backfill.

710-3.6 PRUNING. The Contractor shall prune, thin, and shape trees and shrubs according to standard horticultural practice and as specified in Section 710.03.03(d) of the MSHA Standard Specifications. Prune trees to retain required height and spread. Unless otherwise directed by Engineer, do not cut tree leaders; remove only injured or dead branches from flowering trees. Prune shrubs to retain natural character. Shrub sizes indicated are size after pruning.

710-3.7 GUYING AND STAKING.

a. **Upright Staking and Guying.** Upright staking and guying shall not be required for trees and shrubs which are less than 5 feet in height. All other trees shall be staked and guyed as specified in Section 710.03.03(b) of the MSHA Standard Specifications and as follows. Use a minimum of 2 stakes of length required to penetrate at least 18 inches below bottom of backfilled excavation and to extend at least 72 inches above grade. Set vertical stakes and space to avoid penetrating balls or root masses. Support trees with 2 strands of guy wire encased in hose sections at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree. Use number of stakes as follows:

(1) Two stakes for trees up to 12 feet high and 2-1/2 inches or less in caliper. Use 3 stakes for trees less than 14 feet high and up to 4-inch caliper. Space stakes equally around trees.

(2) Attach flags to each guy wire, 30 inches above finish grade.

710-3.8 MULCHING. The Contractor shall mulch backfilled surfaces of pits, trenches, and other areas indicated in accordance with Section 710.03.03(c) of the MSHA Standard Specifications.

a. **Organic Mulch.** Apply the following average thickness of organic mulch and finish level with adjacent finish grades. Do not place mulch against trunks or stems.

(1) **Thickness:** 3 inches.

710-3.9 CLEANUP AND PROTECTION. During tree and shrub work, keep pavements clean and work area in an orderly condition. Protect trees and shrubs from damage due to landscape operations, operations by other contractors and trades, and trespassers. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged landscape work as directed.

710-3.10 DISPOSAL OF SURPLUS AND WASTE MATERIALS. The Contractor shall remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

METHOD OF MEASUREMENT

710-4.1 Trees and shrubs shall be measured at the contract unit price per each item, in accordance with Section 710.04.01 of the MSHA Standard Specifications.

710-4.2 All Shredded Hardwood Bark Mulch at all individual planting pits will be measured by the square yard. The measurement will be computed on the surface area of the specified thickness.

BASIS OF PAYMENT

710-5.1 Planting trees and shrubs will be paid for at the contract unit price for each plant. The payment will be full compensation for all material, labor, equipment, tools, and incidentals necessary to complete the work as specified and to the satisfaction of the Engineer.

710-5.2 All Shredded Hardwood Mulch at individual plant pits will be paid for at the contract unit price bid per square yard of material placed and accepted. The payment will be full compensation for all material, labor, equipment, tools, and incidentals necessary to complete the work as specified and to the satisfaction of the Engineer.

Payment will be made under:

Item 710.1 *Amelanchier canadensis*, 5 Gallon--per each

Item 710.2 *Aronia arbutifolia* "Brilliantissima," 3 Gallon--per each

Item 710.3 *Cephalanthus occidentalis*, 3 Gallon--per each

Item 710.4 *Ilex glabra*, 3 Gallon--per each

Item 710.5 *Lindera benzoin*, 3 Gallon--per each

Item 710.6 *Myrica pensylanica*, 2 Gallon--per each

Item 710.7 *Quercus borealis*, 2-Inch Caliper--per each

Item 710.8 *Rhus aromatica*, 2 Gallon--per each

Item 710.9 *Viburnum prunifolium*, 5 Gallon--per each

Item 710.10 *Viburnum dentatum*, 3 Gallon--per each

Item 710.11 Shredded Hardwood Mulch, 3-Inch Depth--per square yard

END OF ITEM 710

ITEM 711 PLANTING WETLAND VEGETATION

DESCRIPTION

711-1.1 This work shall consist of furnishing, planting, and fertilization of emergent wetland plants and grasses, as shown on the plans and/or as directed by the Engineer, and all planting operations necessary to complete the work as specified.

711-1.2 QUALITY ASSURANCE.

a. **Installer Qualifications.** The Contractor shall engage an experienced Installer who has completed landscaping work similar in material, design, and extent to that indicated for this Project and who has a record of successful wetland vegetation establishment.

b. **Observation.** Engineer may observe wetland vegetation either at place of growth or at site before planting for compliance with requirements for genus, species, variety, size and quality. Engineer retains right to observe wetland vegetation further for size and condition of root systems, insects, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. The Contractor shall immediately remove all rejected wetland vegetation from the site.

711-1.3 WARRANTY.

a. **General Warranty.** The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

b. **Special Warranty.** The Contractor shall warrant living wetland vegetation for a period of one year after date of Substantial Completion, against defects including death and unsatisfactory growth, as specified under Section 710.03.06 of the MSHA Standard Specifications.

c. The Contractor shall remove and replace wetland vegetation that are in an unhealthy condition at the end of the warranty period.

711-1.4 MAINTENANCE. The Contractor shall maintain wetland vegetation by watering, weeding, and fertilizing, as required to establish healthy, viable plantings in strict accordance with Section 710.03.06(b) of the MSHA Standard Specifications. Spray as required to keep wetland vegetation free of insects and disease. Remove all competing Common Reed (*Phragmites*) and Cattail (*Typha*) plants which sprout in the wetland mitigation area in strict accordance with Section 710.03.06(b)(2) "Weed Control" of the MSHA Standard Specifications, and these Specifications.

MATERIALS

711-2.1 WETLAND PLANTS. Wetland plants, as shown on the plans shall conform to Section 920.07 of the MSHA Standard Specifications with the following additions:

a. Some of the plant species required are normally unavailable from standard landscape nursery sources. The Contractor shall make arrangements with competent wetlands restoration specialists or wetland nurseries to insure a supply of the required material. Substitutions of plant species shall not be allowed.

b. The Contractor and/or his subcontractor should be aware of the site design conditions and should take all prudent steps to insure that the plant material specified on the plans is acclimated to wetland conditions prior to delivery to the job site. ALL PLANT MATERIAL TO BE INSTALLED IN THE LOW MARSH ZONE (*PELTANDRA, PONTEDERIA*, AND *SCIRPUS*) SHALL HAVE BEEN ACCLIMATED IN THE NURSERY IN BRACKISH WATER CONDITIONS OF 2 TO 3 PARTS PER THOUSAND SALT FOR A MINIMUM OF ONE WEEK PRIOR TO DELIVERY TO THE SITE.

c. The emergent plant material specified on the plans shall have been propagated, germinated, or otherwise developed from field collected specimens growing in the mid-Atlantic region.

711-2.2 FERTILIZER.

a. Emergent wetland plants (including *Peltandra, Pontederia*, and *Scirpus*).

(1) Plant fertilizer shall be a commercially-available granular product, coated with a plastic resin film for three to four month slow release, with a nutrient analysis of 19-6-12.

b. Shoreline wetland plants (including *Panicum*).

(1) Plant fertilizer shall be a commercially-available granular product, coated with a plastic resin film for six to nine month slow release, with a nutrient analysis of 18-6-12.

CONSTRUCTION METHODS

711-3.1 GENERAL. The sites of the constructed shallow marshes shall be inspected, planted, and fertilized in conformance with Section 711.03 of the MSHA Standard Specifications with the following additions:

a. **Site Inspection.** The Engineer shall inspect the planting area to insure the proper elevation and grade for successful plant establishment. If the grades and elevations are not acceptable, it will be the responsibility of the Contractor or subcontractor performing the grading operation to prepare the planting area in accordance with the plans and to the satisfaction of the Engineer.

b. **Planting Season.** The planting season extends from April 1 to September 30. The Contractor shall perform all plantings during the planting season. Requests for planting out-of-season will not be considered and planting out-of-season will not be allowed.

c. **Plant Material.**

(1) Rootstock of wetland plant material shall be kept moist during transport from the source to the job site and until planted.

(2) Emergent wetland bulbs, tubers, and peat potted grasses, rushes and sedges shall be planted in existing soil with each planting pit excavated to a size sufficient to contain the entire rootstock without cramping.

Fertilizer for emergent wetland bulbs, tubers, and peat potted grasses, rushes, and sedges shall be 1 oz. per plant or peat pot.

Bareroot or container stock shall be positioned in the planting hole. Backfill halfway up the root ball. Place fertilizer beside the root ball approximately 1-inch from the root tips. Do not place fertilizer in the bottom of the hole. Complete backfill, tamp, and water.

Mulching and bed edging are not required.

Care and replacement of planting shall be per Sections 711.03.05 and 710.03.06 of the MSHA Standard Specifications with the following additions:

a. Monthly site visits (a total of six) shall be conducted between April 1 and September 30, following plant installation. During the monthly maintenance inspections, the Contractor shall:

(1) Replant all transplants that have died or are otherwise missing.

(2) Remove all litter and debris deposits that may impede a successful establishment.

(3) Control infestations of *Phragmites communis (australis)* (Common Reed) and *Typha angustifolia* (Narrowleaf cattail) through drip application or sponge application of a

glyphosate herbicide approved for use in wetlands in September following initial installation and again in the following September, at the end of the contract period.

METHOD OF MEASUREMENT

711-4.1 Wetland plant material shall be measured at the contract unit price per each item in accordance with Section 711.04.01 of the MSHA Standard Specifications.

711-4.2 Goose enclosure fence shall be measured at the contract unit price per linear foot of fence installed in accordance with the drawings and specifications and to the satisfaction of the Engineer.

711-4.3 Monthly site visits, litter and debris removal, and herbicide control of invasive plants shall not be measured, but shall be incidental to the cost of installing the wetland vegetation.

BASIS OF PAYMENT

711-5.1 Payment for planting wetland vegetation shall be made at the contract unit price for each plant. Fertilizer and all other soil amendments shall be incidental to the cost of the plant material. The price will include complete installation including all materials, tools, labor, and other items necessary to complete the work as specified and to the satisfaction of the Engineer.

711-5.2 Payment for goose enclosure fence shall be made at the contract unit price per linear foot of fence. This price shall be full compensation for furnishing all materials and for all preparation, erection, and installation, and for all labor, equipment, tools, and incidentals necessary to complete the work.

711-5.3 Payment for monthly site visits, litter and debris removal, and herbicide control of invasive plants shall not be made separately but shall be incidental to the cost of the wetland plantings.

Payment will be made under:

Item 711.1 *Panicum virgatum*, 1¾-Inch Peat Pot--per each

Item 711.2 *Peltandra virginica*, 1 Quart Pot--per each

Item 711.3 *Pontederia cordata*, 1 Quart Pot--per each

Item 711.4 *Scirpus pungens*, 1¾-Inch Peat Pot--per each

Item 711.5 *Scirpus robustus*, 1 Quart Pot--per each

Item 711.6 *Scirpus 3validus*, 1 Quart Pot--per each

Item 711.7 Goose Enclosure Fence--per linear foot

END OF ITEM 711

ADDENDUM NO. 3

MARYLAND DEPARTMENT OF TRANSPORTATION
MARYLAND AVIATION ADMINISTRATION

ADDENDUM TO PLANS AND SPECIFICATIONS

CONTRACT NO. MAA-CO-97-019
MIDFIELD COMPLEX CONSTRUCTION SITE DEVELOPMENT
AT MARTIN STATE AIRPORT

ACKNOWLEDGEMENT OF RECEIPT

The undersigned acknowledges that Addendum No. 3 to Maryland Aviation Administration Plans and Specifications for Contract No. MAA-CO-97-019 has been received by the undersigned and will be incorporated in all copies of said Plans and Specifications in the possession of the undersigned.

It is understood that all proposals submitted in response to MAA-CO-97-019 will be presumed to be based upon full knowledge of the contents of Addendum No. 3.

BALTIMORE/WASHINGTON INTERNATIONAL AIRPORT MD 21240

Midfield Complex Construction Site Development at Martin State Airport

Contract No. MAA-CO-97-019

ADDENDUM NO. 3

IMPORTANT: Bidders must acknowledge receipt of this Addendum on the Bid Proposal, Section 5, Page BF.18, stating the Addendum Number.

REVISED BID DUE DATE: THURSDAY, MAY 28, 1998, 2:00 P.M.

REVISIONS, ADDITIONS AND DELETIONS TO CONTRACT DOCUMENTS:

1. Clarification: Addendum No. 2 (Wetlands Mitigation) was issued with incorrect contract number on face sheet and plan sheets. Correct contract number is as shown above.

2. Part V, Interim Standard Provisions: Add Section **SP-5.06, Authority of the Procurement Officer:**

SP-5.06 Authority of the Procurement Office

A. Project Manager and Superintendent

The Contractor shall submit for the approval of the Procurement Officer the name and qualifications of the individuals intended to function as the Project Manager and the Superintendent. In the event the Procurement Officer does not approve of an individual offered by the Contractor, the Contractor shall offer a suitable substitute. At any time during the course of the work, if in the judgment of the Procurement Officer, the Project Manager and/or the Superintendent are deemed unacceptable, upon written notification from the Procurement Officer, the Contractor shall promptly offer a replacement for the Procurement Officer's approval. Any cost arising from the action of the Procurement Officer relative to **SP-5.06.A.** shall be borne entirely by the Contractor.

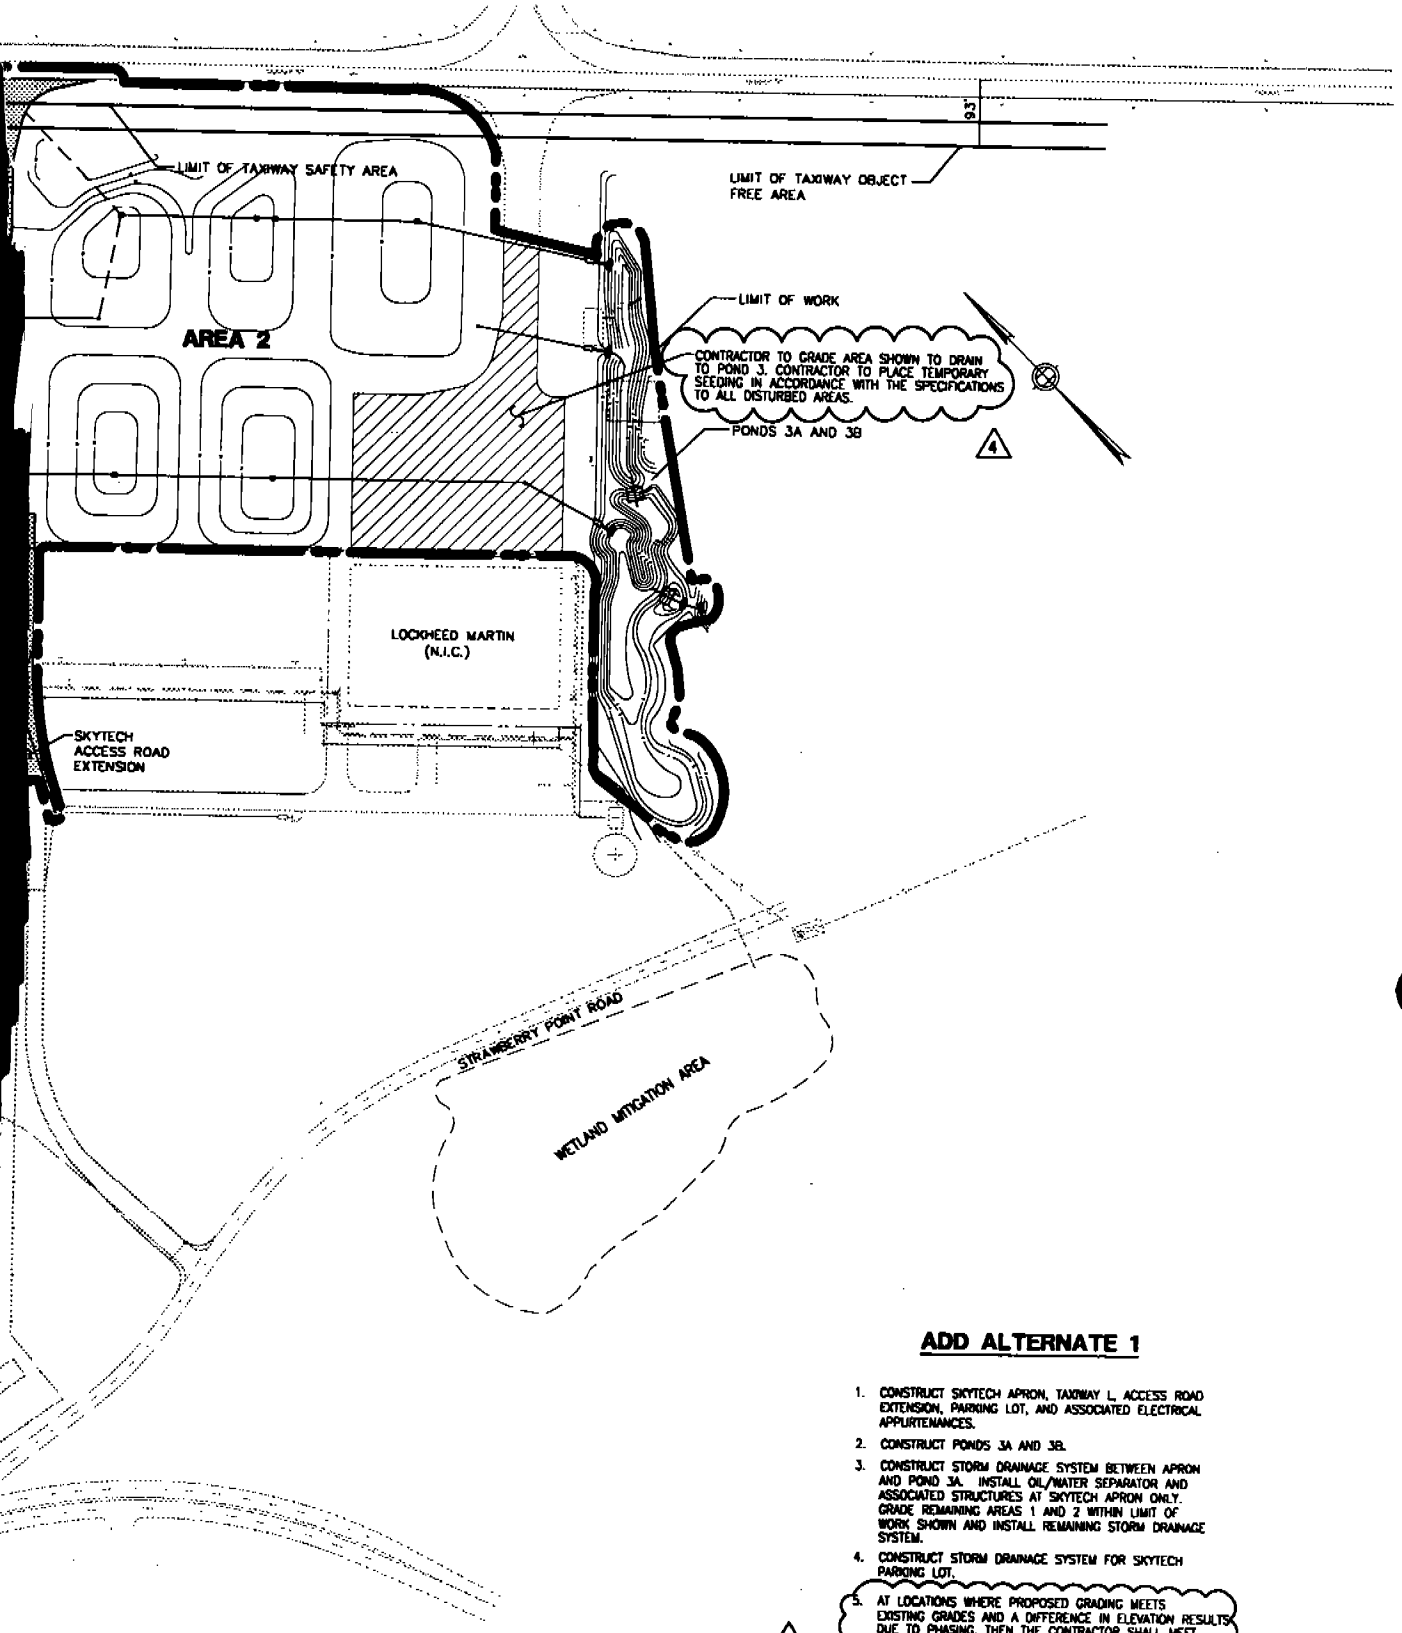
1	4/27/98	ADDENDUM 1
2	5/14/98	ADDENDUM 4



ADD ALTERNATE 1

1. CONSTRUCT SKYTECH APRON, TAXIWAY L, ACCESS ROAD EXTENSION, PARKING LOT, AND ASSOCIATED ELECTRICAL APPURTENANCES.
2. CONSTRUCT PONDS 3A AND 3B.
3. CONSTRUCT STORM DRAINAGE SYSTEM BETWEEN APRON AND POND 3A. INSTALL OIL/WATER SEPARATOR AND ASSOCIATED STRUCTURES AT SKYTECH APRON ONLY. GRADE REMAINING AREAS 1 AND 2 WITHIN LIMIT OF WORK SHOWN AND INSTALL REMAINING STORM DRAINAGE SYSTEM.
4. CONSTRUCT STORM DRAINAGE SYSTEM FOR SKYTECH PARKING LOT.
5. AT LOCATIONS WHERE PROPOSED GRADING MEETS EXISTING GRADES AND A DIFFERENCE IN ELEVATION RESULTS DUE TO PHASING, THEN THE CONTRACTOR SHALL MEET THE EXISTING GRADE WITH A 2:1 SLOPE (MAX.)

SECTION A-A

TEMPORARY CATCH BASIN

NTS

FOLLOW DETAIL OF PRECAST YARD INLET ON SHEET NO. U-15 EXCEPT FOR MODIFICATIONS SHOWN ABOVE.

TEMPORARY CATCH BASINS TO BE PAID FOR AS STORM DRAINAGE INLET TYPE 2

4

ADD ALTERNATE 2

1. CONSTRUCT LOCKHEED-MARTIN APRON, TAXIWAY J, ACCESS ROAD EXTENSION, PARKING LOT, AND ASSOCIATED ELECTRICAL APPURTENANCES.
2. CONSTRUCT PONDS 3A AND 3B.
3. CONSTRUCT STORM DRAINAGE SYSTEM FOR APRON AND POND 3A. INSTALL OIL/WATER SEPARATOR AND ASSOCIATED STRUCTURES AT LOCKHEED-MARTIN APRON ONLY. GRADE REMAINING AREAS 2 AND 3 WITHIN LIMIT OF WORK SHOWN AND INSTALL REMAINING STORM DRAINAGE SYSTEM.
4. CONSTRUCT STORM DRAINAGE SYSTEM FOR LOCKHEED-MARTIN PARKING LOT.
5. AT LOCATIONS WHERE PROPOSED GRADING MEETS EXISTING GRADE AND A DIFFERENCE IN ELEVATION RESULTS DUE TO PHASING, THEN THE CONTRACTOR SHALL MEET THE EXISTING GRADE WITH A 2:1 SLOPE (MAX.).

POND 2B

1"=30'

NOTES FOR POND 2B OUTLET:

① INSTALL EROSION CONTROL AS SHOWN ON SHEET R-04.

② EXCAVATE AND REGRADE OUTLET AREA AND PLACE PROPOSED HEADWALL.

③ INSTALL PROPOSED RIP-RAP AS SHOWN.

④ INSTALL TEMPORARY STRAW BALE CHECK DAM.

⑤ PLACE EROSION CONTROL NETTING ON 6" OF LOAM, SEED ALL DISTURBED AREAS. ALLOW NATURAL WETLAND VEGETATION TO RE-ESTABLISH IN DISTURBED AREA. MAINTAIN STRAW BALE CHECK DAM TO KEEP ADJACENT WETLAND FREE OF SILT. IF NATURAL VEGETATION DOES NOT RE-ESTABLISH WITHIN 24 MONTHS, SUPPLEMENT DISTURBED AREA WITH SIMILAR VEGETATION.

1 AND 2B SUBJECT TO SALT WATER INTRUSION

NOTES (PONDS 1 & 2B)

1. SEE SHEET V-04 FOR PLANT SPACING, LOCATION AND METHOD.
2. SEE SHEET V-05 FOR PLANT SELECTION AND DETAILS. ANY PROPOSED SUBSTITUTION OF WETLAND SPECIES FROM THE DESCRIBED LIST MUST BE APPROVED BY THE ENGINEER.
3. ALL EXCAVATION, GRADING, LOAM AND SEEDING SHALL BE DONE BETWEEN JUNE 15 AND SEPTEMBER 30. WETLAND PLANTS SHALL BE PLANTED BETWEEN SEPTEMBER 30 AND OCTOBER 15.
4. CONTRACTOR SHALL PROVIDE AS-BUILT DRAWINGS SHOWING FINAL LOCATION OF PIPES AND GRADING FOR ALL PONDS.
5. THE CONTRACTOR SHALL MAINTAIN PONDS FREE FROM EROSION AND SILT UNTIL VEGETATION HAS STABILIZED ALL DISTURBED AREAS.
6. ALL OTHER AREAS ABUTTING THE PROPOSED PONDS SHALL BE LOAMED AND SEEDED. (SEE SHEET R-06 FOR DETAILS)
7. PONDS 1, 2A, 2B, 3A AND 3B ARE DESIGNED FOR WATER QUALITY CONTROL. THEY ARE NOT DESIGNED TO MITIGATE THE INCREASE IN RUNOFF DUE TO THE PROPOSED CONSTRUCTION. PONDS 4A AND 4B ARE DESIGNED TO MITIGATE THE INCREASE IN RUNOFF FOR THE 2, 10 AND 100 YEAR STORM EVENTS AS WELL AS WATER QUALITY.

ALL PONDS

AFTER COMPLETION OF EXCAVATION, MONITOR AREAL EXTENT OF INUNDATION AND STANDING WATER LEVELS IN POND THREE TIMES, AT THE BEGINNING, MID-POINT AND END OF A TWO-WEEK PERIOD. SIMULTANEOUSLY MONITOR DEPTH TO WATER TABLE IN ADJACENT WELLS, AT SAME FREQUENCY AND ON SAME DATES. THE ENGINEER WILL CORRELATE STANDING WATER ELEVATIONS TO DEPTH TO WATER TABLE AND, BASED ON PREVIOUS WELL MONITORING RECORD, WILL ESTIMATE SEASONAL HIGH WATER (SHW) AND SEASONAL LOW WATER (SLW) ELEVATIONS.

IMMEDIATELY PRIOR TO PLANTING, INUNDATE POND TO ESTIMATED SHW ELEVATION, HOLDING THE STANDING WATER LEVEL AT THE SHW ELEVATION FOR 48 HOURS AND SUBSEQUENTLY DEWATERING.

PONDS READY FOR PLANTING DURING EARLY SPRING 1998

EARLY SPRING 1998 –

WITHIN 24 HOURS OF DEWATERING THE POND, BEGIN PLANTING THE POND TO THE SELECTED VEGETATION SPECIES.

KEEP THE POND DEWATERED UNTIL THE VEGETATION PLANTED ON THE BOTTOM OF THE POND REACHES HEIGHTS RANGING BETWEEN ONE AND TWO AND ONE-HALF FEET TALL; AT WHICH TIME, ALLOW POND WATER TO REACH NORMAL LEVELS.

THE ENGINEER WILL PERIODICALLY INSPECT THE POND AFTER PLANTING TO RECOMMEND AS APPROPRIATE, REVISIONS TO THE INUNDATION AND DEWATERING PROGRAM.

EARLY SPRING 1999 –

PRIOR TO MAINTENANCE PLANTING, MONITOR AREAL EXTENT OF INUNDATION AND STANDING WATER LEVELS IN POND ONCE A WEEK FOR FOUR WEEKS. SIMULTANEOUSLY MONITOR DEPTH TO WATER TABLE IN ADJACENT WELLS, AT SAME FREQUENCY AND ON SAME DATES. THE ENGINEER WILL CORRELATE STANDING WATER ELEVATIONS TO DEPTH TO WATER TABLE. BASED ON PREVIOUS WELL MONITORING RECORD AND SUCCESS OF PRIOR PLANTINGS, AS APPROPRIATE, THE ENGINEER WILL MODIFY ESTIMATE OF SEASONAL HIGH WATER (SHW) AND SEASONAL LOW WATER (SLW) ELEVATIONS AND WILL PREPARE A MAINTENANCE PLANTING PLAN.

IMMEDIATELY PRIOR TO PLANTING, INUNDATE POND TO ESTIMATED SHW ELEVATION, HOLDING THE STANDING WATER LEVEL AT THE SHW ELEVATION FOR 48 HOURS AND SUBSEQUENTLY DEWATERING.

WITHIN 24 HOURS OF DEWATERING THE POND, BEGIN PLANTING THE POND TO THE SELECTED VEGETATION SPECIES.

KEEP THE POND DEWATERED UNTIL THE VEGETATION PLANTED ON THE BOTTOM OF THE POND REACHES HEIGHTS RANGING BETWEEN ONE AND TWO AND ONE-HALF FEET TALL; AT WHICH TIME, ALLOW POND WATER TO REACH NORMAL LEVELS.

THE ENGINEER WILL PERIODICALLY INSPECT THE POND AFTER PLANTING TO RECOMMEND AS APPROPRIATE, REVISIONS TO THE INUNDATION AND DEWATERING PROGRAM.

PONDS NOT READY FOR PLANTING DURING EARLY SPRING 1998

LATE SPRING, SUMMER OR FALL 1998 –

WITHIN 24 HOURS OF DEWATERING THE POND, SEED ALL POND AREAS 18 INCHES ABOVE THE SHW ELEVATION TO THE POND BOTTOM, INCLUSIVE, TO REDTOP (AGROSTIS ALBA).

EARLY SPRING 1999 –

PRIOR TO PLANTING, MONITOR AREAL EXTENT OF INUNDATION AND STANDING WATER LEVELS IN POND ONCE A WEEK FOR FOUR WEEKS. SIMULTANEOUSLY MONITOR DEPTH TO WATER TABLE IN ADJACENT WELLS, AT SAME FREQUENCY AND ON SAME DATES. THE ENGINEER WILL CORRELATE STANDING WATER ELEVATIONS TO DEPTH TO WATER TABLE. BASED ON PREVIOUS WELL MONITORING RECORD, AS APPROPRIATE, THE ENGINEER WILL MODIFY ESTIMATE OF SEASONAL HIGH WATER (SHW) AND SEASONAL LOW WATER (SLW) ELEVATIONS AND WILL REVISE THE PLANTING PLAN.

IMMEDIATELY PRIOR TO PLANTING, INUNDATE POND TO ESTIMATED SHW ELEVATION, HOLDING THE STANDING WATER LEVEL AT THE SHW ELEVATION FOR 48 HOURS AND SUBSEQUENTLY DEWATERING.

WITHIN 24 HOURS OF DEWATERING THE POND, BEGIN PLANTING THE POND TO THE SELECTED VEGETATION SPECIES.

KEEP THE POND DEWATERED UNTIL THE VEGETATION PLANTED ON THE BOTTOM OF THE POND REACHES HEIGHTS RANGING BETWEEN ONE AND TWO AND ONE-HALF FEET TALL; AT WHICH TIME, ALLOW POND WATER TO REACH NORMAL LEVELS.

THE ENGINEER WILL PERIODICALLY INSPECT THE POND AFTER PLANTING TO RECOMMEND AS APPROPRIATE, REVISIONS TO THE INUNDATION AND DEWATERING PROGRAM.

2 P.M.

REVISIONS ADDITIONS AND DELETIONS TO THE CONTRACT DOCUMENTS

Technical Provisions

PART I GENERAL INFORMATION

Section GI-1.02 Notice to Contractors: *After the first paragraph, add the following:*

"THE MARYLAND AVIATION ADMINISTRATION RESERVES THE RIGHT TO REJECT ANY AND ALL BIDS IF IN ITS JUDGEMENT THE INTEREST OF THE ADMINISTRATION MAY SO REQUIRE."

Section GI-1.06 Critical Path Schedule: Revised to read as follows:

"Critical Path Method (CPM) Schedule is required for this project. The Contractor shall develop and submit the CPM Schedule in accordance with the requirements specified in the Special Provisions, Section SP-8.03."

Section GI-1.08 Special Construction Requirements

Article G Basis of Award: second sentence: after "Same items", add ", except earthwork Items P-152.2 and P-152.3,".

PART I TECHNICAL SPECIFICATIONS

Section 1300 Sanitary Sewage and Water Supply System

A. Article 2.3 Sanitary Sewage Lift Station:

1. First line: after "..dry pit design", add "and shall be either total inground or partial inground type design."

2. Eleventh line: change "a flow rate of 130 gallons per minute," to read "a flow rate as follows: Sewer Pump Station No. 1 - 225 GPM, Sewer Pump Station Nos. 2 and 3 - 130 GPM, Sewer Pump Station No. 4 - 100 GPM,".

3. Next to the last line: after "Mansfield, Ohio", add "or Precision System Twin Pac by AMES, Inc. Columbia, Maryland, or approved equal."

B. Article 6.3 : add the following Pay Items:

"Item 1300.9.1 Sanitary Sewer Pump Station (100 GPM)--- each
Item 1300.9.2 Sanitary Sewer Pump Station (130 GPM)--- each
Item 1300.9.3 Sanitary Sewer Pump Station (225 GPM)--- each"

Section 16120 Wires and Cables: Article 2.3.A.: first line: change "twelve (24) fiber" to "twenty (24) fiber".

Item 16321 Pole Mount Transformer: Article 3.1.B. add the following: "Primary lightning arresters and fused cutouts shall be equivalent to Cooper Power Systems Type AZL/STF, rated 15 kv, 50 Amperes Continuous, 1200 Amps interrupting minimum."

Item D-751 Manholes, Catch Basins, and Inlets

Article 1.3:

Manhole: After the last line, add the following: "This item include the following structures DMH3-9, DMH3-10, DMH1-1, DMH1-2, DMH1-3, DMH1-5, and DMH1-6. Manhole structure shall be as shown on the Plans, Sheet U-15."

Type I: After the last line, add the following: "This item includes the following structures: DMH3-3A, DMH3-4 through DMH3-8, CB3-3A, CB3-4, CB3-5, CB3-6, and CB3-17 through CB3-25. Type I drainage structure shall be as shown on the Plans Sheet U-17."

Type II: After the last line, add the Following: "This item includes the following structures: CB1-1 through CB1-6, CB1-7A, CB1-8 through CB1-11, CB1-12A, and CB2-33. Type II drainage structure shall be as shown on the Plans Sheet 17."

Type III: After the last line, add the following: "Curb inlets shall be Maryland Department of Transportation Curb Inlet Standard Nos. 374.51 or 374.61 with 5' trough opening.

Item L-110 Installation of Airport Underground Electrical Duct

Article 5.1: six line: change "Sched. 40 Conduit" to "Sched. 80 Conduit".

PART VI BID FORMS

Bid Tabulation Forms

A new set of Bid Tabulation Forms is issued. The attached Bid Tabulation Forms, Page BF-20B to Page BF-70B supersedes the existing form.

CONTRACT PLANS

Sheet G-04 : Revised Summary of Estimated Quantities Table. See the attached reduced size print of Sheet G-04.

Sheet G-09 : Revised Plan and Notes. See the attached reduced size print of Sheet G-09.

Sheet G-10 : Revised Plan and Note, detail added. See the attached reduced size print of Sheet G-10

Sheet G-11 : Revised Plan and Note. See the attached reduced size print of Sheet G-11.

Sheet C-01 : Added manhole description. See the attached reduced size print of Sheet C-01.

Sheet C-02 : Added drainage structure descriptions. See the attached reduced size print of Sheet C-02.

Sheet C-03 : Revised pipe sizes. See the attached reduced size print of Sheet C-03.

Sheet C-05 : Clarified limit of work. See the attached reduced size print of Sheet C-05.

Sheet C-06 : Clarify pipe dimensions. See the attached reduced size print of Sheet C-06.

Sheet C-07 : Added drainage structure descriptions. See the attached reduced size print of Sheet C-07.

Sheet C-21 : Revised pipe sizes, invert and pump identifications. See the attached reduced size print of Sheet C-21.

Sheet C-22 : Revised pipe sizes, invert and pump identifications. See the attached reduced size print of Sheet C-22.

Sheet V-01 : Clarified netting area. See the attached reduced size print of Sheet V-01.

Sheet V-02 : Misc. revisions. See the attached reduced size print of Sheet V-02.

Sheet V-04 : Added planting SF quantities. See the attached reduced size print of Sheet V-04.

Sheet P-04 : Added note. See the attached reduced size print of Sheet P-04.

Sheet U-17 : Revised details and note. See the attached reduced size print of Sheet U-17.

Sheet U-22 : Added detail and pump information. See the attached reduced size print of Sheet U-22.

Sheet E-01 : Revised Legend. See Attachment E-01B.

Sheet E-04 : Clarified Handholes and elect. duct. See Attachment E-04B.

Sheet E-06 : Revised Light Pole Plan. See Attachment E-06B.

Response to written inquiries

Responses to the attached written inquiries from CNR Lighting, dated April 29, 1998, are as follows:

1. As indicated in the Technical Specification Section L-125.2.1.A., manufacturers for airport lighting equipment and materials shall have prior approval of the FAA, and shall be as listed in Advisory Circular (AC) 150/5345-1U. FAA Advisory Circular can be examined on the Internet at the following address:

   "WWW.FAA.GOV/ARP/ARPHOME.HTM".

   The existing taxiway edge lights and retroreflective guidance signs at Martin State Airport are manufactured ADB-ALNACO, Inc.

2. See the above.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 4, 1998 (Letter No. 1), are as follows:

1. There is a 12' run of 42" RCP between EW3-4 and EW3-5 in all Add Alternates. For revised quantities of RCP's, CB's and DMH's, see revised pages of the Bid Tabulation Form, included in this Addendum.

2. The number immediately after "CB" and "DMH" depicts the designated pond where the storm water is drained into. The required type of each drainage structure is clarified in the revised Section D-751.1.3, included in this Addendum.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 4, 1998 (Letter No.2), are as follows:

1. The storm drainage pipes from CB2-33 to CB2-29 to CB2-28 are 30" RCP, and pipe between CB2-28 and DMH1-2 is 18" RCP as shown on the Plans. It should be noted that since Pond 2 will not be constructed in this contract, the 18" pipe between CB2-28 and DMH1-2 is provided at this location to temporarily drain the storm water to Pond 1 in stead of Pond 2 as the original design was intended. Once Pond 2 is constructed (in the next contract), this 18" pipe will be abandoned, and a 30" RCP will be installed between CB2-28 and Pond 2.

2. The 42" RCP across the Access Road at Station 4+50 will not be constructed in this contract. See Addendum 1 for clarification.

3. There will be approximately 54 LF of 30" RCP at the Access Road Station 9+80. For the required quantity of this pipe, see the revised pages of the Bid Tabulation Form, included in this Addendum.

4. Sediment Chamber 1-1 has a 12" overflow and a 30" outlet pipes as shown on the Plans. Revised quantities for these items are incorporated on the revised pages of the Bid Tabulation Form, included in this Addendum.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 4, 1998 (Letter No. 3), are as follows:

1. Clarification for all storm drain inlet types is included in this Addendum. Inlet Type 3 is a MDOT Curb Inlet Standards 374.51 or 374.61, 5' trough opening.

2. Clarification for Inlet Types 1 and 2 details is included in this Addendum. See Technical Provisions Item D-751.

3. Add Alternate 1 will include grading for Lockheed-Martin Taxiway and Apron areas. Revised scope of work and quantities are included in this Addendum.

4. Filter fabric is required for all storm drain pipe as shown on the Plans.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 5, 1998 (Letter No. 1), are as follows:

1. Clarification for all storm drain structures is included in this Addendum. The inquired catch basin is a MDOT Curb Inlet Standards 374.51 or 374.61.

2. The 320' - 36" RCP from DMH1-2 to SC1-1 is included in the Base Project. The required quantity is included in this Addendum.

3. Clarification for all storm drain structures is included in this Addendum.

4. Filter fabric is required for all storm drain pipe as shown on the Plans.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 5, 1998 (Letter No. 2), are as follows:

1. Connection of the 14" pump house supply main to the existing 12" water main requires a wet tap.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 5, 1998 (Letter No. 3), are as follows:

1. The sanitary force main from the pump station and SMH 14 is a 4" PVC.

Responses to the attached written inquiries from Benfield Electric Company, Inc., dated May 5, 1998, are as follows:

1. The existing sewage pump station is not required to be connected to the autodialer system. Replaced equipment at this location is to be reconnected to the existing power source.

2. The power source for the oil/water high level alarm panel(s) is to come from 120 volt panelboard circuit(s) originating in the proposed hanger/office complexes. In addition, the alarm panels are to be mounted on the exterior building wall of these complexes. The contractor will have to provide a temporary support (4"x 4 x 8' lumber) for the alarm panel(s) until the building(s) are constructed. In addition, he will have to coordinate with the building contractor to complete installation of the alarm panel(s). The drawings do show a conduit originating from handhole(s) adjacent the oil/water separators and terminating at 15 feet from the building edge. This conduit is for routing signal wires from the oil/water separator to the building wall.

3. Seeding is part of T-901.1 Permanent Seeding.

4. The fire pump house will house two fuel day tanks for the fire pump generators. Each of these day tanks is to be provided with fuel gauges with electrical analog outputs (4-20mA) wired back to the autodialer with 2-conductor shielded cable, #22 AWG copper conductors, color coded, 100% foil shield with drain wire. Conductors are to be installed in conduit from fuel gauge to autodialer.

5. Airside manholes are mislabeled. They should be identified as airside handholes. These handholes are detailed on drawing sheet E-09. These handholes and 4-way duct bank are to be paid under Item 16110.1- Electrical Handhole, and Item 16110.6 - 4 Way Ductbank respectively.

6. These pads are for the utility padmount transformers XFR-1 and XFR-2. The contractor should coordinate with BG&E for details.

Responses to the attached written inquiries from IA Construction Corporation, dated May 5, 1998, are as follows:

1. For the earthwork item only (Items P-152.2 and P-152.3), contractors will be allowed to quote different prices for different alternates.

2. Prices for Lump Sum items including Mobilization/Demobilization and Temporary Construction Items should be different for different alternates.

Responses to the attached written inquiries from Black River Supply, Inc., dated May 5, 1998, are as follows:

1. See responses to FACCHINA Construction Company's inquiries including in this Addendum.

2. Same as the above.

3. Same as the above.

4. There is no pipe profiles. Contractors are to follow pipe inverts shown on the Plans.

5. All pipe inverts are listed on the Plans.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 6, 1998, are as follows:

1. DMH1-4 shown on Sheet C-07 is a Type 4 Storm drainage structure to be constructed in the base project. Detail for this structure is included in Addendum 1. See also this Addendum for addition clarifications.

Responses to the attached written inquiries from RHOTEN & SONS, Inc., dated May 6, 1998, are as follows:

Contrary to the wetland, Ponds 1, 3A and 3B are extended detention ponds where water level will be fluctuated or even dry most of the time. Pond planting will have to be done after the water level has been determined in field. Contractors are allowed options to select anyone of species listed on Sheet V-04. For estimated SF for each plant type required for ponds, see revised Sheet V-04 included in this Addendum.

Responses to the attached written inquiries from MODERN Electric of Maryland, Ltd., (Letter No. 1), dated May 7, 1998, are as follows:

1. Fire Alarm System specifications are shown on Sheet U-14.

2. Sewage pump station #4 is to be reconnected to the existing station electrical source.

3. The contractor should coordinate with BG&E and furnish a 480/277v, 200 Amp Electric Service. If BG&E does not require a CT cabinet then the contractor does not have to supply one.

4. The contractor should furnish the telephone termination cabinet, cabinet foundation with associated duct work and cabinet grounding components.

5. Contractor should coordinate with BG&E and furnish cable racks and/or rack supports according to BG&E requirements.

6. Yes. The local alarm panels are to be included under Item 1300.9 - Sanitary Sewer Pump Station.

7. Primary lightning arresters and fused cutouts are to be equivalent to Cooper Power Systems Type AZL/STF, rated 15 kv, 50 Amperes Continuous, 1200 Amps interrupting minimum.

8. Sewage pump station 4 does not need telephone autodialer. However, pump station 4 requires only a local alarm panel.

9. 2#8 5 kv L-824 cables is the correct designation. Revised drawing Sheets E-01 and E-04 are included in this Addendum.

Responses to the attached written inquiries from MODERN Electric of Maryland, Ltd., (Letter No. 2), dated May 7, 1998, are as follows:

1. Cable racks and manhole cover frame are to be grounded with #6 bare copper stranded wire.

2. Quantity of two is correct for bid item 16510-4. Revised corresponding page of the Bid tabulation Form is included in this Addendum.

3. Exothermic weld of ground wire to ground rod should be used where identified on contract drawings. Mechanical ground clamp is acceptable where shown on the contract drawings.

4. Yes. Counterpoise wire only gets installed over ducts that contain L-824 cable.

5. Round tapered pole is correct. Revised pole foundation detail for grass area is included in this Addendum.

Responses to the attached written inquiries from John Driggs Company, Inc., dated May 7, 1998, are as follows:

1. P-152 is a prepared subgrade for the pavement section. For compaction requirements, see Technical Specification Section P-152.2.2.C.5.

2. Unless the Contractor can demonstrate that the existing subgrade soil is suitable and well compacted, he is required to undercut the existing soil and backfill with P-152 material.

3. P-152 material is any non-organic, compactable material found on the site. The suitability of P-152 material shall be approved by the Engineer.

Responses to the attached written inquiries from MODERN Electric of Maryland, Ltd., dated May 8, 1998, are as follows:

1. Item 16170.1 identifies safety disconnect switches which may be located at the point of connection of electric service to sewage pump stations 1, 2, 3 & 4.

2. The base project requires seven luminaires to be installed. Luminaire quantities on drawing sheet G-04 shown for the base project should be changed from 13 to 7 pole mount luminaires.

3. The power source for the oil/water high level alarm panel(s) is to come from 120 volt panelboard circuit(s) originating in the proposed hanger/office complexes. In addition, the alarm panels are to be mounted on the exterior building wall of these complexes. The contractor will have to provide a temporary support (4"x 4 x 8' lumber) for the alarm panel(s) until the building(s) are constructed. In addition, he will have to coordinate with the building contractor to complete installation of the alarm panel(s). The drawings do show a conduit originating from handhole(s) adjacent the oil/water separators and terminating at 15 feet from the building edge. This conduit is for routing signal wires from the oil/water separator to the building wall.

4. See answer above.

5. The fire pump house will house two fuel day tanks for the fire pump generators. Each of these day tanks is to be provided with fuel gauges with electrical analog outputs (4-20mA) wire back to the autodialer with 2-conductor shielded cable, #22 AWG copper conductors, color coded, 100% foil shield with drain wire. Conductors are to be installed in conduit from fuel gauge to autodialer.

6. Schedule 80 PVC conduit is correct. Revised Bid Item L-110.5 is included in this Addendum.

7. These pads are for the utility padmount transformers XFR-1 and XFR-2. The contractor should coordinate with BG&E for details.

8. Three panel signs are provided in case of the required sign legend do not fit in two modules. If three module signs are not required, this item will not be used.

Responses to the attached written inquiries from Johnson Controls, dated May 8, 1998, are as follows:

1. The fiber optic cable should be a twenty-four fiber cable. Revised specifications for Item 16120 is included in this Addendum.

2. Correct. It is not required to install the fiber optic cable within an innerduct in the underground duct bank.

Responses to the attached written inquiries from Concrete Transport Inc., dated May 11, 1998, are as follows:

See the Technical Specification Section P-610.3.2.A for structural and pavement concrete mix.

LETTER NO. 1

Division of Engineering
Office of Planning and Engineering
Maryland Aviation Administration
Maryland Department of Transportation
FAX: 410-859-5440

Reference: Midfield Terminal Complex
Site Development, Phase I
Contract No. MAA-CO-97-019

Attention: **Ms. Suzette Moore**

Facchina Construction would like to submit for your review the following questions and concerns in reference to the above mentioned project:

1. The Alternate 1 includes the storm drainage for Pond 3A & 3B. Between EW3-4 and EW3-5 there is a 20' run of 42" RCP. There is zero LF in the Bid Form for the Alternate.1?

2. Does the 1 in the Catch Basin numbering (i.e. CB1-6) indicate that the basin is a Drainage Structure Type 1? If not, how can we determine what type of structure is called for on the plans since there is no drainage structure schedule?

Facchina Construction Company, Inc.

Site Development, Phase I
Contract No. MAA-CO-97-019

Attention: **Ms. Suzette Moore**

Facchina Construction would like to submit for your review the following questions and concerns in reference to the above mentioned project:

1. Shouldn't the storm drainage pipe between CB2-33 and CB2-29 be 30" RCP not 18" RCP?

2. The Base Project includes the storm drainage up to station 11+50 of the Access Road. At station 4+05 a 80' run of 42" RCP crosses the Access Road. There is zero LF in the Bid Form for the Base Project?

3. The Base Project includes the storm drainage up to station 11+50 of the Access Road. At station 9+80 there is 74' of 30" RCP on the Access Road. There is zero LF in the Bid Form for the Base Project?

4. On plan sheet U-18, Sediment Chamber 1-1 has a 36" RCP outlet pipe and is part of the Base Project. There is zero LF for 30" RCP in the Bid Form for the Base Project?

LETTER NO. 3

Division of Engineering
Office of Planning and Engineering
Maryland Aviation Administration
Maryland Department of Transportation
FAX: 410-859-5440

Reference: Midfield Terminal Complex
Site Development, Phase I
Contract No. MAA-CO-97-019

Attention: **Ms. Suzette Moore**

Facchina Construction would like to submit for your review the following questions and concerns in reference to the above mentioned project:

1. Where are the details for a Storm Drainage Inlet Type 3?

2. The details for Storm Drainage Inlet Type 1 & 2 are not drawn to scale, what are the dimensions for these structures (wall thickness, inside width & length)? What type of frame & grate will be required?

3. For Alternate No.1 construction of Taxiway J and the Lockheed Martin Apron are not included, what will be the grading requirements in these areas?

4. Detail A & B on plan sheet U-17 shows filter fabric around all storm drainage pipe. The pipe is not working as a underdrain, why do you want the filter fabric? Will the filter fabric be required on all storm drainage pipe as stated (this would be a waste of money)?

Attention: **Ms. Suzette Moore**

Facchina Construction would like to submit for your review the following questions and concerns in reference to the above mentioned project:

1. The catch basin shown on the upper left hand corner of plan sheet C-02 (RIM ELEV = 13.31) does not have a reference to its type (i.e. Drainage Structure Type1). What type of structure is it?

2. Should the 320' – 36" RCP from DMH1-2 to SC1-1 be included in the Base Project? If it should, there is zero LF in the Bid Form for the Base Project.

3. The plans do not have a storm drainage schedule, how can we determine what type structure each catch basin is (i.e. Storm Drainage Structure Type 1 or 2 or 3 or 4)?

Re: Midfield Terminal Complex Site Development, Phase I
MAA-CO-97-019

Gentlemen:

The following are several questions regarding the above referenced project:

1 - On drawing C-22, the existing pump station isn't indicated on the electrical drawings for high alarm status and a power feed for the pumps. Does this sewage pump station require the same requirements as the other three stations? If so, please indicate where and how the power is originating and how the alarm wire is getting from the Fire Pumphouse to the existing pump station.

2 - On drawing E-08, the "High Level Alarm Panels" detail indicates a power feed for the high alarm panels for the oil/water separator tanks; but the drawings don't indicate a power source for the alarm panel. Please provide a source and a raceway/ductbbank to use to get back to the power source.

3 - Under all bid items involving ductbanks and direct buried conduit, is seeding/sodding incidental to these bid items or is it part of bid item "T-901.1 Permanent Seeding".

4 - On drawing E-08, the "Proposed Telephone Autodialer System" detail indicates two fuel level analog inputs, please indicate where the level device is and how the wiring is connected back to the dialer. Also, specify type of cable to be used.

5 - On drawing E-04, both Alternate #1 and Alternate #2 show two manholes on each alternate, but there is no bid item under the two alternates that address the manholes. Also, the 4W-4" ductbank is not addressed under the bid items, this ductbank runs between the two manholes on both alternates.

6 - The bid items for the "Electrical Equipment Pad" for the base bid and the alternates are not detailed. Please provide a detail for the particular equipment pad and show where they all are located.

Thank You,
Benfield Electric Co., Inc.

RE: Martin State Airport Midfield Terminal Complex Site Development
MAA-CO-97-019

Dear Suzette,

We have the following questions on the above referenced project.

1) A takeoff of the earthwork quantities reveals a great variance in the quantity of material to be trucked off site depending on which alternates are awarded. We request that we be able to price the excavation items accordingly, and not have to quote similar excavation items in different alternates at the same unit price.
2) Similarly, it would be unreasonable to quote the Mobilization/Demobilization and Temporary Construction items at the same price for different alternates. Are these items excluded from the requirement to quote similar items at the same price for different alternates?
3) Attached are questions from Back River Supply.

Please contact me if you have any questions.

Sincerely,

John Kelble

Re: Martins State Airport
Mid Field Terminal Complex

Dear Mr. Kelble:

The following questions are required to price the inlets for this project.

1. There are no details for a type III inlets.
2. The details of the type I and type III inlets do not show the wall thickness or the inside dimensions.
3. Does "CR3-1" indicate that this inlet is a type III inlet?
4. Are there pipe profiles?
5. Not all inverts for pipes are not given, for heights use lowest given?

If you have any questions please feel free to call me at your convenience.

Sincerely,

Back River Supply, Inc.

Project Title: Midfield Terminal Complex
Site Development, Phase I
Martin State Airport
Contract No. MAA-Co ~~98-009~~ 97-019

Gentlemen:

Please fax this request for Clarification.

Bid Item's T-901.2 Wetland Vegetation for Ponds 1, 3A, & 3B is only noted in the Seeding Specification Item T-901 Seeding, with basis of payment to be made under 901-5, at a unit price per thousand square feet.

Addendum No 2 Has a new specification Item 711 Planting Wetland Vegetation with Basis of payment paid by the each, for each Plant Species to by used. And Drawings WM-1 thru WM-10 done by Urs Greiner for the Pond by Stanbury Creek. This is very good information from which we can Establish Prices from to bid.

Bid Item's T-901.2 Wetland Vegetation for Ponds 1, 3A, & 3B are almost impossible to develop Bid Prices, for when Bidding the item Per Thousand Square Feet.

The Plant Species and Quantities are determined by water levels, which will not be known, until the Job is in progress, and maybe not then.

This will affect the quantity and species Per Thousand Square Feet, and will be different for each Pond, making it impossible to Bid, the same unit prices for the Base Bid and Alternates.

Why can't Bid Item's T-901.2 be Bid under the correct Specification Section Per Addendum No 2 Item 711 Planting Wetland Vegetation and Bid Per Each For Pond 1, 3A, & 3B in the Base Bid and Alternates, similar to Item's 711.1 thru 711.7 established in Addendum No 2. This is the only proper way to Bid this given, the lack of information we are afforded, to Bid Item's
T-901.2.

RE: INV#: MAA-CO-97-019

Dear Ms. Moore:

In reviewing the plans and specifications for the above referenced project, I have the following questions which require your responses:

1. In addendum no. 1, page 13, question 4 requires the fire alarm system to be part of item 16900.1 - General Instrumentation. Where can we find the specifications for the fire alarm system?

2. Electrical drawings E-02 and E-03 indicate 3 pumping stations and the electrical requirements. Please provide detailed information how the fourth pumping station is to be electrically connected.

3. The addendum No. 1, page 13, question 10 indicates a 200 AMP service to be provided by BGE. The drawings indicate a CT cabinet to be installed. BGE does not furnish a CT cabinet and does not require a CT cabinet for a 200 AMP service. So, is the contractor to install one because it is shown on the plans?

4. The addendum No. 1, page 13, question 11 requires the contractor to furnish all incidentals for the telephone termination cabinet. The telephone company will not give any information as to what incidentals need to be provided until they know more about the project. How can we formulate our pricing without such information?

5. On drawing E-07, the proposed precast electric manhole requires cable racks. Please provide a specification for this item.

7501 RESOURCE COURT
BALTIMORE, MARYLAND 21226
(410) 437-5400 FAX (410) 437-5401

6. Drawings E-02 and E-03 indicate the local alarm panel to be in NEMA 4X enclosure. Is the sewage pump station supplier to provide this enclosure?

7. Spec. section 16321 3.1B states "Furnish primary lighting arresters; and fuse cutouts as required." As required by whom? Please furnish specs. for arresters and cutouts.

8. Drawing E-08 proposed telephone autodialer has information of trouble alarms for sewage pump station Nos. 1-3. Addendum No. 1 indicated a fourth pump station. Are any trouble alarms to be connected to the autodialer from the fourth sewage pump station?

9. Drawing E-09 detail "Typical Taxiway Edge Light" indicated 2 #8 5KV L-824 cables in conduit. Drawing E-04 indicates 1 - #8 5KV cable in a series loop installation. Please clarify.

Please provide responses to the above questions at your earliest convenience. If you have any questions or concerns, please feel free to contact me.

Sincerely,

David R. Ashburn

RE: INV#: MAA-CO-97-019

Dear Ms. Moore:

In reviewing the plans and specifications for the above referenced project, I have encountered the following points which require clarification:

1. Drawing E-07, Proposed Electric Manhole, indicates a ¾ x 10' ground rod to be installed with an exothermic weld for ground wire, but it does not indicate a ground wire. What gets grounded?

2. Bid item 16510.4 indicates Quantity 1, drawing E-10 indicates Quantity 2. Please clarify.

3. Drawing E-07 indicates exothermic weld to the ground rods. Spec. 16450 2.1C indicates a mechanical clamp. Please clarify.

4. On drawing E-09 the #8 bare copper counterpoise cable is indicated in typical 4 - way duct. On drawing E-07 there is no counterpoise indicated in the trench details. Does the counterpoise only get installed in the ducts that contain the L-824 cable? Spec. 16450 3.1 C.3. indicates underground ducts.

5. Drawing E-06 typical pole-mount luminaire detail indicates a round-tapered pole, the typical pole foundation for grass areas detail indicates a square pole shaft. Please clarify if you want round or square.

Please provide responses to the above questions at your earliest convenience. If you have any questions or concerns, please feel free to contact me.

TO: Maryland Aviation Administration **SUBJECT:** Solicitation MAA-CO-97-019

Attn: Ms. Suzette Moore **JOB:** Martin State Airport

Ms. Moore:

In reference to the above referenced solicitation, JDCI has questions regarding the pavement details. The typical pavement sections, as shown on Drawing P-03 of the project plans, indicate a base of P-152; we are unclear as to the nature of this material and have the following questions:

1. Where is sub-grade in relation to the section (above or below section P-152)?
2. If the P-152 section is below sub-grade, is the proposed sub-grade under-cut and then backfilled with the P-152 material?
3. What type of material is required for the P-152 section?

Your attention into this matter is greatly appreciated; please respond to Saeed Milani-Nia via fax at (301) 499-4215.

RE: INV#: MAA-CO-97-019

Dear Ms. Moore:

In reviewing the plans and specifications for the above referenced project, I have encountered the following points which require clarification:

1. Bid schedule 16170.1 Motor and Circuit Disconnect - LS and spec. section 16170 is for Motor and Circuit Disconnects. Please indicate where on the plans this item is required.

2. Bid schedule 16510.1 Pole Mount Luminaire has a quantity of 13 each. The drawing E-06 only requires 7 luminaire for poles under the base bid. Where are the remaining 6 luminaires to be installed?

3. Where do the Oil/Water separator get their electrical power? None shown on electrical drawings.

4. Where do the tank high level alarm panels for the Oil/Water separator tanks get installed?

5. Where do the two fuel level analog imputs originate that connect to the auto dialer in the fire pump house?

6. Bid schedule L-110.5 indicates 2" conduit sched. 40, drawing E-09 indicates sched. 80 PVC conduit. Please clarify.

7. Bid schedule 16110.14 indicates 2 electrical equipment pads. Are these pads for the taxiway guidance signs? If so, there are 3 new guidance signs. If not, what are they for?

7501 RESOURCE COURT
BALTIMORE, MARYLAND 21226
(410) 437-5400 FAX (410) 437-5401

8. Bid schedule L-125.4 in ALT. #1 and 2 indicates a three panel sign. The guidance sign schedule on drawing E-04 only indicates 2 module signs. Please clarify.

Please provide responses to the above questions at your earliest convenience. If you have any questions or concerns, please feel free to contact me.

WE HAVE THE FOLLOWING QUESTIONS IN REFERENCE TO THE BID FOR CONTRACT NO. MAA-CO-97-019.

1. THE BID SPECIFICATIONS STATE THAT A TWELVE (24) STRAND FIBER CABLE IS TO BE INSTALLED BETWEEN HANDHOLE # 216 AND HANDHOLE #236. HOW MANY STRANDS SHOULD THIS CABLE CONTAIN, 12 OR 24?
2. THE BID SPECIFICATION DOES NOT STATE THAT THE FIBER OPTIC CABLE HAS TO BE INSTALLED IN INNERDUCT WITHIN THE UNDERGROUND CONDUITS. IS THIS CORRECT OR DO YOU IN FACT WANT THE CABLE INSTALLED WITHIN INNERDUCT?

THANK YOU IN ADVANCE FOR YOUR RESPONSE.

ADDENDUM NO. 5

PRE-BID MEETING DATE:	April 15, 1998
ADDENDUM DATE:	May 20, 1998
BID DATE:	May 28, 1998

IMPORTANT: Bidders must acknowledge the receipt of this Addendum on the Bid Forms, page BF-18, stating the Addendum Number. Additionally, Bidders must acknowledge purchase of the Standard Provisions by volume and date on page BF-18.

REVISIONS ADDITIONS AND DELETIONS TO THE CONTRACT DOCUMENTS

Technical Provisions

PART I TECHNICAL SPECIFICATIONS

Section 16120 Wires and Cables: Article 2.3.A.: first line: change "twenty (24) fiber" to "twenty-four (24) fiber".

PART IV WAGE RATES

Replace the existing Wage Rates section (3 pages) with the attached Addendum No. 5 Wage Rates section.

PART VI BID FORMS

Bid Tabulation Forms

A new set of Bid Tabulation Forms is issued. The attached Bid Tabulation Forms, Page BF-20C to Page BF-70C supersedes the existing form.

Response to written inquiries

Responses to the attached written inquiries from Cherry Hill Construction, Inc. (Letter No. 1) are as follows:

1. Water system for the Midfield Complex does not require any connection permit since the main supply will be tapped to the Airport private main. Permit for sanitary sewer connection to the County manhole, located on the South side of Wilson point Road will be provided to the Contractor.

Responses to the attached written inquiries from Cherry Hill Construction, Inc., dated May 16, 1998 (Letter No. 2) are as follows:

1. Casing pipe shall be a-12" dia.(min.) smooth-wall steel pip capable of withstanding the load superimposed by the jacking apparatus. See Article 1300.3.7 for Pipe Jacking specifications.

2. Grout shall be a non-shrink, high early strength cement grout with a 7 day compressive strength of at least 4,000 psi when tested in accordance with ASTM C109.

Responses to the attached written inquiries from PAVEX Incorporated, dated May 15, 1998, are as follows:

1. For this project the Engineer will perform the general construction inspections, including concrete and asphalt testing. Other tests and equipment demonstrations, as specified in the specifications, will be the Contractor's responsibilities.

Responses to the attached written inquiries from FACCHINA Construction Company, Inc., dated May 19, 1998, are as follows:

1. Yes. Precast Yard Inlet detail on Sheet U-15 is used for Item D-751.2 Storm drainage Inlet Type 2. This structural detail is also applicable for Type 2 Inlet in pavement area. For Type 2 Inlet in pavement area, slope ground shown in the detail should be replaced with sloped pavement.

2. CB1-8 and CB1-9 are intended to be Type 2 structures because the access road to Lockheed-Martin hangar will be a part of the main parking lot for the Midfield complex in the final development.

3. Drainage Structure Type 4 detail shown on Sheet U-17 was designed to be a double chamber structure to minimize wall thickness and reinforced steel. This detail will be modified to simplify the construction once the contract is awarded.

DIVISION OF LABOR AND INDUSTRY
PREVAILING WAGE SECTION
1100 N. EUTAW STREET, ROOM 607
BALTIMORE, MARYLAND 21202-2272
(410) 767-2342

The wage rates to be paid laborers and mechanics on the contract described below is announced by order of the Commissioner of Labor and Industry.

It is mandatory upon the successful bidder and any subcontractor under him, to pay not less than the specific rates to all workers employed by them in execution of this contract. Reference: Annotated Code of Maryland State Finance and Procurement, Section 17-201 thru 17-226 inclusive.

These rates were taken from the locality determination dated January 5, 1998 for Baltimore County, issued pursuant to the Commissioner's authority under State Finance and Procurement Article Section 17-209, Annotated Code of Maryland.

PREVAILING WAGE
INSTRUCTIONS FOR THE CONTRACTOR

The contractor shall submit two complete copies of his payroll records and the payroll records of each of his subcontractors-one copy to the Contracting Officer and one to the Commissioner of Labor & Industry, 1100 N. Eutaw Stree, Room 607, 6th Floor, Baltimore, Maryland 21201, where they will be available for inspection during business hours. These payroll records **MUST BE SUBMITTED WITHIN 14 CALENDAR DAYS AFTER THE END OF EACH PAYROLL PERIOD** and shall contain the following information: Name, address & **TELEPHONE NUMBER**; location and project number of the job; Employees name, address, social security number, exact and specific work classification, hours-straight time and overtime-worked each day, total hours-straight time and overtime-worked rate of pay and gross wages earned. Employee's address may be dropped after it has been reported one time. Payrolls shall be submitted on U.S. Department of Labor Wage and Hour Public Contracts Division Payroll Form WH-347 or its equivalent and contain only information relevant to the job and be serially numbered starting with payroll number one.

The contractor shall be responsible for submission of all subcontractors' payroll records covering work performed directly at the work site. Each copy of the payroll records shall be accompanied by a statement signed by the contractor or the subcontractor, indicating that the wage rates contained therein are not less than those established by the Commissioner as set forth in the contract, that the classification set forth for each worker or apprentice conforms with the work performed, and that the contractor or subcontractor, as the case may be, has complied with the provisions of the law.

A contractor or subcontractor may make **deductions** that are (1) required by law; (2) required by a collective bargaining agreement between a bona fide labor organization and the contractor or subcontractor; or (3) contained in **WRITTEN AGREEMENT** between an employee and an employer undertaken at the beginning of employment, if the agreement is submitted by the employer to the **PUBLIC BODY** awarding the public work and is approved by the public body as fair and reasonable.

If the contractor is delinquent in submitting payroll records, processing of partial payment estimates may be held in abeyance pending receipt of the records. In addition, if the contractor is delinquent in submitting the payroll records, the contractor shall be liable to the Contracting Public Body for liquidated damages. The liquidated damages shall constitute the sum of $10.00 for each calendar day that the records are late.

Only apprentices registered with the Maryland State Apprenticeship and Training Council shall be employed on Prevailing Wage projects. Apprentices shall be paid a percentage of the determined journeyperson's wage rate for the specific craft.

OVERTIME rates shall be paid by the general contractors and subcontractors under its contracts and agreements with their employees which in no event shall be less than time and one-half the prevailing hourly rate of wages for all hours worked **IN EXCESS OF EIGHT (8) HOURS IN ANY ONE CALENDAR DAY** and work performed on Sundays and legal holidays.

Contractors and subcontractors employing a classification of worker for which a wage rate was not issued, shall notify the Commissioner of Labor & Industry, Prevailing Wage Section, for the purpose of obtaining the wage rate for said classification **PRIOR TO BEING EMPLOYED** on this project.

Re: MAA-CO-97-019

Dear Ms. Moore:

SP-8.05 Construction Quality Control Plan, Paragraph C states:..." The contractor's plan shall encompass all management and finished construction work, including all inspection controls and tests required for compliance with the Technical Specifications, except for those inspections and tests specifically reserved to be accomplished by the Engineer."

What are the specific inspections and tests reserved for the Engineer that are not the responsibility of the contractor?

Thank you,
Pavex, Inc.

FAX: 410-859-5440

Reference: Midfield Terminal Complex
Site Development, Phase I
Contract No. MAA-CO-97-019

Attention: **Ms. Suzette Moore**

Facchina Construction would like to submit for your review the following questions and concerns in reference to the above mentioned project:

1. Is the detail PRECAST YARD INLET on plan Sheet U-15 the detail to use for item D-751.2 Storm Drainage Inlet Type 2 (yard inlets to be used on the landside portion of the site)?

2. Addendum 4 indicates that CB1-8 & CB1-9 are Type 2 structures (yard inlets), shouldn't these inlets be Type 3 structures (curb inlets) since they are on the access road?

3. Addendum 4 states that storm structure DMH1-4 shown on Sheet C-07 is a Type 4 Storm Drainage Structure. The detail on plan Sheet U-17 for a Drainage Structure Type 4 is a double chamber structure with two parallel pipe entering & leaving each chamber. DMH1-4 shown on Sheet C-07 is a storm drainage manhole built over a existing 54" pipe. Are you sure you want a Type 4 Storm Drainage Structure for DMH1-4? If yes, what do we do with the chamber that doesn't have a pipe entering or leaving it?

Facchina Construction Company, Inc.

P.O. Box 8766
Baltimore/Washington International
Airport, Maryland 21240

ADDENDUM DATE: **MAY 26, 1998**

BID DUE DATE: **MAY 28, 1998 - 2 P.M.**

MIDFIELD TERMINAL SITE COMPLEX SITE DEVELOPMENT, PHASE I AT MARTIN STATE AIRPORT

CONTRACT NO. MAA-CO-97-019

ADDENDUM NO. 6

Important: Bidders must acknowledge the receipt of this Addendum on page BF.18 of the Bid Forms, Section 5, Bid Proposal stating the Addendum number. All documents must be fully executed at the time the Bid is submitted.

REVISION TO STANDARD PROVISIONS FOR CONSTRUCTION CONTRACTS:

SP-4.02 Notice to Proceed

The Notice to Proceed as defined in **GP-8.02** will be issued within one hundred and twenty (120) days after the Notice of Recommended Award.

CLARIFICATIONS/REVISIONS TO TECHNICAL PROVISIONS:

Response to Written Inquiries:

1. IA Construction Corporation, 5/22/98:

   Q. Please clarify if we will be paid for topsoil that we strip, stockpile and later place under both one of the P-152 items, as well as under Item T-905.1. Item P-152-2.2.11C conflicts with Item T-905-3.3A regarding this issue.

   A. Topsoil will be paid only once as follows:

      1. Topsoil that is stripped and disposed of off site is to be paid under Item P-152.1 Stripping.

2. Disposal of existing topsoil stockpile remaining from a previous contract is to be paid under Bid Item P-152.4 Remove Existing Soil Stockpile.
3. Placing topsoil obtained on-site or off-site is to be paid under Item T-905.1 Topsoiling.
4. Stripping and stockpiling topsoil for reuse will not be paid. Payment will be made for placing topsoil only (see item 1 above).

2. John C. Driggs Company, 5/22/98:

Q. Please clarify what type of inspections are included in "general construction inspections"?

A. General construction inspections by the Engineer include visual inspection, measurements and other means to insure work is in compliance with the Plans and Specifications. General construction inspections do not include geotechnical testing.

SECTION 2
BID/PROPOSAL AFFIDAVIT

A. AUTHORIZED REPRESENTATIVE

I HEREBY AFFIRM THAT:

I am the _____ and the duly authorized representative of
Title

_____, and that I possess the legal authority to make
Firm
this Affidavit on behalf of myself and the business for which I am acting.

B. AFFIRMATION REGARDING BRIBERY CONVICTIONS

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business (as is defined in **Section 16-101(b)** of the State Finance and Procurement Article of the Annotated Code of Maryland), or any of its officers, directors, partners, or any of its employees directly involved in obtaining or performing contracts with public bodies (as is defined in **Section 16-101(f)** of the State Finance and Procurement Article of the Annotated Code of Maryland), has been convicted of, or has had probation before judgment imposed pursuant to **Article 27, Section 641** of the Annotated Code of Maryland, or has pleaded *nolo contendere* to a charge of, bribery, attempted bribery, or conspiracy to bribe in violation of Maryland law, or of the law of any other state or federal law, except as follows (indicate the reasons why the affirmation cannot be given and list any conviction, plea, or imposition of probation before judgment with the date, court, official or administrative body, the sentence or disposition, the name(s) of person(s) involved, and their current positions and responsibilities with the business):

_____
_____
_____
_____

C. AFFIRMATION REGARDING OTHER CONVICTIONS

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, or any of its officers, directors, partners, or any of its employees directly involved in obtaining or performing contracts with public bodies, has:

(a) Been convicted under state or federal statute of a criminal offense incident to obtaining, attempting to obtain, or performing a public or private contract, fraud, embezzlement, theft, forgery, falsification or destruction of records, or receiving stolen property;

(b) Been convicted of any criminal violation of a state or federal antitrust statute;

(c) Been convicted under the provisions of **Title 18** or the United States Code for violation of the Racketeer Influenced and Corrupt Organization Act, **18 U.S.C. §1961**, *et seq.*, or the Mail Fraud Act, **18 U.S.C. §1341**, *et seq.*, for acts arising out of the submission of bids or proposals for a public or private contract;

(d) Been convicted of a violation of the State Minority Business Enterprise Law, **Section 14-308** of the State Finance and Procurement Article of the Annotated Code or Maryland;

(e) Been convicted of conspiracy to commit any act or omission that would constitute grounds for conviction or liability under any law or statute described in Subsections (a), (b), (c) or (d) above;

(f) Been found civilly liable under a state or federal antitrust statute for acts or omissions in connection with the submission of bids or proposals for a public or private contract;

(g) Admitted in writing or under oath, during the course of an official investigation or other proceedings, acts or omissions that would constitute grounds for conviction or liability under any law or statute described above, except as follows (indicate reasons why the affirmations cannot be given, and list any conviction, plea, or imposition of probation before judgment with the date, court, official or administrative body, the sentence or disposition, the name(s) of the person(s) involved and their current positions and responsibilities with the business, and the status of any debarment):

_____

_____

_____

_____

D. AFFIRMATION REGARDING DEBARMENT

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, or any of it its officers, directors, partners, or any of its employees directly involved in obtaining or performing contracts with public bodies, has ever been suspended or debarred (including being, issued a limited denial of participation) by any public entity, except as follows (list each debarment or suspension providing the dates of the suspension or debarment, the name of the public entity and the status of the proceedings, the name(s) of the persons(s) involved and their current positions

and responsibilities with the business, the grounds of the debarment or suspension, and the details of each person's involvement in any activity that formed the grounds of the debarment or suspension):

_____

_____

_____

_____

E. AFFIRMATION REGARDING DEBARMENT OF RELATED ENTITIES

I FURTHER AFFIRM THAT:

(a) The business was not established and it does not operate in a manner designed to evade the application of or defeat the purpose of debarment pursuant to **Section 16-101**, *et seq.*, of the State Finance and Procurement Article of the Annotated Code of Maryland; and

(b) The business is not a successor, assignee, subsidiary, or affiliate of a suspended or debarred business, except as follows (you must indicate the reasons why the affirmations cannot be given without qualification):

_____

_____

_____

_____

F. SUB-CONTRACT AFFIRMATION

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, has knowingly entered into a contract with a public body under which a person debarred or suspended under **Title 16** of the State Finance and Procurement Article of the Annotated Code of Maryland will provide, directly or indirectly, supplies, services, architectural services, construction related services, leases of real property, or construction.

G. AFFIRMATION REGARDING COLLUSION

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, has:

(a) Agreed, conspired, connived, or colluded to produce a deceptive show of competition in the compilation of the accompanying bid or offer that is being submitted;

(b) In any manner, directly or indirectly, entered into any agreement of any kind to fix the bid price or price proposal of the bidder or offeror or of any competitor, or otherwise taken any action in restraint of free competitive bidding in connection with the Contract for which the accompanying bid or offer is submitted.

H. FINANCIAL DISCLOSURE AFFIRMATION

I FURTHER AFFIRM THAT:
I am aware of, and the above business will comply with, the provisions of **Section 13-221** of the State Finance and Procurement Article of the Annotated Code of Maryland, which require that every business that enters into contracts, leases, or other agreements with the State of Maryland or its agencies during a calendar year under which the business is to receive in the aggregate $100,000 or more shall, within 30 days of the time when the aggregate value of the contracts. leases or other agreements reaches $100,000, file with the Secretary of State of Maryland certain specified information to include disclosure of beneficial ownership of the business.

I. POLITICAL CONTRIBUTION DISCLOSURE AFFIRMATION

I FURTHER AFFIRM THAT:
I am aware of, and the above business will comply with the provisions of **Article 33, Sections 30-1 through 30-4** of the Annotated Code of Maryland, which requires that every person that enters into contracts, leases, or other agreements with the State of Maryland, including its agencies or a political subdivision of the State, during a calendar year in which the person receives in the aggregate $100,000 or more shall file with the Administrative Board of Election Laws a statement disclosing contributions in excess of $500 or more during the reporting period to a candidate for elective office in any primary or general election.

J. DRUG AND ALCOHOL FREE WORKPLACE
(Applicable to all contracts unless the contract is for a law enforcement agency and the agency head or the agency head's designees has determined that application of **COMAR 21.11.08** and this certification would be inappropriate in connection with the law enforcement agency's undercover operations).

I CERTIFY THAT:

1. Terms defined in **COMAR 21.11.08** shall have the same meaning when used in this certification.

2. By submission of its bid or offer, the business, if other than an individual, certifies and agrees that, with respect to its employees to be employed under a contract resulting from this solicitation, the business shall:

   (a) Maintain a workplace free of drug and alcohol abuse during the term of the Contract;

(b) Publish a statement notifying its employees that the unlawful manufacture, distribution, dispensing, possession, or use of drugs, and the abuse of drugs or alcohol is prohibited in the business' workplace and specifying the actions that will be taken against employees for violation of these prohibitions,

(c) Prohibit its employees from working under the influence of drugs or alcohol;

(d) Not hire or assign to work on the Contract anyone whom the business knows, or in the exercise of due diligence should know, currently abuses drugs or alcohol and is not actively engaged in a *bona fide* drug or alcohol abuse assistance or rehabilitation program;

(e) Promptly inform the appropriate law enforcement agency of every drug-related crime that occurs in its workplace if the business has observed the violation or otherwise has reliable information that a violation has occurred;

(f) Establish drug and alcohol abuse awareness programs to inform its employees about:

(1) The dangers of drug and alcohol abuse in the workplace;

(2) The business' policy of maintaining a drug and alcohol free workplace;

(3) Any available drug and alcohol counseling, rehabilitation, and employee assistance programs; and

(4) The penalties that may be imposed upon employees who abuse drugs and alcohol in the workplace;

(g) Provide all employees engaged in the performance of the Contract with a copy of the statement required by §J(2)(b), above;

(h) Notify its employees in the statement required by §J(2)(b), above that, as a condition of continued employment on the Contract, the employee shall:

(1) Abide by the terms of the statement; and

(2) Notify the employer of any criminal drug or alcohol abuse conviction for an offense occurring in the workplace not later that 5 days after a conviction;

(i) Notify the Procurement Officer within 10 days after receiving notice under §J(2)(h)(2), above, or otherwise receiving actual notice of a conviction;

(j) Within 30 days after receiving notice under §J(2)(h)(2), above, or otherwise receiving actual notice of a conviction, impose either of the following sanctions or remedial measures on any employee who is convicted of a drug or alcohol abuse offense occurring in the workplace:

(1) Take appropriate personnel action against an employee, up to and including termination; or

(2) Require an employee to satisfactorily participate in a *bona fide* drug or alcohol abuse assistance or rehabilitation program; and

(k) Make a good faith effort to maintain a drug and alcohol free workplace through implementation of §§J(2)(a)-(j), above.

3. If the business is an individual, the individual shall certify and agree as set forth in §J(4), below, that the individual shall not engage in the unlawful manufacture, distribution, dispensing, possession, or use of drugs or the abuse of drugs or alcohol in the performance of the Contract.

4. I acknowledge and agree that:

(a) The award of the Contract is conditional upon compliance with **COMAR 21.11.08** and this certification;

(b) The violation of the provisions of **COMAR 21.11.08** or this certification shall be cause to suspend payments under, or terminate the Contract for default under **COMAR 21.07.01.11 or 21.07.03.15**, as applicable; and

(c) The violation of the provisions of **COMAR 21.11.08** or this certification in connection with the Contract may, in the exercise of the discretion of the Board of Public Works, result in suspension and debarment of the business under **COMAR 21.08.06**.

K. CERTIFICATION OF CORPORATION REGISTRATION AND TAX PAYMENT

I FURTHER AFFIRM THAT:

1. The business named above is a domestic ____ or foreign ____ corporation registered in accordance with the Corporations and Associations Article, Annotated Code of Maryland, and that it is in good standing and has filed all of its annual reports, together with filing fees, with the Maryland State Department of Assessments and Taxation, and that the name and address of its resident agent filed with the State Department of Assessments and Taxation is:

Name: _____

Address: _____

_____

(If not applicable, so state)

2. Except as validly contested, the business has paid, or has arranged for payment of, all taxes due the State of Maryland and has filed all required returns and reports with the Comptroller of the Treasury, the State Department of Assessments and Taxation, and the Employment Security Administration, as applicable, and will have paid all withholding taxes due the State of Maryland prior to final settlement.

L. CONTINGENT FEES

I FURTHER AFFIRM THAT:
The business has not employed or retained any person, partnership, corporation, or other entity, other than a *bona fide* employee or agent working for the business to solicit or secure this agreement, and that the business has not paid or agreed to pay any person, partnership, corporation, or other entity, other than a *bona fide* employee or agent, any fee or any other consideration contingent on the making of this Contract.

M. ACKNOWLEDGEMENT

I ACKNOWLEDGE THAT:

This Affidavit is to be furnished to the Procurement Officer and may be distributed to units of: (1) the State of Maryland; (2) counties or other subdivisions of the State of Maryland; (3) other states; and (4) the Federal Government. I further acknowledge that this Affidavit is subject to applicable laws of the United States and the State of Maryland, both criminal and civil, and that nothing in this Affidavit or any contract resulting from the submission of this bid or proposal shall be construed to supersede, amend, modify or waive, on behalf of the State of Maryland, or any unit of the State of Maryland having jurisdiction, the exercise of any statutory right or remedy conferred by the Constitution and the laws of Maryland with respect to any misrepresentation made or any violation of the obligations, terms and covenants undertaken by the above business with respect to (1) this Affidavit; (2) the Contract; and (3) other Affidavits comprising part of the Contract.

I DO SOLEMNLY DECLARE AND AFFIRM UNDER THE PENALTIES OF PERJURY THAT THE CONTENTS OF THIS AFFIDAVIT ARE TRUE AND CORRECT TO THE BEST OF MY KNOWLEDGE, INFORMATION, AND BELIEF.

Name of Firm

as the General Contractor, in performing the above-referenced Contract, we shall make every effort to achieve a minimum goal as specified in the Technical Provisions. The Disadvantaged Business Enterprise (DBE) participation goal is measured by the dollar value of the Contract, including any modifications or change orders executed subsequent to the award of the Contract.

C. IT IS ACKNOWLEDGED:
That all required documentation relative to affirmative action taken by the General Contractor to seek out and consider the use of Minority Business Enterprise will be submitted to and/or made available for inspection by the Maryland Department of Transportation.

B. BASIS OF AWARD:

The Maryland Aviation Administration reserves the right to award the Contract to the lowest responsive and responsible bidder on the basis of one of the following:

1. The lowest total price bid for the **Base Project**, or

2. The lowest total price bid for the **Base Project** and **Add Alternate 1**, or

3. The lowest total price bid for the **Base Project** and **Add Alternate 2**, or

4. The lowest total price bid for the **Base Project** and **Add Alternate 3**.

C. NOTICE OF AWARD:

Notice of award as described in General Provisions, Sections **GP-2.19** and **GP-3.01** will be issued within one hundred and twenty (120) days of bid opening.

D. BID GUARANTY:

Five percent (5%) of total bid (Not required when bid is less than One Hundred Thousand Dollars ($100,000.00)).

TO THE MARYLAND DEPARTMENT OF TRANSPORTATION,
MARYLAND AVIATION ADMINISTRATION

GENTLEMEN:

A. The undersigned hereby declares to have carefully examined the Contract Documents entitled:

Contract Number: MAA-CO-97-019

Contract Title: Midfield Terminal Complex Site Development, Phase I

and to have examined the other Contract Documents (including the Standard Provisions, Addendum(s), Bid Forms, and Contract Forms), and to have carefully inspected the site(s) whereon the proposed work is to be performed.

B. The undersigned proposes and agrees to furnish all labor, materials, equipment and services necessary for the above said project for the Maryland Aviation Administration in accordance with the Specifications, and other Contract Documents including:

1. Addendum(s) issued by the Maryland Aviation Administration,

   Number(s): _____ , and

2. Standard Provisions

   Volume: _____, Date: _____

at the Unit Prices Bid as delineated on the Bid Tabulation Forms, or at the Lump Sum Price Bid as stipulated in the Contract Documents.

C. The prices shown on the Bid Tabulation Forms for the Contract entitled:

Contract Number: MAA-CO-97-019

Contract Title: Midfield Terminal Complex Site Development, Phase I

include and cover the furnishing of all materials and labor requisite and proper, and the providing of all necessary machinery, tools, apparatus, and means for performing the work, as set forth, described, and shown in the Contract Drawings, Specifications and other Contract Documents.

D. The undersigned affirms that Bid has been executed in accordance with General Provisions, Section **GP-2.06**, titled "Preparation of Bid".

FOR CORPORATIONS:

A. The undersigned Corporation affirms that it is ____ is not____ registered with the Maryland State Department of Assessments and Taxation and, if registered, is in good standing.

B. If not registered with the Maryland State Department of Assessments and Taxation, see Special Provision, Section **SP-2.03**, titled "Corporate Registration".

INTRODUCTION

This book, Technical Provisions for Construction Contracts, is a supplement to the Maryland Aviation Administration's Standard Provisions for Construction Contracts, Volume I, December 1993. This book along with the Standard Provisions is intended to describe and establish all requirements and standards for this construction contract.

The requirements contained in this book shall be binding upon the parties signatory to the Contract. By submitting a bid for this Contract, the Contractor agrees to adhere to the requirements of these Provisions.

The Contractor shall be required to acknowledge possession of the Standard Provisions, Volume I, December 1993, in the space provided in the Proposal Section. Failure to acknowledge possession of the referenced Standard Provisions as required shall deem the bid to be non-responsive and subject to rejection in accordance with General Provisions, Section GP-2.17, Rejection of Individual Bids or Proposals.

GI-1.02 Notice to Contractors

Sealed bids for the Maryland Aviation Administration (MAA) project marked Midfield Terminal Complex Site Development, Phase I, MAA-CO-97-019 will be received at the *Office of Planning and Engineering of the Maryland Aviation Administration, Lower Level, Pier A, Baltimore/Washington International Airport, Maryland 21240*, until 11:00 am, local time May 12, 1998. At 11:15 am, on this same date they will be publicly opened and read aloud. Positively no bids will be received after 11:00 am on May 12, 1998.

The work to be done under this contract includes the furnishing of all supervision, labor, materials, equipment and all incidentals necessary for the Midfield Terminal Complex Site Development, Phase I project.

The work under this contract includes, but is not limited to, the installation of infrastructure and the development of approximately 45-acre site for aviation uses at the Martin State Airport, Baltimore County, Maryland. The Maryland Aviation Administration will award the Contract to the lowest responsible and responsive bidder based on the lowest bid price. The work includes, but is not necessarily limited to: site clearing and grading; demolition of three (3) abandoned buildings on the site, and demolition of, and removal of hazardous materials from these buildings, and proper disposal of the hazardous materials; installation of site utilities including domestic and fire protection water system including a 500,000 gallon water storage tank, pumps, control systems and pumping station; gravity and force main sanitary sewer; installation of fiber optic communication cable; electrical distribution system, switchgear, transformers, duct bank, conduits and cable; site drainage and storm water quality and quantity management systems; the construction of taxiways, taxilanes, aprons, parking lots and access roads including curb and gutter and lighting, and pavement markings; seeding, topsoiling; construction of wetland mitigation and wetland replication vegetation; and erosion and sediment control measures during construction in accordance with standards and permits issued by the Maryland Department of the Environment. All work shall be performed in accordance with the Contract Drawings and as described in the Specifications. Natural gas, telephone, cable television systems, and electrical cable and distribution systems for this project will be installed by respective utility companies under utility installation allowances provided under this Contract. Work shall also includes procurement of respective utility companies construction services including all necessary permits for private and public utility connections.

Plans, Specifications, and other contract documents may be examined without charge, or Contract Drawings and Technical Provisions may be purchased for **$150.00** and Standard Provisions for **$30.00** at the Office of Planning and Engineering of the Maryland Aviation Administration at the Lower Level, Pier A, Baltimore/Washington International Airport. These payments will **not** be refunded.

A site inspection/pre-bid conference be held on April 15, 1998. at 1:00 p.m. for all interested bidders. Please assemble at Hangar 4 Classroom, Martin State Airport, Maryland.

The Bid must be accompanied by a Bid Guaranty in the amount of five per cent (5%) of the Bid Price in the name of the "State of Maryland," a Bid/Proposal Affidavit, and the Minority Business Enterprise and Subcontractor Utilization Affidavits. A Performance and a Payment Bond in the amount of the Contract Price will be required of the successful bidder if the contract price is over One Hundred Thousand Dollars ($100,000). Assistance in obtaining Bid, Performance and Payment Bonds may be available to qualifying small businesses through the Maryland Small Business Development Financing Authority (MSBDFA). Questions regarding the bonding assistance program should be referred to: MSBDFA, 217 E. Redwood Street, 22nd Floor, Baltimore, MD 21202, (410) 333-4270.

Bidders are hereby notified that in regard to any contract entered into pursuant to this advertisement, Minority Business Enterprises (MBE) will be afforded full opportunity to submit bids in response to this notice and will not be subjected to discrimination on the basis of race, color, sex, creed, or national origin. Minority Business Enterprises are encouraged to respond to this solicitation notice.

It is the goal of Maryland Department of Transportation that Minority Business Enterprises participate in all contracts. The MAA has established a minimum goal of sixteen percent (16%) participation for this Contract.

If any prospective bidders are physically impaired and are planning to attend the Pre-Bid/Site Inspection or Bid Opening meetings, please call at least two business days in advance of the meeting to (410) 859-7267 (Contact Administration), (410) 859-7111 (MAA Communications Center), or (410) 859-7227 (TDD) to advise of any reasonable accommodations required.

By submitting a response to this solicitation, a vendor shall be deemed to represent that it is not in arrears in the payment of any obligation due and owing the State of Maryland, including the payment of taxes and employee benefits, and that it shall not become so in arrears during the term of the contract if selected for contract award.
The Maryland Aviation Administration reserves the right to reject any and all bids, if in its judgement the interest of the Administration may so require.

Any questions regarding this solicitation or contract should be addressed to Ms. Suzette Moore, in writing at the Maryland Aviation Administration, Office of Planning and Engineering, or by phone at (410) 859-7792.

Alex E. Noorani, Director
Division of Engineering
Office of Planning and Engineering
Maryland Aviation Administration
Maryland Department of Transportation

GI-1.03 Notice of Pre-Bid Conference

A site inspection/Pre-Bid conference will be held on April 15, 1998 at 1:00 p.m. for all bidders. Please assemble at at Hangar 4 Classroom, Martin State Airport, Maryland. Interested bidders are encouraged to attend.

A State Equal Opportunity Officer will be available to discuss the Affirmative Action Requirements of this Contract.

GI-1.04 Description of Project

The work to be done under this contract includes the furnishing of all supervision, labor, materials, equipment, and all incidentals necessary for the Midfield Terminal Complex Site Development, Phase I project.

The work under this contract includes, but is not limited to, the installation of infrastructure and the development of approximately 45-acre site for aviation uses at the Martin State Airport, Baltimore County, Maryland. The Maryland Aviation Administration will award the Contract to the lowest responsible and responsive bidder based on the lowest bid price. The work includes, but is not necessarily limited to: site clearing and grading; demolition of three (3) abandoned buildings on the site, and demolition of, and removal of hazardous materials from these buildings, and proper disposal of the hazardous materials; installation of site utilities including domestic and fire protection water system including a 500,000 gallon water storage tank, pumps, control systems and pumping station; gravity and force main sanitary sewer; installation of fiber optic communication cable; electrical distribution system, switchgear, transformers, duct bank, conduits and cable; site drainage and storm water quality and quantity management systems; the construction of taxiways, taxilanes, aprons, parking lots and access roads including curb and gutter and lighting, and pavement markings; seeding, topsoiling; construction of wetland mitigation and wetland replication vegetation; and erosion and sediment control measures during construction in accordance with standards and permits issued by the Maryland Department of the Environment. All work shall be performed in accordance with the Contract Drawings and as described in the Specifications. Natural gas, telephone, cable television systems, and electrical cable and distribution systems for this project will be installed by respective utility companies under utility installation allowances provided under this Contract. Work shall also includes procurement of respective utility companies construction services including all necessary permits for private and public utility connections.

GI-1.05 Basis of Award

The Maryland Aviation Administration will award this Contract to the lowest responsive and responsible bidder on the basis of one of the following:

1. The lowest total price bid for the **Base Project**, or

2. The lowest total price bid for the **Base Project** and **Add Alternate 1**, or

3. The lowest total price bid for the **Base Project** and **Add Alternate 2**, or

4. The lowest total price bid for the **Base Project** and **Add Alternate 3**.

Determination of which of the preceding will be used as the basis for award will be at MAA's sole discretion. The scope of the Contract to be awarded will be subject to available funding as well as other considerations to be determined solely by MAA.

Work to be included in the **Base Project**, **Add Alternate 1**, **Add Alternate 2**, and **Add Alternate 3** is specified in the Contract Drawings, and is summarized as follows:

Base Project — The Base Project will include clearing and grubbing of the entire project site; demolition and removal of abandoned buildings (included removal and disposal of hazardous materials therein) and utilities; construction of the access road and associated storm drainage system up to Station 11+50; construction of stormwater management Pond 1; and the installation of utility services (water, fire suppression, natural gas, sanitary sewer, electrical, communications, and cable television services) to and throughout the Midfield Terminal Complex, including the extension of the proposed sanitary sewer system to the airport's Strawberry Point complex.

Add Alternate 1 — Add Alternate 1 will consist of development of the Skytech portion of the Midfield Complex. This work will include construction of the Skytech apron, Taxiway L, and associated storm drainage, lighting and signage, and other related work; construction of stormwater management Ponds 3A and 3B; extension of the access road to the Skytech apron and construction of the adjacent parking lot and associated storm drainage, electrical, and lighting facilities. Rough grading of the future hangar site will also be included.

Add Alternate 2 — Add Alternate 2 will consist of development of the Lockheed Martin portion of the Midfield Complex. This work will include construction of the Lockheed Martin apron, extension of Taxiway J, and associated storm drainage, lighting and signage, and other related work; construction of stormwater management Ponds 3A and 3B; extension of the access road to the Lockheed Martin apron and construction of the adjacent parking lot and associated storm drainage, electrical, and lighting facilities. Rough grading of the future hangar site will also be included.

Add Alternate 3 — Add Alternate 3 will consist of the all work shown under Add Alternate 1 and Add Alternate 2.

Bidders should be thoroughly familiar with the requirements of the MAA Standard Provisions and these Specifications, including the Interim Standard Provisions Addenda contained herein, especially with those requirements for unit price contracts including add and deduct alternates.

GI-1.06 Critical Path Schedule

The Contractor is required to furnish a standard bar chart construction schedule in lieu of a Critical Path Method Schedule specified in SP-8.03.

GI-1.07 Sequence of Construction

Upon receiving the Notice-to-Proceed, the Contractor shall prepare and construct the project in accordance with an approved Construction Staging Plan, unless otherwise directed by the Engineer. The Construction Staging Plan shall detail the following sequence of work:

(a) Mobilize for construction

(b) Install temporary traffic maintenance markings, signage, and furnish temporary construction items.

(c) Install erosion and sediment control measures.

(d) Clearing and grubbing, grading, and building and structure demolition, including removal and disposal of hazardous materials.

(e) Construct storm water quantity and quality management facilities including wetland replication vegetations and appurtenant drainage structures.

(h) Construct airfield and landside pavements, utilities, lighting, water tank and pumping equipment, pavement marking, signage, etc.

(I) Final clean up, systems testing and commissioning.

(j) Final inspection and occupancy by MAA.

GI-1.08 Special Construction Requirements

A. Time Restrictions:

All work within runway and taxiway object free areas shall be performed only during periods of runway or taxiway closure, which shall be between the hours of 10:00 pm and 6:00 am local time only, unless otherwise approved by the Airport Manager. The contractor shall notify the Engineer in writing at least forty-eight hours in advance of any desired closure, and approval will be granted (or denied) in writing. If the desired closure requires that a Notice to Airmen (NOTAM) be issued, such NOTAM will be issued by airport management. Work shall be permitted only during the effective hours of the particular NOTAM issued, regardless of the closure requested.

B. Deliveries and Removal:

The delivery and removal of all materials and equipment is unrestricted. Loading and unloading of equipment and materials from the airport roadways must be completed expeditiously, and parking of delivery vehicles on the airport roadways is not permitted. Deliveries by suppliers must be coordinated with the Contractor. The Contractor must be available to take all deliveries.

C. Staging Areas:

The Contractor will be provided with a staging area for his equipment during construction. The locations of the staging areas will be as shown on the plans or as determined by MAA prior to first mobilization. At MAA request any assigned staging area(s) shall be relocated within seven days of receiving prior notice. All staging area relocations originated by the MAA or the Contractor shall be at no additional cost to this contract.

The Contractor shall be responsible for the security and maintenance of his staging areas at all times. All costs incurred shall be considered incidental to work under this contract.

It is intended that equipment and materials needed for the construction will be stored in the Contractor's designated staging area. Equipment and materials necessary at the work site(s) may be transported to those site(s) only as necessary to meet approved schedules.

During the course of this contract the Contractor shall maintain all of his staging and work areas in a clean and usable condition acceptable to the Engineer.

All areas used for the storage of equipment or material shall be restored to their original condition immediately upon completion of this contract to the satisfaction of the Engineer. No additional compensation shall be provided for regrading, placement of topsoil, or seeding and mulching in these areas, or for any restoration activity required by the Engineer.

D. Contract Duration:

The contract duration for completion of this project, including mobilization, but excluding winter shutdowns as directed or approved by MAA:

i.	Base Project	230 Calendar days
ii.	Base Project + Add Alternate 1	260 Calendar days
iii.	Base Project + Add Alternate 2	260 Calendar days
iv.	Base Project + Add Alternate 3	275 Calendar days

Upon approval of the Administration, the successful bidder shall be available to begin work immediately following notice to proceed. Accordingly, the specified contract time/duration (including mobilization) shall begin on the Notice to Proceed date determined by the Administration.

The work to be completed in this project must not disrupt normal operations at the Martin State Airport. The completion of this project is critical to the operation of the airport. Therefore, the contract duration that the Contractor will be allowed to perform the work has been reduced to the minimum practical time.

E. Liquidated Damages:

Pursuant to General Provisions Articles GP-8.02 and GP-8.03, commence work on or before the date specified in the Notice to Proceed and complete the specified portions of the work within the number of calendar days identified below. In the event that the Contractor fails to complete the specified work within the specified number of days after Notice to Proceed, with the exception of extensions granted by change order, liquidated damages will be assessed pursuant to General Provisions Article GP-8.09 and as specified herein for each day the completion of the specified work is delayed.

Liquidated damages for completion of this construction project including the required milestone will be assessed at one thousand dollars ($1000) for each calendar day beyond the required contract completion date.

The Administration may deduct the sum of liquidated damages from any monies due or that may become due the Contractor under the Contract.

F. MBE Documentation:

The Maryland Aviation Administration requests all bidders to submit their MBE participation schedules with their bid submittal. MBE must be certified at the time of bid submittal.

G. Basis of Award:

The Contract will be awarded on a unit price basis. To be considered responsive, the bidder must bid on all items of the Base Project and Add Alternates. Same items within different portions of the Base Project and Add Alternates must be given the same unit prices. The Maryland Aviation Administration reserves the right to award the contract to the lowest responsive and responsible bidder based on the stipulations contained in Section GI-1.05. All work shall be accomplished in accordance with the Contract Drawings and Specifications.

H. Project Coordination:

The Contractor shall coordinate scheduling, submittals, and work of the various Items of the Technical Specifications to assure efficient and orderly sequence of installation of interdependent construction elements.

The Contractor shall verify that utility service requirements of proposed equipment are compatible with existing utilities. The Contractor shall also coordinate work of various sections having joint responsibility for installation, connection, and commissioning of such equipment.

The Contractor shall coordinate the requirements and installation of mechanical and electrical work which are indicated diagrammatically on Contract Drawings. Follow routing shown for pipes, ducts, and conduit, as closely as practicable. Utilize spaces efficiently to maximize accessibility for installation work covered under other Items, for maintenance, and for repairs.

Where scale of Contract Drawings is too small to show details clearly, prepare large scale sketches or drawings and submit as directed for approval.

Other construction contracts within this project site and/or elsewhere within the airport will be undertaken during the time which this project will be constructed. The Contractor shall cooperate and coordinate with Contractors working in those areas.

I. Utility Shut Downs:

The Contractor shall notify and receive approval from the Engineer seven (7) days in advance of any utility shut down that will affect the normal operations at the Martin State Airport. Utility shut downs shall only be allowed at night and during hours determined by the Engineer (normally between 12:00 midnight to 5:00 am). The Contractor shall provide the Engineer with the type of utility and duration of shut down and specific areas that will be affected as a result of this work.

J. Shop Drawings:

The time for shop drawing submittals, reviews and approvals is incorporated into the contract duration. The Contractor must submit complete shop drawing packages for each item of work. Delays caused by incomplete submittals of shop drawings by the Contractor will not be accepted by the Engineer, and the Contractor will be considered non-responsive under the Contract.

K. Access to the Site:

The Contractor's Access to the site shall be via the Airport Maintenance Complex on Strawberry Point Road, unless otherwise authorized by the Engineer. Stabilized construction entrances will be provided by the Contractor as shown on the plans, or as directed by the Engineer, and shall be the sole points of entry to the site. No dirt or debris may

be trafficked onto offsite roadways. The Contractor shall have a sweeper and water hose down equipment available at all times.

L. Airport Operations:

Although construction is largely within non-movement areas, the project site abuts active portions of the Aircraft Operations Area (AOA). The Contractor is referred to the requirements of the Special Provisions. Seven days' notice is required from the contractor to the Engineer for any activities that may impact aircraft operations. No debris shall be permitted to accumulate on or in the vicinity of the AOA. Any clean-up deemed necessary by the Engineer will be charged to the Contractor.

M. Dewatering:

The Contractor's attention is directed to the project Boring Logs shown on the Contract drawings, which indicate fluctuating and seasonally high ground water levels have been found across the site. Dewatering will be a preeminent requirement for this project and will be considered incidental for the successful construction of the project. No separate measurement or payment will be made for dewatering, or associated environmental requirements. Costs shall be included in all applicable pay items where dewatering is required.

N. Wetlands Mitigation:

Construction of wetlands mitigation is included in this contract. However, plans and specifications, including Bid Forms for the wetland mitigation are not included in these Contract Documents. Separate plans, specifications, and Bid Forms for this work will be issued as an Addendum to the Contract Documents.

O. Project Milestones:

The Contractor shall perform all work in stages shown in the Contract Drawings. However, MAA reserves the right to direct the Contractor to alter the required work sequences, and/or work areas, if necessary. Unless directed otherwises, the Contractor shall complete the work in accordance with the following milestone:

Stage I - 90 Calendar days from NTP

ITEM 10 SPECIFICATIONS AND STANDARDS

10-1 SPECIFICATIONS

1.1 The Contractor's operations shall conform to the technical specifications, and all applicable federal, state and local regulations, codes and ordinances. When not specified, the work under this contract, shall be done in accordance with the requirements of Part II, Technical Requirements, of the Maryland Department of Transportation, State Highway Administration's "Standard Specifications for Construction and Materials" dated October 1993, revisions thereof or additions thereto, the General Provisions, and the Special Provisions. Copies of the above noted "Standard Specifications for Construction and Materials" is available for a charge from the following source:

Maryland Department of Transportation
State Highway Administration
707 North Calvert Street
Baltimore, Maryland 21203-0717
(410) 333-1305

Sections referenced in the Specifications refer to the above standard unless otherwise noted.

1.2 Any reference to a specific requirement of a numbered paragraph of the specifications or a cited standard shall be interpreted to include all general requirements of the entire section, specification item, or cited standard that may be pertinent to such specific reference.

10-2 STANDARDS

2.1 The following documents are hereby included as contract documents by reference:

A. Erosion and Sediment Control, Maryland Department of Transportation, State Highway Administration, current edition, with revisions.

B. Maryland Standards and Specifications for Soil Erosion and Sediment Control, Water Resources Administration, Soil Conservation Service and State Soil Conservation Committee, current edition.

C. Book of Standards, Highways and Incidental Structures, Maryland Department of Transportation, State Highway Administration, current edition.

D. Maryland Seed Law from the Agricultural Article of the Annotated Code of Maryland, current edition.

E. Manual on Uniform Traffic Control Devices (MUTCD); US Department of Transportation, Federal Highway Administration, current edition.

F. Occupational Safety and Health Standard, Maryland Occupational Safety and Health, Maryland Division of Labor and Industry, Department of Licensing and Regulation, latest applicable standards.

2.2 In case of discrepancy between the Technical Provisions and any other provisions contained in or incorporated by reference into the contract, the Engineer shall be the sole authority on the resolution of such discrepancy and his/her decision shall be final.

10-3 CODES, PERMITS AND TEST REQUIREMENTS

3.1 All work under this contract shall comply with the provisions of these specifications, as shown on the contract drawings, or as directed by the Engineer, and shall satisfy all applicable federal, state and local codes, ordinances and regulation of the governing bodies, and all authorities having jurisdiction over the work, or services thereto, whether so specified or not, and all modifications required by such authorities shall be made by the contractor without any additional compensation beyond contract unit prices bid.

3.2 Miscellaneous work and materials required to fulfill the obvious intent of the job as indicated on the drawings, but not specifically defined, shall be performed according to the requirements of the methods selected by the Engineer as being the most appropriate.

3.3 The Contractor shall obtain and pay for all tests, permits, certificates of inspection, etc. required by the provisions of these specifications and/or the authorities having jurisdiction over this work. Such documents shall be submitted to the Engineer before the final acceptance of work or before the work begins, whichever is applicable.

3.4 The Contractor shall furnish all labor, materials, instruments, fuel, power and any incidentals required to perform any test(s) or measurement(s) as may be required by the Engineer to indicate the fulfillment of these specifications and/or his directives. Any changes or adjustments required to meet the specifications or to satisfy the Engineer shall be made by the Contractor at no expense to the Owner, and he shall furnish, at the completion of the job, a final compliance certificate to the Engineer for testing performed or adjustments made as required.

3.5 Upon completion of work and prior to final acceptance of any work, the Contractor shall demonstrate to the Engineer at his presence that all materials/equipments installed are in perfect operating condition. All defective materials or workmanship discovered as a result of these tests, measurements and/or inspections shall be removed and replaced at the Contractor's expense and the test, measurement and/or adjustment shall be repeated to meet the satisfaction of the Engineer.

3.6 All testings, adjusting, or measurements shall be performed by competent and experienced workmen skilled in their trade and in accordance with the requirements of applicable codes and standards governing such trade.

3.7 Unless directed by the Engineer otherwise, all tests, permits, certificates of inspection, etc. required by the provisions of these specifications and/or the authorities having jurisdiction over this work will apply to each item of work independently. Such document(s) shall be submitted to the Engineer before the final acceptance of each item of work, or before the work begins, whichever is applicable.

END OF ITEM 10

ITEM 100 DEMOLITION AND REMOVAL

100-1 DESCRIPTION

1.1 Work under this item will include the demolition, removal, and disposal of the following:

a) Existing concrete slabs on grade,
b) Existing chain link fence and gates (regardless of height),
c) Existing porous concrete underdrain pipe,
d) Existing utility manholes and other in-ground structures,
e) Existing concrete-encased duct bank and cable,
f) Existing electrical and communications conduit and cable,
g) Existing abandoned buildings and foundations, regardless of type of construction. This work shall include the buildings shown on the plans as well as associated structures including silos, storage sheds, vestibules, and other structures and debris in the vicinity of the buildings shown on the demolition plans, and
h) Existing concrete storm drainage pipe.

1.2 Demolition, removal, and disposal of hazardous materials contained in buildings to be removed, whose locations are shown on the plans, shall be done in strict accordance with the provisions of Item 2080. Hazardous material removal from all of the three buildings shown on the plans shall be certified complete in accordance with the provisions of Item 2080 before demolition of any of the structures may begin.

100-2 GENERAL

2.1 Any buildings and miscellaneous structures that are shown on the plans to be demolished and/or removed shall be demolished or removed, and their contents and all materials therefrom shall be disposed of off airport property in accordance with the provisions of this Item. The remaining or existing foundations, wells, cesspools, and other structures shall be demolished or destroyed by breaking out or breaking down the materials of which the foundations, wells, cesspools, etc., are built to a depth at least two feet below the existing surrounding ground or proposed grade shown on the plans, whichever may be lower. Any broken concrete, blocks, or other objectionable material which cannot be used in backfill shall be removed and disposed of. The holes or openings shall be backfilled in accordance with the provisions of Item P-152.

2.2 Before beginning any cutting or demolition work, the Contractor shall verify the locations of utilities to be removed and other existing utlities in the vicinity thereof. He shall contact "Miss Utility" as required by applicable laws and ordinances to determine the exact location of existing buried utilities prior to excavation, and shall dig test pits or use rods or other probing or detection devices to accurately determine utility locations as directed by the Engineer. The Contractor shall also be responsible for ensuring that neither present utility services nor airport traffic is interrupted during the prosecution of his work. Utilities to be relocated shall remain in place and operational until proposed replacement utilities are completed and shown to be functioning properly, except as approved by the Engineer.

2.3 Unless otherwise called for in the Contract Documents, items shown or identified as "to be demolished" and/or "to be demolished and removed" shall immediately be removed from airport property and disposed of in accordance with federal, State, and/or local laws and ordinances. The Contractor shall acquire all permits necessary to complete this work. Stockpiling or other storage of demolished and removed materials on airport property shall not be permitted without prior approval of airport management.

2.4 Except as otherwise noted, all material shown on the plans to be salvaged will remain airport property and shall be delivered and stored or stockpiled at a site on airport property to be designated by the Engineer. Any existing damage to such items shall be reported to the Engineer prior to removal. Should any damage occur

to such items during removal, transport, or storage the Contractor shall be responsible to the Owner for repair, replacement, or reimbursement at the discretion of the Engineer.

2.5 Items shown on the plans to remain in place shall not be disturbed or damaged. Where adjacent items are shown to be demolished or removed, the items to be so demolished and removed shall be isolated by sawing to their full depth or thickness or other means approved by the Engineer before demolition may begin. Any items to remain which may be damaged due to the Contractor's work shall be repaired or replaced at his own expense as directed by the Engineer.

2.6 Backfilling and/or grading of excavations resulting from demolition and removal work shall be done in accordance with the grading plans and the provisions of Item P-152.

100-3 CONSTRUCTION METHODS

3.1 Existing concrete slabs on grade and building foundations, including embedded items including but not limited to reinforcement, steel rails, angles, and other hardware, shall be demolished and removed to their full depth and removed from airport property.

3.2 The existing chain link fence, barbed wire, posts (including concrete foundations), gates, and other hardware shall be removed to the extents shown on the plans and disposed of off the airport property. The existing fence fabric shall cut at the locations shown on the plans (or to the nearest post) and removed, leaving a length of fabric suitable for splicing.

3.3 Existing porous concrete underdrain pipe shall be carefully excavated and removed to the extent shown on the plans. Pipe shall be removed to the end of the nearest section, and the resulting ends shall be capped with a suitable plastic or rubber device. The device shall be securely attached, by clamping or other means approved by the Engineer, resulting in a watertight seal. In no case shall the use of erosion control fabric or other permeable material be used to cap the ends of pipes to remain. The Contractor shall place temporary barricades and other markings along the taxiway as directed by the Engineer in accordance with the provisions of Item 109 before beginning this work. Should a NOTAM be required for this work, it shall requested from and be issued the Airport Manager before this work may begin.

3.4 Existing utility structures, including manholes, drainage inlets, handholes, and junction boxes shown on the plans to be removed shall be removed to their entire depth and disposed of off airport property. Utilities served by such structures shall be relocated as shown on the plans or taken out of service before any such structure may be removed.

3.5 Existing concrete encased duct banks shown on the plans to be removed shall be excavated, demolished, and removed by any means necessary to avoid damage to nearby utilities or other structures shown to remain in place. Cables in the ducts shall be removed and disposed of off airport property prior to beginning demolition work.

100-4 METHOD OF MEASUREMENT

4.1 The quantity of concrete slab on grade and/or building foundation demolition to be paid for under this item shall be the number of square yards of slab and/or foundations demolished, removed, and disposed of in accordance with applicable laws and ordinances.

4.2 The quantity of chain link fence (including gates), porous concrete underdrain pipe, concrete encased duct bank, and cable and conduit demolition and/or removal to be paid for under this item shall be the number of lineal feet of each item measured along the centerline.

4.3 The quantity of utility manholes and other in-ground structures to be removed, or of items to be removed and salvaged to the Owner, to be paid for shall be the number of such structures demolished, removed,and/or salvaged to the Owner, regardless of size. The types of structures and items to be demolished and removed under this item shall be measured separately as enumerated in Section 100-5 below.

4.4 There will be no direct measurement for payment of the demolition and removal of the existing buildings identified on the plans. Payment for this work will be made on a lump sum basis. This work shall include demolition, removal, and disposal off airport property of the buildings and their contents (not including hazardous materials removed and disposed of under Item 2080) as shown on the plans.

4.5 The quantity of pipe removal to be paid for under this item shall be number of lineal feet of each class or size measured along the centerline. The several sizes of pipe to be removed will be measured separately as specified in Section 100-5 below.

100-5 PAYMENT

5.1 Payment will be made at the contract unit price per square yard, lineal foot, or each for demolition, removal, and/or salvaging the several items shown on the plans. These prices shall be full compensation for furnishing all labor, equipment, materials, permits, including excavation, demolition, removal, disposal, salvaging, and any other incidentals necessary to complete the work in accordance with the provisions of this Item.

5.2 Payment will be made at the contract lump sum price for building demolition and removal. This price shall be full compensation for furnishing all labor, equipment, materials, and permits, including excavation, demolition, removal, disposal, salvaging, and other incidentals necessary to completely demolish and remove the buildings shown in accordance with the plans and the provisions of this Item.

Payment will be made under:

Item 100.1 **Demolish/Remove Existing Concrete Slabs -- per square yard**

Item 100.2 **Remove Existing Chain Link Fence -- per lineal foot**

Item 100.3 **Remove Existing Underdrain Pipe -- per lineal foot**

Item 100.4 **Demolish/Remove Existing Utilities Structures -- each**

Item 100.5 **Remove Existing Duct Bank -- per lineal foot**

Item 100.6 **Remove Existing Conduit and Cable -- per lineal foot**

Item 100.7 **Demolish/Remove Existing Buildings -- lump sum**

Item 100.8 **Remove Existing Pipe, Smaller than 12" Diameter -- per lineal foot**

Item 100.9 **Remove Existing Pipe, 12" to 24" Diameter -- per lineal foot**

Item 100.10 **Remove Existing Pipe, Larger than 48" Diameter -- per lineal foot**

END OF ITEM 100

ITEM 101 CLEARING AND GRUBBING

101-1 DESCRIPTION

1.1 This item shall consist of clearing or clearing and grubbing, including the disposal of materials, for all areas within the limits designated on the plans or as required by the Engineer.

1.2 Clearing shall consist of the cutting and removal of all trees, stumps, brush, logs, hedges, undergrowth, heavy growth of grass or weeds, debris, and rubbish of any nature, natural obstructions, loose or projecting material, or such material which in the opinion of the Engineer is unsuitable for the foundation of pavements or other required facilities, the removal of from the designated areas. The grubbing of stumps and roots will not be required. Clearing, when so designated, shall consist of the cutting and removal of isolated single trees or isolated groups of trees. The cutting of all the trees of this classification shall be in accordance with the requirements for the particular area being cleared, or as shown on the plans, or as directed by the Engineer. The trees shall be considered isolated when they are forty (40 feet or more apart, with the exception of a small clump of approximately five trees or less.

1.3 Clearing and grubbing shall consist of clearing the surface of the ground of the designated areas of all trees, stumps, down timber, logs, snags, brush, undergrowth, hedges, heavy growth of grass or weeds, debris, and rubbish of any nature, natural obstructions, or such material which in the opinion of the Engineer is unsuitable for the foundation of strips, pavements, or other required structures, including the grubbing of stumps, roots, matted roots, foundations, and the disposal from airport property of all spoil materials resulting from clearing and grubbing.

101-2 CONSTRUCTION METHODS

2.1 GENERAL:

A. Prior to performing and clearing and/or grubbing the Contractor shall verify that sediment and erosion controls are installed, utilities have been turned off or removed and that, where wells are present, wells and well casings are protected during the clearing and grubbing operations.

B. The areas denoted on the plans to be cleared or cleared and grubbed shall be staked on the ground by the Contractor. The clearing and grubbing shall be done at a satisfactory distance in advance of the grading operations.

C. All spoil materials removed by clearing or by clearing and grubbing shall be removed to approved disposal areas. Piles of cleared and grubbed material shall be placed either in the cleared area near the center or in adjacent open spaces where no damage to trees, other vegetation, or other property will occur during the disposal operations. The Contractor will be responsible for controlling his operations in compliance with all federal, state and local laws and regulations. All residue resulting from the clearing and grubbing operations shall be removed and disposed of off airport property, unless directed otherwise by the Engineer.

D. As far as practicable, waste concrete and masonry shall be placed on slopes of embankments or channels. When embankments are constructed of such material, this material shall be placed in accordance with requirements for formation of embankments. Any broken concrete or masonry which cannot be used in construction, and all other materials not considered suitable for use elsewhere, shall be disposed of by the Contractor. In no case shall any discarded materials be left in windrows or piles adjacent to or within the airport limits. The manner and location of disposal of materials shall be subject to the approval of the Engineer and shall not create an unsightly or objectionable view. When the Contractor is required to locate a disposal area outside the airport property limits at his own expense, he shall obtain and file with the Engineer permission in writing from the property owner for the use of private property for this purpose.

E. The removal of existing structures and utilities required to permit orderly progress of work shall be accomplished in accordance with the provisions of Item 100, unless otherwise shown on the plans. Clearing and/or clearing and grubbing in the vicinity of structures and utilities removed under Item 00000 shall be begun only after the sites have been cleared of hazardous materials. Whenever a telephone or telegraph pole, pipeline, conduit, sewer, roadway, or other utility not shown on the plans is encountered and must be removed or relocated the Contractor shall advise the Engineer who will notify the proper local authority or owner and attempt to secure prompt action.

2.2 CLEARING:

A. The Contractor shall clear the staked or indicated area of all objectionable materials. Trees unavoidably falling outside the specified limits must be cut up, removed, and disposed of in a satisfactory manner. In order to minimize damage to trees that are to be left standing, trees shall be felled toward the center of area being cleared. The Contractor shall preserve and protect from injury all trees not to be removed. The trees, stumps, and brush shall be cut to a height of not more than six inches above the ground. The grubbing of stumps and roots will be required.

B. When isolated trees are designated for clearing, the trees shall be classed in accordance with the butt diameter size as measured at a point eighteen inches above the ground.

2.3 CLEARING AND GRUBBING:

A. In areas designated to be cleared and grubbed, all stumps, roots, buried logs, brush, grass, and other unsatisfactory materials shall be removed, except as otherwise shown on the plans. Tap roots and other projections over one and one-half inches in diameter shall be grubbed out to a depth of at least eighteen inches below the finished subgrade or slope elevation.

B. All holes remaining after the grubbing operation in embankment areas shall have the sides broken down to flatten out the slopes, and shall be backfilled in accordance with the provision of Item P-152. The same construction procedure shall be applied to all holes remaining after grubbing in excavation areas where the depth of holes exceeds the depth of the proposed excavation.

101-3 METHOD OF MEASUREMENT

3.1 The quantities of clearing or clearing and grubbing as shown by the limits on the plans or as ordered by the Engineer shall be the number of acres or fractions thereof, of land specifically cleared or cleared and grubbed.

3.2 When isolated trees are designated for clearing, the quantities of trees, as determined in accordance with ranges of butt diameter size, measured at a point eighteen (18) inches above the ground level at the tree, shall be paid for according to the schedule of sizes as follows:

Type I: From six (6) to eighteen (18) inches butt diameter
Type II: Over eighteen (18) inches butt diameter

3.3 No measurement or payment will be made for unauthorized work. Each tree removed without authorization will be replaced with three trees of the type selected by the Engineer at the Contractor's own expense.

101-4 BASIS OF PAYMENT

4.1 Payment shall be made at the contract unit price per acre for clearing and grubbing. This price shall be full compensation for furnishing all materials and for all labor, equipment, tools, and incidentals necessary to complete the item.

4.2 Payment shall be made at the contract unit price for clearing isolated trees. This price shall be full compensation for furnishing all materials and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item P-151.1 Clearing and Grubbing -- per acre

Item P-151.2 Clearing Isolated Trees, Type I -- each

END OF ITEM 101

ITEM 108 MOBILIZATION/DEMOBILIZATION

108-1 DESCRIPTION

1.1 This item shall consist of the performance of construction preparatory operations, including the movement of personnel, equipment and materials to and from the project site; providing or securing permits, employee identification badges, temporary parking permits, airfield operator's permits, and vehicle registration; construction stakeout; payment of performance bond, payment bond, guaranty bond, and other insurance premiums; construction stakeout; utilities location; general requirements of the Contractor not otherwise included in pay items; and for the establishment and subsequent removal of the Contractor's offices and other facilities necessary to begin and sustain work on the Contract. All equipment locations are to be staked out by the Contractor and approved by the Engineer before installation. At the completion of work all areas disturbed by the Contractor's operations shall be restored to the same conditions as existed prior to commencement of mobilization operations, to the satisfaction of the Engineer.

1.2 This item shall also include an allowance for miscellaneous construction items which may be required over the duration of the contract due to unforeseen conditions or occurrences. Use of these funds shall be on a case-by-case basis only and shall be at the sole discretion of the Engineer, and will be done in accordance with policies and procedures established by the Maryland Aviation Administration.

108-2 METHOD OF MEASUREMENT

2.1 There will be no direct measurement for payment of materials, labor, equipment, services, or fees furnished or paid by the Contractor in the performance of work under this Item. Payment for mobilization and demobilization will be made on a pro-rated basis as specified below.

2.2 There will be no direct measurement for payment of materials, labor, equipment, or services furnished by the Contractor to complete miscellaneous construction items as directed by the Engineer. Payment for miscellaneous construction items will be made on a case-by-case basis as determined by the Engineer.

108-3 BASIS OF PAYMENT

3.1 This item will be paid for at the contract lump sum price for mobilization/demobilization, which price shall be full compensation for performing the work specified and the furnishing of all materials, labor, equipment, services, fees, and incidentals necessary to mobilize and subsequently demobilize the construction preparatory operations.

3.2 Payment for this item will be made in installments. The first payment of fifty (50) percent of the lump sum price will be included in the first progress estimate following partial mobilization including the placement or erection of the Contractor's office and the initiation of construction work. The remaining 50 percent of the lump sum price will be included as installments in subsequent progress estimates. Each such installment will be determined based on the ratio of the total work completed to date to the total contract amount.

3.3 If the Contract lump sum price for mobilization/demobilization exceeds five (5) percent of the total contract amount less the price for mobilization/demobilization the first payment and subsequent installments included in progress estimates shall be based on said five (5) percent. The remainder of the contract lump sum price will be included in the semi-final estimate.

3.4 No additional payment will be made for demobilization and remobilization due to shutdowns, suspensions of the work, or for other mobilization activities.

3.5 Payment for miscellaneous construction items will be made on a case-by-case basis in the amount(s) agreed to between the Engineer and Contractor. Such amounts shall be full compensation for performing the miscellaneous work specified and for furnishing all materials, labor, equipment, services, and other incidentals necessary to complete the work. The total amounts paid under this item under the contract shall not exceed the amount of the allowance as specified in Part VI of these contract documents.

Payment will be made under:

Item 108.1 Mobilization/Demobilization -- lump sum

Item 108.2 Miscellaneous Construction Items Allowance -- lump sum

END OF ITEM 108

ITEM 109 TEMPORARY CONSTRUCTION ITEMS

109-1 DESCRIPTION

1.1 This item shall consist of furnishing all labor, materials, and equipment for temporary construction items necessary for the safe and proper execution of work and not otherwise included in Contract items. The Contractor will be expected to supply the items listed herein and other items as required in the General Construction, Safety and Phasing Notes as contained in the plans and specifications. Temporary construction items to be provided are as follows: construction barricades, temporary access roads, flaggers, radio(s), fences, gates, portable floodlighting, closed taxilane/taxiway markings, temporary signs, temporary pavement markings, steel plates for temporary covering of excavations as required, and materials, labor, and equipment as needed to keep adjacent portions of the Airport Operations Area (AOA) areas free of debris.

109-2 MATERIALS AND EQUIPMENT

2.1 Construction barricades shall be five-gallon buckets painted around the circumference with alternating four-inch wide stripes of international orange and white. Each bucket shall have a securely fitting lid with a 12-volt, high intensity yellow flashing light mounted on the lid. The buckets shall be at least half-filled with sand or other approved ballast material.

2.2 Radios shall be capable of transmitting and receiving between the Control Tower and airfield work sites on a frequency of 121.9 MHz for ground control or 154.98 MHz for Airport Operations, as specified or required herein. Sufficient radios shall be on site and operating at all times so that instructions or communications may be dispatched to all crews and/or equipment working in active portions of the Airport Operations Area (AOA).

2.3 Portable floodlighting shall be provided, as required, for construction operations. The Contractor shall provide sufficient units so that all work areas are illuminated to a level of five (5) horizontal footcandles. The lighting levels shall be calculated and measured in accordance with the current standards of the Illumination Engineering Society.

2.4 Temporary taxiway/taxilane closure markings shall be constructed of plywood, snow fence, or other material approved by the Engineer and painted aviation yellow. Sandbags or other suitable weights shall be provided to securely anchor the taxiway/taxilane closure markings to the pavement.

2.5 All materials for temporary access or bypass roads, such as crushed aggregate for surfacing and drainage pipe, shall be approved by the Engineer prior to use.

2.6 Steel plates of adequate size and thickness shall be approved by the Engineer and furnished as necessary to cover temporary excavations, unfinished structures or surfaces requiring protection or for safety purposes. Plates shall be securely fastened down and shall be adequate to safely support any anticipated loading to be imposed.

109-3 CONSTRUCTION METHODS

3.1 Construction barricades shall be placed as directed by the Engineer. Barricades will typically be placed parallel or perpendicular to the runway or taxiway centerline. Barricades shall remain in place for each phase from the beginning of construction until removal is authorized by the Engineer. All flashing lights shall be inspected daily by the Contractor and remain in operation at all times for the duration of the construction work.

3.2 Flaggers shall be provided, as necessary, to control the Contractor's traffic during the prosecution of work. All Contractor vehicles or equipment that are required to cross active pavement or safety areas shall do so

under the direct control of a competent flagger who is in direct radio contact with ground control. All aircraft traffic shall have priority over the Contractor's traffic.

3.3 Radio Communications:

Specific requirements for the following will be coordinated in advance with MAA operations.

A. Contractor shall provide two-way radio communication between certain of his personnel on the job site. The frequency utilized for these transmissions shall be selected by the Contractor and approved by the Engineer, but shall not conflict with or overlay any of the Airport's radio frequencies. The Contractor's personnel required to be provided with radio equipment shall, at minimum, include the project Superintendent, foremen of all work groups physically separated form the general vicinity of the project Superintendent, gate guards, flaggers, and others who may be working in a separate and remote area.

B. For work adjacent to or impacting taxiways or apron areas, the Contractor shall have two-way radios capable of operating on both the FAA ground control and MAA Airport Operations frequencies. Sufficient numbers of radios shall be deployed to allow each isolated area to have direct communications ability.

C. The Contractor shall also provide four portable battery operated radio units with batteries and charger for use by the Engineer. Radio equipment shall be capable of transmitting and receiving on the FAA ground control frequency (two units), and MAA Airport Operations frequency (two units). Radio equipment furnished by the Contractor shall be maintained in working order at his expense.

3.4 Portable floodlighting is required for construction during periods of limited visibility or at night. Illumination requirements shall be those contained in Paragraph 2.3.

3.5 Closed taxilane/taxiway markings shall be installed on both ends of the closed pavement or at other locations as directed by the Engineer. They shall be secured to the pavement by sandbags or other methods sufficient to withstand the effects of jet blast. Upon opening of the closed pavement, the closed taxilane/taxiway markings shall be removed.

3.6 Temporary access and bypass roads shall be constructed as shown on the plans or as approved by the Engineer. Unless otherwise approved by the Engineer, all temporary access and bypass roads shall be removed by the Contractor when no longer required.

109-4 METHOD OF MEASUREMENT

4.1 There will be no direct measurement for payment of materials, labor, equipment, or services furnished by the Contractor in the performance of work under this Item.

109-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract lump sum price for temporary construction items. This payment shall be full compensation for furnishing all materials, labor, equipment, or services for placing, moving, and removing construction barricades, constructing and removing temporary access road and security fence, providing flagmen, furnishing radios and furnishing portable floodlighting, providing temporary signs, pavement markings, furnishing and maintaining security guards at all access points, fences, gates, steel plates and for any other labor, materials, equipment, tools and incidentals necessary for temporary items required for construction of this project.

Payment for temporary construction items shall be made in accordance with the following schedule:

Monthly Estimate 1 - 20%
Monthly Estimate 2 - 20%
Monthly Estimate 3 - 20%
Monthly Estimate 4 - 20%
Monthly Estimate 5 - 10%
Monthly Estimate 6 - 10%

Payment will be made under:

Item 109.1 Temporary Construction Items -- lump sum

END OF ITEM 109

ITEM 110 METHOD OF ESTIMATING PERCENTAGE OF MATERIAL WITHIN SPECIFICATION LIMITS (PWL)

110-1 GENERAL

1.1 When the specifications provide for material to be sampled and tested on a statistical basis, the material will be evaluated for acceptance in accordance with this section. All test results for a lot will be analyzed statistically, using procedures to determine the total estimated percent of the lot that is within specification limits. This concept, termed percent within limits (PWL), is a statistically based evaluation method, whereby the PWL is computed on a lot basis, using the average (X) and standard deviation (S_n) of the specified number (n) of sublot tests for the lot and the specification tolerance limits (L for lower and U for upper) for the particular acceptance parameter. From these values, the respective Quality index (indeces) (QL for Lower Quality Index and/or QU for Upper Quality Index) is computed and the PWL for the specified n is determined from Table 1.

110-2 METHOD FOR COMPUTING PWL

2.1 The computational sequence for computing the PWL is as follows:

a. Divide the lot into n sublots in accordance with the acceptance requirements of the specification.

b. Locate the sampling position within the sublot in accordance with the random sampling requirements of the specification.

c. Make a measurement at each location, or take a test portion and make the measurement on the test portion in accordance with the testing requirements of the specification.

d. Average all sublot values within the lot to find X by using the following formula:

$$X = (x_1 + x_2 + x_3 \ldots + x_n) / n$$

Where:

X	=	Average of all sublot values within a lot
x_1, x_2	=	Individual sublot values
n	=	Number of sublots

e. Find the standard deviation S_n by use of the following formula:

$$S_n = \mathrm{SQRT}\left\{(x_1^2 + x_{12}^2 + x_3^2 \ldots + x_n^2) / (n-1)\right\}$$

Where:

S_n	=	standard deviation of the number of sublot values in the set
x_1, x_2	=	deviations of the individual sublot values x_1, $x_2 \ldots x_n$ from the average value X,

that is: $d_1 = (x_1 - X)$, $d_2 = (x_2 - X) \ldots d_n = (x_n - X)$

n = number of sublots

f. For single-sided specification limits (i.e., L only), compute the Lower Quality Index Q_L by use of the following formula:

$$Q_L = (X - L) / S_n$$

Where:

L = specification lower tolerance limit

Estimate the percentage of material within limits (PWL) by entering Table 1 with Q_L, using the column appropriate to the total number (n) of measurements. If the value of Q_L falls between values shown on the table, use the next higher value of PWL.

g. For double-sided specification limits (i.e. L and U), compute the Quality Indexes Q_L and Q_U by use of the following formulas:

$$Q_L = (X - L) / S_n \quad \text{and} \quad Q_U = (U - X) / Sn$$

Where:

L, U = specification lower and upper tolerance limits

Estimate the percentage of material between the lower (L) and upper (U) tolerance limits (PWL) by entering Table 1 separately with Q_L and Q_U, using the column appropriate to the total number (n) of measurements, and determining the percent of material above P_L and percent of material below P_U for each tolerance limit. If the values of Q_L fall between values shown on the table, use the next higher value of P_L or P_U. Determine the PWL by use of the following formula:

$$PWL = (P_U + P_L) - 100$$

Where:

P_U = percent within lower specification limit
P_L = percent within upper specification limit

EXAMPLE OF PWL CALCULATION

Project: Example Project
Test Item: Item P-401, Lot A.

A. PWL Determination for Mat Density.

1. Density of four random cores taken from Lot A.

$A_1 = 96.60$
$A_2 = 97.55$
$A_3 = 99.30$
$A_4 = 98.35$

$n = 4$

2. Calculate average density for the lot.

$X = (x_1 + x_2 + x_3 \ldots + x_n) / n$
$X = (96.60 + 97.55 + 99.30 + 98.35) / 4 = 97.95\%$ density

3. Calculate the standard deviation for the lot.

$S_n = SQRT[(96.60 - 97.95)^2 + (97.55 - 97.95)^2 + (99.30 - 97.95)^2 + (98.35 - 97.95)^2 / (4 - 1)]$

$S_n = SQRT[(1.82 + 0.16 + 1.82 + 0.16) / 3]$

$S_n = 1.15$

4. Calculate the Lower Quality Index Q_L for the lot. (L = 96.3)

$Q_L = (X - L) / S_n$

$Q_L = (97.95 - 96.30) / 1.15$

$Q_L = 1.4384$

5. Determine PWL by entering Table 1 with $Q_L = 1.44$ and n = 4.

PWL = 98

B. PWL Determination for Air Voids.

1. Air Voids of four random samples taken from Lot A.

$A_1 = 5.00$
$A_2 = 3.74$
$A_3 = 2.30$
$A_4 = 3.25$

2. Calculate the average air voids for the lot.

$X = (x_1 + x_2 + x_3 \ldots + x_n) / n$

$X = (5.00 + 3.74 + 2.30 + 3.25) / 4$

$X = 3.57\%$

3. Calculate the standard deviation S_n for the lot.

$S_n = SQRT\{[(3.57 - 5.00)^2 + (3.57 - 3.74)^2 + (3.57 - 2.30)^2 + (3.57 - 3.25)^2 / (4 - 1)]\}$

$S_n = SQRT[(2.04 + 0.03 + 1.62 + 0.10) / 3]$

$S_n = 1.12$

4. Calculate the Lower Quality Index Q_L for the lot. (L = 2.0)

$Q_L = (X - L) / S_n$

$Q_L = (3.57 - 2.00) / 1.12$

$Q_L = 1.3992$

5. Determine P_L by entering Table 1 with $Q_L = 1.40$ and n = 4.

$P_L = 97$

6. Calculate the Upper Quality Index Q_U for the lot. (U = 5.0)

$Q_U = (U - X) / S_n = (5.00 - 3.57) / 1.12 = 1.2702$

7. Determine P_U by entering Table 1 with $Q_U = 1.27$ and $n = 4$.

   $P_U = 93$

8. Calculate Air Voids PWL

   $PWL = (P_L + P_U) - 100 = (97 + 93) - 100 = 90$

110-3 METHOD OF MEASUREMENT

3.1 No direct measurement for payment will be made for work under this item. All costs for evaluating materials or procedures for acceptance in accordance with the requirements of this item will be incidental to the item to be evaluated.

110-4 BASIS OF PAYMENT

4.1 No direct payment will be made for work under this item. All costs for for this item shall be included in the unit price for items to be evaluated in accordance with the provisions of this item.

END OF ITEM 110

ITEM 206 PAVEMENT DEMOLITION AND REMOVAL

206-1 DESCRIPTION

1.1 Pavement removal shall consist of full depth removal and disposal of existing bituminous or Portland cement concrete pavements or composite pavement sections regardless of thickness, length, and width, including base course and/or earth material directly under the pavements.

1.2 It is the intent of this item to effect the complete removal and disposal all materials which would be an obstruction to the completion of this work. As such any items so encountered shall be removed and disposed of as if they were specifically enumerated herein. References to pavement under this item shall not be construed as necessarily a riding surface, rather any structure or object having Portland cement and/or bituminous concrete construction regardless of its location or function.

206-2 CONSTRUCTION METHODS

2.1 Method of construction shall be subject to approval by the Engineer. No work shall begin until such approval has been obtained.

2.2 Pavement to be removed shall be broken up into pieces of such size easily handled by air-driven machinery or other suitable means. The use of explosives is not permissible. Reinforcing steel shall be cut as necessary for satisfactory disposal.

2.3 Where only a portion of the existing pavement is to be removed, special care shall be exercised to avoid damage to that portion of the pavement to remain in place. The existing pavement shall be sawcut to its full depth and to the neat lines shown on the plans. Any existing pavement or other items beyond those neat lines which is damaged or destroyed by these operations shall be replaced at the Contractor's expense.

2.4 Pavements including base and/or earth materials which are removed shall be loaded, hauled, and disposed of by the Contractor off airport property. The limits of removal shall be as required by the Engineer, which may provide for reconstruction of new pavement sections between the limits of pavement removal or other purposes desired.

2.5 Excavated areas expected to be exposed to adverse weather conditions, or when it must remain unfilled for an extended period of time, shall be immediately protected by the Contractor at his expense by a method approved by the Engineer.

2.6 Removal of pavement material beyond the limits and the thicknesses in excess of that directed by the Engineer or shown on the drawings shall be replaced to required elevation by an approved material selected by the Engineer at the Contractor's expense.

2.7 In areas of pavement removal, no separate payment will be made for removal of existing pavement markings, milling, etc.

206-3 METHOD OF MEASUREMENT

3.1 Bituminous concrete pavement, Portland cement concrete pavement, or composite sections removed as prescribed above, will be measured by the number of square yards in its original position without regard to pavement type or thickness.

3.2 There shall be no measurement or payment for the quantity of material removed for work beyond the limits designated and replacement of same with approved material.

3.3 No separate measurement or payment will be made under this item when materials and methods of construction of this item is utilized for work of similar nature under other items.

206-4 BASIS OF PAYMENT

4.1 Work under this item will be paid for at the unit price bid per square yard for pavement removal regardless of pavement type or thickness. This price shall be full compensation for sawcutting; breaking up the pavement; cutting reinforced steel, when required; loading, hauling, unloading, and disposing of all material; and for all labor, tools, equipment, supervision and incidentals necessary to complete the work.

4.2 Payment for work will be made under:

Item 206.1 Pavement Removal -- per square yard

END OF ITEM 206

ITEM 308 TEMPORARY WATER POLLUTION, SOIL EROSION, AND SILTATION CONTROL

308-1 DESCRIPTION

1.1 This item shall consist of temporary control measures as shown on the plans or as ordered by the Engineer during the life of a contract to control water pollution, soil erosion, and siltation through the use of berms, dikes, dams, sediment basins, fiber mats, gravel, mulches, grasses, slope drains, and other erosion control devices or methods.

1.2 The temporary erosion control measures contained herein shall be coordinated with the permanent erosion control measures specified as part of this contract to the extent practical to assure economical, effective, and continuous erosion control throughout the construction period.

1.3 Temporary controls may be required for work outside the construction limits such as borrow pit operations, equipment and materials storage sites, parking areas, waste areas, and temporary plant sites. When such off-site areas are to be disturbed, the Contractor shall prepare, submit, and gain approval of an erosion and sediment control plan from the Maryland Department of the Environment before beginning any disturbance to such areas.

308-2 MATERIALS

2.1 Materials for erosion and sediment controls shall conform to the Maryland State Highway Administration Standard Specifications for Construction and Materials, October 1993, and the 1994 Maryland Standards and Specifications for Erosion and Sediment Control. The Engineer shall be responsible for assuring compliance to the extent that construction practices, construction operations, and construction work are involved.

2.2 All other materials shall meet commercial grade standards and shall be approved by the Engineer before being used in the work.

308-3 CONSTRUCTION REQUIREMENTS

3.1 In the event of conflict between these requirements and pollution control laws, rules, or regulations of other Federal, state, or local agencies, the more restrictive laws, rules, or regulations shall apply. The Engineer shall be responsible for assuring compliance with the approved erosion and sediment control plan to the extent that construction practices, construction operations, and construction work are involved.

3.2 Authority of Engineer: The Engineer shall have the authority to limit the surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and fill operations, and to direct the Contractor to provide immediate permanent or temporary pollution control measures to minimize contamination of adjacent streams or other watercourses, lakes, ponds, or other areas of water impoundment.

3.3 Construction Details:

4.1 The Contractor's attention is directed to Sections 308, 310 and 311 of the SHA Specifications. The restrictions contained therein will be strictly enforced and the Contractor is cautioned, therefore, to make every effort possible to comply with these regulations.

Within 14 days after the Notice of Award the Contractor shall submit an Erosion and Sediment Control Schedule to the Engineer indicating the sequence of construction and describing the relationship between the implementation and maintenance of control, including temporary and permanent stabilization and the various stages (phases) of soil disturbance and construction for each area. A Notice to Proceed will not be issued

until this schedule is received. The sequence of construction shall, at a minimum, include a schedule and time frames for the following activities:

a. Clearing and grubbing for those areas necessary for installation of Perimeter Controls.

b. Construction of Perimeter Controls.

c. Remaining clearing and grubbing.

d. Grading (including off-site activities).

e. Utility installation and whether storm drain will be used or blocked after construction.

f. Final grading, landscaping, stabilization.

g. Removal of Controls.

At the Preconstruction Conference, the Contractor shall present a general overview of how he will handle Erosion and Sediment Control on the Contract.

No work shall be started until the Erosion and Sediment Control schedules and methods of operations have been accepted by the Maryland Aviation Administration (MAA), the Department of Natural Resources - Water Resources Administration (DNR-WRA) and/or the Department of the Environment (MDE). This includes both on-site and off-site activities. At least five working days prior to the start of work, the Engineer will initiate and conduct an Erosion and Sediment Control Field Meeting.

In addition to the initial Erosion and Sediment Control Field Meeting, periodic in-field Erosion and Sediment Control Meetings shall be held during the period of this Construction Contract. The Engineer along with the DNR-WRA's and/or MDE's Inspector and Plan Reviewer and the Contractor shall review and evaluate the effectiveness of practices already installed and shall plan for the installation necessary to control proposed areas of soil disturbances.

The MAA, MDE and/or DNR-WRA are concerned with controlling erosion and sedimentation on construction sites. Other than listed below, one unit equaling 20 acres (871,200 ft^2) that has been cleared and grubbed can be actively graded at one time. Once grading begins in the first unit and is approximately 50 percent complete, a second unit may be cleared and grubbed. Two units (one grading operation) is defined as the Contractor's ability to provide adequate resources to perform the grading in a timely manner and provide and maintain the proper erosion and sediment control measures. The Engineer or his designate will be the final authority in this determination. A grading unit need not be 20 continuous acres.

When balancing earthwork (borrow from a cut used as fill at a location distant from the cut), consideration may be allowed by the Engineer for more than one unit of grading. When wet soil conditions are encountered, the Contractor will be allowed to clear and grub and grade another unit providing the initial unit has been properly stabilized. No more than two grading units shall be active at any time.

All appropriate perimeter controls shall be installed prior to any grubbing operations. Areas shall be permanently or temporarily stabilized within seventy-two (72) hours from disturbance. The 72-hour requirement means that the stabilization operation is complete or nearing completion. If previously stabilized areas are disturbed by the Contractor's grading operation or other activities not specifically approved by the Engineer, the cost for stabilization will be at the Contractor's expense.

The most stringent requirements for stabilization under Excavation, Embankment or Stabilization/Limits of Disturbance will be enforced.

Disposal of excess earth material on State or Federal property requires MDE approval, otherwise materials shall be disposed of at a location approved by the appropriate local Soil Conservation District for each county or the Baltimore City Department of Public Works.

The Contractor shall give particular attention to the project's construction activities that involve erosion and sediment control. The MAA and its field engineering staff will strictly enforce erosion and sediment control measures as required by the Plans, Standard Provisions, applicable referenced Standards and the Specifications.

The Contractor shall become thoroughly familiar with all provisions relative to erosion and sediment control. The Contractor is advised that terminology such as "...prior to, or as soon as practicable", and "...to the extent considered desirable and practicable", shall not be interpreted to preclude or unnecessarily delay the construction or application of erosion and sediment control measures. These terms are intended to state that erosion controls must be applied as soon as it is physically possible within any construction or grading operation which removes natural ground cover or results in any unstabilized soil condition.

The Contractor is also hereby notified that DNR-WRA and/or MDE will conduct frequent field inspections relative to sediment control compliance. If, in their judgement, noncompliance with erosion and sediment control provisions are found, their representative will immediately notify the Engineer relative to corrective action. This corrective action may require a shut-down of construction activities until such time as the noncompliance is satisfactorily corrected, and no claims to the MAA will be entertained because of a shutdown of the grading operations or the entire project.

308-4 METHOD OF MEASUREMENT

4.1 The quantity of temporary water pollution, soil erosion, and siltation control measures to be paid for shall be the number of units of each item installed in accordance with the plans and the provisions of this Item and accepted by the Engineer. Measurement of the several items shall be by the lineal foot, square yard, acre, or per each as specified in Section 5 below. There will be no direct measurement for payment of items to be paid for on a lump sum basis as specified below.

308-5 BASIS OF PAYMENT

5.1 Accepted quantities of temporary water pollution, soil erosion, and siltation control work ordered by the Engineer and measured as provided in paragraph 308-14 will be paid for under:

Item 308.1 **Stabilized Construction Entrance -- per square yard**

Item 308.2 **Silt Fence -- per lineal foot**

Item 308.3 **Super Silt Fence -- per lineal foot**

Item 308.4 **Stone Check Dam -- each**

Item 308.5 **Removable Pumping Station -- each**

Item 308.6 **Sediment Basin Riser Discharge Structure -- lump sum**

Item 308.7 **Class I Rip Rap Spillway Protection -- per square yard**

Item 308.8 **Sump Pit -- each**

Item 308.9 **Portable Sediment Tank -- lump sum**

Item 308.10 **At-Grade Inlet Protection -- each**

Item 308.11 **Curb Inlet Protection -- each**

Item 308.12 **Temporary Seeding and Mulching -- per acre**

END OF ITEM 308

ITEM 427 OIL/WATER SEPARATOR

427-1 DESCRIPTION

1.1 Work under this Item will consist of the furnishing and installation of oil/water separators to trap and separate oil from runoff from potions of the airfield apron pavement. Each oil/water separator shall be capable of treating flow at a rate of five hundred (500) gallons per minute and shall have an oil storage capacity of 5000 gallons. Work under this item shall include all associated ductile iron piping, fittings, excavation, concrete anchoring pad, anchoring straps, pea gravel backfill, alarm and control system, and other incidentals necessary to install a fully operational system.

427-2 DESIGN CRITERIA

2.1 The oil/water separator shall be a special purpose factory-assembled unit which is the standard product of a manufacturer regularly engaged in the production of such equipment.

2.2 The separator shall be designed in accordance with Chapters 3 and 5 of the American Petroleum Institute (API) Manual on Disposal of Refinery Wastes (volume on Liquid Wastes, Latest Edition) and with API Bulletin #1630, First Edition.

2.3 The oil/water separator shall be fabricated, inspected and tested for leakage before shipment from the factory as a completely assembled vessel ready for installation.

2.4 Construction and thickness of the separator shall be in strict accordance with Underwriters' Laboratories, Subject UL-58 Standard for Safety, Steel Underground Tanks for flammable and Combustible Liquids. Separator shall bear Underwriters' label.

2.5 Underground corrosion control system for the separator shall be in strict accordance with STI-P_3 specifications as applied by a licensee of the Steel Tank Institute. Separator shall bear the STI-P_3 label.

2.6 The separator shall be designed for intermittent, variable or continuous flows of water, oil and/or any combination of non-emulsified oil/water mixtures.

2.7 The separator shall process uncontrolled surges of water, oil, or water/oil mixtures ranging from zero flow up to 100 percent of maximum hydraulic throughput capacity and provide wastewater effluents, which meet Federal, State or local oil and grease discharge requirements of ten 10 ppm hydrocarbon for at least five minutes.

2.8 The separator shall have an integral oil storage capacity of at least 40 percent of the total separator volume; and minimum 2500 gallons of oil storage.

2.9 The separator shall be designed in a manner to minimize solid build-up in the oil/water separator chamber, which could reduce the oil/water separation of the unit.

2.10 The oil/water separator shall be the Model HT-5000 as manufactured by the Highland Tank and Manufacturing Company, Stoystown, Pennsylvania, or approved equal. Submit manufacturers data for approval.

427-3 MATERIALS

3.1 The separator shall be a cylindrical steel vessel and construction and thickness shall be in strict accordance with UL-58 using flat flanged heads. The separator shall have the structural capability to withstand static

and dynamic hydraulic soil, pavement, and aircraft loadings both while empty and during operating conditions.

3.2 The inlet shall be a 14-inch, 150-pound F.F. flanged connection. An inlet flow diffusing nozzle shall be installed at the inlet end of the separator, located at the furthest diagonal point distant from the outlet. The inlet shall be provided with flanged tee and isolation spool piece to permit direct connection with ductile iron pipe influent line.

3.3 The inlet nozzle shall flow against a single velocity head diffusion baffle plate set at a 45 degree angle, supported on steel supports and welded on either side of the separator wall.

3.4 A series of corrugated parallel plates shall be downstream of the velocity diffusion baffle plate and set at a 22-1/2 degree angle, spaced three inches apart, and supported by steel supports, welded to a solid steel plate on either side of the separator wall. A sludge baffle plate twelve inches in height, shall be installed at the bottom of the separator to retain settleable solids and sediment and prevent them from entering the separation chamber.

3.5 An internal discharge pipe shall be installed at the outlet end of the separator, located at the furthest diagonal point distant from the inlet, extending down to within 6 inches of the bottom of the separator and tack welded or supported to the end plate of the separator. The outlet shall be a 14-inch, 150-pound F.F. flanged connection. The outlet shall be proved with a flanged tee and isolation spool piece to permit direct connection with ductile iron pipe effluent line.

3.6 The separator shall be equipped with two 24-inch diameter API manholes, UL approved, complete with extension, flanged cover, gasket and bolts.

3.7 The separator shall be furnished with fittings for vents; oil/water interface level sensor; and waste oil pumpout, sampling, and tank gauge connection.

3.8 The separator shall be constructed for transport to job site as one integral unit, ready for immediate installation (field splicing or field fabrication are unacceptable).

3.9 Separator lifting lugs shall be located at the balance points.

3.10 The separator STI-P_3 Corrosion Control System shall include:

A. Corrosion resistant coating;

B. Cathodic Protection System with monitor;

C. Electrical Isolation;

D. 30-year warranty; and

E. UL and STI-P_3 labels.

3.11 The separator shall be furnished with a removable coalescer. The polypropylene coalescing media shall consist of a matrix of at least six layers of 32 mm strands and four layers of 16 mm strands. The multi-monofilament design shall be such that each monofilament is perpendicular to the fluid flow and also perpendicular to each monofilament. The coalescer shall be designed to intercept oil particles of less than 20 microns in size and produce an effluent quality of less than 10 ppm free petroleum hydrocarbon.

3.12 The coalescing media shall be housed in a frame with a lifting hook and arm for easy removal through a 24-inch diameter manway complete with extension, cover, gasket and bolts.

3.13 The separator shall be furnished with an automatic waste oil multi-station liquid level indicating system with control floats mounted in the tank set at approximately 20 percent and 43 percent separator volume and consisting of an interface probe with solid state controls for an audible and visual alarm system enclosed in a NEMA 4 alarm panel furnished by the separator manufacturer.

3.14 Audible and visual alarms shall be installed at the locations shown on the plans or as directed by the Engineer. The audible alarm shall have a pushbutton silencer, however, the visual alarm shall remain active until the oil in the separator is pumped out. Levels of the interface shall be adjustable.

3.15 Concrete for the oil/water separator foundation shall conform to the requirements of Item P-610.

3.16 Steps for the oil/water diversion vault shall be ductile iron, Model R-1982-J by Neenah or approved equal. Field paint a coat of bituminous paint. Steps shall conform to the requirements of the Occupational Safety and Health Standards, U.S. Department of Labor.

3.17 Access covers for the oil/water diversion vault shall be constructed of ductile iron suitable for aircraft loading as manufactured by Neenah or accepted equal. Casting shall be uniform and free of any defects, conforming to ASTM A 536-80 Grade 65-45-12. Access covers shall have the following lettering "Glycol Diversion Vault" cast in each cover. See drawings for access cover sizes.

427-4 INSTALLATION

4.1 Upon delivery of the separator and accessory equipment, the Contractor shall inspect units for damage to exterior, including protective coating and STI-P_3 system. Also, determine that all internal baffle plates and internal piping are secure.

4.2 Above ground vent piping shall be Schedule 40, threaded galvanized carbon steel pipe conforming to ASTM A53 to A120 with 150 pound malleable iron fittings conforming to ASTM A47 and A153.

4.3 Buried vent piping shall be schedule 40, threaded black steel pipe with 150 pound malleable iron fittings. All pipe and fittings including threads shall be coated with coal tar epoxy in accordance with AWWA Specification C203. Cold applied vinyl or polyethylene tape shall be applied over the coated pipe and fittings 10 to 20 mils thick. Use an effective primer and a double wrap on fittings and threads.

4.4 Pump-out pipe and interface/level sensor pipe shall be Schedule 80, flanged galvanized steel pipe, conforming to ASTM A 120.

4.5 Dielectric isolation gaskets and bushings shall be provided for all separator openings.

4.6 Manhole frames and lids shall be square and in accordance with the size shown on the plans. The frames and lids shall be ductile-iron and shall be capable of withstanding aircraftt loadings. The frames and lids shall be as shown on drawings.

4.7 Pea gravel backfill material placed to one foot above tank must be clean, washed, naturally-rounded aggregate, with particles no smaller than 1/8" nor larger than 3/4". Washed stone or gravel crushings may be used as alternate material with angular particle size not less than 1/8" nor more than 1/2". Material must meet all ASTM C-33 requirements for quality and soundness. Select backfill must meet SHA requirements for No. 57 stone. In freezing conditions, backfill material must be free of ice.

4.8 Leak monitoring wells shall be constructed of 4-inch Schedule 40 PVC slotted well screen pipe. The pipe shall have a minimum /maximum slot size of 0.20/0.25 inch and shall be screened from the bottom to within 1'-6" of the ground surface. Pipe shall be equal to EBW Model No. 773-200-02.

Install lockable well cap plug with padlock equal to EBW Model No. 772-4, 4-inch diameter.

Protect leak monitoring pipe with ten-inch diameter cast-iron manhole cover, which shall be painted white with black equilateral triangle in center for identification as monitoring well. Manhole shall be equal to EBW Model No. 810.

4.9 Excavation and backfill for the installation of the oil/water separator and appurtenances shall be performed in accordance with the requirements for Item D-752. All sheeting, shoring, bracing, and dewatering required shall be performed as a subsidiary obligation to excavation and backfill.

4.10 The backfill shall be free from material that may cause damage to the separator coating. Care shall be taken during installation that foreign matter is not introduced into the excavation or backfill.

4.11 Separator must be installed in a level and plumb position for proper system function. Piping to separator must be sloped as shown on the drawings to obtain a proper gravity system.

4.12 The bottom of the excavation shall be covered with clean sand or gravel to a depth of one foot, suitably compacted, graded, and leveled.

4.13 The separator tank hole excavation shall extend a distance of at least 3 feet around the perimeter of the separator.

4.14 An air test of the separator above ground should not exceed 5 pounds per square inch (psig) pressure while a soap solution is applied to weld seams.

4.15 Before placing the separator in the excavation, all dirt clods and similar foreign matter shall be cleaned from the separator, and areas of coating damage shall be repaired with a suitable coating recommended by the separator manufacturer.

4.16 Equipment to lift the separator shall be of adequate size to lift and lower the separator without dragging and dropping to ensure no damage to the separator or the coating.

4.17 Separator shall be carefully lifted and lowered by use of cables or chains of adequate length (not less than 45 degree included angle) attached to the lifting lugs provided. A spreader bar should be used where necessary. Under no circumstances use chains or slings around the separator shall.

4.18 Backfill consisting of clean pea gravel shall be placed along bottom sides of separator by hand shoveling and tamping to ensure that the separator is fully and evenly supported around bottom quadrant.

4.19 Separator shall be filled with clean water as soon as possible after placement on sand bed.

4.20 Select backfill and pea gravel backfill shall be deposited carefully around separator to avoid damage to coating and to at least 1 foot above the top of the separator and thoroughly tamped.

4.21 During air or hydrostatic testing of separator after installation, it is recommended that the pressure applied shall not be in excess of 5 pounds per square inch (psig) as measured at the top of the separator.

4.22 Connect all vent lines to atmosphere from manway extensions and separator unit. The discharge line shall be vented to prevent siphoning of the outlet pipe of the separator.

4.23 Metal or plastic thread or flange protectors shall be removed from the unused openings and pipe plus installed. Pipe plugs and blind flanges shipped installed in the separator should be removed from unused openings and reinstalled with proper joint compound or gaskets.

427-5 OPERATION

5.1 Before the separator is put into operation, it shall be filled with clean water, as noted in the installation instructions.

5.2 Separation within the unit shall be perpetual on a last-in, last-out basis. As influent enters the oil/water separator, a corresponding amount of separated effluent shall be automatically discharged through the outlet pipe; separating action shall begin immediately as the contaminated product enters the system.

5.3 The invert of the inlet of the separator shall be above the operating surface level of the separator to provide positive drainage of the inlet sewer. The inlet pipe to the separator shall be designed to conform to the flow capacity of the separator.

5.4 The distribution chamber shall distribute the flow in an even manner across the width of the separator and reduce the velocity.

5.5 The corrugated plate separator shall improve the hydraulic characteristics and retention performance of the oil/water separator. it shall equalize the velocity of flow across the distribution chamber and helps to capture oil/water globules that would not separate out ordinarily.

5.6 As the influent passes over the velocity head diffusion baffle, the tumbling action of the oil-laden water passing over the plate shall include the proper agitation in the stream, and cause the oils or lighter density substances to break away from the wastewater stream. s the oil starts to rise, it shall be joined by other droplets of oil and due to the buoyancy, rise rapidly to the surface. The rising rate of the oils or other floating industrial waste depends on the oil droplet size. The larger the droplet, the faster the rate of rise and separation. Free oil and other floatable industrial waste, collect together above the operating surface of the corrugated plate separator and a rapid rising of the separated products is accomplished within the distribution chamber. Sludge or heavy solids within the stream settle to the bottom of the separator, collecting behind the sludge baffle plate.

5.7 The corrugated parallel plate separator within the oil/water separator increases the effective separation surface area through the use of multiple parallel corrugated plates.

5.8 The corrugated plates shall be stacked upwards at a 22-1/2 degree angle, spaced every 3 inches apart, to prevent fouling by debris and gummy solids. Under laminar flow conditions, buoyancy forces cause oil droplets to rise and coalesce into "sheets" of oil on the underside of each of the plates, creep up the surfaces, and finally break loose at the top in the form of large globules that rapidly rise through the separating chamber to the surface. A small area at the extreme bottom of the plate pack shall be left open so that any sludge or heavy solids immediately drop and are collected by the center sludge baffle plate.

5.9 In a major oil spill condition, the separator shall be designed so that the contaminated surface increases as the water capacity decreases. In a major rainfall condition, water flow shall pass through the separator system without disturbing any standing oil or settled sludge within the system.

5.10 Under laminar flow conditions, oil droplets from all strata of the wastewater stream enter the coalescing media and attach themselves to the polypropylene strands. Once attached, the oil globules agglomerate and either wick-up or, if sufficiently large, break free and rise through the media to the surface. After reaching the surface, oil continues to move with the flow allowing for unrestricted flow conditions.

5.11 Any settleable solids that have not been trapped by the corrugated plate separator and parallel corrugated plate separator and have not been collected at the center sludge baffle plate shall attach themselves to the media strands. As they agglomerate and increase in weight, they fall through the coalescing media to the bottom of the separation chamber and collect at the coalescing media baffle plate.

5.12 Due to these self-cleaning properties of the coalescing media, maintenance requirements shall be minimal. Under oil spill conditions or if gross amounts of sludge enter the oil-water separator system, the coalescing media shall be easily removable from the units holding channel and hosed down in order to remove any gummy solids or debris that may accumulate on the fibers.

5.13 Access to separator shall be through 24-inch diameter manholes, U.L. approved, complete with extension, bolted cover and gasket.

5.14 The outlet pipe opening shall be located at the furthest point distant form the inlet; at the most quiescent zone of the oil/water separator. The invert of the outlet shall be below the operating surface level of the separator to provide positive drainage of the system. The outlet pipe to the separator shall be designed to conform to the flow capacity of the separator.

5.15 A multi-station liquid level sensor for tank gauging shall be furnished. The floats controlling the gauge shall lie in the interface of the contaminant and free water and shall be adjustable. When the desired level of oil is reached, at a predetermined level, an audible and visual alarm shall be activated. A pushbuttom shall be furnished to silence the audible alarm, however, the visual alarm shall continue to be activated until the oil is pumped out to the predetermined level.

427-6 METHOD OF MEASUREMENT

6.1 The number of oil/water separators to be paid for shall be the number of oil/water separators installed in accordance with the provisions of this Item and accepted by the Engineer.

427-7 BASIS OF PAYMENT

7.1 Payment shall be made at the contract unit price for oil/water separators. This price shall be full compensation for the furnishing of all materials, labor, equipment, and incidentals to complete each installation in accordance with the provisions of this Item. No separate payment shall be made for such incidentals as excavation, sheeting, shoring, and dewatering; bedding; concrete foundations; pipe; fittings; connections; vents, pump-out, and level sensor piping; level sensor and alarm system, including wiring and alarm panel located as shown on the plans; manhole frames and lids; and other items necessary to furnish and install each oil/water separator in accordance with the provisions of this Item.

Payment will be made under:

Item 427.1 Oil/Water Separator -- each

END OF ITEM 427

ITEM 813 ROADWAY SIGNS

813-1 GENERAL

1.1 Work under this Item shall include the provision of all labor, material, equipment, and services necessary for and reasonably incidental to furnishing and installing signs and graphics, or removing existing signs, along public and airport roads and adjacent to the parking lots as specified herein. The types and numbers of signs and graphics is shown schematically on the plans and may be subject to change by the Engineer.

1.2 This item modifies Section 183 of the SHA Standard Specifications, October 1993.

813-2 SCOPE OF WORK

2.1 Signs along public roads, airport access roads, and adjacent to parking lots area shall be made using sheet aluminum panels mounted on timber posts. Color, copy, paint, size, sheeting, hardware and finish will conform to the Standard Specifications or manufacturers data as directed by the Engineer or as shown on the plans. Completed signs shall conform with the standards of the SHA Division of Traffic and Safety. Relocation and removal of existing signs are included in this work.

2.2 Signs shown on the plans to be removed shall be removed in their entirety. Such removal shall include sign panels, posts, post foundations, and hardware. All materials removed shall be disposed of off Airport property in accordance with the contract documents.

813-3 QUALITY ASSURANCE

3.1 The work shall comply with the following codes, specifications, and standards (current editions):

A. Applicable current U.S. Department of Transportation standards, including, but not limited to, the Manual on Uniform Traffic Control Devices, latest edition.

B. SHA Standard Specifications, dated October 1993.

C. Sign Standards of the SHA Division of Traffic and Safety.

3.2 All work called for by this Item shall be done by recognized graphic fabricators and installers having at least five years' successful experience in such work.

813-4 SUBMITTALS

4.1 The contractor shall submit shop drawings for the manufacture, fabrication, and installation of sign structures at a large scale. Show posts, joints, welds, anchorage, accessory items, and finishes.

4.2 The contractor shall submit copies of manufacturer's printed specifications, anchorage details, and installation and maintenance instruction for products to be used in the fabrication and installation of signs.

813-5 DELIVERY, STORAGE AND HANDLING

5.1 Furnish factory wrapping, packaging, and other means necessary to prevent damage or deterioration during shipment, handling, storage and installation.

5.2 Maintain protective coverings in place and in good repair until removal is necessary.

5.3 Store products inside enclosed facilities or closed buildings.

5.4 Maintain storage spaces and products in dry condition.

813-6 JOB CONDITIONS

6.1 Inspection of Site. Examine related work and surfaces before starting work on this item. Report to Engineer, in writing, site conditions which will prevent the proper provision of this work. Beginning the work without reporting unsuitable conditions, constitutes acceptance of site conditions by the Contractor, with changes or additions to work caused by unsuitable conditions provided at no additional cost to the Owner.

6.2 Coordination. Coordinate and cooperate with other Contractors to enable work to proceed as rapidly and efficiently as possible. Coordinate with general Contractor, items of other trades to be furnished and set in place. Any additional work incurred resulting from lack of Contractor coordination, shall be done at no additional cost to the Owner.

813-7 SIGNS, GENERAL

7.1 Sign posts shall be of 4"x6" timber of the length required for each installation shown on the plans. Posts shall be straight without material defects, and shall have drilled holes conforming to the breakaway requirements contained in the SHA Standard Specifications. Posts shall be treated with preservative in accordance with the SHA Standard Specifications before delivery to the site.

7.2 Provide graphics items as completed units produced by a single manufacturer, including necessary mounting accessories, fittings and fastenings.

7.3 Do not deliver units until area is ready for installation. Protect from damage during delivery, handling, storage and installation.

7.4 Verify with Engineer prior to fabrication for any revisions to Sign Schedule.

7.5 Take field measurements prior to preparation of Shop Drawings and fabrication, where possible. Allow for trimming and fittings wherever the taking of field measurements before fabrication might delay work.

7.6 Furnish anchoring devices which must be set in concrete or other material for installation of this work. Provide setting drawings, templates, instructions and direction for installation of anchorage devices.

7.7 Pre-assemble item in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary because of shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

7.8 Design Responsibility:

A. The requirements shown by the details are intended to establish basic dimensions of units or modules, profiles and sight lines of members. Within these limitations the Contractor is responsible for the construction design of the entire system, and to make whatever modifications of, and additions to the details as may be required, by the Engineer. Maintain the visual design concept as shown, including member sizes, profiles and alignment of components as accurately as possible.

B. The Contractor shall supplement the outline design shown with a detailed design for the Engineer's approval. The design drawing shall include major aspects of the system proposed, such as sections, shapes and connections of components, joint connections and anchorage to structure.

7.9 Typography:

A. Use applicable standard for all sign messages, unless shown otherwise on the Contract Drawings. Contractor shall contact Engineer for the appropriate typography.

7.10 Statement of Application:

A. The Contractor, by commending the work of this section, assumes overall responsibility as part of his warranty of the work, to assure that all assemblies, components and parts shown or required within the work of the section, comply with the contract documents or direction of the Engineer. The Contractor shall further warrant:

1. That all components, specified or required to satisfactorily complete the installation are compatible with each other and with the conditions of installations.

2. The overall effective integration and correctness of individual parts and the whole of the system.

3. Compatibility with adjoining substrates, finishes, materials and work by other trades.

7.11 Messages:

A. Full scale fabricating message patterns shall be prepared by the Contractor from sign panel layouts in accordance with the Sign Schedules. Sign panel layouts are to be enlarged for position only; are to be used for photographic reproduction. Contractor shall provide full sign patters from master alphabet and master symbols.

B. The Contractor shall not be permitted to cut apart characters, words, or message lines or in any way alter the alphabet spacing, message layouts and dimensions in the fabrication message patterns, without approval of the Engineer.

813-8 ALUMINUM PANEL

8.1 Aluminum shall be mill aluminum of the thickness required by the design (0.125 inch). All elements shall have a finish as identified hereinafter.

8.2 Metal Finish. Sign background shall be Dupon "Imron," or approved equal satin finish polyurethane enamel applied in two coats over a metal primer as per manufacturer's recommendations; i.e., clean bare metal with 225S Cleaner followed by 226S Conversion Coating.

8.3 Before painting, all loose mill scale, dirt, weld flux, weld spatter and other foreign material shall be removed. All grease and oil shall be removed by solvent. Surfaces shall be dry when paint is applied.

8.4 All exposed metal shall receive one (1) thorough prime coat of a suitable primer before leaving the shop. In addition to primer, all exposed metal shall receive two (2) color coats. Color shall match the grey of existing porcelain enamel honeycomb exterior sign panels. Color samples shall be submitted to and approved by the Engineer.

8.5 Apply each material at not less than the manufacturer's recommended spreading rate, to establish a total dry film thickness of not less than 4.0 mils for the entire coating system of prime/conversion coating and finish coats for 3-coat work.

813-10 EXTRUDED ALUMINUM PANELS

10.1 Extruded aluminum panels shall conform to the requirements of SHA Standard specifications for Construction and Material, October 1993.

10.2 Extruded aluminum panels shall have demountable copy. Copy, color, size and finish will be subject to review and approval by the Engineer and Department of Transportation, SHA Division of Traffic and Safety prior to fabrication and delivery.

813-11 INSTALLATION

11.1 Protect products against damage field handling and installation. Protect adjacent existing and newly placed construction and finishes as necessary to prevent damage during installation.

11.2 Install timber posts in holes excavated to the depths shown on the plans. Holes shall be plumb and neat, and shall be cleared of loose material before posts may be installed. Post holes shall be filled with earth or concrete as shown on the plans. Sign panels to be installed on posts set in concrete may not be installed until at least seven days after concrete placement.

11.3 Touch up paint all exposed mechanical fasteners to match color and finish of surface surrounding the fastener upon completion of installation.

813-12 FIELD QUALITY CONTROL

12.1 Signs shall be accurately cut and fit for easy assembly; install plumb, level and in proper alignment, as shown, and per manufacturer's recommendations. Manufacturing of signs shall be guaranteed against warpage, delamination or faulty veneer for the one (1) year guarantee period.

12.2 Signs shall be mounted level and plumb according to the plan locations. Where otherwise not demensioned, signs shall be installed where best suited to provide an even and consistent appearance through the project. When the exact position, angel, height or location is in doubt, the Contractor shall contact the Engineer for clarification.

12.3 The Contractor shall fabricate and assemble each unit, in the shop, complete as possible and as specified, before delivering to the job site to assure that each unit is installed with its correct components.

12.4 The Contractor shall own and be responsible for all signage that is damaged. lot or stolen while materials are on the job site and up until the completion and final acceptance of the job.

12.5 All field painting is to be executed per the manufacturer's suggested specifications and methods for surface preparation and material application as outlined in this section.

813-13 REMOVAL OF EXISTING SIGNS

13.1 Existing signs may be relocated during construction. During the installation of the new signing system, all existing and relocated signs will be removed unless otherwise noted on the plans.

13.2 To prevent confusing messages to motorists, all new signs in a particular sequence, giving similar directions, must be in place before existing signs, involving similar directions, are removed.

13.3 The Engineer, at his discretion, may direct a new sign face to be covered to avoid confusion. The sign face is to be covered by plastic sheets and attached in the back by tape. NO TAPE IS TO BE ATTACHED TO THE REFLECTIVE SHEETING.

13.4 Any removed material shall become the property of the State Highway Administration Office of Traffic & Safety Sign Shop, and shall be transported to that location, or to the Engineer.

13.5 All material, equipment and labor needed to perform the removal of existing signs shall be considered incidental to other items herein and will not be measured or paid.

813-14 RELOCATE EXISTING SIGNS

14.1 Signs relocated as part of this contract shall be removed and, if necessary, stored by the Contractor until ready for reinstallation. Reinstallation of the signs shall meet the same requirements as the installation of new sign panels.

14.2 Relocation of existing signs will not be measured. This work will be considered incidental to other items herein and will not be paid for separately.

813-15 ADJUSTING AND CLEANING

15.1 Measure vertical clearance of signs and adjust an necessary to meet the minimum requirements as indicated on Drawings.

15.2 Clean all exposed sign surfaces after completing installation.

15.3 Adjust sign panels as required to level and to tightly butt seams together.

813-16 METHOD OF MEASUREMENT

16.1 The quantity of new signs to be paid for will be measured by the area in square feet of the vertical front face of each sign fabricated, installed and accepted by the Engineer. No deduction in sign area will be made for required scoping.

16.2 The quantity of sign removal to be paid for will be the number of signs removed, regardless of the number of posts supporting each sign.

813-17 BASIS OF PAYMENT

17.1 Accepted signs will be paid for at the Contract unit price per square foot for the front vertical face area of the completed sign installed. The payment will be full compensation for all material, labor, equipment, tools, mounting hardware, drilling holes, etc., necessary to complete the work and provide a complete installation.

Payment will be made under:

Item 813.1 Roadway Signs -- per square foot

END OF ITEM 813

ITEM 1000 PRE-ENGINEERED METAL BUILDING

1000-1 DESCRIPTION

1.1 This item shall consist of the furnishing and installation of a clear span, frame pre-engineered metal building to house pumping equipment for the Midfield Complex fire suppression system, complete with concrete floor and equipment pads, concrete and cement masonry unit wall foundations, and all building accessories, including fire sprinkler system, fire extinguisher, emergency lighting and lighted exit sign, and all necessary fire department signs in accordance with the various sizes and shapes shown on the Plans.

1.2 The building system shall include but not be limited to the following:

A. Structural steel main building frames and secondary framing including purlins and girts, engineered and fabricated by the building systems supplier.

B. Insulated steel wall and roof system.

C. Exterior door, powered wall exhauster, louvers, gutters and downspouts, roof curbs, pipe flashing, all trims and paints as shown on the Plans or specified herein.

D. Fire Extinguishers, types and sizes as shown on the Plans or specified herein.

1.3 Related Sections

A. Item P-152: Excavation and Embankment.

B. Item P-610: Portland Cement Concrete.

1.5 System Description

A. Clear span rigid frame; 10 foot minimum clearance. Roof Slope: 1 in 12.

B. Primary and secondary framings and lateral bracings: per the manufacturer's recommendations.

C. Wall and Roof System: Preformed steel panels and accessory components.

1.6 Design Requirements

A. Members to withstand building system dead loads, ground snow load of 25 psf, live load of 30 psf with tributary area load reduction, wind load of 80 mph, Seismic Zone 1, Building Use Occupancy Group U. All loads shall be proportioned and applied in accordance with the MBMA Low Rise Building Systems Manual.

B. Deflections shall be limited as follows:

Primary Framing	L/180 for roof snow load. H/60 for 10-year wind load.
Secondary Framing and Roof Framing for Gravity Load	L/150 for dead load + roof snow load; but not less than that required to maintain positive drainage for the greater of dead load + ½ roof snow load or dead load + 5 PSF.
Wall and Roof Framing for Wind Load	L/120 for 10-year wind load.
Sheeting	L/180 for roof snow load (but not less than 20 PSF), where L is the span of the element between support points, and H is the eve height of the building. For 10-year wind values, use 75% of the 50-year wind pressure.

C. Assembly to permit movement of components without buckling, failure of joint seals, undue stress on fasteners or other detrimental effects, when subject to temperature range of 80 degrees F.

D. Roof drainage system to withstand rainfall intensity of 7.5 inches per hour with 5 minute duration.

E. Site Conditions: The following site features and adjacent structures must be considered in the design. Building is approximately 10 feet above surrounding terrain. Building is approximately 25 feet away from a 60 Ft. diameter x 24 Ft. high circular water tank, as shown on the Plans.

1.7 Submittals

A. Product Data: Provide data on profiles, component dimensions and fasteners.

B. Manufacturer's Installation Instructions: Indicate preparation requirements, assembly sequence.

1.8 Quality Assurance

A. Fabricate structural steel members in accordance with MBMA Low Rise Building Systems manual, and, for items not covered, AISC - Specification for Structural Steel for Buildings.

1.9 Qualifications

A. Manufacturer: The company specializing in manufacturing the products specified in this Item shall be a member of MBMA, and shall be certified in Category MB of the AISC Quality Assurance Program. The building manufacturer shall have three (3) years experience in the manufacture of steel building systems.

B. Structural framing and covering shall be the design of a licensed Professional Engineer experienced in design of this work

1.10 Field Measurements

A. Metal building contractor shall verify that field measurements are as indicated on the plans.

1.11 Warranty

A. Building manufacturer shall provide the following warranties:

i. Warranty against failures caused by faulty or substandard material - 3 years
ii. Workmanship Guarantee against failures caused by faulty erection - 1 year
iii. Galvalume Panels - 20 years
iv. Wall paint - 20 years
v. Weathertightness - 20 years

B. Building contractor shall provide the following warranties:

i. Workmanship - 5 years
ii. Weathertightness - 20 years

C. All warranties shall begin on the day when the building is inspected and accepted by the Engineer.

1.12 Administration

A. All nomenclature shall conform to the MBMA Low Rise Building Systems Manual.

B. Coordination and administration of the work shall be in accordance with the MBMA Low Rise Building Systems Manual - Common Industry Practices.

1000-2 MATERIALS

2.1 Roof System

A. Sheet Steel Stock: Galvanized to G90 designation.

B. Roof Insulation: ASTM C665, batt glass fiber type, faced with reinforced white vinyl UL flame spread classification of 25 or less where exposed, friction fit, 3 inches thick.

C. Standing Seam Roofing: Minimum 24 gauge, 2-13/16" profile, UL 90 rated snap edges.

D. Closures: Manufacturer's standard type.

E. Fasteners: Manufacturer's standard type, stainless steel finish to match adjacent surfaces when exterior exposed. Size to maintain load and weather tightness requirements.

F. Sealant: Manufacturer's standard type.

G. Exterior Surfaces of Roof panels: Precoated steel of silicone polyester finish, color to be selected from the manufacturer's standard colors by MAA.

H. Interior Surfaces of Roof Panels: Precoated steel of silicone polyester finish, color to be selected from the manufacturer's standard colors by MAA.

2.2 Wall Systems

A. Sheet Steel Stock: Galvanized to G90 designation.

B. Siding: Minimum 24 gauge metal thickness, 1-1/2" profile lapped male/female edges.

C. Wall Insulation: ASTM C665, batt glass fiber type, faced with reinforced foil UL flame spread classification of 25 or less where exposed, 4 inches thick.

D. Closures: Manufacturer's standard type.

E. Fasteners: Manufacturer's standard type, stainless steel finish to match adjacent surfaces when exterior exposed. Size to maintain load and weather tightness requirements.

F. Exterior Surfaces of Wall Panels: Precoated steel of silicone polyester finish, color to be selected from the manufacturer's standard colors by MAA.

F. Interior Surfaces of Wall Panels: Precoated steel of polyester finish, color to be selected from the manufacturer's standard colors by MAA.

2.3 Trim

A. Flashings, Internal and External Corners, Closure Pieces, Fascia, Infills, Caps: Same material and finish as adjacent material, profile to suit system; color to be selected from manufacturer's standards by MAA.

2.4 Metal Door And Frame

2.4.1 Door and frame shall be designed by the manufacturer to meet the wind load provisions as specified in section 1.5. Door shall be designed using beam action to transfer loads from jamb to jamb.

2.4.2 Door and frame construction shall be as follows:

A. Door leaves shall be full flush hollow metal doors, 1-3/4 inches thick with 20 gauge, G-60 galvanized skins over a urethane foam core. Leaf shall be reversible to work with non-handed door frames.

B. Door frames shall be non-handed (reversible) frames, 6-3/4 inches deep with a 2-inch wide face, 16 gauge, G-60 galvanized steel with square cut, butted corners. Jambs and header are of knock-down type for field assembly through bolted connections. Door frame shall be an open "C" section to "wrap-around" end of 6-1/2" girts.

C. Doors shall be manufacturer standard quality, sizes shall be as shown on the plans, and shall be designated as solid leaf door, provide shut metal trim to flash around door frame and provide a finish appearance.

D. Hardware furnished with all doors shall consist to 1-1/2 pair of butts for each leaf, a lockset in US26D or US32D finish, and an aluminum threshold (3-3/8 inches wide) with vinyl door sweep. An astragal will be furnished for active leaf of double doors as will head and foot bolts for inactive leaf. Hardware shall include:

(I) Panic exit/entrance hardware. Panic device will be touchbar type with cylindrical locks and pushbar type with mortise locks.

(ii) Surface mounted door closers

(iii) Vinyl weatherstripping kit

(iv) Stainless steel kick plate.

E. Shop prime and shop paint door; color to be selected from the manufacturer's standard colors by MAA.

2.5 Frames for Other Openings

Frames for all openings shall be designed by the manufacturer to meet the wind load provisions as specified in Section 1.5. Frames shall be designed using beam action to transfer loads from jamb to jamb. Frame shall also be designed to provide support for future installation of motor-driven rollup door.

2.6 Fabrication - Primary Framing

A. Framing Members: Clean in accordance with SSPC-SP2, prepare, and coat with building manufacturer's standard primer.

B. Hot rolled members shall be fabricated in accordance with AISC Specification for pipe, tube, and rolled structural shapes.

C. Fabricate built-up members in accordance with MBMA Low Rise Building Systems Manual, Common Industry Practices.

2.7 Fabrication - Wall And Roof Framing

A. Framing Members: Clean in accordance with SSPC-SP2, prepare, and coat with building manufacturer's standard primer.

B. Cold Formed Members: Cold formed structural shapes shall be fabricated in accordance with MBMA Low Rise Building Systems Manual, Common Industry Practice.

2.8 Accessories

A. Wall louvers: shall be operable type, with pull-chain operator, weather-stripped blades, same finish as adjacent material with removable steel mesh insect screen and frame. Mounting fins for connecting to structural sub-framing shall be provided. Sizes shall be as show on the Plans.

(i) Louver shall be made of galvanized steel. Frame shall be 18 gauge (min.) and blades shall be 20 gauge (min.) material. Frame joints shall be welded. Blades shall be overlapping type, providing maximum weather tightness when closed and allowing free air flow when open.

(ii) Screens shall be 1-8/16 aluminum or fiber mesh in an extruded or formed aluminum frame. Screens shall be exterior mounted.

(iii) Structural sub-framing, consisting of angle or channel sections (hot-rolled or cold formed), shall be furnished with each louver.

(iv) Sheet metal trim shall be furnished to flash around louver and provide a finished appearance.

(v) Louvers shall be designed by the manufacturer to meet the wind load provision as specified in Section 1.5.

B. Powered wall Exhauster: shall consist of a belt-driven exhaust fan, a self-closing exterior louver, structural sub-framing to support the unit, and trim to flash around unit and provide a finished appearance.

i. Exhaust fan shall be 24 inches in diameter, four (or more) blades, belt-driven, complete with frame and mounting cage. Fan shall be powered with a 1/2 HP electric motor (460 volt, 3 phase, non-reversible, overload protection). Fan rating is 4090 CFM at 0 static pressure. Wiring and controls shall be included.

ii. Louver shall be automatic type which opens by action of exhaust air when fan is turned on and self-closes, by gravity action, when fan is shut off. Louver shall be 40" x 40". Frame and blades (interlocking type) shall be fabricated from mill finished aluminum extrusions.

iii. Structural sub-framing, consisting of cold-formed channel sections, shall be furnished with each exhaust fan. Trim shall be the building manufacturer's standard to accommodate wall panel configuration.

C. Roof Curbs and Flashing (for diesel water pump exhaust and silencer): Roof curb shall be a one piece unit consisting of a top box, or shell, and bottom skirt, or flange. Units shall be of welded construction, land top of shell shall provide a level surface for supporting mounted equipment.

i. Roof curbs unit shall be individually sized and designed to meet specific job requirements.

ii. Roof curbs shall be made of 18 gauge (min.), G-90 galvanized steel for shell and flange and shall have internal angle reinforcing as required. Paint units to match color coated roof panels.

iii. Roof curbs are supported by structural sub framing and shall be installed with flange under the roof panels. Roof panels are fastened to the flange with sealant and screws to provide a watertight assembly.

iv. Pipe Flashing shall be a one piece construction that accommodates pipes made of steel, copper, cast iron, PVC and sheet metal.

v. The building manufacturer is required to coordinate with the water pump manufacturer and/or installer for the numbers, sizes and locations of roof curbs and pipe flashing required on the building roof.

2.9 Fabrication - Gutters And Downspouts

A. Fabricate gutters from manufacturer's standard. Color as selected from manufacturer's standard offering.

B. Fabricate downspouts from manufacturer's standard. Color as selected from manufacturer's standard offering.

C. Form sections in maximum possible lengths. Hem exposed edges. Allow for expansion at joints.

D. Fabricate gutter support straps of manufacturer's standard material and finish.

E. Fabricate downspout support straps of manufacturer's standard material. Color as selected from manufacturer's standard offering.

1001-3 EXECUTION

3.1 Examination

A. Verify site conditions under the General Provisions.

B. Verify that foundation, floor slab, mechanical and electrical utilities, and placed anchors are in correct position.

C. Provide access to the work as scheduled for owner provided inspections, if required.

3.2 Erection - Framing

A. Erect framing in accordance with MBMA Low Rise Building Systems Manual, Common Industry Practices.

B. The erector shall furnish temporary guys and bracing where needed for squaring, plumbing, and securing the structural framing against loads, such as wind loads acting on the exposed framing and seismic forces, as well as loads due to erection equipment and erection operation, but not including loads resulting from the performance of work by others. Bracing furnished by the manufacturer for the steel building system cannot be assumed to be adequate during erection. The temporary guys, braces, falseworks and cribbing are the property of the erector, and the erector shall remove them immediately upon completion of erection.

C. Do not field cut or alter structural members without approval of steel building manufacturer.

D. After erection, prime welds, abrasions, and surfaces not galvanized.

3.3 Erection - Wall And Roofing Systems

A. Install in accordance with manufacturer's instructions.

B. Exercise care when cutting prefinished material to ensure cuttings do not remain on finish surface.

C. Fasten cladding system to structural supports, aligned level and plumb.

3.4 Erection - Gutter And Downspout

A. Install gutters and downspouts in strict accordance with manufacturer's instructions.

B. Provide concrete splash block at each downspout.

3.5 Installation - Accessories

A. Install door frame, door, in accordance with manufacturer's instructions.

B. Seal wall and roof accessories weather tight.

3.6 Tolerances

A. All work shall be performed in a workmanlike manner.

B. Install Framing in accordance with MBMA Low Rise Building Systems Manual, Common Industry Practices.

1000-4 METHOD OF MEASUREMENT

4.1 Payment for pre-engineered metal building will be made on a lump sum basis wherein no measurement will be made. Reinforced Portland cement concrete for the building foundation and floor, and concrete masonry unit wall will not be separately measured for payment, but will be considered as incidentals for the building construction.

4.2 Excavation, embankment, and subgrade preparation for the building site will be measured and paid for as unclassified excavation under Item P-152.

4.3 Emergency lighting and lighted exit sign will be measured and paid under Item 16510.

1000-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract lump sum price for pre-engineered metal building which price shall be full compensation for the work specified and the furnishing of all labor, materials, equipment, and all incidentals necessary to complete the work as indicated on the plans and specified herein. The payment shall include the the costs for furnishing and installation of reinforced Portland cement concrete foundation and floor, concrete unit masonry wall, fire sprinkler system, fire extinguisher, and all building accessories.

Payment will be made under:

Item 1000.1 Pre-Engineered Metal Building -- lump sum

END OF ITEM 1000

ITEM 1200 WATER TANK

1200-1 GENERAL

1.1 SCOPE:

A. This item shall consist of the furnishing of all engineering, labor, material, equipment, tools, services, and erection of a 500,000-gallon, factory powder-coated bolted steel water storage tank and all accessories including the tank foundation as shown on the Plans and specified herein.

B. The bolted steel tank shall conform to the requirements of AWWA D103-87.

1.2 SUBMITTALS:

Shop Drawings: Submit shop drawings of the bolted steel reservoir and all accessories for review and approval by the engineer prior to beginning any related shop fabrication or erection. Include sufficient data to show that the reservoir and accessories conform to the requirements to these Specifications.

Submittals shall include:

A. Design calculations, sealed and signed by a Professional Civil or Structural Engineer.

B. Fabrication and erection drawings and details for the reservoir and all accessories.

C. Certified mill tests on steel plate and structural members demonstrating that the physical and chemical requirements of this Specification have been met.

1200-2 PRODUCTS

2.1 GENERAL DESCRIPTION:

A. Water tank shall be a 500,000-gallon, Factory powder-coated bolted steel water storage tank, Model #2400, manufactured by Superior Tank Co., Inc., Santa Fe Springs, CA, or an approved equal. Submit Manufacturers data for approval.

B. The tank manufacturer shall furnish, erect and test the tank on an approved foundation, as required by AWWA D103-87. The tank manufacturer shall be completely responsible for the construction and satisfactory performance of the tank during the guarantee period. The tank shall conform to AWWA D103-87, to the latest edition of the Uniform Building Code, and to the requirements of the plans and these Specifications. The supplier shall submit for approval complete and detailed plans for the tank and appurtenances.

C. The Factory Powder Coated, bolted steel tank shall have a nominal capacity of 500,000 gallons. It shall have a nominal diameter of 60 feet and a nominal height of 24 feet. A cone roof, sloped to drain toward the wall shall be provided. Provide the reservoir complete with all pipe connections, access openings, nozzles, taps, drains, ladders, vent, and other accessories as shown on the plans or required herein.

2.2 DESIGN DATA:

A. The following data and information are supplied as a basis for design and erection of the tank, foundation, and appurtenances:

1. Minimum capacity	500,000 gallons
2. Inside diameter	60' plus or minus
3. Minimum tank height	24' plus or minus
4. Minimum overflow height	23' plus or minus
5. Seismic zone	1
6. Liquid to be stored	Potable water
7. Wind load	100 mph
8. Deck load	25 psf
9. Allowable Soil Bearing	1800 psf
10. Design standard	AWWA. D103-87

2.3 ACCESSORIES:

A. Shell Manhole: Provide a 24 inch, minimum, hinged shell manhole located as shown on the drawings. The center of the manhole shall be located 36 inches above the bottom of the tank.

B. Manway: Provide a 24"x36" shell manway located as shown on the drawings.

C. Pipe Connections:

1. Provide backwash inlet nozzle with deflector plate, outlet nozzle with anti-vortex plate, and overflow and drain outlets as shown on the plans.

2. Provide a 1-inch NPT tank connection as shown on the plans for sampling connection.

D. Overflow pipe: Provide steel internal and external overflow pipe, internal weir box, if required, and supports as shown on the plans. Overflow pipe assembly shall be powder epoxy lined and coated.

E. Ladders:

1. Provide a galvanized steel welded exterior ladder with backguard as shown on the plans. The ladder shall have a lockable closure at the bottom.

2. Provide a galvanized steel welded interior ladder with a Safe-T-Climb assembly and backguard, or approved equal, as shown on the plans.

F. Roof Openings:

1. Two- 20 inch screened vent shall be provided on the roof. The vents shall be fabricated to provide removable screened openings between the vertical support members of the vent. The screened openings of the vent shall be sized by the manufacturer to all venting of a 8,000 gpm pumping rate. An effective area of 75% of screen opening shall be assumed. The screen shall consist of one layer of Type 316 stainless steel: 16 x 16 x 0.018 wire mesh insect screen.

2. The tank roof shall have a curbed, upward opening 24-inches square, minimum hatch located near the ladder. The curb shall extend at least 4 inches above the tank. The hatch cover shall be hinged and shall have locking provisions. The hatch cover lip shall extend for a distance of 2-inches down on the outside of the curb.

G. The tank shall have Liquid Level Indicator with Type 316 stainless steel internals and complete with float and target board assembly.

H. Gaskets and sealants shall meet or exceed AWWA, FDA, and EPA standards for potable water.

I. Anchor bolts and stirrups, if required, to be furnished by the tank manufacturer.

1200-3 EXECUTION

3.1 PROTECTIVE COATING:

A. General: All metal plates, supports, members and miscellaneous parts, except bolts, shall be Factory Powder Coated in accordance with AWWA D103, Section 10.6 and this Section. Field coating, other than touch-up, will not be permitted.

B. Surface Preparation:

1. Prior to application of coating, all metal plate, supports, members and miscellaneous parts, other than fasteners shall be thoroughly cleaned by a hot-rinse wash process followed immediately by hot air drying.

2. All steel surfaces shall be sandblasted to equivalent of a SP 6 commercial blast metal finish. The surface anchor pattern shall be no less than 1.5 mils.

3. All steel surfaces shall receive an iron phosphate coating applied with a power spray washer with not less than 25 p.s.i. pressure, followed by a warm water rinse and by an acidulated sealant. Then spray a final Deionized water rinse to prevent rusting prior to the powder coating application.

4. All steel surfaces shall drip for seven (7) minutes prior to entering the dry off oven for eight (8) minutes at 425 degrees F.

C. Coating:

1. All interior steel surfaces, support members and miscellaneous parts shall receive 5 mils minimum average dry film thickness using Fuller O'Brien "Tank Tan" (an NSF 61 approved, thermal set epoxy powder coating) or approved equal.

2. All exterior steel surfaces, support members and miscellaneous parts shall receive 3 mils minimum average dry film thickness using Fuller O'Brien "Superior Sand" (a thermal set TGIC-polyester powder coating) or approved equal.

3.2 CONSTRUCTION:

A. Field erection of Factory Powder Coated bolted steel tanks shall be in strict compliance with manufacturer's recommendations and performed by manufacturer's employees to alleviate any potential disputes in coating quality or erection thereof. Particular care shall be exercised in handling and bolting of the tank plates, supports, and members to avoid abrasion or scratching the coating. Prior to placing water in the tank, a "holiday" inspection of the entire tank, corners included, will be provided and performed by the manufacturer in the presence of the Engineer. Touch-up coating shall be done per the manufacturer's recommendations where and as directed.

3.3 TESTING AND INSPECTION:

A. General: Test storage tank after erection. Floor shall be clean and free from dirt, foreign substances, and debris.

B. Bottom: Vacuum test seams in floor plates.

C. Shell: Test by filling with water to elevation of overflow. Completed storage tank shall show no leaks at end of 24 hour test period. No charge will be made for water required to fill tank.

D. Disinfection:

1. General: After testing has been satisfactorily completed, tank shall be disinfected.

2. Standards: Disinfecting of interior surfaces shall be performed in accordance with AWWA C652-86. After disinfection, a water specimen shall be taken for bacteriological test, as prescribed at Code 40 of the Federal Regulations, Sections 141.21 through 141.30, 141.41 and 141.42.

3. After disinfection, the tank shall be filled to the overflow level and allowed to stand for 5 days, minimum. After 5 days, water specimens shall be taken for V.O.C. test per EPA 502.2. The tank may be placed into service once acceptable test results are received.

3.4 WARRANTY:

A. The tank manufacturer shall provide the following warranties:

1. Warranty against any defects in workmanship and materials - 3 Years

2. Coating warranty - 15 Years

B. Warranty period shall begin from date the tank is completely installed and accepted by the Engineer.

1200-4 METHOD OF MEASUREMENT

4.1 Payment for furnishing and installation of the water tank and all appurtenant piping, accessories, disinfection, inspection and testing will be made on a lump sum basis wherein no measurement will be made.

4.2 Payment for excavation, support of excavation, embankment and compacted backfill will be made under Item P-152.

4.3 Filter fabric and pea gravel for tank foundation will not be measured for payment, but will be considered incidental to the cost of water tank.

1200-5 BASIS OF PAYMENT

5.1 This item will be paid for at the Contract Lump Sum price, which shall be full compensation for performing all work and the furnishing of all materials, labor, tools, equipment and incidentals necessary to complete the item. No separate payment will be made for piping, connections and fittings, ladder, coating and other tank accessories, filter fabric, pea gravel, inspection, disinfection and testing or other items necessary to furnish and install the water tank as described in the Specifications and shown on the Plans.

Payment will be made under:

Item 1200.1 Water Tank -- lump sum

END OF ITEM 1200

ITEM 1300 SANITARY SEWAGE AND WATER SUPPLY SYSTEM

1300-1 DESCRIPTION

1.1 The work to be performed under this item shall include, but not be limited to, the furnishing of all materials, labor, and equipment required for the construction of gravity and force main sanitary sewers and metered water service for the project; including all necessary excavation and backfilling; the furnishing and installation of equipment, pipes, valves, manholes, cleanouts, connection to existing piping and manhole while maintaining existing sanitary sewer services and water; pavement cutting and repair; testing; and all incidentals necessary to complete the work as indicated on the plans and specified herein.

1300-2 MATERIALS AND EQUIPMENT

2.1 General

A. All materials shall be new and suitable for the conditions and duties imposed upon them after installation. Where applicable, materials and equipment shall bear the approval label of the Underwriter's Laboratories, Inc.

B. All structural steel shall be galvanized, meeting requirements of ASTM A 123. Bolts, nuts and washers shall be hot-dipped or mechanically galvanized. The coating shall meet the adherence thickness and quality requirements of ASTM A 153. Structural steel shall be galvanized after fabrication.

2.2 Shop Drawings

A. Shop drawings shall be submitted to the Engineer for approval within four weeks following the execution of the contract.

B. Shop drawings shall consist of manufacturer's catalog cuts, working drawings, wiring diagrams, certified test reports, etc. for pipe and fittings, joints, couplings, valves, gaskets, precast sanitary sewer manholes, including frame and cover and ladder rungs, casing pipe end seals, insulator pipe supports, fire hydrants, and other materials or equipment which may be requested by the Engineer.

C. Shop drawings for sanitary sewer crossing of Wilson Point Road shall consist of complete and detailed plans and schedules for the jacking operation and shall be approved by the Engineer before the work may begin. The shop drawings shall include complete details of sheeting, shoring, bracing, and dewatering for protecting the roadbed and materials and equipment to be installed.

D. The Contractor shall keep at the site at all times during construction one set of contract prints for the express purpose of showing any and all changes made during construction. The Contractor shall mark the prints showing each change and shall incorporate all changes in "Record/As-Built Drawings" to be submitted to the Engineer upon completion of the project.

2.3 Sanitary Sewer Lift Stations: The pump stations shall be of dry pit design. All motors, pumps, impellers, and equipment shall be installed on the dry side with pipe connections to the wet side (sewage pit side). The dryside pit shall be below ground with a minimum three-foot diameter entrance tube. An integral emergency power generator shall be provided and shall be located at the surface. The design and construction of hold-down pads shall be the responsibility of the Contractor. Any additional soil testing required for the design and placement of the pump station and the sewage pit shall be the responsibility of the Contractor. The pump station shall have a primary and secondary pump within the station. A concrete surface pad shall be constructed for accessibility to the pump station and sewage pit, and for mounting the emergency generator. The concrete surface pad shall be deigned to allow for proper surface drainage to be directed away from the

pump station and sewage pit. The pump station may be of fiberglas or concrete construction and the sewage pit shall be of concrete construction. Pumps shall be selected for a flow rate of 130 gallons per minute, and static and total dynamic head shall be calculated from the sanitary sewer system layout shown on the plans. Lift stations shall be as manufactured by The Gorman-Rupp Company, Mansfield, Ohio, or equal approved by the Engineer.

2.4 PVC Gravity and Force Main Sanitary Sewer: Pipe and fittings shall be PVC conforming to ASTM D 3034, SDR 35. Jointing shall be accomplished by means of elastomeric gasket joints conforming to ASTM D 3212. Gasket material shall be suitable for use with domestic sewage and shall conform to ASTM F 477.

2.5 Joints and Jointing Material for PVC Gravity and Pressure Pipe: Joints for pipe shall be socket type couplings with solvent cement weld as specified in ASTM D 2466 and D 2564 or push-on joints with elastomeric gaskets conforming to ASTM D 3139 and F 477.

2.6 Ductile Iron Water Pipe and Fittings: The pipe furnished shall be ductile iron pipe meeting the requirements of AWWA C-151, Class 52. The pipe shall be in 18-foot lengths and shall be of bell and spigot construction for mechanical joints. Bells shall be formed integrally with the pipe and contain a restrained gland and rubber gasket. The completed joint shall create a hydraulic seal capable of withstanding an internal hydrostatic pressure of 150 psi for one hour without leaking. Fittings shall be ductile or cast iron with mechanical joints and retainer glands with suitable rubber gaskets to make proper connections with new and existing pipe. Retainer glands for mechanical joint pipe shall be of a type which replaces the conventional type mechanical joint gland. Retainer glands shall have alloy case hardened set screws with square heads and cupped ends. The size and quantity of set screws shall be in accordance with the recommendation of the manufacturer.

2.7 Water Service Valves: Valves shall be gate or ball type as manufactured by Jenkins or equal.

2.8 Pipe Bedding Material: Bedding material for all pipe shall be as shown on the Plans and as specified in the Maryland "Standard Specifications for Construction Materials," October 1993.

2.9 Concrete: Where shown on the plans, concrete for pipe encasement, thrust block, or other appurtenances required under this Item, shall meet the requirements of Item P-610, except that the 28-day compressive strength may be 3000 psi minimum at the Contractor's option.

2.10 Lift Station Autodialer Alarm: Each sanitary sewer lift station shall be equipped with an automatic alarm system as shown on the plans and capable of detecting excessive levels of sewage in the wet side pit. The alarms shall be connected to the airport telephone system and shall be capable of sending simulated voice alarm messages to up to six (6) remote locations to be determined by the Engineer. If approved by the Engineer, a single autodialer unit having multiple alarm input capabilities may be installed in a central location and linked to alarm mechanisms installed in each lift station.

2.11 Tracer Wire for Nonmetallic Piping: Tracer wire shall be bare copper or aluminum wire not less than 0.10 inch in diameter and shall be provided in sufficient length to be continuous over each separate run of nonmetallic pipe.

2.12 Buried Warning and Identification Tape: Buried warning and identification tape shall be polyethylene plastic tape manufactured specifically for warning and identification of buried utility lines. Tape shall be provided in rolls, 6 inches minimum width, color codes for water or sewer service with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be "CAUTION BURIED WATER LINE BELOW" or similar wording. Code and letter coding shall be permanent, unaffected by moisture and other substances contained in trench backfill material.

2.13 Corporation stops shall have standard corporation stop thread conforming to AWWA C800 on the inlet end, with flanged joints, compression pattern flared tube couplings, or wiped joints for connections to goosenecks.

2.14 Disinfection: Chlorinating materials shall conform to the following:

Chlorine, Liquid:	AWWA B301
Hypochlorite, Calcium, and Sodium:	AWWA B300

1300-3 CONSTRUCTION METHODS

3.1 General

A. The Contractor shall furnish all materials, perform all excavation and backfill, construct all necessary joints and connections, construct all appurtenances, dispose of all surplus excavation and discard materials as may be necessary to complete the sanitary sewerage and water supply systems.

B. The Contractor shall assume all risk and bear any loss or injury to property or persons occasioned by neglect or accident during the progress of the work. The Contractor shall exercise special care during the work so as not to damage any existing utility lines or appurtenances.

C. Maintenance of Local Service: The Contractor shall exercise utmost care to avoid damage to trees and hedges, fences, electric, telephone, gas and water lines and other operating sewer lines, building, roads and all appurtenances thereto. The interruption of free access to streets and roads due to trench excavation shall be kept to a minimum. Traffic on public and airport roads shall be maintained at all times. All excavated material shall be piled in a manner that will not endanger the work and will not obstruct access to the site.

D. Gutters and ditches shall be kept clear at all times or other satisfactory provisions made. Drainage of natural water courses shall not be obstructed. All trenches, material, excavated pits, equipment and pipe which may cause a hazard or serve as obstruction to either vehicular or pedestrian traffic shall be enclosed by fences or barricades, adequately lighted, to protect persons from injury and to avoid property damage. Where traffic must cross open trenches, the Contractor shall provide suitable bridges, which will be subject to approval of the Engineer. The Contractor shall furnish temporary support, adequate protection and maintenance of all underground and surface structures, drains, telephone and electric conduits, sewers, and other obstructions encountered in the progress of the work.

E. Removal of Water: The Contractor shall at all times during construction provide proper and satisfactory means and devices for the removal of all water entering the excavated area, and he shall remove all such water as fast as it may collect to avoid interference with the prosecution of the work of the proper placing of masonry or other materials.

F. Delivery, Handling and Storage of Materials: Inspect materials delivered to site for damage. Unload and store with 'minimum handling. Store materials on site in enclosures or under protective covering. Store plastic piping and rubber gaskets under cover out of direct sunlight. Do not store materials directly on the ground. Keep inside of pipes and fittings free of dirt and debris. Handle pipe, fittings, valves, and other accessories in such manner as to ensure delivery to the trench in sound undamaged condition. Take special care to avoid injury to coatings and linings on pipe and fittings; make satisfactory repairs if coatings or linings are damaged. Carry pipe to the trench; do not drag it. Do not leave plastic piping or rubber gaskets that are not to be installed immediately out in the sunlight, but store under cover out of direct sunlight.

3-2 Trench Excavation

A. The Contractor shall excavate, protect, and backfill all excavation that may be necessary for completing the work under the contract. Unless otherwise specified, excavation shall be open cut. Sheeting, shoring, and hand excavation shall be done as may be necessary for the protection of the

work and for the safety of personnel in accordance with Local, State, and Federal regulations including OSHA.

B. Trenches shall be excavated to the necessary width and depth, as shown on the Drawings and as specified or as directed.

C. The sides of the trenches shall be practically plumb and will be permitted to be sloped only with the written approval of the Engineer. Bell-holes shall be excavated in the bottoms and sides of trenches to permit the proper making of joints.

D. In paved areas the Contractor shall remove the paving for such width only as is necessary for the excavation of the trench, as shown on trench details. If the Contractor removes the paving for a greater width than is deemed necessary, or in case he removes or disturbs any paving on account of settlement, slides or caves, or in making excavation outside the lines of the work without the written order of the Engineer, the Contractor shall replace at his own expense such paving, etc., or MAA may retain from any monies due or to become due to the Contractor, the cost of permanently replacing the paving so removed.

E. The Contractor shall support the sides and ends of all excavations or structures, whenever necessary or directed, with braces, sheeting, shores or stringers of the quality and character to support the trench walls.

F. All sheeting in excavations shall be withdrawn as the backfilling is being done, except where and to such extent as the Engineer shall order,. in writing, that sheeting and shoring be left in place, or where he shall permit the same to be left in place, at the Contractor's expense and upon his request. The Contractor shall cut off any sheeting left in place, at least 18 inches below finished grade wherever ordered, and shall remove the material cut off without compensation therefore.

G. Wherever necessary, in soft ground, or for the protection of any structure or property, sheeting shall be driven, to such depth below the bottom of the trench as may be required or directed.

H. The Contractor shall be responsible for the condition of all excavations made. All slides and caves shall be removed without extra compensation, at whatever time and under whatever conditions that may occur.

I. The excavation of all trenches shall be fully completed at least 20 feet in advance of pipe laying, unless otherwise authorized or directed. The Engineer may at any time require the backfilling of open trenches over completed pipe line, if in his judgment such action is necessary, and the Contractor shall thereby have no claim for extra compensation, even though to accomplish said backfilling he is compelled temporarily to stop excavation or other work at any place. If work is stopped on any trench, for any reason except by order of the Engineer, and the excavation is left open for an unreasonable length of time in advance of construction, the Contractor shall, if so directed, backfill such trench at his own cost, and shall not again open said trench until he is ready to complete the structure therein. If the Contractor shall refuse or fail to backfill such trench completely within 48 hours after said notice, the Owner shall be authorized to do the work, and the expense thereof shall be charged to the Contractor.

J. All excavations must be kept free of water below the subgrade of the work while work is in progress. This may be accomplished by ordinary pumping methods, use of underdrains, or by wells points, whichever will produce the required results.

K. The Contractor shall complete excavations in earth as nearly as practicable to the neat lines of the structures to be built therein. All irregularities and cavities in the bottom of trenches shall be filled up to the required level with clean earth or required bedding material, firmly compacted, before pipe lines are laid therein, and without extra compensation unless said cavities have been formed by the

direction of the Engineer, and their excavation classed as excavation below subgrade. Wherever directed, the Contractor shall use aggregate meeting the requirements of AASHTO No. 57 in backfilling below subgrade.

3.3 Trench Backfill

A. It is intended that the material excavated from the trench be used for trench backfill, provided that in the opinion of the Engineer, the excavated material is suitable for backfilling. Backfill shall be placed and compacted in a controlled manner in accordance with Item P-152 and as specified below.

B. Backfill material shall be carefully deposited in the trench by methods which will not damage or disturb the pipe or structures, and shall be solidly tamped around the pipe or structure. The volume from the bottom of the trench to the spring line of the pipe shall be placed in 4-inch compacted layers. The volume from the spring line of the pipe to a point 12 inches below road subbase, or to grade, where the pipe is not laid in a road, shall be refilled in 6-inch compacted layers. All tamping of material from the bottom of the trench to the spring line shall be done by pneumatic hand tampers; or if the material is composed largely of coarse aggregate, the Engineer may require the use of other hand tampers, in order to insure protection of the pipe. Above this point, mechanical tampers capable of exerting a blow of 250 foot pounds per square foot of area of tamping face shall be employed.

C. The moisture content of the material being compacted shall be within plus or minus 3 percentage points of optimum. Material containing an excess of moisture shall be processed and dried, or permitted to dry until the moisture content is within the specified range. Material which is too dry shall be wetted until the moisture content is within the specified range.

D. The Engineer may make compaction tests of the backfilled trenches at any time during construction or upon completion of the backfill operations. If the results of any tests show that backfills do not meet the specified compaction requirements, the Contractor shall at his own expense, correct the condition, as directed by the Engineer, in such portions of the trench represented by the unsatisfactory test results.

E. From a point 8 inches below the existing base course to the surface of all trenches located in paved areas and shoulders shall be refilled with well compacted crushed stone, slag or gravel, and maintained for a minimum of 30 days before permanent repairs are made to paving. The crushed stone, slag, or gravel backfill material shall then be excavated as required, and all paving, including sidewalk, curb and gutter shall be replaced over excavations in accordance with the details shown on the Contact Drawings, Standard Details, or as required by permit of the various regulatory agencies.

F. Backfill in all excavations not in paved areas shall be restored to the condition that existed prior to beginning work, and maintained for a period of nine months following the date of conditional acceptance.

G. The Contractor shall, at his own expense, maintain all excavations in proper condition. Just prior to the termination date for maintaining excavations, the trench surfaces shall be given final reshaping where necessary. All depressions appearing in the backfilled excavations shall be properly refilled. If the Contractor fails to make repairs within 48 hours after receipt of written notice from the Owner, the Owner may backfill said depressions or protect with signs and lanterns wherever necessary without giving previous notice to the Contractor and the cost of so doing will be retained from any monies due or to become due the Contractor under the Contract. The Contractor shall be responsible for any injury or damage that may result from lack of maintenance of any backfilled excavation at any time previous to the end of the mentioned termination dates.

H. All unauthorized excavations made by the Contractor shall be immediately backfilled in accordance with the requirements of the specifications for Excavation Backfill at the Contractor's expense.

I. After completion of backfilling, all material not used therein, shall be removed and disposed of in such a manner and at such point as shall be approved or directed and all roads, sidewalks, and other places on the line of the work shall be left free, clean, and in good order. Said cleaning up shall be done by the Contractor without extra compensation and, if he fails to do such work within a reasonable time after receipt of notice, it will be performed by the owner, and the cost will be retained out of the monies due or to become due the Contractor under the contract.

3.4 Excavation Below Trench Subgrade and Backfill

A. Unsuitable or other material encountered at or below the excavation limits which in the judgment of the Engineer should be removed, shall be removed to the extent directed; and all spaces created by the removal of any and all material shall be backfilled as directed by the Engineer. Thoroughly compacted aggregate meeting the requirements of AASHTO No. 57 shall be used as backfill below subgrade.

B. In general, this item of work shall be performed when the planned subgrade is in rock and a cushion is deemed necessary or where the planned subgrade is in an unsuitable or unstable area. In any event, the work will be performed only upon the written direction of the Engineer.

3.5 Pipe Installation

A. Pipe shall be protected during handling against impact shocks and free fall and the pipe. interior shall be free of extraneous material. Pipe laying shall proceed upgrade with the spigot ends of bell-and-spigot pipe and tongue ends of tongue-and-groove pipe pointing in the direction of the flow. Each pipe shall be laid accurately to the line and grade shown on the Plans. Pipe shall be laid and centered so that the sewer has a uniform invert. As the work progresses, the interior of the pipe shall be cleared of all superfluous materials. Before making pipe joints, all surfaces of the portions of the pipe to be joined shall be clean and dry. Lubricants, primers, and adhesives shall be used as recommended by the pipe manufacturer. The joints shall then be placed, fitted, joined, and adjusted so as to obtain the degree of water tightness required.

B. Installations of socket type solvent weld joint pipe, PVC pipe and fittings shall be installed in accordance with ASTM F 402, and all - required precautions shall be taken to assure adequate trench ventilation and protection for workers installing the pipe. Trenches shall be kept free of water and as dry as possible during bedding, laying and jointing and for as long a period as required. When work is not in progress, open ends of pipe and fittings shall be satisfactorily closed so that no trench water or other material will enter the pipe or fittings. As soon as possible after the joint is made, sufficient backfill material shall be placed along the pipe to prevent pipe movement off line or grade. Plastic pipe shall be completely covered to prevent damage from ultraviolet light. Storage facilities for plastic pipe, fittings, joint materials and solvents shall be classified and marked in accordance with NFPA 704, with classification as indicated in NFPA 49 and NFPA 325M.

C. Cutting of pipe shall be done in a neat and workmanlike manner without damage to the pipe. Unless otherwise recommended by the manufacturer and authorized by the Engineer, cutting shall be done with an approved type mechanical cutter. Wheel cutter shall be used when practicable. Squeeze type mechanical cutters shall not be used for ductile iron.

D. Water pipe shall not be laid closer horizontally than 10 feet from a sewer except where the bottom of the water pipe will be at least 12 inches above the top of the sewer pipe, in which case the water pipe shall not be laid closer horizontally than 6 feet from the sewer. Where water lines cross under gravity-flow sewer lines, the sewer pipe for a distance of at least 10 feet each side of the crossing shall be fully encased in concrete or shall be made of pressure pipe with no joint located within 3 feet horizontally of the crossing.

E. Placing and Laying: Pipe bedding and trench details shall be as shown on the Plans. Pipe and accessories shall be carefully lowered into the trench by means of derrick, ropes, belt slings, or other authorized equipment. Under no circumstances shall any of the water and sanitary line materials be dropped or dumped into the trench. Care shall be taken to avoid abrasion of the pipe coating. Except where necessary in making connections with other lines or as authorized by the Engineer, pipe shall be laid with the bells facing in the direction of laying. The full length of each section of pipe shall rest solidly upon the pipe bed, with recesses excavated to accommodate bells, couplings, and joints. Pipe that has the grade or joint disturbed after laying shall be taken up and relaid. Pipe shall not be laid in water or when trench conditions are unsuitable for the work.

1. Water shall be kept out of the trench until joining is completed. When work is not in progress. open ends of pipe, fittings, and valves shall be securely closed so that no trench water, earth, or other substance will enter the pipes or fittings. Where any part of the coating or lining is damaged, the repair shall be made by the Contractor at his expense in a satisfactory manner. Ductile iron and PVC shall be installed in accordance with the details shown on the Plans.

F. Final Certification: Upon completion of the project and before final acceptance, the Contractor shall deliver to the Engineer a statement signed by the principal officer of the contracting firm stating that the installation is satisfactory and in complete accordance with the contract plans and specifications and the manufacturer's prescribed procedures and techniques.

G. Where existing manholes or sewer lines must be removed in order to construct new sewer or structure, the Contractor shall make any necessary cuts in the pipes and remove all piping and appurtenances as required to install new work.

H. Jointing

1. Ductile-Iron Pipe: Mechanical joints shall be installed in accordance with AWWA C600 for buried lines.

2. Polyvinyl Chloride (PVC) Plastic Pipe: Joints shall be made in accordance with instructions recommended by the manufacturer of the pipe.

3. Connections between different types of pipe and accessories shall be made with transition fittings approved by the Engineer.

I. All PVC pipe shall be laid true to line and grade and, where not encased, bedded in No. 6 gravel from 6 inches below the pipe to 4 inches above the top of the pipe.

J. Backfill from the top of the pipe to finished ground shall be compacted to 95 percent modified proctor density.

K. Finished ground level shall be no less than 3.5 feet above the pipe except where shown on the Plans.

L. The gravel base shall be used to adjust the pipe grade. The use of blocks will not be allowed.

M. All PVC pipe shall have a tracer wire and buried warning identification tape placed no less than 1.5 feet above top of the pipe.

N. It is intended that material excavated from the trench be used for backfill above the embedment, provided that the Engineer approves it as suitable for backfill. If the Engineer declares the excavated material unsuitable, borrow backfill with suitable material shall be provided as an extra work item.

O. The Engineer may make compaction tests of the backfilled material at any time during construction or upon completion of the backfill. If results of any test show that backfill does not meet 80 percent

Modified Proctor Density, the Contractor shall, at his own expense, correct the condition, as directed by the Engineer, in the portions of the backfill represented by the unsatisfactory test results.

P. Backfilled and excavated turfed areas shall be restored to the original condition existing prior to excavation by sodding in accordance with Maryland Department of Transportation Standard Specifications for Construction and Materials. Should the Contractor fail in such maintenance, the Owner will correct any deficiencies and deduct the cost of so doing from any monies due or to become due under the Contract.

Q. All paving shall be replaced in kind where necessary according to the details shown on the drawings.

3.6 Sanitary Sewer Manholes

Sanitart sewer manholes shall be furnished and installed in accordance with the provisions of Item D-751.

3.7 Pipe Jacking

A. The contractor shall determine the exact locations of existing utilities along the jacking alignment and in the vicinity of the jacking and receiving pits before any excavation may begin. Such location may be by electronic means or by excavation of test pits as approved by the Engineer. Test pits shall be dug by hand to the extent practicable. Under no circumstance shall the locations of existing utilities be determined solely on the basis of record drawings or other documents.

B. Excavations for the jacking and receiving pits shall be made, and sheeting, shoring, bracing, and dewatering measures installed to suit anticipated conditions. Sheeting, shoring, and/or bracing supporting the jacking pit excavation shall be capable of supporting loads imposed by the jacking equipment. Soil from the pit excavations shall be stockpiled at a location approved by the Engineer, or may be disposed of after excavation.

C. The jacking alignment, horizontally and vertically, shall be established, checked, and approved by the Engineer before jacking may begin. Guide rails shall be installed as required or as directed by the Engineer.

D. Work shall be performed in such a manner that the ground surface above the pipe will not settle. Installation of the pipe or steel casing, if required, shall be performed in a continuous operation once begun. Casing pipe, if used, shall be smooth-wall steel pipe capable of withstanding the loads inposed by the jacking apparatus. The casing exterior may be lubricated to aid in jacking. Voids occurring behind the pipe during installation shall be be filled with hydraulic cement grout, placed under pressure, upon completion of the jacking operation. Joints of steel pipe shall be butt-welded watertight as installation progresses.

E. The sanitary sewer pipe shall be installed inside the casing to the grade shown on the plans. The pipe shall be secured in place through the full length of the casing before grouting. Grouting shall be by pressure injection or other means approved by the Engineer, and shall result in minimal voids between the pipe and casing.

F. After pipe and manholes have been placed, the jacking and receiving pits shall be backfilled in accordance with the provisions of Item P-152. Sheeting, shoring, and bracing shall be removed, and the ground shall be graded and otherwise restored to the preconstruction condition, and seeded and mulched in accordance with the provisions of this Item.

3.8 Permits: The Contractor shall obtain the permits required for connections to the existing sanitary sewer and water systems. Costs for these permits shall be incidental to the work required under this Item.

1300-4 TESTING

4.1 General

A. The Contractor shall furnish all labor, tools, materials, water, and equipment including mirrors, flashlights, or other artificial lighting, weirs, pumps, compressors, stopwatch, gauges and meters, subject to the approval of the Engineer.

B. Under no circumstances will the Contractor be permitted to connect to existing systems until the new work has been tested and accepted by the Engineer.

C. Gravity Sewer: Lines shall be tested for leakage by low pressure air testing, infiltration tests or exfiltration tests, as appropriate. Prior to infiltration or exfiltration tests the trench shall be backfilled up to at least the lower half of the pipe. If required, sufficient additional backfill shall be placed to prevent pipe movement during testing, leaving the joints uncovered to permit inspection. Visible leaks encountered shall be corrected regardless of leakage test results.

D. Water service line shall be disinfected and hydrostatically tested at 150 psi as specified under "Hydrostatic Testing."

4.2 Mirror Testing

A. Upon completion of pipe laying and backfilling to a point at least 2 feet above the crown of the pipe, the Contractor will conduct a mirror test to check for defects, or leakage, and for horizontal or vertical misalignment. Mirror testing shall consist of reflecting sunlight or artificial light via mirrors through the completed section of pipe line, which in order to be accepted, shall be true and straight in horizontal and vertical alignment to allow for the full passage of the reflected light.

4.3 Infiltration and Exfiltration Testing

A. Upon completion of pipe laying and backfilling to a point at least 2 feet above the crown of the pipe of the first laid segment of pipeline between two cleanouts or manholes, the Engineer shall conduct an infiltration test if the pipeline is constructed below the ground water table or an exfiltration test if the pipeline is constructed above the ground water table.

B. Measurement of the infiltrating water shall be accomplished by the use of a weir, or other measuring device and methods acceptable to the Engineer, installed in the inlet of the lowest manhole or cleanout of the section under test. The outlet of the upstream manhole or cleanout shall be plugged.

C. Measurement of exfiltration shall be made by plugging the inlets of the upstream and downstream cleanouts or manholes of the section under test, filling the section and upstream manhole with water and measuring the volume of water leaving the manhole or cleanout over a 24 hour period.

D. Leakage shall not exceed 0.20 gallons per inch of nominal internal diameter per hour per 100 feet of line.

E. Should the test section fail to meet the requirements of these specifications, the Contractor shall make whatever corrections are necessary including removing and relaying the pipeline, until the requirements have been met.

F. Performance of this testing on the initial segment of pipeline installed will permit observation of the quality of construction workmanship required to achieve the specified contract requirements and shall be the basis upon which all subsequent work will be tested, judged and accepted.

G. Pipelines subject to exfiltration testing which are laid on grades where a water load may produce pressures in excess of the joint design capacity shall be tested using a low pressure air test.

4.4 Low Pressure Air Testing

A. Upon completion of pipe laying-and backfilling to a point at least two feet above the crown of the pipe of the first laid segment of pipeline between two cleanouts or manholes, the Engineer shall conduct a low pressure air test where excessive grades preclude proper testing by the exfiltration method.

B. The Contractor shall furnish an inflatable rubber ball of a size that will inflate to fit snugly into the pipe to be tested. The ball may, at the option of the Contractor, be used without a tag line, or a rope or cord may be fastened to the ball to enable the Contractor to know and control its position at all times. The ball shall be placed in the last manhole or cleanout on the pipe to be cleaned, and water shall be introduced behind it. The ball shall pass through the pipe with only the pressure of the water impelling it. All debris flushed out ahead of the ball shall be removed at the first manhole or cleanout where its presence is noted. In the event cemented or wedged debris, or a damaged pipe shall stop the ball, the Contractor shall remove the obstruction and/or replace the pipe.

C. Immediately following the pipe cleaning described, the pipe installation shall be tested with low pressure air. Air shall be slowly supplied to the plugged pipe installation until the internal air pressure reaches 4.0 psi greater than the average back pressure of any ground water that may submerge the pipe. At least two minutes shall be allowed for temperature stabilization before proceeding further.

D. The rate of air loss shall then be determined by measuring the time' interval required for the internal pressure to decrease from 3.5 to 2.5 psi greater than the average back pressure of any ground water that may submerge the pipe.

E. The pipeline shall be considered acceptable, when tested at an average pressure of 3.0 psi greater than the average back pressure of any ground water that may submerge the pipe, if (1) the total rate of air loss from (2) the section under test does not lose air at a rate greater than 0.0030 cfm per square foot of internal pipe surface.

F. The requirements of this Specification shall be considered satisfied if the time required in seconds for the pressure to decrease from 3.5 psi to 2.5 psi greater than the average back pressure of any ground water that may submerge the pipe is not less than that computed by either of the following equations:

$$tQ = .011\, d_1^2 L_1 + .011\, d_2^2 L_2 + \ldots + .011\, d_n^2 L_n \ldots$$

in which $tQ = \sum K$

$$K = .011\, d_2 L$$

$$tQ = \sum K \div \text{by} \sum c$$

4.5 Hydrostatic Testing

A. The pipeline shall be filled with water, supplied by the Contractor, as directed by the Engineer and the pressure raised to obtain a minimum test pressure of 25 psi for sanitary force main and 150 psi for water service line measured at the highest point of the section of pipeline under test. This test pressure shall be maintained for thirty (30) minutes. Should this test show or cause any defects, such defects shall be remedied by the Contractor and 'the pipe shall be retested by him. This procedure shall be repeated until the test requirements have been met. After the successful completion of the pressure test, the pipe shall be subjected to a leakage test using the same minimum working pressure established for the pressure test, measured at the highest point of the section of pipeline under test, or as specified in the special Provisions. This test shall be of twenty four (24) hours duration during which time the

leakage shall not exceed 0.04 gallons per inch of nominal diameter per hour per 100 feet of line. The Contractor shall make any and all repairs that may be necessary until the leakage test requirements have been met.

B. Concurrent Hydrostatic Tests: The Contractor may elect to conduct the hydrostatic tests using either or both of the following procedures. Regardless of the sequence of tests employed, the results of pressure tests, leakage tests, and disinfection shall be satisfactory as specified. All replacement, repair or retesting required shall be accomplished by the Contractor at no additional cost to the State.

1. Pressure test and leakage test may be conducted concurrently.

2. Hydrostatic tests and disinfection may be conducted concurrently, using the water treated for disinfection to accomplish the hydrostatic tests. If water is lost when treated for disinfection and air is admitted to the unit being tested, or if any repair procedure results in contamination of the unit, disinfection shall be reaccomplished.

C. Disinfection: Before acceptance of potable water operation, each unit of completed water line shall be disinfected as prescribed by AWWA C651. After pressure tests have been made, the unit to be disinfected shall be thoroughly flushed with water until all entrained dirt and mud have been removed before introducing the chlorinating material. The chlorinating material shall be either liquid chlorine, calcium hypochlorite, or sodium hypochlorite. The chlorinating material shall provide a dosage of not less than 50 ppm and shall be introduced into the water lines in an approved manner. In no case will the agent be introduced into the line in a dry solid state. The treated water shall be retained in the pipe long enough to destroy all non-spore-forming bacteria. Except where a shorter period is approved, the retention time shall be at least 24 hours and shall produce not less than 25 ppm of free chlorine residual throughout the line at the end of the retention period. All valves on the lines being disinfected shall be opened and closed several times during the contact period. The line shall then be flushed with clean water until the residual chlorine is reduced to less than 1.0 ppm. The Engineer will take samples of water in proper sterilized containers for bacterial examination. The disinfection shall be repeated until tests indicate the absence of pollution for at least two full days. The unit will not be accepted until satisfactory bacteriological results have been obtained.

1300-5 METHOD OF MEASUREMENT

5.1 The length of pipe to be paid for shall be measured in lineal feet along the centerline of pipe in place, completed, and accepted by the Engineer. The several classes, types, and sizes shall be measured separately. All fittings, concrete encasement, concrete thrust blocks, and other incidentals required under this Item shall be included in the footage as typical pipe sections in the pipe being measured.

5.2 The number of fire hydrants, sanitary sewage pump stations, and sanitary sewer manholes to be paid for will be the number of each furnished, installed, completed, tested, and accepted by the Engineer.

5.3 There will be no direct measurement for payment of the work required for the jacked pipe installation of the sanitary sewer crossing of Wilson Point Road. Payment for this work will be on lump sum basis, and shall include the work required between and including the jacking and receiving pits shown on the plans. Sanitary sewer manholes to be installed in the jacking and receiving pits shall be paid for separately as specified elsewhere in this Item.

1300-6 BASIS OF PAYMENT

6.1 Payment will be made at the contract unit price per lineal foot for each kind of pipe of the type and size designated. These prices shall be full compensation for furnishing all materials and for all preparation,

excavation, and installation of these materials; and for all labor, equipment, tools, testing, and incidentals necessary to complete the item.

6.2 Payment will be made at the contract unit price for each fire hydrant, sanitary sewer manhole, and sanitary sewage pump station. These prices shall be full compensation for furnishing all materials and for all preparation, excavation, and installation of these materials; and for all labor, equipment, tools, testing, and incidentals necessary to complete the item.

6.3 Payment will be made at the contract lump sum price for the Wilson Point Road sanitary sewer crossing. This price shall be full compensation for include costs of locating existing utilities; excavation and support of the jacking and receiving pits, including support of existing utilities, as necessary; jacking and installation of pipe casing, installation and grouting of the sewer pipe; and backfilling and restoration of the pit sites following work; and other incidentals necessary to complete the work in accordance with the provisions of this Item.

Payment will be made under:

Item 1300.1 Water Pipe (4" diameter) -- per lineal foot

Item 1300.2 Water Pipe (8" diameter) -- per lineal foot

Item 1300.3 Water Pipe (14" diameter) -- per lineal foot

Item 1300.4 Fire Hydrant -- each

Item 1300.5 Sanitary Sewer Pipe (1¼" diameter) -- per lineal foot

Item 1300.6 Sanitary Sewer Pipe (4" diameter) -- per lineal foot

Item 1300.7 Sanitary Sewer Pipe (6" diameter) -- per lineal foot

Item 1300.8 Sanitary Sewer Pipe (8" diameter) -- per lineal foot

Item 1300.9 Sanitary Sewer Pump Station -- each

Item 1300.10 Sanitary Sewer Manhole -- each

Item 1300.11 Sanitary Sewer Air Release Valve and Vault -- each

Item 1300.12 Wilson Point Road Sanitary Sewer Crossing -- lump sum

END OF ITEM 1300

PART 1 GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the Work of this Section, including but not limited to Division 1, General Requirements.

1.2 GENERAL

A. Asbestos abatement includes either removal, O&M, repair, enclosure or encapsulation as a single work task or in any combination of tasks.

1.3 DESCRIPTION OF WORK:

A. Removal of all asbestos-containing pipe insulation, duct insulation and floor covering materials from the building identified as Building Number One on the project drawings. Quantities shown on drawings.

B. Removal of all asbestos-containing pipe insulation, duct insulation and floor covering materials from the building identified as Building Number Two on the project drawings. Quantities shown on drawings.

C. Removal of all asbestos-containing pipe insulation, duct insulation and floor covering materials from the building identified as Building Number Three on the project drawings. Quantities shown on drawings.

D. Removal of all asbestos-contaminated materials from all three buildings is required. This includes all materials that can not be completely decontaminated prior to removal from the site.

1.4 REFERENCES

A. All applicable requirements of other portions of the contract documents apply to the Work of this Section.

B. The information contained herein has been compiled from Environmental and Occupational Health and Safety information. The Asbestos Removal Contractor shall bear complete responsibility for worker safety and adherence to all laws, regulations and standards. Neither the Engineer nor his representatives shall be

responsible for the Asbestos Removal Contractor's and/or Subcontractor's Work described in this Section.

All of the regulations and/or publications listed in paragraph 1.8, REGULATORY REQUIREMENTS, form a part of this specification by reference.

1.5 ABATEMENT DEFINITIONS/ABBREVIATIONS

A. Abatement: Procedure to control or otherwise limit fiber release from friable asbestos-containing materials or asbestos contaminated materials. Includes all five methods; removal, encapsulation, enclosure, O&M and repair.

B. Aggressive Sampling: An air sampling technique typically used for final clearance wherein the area and surfaces around the air sample are agitated, brushed, or blown with air jets or mechanical fans, or otherwise disturbed in an effort to resuspend any settled dust and detect the presence of residual asbestos fibers.

C. Air Lock: A system for permitting entrance or exit without permitting air movement between a contaminated area and an uncontaminated area, typically consisting of two curtained doorways at least three feet apart.

D. Air Sampling: See Area Monitoring below.

E. Air Monitoring Technician: An independent technician retained by the Engineer fully trained in the air sampling process in accordance with existing regulations who shall conduct air monitoring.

F. Amended Water: Water containing a wetting agent or surfactant.

G. Asbestos: A class of magnesium-silicate minerals that occur in fibrous form. Minerals that are included in this group are Chrysotile, Crocidolite, Amosite, Anthophylite asbestos, Tremolite asbestos, and Actinolite asbestos.

H. Asbestos-Containing Building Material (ACBM): Material composed of asbestos of any type and in any amount greater than one percent by weight, either alone or mixed with other fibrous or nonfibrous materials used in the construction of the structure and/or the protection of the structure from fire hazard.

I. Asbestos-Containing Material (ACM): Material composed of asbestos of any type and in an amount greater than one percent by weight, either alone or mixed with other fibrous or nonfibrous materials.

J. Asbestos-Contaminated Material: Any materials, substances or item impregnated or coated (no matter how lightly) with asbestos fibers.

K. Asbestos Fibers: A particulate form of asbestos, tremolite, anthophylite or actinolite, 5 micrometers or longer, with a length-to-diameter ratio of at least 3 to 1.

L. Asbestos Filtration Device (HEPA Negative Air Filtration System): Filtered exhaust ventilation equipment used for drawing air from inside containment/regulated work areas. Such equipment must have at least three filter stages, including readily accessible pre-and secondary filters, and a final filter which must be a High Efficiency Particulate Air (HEPA) filter rated 99.97% effective in capturing particles having diameters of 0.3 micrometers or greater.

M. Asbestos Removal Contractor/Contractor: An Asbestos Removal Contractor with a valid license, certification or registration issued by a governmental authority of the State in which the Work is to be performed, to perform directly or indirectly in any asbestos hazard abatement activity.

N. Area Monitoring (Air Sampling): Sampling for asbestos fiber concentrations in the air within the regulated/containment area and outside the regulated/containment area which is representative of the airborne concentrations of asbestos fibers which may reach the breathing zone.

O. Barrier: Polyethylene sheeting and/or other materials which, when used in conjunction with the existing floors, ceilings, and walls of the structure, form the containment/regulated area. The barrier separates the contaminated work environment from the uncontaminated environment.

P. Clean Room: An uncontaminated room outside the containment/regulated area, but adjacent to, with provisions for storage of worker's street clothes and protective equipment.

Q. Curtained Doorway: Device to allow entrance or exit from one room to another while restricting air movement between the rooms. Two Curtained Doorways should be spaced a minimum of three feet apart to form an Air Lock.

R. Decontamination Area: An enclosed area adjacent to or connected to the regulated area and consisting of an equipment room, shower area, and clean room which is used for decontamination of workers, materials and equipment.

S. Disposal: All specified procedures necessary to transport and deposit the ACM or asbestos-contaminated waste materials removed from a building to an approved waste disposal site in compliance with existing Sections 61.152 and .156 of the EPA Regulations (40 CFR 61), and Sections 172.101 and 173.1090 of the DOT Regulations (40 CFR), or such other or additional regulations as may be in force.

T. Encapsulant: A liquid material which can be applied to ACM which controls the possible release of asbestos fibers from the material either by creating a membrane over the surface (bridging encapsulant) or by penetrating into the material and binding its components together (penetrating encapsulant).

U. Encapsulate: The process whereby an encapsulant is applied to ACM to control the release of asbestos fibers into the air.

V. Enclosed Regulated Area: A regulated area which has been isolated by physical boundaries to prevent the spread of asbestos dust, fibers, or debris. A local exhaust system is required.

W. EPA (U.S. EPA): United States Environmental Protection Agency.

X. Equipment Room (Change Room): A room located within the decontamination area that is supplied with impermeable bags or containers for the disposal of contaminated protective clothing and equipment.

Y. Fibers: A slender and greatly elongated natural or synthetic filament (such as wool, cotton, asbestos, gold, glass, or rayon) typically capable of being spun into yarn.

Z. Friable Asbestos Material: Material that contains more than one percent asbestos by weight which can be crumbled, pulverized, or reduced to powder by hand pressure when dry.

AA. Glovebag Technique: A method with limited applications for removing small sections of asbestos-containing material from short piping runs, valves, joints, elbows, and other nonplanar surfaces in a noncontained regulated area. The glovebag assembly is a manufactured or fabricated device consisting of a

glovebag (constructed of 6 mil transparent polyethylene or polyvinylchloride plastic), two inward projecting longsleeve gloves, an internal tool pouch, and an attached, labeled receptacle for asbestos waste. The glovebag is constructed and installed in such a manner that it surrounds the object or material to be removed and contains all asbestos fibers released during the removal process.

BB. HEPA Negative Air Filtration System: High efficiency particulate air (HEPA) filtered exhausting equipment with a UL 586 filter system capable of collecting and retaining asbestos fibers. Filters shall be of 99.97 percent efficiency for retaining 0.3 micrometer diameter particles. (This system also applies to HEPA vacuuming equipment).

CC. HVAC: Heating, ventilating and air conditioning; all building mechanical equipment including supply and return ductwork, unit ventilators, fan-coil units, blower cabinets and fans, control devices, damper assemblies and other similar mechanical equipment.

DD. Independent Testing Laboratory: A qualified organization capable of performing air sampling analysis (PCM) or (TEM) and bulk sampling analysis (PLM) with no affiliation with Asbestos Removal Contractor or Engineer and in possession of an EPA interim accreditation as a minimum and/or NIOSH certification.

EE. Lagging: Thermal insulation used to prevent heat loss or condensation from pipes, boilers and similar mechanical equipment. The insulation may be covered with a metal jacket.

FF. NIOSH: National Institute for Occupational Safety and Health.

GG. Non-friable asbestos material is considered hazardous during removal and disposal procedures.

HH. OSHA: United States Department of Labor, Occupational Safety and Health Administration.

II. Permissible Exposure Limit (PEL): An airborne concentration of asbestos of 0.1 fiber (longer than 5 micrometers) per cubic centimeter of air as an 8-hour time weighted average.

JJ. Phase Contrast Microscopy (PCM): A method of counting fibers through air sampling, regardless of composition, using NIOSH Method 7400 procedures and counting only fibers equal to or longer than 5 micrometers with a

length-to-diameter ratio equal to or greater than 3:1. The microscope shall be equipped with a blue or green filter, 8 to 10X eyepiece, and 40 to 45X phase objective (total magnification ca 400X); numerical aperture: 0.65 to 0.75.

KK. Personal Monitoring: Sampling of asbestos fiber concentrations within the breathing zone of an employee. The responsibility of the Contractor.

LL. Polarized Light Microscopy (PLM): A method of identifying minerals through the use of a light microscope equipped with two polarizing filters to observe specific optical characteristics of the sample. This method is used to analyze asbestos bulk samples.

MM. Prior Experience: Experience required of the Asbestos Removal Contractor/Subcontractor on asbestos projects of similar nature and scope to insure capability of performing the asbestos removal in a satisfactory manner. Similarities shall be in areas related to material composition, project size, number of employees and the engineering work practice and personal protection controls required.

NN. Regulated/Containment Areas: Established work areas where airborne concentrations of asbestos, exceed or can reasonably be expected to exceed the asbestos permissible exposure limit prescribed above in Paragraph 1.04.II in this section.

OO. Removal: All specified procedures necessary to gather, enclose in polyethylene bags and/or sealed drums, and make ready for disposal all removed ACM or asbestos-contaminated material.

PP. Surfactant: A chemical wetting agent added to water to reduce its surface tension and thereby improve its penetrating capabilities into ACM.

QQ. Transmission Electron Microscopy (TEM): A method of identifying asbestos fibers collected through air sampling using a 80-120kV transmission electron microscope capable of performing electron diffraction with a fluorescent screen inscribed with calibrated gradations.

RR. Thermal System Insulation (TSI): Material applied to pipes, fittings, boilers, breeching, tanks, ducts, or other interior structural components to prevent heat loss or gain, or water condensation, or for other purposes.

SS. Wash Room (Shower Room): A shower room between the Clean Room and the Decontamination room of the decontamination area with facilities for showering and equipment cleaning.

TT. Wet Cleaning: The process of removing ACM residual debris or asbestos-contaminated material from building surfaces, equipment, objects, tools, disposal containers, etc. This may be accomplished by washing with cloths, mops, sponges, or brushes, or by showering with water in the Wash Room.

1.6 DESCRIPTION OF ABATEMENT

A. The Work in this Section shall include providing all labor, equipment, materials, appurtenances, and incidental required for the complete removal, containment, transporting, and disposal of ACM as listed in Paragraph 1.2A, SUMMARY, to include the cleaning/decontamination and/or collection and disposal of adjacent materials which may become contaminated during the removal process.

B. The total quantity of asbestos containing material and/or other potentially contaminated materials shall be field verified by the Asbestos Removal Contractor through the pre-bid walk through and inspection prior to bidding the project. The cost for the removal and possible replacement of specified materials or items shall be derived through this walk through quantitative survey of existing conditions and a thorough examination of the project sketches and documents. That total cost shall not be increased if during the process of Work the Asbestos Removal Contractor decides that additional removal or replacement covered by this Scope of Work must occur in the work areas.

C. The surfaces which were in contact with the removed asbestos containing material yet remaining after removal shall be cleaned until no visual debris is evident, then encapsulated with an encapsulant creating a lock down membrane over the entire surface. The encapsulant shall be reviewed for conformance by the Engineer prior to any application.

D. The Asbestos Removal Contractor shall provide all items in accordance with this Paragraph.

1. The Asbestos Removal Contractor shall secure the immediate work area(s) during work periods for the duration of the Project as required by either the General Conditions, Specifications, federal and state regulations governing asbestos removal and disposal, and OSHA requirements. The Asbestos

Removal Contractor is totally responsible for all safety and security of Asbestos Removal Contractor equipment.

2. Transfer of the removed asbestos material from the building to the transporting vehicle shall be accomplished through the nearest exit. The proposed exits to be used shall be reviewed by the Engineer for acceptability prior to usage. No other exits will be used without prior written acknowledgement of the Engineer, except for emergency situations. The Asbestos Removal Contractor shall be responsible for controlling both vehicle and pedestrian traffic without endangering other personnel and/or the public during the transferring of ACM.

3. The Asbestos Removal Contractor shall seal off areas of the building acknowledged by the Engineer and proceed with work allowing only authorized personnel directly involved in the removal of asbestos to enter.

E. Project Log

1. The Asbestos Removal Contractor shall maintain a daily Project Log. The log shall be used each day of the project to record the following information:
   a. Name of project superintendent, air monitoring technician, and actual time physically on job for both persons.
   b. Brief description of daily Work accomplishments.
   c. Listing of all employees on the job.
   d. Description of any significant events, incidents, or unusual occurrences, including but not limited to, deviations of plans, contract requirements, or specifications noted Engineer, Oversight Inspector, Air Monitoring Technician, or Asbestos Removal Contractor representative, emergencies, accidents or dangerous conditions, and steps taken to assure continued security of the Work area.

2. The log will also include copies of routine inspection reports, results of air monitoring and analysis, project minutes, chain-of-custody forms and any other routine documents relating to project activities. The log for the project will be made immediately available for inspection by the Engineer.
3. At the completion of the project, the Asbestos Removal Contractor shall forward two (2) copies of the project log to the Engineer.

F. Project Visitor's Log: The Asbestos Removal Contractor shall maintain a Project Visitor's Log which will contain the following as a minimum.

1. Signatures with date and time, by all visitors including the Engineer, private or governmental inspectors, and Asbestos Removal Contractor representatives not involved in the daily removal activities.

2. All visitors who, for any reason, enter the regulated area, reason for entry, date and duration of time in the Work Area, activities in Work area, safety precautions used and safety equipment used.

3. Submit two (2) complete copies to the Engineer upon completion of the Project.

1.7 SUBMITTALS

A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in this and other Sections.

B. All prospective Asbestos Removal Contractors shall submit for approval, and as a condition under the Contract, the following documentation:

1. A notarized letter from an officer of the organization stating that the prospective Asbestos Removal Contractor is thoroughly familiar with Federal and State EPA, OSHA, NESHAP, and other institutional requirements for removal, handling, transporting, and disposal of asbestos hazardous materials.

2. Proof of successful completion of at least three (3) similar projects. The proof or documentation shall include:
   a. Description of projects.
   b. Size and duration of projects.
   c. Project references.
   d. All State certification requirements as applicable.
   e. Statement of Performance Bond Eligibility.

3. Records to indicate that the asbestos hazardous material from at least three (3) previous projects have been properly disposed of at an EPA approved and licensed landfill. The site must be authorized by the authority having jurisdiction to receive such wastes.

4. Records indicating that the prospective Asbestos Removal Contractor has knowledge or experience in proper engineering techniques, i.e., cocooning,

HEPA exhausts filtration, air locks, etc. needed to contain asbestos and prevent the release of fibers.

C. Prior to commencing work and as a condition under the Contract, the Asbestos Removal Contractor shall document with the Certificate of Worker's Acknowledgement through the submittal process, the proof that Asbestos Removal Contractor's employees have:

1. Passed required medical examination.
2. Attended and successfully completed worker training course.
3. Been fitted, tested and trained in the use and maintenance of the respirator equipment.

No worker shall be permitted to work on this Project unless a properly documented Certificate of Worker's Acknowledgement has been signed by the worker and submitted for him. A copy of this Certificate is attached at the end of this Section.

D. The Asbestos Removal Contractor must have satisfactorily performed the removal of asbestos from buildings on at least three projects where the volume of materials removed was equal to or greater that for this project. Submit with the bid, the name, address and telephone numbers of the Engineer and EPA representative for each of the three projects for verification that the removal was performed in full compliance with all EPA and U.S. Department of Labor, OSHA required procedures.

E. Prior to commencing Work at the Project, the Asbestos Removal Contractor shall meet with the Engineer to discuss the details of the air monitoring program.

F. Plan of Work Procedure

1. The Asbestos Removal Contractor shall submit to the Engineer before proceeding with the Project, a detailed plan of the Work procedures to be used in the removal and/or demolition of materials containing asbestos. The plan shall include but not be limited to the following:
   a. Plan overview of asbestos removal.
   b. Details of all equipment to be used, including negative pressure equipment, filters, showers, change rooms, clean rooms, disposal drums or containers, water filters and other miscellaneous items.
   c. Sequence of operation for the scheduling of each work area, and a detailed schedule of Work within each building or work area that shall meet the constraints specified in Paragraph 1.5.F, and the Contract requirements.

d. Documentation of records, including health records of all personnel involved in the removal of asbestos, data on site for disposal, name of air monitoring analytical laboratory, and copies of letters of notification of intended asbestos removal to all Federal, State, or local regulatory agencies having jurisdiction within that State, as required.

e. A detailed narrative description of how the Work is to be accomplished. This shall include a description of any sealed areas, negative pressure equipment and filters, location of decontamination rooms, showers, change rooms, and associated access, methods of actual asbestos removal, methods of encapsulation, cleanup, routing of asbestos and all other operating procedures.

f. Provide a detailed health and safety plan to include all clothing, respirators, masks and filters and other equipment to be used by personnel that will be exposed to asbestos fibers. Provide details of the worker educational training programs. Provide a listing of all worker procedural and safety requirements.

g. Limits of operational parameters, including friable asbestos fibers concentrations inside and outside work areas, negative pressure limits within any enclosures and on site storage limits of asbestos containers.

h. Emergency procedures in the event the air monitoring outside of any work area should indicate asbestos fiber levels exceeding the allowable limit.

2. This plan shall be sent to the Engineer before starting the Project. This submittal shall be in accordance with submittal requirements. The plan shall be either accepted or rejected for compliance with regulations.

G. Asbestos Removal Contractor's Compliance Data

1. Asbestos Removal Contractor shall submit to the Engineer within four (4) days after load-out, an original copy of the chain-of-custody forms signed by the disposal site operator evidencing acceptance of the waste ACM.

2. At completion of the Work the Asbestos Removal Contractor shall submit to the Engineer two (2) copies of the personnel air monitoring data compiled during the Work. The format shall be: air monitoring form, air sampling log, laboratory results, equipment used data, and calibration data all bound in a complete packet.

1.8 REGULATORY REQUIREMENTS

A. The regulations and publications listed in the following paragraphs are hereby incorporated into this specification.

B. Code of Federal Regulations (CFR)

1.	29 CFR 1910.20	Access to Employee Exposure and Medical Records
2.	29 CFR 1910.145	Specifications for Accident Prevention Signs and Tags
3.	29 CFR 1910.134	Respiratory Protection
4.	29 CFR 1910 (Subpart 2)1001	Toxic and Hazardous Substances (US OSHA)
5.	29 CFR 1910.120	Hazardous Communications Regulations
6.	29 CFR 1926.1101	Asbestos, Tremolite, Anthophylite, and Actinolite
7.	29 CFR 1926.1-.1051	Construction Industry Safety & Health Standards (US OSHA)
8.	40 CFR 61, Subpart A & B	General Provisions
9.	40 CFR 61, Subpart M	National Emission Standard for Asbestos
10.	40 CFR 241	Guidelines for the Land Disposal of Solid Wastes
11.	40 CFR 257	Criteria for Classification of Solid Waste Disposal Facilities and Practices

12.	Parts 1 & 2	Asbestos-Containing Materials in School Buildings - EPA
13.	EPA560/5 - 83-002	Guidance for Controlling Friable ACM in Buildings
14.	COMAR 26.11.21	Maryland State Department of the Environment Control of Asbestos

C. American National Standards Institute (ANSI)

1.	Z9.2-79	Fundamentals Governing the Design and Operation of Local Exhaust Systems
2.	Z88.2-80	Practices for Respiratory Protection

D. National Institute of Occupational Safety and Health (NIOSH)

1. Manual of Analytical Methods, 2nd Ed., Vol. 1, Physical and Chemical Analysis Method (P&CAM):

2.	Method 7400	Fibers (N1, 3rd Ed., Vol. 1)

3. Respiratory Protection - An Employer's Manual & Respiratory Protection - A Guide for the Employee

E. U.S. Department of Transportation

1.	CFR Title 49 Parts 172.101 & 173.1090	Hazardous Material Regulations

F. Underwriters Laboratories, Inc. (UL) Publications

1.	586-77 (R 1982)	Test Performance of High Efficiency, Particulate, Air Filter Units

G. Other Regulations: All other federal, state, county, municipal, and local statutes, ordinances, regulations, or rules pertaining to asbestos, including its abatement, storage, transportation and disposal; construction safety and health and hazard communication (worker right-to-know), and contractor or other licensure, certification and regulation, which are now in effect or which may come into effect prior to project completion.

1.9 SPECIAL WARRANTY (Not Used)

1.10 COORDINATION AND SCHEDULING

A. All Work within a regulated area of the building not related to asbestos removal shall cease except for plant operation required to be maintained for which provisions shall be made during asbestos removal operations as specified.

B. The work site shall be made available to authorized government personnel who have authority to inspect the work site and to conduct inspections and make tests for EPA and OSHA compliance. The work site may also be visited by the Engineer, State regulatory personnel or the State Industrial Commission.

1.11 JOB CONDITIONS

A. Dress and Equipment (Minimum Requirements)

1. Workers shall wear disposable, full-body coveralls and disposable head covers in the work area. Footwear may be disposable. Non-disposable footwear shall be left in the work area at all times until disposal at job completion. **Hard hats shall be worn.**

2. According to OSHA CFR Title 29, Section 1910.1001, SEC, Engineering Controls are required to meet exposure limits. For this reason, air cleaning mechanisms are required to minimize airborne fibers.

3. The Asbestos Removal Contractor shall screen workers to determine if they are able to perform the work and wear respirators, and shall also instruct and train his employees in the need for and the method of performing proper work practices. The Asbestos Removal Contractor shall supervise these work practices to assure compliance. The respirator face piece must trap no facial hair.

4. In accordance with NIOSH, OSHA and ANSI Regulations, the respirator program must include of the following information:
   a. Single use, disposable respirators are prohibited.
   b. Employee training covering the hazards of asbestos, respiratory protection and decontamination procedures.
   c. Daily personal monitoring of the most highly exposed worker in accordance with the "EPA Guidance Document," page 47, Personnel Monitoring.

d. Powered air purifying respirators with high efficiency purifying filters (NIOSH Type H) shall be worn by all workers during all phases of gross removal (abatement).

e. Medical exams consisting of, at a minimum, chest X-rays, pulmonary function tests, and history of respiratory disease.

5. The Asbestos Removal Contractor's employees shall be instructed on the dangers of asbestos exposure, on respirator use, decontamination, and OSHA Regulations. The Asbestos Removal Contractor shall supervise work practices to assure compliance with regulations.

B. Change Rooms

1. Provide, as a minimum, a temporary or portable unit with a separate decontamination room and a clean room for personnel required to wear whole body protective clothing. Provide areas for storage of clothing for each asbestos worker. Keep street clothing and street shoes in the clean areas. Workers shall be free of asbestos fibers prior to entering the clean area. Method of decontamination shall be reviewed for compliance by the Engineer. Locate showers between the decontamination room and the clean room and require all employees to shower before changing into street clothes. Clean asbestos contaminated work clothing in accordance with 29 CFR 1910.1001. Unit shall be attached to the individual work site isolated area in accordance with regulations. The unit shall be checked for compliance by the Engineer's Representative.

2. Eating or smoking by Asbestos Removal Contractor's and Engineer's personnel or others shall not be allowed within the regulated areas, including adjacent change rooms. The only movement allowed by personnel from the regulated area, including decontamination room to the clean area, shall be through a shower. Entering or exiting through a disposal or equipment decontamination structure by any personnel shall not be allowed.

PART 2 PRODUCTS

2.1 EQUIPMENT/MATERIALS

A. Furnish Engineer with properly fitting, disposable protective clothing as required for use by the Engineer.

B. Respirators: Select respirators approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH), Department of Health and Human Services, for use in atmospheres containing asbestos fibers. Provide personnel engaged in the removal or demolition of pipes, structures, or equipment covered or insulated with asbestos, or in the removal or demolition of asbestos, or in the removal or demolition of asbestos insulation or covering, with respirators as presented in 29 CFR 1926.58.

Types of Allowable Respirators	Fibers Longer Than 5 Micrometers Per Cubic Centimeter of Air
Reusable half-mask air purifying*, powered air purifying*, or Type C supplied air, continuous flow or pressure demand class	Less than 2.0
Powered air purifying*, or Type C supplied air, continuous flow or pressure demand class	2.0 - 20.0
Type C supplied air, continuous flow or pressure demand class	Greater than 20.0

* Air purifying respirators must be equipped with HEPA filters.

C. Special Clothing: Furnish personnel exposed to airborne concentrations of asbestos fibers with disposable protective whole body clothing, head coverings, gloves, and foot coverings as required for the particular work process. Furnish disposable plastic or rubber gloves to protect hands. Cloth gloves may be worn inside the plastic or rubber gloves for comfort, but shall not be used alone. Use tape to secure sleeves at the wrists and to secure foot coverings at the ankles.

D. Change Rooms: Provide a temporary unit with a separate decontamination room and a clean room for personnel required to wear whole body protective clothing. Locate showers between the decontamination room and the clean room.

E. Eye Protection: Provide goggles for personnel engaged in asbestos operations when the use of a full face respirator is not required, such as disposal container loadout.

F. Warning Signs and Labels

1. Provide warning signs at approaches to regulated areas containing airborne asbestos fibers. Locate signs at such a distance that personnel may read the sign and take the necessary protective steps required before entering the area. Provide labels and affix to asbestos materials, scrap, waste, debris, and other products contaminated with asbestos. Providd signs in all relevant languages.

2. Warning Signs: Provide warning signs that are of sufficient size (minimum 14" x 20") to be clearly legible and display the following information:

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING ARE REQUIRED IN THIS AREA

3. Warning Labels: Provide labels of sufficient size (minimum 3" x 5") to be clearly legible, printed in large, bold letters on a contrasting background, and displaying the following legend:

CANCER AND LUNG DISEASE HAZARD
DANGER
CONTAINS ASBESTOS FIBERS
AVOID CREATING DUST

G. Negative Pressure Differential: Provide a negative pressure differential in the regulated area. Filters on vacuums and exhaust equipment shall be UL 586-labeled HEPA filters. Negative pressure equipment shall be sufficient to maintain a minimum pressure differential of minus 0.02 inch of water column relative to adjacent, unsealed areas. The negative pressure system shall be operated continuously, 24 hours a day, until the regulated area enclosure is removed. Replace filters as required to maintain the efficiency of the system. The building HVAC system shall not be used as the exhaust system for the regulated area.

H. Air Circulation in the Work Area: For the purposes of this Section, air circulation refers to either the introduction of outside air to the work area or the circulation and cleaning of air within the work area. The Asbestos Removal Contractor is responsible for determining air circulation requirements,

specifically calculating the number of air filtration devices necessary to meet the required four (4) air changes per hour. The Asbestos Removal Contractor is also responsible for having at least one (1) additional air filtration device for each active work area as back-up in case of equipment failure or breakdown.

I. Tools and Equipment

1. Airless Sprayer: An airless sprayer, suitable for application of encapsulating material, shall be used.

2. Scaffolding: Scaffolding, as required to accomplish the specified work, shall meet all applicable safety regulations.

3. Transportation Equipment: Transportation equipment as required, shall be suitable for loading, temporary storage, transporting , and unloading of contaminated waste without exposure to persons or property.

4. Vacuum Equipment: All vacuum equipment utilized in the work area shall utilize HEPA filtration systems.

5. Water Sprayer: The water sprayer shall be an airless or other low pressure sprayer for amended water application.

6. HEPA filtration units efficient to 99.97% for 0.3 micron particles.

7. Other Tools and Equipment: The Asbestos Removal Contractor shall provide all other suitable tools for the stripping, removal, encapsulation, and disposal activities including but not limited to: knives, brushes, sponges, shovels, brooms, carts, etc..

J. Materials

1. Encapsulants: The encapsulating agent shall meet the following criteria:
   a. They shall withstand environmental impact or abrasion and protect the encapsulated surface.
   b. Encapsulants selected for use by the Asbestos Removal Contractor shall be one of those demonstrating effective performance under tests conducted by an independent testing laboratory and reviewed by the Engineer for compliance.
   c. They shall have high flame retardant characteristics, and a low toxic fume and smoke emission rating.

d. They shall not be noxious or toxic to application workers, or subsequent workers in the area.
e. They shall have some permeability to water vapor to prevent condensation accumulation, and resist solution by common cleaning agents.
f. They shall be water insoluble when cured.
g. They shall have acceptable weathering and aging characteristics.
h. They shall be acceptable by architectural standards.
i. They shall be compatible with all insulating material or coating systems that may be applied to the stripped surfaces.
j. They shall be demonstrably capable of adhering to the surfaces of the substrate such as steel, plaster, ductile iron, base plaster, etc.
k. They must contain a light tint to distinguish between encapsulated and non-encapsulated areas. (Food coloring is not acceptable.)
l. Encapsulants must be compatible with surface material applied to and replacement materials to be applied thereover.
m. Manufacturer:
    1) Arpin Products, Inc., Asbury Park, NJ.
    2) Better Working Environments, Inc., Carson City, NV.
    3) Certified Technologies Corporation, Eden Prairie, MN.
    4) Fiberlock Technologies, Inc., ABC Encapsulating Compound.
    5) Or Equal.

2. Surfactant: As a minimum the surfactant shall be 50% polyoxyethylene ether and 50% polyglycol ester, equal to Aqua-Grow Corporation of New Jersey. Mix according to manufacturer's written instructions.

3. Construction Materials: Lumber, nails, hardware, shower stalls, hoses, plumbing, drain pans, sump pumps, storage drums, etc.

4. Sheeting, Glue and Duct Tape: Sufficient quantities of 6 mil, flame retardant polyethylene, glue, and duct tape to perform all required sealing, regulated area construction, and wrapping of specific waste.

PART 3 EXECUTION

3.1 WORK PROCEDURES

A. Perform asbestos removal work in accordance with 29 CFR 1926.58 and as specified herein. Use wet removal procedures. Personnel shall wear and use protective clothing and equipment as specified herein. Eating, smoking,

drinking, chewing tobacco or chewing gum shall not be permitted in the regulated area. Personnel of other trades not engaged in the removal and disposal of asbestos shall not be exposed at any time to airborne concentrations of asbestos in excess of 0.01 fibers unless the personnel protection provisions of this specification are complied with by the trade personnel. Protect by wrapping with polyethylene or temporarily disconnect electrical service when wet removal is performed and provide temporary electrical service protected by a ground fault circuit interrupter if electrical service is disconnected.

B. Furnishings: Furniture and non-attached equipment shall be removed from the area of work by the Asbestos Removal Contractor before asbestos removal begins, carefully storing in a location designated by the Engineer, and replaced by the Asbestos Removal Contractor at the completion of the Work in that individual area.

C. Enclosed Regulated Area Requirements - Masking and Sealing

1. Seal openings in areas where the release of airborne asbestos fibers could occur. Establish a regulated area with the use of curtains, portable partitions, or other enclosures in order to prevent the escape of asbestos fibers from the contaminated area. The established regulated area shall be provided with protective covering of walls with a continuous membrane of two layers of minimum 6-mil plastic sheet sealed with tape to prevent water or other damage and three layers of 6-mil plastic sheet over floors extending a minimum of 24 inches up walls. All penetrations of the floor, walls, and ceiling shall be sealed with 6-mil polyethylene plastic and duct tape. Seal joints using spray adhesive and duct tape. Openings will be allowed in enclosures of regulated areas for the supply and exhaust of air for the Local Exhaust System.

2. Decontamination Area: Construct a three (3) chambered decontamination area consisting of the units defined. The area shall be connected to the regulated area. All waste water from the shower room shall be filtered in accordance with current regulations before discharge.

3. Debris Port: Construct a debris removal chamber adequate for container sizes utilized in accordance with current regulations.

D. Removal of Building Components

1. After isolation of regulated area as described in previous sections and initiation of negative pressure ventilation, remove any building components required to be saved or for gaining access from within the work area, carefully. If components are to be reused, vacuum them with a HEPA filtered vacuum cleaner and carefully damp sponge and wrap cleaned components in 4 mil polyethylene sheeting and seal with tape. Store as designated by Engineer outside of the work area. If components are to be discarded it is not necessary to clean them, but wrap in a similar fashion and stage for disposal in the waste containers pass-out airlock.

2. If during any component removal operation a major release episode occurs, the Asbestos Removal Contractor shall immediately notify the Engineer and implement response actions in accordance with current regulations and the personnel protective provisions of this specification.

3. Upon complete removal of all component systems, abatement of asbestos-containing materials specified in this specification may be accomplished.

E. Asbestos Handling Procedures

1. General Procedures: Sufficiently wet the asbestos material with a fine spray of amended water during removal, cutting, or other handling to reduce the emission of airborne fibers. Remove material and immediately place in plastic disposal bags. Where unusual circumstances prohibit the use of plastic disposal bags, the Asbestos Removal Contractor shall submit, in the asbestos plan, an alternate proposal for removal of asbestos materials and containment of asbestos fibers. (Such as double wrap with 6 mil polyethylene for non-friable transite panels.)

2. Glovebag Removal: This procedure is principally for removal of pipe insulation in areas where other methods of asbestos removal can be avoided. Employee protective equipment is required, but only as a safeguard against an accidental bag puncture, defective bag failure, or similar adverse event.
   a. Asbestos Removal Contractor shall seal off all exits and entries to work area with 6-mil plastic including windows, vents and access doors.
   b. Asbestos Removal Contractor shall establish and construct an air-lock near the door assigned by the Engineer, for exit and entry into work area.

c. Any furniture or fixtures unable to be removed shall be covered with 6-mil plastic.
d. Lay down one layer of 6-mil plastic as a drop cloth beneath area being removed as a safety measure. Drop cloth shall be disposed of as contaminated waste.
e. Prior to installation of glovebag, the tools necessary for removal shall be put into the glovebag tool pouch to avoid the reopening of glovebag during removal process for additional tools.
f. Wet wipe everything in area for glovebag use.
g. Wrap glovebag around area of removal, fold excess top edges over and staple (or close zipper, depending on bag type). Seal top edge and side cuts with duct tape or locking straps. Ensure that top edge and sides (including over insulation area), are fastened together so that an airtight seal is formed.
h. Insert nozzle of sprayer in glovebag and seal around nozzle with tape. Sprayer shall not be removed until removal of glovebag.
i. Seal the outside edges of the glovebag with duct tape for double protection against breaking the seal of the bag.
j. Following removal of insulation material, insure that all visible material is inside bag.
k. Spray all tools in glovebag while glovebag is still attached.
l. Properly seal glovebag, remove the glovebag from the pipe, and place in a second impermeable bag.
m. Wet wipe and wash all tools and removal area thoroughly.
n. Dispose of bag in labeled waste drum or other approved container.
o. Clean-up in accordance with Article 3.2 of this Section.

F. Non-Friable Asbestos Materials

1. Sufficiently wet asbestos material with a fine spray of amended water during removal or other handling to reduce the emission of airborne fibers. Abrading, sanding, drilling, cutting, or machining of these materials is prohibited unless approved by the Engineer. Do not allow excessive water to accumulate in the work area. Keep all removed material wet enough to prevent fiber release until it can be containerized for disposal. Every effort should be made to perform this removal work during non-freezing periods. However, if work area temperatures are below 32°F and amended water is subject to freezing, the addition of ethylene glycol in amounts sufficient to prevent freezing is permitted. All residual water shall be collected and filtered in accordance with regulations before discharge.

2. Asbestos-containing material shall be removed in manageable sections. Removed material shall be containerized before moving to a new location for continuance of work. Surrounding areas shall be periodically sprayed and maintained in a wet condition until visible material is cleaned up.

3. Asbestos-containing material removed from the building shall not be dropped or thrown to the floor. Material should be removed as intact sections whenever possible and carefully lowered to the floor. Asbestos materials in open containers shall be kept wet at all times.

4. Containers (drums or 6-mil polyethylene bags or wrap) shall be sealed when full. Wet material will be heavy and double bagging or wrapping of waste material is required. Bags, if used, shall not be overfilled. They should be securely sealed to prevent accidental opening and leakage by tying tops of bags in an overhand knot or by taping in gooseneck fashion. Do not seal bags with wire or cord. Bags shall be placed in drums for staging and transportation to the disposal site. Bags shall be decontaminated on exterior surfaces by wet cleaning before being placed in clean drums and sealed with locking ring tops. Where unusual circumstances prohibit use of plastic disposal bags or drums, the Asbestos Removal Contractor shall submit, in the asbestos plan, an alternate proposal for removal, containerizing, and disposal of the asbestos materials and fibers.

5. Asbestos containing or contaminated waste with sharp edged components (e.g. nails, screws, metal lath, tin sheeting) that could otherwise tear polyethylene bags shall be placed directly into drums for disposal.

G. Air Monitoring: Monitoring of airborne concentrations of asbestos fibers shall be in accordance with 29 CFR 1926.58 and as specified herein.

1. The Asbestos Removal Contractor shall perform exposure monitoring in compliance with OSHA regulations for his employees.

2. The Asbestos Removal Contractor shall keep a log of exposure monitoring activities he performs, and an updated copy of the log shall be submitted to the Engineer at the end of each work week. A complete log of air samples and results shall be submitted to the Engineer at the completion of the Project.

3. It is the Asbestos Removal Contractor's responsibility to furnish and maintain exposure monitoring equipment required. The Asbestos Removal Contractor shall bear costs in connection with exposure monitoring and reporting required.

4. The Engineer may procure personal air samples of Asbestos Removal Contractor's or Engineer's employees to measure work area exposures. If the air monitoring in the work area indicates a fiber concentration above one-tenth of a fiber per cubic centimeter (0.1 f/cc) TWA_8 or one fiber per cubic centimeter (1.0 f/cc) for a 30 minute period, the Asbestos Removal Contractor shall implement appropriate engineering controls in an attempt to reduce concentrations to or below this level.

5. The Engineer may perform air monitoring outside of and adjacent to the work areas. If these measurements indicate contamination outside of the work area from asbestos hazard abatement work, the Engineer may notify the Owner to direct the Asbestos Removal Contractor to immediately cease operations until the presence of contamination is verified and corrected to the satisfaction of the Engineer. The Asbestos Removal Contractor shall resume asbestos operations only upon receiving written authorization from the Engineer.

6. The Asbestos Removal Contractor shall facilitate and cooperate fully with air monitoring performed per this Section, and shall take no action intended to distort or falsify measurements of fiber concentrations and shall not interfere with these air monitoring activities. In the event that the Asbestos Removal Contractor fails to comply with these provisions, the Engineer may notify the Owner to direct the Asbestos Removal Contractor to stop work.

7. Sampling and analytical work performed shall be in conformance with NIOSH Method 7400 for work area monitoring and personal air monitoring.

8. Copies of air monitoring records performed by the Engineer will be submitted to the Asbestos Removal Contractor on a weekly basis.

9. It is the Engineer's responsibility to furnish and maintain air monitoring equipment and supplies in connection with monitoring, testing, and reporting performed. The Owner shall bear these costs except to the extent

that the air monitoring indicates contamination due to the Asbestos Removal Contractor's work.

10. For the purpose of final clearance testing at completion of work area decontamination or as otherwise specified, the Engineer will procure air samples for phase contrast microscopy (PCM) analysis per NIOSH Method 7400.
    a. If analysis by PCM indicate that the concentration of fibers in and of these samples exceed the limit of quantification for PCM (0.01 f/cc), the Asbestos Removal Contractor shall continue to air and surface clean the work area interior until air monitoring has indicated that fiber concentrations have fallen below this limit.

11. The Asbestos Removal Contractor shall provide at least two, 20 amp, 120 VAC electrical circuits for Engineer's use during clearance sampling.

12. The Engineer will bear costs in connection with the initial air sampling and reporting required. The Asbestos Removal Contractor shall bear subsequent air sampling and reporting costs ($25 per PCM sample procured) accrued if the 0.01 f/cc limit is exceeded on the initial sampling.

H. Site Inspection: While performing asbestos removal work, the Asbestos Removal Contractor shall be subject to on-site inspection by the Engineer who may be assisted by safety or health personnel. If the Work is in violation of specification requirements or Federal requirements, the Engineer will issue a stop work order to be in effect immediately and until the violation is corrected. Standby time and expenses required to correct the violation shall be at the Asbestos Removal Contractor's expense.

I. Encapsulate

1. After the asbestos material has been removed to the greatest extent possible all permanent exposed surfaces shall be coated with an approved encapsulant to permanently bind (lock down) any remaining fibers in place. Encapsulant shall be applied by airless sprayers and in accordance with manufacturer's recommendations.

2. The encapsulant shall have an adequate tint to easily distinguish between sections encapsulated and sections not encapsulated.

3. As a minimum the following surfaces shall be encapsulated after the asbestos-containing material has been removed.
   a. The edges of the metal framing that were in contact with any transite wall partitions or bakelite counter tops.
   b. The HVAC ducting exposed from the removal operation.
   c. The piping exposed from the removal operation.
   d. The plaster ceiling or wall exposed from the removal operation.
   e. All other non-asbestos materials that were in contact with asbestos-containing materials.

3.2 CLEANUP AND DISPOSAL

A. Cleanup: Maintain surfaces of the regulated area free of accumulations of asbestos-containing material. Restrict the spread of dust and debris; keep waste from being distributed over the general area. Do not dry sweep or blow down the space with compressed air. Clean all surfaces in the work area and other contaminated areas with water and/or HEPA vacuum equipment. After cleaning the work area, allow 24 hours for settlement of dust and wet clean or clean again with HEPA vacuum equipment all surfaces in the work area. When asbestos removal, disposal, and cleanup are complete the Engineer will visually inspect the affected surfaces for residual asbestos materials and accumulated dust. The Asbestos Removal Contractor shall reclean areas showing dust or residual asbestos materials. If recleaning is required, monitor the airborne fiber concentrations during recleaning. After final cleanup, remove filters on the building HVAC system and provide new filters. Dispose of filters as asbestos-contaminated materials. Re-establish HVAC, mechanical, and electrical systems to proper working order. Notify the Engineer before unrestricted entry is permitted. The Engineer shall have the option to perform independent monitoring to certify the areas are safe before entry is permitted.

B. Disposal of Asbestos Material

1. Collect asbestos waste, scrap, debris, bags, containers, equipment, and asbestos-contaminated clothing which may produce airborne concentration of asbestos fibers; place in sealed impermeable bags imprinted with a caution label and place in a second bag or drum.

2. Once double bagged or placed in drums or otherwise containerized (wrapped) and asbestos-containing materials have been removed from the work area, they shall be loaded into an enclosed truck for transportation to

the designated disposal site. Asbestos waste shall not be allowed to be placed in trucks with non-asbestos waste.

3. The enclosed cargo area of the truck shall be free of debris and lined with 6-mil polyethylene sheeting to prevent contamination from leaking or spilled containers. Floor sheeting shall be installed first and extend up the sidewalls. Wall sheeting shall be overlapped and taped into place so that no materials may escape to the environment.

4. Drums shall be placed on level surfaces in the cargo area and packed tightly together to prevent shifting and tipping. Do not throw containers into the cargo area.

5. Personnel loading asbestos containing waste shall be protected by disposable clothing including head, body, and foot protection and at a minimum, half-facepiece, dual cartridge respirators equipped with high efficiently particulate air (HEPA) filters.

6. Large steel dumpsters (roll-off type) may be used for asbestos waste disposal. These shall be lined with polyethylene and shall have doors, tops, or covers that can be closed and locked to prevent vandalism or other disturbance of the containerized asbestos debris and wind dispersion of asbestos fibers. Uncontainerized asbestos materials shall not be placed in these type dumpsters, nor shall they be used for non-asbestos waste. Bags shall be placed, not thrown, into these containers to avoid splitting.

7. Dispose of waste asbestos material at an EPA or a state permitted disposal site off Owner property as reviewed by the Engineer.

8. For temporary storage, store sealed impermeable bags in asbestos waste drums. Areas for interim storage of asbestos waste-containing containers shall be approved by the Engineer. A lockable storage truck on site will be permitted in designated areas. All removed ACM waste shall be transported from the site.

9. Procedure for hauling and disposal shall comply with 40 CFR 61, Subpart M, 40 CFR 241 and 257, and State, regional, and local standards.

10. Upon reaching the disposal site, trucks are to approach the dump location as closely as possible for unloading of the asbestos-containing waste.

11. Bags, drums, and components shall be inspected by the Asbestos Removal Contractor and landfill operator as they are offloaded at the disposal site. Material in damaged containers shall be repacked in empty drums or bags as necessary. Uncontaminated drums may be recycled if the landfill is licensed to accept bagged materials. The Engineer may observe off-loading procedures at any time deemed necessary to assure compliance with these specifications and current regulations.

12. Waste containers shall be placed on the ground at the disposal site, not pushed or thrown out of trucks since the weight of wet material could rupture containers.

13. Personnel off-loading containers at the disposal site shall wear protective equipment consisting of disposable head, body, and foot protection and, at a minimum, half-facepiece, dual cartridge respirators equipped with HEPA filters. Following the removal of all containerized waste, the truck cargo area shall be decontaminated to meet the no visible residue criteria. Polyethylene sheeting shall be removed and discarded along with contaminated cleaning materials and protective clothing, in bags or drums at the disposal site. The Asbestos Removal Contractor shall submit all chain-of-custody forms signed by the disposal site operator accepting the waste ACM, to the Engineer for review for compliance to regulations.

C. Re-establishment of the Work Area and System

1. Re-establishment of the work area shall only occur following the completion of clean-up procedures and after clearance air monitoring has been performed and documented to the satisfaction of the Engineer.

2. The Asbestos Removal Contractor and Engineer shall visually inspect the work area for any remaining visible residue. Evidence of asbestos materials will necessitate additional cleaning requirements.

3. Following satisfactory clearance of the work area, remaining barriers may be removed and disposed of as asbestos contaminated waste.

3.3 CERTIFICATE OF VISUAL INSPECTION

A. Following this Section is a "Certificate of Visual Inspection". This certification is to be completed by the Asbestos Removal Contractor and certified by the Air Monitoring Technician . Submit completed Certificates with Application for

final payment. Final payment will not be made until this Certification is executed.

final payment. Final payment will not be made until this Certification is executed.

PART 4 METHOD OF MEASUREMENT

4.1 There will be no direct measurement for payment of the work specified in this Item. Work under this Item will be paid for on a lump sum basis as specified in Section 5.1 below.

PART 5 BASIS OF PAYMENT

5.1 Payment will be made at the contract lump sum price for asbestos removal. This price shall be full compensation for all materials, equipment, labor, and incidentals necessary to complete the item in accordance with the plans and the provisions of this Item.

Payment will be made under:

Item 2080.1 Pumphouse Equipment, Pipe, and Fittings -- lump sum

END OF ITEM 2080

SECTION 15000 PUMPHOUSE EQUIPMENT, PIPE, AND FITTINGS

15000-1 GENERAL

1.1 DESCRIPTION

This Section includes the furnishing and installation of two (2) fire pump units, pipe, valves, fittings, and incidental accessories necessary for the complete installation of the fire pump system to supply water at rated capacity and total head required for fire-suppression services for the Midfield Complex, as shown on the Plans and specified herein..

1.2 SYSTEM PERFORMANCE REQUIREMENTS

Provide fire pump systems that include fire pump units, pressure-maintenance pump units, accessories, and piping that comply with performance requirements specified and are compatible with building fire-protection systems.

A. Pump, Equipment, Accessory, and Piping Pressure Rating: 175 psig minimum, except where a higher rating is indicated.

1.3 SUBMITTALS

A. Submit the following to the Engineer for approval:

1. Product data for fire pump units and pressure pump units. Include clearly stated rated capacities of each selected model, performance curve with each selection point indicated, driver, pump controller, furnished specialties, and accessories; plus weights (shipping and installed).

2. Product certificates signed by manufacturers of fire pumps, certifying that their products comply with specified requirements.

3. Test curves of fire pump manufacturer's factory tests for each fire pump, and certificates signed by manufacturer verifying that the test results comply with specified requirements.

4. Welding procedure specifications for each welding process, welding procedure qualifications test records, and welder qualification test records complying with requirements specified in the "Quality Assurance" Article.

5. Shop drawings showing layout and connections for fire pump units and pressure-maintenance pump units. Show pumps, drivers, controllers, accessories, and piping. Include setting drawings with templates and directions for installation of foundation bolts, anchor bolts, and other anchorages.

6. Shop drawings may be incorporated into other Division 15 fire-protection piping system shop drawings.

7. Wiring diagrams detailing field-installed wiring for power, signal, and control systems.

8. Field-acceptance test data showing proper performance according to provisions specified.

9. Maintenance data for each fire pump and pressure-maintenance pump unit to include in the "Operating and Maintenance Manual" specified in Division 1 Section "Project Closeout."

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Firms whose fire pumps, pressure maintenance pumps, drivers, controllers, and accessories are listed by product name and manufacturer in the UL "Fire Protection Equipment Directory" and FM "Approval Guide" and that comply with requirements indicated. The following listings are not required:

   i UL listing and FM approval of pressure-maintenance pumps.

   ii FM approval of pressure-maintenance pump controllers.

   iii UL listing of flow-measuring systems.

B. Single-Source Responsibility: Obtain fire pump units and pressure-maintenance-pump units, components, and accessories from a single source. Include a source with responsibility and accountability to answer and resolve problems regarding compatibility, installation, performance, and acceptance of units.

C. Provide listing/approval stamp, label, or other marking on equipment made to specified standards.

D. Comply with local fire department/marshal standards pertaining to material, hose threads, and installation.

E. Comply with requirements of NFPA 20 "Standard for the Installation of Centrifugal Fire Pumps" for fire pumps, drivers, controllers, accessories, and installation.

F. Comply with requirements of NFPA 70 "National Electrical Code" for electrical materials and installation.

G. Comply with requirements of FM "Approval Guide" applicable to fire pumps, drivers, controllers, and accessories, and provide system capable of FM acceptance.

H. Regulatory Requirements: Comply with provisions of the following:

   i ASME B31.9 "Building Services Piping" for water supply and drain piping materials, products, and installation.

   ii ASME "Boiler and Pressure Vessel Code," Section IX, "Welding and Brazing Qualifications" for qualifications for welding processes and operators.

I. Manufacturer's Factory Tests: Perform factory test for each fire pump.

J. Design Criteria: The Drawings indicate sizes, profiles, connections, and dimensional requirements of fire pump and pressure-maintenance pump units and are based on specific manufacturer types and models indicated. Pump units having equal performance characteristics by other manufacturers may be considered, provided that deviations in dimensions and profiles do not change the design concept or intended performance as judged by the Architect. The burden of proof for equality of units is on the proposer.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Preparation for Shipping: After assembling and testing fire pumps and pressure-maintenance pumps, clean flanges and exposed machined metal surfaces and treat with an anticorrosion compound. Protect flanges, pipe openings, and nozzles.

B. Store fire pumps, pressure-maintenance pumps, drivers, controllers, and accessories in a clean dry place.

C. Retain shipping flange protective covers and protective coatings during storage.

D. Protect bearings and couplings against damage from sand, grit, or other foreign matter.

E. Extended Storage Greater Than 5 Days: Dry internal parts with hot air or vacuum-producing device to prevent rusting. Upon drying, coat internal parts with protective liquid, such as light oil. Dismantle bearings and couplings, dry and coat with acid-free heavy oil, and then tag and store in a dry location.

F. Comply with manufacturer's rigging instructions for handling.

15000-2 PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

(a) Horizontal Fire Pumps:

(i) Armstrong Darling, Inc.
(ii) Aurora Pump, General Signal Corp.
(iii) Fairbanks Morse Pump Div., Colt Industries.
(iv) ITT A-C Pump, ITT Fluid Technology Corp.
(v) Patterson Pump Co. Subsid., Gorman-Rupp Co.
(vi) Peerless Pump, Sterling Fluid Products, Inc.
(vii) Reddy-Buffaloes Pump, Inc.

(b) Diesel-Engine Fire Pump Drivers:

(i) Caterpillar, Inc.
(ii) Clarke GM Diesel, Inc.
(iii) Cummins Engine Co., Inc.

(c) Multistage, Pressure-Maintenance Pumps:

(i) Aurora Pump, General Signal Corp.
(ii) Grundfos Pumps Corp.
(iii) ITT A-C Pump, ITT Fluid Technology Corp.
(iv) Patterson Pump Co. Subsid., Gorman-Rupp Co.
(v) Peerless Pump, Sterling Fluid Products, Inc.
(vi) Taco, Inc.

(d) Regenerative-Turbine, Pressure-Maintenance Pumps:

(i) Aurora Pump, General Signal Corp.
(ii) Burks Pumps, Inc.
(iii) Fairbanks Morse Pump Div., Colt Industries.
(iv) ITT A-C Pump, ITT Fluid Technology Corp.

(v) MTH Tool Co., Inc.

(vi) Pump Controllers and Alarm Panels:

(vii) Firetrol, Inc.
(viii) Hubbell Industrial Controls, Inc.
(ix) Joslyn Clark Controls, Inc. Subsid., Joslyn Corp.
(x) Master Control Systems, Inc.
(xi) Metron, Inc.

(e) Flow-Measuring Systems:

(i) Barco Div., Marison Industries.
(ii) Dieterich Standard, Dover Industries Co.
(iii) Gerand Engineering Co.
(iv) Meriam Instrument Div., Scott & Fetzer Co.
(v) Preso Industries, Ltd.
(vi) Reddy-Buffaloes Pump, Inc.
(vii) Victaulic Company of America.

2.2 FIRE PUMPS

(1)Description: Horizontally mounted, single-stage, double-suction type, UL 448, factory-assembled and -tested, bronze-fitted, axially split case, diesel-drive, horizontal fire pump, of capacities and characteristics indicated.

(2)Description: Horizontally mounted, multistage, single-suction type, UL 448, factory-assembled and -tested, bronze-fitted, axially split case, diesel-drive, horizontal fire pump, of capacities and characteristics indicated.

(3)Characteristics: Capable of furnishing not less than 150 percent of rated capacity at not less than 65 percent of total rated head. Shutoff head is limited to 120 percent of total rated head.

(4)Casing Construction: Axially split case, centrifugal design; cast-iron pump casing with suction and discharge flanges machined to ASME B16.1 dimensions, and 125-psig (860kPa) pressure rating, except where 250-psig (1725kPa) rated flanges are indicated.

(5)Impeller Construction: Statically and dynamically balanced, of construction to match type fire pump, fabricated from cast bronze, keyed to shaft.

(6)Wear Rings: Replaceable, bronze.

(7)Pump Shaft and Sleeve: Steel shaft with bronze sleeve.

(8)Pump Shaft Bearings: Grease-lubricated ball bearings contained in cast-iron housing.

(9)Seals: Stuffing box with minimum of 4 rings of graphite-impregnated braided yarn with bronze lantern ring between center 2 graphite rings, and bronze packing gland.

(10)Pump Couplings: Flexible, capable of absorbing torsional vibration and shaft misalignment, with metal coupling guard.

(11)Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping.

(12)Nameplates: Complete with capacities, characteristics, and other pertinent data.

2.3 DRIVERS

A. Diesel Engines: UL 1247, horizontal shaft, open-type diesel engine, of scheduled capacity. Provide the following accessories for automatic operation:

(a)Emergency Manual Operator: Factory wired for standby engine starting and operation in case of main controller or wiring malfunction.

(b)Engine Cooling System: Factory-installed water piping, valves, strainer, pressure regulator, heat exchanger, coolant pump, bypass piping, and fittings. Piping is ASTM B 88, Type L (ASTM B 88M, Type B), copper water tube; ASME B16.22, wrought-copper, solder-joint pressure fittings; and ASTM B 32, Alloy Sb5 solder.

(c)Flexible exhaust connector.

(d)Exhaust Silencer: Residential type.

(e)Exhaust Silencer: Industrial type.

(f)Engine-Jacket Water Heater: Factory-installed electric elements.

(g)Dual Batteries: Lead-acid-storage type, providing 100 percent standby reserve capacity.

(h)Fuel System: According to NFPA 20.

(i)Fuel Storage Tank: Size indicated, with floor legs and direct-reading level gage. Include secondary-containment tank, with capacity at least that of fuel storage tank.

(j)Exhaust System: ASTM A 53, Type E or S, Schedule 40, black steel pipe, ASME B16.9 weld-type pipe fittings, ASME B16.5 steel flanges, and ASME B16.21 nonmetallic gaskets. Fabricate double-wall, ventilated thimble from steel pipe.

2.4 CONTROLLERS

A. Description: Combined automatic and nonautomatic operation, complying with UL 508, UL listed and FM approved, factory assembled and wired, and factory tested for capacities and characteristics, and with features indicated.

B. Fire-Pump-Engine Controllers: Listed for diesel-drive, fire pump service, and capable of performing or containing the following features:

i. Built-in dual battery charger.
ii. Time clock for weekly automatic test.
iii. System pressure recorder, electric alternating current driven with spring backup.
iv. Timing relay for automatic stop.
v. Power failure start, with time delay to prevent start at momentary loss of power.
vi. Low-fuel-level alarm.
vii. Alarm contacts for remote alarm of "Engine Run," "Switch Off," and "Engine Failure."
viii. Pump room alarms, including both audible and visible signals.

C. Enclosure: NEMA ICS 6, Type 2, dripproof, indoor, except where special-purpose enclosure is indicated.

D. Include controls, devices, alarms, functions, and operations listed in NFPA 20, as required for driver and controller, and specific items listed for controller.

E. Nameplates: Provide nameplate complete with capacity, characteristics, approvals and listings, and other pertinent data on enclosure door.

F. Fire-Pump Controller Enclosure Mounting: Wall- or floor-stand mounting, as indicated, for field electrical connections.

G. Fire-Pump Controller Enclosure Mounting: Wall mounting for field electrical connections.

H. Fire-Pump Controller Enclosure Mounting: Floor-stand mounting for field electrical connections.

I. Fire-Pump-Controller Enclosure Mounting: Pump-base mounting and factory wired.

J. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping.

K. Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with nonferrous-metal sensing piping, 1/2-inch (13-mm) size, with globe valves for testing controller mechanism from system to pump controller as indicated. Include a bronze check valve with a 3/32-inch (2.4-mm) orifice in the clapper or a ground-face union with a noncorrosive diaphragm having a 3/32-inch (2.4-mm) orifice.

2.5 ALARM PANELS

A. Description: NEMA ICS 6, Type 1 enclosure, remote wall-mounting-type panel with audible and visible alarms matching controller. Include the following features and manufacturer's standard features:

i. Engine running.
ii. Main switch off or in manual position.
iii. Engine trouble.
iv. Low-water alarm.
v. Low fuel.

B. Mounting: Wall mounting.

C. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping.

2.6 ACCESSORIES

A. Match fire pump suction and discharge ratings as required for fire pump capacity rating. Include the following accessories:

i. Automatic, air-release valve.
ii. Casing relief valve.
iii. Suction and discharge pressure gages.
iv. Eccentric tapered reducer at suction inlet.
v. Concentric tapered reducer (increaser) at discharge outlet.
vi. Test-Header Manifold: Ductile-iron or brass body for hose valves. Include nozzle outlets arranged in a single line; horizontal, flush-wall mounting attachment; and rectangular, brass, escutcheon plate with lettering equivalent to "PUMP TEST CONNECTION."

(i)Escutcheon Plate Finish: Polished chrome plate.
(ii)Escutcheon Plate Finish: Rough brass.

vii. Test-Header Manifold: Ferrous for hose valves. Include bronze or cast-iron, exposed-type, valve header with nozzle outlets; and round brass escutcheon plate with lettering equivalent to "PUMP TEST CONNECTION." Finish is manufacturer's standard.
viii. Hose Valves: UL 668, straightway pattern, bronze. Include cap attached to valve with chain and NFPA 1963 hose thread that conforms to local fire department standards on valve outlet. Valve and cap finish is same as test-header-manifold escutcheon plate finish.
ix. Ball Drip Valve: UL 1726.
x. Main Relief Valve: UL 1478, pilot operated.
xi. Main Relief Valve: UL 1478, spring loaded.
xii. Discharge Cone: Closed.
xiii. Discharge Cone: Open.

B. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping, except where brass or another finish is specified.

2.7 PRESSURE-MAINTENANCE PUMPS

A. Multistage Pressure-Maintenance Pumps: Centrifugal, vertical construction, base mounted, factory assembled, and factory tested for capacities and characteristics indicated.

B. Regenerative-Turbine, Pressure-Maintenance Pumps: Close-coupled construction, for pad mounting, factory assembled, and factory tested for capacities and characteristics indicated.

1. Capacities: Not less than rated capacity at not less than total rated head indicated.

2. Construction: Cast-iron pump casing with suction and discharge connections of size indicated, threaded, or flanged and machined to ASME B16.1 dimensions, and 125-psig (860kPa) minimum pressure rating, except where 250-psig (1725kPa) rated flanges are indicated.

i. Impeller: Bronze or stainless steel.
ii. Shaft: Stainless steel.
iii. Seals: Mechanical.

C. Nameplates: Provide nameplate complete with capacity, characteristics, and other pertinent data.

D. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping.

2.8 PRESSURE-MAINTENANCE PUMP ELECTRIC-MOTOR DRIVERS

A. Electric-Motor Drivers: NEMA MG 1, open-dripproof, squirrel-cage, induction motors. Include construction that complies with NFPA 20 and NFPA 70, and wiring compatible with controller.

B. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping.

C. Nameplates: Complete with motor horsepower (kW), characteristics, and other pertinent data.

2.9 PRESSURE-MAINTENANCE PUMP CONTROLLERS

A. Description: Across-the-line type; complying with UL 508; UL listed; factory assembled, wired, and tested; and combined automatic and nonautomatic operation. Include types, capacities, characteristics, and features indicated for electric-drive, pressure-maintenance pump service.

B. Enclosure: NEMA ICS 6, Type 2, wall mounted, for field electrical wiring.

C. Include controls, devices, alarms, functions, and operations listed in NFPA 20, and specific items listed.

D. Rate controller for scheduled horsepower (kW) and provide the following items:

1. Fusible disconnect switch.
2. Pressure switch.
3. "HAND-OFF-AUTO" selector switch.
4. Pilot light.
5. Running-period timer.

E. Nameplates: Complete with capacity, characteristics, approvals and listings, and other pertinent data on enclosure door.

F. Mounting: Wall type for field electrical connections.

G. Finish: Manufacturer's standard red paint applied to factory-assembled and -tested units before shipping.

H. Controller Sensing Pipes: Fabricate pipe and fittings according to NFPA 20 with nonferrous-metal sensing piping, 1/2-inch (13-mm) size, with globe valves for testing controller mechanism from system to pump controller as indicated. Include a bronze check valve with a 3/32-inch (2.4-mm) orifice in the clapper or a ground-face union with a noncorrosive diaphragm having a 3/32-inch (2.4-mm) orifice.

2.10 PRESSURE-MAINTENANCE PUMP ACCESSORIES

A. Match pressure-maintenance pump suction and discharge ratings as required for pump capacity rating. Include the following accessories:

1. Casing relief valve.
2. Suction and discharge pressure gages.

2.11 FLOW-MEASURING SYSTEMS

A. Description: FM-approved systems that indicate flow in gpm (L/s) to not less than 175 percent of fire pump rated capacity. Include sensing element of size to match pipe, tubing, flow meter, and fittings.

B. Pressure Rating: 175 psig (1200 kPa) minimum.

C. Sensing Element: Venturi, annular probe, or orifice plate flow sensor.

D. Flow Meter: Compatible with flow-sensing element and direct reading in gpm (L/s); dial not less than 4-1/2 inches (115 mm) in diameter or equivalent.

1. Permanently Mounted: Flow meter suitable for wall mounting with copper tubing for connecting to flow-sensing element.
2. Portable: Flow meter, with two 12-foot (4-m) hoses, in carrying case with handle.

E. Include complete operating instructions.

2.12 SOURCE QUALITY CONTROL

A. Factory Tests: Hydrostatically test and test run fire pumps before shipment. Test at 150 percent of shutoff head plus suction head, but not less than 250 psig (1725 kPa). Produce certified test curves showing head capacity and brake-horsepower (kW) of each pump.

2.13 GROUT

A. Nonshrink, Nonmetallic Grout: ASTM C 1107, Grade B.

B. Characteristics: Post-hardening, volume-adjusting, dry, hydraulic-cement grout.

C. Properties: Nonstaining, noncorrosive, and nongaseous.

D. Recommended Uses: Interior and exterior applications.

E. Design Mix: 5000 psi (34.50 MPa), 28-day compressive strength.

F. Packaging: Factory premixed and packaged.

15000-3 EXECUTION

A EXAMINATION

1. Examine areas, equipment foundations, and conditions with Installer present for compliance with requirements for installation and other conditions affecting fire pump performance. Do not proceed with installation until unsatisfactory conditions have been corrected.

2. Examine fire-protection piping systems. Verify actual locations of piping connections before installation.

3.2 CONCRETE EQUIPMENT BASES

A. Install concrete equipment bases of dimensions indicated for fire pumps, pressure-maintenance pumps, and controllers. Refer to Division 3 Section "Cast-in-Place Concrete" and Division 15 Section "Basic Mechanical Materials and Methods."

3.3 INSTALLATION

A. Comply with manufacturer's written installation and alignment instructions and with NFPA 20 and FM standards.

B. Install pumps in locations indicated and arrange to provide access for periodic maintenance, including removal of motors, impellers, couplings, and accessories.

C. Set base-mounted pumps on concrete equipment bases. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.

1. Support pump base plate on rectangular metal blocks and shims, or on metal wedges having small taper, at points near foundation bolts to provide a gap of 3/4 to 1-1/2 inches (19 to 38 mm) between pump base and foundation for grouting.
2. Adjust metal supports or wedges until pump and driver shafts are level. Check coupling faces and suction and discharge flanges of pump to verify that they are level and plumb.

D. Install suction and discharge pipe sizes equal to or greater than the diameter of fire pump nozzles.

E. Install valves of types and at locations indicated that are same size as piping connecting fire pumps, bypasses, test headers, and other piping systems.

F. Install pressure gages on suction and discharge of fire pumps at integral pressure gage tappings provided.

G. Support pumps and piping separately so that weight of piping system does not rest on pumps.

H. Install piping accessories, hangers and supports, anchors, valves, meters and gages, and equipment supports as indicated for complete installation.

I. Install water supply and drain piping for diesel-engine heat exchangers. Extend drain piping from heat exchangers to point of disposition, as indicated. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation and joint construction.

J. Install exhaust system piping for diesel engines. Extend to point of termination outside structure. Install pipe and fittings with welded joints, and components having flanged connections with gasketed joints. Refer to Division 15 Section "Basic Mechanical Materials and Methods" for basic piping installation and joint construction.

K. Install condensate drain piping for diesel-engine exhaust system. Extend drain piping from low points of exhaust system to condensate traps and to point of disposition, as indicated. Refer to Division 15 Section "Basic

Mechanical Materials and Methods" for basic piping installation and joint construction.

L. Install flow meters and sensing elements where indicated. Install flow-measuring system components and make connections according to manufacturer's written installation instructions.

M. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted. Furnish copy of manufacturer's wiring diagram submittal to Electrical Installer.

1. Verify that electrical wiring installation is according to manufacturer's submittal and installation requirements of Division 16 Sections. Do not proceed with equipment startup until wiring installation is acceptable.

3.4 ALIGNMENT

A. Align fire pump and driver shafts after complete unit has been leveled on foundation and after grout has set and foundation bolts have been tightened.

B. After alignment is correct, tighten foundation bolts evenly but not too firmly. Fill base plate completely with nonshrink, nonmetallic grout with metal blocks and shims or wedges in place. After grout has hardened, fully tighten foundation bolts. Check alignment and take corrective measures required.

C. Make piping connections, check alignment, and take corrective measures required.

1. Adjust alignment of pump and driver shafts for angular and parallel alignment by 1 of 2 methods specified in Hydraulic Institute Standards Section "Centrifugal Pumps--Instructions for Installation, Operation and Maintenance."
2. Alignment Tolerances: Meet manufacturer's recommendations.

3.5 CONNECTIONS

A. Connect water supply to fire pumps and pressure-maintenance pumps.

B. Connect fire pump and pressure-maintenance pump discharge piping to building fire-protection water systems.

C. Connect cooling-system water supply and drain piping to diesel-engine heat exchangers.

D. Connect exhaust system piping to diesel engines.

E. Connect flow-measuring system components according to manufacturer's written installation instructions.

F. Connect fire pump controllers to building fire alarm system. Refer to Division 16 Section "Fire Alarm Systems."

G. Electrical wiring and connections are specified in Division 16 Sections.

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Provide services of factory-authorized service representative to supervise field assembly of components, installation of fire pump units and pressure-maintenance pump units, including piping and electrical connections, and field acceptance tests. Report test results in writing.

B. Check suction lines connections for tightness to avoid drawing air into pumps.

C. Perform field-acceptance tests of each fire pump unit (fire pump, driver, and controller) and system piping, when fire pump unit installation is complete. Comply with operating instructions and procedures of NFPA 20 to demonstrate compliance with requirements. Where possible, field-correct malfunctioning equipment, then retest to demonstrate compliance. Replace equipment that cannot be satisfactorily corrected or that does not perform as specified and as indicated, then retest to demonstrate compliance. Verify that each fire pump unit performs as specified and as indicated.

3.7 COMMISSIONING

A. Startup Services: Provide services of factory-authorized service representative to provide startup service and to demonstrate and train Owner's maintenance personnel as specified below.

1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.
2. Train Owner's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, and preventive maintenance.
3. Review data in the "Operating and Maintenance Manual." Refer to Division 1 Section "Project Closeout."
4. Schedule training with at least 7 days' advance notice.
5. Provide fire hoses in number, size, and of length required to reach a storm drain or other acceptable location to dispose of fire pump test water. These fire hoses are for field acceptance tests only and are not intended to become property of the Owner.

B. Final Checks Before Startup: Perform the following preventive-maintenance operations and checks before startup:

1. Lubricate oil-lubricated bearings.
2. Remove grease-lubricated bearing covers and flush bearings with kerosene and thoroughly clean. Fill with new lubricant according to manufacturer's recommendations.
3. Disconnect coupling and check electric motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
4. Check that pump is free to rotate by hand. Do not operate the pump if it is bound or if it drags even slightly until cause of trouble is determined and corrected.
5. Install coolant in cooling system. Fill closed-loop cooling system with potable water and add rust inhibitor.
6. Install coolant in cooling system. Fill closed-loop cooling system with solution of 50 percent potable water and 50 percent ethylene glycol permanent antifreeze. Add rust inhibitor if not included in antifreeze.

C. Starting procedure for pumps:

1. Prime pump by opening suction valve and closing drains, and prepare pump for operation.
2. Open sealing liquid supply valve if pump is so fitted.
3. Start motor.
4. Open discharge valve slowly.
5. Observe leakage from stuffing boxes and adjust sealing liquid valve for proper flow to ensure lubrication of packing. Do not tighten gland immediately, but let packing run in before reducing leakage through stuffing boxes.
6. Check general mechanical operation of pump and motor.

15000-4 METHOD OF MEASUREMENT

4.1 There will be no direct measurement for payment of the work specified in this Item. Work under this Item will be paid for on a lump sum basis as specified in Section 5.1 below.

15000-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract lump sum price for pumphouse equipment, pipe, and fittings. This price shall be full compensation for all materials, equipment, labor, and incidentals necessary to complete the item in accordance with the plans and the provisions of this Item.

Payment will be made under:

Item 15000.1 Pumphouse Equipment, Pipe, and Fittings -- lump sum

END OF ITEM 15000

ITEM 16000 UTILITY COST ALLOWANCE

16000-1 DESCRIPTION

1.1 This item consists of funds included in the bids to be used to pay charges from utility companies to reimburse them for costs they incur due to construction of this project. The utility companies to whom payments shall be made include: Baltimore Gas & Electric Company (BG&E), Bell Atlantic Company, and Comcast Cablevision (cable television provider). Utility costs incurred will include charges for:

A. Providing primary electric power distribution to the site including underground cables, pad mounted transformers, switchgear, and electric services as shown and described within the contract drawings and specifications.

B. Providing natural gas distribution extension to the site including underground piping and tubing, valves, meters, and leak detection equipment in accordance with utility company policy.

C. Providing telephone distribution extension for proposed services at the midfield site. Bell Atlantic will furnish and install wiring and termination equipment. Contractor will install concrete pad and all necessary conduits, including excavation, pavement removal, trenching, backfilling, termination cabinets, handholes, pavement restoration, etc.

D. Providing distribution extension of cable television utility system. Contractor will install all necessary conduits, including excavation, pavement removal, trenching, backfilling, termination cabinets, handholes, pavement restoration, etc.

E. Relocation of existing cables and conduits and associated facilities necessitated by construction activities such as new drainage items, landscaping, etc.

16000-2 EQUIPMENT AND MATERIALS

2.1 Contractor will be responsible for furnishing all equipment and materials except for the specific items specified herein, which will be furnished by the utility companies.

16000-3 CONSTRUCTION METHODS

3.1 Installation will be by the utility company. No overhead power lines or power poles shall be installed. The Contractor shall contact the utility company, coordinate with same and authorize services as required. The MAA shall be informed of all contacts and service arrangements.

BG&E Contact:	Bell Atlantic Contact:	Comcast CableVision Contact:
Ms. Cynthia M. Upton	Mr. S. S. Sweet	Mr. Wayne Slechter
Baltimore Gas & Electric Company	Bell Atlantic	Comcast CableVision
Marketing and Energy Services	7133 Rutherford Road	8031 Corporate Drive
7225 Windsor Boulevard	Second Floor	Baltimore, Maryland 21236
Baltimore, Maryland 21244	Woodlawn, Maryland 21244	(410) 931-4600
(410) 265-4040	(410) 281-7539	

3.2 The Contractor is to arrange a meeting with the BG&E Power Company, Bell Atlantic Company, Comcast Cablevision representatives, and MAA to establish a suitable schedule for utiliity service connections before any equipment or material related to the utility distribution extensions is installed. The Contractor shall not disconnect, de-energize, reconnect, tamper or otherwise handle any of the utility companies service wires.

Work to be accomplished in making the required service connections to the utility companies supplied points of service is to be supplied by the Contractor.

The Contractor is required to make necessary arrangements with the utility companies to insure having needed services available at the time of systems power-up. Lack of service at the time of power-up is not considered a valid reason for any work time extension. Difficulties in securing the utility companies services are to be reported to the Engineer at the earliest possible time.

Contractor shall locate all utility lines in advance of construction and coordinate relocations with utility companies as required.

This coordination item shall not be measured, and no separate payment shall be made. This work shall be incidental to the installation of utility work.

16000-4 METHOD OF MEASUREMENT AND BASIS OF PAYMENT

4.1 This item will not be measured. Payments will be made to the Contractor on the basis of actual costs billed (as shown on utility invoices) by BG&E, Bell Atlantic, and Comcast Cablevision plus 5 percent for Contractor's overhead and profit. Payment will be made under "Utility Cost Allowance." Partial payments will be made out of the allowance amount as bills are received from the utilities. Contractor shall furnish proof to the MAA that utility payments have been made after he receives payment from MAA. The Contractor shall include the figure indicated in the proposal form in his bid for this item. The Contractor will not be entitled to any unspent portion of monies from this allowance.

All work to be performed by the Contractor is included in other specification items. The Contractor will not be paid for any work under this item which will be used exclusively for payments to BG&E, Bell Atlantic or Comcast Cablevision.

Payment will be made under:

Item 16000.1 Utility Cost Allowance -- lump sum

END OF ITEM 16000

ITEM 16010 BASIC ELECTRICAL REQUIREMENTS

16010-1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Sections, apply to this and the other electrical sections.

1.2 SUMMARY

A. This section includes general administrative and procedural requirements for electrical installations. The following administrative and procedural requirements are included in this section to expand the requirements specified elsewhere:

1. Submittals.
2. Coordination drawings.
3. Record documents.
4. Maintenance manuals.
5. Electrical installations.
6. Cutting and patching.

1.3 SUBMITTALS

A. General: Follow the procedures specified in Standard Provisions for Shop Drawings except as modified or directed by this Specifications.

B. Increase, by the quantity listed below, the number of electrical related shop drawings, product data, and samples submitted, to allow for required distribution plus two copies of each submittal required, which will be retained by the Consulting Engineer.

1. Shop Drawings - Initial Submittal: 1 additional blue- or black-line prints.
2. Shop Drawings - Final Submittal: 1 additional blue- or black-line prints.
3. Product Data: 1 additional copy of each item.
4. Samples: 1 addition as set.

C. Additional copies may be required by individual sections of these Specifications.

D. Schedule: All shop drawings shall be submitted for approval and be approved with a "conform" or "conform as noted" rating prior to fabrication, and/or installation as applicable. MAA will complete each shop drawing submittal evaluation in 21 calendar days after submittal reception. A shop drawing disapproval will not be grounds for Construction Duration delays.

1.4 COORDINATION DRAWINGS

A. Prepare coordination drawings to a scale of 1/4"=1'-0" or larger; detailing major elements, components, and systems of electrical equipment and materials in relationship with other systems, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are of importance to the efficient flow of the Work, including (but not necessarily limited to) the following:

1. Indicate the proposed locations of major raceway systems, equipment, and materials. Include the following:
   a. Equipment connections and support details.

b. Sizes and location of required concrete pads and bases.

2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the hangars during construction.
3. Prepare site plans, elevations, and details to indicate cabinets, junction boxes, handholes, underground conduits, lighting poles to co-ordinate with other trades.

1.5 RECORD DOCUMENTS

A. Prepare record documents in accordance with the requirements in Standard Provisions. In addition to the requirements specified, indicate installed conditions for:

1. Major raceway systems, size and location, locations of control devices; distribution and branch electrical circuitry; and circuit breaker size and arrangements.
2. Equipment locations (exposed and concealed), dimensioned from prominent building lines.
3. Approved substitutions, Contract Modifications, and actual equipment and materials installed.

1.6 MAINTENANCE MANUALS

A. Prepare maintenance manuals in accordance with Standard Provisions. In addition to the requirements specified, include the following information for equipment items:

1. Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
2. Manufacturers printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions.
3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions.
4. Servicing instructions and lubrication charts and schedules.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

1.8 GUARANTEE

A. The Contractor shall guarantee to make good any and all defects in his work, exclusive of lamps, which may develop due to defective workmanship or materials, within one year from the date of final acceptance of the work by the Administration.

B. During the one-year guarantee period, the system supplier shall schedule maintenance inspections of the system on a quarterly basis.

1.9 TESTS

The Contractor shall furnish all labor, materials, instruments and equipment necessary for testing the electrical system in accordance with the NETA Acceptance Standards during the progress of the work and after the installation is completed. The Contractor shall demonstrate to the satisfaction of the Engineer as a minimum the following:

A. That all lighting, power phase, neutral and control circuits are continuous and free from short circuits and unspecified grounds.

ITEM 16010 BASIC ELECTRICAL REQUIREMENTS

16010-1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Sections, apply to this and the other electrical sections.

1.2 SUMMARY

A. This section includes general administrative and procedural requirements for electrical installations. The following administrative and procedural requirements are included in this section to expand the requirements specified elsewhere:

1. Submittals.
2. Coordination drawings.
3. Record documents.
4. Maintenance manuals.
5. Electrical installations.
6. Cutting and patching.

1.3 SUBMITTALS

A. General: Follow the procedures specified in Standard Provisions for Shop Drawings except as modified or directed by this Specifications.

B. Increase, by the quantity listed below, the number of electrical related shop drawings, product data, and samples submitted, to allow for required distribution plus two copies of each submittal required, which will be retained by the Consulting Engineer.

1. Shop Drawings - Initial Submittal: 1 additional blue- or black-line prints.
2. Shop Drawings - Final Submittal: 1 additional blue- or black-line prints.
3. Product Data: 1 additional copy of each item.
4. Samples: 1 addition as set.

C. Additional copies may be required by individual sections of these Specifications.

D. Schedule: All shop drawings shall be submitted for approval and be approved with a "conform" or "conform as noted" rating prior to fabrication, and/or installation as applicable. MAA will complete each shop drawing submittal evaluation in 21 calendar days after submittal reception. A shop drawing disapproval will not be grounds for Construction Duration delays.

1.4 COORDINATION DRAWINGS

A. Prepare coordination drawings to a scale of 1/4"=1'-0" or larger; detailing major elements, components, and systems of electrical equipment and materials in relationship with other systems, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are of importance to the efficient flow of the Work, including (but not necessarily limited to) the following:

1. Indicate the proposed locations of major raceway systems, equipment, and materials. Include the following:
   a. Equipment connections and support details.

b. Sizes and location of required concrete pads and bases.

2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the hangars during construction.
3. Prepare site plans, elevations, and details to indicate cabinets, junction boxes, handholes, underground conduits, lighting poles to co-ordinate with other trades.

1.5 RECORD DOCUMENTS

A. Prepare record documents in accordance with the requirements in Standard Provisions. In addition to the requirements specified, indicate installed conditions for:

1. Major raceway systems, size and location, locations of control devices; distribution and branch electrical circuitry; and circuit breaker size and arrangements.
2. Equipment locations (exposed and concealed), dimensioned from prominent building lines.
3. Approved substitutions, Contract Modifications, and actual equipment and materials installed.

1.6 MAINTENANCE MANUALS

A. Prepare maintenance manuals in accordance with Standard Provisions. In addition to the requirements specified, include the following information for equipment items:

1. Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
2. Manufacturers printed operating procedures to include start-up, break-in, and routine and normal operating instructions; regulation, control, stopping, shutdown, and emergency instructions.
3. Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; aligning and adjusting instructions.
4. Servicing instructions and lubrication charts and schedules.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

1.8 GUARANTEE

A. The Contractor shall guarantee to make good any and all defects in his work, exclusive of lamps, which may develop due to defective workmanship or materials, within one year from the date of final acceptance of the work by the Administration.

B. During the one-year guarantee period, the system supplier shall schedule maintenance inspections of the system on a quarterly basis.

1.9 TESTS

The Contractor shall furnish all labor, materials, instruments and equipment necessary for testing the electrical system in accordance with the NETA Acceptance Standards during the progress of the work and after the installation is completed. The Contractor shall demonstrate to the satisfaction of the Engineer as a minimum the following:

A. That all lighting, power phase, neutral and control circuits are continuous and free from short circuits and unspecified grounds.

B. That the insulation resistance to ground and between all other conductors in the same cable or conduit is not less than 50 megohms.

C. That all circuits are properly connected in accordance with applicable wiring diagrams.

D. That all circuits are operable. Lights shall be operated with no failures within a continuous 48-hour period prior to acceptance.

16010-2 - PRODUCTS (Not Applicable)

16010-3 - EXECUTION

3.1 ROUGH-IN

A. Verify final locations for rough-ins with field measurements and with the requirements of the lighting fixtures.

B. Refer to equipment specifications for rough-in requirements.

3.2 ELECTRICAL INSTALLATIONS

A. General: Sequence, coordinate, and integrate the various elements of electrical systems, materials, and equipment. Comply with the following requirements:

1. Coordinate electrical systems, equipment, and materials installation with other trades.
2. Verify all dimensions by field measurements.
3. Coordinate the installation of required supporting devices and sleeves to be poured-in-place concrete and other structural components, as they are constructed.
4. Sequence, coordinate, and integrate installations of electrical materials and equipment for efficient flow of the Work.
5. Where mounting heights are not detailed or dimensioned, field coordinate with other trades or existing conditions to provide adequate clearances.
6. Install systems, materials, and equipment to conform with approved submittal data, including coordination drawings, to greatest extent possible. Conform to arrangements indicated by the Contract Documents, recognizing that portions of the Work are shown only in diagrammatic form. Where coordination requirements conflict with individual system requirements, refer conflict to the Engineer.
7. Install systems, materials, and equipment level and plumb, parallel and perpendicular to structure.
8. Install electrical equipment to facilitate servicing, maintenance, and repair or replacement of equipment components. As much as practical, connect equipment for ease of disconnecting, with minimum of interference with other installations.
9. Install systems, materials, and equipment giving right-of-way priority to systems required to be installed at a specified slope.

3.3 CUTTING AND PATCHING

A. General: Perform cutting and patching in accordance with corresponding Technical Specification and SHA Standard Specification. In addition to the requirements specified, the following requirements apply:

1. Perform cutting, fitting, and patching of electrical equipment and materials required to:
   a. Uncover Work to provide for installation of ill-timed work.
   b. Remove and replace defective Work.
   c. Remove and replace Work not conforming to requirements of the Contract Documents.

d. Remove samples of installed Work as specified for testing.
e. Install equipment and materials on existing pole foundations as shown on drawings.
f. Upon written instructions from the Engineer, uncover and restore Work to provide for Engineer observation of concealed Work.

2. Cut, remove, and legally dispose of selected electrical equipment, components, and materials as indicated, including but not limited to removal of electrical items indicated to be removed and items made obsolete by the new Work.
3. Protect the structure, furnishings, finishes, and adjacent materials not indicated or scheduled to be removed.
4. Provide and maintain temporary partitions or dust barriers adequate to prevent the spread of dust and dirt to adjacent areas.
5. Protection of Installed Work: During cutting and patching operations, protect adjacent installations.

16010-4 - METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

Measurement will be made for the work items of this section will be lump sum.

16010-5 - BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

Payment for the work of this Section will be made at the contract lump sum price for the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Payment will be made under:

Item 16010.1 Basic Electrical Requirements – lump sum

END OF SECTION 16010

ITEM 16050 BASIC ELECTRICAL MATERIALS AND METHODS

16050-1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

B. Requirements specified in "Basic Electrical Requirements" apply to this Item.

1.2 SUMMARY

A. This Section includes limited scope general construction materials and methods for application with electrical installations as follows:

1. Selective demolition including:

a. Nondestructive removal of materials and equipment.

b. Dismantling electrical materials and equipment made obsolete by these installations.

2. Miscellaneous metals for support of electrical materials and equipment.

3. Nailers, blocking, fasteners, and anchorage for support of electrical materials and equipment.

4. Joint sealers for sealing around electrical materials and equipment; and for sealing penetrations in handholes and foundation walls.

1.3 SUBMITTALS

A. General: Submit the following in accordance with Standard Provisions.

B. Product data for the following products:

1. Joint sealers.

C. Shop drawings detailing fabrication and installation for metal fabrications, and anchorage for electrical materials and equipment.

D. Samples of joint sealer, consisting of strips of actual products showing full range of colors available for each product.

E. Welder certificates, signed by Contractor, certifying that welders comply with requirements specified under "Quality Assurance" article of this Section.

F. Schedules indicating proposed methods and sequence of operations for selective demolition prior to commencement of Work. Include coordination and details for dust and noise control.

1. Coordinate sequencing with construction phasing and Owner occupancy.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Engage an experienced Installer for the installation and application joint sealers and access panels.

B. Qualify welding processes and welding operators in accordance with AWS "Structural Welding Code".

1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver joint sealer materials in original unopened containers or bundles with labels informing about manufacturer, product name and designation, color, expiration period for use, pot life, cuing time, and mixing instructions for multi-component materials.

B. Store and handle joint sealer materials in compliance with the manufacturers' recommendations to prevent their deterioration and damage.

1.6 PROJECT CONDITIONS

A. Conditions Affecting Selective Demolition: The following project conditions apply:

1. Protect adjacent materials indicated to remain. Install and maintain dust and noise barriers to keep dirt, dust, and noise from being transmitted to adjacent areas. Remove protection and barriers after demolition operations are complete.

2. Locate, identify, and protect electrical services passing through demolition area and serving other areas outside the demolition limits. Maintain services to areas outside demolition limits. When services must be interrupted, install temporary services for affected areas.

B. Environmental Conditions: Apply joint sealers under temperature and humidity conditions within the limits permitted by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.

1.7 SEQUENCE AND SCHEDULING

A. Notify the Engineer at least 5 days prior to commencing demolition operations.

B. Perform demolition in phases.

16050-2 - PRODUCTS

2.1 MISCELLANEOUS METALS

A. Steel plates, shapes, bars, and bar grating: ASTM A 36.

B. Cold-Formed Steel Tubing: ASTM A 500.

C. Hot-Rolled Steel Tubing: ASTM A 501.

D. Steel Pipe: ASTM A 53, Schedule 40, welded.

E. Steel channel: ASTM A569-72.

F. Nonshrink, Nonmetallic Grout: Premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout, recommended for interior and exterior applications.

G. Fasteners: Zinc-coated, type, grade, and class as required.

2.2 JOINT SEALERS

A. General: Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.

B. Colors: As selected by the Engineer from manufacturer's standard colors.

C. Elastomeric Joint Sealers: Provide the following types:

1. One-part, nonacid-cuing, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for masonry, glass, aluminum, and other substrates recommended by the sealant manufacturer.

2. One-part, mildew-resistant, silicone sealant complying with ASTM C 920, Type S, Grade NS, Class 25, for uses in non-traffic areas for glass, aluminum, and nonporous joint substrates; formulated with fungicide; intended for sealing interior joints with nonporous substrates; and subject to in-service exposure to conditions of high humidity and temperature extremes.

D. Acrylic-Emulsion Sealants: One-part, nonsag, mildew-resistant, paintable complying with ASTM C 834 recommended for exposed applications on interior and protected exterior locations involving joint movement of not more than plus or minus 5 percent.

16050-3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting installation and application of joint sealers and access panels. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 SELECTIVE DEMOLITION

A. General: Demolish, remove, demount, and disconnect abandoned electrical materials and equipment indicated to be removed.

B. Disposal and Cleanup: Remove from the site and legally dispose of demolished materials and equipment.

16050-4 - METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work of this Section will be lump sum.

5.1 BASIS OF PAYMENT

A. Payment for the work of this Section will be included as part of the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Payment will be made under:

Item 16050.1 Basic Electrical Materials and Methods -- per Lump Sum

END OF ITEM 16050

ITEM 16100 RACEWAYS, BOXES, AND CABINETS

16100-1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

1.2 SUMMARY

A. This Section includes raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

B. Raceways include the following:

1. Rigid metal conduit.

C. Boxes, enclosures, and cabinets include the following:

1. Device boxes.
2. Outlet boxes.
3. Pull and junction boxes.
4. Cabinets and hinged cover enclosures.

D. The following Items contain requirements that relate to this Item:

1. "Supporting Devices" for raceway and box supports.
2. "Wiring Devices" for devices installed in boxes.

1.3 SUBMITTALS

A. General: Submit the following according to the Standard Provisions.

B. Product data for junction boxes, hinged cover enclosures, and cabinets.

1.4 QUALITY ASSURANCE

A. Comply with NFPA 70 "National Electrical Code" for components and installation.

B. Listing and Labeling: Provide products specified in this Section that are listed and labeled.

1. The Terms unlisted and Labeled: As defined in the "National Electrical Code," Article 100.
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory (NRTL) as defined in OSHA Regulation 1910.7.

C. Coordinate layout and installation of raceway and boxes with other construction elements to ensure adequate headroom, working clearance, and access.

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering Products that may be incorporated in the Work include, but are not limited to, the following:

1. Metal Conduit and Tubing:

   a. Monogram Co., AFC.

   b. Afflex Corp

   c. Allied Tube and Conduit, Grinnell Co.

   d. Anamet, Inc., Anaconda Metal Hose.

   e. Anixter Brothers, Inc.

   f. Carol Cable Co., Inc.

   g. Cole-Flex Corp.

   h. Flexcon, Inc., Coleman Cable Systems, Inc.

   i. Spiraduct, Inc.

   j. Triangle PWC, Inc.

   k. Wheatland Tube Co.

2. Conduit Bodies and Fittings:

   a. Scott Fetzer Company, Adalet-PLM.

   b. American Electric, Construction Materials Group.

   c. Emerson Electric Co., Appleton Electric Co.

   d. Carlon.

   e. Hubbell, Inc., Killark Electric Manufacturing Co.

   f. General Signal, O-Z/Gedney Unft.

   g. Spring City Electrical Manufacturing Co.

3. Boxes, Enclosures, and Cabinets:

   a. Scott Fetzer Company, Adalet-PLM.

   b. Butler Manufacturing Co., Walker Division.

   c. Cooper Industries, Midwest Electric.

d. Electric Panelboard Co., Inc.

e. Erickson Electrical Equipment Co.

f. American Electric, FL Industries.

g. Hoffman Engineering Co., Federal-Hoffman, Inc.

h. Hubbell Inc., Killark Electric Manufacturing Co.

i. General Signal, O-Z/Gedney.

j. Parker Electrical Manufacturing Co.

k. Raco, Inc., Hubbell Inc.

l. Robroy Industries, Inc., Electrical Division.

m. Spring City Electrical Manufacturing Co.

n. Square D Co.

o. Thomas & Betts Corp.

p. Woodhead Industries, Inc., Daniel Woodhead Co.

2.2 METAL CONDUIT AND TUBING

A. Rigid Steel Conduit: ANSI C80.1.

B. Fittings: NEMA FB 1, compatible with conduit/tubing materials.

2.3 OUTLET AND DEVICE BOXES

A. Materials: Cast aluminum or zinc plated iron alloy boxes with gasketed cover suitable for wet locations.

B. Compliances: NEMA FB 1; UL Standand 514; ANSI Standard C33.84; Fed Spec. W-C-586.

2.4 PULL AND JUNCTION BOXES

A. Small Sheet Metal Boxes: NEMA Type 3R and Type 4X as shown on contract drawings.

B. Cast Metal Boxes: NEMA FB 1, cast aluminum with gasketed cover.

2.5 CABINETS AND ENCLOSURES

A. Hinged Cover Enclosures: NEMA 250, metal enclosure with continuous hinge cover and flush latch. Finish inside and out with manufacturer's standard enamel.

B. Cabinets: NEMA 250, Type 3R, Type 4X and Type 12 as shown on contract drawings, metal enclosure with removable interior panel and removable front, finished inside and out with manufacturer's paint finish as shown on the drawings. Hinged door in front cover with flush latch and concealed hinge. Key latch to match panelboards. Include metal barriers to separate wiring

of different systems and voltage, and include accessory feet where required for freestanding equipment.

16100-3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces to receive raceways, boxes, enclosures, and cabinets for compliance with installation tolerances and other conditions affecting performance of the raceway system. Do not proceed with installation until
unsatisfactory conditions have been corrected.

3.2 WIRING METHODS

A. Outdoors: Use the following wiring methods:

1. Exposed: Rigid metal conduit.

2. Direct buried concrete encase PVC SCH 80 conduit.

3. Boxes and Enclosures: NEMA Type 3R or Type 4X.

B. Indoors: Use the following wiring methods:

1. Exposed: Rigid steel conduit.

2. Boxes and Enclosures: NEMA Type 4X and Type 12, metal.

3.3 INSTALLATION

A. Install raceways, boxes, enclosures, and cabinets as indicated, according to manufacturer's written instructions.

B. Install raceways level and square and at proper elevations. Provide adequate headroom.

C. Complete raceway installation before starting conductor installation.

D. Support raceway as specified in "Supporting Devices".

E. Use temporary closures to prevent foreign matter from entering raceway.

F. Protect stub-ups from damage where conduits rise through concrete pad and floor slabs. Arrange so curved portion of bends is not visible above the finished slab.

G. Make bends and offsets so the inside diameter is not reduced. Unless otherwise indicated, keep the legs of a bend in the same plane and the straight
legs of offsets parallel.

H. Use raceway fittings compatible with raceway and suitable for use and location.

I. Raceways Embedded in Slabs: Install in middle third of the slab thickness where practical, and leave at least 1 inch (25 mm) concrete cover.

1. Secure raceways to reinforcing rods to prevent sagging or shifting during concrete placement.

2. Space raceways laterally to prevent voids in the concrete.

3. Run conduit larger than 1-inch trade size parallel to or at right angles to main reinforcement. When at right angles to reinforcement, place conduit close to slab support.

J. Install exposed raceways parallel to or at right angles to nearby surfaces or structural members, and follow the surface contours as much as practical.

1. Run parallel or banked raceways together, on common supports where practical.

2. Make bends in parallel or banked runs from same center line to make bends parallel. Use factory elbows only where they can be installed parallel; otherwise, provide field bends for parallel raceways.

K. Join raceways with fittings designed and approved for the purpose and make joints tight.

1. Make raceway terminations tight. Use bonding bushings or wedges at connections subject to vibration. Use bonding jumpers where joints cannot be made tight.

2. Use insulating bushings to protect conductors.

L. Terminations: Where raceways are terminated with locknuts and bushings, align the raceway to enter squarely, and install the locknuts with dished part against the box. Where terminations cannot be made secure with one locknut, use two locknuts, one inside and one outside the box.

M. Where terminating in threaded hubs, screw the raceway or fitting tight into the hub so the end bears against the wire protection shoulder. Where chase nipples are used, align the raceway so the coupling is square to the box, and tighten the chase nipple so no threads are exposed.

N. Install pull wires in empty raceways. Use No. 14 AWG zinc-coated steel or monofilament plastic line having not less than 200-lb (90 kg) tensile strength. Leave not less than 12 inches (300 mm) of slack at each end of the pull wire.

O. Telephone System Raceways 2-inch Trade Size and Smaller: In addition to the above requirements, install in maximum lengths of 150 feet (45 m) and with a maximum of two 90-deg bends or equivalent. Install pull or junction boxes where necessary to comply with these requirements.

P. Install raceway sealing fittings according to the manufacturer's written instructions. Locate fittings at suitable, approved, accessible locations and fill them with UL-listed sealing compound. Install raceway sealing fittings at the following points and elsewhere as indicated:

1. Where conduits pass from warm locations to cold locations, such as the boundaries of air-conditioned spaces.

2. Where otherwise required by the NEC.

Q. Stub-Up Connections: Extend conduits through concrete floor for connection to freestanding equipment with an adjustable top or coupling threaded inside for plugs, and set flush with the finished floor. Extend conductors to equipment with rigid steel conduit.

R. Install hinged cover enclosures and cabinets plumb. Support at each corner.

S. Provide grounding connections for raceway, boxes, and components as instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's

torquing requirements are not indicated, tighten connectors and terminals according to tightening torques specified in UL Standard 486A.

3.4 PROTECTION

A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, to ensure that coatings, finishes, and cabinets are without damage or deterioration at Substantial Completion.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.

3.5 CLEANING

A. Upon completion of installation of system, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finish, including chips, scratches, and abrasions.

16100-4 - METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work items of this Item will be lump sum.

16100-5 - BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

A. Payment for the work of this Item will be made at the contract lump sum price for the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Payment will be made under:

Item 16100.1 Raceways, Boxes and Cabinets -- lump sum

END OF ITEM 16100

ITEM 16110 ELECTRICAL DUCTS, POLE FOUNDATIONS, EQUIPMENT PADS, MANHOLES, AND HANDHOLES

16110-1DESCRIPTION

The work to be performed under this item includes, but is not limited to, the furnishing of all materials, labor, tools, and equipment required for the construction of underground electrical ducts, pole foundations, manholes, equipment pads, and handholes for the project; including all necessary pavement removal, excavation, backfilling and repaving; the furnishing and installation of manholes, pavement cutting and repair, testing; and all incidentals necessary to complete the work as indicated on the Plans and/or specified herein.

16110-2MATERIALS AND EQUIPMENT

2.1 General

a. All materials shall be new and suitable for the conditions and duties imposed upon them after installation. Where applicable, materials and equipment shall bear the approval label of the Underwriter's Laboratories, Inc.

2.2 Shop Drawings

a. Shop drawings shall consist of manufacturer's catalog cuts, working drawings, certified test reports, etc., and other materials or equipment which may be requested by the Engineer.

b. The Contractor shall keep at the site at all times during construction, one set of contract prints for the express purpose of showing any and all changes made during construction. The Contractor shall mark the prints showing each change and shall incorporate all changes in "Record/As-Built Drawings" to be submitted to the Engineer upon completion of the project.

2.3 Rigid Non-Metallic Conduit: Rigid non metallic conduit shall be High impact PVC (polyvinyl chloride) in accordance with NEMA TC2, 90° C. UL labeled, all fittings shall conform to TC3. Provide schedule 80 conduit and fittings, suitable for concrete encasement and direct burial.

2.4 Concrete Encasement: All electrical conduit below grade shall be encased in concrete.

2.5 Pull Wire for Nonmetallic Conduit: All conduit shall be provided with a plastic pull wire between pull points. Wire shall have no less than 200 pound tensile strength.

2.6 Buried Warning and Identification Tape: Buried warning and identification tape shall be polyethylene plastic tape manufactured specifically for warning and identification of buried utility lines. Tape shall be provided in rolls, 6 inches minimum width, color codes for electrical service with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be "CAUTION ELECTRICAL LINE BELOW" or similar wording. Code and letter coding shall be permanent, unaffected by moisture and other substances contained in trench backfill material.

2.7 Asphalt reinforcing Fabric: A nonwoven polypropylene fabric, heat set on one side having an asphalt retention of 0.20 gallons per sq. yd., with a minimum weight od 3.6 oz/sq. yd. as measured per ASTM Method D-3776. Fabric shall be Petromat as manufactured by AMOCO Fabrics and Fibers Co. or approved equal.

2.8 Handholes and Manholes: Construct at the locations and to the dimensions shown in the drawings. All handholes and manholes shall have a reinforcing collar, frame and cover as shown in the drawings.

2.9 Counterpoise wire: A number 8 AWG bare copper conductor, as specified in section 16450 shall be installed approximately 8" above conduits top.

16110-3- CONSTRUCTION METHODS

3.1 General

a. The Contractor shall furnish all materials, perform all excavation and backfill, construct all necessary joints and connections, construct all appurtenances, dispose of all surplus excavation and discard materials as may be necessary to complete the electrical ducts systems.

b. The Contractor shall assume all risk and bear any loss or injury to property or persons occasioned by neglect or accident during the progress of the work. The Contractor shall exercise special care during the work so as not to damage any existing utility lines or appurtenances.

c. Maintenance of Local Service: The Contractor shall exercise utmost care to avoid damage to trees and hedges, fences, electric, telephone, gas and water lines and other operating sewer lines, building, roads and all appurtenances thereto. The interruption of free access to streets and roads due to trench excavation shall be kept to a minimum. Traffic on airport driveway entrance shall be maintained at all times. All excavated material shall be piled in a manner that will not endanger the work and will not obstruct access to the site.

d. Gutters and ditches shall be kept clear at all times or other satisfactory provisions made. Drainage of natural water courses shall not be obstructed. All trenches, material, excavated pits, equipment and pipe which may cause a hazard of serve as obstruction to either vehicular or pedestrian traffic shall be enclosed by fences or barricades, adequately lighted, to protect persons from injury and to avoid property damage. Where traffic must cross open trenches, the Contractor shall provide suitable steel plates which will be subject to approval of the Engineer. The Contractor shall furnish temporary support, adequate protection and maintenance of all underground and surface structures, drains, telephone and electric conduits, sewers, and other obstructions encountered in the progress of the work.

e. Removal of Water: The Contractor shall at all times during construction provide proper and satisfactory means and devices for the removal of all water entering the excavated area, and he shall remove all such water as fast as it may collect to avoid interference with the prosecution of the work or unsuitable conditions for the proper placing of materials.

f. Delivery, Handling and Storage of Materials: Inspect materials delivered to site for damage. Unload and store with minimum handling. Store materials on site in enclosures or under protective covering. Store conduit under cover out of direct sunlight. Do not store materials directly on the ground. Keep inside of conduit and fittings free of dirt and debris. Handle conduit, fittings, and other accessories in such manner as to ensure delivery to the trench in sound undamaged condition. Carry pipe to the trench; do not drag it. Do not leave plastic conduit or materials that are not to be installed immediately out in the sunlight, but store under cover out of direct sunlight.

3-2 Trench and Pole Foundations Excavation

a. The Contractor shall excavate, protect, and back-fill all excavation that may be necessary for completing the work under the contract. Unless otherwise specified, excavation shall be fixed saw cut and as detailed in the drawings and specifications. Walls of trenches shall be essentially vertical so that a minimum of shoulder surface is disturbed.

b. In existing paved areas the Contractor shall remove the paving by a mechanized sawcut method for such width only as is necessary for the excavation of the trench, or pole foundation as shown on drawing details. If the Contractor removes the paving for a greater width than is deemed necessary, or in case he removes or disturbs any paving on account of settlement, slides or caves, or in making excavation outside

the lines of the work without the written order of the Engineer, the Contractor shall replace at his own expense such paving, or MAA may retain from any monies due or to become due to the Contractor, the cost of permanently replacing the paving so removed. The Contractor shall support the sides and ends of all excavations or structures, whenever necessary or directed, with braces or equivalent methods.

c. The Contractor shall be responsible for the condition of all excavations made. All slides and caves shall be removed without extra compensation, at whatever time and under whatever conditions that may occur.

d. The excavation of all trenches shall be fully completed in advance of conduit laying, unless otherwise authorized or directed. The Engineer may at any time require the backfilling of open trenches over completed conduit ducts, if in his judgment such action is necessary, and the Contractor shall thereby have no claim for extra compensation, even though to accomplish said backfilling he is compelled temporarily to stop excavation or other work at any place. If work is stopped on any trench, for any reason except by order of the Engineer, and the excavation is left open for an unreasonable length of time in advance of construction, the Contractor shall, if so directed,- backfill such trench at his own cost, and shall not again open said trench until he is ready to complete the related work therein. If the Contractor shall refuse or fail to backfill such trench completely within 48 hours after said notice, the Owner shall be authorized to do the work, and the expense thereof shall be charged to the Contractor.

e. All excavations must be kept free of water below the subgrade of the work while work is in progress. This may be accomplished by ordinary pumping methods, use of underdrains, or by wells points, whichever will produce the required results.

f. Pole foundation excavation shall be performed with mechanized auger equipment. Hole diameter shall be uniform from top to bottom. Expansion material shall be installed around circular pole foundation to interface with the full pavement thickness. Concrete encased ducts interface with pole foundations shall also have expansion material

3.3 Conduit installation and Trench Backfill

a. A flat layer of fine earth material, at least 4" thick (loose measurement) shall be placed in the bottom of the trench as bedding for the duct. The bedding material shall consist of soft dirt, sand and other fine fill, and it shall contain no particles that would be retained in a ¼" sieve. The bedding material shall be tamped until firm. When connecting handholes or manholes the conduit shall be installed with a slope toward manholes or handholes. Counterpoise copper wires shall be terminated at both ends in every duct section either at the grounding rods of lighting poles or handholes.

b. It is intended that the material excavated from the trench be used for trench backfill, provided that in the opinion of the Engineer, the excavated material is suitable for backfilling.

c. Backfill material shall be carefully deposited in the trench by methods which will not damage or disturb the conduit or structures, and shall be solidly tamped around the conduits. The volume from the bottom of the trench to a point 12 inches below road sub-base, or to grade, where the conduit is not laid in a road, shall be refilled in 6-inch compacted layers. All tamping of material from the bottom of the trench to the spring line shall be done by pneumatic hand tampers; or if the material is composed largely of coarse aggregate, the Engineer may require the use of other hand tampers, in order to insure protection of the pipe. Above this point, mechanical tampers capable of exerting a blow of 250 foot pounds per square foot of area of tamping face shall be employed.

d. The subgrade reinforcing fabric shall be installed at the locations indicated in the drawings.

e. The moisture content of the material being compacted shall be within plus or minus 3 percentage points of optimum, as determined by AASHTO Designation T-99. Material containing an excess of moisture shall be processed and dried, or permitted to dry until the moisture content is within the specified range. Material which is too dry shall be wetted until the moisture content is within the specified range.

f. The Engineer may make compaction tests of the backfilled trenches at any time during construction or upon completion of the backfill operations. If the results of any tests show that backfills do not meet the specified compaction requirements, the Contractor shall at his own expense, correct the condition, as directed by the Engineer, in such portions of the trench represented by the unsatisfactory test results.

g. Backfill in all excavations not in paved areas shall be restored to the condition that existed prior to beginning work, and maintained for a period of three months following the date of conditional acceptance. Where sod has been removed, it shall be replaced after the backfilling is completed. All areas disturbed by the trenching, storing of dirt or construction materials and equipment shall be restored to its original condition. Restoring includes any necessary topsoiling, sodding, liming, seeding, mulching and turfing materials, equipment and labor.

h. The Contractor shall, at his own expense, maintain all excavations and disturbed surfaces in proper condition. Just prior to the termination date for maintaining excavations, the trench surfaces shall be given final reshaping where necessary. All depressions appearing in the backfilled excavations shall be properly refilled. If the Contractor fails to make repairs within 48 hours after receipt of written notice from the Owner, the Owner may backfill said depressions or protect with signs and lanterns wherever necessary without giving previous notice to the Contractor and the cost of so doing will be retained from any monies due or to become due the Contractor under the Contract. The Contractor shall be responsible for any injury or damage that may result from lack of maintenance of any backfilled excavation at any time previous to the end of the mentioned termination dates.

i. All unauthorized excavations made by the Contractor shall be immediately backfilled in accordance with the requirements of the specifications for Excavation Backfill at the Contractor's expense.

j. After completion of backfilling, all material not used therein, shall be removed and disposed of in such a manner and at such point as shall be approved or directed and all roads, sidewalks, and other places on the line of the work shall be left free, clean, and in good order. Said cleaning up shall be done by the Contractor without extra compensation and, if he fails to do such work within a reasonable time after receipt of notice, it will be performed by the owner, and the cost will be retained out of the monies due or to become due the Contractor under the contract.

k. For concrete encased conduits see Item ____ for applicable construction methods.

3.4 Bituminous Asphalt Pavement and Overlay Reinforcing Fabric:

Refer to Item ____ for trench asphalt pavement repair and use of reinforcing fabric requirements.

16110-4- METHOD OF MEASUREMENT

Measurement will be made for this work which will be paid for on a unit price basis, complete, installed and functional.

4.1 No additional measurement for manhole, handhole, or equipment pad connections, or lighting pole foundation connections shall be made.

16110-5- BASIS OF PAYMENT

5.1 General

Payment for materials furnished and work done under the Contract will be made on a unit price basis as herein stipulated, for all materials supplied and work done under authorization of the Engineer. The Contractor shall not be entitled to receive additional compensation for anything furnished or done, except for such extra work as shall be required by written order. It is intended that all work required for a fully functioning electrical duct system be

included in this item whether shown on the Contract Drawings or included in the Specifications. The absence of work not specifically described in the Standard Specifications or shown on the Contract Drawings shall be interpreted as meaning that the cost of any such work contemplated by the Contract Documents, shall be included in the unit price bid for related items.

In the event that the Contractor is required to perform additional work by written order, the Contractor shall agree to perform such work at the corresponding contracted unit price rate for the item as quoted for the entire work.

Item 16110.1	**Electrical Handhole -- each**
Item 16110.2	**Electrical Manhole -- each**
Item 16110.3	**Pole foundation in grassy area -- each**
Item 16110.4	**Pole foundation in paved area -- each**
Item 16110.5	**4W-6" Concrete Encased Duct -- per lineal foot**
Item 16110.6	**4W-4" Concrete Encased Duct -- per lineal foot**
Item 16110.7	**4W-3" Concrete Encased Duct -- per lineal foot**

Item 16110.11	**2W-2" Concrete Encased Duct -- per lineal foot**
Item 16110.12	**1W-4" Concrete Encased Duct -- per lineal foot**
Item 16110.13	**1W-2" Concrete Encased Duct -- per lineal foot**
Item 16110.14	**Electrical Equipment Pad -- each**
Item 16110.15	**Electrical Vault -- each**

END OF ITEM 16110

ITEM 16120 WIRES AND CABLES

16120-1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

1.2 SUMMARY

A. This includes electric power, communication, and control wires and cables and associated splices, connectors, and terminations for wiring systems rated 600 volts and less.

B. The following Items contain requirements that relate to this Item:

1. Basic Electrical Requirements
2. Basic Electrical Materials and Methods

1.3 SUBMITTALS

A. General: Submit the following according to the Standard Provisions.

B. Manufacturer's product data on materials specified herein.

1.4 QUALITY ASSURANCE

A. Comply with NFPA 70 "National Electrical Code" for components and installation.

B. Listing and Labeling: Provide products specified in this Section that are listed and labeled.

1. The Terms Listed and Labeled: As defined in the "National Electrical Code, Article 100".
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

1.5 SEQUENCING AND SCHEDULING

A. Coordination: Coordinate layout and installation of cable with other installations.

1. Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Engineer.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver wire and cable according to NEMA WC-26.

16120-2- PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with require manufacturers offering products that may be incorporated in the Work includes but are not limited to, the following:

1. Wires and Cables:

a. American Insulated Wire Corporation, Leviton Manufacturing Co.
b. Brand-Rex Cable Systems, Bdntec Corp.
c. Carol Cable Company, Inc.
d. Senator Wire & Cable Co.
e. Southwire Co.
f. Chromatic Technologies, Inc.

2. Connectors for Wires and Cables:
a. AFC, Monogram Co.
b. AMP, Inc.
c. Anderson, Square D Co.
d. Electrical Products Division, 3M Co.
e. O-Z/Gedney Unit, General Signal.

2.2 POWER WIRES AND CABLES

A. Building Wire and Cable

1. UL-listed building wires and cables with conductor material, insulation type cable construction, and rating as specified in Part 3 "Applications" Article.
2. Rubber Insulation: Conform to NEMA WC 3.
3. Thermoplastic Insulation: Conform to NEMA WC 5.
4. Solid conductor for 1 0 AWG and smaller; stranded conductor for larger than 1 0 AWG.

B. Overhead Service Drop Cable

1. Configuration: Triplex - ACSR Neutral
2. Material: Stranded aluminum conductors with XLP insulation. Size as shown on contract drawings.

2.3 COMMUNICATION FIBER OPTIC CABLE

A. Fiber Optic Cable shall be twelve (24) fiber, heavy duty outdoor type, all glass graded index profile, multimode, Core 62.5 microns, 125 microns cladding in a loose tube buffer. Buffer tubes shall be blocked to prevent water penetration.

B. Strength member shall be Kevlar with a low smoke and flame retardant spread, outer jacket.

C. Cable shall withstand short term pulling loads up to 1000 pounds.

2.4 CONTROL CABLES

A. Type TC multiconductor control cable with THWN-2 (PVC/nylon) insulated stranded copper conductors. Number and size of conductors as shown on the contract drawings.

B. Overall outer jacker shall be heat, moisture, and sunlight resistant polyvinyl chloride (PVC).

2.5 CONNECTORS AND SPLICES

A. UL-listed factory-fabricated wiring connectors of size, ampacity rating, material, and type and class for application and for service indicated. Select to comply with Project's installation requirements and as specified in Part 3 "Applications" Article.

16120-3- EXECUTION

3.1 EXAMINATION

A. Examine raceways and building finishes to receive wires and cables for compliance with installation tolerances and other conditions. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Feeders: Type THHN/THWN, copper conductor, in raceway.

B. Branch Circuits: Type THHN/THWN, copper conductor, in raceway.

3.3 INSTALLATION

A. Install wires and cables as indicated, according to manufacturers written instructions and the NECA "Standard of Installation."

B. Pull conductors into raceway simultaneously where more than one is being installed in same raceway.

1. Use pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation.
2. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips that will not damage cables or raceway.

C. Conductor Splices: Keep to minimum.

1. Install splices and tapes that possess equivalent or better mechanical strength and insulation ratings than conductors being spliced.
2. Use splice and tap connectors that are compatible with conductor material.

D. Wiring at Outlets: Install with at least 12 inches (300 mm) of slack conductor at each outlet.

E. Connect outlets and components to wiring and to ground as indicated and instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturers published torque-tightening values for equipment connectors. Where manufacturers torquing requirements are not indicated, tighten connectors and terminals according to tightening torques specified in UL Standard 486A.

F. Fiber optic cables shall be not be spliced, unless approved by the Engineer. Splicing method shall be fusion with .3 db maximum loss. Splicing shall include all fibers.

3.4 FIELD QUALITY CONTROL

A. Testing Firm: Provide the services to perform specified field quality-control testing.

B. Testing: Upon installation of wires and cables and before electrical circuitry has been energized, demonstrate product capability and compliance with requirements.

1. Procedures: Perform each visual and mechanical inspection and electrical test stated in NETA Standard ATS, Section 7.3.1. Certify compliance with test parameters.

C. Correct malfunctioning products at site, where possible, and retest to demonstrate compliance; otherwise, remove and replace with new units, and retest.

16120-4- METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work item of this Item by Lump Sum.

16120-5- BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

A. Payment for the work of this Item will be included as part of the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Item 16120.1 Wires and Cables -- lump sum

END OF ITEM 16120

ITEM 16141 WIRING DEVICES

16141-1- GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Sections, apply to this and the other electrical sections.

1.2 SUMMARY

A. This section shall include switches, receptacles, and control devices required for a complete installation as shown and specified.

B. The following Sections contain requirements that relate to this section:

1. Raceways, Boxes, and Enclosures.
2. Wires and Cables.
3. Labeling and Identification.
4. Lighting Equipment.

1.3 SUBMITTALS

A. General: Submit the following according to the Standard Provisions.

B. Submit manufacturer's product data on all products specified herein.

1.4 QUALITY ASSURANCE

A. Comply with NFPA 70 "National Electrical Code" for components and installation.

B. Listing and Labeling: Provide products specified in this Section that are listed and labeled.

1. The Terms Listed and Labeled: As defined in the "National Electrical Code, Article 100".
2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.

1.5 SEQUENCING AND SCHEDULING

A. Coordination: Coordinate layout and installation of devices with other existing installations. Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Engineer.

16141-2- PRODUCTS

2.1 GENERAL

A. Switches and Receptacles

1. Receptacles
   a. Wall receptacles shall be NEMA 5-20R duplex rated 20 amperes at 120 VAC of the two-pole, three wire type. They shall be suitable for use with a three-

wire polarized plug having two parallel blades and shall have the third leg grounded. Receptacle circuits shall have ground fault protection for personnel.

b. Receptacles shall be specification grade.

c. Device boxes shall be of the type appropriate for each location as specified under Section 16100.

2. Switches

a. Lighting switches shall be rated 20 amperes at 120/277 VAC, toggle operated, plastic enclosed, single pole, three-way or four-way as shown or required.

b. Switches shall be suitable for controlling HID type lighting.

c. Device boxes for switches shall be of the type appropriate for each location as specified under Section 16100.

3. Contactors

a. Electrically operated, mechanically held, 6 pole, 20 ampere.

b. Furnish exterior lighting contractor in enclosure with hand/off/auto control switch.

c. Exterior lighting contractor shall be suitable for use with photoswitches.

4. Photoswitches

a. Furnish turn-lock type photoswitch wall or roof mounted for automatic control of exterior lighting.

b. Furnish all mounting and wiring accessories.

16141-3- EXECUTION

3.1 GENERAL

A. Wall receptacles and switches shall be mounted at 48 inches above the finished floor of the maintenance building and, or as directed by the Engineer.

B. Install all devices in accordance with Section 16010.

16141-4- METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

Measurement will be made for the work item of this Section by Lump Sum.

16141-5- BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

Payment for the work of this Section will be made at the contract lump sum price for the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Payment for work will be made under:

Item 16141-1 Wiring Devices -- lump sum

END OF SECTION 16141

SECTION 16170 MOTOR AND CIRCUIT DISCONNECTS

16170-1- GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

1.2 SUMMARY:

A. This Item specifies requirements for safety switches.

1.3 RELATED WORK OF OTHER SECTIONS:

A. It shall be the responsibility of the Contractor to coordinate work between all sections and trades required for the proper completion of the work of this Item.

1.4 REFERENCES AND STANDARDS:

A. All work shall be performed in accordance with the designated standards or references specified and all current addendums, parts or revisions to said references or standards.

B. In event if a duplication, conflict or contradiction in or between the specified references listed herein the most stringent requirements shall prevail as determined by the Engineer.

C. All products, materials, equipment, installation and/or systems shall be provided and installed in full compliance with the references and/or standards specified and the codes, rules or regulations governing same. Where standards are specified, and have more than one part, applicable part or parts as determined by the Engineer shall govern.

1.5 SUBMITTALS:

A. Manufacturer's printed specifications and details.

16170-2 - PRODUCTS

2.1 SAFETY SWITCHES:

A. Safety type disconnecting switches shall be heavy duty, Class 3, Design 3, unless otherwise indicated, mounted in NEMA 4X enclosures. Enclosures exposed to wet or rain conditions shall be NEMA 3R, rain-tight type. Switches shall be rated at 600 volts minimum or as required by the voltage of the circuit on which they are utilized. Switches shall be rated in horsepower, and each shall be capable of interrupting the locked rotor current of the motor for which used. The current will be assumed as ten (10) times the full rated load current.

B. The switches shall be of the quick-make, quick-break type, and all parts shall be mounted on insulating bases to permit replacement of any part from the front of the switch.

C. Safety switches located at motors and which are used as disconnects for maintenance only, shall be unfused.

16170-3 - EXECUTION

3.1 INSTALLATION:

A. Provide nameplate on cover of each switch indicating purpose or load served by the safety switch. Rivet or bolt and gasket the nameplate on cover of NEMA 3R or NEMA 4X enclosures.

B. Install switches so that the maximum height above the floor to the center of the operating handle does not exceed 6'-0".

16170-4- METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work item of this Item by lump sum.

16170-5- BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

A. Payment for the work of this Item will be included as part of the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Item 16170-1 **Motor and Circuit Disconnects -- lump sum**

END OF ITEM 16170

SECTION 16195 LABELING AND IDENTIFICATION

16195-1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

B. Requirements of the following Items.

1. "Basic Electrical Requirements"
2. "Basic Electrical Materials and Methods"

1.2 SUMMARY:

A. This Item specifies the requirements for labeling and identification as specified herein for all indicated electrical items, including:

1. Plastic laminate nameplates to identify Disconnect Switches, Starting Devices, Control Switches.

2. Wire markers at each end of all feeders and control wiring, and feeder wires only in all junction and pull boxes.

3. Labels for exposed conduits, conduits containing feeders, and communications.

4. Identification labeling for raceways, cables, underground conduits and conductors.

5. Operational instruction signs.

6. Warning and caution signs.

7. Equipment labels and signs.

B. Related Items: The following items contain requirements that relate to this item.

1. Wires and Cables for requirements for color coding of conductors for phase identification.

1.3 REFERENCES AND STANDARDS:

A. All work shall be performed in accordance with the designated standards or references specified and all current addendums, parts or revisions to said references or standards.

B. In event if a duplication, conflict or contradiction in or between the specified references listed herein the most stringent requirements shall prevail as determined by the Engineer.

C. All products, materials, equipment, installation and/or systems shall be provided and installed in full compliance with the references and/or standards specified and the codes, rules or regulations governing same. Where standards are specified, and have more than one part, applicable part or parts as determined by the Engineer shall govern.

1.4 SUBMITTALS:

A. Descriptive literature for materials and products specified.

16195-2 - PRODUCTS

2.1 MATERIALS:

A. Equipment Nameplates:

1. Nameplates shall be white core, black laminated plastic having engraved letters.

2. Letter size and nomenclature shall be as specified hereinafter.

B. Conduit Labels:

1. Labels on feeder conduits shall be colored adhesive bands as specified. Letters for lettering on conduit shall be at least 1" inch high.

2. Labels on communication conduits shall be 2 blue bands.

C. Wire Markers: Numerical and alphabetical legends shall be printed in sharp, clear, bold face type. Legends shall be black on an opaque white background. Wire markers shall be plasticized cloth type Brady B-500, Thomas and Belts WBC or Engineer approved equal.

D. Adhesive bands shall be W.H. Brady Co. "Quick-Label" or Engineer approved equal.

E. Underground Line Marking Tape shall be permanent, bright-colored, continuous printed, plastic tape compounded for direct-buried conduit not less than 6 inches wide by 4 mils thick. Printed legend indicative of general type of underground line below.

16195-3 - EXECUTION

3.1 INSTALLATION

A. Lettering and Graphics: Coordinate names, abbreviations, colors, and other designations used in electrical identification work with corresponding designations specified or indicated. Install numbers, lettering, and colors as approved in submittals and as required by code.

B. Install identification devices in accordance with manufacturer's written instructions and requirements of NEC.

C. Sequence of Work: Where identification is to be applied to surfaces that require finish, install identification after completion of finish work.

D. Conduit Identification:

1. The following areas shall be identified:

a. On entire surface of exposed conduits.

2. Apply identification to areas as follows:

a. Clean surface of dust, loose material, and oily films before painting.

b. Prime surfaces: For galvanized metal, use single-component acrylic vehicle coating formulated for galvanized surfaces. For concrete masonry units, use heavy-duty acrylic resin block filler. For concrete surfaces, use clear alkali-resistant alkyd binder-type sealer.

c. Apply one intermediate and one finish coat of orange silicone alkyd enamel.

d. Apply primer and finish materials in accordance with manufacturers instructions.

E. Identify Raceways of Certain Systems with Color Banding: Band exposed or accessible raceways of the following systems for identification. Bands shall be pretensioned, snap-around colored plastic sleeves, colored adhesive marking tape, or a combination of the two. Make each color band 2 inches wide, completely encircling conduit, and place adjacent bands of two-color markings in contact, side by side. Install bands at changes in direction, at penetrations of walls and floors, and at 40-foot maximum intervals in straight runs.

F. Identify Junction, Pull, and Connection Boxes: Code-required caution sign for boxes shall be pressure-sensitive, self-adhesive label indicating system voltage in black, prepainted on orange background. Install on outside of box cover. Also label box covers with identity of contained circuits. Use pressure-sensitive plastic labels at exposed locations and similar labels or plasticized card stock tags at concealed boxes.

G. Conductor Color Coding: Provide color coding for secondary service, feeder, and branch circuit conductors throughout the project secondary electrical system as follows:

208/120 Volts	Phase	480/277 Volts
Black	A	Yellow
Red	B	Brown
Blue	C	Orange
White	Neutral	White
Green	Ground	Green

H. Use conductors with color factory-applied the entire length of the conductors except as follows:

1. The following field-applied color-coding methods may be used in lieu of factory-coded wire for sizes larger than No. 10 AWG.

a. Apply colored, pressure-sensitive plastic tape in half- lapped turns for a distance of 6 inches from terminal points and in boxes where splices or taps are made. Apply the last two laps of tape with no tension to prevent possible unwinding. Use 1-inch-wide tape in colors as specified. Do not obliterate cable identification markings by taping. Tape locations may be adjusted slightly to prevent such obliteration.

b. In lieu of pressure-sensitive tape, colored cable ties may be used for color identification. Apply three ties of specified color to each wire at each terminal or splice point starting 3 inches from the terminal and spaced 3 inches apart. Apply with a special tool or pliers, tighten for snug fit, and cut off excess length.

I. Power Circuit Identification: Securely fasten identifying metal tags or aluminum wraparound marker bands to cables and feeders in pull boxes, junction boxes, and Electrical Closets with ¼-inch steel letter and number stamps with legend to correspond with designations on Drawings. If metal tags are provided, attach them with approximately 55-lb test monofilament line or one-piece self-locking nylon cable ties.

J. Tag or label conductors as follows:

1. Future Connections: Conductors indicated to be for future connection or connection under another contract with identification indicating source and circuit numbers.

2. Multiple Circuits: Where multiple branch circuits or control wiring are present in the same box or enclosure (except for three-circuit, four-wire home runs), label each conductor or cable. Provide legend indicating source, voltage, circuit number, and phase for branch circuit wiring. Phase and voltage of branch circuit wiring may be indicated by mean of coded color of conductor insulation. For control wiring, use color coding or wire/cable marking tape at terminations and at intermediate locations where conductors appear in wiring boxes, and control cabinets. Use consistent letter/number conductor designations throughout on wire/cable marking tapes.

3. Match identification markings with designations used in panelboards shop drawings, Contract Documents, and similar previously established identification schemes for the facility's electrical installations.

K. Apply warning, caution, and instruction signs and stencils as follows:

1. Install warning, caution, or instruction signs where required by NEC, where indicated, or where reasonably required to assure safe operation and maintenance of electrical systems and of the items to which they connect. Install engraved plastic-laminated instruction signs with approved legend where instructions or explanations are needed for system or equipment operation. Install butyrate signs with metal backing for outdoor items.

L. Install equipment/system circuit/device identification as follows:

1. Apply equipment identification labels of engraved plastic-laminate on each major unit of electrical equipment in building, including central or master unit of each electrical system. This includes alarm systems, unless unit is specified with its own self-explanatory identification. Except as otherwise indicated, provide single line of text, with ½-inch-high lettering on 1½-inch-high label (2-inch-high where two lines are required), white lettering in black field. Text shall match terminology and numbering of the Contract Documents and shop drawings. Apply labels for each unit of the following categories of electrical equipment.

a. Panelboards, electrical cabinets, and enclosures.

b. Contactors.

c. Dimmers.

d. Control devices.

M. Apply circuit/control/item designation labels of engraved plastic laminate for disconnect switches, breakers, pushbuttons, pilot lights, and similar items for power distribution and control components above, except panelboards and alarm/signal components,

ITEM 16470 POWER DISTRIBUTION EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Sections, apply to this and the other electrical sections.

1.2 REFERENCE STANDARDS

A. American National Standards Institute, (ANSI).

B. National Electrical Manufacturers Association (NEMA).

C. National Fire Protection Association (NFPA): National Fire Codes 70, National Electrical Code

D. Underwriters' Laboratories (UL).

E. US Department of Agriculture; Rural Electrification Administration Bulletins 803 & 804.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements:

1. Comply with requirements in following order of precedence:

a. Codes, laws, ordinances, rules, regulations or orders of any public authority having jurisdiction over installation, materials, inspection, and testing, including local electrical codes and requirements.
b. Applicable provisions of National Electrical Code, latest edition.
c. Provisions specified in this Section.

2. Manufacturing workmanship and materials shall comply with applicable provisions of NEMA, ANSI, ICEA, and UL standards.
3. Electrical equipment shall be UL listed and comply with UL standards in all cases where UL has published lists and standards applicable to type of equipment required to be provided.

1.4 PRODUCT HANDLING

A. Store indoors boxes, panelboards, circuit and other items subject to damage due to exposure to weather conditions and moisture accumulations; and protect from damage.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with require manufacturers offering products that may be incorporated in the Work includes but are not limited to, the following:

1. General Electric.

2. Gould.
3. Square D.
4. Westinghouse.

2.2 DISTRIBUTION PANELBOARD

A. Type:

1. Dead front type with interiors completely factory assembled.
2. Comply with NEMA PB 1.
3. Hinged doors with cylinder locks keyed alike.
4. Directory cards on inside of door.

B. Panel Bussing, Neutral Bars, and Connections Straps:

1. Copper bolted together.
2. Phase bussing: Full height without size reduction.
3. Equip neutral bars and circuit breakers with solderless load connectors.

C. Branch Circuit Breakers: Furnish spaces for future addition with bus connection straps for maximum device rating which can be installed.

D. Panelboard Enclosure:
1. NEMA 12/3R.
2. Provide minimum wiring gutter space of 4 in. on sides.
3. Provide additional gutter space in panels having branch circuit conductors larger than No. 4/0.
4. Finish: Manufacture's standard grey paint finish.

F. Circuit Breakers:
1. Molded case, thermal magnetic type.
2. Arrange breakers rated 400 amperes and less in double row construction.

G. For distribution panelboard serving as main distribution panelboard meeting following requirements:

1. Ratings, capacities, and characteristics shall equal requirements of service entrance equipment.
2. Provide ground fault protection including:
   a. Branch (GFI) circuit breakers shall detect low level ground faults.
   b. Ground fault protection equipment shall include sensor, current monitor, and test circuit with pushbutton.
3. Provide ground bus.

2.3 DRY TYPE TRANSFORMER

A. Ratings:
1. General Purpose Dry Type; ANSI/NEMA ST 20, 1986
2. Insulation rating: 150 degree winding temperature rise above 40 degree C ambient.
3. kVA and Voltage ratings as shown on the drawings.
4. Sound Level: Not to exceed 45 dB.
5. Primary Taps: 4 - 2 1/2% full capacity minimum. Two above, two below nominal primary voltage.

B. Construction:
1. Steel ventilated enclosure (NEMA 3R) with manufacturer's standard grey painted finish.

2. Coil Conductors: Continuous copper windings with terminations brazed or welded.
3. Core and coil isolated from enclosure using vibration absorbing mounts.
4. Furnish manufacturers wall mounting brackets.

2.4 SAFETY SWITCHES

A. Ratings:
1. Enclosed safety switch (NEMA KS1-1983, Type HD)
2. 100 Amp, 3 Pole, 480 Vac.
3. Suitable for use as service entrance equipment.
4. NEMA 3R or 4X enclosure, as shown on the contract drawings.
5. Full cover interlocks.

B. Construction: Metal enclosure.

2.5 OVERHEAD SERVICES

A. Poles: 35 ft., Class 5 treated wood pole.

B. Service Masts and Weatherheads: 1" rigid galvanized steel secured to pole at 4 ft. intervals.

C. Overhead Wire Supports: Material and installation shall be furnished in accordance with the US Department of Agriculture Rural Electrification Administration standards for overhead electric utility distribution systems.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install panelboards indoors level with top of box or cabinet 6 ft. 6 in. above finished floor.
B. Mounting:
1. Dry wall construction: Toggle bolts.
2. Concrete and masonry construction: Expansion shields with bolts or screws.
3. Plywood backboards: Screws.
4. Building structural steel members: Weld preformed channel to structural steel members.

C. Type directory cards indicating circuits and areas served.

D. Install all equipment in accordance with requirements of Section 16050.

PART 4 - METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

Measurement will be made for the work item of this Section by lump sum.

PART 5 - BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

Payment for the work of this Section will be included as part of the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Payment for work will be made under:

Item 16470-1 **Power Distribution Equipment -- lump sum**

END OF SECTION 16470

ITEM 16510 LIGHTING

16510-1- GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Items, apply to this and the other electrical items.

B. Requirements of the following Items apply:

1. "Basic Electrical Requirements"
2. "Grounding"
3. "Wires and Cables"
4. "Raceways, Boxes, and Cabinets"
5. "Electrical Ducts, Pole Foundations, Equipment Pads, Manholes, and Handholes"

The Contractor shall be responsible for the proper mounting and orientation of all lighting fixtures to be installed under this Contract. All locations shall be examined by the Engineer before proceeding with the ordering of materials or the construction of foundations.

1.2 SUMMARY:

A. This Item specifies requirements for providing lighting systems completely lamped and wired as indicated.

1.3 REFERENCES AND STANDARDS:

A. All work shall be performed in accordance with the designated standards or references specified and all current addendums, parts or revisions to said references or standards.

B. In event of a duplication, conflict or contradiction in or between the specified references listed herein the most stringent requirements shall prevail as determined by the Engineer.

C. All products, materials, equipment, installation and/or systems shall be provided and installed in full compliance with the references and/or standards specified and the codes, rules or regulations governing same. Where standards are specified, and have more than one part, applicable part or parts as determined by the Engineer shall govern.

D. The following is a listing of the publications referenced in this Section:

1. American National Standards Institute (ANSI):
2. National Fire Protection Association ((NFPA):
3. Underwriters Laboratories, Inc. (UL):
4. Illuminating Engineers Society (IES):
   Handbooks, Reference, and Application Volumes.

1.4 SUBMITTALS:

A. Shop drawings and data for lighting fixtures, showing types, size, accessories, installation details and other details of construction including complete bill of materials showing quantity, description and rating of all components, sizes and gages of material and finish of specified items.

B. Manufacturer's data for all fixtures indicating mechanical and electrical construction.

C. Lighting fixture photometrics with fixture output in candela, coefficient of utilization table, and isofoot candle curves. Format data in accordance with I.E.S. recommended practices.

D. Lamp manufacturer's data showing spectral power distribution curve, color temperature, and the "x, y" coordinates locating the chromaticity on the C.I.E chromaticity diagram for each lamp to be provided.

16510-2- PRODUCTS

2.1 LIGHTING FIXTURES AND ACCESSORIES:

A. General:

1. Lighting fixtures and accessories shall conform to the requirements of UL1572 and NEMA LE-3. Lighting fixtures shall be provided complete with lamps of the number, type, voltage and wattage shown. Lighting fixture and corresponding pole shall have the same dark bronze color.
2. Luminaries type and manufacturer shall be as shown in the Fixture Schedule included with the drawings.
3. Manufacturers for all luminaries shall be as shown on the fixture schedule in the plans.

B. POLE MOUNTED LUMINARIES

Pole mounted luminaries shall be rectilinear semi-cutoff luminaries with high pressure sodium lamps (unless otherwise noted) conforming to the following:

1. The housing shall be rectilinear in shape totally enclosed and be a one-piece die-cast aluminum housing with a dark bronze polyester powder paint finish. The door shall be a one piece die-cast aluminum piece with a no-tools access design to all parts. All exposed hardware shall be made of stainless steel.
2. Optical assembly shall have an aluminum reflector with an anodized finish chemically bonded. Reflector shall be field rotatable. Lens cover shall be heat and impact resistant, tempered flat glass. Lamp socket shall be heavy duty.
3. The optical assembly shall produce a light distribution as shown on the contract drawing luminaire schedule.
4. All fixtures shall bear UL 1572 suitable for wet locations.
5. The luminary ballast shall be capable of providing reliable lamp starting down to -20 degrees F., shall have a power factor of .90 or higher, and shall be of the regulating type providing ± 10 percent lamp power regulation with a ± 10 percent variation from rated input voltage. Ballast shall be suitable for use on 277 volt circuits.

C. T-HANGAR AREA LIGHTING FLOODLIGHTS

1. The housing shall be a two piece die-cast aluminum housing with hinged gasketed front for relamping access. All aluminum parts shall have an electrocoat dark bronze finish. All exposed hardware shall be made of stainless steel. A rifle aiming type with adjustable aiming stops shall be provided. Mounting system shall be knuckle slipfitter type suitable for 1.9" to 2.38" diameter tenon.
2. Optical assembly shall be sealed with an aluminum reflector with an anodized finish chemically bonded. Lens cover shall be heat and impact resistant, tempered flat glass. The optical assembly shall provide precise vertical beam control. Lamp socket shall be heavy duty. Glare control shields shall be provided.
3. The reflector assembly shall have IES 6x6 distribution.
4. All fixtures shall bear UL 1572 suitable for wet locations.

5. The luminary ballast shall be capable of providing reliable lamp starting down to -20 degrees F., shall have a power factor of .90 or higher, and shall be of the regulating type providing ±10 percent lamp power regulation with a ±10 percent variation from rated input voltage. Ballast shall be suitable for use on 240 volt circuits.

E. EXTERIOR WALL LUMINAIRES

1. General: Exterior wall mounted lighting fixtures shall be UL listed for wet location applications.
2. Provide integral photocell control for exterior lighting fixtures.
3. HID Lamps: Provide the number, type, and wattage indicated. Provide lamp type conforming to ANSI C78.
4. HID Ballasts: HID ballasts shall conform to UL 1029 and ANSI C82.4, "Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps (Multiple-Supply Type)" constant wattage autotransformer (CWA) or regulator, high power factor type, unless otherwise indicated. Ballasts shall operate on the voltage system to which they are connected. Single-lamp ballasts shall have a minimum starting temperature of minus 30 degrees C. Ballasts shall be designed for installation in a normal ambient temperature of 40 degrees C. Ballasts shall be constructed so that open circuit operation will not reduce the average life. High pressure sodium (HPS) ballasts shall have a solid-state ignitor/starter with an average life in the pulsing mode of 10,000 hours at an ignitor/starter case temperature of 90 degrees C. Average life is defined as the time after which 50 percent will have failed and 50 percent will have survived under normal conditions.

F. INTERIOR FLUORESCENT LUMINAIRES

1. General: Conform to UL 1570, except for damp and wet locations conform to UL 57.
2. Fluorescent Lamps: Provide the number, type, and wattage indicated. Provide lamps conforming to American National Standards Institute (ANSI) C78.
3. Fluorescent Ballasts: Provide fluorescent ballasts conforming to UL 935, "Fluorescent-Lamp Ballasts," ANSI C82.1, "Ballasts for Fluorescent Lamps - Specifications." Provide fixtures labeled by CBM and certified by Electrical Testing Laboratories (ETL). Ballasts shall be high power factor type, unless indicated otherwise, designed to operate on the voltage system to which they are connected. Ballasts shall be Class P with sound rating "A" unless otherwise noted. Fixtures and ballasts shall be designed and constructed to limit the ballast case temperature to 90 degrees C. when installed in an ambient temperature of 40 degrees C.
   a. Low Temperature Ballasts: Provide fluorescent ballasts having a minimum starting temperature of minus 20 degrees C. in fixtures located where ambient temperature may fall below 50 degrees F.
   b. Energy-Saving Ballasts: Provide electronic high frequency energy-saving fluorescent ballasts of the CBM certified full light output type, compatible for use with energy-saving lamps tested in accordance with ANSI C82.2, "Fluorescent Lamp Ballasts - Methods of Measurement," methods.
4. Electromagnetic Interference Filters: Provide electromagnetic interference filters in fluorescent fixtures. Filters shall be integral to the fixture assembly, one filter per ballast and shall suppress electromagnetic interference as required by MIL-STD-461, "Electromagnetic Emission and Susceptibility Requirements for the Control of Electromagnetic Interference."
5. Lamp Sockets: Comply with UL 542 and ANSI C81.20, "Electric Lamp Bases and Holders - Fluorescent Types, Specifications for."

G. EMERGENCY LIGHTING

1. General: Provide emergency lighting equipment conforming to UL 924, NFPA 70 and NFPA 101.
2. Types: Provide types of emergency lighting equipment as follows:
   a. Lens type self-contained emergency lighting unit as described
   b. Housing: Steel painted satin black housing.
   c. Battery shall be maintenance free, nickel cadmium with full 5-year warranty plus minimum 5-year pro-rata.
   d. Unit shall have solid state automatic charger, capable of fully recharging in 12 hours.
   e. Switching and controls sealed transfer switch, test switch, short circuit protection and low voltage, deep discharge disconnect, high charge indicating light. Sealed relay activates lamp when supply voltage drops to 80 percent of nominal.
   f. Lamps: Minimum two 6-watt tungsten halogen lamp.
   g. Surface mounting.

H. LIGHTED EXIT SIGNS

1. General: Provide exit signs conforming to UL 924, NFPA 70 and NFPA 101.
2. Housing: Impact resistant polycarbonate housing and stencil face lens.
3. Provide AC powered exit signs with battery back-up and automatic high/low trickle charger in a self-contained power pack. Battery shall be sealed, maintenance-free, nickel cadmium type with a 15-year life expectancy and a 5-year full warranty plus 7-year pro-rata.
4. Luminaire Requirements:
   a. Letters shall be 6 inches tall with 3/4 inch strokes formed by a stencil face.
   b. Provide red letters on white face.
   c. Provide 2, 7 watt compact fluorescent lamps.
   d. Provide single or double face as indicated.
   e. Provide ceiling, end wall, back wall or pendant mounting as indicated.
   f. Units mounted exposed to weather or damp/wet environment shall have a damp or wet UL label as appropriate and shall not be constructed of steel.
   g. Provide internal provisions for grounding.

I. FIBERGLASS LIGHTING POLES

1. Pole shall be hollow single piece straight round tapered fiberglass unit with smooth finish brown color pigmented resin. Poles shall be non conductive and chemically inert.
2. Poles shall be designed for a minimum safety factor of 2 to 1 and have no more than a 10% deflection at full wind loading. Pole recommended loading shall be 3.5 square feet at 100 m.p.h. E.P.A. Poles indicated to carry banners shall have recommended loading shall be 10 square feet at 100 m.p.h.
3. Poles shall have an hot galvanized steel anchor base bonded to the pole with a high strength adhesive and coated with a matching urethane finish. The shaft of the base mount shall be arc welded to the inside and outside of the base plate entire circumference.
4. All anchor bolts and nuts shall be furnished with pole.
5. Pole top shall be provided with an aluminum cap, tenon shaped to accept the pole mounted luminary being supported. Cap shall be coated with matching urethane finish.
6. Poles shall be equipped with a reinforced handhole, oval shape 3x5 inches with matching finished aluminum cover.
7. Poles manufacturer shall be W. J. Watley Inc., Commerce City, Colorado. Heavy Duty Series A3324 for poles without banners and Series A43 for poles with banners.

J. CABLE CONNECTORS AND CONNECTOR KITS

1. Connector kits shall conform to the materials and construction requirements of SHA Standard Specifications, Section 810.
2. Connector kits shall be provided for each lighting pole. Provide non-fused connectors for all neutral conductors.

2.2 GROUNDING

All conduit systems, electrical equipment, equipment enclosures, conduit ducts, lighting poles and accessories shall be grounded in accordance with Section 16450 requirements of the specifications.

2.3 LABELING AND IDENTIFICATIONS

All electrical equipment wiring installed under this contract shall be properly labeled per the requirements of Section 16195 of these Specifications.

2.4 FOUNDATIONS:

A. Excavation, concrete work, grounding and backfill are included in other sections of this work.

16510-3- EXECUTION

3.1 INSTALLATION:

A. Lighting fixtures installation shall conform with the requirements of NFPA 70.

B. Provide nighttime adjustment of all adjustable lighting units and floodlighting, etc. as required to the satisfaction of the Engineer.

3.2 TESTS

The Contractor shall furnish all labor, materials, instruments and equipment necessary for testing the wiring system during the progress of the work and after the installation is completed. The Contractor shall demonstrate to the satisfaction of the Engineer the following:

A. That all lighting, power and control circuits are continuous and free from short circuits and unspecified grounds.

B. That the insulation resistance to ground and between all other conductors in the same cable or conduit is not less than 50 megohms.

C. That all circuits are properly connected in accordance with applicable wiring diagrams.

D. That all circuits are operable. Lights shall be operated with no failures within a continuous 48-hour period prior to acceptance.

16510-4- METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

A. Measurement will be made for the work item of this Item by unit.

16510-5 - BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

A. Payment for the work of this Item will be included as part of the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems. Payment will be made under:

Item 16510.1	**Pole Mount Luminaire -- each**
Item 16510.2	**Exterior Wall Luminaire -- each**
Item 16510.3	**Interior Fluorescent Luminaire -- each**
Item 16510.4	**Emergency Lighting Unit -- each**
Item 16510.5	**Lighted Exit Sign -- each**
Item 16510.6	**3.5 EPA Light Pole -- each**
Item 16510.7	**10 EPA Light Pole -- each**

END OF ITEM 16510

ITEM 16900 GENERAL INSTRUMENTATION

16900-1- GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and Standard Provisions of Contract, including Technical Provisions and all Technical Specification Sections, apply to this and the other electrical sections.

1.2 SUMMARY

A. This section shall include the automatic telephone dialer and alarm reporting system to be interconnected with the sewage pump station high level alarm panels, oil/water separator high level alarm panels, fire alarm panel, and diesel fuel level indicators as shown on the contract drawings.

B. The following Sections contain requirements that relate to this section:

1. Raceways, Boxes, and Enclosures.
2. Wires and Cables.
3. Labeling and Identification.

1.3 SUBMITTALS

A. General: Submit the following according to the Standard Provisions.

B. Submit manufacturer's product data on telephone autodialer/alarm reporting system.

1.4 QUALITY ASSURANCE

A. Uniformity: Unless otherwise specified, equipment or material of same type of classification, shall be products of same manufacturer. All material shall be new and of the latest design of manufacturer providing equipment or material.

B. Design: Equipment and accessories not specifically described or identified by manufacturer's catalog numbers shall be designed in conformity with ISA, ANSI, ASME, ASTM, and other applicable technical standards and shall have a neat and finished appearance.

C. Comply with NFPA 70 "National Electrical Code" for components and installation.

1.5 SEQUENCING AND SCHEDULING

A. Coordination: Coordinate layout and installation of devices with other existing installations. Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Engineer.

16900-2- PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering Products that may be incorporated in the Work include, but are not limited to, the following:

1. Omega Engineering, Inc.
2. EOS Research LTD.
3. Odessa Engineering, Inc.
4. RACO Manufacturing and Engineering Co.

2.2 AUTODIALER

A. The automatic dialing alarm system shall be microprocessor based and shall have the capability to monitor at least 16 inputs configured as analog inputs, discrete inputs (dry contact) or a combination of both analog and discrete inputs. In addition, the autodialer shall monitor the AC power supplied to it. Upon detecting an alarm on any of its inputs, or detecting loss of its AC power, the autodialer shall dial a minimum of two user-programmed telephone numbers.

The autodialer shall deliver to the called party(s) an audio (speech-synthesized English) or printed (facsimile) report on alarm conditions that are present including location of each alarm. In addition to voice or facsimile reports, the unit shall be able to provide data communication via an integral telephone modem to a remotely located "personal" computer.

A datalogger shall be an integral part of the autodialer and provide the ability to log data from all 16 inputs and store this information internally for retrieval at any time via modem. Data logging intervals shall be variable from seconds to several hours.

The autodialer shall be provided with all software and system programming for remote retrieval and monitoring of system input channels.

The autodialer construction shall conform to the following:

1. Enclosure: Minimum rating of NEMA 4X.
2. Environmental Limits: Temperature : 0-49 degrees Celsius. Humidity: 0 - 90% non-condensing.
3. Power Requirements: 115 VAC, 60 Hz, with integral battery back-up.
4. Transient voltage/surge protection shall be provided on power line, telephone and input channels. Solid state surge protection provided on digital input, telephone and AC power circuitry.
5. Analog Inputs: 4-20 mA, 10 bit resolution.
6. Discrete Inputs: dry contact.

2.3 LEVEL ALARMS

A. Design: Local alarm panels for tank high level monitoring shall be enclosed in a NEMA 4X enclosure. The panel shall have audible and visual alarm annunciators with silencing pushbutton. Level sensor shall be a float activated switch.

B. Regulatory Requirements:

1. Sensing circuit of all monitoring equipment must be U.L. listed intrinsically safe for Class I, Class II, Division I groups C thru G.
2. Monitoring panel must be labeled by Underwriters Laboratory.

16900-3- EXECUTION

3.1 GENERAL

A. Install all devices in accordance with Section 16010.

16900-4- METHOD OF MEASUREMENT

4.1 METHOD OF MEASUREMENT

Measurement will be made for the work item of this Section by Lump Sum.

16900-5- BASIS OF PAYMENT

5.1 BASIS OF PAYMENT

Payment for the work of this Section will be included as part of the payment item listed below. This payment shall be full compensation for furnishing all materials and for all preparation, placing of materials, and installation of connections as required for complete operation of systems.

Payment for work will be made under:

Item 16900-1 **General Instrumentation -- lump sum**

END OF SECTION 16900

ITEM P-152 EXCAVATION AND EMBANKMENT

152-1 DESCRIPTION

1.1 This item covers excavation, disposal, placement, grading, and compaction of all materials within the limits of the work required to construct taxiways, aprons, and intermediate as well as other areas for drainage, building construction, parking, or other purposes in accordance with these specifications and in conformity to the dimensions and typical section shown on the plans.

1.2 All material excavated shall be classified as follows:

A. Stripping. Stripping shall be defined as the removal of material to a minimum depth of six inches below existing ground in areas requiring embankment or where the elevation of the bottom of the proposed pavement subgrade is less than six inches below existing ground elevation. If deeper stripping is required to completely remove encountered root mat such deeper removal shall be performed only as directed by the Engineer. Stripping shall be performed only to the extent required under paragraph 2.4 or to accumulate the quantity of material required for topsoil cover of the stormwater management basins as shown on the plans, whichever quantity is greater.

B. Unclassified Excavation. Unclassified excavation shall consist of the excavation and disposal of all material, regardless of its nature, which is not otherwise classified and paid for under the following items.

C. Unsuitable Excavation. Any material containing vegetable or organic matter, such as muck, peat, organic silt, sod, decaying stumps, roots, logs, or humus shall be considered unsuitable for use in embankment construction. Material, when approved by the Engineer as suitable to support vegetation, may be used on the embankment slope.

D. Removal of Existing Soil Stockpile. This classification shall consist of the removal from the site of the existing soil stockpile remaining from a previous contract. Soil in this stockpile may be used in the work at the Contractor's option, with the approval of the Engineer and subject to the suitability requirements of paragraph 2.1A below.

152-2 CONSTRUCTION METHODS

2.1 GENERAL:

A. Before beginning excavation, grading, and embankment operations in any area, the area shall be completely cleared and grubbed in accordance with Item P-151. Embankment areas shall then be completely stripped of grass, sod, and other organic materials not suitable for use in construction the embankment. Any existing drainage pipes, structures, conduit, cable, and other items shown on the plans to be removed shall be removed and disposed of as specified elsewhere in the Contract Documents.

B. The suitability of material to be placed in embankments shall be subject to approval by the Engineer. All unsuitable material excavated shall be disposed of off airport property. Material that is otherwise suitable shall be not classified as unsuitable solely on the basis of high moisture content. Such wet material, where necessary to construct embankment, shall be allowed to dry to within the moisture content provisions of this Item.

C. When the Contractor's excavating operations encounter artifacts of historical or archaeological significance, the Engineer shall immediately be notified and operations shall be temporarily discontinued. At the direction of the Engineer, the Contractor shall excavate the site in such a manner

as to preserve the artifacts encountered and allow for their removal. Such excavation will be paid for as extra work.

D. Those areas outside of the pavement areas in which the top layer of soil material has become compacted, by hauling or other activities of the Contractor shall be scarified and disked to a depth of four inches, in order to loosen and pulverize the soil.

E. If it is necessary to interrupt existing surface drainage, sewers or under-drainage, conduits, utilities, or similar underground structures the Contractor shall be responsible for and shall take all necessary precautions to preserve them or provide temporary services. When such facilities are encountered, the Contractor shall notify the Engineer, who shall arrange for their removal if necessary. The Contractor shall, at his/her own expense, satisfactorily repair or pay the cost of all damage to such facilities or structures which may result from any of the Contractor's operations during the period of the contract.

2.2 EXCAVATION:

A. No excavation shall be started until the work has been staked out by the Contractor and the Engineer has obtained elevations and measurements of the ground surface. All suitable excavated material shall be used in the formation of embankment, subgrade, or for other purposes shown on the plans. All unsuitable material shall be disposed of as shown on the plans.

B. When the volume of the excavation exceeds that required to construct the embankments to the grades indicated, the excess shall be used to grade the areas of ultimate development or disposed of as directed. When the volume of excavation is not sufficient for constructing the fill to the grades indicated, the deficiency shall be obtained from borrow areas.

C. The grade shall be maintained so that the surface is well drained at all times. When necessary, temporary drains and drainage ditches shall be installed to intercept or divert surface water which may affect the work.

1. Selective Grading. When selective grading is indicated on the plans, the more suitable material as designated by the Engineer shall be used in constructing the embankment or in capping the pavement subgrade. If, at the time of excavation, it is not possible to place this material in its final location, it shall be stockpiled in approved areas so that it can be measured for payment for rehandling as specified in paragraph 3.3.

2. Undercutting. Rock, shale, hardpan, loose rock, boulders, organic material, or other material unsatisfactory for runway safety areas, subgrades, roads, shoulders, or any areas intended for turfing shall be excavated to a minimum depth of twelve inches, or to the depth specified by the Engineer, below the subgrade. Muck, peak, matted roots, or other yielding material, unsatisfactory for subgrade foundation, shall be removed to the depth specified. Unsuitable materials shall be disposed of at locations shown on the plans. This excavated material shall be paid for at the contract unit price per cubic yard for unsuitable excavation. The excavated area shall be refilled with suitable material, obtained from the grading operations or borrow areas, and thoroughly compacted by rolling. The necessary refilling will constitute a part of the embankment. Where rock cuts are made and refilled with selected material, any pockets created in the rock surface shall be drained in accordance with the details shown on the plans.

3. Overbreak. Overbreak, including slides, is that portion of any material displaced or loosened beyond the finished work as planned or authorized by the Engineer. The Engineer shall determine if the displacement of such material was unavoidable and his/her decision shall be final. All overbreak shall be graded or removed by the Contractor and disposed of as directed; however, payment will not be made for the removal and disposal of overbreak which the Engineer determines as avoidable. Unavoidable overbreak will be classified as "Unclassified Excavation."

4. Removal of Utilities. The removal of existing structures and utilities required to permit the orderly progress of work will be accomplished by someone other than the Contractor, e.g., the utility unless otherwise shown on the plans. All existing foundations shall be excavated for at least two (2) feet below the top of subgrade or as indicated on the plans, and the material disposed of as directed. All foundations thus excavated shall be backfilled with suitable material and compacted as specified herein.

5. Compaction Requirements. The subgrade under all areas to be paved shall be prepared as follows:

   a. The bottommost six inches of subgrade, as determined from the proposed layout, grading, and pavement sections shown on the plans, shall be compacted as follows:

      (1) Cohesive soils -- 90 per cent of the maximum dry density determined by ASTM D 1557, or

      (2) Non-Cohesive soils -- 95 per cent of the maximum dry density determined by ASTM D 1557.

   b. The topmost twelve inches of subgrade, as determined from the proposed layout, grading, and pavement sections shown on the plans, shall be compacted as follows:

      (1) Cohesive soils -- 95 per cent of the maximum dry density determined by ASTM D 1557, or

      (2) Non-Cohesive soils -- 100 per cent of the maximum dry density determined by ASTM D 1557.

   c. For this contract, cohesive soils shall be defined as those soils having a plasticity index of greater than six (6) when tested in accordance with ASTM D 4318. All other soils, regardless of gradation, shall be defined as non-cohesive.

   d. Excavation, spreading, and compaction of in-place soils will be required to the extent necessary to improve the subgrade to the densities specified above. Such excavation of the subgrade will not be required if the in-place density of the soil is found to meet the requirements above. In no event shall the subgrade density requirements specified above be waived without the expressed written consent of the Engineer. Excavation, placement, and reworking of soils which may be required to meet the density requirements of this section will be paid for as unclassified excavation.

D. The in-place field density shall be determined in accordance with ASTM D 1556, ASTM D 2167, or ASTM D 2922. Stones or rock fragments larger than four inches in their greatest dimension will not be permitted in top six inches of the subgrade. The finished grading operations, conforming to the typical cross section, shall be completed and maintained ahead of the paving operations as appropriate or as directed by the Engineer.

E. In cuts, all loose or protruding rocks on the back slopes shall be bared loose or otherwise removed to line of finished grade of slope. All cut-and-fill slopes shall be uniformly dressed to the slope, cross-section, and alignment shown on the plans or as directed by the Engineer.

F. Blasting will be not permitted on any part of the work.

2.3 DRAINAGE EXCAVATION:

A. Excavation required for the construction of stormwater management basins, temporary or permanent ditches, temporary levee construction, or for any other drainage facilities, as designed or as shown on the plans. The work shall be performed in accordance with the Contractor's approved construction phasing plan and schedule. All satisfactory material excavated shall be placed in fills to the extent required, and unsuitable material shall be removed from airport property. Intercepting or temporary ditches shown on the plans or required by existing conditions to facilitate construction of embankments shall be constructed prior to starting adjacent excavation operations. All necessary work shall be performed to secure a finish true to the lines, elevations, and cross-sections shown on the plans.

B. The Contractor shall maintain ditches constructed on the project to the required cross-section and shall keep them free of debris or obstructions until the project is accepted.

C. The proposed stormwater management basins shown on the plans shall be rough graded to approximately six inches below the final grades and elevations shown on the plans to accommodate the placement of topsoil as specified in Item T-905.

D. Work under this section, including the fine grading of stormwater management basins, shall not be measured separately, but shall be paid for as unclassified excavation.

2.4 STORMWATER MANAGEMENT POND CONSTRUCTION

A. Before beginning pond construction the Contractor shall submit to the Engineer for approval a plan specifying the horizontal and vertical control to be used in constructing each of the proposed stormwater management ponds. Where pond geometry and drainage structures are shown on the plans, they shall be included in the Contractor's grading control plan. This plan shall also include the means by which the control will be maintained throughout construction and shall be prepared by a professional property line surveyor registered in the State of Maryland. All control shall be located outside the limits of the ponds and shall not be altered without the approval of the Engineer.

B. Excavation and grading of the ponds shall be done in accordance with grade staking laid out in accordance with the approved control plan. Any deviations from the approved grading plan shall be approved by the Engineer before being implemented. Fine grading included in the pond construction shall be done to the extent necessary to permit the placement of topsoil in accordance with the provisions of Item T-905.

C. At the completion of fine grading the Contractor shall conduct an as-built survey of the ponds. This survey shall be prepared by a professional property line surveyor registered in the State of Maryland and shall show the proposed grading and drainage structure locations and elevations (from the plans) and the as-constructed conditions, including (at a minimum) the pond grading and drainage structure locations and elevations. Other features, including but not limited to approved revisions to pond control, shall be included. Any discrepancies in the work, as determined by the as-built survey, shall be corrected by the Contractor without delay. Any required re-survey shall be performed to include such corrections. The completed pond plans shall be submitted to the Engineer for approval.

D. Completion of the pond construction, which will include topsoiling, installation of erosion control netting, planting of permanent pond vegetation, and seeding shall be done only after the as-built pond plans have been approved by the Engineer in writing.

E. Work under this section, including the fine grading of stormwater management basins, shall not be measured separately, but shall be paid for as unclassified excavation.

2.5 PREPARATION OF EMBANKMENT AREA:

A. Where an embankment, regardless of height, is to be constructed all sod and vegetative matter shall be removed from the surface upon which the embankment is to be placed, and the cleared surface shall

be completely broken up by plowing or scarifying to a minimum depth of six inches as specified in paragraph 2.2. The area so scarified shall be compacted as specified in section 2.5 below.

C. Where embankments are to be placed on natural slopes steeper than three horizontal to one vertical, horizontal benches shall be constructed as shown on the plans or as necessary to ensure the stability of the embankment as directed by the Engineer.

D. No direct payment shall be made for the work performed under this section. The necessary clearing and grubbing and/or stripping and the quantity of excavation removed will be paid for under the respective items of work.

2.6 FORMATION OF EMBANKMENTS:

A. Embankments shall be formed in successive horizontal layers of not more than eight inches in loose depth for the full width of the cross section, unless otherwise approved to the Engineer.

B. The grading operations shall be conducted, and the various soil strata shall be placed, to produce a soil structure a shown on the typical cross section or as directed. Materials such as brush, hedge, roots, stumps, grass and other organic matter, shall not be incorporated or buried in the embankment.

C. Operations on earthwork shall be suspended at any time when satisfactory results cannot be obtained because of rain, freezing, or other unsatisfactory conditions of the field. The Contractor shall drag, blade, or slope the embankment to provide proper surface drainage.

D. The material in the layer shall be within ± 2 percent of optimum moisture content before rolling to obtain the prescribed compaction. In order to achieve a uniform moisture content throughout the layer, wetting or drying of the material and manipulation shall be required when necessary. Should the material be too wet to permit proper compaction or rolling, all work on all of the affected portions of the embankment shall be delayed until the material has dried to the required moisture content. Sprinkling of dry material to obtain the proper moisture content shall be done with approved equipment that will sufficiently distribute the water. Sufficient equipment to furnish the required water shall be available at all times. Samples of all embankment materials for testing, both before and after placement and compaction, will be taken for each 500 cubic yards of embankment placed. Where visibly different materials are used in the same 500 cubic yard portion of embankment each such material shall be sampled and tested. Based on these tests, the Contractor shall make the necessary corrections and adjustments in methods, materials or moisture content in order to achieve the correct embankment density.

E. Rolling operations shall be continued until the embankment is compacted to not less than 95 percent of maximum dry density for noncohesive soils, and 90 percent of maximum dry density for cohesive soils as determined by ASTM D 1557. The final eighteen inches of embankment under all areas to be paved shall be compacted in accordance with the provisions of section 2.2.

F. On all areas outside of the pavement areas, no compaction will be required on the top 4 inches.

G. The in-place field density shall be determined in accordance with ASTM D 1556, ASTM D 2167, or ASTM D 2922. When the nuclear method (ASTM D 2922) is used, the gauge shall be calibrated at least once per day. In addition, when directed by the Engineer, the moisture content of soils tested using the gauge shall be determined by ASTM D 2216. Should the moisture content so determined differ from that determined by the nuclear gauge, the Engineer may order more frequent calibration of the device, replacement with a properly functioning gauge, or determination of in-place moisture content using ASTM D 2216.

H. Compaction areas shall be kept separate, and no layer shall be covered by another until the proper density is obtained.

I. During construction of the embankment, the Contractor shall route his/her equipment at all times, both when loaded and when empty, over the layers as they are placed and shall distribute the travel evenly over the entire width of the embankment. The equipment shall be operated in such a manner that hardpan, cemented gravel, clay, or other chunky soil material will be broken up into small particles and become incorporated with the other material in the layer.

J. In the construction of embankments, layer placement shall begin in the deepest portion of the fill; as placement progresses, layers shall be constructed approximately parallel to the finished pavement grade line.

K. When rock and other embankment material are excavated at approximately the same, time, the rock shall be incorporated into the outer portion of the embankment and the other material shall be incorporated under the future paved areas. Stones or fragmentary rock larger than four inches in their greatest dimensions will not be allowed in the top six inches of the subgrade. Rockfill shall be brought up in layers as specified or as directed and every effort shall be exerted to fill the voids with the finer material forming a dense, compact mass. Rock or boulders shall not be disposed of outside the excavation or embankment areas, except at places and in the manner designated by the Engineer.

L. When the excavated material consists predominantly of rock fragments of such size that the material cannot be placed in layers of the prescribed thickness without crushing, pulverizing or further breaking down the pieces, such material may be placed in the embankment as directed in layers not exceeding two feet in thickness. Each layer shall be leveled and smoothed with suitable leveling equipment and by distribution of spalls and finer fragments of rock. These type lifts shall not be constructed above an elevation four feet below the finished subgrade. Density requirements will not apply to portions of embankments constructed of materials which cannot be tested in accordance with specified methods.

M. Frozen material shall not be placed in the embankment nor shall embankment be placed upon frozen material.

N. There will be no separate measurement of payment for compacted embankment. All costs incidental to placing in layers, compacting, disking, watering, mixing, grading, sloping, and other necessary operations for construction of embankments will be included in the contract price for unclassified excavation.

2.7 FINISHING AND PROTECTION OF SUBGRADE:

A. After the subgrade has been substantially completed the full width shall be conditioned by removing any soft or other unstable material which will not compact properly. The resulting areas and all other low areas, holes or depressions shall be brought to grade with suitable select material. Scarifying, blading, rolling and other methods shall be performed to provide a thoroughly compacted subgrade shaped to the lines and grades shown on the plans.

B. Grading of the subgrade shall be performed so that it will drain readily. The Contractor shall take all precautions necessary to protect the subgrade from damage. He shall limit hauling over the finished subgrade to that which is essential for construction purposes.

C. All ruts or rough places that develop in a completed subgrade shall be smoothed and recompacted.

D. No subbase, or surface course shall be placed on the subgrade until the subgrade has been approved by the Engineer.

2.8 HAUL:

All hauling will be considered a necessary and incidental part of the work. Its cost shall be considered by the Contractor and included in the contract unit price for the pay of items of work involved. No payment will be made separately or directly for hauling on any part of the work.

2.9 TOLERANCES:

A. In those areas upon which a subbase or base course is to be placed, the top of the subgrade shall be of such smoothness that, when tested with a sixteen-foot straightedge applied parallel and at right angles to the centerline, it shall not show any deviation in excess of one-half inch, or shall not be more than 0.05 foot from true grade as established by grade hubs or pins. Any deviation in excess of these amounts shall be corrected by loosening, adding, or removing materials; reshaping; and recompacting by sprinkling and rolling.

B. On other areas, the surface shall be of such smoothness that it will not vary more than 0.10 foot from true grade as established by grade hubs. Any deviation in excess of this amount shall be corrected by loosening, adding or removing materials, and reshaping.

2.10 DISPOSITION OF EXCESS EXCAVATION:

A. All excess excavation, regardless of classification, not used in embankments or shoulders in accordance with the plans or the direction of the Engineer shall be disposed aof by the Contractor off airport property. Such removal shall performed in accordance with applicable laws, ordinances, and regulations. Stockpiling of excess excavation prior to removal from the site will be permitted at the location(s) and in the quantities approved by the Engineer. All costs for such removal shall be incidental to the materials excavated as defined in Section 1.2.

2.11 TOPSOIL:

A. When topsoil is specified or required as shown on the plans or under Item T-905, it shall be salvaged from stripping or other grading operations. The topsoil shall meet the requirements of Item T-905. If, at the time of excavation or stripping, the topsoil cannot be placed in its proper and final section of finished construction, the material shall be stockpiled at locations approved by the Engineer. Stockpiles shall not be placed within 600 feet of runway pavement, 100 feet of taxiway pavement, or at any location and height at which the stockpile would become an obstruction to air navigation as defined in FAR Part 77, Objects Affecting Navigable Airspace. Stockpiles shall not be placed on areas which subsequently will require any excavation or embankment. If, in the judgment of the Engineer, it is practical to place the salvaged topsoil at the time of excavation or stripping, the material shall be placed in its final position without stockpiling or further rehandling.

B. Upon completion of grading operations, stockpiled topsoil shall be handled and placed as shown on the plans or as directed by the Engineer, or as required in Item T-905.

C. When stockpiling of topsoil and later rehandling of such material is directed by the Engineer, the material so rehandled shall be paid for at the contract unit price per cubic yard for "Topsoiling," as provided in Item T-905.

152-3 METHOD OF MEASUREMENT

3.1 The quantity of excavation in the various classifications to be paid for shall be the number of cubic yards measured in its original position. Measurement shall not include the quantity of materials excavated without authorization beyond normal slope lines, the quantity of embankment placed, or the quantity of material used for purposes other than those directed.

3.3 Stockpiled stripped topsoil shall be paid for on the basis of the number of cubic yards measured in the stockpiled position as soon as the material has been stockpiled.

3.4 For payment specified by the cubic yard, measurement for all excavation shall be computed by the average end area method. The end area is that bound by the original ground line established by field cross-sections and the final theoretical pay line established by the cross-sections shown on the plans, subject to verification by the Engineer. After completion of all earthwork operations and prior to the placing of base or subbase material, the final excavation quantities shall be verified by means of field cross-sections taken randomly at intervals not exceeding fifty linear feet.

Final field cross-sections shall be taken if the following changes have been made:

1. Plan width of embankments or excavations are changed by more than plus or minus 1.0 foot, or

2. Plan elevations of embankments or excavations are changed by more than plus or minus 0.5 foot.

152-4 BASIS OF PAYMENT

4.1 For "Stripping" payment shall be made at the contract unit price per cubic yard. This price shall be full compensation for furnishing all materials, labor, equipment, tools, and incidentals necessary to complete the item.

4.2 For "Unclassified excavation" payment shall be made at the contract unit price per cubic yard. This price shall be full compensation for furnishing all materials, labor, equipment, tools, and incidentals necessary to complete the item.

4.3 For "Unsuitable Excavation" payment shall be made at the contract unit price per cubic yard. This price shall be full compensation for furnishing all materials, labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item P-152.1 **Stripping -- per cubic yard**

Item P-152.2 **Unclassified Excavation -- per cubic yard**

Item P-152.3 **Unsutable Excavation -- per cubic yard**

Item P-152.4 **Remove Existing Soil Stockpile -- per cubic yard**

TESTING REQUIREMENTS

ASTM D 698	Tests for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures, Using 5.5-pound (2.5 kg) Rammer and 12-inch (300 mm) Drop
ASTM D 1556	Test for Density of Soil In-Place by the Sand Cone Method
ASTM D 1557	Tests for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures, Using 10-pound (4.5 kg) Rammer and 18-inch (45 cm) Drop
ASTM D 2167	Test for Density of Soil In-Place by the Rubber Balloon Method

ASTM D 2922 Test Methods for Density of Soil and Soil-Aggregate In Place by Nuclear Methods (Shallow Depth)

ASTM D 4318 Liquid Limit, Plastic Limit, and Plasticity Index of Soils

END OF ITEM P-152

ITEM P-209 CRUSHED AGGREGATE BASE COURSE

209-1 DESCRIPTION

1.1 This item consists of a base course composed of crushed aggregates constructed on a prepared subgrade in accordance with these specifications and in conformity to the dimensions and typical cross sections shown on the plans.

209-2 MATERIALS

2.1 AGGREGATE:

A. Aggregates shall consist of clean, sound, durable particles of crushed stone, crushed gravel, or crushed slag and shall be free from coatings of clay, silt, vegetable matter, and other objectionable materials and shall contain no clay balls. Fine aggregate passing the No. 4 sieve shall consist of fines from the operation of crushing the coarse aggregate. If necessary, fine aggregate may be added to produce the correct gradation. The fine aggregate shall be produced by crushing stone, gravel, or slag that meet the requirements for wear and soundness specified for coarse aggregate.

B. The crushed slag shall be an air-cooled, blast furnace slag and shall have a unit weight of not less than 70 pounds per cubic foot when tested in accordance with ASTM C 29.

C. The crushed aggregate portion which is retained on the No. 4 sieve shall contain not more than 15 percent, by weight, of flat or elongated pieces as defined in ASTM D 693 and shall have at least 90 percent by weight of particles with at least two fractured faces and 100 percent with at least one fractured face. The area of each face shall be equal to at least 75 percent of the smallest midsectional area of the piece. When two fractured faces are contiguous, the angle between the planes of fractures shall be at least 30 to count as two fractured faces.

D. The percentage of wear shall not be greater than 45 percent when tested in accordance with ASTM C 131. The sodium sulfate soundness loss shall not exceed 12 percent, after 5 cycles, when tested in accordance with ASTM C 88.

E. The fraction passing the No. 40 sieve shall have a liquid limit no greater than 25 and a plasticity index of not more than 4 when tested in accordance with ASTM D 4318. The fine aggregate shall have a minimum sand equivalent value of 35 when tested in accordance with ASTM D 2419.

1. Sampling and Testing. Aggregates for preliminary testing shall be furnished by the Contractor prior to the start of production. All tests for initial aggregate submittals necessary to determine compliance with the specification requirements will be made by the Engineer at no expense to the Contractor.

Samples of aggregates shall be furnished by the Contractor at the start of production and at intervals during production. The sampling points and intervals will be designated by the Engineer. The samples will be the basis of approval of specific lots of aggregates from the standpoint of the quality requirements of this section.

In lieu of testing, the Engineer may accept certified state test results indicating that the aggregate meets specification requirements.

Samples of aggregates to check gradation shall be taken by the Engineer at least once daily. Sampling shall be in accordance with ASTM D 75, and testing shall be in accordance with ASTM C 136 and C 117.

2. Gradation Requirements. The gradation (job mix) of the final mixture shall fall within the design range indicated in Table 1, when tested in accordance with ASTM C 117 and C 136. The final gradation shall be continuously well graded from coarse to fine and shall not vary from the low limit on one sieve to the high limit on an adjacent sieve or vice versa.

Table 1
REQUIREMENTS FOR GRADATION OF AGGREGATE

Sieve Size	Design Range Percentage by Weight Passing Sieves	Job Mix Tolerances
2"	100	--
1½"	95-100	±8%
1"	70-95	±8%
¾"	55-85	±8%
No. 4	30-60	±8%
No. 30	12-30	±5%
No. 200	0-8	±3%

The job mix tolerances in Table 1 shall be applied to the job mix gradation to establish a job control grading band. The full tolerance still will apply if application of the tolerances results in a job control grading band outside the design range.

The fraction of the final mixture that passes the No. 200 sieve shall not exceed 60 percent of the fraction passing the No. 30 sieve.

209-3 CONSTRUCTION METHODS

3.1 PREPARING UNDERLYING COURSE:

The underlying course shall be checked and accepted by the Engineer before placing and spreading operations are started. Any ruts or soft yielding places caused by improper drainage conditions, hauling, or any other cause shall be corrected at the Contractor's expense before the base course is placed thereon. Material shall not be placed on frozen subgrade.

3.2 MIXING:

The aggregate shall be uniformly blended during crushing operations or mixed in a plant. The plant shall blend and mix the materials to meet the specifications and to secure the proper moisture content for compaction.

3.3 PLACING:

A. The crushed aggregate base material shall be placed on the moistened subgrade in layers of uniform thickness with a mechanical spreader.

B. The maximum depth of a compacted layer shall be 6 inches (150 mm). If the total depth of the compacted material is more than six inches, it shall be constructed in two or more layers. In multi-layer construction, the base course shall be placed in approximately equal-depth layers.

C. The previously constructed layer should be cleaned of loose and foreign material prior to placing the next layer. The surface of the compacted material shall be kept moist until covered with the next layer.

3.4 COMPACTION:

A. Immediately upon completion of the spreading operations, the crushed aggregate shall be thoroughly compacted. The number, type, and weight of rollers shall be sufficient to compact the material to the required density.

B. The moisture content of the material during placing operations shall not be below, nor more than 1-1/2 percentage points above, the optimum moisture content as determined by ASTM D 1557.

3.5 ACCEPTANCE SAMPLING AND TESTING FOR DENSITY:

A. Aggregate base course shall be accepted for density on a lot basis. A lot will consist of one day's production where it is not expected to exceed 2000 square yards. A lot will consist of one-half day's production where a day's production is expected to consist of between 2000 and 4000 square yards.

B. Each lot shall be divided into two equal sublots. One test shall be made for each sublot. Sampling locations will be determined by the Engineer on a random basis in accordance with statistical procedures contained in ASTM D 3665.

C. Each lot will be accepted for density when the field density is at least 100 percent of the maximum dry density of laboratory specimens prepared from samples of the base course material delivered to the job site. The specimens shall be compacted and tested in accordance with ASTM D 1557, Method D. The in-place field density shall be determined in accordance with ASTM D 1556, ASTM D 2167. If the specified density is not attained, the entire lot shall be reworked and/or recompacted and two additional random tests made. This procedure shall be followed until the specified density is reached.

D. In lieu of the core method of field density determination, acceptance testing may be accomplished using a nuclear gage in accordance with ASTM D 2922. The gage should be field calibrated in accordance with paragraph 4 of ASTM D 2922. Calibration tests shall be conducted on the first lot of material placed that meets the density requirements.

E. Use of ASTM D 2922 results in a wet unit weight, and when using this method, ASTM D 3017 shall be used to determine the moisture content of the material. The calibration curve furnished with the moisture gages shall be checked as described in paragraph 7 of ASTM D 3017. The calibration checks of both the density and moisture gages shall be made at the beginning of a job and at intervals as determined by the Engineer.

F. If a nuclear gage is used for density determination, two random readings shall be made for each sublot.

3.6 FINISHING:

A. The surface of the aggregate base course shall be finished by blading or with automated equipment especially designed for this purpose.

B. In no case will the addition of thin layers of material be added to the top layer of base course to meet grade. If the elevation of the top layer is 1/2 inch or more below grade, the top layer of base shall be scarified to a depth of at least three inches, new material added, and the layer shall be blended and

recompacted to bring it to grade. If the finished surface is above plan grade, it shall be cut back to grade and rerolled.

3.7 SURFACE TOLERANCES:

The finished surface shall not vary more than 3/8 inch when tested with a sixteen-foot straightedge applied parallel with or at right angles to the centerline of course placed. Any deviation in excess of this amount shall be corrected by the Contractor at the Contractor's expense.

3.8 THICKNESS CONTROL:

The completed thickness of the base course shall be within 1/2 inch of the design thickness. Four determinations of thickness shall be made for each lot of material placed. The lot size shall be consistent with that specified in paragraph 3.5. Each lot shall be divided into four equal sublots. One test shall be made for each sublot. Sampling locations will be determined by the Engineer on a random basis in accordance with procedures contained in ASTM D 3665. Where the thickness is deficient by more than 1/2 inch, the Contractor shall correct such areas at no additional cost by excavating to the required depth and replacing with new material. Additional test holes may be required to identify the limits of deficient areas.

3.9 MAINTENANCE:

The base course shall be maintained in a condition that will meet all specification requirements until the work is accepted. Equipment used in the construction of an adjoining section may be routed over completed portions of the base course, provided no damage results and provided that the equipment is routed over the full width of the base course to avoid rutting or uneven compaction.

209-4 METHOD OF MEASUREMENT

4.1 The quantity of crushed aggregate base course to be paid for will be determined by measurement of the number of square yards of material in the various course depths specified actually constructed and accepted by the Engineer as complying with the plans and specifications.

209-5 BASIS OF PAYMENT

5.1 Payment shall be made at the contract unit price per square yard for crushed aggregate base course placed in the course depths specified. This price shall be full compensation for furnishing all materials, for preparing and placing these materials, and for all labor, equipment tools, and incidentals necessary to complete the item.

Payment will be made under:

Item P-209.1 **Crushed Aggregate Base Course (12" depth) -- per square yard**

Item P-209.2 **Crushed Aggregate Base Course (14" depth) -- per square yard**

Item P-209.3 **Crushed Aggregate Base Course (15" depth) -- per square yard**

TESTING REQUIREMENTS

ASTM C 29 Unit Weight of Aggregate

ASTM C 88 Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate

ASTM C 117	Materials Finer than 75um (No. 200) Sieve in Mineral Aggregates by Washing
ASTM C 131	Resistance to Abrasion of Small Size Coarse Aggregate by Use of the Los Angeles Machine
ASTM C 136	Sieve or Screen Analysis of Fine and Coarse Aggregate
ASTM D 75	Sampling Aggregate
ASTM D 693	Crushed Stone, Crushed Slag, and Crushed Gravel for Dry-or Water-Bound Macadam Base Courses and Bituminous Macadam Base and Surface Courses of Pavements.
ASTM D 698	Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 5.5-lb (2.49-kg) Rammer and 12-in (305mm) Drop
ASTM D 1556	Density of Soil in Place by the Sand Cone Method
ASTM D 1557	Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10-lb (4.5kg) Rammer and 18 in (457 mm) Drop
ASTM D 2167	Density of Soil in Place by the Rubber-Ballon Method
ASTM D 2419	Sand Equivalent Value of Soils and Fine Aggregate
ASTM D 2922	Density of Soil and Soil-Aggregate in Place by Nuclear Methods
ASTM D 3017	Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods
ASTM D 3665	Random Sampling of Paving Materials
ASTM D 4318	Liquid Limit, Plastic Limit, and Plasticity Index of Soils

END OF ITEM P-209

ITEM P-304 CEMENT-TREATED BASE COURSE

304-1 DESCRIPTION

1.1 This item shall consist of a base course composed of mineral aggregate and Portland cement uniformly blended and mixed with water. The mixed material shall be spread, shaped, and compacted in accordance with these specifications and in conformity to the lines, grades, dimensions, and typical cross-sections shown on the plans. Taxiway, apron, roadway pavements shall be built in a series of parallel lanes using a plan of processing that reduces longitudinal and transverse joints to a minimum.

304-2 MATERIALS

2.1 PORTLAND CEMENT:

Portland cement shall conform to the requirements of ASTM C 150, Type I or ASTM C 595.

2.2 WATER:

Water shall be clean, clear, and free from injurious amounts of sewage, oil, acid, strong alkalies, or vegetative matter, and it shall be free from clay or silt. If the water is of questionable quality, it shall be tested in accordance with the requirements of AASHO T 26. Water known to be of potable quality may be used without testing.

2.3 AGGREGATE:

A. The aggregate shall be select granular materials meeting the gradation requirements given in Table 1. The material shall be free of roots, sod, and weeds. The crushed or uncrushed aggregate shall consist of hard, durable particles of accepted quality, free from an excess of flat, elongated, soft, or disintegrated pieces, or objectionable matter. The method used in producing the aggregate shall be such that the finished product shall be as consistent as practicable. All stones and rocks of inferior quality shall be wasted.

B. Aggregates suspected of containing injurious quantities of sulfates shall be examined petrographically in accordance with ASTM C 295.

C. The aggregate shall conform to the gradation shown in Table 1 when tested in accordance with ASTM C 136.

Table 1
AGGREGATE FOR CEMENT-TREATED BASE COURSE

Sieve Designations (square openings)	Percentage by Weight Passing Sieves
¾"	100
No. 4	55-100
No. 10	45-100
No. 40	25-80
No. 80	10-35

D. The gradations in the table represent the limits which shall determine suitability of aggregate for use from the sources of supply. The final gradations decided on, within the limits designated in the table, shall be well graded from coarse to fine and shall not vary form the low limit on one sieve to the high limit on adjacent sieves, or vice versa. The portion of the base aggregate, including any blended material, passing the No. 40 sieve shall have a liquid limit of not more than twenty-five (25) and a plasticity index of not more than six (6) when tested in accordance with ASTM D 4318.

E. The Contractor shall sample and test aggregates, from each source obtained, proposed for use in the work. Sampling shall be in accordance with ASTM D 75 and will be subject to observation by the Engineer. No aggregate shall be used in production of mixtures without prior approval. Should the Contractor elect to supply blended aggregates from more than one source, samples from each source proposed shall tested in accordance with this section and Section 3.1.

2.4 CURING MATERIAL:

A. Curing materials shall be one or more of the following:

1. Water.
2. Burlap.
3. Waterproof paper conforming to the requirements of ASTM C 171.

304-3 CEMENT CONTENT

3.1 Prior to start of work, materials proposed for use in the work shall be sampled and tested by the Contractor to determine the suitability for the proposed use and the quantity of cement required in the mix. The cement content for construction shall be that at which the mix develops a seven-day compressive strength of at least 750 psi **and** the freeze-thaw loss is less than fourteen per cent by weight. The testing procedure shall be as follows:

A. Compressive Strength:

1. Mold five (5) sets of at least two (2) specimens each in accordance with ASTM D 1557, Method C. Specimens shall be prepared using materials meeting the requirements specified herein. The specimens shall be prepared in split or single-piece molds with extensions, resulting in specimens having a height-to-diameter ratio of approximately 1.5. In no case shall the use of tapered molds be permitted. Each set of specimens shall be prepared using cement contents varying by approximately one-half percent by weight, e.g. 6.0%, 6.5%, 7.0%, 7.5%, and 8.0%. The cement contents to be used for this testing shall be at the Contractor's sole discretion.

2. The specimens shall be moist-cured for seven (7) days, then tested for compression strength, both in accordance with ASTM D 1633. Corrections of compressive strength shall be made in accordance with ASTM C 42. Both uncorrected and corrected compressive strengths shall be reported.

B. Freeze-Thaw:

1. An additional five (5) sets of at least two (2) specimens each shall be prepared as in Paragraph 3.1A above and tested for in accordance with ASTM D 560. The size and nature of the particles lost during the testing period shall be noted and reported. The weight of particles lost may also be reported at the Contractor's discretion.

C. In no event shall the same specimens used for freeze-thaw testing be used also for compressive strength testing. Submission of test results and/or data for specimens so used shall be rejected without review by the Engineer, and new specimens shall be made and tested.

D. Results of the completed testing shall be submitted to the Engineer for review and approval. The Engineer shall determine the cement content to be used based on the test results submitted, and such decision shall be final. Should the specimens tested not meet the requirements specified above, the Contractor shall perform additional testing as required to meet the requirements at no additional cost to MAA.

E. No material shall be produced or placed for payment until a mix design is approved by the Engineer.

3.2 For bidding purposes only, the approximate quantity of cement required for this contract shall be based on a cement content of seven (7) per cent, by weight, of cement-treated base course in the various thicknesses and areas to be placed. The actual cement content to be used for the work shall be determined by the Engineer based on the sampling and testing conducted as specified in Section 3.1 above.

304-4 CONSTRUCTION METHODS

4.1 WEATHER LIMITATIONS:

The cement-treated base shall not be mixed or placed while the atmospheric temperature is below 40°F or when conditions indicate that the temperature may fall below 35°F within 24 hours or when the weather is rainy. Cement-treated base shall not be placed on frozen subgrade or mixed when aggregate is frozen.

4.2 OPERATION AT PITS:

A. All work involved in clearing and stripping pits, including handling unsuitable material, shall be performed by the Contractor. The Contractor shall notify the Engineer sufficiently in advance of opening of any designated pit to permit staking of boundaries at the site, to take elevations and measurements of the ground surface before material is produced, to permit the Engineer to take samples of the material for tests to determine its quality and gradation, and to prepare a preliminary design of base mixture.

B. The pits, as utilized, shall be opened immediately to expose vertical faces of the various strata of acceptable material and, unless otherwise directed, the material shall be secured in successive vertical cuts extending through all the exposed strata in order to secure a uniform material.

4.3 PREPARING UNDERLYING COURSE:

The underlying course shall be checked and accepted by the Engineer before placing and spreading operations are started. Any ruts of soft yielding places caused by improper drainage conditions, hauling, or any other cause shall be corrected before the base course is placed thereon.

4.4 MIXING:

The aggregate shall be proportioned and mixed with cement and water in a central mixing plant. The plant shall be equipped with feeding and metering devices which will introduce the cement, aggregate, and water into the mixer in the quantities specified. Mixing shall continue until a thorough and uniform mixture has been obtained.

4.5 PLACING:

The mixture shall be transported to the job site in suitable vehicles and shall be deposited on the moistened subbase in uniform layers by means of approved mechanical spreaders. Not more than sixty (60) minutes shall elapse between the start of moist mixing and the start of compaction of the cement-treated mixture on the prepared subgrade.

4.6 COMPACTION:

Immediately upon completion of the spreading operations, the mixture shall be thoroughly compacted. The number, type, and weight of rollers shall be sufficient to compact the mixture to the required density. The field density of the compacted mixture shall be at least 96 percent of the maximum density of laboratory specimens prepared from samples of the cement-treated base material taken from the material in place. The specimens shall be compacted and tested in accordance with ASTM D 1557, Method C. The in-place field density shall be determined in accordance with ASTM D 1556, ASTM D 2167, or ASTM D 2922. Any mixture that has not been compacted shall not be left undisturbed for more than thirty (30) minutes. The moisture content of the mixture at the start of compaction shall not be below nor more than two percentage points above the optimum moisture content. The optimum moisture content shall be determined in accordance with ASTM D 1557 and shall be less than that amount which will cause the mixture to become unstable during compaction and finishing.

4.7 ACCEPTANCE SAMPLING AND TESTING OF CEMENT-TREATED BASE COURSE (COMPACTION):

A. Immediately upon completion of the spreading operations, the mixture shall be thoroughly compacted. The number, type, and weight of rollers shall be sufficient to compact the mixture to the required density. The cement-treated base course shall be accepted for density on a lot basis. A lot will consist of 3000 square yards and will be divided into four equal sublots. One test shall be made for each sublot. Sampling locations will be determined by the Engineer on a random basis in accordance with statistical procedures contained in ASTM D 3665.

B. Each lot of compacted material will be accepted, with respect to density, when the average field density is equal to or greater than 96 percent of the maximum density of laboratory specimens prepared form samples of cement-treated base course taken from the material in place.

C. The laboratory specimens shall be compacted and tested in accordance with ASTM D 1557, Method C. The in-place field density shall be determined in accordance with ASTM D 1556, ASTM D 2167, or ASTM D 2922.

D. The lot will be accepted without adjustment in payment if the average density, based on four acceptance tests of the lot, is greater than or equal to 96 percent. If the average density does not meet this requirement, the Contractor may elect to leave the lot in place at a reduced unit price determined in accordance with Table 2.

Table 2
SLIDING SCALE PAY FACTORS

Average Density	Recommended Payment
96.00 and higher	100%
95.00-95.99	95%
94.00-94.99	90%
93.00-93.99	75%
Lower than 93.00	reject

E. Any mixture that has not been compacted shall not be left undistributed for more than 30 minutes. The moisture content of the mixture at the start of compaction shall not be below nor more than two (2) percentage points above the optimum moisture content. The optimum moisture content shall be

determined in accordance with ASTM D 558 and shall be less than that amount which will cause the mixture to become unstable during compaction and finishing.

4.8 LAYER THICKNESS:

The maximum depth of a compacted layer shall be eight (8) inches, and no layer shall be less than four (4) inches when compacted. In multilayer contruction, the surface of the compacted material shall be kept moist until covered witht he next layer. Successive layers shall be placeed and compacted so that the requried total depth of the base course is completed the same day.

4.9 FINISHING:

Finishing operations shall be completed during daylight hours, and the completed base course shall conform to the required lines, grades, and cross-section. If necessary, the surface shall be lightly scarified to eliminated any imprints made by the compacting or shaping equipment. The surface shall then be recompacted to the required density. The compaction and finishing operations shall be completed withing two (2) hours of the time water is added to the mixture and shall produce a smooth, dense surface that is free of surface checking, tearing, ridges, or loose material.

4.10 SURFACE TOLERANCE:

The finished surface shall not vary more than 3/8 inch when tested with a sixteen-foot straightedge applied parallel with, or at right angles to, the centerline of the base course placed. Any deviation in excess of this amount shall be corrected by the Contractor at his own expense by means approved by the Engineer.

4.11 CONSTRUCTION JOINTS:

A. At the end of each day's construction, a transverse construction joint shall be formed by a header or by cutting back into the compacted material to form a true and stable vertical face free of loose material.

B. Longitudinal joints shall be formed by cutting back into the compacted material to form a true and stable vertical edge free of loose material.

C. Transverse and longitudinal joints shall be sawed only after initial set has occurred, and shall result in minimal unraveling of the edges to remain. Sawing may be done the day after placement, but in any case shall proceed at least 500 feet ahead of successive placement unless otherwise approved by the Engineer.

D. The sawing of transverse and/or longitudinal joints between adjacent placements (e.g. paving lanes) may be waived by the Engineer if the second placement follows the first by less than sixty (60) minutes and, in the Engineer's judgement, the resulting interface between the two placements is a tightly compacted and cemented joint. Such judgement may be based on visual inspection. The Engineer may require verification of this by means of inspecting and testing (in compression) core samples drilled at age fourteen (14) days at randomly selected locations along the joint.

4.12 PROTECTION AND CURING:

A. The completed cement-treated base course shall be cured using one of the methods listed in Section 2.4. Regardless of the curing method selected, the Contractor shall keep the surface of all cement-treated base course placed in a moist condition for the first seven days after placement. The Contractor shall keep a sufficient supply of water on the site at all times for the performance of this work. Water for this purpose only may obtained from designated fire hydrants or other sources on the airport (with the prior approval of the Engineer), or from another source of the Contractor's choosing. Should an on-airport source be used, a fair and reasonable charge may be made to the Contractor for the water used, at MAA's discretion. Such usage may be metered, estimated based on the capacity of the equipment

used, or measured by any means deemed appropriate by the Engineer. At MAA's discretion, monies so charged will be paid directly to MAA or may be deducted from payments due the Contractor over the course of the work.

B. Water for curing the completed cement-treated base course shall be applied by spraying.

C. Finished portions of the base course shall remain undisturbed for the first seven days after placement. that are used by equipment in the construction of an adjoining section shall be protected to prevent marring or damaging the completed work. The stabilized area shall be protected from freezing during the curing period.

304-5 METHOD OF MEASUREMENT

5.1 The quantity of cement-treated base to be paid for will be the number of square yards of base constructed in accordance with the neat lines, grades, and elevations shown on the plans, the provisions of this Item, and accepted by the Engineer.

304-6 BASIS OF PAYMENT

6.1 Payment shall be made at the contract unit price per square yard for the various depths of cement-treated base course specified. This price shall be full compensation for furnishing all materials, and for all preparation, manipulation, and placing of these materials; and for all labor, equirment, tools, and incidentals necessary to complete the item. Costs for furnishing the quantity of Portland cement used shall not be included in this price, but will be paid for as specified in Section 6.2.

Each lot of cement-treated base course will be accepted for density at the full contract unit price when the results of four density tests indicate that the average density is equal to or greater than 96 percent as determined by paragraph 304-4.6. Each lot not meeting this requirement will be accepted at an adjusted contract unit price in accordance with Table 2.

6.2 Payment shall be made at the contract unit price per ton for Portland cement. This price shall be full compensation for furnishing this material; for all delivery to the mixing location, and incorporation of this material; and for all labor, equipment, tools, and incidentals necessary to furnish the item.

Payment will be made under:

Item P-304.1 **Cement-Treated Base Course (6" depth) -- per square yard**

Item P-304.2 **Cement-Treated Base Course (8" depth) -- per square yard**

Item P-304.3 **Portland Cement -- per ton**

TESTING REQUIREMENTS

ASTM C 136	Sieve or Screen Analysis of Fine and Coarse Aggregate
ASTM C 295	Petrographic Examination of Aggregates for Concrete
ASTM D 75	Sampling Aggregates
ASTM D 558	Moisture-Density Relations of Soil-Cement Mixtures

ASTM D 560	Freezing-and-Thawing Tests of Compacted Soil-Cement Mixtures
ASTM D 1556	Density of Soil in Place by the Sand-Cone Method
ASTM D 1633	Compressive Strength of Molded Soil-Cement Cylinders
ASTM D 2167	Density of Soil in place by the Rubber-Balloon Method
ASTM D 2922	Density of Soil and Soil-Aggregate in Place by Nuclear Methods
ASTM D 3665	Random Sampling of Paving Materials
ASTM D 4318	Liquid Limit, Plastic Limit, and Plasticity Index of Soils
AASHTO T 26	Quality of Water to be Used in Concrete

MATERIAL REQUIREMENTS

ASTM C 150	Portland Cement
ASTM C 595	Blended Hydraulic Cements

END OF ITEM P-304

ITEM P-401 PLANT MIX BITUMINOUS PAVEMENTS

401-1 DESCRIPTION

1.1 This item shall consist of a surface and base course composed of mineral aggregate and bituminous material mixed in a central mixing plant and placed on a prepared course in accordance with these specifications and shall conform to the lines, grades, thicknesses, and typical cross-sections shown on the plans. Each course shall be constructed to the depth, typical section, or elevation required by the plans and shall be rolled, finished, and approved before the placement of the next course.

1.2 The surface course for airfield pavements shown on the plans shall be constructed using the bituminous mixture specified herein. Surface and base courses for roadway and parking lot pavements shall be constructed of Hot Mix Asphalt Surface (SC Type A) and Hot Mix Asphalt Base (BC) in accordance with the State Highway Administration Standard Specifications.

401-2 MATERIALS

2.1 AGGREGATE:

A. Aggregates shall consist of crushed stone, crushed gravel, or crushed slag with or without sand or other inert finely divided mineral aggregate. The portion of materials retained on the No. 8 sieve is coarse aggregate. The portion passing the No. 8 sieve and retained on the No. 200 sieve is fine aggregate, and the portion passing the No. 200 sieve is mineral filler.

B. Coarse Aggregate. Coarse aggregate shall consist of sound, tough, durable particles, free from adherent films of matter that would prevent thorough coating and bonding with the bituminous material and be free from organic matter and other deleterious substances. The percentage of wear shall not be greater than forty (40) percent when tested in accordance with ASTM C 131. The sodium sulfate soundness loss shall not exceed ten (10) percent, or the magnesium sulfate soundness loss shall not exceed thirteen (13) percent, after five cycles, when tested in accordance with ASTM C 88.

C. Aggregate shall contain at least seventy (70) percent by weight of individual pieces having two or more fractured faces and eighty-five (85) percent by weight having at least one fractured face. The area of each face shall be equal to at least 75 percent of the smallest midsectional area of the piece. When two fractured faces are contiguous, the angle between the planes of fractures shall be at least 30 degrees to count as two fractured faces. Fractured faces shall be obtained by crushing.

D. The aggregate shall not contain more than eight (8) percent, by weight, of flat or elongated pieces, when tested in accordance with ASTM D 4791.

E. Slag shall be air-cooled, blast furnace slag, and shall have a compacted weight of not less than seventy (70) pounds per cubic foot when tested in accordance with ASTM C 29.

F. Fine Aggregate. Fine aggregate shall consist of clean, sound, durable, angular shaped particles produced by crushing stone, slag, or gravel that meets the requirements for wear and soundness specified for coarse aggregate. The aggregate particles shall be free from coatings of clay, silt, or other objectionable matter and shall contain no clay balls. The fine aggregate, including any blended material for the fine aggregate, shall have a plasticity index of not more than 6 and a liquid limit of not more than twenty-five (25) when tested in accordance with ASTM D 4318.

G. Natural (nonmanufactured) sand may be used to obtain the gradation of the aggregate blend or to improve the workability of the mix. The amount of sand to be added will be adjusted to produce mixtures conforming to requirements of this specification.

H. The aggregate shall have sand equivalent values of 35 or greater when tested in accordance with ASTM D 2419.

I. Sampling. ASTM D 75 shall be used in sampling coarse and fine aggregate, and ASTM C 183 shall be used in sampling mineral filler.

2.2 MINERAL FILLER:

If filler, in addition to that naturally present in the aggregate, is necessary, it shall meet the requirements of ASTM D 242.

2.3 BITUMINOUS MATERIAL:

Bituminous material shall conform to the requirements of ASTM D 3381, Grade AC-20.

A. The Contractor shall furnish vendor's certified test reports for each lot of bituminous material shipped to the project. The vendor's certified test report for the bituminous material can be used for acceptance or tested independently by the Engineer.

2.4 PRELIMINARY MATERIAL ACCEPTANCE:

A. Prior to delivery of materials to the job site, the Contractor shall submit certified test reports to the Engineer for the following materials:

1. Coarse Aggregate.

   (a) Percent of wear.
   (b) Soundness.
   (c) Unit weight of slag.

2. Fine Aggregate.

   (a) Liquid limit.
   (b) Plastic index.
   (c) Sand equivalent.

3. Mineral Filler.

4. Bituminous Material.

The certification(s) shall show the appropriate ASTM test(s) for each material, the test results, and a statement that the material meets the specification requirement.

The Engineer may request samples for testing, prior to and during production, to verify the quality of the materials and to ensure conformance with the applicable specifications.

401-3 COMPOSITION

3.1 COMPOSITION OF MIXTURE:

The bituminous plant mix shall be composed of a mixture of well-graded aggregate, filler if required, and bituminous material. The several aggregate fractions shall be sized, handled in separate size groups, and combined in such proportions that the resulting mixture meets the grading requirements of the job mix formula (JMF).

3.2 JOB MIX FORMULA:

A. No bituminous mixture for payment shall be produced until a job mix formula has been approved by the Engineer. The bituminous mixture shall be designed using procedures contained in Chapter III, MARSHALL METHOD OF MIX DESIGN, of the Asphalt Institute's Manual Series No. 2 (MS-2), Mix Design Methods for Asphalt Concrete, and shall meet the requirements of Tables 1 and 2.

B. The design criteria in Table 1 are target values necessary to meet the acceptance requirements contained in paragraph 401-5.2b. The criteria is based on a production process which has a material variability with the following standard deviations:

Stability (lbs.)	=	270
Flow (0.01 in)	=	1.5
Air Voids (%)	=	0.65

C. If material variability exceeds the standard deviations indicated, the job mix formula and subsequent production targets should be based on a stability greater than shown in Table 1, and the flow and air voids should be targeted close to the mid-range of the criteria in order meet the acceptance requirements.

D. If the Tensile Strength Ratio (TSR) of the composite mixture, as determined by ASTM D 4867, is less than 75, the aggregates shall be rejected or the asphalt treated with an approved anti-stripping agent. The amount of anti-stripping agent added to the asphalt shall be sufficient to produce a TSR of not less than 75. If an antistrip agent is required, it will be provided by the Contractor at no additional cost.

E. The job mix formula shall be submitted in writing by the Contractor to the Engineer at least thirty (30) days prior to the start of paving operations and shall include as a minimum:

1. Percent passing each sieve size.
2. Percent of asphalt cement.
3. Asphalt viscosity or penetration grade.
4. Number of blows of hammer compaction per side of molded specimen.
5. Mixing temperature.
6. Compaction temperature.
7. Temperature of mix when discharged from the mixer.
8. Temperature-viscosity relationship of the asphalt cement.
9. Plot of the combined gradation on the Federal Highway Administration (FHWA) 45 power gradation curve.
10. Graphical plots of stability, flow, air voids, voids in the mineral aggregate, and unit weight verses asphalt content.
11. Percent natural sand.
12. Percent fractured faces.
13. Percent elongated particles.

14. Tensile Strength Ratio (TSR).

15. Antistrip agent (if required).

F. The Contractor shall submit samples to the Engineer, upon request, for job mix formula verification testing.

G. The job mix formula for each mixture shall be in effect until modified in writing by the Engineer. Should a change in sources of materials be made, a new job mix formula must be approved by the Engineer before the new material is used.

Table 1
MARSHALL DESIGN CRITERIA

Test Property	Design Criteria
Number of blows	75
Stability, pounds (minimum)	1800
Flow, 0.01 in.	8-16
Air voids (percent)	3-5
Percent voids in mineral aggregate, minimum	15

H. The mineral aggregate shall be of such size that the percentage composition by weight, as determined by laboratory screens, will conform to the gradation or gradations specified in Table 2 when tested in accordance with ASTM Standard C 136 and C 117.

I. The gradations in Table 2 represent the limits which shall determine the suitability of aggregate for use from the sources of supply. The aggregate, as selected (and used in the JMF), shall have a gradation within the limits designated in Table 2 and shall not vary from the low limit on one sieve to the high limit on the adjacent sieve, or vice versa, but shall be well graded from coarse to fine.

J. Deviations from the final approved mix design for bitumen content and gradation of aggregates shall be within the action limits for individual measurements as specified in paragraph 6.5A. The limits still will apply if they fall outside the master grading band in Table 2.

K. The maximum size aggregate used shall not be more than one-half of the thickness of the course being constructed.

Table 2
AGGREGATE – BITUMINOUS PAVEMENTS

Sieve Size	Percentage by Weight Passing Sieve
¾ inch	100
½ inch	79-99
⅜ inch	68-88
No. 4	48-68
No. 8	33-53
No. 16	20-40
No. 30	14-30
No. 50	9-21
No. 100	6-16
No. 200	3-6
Asphalt percent	5.0-7.5

L. The aggregate gradations shown are based on aggregates of uniform specific gravity. The percentages passing the various sieves shall be corrected when aggregates of varying specific gravities are used, as indicated in the Asphalt Institute Manual Series No. 2 (MS-2), Appendix A.

3.3 RECYCLED ASPHALT CONCRETE:

A. Recycled asphalt concrete shall consist of reclaimed asphalt pavement (RAP), coarse aggregate, fine aggregate, mineral filler, asphalt cement, and recycling agent, if necessary. Reclaimed asphalt pavement may be used only for base and surface courses of roadway and parking lot pavements as approved by the Engineer. Reclaimed asphalt pavement shall not be permitted on apron or taxiway pavement courses.

B. The RAP shall be of a consistent gradation and asphalt content. The Contractor may obtain the RAP from the job site or an existing source.

C. All new aggregates used in the recycled mix shall meet the requirements of paragraph 2.1. New bituminous material shall meet the requirements of paragraph 2.3. Recycling agents shall meet the requirements of ASTM D 4552.

D. The recycled asphalt concrete mix shall be designed using procedures contained in the Asphalt Institute's Manual Series Number 20 (MS-20), Asphalt Hot-Mix Recycling, in conjunction with MS-2 (MS-2). The job mix shall meet the requirements of paragraph 3.2. In addition to the requirements of paragraph 3.2, the job mix formula shall indicate the percent of reclaimed asphalt pavement, the percent and viscosity grade of new asphalt, the percent and grade of hot-mix recycling agent (if used), and the properties (including viscosity and penetration) of the asphalt blend.

E. The Contractor shall submit documentation to the Engineer, indicating that the mixing equipment proposed for use is adequate to mix the percent of RAP shown in the job mix formula and meet all local and national environmental regulations.

3.4 TEST SECTION:

A. Prior to full production, the Contractor shall prepare and place a quantity of bituminous mixture according to the job mix formula. The amount of mixture should be sufficient to construct a test section 300 feet long and 20 feet wide placed in two lanes, with a longitudinal cold joint, and shall be of the same depth specified for the construction of the course which it represents. The underlying grade or pavement structure upon which the test section is to be constructed shall be the same as the remainder of the course represented by the test section. The equipment used in construction of the test section shall be the same type and weight to be used on the remainder of the course represented by the test section.

B. Three random samples shall be taken at the plant and tested for stability, flow, and air voids in accordance with paragraph 5.1B2. Two random samples of mixture shall be taken at the plant and tested for aggregate gradation and asphalt content in accordance with paragraphs 6.3A and 3B and evaluated in accordance with paragraphs 6.5B1 and B2. Three randomly selected cores shall be taken from the finished pavement mat, and three from the longitudinal joint, and tested in accordance with paragraph 5.1D3. Random sampling shall be in accordance with procedures contained in ASTM D 3665.

C. Mat density and air voids shall be evaluated in accordance with paragraph 5.2I1. Stability and flow shall be evaluated in accordance with paragraph 5.2I2. Joint density shall be evaluated in accordance with paragraph 5.2I3.

D. Voids in the mineral aggregate (VMA), for each plant sample, shall be computed in accordance with procedures contained in Chapter III, MARSHALL METHOD OF MIX DESIGN, of the Asphalt Institute's Manual Series No. 2 (MS-2), Mix Design Methods for Asphalt Concrete.

E. The test section shall be considered acceptable if:

1. Marshall stability, flow, mat density, air voids, and joint density are 90 percent or more within limits,

2. Gradation and asphalt content are within the action limits specified in paragraphs 6.5B1 and B2, and

3. The voids in the mineral aggregate is within the limits of Table 1.

F. If the initial test section should prove to be unacceptable, the necessary adjustments to the job mix formula, plant operation, placing procedures, and/or rolling procedures shall be made. A second test section shall then be placed. If the second test section also does not meet specification requirements, both sections shall be removed at the Contractor's expense. Additional test sections, as required, shall be constructed and evaluated for conformance to the specifications. Any additional sections that are not acceptable shall be removed at the Contractor's expense. Full production shall not begin until an acceptable section has been constructed and accepted by the Engineer. The initial test section, whether acceptable or unacceptable, and any subsequent section that meets specification requirements shall be paid for in accordance with paragraph 8.1.

G. Job mix control testing shall be performed by the Contractor at the start of plant production and in conjunction with the calibration of the plant for the job mix formula. It should be recognized that the aggregates produced by the plant may not satisfy the gradation requirements or produce a mix that exactly meets the JMF. In those instances, it will be necessary to reevaluate and redesign the mix using

plant-produced aggregates. Specimens should be prepared and the optimum bitumen content determined in the same manner as for the original design tests.

3.5 TESTING LABORATORY:

A. The laboratory used to develop the job mix formula shall meet the requirements of ASTM D 3666. A certification signed by the manager of the laboratory stating that it meets these requirements shall be submitted to the Engineer prior to the start of construction. The certification shall contain as a minimum:

1. Qualifications of personnel; laboratory manager, supervising technician, and testing technicians.

2. A listing of equipment to be used in developing the job mix.

3. A copy of the laboratory's quality control system.

4. Evidence of participation in the AASHTO Materials Reference Laboratory (AMRL) program.

401-4 CONSTRUCTION METHODS

4.1 WEATHER LIMITATIONS:

The bituminous mixture shall not be placed upon a wet surface or when the surface temperature of the underlying course is less than 45°F. The temperature requirements may be waived by the Engineer, if requested; however, all other requirements including compaction shall be met.

4.2 BITUMINOUS MIXING PLANT:

Plants used for the preparation of bituminous mixtures shall conform to the requirements of ASTM D 995 with the following changes:

A. Truck Scales. The bituminous mixture shall be weighed on approved scales furnished by the Contractor, or on certified public scales at the Contractor's expense. Scales shall be inspected and sealed as often as the Engineer deems necessary to assure their accuracy. Scales shall conform to the requirements of the General Provisions, Section 90-01.

B. Testing Facilities. The Contractor shall provide laboratory facilities at the plant for the use of the Engineer's acceptance testing and the Contractor's quality control testing, in accordance with paragraph 6.2.

C. Inspection of Plant. The Engineer, or Engineer's authorized representative, shall have access, at all times, to all areas of the plant for checking adequacy of equipment; inspecting operation of the plant: verifying weights, proportions, and material properties; and checking the temperatures maintained in the preparation of the mixtures.

D. Storage Bins and Surge Bins. Paragraph 3.9 of ASTM D 995 is deleted. Instead, the following applies. Use of surge bins or storage bins for temporary storage of hot bituminous mixtures will be permitted as follows:

1. The bituminous mixture may be stored in surge bins for period of time not to exceed three (3) hours.

2. The bituminous mixture may be stored in insulated storage bins for a period of time not to exceed 24 hours.

The bins shall be such that mix drawn from them meets the same requirements as mix loaded directly into trucks. If the Engineer determines that there is an excessive amount of heat loss, segregation or oxidation of the mixture due to temporary storage, no overnight storage will be allowed.

4.3 HAULING EQUIPMENT:

Trucks used for hauling bituminous mixtures shall have tight, clean, and smooth metal beds. To prevent the mixture from adhering to them, the truck beds shall be lightly coated with a minimum amount of paraffin oil, lime solution, or other approved material. Each truck shall have a suitable cover to protect the mixture from adverse weather. When necessary, to ensure that the mixture will be delivered to the site at the specified temperature, truck beds shall be insulated or heated and covers shall be securely fastened.

4.4 BITUMINOUS PAVERS:

A. Bituminous pavers shall be self-propelled, with an activated screed, heated as necessary, and shall be capable spreading and finishing courses of bituminous plant mix material which will meet the specified thickness, smoothness, and grade. The paver shall have sufficient power to propel itself and the hauling equipment without adversely affecting the finished surface.

B. The paver shall have a receiving hopper of sufficient capacity to permit a uniform spreading operation. The hopper shall be equipped with a distribution system to place the mixture uniformly in front of the screed without segregation. The screed shall effectively produce a finished surface of the required evenness and texture without tearing, shoving, or gouging the mixture.

C. If an automatic grade control device is used, the paver shall be equipped with a control system capable of automatically maintaining the specified screed elevation. The control system shall be automatically actuated from either a reference line and/or through a system of mechanical sensors or sensor-directed mechanisms or devices which will maintain the paver screed at a predetermined transverse slope and at the proper elevation to obtain the required surface. The transverse slope controller shall be capable of maintaining the screed at the desired slope within plus or minus 0.1 percent.

D. The controls shall be capable of working in conjunction with any of the following attachments:

1. Ski-type device of not less than thirty (30) feet in length.

2. Taut stringline (wire) set to grade.

3. Short ski or shoe.

4. Laser control.

4.5 ROLLERS:

Rollers of the vibratory, steel wheel, and pneumatic-tired type shall be used. They shall be in good condition, capable of operating at slow speeds to avoid displacement of the bituminous mixture. The number, type, and weight of rollers shall be sufficient to compact the mixture to the required density while it is still in a workable condition. The use of equipment which causes excessive crushing of the aggregate will not be permitted.

4.6 PREPARATION OF BITUMINOUS MATERIAL:

The bituminous material shall be heated in a manner that will avoid local overheating and provide a continuous supply of the bituminous material to the mixer at a uniform temperature. The temperature of the bituminous material delivered to the mixer shall be sufficient to provide a suitable viscosity for adequate coating of the aggregate particles, but shall not exceed 325°F.

4.7 PREPARATION OF MINERAL AGGREGATE:

The aggregate for the mixture shall be heated and dried prior to introduction into the mixer. The maximum temperature and rate of heating shall be such that no damage occurs to the aggregates. The temperature of the aggregate and mineral filler shall not exceed 350°F when the asphalt is added. Particular care shall be taken that aggregates high in calcium or magnesium content are not damaged by overheating. The temperature shall not be lower than is required to obtain complete coating and uniform distribution on the aggregate particles and to provide a mixture of satisfactory workability.

4.8 PREPARATION OF BITUMINOUS MIXTURE:

The aggregates and the bituminous material shall be weighed or metered and introduced into the mixer in the amount specified by the job mix formula.

The combined materials shall be mixed until the aggregate obtains a uniform coating of bitumen and is thoroughly distributed throughout the mixture. Wet mixing time shall be the shortest time that will produce a satisfactory mixture, but not less than 25 seconds for batch plants. The wet mixing time for all plants shall be established by the Contractor, based on the procedure for determining the percentage of coated particles described in ASTM D 2489, for each individual plant and for each type of aggregate used. The wet mixing time will be set to achieve 95 percent of coated particles. For continuous mix plants, the minimum mixing time shall be determined by dividing the weight of its contents at operating level by the weight of the mixture delivered per second by the mixer. The moisture content of all bituminous mix upon discharge shall not exceed 0.5 percent.

4.9 PREPARATION OF THE UNDERLYING SURFACE:

Immediately before placing the bituminous mixture, the underlying course shall be cleaned of all dust and debris. A tack coat shall be applied in accordance with Item P-603.

4.10 TRANSPORTING, PLACING, AND FINISHING:

A. The bituminous mixture shall be transported from the mixing plant to the site in vehicles conforming to the requirements of paragraph 4.3. Deliveries shall be scheduled so that placing and compacting of mixture is uniform with minimum stopping and starting of the paver. Adequate artificial lighting shall be provided night placements. Hauling over freshly placed material shall not be permitted until the material has been compacted, as specified, and allowed to cool to atmospheric temperature.

B. The Contractor may elect to use a material transfer vehicle to deliver mix to the paver.

C. The mix shall be placed and compacted at a temperature suitable for obtaining density, surface smoothness, and other specified requirements but not less than 250°F.

D. Upon arrival, the mixture shall be placed to the full width by a bituminous paver. It shall be struck off in a uniform layer of such depth that, when the work is completed, it shall have the required thickness and conform to the grade and contour indicated. The speed of the paver shall be regulated to eliminate pulling and tearing of the bituminous mat. Unless otherwise permitted, placement of the mixture shall begin along the centerline of a crowned section or on the high side of areas with a one-way slope. The mixture shall be placed in consecutive adjacent strips having a minimum width of twelve (15) feet except where edge lanes require less width to complete the area. The longitudinal joint in one course shall offset the longitudinal joint in the course immediately below by at least one (1) foot. The joint in the surface top course of designated taxiway and taxilane pavements, however, shall be at the centerline of the pavement. Transverse joints in one course shall be offset by at least ten (10) feet from transverse joints in the previous course.

E. Transverse joints in adjacent lanes shall be offset a minimum of ten (10) feet.

F. On areas where irregularities or unavoidable obstacles make the use of mechanical spreading and finishing equipment impractical, the mixture may be spread and luted by hand tools.

4.11 COMPACTION OF MIXTURE:

A. After placing, the mixture shall be thoroughly and uniformly compacted by rolling. The surface shall be compacted as soon as possible when the mixture has attained sufficient stability so that the rolling does not cause undue displacement, cracking or shoving. The sequence of rolling operations and the type of rollers used shall be at the discretion of the Contractor.

B. The speed of the roller shall, at all times, be sufficiently slow to avoid displacement of the hot mixture and be effective in compaction. Any displacement occurring as a result of reversing the direction of the roller, or from any other cause, shall be corrected at once.

C. Sufficient rollers shall be furnished to handle the output of the plant. Rolling shall continue until the surface is of uniform texture, true to grade and cross section, and the required field density is obtained.

D. To prevent adhesion of the mixture to the roller, the wheels shall be kept properly moistened (and scrapers used), but excessive water will not be permitted.

E. In areas not accessible to the roller, the mixture shall be thoroughly compacted with hand tampers.

F. Any mixture that becomes loose and broken, mixed with dirt, contains check-cracking, or in any way defective shall be removed and replaced with fresh hot mixture and immediately compacted to conform to the surrounding area. This work shall be done at the Contractor's expense. Skin patching shall not be allowed.

4.12 JOINTS:

A. The formation of all joints shall be made in such a manner as to ensure a continuous bond between the courses and obtain the required density. All joints shall have the same texture as other sections of the course and meet the requirements for smoothness and grade.

B. The roller shall not pass over the unprotected end of the freshly laid mixture except when necessary to form a transverse joint. When necessary to form a transverse joint, it shall be made by means of placing a bulkhead or by tapering the course. The tapered edge shall be cut back to its full depth and width on a straight line to expose a vertical face prior to placing the adjacent lane. In both methods all contact surfaces shall be given a tack coat of bituminous material before placing any fresh mixture against the joint.

C. Longitudinal joints which are irregular, damaged, uncompacted, or otherwise defective shall be cut back to expose a clean, sound surface for the full depth of the course. All contact surfaces shall be given a tack coat of bituminous material prior to placing any fresh mixture against the joint.

401-5 MATERIAL ACCEPTANCE

5.1 ACCEPTANCE SAMPLING AND TESTING:

All acceptance sampling and testing necessary to determine conformance with the requirements specified in this section will be performed by the Engineer at no cost to the Contractor. Testing organizations performing these tests shall meet the requirements of ASTM D 3666. All equipment in Contractor furnished laboratories shall be calibrated by the testing organization prior to the start of operations.

A. Plant-Produced Material. Plant-produced material shall be tested for stability, flow, and air voids on a lot basis. Sampling shall be from material deposited into trucks at the plant or from trucks at the job site. A lot will consist of:

1. One day's production not to exceed 2,000 tons, or

2. A half day's production where a day's production is expected to consist of between 2,000 and 4,000 tons, or

3. Similar subdivisions for tonnages over 4,000 tons.

B. Where more than one plant is simultaneously producing material for the job, the lot sizes shall apply separately for each plant.

1. Sampling. Each lot will consist of four equal sublots. Sufficient material for preparation of test specimens will be sampled by the Engineer on a random basis, in accordance with the procedures contained in ASTM D 3665. One set of laboratory compacted specimens will be prepared for each sublot in accordance with ASTM D 1559, paragraph 4.5, at the number of blows required by paragraph 401-3.2, Table 1. Each set of laboratory compacted specimens will consist of three test portions prepared from the same sample increment.

   The sample of bituminous mixture may be put in a covered metal tin and placed in an oven for not more than thirty (30) minutes to maintain the heat. The compaction temperature of the specimens should be as specified in the job mix formula.

2. Testing. Sample specimens shall be tested for stability and flow in accordance with ASTM D 1559, paragraph 5. Air voids will be determined by the Engineer in accordance with ASTM D 3203.

   Prior to testing, the bulk specific gravity of each test specimen shall be measured by the Engineer in accordance with ASTM D 2726 or D 1188, whichever is applicable, for use in computing air voids and pavement density.

   For air voids determination, the theoretical maximum specific gravity of the mixture shall be measured twice for each lot in accordance with ASTM D 2041, Type C or D container. Samples shall be taken on a random basis in accordance with ASTM D 3665. The value used in the voids computation for each sublot shall be the average of the two maximum specific gravity measurements for the lot.

   The stability, flow, and air voids for each sublot shall be computed by averaging the results of the three test specimens representing that sublot.

3. Acceptance. Acceptance of plant produced material for stability, flow, and air voids shall be determined by the Engineer in accordance with the requirements of paragraph 5.2E.

C. Field Placed Material. Material placed in the field shall be tested for mat and joint density on a lot basis.

1. Mat Density. The lot size shall be the same as that indicated in paragraph 5.1A and shall be divided into four equal sublots. One core of finished, compacted materials shall be taken by the Contractor from each sublot. Core locations will be determined by the Engineer on a random basis in accordance with procedures contained in ASTM D 3665. Cores shall not be taken closer than one foot from a transverse or longitudinal joint.

2. Joint Density. The lot size shall be the total length of longitudinal joints constructed by a lot of material as defined in paragraph 5.1A. The lot shall be divided into four equal sublots.

   One core of finished, compacted materials shall be taken by the Contractor from each sublot. Core locations will be determined by the Engineer on a random basis in accordance with procedures contained in ASTM D 3665.

3. Sampling. Samples shall be neatly cut with a core drill. The cutting edge of the core drill bit shall be of hardened steel or other suitable material with diamond chips embedded in the metal cutting edge. The minimum diameter of the sample shall be three inches. Samples that are clearly defective, as a result of sampling, shall be discarded and another sample taken. The Contractor shall furnish all tools, labor, and materials for cutting samples and filling the cored pavement. Cored holes shall be filled in a manner acceptable to the Engineer and within one day after sampling.

4. Testing. The bulk specific gravity of each cored sample will be measured by the Engineer in accordance with ASTM D 2726 or D 1188, whichever is applicable. The percent compaction (density) of each sample will be determined by dividing the bulk specific gravity of each sublot sample by the average bulk specific gravity of all laboratory prepared specimens for the lot, as determined in paragraph 5.1B2.

5. Acceptance. Acceptance of field placed material for mat density will be determined by the Engineer in accordance with the requirements of paragraph 5.2F. Acceptance for joint density will be determined in accordance with the requirements of paragraph 5.2G.

D. Partial Lots, Plant-Produced Material. When operational conditions cause a lot to be terminated before the specified number of tests have been made for the lot, the following procedure will be used to adjust the lot size and the number of tests for the lot.

   The last batch produced where production is unexpectedly halted will be sampled and its properties shall be considered as representative of the particular sublot from which it was taken. Where three sublots are produced, they shall constitute a lot. Where one or two sublots are produced, they shall be incorporated into the next lot and the total number of sublots shall be used in the acceptance plan calculation, i.e., $n = 5$ or $n = 6$, for example.

E. Partial Lots, Field-Placed Material. The lot size for field placed material shall correspond to that of the plant material, except that in no cases less than (3) cored samples shall be obtained, i.e., $n = 3$.

5.2 ACCEPTANCE CRITERIA:

A. General. Acceptance will be based on the following characteristics of the bituminous mixture and completed pavement as well as the implementation of the Contractor's Quality Control plan and test results:

1. Stability
2. Flow
3. Air voids
4. Mat density
5. Joint density
6. Thickness
7. Smoothness
8. Grade

B. Stability, flow, and air voids will be evaluated for acceptance in accordance with paragraph 5.2E. Mat density will be evaluated for acceptance in accordance with paragraph 5.2F. Joint density will be evaluated for acceptance in accordance with paragraph 5.2G.

C. Acceptance for mat density and air voids will be based on the criteria contained in paragraph 5.2I1. Acceptance for stability and flow will be based on the criteria contained in paragraph 5.2I2. Acceptance for joint density will be based on the criteria contained in paragraph 5.2I3. Thickness will be evaluated by the Engineer for compliance in accordance with paragraph 5.2I4. Acceptance for smoothness will be based on the criteria contained in paragraph 5.2I5. Acceptance for grade will be based on the criteria contained in paragraph 5.2I6.

D. The Engineer may at any time, not withstanding previous plant acceptance, reject and require the Contractor to dispose of any batch of bituminous mixture which is rendered unfit for use due to contamination, segregation, incomplete coating of aggregate, or improper mix temperature. Such rejection may be based on only visual inspection or temperature measurements. In the event of such rejection, the Contractor may take a representative sample of the rejected material in the presence of the Engineer, and if he can demonstrate in the laboratory, in the presence of the Engineer, that such material was erroneously rejected, payment will be made for the material at the contract unit price.

E. Stability, Flow, Air Voids. Acceptance of each lot of plant produced material for stability, flow, and air voids shall be based on the percentage of material within specification limits (PWL). The PWL plan considers the variability (standard deviation) of the material and the testing procedures, as well as the average (mean) value of the test results. If a material with high variability is produced, the production target must be adjusted as outlined in paragraph 3.2 to achieve a PWL of 90 or more.

F. Mat Density. Acceptance of each lot of in-place pavement for mat density shall be based on the percentage of material within specification limits (PWL). If a material with high variability is produced, then a higher target density must be maintained in order to achieve a PWL of 90 or more.

G. Joint Density. Acceptance of each lot of in-place pavement for joint density shall be based on the percentage of material within specification limits (PWL). If a material with high variability is produced, then a higher target density must be maintained in order to achieve a PWL of 90 or more.

H. Percentage of Material Within Specification Limits (PWL). The percentage of material within specification limits (PWL) shall be determined in accordance with procedures specified in Section 110, of these Technical Specifications. The specification tolerance limits (L) and (U) are contained in Table 3.

I. Acceptance Criteria.

1. Mat Density and Air Voids. If the PWL of the lot equals or exceeds 90 percent, the lot shall be acceptable. If the PWL is less than 90 percent, payment shall be made in accordance with paragraph 8.1A.

2. Stability and Flow. If the PWL of the lot equals or exceeds 90 percent, the lot shall be acceptable. If the PWL is less than 90 percent, the Contractor shall determine the reason and take corrective action. If the PWL is below 80 percent, the Contractor must stop production and make adjustments to the mix.

3. Joint Density. If the PWL of the lot equals or exceeds 90 percent, the lot shall be acceptable. If the PWL is less than 90 percent, the Contractor shall evaluate the method of compacting joints. If the PWL is below 80 percent, the Contractor shall stop production until the reason for poor compaction can be determined.

4. Thickness. Thickness shall be evaluated for compliance by the Engineer to the requirements shown on the plans. Measurements of thickness shall be made by the Engineer using the cores extracted for each sublot for density measurement.

5. Smoothness. The finished surfaces of the pavement shall not vary more than 1/4 inch for the surface course or 3/8 inch for the base course when tested with a twelve-foot straightedge. The lot size shall be 2000 square yards. Measurements will be made perpendicular and parallel to the centerline (or direction of paving) at distances not to exceed 50 feet. When more than 15 percent of all measurements within a lot exceed the specified tolerance, the Contractor shall remove the deficient area and replace with new material. Sufficient material shall be removed to allow placement of the minimum mat thickness specified in paragraph 4.10C. Skin patching shall not be permitted. High points may be ground off.

6. Grade. The finished surface of the pavement shall not vary from the gradeline elevations and cross sections shown on the plans by more than ½ inch. The finished grade of each lot will be determined by running levels at intervals of 50 feet or less longitudinally and transversely to determine the elevation of the completed pavement. The lot size shall be 2000 square yards. When more than 15 percent of all the measurements within a lot are outside the specified tolerance, the Contractor shall remove the deficient area and replace with new material. Sufficient material shall be removed to allow placement of the minimum mat thickness specified in paragraph 4.10C. Skin patching for correcting low areas shall not be permitted. High points may be ground off.

Table 3
ACCEPTANCE LIMITS FOR STABILITY, FLOW, AIR VOIDS, AND DENSITY

Test Property	Specification Tolerance	
	L	U
Number of Blows	75	--
Stability, pounds, minimum	1800	--
Flow, 0.01 inch	8	16
Air voids total mix	2.0%	5.0%
Density	96.3%	--
Joint density	93.3%	--

5.3 RESAMPLING PAVEMENT:

A. General. Resampling of a lot of pavement for mat density will be allowed if the Contractor requests, in writing, within 48 hours after receiving the written test results from the Engineer. A retest will consist of all the sampling and testing procedures contained in paragraphs 5.1C and 5.2F. Only one resampling per lot will be permitted.

1. A redefined PWL shall be calculated for the resampled lot. The number of tests used to calculate the redefined PWL shall include the initial tests made for that lot plus the retests.

2. The cost for resampling and retesting shall be borne by the Contractor.

B. Payment for Resampled Lots. The redefined PWL for a resampled lot shall be used to calculate the payment for that lot in accordance with Table 6.

C. Outliers. If the tests within a lot include a very large or a very small value which appears to be outside the normal limits of variation, check for an outlier in accordance with ASTM E 178, at a significance level of 5 percent, to determine if this value should be discarded when computing the PWL.

401-6 CONTRACTOR QUALITY CONTROL

6.1 GENERAL:

The Contractor shall develop a Quality Control Program in accordance with Section ISPA-1.15 of Part V, Interim Standard Provisions Addenda, of the Technical Provisions. The program shall address all elements which affect the quality of the pavement including, but not limited to:

A. Mix Design
B. Aggregate Grading
C. Quality of Materials
D. Stockpile Management
E. Proportioning
F. Mixing and Transportation
G. Placing and Finishing
H. Joints
I. Compaction
J. Surface smoothness

6.2 TESTING LABORATORY:

A. The Contractor shall provide a fully equipped asphalt laboratory located at the plant or job site. It shall be available for joint use by the Contractor for quality control testing and by the Engineer for acceptance testing and must have adequate equipment for the performance of the tests required by these specifications. The Engineer shall have priority in use of the equipment necessary for acceptance testing.

B. The effective working area of the laboratory shall be a minimum of 150 square feet with a ceiling height of not less than 7.5 feet. Lighting shall be adequate to illuminate all working areas. It shall be equipped with heating and air conditioning units to maintain a temperature of 70°F ± 5°.

C. Laboratory facilities shall be kept clean and all equipment shall be maintained in proper working condition. The Engineer shall be permitted unrestricted access to inspect the Contractor's laboratory facility and witness quality control activities. The Engineer will advise the Contractor in writing of any noted deficiencies concerning the laboratory facility, equipment, supplies, or testing personnel and procedures. When the deficiencies are serious enough to be adversely affecting test results, the incorporation of the materials into the work shall be suspended immediately and will not be permitted to resume until the deficiencies are satisfactorily corrected.

6.3 QUALITY CONTROL TESTING:

The Contractor shall perform all quality control tests necessary to control the production and construction processes applicable to these specifications and as set forth in the Quality Control Program. The testing program shall include, but not necessarily limited to, tests for the control of asphalt content, aggregate gradation, temperatures, aggregate moisture, field compaction, and surface smoothness. A Quality Control Testing Plan shall be developed as part of the Quality Control Program.

A. Asphalt Content. A minimum of two extraction tests shall be performed per lot in accordance with ASTM D 2172 for determination of asphalt content. The weight of ash portion of the extraction test, as described in ASTM D 2172, shall be determined as part of the first extraction test performed at the beginning of plant production; and as part of every tenth extraction test performed thereafter, for the duration of plant production. The last weight of ash value obtained shall be used in the calculation of the asphalt content for the mixture.

The use of the nuclear method for determining asphalt content in accordance with ASTM D 4125 is permitted, provided that it is calibrated for the specific mix being used.

B. Gradation. Aggregate gradations shall be determined a minimum of twice per lot from mechanical analysis of extracted aggregate in accordance with AASHTO T 30 and ASTM C 136 (Dry Sieve). When asphalt content is determined by the nuclear method, aggregate gradation shall be determined from hot bin samples on batch plants, or from the cold feed on drum mix or continuous mix plants, and tested in accordance with ASTM C 136 (dry sieve) using actual batch weights to determine the combined aggregate gradation of the mixture.

C. Moisture Content of Aggregate. The moisture content of aggregate used for production shall be determined a minimum of once per lot in accordance with ASTM C 566.

D. Moisture Content of Mixture. The moisture content of the mixture shall be determined once per lot in accordance with ASTM D 1461.

E. Temperatures. Temperatures shall be checked, at least four times per lot, at necessary locations to determine the temperatures of the dryer, the bitumen in the storage tank, the mixture at the plant, and the mixture at the job site.

F. In-Place Density Monitoring. The Contractor shall conduct any necessary testing to ensure that the specified density is being achieved. A nuclear gauge may be used to monitor the pavement density in accordance with ASTM D 2950.

G. Additional Testing. Any additional testing that the Contractor deems necessary to control the process may be performed at the Contractor's option.

H Monitoring. The Engineer reserves the right to monitor any or all of the above testing.

6.4 SAMPLING:

When directed by the Engineer, the Contractor shall sample and test any material which appears inconsistent with similar material being sampled, unless such material is voluntarily removed and replaced or deficiencies corrected by the Contractor. All sampling shall be in accordance with standard procedures specified.

6.5 CONTROL CHARTS:

A. The Contractor shall maintain linear control charts both for individual measurements and range (i.e., difference between highest and lowest measurements) for aggregate gradation and asphalt content.

B. Control charts shall be posted in a location satisfactory to the Engineer and shall be kept current. As a minimum, the control charts shall identify the project number, the contract item number, the test number, each test parameter, the Action and Suspension Limits applicable to each test parameter, and the Contractor's test results. The Contractor shall use the control charts as part of a process control system for identifying potential problems and assignable causes before they occur. If the Contractor's projected data during production indicates a problem and the Contractor is not taking satisfactory corrective action, the Engineer may suspend production or acceptance of the material.

1. Individual Measurements. Control charts for individual measurements shall be established to maintain process control within tolerance for aggregate gradation and asphalt content. The control charts shall use the job mix formula target values as indicators of central tendency for the following test parameters with associated Action and Suspension Limits:

Table 4
CONTROL CHART LIMITS FOR INDIVIDUAL MEASUREMENTS

Sieve Opening	Action Limit	Suspension Limit
¾ inch	0%	0%
½ inch	±6%	±9%
⅜ inch	±6%	±9%
No. 4	±6%	±9%
No. 16	±5%	±7.5%
No. 50	±13%	±4.5%
No. 200	±2%	±3%
Asphalt Content	±0.5%	±0.7%

2. Range. Control charts for range shall be established to control process variability for the test parameters and Suspension Limits listed below. The range shall be computed for each lot as the difference between the two test results for each control parameter. The Suspension Limits specified below are based on a sample size of n = 2. Should the Contractor elect to perform more than two tests per lot, the Suspension Limits shall be adjusted by multiplying the Suspension Limit by 1.18 for n = 3 and by 1.27 for n = 4.

Table 5
CONTROL CHART LIMITS BASED ON RANGE
(Based on n = 2)

Sieve Opening	Suspension Limit
½ inch (12.5 mm)	11%
⅜ inch (9.5 mm)	11%
No. 4 (4.75 mm)	11%
No. 16 (1.18 mm)	9%
No. 50 (0.30 mm)	6%
No. 200 (0.075 mm)	3.5%
Asphalt Content	0.8%

3. Corrective Action. The Quality Control Plan shall indicate that appropriate action shall be taken when the process is believed to be out of tolerance. The Plan shall contain sets of rules to gauge when a

process is out of control and detail what action will be taken to bring the process into control. As a minimum, a process shall be deemed out of control and production stopped and corrective action taken, if:

a. One point falls outside the Suspension Limit line for individual measurements or range; or

b. Two points in a row fall outside the Action Limit line for individual measurements.

401-7 METHOD OF MEASUREMENT

7.1 Plant mix bituminous concrete pavement shall be measured by the number of tons used in the accepted work. Quantities of the various bituminous mixtures, i.e. P-401, MSHA surface and base course, shall be measured and recorded separately. Recorded batch weights or truck scale weights will be used to determine the basis for the tonnage.

401-8 BASIS OF PAYMENT

8.1 Payment for an accepted lot of bituminous concrete pavement shall be made at the contract unit price per ton for bituminous mixture adjusted according to paragraph 401-8.1A. The price shall be compensation for furnishing all materials, for all preparation, mixing, and placing of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

A. Basis of Adjusted Payment. Each lot shall be accepted at the full contract price when the percent within limits (PWL) for mat density and air voids equals or exceeds 90 percent. Each lot not meeting the 90 percent PWL requirement will be accepted at an adjusted contract unit price in accordance with Table 6. Payment shall be calculated for both mat density and air voids, and payment shall be based on the lower of the two values.

Table 6
PRICE ADJUSTMENT SCHEDULE

Percentage of Material Within the Specification Limit	Percent of Contract Unit Price to be Paid
90-100	100
80-90	0.5×PWL + 55.0
65-80	2.0×PWL - 65.0
below 65	see note below

Note: The lot shall be removed and replaced. However, the Engineer may decide to accept the deficient lot. In that case, if the Engineer and Contractor agree in writing that the lot shall not be removed it will be paid for at fifty (50) percent of the contract price.

Payment will be made under:

Item P-401.1 **Airfield Bituminous Surface Course -- per ton**

Item P-401.2 **MSHA Hot Mix Asphalt Surface Course (SC) -- per ton**

TESTING REQUIREMENTS

ASTM C 29	Unit Weight of Aggregate
ASTM C 88	Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
ASTM C 117	Test Method for Materials Finer than 75-um (No.200) Sieve in Mineral Aggregates by Washing
ASTM C 131	Resistance to Abrasion of Small Size Coarse Aggregate by Use of the Los Angeles Machine
ASTM C 136	Sieve or Screen Analysis of Fine and Coarse Aggregates
ASTM C 183	Sampling Hydraulic Cement
ASTM C 566	Total Moisture Content of Aggregate by Drying
ASTM D 75	Sampling Aggregates
ASTM D 995	Requirements for Mixing Plants for Hot-Mixed Hot-Laid Bituminous Paving Mixtures
ASTM D 118	Bulk Specific Gravity of Compacted Bituminous Mixtures Using Paraffin-Coated Specimens
ASTM D 1461	Moisture or Volatile Distillates in Bituminous Paving Mixtures
ASTM D 1559	Resistance to Plastic Flow of Bituminous Mixtures Using Marshall Apparatus
ASTM D 2041	Theoretical Maximum Specific Gravity and Density of Bituminous Paving Mixtures
ASTM D 2172	Quantitative Extraction of Bitumen from Bituminous Paving Mixtures
ASTM D 2419	Sand Equivalent Value of Soils and Fine Aggregate
ASTM D 2489	Degree of Particle Coating of Bituminous-Aggregate Mixtures
ASTM D 2726	Bulk Specific Gravity of Compacted Bituminous Mixtures Using Saturated Surface-Dry Specimens
ASTM D 3203	Percent Air Voids in Compacted Dense and Open Bituminous Paving Mixtures
ASTM D 2950	Density of Bituminous Concrete in Place by Nuclear Method
ASTM D 3665	Random Sampling of Paving Materials
ASTM D 3666	Inspection and Testing Agencies for Bituminous Paving Materials
ASTM D 4125	Asphalt Content of Bituminous Mixtures by the Nuclear Method
ASTM D 4318	Liquid Limit, Plastic Limit, and Plasticity Index of Soils

ASTM D 3381	Viscosity-Graded Asphalt Cement for Use in Pavement Construction
ASTM D 4552	Classifying Hot-Mix Recycling Agents

END OF ITEM P-401

ITEM P-603 BITUMINOUS TACK COAT

603-1 DESCRIPTION

1.1 This item shall consist of preparing and treating a bituminous, aggregate subbase, or concrete surface with bituminous material in accordance with these specifications and in reasonably close conformity to the lines shown on the plans.

603-2 MATERIALS

2.1 BITUMINOUS MATERIALS:

The bituminous material shall be either cutback or emulsified asphalt tar and shall conform to the requirements of Table 1. The type, grade, controlling specification, and application temperature of bituminous material to be used shall be specified by the Engineer.

Table 1
BITUMINOUS MATERIAL

Type and Grade	Specification	Application Temperature (°F)
Emulsified Asphalt		
SS-1, SS-1h	ASTM D 977	75-130
CSS-1, CSS-1h	ASTM D 2397	75-130
Cutback Asphalt		
RC-70	ASTM D 2028	120-160

603-3 CONSTRUCTION METHODS

3.1 WEATHER LIMITATIONS:

The tack coat shall be applied only when the existing surface is dry and the atmospheric temperature is above 60°F. The temperature requirements may be waived, but only when so directed by the Engineer.

3.2 EQUIPMENT:

A. The Contractor shall provide equipment for heating and applying the bituminous material.

B. The distributor shall be designed, equipped, maintained, and operated so that bituminous material at even heat may be applied uniformly on variable widths of surface at the specified rate. The allowable variation from the specified rate shall not exceed 10 percent. Distributor equipment shall include a tachometer, pressure gages, volume-measuring devices or a calibrated tank, and a thermometer for measuring temperatures of tank contents. The distributor shall be self-powered and shall be equipped with a power unit for the pump and full circulation spray bars adjustable laterally and vertically.

C. A power broom and/or blower shall be provided for any required cleaning of the surface to be treated.

3.3 APPLICATION OF BITUMINOUS MATERIAL:

A. Immediately before applying the tack coat, the full width of surface to be treated shall be swept with a power broom and/or airblast to remove all loose dirt and other objectionable material.

B. Emulsified asphalt shall be diluted by the addition of water when directed by the Engineer and shall be applied a sufficient time in advance of the paver to ensure that all water has evaporated before any of the overlying mixture is placed on the tacked surface.

C. The bituminous material including vehicle or solvent shall be uniformly applied with a bituminous distributor at the rate of 0.05 to 0.15 gallons per square yard depending on the condition of the existing surface. The type of bituminous material and application rate shall be approved by the Engineer prior to application.

D. Following the application, the surface shall be allowed to cure without being disturbed for such period of time as may be necessary to permit drying out and setting of the tack coat. This period shall be determined by the Engineer. The surface shall then be maintained by the Contractor until the next course has been placed. Suitable precautions shall be taken by the Contractor to protect the surface against damage during this interval.

3.4 BITUMINOUS MATERIAL-CONTRACTOR'S RESPONSIBILITY:

A. Samples of the bituminous material that the Contractor proposes to use, together with a statement as to its source and character, must be submitted and approved before use of such material begins. The Contractor shall require the manufacturer or producer of the bituminous material to furnish material subject to this and all other pertinent requirements of the contract. Only satisfactory materials so demonstrated by service tests, shall be acceptable.

B. The Contractor shall furnish the vendor's certified test reports for each carload, or equivalent, of bituminous material shipped to the project. The report shall be delivered to the Engineer before permission is granted for use of the material. The furnishing of the vendor's certified test report for the bituminous material shall not be interpreted as a basis for final acceptance. All such test reports shall be subject to verification by testing samples of material received for use on the project.

3.5 FREIGHT AND WEIGH BILLS:

Before the final estimate is allowed, the Contractor shall file with the Engineer receipted bills when railroad shipments are made, and certified weigh bills when materials are received in any other manner, of the bituminous materials actually used in the construction covered by the contract. The Contractor shall not remove bituminous material from the tank car or storage tank until the initial outage and temperature measurements have been taken by the Engineer, nor shall the car or tank be released until the final outage has been taken by the Engineer. Copies of freight bills and weigh bills shall be furnished to the Engineer during the progress of the work.

603-4 METHOD OF MEASUREMENT

4.1 The bituminous material for tack coat shall be measured by the gallon. Volume shall be corrected to the volume at 60°F in accordance with ASTM D 1250 for cutback asphalt and Table IV-3 of The Asphalt Institute's Manual MS-6 for emulsified asphalt. Water added to emulsified asphalt will not be measured for payment.

603-5 BASIS OF PAYMENT

5.1 Payment shall be made at the contract unit price per gallon of bituminous material. This price shall be full compensation for furnishing all materials, for all preparation, delivery, and application of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item P-603.1 **Bituminous Tack Coat – per gallon**

MATERIAL REQUIREMENTS

ASTM D 633	Volume Correction Table for Road Tar
ASTM D 977	Emulsified Asphalt
ASTM D 1250	Petroleum Measurement Tables
ASTM D 2028	Liquid Asphalt (Rapid-Curing Type)
ASTM D 2397	Cationic Emulsified Asphalt
AASHTO M 52	Tar for Use in Road Construction
Asphalt Institute Manual MS-6 Table IV-3	Temperature-Volume Corrections for Emulsified Asphalts

END OF ITEM P-603

ITEM P-605 JOINT SEALING FILLER

605-1 DESCRIPTION

1.1 This item shall consist of providing and installing a silicone sealant capable of sealing joints in bituminous and Portland cement concrete pavements.

605-2 MATERIALS

2.1 JOINT SEALANT:

A. Silicone sealant (non-acid curing) material shall meet the requirements shown in Table 1.

Table 1
SILICONE SEALANT REQUIREMENTS

Test	Test Method	Requirement
Flow	MIL-S-8802	0.3 maximum
Tack-Free Time	MIL-S-8802	90 minutes maximum
Durometer Hardness[1]	ASTM D 2240	10-25
Modulus at 150% elongation[1]	ASTM D 412 (Die C)	75 psi maximum
Elongation[1]	ASTM D 412 (Die C)	800% minimum
Adhesion to Concrete	MIL-S-8802	20 pounds minimum
Movement	ASTM C 719	±50% minimum

[1] Sample cured seven days at 77°F ± 2°F and 50% ± 5% relative humidity.

B. Each lot or batch of sealing compound shall be delivered to the jobsite in the manufacturer's original sealed container. Each container shall be marked with the manufacturer's name, batch or lot number, shelf life, and storage instructions. In addition, the Contractor shall supply the manufacturer's certification stating that the compound meets the requirements of this specification.

2.2 BACKER ROD:

The backer rod shall be a non-moisture absorbing resilient material. The rod shall be compatible with the sealant and no bond or reaction shall occur between the rod and the sealant.

605-3 CONSTRUCTION METHODS

3.1 WEATHER LIMITATIONS:

Joints shall be sealed as soon after completion of the curing period as feasible and before the pavement is opened to traffic, including construction equipment. The pavement temperature shall be above 40°F at the time of installation of the joint sealant.

3.2 EQUIPMENT:

A. Air Compressor. Air compressors shall be equipped with suitable traps capable of removing all free water and oil from the compressed air and shall be capable of furnishing air with a pressure greater than 90 psi.

B. Extrusion Equipment. Cold applied joint sealing compound shall be applied by means of pressure equipment that will force the sealing material to the bottom of the joint and completely fill the joint without voids and without spilling the material on the surface of the pavement. Before sealing the joints, the Contractor shall demonstrate that the equipment and procedures for preparing, mixing, and placing the sealant will produce a satisfactory joint seal.

3.3 PREPARATION OF JOINTS:

A. Immediately after joint sawing is completed, any resulting cement slurry shall be completely removed from the joints by water washing followed by brushing, if required. Joints shall then be blown clean and dry with compressed air. Joints shall be inspected for proper width, depth, alignment, and preparation, and shall be approved by the Engineer before work may continue.

B. Backer rod shall then be installed. When the surfaces are clean and dry, and just prior to placement of the sealant, compressed air shall be used to blow out the joint and remove all residual dust. Joints shall then be inspected by the Engineer and approved before sealing may begin.

3.4 INSTALLATION OF SEALANTS:

A. Sealant shall be installed in a continuous operation and shall adhere to the concrete and be free of voids. The sealant shall be tooled as necessary to produce a concave surface shown on the plans. Tooling shall be completed before the initial skin forms on the surface of the sealant.

B. Sealant which does not bond to joint walls, contains voids, or fails to set to a tack-free condition will be rejected and replaced by the Contractor at his own expense.

605-4 METHOD OF MEASUREMENT

4.1 There will be no direct measurement for payment of the quantity of joint sealant used. All costs for joint sealant shall be incidental to the various items being sealed.

605-5 BASIS OF PAYMENT

5.1 There will be no direct payment for the work done under this Item. All costs for preparing joints, furnishing and installing backer rod and sealant, and other materials, labor, equipment, and other incidentals necessary to complete the item shall be incidental to the various items being sealed.

MATERIAL REQUIREMENTS

FAA Engineering Brief Number 36 — **Silicone Joint Sealants for Airfield Pavements**

END OF ITEM P-605

ITEM P-610 PORTLAND CEMENT CONCRETE

610-1 DESCRIPTION

1.1 This item shall consist of plain and reinforced Portland cement concrete and structures, prepared and constructed in accordance with these specifications, at the locations and of the form and dimensions shown on the plans.

1.2 This item shall also consist of plain and reinforced Portland cement concrete pavement, prepared and constructed in accordance with these specifications, at the locations and of the form and dimensions shown on the plans.

610-2 MATERIALS

2.1 GENERAL:

A. Only approved materials, conforming to the requirements of these specifications, shall be used in the work. They may be subjected to inspection and tests at any time during the progress of their preparation or use. The source of supply of each of the materials shall be approved by the Engineer before delivery or use is started. Representative preliminary samples of the materials shall be sampled and tested by the Contractor. Materials shall be stored and handled to insure the preservation of their quality and fitness for use and shall be located to facilitate prompt inspection. All equipment for handling and transporting materials and concrete must be clean before any material or concrete is placed therein.

B. In no case shall the use of pit-run or naturally mixed aggregates be permitted. Naturally mixed aggregate shall be screened and washed, and all fine and coarse aggregates shall be stored separately and kept clean. The mixing of different kinds of aggregates from different sources in one storage pile or alternating batches of different aggregates will not be permitted.

C. In lieu of further requirements, locally availble concrete of the strengths specified herein will be accepted provided 28-day compressive strength test results, actual mix designs, and material certifications are submitted and approved by the Engineer. This provision shall also apply to concrete used in the construction of airfield pavements, except that approval for use shall be based on the flexural strength requirements contain herein.

D. Prior to the use of materials the Contractor shall submit certified test reports to the Engineer for approval. The certifications shall show the appropriated ASTM tests for each material, the test results, acceptance criteria, and a statement that the material passed or failed.

2.2 COARSE AGGREGATE:

A. The coarse aggregate for concrete shall meet the requirements of ASTM C 33.

B. Coarse aggregate shall be well graded from coarse to fine and shall meet one of the gradations shown in Table 1, using ASTM C 136.

2.3 FINE AGGREGATE:

A. The fine aggregate for concrete shall meet the requirements of ASTM C 33.

B. The fine aggregate shall be well graded from fine to coarse and shall meet the requirements of Table 2, when tested in accordance with ASTM C 136.

Table 1
GRADATION FOR COARSE AGGREGATE

Sieve Designation (square openings)	Percentage by Weight Passing Sieves
1 inch	100
3/4 inch	90-100
3/8 inch	20-55
No. 4	0-10

Table 2
GRADATION FOR FINE AGGREGATE

Sieve Designation (square openings)	Percentage by Weight Passing Sieves
3/8 inch	100
No. 4	95-100
No. 16	45-80
No. 30	25-55
No. 50	10-30
No. 100	2-10

C. Blending will be permitted, if necessary, in order to meet the gradation requirements for fine aggregate. Fine aggregate deficient in the percentage of material passing the No. 50 mesh sieve may be accepted, provided that such deficiency does not exceed 5% and is remedied by the addition of pozzolanic or cementitious materials other than portland cement, as specified in paragraph 2.6 on admixtures, in sufficient quantity to produce the required workability as approved by the Engineer.

2.4 CEMENT:

A. Cement shall conform to the requirements of ASTM C 150, Type I or ASTM C 595.

B. The Contractor shall furnish vendors' certified test reports for the cement proposed for use. The report shall be delivered to the Engineer before permission to use the cement is granted. All such test reports shall be subject to verification by testing sample materials received for use on the project.

2.5 WATER:

The water used in concrete shall be free from sewage, oil, acid, strong alkalies, vegetable matter, and clay and loam. If the water is of questionable quality, it shall be tested in accordance with AASHO T 26. Water known to be of potable quality may be used without testing.

2.6 ADMIXTURES:

A. The use of any material added to the concrete mix shall be approved by the Engineer. Before approval of any material, the Contractor shall be required to submit the results of complete physical and chemical analyses made by an acceptable testing laboratory. Subsequent tests shall be made of samples taken by the Engineer from the supply of the material being furnished or proposed for use on the work to determine whether the admixture is uniform in quality with that approved.

B. Pozzolanic admixtures shall be fly ash or raw or calcined natural pozzolans meeting the requirements of ASTM C 618.

C. Air-entraining admixtures shall meet the requirements of ASTM C 260. Air-entraining admixtures shall be added at the mixer in the amount necessary to produce the specified air content.

D. Water-reducing, set-controlling admixtures shall meet the requirements of ASTM C 494, Type A, water-reducing or Type D, water-reducing and retarding. Water-reducing admixtures shall be added at the mixer separately from air-entraining admixtures in accordance with the manufacturer's printed instructions.

2.7 PREMOLDED JOINT MATERIAL:

Premolded joint material for expansion joints shall meet the requirements of ASTM D 1752. Premolded joint material meeting the requirements of ASTM D 1751 shall be used only for expansion joints in concrete curb or curb and gutter.

2.8 JOINT SEALANT:

Joint sealant shall meet the requirements of Item P-605.

2.9 STEEL REINFORCEMENT:

Reinforcing shall consist of deformed bars conforming to the requirements of ASTM A 615, Grade 60. Tie bars used in the construction of concrete pavement may be of Grade 40 steel at the Contractor's option.

2.10 COVER MATERIALS FOR CURING:

Curing materials shall conform to one of the following specifications:

Waterproof paper for curing concrete	ASTM C 171
Polyethylene Sheeting for Curing Concrete	ASTM C 171
Liquid Membrane-Forming Compounds for Curing Concrete	ASTM C 309, Type 2

610-3 CONSTRUCTION METHODS

3.1 GENERAL:

The Contractor shall furnish all labor, materials, and services necessary for, and incidental to, the completion of all work as shown on the drawings and specified herein. All machinery and equipment owned or controlled by the Contractor, which he proposes to use on the work, shall be of sufficient size to meet the requirements of the work, and shall be such as to produce satisfactory work; all work shall be subject to the inspection and approval of the Engineer.

3.2 CONCRETE COMPOSITION:

A. Structural Concrete. The concrete shall develop a compressive strength of 4000 psi in 28 days as determined by test cylinders made in accordance with ASTM C 31 and tested in accordance with ASTM C 39. Concrete for items specified elsewhere in these Technical Requirements shall meet the requirements of this paragraph, except the strength of the concrete used may be as specifically provided for the item to be constructed. The concrete shall contain not less than 470 pounds of cement per cubic yard, and shall contain five (5) percent of entrained air, plus or minus one (1) percent, as determined by ASTM C 231. Fresh concrete shall have a slump of not more than four (4) inches as determined by ASTM C 143.

B. Pavement Concrete. The concrete shall be designed achieve a flexural strength of 650 psi at an age of twenty-eight (28) days. The mix shall contain a minimum of 500 pounds of cement per cubic yard, and the water-cement ratio shall not exceed 0.50 by weight. The Contractor shall submit to the Engineer for approval a mix design showing the proportions and flexural strength obtained from the concrete at ages of seven (7) and twenty-eight (28) days. Flexural strength specimens shall be prepared in accordance with ASTM C 31 and tested in accordance with ASTM C 78. The mix shall be a workable concrete having a slump between one and two inches as determined by ASTM C 143 and an entrained air content of between 4.5 and 6.5 per cent when tested in accordance with ASTM C 173 or ASTM C 213.

C. The mix designs shall include copies of test reports, including test dates, and shall include complete lists of the materials and proportions used and the results of tests conducted on the fresh concrete and compressive and flexural specimens prepared. The mix design and test results shall be submitted to the Engineer at least fifteen (15) days prior to anticipated use. Production shall not begin until the mix designs are approved in writing by the Engineer.

3.3 ACCEPTANCE SAMPLING AND TESTING:

A. Concrete for each structure will be accepted on the basis of the compressive strength specified in paragraph 3.2. The concrete shall be sampled in accordance with ASTM C 172. Compressive strength specimens shall be made in accordance with ASTM C 31 and tested in accordance with ASTM C 39.

B. Concrete used in constructing apron pavements will be accepted on the basis of the flexural strength specified in paragraph 3.2. The concrete shall be sampled in accordance with ASTM C 172. Flexural strength specimens shall be prepared in accordance with ASTM C 31 and tested in accordance with ASTM C 78.

3.4 PROPORTIONING AND MEASURING DEVICES:

When package cement is used, the quantity for each batch shall be equal to one or more whole sacks of cement. The aggregates shall be measured separately by weight. If aggregates are delivered to the mixer in batch trucks, the exact amount for each mixer charge shall be contained in each batch compartment. Weighing boxes or hoppers shall be approved by the Engineer and shall provide means of regulating the flow of aggregates into the batch box so that the required and exact weight of aggregates can be readily obtained.

3.5 CONSISTENCY:

The consistency of the concrete shall be checked by the slump test specified in ASTM C 143.

3.6 MIXING:

Concrete may be mixed at the construction site, at a central point, or wholly or in part in truck mixers. The concrete shall be mixed and delivered in accordance with the requirements of ASTM C 94.

3.7 MIXING CONDITIONS:

A. The concrete shall be mixed only in quantities required for immediate use. Concrete shall not be mixed while the air temperature is below 40°F without permission of the Engineer. If permission is granted for mixing under such conditions, aggregates or water, or both, shall be heated and the concrete shall be placed at a temperature not less than 50°F nor more than 100°F. The Contractor shall be held responsible for any defective work, resulting from freezing or injury in any manner during placing and curing, and shall replace such work at his/her expense.

B. Retempering of concrete by adding water or any other material shall not be permitted.

C. The delivery of concrete to the job shall be in such a manner that batches of concrete will be deposited at uninterrupted intervals.

3.8 FORMS:

A. Concrete shall not be placed until all the forms and reinforcement have been inspected and approved by the Engineer. Forms shall be of suitable material and shall be of the type, size, shape, quality, and strength to build the structure as designed on the plans. The forms shall be true to line and grade and shall be mortar-tight and sufficiently rigid to prevent displacement and sagging between supports. The Contractor shall bear responsibility for their adequacy. The surfaces of forms shall be smooth and free from irregularities, dents, sags, and holes.

B. Internal ties shall be arranged so that, when the forms are removed, no metal will show in the concrete surface or discolor the surface when exposed to weathering. All forms shall be wetted with water or with a nonstaining mineral oil which shall be applied shortly before the concrete is placed. Forms shall be constructed so that they can be removed without injuring the concrete or concrete surface. The forms shall not be removed before the expiration of at least thirty (30) hours from vertical faces, walls, slender columns, and similar structures; forms supported by falsework under slabs, beams, girders, arches, and similar construction shall not be removed until tests indicate that at least 60% of the design strength of the concrete has developed.

3.9 PLACING REINFORCEMENT:

All reinforcement, including tie bars and smooth dowels, shall be accurately placed, as shown on the plans, and shall be firmly held in position during concreting. Bars shall be fastened together at intersections. The reinforcement shall be supported by approved metal chairs. Shop drawings, lists, and bending details shall be supplied by the Contractor when required.

3.10 EMBEDDED ITEMS:

Before placing concrete, any items that are to be embedded shall be firmly and securely fastened in place as indicated. All such items shall be clean and free from coating, rust, scale, oil, or any foreign matter. The embedding of wood shall be avoided. The concrete shall be spaded and thoroughly consolidated around and against embedded items.

3.11 PLACING CONCRETE:

A. All concrete shall be placed during daylight, unless otherwise approved. The concrete shall not be placed until the depth and character of foundation, the adequacy of forms and falsework, and the placing of the steel reinforcing have been approved. Concrete shall be placed as soon as practical after mixing and in no case later than one (1) hour after water has been added to the mix. Fresh concrete which is older than one hour or which has reached a temperature of 90°F shall be rejected. The method and manner of placing shall be such to avoid segregation and displacement of the reinforcement. Troughs, pipes, and chutes shall be used as an aid in placing concrete when necessary. Dropping the concrete a distance of more than five (5) feet, or depositing a large quantity at one point, will not be permitted. Concrete shall be placed upon clean, damp surfaces, free from standing or running water, or upon properly consolidated soil.

B. The concrete shall be consolidated with suitable mechanical vibrators operating within the concrete. When necessary, vibrating shall be supplemented by hand spading with suitable tools to assure proper and adequate consolidation. Vibrators shall be manipulated so as to work the concrete thoroughly around the reinforcement and embedded fixtures and into corners and angles of the forms. The vibration at any joint shall be of sufficient duration to accomplish consolidation but shall not be prolonged to the point where segregation occurs. Concrete deposited under water shall be carefully

placed in a compact mass in its final position by means of a tremie, a closed bottom dump bucket, or other approved method and shall not be disturbed after being deposited.

3.12 CONSTRUCTION JOINTS:

When the placing of concrete is suspended, necessary provisions shall be made for joining future work before the placed concrete takes its initial set. For the proper bonding of old and new concrete, such provisions shall be made for grooves, steps, keys, dovetails, and splicing of reinforcing bars or other devices as may be prescribed. The work shall be arranged so that a section begun on any day shall be finished during daylight of the same day. Before depositing new concrete on or against concrete which has hardened, the surface of the hardened concrete shall be cleaned by a heavy steel broom, roughened slightly, wetted, and covered with a neat coating of cement paste, grout, or other approved bonding agent.

3.13 EXPANSION JOINTS:

Expansion joints shall be constructed at such points and of such dimensions as may be indicated on the drawings. The premolded filler shall be cut to the same shape as that of the surfaces being joined. The filler shall be fixed firmly against the surface of the concrete already in place in such manner that it will not be displaced when concrete is deposited against it.

3.14 SAWED JOINTS:

Contraction joints in concrete pavement shall be sawed. Saws used shall be adequate for cutting hardened concrete and capable of cutting a groove in a straight line, producing a slot at least 1/8 inch wide to the depth shown on the plans. Sawing shall commence as soon as the concrete has hardened sufficiently to permit cutting without chipping, spalling, or tearing and before uncontrolled shrinkage cracking of the pavement occurs. Should such uncontrolled cracking occur, the concrete shall be removed and replaced as directed by the Engineer.

3.14 DEFECTIVE WORK:

Any defective work disclosed after the forms have been removed shall be immediately removed and replaced. If any dimensions are deficient, or if the surface of the concrete is bulged, uneven, or shows honeycomb, which in the opinion of the Engineer cannot be repaired satisfactorily, the entire section shall be removed and replaced at the expense of the Contractor.

3.15 SURFACE FINISH:

A. All exposed concrete surfaces shall be true, smooth, free from open or rough spaces, depressions, or projections. The concrete in horizontal plane surfaces shall be brought flush with the finished top surface at the proper elevation and shall be struck-off with a straightedge and floated. Mortar finishing shall not be permitted, nor shall dry cement or sand-cement mortar be spread over the concrete during the finishing of horizontal plane surfaces. Excessive amounts of water shall not be permitted during floating and finishing work

B. When directed, the surface finish of exposed concrete shall be a rubbed finish. If forms can be removed while the concrete is still green, the surface shall be pointed and wetted and then rubbed with a wooden float until all irregularities are removed. If the concrete has hardened before being rubbed, a carborundum stone shall be used to finish the surface. When approved, the finishing can be done with a rubbing machine.

3.16 CURING AND PROTECTION:

All concrete shall be properly cured and protected by the Contractor. The work shall be protected from the elements, flowing water, and from defacement of any nature during the building operations. The concrete

shall be cured as soon as it has sufficiently hardened by covering with an approved material. Water-absorptive coverings shall be thoroughly saturated when placed and kept saturated for a period of at least 3 days. All curing mats or blankets shall be sufficiently weighted or tied down to keep the concrete surface covered and to prevent the surface from being exposed to currents of air. Where wooden forms are used, they shall be kept wet at all times until removed to prevent the opening of joints and drying out of the concrete. Traffic shall not be allowed on concrete surfaces for 7 days after the concrete has been placed.

3.17 DRAINS OR DUCTS:

Pipe, conduits, and ducts that are to be encased in concrete shall be installed by the Contractor before the concrete is placed. The pipe shall be held rigidly so that it will not be displaced or moved during the placing of the concrete.

3.18 COLD WEATHER PROTECTION:

A. When concrete is placed at temperatures below 40°F, the Contractor shall provide satisfactory methods and means to protect the mix from injury by freezing. The aggregates, or water, or both, shall be heated in order to place the concrete at temperatures between 50°F and 100°F.

B. Calcium chloride may be incorporated in the mixing water only when previously approved and as directed by the Engineer. Not more than 2 pounds of Type 1 nor more than 1.6 pounds of Type 2 calium chloride shall be added per bag of cement. After the concrete has been placed, the Contractor shall provide sufficient protection such as cover, canvas, framework, heating apparatus, etc., to enclose and protect the structure and maintain the temperature of the mix at not less than 50°F until at least 60% of the designed strength has been attained.

3.19 FILLING JOINTS:

All joints which require sealing shall be thoroughly cleaned, and any excess mortar or concrete shall be cut out with proper tools. Joint sealing shall not be started until after final curing has occurred and shall be done only when the concrete is completely dry. Joint cleaning and sealing shall be done in accordance with the provisions of Item P-605.

610-4 METHOD OF MEASUREMENT

4.1 There will be no direct measurement for payment of the quantity of Portland cement concrete, reinforcing steel, and other incidental items used in the work except as specifically provided in this Item. Concrete used in the construction of items specified elsewhere in the several Items of these Technical Requirements shall be incidental to the items to be constructed, unless specified otherwise.

4.2 The quantity of concrete curb and curb and gutter to be paid for will be measured by the number of lineal feet of each constructed as shown on the plans and accepted by the Engineer.

4.3 The quantity of concrete utility encasement to be paid for shall be the number of cubic yards of concrete utility encasement placed in accordance with the plans and accepted by the Engineer.

4.4 The quantity of Portland cement concrete pavement to be paid for shall be the number of square yards of concrete pavement placed in accordance with the neat lines shown on the plans and accepted by the Engineer.

610-5 BASIS OF PAYMENT

5.1 Payment shall be made at the contract unit price per lineal foot for concrete curb and curb and gutter. These prices shall be full compensation for furnishing all materials and for all preparation, delivering, and

installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

5.2 Payment shall be made at the contract unit price per cubic yard for concrete utility encasement. This price shall be full compensation for furnishing all materials and for all preparation, delivering, and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

5.3 Payment shall be made at the contract unit price per square yard for Portland cement concrete pavement. This price shall be full compensation for furnishing all materials and for all preparation, delivering, and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item P-610.1 **Concrete Curb -- per lineal foot**

Item P-610.2 **Concrete Curb and Gutter -- per lineal foot**

Item P-610.3 **Concrete Utility Encasement -- per cubic yard**

Item P-610.4 **Portland Cement Concrete Pavement -- per square yard**

TESTING REQUIREMENTS

ASTM C 31	Making and Curing Test Specimens in the Field
ASTM C 39	Compressive Strength of Cylindrical Concrete Specimens
ASTM C 78	Test for Flexural Strength of Concrete (Using Simple Beam with Third-Point Loading)
ASTM C 136	Sieve or Screen Analysis of Fine and Coarse Aggregate
ASTM C 138	Unit Weight, Yield, and Air Content of Concrete
ASTM C 143	Slump of Portland Cement Concrete
ASTM C 173	Test for Air Content of Freshly Mixed Concrete by the Volumetric Method
ASTM C 173	Test for Air Content of Freshly Mixed Concrete by the Pressure Method
ASTM C 231	Air Content of Freshly Mixed Concrete by the Pressure Method
ASTM D 3664	Random Sampling of Construction Materials

MATERIAL REQUIREMENTS

ASTM A 184	Specification for Fabricated Deformed Steel Bar Mats for Concrete Reinforcement
ASTM A 185	Welded Steel Wire Fabric for Concrete Reinforcement
ASTM A 497	Specification for Welded Deformed Steel Wire Fabric for Concrete Pavement
ASTM A 615	Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement

ASTM A 616	Specification for Rail-Steel Deformed and Plain Bars for Concrete Reinforcement
ASTM A 617	Specification for Axle-Steel Deformed and Plain Bars for Concrete Reinforcement
ASTM C 33	Specification for Concrete Aggregates
ASTM C 94	Specification for Ready-Mixed Concrete
ASTM C 150	Specification for Portland Cement
ASTM C 171	Specification for Sheet Materials for Curing Concrete
ASTM C 260	Specification for Air-Entraining Admixtures for Concrete
ASTM C 309	Specification for Liquid Membrane-Forming Compounds for Curing Concrete
ASTM C 494	Specification ro Chemical Admixtures for Concrete
ASTM C 595	Specification for Blended Hydraulic Cements
ASTM C 618	Specification for Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Portland Cement Concrete
ASTM D 1751	Specification for Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction
ASTM D 1752	Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction

END OF ITEM P-610

ITEM P-620 PAVEMENT MARKING AND MARKING REMOVAL

620-1 DESCRIPTION

1.1 This item shall consist of the painting of markings and stripes and the removal of existing markings on the surfaces of taxiways, taxilanes, roadways, and parking lots applied in accordance with these specifications and at the locations shown on the plans, or as directed by the Engineer.

620-2 MATERIALS

2.1 MATERIALS ACCEPTANCE. The Contractor shall furnish manufacturer's certified test reports for materials shipped to the project. The certified test reports shall include a statement that the materials meet the specification requirements. The reports can be used for material acceptance or the Engineer may perform verification testing. The reports shall not be interpreted as a basis for payment. The Contractor shall notify the Engineer upon arrival of a shipment of materials to the site.

2.2 PAINT. Paint shall be waterborne, epoxy, or methacrylate base in accordance with the requirements of this Item. Paint shall be furnished in white (37925) and yellow (33538 or 33655) colors meeting the requirements Federal Standard No. 595. Paint shall be Type I, standard drying time, as determined by ASTM D 711.

A. WATERBORNE PAINT. Paint shall meet the requirements of Federal Specification TT-P-1952.

B. EPOXY PAINT. Paint shall be a two component, minimum 99 percent solids type system conforming to the following:

1. Pigments. Component A. Epoxy resin shall be 75 to 79 per cent by weight.

   a. White: Titanium Dioxide, ASTM D 476, Type II shall be 18 percent minimum (16.5 percent minimum at 100 percent purity).

   b. Yellow: Titanium Dioxide, ASTM D 476, Type II shall be 14 to 17 percent.

2. Epoxy Content. Component A. The weight per epoxy equivalent, when tested in accordance with ASTM D 1652 shall be the manufacturer's target plus or minus 50.

3. Amine Number. Component B. When tested in accordance with ASTM D 2074 shall be the manufacturer's target plus or minus 50.

4. Prohibited Materials. The manufacturer shall certify that the product does not contain mercury, lead, hexavalent chromium, halogenated solvents, nor any carcinogen, as defined in 29 CFR 1910.1200.

5. Daylight Directional Reflectance:

   a. White: The daylight directional reflectance of the white paint shall not be less than 75 percent (relative to magnesium oxide), when tested in accordance with Federal Test Method Standard No. 141, Method 6121.

   b. Yellow: The daylight directional reflectance of the yellow paint shall not be less than 38 percent (relative to magnesium oxide), when tested in accordance with Federal Test Method Standard No. 141. The x and y values shall be consistent with the Federal Hegman yellow

color standard chart for traffic yellow standard 33538, or shall be consistent with the tolerance listed below:

x .462	x .470	x .479	x .501
y .438	y .455	y .428	y .452

6. Accelerated weathering.

   a. Sample preparation. Apply the paint at a wet film thickness of 0.013 inch to four 3"x6" aluminum panels prepared as described in Federal Test Method Standard No. 141, Method 2013. Air dry the sample 48 hours under standard conditions.

   b. Testing conditions. Test in accordance with ASTM G 53 using both Ultra Violet (UV-B) Light and condensate exposure, 72 hours total, alternating 4 hours UV exposure at 60°C, and 4 hours condensate exposure at 40°C.

   c. Evaluation. Remove the samples and condition for 24 hours under standard conditions. Determine the directional reflectance and color match using the procedures in paragraph 620-2.2b(5) above. Evaluate for conformance with the color requirements.

7. Volatile Organic Content. Determine the volatile organic content in accordance with 40 CFR Part 60 Appendix A, Method 24.

8. Dry Opacity. Use Procedure B, Method B of Method 4121 of Federal Test Method Standard No. 141. The wet film thickness shall be 0.015 inch. The minimum opacity for white and colors shall be 0.92.

9. Abrasion resistance. Subject the panels prepared in paragraph 620-2.2b(6) to the abrasion test in accordance with ASTM D 968, Method A, except that the inside diameter of the metal guide tube shall be from 0.747 to 0.750 inch. Five liters of unused sand shall be used for each test panel. The test shall be run on two test panels. Both baked and weathered paint films shall require not less than 150 liters of sand for the removal of the paint films.

10. Hardness, Shore. Hardness shall be at least 80 when tested in accordance with ASTM D 2240.

C. METHACRYLATE. Paint shall be a two-component, minimum 99 percent solids type system conforming to the standards listed below. Methacrylate resin shall be 18 percent minimum.

1. Pigments. Component A. Percent by weight.

   a. White: Titanium Dioxide, ASTM D 476, Type II shall be 6 percent minimum. Methacrylate resin shall be 18 percent minimum.

   b. Yellow: Titanium Dioxide, ASTM D 476, Type II shall be 6 percent minimum.

2. Prohibited Materials. The manufacturer shall certify that the product does not contain mercury, lead, hexavalent chromium, halogenated solvents, nor any carcinogen, as defined in 29 CFR 1910.1200.

3. Daylight Directional Reflectance:

   a. White: The daylight directional reflectance of the white paint shall not be less than 80 percent (relative to magnesium oxide), when tested in accordance with Federal Test Method Standard No. 141, Method 6121.

b. Yellow: The daylight directional reflectance of the yellow paint shall not be less than 55 percent (relative to magnesium oxide), when tested in accordance with Federal Test Method Standard No. 141. The x and y values shall be consistent with the Federal Hegman yellow color standard chart for traffic yellow standard 33538, or shall be consistent with the tolerance listed below:

x .462	x .470	x .479	x .501
y .438	y .455	y .428	y .452

4. Accelerated weathering:

a. Sample preparation. Apply the paint at a wet film thickness of 0.013 inch to four 3 by 6 inch aluminum panels prepared as described in Method 2013 of Federal Test Method Standard No. 141. Air dry the sample 48 hours under standard conditions.

b. Testing conditions. Test in accordance with ASTM G 53 using both Ultra Violet (UV-B) Light and condensate exposure, 72 hours total, alternating 4 hours UV exposure at 60°C, and 4 hours condensate exposure at 40°C.

c. Evaluation. Remove the samples and condition for 24 hours under standard conditions. Determine the directional reflectance and color match using the procedures in paragraph 2.2C3 above. Evaluate for conformance with the color requirements.

5. Volatile Organic Content. Determine the volatile organic content in accordance with 40 CFR Part 60 Appendix A, Method 24.

6. Dry opacity. Use Procedure B, Method B of Method 4121 of Federal Test Method Standard No. 141. The wet film thickness shall be 0.015 inch. The minimum opacity for white and colors shall be 0.92.

7. Abrasion resistance. Subject the panels prepared in paragraph 620-2.2c(4) to the abrasion test in accordance with ASTM D 968, Method A, except that the inside diameter of the metal guide tube shall be from 0.747 to 0.750 inch. Five liters of unused sand shall be used for each test panel. The test shall be run on two test panels. Both baked and weathered paint films shall require not less than 150 liters of sand for the removal of the paint films.

8. Hardness, Shore. Hardness shall be at least 80 when tested in accordance with ASTM D 2240.

2.3 REFLECTIVE MEDIA. Glass beads shall meet the requirements of Fed. Spec. TT-B-1325, Type III. Glass beads shall be treated with adhesion promoting and/or flotation coatings as specified by the manufacturer of the paint.

620-3 CONSTRUCTION METHODS

3.1 WEATHER LIMITATIONS:

The painting shall be performed only when the surface is dry, when the atmospheric temperature is above 45°F and rising, and when the weather is not foggy or windy.

3.2 EQUIPMENT:

A. All equipment for the work shall be approved by the Engineer and shall include the apparatus necessary to properly clean the surface to be painted, a mechanical marking machine, and such auxiliary hand-painting equipment as may be necessary to satisfactorily complete the job.

B. The mechanical marker shall be an atomizing spray-type marking machine suitable for application of traffic paint. It shall produce an even and uniform film thickness at the required coverage and shall apply markings of uniform cross-section and clear-cut edges without running, spattering, or overspray.

C. Glass spheres shall be dispensed by an apparatus designed specifically for this purpose which can be attached to the marking machine. The dispenser shall be capable of dispensing glass spheres in a uniform manner across the full width of the markings to be painted.

D. Sandblasting and waterblasting equipment shall operate at a pressure and delivery rate sufficient for removing existing pavement markings and cleaning surfaces to be painted without damaging the surface of the pavement. The cleaning equipment proposed for use shall be tested on an area to be determined by the Engineer. Such testing shall be conducted in the presence of the Engineer, who shall approve the use of the equipment before further work may begin.

3.3 MARKING REMOVAL AND PREPARATION OF SURFACE:

A. Markings to be removed shall be removed by sandblasting or high-pressure water. Areas which cannot satisfactorily cleaned shall be scrubbed as directed by the Engineer with a solution of trisodium phosphate (ten per cent by weight in water). Removal shall be done in a manner which will not cause damage to pavement surfaces. Pavement damaged as a result of this work which in the opinion of the Engineer is due to the Contractor's negligence, or could have been avoided, shall be removed and replaced by the Contractor at his own expense. The limits of such removal and replacement shall be determined by the Engineer.

B. Immediately before application of the paint, the surface shall be dry and free from dirt, grease, oil, laitance, or other foreign material which would reduce the bond between the paint and the pavement. The area to be painted shall be thoroughly cleaned by sweeping, blowing, scrubbing with trisodium phophate solution as specified in the preceding paragraph, or by other methods as required to remove all dirt, laitance, and loose materials.

C. Paint shall not be applied to Portland cement concrete pavement until the concrete in the areas to be painted is clean of curing material. Sandblasting or high-pressure water shall be used to remove curing material from concrete surfaces.

3.4 LAYOUT OF MARKINGS:

On those sections of pavement where no previously applied markings are available to serve as a guide, the proposed markings shall be laid out in advance of the paint application. The marking layout shall be approved by the Engineer before paint may be applied.

3.5 APPLICATION:

A. Markings shall be applied at the locations and to the dimensions and spacing shown on the plans. Paint shall not be applied until the layout and condition of the surface have been approved by the Engineer. The paint shall be mixed in accordance with the manufacturer's instructions and applied to the pavement with a marking machine at the rates shown in Table 1. The addition of thinner will not be permitted. A period of 48 hours shall elapse between placement of a bituminous surface course and application of the paint.

Table 1
APPLICATION RATES FOR PAINT AND GLASS BEADS

Type of Paint	Paint (SF/gal)	Glass Beads (lb/gal)
Waterborne	115 max.	7 min.
Epoxy	90 max.	15 min.
Methacrylate	90 max.	15 min.

B. The edges of the markings shall not vary from a straight line more than 1/2 inch in 50 feet, and the dimensions shall be within a tolerance of plus or minus 5 percent. Glass spheres shall be distributed to the surface of the marked areas immediately after application of the paint.

3.6 PROTECTION:

After application of the paint, all markings shall be protected from damage until the paint is dry. All surfaces shall be protected from disfiguration by spatter, splashes, spillage, or drippings of paint.

620-4 METHOD OF MEASUREMENT

4.1 The quantity of pavement markings to be paid for shall be the number of square feet of painting, regardless of color, performed in accordance with the provisions of this Item and accepted by the Engineer.

4.2 The quantity of pavement marking removal to be paid for shall be the number of square feet of existing pavement markings removed in accordance with the provisions of this Item and accepted by the Engineer.

620-5 BASIS OF PAYMENT

5.1 Payment shall be made at the contract unit price per linear foot for pavement marking. This price shall be full compensation for furnishing all materials and for all labor, equipment, tools, and incidentals necessary to complete the item.

5.2 Payment shall be made at the contract unit price per linear foot for pavement marking removal. This price shall be full compensation for furnishing all materials and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item P-620.1 **Pavement Marking -- per square foot**

Item P-620.2 **Pavement Marking Removal -- per square foot**

MATERIAL REQUIREMENTS

ASTM D 476 Specification for Titanium Dioxide

ASTM D 711 No-Pick-Time of Traffic Paint

ASTM D 968 Abrasion Resistance of Organic Coatings by Falling Abrasive

ASTM D 2240	Shore Hardness
ASTM G 53	Standard Practice for Operating Light- and Water-Exposure Apparatus (Fluorescent UV-Condensation Type) for Exposure of Nonmetallic Materials
Fed.Spec. TT-P-1952	Paint, Traffic and Airfield Marking, Water Emulsion Base
Fed.Spec. TT-P-110	Paint, Traffic Black (Nonreflectorized)
Fed.Spec. TT-B-1325	Beads (Glass Spheres) Retroreflective

END OF ITEM P-620

ITEM D-701 PIPE FOR STORM DRAINS AND CULVERTS

701-1 DESCRIPTION

1.1 This item shall consist of the construction of pipe culverts and storm drains in accordance with these specifications and in reasonably close conformity with the lines and grades shown on the plans.

701-2 MATERIALS

2.1 Materials shall meet the requirements shown on the plans and specified below.

2.2 PIPE:

Reinforced concrete pipe 24" in diameter and smaller shall be C-wall bell and spigot pipe meeting the requirements of ASTM C 76, Class IV. Reinforced concrete pipe 27" in diameter and larger shall be bell and spigot pipe meeting the requirements of ASTM C 361, Class A-25. For ASTM C 361 pipe the largest wall thickness for the class and size shown on the plans shall be used.

2.3 RUBBER GASKETS:

Rubber gaskets for rigid pipe shall conform to the requirements of ASTM C 443.

2.4 CONCRETE:

Concrete for pipe cradles shall conform to the requirements of Item P-610, except that the 28-day compressive strength may be 2000 psi at the Contractor's option.

701-3 CONSTRUCTION METHODS

3.1 EXCAVATION:

A. The width of the pipe trench shall be sufficient to permit satisfactory jointing of the pipe and thorough tamping of the bedding material and/concrete cradle under and around the pipe, but it shall not be less than the external diameter of the pipe plus twelve inches on each side. The trench walls shall be approximately vertical.

B. Where rock, hardpan, or other unyielding material is encountered, the Contractor shall remove it from below the foundation grade for a depth of at least twelve inches or one-half inch for each foot of fill over the top of the pipe (whichever is greater) but for no more than three-quarters of the nominal diameter of the pipe. The width of the excavation shall be at least one foot greater than the horizontal outside diameter of the pipe. The excavation below grade shall be backfilled with selected fine compressible material, such as silty clay or loam, and lightly compacted in layers not over six inches in uncompacted depth to form a uniform but yielding foundation.

C. Where a firm foundation is not encountered at the grade established, due to soft, spongy, or other unstable soil, the unstable soil shall be removed and replaced with approved granular material for the full trench width. The Engineer shall determine the depth of removal necessary. The granular material shall be compacted to provide adequate support for the pipe.

D. The excavation for pipes that are placed in embankment fill shall not be made until the embankment has been completed to a height above the top of the pipe as shown on the plans.

E. All costs for dewatering required to install pipe in accordance with the provisions of this Item shall be incidental to the costs of the several classes and sizes of pipe to be installed.

3.2 BEDDING:

A. Concrete Pipe.

1. Stone Bedding. Bedding shall consist of granular material having a thickness of at least six inches below the bottom of the pipe and extending up around the pipe for a depth of not less than 50 percent of the pipe's vertical outside diameter. The layer of bedding material shall be shaped to fit the pipe for at least 10 percent of the pipe's vertical diameter and shall have recesses shaped to receive the bell of bell and spigot pipe. The bedding material shall be crushed aggregate meeting the gradation requirements of AASHTO T 27, Band 57.

2. Concrete Cradle. Cradles for reinforced concrete pipe at stormwater management basin outfalls shall be continuous along the full length of the pipe runs shown and shall be constructed in accordance with the details shown on the plans.

B. Flexible Pipe. Bedding for flexible pipe shall be of sand or native fine granular material roughly shaped to fit the pipe. The bedding shall have a maximum particle size of 1/4 inch, and shall not have angular edges which could puncture or damage the pipe. The bedding shall be placed to the dimensions shown on the plans and shall be placed in layers and thoroughly compacted.

3.3 LAYING PIPE:

A. The pipe laying shall begin at the lowest point of the trench and proceed upgrade. The lower segment of the pipe shall be in contact with the bedding throughout its full length. Bell ends of rigid and flexible pipes and outside circumferential laps of flexible pipes shall be placed facing upgrade. The pipe shall be firmly and accurately set to line and grade, using laser equipment as appropriate. The invert of each run of pipe shall be smooth and uniform.

3.4 JOINING PIPE:

A. Joints shall be made with rubber gaskets. Rubber ring gaskets shall be installed to form a flexible watertight seal. The method of joining pipe sections shall be such that the ends are fully entered and the inner surfaces are reasonably flush and even. Joints shall be thoroughly lubricated and rubber gaskets installed before pipe sections are joined.

B. PVC and Polyethylene Pipe. Joints for PVC pipe shall conform to the requirements of ASTM D 3212. Fittings for polyethylene pipe shall conform to the requirements of AASHTO M 252.

3.5 BACKFILLING:

A. Pipes shall be inspected before any backfill is placed; any pipes found to be out of alignment, unduly settled, or damaged shall be removed and relaid or replaced at the Contractor's expense.

B. Material for backfill shall be crushed aggregate meeting the gradation requirements of paragraph 3.2A or fine, readily compatible soil, or granular material selected from the excavation or a source of the Contractor's choosing. It shall not contain frozen lumps, stones that would be retained on a 2-inch sieve, chunks of highly plastic clay, or other objectionable material. No less than 95 percent of a granular backfill material shall pass through a ½ inch sieve, and no less than 95 percent of it shall be retained on a No. 4 sieve.

C. When the top of the pipe is even with or below the top of the trench, the backfill shall be compacted in layers not exceeding six inches on both sides of the pipe and shall be brought up one foot above the

top of the pipe or to natural ground level, whichever is greater. Care shall be exercised to thoroughly compact the backfill material under the haunches of the pipe. Material shall be brought up evenly on both sides of the pipe.

D. When the top of the pipe is above the top of the trench, the backfill shall be compacted in layers not exceeding six inches and shall be brought up evenly on both sides of the pipe to one foot above the top of the pipe. The width of backfill on each side of the pipe for the portion above the top of the trench shall be equal to twice the pipe's diameter or twelve feet, whichever is less.

E. Underneath areas to be paved, and other areas shown on the plans or designated by the Engineer, granular backfill (#57 stone) shall be placed to a minimum depth of twelve inches over rigid pipe. The aggregate shall be placed in layers not exceeding six inches in depth and thoroughly tamped.

E. For PVC and polyethylene pipe, the backfill shall be placed in two stages; first to the top of the pipe and then at least twelve inches over the top of the pipe. The backfill material shall meet the requirements of paragraph 701-3.2c.

F. All backfill shall be compacted to the density required under Item P-152.

701-4 METHOD OF MEASUREMENT

4.1 The length of pipe to be paid for shall be the number of linear feet of pipe installed in accordance with the plans and the provisions of this Item and accepted by the Engineer. It shall be measured along the centerline of the pipe from end or inside face of structure to the end or inside face of structure, whichever is applicable. The several classes, types and size shall be measured separately. All fittings shall be included in the footage as typical pipe sections in the pipe being measured.

4.2 The quantity of Portland cement concrete for pipe cradles to be paid for shall be the number of cubic yards of concrete placed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

701-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price per linear foot for each kind of pipe of the type, class, and size installed. These prices shall be full compensation for furnishing all materials and for all preparation, excavation, and installation of these materials; and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item D-701.1 **12-inch RCP Class IV -- per lineal foot**

Item D-701.2 **15-inch RCP Class IV -- per lineal foot**

Item D-701.3 **18-inch RCP Class IV -- per lineal foot**

Item D-701.4 **24-inch RCP Class IV – per lineal foot**

Item D-701.5 **27-inch RCP Class A-25 -- per lineal foot**

Item D-701.6 **30-inch RCP Class A-25 -- per lineal foot**

Item D-701.7 **36-inch RCP Class A-25 -- per lineal foot**

Item D-701.8	**42-inch RCP Class A-25 -- per lineal foot**
Item D-701.9	**Concrete for Pipe Cradles -- per cubic yard**
Item D-701.10	**Seepage Pipe -- per lineal foot**

MATERIAL REQUIREMENTS

ASTM C 76	Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe
ASTM C 443	Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets

END OF ITEM D-701

ITEM D-705 PAVEMENT UNDERDRAINS FOR AIRPORTS

705-1 DESCRIPTION

1.1 This item shall consist of the installation of a geocomposite pavement subgrade drainage system in accordance with the plans and the provisions of this Item.

705-2 MATERIALS

2.1 GEOCOMPOSITE DRAIN AND FITTINGS:

The geocomposite drain shall have a flexible rectangular cross-section consisting of a geotextile fabric and a polyethylene support core. The drain system shall be installed with fittings suitable for capping drain ends, making connections to corrugated drainage tubing specified in paragraph 2.2 below, and other fittings as required to install the complete system shown on the plans. The geocomposite shall be suitable for either manual or machine installation. The geocomposite shall have a minimum flow capacity of ten gallons per minute per square foot when installed in a vertical orientation at a gradient of 0.5 foot per foot of length (0.5%). The core shall permit unobstructed inflow through one or both sides through a fabric having an apparent opening size (AOS) smaller than 0.24 mm (approximately No. 70 Sieve). This filter capability shall be achieved, if necessary, by enclosing the geocomposite in a geotextile filter meeting this AOS criterion. The geocomposite and accompanying fittings shall also meet the requirements of Table 1.

Table 1
PHYSICAL REQUIREMENTS FOR GEOCOMPOSITE DRAINS

Property	Criteria	Test Method
Grab Tensile Strength, pounds, min.	90	ASTM D 4632
Elongation, % min.	50	ASTM D 4632
Puncture Strength, pounds, min.	45	ASTM D 4833
Burst Strength, psi, min.	150	ASTM D 3786
Trapezoidal Tear, pounds, min.	40	ASTM D 4533
Coefficient of Permeability, cm/sec, min.	0.20	ASTM D 4491

2.2 PIPE:

The pipe shall conform with the following:

Corrugated Polyethylene Drainage Tubing	AASHTO M 252
Corrugated Polyethylene Pipe	AASHTO M 294

2.4 POROUS BACKFILL:

Porous backfill shall be sand for masonry mortar meeting the material requirements of ASTM C 144, except that the gradation shall conform to that shown in Table 1 when tested in accordance with ASTM C 136.

Table 1
GRADATION OF POROUS BACKFILL

Sieve Designation (square openings)	Percentage Passing by Weight
No. 4	100
No. 8	95-100
No. 16	70-100
No. 30	40-75
No. 50	10-35
No. 100	2-10
No. 200	0-5

705-3 CONSTRUCTION METHODS

3.1 EQUIPMENT:

All equipment necessary and required for the proper installation of the geocomposite underdrain shall be on the project, in first-class working condition, and approved by the Engineer before construction may begin.

3.2 TRENCH EXCAVATION:

A. Trenches to receive the geocomposite drain shall be excavated by equipment intended specifically for the purpose, and shall be capable of excavating a neat vertical trench at least four inches but not more than eight inches wide and to the depths shown on the plans. The trench bottom shall be cleaned of loose material and checked for grade before the geocomposite may be placed.

B. Trenches for perforated and solid-walled corrugated pipe drains shall be excavated to a width of at least twice the pipe diameter and to the depths shown on the plans. The trench walls shall be neat and vertical, and the bottom shall be cleaned of loose material and checked for grade before pipe may be placed.

C. The trench bottom shall be so shaped that the geocomposite or pipe may be firmly seated and in continuous contact with the bottom of the trench. Spaces for fittings, where required, shall be excavated accurately to size to provide displacement for the fittings.

D. Where rock, hardpan, or other unyielding material is encountered, it shall be removed below the foundation grade for a depth of at least four inches. The excavation below grade shall be backfilled with mortar sand backfill and lightly compacted in layers not over six inches in uncompacted depth to form a uniform but yielding foundation.

E. Where a firm foundation is not encountered at the grade established, due to soft, spongy, or other unstable soil, the unstable soil shall be removed and replaced with mortar sand for the full trench width. The Engineer shall determine the depth of removal necessary. The mortar sand shall be compacted to the degree required to provide adequate support for the pipe.

F. Excavated material shall be disposed of by the Contractor off airport property. The excavation shall not be carried below the depth shown on the plans. When such overexcavation is done, the trench shall

be backfilled at the Contractor's expense with material approved by the Engineer and compacted to the density required in Item P-152.

G. The Contractor shall do such trench bracing, sheathing, or shoring necessary to perform and protect the excavation as required for safety and conformance to governing laws and ordinances. Unless otherwise provided, the bracing, sheathing, or shoring shall be removed by the Contractor after the completion of the backfill. The sheathing or shoring shall be pulled as the granular backfill is placed and compacted to avoid any unfilled spaces between the trench wall and the backfill material. The cost of bracing, sheathing, or shoring, and the removal of same, shall be included in the unit price bid per foot for the geocomposite system.

3.3 LAYING AND INSTALLING GEOCOMPOSITE DRAIN AND PIPE:

A. The geocomposite shall be set and firmly seated in the trench bottom in accordance with the elevations shown on the plans. Deviations from plan invert elevations shall not be permitted. The geocomposite shall be placed against the downgrade side of the trench, as shown on the plans, and shall be oriented so that water may enter from the upgrade side of the drain. The drain shall be held firmly against the trench wall until the mortar sand backfill is placed.

B. Perforated pipe shall be placed and firmly seated in mortar sand bedding in the center of the trench. Perforated pipe shall be installed with the perforated portion of the pipe oriented downward.

C. End caps, splices, and connections, where required, shall be made using PVC or polyethylene tape or fittings made for the purpose intended and that will maintain the structural integrity of the section while preventing the intrusion of soil or bedding sand. Splices and connections shall be made before the drain or pipe is laid in the trench. The upgrade end of pipelines, not terminating in a structure, shall be plugged or capped as approved by the Engineer. Pipelines ending in a drainage inlet or manhole shall be installed in openings provided or cut through structure walls. Pipe ends shall be grouted in place and cut to flush with the structure wall.

D. Pipe which is not true in alignment, or which shows any settlement after laying, shall be taken up and relaid without extra compensation.

3.4 MORTAR:

The mortar shall conform to the requirements of Item D-751 and shall be of sufficient consistency for making watertight connections to structures. Mortar that is not used within 45 minutes after water has been added shall be discarded. Retempering of mortar shall not be permitted.

3.6 BACKFILLING:

A. Mortar sand backfill shall be placed in the trench against and over the geocomposite drain or pipe as shown on the plans. Special care shall be taken in placing the backfill. The granular backfill shall not contain a damaging amount of foreign matter, nor shall earth from the sides of the trench or from the windrow be allowed to filter into the backfill. When recommended by the geocomposite drain manufacturer, a template shall be used to properly place and keep the geocomposite firmly in position against the trench wall. The backfill shall be placed in loose layers not exceeding six inches in depth and compacted by hand and pneumatic tampers. Backfilling and compaction shall be done in a manner to avoid injurious top or side pressure on the drain or pipe. The granular backfill shall be made to the top of the trench, as shown on the plans.

B. When drain or pipe and sand backfill is to be placed underneath areas to be paved or in adjacent areas prior to the completion of grading or subgrade operations, the backfill material shall be placed immediately after laying the pipe and to the depth shown on the plans. During subsequent construction operations, this backfill shall not be disturbed until such time as the subgrade preparatory operations

are to be completed. When such work is to be completed, the top of the sand backfill shall be exposed. Any portion of the sand backfill which contains objectionable material shall be removed and replaced with suitable material. The cost of removing and replacing any such unsuitable material shall be borne by the Contractor.

C. When drain or pipe and sand backfill are installed underneath areas to be paved following subgrade preparatory operations, the sand backfill over the geocomposite drain or perforated pipe shall be placed to an elevation of two inches above the bottom of the subbase course. Immediately prior to the placing of the subbase course, the Contractor shall blade this excess trench backfill from the top of the trench onto the adjacent subgrade where it can be incorporated into the granular subbase blanket course. Any unsuitable material which remains over the underdrain trench shall be removed and replaced. The subbase material shall be placed to provide clean contact between the subbase material and the underdrain granular backfill material for the full width of the underdrain trench.

705-4 METHOD OF MEASUREMENT

4.1 The length of geocomposite underdrain and corrugated drainage pipe to be paid for shall be the number of lineal feet, measured along its centerline, installed in accordance with the plans and the provisions of this Item and accepted by the Engineer. The several types and sizes of pipe shall be measured separately. Fittings, splices, and connections required to complete the system shown on the plans shall be included in the length measured.

705-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price per lineal foot for geocomposite underdrain. This price shall be full compensation for furnishing all materials and for all preparation, excavation, and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

5.2 Payment will be made at the contract unit price per lineal foot for each kind of the type and size of corrugated drainage pipe. This price shall be full compensation for furnishing all materials and for all preparation, excavation, and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item D-705.1 **Geocomposite Underdrain – per lineal foot**

Item D-705.2 **4-inch Polyethylene Pipe -- per lineal foot**

Item D-705.3 **4-inch Perforated Polyethylene Pipe-- per lineal foot**

Item D-705.4 **6-inch Polyethylene Pipe – per lineal foot**

MATERIAL REQUIREMENTS

ASTM C 136 Sieve or Screen Analysis of Fine and Coarse Aggregates

ASTM C 144 Aggregate for Masonry Mortar

ASTM C 150 Portland Cement

ASTM D 3786	Hydraulic Bursting Strength of Knitted Goods and Nonwoven Fabrics -- Diaphragm Bursting Strength Method
ASTM D 3787	Bursting Strength of Knitted Goods -- Constant-Rate-of-Traverse (CRT) Ball Burst Test
ASTM D 4583	Trapezoidal Tearing Strength of Nonwoven Fabrics
ASTM D 4632	Tensile Strength of Nonwoven Fabrics
AASHTO M 252	Corrugated Polyethylene Drainage Tubing

END OF ITEM D-705

ITEM D-751 MANHOLES, CATCH BASINS, AND INLETS

751-1 DESCRIPTION

1.1 This item shall consist of construction of manholes and storm drainage inlets, and adjusting existing structure tops to proposed grades, at the locations shown and conforming to the lines, grades, and dimensions shown on the plans or required by the Engineer.

1.2 Structures located within or adjacent to the Airport Operations Area (AOA) or shown on the plans to be subjected to aircraft loads shall be constructed as shown on the plans and in accordance with the provisions of this Item. Other structures, such as stuctures within or adjacent to access roads and parking lots shall be constructed in accordance with applicable provisions of the SHA Standard Specifications for Construction and Materials, October 1993.

1.3 Drainage structures to be installed under this contract shall be classified as follows:

Manhole Storm drainage manholes capable of supporting AASHTO HS20 loads. These structures will be installed on the landside portion of the site, in and around the proposed access roads and parking lots.

Type I Inlets and manholes capable of supporting aircraft loads. These structures will be installed on the airside portion of the site, which includes the proposed aprons and taxiways and the turfed areas between the future hangars and the existing Taxiway F.

Type II Yard inlets capable of supporting AASHTO HS20 loads. These structures will be installed on the landside portion of the site, in and around the proposed access roads and parking lots.

Type III Curb inlets. These structures will be installed on the landside portion of the site, in and around the proposed access roads and parking lots.

751-2 MATERIALS

2.1 BRICK:

Brick shall conform to the requirements of ASTM C 32, Grade SM.

2.2 MORTAR:

Mortar shall consist of one part Portland cement and two parts sand. The cement shall conform to the requirements of ASTM C 150, Type I. The sand shall conform to the requirements of ASTM C 144.

2.3 CONCRETE:

Plain and reinforced concrete used in precast and cast-in-place structures, connections of pipes with structures, and the support of structures or frames shall conform to the requirements of Item P-610.

2.6 FRAMES, COVERS, AND GRATES:

A. The castings shall conform to one of the following requirements:

1. Gray iron castings shall meet the requirements of ASTM A 48, Class 30B and 35B.

2. Malleable iron castings shall meet the requirements of ASTM A 47.

3. Steel castings shall meet the requirements of ASTM A 27.

4. Structural steel for grates and frames shall conform to the requirements of ASTM A 283, Grade D.

5. Ductile iron castings shall conform to the requirements of ASTM A 536.

B. All castings or structural steel units shall conform to the dimensions shown on the plans and shall be designed to support the loadings specified.

C. Frames and covers or grates shall be provided with fastening members to prevent it from being dislodged by traffic but which will allow easy removal for access to the structure. Structure covers shall be stamped as shown on the plans to indicate the type of utility served by the structure.

D. After fabrication, structural steel units shall be galvanized to meet the requirements of ASTM A 123.

2.7 STEPS:

The steps or ladder bars shall be gray or malleable cast iron or galvanized steel. The steps shall be the size, length, and shape shown on the plans and those steps that are not galvanized shall be given a coat of bituminous paint, when directed.

751-3 CONSTRUCTION METHODS

3.1 EXCAVATION:

A. The Contractor shall do all excavation for structures and structure footings to the lines and grades or elevations, shown on the plans, or as directed by the Engineer. The excavation shall be of sufficient size to permit the placing of the full width and length of the structure or structure footings shown. The elevations of the bottoms of footings, as shown on the plans, shall be considered as approximate only; and the Engineer may order, in writing, changes in dimensions or elevations of footings necessary to secure a satisfactory foundation.

B. Boulders, logs, or any other objectionable material encountered in excavation shall be removed. All rock or other hard foundation material shall be cleaned of all loose material and cut to a firm surface either level, stepped, or serrated, as directed by the Engineer. All seams or crevices shall be cleaned out and grouted. All loose and disintegrated rock and thin strata shall be removed. When concrete is to rest on a surface other than rock, special care shall be taken not to disturb the bottom of the excavation, and excavation to final grade shall not be made until just before the concrete or reinforcing is to be placed.

C. The Contractor shall do all bracing, sheathing, shoring, or dewatering necessary to implement and protect the excavation and the structure as required for safety or conformance to governing laws and ordinances. Costs of bracing, sheathing, shoring, or dewatering shall be included in the unit price bid for the structure.

D. Unless otherwise provided, bracing, sheathing, or shoring involved in the construction of this item shall be removed by the Contractor after the completion of the structure. Removal shall be effected in a manner which will not disturb or mar finished masonry. The cost of removal shall be included in the unit price bid for the structure.

E. After each excavation is completed, the Contractor shall notify the Engineer to that effect; and concrete or reinforcing steel shall be placed after the Engineer has approved the depth of the excavation and the character of the foundation material.

3.2 BRICK STRUCTURES:

A. Foundations. A prepared foundation shall be placed for all brick structures after the foundation excavation is completed and accepted. Unless otherwise specified, the base shall consist of reinforced concrete mixed, prepared, and placed in accordance with the requirements of Item P-610.

B. Laying Brick. All brick shall be clean and thoroughly wet before laying so that they will not absorb any appreciable amount of additional water at the time they are laid. All brick shall be laid in freshly made mortar. Mortar that is not used within 45 minutes after water has been added shall be discarded. Retempering of mortar shall not be permitted. An ample layer of mortar shall be spread on the beds and a shallow furrow shall be made in it which can be readily closed by the laying of the brick. All bed and head joints shall be filled solid with mortar. End joints of stretchers and side or cross joints of headers shall be fully buttered with mortar and a shoved joint made to squeeze out mortar at the top of the joint. Any bricks that may be loosened after the mortar has taken its set, shall be removed, cleaned, and relaid with fresh mortar. No broken or chipped brick shall be used in the face, and no spalls or bats shall be used except where necessary to shape around irregular openings or edges; in which case, full bricks shall be placed at ends or corners where possible, and the bats shall be used in the interior of the course. In making closures, no piece of brick shorter than the width of a whole brick shall be used; and wherever practicable, whole brick shall be used and laid as headers.

C. Joints. All joints shall be slushed with mortar at every course, but slushing alone will not be considered adequate for making an acceptable joint. Exterior faces shall be laid up in advance of backing. Exterior faces shall be back plastered or pargeted with a coat of mortar not less than ⅜ inch thick before the backing is laid up. Prior to pargeting, all joints on the back of face courses shall be cut flush. Unless otherwise noted, joints shall be not less than ¼ inch nor more than ½-inch wide and whatever width is adopted shall be maintained uniform throughout the work.

D. Pointing. Face joints shall be neatly struck, using the weather joint. All joints shall be finished properly as the laying of the brick progresses. When nails or line pins are used the holes shall be immediately plugged with mortar and pointed when the nail or pin is removed.

E. Cleaning. Upon completion of the work all exterior surfaces shall be thoroughly cleaned by scrubbing and washing down with water and, if necessary to produce satisfactory results, cleaning shall be done with a 5% solution of muriatic acid which shall then be rinsed off with liberal quantities of clean fresh water.

F. Curing and Cold Weather Protection. In hot or dry weather, or when directed by the Engineer, the brick masonry shall be protected and kept moist for at least 48 hours after laying the brick. Brick masonry work or pointing shall not be done when there is frost in the brick or when the air temperature is below 50°F unless the Contractor has on the project ready to use, suitable covering and artificial heating devices necessary to keep the atmosphere surrounding the masonry at a temperature of not less than 60°F for the duration of the curing period.

3.3 CONCRETE STRUCTURES:

A. Concrete structures shall be built on prepared foundations, conforming to the dimensions and form indicated on the plans. The construction shall conform to the requirements specified in Item P-610. Any reinforcement required shall be placed as indicated on the plans and shall be approved by the Engineer before the concrete is poured.

B. All invert channels shall be constructed and shaped accurately so as to be smooth, uniform, and cause minimum resistance to flowing water. The interior bottom shall be sloped downward toward the outlet.

3.4 PRECAST CONCRETE STRUCTURES:

Precast concrete structures shall be installed on prepared or previously placed slab foundations and shall conform to the dimensions and locations shown on the plans. All precast concrete sections necessary to build a completed structure shall be furnished. The different sections shall fit together readily, and all jointing and connections shall be cemented with mortar. The top of the upper precast concrete member shall be suitably formed and dimensioned to receive the metal frame and cover or grate, or other cap, as required. Provision shall be made for any connections for lateral pipe, including drops and leads that may be installed in the structure. Knockout panels or openings for future pipe connections shall be provided where called for by the plans. Structure inverts shall be shaped with concrete as shown on the plans, resulting in flow lines which are smooth, uniform, and cause minimum resistance to flow. The metal steps which are embedded or built into the side walls shall be aligned and placed at vertical intervals of twelve inches.

3.6 INLET AND OUTLET PIPES:

Inlet and outlet pipes shall extend through openings provided in the walls of the structures for a sufficient distance beyond the outside surface to allow for connections, but shall be cut off flush with the wall on the inside surface, unless otherwise directed. Once pipe is installed, openings shall be sealed with brick and mortar or concrete to form a water-tight, neat connection.

3.7 PLACEMENT AND TREATMENT OF CASTINGS, FRAMES, AND FITTINGS:

A. All castings, frames, and fittings shall be placed in the positions indicated on the plans or as directed by the Engineer, and shall be set true to line and to correct elevation. If frames or fittings are to be set in concrete or cement mortar, all anchors or bolts shall be in place and position before the concrete or mortar is placed. The unit shall not be disturbed until the mortar or concrete has set.

B. When frames or fittings are to be placed upon previously constructed masonry, the bearing surface or masonry shall be brought true to line and grade and shall present an even bearing surface in order that the entire face or back of the unit will come in contact with the masonry. The unit shall be set in mortar beds and anchored to the masonry as indicated on the plans or as directed and approved by the Engineer. All units shall set firm and secure. After the frames or fittings have been set in final position and the concrete or mortar has been allowed to harden for seven days, then the grates or covers shall be placed and fastened down.

3.8 INSTALLATION OF STEPS:

A. The steps shall be installed as indicated on the plans or as directed by the Engineer. When the steps are to be set in concrete, they shall be placed and secured in position before the concrete is placed. When the steps are installed in brick masonry, they shall be placed as the masonry is being built. The steps shall not be disturbed or used until the concrete or mortar has hardened for at least seven days. After this period has elapsed, the steps shall be cleaned and painted, unless they have been galvanized.

B. When steps are required with precast concrete structures, they shall be cast into the sides of the structure at the time the sections are manufactured, or set in place after the structure is erected by drilling holes in the concrete and cementing the steps in place.

C. In lieu of steps, prefabricated ladders may be installed. In the case of brick or concrete structures, the ladder shall be held in place by grouting the supports in drilled holes.

3.9 BACKFILLING:

A. After a structure has been completed, the area around it shall be filled with approved material, in horizontal layers not to exceed eight inches in loose depth, and compacted to the density required in Item P-152. Each layer shall be deposited all around the structure to approximately the same elevation. The top of the fill shall meet the elevation shown on the plans or as directed by the Engineer.

B. Backfilling shall not be placed against any structure until permission is given by the Engineer. In the case of cast-in-place concrete, such permission shall not be given until the concrete has been in place seven days, or until tests made by the laboratory under supervision of the Engineer establish that the concrete has attained sufficient strength to provide a factor of safety against damage or strain in withstanding any pressure created by the backfill or the methods used in placing it.

C. Backfill shall not be measured for direct payment. Performance of this work shall be considered as a incidental and subsidiary obligation of the Contractor covered under the contract unit price for the structure involved.

3.10 CLEANING AND RESTORATION OF SITE:

A. After the backfill is completed, the Contractor shall dispose of all surplus material, dirt, and rubbish from the site. Surplus dirt may be deposited in embankments, shoulders, or as ordered by the Engineer. The Contractor shall restore all disturbed areas to their original condition.

B. After all work is completed, the Contractor shall remove all tools and equipment, leaving the entire site free, clear, and in good condition.

751-4 METHOD OF MEASUREMENT

4.1 The number of manholes and storm drainage inlets to be paid for shall be the number of structures constructed and installed in accordance with the plans and the provisions of this Item and accepted by the Engineer. The several types of structures will be paid for separately in accordance with the provisions of paragraph 5.1 below.

4.2 The number of structure adjustments to grade to be paid for shall be the number of structures constructed and installed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

751-5 BASIS OF PAYMENT

5.1 Payment at the contract unit prices per each for manholes and inlets. These prices shall be full compensation for furnishing all materials and for all preparation, excavation, backfilling and placing of the materials; furnishing and installation of such special items and connections to pipes and other structures as may be required to complete the item as shown on the plans; and for all labor equipment, tools and incidentals necessary to complete the item.

Payment will be made under:

Item D-751.1 **Storm Drainage Manhole -- each**

Item D-751.2 **Storm Drainage Inlet, Type I -- each**

Item D-751.3 **Storm Drainage Inlet, Type II -- each**

Item D-751.4 **Storm Drainage Inlet, Type III -- each**

Item D-751.5 **Storm Drainage Inlet, Type IV -- each**

Item D-751.6 **Adjust Structure to Grade -- each**

MATERIAL REQUIREMENTS

ASTM A 27	Mild to Medium-Strength Carbon-Steel Castings for General Application
ASTM A 47	Malleable Iron Castings
ASTM A 48	Gray Iron Castings
ASTM A 123	Zinc (Hot-Galvanized) Coatings on Products Fabricated from Rolled, Pressed, and Forged Steel Shapes, Plates, Bars, and Strip
ASTM A 283	Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes, and Bars
ASTM A 536	Ductile Iron Castings
ASTM C 32	Sewer and Manhole Brick
ASTM C 144	Aggregate for Masonry Mortar
ASTM C 150	Portland Cement
AASHTO M 36	Zinc-Coated (Galvanized) Corrugated Iron or Steel Culverts and Underdrains

END OF ITEM D-751

ITEM D-752 MISCELLANEOUS DRAINAGE STRUCTURES

752-1 DESCRIPTION

1.1 This item shall consist of reinforced concrete endwalls, sedimentation chambers, energy-dissipating outlet structures, rip rap, and other miscellaneous drainage structures constructed in accordance with the plans and the provisions of this Item and as directed by the Engineer. The structures shall be classified and described as follows:

A.	Endwall	Concrete endwall with concrete apron and wingwalls, with or without energy-dissipating structures as shown on Sheets U-18B and U-18C of the plans.
B.	Sedimentation Chamber	Three-chamber concrete sedimentation chamber as shown on Sheets U-18 and U-18A of the plans.
C.	Class I Rip Rap	Rip rap aprons placed adjacent to concrete endwalls.
D.	Grouted Rip Rap	Grouted Class I rip rap placed on spillways constructed within stormwater management basins

752-2 MATERIALS

2.1 CONCRETE:

Reinforced concrete shall meet the requirements of Item P-610.

2.2 REINFORCING STEEL:

Reinforcing steel shall be Grade 60 deformed bars meeting the requirements of ASTM A 615.

2.3 PIPE:

Pipe used in energy-dissipating endwalls shall be PVC pipe meeting the requirements of Fed. Spec. W-C-571, Type I.

2.3 RIP RAP:

Stone for outlet protection and spillways shall be Class I rip rap meeting the requirements of the SHA Standard Specifications for Construction and Materials, October 1993.

2.4 GROUT:

Grout for rip rap spillways shall meet the requirements of the SHA Standard Specifications for Construction and Materials, October 1993.

2.5 FILTER FABRIC:

Filter fabric shall meet the requirements of Item 308.

752-3 CONSTRUCTION METHODS

3.1 EXCAVATION:

A. Trenches and foundation pits for structures or structure footings shall be excavated to the lines and grades or elevations shown on the plans. The excavation shall be of sufficient size to permit the placing of the full width and length of the structure or structure footings shown. The elevations of the bottoms of footings, as shown on the plans, shall be considered as approximate only; and the Engineer may order, in writing, changes in dimensions or elevations of footings necessary to secure a satisfactory foundation.

B. Boulders, logs, or any other objectionable material encountered in excavation shall be removed. All rock or other hard foundation material shall be cleaned of all loose material and cut to a firm surface either level, stepped, or serrated, as directed by the Engineer. All seams or crevices shall be cleaned out and grouted. All loose and disintegrated rock and thin strata shall be removed. When concrete is to rest on a surface other than rock, special care shall be taken not to disturb the bottom of the excavation, and excavation to final grade shall not be made until just before the concrete or reinforcing steel is to be placed.

C. The Contractor shall do all bracing, sheathing, shoring, and dewatering necessary to perform and protect the excavation and the structure as required for safety or conformance to governing laws. The cost of bracing, sheathing, or shoring shall be included in the unit price bid for each structure. Costs for dewatering shall be incidental to Item xxxx.

D. Unless otherwise provided, bracing, sheathing, or shoring involved therewith shall be removed by the Contractor after the completion of the structure. Removal shall be effected in a manner which will not disturb or mar finished concrete. The cost of removal shall be included in the unit price bid for each structure.

E. After each excavation is completed, the Contractor shall notify the Engineer to that effect, and concrete or reinforcing steel shall be placed after the Engineer has approved the depth of the excavation and the character of the foundation material.

3.3 CONCRETE STRUCTURES:

A. Concrete structures shall be built on prepared foundations, conforming to the dimensions and form indicated on the plans. Concrete formwork, reinforcement, and placement shall conform to the requirements of Item P-610. Any reinforcement and embedded items required shall be placed as indicated on the plans and shall be approved by the Engineer before the concrete is placed. When cast-in-place structures are to be constructed in separate concrete placements, PVC waterstops shall be used.

B. All endwall aprons and invert channels shall be constructed and shaped accurately so as to be smooth, uniform, and cause minimum resistance to flowing water. Concrete aprons shall be constructed smooth and level as shown on the plans.

C. Forms shall be removed in accordance with the provisions of Item P-610.

3.4 PRECAST CONCRETE STRUCTURES:

A. Precast concrete structures shall be installed on prepared or previously placed slab foundations and shall conform to the dimensions and locations shown on the plans. All precast concrete sections necessary to build a completed structure shall be furnished. The different sections shall fit together readily, and all jointing and connections shall be watertight and cemented with mortar. The top of the upper precast concrete member shall be suitably formed and dimensioned to receive the metal frame and cover or grate, or other cap, as required. Structure inverts shall be shaped with concrete as shown on the plans, resulting in flow lines which are smooth, uniform, and cause minimum resistance to flow. The metal steps which are embedded or built into the side walls shall be aligned and placed at vertical intervals of twelve inches.

B. Provision shall be made for any connections for lateral pipe, including drops and leads that may be installed in the structure. Knockout panels or openings for future pipe connections shall be provided where called for by the plans. Where openings for future pipe are provided, the openings shall be closed and made watertight using brick and mortar or other suitable means approved by the Engineer.

3.5 INLET AND OUTLET PIPES:

Inlet and outlet pipes shall extend through openings provided in the walls of the structures for a sufficient distance beyond the outside surface to allow for connections, but shall be cut off flush with the wall on the inside surface, unless otherwise directed. Once pipe is installed, openings shall be sealed with brick and mortar or concrete to form a water-tight, neat connection.

3.6 PLACEMENT AND TREATMENT OF CASTINGS, FRAMES, AND FITTINGS:

A. All castings, frames, and fittings shall be placed in the positions indicated on the plans or as directed by the Engineer, and shall be set true to line and to correct elevation. If frames or fittings are to be set in concrete or cement mortar, all anchors or bolts shall be in place and position before the concrete or mortar is placed. The unit shall not be disturbed until the mortar or concrete has set.

B. When frames or fittings are to be placed upon previously constructed masonry, the bearing surface or masonry shall be brought true to line and grade and shall present an even bearing surface in order that the entire face or back of the unit will come in contact with the masonry. The unit shall be set in mortar beds and anchored to the masonry as indicated on the plans or as directed and approved by the Engineer. All units shall set firm and secure. After the frames or fittings have been set in final position and the concrete or mortar has been allowed to harden for 7 days, then the grates or covers shall be placed and fastened down.

3.7 BACKFILLING:

After a structure has been completed, backfilling with approved material shall be accomplished as specified in Item P-152. No backfilling shall be placed against any structure until permission is given by the Engineer. In the case of cast-in-place concrete, such permission shall not be given until the concrete has been in place seven days, or until tests made by the laboratory under the supervision of the Engineer establish that the concrete has attained sufficient strength to provide a factor of safety against damage or strain in withstanding any pressure created by the backfill or the methods used in placing it. Backfill shall be incidental to the contract price for each structure.

3.8 INSTALLATION OF FILTER FABRIC:

Where specified on the plans filter fabric shall be spread uniformly over the prepared surface. The fabric shall be unrolled directly on the surface to the lines and dimensions shown. The filter fabric shall be lapped a minimum of twelve inches in each direction and shall be anchored in position with approved anchoring devices.

3.9 INSTALLATION OF RIP RAP:

Stone for rip rap shall be placed by methods that will produce a compact uniform blanket of rip rap protection having a reasonbly smooth surface. Rip rap shall be placed to its full depth in one operation and in a manner which will avoid displacing the underlying material or tearing or puncturing the filter fabric. Placing of rip rap by end dumping or by other methods likely to cause segregation or damage to the ground surface or filter fabric will not be permitted. Hand placing or rearranging of individual stones by mechanical equipment may be required to the extent necessary to secure the results specified. Where grouted rip rap is to be installed, rip rap shall be placed in general accordance with the provisions of Item P-610, using forms as required or directed by the Engineer.

3.10 CLEANING AND RESTORATION OF SITE:

After the backfill is completed, the Contractor shall dispose of all surplus material, dirt, and rubbish from the site. Surplus dirt may be deposited in embankment, shoulders, or removed from the site. The Contractor shall restore all disturbed areas as shown on the plans or to their original condition. After all work is completed, the Contractor shall remove all tools and equipment, leaving the entire site free, clear, and in good condition.

752-4 METHOD OF MEASUREMENT

4.1 The quantity of concrete sedimentation chamber and endwall construction to be paid for shall be the number of cubic yards of concrete placed in accordance with the plans and the provisions of this Item and accepted by the Engineer. The quantity of concrete to be paid for will be determined from the neat lines for each structure shown on the plans. No separate measurement for payment will be made of the preparation, excavation, reinforcing, formwork, backfill, or any other incidentals neccessary to complete each structure.

4.2 The quantity of rip rap and grouted rip rap to be paid for shall be the number of square yards of rip rap and grouted rip rap installed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

752-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price per cubic yard for concrete sedimentation chambers and endwalls. This price shall be full compensation for furnishing all materials and for all preparation, excavation, formwork, placing the materials, and backfill, and for all labor, equipment, tools, and incidentals necessary to complete each structure.

5.2 Payment will be made at the contract unit price per square yard for Class I rip rap and grouted rip rap. This price shall be full compensation for furnishing all materials and for all preparation, excavation, placing the materials, and backfill, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item D-752.1	**Sedimentation Chamber -- per cubic yard**
Item D-752.2	**Endwall -- per cubic yard**
Item D-752.3	**Class I Rip Rap -- per square yard**
Item D-752.4	**Grouted Rip Rap -- per square yard**

TESTING REQUIREMENTS

ASTM D 698	Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 5.5 lb (2.49 kg) Rammer and 12-in (305 mm) Drop
ASTM D 1556	Density of Soil in Place by the Sand-Cone Method
ASTM D 2167	Density of Soil in Place by the Rubber-Ballon Method

END OF ITEM D-752

ITEM L-108 INSTALLATION OF UNDERGROUND CABLE FOR AIRPORTS

108-1 DESCRIPTION

1.1 This item shall consist of furnishing and installing underground cable for the taxiway lighting and signage system only in accordance with these specifications at the locations shown in the plans. This item shall include the excavation and backfill of the trench and the installation of cable and counterpoise wire in trench, duct, or conduit. It shall include splicing, cable marking, and testing of the installation and all incidentals necessary to place the cable in operating condition as a completed unit to the satisfaction of the Engineer. This item shall not include the installation of the duct or conduit. Cable for landside electrical systems shall be furnished and installed in accordance with the provisions of Item 16120.

108-2 EQUIPMENT AND MATERIALS

2.1 GENERAL

A. Airport lighting equipment and materials covered by Federal Aviation Administration (FAA) specifications shall have the prior approval of the FAA, and are listed in Advisory Circular (AC) 150/5345-1, Approved Airport Equipment. All other equipment and materials covered by other referenced specifications shall be subject to acceptance through manufacturer's certification of compliance with the applicable specification, when requested by the Engineer.

B. Underground cable shall conform to the requirements of AC 150/5345-7, Specification for L-824 Underground Electrical Cable for Airport Lighting Circuits.

C. If telephone control cable is specified, copper shielded, polyethylene insulated and jacketed, No. 19 AWG telephone cable conforming to the United States Department of Agriculture, Rural Electrification Administration (REA) Bulletin 345-14, REA Specification for Fully Color-Coded, Polyethylene Insulated, Double Polyethylene-Jacketed Telephone Cables for Direct Burial, shall be used.

D. Where counterpoise conductors are to be installed and where soil conditions would adversely affect bare copper wire, thermoplastic wire conforming to Fed. Spec. J-C-30, Type TW, 600 volt, may be used.

E. Cable type, size, number of conductors, strand and service voltage shall be specified in the plans and/or proposal.

2.3 BARE COPPER WIRE (COUNTERPOISE). Bare copper wire for counter-poise installations shall be stranded wire conforming to ASTM Specifications B 3 and B 8.

2.4 CABLE CONNECTIONS. In-line connections of underground primary cables shall be of the type called for in the plans or in the proposal, and shall be one of the types listed below. When the plans or the proposal permit a choice of connection, the Contractor shall indicate in the bid the type of connection he proposes to furnish.

A **The Field-attached Plug-in Splice.** Figure 3 of AC 150/5345-26, Specification for L-823 Plug and Receptacle, Cable Connectors, employing connector kits, is approved for field attachment to single conductor cable.

B. **The Factory-Molded Plug-in Splice.** Specification for L-823 Connectors, Factory-Molded to Individual Conductors, are approved.

108-2.5 CONCRETE. Concrete for cable markers shall conform to Specification Item P-610, Structural Portland Cement Concrete.

108-3 CONSTRUCTION METHODS

3.1 GENERAL.

A. The Contractor shall install the specified cable at the approximate locations indicated in the airport lighting layout plans. The Engineer shall indicate specific locations.

B. Cable connections between lights will be permitted only at the light locations for connecting the underground cable to the primary leads of the individual isoating transformers. The Contractor shall be responsible for providing cable in continuous lengths for home runs or other long cable runs without connections, unless otherwise authorized in writing by the Engineer or shown in the plans.

3.2 INSTALLATION IN DUCT OR CONDUIT.

A. This item includes the installation of the cable in duct or conduit as described below. The maximum number and voltage ratings of cables installed in each single duct or conduit, and the current-carrying capacity of each cable shall be in accordance with the latest National Electric Code, or the code of the local agency having jurisdiction.

B. The Contractor shall make no connections or joints of any kind in cables installed in conduits or ducts.

C. The duct or conduit shall be installed as a separate item in accordance with Item L-110, Installation of Airport Underground Electrical Duct. The Contractor shall make sure that the duct is open, continuous, and clear of debris before installing cable. The cable shall be installed in a manner to prevent harmful stretching of the conductor, injury to the insulation, or damage to the outer protective covering. The ends of all cables shall be sealed with moisture-seal tape before pulling into the conduit and it shall be left sealed until connections are made. Where more than one cable is to be installed in a duct under the same contract, all cable shall be pulled in the duct at the same time. The pulling of a cable through ducts or conduits may be accomplished by handwinch or power winch with the use of cable grips or pulling eyes. Pulling tensions should be governed by recommended standard practices for straight pulls or bends. A lubricant recommended for the type of cable being installed shall be used where pulling lubricant is required. Duct or conduit markers temporarily removed for excavations shall be replaced as required.

3.3 TRENCHING.

A. Where turf is well established and the sod can be removed, it shall be carefully stripped and properly stored. Trenches for cables may be excavated manually or with mechanical trenching equipment. Walls of trenches shall be essentially vertical so that a minimum of shoulder surface is disturbed. Road patrols or graders shall not be used to excavate the trench with their blades. The bottom surface of trenches shall be essentially smooth and free from coarse aggregate. Unless otherwise specified, cable trenches shall be excavated to a minimum depth of 18 inches below finished grade, except as follows:

1. When off the airport or crossing under a roadway or driveway, the minimum depth shall be 36 inches unless otherwise specified.

2. Minimum cable depth when crossing under a railroad track, shall be 42 inches unless otherwise specified.

3. The Contractor shall excavate all cable trenches to a width not less than 6 inches. The trench shall be widened where more than two cables are to be installed parallel in the same trench. Unless

otherwise specified in the plans, all cables in the same location and running in the same general direction shall be installed in the same trench.

4. When rock excavation is encountered, the rock shall be removed to a depth of at least 3 inches below the required cable depth and it shall be replaced with bedding material of earth or sand containing no mineral aggregate particles that would be retained on a ¼ inch sieve. The Contractor shall ascertain the type of soil or rock to be excavated before bidding. All excavation shall be unclassified.

3.4 INSTALLATION IN TRENCHES.

A. The Contractor shall not use a cable plow for installing the cable. Mechanical cable-laying equipment may be used in conjunction with a trenching machine if specified on project plans and specifications; and it should provide for physical inspection of cable prior to backfilling. Sharp bends or kinks in the cable shall not be permitted.

B. Cables shall be unreeled in place alongside or in the trench and shall be carefully placed along the bottom of the trench. The cable shall not be unreeled and pulled into the trench from one end.

C. Where two or more cables are laid parallel in the same trench, they shall be placed laterally a minimum distance of 3 inches apart, and the trench shall be widened sufficiently to accomplish this.

D. Cables crossing over each other shall have a minimum of 3-inch vertical displacement with the topmost cable depth at or below the minimum required depth below finished grade.

E. Not less than 1 foot of cable slack shall be left on each side of all connections, insulating transformers, light units, and at all other points where cable is connected to field equipment. The slack cable shall be placed in the trench in a series of S curves. Additional slack cable shall be left in runway light bases, handholes, manholes, etc., where it is required to bring the cable above ground level to make connections. The amount of slack cable shall be stipulated by the Engineer, or as shown in the plans and specifications.

3.5 BACKFILLING.

A. After the cable has been installed, the trench shall be 3 inches deep, loose measurement, and shall be either earth or sand containing no mineral aggregate particles that would be retained on a 1/4-inch sieve. This layer shall not be compacted. the second layer shall be 5 inches deep, loose measurement, and shall contain no particles that would be retained on a 1-inch sieve. The remainder of the backfill shall be excavated or imported mineral and shall not contain stone or aggregate larger than 4 inches maximum diameter. The third and subsequent layers of the backfill shall not exceed 8 inches in maximum depth, loose measurement.

B. The second, and subsequent layers shall be thoroughly tamped and compacted to at least the density of the adjacent undisturbed soil, and to the satisfaction of the Engineer. If necessary to obtain the desired compaction, the backfill material shall be moistened or aerated as required.

C. Trenches shall not be excessively wet and shall not contain pools of water during backfilling operations. The trench shall be completely backfilled and tamped level with the adjacent surface, except that when sod is to be placed over the trench, the backfilling shall be stopped at a depth equal to the thickness of the sod to be used, with proper allowance for settlement. Any excess excavated material shall be removed and disposed of in accordance with instructions issued by the Engineer.

3.6 RESTORATION.

Where sod has been removed, it shall be replaced as soon as possible after the backfilling is completed. All areas disturbed by the trenching, storing of dirt, cable laying, pad construction, and other work shall be restored to its

original condition. The restoration shall include any necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging or mulching. All such work shall be performed in accordance with the FAA standard turfing specifications. the Contractor shall be held responsible for maintaining all disturbed surfaces and replacements until final acceptance.

3.7 CABLE MARKERS.

A. The location of runway light circuits shall be marked by a concrete slab marker, 2 feet square and 4 inches thick, extending approximately 1 inch above the surface. Each cable run from the line of runway lights to the equipment vault shall also be marked at approximately every 200 feet along the cable run, with an additional marker at each change of direction of cable run. All other cable buried directly in the earth shall be marked in the same manner. The Contractor shall not install slab markers where cable lies in straight lines between obstruction light poles which are spaced 300 feet apart, or less. Cable markers shall be installed immediately above the cable. The Contractor shall impress the word "cable" and directional arrows on each cable marking slab. The letters shall be approximately 4 inches high and 3 inches wide, with strokes ½ inch wide and ¼ inch deep.

3.8 SPLICING.

A. Connections of the type shown in the plans shall be made by experienced personnel regularly engaged in this type of work and shall be made as follows:

1. **Field-attached Plug-in Splices.** These shall be assembled in accordance with manufacturer's instructions. These splices shall be made by plugging directly into mating connectors. In all cases the joint where the connectors come together shall be wrapped with at least one layer of rubber or synthetic rubber tape and one layer of plastic tape, one-half lapped, extending at least 1½ inch on each side of the joint.

2. **Factory-Molded Plug-in Splices.** These shall be made by plugging directly into mating connectors. In all cases, the joint where the connectors come together shall be wrapped with at least one layer of rubber or synthetic rubber tape and one layer of plastic tape, one-half lapped, extending at least 1½ inch on each side of the joint.

3.9 BARE COUNTERPOISE WIRE INSTALLATION AND GROUNDING FOR LIGHTNING PROTECTION.

A. A stranded bare copper wire, No. 8 AWG minimum size, shall be installed for lightning protection of the underground cables. The bare counterpoise wire shall be installed in the same trench and for the entire length of the insulated cables it is designed to protect, and shall be placed at a distance of approximately 4 inches from the insulated cable. The counterpoise wire shall be securely attached to each light fixture base. The counterpoise wire shall also be securely attached to copper or copper-clad ground rods installed not more than 1,000 feet apart around the entire circuit. The ground rods shall be of the length and diameter specified in the plans, but in no case shall they be less than 8 feet long nor less than ⅝ inch in diameter.

3.10 TESTING.

a. The Contractor shall furnish all necessary equipment and appliances for testing the underground cable circuits after installation. The Contractor shall test and demonstrate to the satisfaction of the Engineer the following:

1. That all lighting power and control circuits are continuous and free from short circuits.

2. That all circuits are free from unspecified grounds.

3. That the insulation resistance to ground of all nongrounded series circuits is not less than 50 megohms.

4. That the insulation resistance to ground of all nongrounded conductors of multiple circuits is not less than 50 megohms.

5. That all circuits are properly connected in accordance with applicable wiring diagrams.

6. That all circuits are operable. Tests shall be conducted that include operating each control not less than 10 times and the continuous operation of each lighting and power circuit for not less than ½ hour.

METHOD OF MEASUREMENT

4.1 The quantity of cable and counterpoise to be paid for shall be the number of lineal feet of cable and counterpoise wire installed in duct or conduit, measured between taxiway edge lights and/or signs, tested and ready for operation and accepted by the Engineer. Separate measurement shall be made for each type of cable and counterpoise wire installed.

4.2 The quantity of ground rods to be paid for shall be the number of ground rods installed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

4.3 The quantity of concrete cable markers to be paid for shall be the number of concrete cable markers installed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

BASIS OF PAYMENT

5.1 Payment will be made at the contract unit prices for cable and bare counterpoise wire installed in trench or duct in place by the Contractor and accepted by the Engineer. These prices shall be full compensation for furnishing all materials and for all preparation and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the items.

5.2 Payment will be made at the contract unit price for each ground rod and concrete cable marker installed by the Contractor and accepted by the Engineer. These prices shall be full compensation for furnishing all materials and for all preparation and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item L-108.1	**No. 8 AWG 5 kV Underground Cable, installed in duct or conduit -- per lineal foot**
Item L-108.2	**No. 8 AWG Bare Counterpoise Wire, installed in trench -- per lineal foot**
Item L-108.3	**Ground Rod -- each**
Item L-108.4	**Concrete Cable Marker – each**

MATERIAL REQUIREMENTS

AC 150/5345-7	Specification for L-824 Underground Electrical Cable for Airport Lighting Circuits
AC 150/5345-26	Specification for L-823 Plug and Receptacle Cable Connectors

Fed. Spec. J-C-30	Cable and Wire, Electrical Power, Fixed Installation
Fed. Spec. HH-I-595	Insulation Tape, Electrical, Pressure-Sensitive Adhesive, Plastic, for Low-Temperature Application
ASTM B 3	Soft or Annealed Copper Wire
ASTM B 8	Concentric-Lay-Stranded Cooper Conductor, Hard, Medium-Hard, or Soft
MIL-I-3825	Insulation Tape, Electrical, Self-Fusing, For Use in Electronics, Communications, and Allied Equipment
MIL-I-7798	Insulation Tape, Electrical, Pressure-Sensitive Adhesive, Plastic

END OF ITEM L-108

ITEM L-110 INSTALLATION OF AIRPORT UNDERGROUND ELECTRICAL DUCT

110-1 DESCRIPTION

1.1 This item shall consist of underground electrical ducts installed in accordance with this specification at the locations and in accordance with the dimensions, designs, and details shown in the plans. This item shall include the installation of all underground electrical ducts or underground conduits. It shall also include all trenching, backfilling, removal, and restoration of any paved areas; manholes, concrete encasement, mandreling installation of steel drag wires and duct markers, capping, and the testing of the installation as a completed duct system ready for installation of cables, to the satisfaction of the Engineer.

110-2 EQUIPMENT AND MATERIALS

2.1 GENERAL.

All equipment and materials covered by referenced specifications shall be subject to acceptance through manufacturer's certification of compliance with the applicable specification when so requested by the Engineer.

2.2 PLASTIC CONDUIT.

A. Plastic conduit and fittings shall conform to the requirements of Fed. Spec. W-C-1094 and shall be one of the following, as specified in the proposal:

1. Type I -- suitable for underground use either directly in the earth or encased in concrete.

2. Type II -- suitable for either above ground or underground use.

2.3 CONCRETE. Concrete shall conform to Item P-610, Portland Cement Concrete.

110-3 CONSTRUCTION METHODS

3.1 GENERAL.

A. The Contractor shall install underground ducts at the approximate locations indicated in the airport layout plans. The Engineer shall indicate specific locations as the work progresses. Ducts shall be of the size, material, and type indicated in the plans or specifications. Where no size is indicated in the plans or specifications, the ducts shall be not less than 3 inches inside diameter. All duct lines shall be laid so as to grade toward handholes, manholes and duct ends for drainage. Grades shall be at least 3 inches per 100 feet. On runs where it is not practicable to maintain the grade all one way, the duct lines shall be graded from the center in both directions toward manholes, handholes, or duct ends. Pockets or traps where moisture may accumulate shall be avoided.

B. The Contractor shall mandrel each duct. An iron-shod mandrel, not more than ¼ inch smaller than the bore of the duct shall be pushed through each duct by means of jointed conduit rods. The mandrel shall have a leather or rubber gasket slightly larger than the duct hole.

C. All ducts installed shall be provided with a No. 10 gauge galvanized iron or steel drag wire for pulling the permanent wiring. Sufficient length shall be left in manholes or handholes to bend the drag wire back to prevent it from slipping back into the duct. Where spare ducts are installed, as indicated on the plans, the open ends shall be plugged with removable tapered plugs, designed by the duct manufacturers, or with hardwood plugs conforming accurately to the shape of the duct and having the larger end of the plug

at least ¼ inch greater in diameter than the duct

D. All ducts shall be securely fastened in place during construction and progress of the work and shall be plugged to prevent seepage of grout, water, or dirt. Any duct section having a defective joint shall not be installed.

E. All ducts, except steel conduit, installed under runways, taxiways, aprons, and other paved areas shall be encased in a concrete envelope.

F. Where turf is well established and the sod can be removed, it shall be carefully stripped and properly stored.

G. Trenches for ducts may be excavated manually or with mechanical trenching equipment. Walls of trenches shall be essentially vertical so that a minimum of shoulder surface is disturbed. Blades of road patrols or graders shall not be used to excavate the trench. The Contractor shall ascertain the type of soil or rock to be excavated before bidding. All excavation shall be unclassified.

3.2 DUCTS ENCASED IN CONCRETE.

A. Unless otherwise shown in the plans, concrete-encased ducts shall be installed so that the top of the concrete envelope is not less than 18 inches below the finished subgrade where installed under runways, taxiways, aprons, or other paved areas, and not less than 18 inches below finished grade where installed in unpaved areas. Ducts under paved areas shall extend at least 3 feet beyond the edges of the pavement or 3 feet beyond any underdrains which may be installed alongside the paved area. Trenches for concrete-encased ducts shall be opened the complete length before concrete is laid so that if any obstructions are encountered, proper provisions can be made to avoid them. All ducts for concrete encasements shall be placed on a layer of concrete not less than 3 inches thick prior to its initial set. Where two or more ducts are encased in concrete, the Contractor shall space them not less than 1½ inches apart (measured from outside wall to outside wall) using spacers applicable to the type of duct. As the duct laying progresses, concrete not less than 3 inches thick shall be placed around the sides and top of the duct bank. End bells or couplings shall be installed flush with the concrete encasement where required.

B. When specified, the Contractor shall reinforce the bottom side and top of encasements with steel reinforcing mesh or fabric or other approved metal reinforcement. When directed, the Contractor shall supply additional supports where the ground is soft and boggy, where ducts cross under roadways, or where otherwise shown on the plans. under such conditions, the complete duct structure shall be supported on reinforced concrete footings, piers, or piles located at approximately 5 foot intervals.

C. When clay or soapstone ducts are specified, they shall be installed with concrete encasement as described above. Clay conduit shall be of the single-bore type. Where the self-centering socket-joint type of single clay duct is used, conduit shall be built up, tier by tier, and separated only by sufficient mortar or fine aggregate concrete to bed the ducts evenly and fill all voIds between ducts. Single ducts shall be jointed together and the joints grouted with portland cement mortar. A suitable gasket (of rubber or other approved material) shall first be placed in the receptacle end of the duct, prior to the joining operation, in order to exclude all mortar from the duct.

D. Where the square bore butt-joint type of clay duct, single or multicell, is used, sections shall be aligned with at least four steel dowel pins and joints wrapped with duct tape 6 inches wide and lapped 6 inches. All joints in a bank of single-bore ducts shall be staggered, beginning evenly from the manhole or handhole, by means of short lengths 6, 8, 9, 12, and 15 inches long. Cement mortar shall be trowled around each and every joint. Voids in the duct bank, caused by the external shape of the corners of the conduit, shall also be filled with mortar. The joining and joints of soapstone duct shall be done in accordance with the manufacturer's recommendations.

3.3 DUCTS WITHOUT CONCRETE ENCASEMENT.

A. Trenches for single-duct lines shall be not less than 6 inches nor more than 12 inches wide, and the trench for two or more ducts installed at the same level shall be proportionately wider. Trench bottoms for ducts without concrete encasement shall be made to conform accurately to grade so as to provide uniform support for the duct along its entire length.

B. A layer of fine earth material, at least 4 inches thick (loose measurement) shall be placed in the bottom of the trench as bedding for the duct. The bedding material shall consist of soft dirt, sand or other fine fill, and it shall contain no particles that would be retained on a ¼ inch sieve. The bedding material shall be tamped until firm.

C. Unless otherwise shown in plans, ducts for direct burial shall be installed so that the tops of all ducts are at least 18 inches below the finished grade.

D. When two or more ducts are installed in the same trench without concrete encasement, they shall be spaced not less than 2 inches apart (measured from outside wall to outside wall) in a horizontal direction and not less than 6 inches apart in a vertical direction.

E. Trenches shall be opened the complete length before duct is installed so that if any obstructions are encountered, proper provisions can be made to avoid them.

3.4 DUCT MARKERS.

A. The location of the ends of all ducts shall be marked by a concrete slab marker 2 feet square and 4 inches thick extending approximately 1 inch above the surface. The markers shall be located above the ends of all ducts or duct banks, except where ducts terminate in a handhole, manhole, or building.

B. The Contractor shall impress the word "duct" on each marker slab. He shall also impress on the slab the number and size of ducts beneath the marker. The letters shall be 4 inches high and 3 inches wide with width of stroke½ inch and ¼ inch deep or as large as the available space permits.

3.5 BACKFILLING.

A. After concrete-encased ducts have been properly installed and the concrete has had time to set, the trench shall be backfilled in at least two layers with excavated material not larger than 4 inches in diameter and thoroughly tamped and compacted to at least the density of the surrounding undisturbed soil. If necessary to obtain the desired compaction, the backfill material shall be moistened or aerated as required. Trenches shall not be excessively wet and shall not contain pools of water during backfilling operations.

B. The trench shall be completely backfilled and tamped level with the adjacent surface, except that when sod is to be placed over the trench, the backfilling shall be stopped at a depth equal to the thickness of the sod to be used, with proper allowance for settlement.

C. Any excess excavated material shall be removed and disposed of in accordance with instructions issued by the Engineer.

D. For ducts without concrete envelope, 8 inches of sand, soft earth, or other fine fill (loose measurement) shall be placed around the ducts and carefully tamped around and over them with hand tampers. The remaining trench may be filled with regular run of excavated material and thoroughly tamped as specified above.

3.6 RESTORATION.

Where sod has been removed, it shall be replaced as soon as possible after the backfilling is completed. All

areas disturbed by the trenching, storing of dirt, cable laying, pad construction and other work shall be restored to its original condition. The restoration shall include any necessary topsoiling, fertilizing, liming, seeding, sprigging, or mulching. All such work shall be performed in accordance with the FAA Standard Turfing Specifications. The Contractor shall be held responsible for maintaining all disturbed surfaces and replacements until final acceptance.

110-4 METHOD OF MEASUREMENT

4.1 The quantity of underground electrical duct and concrete encased duct to be paid for shall the number of lineal feet, measured along the centerline, installed in accordance with the plans and the provisions of this Item and accepted by the Engineer. The several sizes, numbers, and classes of duct and concrete-encased duct shall be measured separately.

110-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price for each type and size of single-way or multi-way duct completed and accepted. This price shall be full compensation for furnishing all materials and for all preparation, assembly, and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete this item.

Payment will be made under:

Item L-110.5 2" PVC Sched. 40 Conduit -- per lineal foot

MATERIAL REQUIREMENTS

Fed. Spec. W-C-1094 — Conduit and Fittings; Nonmetallic, Rigid, (Plastic)

END OF ITEM L-110

ITEM L-125 INSTALLATION OF AIRPORT LIGHTING SYSTEMS

125-1 DESCRIPTION

1.1 This item shall consist of furnishing and installing new or relocating existing medium-intensity taxiway edge lights and furnishing and installing new or modifying existing taxiway guidance signs in accordance with the plans and the provisions of this Item. This item shall include the furnishing of all equipment, materials, services, and incidentals necessary to place the systems in operation as completed units to the satisfaction of the Engineer.

1.2 Additional details pertaining to a specific system covered in this item are contained in the Federal Aviation Administration Advisory Circulars listed below:

AC 150/5340-24	Runway and Taxiway Edge Lighting Systems.
AC 150/5340-18C	Standards for Airport Sign Systems
AC 150/5345-1U	Approved Airport Equipment
AC 150/5345-7D	Specification for L-824 Underground Electrical Cable for Airport Lighting Circuits
AC 150/5345-26B	Specification for L-823 Plug and Receptacle, Cable Connectors
AC 150/5345-42C	Specification for Airport Light Bases, Transformer Houses, Junction Boxes, and Accessories
AC 150/5345-44F	Specification for Runway and Taxiway Signs
AC 150/5345-46A	Specification for Runway and Taxiway Edge Light Fixtures
AC 150/5345-47A	Isolation Transformers for Airport Lighting Systems

125-2 EQUIPMENT AND MATERIALS

2.1 GENERAL.

A. Airport lighting equipment and materials covered by FAA specifications shall have prior approval of the Federal Aviation Administration, Airport Service, Washington, D.C. 25090, and shall be as listed in Advisory Circular 150/5345-1U, Approved Airport Lighting Equipment.

B. All other equipment and materials covered by other referenced specifications shall be subject to acceptance through the manufacturer's certification of compliance with the applicable specifications.

C. Lists of the equipment and materials required for a particular system are contained in the applicable advisory circulars.

2.2 TAPE.

Rubber and plastic electrical tapes shall be Scotch Electrical Tape Numbers 23 and 88, respectively, as manufactured by the Minnesota Mining and Manufacturing Company, or an approved equal.

2.3 CONCRETE.

Concrete for sign support slabs and light base encasement shall meet the requirements of Item P-610, Portland Cement Concrete, except that the compressive strength may be not less than 3000 psi at the Contractor's option.

2.4 CONDUIT.

A. Rigid steel conduit and fittings shall conform to the requirements of Fed. Spec. WW-C-581.

B. Plastic conduit and fittings shall conform to the requirements of Fed. Spec. W-C-1094 and shall be one of the following, as appropriate:

1. Type I -- suitable for underground use either directly in the earth or encased in concrete.

2. Type II -- suitable for either above ground or underground use.

2.5 SQUEEZE CONNECTORS.

Squeeze connectors, if specified, shall be as manufactured by Crouse-Hinds Company, type CGB cable connector with neoprene rubber bushing, or approved equal.

2.6 TEES.

Large radius bend tees, if specified, shall be as manufactured by Crouse-Hinds Company No. ET-43 or approved equal.

125-3 CONSTRUCTION METHODS

3.1 GENERAL.

The installation and testing details for the systems shall be as specified in the applicable advisory circulars.

3.2 INSTALLING EDGE LIGHTS.

The light bases, isolation transformers, and fixtures shall be installed at the locations shown on and in the manner shown on the plans. Excavations for light bases shall be dug true to line and grade. Remove loose material from the bottom of the excavation and tamp the bottom and sides firm. Set the light base in position, with the top at the required elevation, make conduit connections as required, and secure to reinforcing. Concrete shall be placed only after the position (horizontal and vertical) of each fixture has been verified correct. Where possible, concrete for light bases and adjoining concrete-encased duct should be placed in the same pour.

3.3 INSTALLING GUIDANCE SIGNS.

A. The guidance sign bases, isolation transformers, and fixtures shall be installed at the locations shown on and in the manner shown on the plans. Excavations for light bases and sign base slabs shall be dug true to line and grade. Remove loose material from the bottom of the excavation and tamp the bottom and sides firm. Set the light base in position, with the top at the required elevation, and secure to reinforcing. Concrete shall be placed only after the position (horizontal and vertical) of each fixture has been verified correct. Where possible, concrete for light bases and adjoining concrete-encased duct should be placed in the same pour.

B. Where the plans call for adding one or more modules to an existing sign, the new modules shall be added on the side opposite the side nearest the taxiway edge. The end of the existing concrete sign foundation

125-4 METHOD OF MEASUREMENT

4.1 The quantity of taxiway edge lights to be paid for under this item shall be the number of lights installed in accordance with the plans and the provisions of this item and accepted by the Engineer.

4.2 The quantity of relocated taxiway edge lights to be paid for will be the number of existing edge light fixtures, including isolation transformers, relocated and reinstalled on new light bases in accordance with the plans and the provisions of this Item and accepted by the Engineer.

4.3 The quantity of taxiway guidance signs to be paid for shall be the number of signs installed in accordance with the plans and the provisions of this Item and accepted by the Engineer. The several sizes (classified by the number of modules) of signs shall be measured separately.

4.4 The quantity of taxiway guidance sign modifications to be paid for shall be the number of sign modules installed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

4.5 The quantity of replacement taxiway guidance sign legend panels to be paid for shall be the number of legend panels installed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

125-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price for each medium intensity taxiway edge light, relocated taxiway edge light, taxiway guidance sign, taxiway guidance sign modification, or replacement legend panel installed. This price shall be full compensation for furnishing all materials and for all preparation, assembly, and installation of these materials, and for all labor, equipment, tools, and incidentals necessary to complete this item.

Payment will be made under:

Item L-125.1	**Medium Intensity Taxiway Light, Base Mounted -- each**
Item L-125.2	**Relocate Existing Taxiway Edge Light -- each**
Item L-125.3	**Two-Panel Taxiway Guidance Sign -- each**
Item L-125.4	**Three-Panel Taxiway Guidance Sign -- each**
Item L-125.5	**Modify Existing Taxiway Guidance Sign -- each**
Item L-125.6	**Replace Existing Taxiway Guidance Sign Panel -- each**

MATERIAL REQUIREMENTS

INSTALLATION REQUIREMENTS

AC 150/5340-24	Runway and Taxiway Edge Light Systems

END OF ITEM L-125

ITEM T-901 SEEDING

901-1 DESCRIPTION

1.1 This item shall consist of soil preparation, seeding the areas shown on the plans or as directed by the Engineer in accordance with these specifications.

901-2 MATERIALS

2.1 SEED:

A. The species and application rates of grass, legume, and cover-crop seed furnished shall be those shown on the plans. Seed shall conform to the requirements of 1994 Standards and Specifications for Erosion and Sediment Control, Maryland Department of the Environment.

B. Seed shall be furnished separately or in mixtures in standard containers with the seed name, lot number, net weight, percentages of purity and of germination and hard seed, and percentage of maximum weed seed content clearly marked for each kind of seed. The Contractor shall furnish the Engineer duplicate signed copies of a statement by the vendor certifying that each lot of seed has been tested by a recognized laboratory for seed testing within 6 months of date of delivery. This statement shall include: name and address of laboratory, date of test, lot number for each kind of seed, and the results of tests as to name, percentages of purity and of germination, and percentage of weed content for each kind of seed furnished, and, in case of a mixture, the proportions of each kind of seed.

2.2 LIME:

Lime shall be ground limestone containing not less than 85% of total carbonates, and shall be ground to such fineness that 90% will pass through a No. 20 mesh sieve and 50% will pass through a No. 100 mesh sieve. Coarser material will be acceptable, providing the rates of application are increased to provide not less than the minimum quantities and depth specified in the special provisions on the basis of the two sieve requirements above. Dolomitic lime or a high magnesium lime shall contain at least 10% of magnesium oxide. Lime shall be applied at the rate of two tons per acre. All liming materials shall conform to the requirements of ASTM C 602.

2.3 FERTILIZER:

A. Fertilizer shall be standard commercial fertilizers supplied separately or in mixtures containing the percentages of total nitrogen, available phosphoric acid, and water-soluble potash. They shall be applied at the rate and to the depth specified herein, and shall meet the requirements of Fed. Spec. O-F-241 and applicable state laws. They shall be furnished in standard containers with name, weight, and guaranteed analysis of contents clearly marked thereon. No cyanamide compounds or hydrated lime shall be permitted in mixed fertilizers.

B. The fertilizers may be supplied in one of the following forms:

1. A dry, free-flowing fertilizer suitable for application by a common fertilizer spreader;

2. A finely-ground fertilizer soluble in water, suitable for application by power sprayers; or

3. A granular or pellet form suitable for application by blower equipment.

C. Fertilizers shall be spread at the rate of 1500 pounds per acre.

2.4 WETLANDS VEGETATION:

Permanent vegetation to be planted in stormwater management basins shall be of the varieties shown on the plans. Vegetation shall be furnished and planted in strict accordance with the plans and the requirements of the 1994 Standards and Specifications for Erosion and Sediment Control, Maryland Department of the Environment.

2.5 SOIL FOR REPAIRS:

The soil for fill and topsoiling of areas to be repaired shall be at least of equal quality to that which exists in areas adjacent to the area to be repaired. The soil shall be relatively free from large stones, roots, stumps, or other materials that will interfere with subsequent sowing of seed, compacting, and establishing turf, and shall be approved by the Engineer before being placed.

901-3 CONSTRUCTION METHODS

3.1 ADVANCE PREPARATION AND CLEANUP:

A. After grading of areas has been completed and before applying fertilizer and ground limestone, areas to be seeded shall be raked or otherwise cleared of stones larger than 2 inches (50 mm) in any diameter, sticks, stumps, and other debris which might interfere with sowing of seed, growth of grasses, or subsequent maintenance of grass-covered areas. If any damage by erosion or other causes has occurred after the completion of grading and before beginning the application of fertilizer and ground limestone, the Contractor shall repair such damage. This may include filling gullies, smoothing irregularities, and repairing other incidental damage.

B. An area to be seeded shall be considered a satisfactory seedbed without additional treatment if it has recently been thoroughly loosened and worked to a depth of not less than 5 inches (125 mm) as a result of grading operations and, if immediately prior to seeding, the top 3 inches (75 mm) of soil is loose, friable, reasonably free from large clods, rocks, large roots, or other undesirable matter, and if shaped to the required grade.

C. However, when the area to be seeded is sparsely sodded, weedy, barren and unworked, or packed and hard, any grass and weeds shall first be cut or otherwise satisfactorily disposed of, and the soil then scarified or otherwise loosened to a depth not less than 5 inches (125 mm). Clods shall be broken and the top 3 inches (75 mm) of soil shall be worked into a satisfactory seedbed by discing, or by use of cultipackers, rollers, drags, harrows, or other appropriate means.

3.2 DRY APPLICATION METHOD:

A. Liming. Lime shall be applied separately and prior to the application of any fertilizer or seed and only on seedbeds which have previously been prepared as described above. The lime shall then be worked into the top 3 inches (75 mm) of soil after which the seedbed shall again be properly graded and dressed to a smooth finish.

B. Fertilizing. Following advance preparations and cleanup fertilizer shall be uniformly spread at the rate which will provide not less than the minimum quantity stated in paragraph 901-2.3.

C. Seeding. Grass seed shall be sown at the rate specified in paragraph 901-2.1 immediately after fertilizing, and the fertilizer and seed shall be raked within the depth range stated in the special provisions. Seeds of legumes, either alone or in mixtures, shall be inoculated before mixing or sowing, in accordance with the instructions of the manufacturer of the inoculant. When seeding is required at other than the seasons shown on the plans or in the special provisions, a cover crop shall be sown by the same methods required for grass and legume seeding.

D. Rolling. After the seed has been properly covered, the seedbed shall be immediately compacted by means of an approved lawnroller, weighing 40 to 65 pounds per foot (60 to 97 kg per meter) of width for clay soil (or any soil having a tendency to pack), and weighing 150 to 200 pounds per foot (223 to 298 kg per meter) of width for sandy or light soils.

3.3 WET APPLICATION METHOD:

A. General. The Contractor may elect to apply seed and fertilizer (and lime, if required) by spraying them on the previously prepared seedbed in the form of an aqueous mixture and by using the methods and equipment described herein. The rates of application shall be as specified in the special provisions.

B. Spraying Equipment. The spraying equipment shall have a container or water tank equipped with a liquid level gauge calibrated to read in increments not larger than 50 gallons (190 liters) over the entire range of the tank capacity, mounted so as to be visible to the nozzle operator. The container or tank shall also be equipped with a mechanical power-driven agitator capable of keeping all the solids in the mixture in complete suspension at all times until used.

1. The unit shall also be equipped with a pressure pump capable of delivering 100 gallons (380 liters) per minute at a pressure of 100 pounds per square inch (690 kPa). The pump shall be mounted in a line which will recirculate the mixture through the tank whenever it is not being sprayed from the nozzle. All pump passages and pipe lines shall be capable of providing clearance for 5/8 inch (15 mm) solids. The power unit for the pump and agitator shall have controls mounted so as to be accessible to the nozzle operator. There shall be an indicating pressure gauge connected and mounted immediately at the back of the nozzle.

2. The nozzle pipe shall be mounted on an elevated supporting stand in such a manner that it can be rotated through 360 degrees horizontally and inclined vertically from at least 20 degrees below to at least 60 degrees above the horizontal. There shall be a quick-acting, three-way control valve connecting the recirculating line to the nozzle pipe and mounted so that the nozzle operator can control and regulate the amount of flow of mixture delivered to the nozzle. At least three different types of nozzles shall be supplied so that mixtures may be properly sprayed over distance varying from 20 to 100 feet (6 to 30 m). One shall be a close-range ribbon nozzle, one a medium-range ribbon nozzle, and one a long-range jet nozzle. For case of removal and cleaning, all nozzles shall be connected to the nozzle pipe by means of quick-release couplings.

3. In order to reach areas inaccessible to the regular equipment, an extension hose at least 50 feet (15 m) in length shall be provided to which the nozzles may be connected.

C. Mixtures. Lime, if required, shall be applied separately, in the quantity specified, prior to the fertilizing and seeding operations. Not more than 220 pounds (100 kg) of lime shall be added to and mixed with each 100 gallons (380 liters) of water. Seed and fertilizer shall be mixed together in the relative proportions specified, but not more than a total of 220 pounds (100 kg) of these combined solids shall be added to and mixed with each 100 gallons (380 liters) of water.

D. All water used shall be obtained from fresh water sources and shall be free from injurious chemicals and other toxic substances harmful to plant life. Brackish water shall not be used at any time. The Contractor shall identify to the Engineer all sources of water at least 2 weeks prior to use. The Engineer may take samples of the water at the source or from the tank at any time and have a laboratory test the samples for chemical and saline content. The Contractor shall not use any water from any source which is disapproved by the Engineer following such tests.

E. All mixtures shall be constantly agitated from the time they are mixed until they are finally applied to the seedbed. All such mixtures shall be used within 2 hours from the time they were mixed or they shall be wasted and disposed of at locations acceptable to the Engineer.

F. Spraying. Lime, if required, shall be sprayed only upon previously prepared seedbeds. After the applied lime mixture has dried, the lime shall be worked into the top 3 inches (8 cm), after which the seedbed shall again be properly graded and dressed to a smooth finish.

G. Mixtures of seed and fertilizer shall only be sprayed upon previously prepared seedbeds on which the lime, if required, shall already have been worked in. The mixtures shall be applied by means of a high-pressure spray which shall always be directed upward into the air so that the mixtures will fall to the ground like rain in a uniform spray. Nozzles or sprays shall never be directed toward the ground in such a manner as might produce erosion or runoff.

H. Particular care shall be exercised to insure that the application is made uniformly and at the prescribed rate and to guard against misses and overlapped areas. Proper predetermined quantities of the mixture in accordance with specifications shall be used to cover specified sections of known area. Checks on the rate and uniformity of application may be made by observing the degree of wetting of the ground or by distributing test sheets of paper or pans over the area at intervals and observing the quantity of material deposited thereon.

I. On surfaces which are to be mulched as indicated by the plans or designated by the Engineer, seed and fertilizer applied by the spray method need not be raked into the soil or rolled. However, on surfaces on which mulch is not to be used, the raking and rolling operations will be required after the soil has dried.

3.4 MAINTENANCE OF SEEDED AREAS:

A. The Contractor shall protect seeded areas against traffic or other use by warning signs or barricades, as approved by the Engineer. Surfaces gullied or otherwise damaged following seeding shall be repaired by regrading and reseeding as directed. The Contractor shall mow, water as directed, and otherwise maintain seeded areas in a satisfactory condition until final inspection and acceptance of the work.

B. When either the dry or wet application method outlined above is used for work done out of season, it will be required that the Contractor establish a good stand of grass of uniform color and density to the satisfaction of the Engineer. If at the time when the contract has been otherwise completed it is not possible to make an adequate determination of the color, density, and uniformity of such stand of grass, payment for the unaccepted portions of the areas seeded out of season will be withheld until such time as these requirements have been met.

901-4 METHOD OF MEASUREMENT

4.1 The quantity of seeding to be paid for shall be the number of acres of seeding, measured on the ground surface, completed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

4.2 The quantity of wetlands vegetation to be paid for shall be the number of thousands of square feet or fraction thereof of wetlands vegetation, measured on the ground surface, completed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

901-5 BASIS OF PAYMENT

5.1 Payment shall be made at the contract unit price per acre or fraction thereof of seeding, which price and payment shall be full compensation for furnishing and placing all material and for all labor, equipment, tools, and incidentals necessary to complete the work prescribed in this Item.

5.2 Payment shall be made at the contract unit price per thousand square feet or fraction thereof of wetlands vegetation, which price and payment shall be full compensation for furnishing and placing all material and for all labor, equipment, tools, and incidentals necessary to complete the work prescribed in this Item.

Payment will be made under:

Item T-901.1	**Seeding -- per acre**
Item T-901.2	**Wetlands Vegetation -- per thousand square feet**

MATERIAL REQUIREMENTS

ASTM D 977	Emulsified Asphalt
Fed. Spec. JJJ-S-181B	Agricultural Seeds
Fed. Spec. O-F-241D	Commercial Mixed Fertilizer

END OF ITEM T-901

ITEM T-905 TOPSOILING

905-1 DESCRIPTION

1.1 This item shall consist of preparing the ground surface for topsoil application, removing topsoil from stockpiled topsoil resulting from stripping operations performed under Item P-152, and placing and spreading the topsoil on prepared areas in accordance with this specification at the locations shown on the plans or as directed by the Engineer. This item shall include furnishing and installing erosion control netting on prepared surfaces inside stormwater management basins as shown on the plans.

1.2 The quantity of topsoil work required under this Item shall be limited to the quantity required to cover the surfaces of the proposed stormwater management basins as shown on the plans. The approximate quantity required to accomplish this is shown on the plans. The Contractor shall be responsible for verifying the actual quantity of topsoil required from the grades and sections shown on the plans. Any topsoil remaining after the completion of this work, or topsoil stripped in excess of the quantity required shall, at MAA's option, remain the property of MAA, and the Contractor shall be entitled to no additional compensation under this Item.

905-2 MATERIALS

2.1 TOPSOIL:

Topsoil shall be the surface layer of soil with no admixture of refuse or any material toxic to plant growth, and it shall be reasonably free from subsoil and stumps, roots, brush, stones (2 inches or more in diameter), clay lumps or similar objects. Brush and other vegetation which will not be incorporated with the soil during handling operations shall be cut and removed. Ordinary sods and herbaceous growth such as grass and weeds are not to be removed but shall be thoroughly broken up and intermixed with the soil during handling operations. The topsoil or soil mixture, unless otherwise specified or approved, shall have a pH range of approximately 5.5 pH to 7.6 pH, when tested in accordance with the methods of testing of the association of official agricultural chemists in effect on the date of invitation of bids. The organic content shall be not less than 3% nor more than 20% as determined by the wet-combustion method (chromic acid reduction). there shall be not less than 20% nor more than 80% of the material passing the 200 mesh (0.075 mm) sieve as determined by the wash test in accordance with ASTM C 117. Natural topsoil may be amended by the Contractor with approved materials and methods to meet the above specifications.

2.2 INSPECTION AND TESTS:

The topsoil shall be inspected to determine if the stripped material meets the requirements specified and to determine the depth to which stripping will be permitted. At this time, the Contractor may be required to take representative soil samples from several locations within the area under consideration and to the proposed stripping depths, for testing purposes as specified in 905-2.1.

2.3 EROSION CONTROL NETTING:

Erosion control netting shall be of the type specified on the plans and shall meet the requirements of the 1994 Standards and Specifications for Erosion and Sediment Control, Maryland Department of the Environment.

905-3 CONSTRUCTION METHODS

3.1 GENERAL:

A. Areas to be topsoiled shall be shown on the plans. If topsoil is available on the site, the location of the stockpiles or areas to be stripped of topsoil and the stripping depths shall be shown on the plans.

B. Suitable equipment necessary for proper preparation and treatment of the ground and for the handling and placing of all required materials shall be on hand, in good condition, and approved by the Engineer before the various operations are started.

3.2 PREPARING THE GROUND SURFACE:

A. Immediately prior to dumping and spreading the topsoil on any area, the surface shall be loosened by discs or spike-tooth harrows, or by other means approved by the Engineer, to a minimum depth of 2 inches (50 mm) to facilitate bonding of the topsoil to the covered subgrade soil. The surface of the area to be topsoiled shall be cleared of all stones larger than 2 inches (50 mm) in any diameter and all litter or other material which may be detrimental to proper bonding, the rise of capillary moisture, or the proper growth of the desired planting. Limited areas, as shown on the plans, which are too compact to respond to these operations shall receive special scarification.

B. Grades on the area to be topsoiled, which have been established by others as shown on the plans, shall be maintained in a true and even condition. Where grades have not been established, the areas shall be smooth-graded and the surface left at the prescribed grades in an even and properly compacted condition to prevent, insofar as practical, the formation of low places or pockets where water will stand.

3.3 OBTAINING TOPSOIL:

A. Prior to the stripping of topsoil from designated areas, any vegetation, briars, stumps and large roots, rubbish or stones found on such areas, which may interfere with subsequent operations, shall be removed using methods approved by the Engineer. Heavy sod or other cover, which cannot be incorporated into the topsoil by discing or other means shall be removed. When suitable topsoil is available on the site, the Contractor shall remove this material from the designated areas and to the depth as directed by the Engineer. The topsoil shall be spread on areas already tilled and smooth-graded, or stockpiled in areas approved by the Engineer. Any topsoil stockpiled by the Contractor shall be rehandled and placed without additional compensation. Any topsoil that has been stockpiled on the site by others, and is required for topsoiling purposes, shall be removed and placed by the Contractor. The sites of all stockpiles and areas adjacent thereto which have been disturbed by the Contractor shall be graded if required and put into a condition acceptable for seeding.

B. When suitable topsoil is secured off the airport site, the Contractor shall locate and obtain the supply, subject to the approval of the Engineer. The Contractor shall notify the Engineer sufficiently in advance of operations in order that necessary measurements and tests can be made. The Contractor shall remove the topsoil from approved areas and to the depth as directed. The topsoil shall be hauled to the site of the work and placed for spreading, or spread as required. Any topsoil hauled to the site of the work and stockpiled shall be rehandled and placed without additional compensation.

3.4 PLACING TOPSOIL:

A. The topsoil shall be evenly spread on the prepared areas to a uniform depth of 2 inches (50 mm) after compaction, unless otherwise shown on the plans or stated in the special provisions. Spreading shall not be done when the ground or topsoil is frozen, excessively wet, or otherwise in a condition detrimental to the work. Spreading shall be carried on so that turfing operations can proceed with a minimum of soil preparation or tilling.

B. After spreading, any large, stiff clods and hard lumps shall be broken with a pulverizer or by other effective means, and all stones or rocks (2 inches (50 mm) or more in diameter), roots, litter, or any foreign matter shall be raked up and disposed of by the Contractor. after spreading is completed, the topsoil shall be satisfactorily compacted by rolling with a cultipacker or by other means approved by the Engineer. The compacted topsoil surface shall conform to the required lines, grades, and cross sections. Any topsoil or other dirt falling upon pavements as a result of hauling or handling of topsoil shall be promptly removed.

3.5 PLACING EROSION CONTROL NETTING

Following the placement, spreading, and grading of topsoil in the proposed stormwater management basins, erosion control shall be placed across the pond bottoms up to the elevations shown on the plans. Netting shall be placed in continuous lapped fashion by unrolling as close to its final position as practicable. The netting shall not be stretched to deformity during placement and shall be anchored with staples as soon as possible after being set in its final position. Netting shall be protected from damage until seeding to follow has been established. Netting which becomes torn or otherwise damaged shall be repaired or replaced by the Contractor as directed by the Engineer.

905-4 METHOD OF MEASUREMENT

4.1 The quantity of topsoiling to be paid for shall be the number of cubic yards of topsoil placed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

4.2 The quantity of erosion control netting to be paid for shall be the number of square yards measured on the ground placed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

905-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price per cubic yard for topsoiling (obtained on the site). This price shall be full compensation for furnishing all materials and for all preparation, placing, and spreading of the materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

5.2 Payment will be made at the contract unit price per square yard for erosion control netting. This price shall be full compensation for furnishing all materials and for all preparation and placing of the materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item T-905.1 **Topsoiling -- per cubic yard**

Item T-905.2 **Erosion Control Netting -- per square yard**

END OF ITEM T-905

ITEM T-908 MULCHING

908-1 DESCRIPTION

1.1 This item shall consist of furnishing, hauling, placing, and securing mulch on surfaces indicated on the plans or designated by the Engineer.

908-2 MATERIALS

2.1 MULCH MATERIAL:

A. Acceptable mulch shall be the materials listed below or any approved locally available material that is similar to those specified. Low grade, musty, spoiled, partially rotted hay, straw, or other materials unfit for animal consumption will be acceptable. Mulch materials, which contain matured seed of species which would volunteer and be detrimental to the proposed overseeding, or to surrounding farm land, will not be acceptable. Straw or other mulch material which is fresh and/or excessively brittle, or which is in such an advanced stage of decomposition as to smother or retard the planted grass, will not be acceptable.

1. Hay. Hay shall be native hay, sudan grass hay, broomsedge hay, legume hay, or similar hay or grass clippings.

2. Straw. Straw shall be the threshed plant residue of oats, wheat, barley, rye, or rice from which grain has been removed.

3. Hay Mulch Containing Seed. Hay mulch shall be mature hay containing viable seed of native grasses or other desirable species stated in the special provisions or as approved by the Engineer. The hay shall be cut and handled so as to preserve the maximum quantity of viable seed. Hay mulch which cannot be hauled and spread immediately after cutting shall be placed in weather-resistant stacks or baled and stored in a dry location until used.

4. Manufactured Mulch. Cellulose-fiber or wood-pulp mulch shall be products commercially available for use in spray applications.

5. Asphalt Binder. Asphalt binder material shall conform to the requirements of ASTM D 977, Type SS-1 or RS-1.

2.2 INSPECTION:

Within 5 days after acceptance of the bid, the Engineer shall be notified of sources and quantities of mulch materials available and the Contractor shall furnish him with representative samples of the materials to be used. These samples may be used as standards with the approval of the Engineer and any materials brought on the site which do not meet these standards shall be rejected.

908-3 CONSTRUCTION METHODS

3.1 MULCHING:

A. Before spreading mulch, all large clods, stumps, stones, brush, roots, and other foreign material shall be removed from the area to be mulched. Mulch shall be applied immediately after seeding.

The spreading of the mulch may be by hand methods, blower, or other mechanical methods, provided a uniform covering is obtained.

B. Mulch material shall be furnished, hauled, and evenly applied on the area shown on the plans or designated by the Engineer. Straw or hay shall be spread over the surface to a uniform thickness at the rate of 2 to 3 tons per acre (1800-2700 kg per acre) to provide a loose depth of not less than 1½ inches (37 cm) nor more than 3 inches (75 mm). Other organic material shall be spread at the rate directed by the Engineer. Mulch may be blown on the slopes and the use of cutters in the equipment for this purpose will be permitted to the extent that at least 95% of the mulch in place on the slope shall be 6 inches (150 mm) or more in length. When mulches applied by the blowing method are cut, the loose depth in place shall be not less than 1 inch (25 mm) nor more than 2 inches (50 mm).

3.2 SECURING MULCH:

A. The mulch shall be held in place by light discing, a very thin covering of topsoil, small brush, pins, stakes, wire mesh, asphalt binder, or other adhesive material approved by the Engineer. Where mulches have been secured by either of the asphalt binder methods, it will not be permissible to walk on the slopes after the binder has been applied. The Contractor is warned that in the application of asphalt binder material he must take every precaution to guard against damaging or disfiguring structures or property on or adjacent to the areas worked and that he will be held responsible for any such damage resulting from his/her operations.

B. If the "peg and string" method is used, the mulch shall be secured by the use of stakes or wire pins driven into the ground on 5-foot (150 m) centers or less. Binder twine shall be strung between adjacent stakes in straight lines and crisscrossed diagonally over the mulch, after which the stakes shall be firmly driven nearly flush to the ground to draw the twine down tight onto the mulch.

3.3 CARE AND REPAIR:

A. The Contractor shall care for the mulched areas until final acceptance of the project. Such care shall consist of providing protection against traffic or other use by placing warning signs, as approved by the Engineer, and erecting any barricades that may be shown on the plans before or immediately after mulching has been completed on the designated areas.

B. The Contractor shall be required to repair or replace any mulching that is defective or becomes damaged until the project is finally accepted. When, in the judgment of the Engineer, such defects or damages are the result of poor workmanship or failure to meet the requirements of the specifications, the cost of the necessary repairs or replacement shall be borne by the Contractor. However, once the Contractor has completed the mulching of any area in accordance with the provisions of the specifications and to the satisfaction of the Engineer, no additional work at his/her expense will be required, but subsequent repairs and replacements deemed necessary by the Engineer shall be made by the Contractor and will be paid for as additional or extra work.

C. If the "asphalt spray" method is used, all mulched surfaces shall be sprayed with asphalt binder material so that the surface has a uniform appearance. The binder shall be uniformly applied to the mulch at the rate of approximately 8.0 gallons (32 liters) per 1,000 square feet (100 square meters), or as directed by the Engineer, with a minimum of 6.0 gallons (24 liters) and a maximum of 10 gallons (40 liters) per 1,000 square feet (100 square meters) depending on the type of mulch and the effectiveness of the binder securing it. Bituminous binder material may be sprayed on the mulched slope areas from either the top or the bottom of the slope. An approved spray nozzle shall be used. The nozzle shall be operated at a distance of not less than 4 feet (120 cm) from the surface of the mulch and uniform distribution of the bituminous material shall be required. A pump or an air compressor of adequate capacity shall be used to insure uniform distribution of the bituminous material.

D. If the "asphalt mix" method is used, the mulch shall be applied by blowing, and the asphalt binder material shall be sprayed into the mulch as it leaves the blower. The binder shall be uniformly applied to the mulch at the rate of approximately 8.0 gallons (32 liters) per 1,000 square feet (100 square meters) or as directed by the Engineer, with a minimum of 6.0 gallons (24 liters) and a maximum of 10 gallons (40 liters) per 1,000 square feet (100 square meters) depending on the type of mulch and the effectiveness of the binder securing it.

908-4 METHOD OF MEASUREMENT

4.1 The quantity of mulching to be paid for shall be the number of acres of mulch placed in accordance with the plans and the provisions of this Item and accepted by the Engineer.

908-5 BASIS OF PAYMENT

5.1 Payment will be made at the contract unit price per acre for mulching. This price shall be full compensation for furnishing all materials and for placing and anchoring the materials, and for all labor, equipment, tools, and incidentals necessary to complete the item.

Payment will be made under:

Item T-908.1 **Mulching -- per acre**

Contract Title:	Item #:
Contract Number:	Section #:
Contractor:	Paragraph #:
Item Specified:	
Proposed Substitution:	

Fill in the blanks below (incomplete forms will not be considered):

A. Does the substitution affect dimensions shown on the Drawings?

Yes No

B. Will the undersigned pay for changes to the building design, including engineering and detailing cost caused by the requested substitution?

Yes No

C. What affect does substitution have on other trades?

D. What affect does substitution have on construction schedules?

E. Manufacturer's guarantees of proposed and specified items are:

Same _____ Different _____

Explain if different:

F. Reason for request:

G. Itemized comparison of specified item with the proposed substitution; list significant variations:

H. Accurate cost data comparing proposed substitution with product specified:

I. Designation of maintenance services and sources:

J. Attach complete technical data, including laboratory tests, If applicable.

K. Include complete information on changes to Drawings and/or Specifications which proposed substitution will require for its proper installation.

L. Submit with the request all necessary samples and substantiating data to prove equal quality and performance to the item specified in the Contract. Clearly mark the Manufacturer's literature to indicate equality in performance.

The Contractor certifies that the proposed substituted product is of equal performance and assumes the liability for equal performance, design, and compatibility with adjacent materials.

The undersigned states that the function, appearance, and quality of the proposed substituted product is equivalent or superior to the specified item/product. Signature shall be the principal having the authority to legally bind his/her firm to the above terms. Failure to provide legally binding signature will result in retraction of approval.

PART IV

WAGE RATES

STATE OF MARYLAND
DEPARTMENT OF LABOR, LICENSING AND REGULATION
DIVISION OF LABOR AND INDUSTRY
PREVAILING WAGE SECTION
1100 N. EUTAW STREET, ROOM 607
BALTIMORE, MARYLAND 21202-2272
(410) 767-2342

The wage rates to be paid laborers and mechanics on the contract described below is announced by order of the Commissioner of Labor and Industry.

It is mandatory upon the successful bidder and any subcontractor under him, to pay not less than the specific rates to all workers employed by them in execution of this contract. Reference: Annotated Code of Maryland State Finance and Procurement, Section 17-201 thru 17-226 inclusive.

These rates were taken from the locality determination dated January 5, 1998 for Baltimore County, issued pursuant to the Commissioner's authority under State Finance and Procurement Article Section 17-209, Annotated Code of Maryland.

Suzette Moore, Manager, Contract Administration — March 26, 1998
(Name and Title of Requesting Officer) — (Date of Issue)

Maryland Aviation Administration, P.O. Box 8766, BWI Airport, Md 21240

IRONWORKER	$21.14	$8.27
CHAIN LINK FENCE ERECTOR	$17.69	$7.30

PREVAILING WAGE
INSTRUCTIONS FOR THE CONTRACTOR

The contractor shall submit two complete copies of his payroll records and the payroll records of each of his subcontractors-one copy to the Contracting Officer and one to the Commissioner of Labor & Industry, 1100 N. Eutaw Stree, Room 607, 6th Floor, Baltimore, Maryland 21201, where they will be available for inspection during business hours. These payroll records **MUST BE SUBMITTED WITHIN 14 CALENDAR DAYS AFTER THE END OF EACH PAYROLL PERIOD** and shall contain the following information: Name, address & **TELEPHONE NUMBER**; location and project number of the job; Employees name, address, social security number, exact and specific work classification, hours-straight time and overtime-worked each day, total hours-straight time and overtime-worked rate of pay and gross wages earned. Employee's address may be dropped after it has been reported one time. Payrolls shall be submitted on U.S. Department of Labor Wage and Hour Public Contracts Division Payroll Form WH-347 or its equivalent and contain only information relevant to the job and be serially numbered starting with payroll number one.

The contractor shall be responsible for submission of all subcontractors' payroll records covering work performed directly at the work site. Each copy of the payroll records shall be accompanied by a statement signed by the contractor or the subcontractor, indicating that the wage rates contained therein are not less than those established by the Commissioner as set forth in the contract, that the classification set forth for each worker or apprentice conforms with the work performed, and that the contractor or subcontractor, as the case may be, has complied with the provisions of the law.

A contractor or subcontractor may make **deductions** that are (1) required by law; (2) required by a collective bargaining agreement between a bona fide labor organization and the contractor or subcontractor; or (3) contained in **WRITTEN AGREEMENT** between an employee and an employer undertaken at the beginning of employment, if the agreement is submitted by the employer to the **PUBLIC BODY** awarding the public work and is approved by the public body as fair and reasonable.

If the contractor is delinquent in submitting payroll records, processing of partial payment estimates may be held in abeyance pending receipt of the records. In addition, if the contractor is delinquent in submitting the payroll records, the contractor shall be liable to the Contracting Public Body for liquidated damages. The liquidated damages shall constitute the sum of $10.00 for each calendar day that the records are late.

Only apprentices registered with the Maryland State Apprenticeship and Training Council shall be employed on Prevailing Wage projects. Apprentices shall be paid a percentage of the determined journeyperson's wage rate for the specific craft.

OVERTIME rates shall be paid by the general contractors and subcontractors under its contracts and agreements with their employees which in no event shall be less than time and one-half the prevailing hourly rate of wages for all hours worked **IN EXCESS OF EIGHT (8) HOURS IN ANY ONE CALENDAR DAY** and work performed on Sundays and legal holidays.

Contractors and subcontractors employing a classification of worker for which a wage rate was not issued, shall notify the Commissioner of Labor & Industry, Prevailing Wage Section, for the purpose of obtaining the wage rate for said classification **PRIOR TO BEING EMPLOYED** on this project.

PREVAILING WAGE
INSTRUCTIONS FOR THE CONTRACTOR

The contractor shall submit two complete copies of his payroll records and the payroll records of each of his subcontractors-one copy to the Contracting Officer and one to the Commissioner of Labor & Industry, 1100 N. Eutaw Stree, Room 607, 6th Floor, Baltimore, Maryland 21201, where they will be available for inspection during business hours. These payroll records **MUST BE SUBMITTED WITHIN 14 CALENDAR DAYS AFTER THE END OF EACH PAYROLL PERIOD** and shall contain the following information: Name, address & **TELEPHONE NUMBER**; location and project number of the job; Employees name, address, social security number, exact and specific work classification, hours-straight time and overtime-worked each day, total hours-straight time and overtime-worked rate of pay and gross wages earned. Employee's address may be dropped after it has been reported one time. Payrolls shall be submitted on U.S. Department of Labor Wage and Hour Public Contracts Division Payroll Form WH-347 or its equivalent and contain only information relevant to the job and be serially numbered starting with payroll number one.

The contractor shall be responsible for submission of all subcontractors' payroll records covering work performed directly at the work site. Each copy of the payroll records shall be accompanied by a statement signed by the contractor or the subcontractor, indicating that the wage rates contained therein are not less than those established by the Commissioner as set forth in the contract, that the classification set forth for each worker or apprentice conforms with the work performed, and that the contractor or subcontractor, as the case may be, has complied with the provisions of the law.

A contractor or subcontractor may make deductions that are (1) required by law; (2) required by a collective bargaining agreement between a bona fide labor organization and the contractor or subcontractor; or (3) contained in **WRITTEN AGREEMENT** between an employee and an employer undertaken at the beginning of employment, if the agreement is submitted by the employer to the **PUBLIC BODY** awarding the public work and is approved by the public body as fair and reasonable.

If the contractor is delinquent in submitting payroll records, processing of partial payment estimates may be held in abeyance pending receipt of the records. In addition, if the contractor is delinquent in submitting the payroll records, the contractor shall be liable to the Contracting Public Body for liquidated damages. The liquidated damages shall constitute the sum of $10.00 for each calendar day that the records are late.

Only apprentices registered with the Maryland State Apprenticeship and Training Council shall be employed on Prevailing Wage projects. Apprentices shall be paid a percentage of the determined journeyperson's wage rate for the specific craft.

OVERTIME rates shall be paid by the general contractors and subcontractors under its contracts and agreements with their employees which in no event shall be less than time and one-half the prevailing hourly rate of wages for all hours worked **IN EXCESS OF EIGHT (8) HOURS IN ANY ONE CALENDAR DAY** and work performed on Sundays and legal holidays.

Contractors and subcontractors employing a classification of worker for which a wage rate was not issued, shall notify the Commissioner of Labor & Industry, Prevailing Wage Section, for the purpose of obtaining the wage rate for said classification **PRIOR TO BEING EMPLOYED** on this project.

PART I CODE OF MARYLAND REGULATIONS (COMAR) REVISIONS/INFORMATION

I. COMAR 21.06.07 - BID AND CONTRACT SECURITY/BONDS
Subsection .01 - General

A. Effective May 20, 1996, as amended by the Board of Public Works, the requirement for bonding (bid, payment, and performance) is raised from $50,000 to $100,000, unless otherwise specified.

B.(4) Effective May 20, 1996, as amended by the Board of Public Works, an irrevocable letter of credit in a form satisfactory to the Attorney General and issued by a financial institution approved by the State Treasurer is an acceptable form of security.

B.(5) Effective January 26, 1998, as adopted by the Board of Public Works, the granting of a mortgage or deed of trust on real property located in the State of Maryland is an acceptable form of performance security on construction contracts when:

1. such security is satisfactory to the procurement officer;

2. the face amount of the instrument does not exceed 75% of the Contractor's equity interest in the property; and

3. the assignment of the mortgage or deed of trust is recorded in the county land records pursuant to Real Property, Article §3-103 Annotated Code of Maryland.

II. BONDING ASSISTANCE

Assistance in obtaining bid, performance and payment bonds may be available to qualifying small businesses through the Maryland Small Business Development Financing Authority (MSBDFA). MSBDFA can directly issue bid, performance or payment bonds up to $750,000. MSBDFA may also guaranty up to 90% of a surety's losses as a result of a contractor's breach of contract; MSBDFA's exposure on any bond guaranteed may not, however, exceed $900,000. Bonds issued directly by the program will remain in effect for the duration of the contract, and those surety bonds that are guaranteed by the program will remain in effect for the duration of the surety's exposure under the contract.

To be eligible for bonding assistance, a business must first be denied bonding by at least one surety in both the standard and specialty markets within 90 days of submitting a bonding application to MSBDFA. The applicant must employ fewer than 500 full-time employees or have gross sales of less than $50 million annually, have its principal place of business in Maryland or be a Maryland resident, must not subcontract more than 75 percent of the work, and the business or its principals must have a reputation of good moral character and financial responsibility.

Finally, it must be demonstrated that the bonding or guarantee will have a measurable economic impact, through job creation and expansion of the state's tax base. Applicants are required to work through their respective bonding agents in applying for assistance under the program. Questions regarding the bonding assistance program should be referred to:

Maryland Department of Business and Economic Development
Maryland Small Business Development Financing Authority
217 East Redwood Street, 22nd Floor
Baltimore MD 21202
Phone (410) 333-4270
Fax (410) 333-6931

III. COMAR 21.07.02 - MANDATORY CONSTRUCTION CONTRACT CLAUSES

Subsection .05-1 - Disputes

(Adopted January 26, 1998 by the Board of Public Works)

A. This Contract is subject to the provisions of State Finance and Procurement Article, Title 15, Subtitle 2, Annotated Code of Maryland, and COMAR 21.10.

B. Except as otherwise provided in this Contract, or by law, all disputes arising under or as a result of a breach of this Contract that are not disposed of by mutual agreement shall be resolved in accordance with this clause.

C. As used herein, "claim" means a written demand or assertion by one of the parties seeking, as a legal right, the payment of money, adjustment or intepretation of contract terms, or other relief, arising under or relating to this Contract. A voucher, invoice, or request for payment that is not in dispute when submitted is not a claim under this clause. However, if the submission subsequently is not acted upon in a reasonable time, or is disputed as to liability of amount, it may be converted to a claim for the purpose of this clause.

D. Within 30 days after Contractor knows or should have know of the basis for a claim relating to this Contract, Contractor shall file a written notice of claim with the Procurement Officer.

E. Contemporaneously with, or within 30 days after, the filing of a notice of claim, Contractor shall submit the written claim to the Procurement Officer. If Contractor so requests, the Procurement Officer, on conditions the Procurement Officer deems satisfactory to the unit, may extend the time in which a Contractor must submit the claim. An example of when a Procurement Officer may grant an extension includes situations in which the Procurement Officer finds that a contemporaneous or timely cost quantification following the filing of the notice of claim is impossible or impractical.

F. The claim shall set forth all the facts surrounding the controversy. Contractor, at the discrretion of the Procurement Officer, may be afforded an opportunity to be heard and to offer evidence in support of the claim.

G. The Procurement Officer shall mail or deliver written notification of the final decision within:

(1) 90 days after the Procurement Officer receives the claim if the claim is an amount for which the Appeals Board accelerated procedure, set forth in **COMAR 21.10.06.12**, may be used;

(2) 180 days after the Procurement Officer receives the claim for a claim not covered under §H(1) of this regulation; or

(3) A longer period that the Procurement Officer and Contractor agree to in writing.

H. The final decision may award a contract claim only for those expenses incurred not more than 30 days before Contractor was initially required to have filed the notice of claim.

I. The Procurement Officer's decision is the final action of the Administration. If the Procurement Officer fails to render a final decision within the time required, Contractor may deem the failure to be a final decision not to pay the claim.

J. If the final decision grants the claim in part and denies the claim in part, the Administrator shall pay the Contractor the undisputed amount. Payment of the partial claim is not an admission of liability by the Administration and does not preclude the Administration from recovering the amount paid if a subsequent determination modifies the final decision.

K. Contractor may file a written appeal with the Maryland State Board of Contract Appeals within 30 days of receipt of notice of decision.

L. Pending resolution of a claim, Contractor shall proceed diligently with the performance of the Contract in accordance with the Procurement Officer's decision.

IV. COMAR 21.10.04 - CONTRACT CLAIMS AND DISPUTES

Subsection .02 - Filing of Claim by Contractor
(Amended October 6, 1997 by the Board of Public Works)

B. Contemporaneously with or within 30 days of the filing of a notice of a claim, but no later than the date that final payment is made, a contractor shall submit the claim to the appropriate procurement officer. On conditions the Procurement Officer considers satisfactory to the unit, the Procurement Officer may extend the time in which a contractor, after timely submitting a notice of claim, must submit a contract claim under a procurement contract for construction. An example of when a Procurement Officer may grant an extension includes situations in which the Procurement Officer finds that a contemporaneous or timely cost quantification following the filing of the notice of claim is impossible or impractical. The claim shall be in writing and shall contain:

(1) An explanation of the claim, including reference to all contract provisions upon which it is based;

(2) The amount of the claim;

(3) The facts upon which the claim is based;

(4) All pertinent data and correspondence that the contractor relies upon to substantiate the claim; and

(5) A certification by a senior official, officer, or general partner of the contractor or the subcontractor, as applicable, that, to the best of the person's knowledge and belief, the claim is made in good faith, supporting data are accurate and complete, and the amount requested accurately reflects the contract adjustment for which the person believes the procurement agency is liable.

Subsection .04 - Disposition of Claim
(Amended October 6, 1997 by the Board of Public Works)

A. The Procurement Officer may conduct discussions or negotiations regarding the claim and, subject to approval by the reviewing authority and the Office of the Attorney General, and consistent with the budget and applicable law, may settle the claim. The settlement agreement shall be written, shall provide for an appropriate release, and shall be supported by a written determination of the Procurement Officer that the settlement is in the best interests of the State.

B-D. If discussions or negotiations are not conducted or if the claim is not settled, the Procurement Officer shall prepare a written, recommended decision on the claim, which shall be furnished to the Contractor by certified mail, return receipt requested, or any other method that provides evidence of receipt, within:

E. (1) 90 days after the Procurement Officer receives the claim if the claim is an amount for which the Appeals Board accelerated procedure, set forth in **COMAR 21.10.06.12**, may be used;

(2) 180 days after the Procurement Officer receives the claim for a claim not covered under §C(1) above; or

(3) A longer period that the Contractor agrees to in writing.

(4) Failure to reach a decision within the time prescribed in Section C(1), (2) or (3) above shall be considered a decision to deny the claim that may be appealed in accordance with **COMAR 21.10.04.06**.

(5) The final decision may award a contract claim only for those expenses incurred not more than 30 days before the notice of claim was initially required to have been submitted.

(6) If the final decision grants the claim in part and denies the claim in part, the Administration shall pay the Contractor the amount granted. Payment of the partial claim is not an admission of liability by the unit on the claim and does not preclude the unit from recovering the amount paid if a subsequent determination modifies the final decision.

SP-3.04 Builder's Risk Insurance

Contractor shall at its own cost insure the work on an "all risk" basis and keep it insured at all times during the period of construction, until receipt of notice of final acceptance from the Administration. The amount of insurance shall be, at all times, at least equal to the amount paid on account of work and materials plus the value of work and materials furnished or delivered but not yet paid for by the Administration. The Administration shall be named as loss payee under the builder's risk policy.

SP-4.09 Dust Control and Housekeeping

A. The Contractor shall maintain the work during construction and until the work is accepted. This maintenance shall constitute continuous and effective work prosecuted day by day, with adequate equipment and forces so that the work is maintained in satisfactory condition at all times.

B. The Contractor shall maintain all existing utilities in an operational manner or standard as required by the Engineer.

C. The Contractor shall be responsible for the control of dust in his/her own construction zone, and along all haul routes. The Contractor shall be liable for any damage caused as a result of dust arising out of negligent control and maintenance. Housekeeping of the entire construction area should be done on a continuous basis.

D. The Contractor shall be responsible for safeguarding his/her construction area against thunderstorms and high winds. The Contractor shall monitor weather reports daily. If severe weather is forecasted, the Contractor shall properly secure all construction material and equipment and ensure that the construction site is free of all loose debris which could be blown off/around by the wind. When severe weather is forecasted to develop after working hours, the Contractor shall inspect the construction site at the end of the day to insure that the site is secured for high winds. The Contractor shall be liable for any damages caused as a result of blown debris, negligent control and maintenance.

E. All work shall be properly protected during construction including the shielding of soft or fragile materials, when necessary and/or upon Engineers request, the temporary plugging of open lines and conduits during construction. At completion of each construction area(s), the work area(s) shall be thoroughly cleaned and all tools, equipment, obstructions, or debris as a result of the Contractor's operation shall be removed from the premises.

F. If the Contractor fails to properly remove materials dropped, tracked, deposited, spilled, or blown onto existing facilities, within twenty-four (24) hours, the removal will be performed by the Maryland Aviation Administration, and the direct cost thereof plus one hundred percent (100%) of said cost will be deducted from monies due, or to become due the Contractor.

SP-4.14 Request for Information Procedures

This section specifies administrative and procedural requirements for handling and processing of Requests For Information (RFI) initiated by the Contractor seeking clarification of contract drawings and specifications modifications. A sample RFI form is included under these Special Provisions, Section 10, **SP-10.01** and in the Technical Provisions.

A. Submit RFI as soon as an issue requiring clarification arises. Allow a minimum of seven (7) business days for a response from the Administration.

B. Completely identify all work affected by the RFI with reference to all pertinent drawing numbers and specification paragraphs.

C. Clearly identify field conditions or as-built conditions that affect the work on sketches attached to the RFI.

D. If RFI addresses a conflict in the Contract Documents, clearly describe all dimensions, materials, and other data necessary to enable the Administration to respond to the RFI.

E. Include a suggested solution to the issue addressed in the RFI. If, upon review of the RFI by the Administration, a solution is determined to affect construction time or costs, the Contractor shall be required to submit a proposed change order request in accordance with **GP-4.06**, Changes.

F. Allow each subcontractor or supplier involved in, or affected by the RFI, to review the request prior to submission to the Administration.

G. Incomplete RFI's will not be considered and will be returned to the Contractor.

SP-4.15 Supervision by the Engineer

The work is to be carried out under the supervision of the Engineer and to his/her entire satisfaction. The work and materials shall be strictly of the best quality of the kinds herein specified; and should any work or materials other than those specified or shown be introduced into the construction of the work, the Engineer, or authorized agent, shall have full power to reject them, and they shall be removed from the premises within twenty-four (24) hours by the Contractor after being notified to do so.

SP-4.16 Burning and Welding Permits

A burning and welding must be obtained by the Contractor from the Airport Operations Center before burning, welding, or use of an open flame on airport property. The Contractor shall comply with all requirements of the permit at all times.

SP-6.01 Security and Safety

A. **Airport Security**

1. All Contractor employees shall comply with all BWI Airport security regulations, as mandated by the Federal Aviation Administration (FAA). The Airport shall take immediate and aggressive action to ensure compliance with Federal Aviation Regulation (FAR) Part 107 (Airport Security).

2. Security is to be maintained at all times. If security is breached or penetrated in any manner or form at any time during this contract, the Contractor is required to immediately restore "security" regardless of the circumstances. The Contractor shall be responsible for maintaining the integrity of the Controlled Access Security System for the duration of this contract.

B. **BWI Airport Access Badges**

1. All Contractor personnel who, in the performance of their duties, must have unescorted access to the Security Identification Display Area (SIDA) of the Airport shall first obtain a valid BWI Airport-issued Access (Identification) Badge from the Administration. Prior to badge issuance, the individual requesting a badge must first undergo a 10-year employment history review including a five-year verification by the employer, in accordance with FAR Part 107.

   If the work to be completed by a particular sub-contractor is short-term, and appropriately badged personnel are available, said employees may be escorted. The escort(s) must stay with the non-badged employee(s) at all times, and be able to "control" that person(s).

2. The Administration office or section with the primary duty of managing the subject contract (known as the Airport Operator) shall perform the necessary employment history review and verification on one (1) of the Contractor's managers or supervisors, who shall then be responsible for verifying all subsequent Contractor's employees and signing access badge applications. A letter to the Administration indicating who shall be responsible for the employment verifications, along with an "authorized signature" shall be required.

3. Contractor personnel shall not be permitted to begin work on the job site until issued an access badge. Badges must be displayed at all times while the employee is in the SIDA.

4. The Administration reserves the right to confiscate and suspend the access badge of any employee allegedly involved in any felonious act or security violation at the Airport; and, upon a guilty, nolo contendere, or probation before judgement disposition of the charge, to revoke the access badge.

5. The Contractor is hereby warned that all persons not properly identified by an Airport-issued access badge may be challenged, and if positive identification or association cannot be made, the appropriate corrective action shall be taken.

6. At the completion of the contract or in the event any employees are terminated, the Contractor must return all access badges and airfield vehicle permits to the Procurement Officer for computer deprogramming.

7. The Contractor is also responsible for the cost of replacement badges, if lost.

C. **Access Badge Procedures**

1. All BWI Airport access badge applicants and those requesting the authority to authorize others to have unescorted access privileges to the SIDA must thoroughly complete a BWI Airport Access Badge Application and Attachments.

2. The Contractor shall verify the identity of the access badge applicant through the presentation of two forms of identification, one (1) with the individual's photograph.

3. The access badge applicant must satisfactorily undergo a review, by the present employer, covering the past 10 years of employment history, and verification of the five (5) years preceding the date the access investigation is initiated. Information on the most recent five (5) years must be verified in writing, by documentation, by telephone, or in person. If verification is made by telephone, the information shall be obtained from a person in a position to speak on behalf of the company, and who has access to those records used to verify the information being requested.

4. The BWI Airport Access Badge Application along with the Attachments shall be submitted to the Administration prior to access badge issuance. The applicant's "access investigation" information shall be maintained by the employing agency/company in written form until 180 days after the termination of the individual's authority for unescorted access. The "access investigation" records

must include: the application, the employment verification information obtained by the employer, the names of those from whom the employment verification information was obtained, the date the contact was made, and any other information as required by the Assistant Administrator for Civil Aviation Security.

D. **Airfield Vehicle Ramp Permit/Temporary Airfield Vehicle Registration**

1. The Contractor shall secure from the Airport Operations Center an airfield vehicle ramp permit or temporary airfield vehicle registration to facilitate unescorted vehicular movement around the airfield areas, where necessary, to fulfill the obligations of this contract.

2. The Contractor shall abide by all driving rules and regulations at BWI Airport as determined and approved by the Administration.

E. **Airport Perimeter Access Control**

1. Dependent on the contract's scope of work, perimeter access control may be an issue. All perimeter fence gates (manual and automatic) must be secured or manned (guarded) at all times. Any access portal (gates/doors) found to be unsecured, or any entry by an unauthorized person(s) and/or vehicle(s) shall subject the Contractor to a FAA-imposed penalty or fine of up to $10,000 per occurrence, and/or suspension/revocation of the violator's BWI Airport access badge.

2. Gate attendants (guards) may be Contractor employees, or others hired by the Contractor for this sole purpose. It shall be the responsibility of the Contractor to ensure all required security training is completed and understood. All gate attendants must have been issued a BWI Airport access badge prior to manning any access portal. The access badge must be displayed at all times while in the SIDA. Specific FAA-mandated security rules and regulations, as well as BWI Airport Security Program requirements will be provided by the Airport Security Center.

F. **Vehicular Movement on the Air Operations Area (AOA)**

1. Control of vehicular traffic on the AOA is regulated by Code of Maryland Regulation (COMAR) 11.03.01.04. Detailed regulations are available at the Airport Security Center (Study Guide -- COMAR 11.03.01.04). As part of the Airfield Safety Training requirements, and prior to taking the written test, this Study Guide shall be provided to all appropriate personnel.

2. All vehicles shall be inspected and approved for operating on the AOA by the Administration's Division of Maintenance, prior to airfield vehicle registration. Vehicles satisfactorily completing the safety inspection shall be registered by the Airport Operations Center.

G. **Penalties**

In the event that the Administration shall be subject to any fine or penalty by reason of any violation at BWI Airport of any governmental (including FAA) rules, regulations, or standards as they now exist or may hereafter be promulgated or enacted, the Administration may conduct an investigation and make a determination as to the identity of the party responsible for the violation. If it is determined by the Administration that the Contractor is responsible for all or part of the fine or penalty, the Contractor shall pay said amount of the fine or penalty. The Administration and the Contractor shall each have the right to contest the validity or amount of such fine or penalty before the governmental entity seeking to impose such fine or penalty. In addition, the Administration and the Contractor are each entitled to a hearing regarding the Administration's determination pursuant to the Laws of Maryland, Transportation Article, Section 5-209

and 5-210, the Maryland Administrative Procedure Act and COMAR Title 11, Subtitle 01, Chapter 14 entitled "Procedure for Hearings in Contested Cases."

SP-6.03 Safety Requirements During Construction

A. For all projects within the airfield, the Contractor shall acquaint his/her supervisors and employees with the Airport activity and operations that are inherent to Baltimore/Washington International and/or Martin State Airports and shall conduct his/her construction activities to conform to all routine and emergency air traffic requirements and guidelines for safety specified herein.

B. The Contractor shall not allow employees, subcontractors, suppliers, or any other unauthorized person to enter or remain in any airport area which would be hazardous to persons or to aircraft operations.

C. The Contractor shall be aware of the following types of safety problems and/or hazards:

1. Trenches, holes, or excavations on or adjacent to any open runway or in safety areas.

2. Unmarked/unlighted holes or excavation in any apron, open taxiway, open taxilane, or related safety area.

3. Mounds or piles of earth, construction materials, temporary structures, or other objects in vicinity of the open runway, taxiways, taxilanes, or in a related safety, approach, or departure area.

4. Vehicles, equipment, excavations, stockpiles, or other materials which could degrade or otherwise interfere with electronic signals from radios or NAVAIDs.

5. Pavement drop-offs or pavement-turf lips (either permanent or temporary) which could cause, if crossed at normal operating speeds,damage to aircraft that normally use the Airport. The normal maximum is 1-1/2 inches for either pavement drop-offs or pavement-turf lips.

6. Unmarked utility, Navaid, weather service, runway lighting, or other power or signal cables that could be damaged during construction.

7. Objects (whether or not marked or flagged) or activities anywhere on or in the vicinity of Airport which could be distracting, confusing, or alarming to pilots during aircraft operations.

8. Unflagged/unlighted low visibility items (such as tall cranes, drills, and the like) anywhere in the vicinity of active runways, or in any approach or departure area.

9. Misleading or malfunctioning obstruction lights or unlighted/unmarked obstructions in approach to any open runway.

10. Inadequate approach/departure surfaces (These surfaces are needed to assure adequate landing/takeoff clearance over obstructions or work or storage areas).

11. Inadequate, confusing, or misleading (to user pilots) marking/lighting of runways, taxiways or taxilanes (including displaced or relocated threshold).

12. Water, snow, dirt, debris, or other transient accumulation which temporarily obscures pavement marking or pavement edges, or derogates visibility of runway/taxiway marking or lighting, or of construction and maintenance areas.

13. Inadequate or improper methods of marking, barricading, and lighting of temporarily closed portions of airport operations area.

14. Trash or other materials with FOD potential, whether on runways, taxiways, aprons, or in related safety areas.

15. Inadequate barricading or other marking to separate construction or maintenance areas from open aircraft operating areas.

16. Failure to control vehicle and human access to, and nonessential non-aeronautical activities in, active aircraft operating areas.

17. Failure to maintain radio communication between construction/ maintenance vehicles and ATCT.

18. Construction/maintenance activities or materials which could hamper the response of aircraft rescue and fire fighting equipment from reaching all aircraft or any parts of the runway/taxiway system, to runway approach and departure areas, and to aircraft parking locations.

19. Bird attractants such as edibles (food scraps, etc.) or other miscellaneous garbage, other trash, or ponded water on Airport.

D. The Contractor is totally responsible for safety and health on the project. The Contractor shall conduct activities so as not to violate any safety standards contained herein. The Contractor shall inspect all construction and storage areas as often as necessary to be aware of conditions, and promptly take all steps necessary to prevent/remedy any unsafe or potentially unsafe conditions or activities discovered. If the Engineer becomes aware of any conditions which poses a serious or imminent danger to the health or safety of the public or Administration personnel, the Engineer shall notify the Contractor orally, with written confirmation, and request immediate initiation of corrective action. This notice, when delivered to the Contractor or the Contractor's representative at the work site, shall be deemed sufficient notice of the noncompliance and that corrective action is required. After receiving the notice, the Contractor shall immediately take corrective action. If the Contractor fails or refuses to promptly take corrective action, the Procurement Officer may issue an order stopping all or part of the work until satisfactory corrective action has been taken. The Contractor shall not be entitled to any equitable adjustment of the Contract price or extension of time of the performance schedule on any stop work order issued under this clause. The Contractor shall insert this clause, including this paragraph, with appropriate changes in the designation of the parties, in all subcontracts. At no time shall the Contractor be relieved of the responsibility to be aware and correct any unsafe conditions.

E. Before actual commencement of construction activity, the Contractor shall, through the Airport Management, give notice, using the NOTAM system, of proposed time and date of commencement of construction as well as the length and duration of the work in such areas. Upon completion of work and return of all such areas to standard conditions the Contractor shall, through the Airport Management, give notice, using the NOTAM system, of completion of construction.

F. All Contractor's vehicles that are authorized to operate on the Airport outside of the designated construction area limits or haul routes as specified and in the active AOA shall display in full view above the vehicle a 3' x 3' or larger, orange and white checkerboard flag, each checkerboard color being square. Any vehicle operating in the active AOA during the hours of darkness shall be equipped with a flashing amber (yellow) dome-type light, mounted on top of the vehicle and of such intensity to conform to local codes for maintenance and emergency vehicles.

G. Vehicles making only occasional visits to the job site are exempt from the identification requirements contained in Paragraph F. provided that they are escorted into, through, and out of the Airport secured area by a properly identified vehicle.

H. Radio communications are required between the Contractor's representative and the ATCT. Radio contact is required at all times while the Contractor has personnel and equipment on the project site and while they are in an active AOA of the Airport. Radios shall be furnished by the Contractor and shall be capable of transmitting and receiving at a ground frequency of 121.9 MHZ for BWI Airport and 121.8 MHZ for Martin State Airport. Sufficient radios shall be on site and operating at all times so that instructions or

communications may be dispatched to all crews and/or equipment working in an active AOA within one minute after receipt from the ATCT.

I. Debris, waste and loose material (including dust and dirt) capable of causing damage to aircraft landing gear or propellers or being ingested in jet engines shall not be allowed on active aircraft movement areas or adjacent grassed areas. Materials observed to be within these areas shall be removed immediately and/or continuously by the Contractor during construction.

J. The Contractor shall furnish, at his/her own expense, flagmen as necessary to control his/her traffic in accordance with these specifications unless otherwise directed by the Engineer, in which case the direction of the Engineer shall be followed.

K. All Contractor's vehicles that are required to cross active runways, ramp areas, taxiways and aprons shall do so under the direct control of a competent flagman who is in direct radio contact with ATCT. All aircraft traffic on runways, ramp areas, taxiways and aprons shall have priority over Contractor's traffic. Radios shall be supplied by the Contractor and shall be capable of transmitting and receiving at a frequency of 121.9 MHZ for BWI Airport and 121.8 MHZ for Martin State Airport.

L. Where project access requires travel on or across runways, ramp areas, taxiways, or aircraft aprons, all personnel shall keep such surfaces clear of debris. At no time shall the Contractor's vehicles or personnel be allowed to enter or cross active runways or clear zones without proper authorization obtained through ground control.

M. Open flame, welding or torch cutting operations are prohibited unless adequate fire and safety precautions have been taken and the procedure previously approved by the Engineer.

N. Equipment and stockpiled material shall be constrained in a manner to prevent movement resulting from aircraft jet blast or wind conditions.

O. The Contractor shall provide timber or bucket type construction barricades with flashing yellow lights as shown on the drawings or directed by the Engineer to delineate the work areas when these areas are closed to airport traffic. Open trenches, excavations and stockpiled material located in the AOA shall be prominently marked with aviation orange flags and lighted by approved light units during hours of restricted visibility and darkness.

P. All materials and equipment when not in use shall be placed in approved areas where they will not constitute a hazard to aircraft operations and not penetrate clearance surfaces defined in Federal Aviation Regulation, Part 77 (**14 CFR, Part 77**).

Q. The Contractor shall adhere to the requirements of Order **EA 5210.1**, "Safety Requirements on Airports During Construction," current edition and Advisory Circular **150/5370-2C**, "Operational Safety on Airports During Construction." Where **Part 77, EA 5210.1** and Advisory Circular **150/5370-2C** are in conflict, the most restrictive requirement shall be met.

R. Maximum equipment height shall not exceed twenty (20) feet unless prior approval is obtained from the Engineer.

S. Debris, waste and loose material (including dust and dirt) capable of causing damage to aircraft landing gear, propellers or being ingested in jet engines shall not be allowed on active aircraft movement areas or adjacent grassed areas. Materials observed to be within these areas shall be removed immediately and/or continuously by the Contractor during construction.

T. Upon completion of any stage/phase of the work the Engineer will arrange a physical inspection with Airport operations personnel prior to opening for aircraft use any runway, taxiway, ramp area or airport roadway that has been closed for work, on or adjacent thereto, that has been used for a crossing point or haul route by the Contractor.

U. Entrance to the airfield is subject to strict security regulations. All personnel entering the airfield must obtain and display security identification badges and all vehicles must have and display special permits issued by the Maryland Aviation Administration. The cost of these security items is fully refundable upon their return. The Contractor shall be responsible for assuring that all their employees who have unescorted access to the airfield, have background checks, including at a minimum, references and prior employment histories to the extent necessary to verify representations made by the employee relating to employment in the preceding five (5) years.

V. The smoking or carrying of lighted tobacco, or other products is strictly prohibited on the airside of the airport. Failure to comply may result in fines and/or suspension of individual security badges.

SP-6.04 Safety and Health Plan

A. **Related Documents**. The following is a list of publications which form a part of these Specifications by reference:

1. OSHA General Industry Safety and Health Standards **(29 CFR 1910)** and OSHA Construction Industry Standards **(29 CFR 1926)**. One source of these regulations is OSHA Publication **2207**, which includes a copy of both Parts 1910 and 1926 as they relate to construction safety and health. It is for sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402.

2. National Emission Standards for Hazardous Air Pollutants **(40 CFR 61)**.

3. Environmental Protection Agency Final Rule **(40 CFR 761)**.

4. Federal Standard **313A** - Material Safety Data Sheets, Preparation and Submission.

B. **Definition of Hazardous Materials.** All Contractor's bound to the terms of this Contract shall refer to the definitions for hazardous and toxic materials/substances included in **Sub-parts H and Z of 29 CFR 1910**, and to others as additionally defined in Federal Standard **313A**. Those most commonly encountered include asbestos, polychlorinated biphenyls (PCB), explosives, and radioactive material, but may include others. The most likely products to contain asbestos are sprayed-on fireproofing, insulation, boiler lagging and pipe covering. Likely products to contain PCB are transformers, capacitors, voltage regulators and oil switches.

C. **Quality Assurance:**

1. Representatives of the Contractor shall meet with the Engineer and/or their representative prior to the start of work under this Contract for the purpose of reviewing the Contractor's safety and health provisions pertinent to the work to be performed under this Contract. The Contractor shall be prepared to discuss, in detail, the measures that are intended to be taken to control any unsafe or unhealthy conditions associated with the work to be performed under this Contract. The level of detail for the safety meeting is dependant upon the nature of the work and the potential inherent hazards. The Contractor's principal on-site representative(s), the general superintendent and the safety representative(s) shall attend this meeting.

2. All work, including contact with and handling of hazardous materials, the disturbance and dismantling of structures containing hazardous materials, and/or the disposal of hazardous materials, shall comply with the applicable requirements of **29 CFR 1926/1910** and **40 CFR 761**. Work involving the disturbance or dismantling of asbestos or asbestos containing materials shall also comply with the requirements of **40 CFR 61, Subparts A and M**. All work shall comply with all applicable state and municipal safety and health requirements. Where there is a conflict between applicable regulations, the most stringent shall apply.

3. The Contractor shall assume full responsibility for compliance with all applicable regulations pertaining to the health and safety of personnel during the execution of the work, and shall hold the Administration harmless for any action on the Contractor's part, or that of the Contractor's employees or subcontractors that result in illness, injury or death.

D. **Submittals:**

1. A copy of each accident report that the Contractor or subcontractors submit to their insurance carriers shall be forwarded to the Engineer as soon as possible, but in no event later than seven (7) days after the day the accident occurred.

2. A copy of the Monthly Injury/Illness Report for the Contractor and each Subcontractor of every tier shall be forwarded to the Engineer as soon as possible, but in no event later than seven (7) days after the end of each month. A copy of the standard report form is included under these Special Provisions Section 10, **SP-10.06.**

3. If hazardous materials are disposed of off-site, submit copies of permits from applicable Federal, State or Municipal authorities and necessary certificates that the material has been disposed of as per applicable regulations.

4. If required, a hazardous material handling plan may be necessary. The plan shall contain the following:

   a. Number, type, and experience of employees to be used for the work;
   b. Description of how applicable safety and health regulations and standards are to be met;
   c. Type of protective equipment and work procedures to be used;
   d. Emergency procedures for accidental spills or exposures;
   e. Procedures for disposing of or storing the toxic/hazardous materials;
   f. Identification of possible hazards, problems, and proposed control mechanisms;
   g. Protection of public or others not related to the operation;
   h. Interfacing and control of subcontractors, if any;
   i. Identification of any required analyses, test demonstrations, and validation requirements; and
   j. Method of certification for compliance.

5. The Contractor shall provide to the Administration, for approval, a detailed accident prevention/safety program related to its work and the subcontractors work within fifteen (15) days after Notice to Proceed and before the first progress payment.

6. The Contractor's written accident prevention/safety program shall, as a minimum, address the following areas:

   a. The Contractor shall designate the individual or individuals responsible for implementation of the accident prevention/safety program as well as designating those responsible for the development of safety policy and procedures, indoctrination of new employees, project site inspection responsibilities, and the conduct of the Contractor's weekly safety meetings, as well as responsibility for submission of necessary reports related to project injuries and/or safety;

   b. Accident Prevention:

      (1) The Contractor shall specify the scope of indoctrination for new employees, procedures for weekly safety meetings, and the scope and frequency of project site inspections;

      (2) The Contractor shall specify the availability of, and enforcement of, procedures for the use of protective devices such as head protection, eye protection, hearing protection, respirators, safety belts and lanyards, wet weather gear, fire resistant blankets and/or

barriers, and any other devices used for the protection of the individual employee's health and safety; and

(3) The Contractor shall specify the availability on site and the type of instrumentation to be used to determine flammable gases, oxygen levels, noise levels, gas sampling, and such other instrumentation as may be required to ensure a safe working environment;

(4) The program shall cover, in addition to accident and injury prevention procedures, specific procedures for fire protection and prevention of damage to property, as well as such other procedures beyond statutory requirements that may be necessary to conduct the work in a safe manner and provide maximum protection for the health and safety of all employees; and

(5) The Contractor's program shall set forth specific actions that will be taken to require compliance with the Contractor's accident prevention/safety program by its subcontractors.

c. The Contractor's representatives shall attend the weekly project safety committee meeting.

7. The Engineer may withhold processing of the Contractor's progress payment for failure to submit the project safety plan, or any other required reports within the time period specified in these specifications.

E. **Products:**

1. Special facilities, devices, equipment, clothing, and similar items used by the Contractor in the execution of the work shall comply with the applicable regulations.

2. The Contractor shall bring to the attention of the Engineer any material suspected of being hazardous that he/she encounters during execution of the work. A determination will be made by the Engineer as to whether the Contractor shall perform tests to determine if the material is hazardous. If the Engineer directs the Contractor to perform tests, and/or if the material is found hazardous and additional protective measures are needed, a change order may be required, subject to applicable provisions of the Contract.

F. **Execution:**

1. When the Contractor is notified by the Engineer of any noncompliance with the provisions of the Contract and the action(s) to be taken, the Contractor shall immediately, if so directed, or within 48 hours after receipt of a notice of violation correct the unsafe or unhealthy condition. If the Engineer becomes aware of any conditions which poses a serious or imminent danger to the health or safety of the public, Administration personnel and their agents, or the Contractor's personnel, the Engineer shall notify the Contractor orally, with written confirmation, and request immediate initiation of corrective action. If the Contractor fails to comply promptly, all or any part of the of the work being performed may be stopped by the Engineer with a "stop work order" in accordance with the General Provisions Section **GP-8.07**, Suspension of Work. When, in the opinion of the Engineer, satisfactory corrective action has been taken to correct the unsafe and unhealthy condition, a start work order will be issued immediately. The Contractor shall not be allowed any extension of time or compensation for damages by reason of or in connection with such suspension of work. The Contractor shall insert this clause, with appropriate changes in the designation of the parties, in all subcontracts. At no time shall the Contractor be relieved of the responsibility to be aware and correct any unsafe conditions.

2. The Contractor shall take all necessary precautions to prevent injury to the public, or damage to property of others. For the purposes of this Contract, the public shall include all persons not employed by the Contractor or a subcontractor working under its direction.

3. Storing, positioning, or use of equipment, tools, materials, scraps, and trash in a manner likely to present a hazard to the public or building occupants by its accidental shifting, ignition, or other hazardous qualities is strictly prohibited.

SP-8.03 Critical Path Method Schedules

A. **General:**

1. Careful evaluation and pricing of the schedule provisions of this Contract are important to assure compliance with the language and intent of the schedule specification. The schedule provisions are designed to provide the Contractor with a tool for planning and controlling the work. The schedule provisions must be strictly followed to insure both timely progress payments and equitable compensation for changes and delays. The Contractor must perform work in accordance with the approved Critical Path Method (CPM) Schedule to achieve timely completion of all Contract milestones and to avoid acceleration, termination for default, and end of Contract claims for liquidated damages. The Contractor must give the schedule provisions particular consideration and resolve any areas of uncertainty by asking appropriate questions prior to bid opening.

   The time of submission requirements for the Critical Path Method Schedule included in this section shall supersede the thirty (30) day requirements of the General Provisions Section **GP-8.04**: Progress Schedule and the Special Provisions Section **SP-8.02**: Schedules.

   Time of submission requirements for projects is shown in the following table:

Time of Submission Requirements Schedule
(Number of Calendar Days After Notice-to-Proceed)

Activity Description	Project Duration less than 400 days	Project Duration greater than 400 days
Notice to Proceed	0	0
Contractor Designates Scheduling Rep.	2	2
Schedule Requirements Review Meeting	5	7
Contractor Presentation to Engineer	10	14
Preliminary Network Submission	14	21
Engineer's Review of Prelim. Network #1 Due	18	35
Submit Revised Preliminary Network	24	42
Engineer's Review of Prelim. Network #2 Due	27	49
Planned Acceptance of Preliminary Network	28	50
Submit Detailed Network #1	18	35
Joint Review Meeting #1	25	49
Submit Revised Version of Detailed Network #1	30	56
Engineer's Review of Detail Network #1 Due	35	63
Submit Detailed Network #2	40	77
Joint Review Meeting #2	45	84
Submit Revised Version of Detailed Network #2	50	91
Engineer's Review of Detail Network #2 Due	55	98
Planned Acceptance of Construction Schedule	57	100

2. The Contractor shall provide CPM format, with horizontal activity schedules, written in software, with detailed entries for each activity in each portion of the work, in chronological order, as defined in the following criteria.

a. The purpose of the Project Schedule shall be to:

(1) Assure adequate planning, scheduling and reporting during execution of the work by the Contractor;

(2) When more than one Prime Contractor is working at a site, assure coordination of the work of the Contractor and the various subcontractors and suppliers at all tiers;

(3) Assist the Contractor and Engineer in monitoring the progress of the work and evaluating proposed changes to the Contract and the Project Schedule; and

(4) Assist the Engineer and the Contractor in the preparation and evaluation of the Contractor's monthly progress payments.

b. The Project Schedule shall employ the CPM using retained logic for the planning, scheduling and reporting of the work to be performed under the Contract. The schedule will be produced utilizing the most current version of Primavera Project Planner (P3) software system, or fully transferrable to P-3 (refer to "Products (Scheduling Software)" under this item). The type of schedule shall be Precedence Diagramming Method (PDM). Definitions applicable to this Article include the following:

(1) **Project Schedule** The Project Schedule includes the preliminary network, the computer generated network and computer produced reports as stipulated in the requirement of this Section;

(2) **Critical Path** The Critical Path is the sequence of the activities in the Project Schedule network which requires the longest total amount of time to complete the work or any path(s) which have total float less than one (1) working day;

(3) **Network** - The Network is the graphic representation of the Project Schedule prepared using the CPM. The Network shows the sequence and interdependence of the activities, and planned and actual progress by activity, required for complete performance of the work;

(4) **Working Day** A working day is any calendar day scheduled for active performance of Contract requirements; and

(5) **Key Plans** Graphic representations of the Contractor's planned breakdown of the project for scheduling purposes. The key plans will clearly define the boundaries of the work for each designated area. The boundaries of each area may change depending on the phase of construction. The alpha-numeric codes on the key plans shall match the code values for the "Area" in the schedule.

c. The Project Schedule shall include a preliminary network, which shall be used to monitor the progress of the work during the first one hundred and twenty (120) calendar days of the Contract and during the development and acceptance process of the detailed network.

d. The Contractor shall provide a preliminary network, a detailed network and computer-produced schedule and cost reports as stipulated herein.

e. The Contractor shall provide the computer processing of the computer-produced schedule and cost reports required under the Contract at no cost to the Administration.

f. The Contractor shall meet with the Engineer per the time of submission requirements schedule to conduct a joint review of the Project Schedule requirements of the Contract to assure the Administration of the Contractor's and subcontractor's understanding of the requirements of this Section. Refer to "Schedule Approval Process" under this item.

g. Per the time of submission requirements schedule, there will be a formal presentation by the Contractor. The Contractor's General Superintendent shall conduct the formal presentation utilizing milestone bar charts of the approach the Contractor will take to complete the project within the contractual milestones. The Contractor shall provide proposed key plans (8-1/2" x 11") of the project and each structure for each phase throughout the duration of the project. The Contractor shall also provide proposed codes and code values of activities for the project. The key plans and coding descriptions shall match exactly.

h. The individual who will input information into the scheduling software shall attend all schedule related meetings and all monthly update meetings throughout the duration of the Contract in addition to the General Superintendent.

3. Contractor's Representatives:

a. Per the time of submission requirements schedule, the Contractor shall designate in writing an authorized representative in the Contractor's organization who shall be responsible for coordinating with the Engineer during the preparation and maintenance of the Project Schedule. The Contractor's representative may not be replaced by the Contractor without prior written consent of the Engineer.

b. The Contractor's representative shall have complete authority to act on behalf of the Contractor in fulfilling the Project Schedule requirements of the Contract and such authority shall not be interrupted throughout the duration of the Contract unless approved in writing by the Engineer.

c. The Contractor agrees that whenever the Engineer advises the Contractor in writing that the Contractor's representative is not performing his/her duties to the satisfaction of the Administration, the Contractor shall replace such representative at no additional cost to the Administration and designate in writing, within seven (7) calendar days, a new authorized representative satisfactory to the Engineer.

4. Preliminary Network:

a. Per the time of submission requirements schedule, the Contractor shall submit for the Engineer's review, computer diskettes, one (1) sepia and four (4) color coded prints of the revised Preliminary Network (Logic Diagram) which shall be neatly organized and plotted, time scaled from left to right on either 24" x 36" or 30" x 42" standard size sheets with suitable notation relating the interface points among sheets. The Contractor's General Superintendent shall present the construction approach and explain the schedule logic, durations, sequencing, cost loading and resource loading. Resource loading includes the planned utilization of manpower and equipment on the project. The Contractor's submittal shall state which days of the week will be planned workdays and dates of all scheduled non-workdays (holidays). The preliminary network shall cover the following Project phases and/or activities:

(1) Proposed procurement activities to be accomplished during the first one hundred and twenty (120) calendar days of the Contract.

(a) The proposed one hundred and twenty (120) calendar day procurement activities shall include mobilization, shop drawings and sample submittal and the fabrication and delivery of key and long-lead procurement elements. The schedule shall indicate intended submittal dates and realistic delivery dates for fabrication and delivery activities.

(b) The Administration's review of shop drawings, samples and requested substitutions shall be identified as network activities. The minimum duration for these activities shall be twenty-one (21) calendar days for specified product submittal, twenty-one (21) calendar days for submittal of products required by performance specifications and other named manufacturers, and forty five (45) calendar days for requested substitutions.

(c) The proposed one hundred and twenty (120) calendar day procurement activities shall be incorporated into the Detailed network (discussed hereinafter) including all revisions approved or required by the Engineer.

b. Proposed construction activities to be accomplished during the first one hundred and twenty (120) calendar days of the Contract.

(1) Activity duration shall be in units of whole working days and shall be limited to a maximum of fifteen (15) working days for each activity.

(2) The proposed one hundred and twenty (120) calendar day construction activities shall be incorporated into the detailed network (discussed hereafter) including all revisions approved by the Engineer.

5. The proposed procurement and construction activities described above shall include the information required under the following paragraphs:

a. Summary activities not specified which are necessary to properly indicate:

(1) The approach to scheduling the remaining work areas or phases of the work. The work for each phase or area must be represented by at least one summary activity such that they cumulatively indicate the entire Project Schedule. Incorporate milestone events and dates in the Project Schedule as required by the Contract Documents; and

(2) The approximate cost and duration for each summary activity shall be shown on the Preliminary Network and shall include the Contractor's best estimate of the work it represents. The Contract price remaining after cost-loading shall be distributed among the summary activities by approximate value of each summary activity;

b. The Preliminary Network shall be the basis for progress payments during the first one hundred and twenty (120) calendar days of the Contract while the Detailed Network (discussed hereafter) is being developed and accepted.

c. The Preliminary Network shall be updated on a monthly basis while the Detailed Network is being developed. The monthly updating of the Preliminary Network shall be consistent with the procedures and requirements described in the Detailed Network portion of this specification, except the computer-produced schedule and cost reports will not become a part of the Detailed Network until after the acceptance of the Detailed Network by the Engineer.

d. The Preliminary Network, including schedule logic, durations, sequencing, cost loading and resource loading, shall be used as follows for the preliminary review of time extension request(s) during the first one hundred and twenty (120) calendar days of the Contract while the Detailed Network is being developed:

(1) When change modifications are initiated, delays are experienced, or the Contractor desires to revise the Preliminary Network, the Contractor shall submit to the Engineer a written Time Impact Analysis as required under the "Time Impact Analysis for Change Orders and Delay" section of these specifications, except theactivities and event times in the Time Impact Analysis shall be those included in the latest Preliminary Network update; and

(2) The final determination with regard to the extent of a time extension to be granted to the Contractor shall be determined in accordance with the "Time Impact Analysis for Change Orders and Delay" section of these specifications, subsequent to the development, review, and acceptance of the Detailed Network. Extensions of time are considered pending until the extension can be justified by the Detailed Network, after acceptance by the Engineer. The Contractor may be requested by the Engineer to revise the Time Impact Analysis to reflect approved revisions which may have been made to the Preliminary Network during the development, review and acceptance of the Detailed Network. If so requested, the Contractor shall provide the revision to the satisfaction of the Engineer.

e. Per the time of submission requirements schedule, the Engineer shall meet with the Contractor to discuss any concerns the Engineer may have in regard to the Preliminary Network. The Contractor shall submit the revised Preliminary Network to the Engineer, for acceptance, within the time specified in the time of submission requirements schedule.

f. If revision to the Preliminary Network is contemplated by the Contractor during the preparation of the Detailed Network, the Contractor shall so advise the Engineer in accordance with the "Detailed Network" and "Project Schedule Updating" sections of these specifications, and prior to submission of the Detailed Network.

6. Detailed Network:

a. Schedule Development by the Contractor (First Submission):

(1) Per the time of submission requirements schedule, the Contractor shall submit computer diskettes, one (1) sepia and four (4) color coded prints of its proposed Detailed Network (hereafter referred to as the Network) to the Engineer. The Contractor's General Superintendent shall present the construction approach and explain the schedule logic, durations and sequencing. The Network shall cover the entire Contract time and incorporate in detail the first one hundred and twenty (120) calendar days of the Preliminary Network including all requested revisions (reviewed and accepted) by the Engineer. The Network shall be neatly organized and plotted time scaled from left to right on either 24" x 36" or 30" x 42" standard size sheets with suitable notation relating the interface points among sheets. The Contractor's network shall consist of, but not be limited to, the following:

(a) Proposed procurement activities;
(b) Proposed construction activities;
(c) Proposed duration for activities;
(d) Proposed sequencing of activities;
(e) Milestone events as required by the Contract Documents;
(f) Proposed area (location) of activities;
(g) Proposed phase of activities; and
(h) Proposed Subcontractor and Trade breakdown.

(2) The following shall be depicted on the Network for each activity:

(a) The Contractor shall initialize a numeric activity number for all schedule activities. The Contractor shall submit to the Engineer for review and approval the prepared activity number structure. The activity number shall be limited to a maximum of ten (10) numbers; no letters, no spaces, no symbols;

(b) Concise description of the work represented by the activity (maximum forty-eight (48) characters). The work related to each activity shall be limited to one work trade and one floor or other building as required by the Specifications. All descriptions shall include area designations which match the key plans submitted by the Contractor;

(c) Activity duration in whole working days with a maximum duration of fifteen (15) workdays each, unless otherwise approved or directed by the Engineer, except for non-construction activities including mobilization, shop drawing and sample submittal, fabrication of materials, delivery of materials and equipment and concrete curing;

(d) Work area code for construction activities (maximum six (6) characters). All abbreviations shall be fully described in a legend attached to the Network. As requested by the Engineer, either prior or subsequent to the acceptance of the Network the Contractor shall provide, without additional cost to the Administration, a graphic illustration of the relationship of construction activities to intended work areas as identified by the Contractor on prints of the Contract Drawings;

(e) Performance responsibility by discipline code: MECH, ELEC, etc., or other acceptable abbreviations approved by the Engineer (maximum of six (6) characters). Each subcontractor shall be coded separately and each trade within each subcontract shall also be coded separately. All abbreviations shall be fully described in a legend attached to the Network;

(f) The contractor shall identify the area (location) in which the activity is to be performed; and

(g) The contractor shall identify the phase of the project in which the activity is to be performed.

(3) In developing the Network, the Contractor shall be responsible for assuring that subcontractor and supplier work at all tiers, as well as its own work, is included in the Network.

(4) The Network as developed shall show the sequence and interdependence of activities required for complete performance of the work. The Contractor shall be responsible for assuring all work sequences are logical and the Network shows a coordinated plan of the work.

(5) Proposed durations assigned to each activity shall be the Contractor's best estimate of time required to complete the activity considering the scope and resources planned for the activity.

(6) Failure by the Contractor to include any element of work required for performance of the Contract shall not excuse the Contractor from completing all work within the Contract time.

(7) Seasonal weather conditions shall be considered and included in the planning and scheduling of all work influenced by high or low ambient temperatures and/or precipitation to ensure completion of all work within the Contract time. Seasonal weather conditions shall be determined by an assessment of average historical climatic conditions based upon the preceding ten (10) year records published for the locality by the National Ocean and Atmospheric Administration (NOAA) and entitled, "Local Climatological Data". The local NOAA weather station is currently located at BWI Airport. Special Provision Section **SP-8.12**, Time Extensions for Unusually Severe Weather, is to be utilized inconjunction with this item. Time extensions granted for abnormal weather are not compensable.

(8) If the Engineer questions the Contractor's proposed activities, logic or durations, the Contractor shall, within seven (7) calendar days of receipt of the Engineer's request, provide a satisfactory revision to, or adequate justification for, these activities, logic, durations, manpower, cost, or equipment loading to the satisfaction of the Engineer.

(9) In the event that the approved schedule indicates the Contractor's plan to finish prior to the Contract completion date, the Contractor and the Administration shall execute a change order adjusting the Contract completion date to coincide with the Contractor's planned finish date at no expense to the Administration.

b. Schedule Development by Contractor (Second Submission):

(1) Within fourteen (14) calendar days after receipt of the Engineer's comments of the first detailed submission, there shall be a second submission. The second submission shall include all cost manpower and equipment loading. The format for the submission shall be the same as required in the "Detailed Network; Schedule Development by the Contractor (First Submission)."

(2) The following shall be depicted on the network for each activity:

(a) The assigned dollar value (cost-loading) and quantities of each activity of the Network, which shall cumulatively equal the Contract price. Mobilization, bond and insurance costs may be shown separately; however, other general requirement costs, overhead, profit, etc., shall be prorated through all activities. Delivery activities may be cost-loaded and shall be shown separate from the related fabrication activity. Material submittal activities shall not be cost loaded. Activity cost estimates shall be stated in at least the same level of detail as, and shall correlate with, the breakdown of the total Contract price as set forth in the General Provisions Section **GP-9.03**, Progress Payments;

(b) The manpower-loading of each activity of the network (total number of workmen, not total number of crews). In addition, the Contractor shall prepare and submit a separate manpower per day summary analysis in graphic format, depicting man days by principal trades and aggregate. The graph shall show the number of may days of effort, by month, over the duration of the Project Schedule. This manpower-loading graph shall be computer generated from the Contractor's schedule data;

(c) The assignment to applicable activities of the Network of all major construction equipment to be utilized by the Contractor and subcontractor at all tiers in prosecuting the work; and

(d) If the Contractor plans to invoice for stored materials, an activity must be included in the Network with an activity duration of zero (0) days.

c. Joint Review, Revisions, and Acceptance:

(1) The Engineer and the Contractor shall meet within the time of submission requirements schedule of the Contractor's First Submission for joint review, correction or adjustment of the proposed Network. The Engineer and the Contractor shall meet within the time of submission requirements schedule of the Contractor's second submission for joint review, correction or adjustment of the proposed Network and resource loading. Any areas which, in the opinion of the Engineer, conflict with timely completion of the Contract shall be subject to revision by the Contractor.

(2) In the event the Contractor fails to define any element of work, activity, or logic and the Engineer review does not detect this omission or error, such omission or error, when discovered by the Contractor or the Engineer, shall be corrected by the Contractor at the next monthly Schedule Update (as discussed hereinafter) and shall not affect the Contract time.

(3) As required by the time of submission requirements schedule, the Contractor shall revise the Network in accordance with agreements reached during the joint review meetings and submit computer diskettes, one (1) Diaza (reproducible) mylar sepia and four (4) color coded prints of the revised Network.

(4) Upon establishment of an agreed-upon Project Schedule, the Contractor (Authorized Representative and General Superintendent) shall sign and date on the face of the Project Schedule documents (the Network and computer- produced Schedule and Cost Report), which shall then indicate the Contractor's acceptance and approval of the Project Schedule.

(5) Acceptance by the Engineer of the Contractor's approved Project Schedule will be a condition precedent to the making of any progress payments under the Contract after the first one hundred and twenty (120) calendar days of the Contract.

(6) Upon acceptance of the Project Schedule by the Engineer, the cost-loaded values of the Project Schedule will be used as a basis for determining progress payments. Monthly progress payments shall be based upon information developed at the monthly Schedule Update. The computer-produced Cost Report will be utilized by the Engineer for verification of the Application for Payment submitted by the Contractor. Acceptance by the Engineer of the Contractor's Project Schedule does not relieve the Contractor of any responsibility whatsoever for the accuracy or feasibility of the Project Schedule, or of the Contractor's ability to meet the Contract Completion Date. Nor does such acceptance create a warranty, expressed or implied, or acknowledge or admit the reasonableness of the activities, logic, durations, manpower, cost or equipment loading of the Contractor's Project Schedule.

7. Project Schedule Updating:

a. The Project Schedule shall be updated on a monthly basis throughout the entire Contract time and until the Contract's Substantial Completion. The Contractor shall meet with the Engineer each month at the Schedule Update meeting to review actual progress made through the data date of the Schedule Update, including dates activities started and/or completed. The data date

of each Schedule Update shall be on or before the seventh (7th) day preceding the progress payment submittal deadline. Contractor-prepared estimates of the percent completion of each schedule activity and the necessary supporting data shall be submitted on or before the data date referenced above and shall include the following information:

(1) One (1) marked-up copy of the previous months Schedule Update Network indicating the progress on schedule activities and the revised (current) remaining durations. This marked-up copy shall be clearly legible and shall be accomplished by use of felt-tip markers and red ink.

(2) One (1) original and three (3) reproduced marked-up copies of the previous months Schedule Update computer-produced reports coordinated with the requirements of the above paragraphs and indicating actual activity start and/or complete dates, revised (current) remaining durations, and percent complete with regard to activity cost/progress.

(3) The Contractor shall indicate in writing those activities he/she plans to work on during the following month and current or anticipated conditions which may delay the work.

(4) Any additional written information necessary to support the above.

b. In case of disagreements at the schedule update meeting, concerning actual progress to date, the Engineer's determination shall govern.

c. Upon completion of the schedule update meeting, which shall occur on or before the seventh (7th) day preceding the progress payment submittal deadline, the Contractor shall revise the Project Schedule to reflect progress as of the data date of the Schedule Update and any required revisions to the Project Schedule, and carry out a computer-produced calculation to determine the status of the Project Schedule. The Contractor shall process the schedule within three (3) calendar days and forward the update and pay request to the Engineer. The Engineer shall review the update upon receipt, and shall process the monthly request for payment based upon the accepted update.

d. Each Project Schedule Update, based upon the Contractor's input as discussed above, will be forwarded to the Engineer and will include three (3) copies of the following information:

(1) A list of all activities completed during the preceding month;

(2) A list of all activities started but not completed during the preceding month, including percent complete;

(3) A list of any revisions to the schedule logic, initial activity durations, or activity costs;

(4) Computer Diskettes (2 copies);

(5) The following computer produced reports:

(a) Total Float Report by Area;
(b) Detailed Cost Report by Contractor and all Subcontractors;
(c) Summary Cost Report by Contractor and all Subcontractors;
(d) Detailed Labor Report by Contractor and all Subcontractors;
(e) Summary Labor Report by Contractor and all Subcontractors;
(f) Detailed Equipment Report by Contractor and all Subcontractors;
(g) Summary Equipment Report by Contractor and all Subcontractors;
(h) 60-Day Look-Ahead Bar Chart by Area (Early and Late Bars);
(i) Summary Bar Chart by Area;
(j) Detailed Bar Chart by Area (Early and Late Bars); and
(k) Early Start Sort of all Activities by Area.

(6) The Total Float and Early Start computer-produced Schedule Reports listed above shall include, for each activity depicted on the Network, the following information:

(a) Activity Number(s);
(b) Activity Description;
(c) Original Duration;
(d) Remaining Duration;
(e) Activity Responsibility Code;
(f) Activity Early Start Date;
(g) Activity Early Finish Date;
(h) Activity Late Start Date;
(i) Activity Late Finish Date;
(j) Total Float;
(k) Percent Complete;
(l) Actual Start Date; and
(m) Actual Finish Date.

e. If the Engineer does not record any exceptions to the published Project Schedule Update within seven (7) calendar days of its receipt, the Engineer will be deemed to have accepted the schedule.

f. The monthly updating of the Project Schedule shall be an integral part and basic element of the estimate upon which progress payments will be made. If, in the judgement of the Engineer, the Contractor fails or refuses to provide information required to accomplish a complete Project Schedule Update or revision as specified hereafter, the Contractor shall be deemed to have not provided the required estimate upon which progress payments may be made, and shall not be entitled to progress payments until it has furnished the information necessary for a complete Schedule Update to the satisfaction of the Engineer.

8. Project Schedule Revisions:

a. Updating the Project Schedule to reflect actual progress made up to the date of a Schedule Update shall not be considered revisions to the Project Schedule.

b. If, as a result of the monthly Schedule Update, it appears the Project Schedule no longer represents the actual prosecution and the progress of the work, the Engineer will request, and the Contractor shall submit, a revision to the Project Schedule. The Contractor shall not artificially improve its progress by revising schedule logic restraints or shortening planned activity durations. The Contractor may improve its progress by performing sequential activities concurrently or by performing activities more quickly than planned, but such improvements shall not be recorded on the schedule until they have actually been achieved by the Contractor. Additionally, the Contractor shall not artificially worsen or exacerbate delays caused by the Administration by revising schedule logic restraints or lengthening planned activity durations. It is understood and agreed that if the Contractor falls behind in meeting the schedule, as presented in the currently monthly schedule update, the Contractor has extended the critical path for achieving project completion and affected the schedule float time available for use by the Administration.

c. The Contractor may also request revisions to the Project Schedule in the event the Contractor's planning for the work is revised. If the Contractor desires to make changes in the Project Schedule to reflect revisions in its method of operating and scheduling of the work, the Contractor shall notify the Engineer in writing, stating the reason for the proposed revisions. Accepted revisions will be incorporated into the Project Schedule at the next monthly Schedule Update.

d. If revision to the Project Schedule is contemplated, the Contractor or the Engineer shall so advise the other in writing at least seven (7) calendar days prior to the next Schedule Update meeting, describing the revision and setting forth the reasons thereof.

e. Revisions directed by the Engineer to the Project Schedule will not be incorporated into the Project Schedule without written notice to the Contractor, who shall respond in writing within seven (7) calendar days, either agreeing with the Engineer's proposed revision, or setting forth justification why it should not be accomplished. If the Contractor's justification for not accomplishing the revision is accepted, such revision will not be incorporated into the Project Schedule. The Contractor's failure to respond in writing within seven (7) calendar days will be deemed to be an acceptance of the Engineer-directed revisions, and such revisions shall be incorporated into the Project Schedule.

f. Requests for revisions of activity manpower, activity costs, or redistribution of activity costs shall be made in accordance with the requirements of the "Project Schedule Updating" section of the specifications.

9. Time Impact Analysis for Proposed Change Orders and Delays.

a. When change orders are indicated, delays are experienced, or the Contractor, in accordance with the "Project Schedule Updating" section of these specifications, desires to revise the Project Schedule, the Contractor shall submit to the Engineer a written Time Impact Analysis illustrating the influence of each change order or delay on the Contract time. Each Time Impact Analysis shall include a Fragmentary Network (Network analysis) demonstrating how the Contractor proposes to incorporate the change order or delay into the Project Schedule. The Time Impact Analysis shall demonstrate the time impact based on the date the change order is given to the Contractor or the date the delay occurred; the status of construction at that point

in time; and the event time computation of all affected activities. The event times used in the Time Impact Analysis shall be then included in the latest Project Schedule Update or as adjusted by mutual agreement.

b. Activity delays shall not automatically mean that an extension of the Contract time is warranted or due the Contractor. It is possible that a change order or delay will not affect existing critical activities or cause non-critical activities to become critical. A change order or delay may result in only absorbing a part of the available total float that may exist within an activity chain of the Network, thereby not causing any effect on the Contract time.

c. Float is not for the exclusive use or benefit of either the Administration or the Contractor. Extension of the Contract time will be granted only to the extent the equitable time adjustments to the activity or activities affected by the change order or delay exceeds the total (positive or zero) float of a critical activity (or path) and extends the Contract time set forth in the General Provisions Section **GP-8.03**, Prosecution of the Work, and Section **GP-8.09**, Liquidated Damages.

d. Four (4) copies of each Time Impact Analysis shall be submitted in accordance with the following:

(1) Along with the proposal for any requested change;

(2) Within seven (7) calendar days after receipt of a written change order under General Provisions Section **GP-4.06**, Changes, and Special Provisions Section **SP-8.06**, Changes.

(3) Within seven (7) calendar days after the furnishing of a written notice by the Engineer as set forth under the General Provisions Section **GP-4.06**, Changes, and Special Provisions Section **SP-8.06**, Changes.

(4) Within seven (7) calendar days from the beginning of a delay from unforeseeable causes as set forth in General Provisions Section **GP-8.08**, Termination for Default - Damages for Delay - Time Extensions, provided that the Contractor complies with the General Provisions Section **GP-4.06**, Changes, and Special Provisions Section **SP-8.06**, Changes.

e. In cases where the Contractor does not submit a Time Impact Analysis within the time requirements stated above, it is mutually agreed that the particular change order or delay does not require an extension of the Contract time.

f. Approval or rejection of each Time Impact Analysis by the Engineer shall be made after receipt of each Time Impact Analysis, unless subsequent meetings and negotiations are necessary. Upon approval, a copy of the Time Impact Analysis signed by the Engineer shall be returned to the Contractor, and incorporated into the Project Schedule at the next monthly Schedule Update.

g. Time Impact Analysis related to an extension of the Contract time and/or change order work shall be incorporated into and attached to the applicable change order.

10. Responsibility for Completion:

a. The Contractor shall furnish sufficient forces, offices, facilities and equipment, and shall work such hours including night shift and overtime operations, as necessary to ensure the prosecution of the work in accordance with the current monthly Project Schedule Update. If the Contractor falls behind in meeting the Project Schedule as noted by negative float in the current monthly Project Schedule Update, the Contractor shall take such steps as may be necessary to improve its progress without additional cost to the Administration. The provision of this paragraph shall not be construed as prohibiting the Contractor from increasing the hours of work, the number of shifts, overtime operations and/or the amount of construction plant and equipment or working on Saturdays, Sundays and holidays, provided the Contractor gives reasonable notice to the Engineer as required under Special Provisions Section **SP-7.03**, Night Work, and Section **SP-7.04**, Saturday, Sunday, and Holiday Work.

b. Failure of the Contractor to comply with the requirements of this paragraph shall be a basis for determination by the Engineer that the Contractor is not prosecuting the work with such diligence as will ensure completion within the Contract time. Upon such determination, the Engineer may terminate the Contractor's right to proceed with the work or any separable part thereof, in accordance with the General Provisions Section **GP-8.08**, Termination for Default, Damages for Delay - Time Extensions, or may take such other actions as may be deemed appropriate.

11. Performance Monitoring:

a. The Engineer may elect throughout or at any time during the Contract to record the number of workers and construction equipment working on each schedule activity in each area of the Contract and give a copy of this log to the Contractor who shall be responsible for advising the Engineer, without additional cost to the Administration, of any error in this work history, in writing, within seven (7) calendar days of receipt of same. This information will be used by the Engineer in its evaluation of the adequacy of the Contractor's performance and on-site manpower staffing, as well as in the evaluation of any Contractor claims.

b. Each Monday morning (or following day if a holiday) the Contractor shall submit to the Engineer, on portions of the current computer- produced Schedule Reports, a Status Report of any progress which has occurred in any schedule activity, including:

(1) Percent Complete; and

(2) Actual Start/Finish Dates.

c. This Status Report shall also include a check mark indicating which activities the Contractor plans to start, or to continue during that week. This Status Report shall serve as a basis for discussion at the project progress meetings. These actual start and finish dates and percentages of completion estimates will be used by the Engineer to record actual progress and evaluate the monthly Project Schedule Update.

B. **Products (Scheduling Software):**

1. The scheduling software used by the Contractor shall be capable of importing/exporting data to/from Primavera Project Planner (P-3), latest version. The proposed software shall be capable of transferring the information without degradation in the data, including but not limited to, scheduling logic and sequencing, activities, durations, cost loading, etc. The storage media shall be 3.5" double sided, high density (1.44MB) floppy disks, DOS, or Windows compatible.

2. The proposed software shall meet the following minimum criteria.

   a. Scheduling:

      (1) Provide daily scheduling units;
      (2) Provide thirty (30) independent scheduling calendars;
      (3) Sort information with a minimum of twenty eight (28) criteria selections;
      (4) User defined statusing;
      (5) F-S, S-S, F-F, and S-F relationships with positive/negative lags;
      (6) Unlimited projects and target schedules;
      (7) Dependent or independent sub-project schedule;
      (8) Provide intelligent alphanumeric activity identifiers - 4 fields;
      (9) Provide Activity coding: 64 characters in 20 fields;
      (10) Data and and duration constraints;
      (11) Provide ability to Summarize Master networks;
      (12) Provide Milestones and flags for constraints;
      (13) Provide contiguous and interruptible activity scheduling;
      (14) Provide suspend and resume dates;
      (15) Provide resource driven durations; and
      (16) Provide Activity and procurement matrix reports.

   b. Resource Management:

      (1) Unlimited resources per activity and per project;
      (2) Provide variable resource usage;
      (3) Prioritized forward and backward leveling and smoothing;
      (4) Provide hierarchial resource codes;
      (5) Provide resource lags and durations;
      (6) Fixed crew size or available staffing resource allocation;
      (7) Provide resource loading bar charts;
      (8) Provide nonlinear resource profiles;
      (9) Provide productivity reporting;
      (10) Provide internal means for time sheet data entry; and
      (11) Provide resource matrix report.

   c. Cost Control:

      (1) Autocost: user-definable progress calculations;
      (2) Variable unit prices over time;
      (3) 12 character account code including cost type;

(4) Wild-card selection and roll-up;
(5) Summarize costs at any level;
(6) Performance-adjusted cost-to complete calculation;
(7) Unit pricing/costing analysis;
(8) Cash flow project with payment lag;
(9) Earned value analysis; and
(10) Actual-this-period calculations.

d. Management Graphics:

(1) Gantt charts (bar charts);
(2) Time-scaled logic diagrams;
(3) Pure logic plots;
(4) Portrait or landscape orientation;
(5) On-screen drawing tools to create lines, boxes, symbols and logo, and add to text;
(6) Early, late and target dates;
(7) Progress and critical activities highlighting;
(8) Horizontal banding (user-defined sequence);
(9) Summary bars;
(10) Discrete activities within summary bars;
(11) Resource supply and demand curves;
(12) Comparative resource application charts;
(13) Cash flow curves;
(14) Resource requirement graphics;
(15) Cash flow and bar chart combination;
(16) Import HPGL files from graphics packages;
(17) Point size control of lettering; and
(18) Bar sizing and spacing.

e. Graphic User interface Features:

(1) Create, modify, arrange, personalize networks on screen;
(2) Create, store, recall fragnets;
(3) Choice of shape and color for activity;
(4) Click on activities to define relationships and to edit activity data;
(5) Cut, copy, and paste functions;
(6) Mark and group functions;
(7) Horizontal banding by code;
(8) Collapse and explode activity groups;
(9) 6 levels of zoom plus cosmic view; and
(10) WYSIWYG output.

f. Reporting:

(1) Provide fill-in the blank Custom report writer without a command language to operate;
(2) More than one hundred (100) standard scheduling, resource and cost reports; and
(3) Batch and series reporting.

g. Multiuser Features (for LAN environments):

(1) Read-write, read only and exclusive access;
(2) File and record-locking;
(3) Simultaneous updating, reporting, and plotting;
(4) User name and password protection;
(5) Integrated electronic mail and bulletin board; and
(6) Network administrative program (NETSET).

SP-8.04 Progress Meetings

A. The Contractor shall attend weekly progress meetings with the Engineer. The meetings shall be attended by the Contractor's key project personnel. The overall status of the Contract shall be reviewed with particular attention to planned activities with special emphasis toward planned interruptions to existing utilities or services.

B. The Contractor shall prepare for each meeting a bar chart construction schedule depicting the work accomplished the previous week and planned activities for the upcoming two week period. This schedule shall be directly related to the specified Bar Chart or Critical Path Method Construction Schedule. Any deviations from this planned schedule shall be documented in writing and immediately brought to the attention of the Engineer. All deviations from this planned schedule shall be subject to the Engineer's review and approval.

SP-8.05 Construction Quality Control Plan

A. It shall be the responsibility of the Contractor to provide and maintain a Construction Quality Control Plan (hereinafter "Plan") for all phases of the project. This requirement is in addition to any acceptance testing performed by the Engineer or his/her laboratory. Within three (3) weeks after Notice to Proceed for the Contract, the Contractor shall submit the Plan to the Engineer for approval. The Plan shall conform to the requirements of this Item. The Administration will consider an interim Plan for the first sixty (60) days of operation. The Contractor's work may be suspended or progress payments may be withheld if the Contractor fails to submit the required and satisfactory Plan as scheduled.

B. The Contractor shall maintain an effective Plan that complies with the Technical Specifications. The Plan shall encompass all actions involving selection of construction material sources and suppliers, on-site and off-site fabrication of the Contractor-furnished items to be included in the work, on-site and off-site production of construction materials, work placement procedures, workmanship, inspection, and testing. Detailed Plan requirements for certain items of Contractor-procured equipment to be installed in the finished work or off-site prefabricated materials are covered in the Technical Specifications. The Contractor shall not build upon or conceal any feature of the work containing uncorrected defects. Payment on such defective or deficient features will be withheld until they are satisfactorily corrected or other action has been taken as authorized.

C. The Contractor shall maintain a Plan to provide the necessary supervision, inspection, and testing of all items of work, including that of his/her suppliers and subcontractors, that will assure the compliance of all work with applicable specifications and drawings in respect to the Contractor-furnished equipment, materials, workmanship, construction, finish, functional performance and identification. The Contractor's Plan shall

encompass all management and finished construction work, including all inspection controls and tests required for compliance with the Technical Specifications, except for those inspections and tests specifically reserved to be accomplished by the Engineer. Results of tests conducted by the Engineer may be provided to the Contractor.

D. The Plan shall be adequate to cover all construction operations, including both on-site and off-site fabrication, and shall be keyed to the proposed construction sequence. The Engineer shall be notified at least forty eight (48) hours in advance of the preparatory and initial phases of inspection and all phases of inspection shall be made a matter of record in the Plan documentation. The Plan shall include as a minimum at least three (3) phases of inspection for all definable features of work, as follows:

1. A preparatory inspection shall be performed prior to beginning any work on any definable feature of work. It shall include a review of Contract requirements; a check to assure that all materials and/or equipment has been tested, submitted, and approved; a check to assure that provisions have been made to provide required control testing; examination of the work area to ascertain that all preliminary work has been completed; and a physical examination of materials and equipment to assure that they conform to approved shop drawings or submittal data and that all materials and/or equipment is on hand.

2. An initial inspection shall be performed as soon as a representative portion of the particular feature of work has been accomplished and shall include examination of the quality of workmanship, a review of control testing for compliance with the Contract requirements, use of defective or damaged materials, omissions, and dimensional requirements.

3. Follow-up inspections shall be performed daily to assure continuing compliance with the Contract requirements, including control testing, until completion of the particular feature of work.

E. The Contractor shall maintain current records for all inspections and tests performed throughout the life of the Contract, in a form approved by the Engineer. These records shall include, but not be limited to, factual evidence that the required inspections or tests have been performed, including type and number of inspections or tests involved, identification of operators and inspectors, results of inspections or tests, nature of defects, causes for rejection, etc., proposed remedial and corrective actions taken. These records must cover both conforming and defective or deficient features and must include a statement that all supplies and materials incorporated in the work are in full compliance with the terms of the Contract. Legible copies of these records must be furnished to the Engineer daily, or at such other intervals as directed. The records shall cover all work placement subsequent to the previously furnished records and shall be verified by the Contractor or designated representative.

F. The Contractor shall identify a qualified individual within his/her organization who shall be responsible for overall management of the Plan and shall maintain an adequate staff under his/her direction to perform, monitor, and evaluate the Contractor-performed inspection and tests required by the Technical Specifications. The individual designated to direct the program shall report to the Contractor's management at a level not lower than the Superintendent, and shall have the necessary authority to discharge his/her responsibility. **When required, the Contractor must designate at least one qualified individual who will be assigned full-time responsibilities for the administration and execution of the CQC Plan. The individual(s) shall not have any other responsibilities other than those specified in this section of the Standard Provisions.**

G. Approval of the Plan shall not relieve the Contractor of his/her responsibility to comply with the requirements of the Contract Documents. The Plan shall be revised or updated as required or as requested by the Engineer. No additional cost or time extensions will be allowed for the Contractor's resubmittal of plans. This document shall include as a minimum:

1. An organization chart showing the portion of the Contractor's corporate organization which is concerned with the on-site construction activities;

2. The Contractor's on-site organization chart including his/her quality control organization;

3. Types of personnel (work classification) to be used in the quality control organization, required qualification standards, and the planned duration of their services;

4. Authority and responsibilities of quality control personnel;

5. Operational procedures for accomplishing and reviewing work, supervision, inspections, tests, construction material production controls, fabrication controls, certifications, documentation of quality control operations, and inspections and tests, including those for subcontractors. These procedures shall include the methods to be utilized during the procurement cycle (order to delivery) for those items of materials or equipment which require source inspection, shop fabrication, and operations away from the work site;

6. Methods and procedures for selecting suppliers;

7. The Contractor's plan for the testing and certification of welders;

8. Methods and procedures for indoctrination and instruction of quality control personnel, construction supervisors, and foremen;

9. An appropriate schedule of submission of the detailed CQC Plans required by the Technical Specifications;

10. A copy of the letter of direction to the Contractor's representative andhis/her staff for quality control which defines their delegated duties and responsibilities; and

11. When the quality control functions are to be accomplished by personnel not located at the site and/or not directly under the control of the Project Manager, the on-site/off-site coordinating procedures and authorities shall be covered in detail in the specific Plan(s) involved.

H. At least thirty (30) calendar days prior to starting any specific phase of the work as identified in the various Technical Specifications, the Contractor shall submit to the Engineer for review and approval three (3) copies of a detailed Plan covering the following general items and any additional pertinent items. Such approval shall not relieve the Contractor of his/her responsibility for the compliance with the Contract requirements. Similar categories of work may be consolidated into a single plan even though they may relate to several different Technical Specifications Sections. If the majority of any one phase of the work is to be accomplished by a subcontractor, the subcontractor's Plan may form the basic document, supplemented by those actions, inspections, and reports to be accomplished or made by the Contractor's quality control staff. In addition, the Contractor's Plan Representative shall have job site discussions with the Engineer on the

interrelationship of their activities before starting each major phase of construction. These meetings shall be monthly or as otherwise required by the Engineer.

1. The specific requirements stated in the Technical Specifications;

2. Phased inspection procedures as stated in paragraph "Quality Control System";

3. Total list of all tests to be performed by the Contractor, and the respective test methods and copies of forms to be used for recording inspection results, performance, or test data;

4. Procedures and methods for documentation and submittal for factory or off-site inspections;

5. Names of laboratories or individuals designated to accomplish the various types of inspection and test work;

6. The Contractor's program for regular indoctrination, coordination, and orientation meetings to keep workmen and craftsmen apprised of peculiar requirements for the succeeding period and general findings on work placement during preceding period;

7. Specific reports to be rendered to the Engineer including the normal time required for processing information or data;

8. Documentation procedures which reference applicable specifications, Contract Drawings, and shop drawings; and

9. Pending submission and approval of CQC Plans, the Contractor shall submit written interim quality control reports as directed by the Engineer.

I. All inspections and Contractor-required tests involving the recording of equipment or system performance data, including all corrective actions taken, shall be recorded on approved forms and endorsed by the Contractor's CQC Manager. The Contractor shall also prepare a monthly report, or at such intervals as directed by the Engineer, which summarizes all quality control operations.

J. This summary report shall identify inspections made, deficiencies found, corrective action taken, preparation status of plans being developed, and status of plans requiring resubmission under this section. These inspection reports shall be completed and transmitted by the Superintendent to the Engineer.

K. All quality control records, other than those specified in the paragraphs above entitled, "Inspection Records" and "Performance Reports," shall be maintained in a central on-site location by the Contractor.

L. These records shall include all quality control sampling data; factory tests and/or manufacturer's certifications; quality control coordinating actions; records of quality control training; and routine hydrostatic, electrical continuity, grounding, welding and line cleaning tests. The quality control records will be available for examination, and the Contractor shall provide copies of specific tests and data as requested by the Engineer. The requirements to maintain quality control records, as described above, shall not be construed to relieve the Contractor from submitting samples, test data, shop drawings, material certificates, or other information required elsewhere in the Contract.

M. If the Engineer determines that the Contractor's Plan or its operation are deficient in the identification and correction of nonconforming quality of workmanship or materials, documentation, or other operational procedures, the Contractor shall correct and/or modify his/her quality control system as directed. In addition, the Contractor shall take prompt action to correct conditions which have resulted or might result in substandard or defective materials, parts, components, or services. This action shall include preventive measures as well as correction of conditions which have occurred. The Contractor shall document his/her efforts to correct existing deficiencies and to minimize their future occurrence. Reports prepared shall carry follow-up action on all deficiencies until adequate correction has been made. The Contractor shall not build upon or conceal any feature of the work containing uncorrected defects.

N. Inspection and test results and detailed examination of deficient or failed articles shall be used to determine the nature and basic causes of deficiencies or failures. The Contractor shall provide samples of the deficient or failed articles to the Engineer upon request.

O. The Contractor shall provide and maintain gauges and other measuring and testing devices necessary to assure that articles conform to the Contract requirements. These devices shall be calibrated against certified measurement standards which have known valid relationships to national standards. At established periods to assure continued accuracy. Records shall be maintained of the data resulting from calibration operations. Any equipment exceeding its required due date or tolerance and any nonconforming articles shall be suitably isolated, tagged, or otherwise marked to prevent its use without written permission of the Engineer.

P. If the Contractor's work does not conform to the requirements of the construction documents, the Engineer may issue a non-conformance report to the Contractor. The Contractor must correct all deficiencies, or otherwise respond to the report, within ten (10) calendar days of issuance of the report by the Engineer. If the work remains unresolved at the time of processing of the progress payment, the Engineer may withhold monies due to the Contractor until the deficiencies are corrected.

SP-8.06 Shop Drawings, Product Data, and Samples

A. **General.** Shop drawings shall include, but are not limited to, drawings, diagrams, illustrations, schedules, performance charts, brochures and other data prepared by the Contractor, subcontractor, manufacturer, supplier, or distributor which illustrates how specific portions of the work shall be fabricated and/or installed. The Contract performance period outlined in the Contract Documents includes time for the review and approval of the Contractor's shop drawings. The Engineer's review of shop drawings, samples and requested substitutions shall be as follows:

1. Specified product submittal: twenty-one (21) calendar days

2. Submittal of products required by performance specifications and other named manufacturers: twenty-one (21) calendar days

3. Requested substitutions: forty-five (45) calendar days

4. Review time will begin and end with dates received and returned from the representative of the Administration.

B. **Submittal Register**:

1. The Contractor shall complete and submit two copies of "Submittal Register Form" listing each and every item of equipment, material, certification, samples, etc. for which approvals are required by the specifications no later than seven (7) days after Notice to Proceed has been issued. The Engineer may request submittals in addition to those listed when deemed necessary.

2. For select contracts, completed "Submittal Register Form" will be included in the Technical Provisions listing major submittal items. This Register shall not be construed to include a comprehensive listing of all documents to be submitted by the Contractor for approval. The Contractor must review and complete the Register listing all the required submittals and necessary details. The completed Submittal Register shall be submitted to the Engineer no later than seven (7) days after Notice to Proceed has been issued.

3. The approved Submittal Register will become a scheduling document and will be used to control submittals throughout the life of the Contract. The Submittal Register and the Project Schedule shall be coordinated by inserting the Register Schedule into the Project Schedule to form one complete scheduling document. Submittals covering component items forming a system or items that are interrelated shall be scheduled to be coordinated and submitted concurrently. Certifications to be submitted with the pertinent drawings shall be so scheduled. Adequate time shall be allowed on the register for review and approval. Approved Submittal Register shall not be construed as relieving the Contractor from submitting every and all submittals required by the Specifications and/or the Engineer.

4. A sample "Submittal Register Form" is included under Special Provisions, Section 10, **SP-10.04**, and in the Technical Provisions.

C. **Submission Requirements**. Within seven (7) days after the Notice to Proceed, the Contractor shall submit for review and approval a preliminary schedule of Shop Drawing submittal. After review and verifying all field measurements, the Contractor shall submit to the Engineer for approval in accordance with this schedule, the required shop drawings checked and stamped with the Contractor's approval stamp. The stamp should include the name of the project, drawing number, specification section number, and specific article the Drawing references. All submittal should be transmitted far enough in advance of the scheduled dates of installation to provide adequate time for reviews and approval, for possible revision and resubmittal, and for placing orders and securing delivery.

D. **Submissions**:

1. Samples, drawings, specifications, catalogs, etc., submitted for approval shall be properly labeled indicating specific service for which materials or equipment are to be used including, section and article numbers of the Specifications governing, Contractor's name, and title of the Contract. Catalogs, pamphlets or other documents submitted to describe items on which approval is being requested shall be specific and identification in catalogs, pamphlets, etc., of the item submitted shall be clearly made in ink. Data of a general nature will not be accepted. Six (6) samples are required on finish color submissions.

2. Any costs incurred by the Contractor or the Administration due to the resubmittal of documents caused by inaccuracy, lack of coordination, and/or checking shall be the responsibility of the

Contractor. Each variation from the Contract Specifications and Drawings shall be noted on the submittal. The Contractor shall also state the reason for such variations. If these requirements are not met, the submittal may be returned for corrective action.

3. The Contractor shall carefully control his/her procurement operations to ensure that each individual submittal is made on or before the Contractor scheduled submittal date shown on the approved Submittal Register.

E. **Submittal Classification**:

1. Administration Approved: Administration approval is required for extensions of design, critical materials, deviations, equipment whose compatibility with the entire system must be checked, and other items as designated by the Engineer. Within the terms of this Contract, they are considered to be "shop drawings".

2. Information only: All submittals not requiring Administration approval will be for information only. They are not considered to be shop drawings as outlined in 1. above.

F. **Schedule of Submission**. The Contractor shall submit for approval two (2) sepia reproducible and two (2) ozalid prints of shop drawings as called for in the Specifications or necessary for the work. If any contradiction exists between this requirement and the particular Specification, this requirement shall supersede. Send Shop Drawings to the organization designated by the Administration at the pre-construction meeting.

G. **Certificates of Compliance**. Any certificates required for demonstrating proof of compliance of materials with specification requirements shall be executed in four (4) copies. Each certificate shall be signed by an official authorized to certify in behalf of the manufacturing company. The certificate shall contain the name and address of the Contractor, the project name and location, the quantity and date or dates of shipment or delivery to which the certificate applies. Copies of laboratory test reports submitted with certificates shall contain the name and address of the testing laboratory and the date or dates of the tests to which the report applies. Certification shall not be construed as relieving the Contractor from furnishing satisfactory material that meet the requirements of the specification.

H. **Templates/Patterns**. The Contractor shall furnish all necessary templates, patterns, etc., for installing work, and for the purpose of making the general arrangement of the systems. All work included in the Drawings and details shall be consulted in connection with mechanical and electrical installations. Where the exact location of fixtures and equipment are not specifically located, the Contractor shall obtain this information in the field or from the Engineer.

I. **Process of Approval**. The Engineer, on receiving sepia reproducible, will promptly approve them or indicate desired corrections, and return one (1) sepia of each drawing to the Contractor. The Contractor shall make all corrections and resubmit drawings which are not approved in accordance with requirements for first submission. If the Contractor considers any correction indicated on the submittals to constitute a change to the Contract, notice as required under **GP-4.06**, Changes, shall be given promptly to the Engineer.

J. **Withholding of Payment**. Payment for materials incorporated in the work will not be made if required approval has not been obtained.

K. **Interpretation**. Approval by the Engineer shall not be construed as a complete check but will indicate only that the general method of construction and detailing is satisfactory. Approval of drawings shall not be considered as a guarantee of measurements of building conditions. Where drawings are approved, said approval does not mean the drawings have been checked in detail; said approval does not in any way relieve the Contractor from his/her responsibility or necessity for furnishing material or performing work as required by the Contract Drawings and Specifications.

L. **Use**. Use of shop drawings in fabrication or erection will not be permitted until approved, stamped, and dated by the Engineer. All shop drawings will be numbered consecutively by the Engineer when approved. Before submission for approval, drawings and schedules shall be fully checked by the Contractor for materials, sizes, dimensions, details, and shall bear evidence of the Contractor's verification and approval. All drawings shall be on same size sheets.

M. **Distribution**. After approval of the shop drawings, the Contractor shall furnish prints to other Contractors furnishing work which will or may be affected by his/her work.

N. **Work Prosecution**. The Contractor shall follow drawings in laying out work and check drawings of the various trades to verify spaces in which work will be installed. Maximum headroom and space conditions should be maintained, and where they appear inadequate, the Engineer shall be notified before proceeding with installations.

O. **Construction Drawings**. If directed by the Engineer, the Contractor shall, without extra charge, make reasonable modifications in layout as needed to prevent conflict with work of other trades or for proper execution of the work. Detailed drawings of proposed departures due to actual field conditions or other causes shall be submitted to the Engineer for approval and any such changes shall be made without additional cost to the Owner.

P. **Additional Materials and/or Equipment**. Because of the small scale of the drawings, it is not possible to indicate all offsets, fittings, and accessories which may be required. The Contractor shall carefully investigate the structural and finish conditions affecting his/her work and shall arrange such work accordingly, furnishing such fittings, valves, transitions, pull or junction boxes, and accessories as may be required to meet such conditions at no additional cost to the Owner.

Q. **Variances**. Where variances occur between the Contract Drawings and Specifications or within either document itself, the item or arrangement of better quality, greater quality, or higher cost shall be included in the Contract Price. The Engineer will decide on the item and manner in which the work shall be installed.

R. **Time Extensions**. Failure by the Contractor to submit revised Shop Drawings in ample time for further review shall not entitle him to an extension of Contract time, and no claim for extension by reason of such default will be allowed.

S. **Quality Control:**

1. Source limitations. To the greatest extent possible for each unit of work, and subject to the restrictions of the Buy American Act, provide products, materials, or equipment of a singular generic kind from a single source.

2. Compatibility of Options. Where more than one choice is available as options for the Contractor's selection of a product or material, select an option that is compatible with other products and materials already selected. Total compatibility among options is not assured by limitations within the Contract Documents, but must be provided by the Contractor. Compatibility is a basic general requirement of product/material selections.

T. **Product Delivery/Storage/Handling.** Deliver, handle, and store products in accordance with manufacturer's recommendations and by methods and means that will prevent damage, deterioration, and loss, including theft, and protect against damage from climatic conditions. Control delivery schedules to minimize long-term storage of products at the site and over crowding of construction spaces and staging area. In particular, provide delivery/installation coordination to ensure minimum holding or storage times for products recognized to be flammable, hazardous, easily damages, or sensitive to deterioration, theft, and other sources of loss. Damaged or defective items, in the opinion of the Engineer, shall be replaced at no cost to the Administration.

U. **Products:**

1. General Product Compliance:

a. General. The compliance requirements for individual products, as indicated in the Contract Documents, are multiple in nature and may include generic, descriptive, performance, prescriptive, compliance with standards, conformance with graphic details, and other similar forms and methods of indicating requirements, all of which must be complied with.

b. Procedures for Selecting Products. The Contractor's options for selecting products are limited by Contract Document requirements and governing regulations, and are not controlled by industry traditions or procedures experienced by the Contractor on previous construction projects. Required procedures include, but are not necessarily limited to, the following for various indicated methods of specifying:

(1) Standards, Codes and Regulations. Where only compliance with an imposed standard, code, or regulation is required, selection from among complying products is the Contractor's option.

(2) Performance Requirements. Provide products that comply with specific performances indicated, and that are recommended by the Manufacturer (in published product literature) for the applications indicated. Overall performance of a product is implied where the product is specified with only certain specific performance requirements.

(3) Products Specified as Acceptable: Any products complying with the Specifications can be proposed whether listed specifically or not on the listing of acceptable products or manufacturers. Acceptable product items are listed for the convenience of the Contractor, but are not to be considered an all-inclusive list.

(4) Visual Matching. Where matching with an established sample is required, the Engineer will render the final judgement of whether a product proposed by the Contractor matches a sample satisfactorily.

(5) Visual Selection. Except as otherwise indicated, where specified product requirements include "... as selected from the Manufacturer's standard colors, patterns, textures..." or words of similar effect, the selection of manufacturer and basic product (complying with requirements) is the Contractor's option, and subsequent selection of color, pattern, and texture is the Engineer's selection. A phrase such as "...as selected from the Manufacturer's full color line..." means selection of standard or optional colors regularly produced by the selected manufacturer.

c. General Requirements for Electrical Work: The following applies to electrical work unless otherwise specified:

(1) Comply with the National Electrical Code.

(2) Conduits, Wiring and Equipment. Arrange generally as indicated. Any change resulting in a savings in labor or materials shall be made only in accordance with a contract change order. Deviations are permitted only where necessary to avoid interferences and only after drawings showing the proposed deviations have been submitted to and approved by the Engineer.

(3) Ratings. The motor horsepower and apparatus wattage ratings shown or specified are estimated values, and the corresponding sizes of feeders and other electrical equipment indicated to serve them are minimum sizes. Motors of greater horsepower and apparatus with larger wattage ratings may be furnished if necessary to meet the requirements of the various sections of the Specifications in which they are specified. Where larger motors or apparatus with larger wattage ratings are furnished, increase the capacity of the feeders and other electrical equipment serving them to correspond, at no additional cost to the Administration, in each case in which the Engineer determines that apparatus meeting the Specification requirements and requiring a horsepower or wattage not exceeding that listed is available from two or more sources.

2. General Product Requirements:

a. General. All equipment, material, and articles incorporated into the work covered by this Contract shall be new and of the most suitable grade for the purpose intended, unless otherwise specifically provided in the Contract. References in the specifications to equipment, material, articles, or patented processes by trade name, make, or catalog number, shall be regarded as establishing a standard of quality and shall not be construed as limiting competition. The Contractor may, at its option, use any equipment, material, article, or process that, in the judgement of the Engineer, is equal to that named in the Specifications, unless otherwise specifically provided in the Contract. Provide products that are undamaged and unused at the time of installation, and that are complete with accessories, trim, finish, safety guards, and other devices and details needed for a complete installation and is suitable for the intended use and effect.

b. Standard Products. Products shall be essentially the standard catalogued products of manufacturers regularly engaged in production of such products and shall be the

manufacturers' latest standard design that complies with the Specification requirements. Equipment shall essentially duplicate items that have been in satisfactory commercial and industrial use at least two (2) years, or more if otherwise specified, prior to bid opening; or, in lieu thereof, shall have been used and operated in a test installation that, in the opinion of the Engineer, duplicates its field performance for the same period of time. The Engineer reserves the right to require the Contractor to submit evidence of this effect for approval. When two units of that same class of equipment are required, these units shall be the product of a single manufacturer; however, the component parts of the system may not require to be the products of the same manufacturer.

c. Continued Availability. Products that, by nature of their application, are likely to be needed at a later date for maintenance and repair or replacement work shall be current models for which replacement parts are available.

V. **Working Drawings for Falsework Systems.** Falsework systems plans (design and construction) shall be the responsibility of the Contractor, includingsubmitting and obtaining written acceptance of the design and plans by the Engineer before erection.

1. The Contractor shall utilize a Professional Engineer (PE) registered in the State of Maryland who has a minimum of five years experience in falsework design. The falsework design calculation and plans shall be signed by the PE and bear the seal of the PE. The submittal of the design and falsework plans shall include the PE's resume showing evidence of the required experience.

2. The Contractor's plans and design calculations shall evaluate and qualify all products and components including manufactured products and proprietary items for their intended service. Acceptance by the Engineer of falsework systems shall not in any way relieve the Contractor of the responsibility for the safety and adequacy of the design and construction for the falsework systems and operations, including all components.

3. Every structure in the Contract will require a separate falsework design analysis, separate plans and design submittals as set forth above. This applies even though structures may appear to be identical.

4. Each falsework system shall be designed to have the capacity to support all vertical and horizontal loading with enough redundancy to prevent progressive failure. Vertical loading, differential settlement forces, live load where applicable, and all horizontal lateral and longitudinal forces shall be taken into account. Unbalanced temporary loading caused by placement sequence shall also be provided for in the design. Adequate diagonal bracing in all planes shall be employed.

5. All falsework systems designs and plans shall provide for adequate foundations with bearings below the frost line or on rock or on piling and for possible settlement. If additional subsurface data is necessary, it shall be obtained and analyzed for proper design of the plans and performance of construction.

6. Falsework designs and plans shall include protection against impact from uncontrolled highway vehicles, accidental collision of a crane boom, or other construction equipment and vehicles, traffic vibration, flood waters, high winds, and any other envisioned contingent situations.

SP-9.01 Payroll Records

(Amended February 9, 1998 by the Board of Public Works)

A. Include for each apprentice, proof that the apprentice is in an apprenticeship program:

(a) Registered with the Maryland Apprenticeship and Training Council of the Department of Labor, Licensing, and Regulation; and

(b) Approved by the Bureau of Apprenticeship and Training of the U.S. Department of Labor.

SP-9.03 Payment

When the Contractor requests payment allowance for materials in accordance with **GP-9.01**, Payment, Paragraph 3, the following terms and conditions will apply:

A. For permanent materials delivered to the project site, or stored in an approved location off-site, an allowance of one hundred percent (100%) of the material cost plus freight charges as invoiced may be made. The allowance will be based upon validated invoices or bills for such materials, including freight charges, and a copy thereof shall be made a part of the documented records for the project. All permanent materials approved for payment will have been tested by the Administration for compliance with the requirements of the Contract Documents. Payment will only be made for permanent materials which conform to the requirements of the Contract Documents.

B. No allowance will be made for fuels, form lumber, falsework, temporary structures or other materials of any kind which will not become an integral part of the finished construction.

C. All permanent materials for which an allowance is requested shall be stored in an approved manner where damage is not likely to occur. If any of the stored materials are lost or become damaged in any manner, the Contractor shall be responsible for repairing or replacement of such damaged materials. The value of the lost or damaged permanent material will be deducted from the Contractor's subsequent progress payments until replacement has been accomplished.

D. Permanent material for which payment has been made, either wholly or partially, shall not be removed from the approved location until such time that it is incorporated into the work, unless authorized by the Engineer.

E. The following must accompany the written request for payment of stored materials:

1. Consent of the Surety specifying the material type and the bid items in which the material is to be used.

2. Validated invoices showing that payment for the material has been made.

3. A notarized statement from the Contractor attesting that the invoices, as submitted do not include charges and/or fees for placing, handling, erecting or any other charges and/or markups other than the actual material cost, sales tax(es) if applicable, and freight charges.

4. Bill of lading showing delivery of the material.

5. Inspection test reports, certifications required by the Contract Documents and approved by the Engineer.

6. Nothing in these specifications shall be interpreted as requiring the Administration to pay for stored materials. The Administration shall decide on a case-by-case basis whether stored materials shall be paid for. Some factors the Administration will consider are: the Contractor's ability to meet the project schedule and milestones, the effectiveness of the Contractor's Quality Control Plan, the number of unilateral extra work orders the Administration issues, how record drawings are being kept up, the status of material submittals, the effectiveness of the Contractor's safety, erosion and sediment control programs and the on-going cleanliness of the project site. No payment will be made for stored materials which have not been submitted and accepted.

7. If the permanent material is stored outside of the general vicinity of the airport, the Contractor must pay for the Administration's representative's transportation and lodging to the see the permanent materials.

SP-9.07 Prompt Payment to Subcontractors

A. The Prime Contractor is responsible for making timely payments to all subcontractors and suppliers as required in **the 1988 edition of the State Finance and Procurement Article of the Annotated Code of Maryland, Section 17-106.**

B. The Administration has established the following time frame for subcontractor payment.

1. Once the monthly progress estimate is processed and payment is received by the Prime Contractor, payment is to be made to all subcontractors within ten (10) calendar days.

2. Each month, the Engineer will review the current pay items with the Prime Contractor and all involved subcontractors to ensure that all work satisfactorily completed within specifications is included in the monthly progress payment. For payment purposes, the same quantity totals used to compute the payment to the Prime Contractor will be the basis for payment to the subcontractor.

3. If the subcontractor does not receive payment within the required ten (10) days, the subcontractor shall notify the Engineer in writing of the amount in dispute including item numbers, if appropriate, and payment quantity for each. The Engineer will then notify the Director of Engineering of the dispute. The Director of Engineering or his representative will verbally contact the Prime Contractor within forty eight (48) hours to ascertain whether or not a performance dispute exists which necessitates non-payment to the subcontractor.

4. If a performance dispute exists, the Prime Contractor must demonstrate that there exists a valid basis to withhold payment from the subcontractor.

5. If the Prime Contractor withholds payment from a subcontractor, the Prime Contractor shall provide the subcontractor written notice of the withholding of payment. The notice shall detail the reasons for withholding payment as well as the amount. A copy of the notice shall be provided to the Surety and the Administration.

If no valid dispute exists, the Prime Contractor will be asked to make immediate payment to the subcontractor. The subcontractor will be responsible for notifying the Administration's Director of Engineering if this payment is not made. Upon receipt of notification, the Director of Engineering will schedule a meeting to verify and discuss the non-payment issue. This meeting will be held at the Maryland Aviation Administration, Office of Planning and Engineering within forty eight (48) hours (2 working days of the Administration's contact with the subcontractor).

Invited to this meeting will be the Prime Contractor, the subcontractor, the Director of Engineering, and the Engineer. The purpose of this meeting will be to establish why payment was not made to the subcontractor in the required ten (10) days. If it is determined that the Prime Contractor is delinquent in payment to the subcontractor, further progress payments to the Prime Contractor may be withheld until the subcontractor is paid.

6. If the next monthly estimate becomes due and payment to the subcontractor has not been corrected by the Prime Contractor, the monthly estimate will **NOT** be processed and another meeting will be held at the Maryland Aviation Administration, Office of Planning and Engineering to correct the problem. Should the results of this second meeting reveal that payment to the subcontractor continues to be delinquent, the Director of Engineering may order a suspension of work based upon the failure of the Contractor to carry out the provisions of the Contract or he may allow work to continue and withhold future estimate payments as state above.

C. If this issue cannot be resolved and work is suspended, the Contractor may appeal the decision of the Director of Engineering to the Procurement Officer in accordance with **GP-5.15**, Disputes. The Procurement Officer will render a final decision on this issue in accordance with **GP-5.15**.

D. It is the responsibility of the Prime Contractor to notify the Engineer when payment has been made. The Engineer will verify the payment with the subcontractor to ensure payment was received.

E. Any administrative costs incurred by the Administration shall be deducted from the Prime Contractor's retainage at the conclusion of the project.

F. Nothing in this special provision will prevent the subcontractor from pursuing a claim with the Surety under the Prime Contractor's payment bond at any time.

SP-9.05 Force Account Work

In addition to **GP-9.02**, Force Account Work (Paragraph 3), the following requirements shall apply:

A. The Contractor shall receive the current rental rates recommended in the Rental Rate Blue Book for Construction Equipment for the use of any machinery or special equipment authorized by the Engineer. The rental rates must be agreed upon in writing before work is begun, except in the those cases where the Engineer finds that an emergency exists. Payment will be made for the actual number of hours the equipment is at the work site. The maximum number of hours allowed for each working day will be eight (8) or the actual number of hours in operation, whichever is greater. Weekly rates will be used on the force account project if the total time exceeds three (3) days. Monthly rates will be used for all equipment used on the force account project if the total time exceeds three (3) weeks.

B. Approved transportation charges will be paid from and to the nearest source if the equipment is brought to the project specifically for use on the force account work and is not used on any other work.

C. The rental rate will consist of the sum of the rate for the basic piece of equipment, the rates for attachments (where applicable), and the estimated hourly operating cost.

D. The above component parts of the rate are to be obtained from the Rental Rate Blue Book when listed in that book. If a piece of equipment is not listedin the Rental Rate Blue Book, then the rate will be the prevailing rate being paid in the area where the force account work is being performed.

E. When the equipment is used in excess of eight (8) hours per day, or forty (40) hours per week, the excess time will be considered as overtime. The rental rates for this overtime will be the sum of fifty percent (50%) of the rate for the basic piece of equipment, fifty percent (50%) of the rates for attachments where applicable and one hundred percent (100%) of the estimated hourly operating costs above.

F. Whenever equipment is ordered by the Engineer to be held on the project on a standby basis, or when the Administration is obligated for other reasons to pay for idle equipment, the rate will be seventy five percent (75%) of the rental rate with no allowance for operating costs. Standby or idle time cannot exceed eight (8) hours per day and will not be allowed for Saturday, Sunday, or holidays. Non-operating time for equipment required for force account work is not considered standby or idle time if the equipment is operated and used at least once during each working day.

G. Regional Rate Modifications and Life Expectancy Adjustments will not be allowed.

SP-9.06 Progress Payments

In addition to **GP-9.03**, Progress Payments, the following information and documentation is required to be included in any proper invoice for payment.

A. Original construction schedule, look-ahead construction schedule, updated construction progress schedule, recovery construction schedule, whichever are appropriate.

B. Certified payroll records for the General Contractor and all subcontractors working on the Contract.

C. Certification that the as-built drawings have been updated and jointly reviewed by the Engineer and the Contractor's representative for the month that payment is requested.

D. Copies of invoices and all documentation necessary for payment with regards to materials stored which have not been incorporated into the work, but for which payment is requested.

E. Copies of completed Monthly Minority Subcontractor Utilization Forms.

F. Certification of payment from the subcontractors as required by **GP-9.01**, Scope of Payment.

G. Copy of all the Contractor's Quality Control Reports for the period being invoiced.

H. Contractor Quality Control Plan submitted by the Contractor and approved by the Engineer.

I. Contractor Safety Plan and/or reports submitted by the Contractor and approved by the Engineer.

The Contractor is responsible to submit with its invoice, additional information or documentation which may be required elsewhere in this Contract. If the Contractor does not submit the required information, processing of the progress payment may be withheld by the Engineer, or the Administration.

PART III CONTRACTOR AFFIRMATIVE ACTION PROGRAM

Section 2 Affirmative Action/Equal Employment Opportunity Program

A. AAP-2.08 - Utilization of Unions is deleted in its entirety.

PART IV MINORITY BUSINESS ENTERPRISE PROGRAM

Section 2 - Contractual Requirements

A. The Maryland Department of Transportation (Department) has established a program under which MBE participation will be assessed without consideration of the cost of supplying structural steel. The cost of supplying structural steel will be excluded from the proposed value of MBE participation. This program applies only to the cost of supplying structural steel, and the installation costs and other costs related to structural steel erection may still be included in a contractor's proposed Affirmative Action Plan. The Administration reserves the right to verify the accuracy of any dollar value included on the Contractor's Affirmative Action Plan, including the value associated with the supply and installation of structural steel.

B. It is the goal of the Department that MBEs participate in all contracts. Each contract contains a goal for MBE participation (see Contract Summary GI-1.01). The goal may be met using any combination of MBE, DBE and WBE.

A study prepared for the State of Maryland entitled The Utilization of Minority Businesses by the State of Maryland (Dec 1994) determined the availability of MBEs in construction as follows: African-American/Black - 7.1%; Hispanic - 2.8%; Asian and Native Americans - 2.3%; and white women - 5.4%. These percentages equal 17.6% of the total number of construction firms available in the Maryland Economic Region as defined in the study.

Where subcontracting opportunities exist, bidders are encouraged to consider these availability percentages in meeting the MBE goal for this contract.

C. **Minority Business Enterprise Amendment of 1995**

The State Finance And Procurement, Section 14-302(2)(i) , Procurement From Minority Businesses, effective June 30, 1995, applies to Department construction contracts in excess of $100,000. This Act requires that contractors shall provide documentation of the following:

1. That at least ten (10) days before bid opening MBEs were solicited through written notices identifying specific work categories appropriate for subcontracting;

2. Provide information on the type of work being solicited and specific instructions on how to submit a bid to the contractor;

3. Make personal contact with MBE firms;

4. Assist MBE firms to fulfill bonding requirements or obtain waiver of those requirements;

5. Publicize contracting opportunities to MBEs by attending pre-bid meetings or other meetings

scheduled by the Administration;

6. Provide the Administration, upon acceptance of bids from subcontractors a listing of MBEs with whom contractor negotiated, including price quotes from all MBE and non-MBE firms.

The Administration shall determine contractor's *Good Faith* compliance with these requirements. Contractor will be required to renegotiate any subcontract if the Administration makes a determination that contractor is not in compliance with the provisions of this subtitle and subsection. An appropriate report will be filed in accordance with these provisions.

AGREEMENT

A. THIS AGREEMENT:

MADE THIS 4th DAY OF September 19 98

by and between IA CONSTRUCTION CORPORATION

hereinafter called the "Contractor", and the Maryland Aviation Administration, hereinafter called the "Administration".

WHEREAS, the Contract for furnishing all labor and material and delivering and completing:

Contract Number: MAA - CO- 97-019

Contract Title: Midfield Terminal Complex - Martin State Airport

for the Maryland Aviation Administration of the Maryland Department of Transportation, subject to all the conditions, covenants, stipulations, terms and provisions contained in certain plans and specifications, a copy of which is hereto attached, and in all respects made a part hereof, has recently been awarded to the Contractor by the Administration at and for a sum equal to the aggregate cost thereof at the prices named therefor, in the proposal attached hereto.

AND WHEREAS, it was one of the conditions of said award that a formal contract should be executed by and between the Contractor and the Administration evidencing the terms of said award.

NOW THEREFORE, THIS AGREEMENT WITNESSETH, that the Contractor does hereby covenant and agree with the Administration that

IA CONSTRUCTION CORPORATION

will well and faithfully, furnish all labor and material, and deliver and complete, the said

Contract Number: MAA - CO - 97-019

Contract Title: Midfield Terminal Complex - Martin State Airport

for the Maryland Aviation Administration of the Department of Transportation, in accordance with each and every one of the conditions, covenants, stipulations, terms, and provisions contained in said specifications, at and for a sum equal to the aggregate cost thereof, at the prices named therefor, in the Bid Proposal attached hereto, and will well and faithfully comply with and perform each and every obligation imposed upon:

IA CONSTRUCTION CORPORATION
firm

by said specifications or the terms of said award.

AND, the Administration does hereby covenant and agree with the Contractor that it will pay to the Contractor, when due and payable under the terms of said specifications and of said award, the sum stated on the following page; and that it will well and faithfully comply with and perform each and every obligation imposed upon it by said specifications or by the terms of said award.

B. The Contractor agrees to be bound by all of the terms and conditions of the documents set forth in the Table of Contents, attached hereto, all of which documents are attached hereto or intended to be attached as part hereof to the extent such terms and conditions are applicable to the performance of this Agreement.

C. This Agreement contains the entire agreement between the parties. It may not be altered or supplemented orally, but only by agreement in writing, signed by the party against whom enforcement of any waiver, alteration, supplement of discharge is sought.

D. It is agreed and understood by all parties hereto that the execution of this Agreement and its effectiveness is contingent upon approval by the Secretary of Transportation and the Board of Public Works of Maryland and this Agreement shall be considered to bind the parties hereto in accordance with the Constitution and laws of the State of Maryland.

E. IN WITNESS WHEREOF, the parties of these presents have hereunto caused this Agreement to be executed, the day and year first above mentioned.

CONSTRUCTION CONTRACT

ITEM: 1-C

MARYLAND AVIATION ADMINISTRATION: Baltimore/Washington International Airport (BWI)

CONTRACT NO. & TITLE: MAA-CO-97-019
Midfield (General Aviation) Complex Site Development, Phase I at Martin State Airport (MTN)

DESCRIPTION: This Contract provides for the construction of the infrastructure for a 45-acre General Aviation Midfield Complex at MTN. The work includes, construction of taxiways, aprons, vehicular parking area, and access roads. Work also includes wetland mitigation; installation of fiber optic communication cable; electrical distribution system; fire protection water system; removal/disposal of hazardous materials and demolition of three abandoned buildings.

PROCUREMENT METHOD: **Competitive Sealed Bidding**

AWARD: IA Construction, Inc.
White Marsh, MD

- This Contract was advertised in the Maryland Contract Weekly, The Baltimore Sun, and the Baltimore Times.
- The Notice to Contractors was sent to ten (10) minority organizations and to the following area construction industry clearinghouses: Dodge Reports, Construction Market Data, Building Congress, and Blue Reports. Copies were also sent to Environmental Contract Opportunity Report, Center for Aviation Research & Education, The Walbrook news, and Airport Consultants Council.

CONTINUED

ITEM: 1-C
Continued

- Thirty-five (35) contractors, four (4) of which were not Maryland firms, purchased plans and specifications. Copies of the plans and specifications were sent to seven (7) MBE organizations.

- 16% of the work will be performed by MDOT certified MBE firms.

AMOUNT: $5,167,567.61

A Performance Bond, of 100% of the award amount, exists for this Contract.

FUND SOURCE: 100% Special Funds budgeted to MAA

Appropriation Code: 29.09.00.03
Object/Subobject: 1455
Title of Program: Airport Facilities & Capital Equipment

BIDS:

IA Construction, Inc. White Marsh MD	$5,167,567.61
Cherry Hill Construction, Inc. Jessup MD	$5,736,683.10
Pavex , Inc. Hunt Valley MD	$5,889,173.22

REMARKS The Engineer's Estimate for this project is $5,659,744.00. The contract duration is 260 calendar days.

The first contract milestone calls for the Contractor to complete within 90 days the site preparation and provide access for Lockheed-Martin Corporation to begin construction, at its own expense, a 40,000 square foot aircraft hangar and contiguous operations and support area. (Item 32-GM, 9/2/98 BPW) Lockheed-Martin has begun expanding its fleet at MTN and will take delivery of new aircraft in 1999 which will be housed and maintained in the new facility.

"The Office of the State Comptroller has verified, under Control No. 98-6068-1111, that the recommended contractor has **no known deficiencies** in the payment of its Maryland tax obligations. Verification has also been obtained from the Comptroller's Office, or Department of Assessments and Taxation, as applicable, that the contractor is appropriately registered to conduct business within the State to the extent required by the laws of Maryland."

The Contractor is a resident business under the guidelines of BPW Advisory P-003-95 **Revised**.

ACTION AGENDA

CONSTRUCTION CONTRACT

ITEM: -C

MARYLAND AVIATION ADMINISTRATION: Baltimore/Washington International Airport (BWI)

CONTRACT NO. & TITLE: MAA-CO-97-019
Midfield (General Aviation) Complex Site Development, Phase I at Martin State Airport (MTN)

DESCRIPTION: This Contract provides for the installation of infrastructure and development of an approximate 45-acre site for aviation uses. The work includes, construction of taxiways, taxilanes, aprons, parking lots, and access roads; construction of wetland mitigation; installation of fiber optic communication cable; electrical distribution system; fire protection water system; removal/disposal of hazardous materials and demolition of three abandoned buildings.

PROCUREMENT METHOD: **Competitive Sealed Bidding**

AWARD: IA Construction, Inc.
White Marsh MD

- This contract was advertised in the Maryland Contract Weekly, The Baltimore Sun, and the Baltimore Times.
- The Notice to Contractors was sent to ten (10) minority organizations and to the following area construction industry clearinghouses: Dodge Reports, Construction Market Data, Building Congress, and Blue Reports. Copies were also sent to Environmental Contract Opportunity Report, Center for Aviation Research & Education, The Walbrook news, and Airport Consultants Council.

CONTINUED

- Thirty-five (35) contractors, four (4) of which were not Maryland firms, purchased plans and specifications. Copies of the plans and specifications were sent to seven (7) MBE organizations.
- 16% of the work will be performed by MDOT certified MBE firms.

AMOUNT: $5,167,567.61

A Performance Bond, of 100% of the award amount, exists for this Contract.

FUND SOURCE: 100% Special Funds budgeted to MAA

REMARKS The Engineers Estimate for this project is $5,659,744. The contract duration is 260 calendar days.

The first contract milestone calls for Lockheed-Martin to be able to access its portion of the Midfield Complex within 90 days to begin the nine month construction of an approximate 60,000 square foot hangar and contiguous operations support areas. Lockheed-Martin has begun expanding its fleet at MTN and will take delivery of new aircraft in 1999 thus requiring access to its site no later than Spring 1999, but preferably Winter 1999.

"The Office of the State Comptroller has verified, under Control No. 98-6068-1111, that the recommended contractor has **no known deficiencies** in the payment of its Maryland tax obligations. Verification has also been obtained from the Comptroller's Office, or Department of Assessments and Taxation, as applicable, that the contractor is appropriately registered to conduct business within the State to the extent required by the laws of Maryland."

Contract Title: Midfield Terminal Complex - Martin State Airport

Contract Number: MAA - CO -97-019

A. KNOW ALL MEN BY THESE PRESENTS, That we, the Principal named above and Surety named above, being authorized to do business in Maryland, and having business addresses as shown above, are held and firmly bound unto the Obligee named above, for the use and benefit of claimants as herein after defined, in the Penal Sum of this Payment Bond stated above, for the payment of which Penal Sum we bind ourselves, our heirs, executors, administrators, personal representatives, successors, and assigns jointly and severally, firmly by these co-sureties, bind ourselves, our successors and assigns, in such Penal Sum jointly and severally as well as severally only for the purpose of allowing a joint action or actions against any or all of us, and for all other purposes each co-surety binds itself, jointly and severally with the Principal, for the payment of such sum as appears above its name below, but if no limit of liability is indicated, the limit of such liability shall be the full amount of the Penal Sum.

B. WHEREAS, Principal has entered into or will enter into a contract with the State, by and through the Administration named above acting for the State of Maryland, which Contract is described and dated as shown above, and incorporated herein by reference. The Contract and all items incorporated into the Contract, together with any and all changes, extensions of time, alterations, modifications, or additions to the Contract or to the work to be performed thereunder or to the Plans, Specifications, and Standard Provisions, or any of them, or to any other items incorporated into the Contract shall hereinafter be referred to as "the Contract".

C. WHEREAS, it is one of the conditions precedent to the final award of the Contract that these presents be executed.

D. NOW THEREFORE, the condition of this obligation is such that if the Principal shall promptly make payments to all claimants as hereinafter defined, for all labor and materials furnished, supplied and reasonably required for use in the performance of the Contract, then this obligation shall be null and void otherwise it shall remain in full force and effect, subject to the following conditions:

1. A claimant is defined to be any and all of those persons supplying labor and materials (including lessors of the equipment to the extent of the fair market value thereof) to the Principal or its subcontractors and subcontractors in the prosecution of the work provided for in the Contract, entitled to the protection provided by Section 9-113 of the Real Property Article of the Annotated Code of Maryland, as from time to time amended.

2. The above named Principal and Surety hereby jointly and severally agree with the Obligee that every claimant as herein defined, who has not been paid in full may, pursuant to and when in compliance with the provisions of the aforesaid Section 9-113, sue on this Bond for the use of such claimant, prosecute the suit to final judgement for such sum or sums as may be justly

due claimant and have execution thereon. The Obligee shall not be liable for the payment of any costs or expenses of any such suit.

E. The Surety hereby stipulates and agrees that no change, extension of time, alteration or addition to the terms of the Contract or to the work to be performed thereunder or the Specifications accompanying the same shall in any way affect its obligations on this Payment Bond, and it does hereby waive notice of any such change, extension of time, alteration or addition to the terms of the Contract or to the work or to the Specifications.

F. This Payment Bond shall be governed by and construed in accordance with the laws of the State of Maryland and any reference herein to Principal or Surety in the singular shall include all entities in the plural who or which are signatories under the Principal or Surety heading below.

G. IN WITNESS WHEREOF, Principal and Surety have set their hands and seals to this Payment Bond. If any individual is a signatory under the Principal heading below, then each such individual has signed below on his/her own behalf, has set forth below the name of the firm, if any, in whose name he or she is doing business, and has set forth below his/her title as a sole proprietor. If any partnership or joint venture is a signatory under the Principal heading below, then all members of each such partnership or joint venture have signed below, each member has set forth below the name of the partnership or joint venture, and each member has set forth below his or her title as a general partner, limited partner, or member of joint venture, whichever is applicable. If any corporation is a signatory under the Principal or Surety heading below, then each such corporation has caused the following: the corporation's name to be set forth below, a duly authorized representative of the corporation to affix below the corporation's seal and to attach hereto a notarized corporate resolution or power of attorney authorizing such action, and each such duly authorized representative to sign below and to set forth below his or her title as a representative of the corporation. If any individual acts as a witness to any signature below, then each such individual has signed below and has set forth below his or her title as a witness. All of the above has been done as of the date of bond shown above.

Dennis J. Langwell

Vice President and Comptroller

THIS POWER OF ATTORNEY IS NOT VALID UNLESS IT IS PRINTED ON RED BACKGROUND. 426052

This Power of Attorney limits the act of those named herein, and they have no authority to bind the Company except in the manner and to the extent herein stated.

LIBERTY MUTUAL INSURANCE COMPANY
BOSTON, MASSACHUSETTS

POWER OF ATTORNEY

KNOW ALL PERSONS BY THESE PRESENTS: That **Liberty Mutual Insurance Company** (the "Company"), a Massachusetts mutual insurance company, pursuant to and by authority of the By-law and Authorization hereinafter set forth, does hereby name, constitute and appoint, **JOHN K. JOHNSON, WENDY LEE WADKINS, KAREN E. HEIN, ALL OF THE CITY OF RADNOR, STATE OF PENNSYLVANIA** .....

, each individually if there be more than one named, its true and lawful attorney-in-fact to make, execute, seal, acknowledge and deliver, for and on its behalf as surety and as its act and deed, any and all undertakings, bonds, recognizances and other surety obligations in the penal sum not exceeding **FIFTY MILLION**********_____DOLLARS ($ **50,000,000**********) each, and the execution of such bonds or undertakings, in pursuance of these presents, shall be as binding upon the Company as if they had been duly signed by the president and attested by the secretary of the Company in their own proper persons.

That this power is made and executed pursuant to and by authority of the following By-law and Authorization:

ARTICLE XVI - Execution of Contracts: Section 5. Surety Bonds and Undertakings.
Any officer or other official of the company authorized for that purpose in writing by the chairman or the president, and subject to such limitations as the chairman or the president may prescribe, shall appoint such attorneys-in-fact, as may be necessary to act in behalf of the company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations. Such attorneys-in-fact, subject to the limitations set forth in their respective powers of attorney, shall have full power to bind the company by their signature and execution of any such instruments and to attach thereto the seal of the company. When so executed such instruments shall be as binding as if signed by the president and attested by the secretary.

By the following instrument the chairman or the president has authorized the officer or other official named therein to appoint attorneys-in-fact:

Pursuant to Article XVI, Section 5 of the By-laws, Assistant Secretary Garnet W. Elliott is hereby authorized to appoint such attorneys-in-fact as may be necessary to act in behalf of the company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations.

the By-law and the Authorization above set forth are true copies thereof and are now in full force and effect.

IN WITNESS WHEREOF, this instrument has been subscribed by its authorized officer and the corporate seal of the said Liberty Mutual Insurance Company has been affixed thereto in Plymouth Meeting, Pennsylvania this 21st day of January, 19 98.

LIBERTY MUTUAL INSURANCE COMPANY

By Garnet W. Elliott
Garnet W. Elliott, Assistant Secretary

COMMONWEALTH OF PENNSYLVANIA ss
COUNTY OF MONTGOMERY

On this 21st day of January, A.D. 19 98, before me, a Notary Public, personally came the individual, known to me to be the therein described individual and officer of Liberty Mutual Insurance Company who executed the preceding instrument, and he acknowledged that he executed the same and that the seal affixed to the said preceding instrument is the corporate seal of said company; and that said corporate seal and his signature subscribed thereto was duly affixed and subscribed to the said instrument by authority and direction of the said company.

IN TESTIMONY WHEREOF, I hereunto set my hand and affix my official seal at Plymouth Meeting, PA, the day and year first above written.

CERTIFICATE

I, the undersigned, Assistant Secretary of Liberty Mutual Insurance Company, do hereby certify that the original power of attorney of which the foregoing is a full, true and correct copy, is in full force and effect on the date of this certificate; and I do further certify that the officer who executed the said power of attorney was one of the officers specially authorized by the chairman or the president to appoint any attorney-in-fact as provided in Article XVI, Section 5 of the By-laws of Liberty Mutual Insurance Company.

This certificate may be signed by facsimile under and by authority of the following vote of the board of directors of Liberty Mutual Insurance Company at a meeting duly called and held on the 12th day of March, 1980.

VOTED that the facsimile or mechanically reproduced signature of any assistant secretary of the company wherever appearing upon a certified copy of any power of attorney issued by the company, shall be valid and binding upon the company with the same force and effect as though manually affixed.

IN TESTIMONY WHEREOF, I have hereunto subscribed my name and affixed the corporate seal of the said company, this 28th day of August, 19 98.

Assistant Secretary

THIS POWER OF ATTORNEY MAY NOT BE USED TO EXECUTE ANY BOND WITH AN INCEPTION DATE AFTER December 31, 19 99.

Not valid for mortgage, letter of credit, bank deposit, currency rate, interest rate or residual value guarantees.

To confirm the validity of this Power of Attorney call 1-610-832-8240 between 9:00 am and 4:30 pm EST on any business day.

Contract Title: Midfield Terminal Complex - Martin State Airport

Contract Number: MAA - CO -97-019

A. KNOW ALL MEN BY THESE PRESENTS, That we, the Principal named above and Surety named above, are held and firmly bound unto the Obligee named above in the Penal Sum of this Performance Bond stated above, for the payment of which Penal Sum we bind ourselves, our heirs, executors, administrators, personal representatives, successors, and assigns, jointly and severally, firmly by these presents.

However, where Surety is composed of corporations acting as co-sureties, we, the co-sureties, bind ourselves, our successors and assigns, in such Penal Sum jointly and severally as well as severally only for the purpose of allowing a joint action or actions against any or all of us, and for all other purposes each co-surety binds itself, jointly and severally with the Principal, for the payment of such sum as appears above its name below, if no limit of liability is indicated, the limit of such liability shall be the full amount of the Penal Sum.

B. WHEREAS, Principal has entered into or will enter into a contract with the State of Maryland, by and through the Administration named above acting for the State of Maryland, which contract is described and dated as shown above, and incorporated herein by reference. The Contract and all items incorporated into the Contract, together with any and all changes, extensions of time, alterations, modifications, or additions to the contract or to the work to be performed thereunder or to the Plans, Specifications, and Standard Provisions, or any of them, or to any other items incorporated into the Contract shall hereinafter be referred to as "the Contract".

C. WHEREAS, it is one of the conditions precedent to the final award of the Contract that these presents be executed.

D. NOW, THEREFORE, during the original term of said Contract, during any extensions thereto that may be granted by the Administration, and during the guarantee and warranty period, if any, required under the Contract, unless otherwise stated therein, this Performance Bond shall remain in full force and effect unless and until the following terms and conditions are met:

1. Principal shall well and truly perform the Contract; and

2. Principal and Surety shall comply with the terms and conditions contained in this Performance Bond.

E. Whenever Principal shall be declared by the Administration to be in default under the Contract, the Surety may, within fifteen (15) days after notice of default from the Administration, notify the Administration of its election to either promptly proceed to remedy the default or promptly proceed to complete the Contract in accordance with and subject to its terms and conditions. In the event the Surety

does not elect to exercise either of the above stated options, then the Administration thereupon shall have the remaining Contract work completed, Surety to remain liable hereunder for all expenses of completion up to but not exceeding the penal sum state above.

F. The Surety hereby stipulates and agrees that no change, extension of time, alteration or addition to the terms of the Contract or to the work to be performed thereunder or the specifications accompanying the same shall in any way affect its obligations on this Performance Bond, and it does hereby waive notice of any such change, extension of time, alteration or addition to the terms of the Contract or to the work or to the Specifications.

G. This Performance Bond shall be governed by and construed in accordance with the laws of the State of Maryland and any reference herein to Principal or Surety in the singular shall include all entities in the plural who or which are signatories under the Principal or Surety heading below.

H. IN WITNESS WHEREOF, Principal and Surety have set their hands and seals to this Performance Bond. If any individual is a signatory under the Principal heading below, then each such individual has signed below on his or her own behalf, has set forth below the name of the firm, if any, in whose name he or she is doing business, and has set forth below his or her title as a sole proprietor. If any partnership or joint venture is a signatory under the Principal heading below, then all members of each such partnership or joint venture have signed below, each member has set forth below the name of the partnership or joint venture, and each member has set forth below his or her title as a general partner, limited partner, or member of joint venture, whichever is applicable.

I. If any corporation is a signatory under the Principal or Surety heading below, then each such corporation has caused the following: the corporation's name to be set forth below, a duly authorized representative of the corporation to affix below the corporation's seal and to attach hereto a notarized corporate resolution or power of attorney authorizing such action, and each such duly authorized representative to sign below and to set forth below his or her title as a representative of the corporation. If any individual acts as a witness to any signature below, then each such individual has signed below and has set forth below his or her title as a witness. All of the above has been done as of the date of bond shown above.

Vice President and Comptroller

THIS POWER OF ATTORNEY IS NOT VALID UNLESS IT IS PRINTED ON RED BACKGROUND. 426056

This Power of Attorney limits the act of those named herein, and they have no authority to bind the Company except in the manner and to the extent herein stated.

LIBERTY MUTUAL INSURANCE COMPANY
BOSTON, MASSACHUSETTS

POWER OF ATTORNEY

KNOW ALL PERSONS BY THESE PRESENTS: That **Liberty Mutual Insurance Company** (the "Company"), a Massachusetts mutual insurance company, pursuant to and by authority of the By-law and Authorization hereinafter set forth, does hereby name, constitute and appoint, **JOHN K. JOHNSON, WENDY LEE WADKINS, KAREN E. HEIN, ALL OF THE CITY OF RADNOR, STATE OF PENNSYLVANIA**

, each individually if there be more than one named, its true and lawful attorney-in-fact to make, execute, seal, acknowledge and deliver, for and on its behalf as surety and as its act and deed, any and all undertakings, bonds, recognizances and other surety obligations in the penal sum not exceeding **FIFTY MILLION**********DOLLARS ($ **50,000,000**********) each, and the execution of such bonds or undertakings, in pursuance of these presents, shall be as binding upon the Company as if they had been duly signed by the president and attested by the secretary of the Company in their own proper persons.

That this power is made and executed pursuant to and by authority of the following By-law and Authorization:

ARTICLE XVI - Execution of Contracts: Section 5. Surety Bonds and Undertakings.
Any officer or other official of the company authorized for that purpose in writing by the chairman or the president, and subject to such limitations as the chairman or the president may prescribe, shall appoint such attorneys-in-fact, as may be necessary to act in behalf of the company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations. Such attorneys-in-fact, subject to the limitations set forth in their respective powers of attorney, shall have full power to bind the company by their signature and execution of any such instruments and to attach thereto the seal of the company. When so executed such instruments shall be as binding as if signed by the president and attested by the secretary.

By the following instrument the chairman or the president has authorized the officer or other official named therein to appoint attorneys-in-fact:

Pursuant to Article XVI, Section 5 of the By-laws, Assistant Secretary Garnet W. Elliott is hereby authorized to appoint such attorneys-in-fact as may be necessary to act in behalf of the company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations.

the By-law and the Authorization above set forth are true copies thereof and are now in full force and effect.

IN WITNESS WHEREOF, this instrument has been subscribed by its authorized officer and the corporate seal of the said Liberty Mutual Insurance Company has been affixed thereto in Plymouth Meeting, Pennsylvania this 21st day of January, 19 98.

LIBERTY MUTUAL INSURANCE COMPANY

By Garnet W. Elliott
Garnet W. Elliott, Assistant Secretary

COMMONWEALTH OF PENNSYLVANIA ss
COUNTY OF MONTGOMERY

On this 21st day of January A.D. 19 98, before me, a Notary Public, personally came the individual, known to me to be the therein described individual and officer of Liberty Mutual Insurance Company who executed the preceding instrument, and he acknowledged that he executed the same and that the seal affixed to the said preceding instrument is the corporate seal of said company; and that said corporate seal and his signature subscribed thereto was duly affixed and subscribed to the said instrument by authority and direction of the said company.

IN TESTIMONY WHEREOF, I hereunto set my hand and affix my official seal at Plymouth Meeting, PA, the day and year first above written.

ESCROW ACCOUNTS FOR RETAINED FUNDS

Contractor: IA CONSTRUCTION CORPORATION

Contractor's Identification Number: 23-2224715

The Contractor is given the option of selecting an escrow agent for retained funds on this Contract.

_____ Escrow option not selected.

XX Escrow option selected.

Escrow Agent Name: FMB Trust Company, National Association

Escrow Agent Address: 25 S. Charles Street, 101-591, Baltimore, MD 21201

Name of Account Manager: Lisa Pedzich

Account Number: 74349

Surety Name: LIBERTY MUTUAL INSURANCE COMPANY

Surety Address: 600 W. GERMANTOWN PIKE, SUITE 300, PLYMOUTH MEETING, PA 19462

A. The selection of an option must be exercised on this form at the time of signing the Contract.

B. If a Contractor elects to utilize the escrow account procedure described in this section, the Contractor shall indicate the election in the space provided. If the Contractor fails to indicate an election or then refuses the election, the Contractor shall forfeit rights to the use of the escrow account.

C. In a Department of Transportation or Maryland Transportation authority construction or reconstruction contract, in order to have retained funds paid to an escrow agent, a Contractor, the Contractor's escrow agent, and the Contractor's surety must execute an escrow agreement form to be submitted to the Department of Transportation or the Maryland Transportation authority for approval.

A. ESCROW AGREEMENT:

1. THIS AGREEMENT (The "Agreement") made and entered into pursuant to Section 15-108, State Finance and Procurement Article Annotated Code of Maryland, by, between and among the Maryland Aviation Administration an agency of the Department of Transportation; ("MAA"), and

IA CONSTRUCTION CORPORATION
Name of Contractor located at

P.O. BOX 210, WHITEMARSH, MD 21162
Address of Contractor ("CONTRACTOR") and

FMB Trust Company, National Association
Bank or Trust Company located at

25 S. Charles Street, 101-591, Baltimore, MD 21201
Address of Bank or Trust Company

2. A Maryland financial institution having trust powers and its principal place of business in the State of Maryland and insured by an Agency or instrumentality of the Federal Government, hereinafter called "ESCROW AGENT", and

LIBERTY MUTUAL INSURANCE COMPANY
Name of Surety located at

600 W. GERMANTOWN PIKE, SUITE 300, PLYMOUTH MEETING, PA 19462
address of surety ("SURETY")

3. The MAA and the CONTRACTOR have entered into a contract with respect to the Maryland Aviation Administration

Contract Number: MAA - CO - 97-019

Contract Title: Midfield Terminal Complex - Martin State Airport

4. Pursuant to the Contract and the general laws of the State of Maryland, certain sums otherwise due to the CONTRACTOR are to be retained by MAA to insure full and satisfactory completion of the Contract by the CONTRACTOR.

B. The CONTRACTOR hereby exercises the option of selecting an ESCROW AGENT for funds retained by MAA under the Contract, in accordance with Section 15-108 of the State Finance and Procurement Article of the Annotated Code of Maryland and selects ESCROW AGENT.

1. In consideration of the covenants and conditions herein set forth the parties of this Agreement agree as follows:

a. That this Agreement neither amends nor modifies, the Contract.

b. That the CONTRACTOR hereby assigns to the ESCROW AGENT its right to receive the sums of money retained by the Maryland Aviation Administration pursuant to GP-9.03 of the General Provisions of the Standard Provisions for Construction Contracts ("hereinafter GP-9.03"), and any revisions thereto.

c. The ESCROW AGENT hereby agrees to deposit and maintain the amounts of money received pursuant to this Agreement into an interest bearing account. The ESCROW AGENT shall provide a monthly statement showing all account transactions to: Manager, Accounting Section, Maryland Aviation Administration, P.O. Box 8766, Baltimore/Washington International Airport 21240-0766.

d. MAA agrees to pay to the ESCROW AGENT all monies retained under GP-9.03, unless

(1) the Contract involves a federally funded project, and the application of Section 13-1106 would jeopardize timely recovery of federal funds, or

(2) MAA withholds such funds for lack of progress or other CONTRACTOR violations.

e. Interest on retained amounts deposited with the ESCROW AGENT shall be payable to CONTRACTOR only in accordance with directions provided by MAA.

f. The form of the account used shall be as agreed by CONTRACTOR and ESCROW AGENT, provided however, that no form of account shall be used which could, under any circumstances, result in a loss or diminution of any part of the principal, if any portion of the retained amounts or interest thereon was withdrawn or paid prior to the maturity date for the deposit.

g. Any service charge or fee assessed to the account shall be paid by the CONTRACTOR and cannot be deducted from the principal.

h. ESCROW AGENT may

(1) invest the funds paid into the account only in approved securities specified in Paragraphs i. and j. hereof.

(2) pay earnings on the investments to Contractor to the extent the Contractor is entitled to such amounts under Paragraph e. of this Agreement.

i. That the following securities, and none other, are approved securities for all purposes of this agreement.

(1) United States Treasury Bonds, United States Treasury Notes, United States Treasury Certificates of Indebtedness or United States Treasury Bills.

(2) Bonds, notes and other evidences of indebtedness unconditionally guaranteed as to the payment of principal and interest by the United States.

(3) Bonds or notes of the State of Maryland.

(4) Bonds of any political subdivision of the State of Maryland, if such bonds carried a Standard and Poor's or Moody's Investors Service Rating of "A" or better on the later of

(a) the date of purchase of such security by the ESCROW AGENT, or

(b) the date of payment to the ESCROW AGENT of funds used to purchase such bonds.

(5) Certificates of deposit issued by federally insured financial institutions located within the State of Maryland.

j. No security is approved which matures later than the anticipated final payment under:

Contract Number: MAA - CO - 97-019

Contract Title: Midfield Terminal Complex - Martin State Airport

k. The risk of loss or diminution of the principal of any funds invested under the terms of this Agreement shall be solely upon the CONTRACTOR.

l. CONTRACTOR agrees that it will not assign, pledge, discount, sell or otherwise transfer or dispose of its interest in the retained amounts or any part thereof, except to SURETY.

m. The ESCROW AGENT may release the retained amounts only as directed by MAA in accordance with Section 15-108 of the State Finance and Procurement Article of the Annotated Code of Maryland, and shall be fully liable to MAA for any funds which ESCROW AGENT held pursuant to this Agreement and which are released in the absence of, or in derogation of, MAA instructions.

n. At the time of final payment, in the event any sums of monies are paid to the Department of Transportation or MAA pursuant to Section 15-108 of the State Finance and Procurement Article of the Annotated Code of Maryland, such monies shall include a pro-rata share of the interest accrued as of the date of the final payments.

C. This Agreement shall be governed by the laws of the State of Maryland and shall not be binding on any party hereto until and unless executed by all parties hereto.

SECTION 1
BID BOND

NOTE: THIS BID BOND IS NOT REQUIRED IF THE TOTAL CONTRACT PRICE IS LESS THAN ONE HUNDRED THOUSAND DOLLARS ($100,000).

Bond Number: 425932

A. KNOW ALL MEN BY THESE PRESENTS, that we **IA CONSTRUCTION CORPORATION**
Bidding Company

as Principal, hereinafter called the Principal, and Liberty Mutual Insurance Company
Bonding Company

a corporation duly organized under the laws of the State of: Massachusetts
Name of State

as Surety, hereinafter called the Surety, are held and firmly bound unto the State of Maryland, hereinafter called, "State", for the sum of:

Five Percent of The Total Amount Bid
(Dollars, Written in Words)

for the payment of which sum, the said Principal and the said Surety bind ourselves, our heirs, executors, administrators, successors and assigns, jointly and severally, firmly by these presents.

WHEREAS, the Principal has submitted a bid for:

Contract Numbers: MAA-CO-97-019

Contract Titles: Midfield Terminal Complex Site Development, Phase I

B. NOW THEREFORE, if the Principal, upon acceptance by the State of its bid identified above, within the period specified herein for acceptance (ninety (90) days, if no period is specified), shall execute such further contractual documents, if any, and give such bond(s) as may be required by the terms of the bid as accepted within the time specified (ten (10) days if no period is specified) after receipt of the forms, or in the event of failure to so execute such further contractual documents and give such bonds, if the Principal shall pay the State for any cost of procuring the work which exceeds the amount of its bid, then the above obligation shall be void and of no effect. The Surety executing this instrument hereby agrees that its obligation shall not be impaired by any extension(s) of the time for acceptance of the bid that the Principal may grant to the State, notice of which extension(s) to the Surety being hereby waived; provided that such waiver of notice shall apply only with respect to extensions aggregating not more than ninety (90) calendar days in addition to the period originally allowed for acceptance of the Bid.

COUNTY OF SUFFOLK

Dennis Langwell, being duly sworn, says: That he is Vice President and Comptroller of Liberty Mutual Insurance Company; that said Company is a mutual insurance company duly organized, existing and engaged in business as a surety by virtue of the laws of the Commonwealth of Massachusetts and has duly complied with all the requirements of the laws of said Commonwealth and of the laws of the State of MY applicable to said Company and is duly qualified to act as surety under such laws; that said Company has also complied with and is duly qualified to act as surety on federal bonds under Section 9305 of Title 31 of the United States Code.

That the foregoing is a full, true and correct statement of the financial condition of said Company an the 31st day December, 1997.

Sworn to before me this 31st day of March, 1998

Patricia Smith

My Commission Expires Jan 19, 2001

Dennis J. Langwell

Vice President and Comptroller

THIS POWER OF ATTORNEY IS NOT VALID UNLESS IT IS PRINTED ON RED BACKGROUND. 425932

This Power of Attorney limits the act of those named herein, and they have no authority to bind the Company except in the manner and to the extent herein stated.

LIBERTY MUTUAL INSURANCE COMPANY
BOSTON, MASSACHUSETTS

POWER OF ATTORNEY

KNOW ALL PERSONS BY THESE PRESENTS: That **Liberty Mutual Insurance Company** (the "Company"), a Massachusetts mutual insurance company, pursuant to and by authority of the By-law and Authorization hereinafter set forth, does hereby name, constitute and appoint, **JOHN K. JOHNSON, WENDY LEE WADKINS, KAREN E. HEIN, ALL OF THE CITY OF RADNOR, STATE OF PENNSYLVANIA** .....

, each individually if there be more than one named, its true and lawful attorney-in-fact to make, execute, seal, acknowledge and deliver, for and on its behalf as surety and as its act and deed, any and all undertakings, bonds, recognizances and other surety obligations in the penal sum not exceeding **FIFTY MILLION**********_____DOLLARS ($ **50,000,000**********) each, and the execution of such bonds or undertakings, in pursuance of these presents, shall be as binding upon the Company as if they had been duly signed by the president and attested by the secretary of the Company in their own proper persons.

That this power is made and executed pursuant to and by authority of the following By-law and Authorization:

ARTICLE XVI - Execution of Contracts: Section 5. Surety Bonds and Undertakings.
Any officer or other official of the company authorized for that purpose in writing by the chairman or the president, and subject to such limitations as the chairman or the president may prescribe, shall appoint such attorneys-in-fact, as may be necessary to act in behalf of the company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations. Such attorneys-in-fact, subject to the limitations set forth in their respective powers of attorney, shall have full power to bind the company by their signature and execution of any such instruments and to attach thereto the seal of the company. When so executed such instruments shall be as binding as if signed by the president and attested by the secretary.

By the following instrument the chairman or the president has authorized the officer or other official named therein to appoint attorneys-in-fact:

Pursuant to Article XVI, Section 5 of the By-laws, Assistant Secretary Garnet W. Elliott is hereby authorized to appoint such attorneys-in-fact as may be necessary to act in behalf of the company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations.

The By-law and the Authorization above set forth are true copies thereof and are now in full force and effect.

IN WITNESS WHEREOF, this instrument has been subscribed by its authorized officer and the corporate seal of the said Liberty Mutual Insurance Company has been affixed thereto in Plymouth Meeting, Pennsylvania this 21st day of January, 19 98.

LIBERTY MUTUAL INSURANCE COMPANY

By Garnet W. Elliott
Garnet W. Elliott, Assistant Secretary

COMMONWEALTH OF PENNSYLVANIA ss
COUNTY OF MONTGOMERY

On this 21st day of January, A.D. 19 98, before me, a Notary Public, personally came the individual, known to me to be the therein described individual and officer of Liberty Mutual Insurance Company who executed the preceding instrument, and he acknowledged that he executed the same and that the seal affixed to the said preceding instrument is the corporate seal of said company; and that said corporate seal and his signature subscribed thereto was duly affixed and subscribed to the said instrument by authority and direction of the said company.

IN TESTIMONY WHEREOF, I hereunto set my hand and affix my official seal at Plymouth Meeting, PA, the day and year first above written.

CERTIFICATE

I, the undersigned, Assistant Secretary of Liberty Mutual Insurance Company, do hereby certify that the original power of attorney of which the foregoing is a full, true and correct copy, is in full force and effect on the date of this certificate; and I do further certify that the officer who executed the said power of attorney was one of the officers specially authorized by the chairman or the president to appoint any attorney-in-fact as provided in Article XVI, Section 5 of the By-laws of Liberty Mutual Insurance Company.

This certificate may be signed by facsimile under and by authority of the following vote of the board of directors of Liberty Mutual Insurance Company at a meeting duly called and held on the 12th day of March, 1980.

VOTED that the facsimile or mechanically reproduced signature of any assistant secretary of the company wherever appearing upon a certified copy of any power of attorney issued by the company, shall be valid and binding upon the company with the same force and effect as though manually affixed.

IN TESTIMONY WHEREOF, I have hereunto subscribed my name and affixed the corporate seal of the said company, this 12th day of May, 19 98.

Assistant Secretary

THIS POWER OF ATTORNEY MAY NOT BE USED TO EXECUTE ANY BOND WITH AN INCEPTION DATE AFTER December 31, 19 99.

To confirm the validity of this Power of Attorney call 1-610-832-8240 between 9:00 am and 4:30 pm EST on any business day.

Section 3 - MBE Utilization Affidavit . . . . . BF - 11

Section 4 - Subcontractor Utilization Affidavit . . . . . BF - 14

Section 5 - Bid Proposal and Bid Tabulation Forms . . . . . BF - 16

SECTION 2
BID/PROPOSAL AFFIDAVIT

A. AUTHORIZED REPRESENTATIVE

I HEREBY AFFIRM THAT:

I am the PRESIDENT and the duly authorized representative of
Title

IA CONSTRUCTION CORPORATION
Firm, and that I possess the legal authority to make this Affidavit on behalf of myself and the business for which I am acting.

B. AFFIRMATION REGARDING BRIBERY CONVICTIONS

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business (as is defined in **Section 16-101(b)** of the State Finance and Procurement Article of the Annotated Code of Maryland), or any of its officers, directors, partners, or any of its employees directly involved in obtaining or performing contracts with public bodies (as is defined in **Section 16-101(f)** of the State Finance and Procurement Article of the Annotated Code of Maryland), has been convicted of, or has had probation before judgment imposed pursuant to **Article 27, Section 641** of the Annotated Code of Maryland, or has pleaded *nolo contendere* to a charge of, bribery, attempted bribery, or conspiracy to bribe in violation of Maryland law, or of the law of any other state or federal law, except as follows (indicate the reasons why the affirmation cannot be given and list any conviction, plea, or imposition of probation before judgment with the date, court, official or administrative body, the sentence or disposition, the name(s) of person(s) involved, and their current positions and responsibilities with the business):

N/A

C. AFFIRMATION REGARDING OTHER CONVICTIONS

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, or any of its officers, directors, partners, or any of its employees directly involved in obtaining or performing contracts with public bodies, has:

(a) Been convicted under state or federal statute of a criminal offense incident to obtaining, attempting to obtain, or performing a public or private contract, fraud, embezzlement, theft, forgery, falsification or destruction of records, or receiving stolen property;

(b) Been convicted of any criminal violation of a state or federal antitrust statute;

(c) Been convicted under the provisions of **Title 18** or the United States Code for violation of the Racketeer Influenced and Corrupt Organization Act, **18 U.S.C. §1961**, *et seq.*, or the Mail Fraud Act, **18 U.S.C. §1341**, *et seq.*, for acts arising out of the submission of bids or proposals for a public or private contract;

(d) Been convicted of a violation of the State Minority Business Enterprise Law, **Section 14-308** of the State Finance and Procurement Article of the Annotated Code or Maryland;

(e) Been convicted of conspiracy to commit any act or omission that would constitute grounds for conviction or liability under any law or statute described in Subsections (a), (b), (c) or (d) above;

(f) Been found civilly liable under a state or federal antitrust statute for acts or omissions in connection with the submission of bids or proposals for a public or private contract;

(g) Admitted in writing or under oath, during the course of an official investigation or other proceedings, acts or omissions that would constitute grounds for conviction or liability under any law or statute described above, except as follows (indicate reasons why the affirmations cannot be given, and list any conviction, plea, or imposition of probation before judgment with the date, court, official or administrative body, the sentence or disposition, the name(s) of the person(s) involved and their current positions and responsibilities with the business, and the status of any debarment):

N/A

D. AFFIRMATION REGARDING DEBARMENT

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, or any of it its officers, directors, partners, or any of its employees directly involved in obtaining or performing contracts with public bodies, has ever been suspended or debarred (including being, issued a limited denial of participation) by any public entity, except as follows (list each debarment or suspension providing the dates of the suspension or debarment, the name of the public entity and the status of the proceedings, the name(s) of the persons(s) involved and their current positions

and responsibilities with the business, the grounds of the debarment or suspension, and the details of each person's involvement in any activity that formed the grounds of the debarment or suspension):

N/A

E. AFFIRMATION REGARDING DEBARMENT OF RELATED ENTITIES

I FURTHER AFFIRM THAT:

(a) The business was not established and it does not operate in a manner designed to evade the application of or defeat the purpose of debarment pursuant to **Section 16-101**, *et seq.*, of the State Finance and Procurement Article of the Annotated Code of Maryland; and

(b) The business is not a successor, assignee, subsidiary, or affiliate of a suspended or debarred business, except as follows (you must indicate the reasons why the affirmations cannot be given without qualification):

N/A

F. SUB-CONTRACT AFFIRMATION

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, has knowingly entered into a contract with a public body under which a person debarred or suspended under **Title 16** of the State Finance and Procurement Article of the Annotated Code of Maryland will provide, directly or indirectly, supplies, services, architectural services, construction related services, leases of real property, or construction.

G. AFFIRMATION REGARDING COLLUSION

I FURTHER AFFIRM THAT:
Neither I, nor to the best of my knowledge, information, and belief, the above business, has:

(a) Agreed, conspired, connived, or colluded to produce a deceptive show of competition in the compilation of the accompanying bid or offer that is being submitted;

(b) In any manner, directly or indirectly, entered into any agreement of any kind to fix the bid price or price proposal of the bidder or offeror or of any competitor, or otherwise taken any action in restraint of free competitive bidding in connection with the Contract for which the accompanying bid or offer is submitted.

H. FINANCIAL DISCLOSURE AFFIRMATION

I FURTHER AFFIRM THAT:
I am aware of, and the above business will comply with, the provisions of **Section 13-221** of the State Finance and Procurement Article of the Annotated Code of Maryland, which require that every business that enters into contracts, leases, or other agreements with the State of Maryland or its agencies during a calendar year under which the business is to receive in the aggregate $100,000 or more shall, within 30 days of the time when the aggregate value of the contracts. leases or other agreements reaches $100,000, file with the Secretary of State of Maryland certain specified information to include disclosure of beneficial ownership of the business.

I. POLITICAL CONTRIBUTION DISCLOSURE AFFIRMATION

I FURTHER AFFIRM THAT:
I am aware of, and the above business will comply with the provisions of **Article 33, Sections 30-1 through 30-4** of the Annotated Code of Maryland, which requires that every person that enters into contracts, leases, or other agreements with the State of Maryland, including its agencies or a political subdivision of the State, during a calendar year in which the person receives in the aggregate $100,000 or more shall file with the Administrative Board of Election Laws a statement disclosing contributions in excess of $500 or more during the reporting period to a candidate for elective office in any primary or general election.

J. DRUG AND ALCOHOL FREE WORKPLACE
(Applicable to all contracts unless the contract is for a law enforcement agency and the agency head or the agency head's designees has determined that application of **COMAR 21.11.08** and this certification would be inappropriate in connection with the law enforcement agency's undercover operations).

I CERTIFY THAT:

1. Terms defined in **COMAR 21.11.08** shall have the same meaning when used in this certification.

2. By submission of its bid or offer, the business, if other than an individual, certifies and agrees that, with respect to its employees to be employed under a contract resulting from this solicitation, the business shall:

   (a) Maintain a workplace free of drug and alcohol abuse during the term of the Contract;

(b) Publish a statement notifying its employees that the unlawful manufacture, distribution, dispensing, possession, or use of drugs, and the abuse of drugs or alcohol is prohibited in the business' workplace and specifying the actions that will be taken against employees for violation of these prohibitions,

(c) Prohibit its employees from working under the influence of drugs or alcohol;

(d) Not hire or assign to work on the Contract anyone whom the business knows, or in the exercise of due diligence should know, currently abuses drugs or alcohol and is not actively engaged in a *bona fide* drug or alcohol abuse assistance or rehabilitation program;

(e) Promptly inform the appropriate law enforcement agency of every drug-related crime that occurs in its workplace if the business has observed the violation or otherwise has reliable information that a violation has occurred;

(f) Establish drug and alcohol abuse awareness programs to inform its employees about:

(1) The dangers of drug and alcohol abuse in the workplace;

(2) The business' policy of maintaining a drug and alcohol free workplace;

(3) Any available drug and alcohol counseling, rehabilitation, and employee assistance programs; and

(4) The penalties that may be imposed upon employees who abuse drugs and alcohol in the workplace;

(g) Provide all employees engaged in the performance of the Contract with a copy of the statement required by §J(2)(b), above;

(h) Notify its employees in the statement required by §J(2)(b), above that, as a condition of continued employment on the Contract, the employee shall:

(1) Abide by the terms of the statement; and

(2) Notify the employer of any criminal drug or alcohol abuse conviction for an offense occurring in the workplace not later that 5 days after a conviction;

(i) Notify the Procurement Officer within 10 days after receiving notice under §J(2)(h)(2), above, or otherwise receiving actual notice of a conviction;

(j) Within 30 days after receiving notice under §J(2)(h)(2), above, or otherwise receiving actual notice of a conviction, impose either of the following sanctions or remedial measures on any employee who is convicted of a drug or alcohol abuse offense occurring in the workplace:

(1) Take appropriate personnel action against an employee, up to and including termination; or

(2) Require an employee to satisfactorily participate in a *bona fide* drug or alcohol abuse assistance or rehabilitation program; and

(k) Make a good faith effort to maintain a drug and alcohol free workplace through implementation of §§J(2)(a)-(j), above.

3. If the business is an individual, the individual shall certify and agree as set forth in §J(4), below, that the individual shall not engage in the unlawful manufacture, distribution, dispensing, possession, or use of drugs or the abuse of drugs or alcohol in the performance of the Contract.

4. I acknowledge and agree that:

(a) The award of the Contract is conditional upon compliance with **COMAR 21.11.08** and this certification;

(b) The violation of the provisions of **COMAR 21.11.08** or this certification shall be cause to suspend payments under, or terminate the Contract for default under **COMAR 21.07.01.11 or 21.07.03.15**, as applicable; and

(c) The violation of the provisions of **COMAR 21.11.08** or this certification in connection with the Contract may, in the exercise of the discretion of the Board of Public Works, result in suspension and debarment of the business under **COMAR 21.08.06**.

K. CERTIFICATION OF CORPORATION REGISTRATION AND TAX PAYMENT

I FURTHER AFFIRM THAT:

1. The business named above is a domestic ____ or foreign ✓ corporation registered in accordance with the Corporations and Associations Article, Annotated Code of Maryland, and that it is in good standing and has filed all of its annual reports, together with filing fees, with the Maryland State Department of Assessments and Taxation, and that the name and address of its resident agent filed with the State Department of Assessments and Taxation is:

Name: THE CORPORATION TRUST INC

Address: 32 SOUTH STREET

BALTIMORE, MD 21202

(If not applicable, so state)

2. Except as validly contested, the business has paid, or has arranged for payment of, all taxes due the State of Maryland and has filed all required returns and reports with the Comptroller of the Treasury, the State Department of Assessments and Taxation, and the Employment Security Administration, as applicable, and will have paid all withholding taxes due the State of Maryland prior to final settlement.

L. CONTINGENT FEES

I FURTHER AFFIRM THAT:
The business has not employed or retained any person, partnership, corporation, or other entity, other than a *bona fide* employee or agent working for the business to solicit or secure this agreement, and that the business has not paid or agreed to pay any person, partnership, corporation, or other entity, other than a *bona fide* employee or agent, any fee or any other consideration contingent on the making of this Contract.

M. ACKNOWLEDGEMENT

I ACKNOWLEDGE THAT:

This Affidavit is to be furnished to the Procurement Officer and may be distributed to units of: (1) the State of Maryland; (2) counties or other subdivisions of the State of Maryland; (3) other states; and (4) the Federal Government. I further acknowledge that this Affidavit is subject to applicable laws of the United States and the State of Maryland, both criminal and civil, and that nothing in this Affidavit or any contract resulting from the submission of this bid or proposal shall be construed to supersede, amend, modify or waive, on behalf of the State of Maryland, or any unit of the State of Maryland having jurisdiction, the exercise of any statutory right or remedy conferred by the Constitution and the laws of Maryland with respect to any misrepresentation made or any violation of the obligations, terms and covenants undertaken by the above business with respect to (1) this Affidavit; (2) the Contract; and (3) other Affidavits comprising part of the Contract.

I DO SOLEMNLY DECLARE AND AFFIRM UNDER THE PENALTIES OF PERJURY THAT THE CONTENTS OF THIS AFFIDAVIT ARE TRUE AND CORRECT TO THE BEST OF MY KNOWLEDGE, INFORMATION, AND BELIEF.

as the General Contractor, in performing the above-referenced Contract, we shall make every effort to achieve a minimum goal as specified in the Technical Provisions. The Disadvantaged Business Enterprise (DBE) participation goal is measured by the dollar value of the Contract, including any modifications or change orders executed subsequent to the award of the Contract.

C. IT IS ACKNOWLEDGED:
That all required documentation relative to affirmative action taken by the General Contractor to seek out and consider the use of Minority Business Enterprise will be submitted to and/or made available for inspection by the Maryland Department of Transportation.

D. I ACKNOWLEDGE:

That this Affidavit is to be furnished to the Secretary of the Maryland Department of Transportation and may be distributed to boards, commissions, administrations, departments and agencies of: (1) the State of Maryland; and (2) counties or other subdivisions of the State of Maryland; and (3) other states; and (4) the Federal Government. I further acknowledge that this Affidavit is subject to applicable laws of the United States and the State of Maryland, both criminal, and civil, and that nothing in this Affidavit or the Contract shall be construed to supersede, amend, modify or waive, on behalf of the Maryland Department of Transportation, the Maryland Board of Public Works and any other office or agency of the State of Maryland having jurisdiction, and the exercise of any statutory right or remedy conferred by the Constitution and the Laws of Maryland in respect to any misrepresentation made or any violation of the obligations, terms and covenants undertaken by the above firm in respect to (1) this Affidavit, (2) the Contract, and (3) other Affidavits comprising part of the proposal documents associated with the Contract.

IN MAKING THIS AFFIDAVIT, I represent that I have personal knowledge of the matters and facts herein stated.

I DO SOLEMNLY DECLARE AND AFFIRM UNDER THE PENALTIES OF PERJURY THAT THE CONTENTS OF THE FOREGOING DOCUMENT ARE TRUE AND CORRECT, AND THAT I AM AUTHORIZED, ON BEHALF OF THE ABOVE FIRM, TO MAKE THIS AFFIDAVIT.

Federal Tax ID or Social Security Number

PO Box 210 10711 Philadelphia Rd White Marsh, MD 21162

Address

MADE THIS 28th DAY OF May ,19 98

CONTRACT NUMBER: MAA-CO-97-019

CONTRACT TITLE: Midfield Terminal Complex Site Development, Phase I

BIDS DUE: May ~~12~~ 28 1998 at ~~11:00 A.M.~~ 2:00 PM RSF

Date and Time

BID OPENING: May ~~12~~ 28 1998 at ~~11:15 A.M.~~ 2:15 PM RSF

Date and Time

A. TIME OF COMPLETION:

1. **Base Bid**

The contract duration for completion of this project, including mobilization will be as follows:

Base Project:	230 calendar days
Base Project+Add Alternate 1:	260 calendar days
Base Project+Add Alternate 2:	260 calendar days
Base Project+Add Alternate 3:	275 calendar days

The successful bidder will be required to begin work immediately following Notice to Proceed.

B. BASIS OF AWARD:

The Maryland Aviation Administration reserves the right to award the Contract to the lowest responsive and responsible bidder on the basis of one of the following:

1. The lowest total price bid for the **Base Project**, or

2. The lowest total price bid for the **Base Project** and **Add Alternate 1**, or

3. The lowest total price bid for the **Base Project** and **Add Alternate 2**, or

4. The lowest total price bid for the **Base Project** and **Add Alternate 3**.

C. NOTICE OF AWARD:

Notice of award as described in General Provisions, Sections **GP-2.19** and **GP-3.01** will be issued within one hundred and twenty (120) days of bid opening.

D. BID GUARANTY:

Five percent (5%) of total bid (Not required when bid is less than One Hundred Thousand Dollars ($100,000.00)).

TO THE MARYLAND DEPARTMENT OF TRANSPORTATION,
MARYLAND AVIATION ADMINISTRATION

GENTLEMEN:

A. The undersigned hereby declares to have carefully examined the Contract Documents entitled:

Contract Number: MAA-CO-97-019

Contract Title: Midfield Terminal Complex Site Development, Phase I

and to have examined the other Contract Documents (including the Standard Provisions, Addendum(s), Bid Forms, and Contract Forms), and to have carefully inspected the site(s) whereon the proposed work is to be performed.

B. The undersigned proposes and agrees to furnish all labor, materials, equipment and services necessary for the above said project for the Maryland Aviation Administration in accordance with the Specifications, and other Contract Documents including:

1. Addendum(s) issued by the Maryland Aviation Administration,

   Number(s): 1, 2, 3, 4, 5, 6, 7 , and

2. Standard Provisions

   Volume: 1 , Date: December 1993

at the Unit Prices Bid as delineated on the Bid Tabulation Forms, or at the Lump Sum Price Bid as stipulated in the Contract Documents.

C. The prices shown on the Bid Tabulation Forms for the Contract entitled:

Contract Number: MAA-CO-97-019

Contract Title: Midfield Terminal Complex Site Development, Phase I

include and cover the furnishing of all materials and labor requisite and proper, and the providing of all necessary machinery, tools, apparatus, and means for performing the work, as set forth, described, and shown in the Contract Drawings, Specifications and other Contract Documents.

D. The undersigned affirms that Bid has been executed in accordance with General Provisions, Section **GP-2.06**, titled "Preparation of Bid".

FOR CORPORATIONS:

A. The undersigned Corporation affirms that it is ✓ is not ____ registered with the Maryland State Department of Assessments and Taxation and, if registered, is in good standing.

B. If not registered with the Maryland State Department of Assessments and Taxation, see Special Provision, Section **SP-2.03**, titled "Corporate Registration".

MARTIN STATE AIRPORT

MARYLAND DEPARTMENT OF TRANSPORTATION
MARYLAND AVIATION ADMINISTRATION
DIVISION OF ENGINEERING

MARTIN STATE AIRPORT

PROJECT TITLE: MIDFIELD TERMINAL COMPLEX SITE DEVELOPMENT PHASE I

SHEET TITLE: DRAWING INDEX

SCALE: NO SCALE

DATE: September 08, 1998

PROJECT NO.: MAA-CO-97-019

SHEET NO.: G-02

GENERAL NOTES

1. THIS PROJECT SHALL BE CONSTRUCTED IN ACCORDANCE WITH THE CONTRACT PLANS AND SPECIFICATIONS AND ANY RULES, REGULATIONS, STANDARDS OR SPECIFICATIONS REFERENCED THEREIN. THE PROJECT IS SUBJECT TO INSPECTION BY REPRESENTATIVES OF THE MARYLAND AVIATION ADMINISTRATION (MAA) AND THE MARYLAND DEPARTMENT OF THE ENVIRONMENT (MDE).

2. MARTIN STATE (MTN) AIRPORT WILL BE IN OPERATION DURING THE CONSTRUCTION OF THE PROJECT. COORDINATION OF WORK WITH MAA IS MANDATORY TO MINIMIZE IMPACTS ON AIRPORT OPERATIONS.

3. CONSTRUCTION AND MAINTENANCE OPERATIONS BY OTHERS WILL OCCUR CONCURRENTLY, AND AT TIMES IN THE VICINITY OF CONSTRUCTION ASSOCIATED WITH THIS CONTRACT. THE CONTRACTOR SHALL COORDINATE HIS OPERATIONS AND COOPERATE WITH MAINTENANCE CREW AND OTHERS CONTRACTORS WORKING ON THE AIRPORT. COORDINATION WITH APPROPRIATE GOVERNMENT AND UTILITY AGENCIES IS ALSO REQUIRED.

4. ACCESS TO THE SITE – THE CONTRACTOR'S ACCESS POINTS TO THE SITE ARE SHOWN ON THE PLAN. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL CONSTRUCTION VEHICLES AND PERSONNEL WHO ENTER AT THESE POINTS.

5. HAUL ROUTES – LOCATION OF HAUL ROUTES ON THE AIRPORT SITE WILL BE SPECIFIED AT THE PRE-BID MEETING. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO COORDINATE OFF-SITE HAUL ROUTES (STATE HIGHWAYS, COUNTY ROADS, OR CITY STREETS) WITH THE APPROPRIATE OWNER WHO HAS JURISDICTION OVER THE AFFECTED ROUTE. ON-SITE HAUL ROUTES SHALL BE MAINTAINED BY THE CONTRACTOR AND SHALL BE RESTORED TO THE ORIGINAL CONDITION UPON COMPLETION OF BEING USED AS A HAUL ROUTE. THE BEFORE AND AFTER CONDITION OF ON-SITE HAUL ROUTES SHALL BE JOINTLY INSPECTED AND DETERMINED BY THE CONTRACTOR AND THE ENGINEER. CONSTRUCTION (FENCING, GRADING, DRAINAGE, ETC.)REQUIRED FOR TEMPORARY HAUL ROUTES OR ACCESS POINTS ON THE AIRPORT WILL BE THE CONTRACTOR'S TOTAL RESPONSIBILITY AND SHALL BE APPROVED BY THE ENGINEER PRIOR TO COMMENCING THE WORK. ALL ON-SITE ACCESS ROADS TO THE T-HANGARS AND OTHER AIRPORT FACILITIES SHALL REMAIN OPEN AND MAINTAINED AT ALL TIME.

6. STAGING AREAS – CONTRACTOR'S STAGING AREA(S) WILL BE SPECIFIED AT THE PRE-BID MEETING. CONTRACTOR'S STAGING AREA(S) SHALL BE RETURNED TO ITS ORIGINAL CONDITION UPON COMPLETION.

7. WASTE MATERIALS (i.e. TREES, STUMPS, EXCESS SOIL, ETC.) SHALL BE DISPOSED OF OFF AIRPORT PROPERTY. TRASH (i.e. CUPS, CANS, ETC.) SHALL BE DISPOSED OF THROUGH PROPER SANITARY METHODS.

8. SAFETY – THE CONTRACTOR SHALL CONDUCT HIS ACTIVITIES IN A SAFE MANNER AS SPECIFIED IN THE "SAFETY REQUIREMENTS DURING CONSTRUCTION" SECTION.

9. PROTECTION AND REPAIR OF DAMAGE TO EXISTING CABLES AND UTILITIES – LOCATION OF KNOWN EXISTING AIRPORT UNDERGROUND CABLES AND UTILITIES ARE SHOWN ON THE PLANS FROM AVAILABLE RECORDS AND MUST BE VERIFIED BY THE CONTRACTOR. TEST PITS ARE REQUIRED TO VERIFY UTILITY LOCATIONS NOT SHOWN ON THE PLANS, BUT EVIDENT FROM ADJACENT FACILITIES (LIGHTING POSTS, MANHOLES, ETC.) REPAIR OF DAMAGED CABLE/PIPE MUST BE STARTED IMMEDIATELY AND CONTINUED UNTIL COMPLETED. ALL SUCH REPAIRS SHALL BE IN ACCORDANCE WITH THE SPECIFICATIONS AND SHALL BE THE CONTRACTOR'S EXPENSE. IF FAA CABLES ARE DAMAGED, REPAIRS SHALL BE DONE IN ACCORDANCE WITH FAA REQUIREMENTS AND IN THE PRESENCE OF AN FAA REPRESENTATIVE. THE FAA MAY ELECT TO HAVE THE REPAIR PERFORMED BY OTHERS IN WHICH CASE THE CONTRACTOR SHALL BE RESPONSIBLE FOR PAYING THE INCURRED COSTS OF REPAIRS.

10. EXISTING AIRFIELD LIGHTING SYSTEMS – INTERRUPTION TO EXISTING AIRFIELD LIGHTING SYSTEMS NOT INCLUDED IN THIS PROJECT SHALL NOT BE PERMITTED. ALL AIRFIELD LIGHTING CIRCUITS AFFECTED BY THIS PROJECT SHALL BE TEMPORARILY MAINTAINED BY THE CONTRACTOR DURING OPERATIONAL PERIODS IN ACCORDANCE WITH THE SPECIFICATIONS AND/OR AS DIRECTED BY THE ENGINEER.

11. PORTABLE FLOODLIGHTING – THE CONTRACTOR SHALL PROVIDE PORTABLE FLOODLIGHTING AS REQUIRED FOR CONSTRUCTION OPERATIONS. THE CONTRACTOR SHALL PROVIDE SUFFICIENT UNITS SO THAT ALL WORK AREAS ARE ILLUMINATED TO A LEVEL OF FIVE (5) HORIZONTAL FOOT CANDLES. THE LIGHTING LEVEL SHALL BE CALCULATED AND MEASURED IN ACCORDANCE WITH THE CURRENT STANDARD OF THE ILLUMINATION ENGINEERING SOCIETY. COORDINATE THE USE OF FLOODLIGHTING WITH THE CONTROL TOWER TO ENSURE LIGHT DOES NOT COMPROMISE THE CONTROL TOWER'S VISIBILITY, OR CREATE CONFUSION FOR THE PILOTS.

12. THE CONTRACTOR SHALL OBTAIN ALL PERMITS AND LICENSES REQUIRED FOR FOR THE PROJECT'S WORK AT HIS OWN EXPENSE.

13. EXISTING TOPOGRAPHIC FIELD SURVEYS FOR THIS PROJECT AREA WERE PERFORMED BY A. MORTON THOMAS AND ASSOCIATES, INC. IN 1997.

14. THE CONTROLS ON THIS PROJECT ARE TIED TO :
HORIZONTAL: MARYLAND COORDINATE SYSTEM.
VERTICAL: NATIONAL GEODETIC VERTICAL DATUM 1929.

15. FOR WETLAND MITIGATION PLANS AND SPECIFICATIONS, SEE WETLAND MITIGATION PLAN AND SPECIFICATION SETS BY URS GREINER, INC. UNDER SEPARATE COVER.

16. FOR LIMIT OF BASE PROJECT, AND EACH ALTERNATE, THE CONTRACTOR IS REQUIRED TO FOLLOW SHEETS G-08 THROUGH G-11, D-01 THROUGH D-06, ALL A-SERIES, AND ALL C-SERIES SHEETS.

CONSTRUCTION NOTES

1. THE FOLLOWING NOTES ALONG WITH THE GENERAL AND SAFETY REQUIREMENTS DURING CONSTRUCTION NOTES WILL ALERT THE CONTRACTOR TO AIRPORT OPERATING REQUIREMENTS AND PROCEDURES, AND WILL ENSURE THAT THE EFFECTS OF CONSTRUCTION ON AIRPORT OPERATIONS AND USERS WILL BE MINIMIZED.

2. THE WORK TO BE COMPLETED IN THIS PROJECT WILL DISRUPT AIRCRAFT OPERATIONS AT MTN AIRPORT. THEREFORE, THE LENGTH OF TIME THAT THE CONTRACTOR WILL BE ALLOWED TO PERFORM THE WORK IN OPERATIONAL AREAS MUST BE REDUCED TO THE MINIMUM PRACTICAL TIME.

3. THE PROJECT IS TO BE COMPLETED IN CLOSE CONFORMANCE WITH THE CONSTRUCTION PLANS AND SHALL BE CONSTRUCTED IN A TIMELY MANNER IN ACCORDANCE WITH THE CONTRACTOR'S APPROVED PROJECT SCHEDULE.

4. IT IS THE INTENT OF THIS CONTRACT THAT THE WORK WILL BE PERFORMED WITHIN THE CONSTRUCTION TIMES SPECIFIED AND THAT NO EXTENSION WILL BE GRANTED FOR INCLEMENT WEATHER. CONTRACTOR MUST ANTICIPATE INCLEMENT WEATHER AND TAKE NECESSARY ACTION TO COMPLETE THE WORK IN ACCORDANCE WITH THE PLANS AND SPECIFICATIONS DESPITE ANY INCLEMENT WEATHER.

5. THE MOST CRITICAL PORTION OF THE PROJECT AFFECTING AIRPORT OPERATIONS IS THE CONSTRUCTION OF NEW PAVEMENT AND DRAINAGE ITEMS WITHIN THE SAFETY AREA OF THE EXISTING TAXIWAY AND T-HANGARS. THE WORK WILL REQUIRE THE TEMPORARY DAILY CLOSURES OF THESE FACILITIES WHICH WILL SERIOUSLY CURTAIL THE GENERAL AVIATION TRAFFIC AT THE AIRPORT. THEREFORE, SPECIAL PHASING AND CONSTRUCTION TECHNIQUES (INCLUDING MULTI-SHIFT CONSTRUCTION) WILL BE REQUIRED TO LIMIT THE TIME OF DAILY CLOSURES TO THE MINIMUM POSSIBLE.

6. OTHER CONSTRUCTION CONTRACTS WITHIN THE AIRPORT, SOME IMMEDIATELY ADJACENT TO THIS CONTRACT, HAVE BEEN OR WILL BE UNDERTAKEN DURING THE TIME WHICH THIS PROJECT WILL BE CONSTRUCTED. THE CONTRACTOR SHALL COOPERATE AND COORDINATE WITH CONTRACTORS WORKING IN ADJACENT AREAS.

7. IT IS INTENDED THAT EQUIPMENT AND MATERIALS NEEDED FOR THE CONSTRUCTION WILL BE STORED IN THE DESIGNATED CONTRACTOR'S STAGING AREA. EQUIPMENT AND MATERIALS NECESSARY AT THE WORK AREAS SHALL BE TRANSPORTED TO THOSE AREAS ONLY AS NECESSARY TO MEET APPROVED SCHEDULES OR AS APPROVED BY THE ENGINEER.

8. THE CONTRACTOR SHALL PROVIDE TIMBER OR BARREL-TYPE CONSTRUCTION BARRICADES WITH FLASHING YELLOW LIGHTS TO DELINEATE THE WORK AREAS WHEN THESE AREAS ARE CLOSED TO AIRPORT TRAFFIC. THESE BARRICADES SHALL BE PLACED AS DIRECTED BY THE ENGINEER. THE BARRICADE TYPE USED SHALL BE AS DESIGNATED BY THE ENGINEER.

SAFETY REQUIREMENTS DURING CONSTRUCTION

(A) FEDERAL AVIATION ADMINISTRATION (FAA) ADVISORY CIRCULARS (AC) AND ORDERS AND FEDERAL AVIATION REGULATIONS (FAR)

THE FOLLOWING PUBLICATIONS CONTAIN DEFINITIONS/DESCRIPTIONS OF CRITICAL AIRPORT OPERATING AREAS. THE AREAS DEFINED BELOW PERTAIN TO AIRFIELD SAFETY REQUIREMENTS AND ARE REFERENCED THROUGHOUT THE CONTRACT DOCUMENTS. COPIES OF THESE PUBLICATIONS ARE AVAILABLE THROUGH THE FAA AND CAN BE REVIEWED AT MARYLAND AVIATION ADMINISTRATION OFFICES.

(1) ORDER EA 5210.1 "SAFETY REQUIREMENTS ON AIRPORT DURING AGENCY FUNDED CONSTRUCTION AND MAINTENANCE ACTIVITIES," CURRENT EDITION: ESTABLISHED EASTERN REGION AIRPORT SAFETY STANDARDS FOR FAA-FUNDED CONSTRUCTION. THE SAFETY REQUIREMENTS WHICH ARE CONTAINED IN THE FOLLOWING SECTIONS ARE DEVELOPED TO MEET THE NEEDS OF THIS CONTRACT AND ARE BASED ON THIS ORDER AND THE REMAINING PUBLICATIONS DESCRIBED. WHERE THE PUBLICATIONS ARE IN CONFLICT, THE MOST RESTRICTIVE REQUIREMENT SHALL BE MET.

(2) AC 150/5370-2, "OPERATIONAL SAFETY ON AIRPORTS DURING CURRENT EDITION: CONSTRUCTION," SETS FORTH GUIDELINES TO ASSIST OPERATIONS IN COMPLYING WITH FAR PART 139, "CERTIFICATION AND OPERATION/LAND AIRPORTS SERVING CERTAIN AIR CARRIERS" AND WITH FEDERALLY FUNDED REQUIREMENTS OF CONSTRUCTION PROJECTS.

(3) FAR PART 77, "OBJECTS AFFECTING NAVIGABLE AIRSPACE," CURRENT EDITION:

(a) ESTABLISHES STANDARDS FOR DETERMINING OBSTRUCTIONS TO NAVIGABLE AIRSPACE. CIVIL AIRPORT IMAGINARY SURFACES ARE DEFINED IN THE PUBLICATION.

(b) SETS FORTH REQUIREMENTS FOR NOTICE OF CERTAIN PROPOSED CONSTRUCTION OR ALTERATION. NOTICE OF CONSTRUCTION PROVIDES A BASIS FOR RECOMMENDATIONS FOR IDENTIFYING THE CONSTRUCTION IN ALTERATION IN ACCORDANCE WITH AS 70f7460-1, OBSTRUCTION "MARKING AND LIGHTING," CURRENT EDITION.

(4) AC 150/5300-12, "AIRPORT DESIGN STANDARDS-TRANSPORT AIRPORTS" AND AC 150/5300-4, "UTILITY AIRPORTS – AIR ACCESS TO NATIONAL TRANSPORTATION," CURRENT EDITION: ESTABLISH DESIGN, OPERATIONAL AND MAINTENANCE STANDARDS FOR TRANSPORT AND UTILITY AIRPORTS, STANDARD TERMS USED IN THE CONTRACT PLANS AND SPECIFICATIONS ARE DEFINED BELOW:

(a) OBSTACLE FREE ZONE (OFZ) – A VOLUME OF SPACE WHICH IS FREE OF ALL FIXED OBJECTS AND CLEAR OF VEHICLES IN THE PROXIMITY OF AN AIRPLANE CONDUCTING AN APPROACH, MISSED APPROACH, LANDING, TAKEOFF, OR DEPARTURE.

(b) SAFETY AREA – THE SURFACE ADJACENT TO RUNWAYS, TAXIWAYS, AND TAXILANES OVER WHICH AIRCRAFT SHOULD, IN DRY WEATHER, BE ABLE TO CROSS AT NORMAL OPERATING SPEEDS WITHOUT INCURRING SIGNIFICANT DAMAGE. A SAFETY AREA IS GRADED, DRAINED AND COMPACTED. IT IS FREE OF ANY HOLES, TRENCHES, HUMPS OR OTHER SIGNIFICANT SURFACE VARIATIONS OR OBJECTS, OTHER THAN THOSE WHICH MUST BE THERE BECAUSE OF THEIR ESSENTIAL AERONAUTICAL FUNCTION. THE SAFETY AREA REQUIRES THE CAPABILITY OF SUPPORTING MAINTENANCE, FIRE FIGHTING, AND RESCUE VEHICLES UNDER NORMAL (DRY) CONDITIONS.

(B) GENERAL SAFETY REQUIREMENTS

(1) THE CONTRACTOR SHALL ACQUAINT HIS SUPERVISORS AND EMPLOYEES WITH THE AIRPORT ACTIVITY AND OPERATIONS THAT ARE INHERENT TO MTN AIRPORT AND SHALL CONDUCT HIS CONSTRUCTION ACTIVITIES TO CONFORM TO ALL ROUTINE AND EMERGENCY AIR TRAFFIC REQUIREMENTS AND GUIDELINES FOR SAFETY SPECIFIED HEREIN.

(2) DURING PERFORMANCE OF THIS CONTRACT, THE AIRPORT TAXIWAYS, TAXILANES, AND GENERAL AVIATION PARKING APRONS SHALL REMAIN IN USE BY AIRCRAFT TO THE MAXIMUM EXTENT POSSIBLE. ALL AIRCRAFT TRAFFIC ON THESE AREAS SHALL HAVE PRIORITY OVER THE CONTRACTOR TRAFFIC. MAA RESERVES THE RIGHT TO ORDER THE CONTRACTOR AT ANY TIME TO VACATE THE AREA NECESSARY TO MAINTAIN SAFE AIRCRAFT OPERATIONS. USE OF AREAS NEAR THE CONTRACTOR'S WORK WILL BE CONTROLLED TO MINIMIZE DISTURBANCE TO THE CONTRACTOR'S OPERATION. THE CONTRACTOR SHALL NOT ALLOW SUBCONTRACTORS, SUPPLIERS, OR ANY OTHER UNAUTHORIZED PERSON TO ENTER OR REMAIN IN ANY AIRPORT AREA WHICH WOULD BE HAZARDOUS TO PERSONS OR TO AIRCRAFT OPERATIONS.

(3) ALL WORK TO BE PERFORMED WHICH IS TOO CLOSE TO AN ACTIVE RUNWAY, TAXIWAY OR APRON UNDER OPERATIONAL CONDITIONS SHALL BE PERFORMED WHEN THE RUNWAY, TAXIWAY OR APRON IS NOT IN USE. SUCH WORK SHALL NOT BE ACCOMPLISHED WITHOUT PRIOR PERMISSION FROM THE ENGINEER. REQUESTED CLOSING SHALL BE DIRECTED TO THE ENGINEER AT LEAST 48 HOURS IN ADVANCE. WHEREVER POSSIBLE CLOSURE WILL BE SCHEDULED TO ALLOW DAY TIME WORK BY THE CONTRACTOR. HOWEVER, DUE TO AIR TRAFFIC CONSTRAINTS, CLOSURE OF ACTIVE AIRFIELD AREAS MAY BE LIMITED TO NIGHTTIME HOURS.

(C) CONSTRUCTION AND FACILITIES MAINTENANCE

(1) THE CONTRACTOR SHALL BE AWARE OF AND TAKE STEPS TO PREVENT THE FOLLOWING TYPES OF SAFETY PROBLEMS AND/OR HAZARDS:

(a) TRENCHES, HOLES, OR EXCAVATIONS ON OR ADJACENT TO ANY OPEN RUNWAY OR IN SAFETY AREAS.

(b) UNMARKED AND UNLIGHTED HOLES OR EXCAVATION IN ANY APRON, OPEN TAXIWAY, OPEN TAXILANE, OR RELATED SAFETY AREA.

(c) MOUNDS OR PILES OF EARTH, CONSTRUCTION MATERIALS, TEMPORARY STRUCTURES, OR OTHER OBJECTS IN THE VICINITY OF THE OPEN RUNWAY, TAXIWAYS, TAXILANES, OR IN A RELATED SAFETY APPROACH, OR DEPARTURE AREA.

(d) VEHICLES OR EQUIPMENT (WHETHER OPERATING OR IDLE) ON ANY OPEN RUNWAY, TAXIWAY, TAXILANE, OR IN ANY RELATED SAFETY, APPROACH, OR DEPARTURE AREA.

(e) VEHICLES, EQUIPMENT, EXCAVATIONS, STOCKPILES, OR OTHER MATERIALS WHICH COULD DEGRADE OR OTHERWISE INTERFERE WITH ELECTRONIC SIGNALS FROM RADIOS OR ELECTRONIC NAVIGATIONAL AIDS.

(f) PAVEMENT DROP-OFFS OR PAVEMENT TURF-LIPS (EITHER PERMANENT OR TEMPORARY) WHICH COULD CAUSE DAMAGE TO AIRCRAFT, IF CROSSED AT NORMAL OPERATING SPEED. THE NORMAL MAXIMUM IS 1-1/2 INCHES FOR EITHER.

(g) UNMARKED UTILITY, NAVAID, WEATHER SERVICES, LIGHTING, OR OTHER POWER OR SIGNAL CABLES THAT COULD BE DAMAGED DURING CONSTRUCTION.

(h) OBJECTS (WHETHER OR NOT MARKED OR FLAGGED) OR ACTIVITIES ANYWHERE ON OR IN THE VICINITY OF AIRPORT WHICH COULD BE DISTRACTING, CONFUSING, OR ALARMING TO PILOTS DURING AIRCRAFT OPERATIONS.

(i) UNFLAGGED/UNLIGHTED LOW VISIBILITY ITEMS (SUCH AS TALL CRANES, DRILLS, AND THE LIKE) ANYWHERE IN THE VICINITY OF ACTIVE RUNWAYS, OR IN ANY APPROACH OR DEPARTURE AREA.

(j) MISLEADING OR MALFUNCTIONING OBSTRUCTION LIGHTS, OR UNLIGHTED/UNMARKED OBSTRUCTIONS IN THE APPROACH TO ANY ACTIVE RUNWAY.

(k) INADEQUATE APPROACH/DEPARTURE SURFACES (NEEDED TO ASSURE ADEQUATE LANDING/TAKEOFF CLEARANCE OVER OBSTRUCTIONS, OR WORK OR STORAGE AREAS).

(l) INADEQUATE, CONFUSING OR MISLEADING (TO USER PILOTS) MARKING/LIGHTING OF RUNWAYS, TAXIWAYS, OR TAXILANES (INCLUDING DISPLACED OR THRESHOLD).

(m) WATER, SNOW, DIRT, DEBRIS, OR OTHER TRANSIENT ACCUMULATION WHICH TEMPORARILY OBSCURES PAVEMENT MARKING, PAVEMENT EDGES, OR DEGRADES VISIBILITY OF RUNWAY/TAXIWAY MARKING, OR LIGHTING, OR OF CONSTRUCTION AND MAINTENANCE AREAS.

(n) INADEQUATE OR IMPROPER METHODS OF MARKING, BARRICADING, AND LIGHTING OF TEMPORARILY CLOSED PORTIONS OF AIRPORT OPERATIONS AREA.

(o) TRASH OR OTHER MATERIALS WITH FOREIGN OBJECT DAMAGE (FOD) POTENTIAL, WHETHER ON RUNWAYS, TAXIWAYS, OR APRONS, OR IN RELATED SAFETY AREAS.

(p) INADEQUATE BARRICADING OR OTHER DELINEATION (MARKING, ETC.), TO SEPARATE CONSTRUCTION OR MAINTENANCE AREAS FROM OPEN AIRCRAFT OPERATING AREAS.

(q) FAILURE TO CONTROL VEHICLE AND HUMAN ACCESS TO, AND NONESSENTIAL NONAERONAUTICAL ACTIVITIES, IN ACTIVE AIRCRAFT OPERATING AREAS.

(r) FAILURE TO MAINTAIN RADIO COMMUNICATION BETWEEN CONSTRUCTION/MAINTENANCE VEHICLES AND AIR TRAFFIC CONTROL TOWER. GROUND CONTROL FREQUENCY OF 121.8 MHz IS TO BE UTILIZED.

(s) CONSTRUCTION/MAINTENANCE ACTIVITIES OR MATERIALS WHICH COULD HAMPER AIRCRAFT RESCUE AND FIRE FIGHTING (ARFF) VEHICLE ACCESS FROM ARFF STATIONS TO ALL PARTS OF THE RUNWAY/TAXIWAY SYSTEM, TO RUNWAY APPROACH AND DEPARTURE AREAS, AND TO AIRCRAFT PARKING LOCATIONS.

(t) BIRD ATTRACTANTS ON AIRPORT SUCH AS EDIBLES (FOOD SCRAPS ETC.) OR OTHER MISCELLANEOUS GARBAGE, OTHER TRASH, OR PONDED WATER ON AIRPORT.

(2) THE CONTRACTOR SHALL CONDUCT ACTIVITIES SO AS NOT TO VIOLATE ANY SAFETY STANDARDS CONTAINED HEREIN. THE CONTRACTOR SHALL INSPECT ALL CONSTRUCTION, STORAGE AND STAGING AREAS AS OFTEN AS NECESSARY TO BE AWARE OF CONDITIONS, AND PROMPTLY TAKE ALL STEPS NEEDED TO PREVENT/REMEDY ANY UNSAFE OR POTENTIALLY UNSAFE CONDITIONS OR ACTIVITIES DISCOVERED.

(3) BEFORE ACTUAL COMMENCEMENT OF CONSTRUCTION ACTIVITY, THE CONTRACTOR SHALL NOTIFY MAA, IN WRITING, AT LEAST 48 HOURS IN ADVANCE USING THE NOTICE TO AIRMEN (NOTAM) SYSTEM, OF PROPOSED TIME AND DATE OF COMMENCEMENT OF CONSTRUCTION IN SUCH AREAS.

UPON COMPLETION OF WORK, AND RETURN OF ALL SUCH AREAS TO STANDARD CONDITIONS, THE CONTRACTOR SHALL NOTIFY MAA, IN WRITING, USING THE NOTAM SYSTEM, OF COMPLETION OF CONSTRUCTION.

(D) MOTORIZED VEHICLE

ALL CONTRACTOR VEHICLES THAT ARE AUTHORIZED TO OPERATE ON THE AIRPORT OUTSIDE OF THE DESIGNATED CONSTRUCTION AREA LIMITS OR HAUL ROUTES AS SPECIFIED AND IN THE ACTIVE AIRCRAFT OPERATIONS AREA (AOA) SHALL DISPLAY IN FULL VIEW ABOVE THE VEHICLE A 3'X 3' OR LARGER , ORANGE AND WHITE CHECKERBOARD FLAG, EACH CHEKERBOARD COLOR BEING 1' SQUARE. ANY VEHICLE OPERATING IN THE ACTIVE AOA DURING THE HOURRS OF DARKNESS SHALL BE EQUIPPED WITH A FLASHING AMBER (YELLOW) DOME-TYPE LIGHT, MOUNTED ON TOP OF THE VEHICLE AND OF SUCH INTENSITY TO CONFORM TO LOCAL CODES FOR MAINTENANCE AND EMERGENCY VEHICLES. ALL CONTRACTOR VEHICLES SHALL HAVE THE FIRMS' NAME AND/OR LOGO PROMINENTLY DISPLAYED ON BOTH SIDES OF THE VEHICLE.

VEHICLES MAKING ONLY OCCASIONAL VISITS TO THE JOB SITE ARE EXEMPT FROM THE IDENTIFICATION REQUIREMENTS CONTAINED HEREIN ABOVE PROVIDED THAT THEY ARE ESCORTED INTO, THROUGH, AND OUT OF THE ACTIVE AOA AREAS BY A PROPERLY IDENTIFIED VEHICLE.

(E) RADIO COMMUNICATIONS

RADIO COMMUNICATIONS ARE REQUIRED BETWEEN THE CONTRACTOR'S REPRESENTATIVE AND THE AIR TRAFFIC CONTROL TOWER (ATCT). RADIO CONTACT IS REQUIRED AT ALL TIMES WHILE THEY ARE IN AN ACTIVE AIR OPERATIONS AREA (AOA) OF THE AIRPORT. RADIOS SHALL BE FURNISHED BY THE CONTRACTOR AND SHALL BE CAPABLE OF TRANSMITTING AND RECEIVING AT A FREQUENCY OF 121.8 MHz. SUFFICIENT RADIOS SHALL BE ON SITE AND OPERATING AT ALL TIMES SO THAT INSTRUCTIONS OR COMMUNICATIONS MAY BE DISPATCHED TO ALL CREWS AND/OR EQUIPMENT WORKING IN AN ACTIVE AOA WITHIN ONE MINUTE RECEIPT FROM THE ATCT.

(F) DEBRIS

DEBRIS, WASTE AND LOOSE MATERIAL (INCLUDING DUST AND DIRT) CAPABLE OF CAUSING DAMAGE TO AIRCRAFT LANDING GEAR, PROPELLERS, OR BEING INGESTED IN JET ENGINES SHALL NOT BE ALLOWED ON ACTIVE AIRCRAFT AREAS OR ADJACENT GRASSED AREAS. MATERIALS OBSERVED TO BE WITHIN THESE AREAS SHALL BE REMOVED IMMEDIATELY AND/OR CONTINUOUSLY BY THE CONTRACTOR DURING CONSTRUCTION.

(G) FLAGMEN

(1) THE CONTRACTOR SHALL FURNISH, AT HIS OWN EXPENSE, FLAGMEN AS NECESSARY TO CONTROL HIS TRAFFIC IN ACCORDANCE WITH THESE SPECIFICATIONS UNLESS OTHERWISE DIRECTED BY THE ENGINEER, IN WHICH CASE THE DIRECTION OF THE ENGINEER SHALL BE FOLLOWED.

ALL CONTRACTOR VEHICLES THAT ARE REQUIRED TO CROSS ACTIVE RUNWAYS, RAMP AREAS, TAXIWAYS AND APRONS SHALL DO SO UNDER THE DIRECT CONTROL OF A COMPETENT FLAGMAN WHO IS IN DIRECT RADIO CONTACT WITH GROUND CONTROL. ALL AIRCRAFT TRAFFIC ON RUNWAYS, RAMP AREAS, TAXIWAYS AND APRONS SHALL HAVE PRIORITY OVER CONTRACTOR'S TRAFFIC. RADIOS SHALL BE SUPPLIED BY THE CONTRACTOR AND SHALL BE CAPABLE OF TRANSMITTING AND RECEIVING AT A FREQUENCY OF 121.8 MHz.

WHERE PROJECT ACCESS REQUIRES TRAVEL ON, ACROSS OR ADJACENT TO RUNWAYS, RAMP AREAS, TAXIWAYS, OR AIRCRAFT APRONS, THE CONTRACTOR SHALL PROVIDE ADEQUATE PERSONNEL AND EQUIPMENT TO KEEP SUCH SURFACES CLEAR OF DEBRIS. AT NO TIME SHALL THE CONTRACTOR'S VEHICLES OR PERSONNEL BE ALLOWED TO ENTER OR CROSS ACTIVE RUNWAYS OR CLEAR ZONES WITHOUT PROPER AUTHORIZATION OBTAINED THROUGH GROUND CONTROL.

(H) MISCELLANEOUS

(1) OPEN FLAME, WELDING OR TORCH CUTTING OPERATIONS ARE PROHIBITED UNLESS ADEQUATE FIRE AND SAFETY PRECAUTIONS HAVE BEEN TAKEN AND THE PROCEDURE APPROVED.

(2) EQUIPMENT AND STOCKPILED MATERIAL SHALL BE CONSTRAINED IN A MANNER TO PREVENT MOVEMENT RESULTING FROM AIRCRAFT JET/PROPELLER BLAST OR WIND CONDITIONS.

(3) THE CONTRACTOR SHALL PROVIDE TIMBER, OR BARREL TYPE CONSTRUCTION BARRICADES WITH FLASHING YELLOW LIGHTS TO DELINEATE THE WORK AREAS WHEN THESE AREAS ARE CLOSED TO AIRPORT TRAFFIC. OPEN TRENCHES, EXCAVATIONS AND STOCKPILED MATERIAL LOCATED IN THE AOA SHALL BE PROMINENTLY MARKED WITH RED-FLAGS AND LIGHTED BY APPROVED LIGHT UNITS DURING HOURS OF RESTRICTED VISIBILITY AND DARKNESS.

(4) ALL MATERIALS AND EQUIPMENT WHEN NOT IN USE SHALL BE PLACED IN APPROVED AREAS WHERE THEY WILL NOT CONSTITUTE A HAZARD TO AIRCRAFT OPERATIONS AND NOT PENETRATE CLEARANCE SURFACES DEFINED IN FEDERAL AVIATION REGULATION, PART 77 (14 CRF PART 77). THE CONTRACTOR SHALL ADHERE TO THE REQUIREMENTS OF ORDER EA 5210.1, "SAFETY REQUIREMENTS ON AIRPORTS DURING CONSTRUCTION," CURRENT EDITION AND ADVISORY CIRCULAR 150/5370-2, "OPERATIONAL SAFETY ON AIRPORTS DURING CONSTRUCTION", CURRENT EDITION. WHERE PART 77, EA 5210.1 AND AC 150/5370-2 ARE IN CONFLICT, THE MOST RESTRICTIVE REQUIREMENTS SHALL BE MET.

(5) MAXIMUM EQUIPMENT HEIGHT SHALL NOT EXCEED 20 FEET UNLESS PRIOR APPROVAL IS OBTAINED FROM THE ENGINEER.

(6) THE ENGINEER WILL ARRANGE WITH AIRPORT OPERATIONS FOR INSPECTIONS PRIOR TO OPENING FOR AIRCRAFT USE ANY RUNWAY, TAXIWAY, RAMP AREA OR AIRPORT ROADWAY THAT HAS BEEN CLOSED FOR WORK ON, OR ADJACENT TO, OR THAT HAS BEEN USED FOR A CROSSING POINT OR HAUL ROUTE BY THE CONTRACTOR.

(7) THE CONTRACTOR SHALL PROVIDE THE ENGINEER WITH A CURRENT LIST OF ALL EMPLOYEES WORKING ON THE AIRPORT. THE LIST SHALL BE MAINTAINED CURRENT BY THE CONTRACTOR AND APPLIES TO BOTH CONTRACTOR AND SUBCONTRACTOR.

(8) THE CONTRACTOR SHALL FAMILIARIZE HIS PERSONNEL WITH CLEARANCES NEEDED TO PROVIDE FOR THE SAFE OPERATION OF RUNWAYS AND TAXIWAYS AS SHOWN IN THE PLAN.

(9) EXCEPT FOR EMERGENCIES, ALL CONTACT WITH AIRPORT PERSONNEL SHALL BE MADE THROUGH THE RESIDENT ENGINEER. FOR EMERGENCIES INVOLVING SAFETY (INJURIES, FIRES, ETC.) THE CONTRACTOR SHALL MAKE DIRECT CONTACT WITH AIRPORT OPERATIONS FOLLOWED BY NOTIFICATION TO THE RESIDENT ENGINEER AS SOON AS POSSIBLE.

(10) THE CONTRACTOR SHALL PROVIDE THE PHONE NUMBERS OF THREE PERSONNEL INCLUDING THE PROJECT SUPERINTENDENT, WHO MAY BE CONTACTED IN AN EMERGENCY. PERSONNEL SHALL BE ON CALL 24 HOURS PER DAY FOR MAINTAINING AIRPORT HAZARD LIGHTING AND BARRICADES.

UTILITIES

(1) UNDERGROUND UTILITIES: THE LOCATION OF THE UNDERGROUND UTILITIES SHOWN ON THE PLANS ARE CONSIDERED TO BE ONLY ESTIMATED LOCATIONS. ALL UTILITY LOCATIONS SHALL BE FIELD VERIFIED BE THE CONTRACTOR PRIOR TO COMMENCING CONSTRUCTION. IN THE EVENT ANY UTILITY IS DAMAGED THE CONTRACTOR SHALL BE RESPONSIBLE FOR PAYING FOR INCURRED COST OF REPAIRS.

(2) UTILITIES NOTIFICATION: AT LEAST TWO WORKING DAYS PRIOR TO COMMENCING CONSTRUCTION OPERATIONS IN AN AREA WHICH MAY INVOLVE UNDERGROUND UTILITY FACILITIES, THE CONTRACTOR SHALL NOTIFY THE RESIDENT ENGINEER, AND THE OWNER OF EACH UNDERGROUND UTILITY AFFECTED.

(3) THE FOLLOWING IS A LIST OF THE COMPANIES WITH POSSIBLE UTILITIES WITHIN THE CONSTRUCTION LIMITS.

UTILITY OWNERSHIP:

MISS UTILITY CENTER 1-800-257-7777

BALTIMORE GAS AND ELECTRIC COMPANY 1-410-234-5000

BELL ATLANTIC TELEPHONE

BELL ATLANTIC BURIED CABLE 800-254-2222

BELL ATLANTIC CABLE 800-257-7777

* FOR FIRE PROTECTION SYSTEM INSTALLATION CRITERIA SEE SHEET G-07.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED. IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

FIRE PROTECTION SYSTEM INSTALLATION GENERAL NOTES:

1. All fire protection system work and installation shall conform with the following codes and standards:

   Maryland Fire Laws, 1996 Edition;
   BOCA Fire Prevention Codes, 1993 Edition;
   1997 NF7A 13, 14, 20, 24, 25, 70, 72, 101, 111, and 170.

2. Prior to doing any "HOT WORK" at the site, a WELDING & BURNING PERMIT shall be obtained and complied with! This permit is acquired from the MAN office of Martin State Airport Operations (410-628-8831).

3. BOCA F-110.0, "Unsafe Conditions", and the MARYLAND FIRE LAWS shall be followed. Any UNSAFE acts or conditions observed or reported to FRS will be investigated, and where conditions are assessed unsafe a correction order will be executed (outlining requirements).

4. Safety and Security issues are separate. All issues relevant to security shall be discussed with a representative from the Airport Security Center on the upper level in the central main corridor or contact them Monday – Friday on 401-859-7124 or 410-682-8831.

5. The permit process begins by filing your submittals at the Maryland Aviation Administration office of CONSTRUCTION INSPECTIONS at BWI Airport on the ground level of A Pier, and they may be reached on 410.859.7637.

6. ALL INSPECTING, TESTING & MAINTENANCE appointments will be accomplished "via" the appropriate MAA Construction Inspector at 410-859-7637, Maintenance representative (410-682-8814), or the Parsons inspections team on 410-859-7484.

A. NEC 70, Article 700 Emergency Systems & 701 Standby Systems have been met in the past by the MAA facility practice; which is the use of the B.G.&E. Secondary power source grid NEC-70, 700.12(d) & NEC-70, 701.11(d), and/or by other code allowed Uninterruptible Power Supplies & Emergency Power Generator.

B. Conduit connectors shall be of the all-steel, corrosion-resistant, compression type, and or threaded in rigid steel conduit applications. The use of running threads and or set screw connectors shall not be permitted in exposed applications.

C. To ensure reliable and trouble-free service continuity in Facilities, the FM-AHJ considers that all spaces which are "Fire Sprinklered" are locations which shall be reviewed and inspected as potential "Wet Locations" (NEC-70, 73-2) and "Rain Tight Connectors" (NEC-70, 348.8) are required as well, for all exposed top entries. To assist in this compliance effort to ensure the safeguarding of Dependable Power and Emergency/Standby Power Sources (NEC 110,5.11 & 111, 5.1) details shall be followed. Seek written approval for the variance review of all other alternate considerations from the FM-AHJ & the Electrical Engineer at MAA Engineering.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED, IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

BASE PROJECT

1. SITE CLEARING AND GRUBBING, INCLUDING REMOVAL OF HAZARDOUS MATERIALS, DEMOLITION OF EXISTING BUILDINGS, AND REMOVAL OF THE EXISTING SOIL STOCKPILE.
2. CONSTRUCT PROPOSED ACCESS ROAD.
3. INSTALL UTILITY SERVICES AS FOLLOWS:
   - A. WATER (FOR DOMESTIC AND FIRE SUPPRESSION SYSTEMS)
   - B. SANITARY SEWER
   - C. ELECTRIC.
   - D. COMMUNICATIONS.
   - E. GAS MAIN.
   - F. CABLE TELEVISION.
4. CONSTRUCT POND 1.
5. CONSTRUCT WATER TANK AND PUMP HOUSE EQUIPMENT FOR FIRE SUPPRESSION SYSTEM.
6. CONSTRUCT STORM DRAINAGE SYSTEM BETWEEN ACCESS ROAD AND POND 1.
7. CONSTRUCT WETLANDS MITIGATION AREA (SEE WETLAND MITIGATION PLANS ATTACHED).

ESTIMATED EARTHWORK QUANTITIES		
UNSUITABLE EXCAVATION **	1,000	CY
UNCLASSIFIED EXCAVATION	11,800	CY
UNCLASSIFIED EXCAVATION (WETLAND MITIGATION)	13,500	CY
EXISTING STOCK PILE	7,500	CY
EMBANKMENT (PAVEMENT AREAS) *	1,100	CY
EMBANKMENT (GRADED AREAS)	30	CY

EMBANKMENT QUANTITIES ARE MEASURED IN PLACE AND EXCLUDE ANY SHRINKAGE AND SWELLING FACTORS.
* QUANTITY INCLUDES EXCAVATION OF ENTIRE DEPTH OF PAVEMENT SUBGRADE (18")
** QUANTITY INCLUDES WETLAND MITIGATION

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED, IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

ADD ALTERNATE 1

1. CONSTRUCT SKYTECH APRON, TAXIWAY L, ACCESS ROAD EXTENSION, PARKING LOT, AND ASSOCIATED ELECTRICAL APPURTENANCES.
2. CONSTRUCT PONDS 3A AND 3B.
3. CONSTRUCT STORM DRAINAGE SYSTEM BETWEEN APRON AND POND 3A. INSTALL OIL/WATER SEPARATOR AND ASSOCIATED STRUCTURES AT SKYTECH APRON ONLY. GRADE REMAINING AREAS 1 AND 2 WITHIN LIMIT OF WORK SHOWN AND INSTALL REMAINING STORM DRAINAGE SYSTEM.
4. CONSTRUCT STORM DRAINAGE SYSTEM FOR SKYTECH PARKING LOT.
5. AT LOCATIONS WHERE PROPOSED GRADING MEETS EXISTING GRADES AND A DIFFERENCE IN ELEVATION RESULTS DUE TO PHASING, THEN THE CONTRACTOR SHALL MEET THE EXISTING GRADE WITH A 2:1 SLOPE (MAX.)

ESTIMATED EARTHWORK QUANTITIES		
UNSUITABLE EXCAVATION	450	CY
UNCLASSIFIED EXCAVATION	21,700	CY
EMBANKMENT (PAVEMENT AREAS) *	12,300	CY
EMBANKMENT (GRADED AREAS)	26,000	CY

EMBANKMENT QUANTITIES ARE MEASURED IN PLACE AND EXCLUDE ANY SHRINKAGE AND SWELLING FACTORS.
* QUANTITY INCLUDES EXCAVATION OF ENTIRE DEPTH OF PAVEMENT SUBGRADE (18")

GENERAL NOTES:

1. THE TOPOGRAPHIC MAPPING SHOWN HEREON WAS COMPILED BY THE AIR SURVEY CORPORATION, 45180 BUSINESS COURT, STERLING VIRGINIA FROM AERIAL PHOTOGRAPHS OBTAINED ON 12/03/96.
2. THIS MAPPING WAS ENHANCED WITH FIELD MEASURED DATA AND ANNOTATED WITH TEXT LABELS AND SYMBOLS BY A. MORTON THOMAS AND ASSOCIATES, INC., REGISTERED PROFESSIONAL ENGINEERS AND LAND SURVEYORS, 12750 TWINBROOK PARKWAY, ROCKVILLE MD, 20852, TELEPHONE 301-881-2545, FAX 301-881-0814, PROJECT NO. 95036.03.
3. THE LIMITS OF THE AERIAL AND GROUND SURVEY PROPOSED ON DECEMBER 4, 1996 ARE SHOWN HEREON.
4. THE HORIZONTAL DATUM FOR THIS PROJECT IS NAD 83/91 BASED ON NGS MONUMENTS "MARTAIR", "MARTAIR AZ MK" AND "MTN A".
5. THE VERTICAL DATUM FOR THIS PROJECT IS NGVD 29 AND IS RELATED TO NGS MONUMENTS "MARTAIR", "MARTAIR AZ MK" AND "MTN A".
6. THE POSITION OF THE SUB-SURFACE UTILITIES SHOWN HEREON HAVE BEEN RELATED TO THE FOLLOWING
   A. AIR OR FIELD SURVEYED UTILITY FEATURES;
   B. FIELD SURVEYED DESIGNATED UTILITIES (PAINTED MARKS), WHEN AND IF FOUND.
   C. UTILITY LINES SHOWN ON COMPOSITE PLANS PROVIDED BY MAA, BGE, SHA, BALTIMORE COUNTY DEPARTMENT OF PUBLIC WORKS, TAMS, OTHER ENGINEERS, AND OTHER VARIOUS SOURCES.
   D. APPROXIMATE UTILITY LOCATIONS THAT WERE POINTED OUT IN THE FIELD BY THE MAA'S SENIOR MAINTENANCE STAFF MEMBER, GLENN PERIGORY.
7. THE FOLLOWING IS A PARTIAL LIST OF PLANS THAT WERE USED TO SHOW THE APPROXIMATE LOCATION OF SUB-SURFACE UTILITIES.
   - BGE GAS DISTRIBUTION PLANS ALONG WILSON POINT AND STRAWBERRY POINT ROADS NUMBERED BF-2-49, BF-2-59, BF-2-69 AND BF-2-73.
   - MAA ELECTRIC DISTRIBUTION PLANS ALONG WILSON POINT ROAD ENTITLED MARTIN BGE DRAWING DATED 2/01/91.
   - ELECTRIC PLANS ENTITLED OVERHEAD DISTRIBUTION, PREPARED BY GIPE ASSOCIATES, INC.
   - DUCTBANK PLANS ENTITLED SITEPLAN AND LEGEND PREPARED BY GIPE ASSOCIATES, INC., DATED 5/19/97 AND NUMBERED SAA-CO-95-009.
   - BALTIMORE COUNTY DPW WATER PLANS NUMBERED 90-1295 AND 90-1296.
   - BALTIMORE COUNTY DPW FORCE MAIN PLANS, SHEET 2 OF 3 JOB I-46-11 57-721.
8. THE POSITION OF THE FEW PROPERTY LINES SHOWN HEREON ARE RELATED TO SEVERAL BOUNDARY MARKERS FOUND. THE CORRECT POSITION OF THESE PROPERTY LINES CAN ONLY BE DETERMINED BY A COMPLETE EXAMINATION OF THE DOCUMENTS LISTED IN A TITLE REPORT (NOT SUPPLIED) AND A COMPLETE BOUNDARY SURVEY. THE WILSON POINT ROAD RIGHT OF WAY SHOWN HEREON IS BASED ON MD. SRC PLATS 1274, 3690 THRU 3693, 20343 THRU 20348 AND 24729 THRU 24736.
9. BEFORE CONSTRUCTION OR BEFORE A FINAL DESIGN OF IMPROVEMENTS HAS BEEN COMPLETED, OBTAIN THE SERVICES OF MISS UTILITY OR A SUB-SURFACE UTILITY ENGINEERING CONSULTANT TO VERIFY THE LOCATIONS AND DEPTHS OF THE TELEPHONE, ELECTRIC, GAS, WATER, FORCE SEWER, ETC. LINES AND PIPES SHOWN ON THIS PLAN. OTHER UTILITIES MAY EXIST THAT ARE NOT SHOWN HEREON.

SURVEYOR'S CERTIFICATION

I, GERARD J. LONG, HEREBY CERTIFY, TO THE BEST OF MY KNOWLEDGE, INFORMATION AND BELIEF, AND AS OF THE LATEST DATE SHOWN HEREON, THAT THE TOPOGRAPHIC MAPPING SHOWN HEREON IS CORRECT, THAT IT IS AN AERIAL TOPOGRAPHIC SURVEY THAT WAS ENHANCED WITH FIELD SURVEY MEASUREMENTS, THAT THE POSITION OF THE RIGHT OF WAY LINES SHOWN ALONG WILSON POINT ROAD ARE RELATED TO BOUNDARY AND RIGHT OF WAY MONUMENTS FOUND AND THAT THE LOCATIONS OF THE SUBSURFACE UTILITIES ARE RELATED TO THOSE ITEMS LISTED IN THE GENERAL NOTES SHOWN ON THIS PLAN.

THIS IS NOT A BOUNDARY SURVEY, SEE GENERAL NOTES. ONLY A LIMITED NUMBER OF PROPERTY AND EASEMENT LINES ARE SHOWN. A CURRENT TITLE REPORT WAS NOT FURNISHED. THIS PLAN IS SUBJECT TO ALL RIGHTS OF WAY AND EASEMENTS OF RECORD.

DATE: September 08, 1998

PROJECT NO.: MAA-CO-97-019

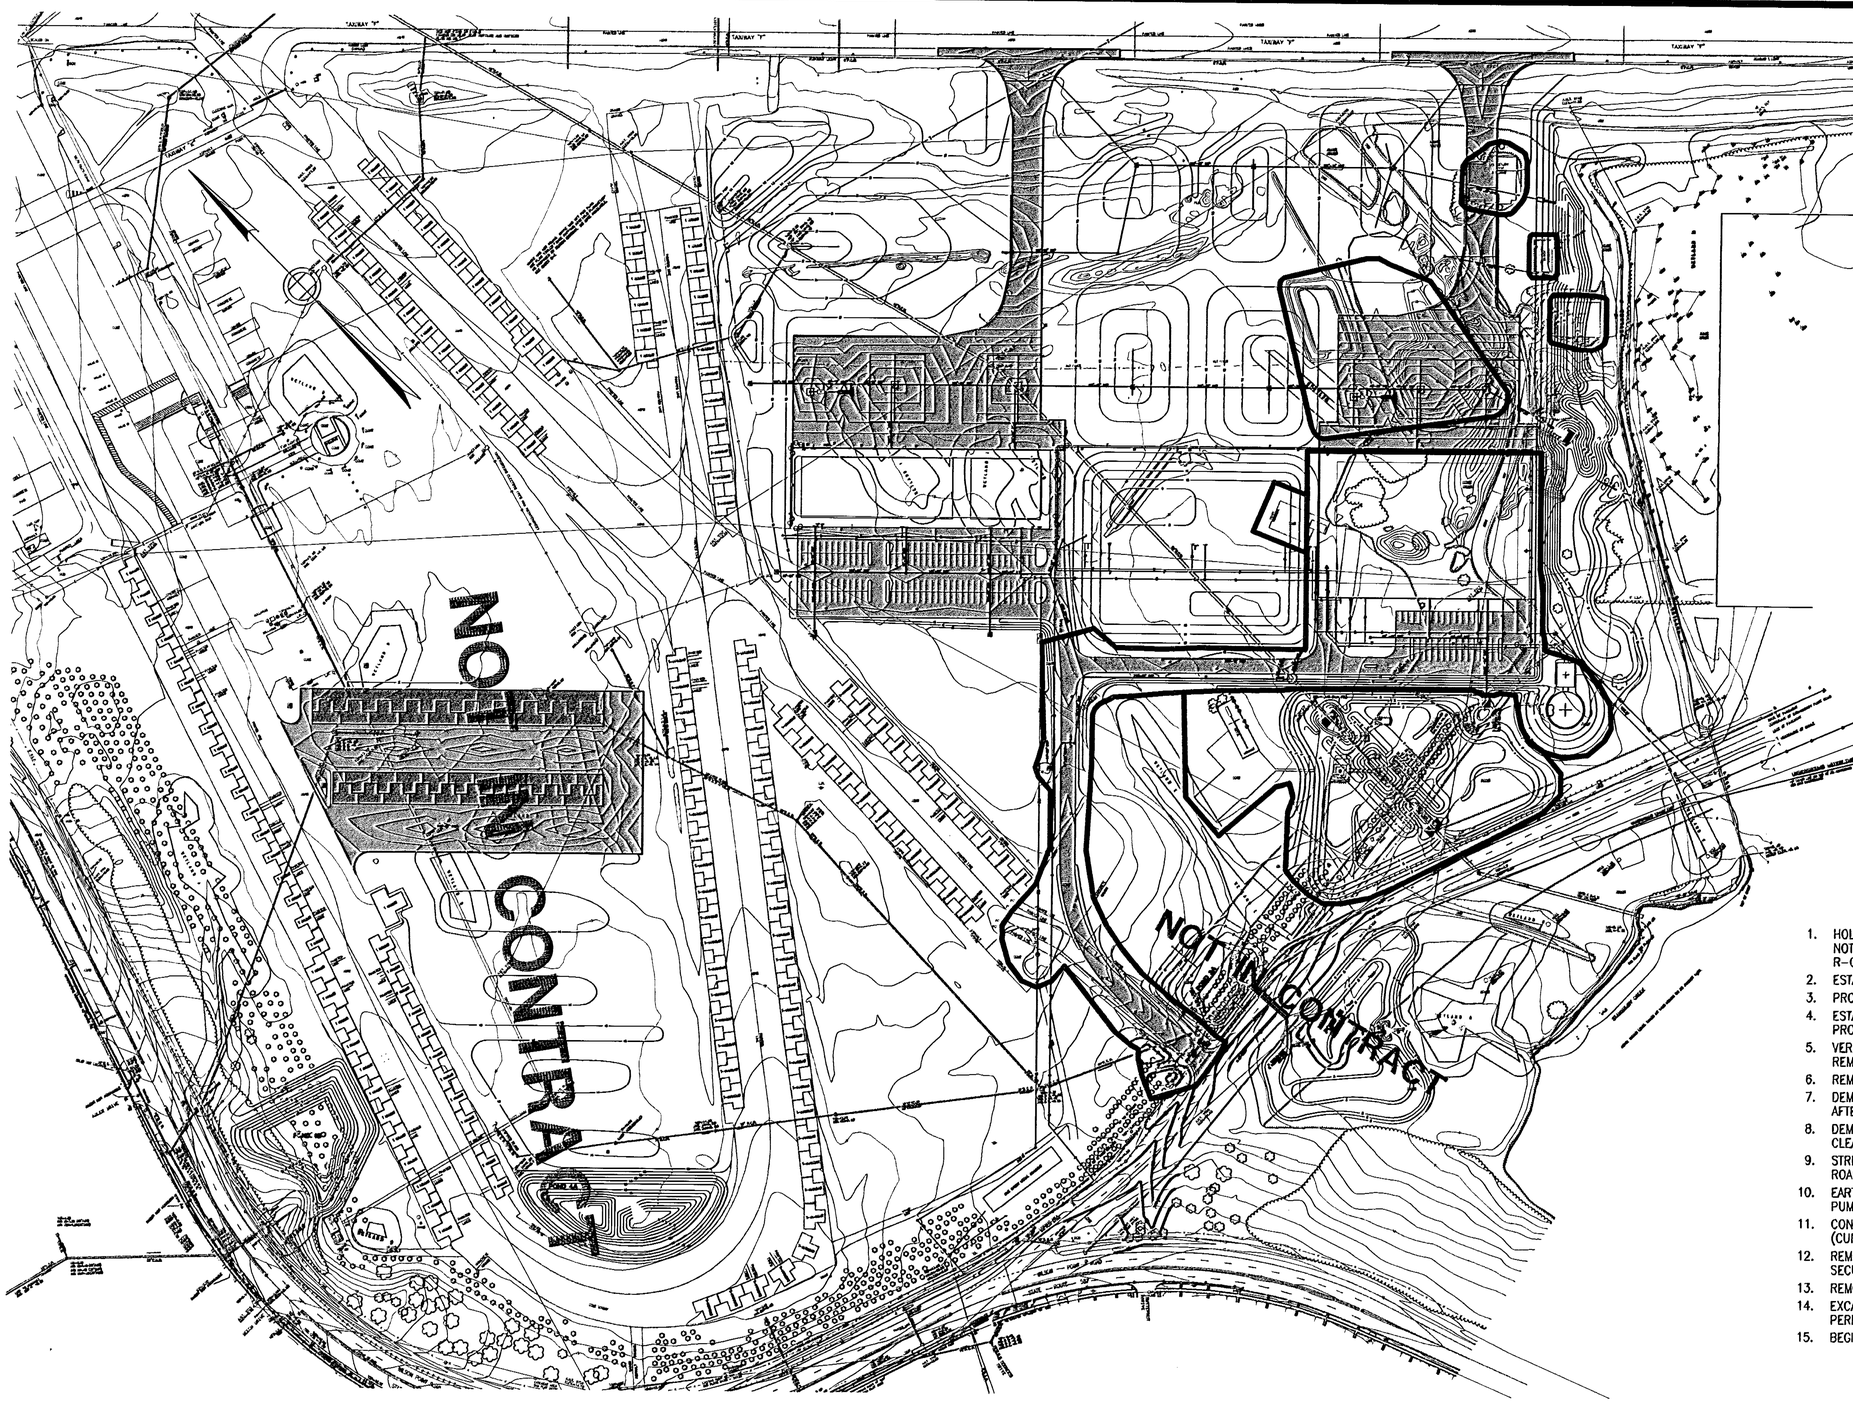
SHEET NO.: B-08



NOTE: THE WORK SHOWN ON THIS SHEET MUST BE COMLETED WITHIN 60 DAYS OF NOTICE TO PROCEED. SEE PART 1 OF THE SPECIFICATIONS FOR SPECIAL REQUIREMENTS.

AS BUILT

THESE DRAWINGS DATED 07/06/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT, AS CONSTRUCTED, IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

STAGE 1 CONSTRUCTION

1. HOLD PRECONSTRUCTION CONFERENCE, NOTIFY MDE IN ACCORDANCE WITH NOTE 1 OF THE STANDARD EROSION AND SEDIMENT CONTROL NOTES (SHEET R-01).
2. ESTABLISH STAGING AND STORAGE AREA.
3. PROJECT STAKE-OUT.
4. ESTABLISH PERIMETER EROSION AND SEDIMENT CONTROLS FOR BASE PROJECT AREA.
5. VERIFY LOCATIONS OF EXISTING UTILITIES, AND LOCATE UTILITIES TO BE REMOVED AND/OR ABANDONED.
6. REMOVE HAZARDOUS MATERIALS FROM ABANDONED BUILDINGS.
7. DEMOLISH AND REMOVE EXISTING BUILDINGS AND FOUNDATIONS (ONLY AFTER HAZMAT REMOVAL IS CERTIFIED COMPLETE).
8. DEMOLISH AND REMOVE ASPHALT AND CONCRETE PAVEMENT IN AREAS SHOWN CLEAR AND GRUB IN AREA OF ACCESS ROAD, PARKING LOT AND HANGAR SITE.
9. STRIP AND STOCKPILE TOPSOIL FROM EMBANKMENT AREAS ALONG ACCESS ROAD, PARKING LOT, HANGAR SITE, TANK AND PUMP HOUSE AREAS.
10. EARTHWORK FOR ACCESS ROAD, PARKING LOTS, HANGAR SITE, TANK AND PUMP HOUSE FOUNDATIONS.
11. CONSTRUCT ACCESS ROAD AND PARKING LOT TO TOP OF ASPHALT BASE (CURB, CURB AND GUTTER, SUBBASE, BASE, AND ASPHALT BASE).
12. REMOVE FENCE BETWEEN WILSON POINT ROAD AND FOREST (MAINTAIN SECURE AIRPORT PERIMETER).
13. REMOVE EXISTING STRUCTURES AND PIPE IN VICINITY OF POND 1.
14. EXCAVATE POND 1 AND CONSTRUCT STRUCTURES AND STABILIZE WITH PERMANENT VEGETATION AND GROUND COVER.
15. BEGIN REMOVAL AND DISPOSAL OF SOIL STOCKPILE.

IN EVERY DETAIL THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

STAGE 2 CONSTRUCTION

1. CLEAR/CRUB REMAINDER OF SITE.
2. ESTABLISH PERIMETER EROSION AND SEDIMENT CONTROLS FOR STAGE 2 WORK AREA.
3. EXCAVATE PONDS 3A/3B, STRUCTURES, SET UP AS SEDIMENT BASIN (PER SHEET R-02)
4. VERIFY LOCATIONS OF EXISTING UTILITY, AND LOCATE UTILITIES TO BE REMOVED AND/OR ABANDONED.
5. DEMOLISH AND REMOVE REMAINDER OF ASPHALT AND CONCRETE PAVEMENT ACCESS SITE.
6. REPLACE MANHOLE ON EXISTING 48" TRUNK DRAINAGE LINE (SEE SHEETS D-02 AND C-01) (ADD ALTERNATE 1 ONLY).
7. CONTINUE REMOVAL AND DISPOSAL OF SOIL STOCKPILE.
8. CONSTRUCT SKYTECH PARKING LOT UP TO AND INCLUDING BITUMINOUS BASE COURSE.
9. SEE SAFETY REQUIREMENT DURING CONSTRUCTION NOTE (B) (2), SHEET G-02, FOR WORK ADJACENT TO ACTIVE TAXIWAY.

STAGE 4 CONSTRUCTION

1. INSTALL EROSION CONTROL FOR STAGE 4 WORK.
2. EARTHWORK FOR APRONS AND TAXIWAYS.
3. INSTALL NATURAL GAS FEEDER AND SERVICE LINES.
4. CONTINUE INSTALLATION OF SANITARY SEWER LINE AND LIFT STATIONS (INCLUDING EXTENSION TO STRAWBERRY POINT COMPLEX).
5. INSTALL APRON SUBBASE DRAINAGE SYSTEM.
6. BEGIN TANK AND PUMPHOUSE INSTALLATION.

MAA-CO-97-019 SHEET NO. A-07

NOTES:

1. HORIZONTAL GEOMETRY BASED ON MARYLAND STATE PLANE COORDINATE SYSTEM. VERTICAL DATUM IS NATIONAL GEOMETRIC VERTICAL DATUM, 1929.
2. POINTS SHOWN ALONG PROPOSED CURB AND GUTTER ARE FRONT FACE OF CURB AT PAVEMENT SURFACE UNLESS OTHERWISE NOTED.
3. FOR LAYOUT OF PROPOSED STORM WATER MANAGEMENT BASINS SEE SHEETS C-03 THROUGH C-10.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED. IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

DEMOLITION LEGEND

- ISOLATED TREES TO BE REMOVED
- EXISTING FENCE TO BE REMOVED
- EXISTING PIPE AND STRUCTURE TO BE REMOVED
- AREA TO BE CLEARED AND/OR CLEARED AND GRUBBED
- BITUMINOUS PAVEMENT TO BE DEMOLISHED AND REMOVED
- CONCRETE PAVEMENT TO BE DEMOLISHED AND REMOVED

DEMOLITION NOTES

1. THE SIZE AND LOCATION OF THE EXISTING PIPE AND STRUCTURES SHOWN IS APPROXIMATE ONLY. THE CONTRACTOR SHALL LOCATE THE EXISTING PIPE AND STRUCTURES BETWEEN THE INLET AND OUTFALL SHOWN ON SHEET D-04. THESE LOCATIONS SHALL BE MADE KNOWN TO THE ENGINEER BEFORE WORK IN THE VICINITY MAY BEGIN.
2. EXISTING BITUMINOUS SURFACE MAY BE REMOVED BY COLD MILLING OR OTHER MEANS APPROVED BY THE ENGINEER. DEMOLITION OF AIRFIELD PAVEMENTS SHALL BE CLOSELY COORDINATED WITH FINAL PAVING TO FOLLOW.
3. THE EXTENT OF THE EXISTING WATER SYSTEM SHOWN ON SHEET D-02 IS NOT KNOWN. THIS SYSTEM IS ASSUMED TO BE ABANDONED AND WILL BE REMOVED. COSTS FOR PIPE AND STRUCTURE REMOVAL WILL BE PAID FOR ON A UNIT PRICE BASIS AS SPECIFIED IN ITEM 100.
4. EXISTING FACILITIES WITHIN THE LIMITS OF WORK WHICH ARE NOT SPECIFICALLY SHOWN TO BE ALTERED OR REMOVED SHALL REMAIN IN SERVICE AND UNDAMAGED THROUGH THE DURATION OF THE CONTRACT. WHERE THE DISPOSITION OF EXISTING FACILITIES IS UNCLEAR, OR FACILITIES ARE NOT SHOWN ON THESE PLANS ARE ENCOUNTERED, THE CONTRACTOR SHALL NOTIFY THE ENGINEER AND OBTAIN DIRECTION BEFORE PROCEEDING WITH WORK AFFECTING THE FACILITIES.

AS-BUILTS

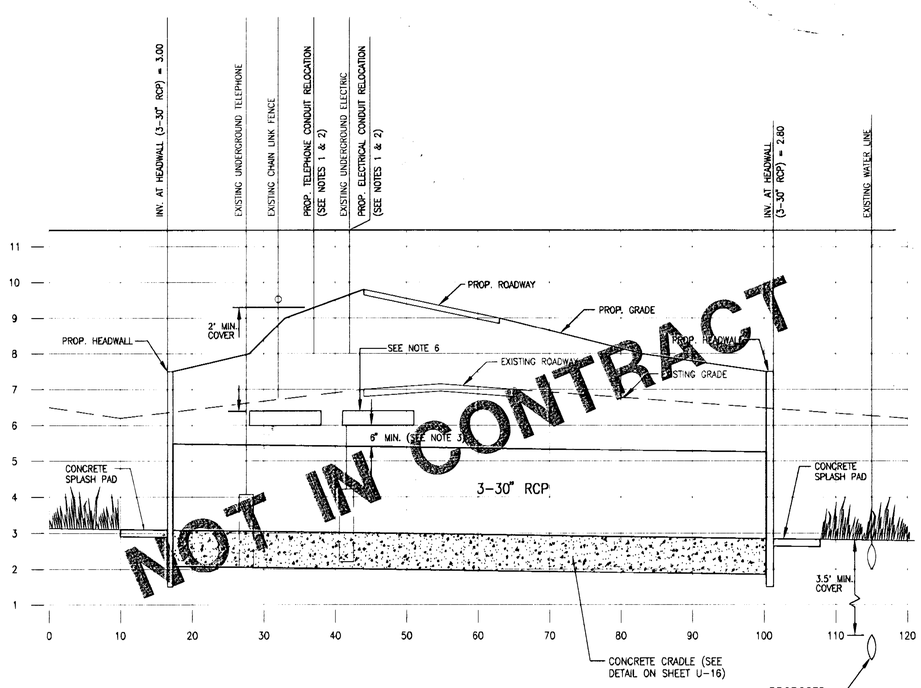
8. SEE NOTE 5, SHEET C-11.



PROFILE

SCALE: 1"=2' (VERT)
1"=10' (HORIZ.)

WATER LINE RELOCATION NOTES:

1. THE LENGTH OF EXISTING WATER LINE TO BE RELOCATED IS APPROXIMATE. THE CONTRACTOR SHALL CONFIRM THE DEPTH OF THE WATER LINE TO DETERMINE THE LENGTH OF WATER LINE TO BE RELOCATED IN ORDER TO MAINTAIN A MINIMUM COVER OF 3.5' OVER THE WATER LINE.
2. PRIOR TO SHUTTING DOWN THE EXISTING WATER LINE, THE CONTRACTOR SHALL COORDINATE WITH THE UTILITY PROVIDER TEMPORARY WATER SERVICES, IF REQUIRED.
3. SAW CUT THE EXISTING WATER LINE, OR BREAK LINE AT AN EXISTING JOINT.
4. NEW CONNECTIONS TO THE EXISTING WATER LINE SHALL BE MADE WITH MECHANICAL JOINT FITTINGS.
5. AT COMPLETION OF RELOCATION, THE CONTRACTOR SHALL FLUSH THE EXISTING LINE (SEE SPECIFICATIONS FOR ADDITIONAL TESTING REQUIRED).
6. CONTRACTOR SHALL SUBMIT AS-BUILT DRAWINGS SHOWING BOTH HORIZONTAL AND VERTICAL LOCATIONS OF THE NEW WATER LINE.
7. SEE SHEETS U-19 THRU U-22 FOR UTILITY DETAILS.

PROJECT TITLE: MIDFIELD TERMINAL COMPLEX SITE DEVELOPMENT PHASE I

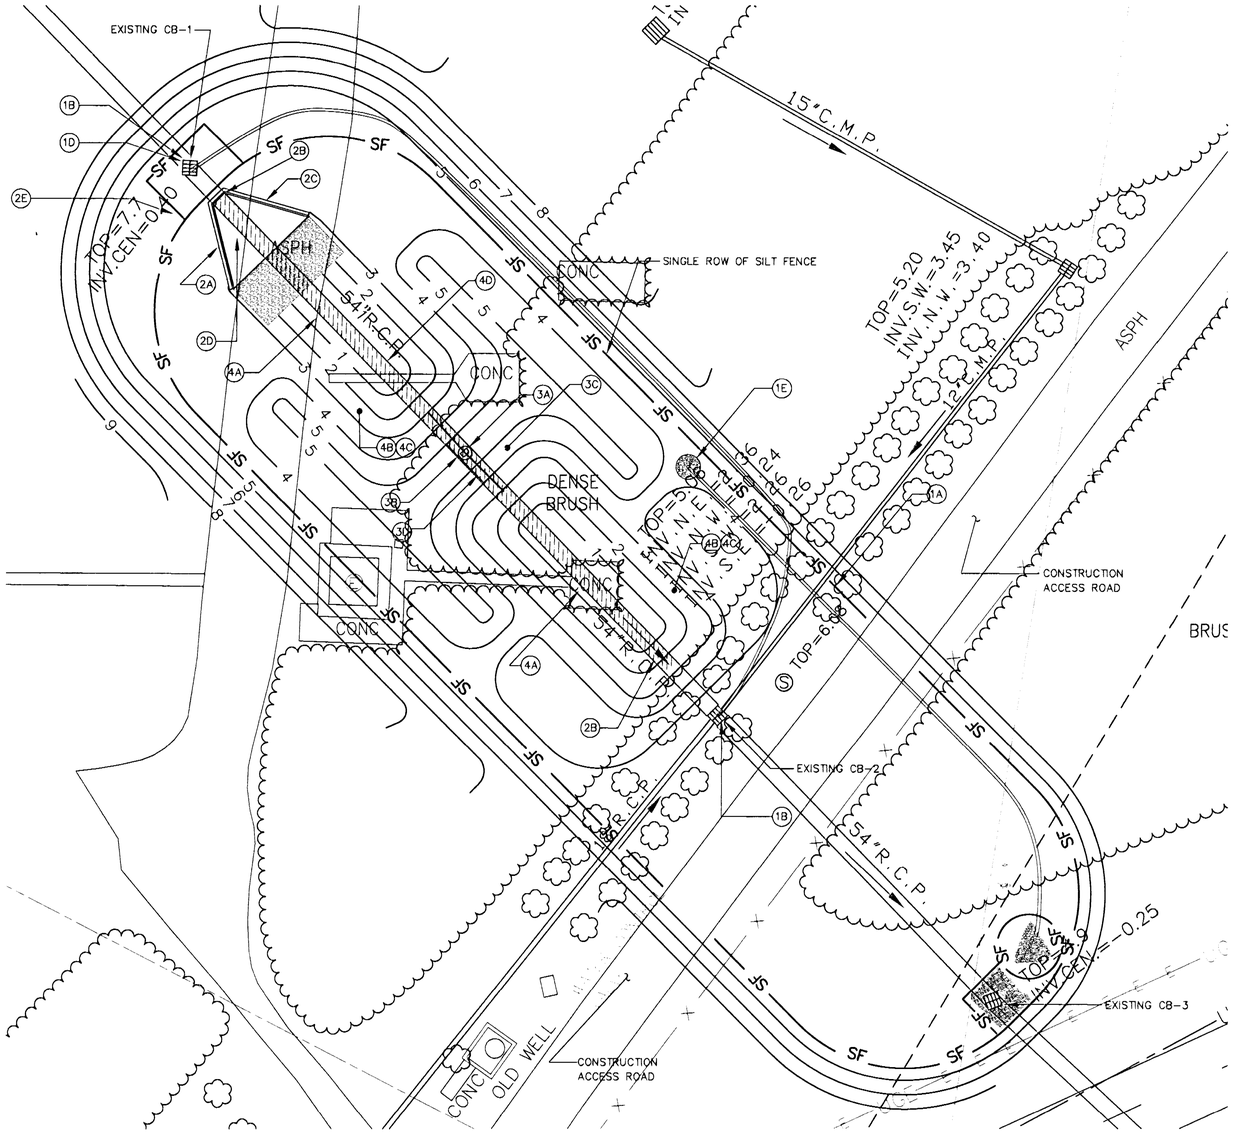
SHEET TITLE: POND 4B ENLARGEMENT & DETAIL PLAN

SCALE: AS NOTED

DATE: September 08, 1998

PROJECT NO.: MAA-CO-97-019

SHEET NO.: C-16



PLAN
1"=20'

0 10 20 40 60
SCALE IN FEET

CONSTRUCTION PHASING FOR POND 1:

GENERAL NOTES

1. SEE DEMOLITION PLAN, SHEET NO. D-01 THROUGH D-06 FOR INITIAL MATERIAL REMOVAL.
2. SEE EROSION AND SEDIMENT CONTROL PLANS, SHEET NO. R-01 THROUGH R-10.
3. SEE SHEET NO. C-20 FOR POND 1 SECTION.
4. SEE SHEET V-01 FOR PLANTING DETAILS.

PHASE 1 – SWALE CONSTRUCTION

1 SILT FENCE & PUMP

A. SILT FENCE SHALL BE SET AROUND CONSTRUCTION AREAS, AS SHOWN TO PREVENT RUNOFF AND SILT FROM ENTERING THE AREA.

B. BLOCK UPSTREAM INVERT OF EXISTING CATCH BASIN TO PREVENT FLOW THROUGH THE EXISTING 54" RCP PIPE.

C. BLOCK DOWNSTREAM INVERT TO PREVENT FLOW BACK INTO THE EXISTING 54" RCP.

D. PLACE A PUMP IN THE EXISTING CB-1 AND PUMP FLOW TO DOWNSTREAM CATCH BASIN. (SEE DETAIL ON THIS SHEET).

E. CONSTRUCT DEWATERING PIT AND PUMP FLOW TO EROSION CONTROL BASIN.

2 HEADWALL

A. EXCAVATE AREA IMMEDIATELY ADJACENT TO THE PROPOSED HEADWALL AND THE EXISTING 54" PIPE. DEWATER AS NEEDED.

B. SAW CUT AND REMOVE THE EXISTING PIPE FROM FACE OF PROPOSED HEADWALL (APPROXIMATE INVERT IS 0.34) TO THE END OF PHASE 1 EXCAVATION.

C. CONSTRUCT HEADWALL. (SEE SHEET U-18B AND U-18C)

D. CONSTRUCT CONCRETE SPLASH PAD.

E. AFTER HEADWALL AND SPLASH PAD HAVE BEEN CONSTRUCTED, STABILIZE THE BACKSIDE EARTH WITH EROSION CONTROL NETTING TO PREVENT EROSION INTO THE PROPOSED SWALE.

3 PROPOSED MANHOLE

A. EXCAVATE AREA IMMEDIATELY ADJACENT TO THE PROPOSED MANHOLE STRUCTURE.

B. CONSTRUCT PROPOSED MANHOLE, AND SPILLWAY AS SHOWN ON SHEET C-15.

C. STABILIZE SLOPES WITH EROSION CONTROL NETTING UNTIL FINAL COMPLETION OF POND.

D. CONSTRUCTED GROUT STONE OVERFLOW (SEE DETAIL SHEET C-15).

4 SWALE

A. EXCAVATE PROPOSED SWALE AS SHOWN.

B. GRADE SIDE SLOPES AND BASE OF PROPOSED SWALE AS SHOWN.

C. STABILIZE SIDE SLOPES AND SWALE BASE WITH EROSION CONTROL NETTING UNTIL POND CONSTRUCTION IS COMPLETE.

D. REMOVE EXISTING RCP TO LIMITS SHOWN AND STORE PIPE ON SITE.

PROJECT TITLE: MIDFIELD TERMINAL COMPLEX SITE DEVELOPMENT PHASE I

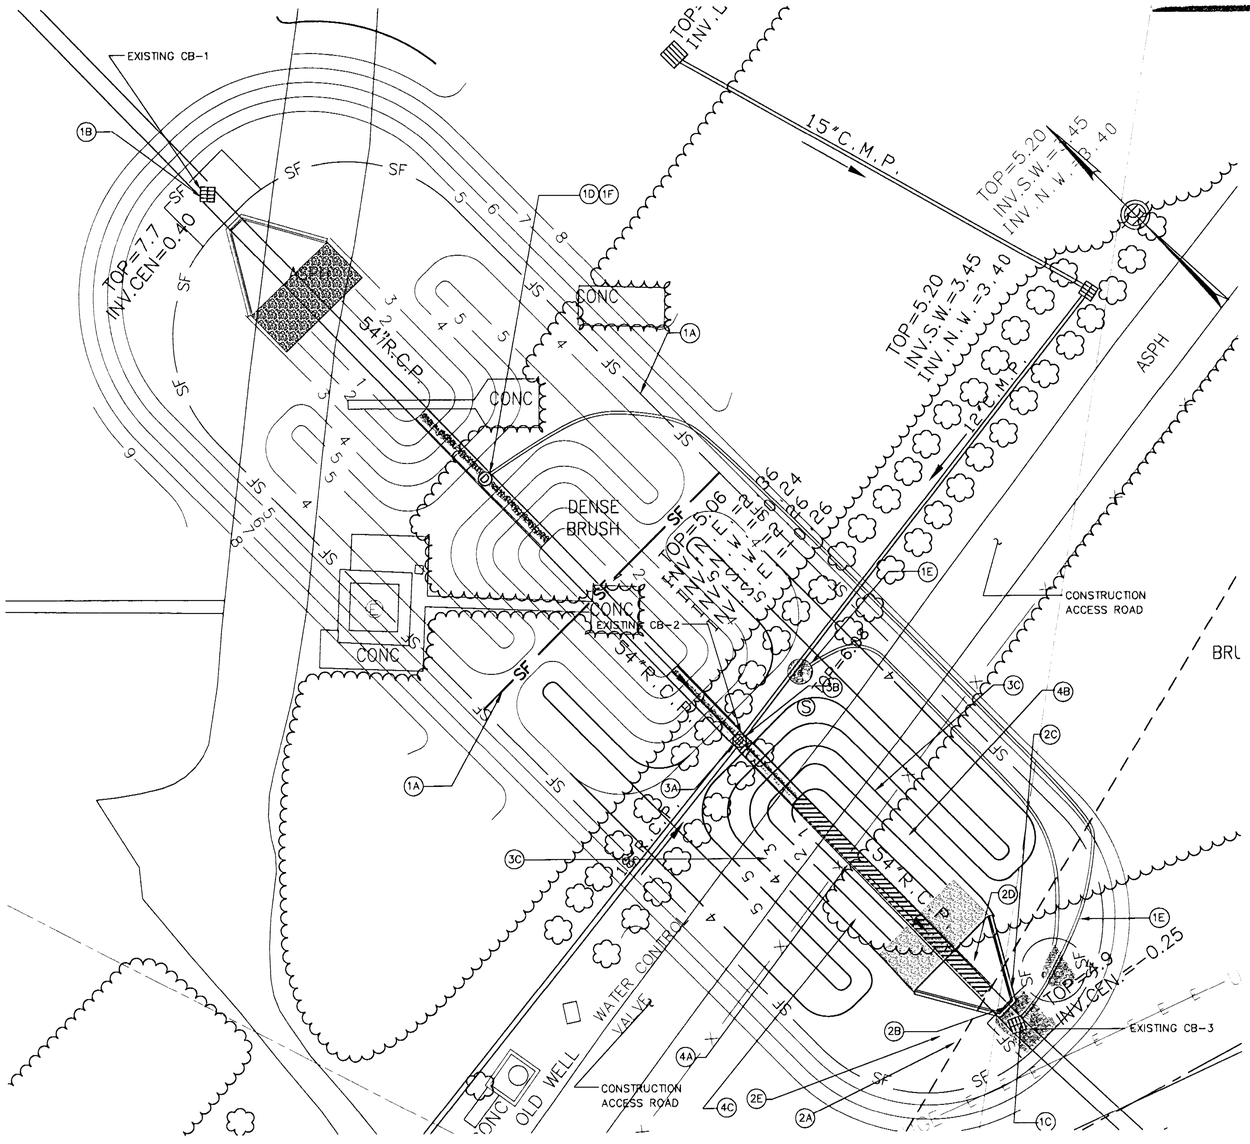
SHEET TITLE: POND 1 CONSTRUCTION PLAN PHASE 1

SCALE: AS NOTED

DATE: September 08, 1998

PROJECT NO.: MAA-CO-97-019

SHEET NO.: C-17



PLAN
1"=20'

CONSTRUCTION PHASING FOR POND 1:

GENERAL NOTES

1. SEE DEMOLITION PLAN, SHEET NO. D-01 THROUGH D-06 FOR INITIAL MATERIAL REMOVAL.
2. SEE EROSION AND SEDIMENT CONTROL PLANS, SHEET NO. R-01 THROUGH R-10.
3. SEE SHEET NO. C-20 FOR POND 1 SECTION.
4. SEE SHEET V-01 FOR PLANTING DETAILS.

PHASE 2 - COMPLETE SWALE CONSTRUCTION

1 SILT FENCE & PUMP

A. LEAVE PREVIOUSLY PLACED SILT FENCE TO PREVENT RUNOFF FROM ENTERING THE AREA, AND PLACE NEW SILT FENCE WITHIN SWALE AREA AS SHOWN.

B. REMOVE PUMP AND PLUG FROM EXISTING CB-1. ALL FLOW TO PASS THROUGH THE PROPOSED FILTER DRAIN.

C. PLUG UPSTREAM INVERT OF 54" RCP IN EXISTING CB-3.

D. PLACE PUMP IN FILTER DRAIN MANHOLE AND PUMP FLOW TO EXISTING CB-3.

E. CONSTRUCT DEWATERING PIT AND PUMP FLOW TO EROSION CONTROL BASIN.

F. BLOCK UPSTREAM INVERT OF PROPOSED DMH-1 TO PREVENT FLOW INTO PHASE 1 POND SECTION.

2 HEADWALL

A. EXCAVATE AREA IMMEDIATELY ADJACENT TO THE PROPOSED HEADWALL AND THE EXISTING 54" PIPE (SEE PLAN). DEWATER AS NEEDED.

B. SAW CUT AND REMOVE THE EXISTING PIPE FROM FACE OF PROPOSED HEADWALL (APPROXIMATE INVERT IS -0.21) TO THE END OF PHASE 2 EXCAVATION. STORE PIPE ON SITE.

C. CONSTRUCT HEADWALL (SEE SHEET U-18B AND U-18C).

D. CONSTRUCT CONCRETE SPLASH PAD.

E. AFTER HEADWALL AND SPLASH PAD HAVE BEEN PLACED, STABILIZE THE BACKSIDE EARTH WITH EROSION CONTROL NETTING TO PREVENT EROSION INTO THE PROPOSED SWALE UNTIL FINAL GRADING OF POND.

3 PROPOSED MANHOLE

A. EXCAVATE AREA IMMEDIATELY ADJACENT TO THE PROPOSED MANHOLE. (EXISTING CB-2)

B. CONSTRUCT PROPOSED MANHOLE, AND SPILLWAY AS SHOWN ON SHEET C-15.

C. STABILIZE SLOPES WITH EROSION CONTROL NETTING UNTIL FINAL COMPLETION OF POND.

4 SWALE

A. EXCAVATE PROPOSED SWALE TO LIMIT AS SHOWN.

B. GRADE SIDE SLOPES AND BASE OF PROPOSED SWALE AS SHOWN.

C. STABILIZE SIDE SLOPES AND SWALE BASE WITH EROSION CONTROL NETTING UNTIL POND CONSTRUCTION IS COMPLETE.

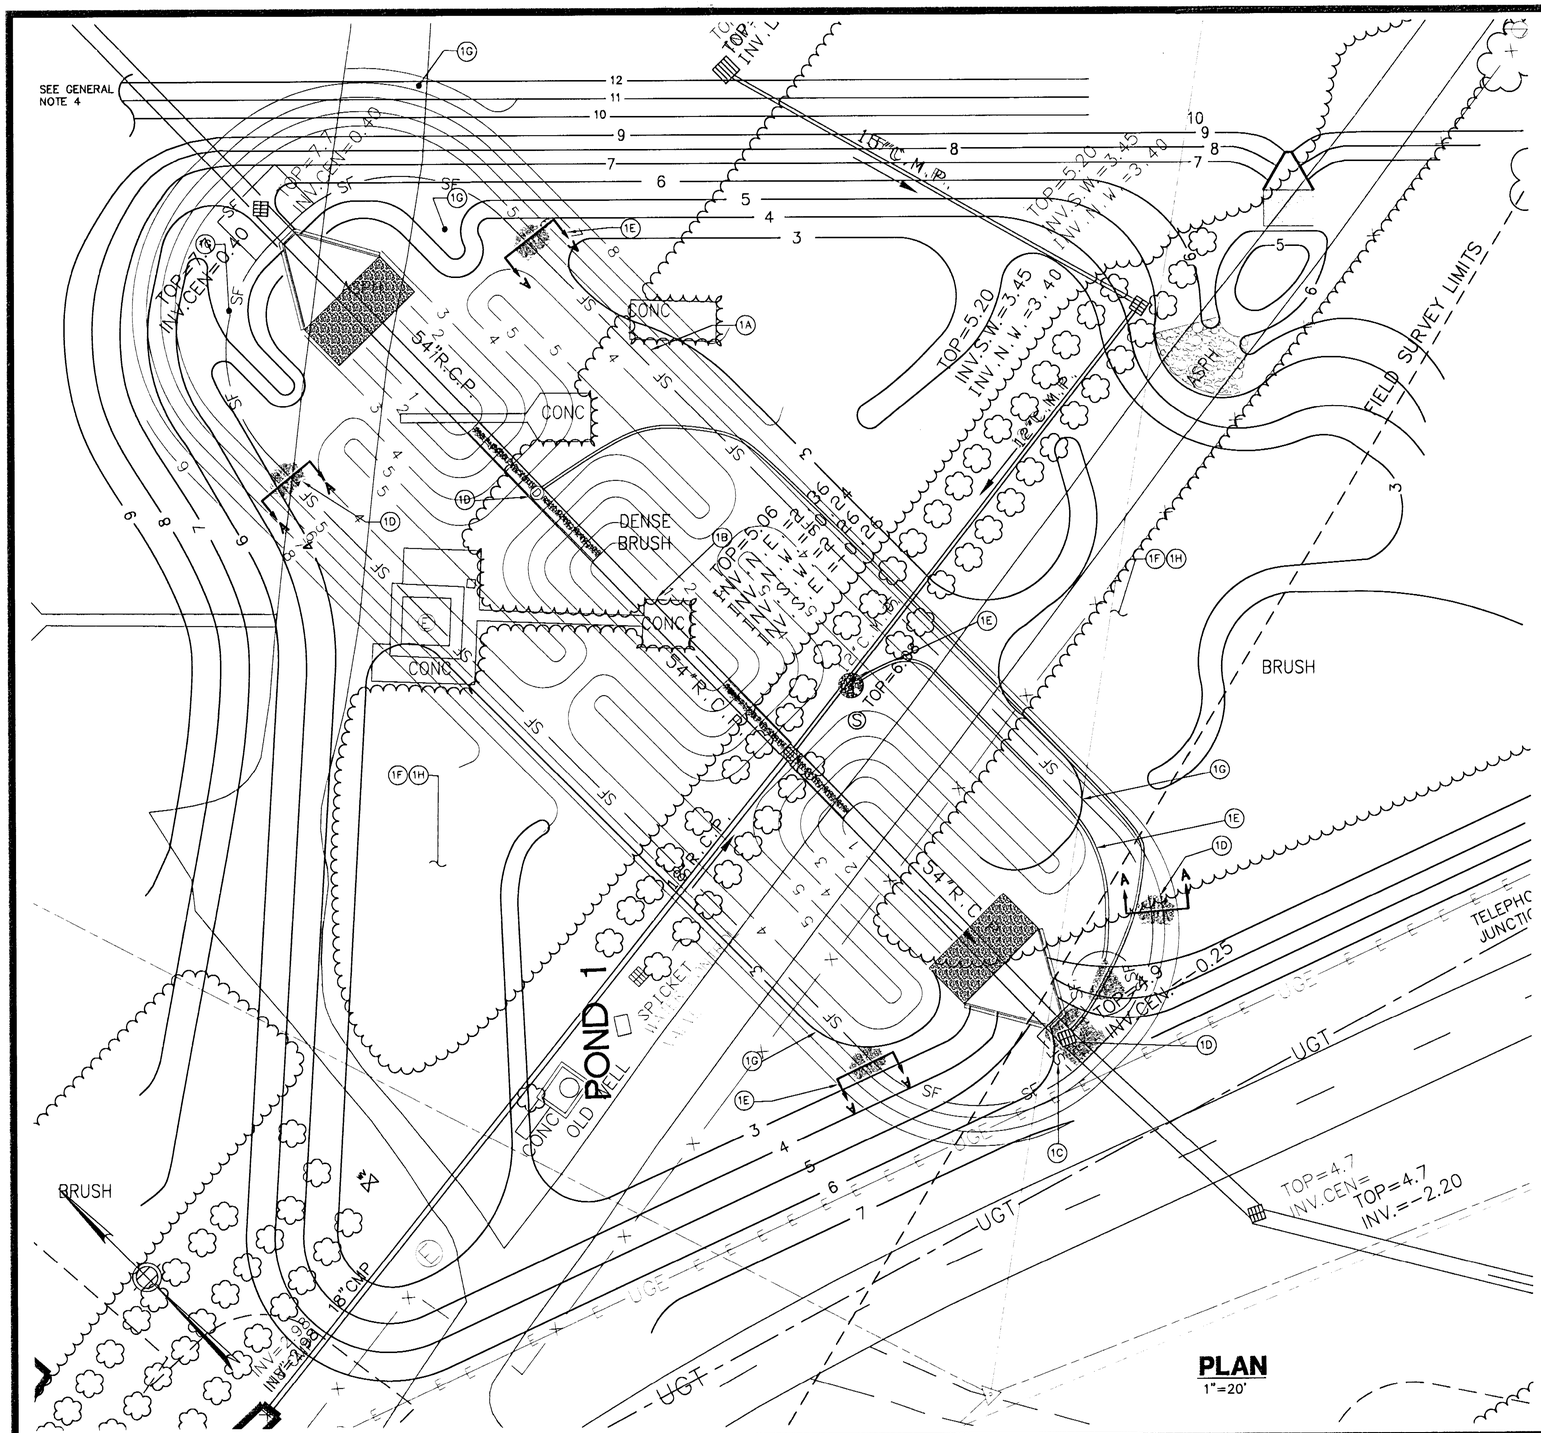
PROJECT TITLE	MIDFIELD TERMINAL COMPLEX SITE DEVELOPMENT PHASE I
SHEET TITLE	POND 1 CONSTRUCTION PLAN PHASE 2
SCALE	AS NOTED
DATE	September 08, 1998
PROJECT NO.	MAA-CO-97-019
SHEET NO.	C-18



PLAN
1"=20'

CONSTRUCTION PHASING FOR POND 1:

GENERAL NOTES

1. SEE DEMOLITION PLAN, SHEET NO. D-01 THROUGH D-06 INITIAL MATERIAL REMOVAL.
2. SEE EROSION AND SEDIMENT CONTROL PLANS, SHEET NO. R-01 THROUGH R-10.
3. SEE SHEET NO. C-20 FOR POND 1 SECTION.
4. TIE GRADING AS REQUIRED TO EXISTING GRADES AND STABILIZE SLOPES WITH EROSION CONTROL NETTING. IF WORK HAS ADVANCED ON SITE AROUND PROPOSED PARKING AREA AND ROADWAY THEN TIE IN TO FINAL GRADES.

PHASE 3 – FINAL GRADING FOR POND 1

1 POND

A. LEAVE PREVIOUSLY PLACED SILT FENCE TO PREVENT RUNOFF FROM ENTERING THE AREA.

B. REMOVE SILT FENCE AS SHOWN IN PHASE 2 WITHIN SWALE AREA.

C. PLACE SILT FENCE AROUND EXISTING CATCH BASIN

D. PLACE SILT FENCE AND SEDIMENT BARRIERS WHERE INDICATED ON PLAN.

E. REMOVE PIPE BLOCKS, PUMP, AND HOSE TO ALLOW FLOW TO RUN THROUGH THE SWALE.

F. COMPLETE POND 1 GRADING AS SHOWN (SEE SHEET NO. C-01 THROUGH C-10 FOR OVERALL GRADING).

G. TIE GRADING TO COMPLETED SWALE CONSTRUCTED IN PHASE 1 AND 2 AS NEEDED. MOVE AND REPLACE SILT FENCE AS REQUIRED.

H. ON COMPLETION OF GRADING, PLACE 6" OF LOAM AND HYDROSEED (SEE SHEET R-06).

PHASE 4 – POND 1 COMPLETION

4 FINAL POND GRADING

A. AT COMPLETION OF CONSTRUCTION, REMOVE A ALL TRAPPED SILT FROM PROPOSED DRAINAGE SWALE AND EROSION CONTROL DEVICES AND PLANT SWALE BASE WITH APPROPRIATE VEGETATION ON SHEETS V-01, V-04, AND V-05.

POND 2B

1"=30'

NOTES FOR POND 2B OUTLET:

① INSTALL EROSION CONTROL AS SHOWN ON SHEET R-04.

② EXCAVATE AND REGRADE OUTLET AREA AND PLACE PROPOSED HEADWALL.

③ INSTALL PROPOSED RIP-RAP AS SHOWN.

④ INSTALL TEMPORARY STRAW BALE CHECK DAM.

⑤ PLACE EROSION CONTROL NETTING ON 6" OF LOAM. SEED ALL DISTURBED AREAS. ALLOW NATURAL WETLAND VEGETATION TO RE-ESTABLISH IN DISTURBED AREA. MAINTAIN STRAW BALE CHECK DAM TO KEEP ADJACENT WETLAND FREE OF SILT. IF NATURAL VEGETATION DOES NOT RE-ESTABLISH WITHIN 24 MONTHS, SUPPLEMENT DISTURBED AREA WITH SIMILAR VEGETATION.

WATER SURFACE ELEVATIONS (POND 1)

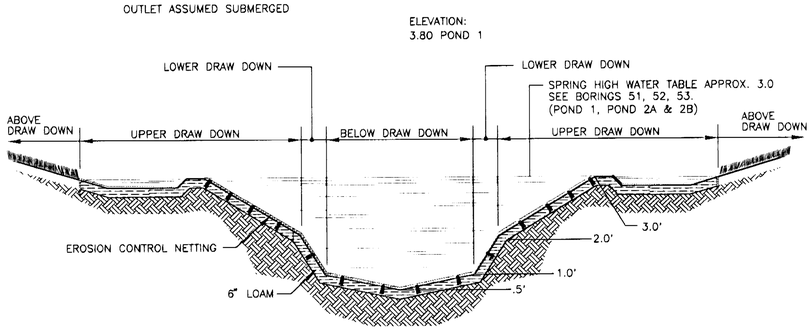
1-YEAR STORM	3.80
OUTLET ASSUMED SUBMERGED	



SECTION A-A

PONDS 1 AND 2B SUBJECT TO SALT WATER INTRUSION

ELEVATION: 5.20 POND 2

NOTES (PONDS 1 & 2B)

1. SEE SHEET V-04 FOR PLANT SPACING, LOCATION AND METHOD.
2. SEE SHEET V-05 FOR PLANT SELECTION AND DETAILS. ANY PROPOSED SUBSTITUTION OF WETLAND SPECIES FROM THE DESCRIBED LIST MUST BE APPROVED BY THE ENGINEER.
3. ALL EXCAVATION, GRADING, LOAM AND SEEDING SHALL BE DONE BETWEEN JUNE 15 AND SEPTEMBER 30. WETLAND PLANTS SHALL BE PLANTED BETWEEN SEPTEMBER 30 AND OCTOBER 15.
4. CONTRACTOR SHALL PROVIDE AS-BUILT DRAWINGS SHOWING FINAL LOCATION OF PIPES AND GRADING FOR ALL PONDS.
5. THE CONTRACTOR SHALL MAINTAIN PONDS FREE FROM EROSION AND SILT UNTIL VEGETATION HAS STABILIZED ALL DISTURBED AREAS.
6. ALL OTHER AREAS ABUTTING THE PROPOSED PONDS SHALL BE LOAMED AND SEEDED. (SEE SHEET R-06 FOR DETAILS)
7. PONDS 1, 2A, 2B, 3A AND 3B ARE DESIGNED FOR WATER QUALITY CONTROL. THEY ARE NOT DESIGNED TO MITIGATE THE INCREASE IN RUNOFF DUE TO THE PROPOSED CONSTRUCTION. PONDS 4A AND 4B ARE DESIGNED TO MITIGATE THE INCREASE IN RUNOFF FOR THE 2, 10 AND 100 YEAR STORM EVENTS AS WELL AS WATER QUALITY.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED. PLANTING METHOD

PLANTING SHALL BE DONE BY HAND USING A DIBBLE, PLANTING SPADE, OR OTHER METHOD APPROVED BY THE ENGINEER. THE DIBBLE OR SPADE SHALL BE USED TO CREATE A SHALLOW HOLE IN THE MOIST TOPSOIL FOR PLANTING. THE HOLE SHALL BE OF SUFFICIENT DEPTH AND WIDTH TO ALLOW THE ROOT TO BE INSERTED WITHOUT BREAKAGE OR OTHER DAMAGE. THE PLANTS SHALL BE PLANTED SO THAT THE LEAF BASES ARE AT THE SOIL SURFACE. AFTER PLACEMENT OF THE PLANT IN THE HOLE, THE HOLE SHALL BE CAREFULLY CLOSED AROUND THE PLANT ROOT BY GENTLY APPLYING PRESSURE TO THE EDGE OF THE HOLE WITH ONE'S FOOT OR OTHER METHOD APPROVED BE THE ENGINEER. PLANTS WHICH HAVE BEEN JUDGED BY THE ENGINEER TO BE DAMAGED BY MISHANDLING DURING THE PLANTING PROCESS SHALL BE REPLACED AT THE CONTRACTOR'S EXPENSE.

ALL PONDS

AFTER COMPLETION OF EXCAVATION, MONITOR AREAL EXTENT OF INUNDATION AND STANDING WATER LEVELS IN POND THREE TIMES, AT THE BEGINNING, MID-POINT AND END OF A TWO-WEEK PERIOD. SIMULTANEOUSLY MONITOR DEPTH TO WATER TABLE IN ADJACENT WELLS, AT SAME FREQUENCY AND ON SAME DATES. THE ENGINEER WILL CORRELATE STANDING WATER ELEVATIONS TO DEPTH TO WATER TABLE AND, BASED ON PREVIOUS WELL MONITORING RECORD, WILL ESTIMATE SEASONAL HIGH WATER (SHW) AND SEASONAL LOW WATER (SLW) ELEVATIONS.

IMMEDIATELY PRIOR TO PLANTING, INUNDATE POND TO ESTIMATED SHW ELEVATION, HOLDING THE STANDING WATER LEVEL AT THE SHW ELEVATION FOR 48 HOURS AND SUBSEQUENTLY DEWATERING.

PONDS READY FOR PLANTING DURING EARLY SPRING 1998

EARLY SPRING 1998 –

WITHIN 24 HOURS OF DEWATERING THE POND, BEGIN PLANTING THE POND TO THE SELECTED VEGETATION SPECIES.

KEEP THE POND DEWATERED UNTIL THE VEGETATION PLANTED ON THE BOTTOM OF THE POND REACHES HEIGHTS RANGING BETWEEN ONE AND TWO AND ONE-HALF FEET TALL; AT WHICH TIME, ALLOW POND WATER TO REACH NORMAL LEVELS.

THE ENGINEER WILL PERIODICALLY INSPECT THE POND AFTER PLANTING TO RECOMMEND AS APPROPRIATE, REVISIONS TO THE INUNDATION AND DEWATERING PROGRAM.

EARLY SPRING 1999 –

PRIOR TO MAINTENANCE PLANTING, MONITOR AREAL EXTENT OF INUNDATION AND STANDING WATER LEVELS IN POND ONCE A WEEK FOR FOUR WEEKS. SIMULTANEOUSLY MONITOR DEPTH TO WATER TABLE IN ADJACENT WELLS, AT SAME FREQUENCY AND ON SAME DATES. THE ENGINEER WILL CORRELATE STANDING WATER ELEVATIONS TO DEPTH TO WATER TABLE. BASED ON PREVIOUS WELL MONITORING RECORD AND SUCCESS OF PRIOR PLANTINGS, AS APPROPRIATE, THE ENGINEER WILL MODIFY ESTIMATE OF SEASONAL HIGH WATER (SHW) AND SEASONAL LOW WATER (SLW) ELEVATIONS AND WILL PREPARE A MAINTENANCE PLANTING PLAN.

IMMEDIATELY PRIOR TO PLANTING, INUNDATE POND TO ESTIMATED SHW ELEVATION, HOLDING THE STANDING WATER LEVEL AT THE SHW ELEVATION FOR 48 HOURS AND SUBSEQUENTLY DEWATERING.

WITHIN 24 HOURS OF DEWATERING THE POND, BEGIN PLANTING THE POND TO THE SELECTED VEGETATION SPECIES.

KEEP THE POND DEWATERED UNTIL THE VEGETATION PLANTED ON THE BOTTOM OF THE POND REACHES HEIGHTS RANGING BETWEEN ONE AND TWO AND ONE-HALF FEET TALL; AT WHICH TIME, ALLOW POND WATER TO REACH NORMAL LEVELS.

THE ENGINEER WILL PERIODICALLY INSPECT THE POND AFTER PLANTING TO RECOMMEND AS APPROPRIATE, REVISIONS TO THE INUNDATION AND DEWATERING PROGRAM.

PONDS NOT READY FOR PLANTING DURING EARLY SPRING 1998

LATE SPRING, SUMMER OR FALL 1998 –

WITHIN 24 HOURS OF DEWATERING THE POND, SEED ALL POND AREAS 18 INCHES ABOVE THE SHW ELEVATION TO THE POND BOTTOM, INCLUSIVE, TO REDTOP (AGROSTIS ALBA).

EARLY SPRING 1999 –

PRIOR TO PLANTING, MONITOR AREAL EXTENT OF INUNDATION AND STANDING WATER LEVELS IN POND ONCE A WEEK FOR FOUR WEEKS. SIMULTANEOUSLY MONITOR DEPTH TO WATER TABLE IN ADJACENT WELLS, AT SAME FREQUENCY AND ON SAME DATES. THE ENGINEER WILL CORRELATE STANDING WATER ELEVATIONS TO DEPTH TO WATER TABLE. BASED ON PREVIOUS WELL MONITORING RECORD, AS APPROPRIATE, THE ENGINEER WILL MODIFY ESTIMATE OF SEASONAL HIGH WATER (SHW) AND SEASONAL LOW WATER (SLW) ELEVATIONS AND WILL REVISE THE PLANTING PLAN.

IMMEDIATELY PRIOR TO PLANTING, INUNDATE POND TO ESTIMATED SHW ELEVATION, HOLDING THE STANDING WATER LEVEL AT THE SHW ELEVATION FOR 48 HOURS AND SUBSEQUENTLY DEWATERING.

WITHIN 24 HOURS OF DEWATERING THE POND, BEGIN PLANTING THE POND TO THE SELECTED VEGETATION SPECIES.

KEEP THE POND DEWATERED UNTIL THE VEGETATION PLANTED ON THE BOTTOM OF THE POND REACHES HEIGHTS RANGING BETWEEN ONE AND TWO AND ONE-HALF FEET TALL; AT WHICH TIME, ALLOW POND WATER TO REACH NORMAL LEVELS.

THE ENGINEER WILL PERIODICALLY INSPECT THE POND AFTER PLANTING TO RECOMMEND AS APPROPRIATE, REVISIONS TO THE INUNDATION AND DEWATERING PROGRAM.

NOTES:

1. FOR PLANTING LOCATIONS SEE SHEETS V-01 TO V-03.
2. FOR POND DETAILS SEE SHEETS C-11 TO C-16.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED, IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

PROJECT TITLE: MIDFIELD TERMINAL COMPLEX SITE DEVELOPMENT PHASE I

SHEET TITLE: POND VEGETATION NOTES AND DETAILS I

SCALE: AS NOTED

DATE: September 08, 1998

PROJECT NO.: MAA-CO-97-019

SHEET NO.: V-04

DESCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
POND AND STREAM EDGES
REQUIRES FULL SUN
SALINITY UP TO 15PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	2 FT. OC
IN 2 YRS.	4 FT. OC
IN 3 YRS.	6 FT. OC

FORMS AVAILABLE: DORMANT RHIZOME, BARE ROOT PLANT, PEAT POT, CONTAINER

TYPHA ANGUSTIFOLIA
(Narrow Leaved Cattail)

DESCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
WET SANDY SHORES
COASTAL DUNES
REQUIRES FULL SUN
TOLERATES DROUGHT
SALINITY UP TO 15PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	2 FT. OC
IN 2 YRS.	4 FT. OC
IN 3 YRS.	6 FT. OC

FORMS AVAILABLE: RHIZOME, BARE ROOT PLANT, CONTAINER

SCIRPUS PUNGENS
(Sword Grass)

DESCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
PONDS AND STREAMS
SALINITY UP TO 5PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	2 FT. OC
IN 2 YRS.	4 FT. OC
IN 3 YRS.	6 FT. OC

FORMS AVAILABLE: SEED, BARE ROOT PLANT

POTAMOGETON PERFOLIATUS
(Redhead Grass)

DISCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH
METHOD OF VEGETATIVE REPRODUCTION: RUNNERS, TUBERS

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
SWAMPS
PONDS
SALINITY UP TO 2PPT

PLANTING:
SUGGESTED SPACING:
(SEE SHEET V-04)
FORMS AVAILABLE: TUBER, BARE ROOT PLANT

SAGITTARIA RIGIDA
(Deep Water Duck Potato)

DESCRIPTION:
PERENNIAL
MODERATE RATE OF SPREAD AND GROWTH
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
DAMP THICKETS AND SWALES
PREFERS FULL SUN
SALINITY FRESH WATER; LESS THAN .5PPT

PLANTING:
5LBS PURE LIVE SEED PER ACRE
TOLERATES DROUGHT
STABILIZES SEDIMENT

FORMS AVAILABLE: SEED

AGROTIS ALBA
(Redtop)

DESCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH (OVER 1FT PER YEAR IN UNCONSOLIDATED SEDIMENT)
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
NONTIDAL MARSHES
NONTIDAL SWAMPS
LAKE MARGINS
REQUIRES FULL SUN
FRESH WATER; LESS THAN 0.5 PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	2 FT. OC
IN 2 YRS.	4 FT. OC
IN 3 YRS.	6 FT. OC

FORMS AVAILABLE: SEED, BARE ROOT PLANT, PEAT OR FIBER POT

COREX LACUSTRIS
(Lake Sedge, Ripgut)

DESCRIPTION:
PERENNIAL
MODERATE; APPROXIMATELY .05FT PER YEAR IN UNCONSOLIDATED SEDIMENT
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
SWAMPS AND FORESTED SEASONAL WETLANDS
WET MEADOWS
SWALES AND DITCHES
SLOUGHS, PONDS, BOGS
REQUIRES FULL SUN
SALINITY UP TO .5PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	1 FT. OC
IN 2 YRS.	2 FT. OC
IN 3 YRS.	3 FT. OC

FORMS AVAILABLE: SEED, BARE ROOT PLANT, RHIZOME CONTAINER

SCIRPUS CYPERINUS
(Wool Grass)

DISCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH
OVER 1FT PER YEAR IN UNCONSOLIDATED SEDIMENT

METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH TIDAL MARSHES
NONTIDAL MARSHES
PONDS AND STREAM EDGES
DITCHES
REQUIRES FULL SUN
SOIL STABILIZER
TOLERATES DROUGHT
SALINITY UP TO .5PPT

SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	2 FT. OC
IN 2 YRS.	4 FT. OC
IN 3 YRS.	6 FT. OC

FORMS AVAILABLE: DORMANT RHIZOME, BARE ROOT PLANT PEAT POT, CONTAINER

TYPHA LATIFOLIA
(Broad-Leaved Cattail)

DESCRIPTION:
PERENNIAL
RAPID RATE OF SPREAD AND GROWTH; OVER 1 FT PER YEAR
IN UNCONSOLIDATED SEDIMENT
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
SHORES
REQUIRES FULL SUN
SALINITY UP TO 5PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	2 FT. OC
IN 2 YRS.	4 FT. OC
IN 3 YRS.	6 FT. OC

FORMS AVAILABLE: DORMANT RHIZOME, BARE ROOT PLANT, CONTAINER, SEED

SCIRPUS VALIDUS
(Soft Stem Bulrush)

DISCRIPTION:
PERENNIAL
MODERATE; APPROXIMATELY .05 FT PER YEAR
IN UNCONSOLIDATED SEDIMENT
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
WET MEADOWS
SHALLOW WATERS
SALINITY UP TO 10PPT
TOLERATES PARTIAL SHADE

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	1 FT. OC
IN 2 YRS.	2 FT. OC
IN 3 YRS.	3 FT. OC

FORMS AVAILABLE: DORMANT RHIZOME, BARE ROOT PLANT, PEAT POT

ACORUS CALAMUS
(Sweet Flag, Sweet Myrtle, Sea Sedge)

DISCRIPTION:
PERENNIAL
SLOW RATE OF SPREAD AND GROWTH; LESS THAN .2 FT PER YEAR
IN UNCONSOLIDATED SEDIMENT
METHOD OF VEGETATIVE REPRODUCTION: RHIZOME

HABITAT:
FRESH AND BRACKISH TIDAL MARSHES
NONTIDAL MARSHES
WET MEADOWS
OPEN WOODS, PRAIRIES, DUNES
PREFERS FULL SUN, TOLERATES SOME SHADE
TOLERATES DROUGHT
SALINITY UP TO 10PPT

PLANTING:
SUGGESTED SPACING:

FOR UNIFORN GROUND COVER	PLANT AT
IN 1 YR.	.5 FT. OC
IN 2 YRS.	1 FT. OC
IN 3 YRS.	2 FT. OC

FORMS AVAILABLE: SEED, BARE ROOT PLANT, PEAT OR FIBER POT

PANICUM VIRGATUM
(Switch Grass)

PROJECT NO.: MAA-CO-97-019

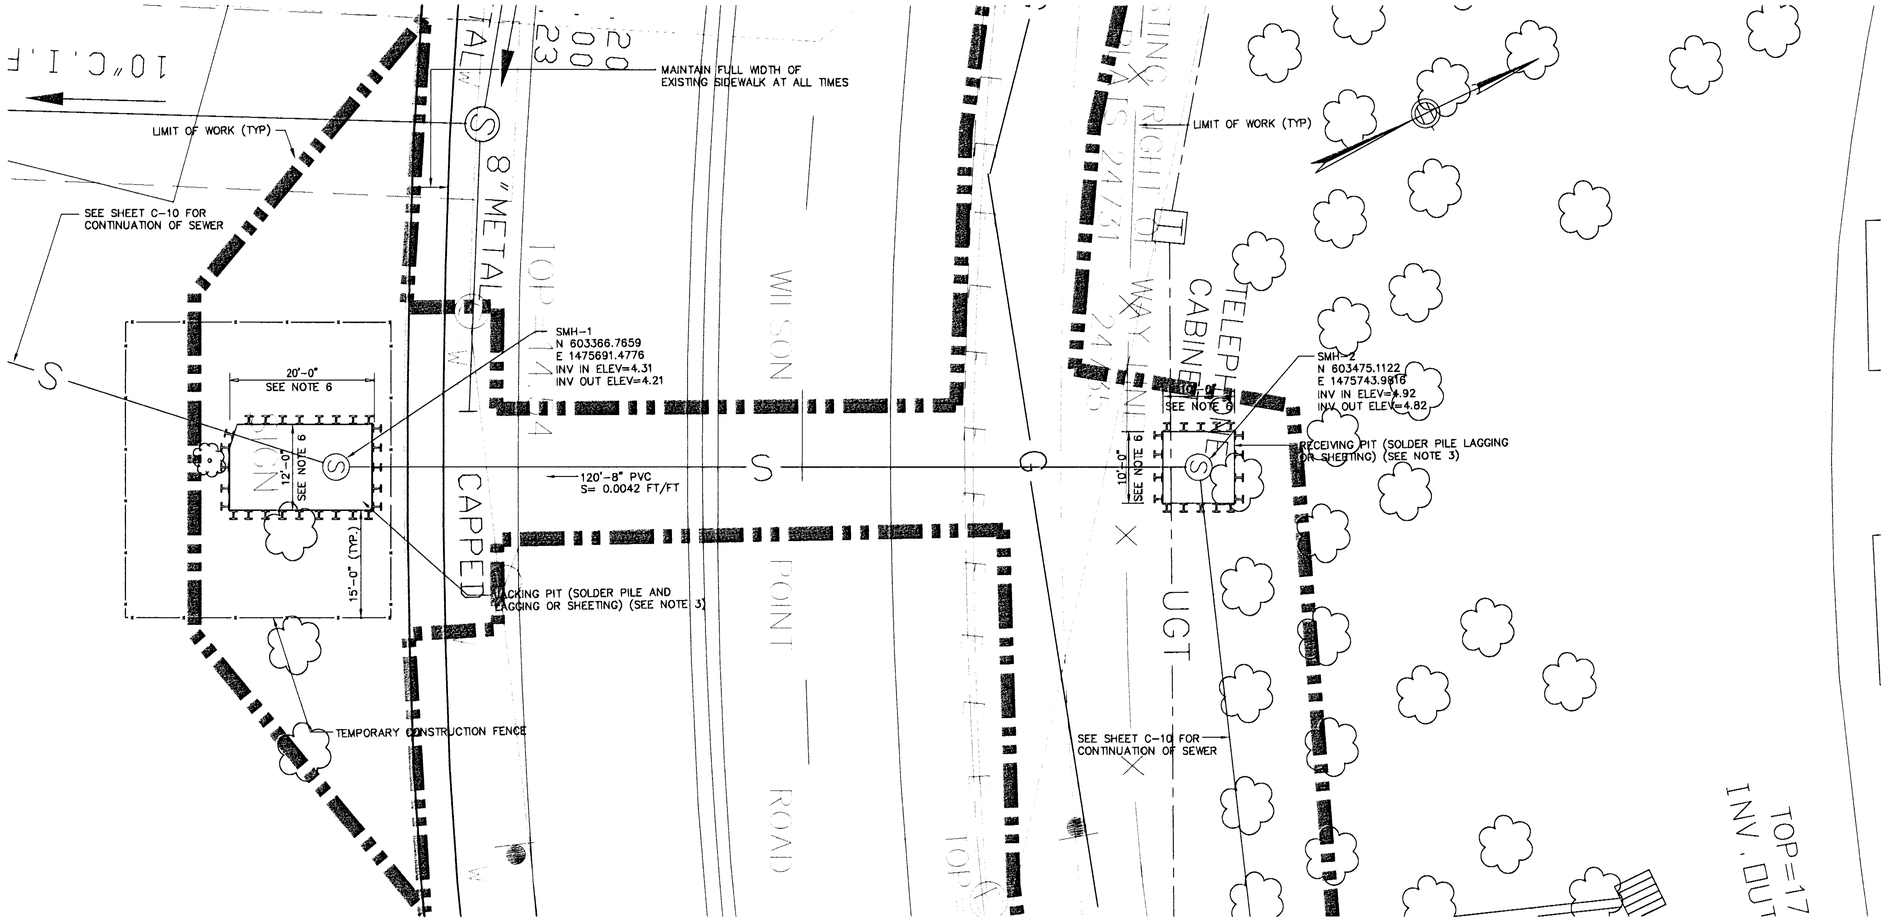
SHEET NO.: U-04



NOTES:

1. CONTRACTOR SHALL CONFIRM ALL LOCATIONS OF EXISTING UTILITIES IN THE FIELD PRIOR TO CONSTRUCTION.
2. CONTRACTOR SHALL SECURE WORKING EASEMENT FOR JACKING PIT PRIOR TO CONSTRUCTION.
3. CONTRACTOR TO CONFIRM SOIL CONDITIONS AND WATER TABLE PRIOR TO EXCAVATION OF JACKING AND RECEIVING PITS.
4. CONSTRUCTION WORKING HOURS WILL BE DEFINED BY THE STATE OF MARYLAND HIGHWAY DEPARTMENT.
5. ALL WORK AREAS SHALL BE PROPERLY SECURED FROM PEDESTRIAN AND VEHICLE TRAFFIC.
6. SUGGESTED MAXIMUM DIMENSIONS ARE SHOWN FOR JACKING AND RECEIVING PITS. CONTRACTOR SHALL SUBMIT COMPLETE JACKING PROCEDURE AND PIT DESIGNS TO THE ENGINEER FOR REVIEW AND APPROVAL BEFORE TO THE BEGINNING WORK.
7. FOR SEWER PROFILE SEE SHEET U-01.
8. SEWER MANHOLE SHALL CONFORM TO BALTIMORE COUNTY STANDARD "48 INCH STANDARD PRECAST MANHOLE TYPE A-2".

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED, IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

			⚠1		

NOTES:

1. PROVIDE A COMPLETE FIRE PUMP SYSTEM AS SHOWN INCLUDING (3) HORIZONTAL SPLIT-CASE CENTRIFUGAL-TYPE FIRE PUMPS INCLUDING DIESEL-ENGINE DRIVER, FUEL STORAGE AND TRANSFER EQUIPMENT AND ASSOCIATED TRIM, CHECK VALVES, SIAMESE CONNECTIONS, FLOW METER, CONTROL VALVES, PIPING AND ASSOCIATED EQUIPMENT, LISTED FIRE PUMP CONTROLLERS, JOCKEY PUMPS AND JOCKEY PUMP CONTROLLERS. SYSTEM SHALL BE CONNECTED TO WATER SUPPLY AS INDICATED.
2. ALL FIRE PROTECTION SYSTEM WORK AND INSTALLATION SHALL CONFORM WITH ALL APPLICABLE CODES, RULES AND REGULATION OF THE STATE OF MARYLAND, INCLUDING NFPA STANDARD NUMBERS: 13, 14, 20, 24, 37, 70, 72A, 101 AND 409, AND BOCA - NATIONAL BUILDING CODE , LATEST APPLICABLE EDITION.
3. ALL FIRE PROTECTION SYSTEM CONTROL VALVES SHALL BE EQUIPPED WITH APPROVED VALVE TAMPER SWITCHES AND SHALL BE SUPERVISED PER NFPA 20,2-11.
4. ALL ELECTRICAL DEVICES FOR FIRE PROTECTION SYSTEM SUPERVISION AND/OR MONITORY SHALL BE COMPATIBLE WITH THE FIRE ALARM SYSTEM.
5. ALL COMPONENTS SHALL BE APPROVED AND LISTED BY RECOGNIZED TESTING LABORATORY FOR INTENDED USE.
6. PERFORMANCE AND ACCEPTANCE TESTS ON ALL SYSTEM COMPONENTS SHALL BE THE RESPONSIBILITY OF THE GENERAL CONTRACTOR, SUBCONTRACTOR AND FIRE PUMP MANUFACTURER'S REPRESENTATIVE. ALL TESTS SHALL BE WITNESSED BY A REPRESENTATIVE OF THE OFFICE OF THE FIRE MARSHALL (410-859-7815).

   THE FOLLOWING TESTS ARE REQUIRED

   (i) UNDERGROUND
   a. 200 PSI HYDROSTATIC
   b. FLUSH

   ⚠1 FIRE PUMP - NFPA 20-11
   a. 130% OF RATED CAPACITY
   b. STANDPIPE FLOW AS LISTED UNDER NFPA 14, BOCA BUILDING AND MECHANICAL CODE

   (ii) FIRE ALARM - NFPA 72.

7. THE TERM "PROVIDE" SHALL MEAN THE CONTRACTOR SHALL FURNISH NEW, INSTALL AND CONNECT FOR A COMPLETE AND OPERATIONAL SYSTEM FOR ITS INTENDED PURPOSE.
8. N.O. = NORMALLY OPEN VALVE
   N.C. = NORMALLY CLOSE VALVE

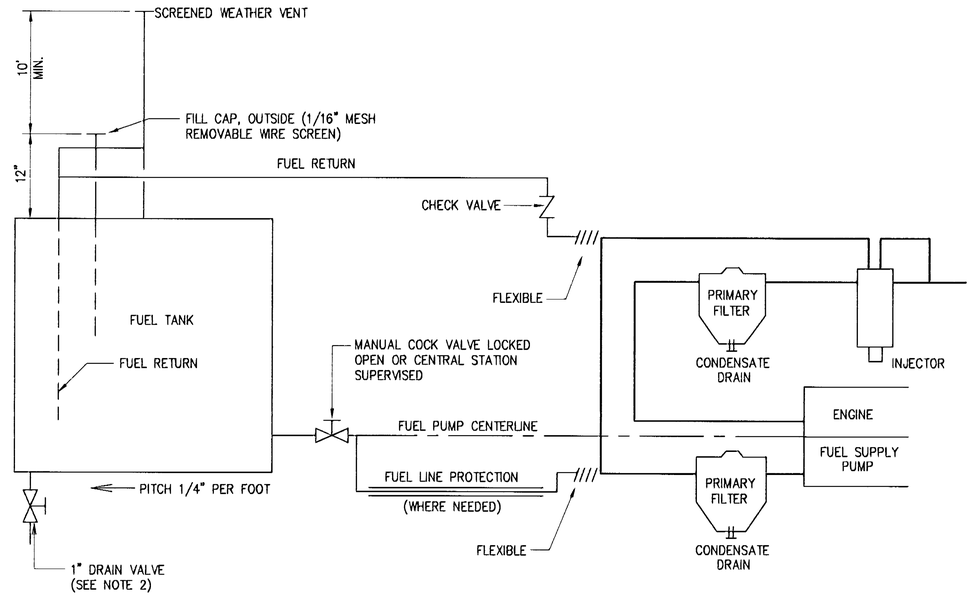
FIRE ALARM RISER DIAGRAM



FIRE PUMP FUEL SYSTEM DIAGRAM

FIRE ALARM SYSTEM NOTES:

1. PROVIDE A COMPLETE FIRE ALARM FOR THE FIRE PUMP HOUSE INCLUDING: ELECTRICALLY/ELECTRONICALLY NON-CODED FIRE ALARM CONTROL PANEL, CONDUIT, PULL BOXES, OUTLET AND MOUNTING BOXES, WIRING, SPRINKLER SYSTEM SUPERVISION AND/OR MONITORING, WATER FLOW ALARMS, TANK LEVEL SUPERVISION AND/OR MONITORING, FIRE PUMP SUPERVISION AND/OR MONITORING, MANUAL PULL STATIONS VISUAL AND AUDIBLE DEVICES, REMOTE FIRE PUMP RUN CONTROL AS WELL AS, ALL OTHER ACCESSORIES AND MISCELLANEOUS ITEMS REQUIRED FOR AN OPERATING SYSTEM EVEN THOUGH EACH ITEM IS NOT SPECIFICALLY MENTIONED, SHOWN, OR DESCRIBED. ALL EQUIPMENT AND DEVICES SHALL BE PROVIDED AS SHOWN ON THE DRAWINGS, DESCRIBED IN THE SPECIFICATIONS AND BE CONNECTED PER SPECIFICATIONS.
2. UNLESS OTHERWISE NOTED OR RECOMMENDED BY THE MANUFACTURER AS PART OF THE WRITTEN AND DOCUMENTED SYSTEM APPROVAL AND LISTING BY A RECOGNIZED TESTING LABORATORY, ALL INDICATING CIRCUIT CONDUCTORS SHALL BE SOLID COPPER, NUMBER 14 AWG, THHN/THWN 600 VAC INSULATED AT A MINIMUM. WIRING CIRCUITS CONNECTING THE 120 VAC POWER SUPPLY SHALL BE NUMBER 12 AWG MINIMUM.
3. MINIMUM CONDUIT SIZE FOR ALL FIRE ALARM RELATED WORK SHALL BE 3/4-INCH TRADE SIZE ELECTRIC METALLIC TUBING (EMT) WITH COMPRESSION TYPE FITTINGS. SET SCREW TYPE FITTINGS ARE NOT PERMITTED. PROVIDE LIQUID-TIGHT FLEXIBLE METAL CONDUIT WITH LISTED COMPATIBLE FITTINGS FOR EQUIPMENT CONNECTIONS OF FIRE PUMP RELATED EQUIPMENT, TAMPER SWITCHES, AND FLOW SWITCHES OR WHERE REQUIRED BY NFPA 70.
4. ALL FIRE ALARM SYSTEM WORK AND INSTALLATION SHALL CONFORM WITH ALL APPLICABLE CODES, RULES AND REGULATIONS OF THE STATE OF MARYLAND, NFPA STANDARDS NUMBERS: 70 AND 72A AND BOCA-NATIONAL BUILDING CODE, LATEST APPLICABLE EDITIONS.
5. ALL COMPONENTS SHALL BE APPROVED AND LISTED BY RECOGNIZED TESTING LABORATORY FOR INTENDED USE.
6. PERFORMANCE AND ACCEPTANCE TESTS ON THE SYSTEM SHALL BE THE CONTRACTOR'S RESPONSIBILITY. ALL TESTS SHALL BE WITNESSED BY A REPRESENTATIVE OF THE OFFICE OF THE FIRE MARSHALL (410-859-7815).
7. THE TERM "PROVIDE" SHALL MEAN THE CONTRACTOR SHALL FURNISH NEW, INSTALL AND CONNECT FOR A COMPLETE AND OPERATIONAL SYSTEM FOR ITS INTENDED PURPOSE.
8. ENGINE STARTING SEQUENSE SHALL BE AS FOLLOWS:
   a. FP-1
   b. FP-2
   c. FP-3 (STANDBY PUMP TO START IN THE EVENT OF ANY OF THE ABOVE PUMPS FAILS TO START)

1

FUEL SYSTEM NOTES:

1. COORDINATE WITH PUMP MANUFACTURER FOR SIZE OF FUEL PIPING, OTHER ACCESSORIES AND/OR REQUIREMENTS.
2. IF SUBJECTED TO FREEZING, PROVIDE 1" DRAIN PLUG INSTEAD.
3. FUEL SYSTEM AND INSTALLATION SHALL CONFORM WITH ALL APPLICABLE CODES, RULES AND REGULATIONS OF THE STATE OF MARYLAND, NFPA STANDARD NOS. 20, 30 AND 37 AND BOCA NATIONAL BUILDING CODE, LATEST EDITION.
4. OIL TANK SHALL CONFORM WITH UL 80 STANDARD.

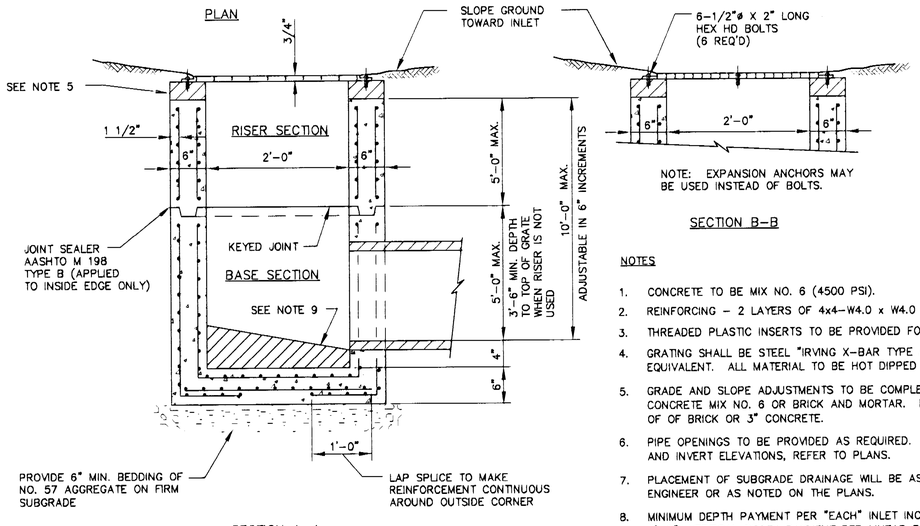
PLAN



SECTION A-A

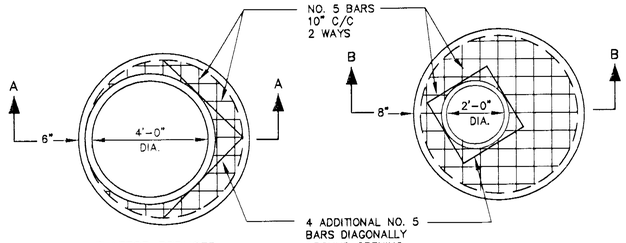
NOTE: EXPANSION ANCHORS MAY BE USED INSTEAD OF BOLTS.

SECTION B-B

NOTES

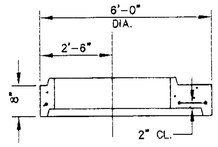
1. CONCRETE TO BE MIX NO. 6 (4500 PSI).
2. REINFORCING - 2 LAYERS OF 4x4-W4.0 x W4.0 WELDED WIRE FABRIC.
3. THREADED PLASTIC INSERTS TO BE PROVIDED FOR HANDLING.
4. GRATING SHALL BE STEEL "IRVING X-BAR TYPE AA" OR APPROVED EQUIVALENT. ALL MATERIAL TO BE HOT DIPPED GALVANIZED STEEL.
5. GRADE AND SLOPE ADJUSTMENTS TO BE COMPLETED IN THE FIELD USING CONCRETE MIX NO. 6 OR BRICK AND MORTAR. MINIMUM ONE LAYER OF OF BRICK OR 3" CONCRETE.
6. PIPE OPENINGS TO BE PROVIDED AS REQUIRED. FOR SIZE, LOCATION AND INVERT ELEVATIONS, REFER TO PLANS.
7. PLACEMENT OF SUBGRADE DRAINAGE WILL BE AS DIRECTED BY THE ENGINEER OR AS NOTED ON THE PLANS.
8. MINIMUM DEPTH PAYMENT PER "EACH" INLET INCLUDES DEPTHS UP TO 3'-6". VERTICAL DEPTH PAYMENT PER LINEAR FOOT FOR DEPTHS IN EXCESS OF 3'-6".
9. INVERT TO BE CONCRETE OR BRICK AND SHALL SLOPE 2" PER FOOT TOWARD OUTLET OR AS DIRECTED BY THE ENGINEER. (INVERT PROVIDED IN THE FIELD)

PRECAST YARD INLET
NTS

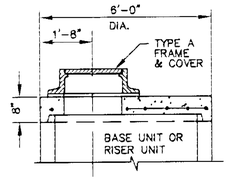


FLATTOP REDUCER

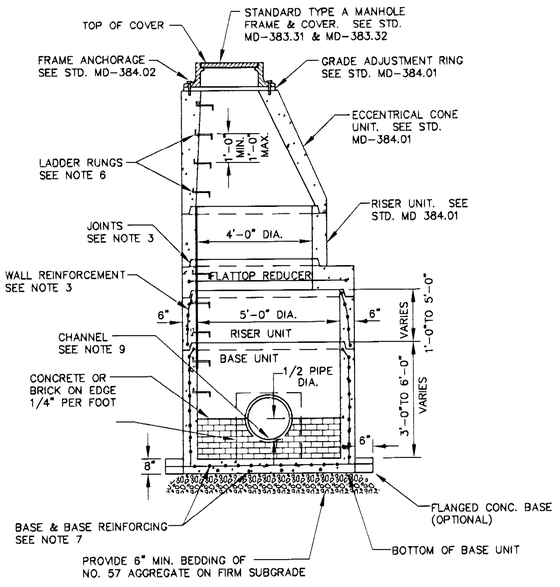
FLAT SLAB TOP



SECTION A-A



SECTION B-B



PRECAST CONCRETE MANHOLE
NTS

NOTES

1. MANHOLES SHALL BE CONSTRUCTED IN ACCORDANCE WITH ASSHTO M 199.
2. CONCRETE SHALL BE MIX NO. 6 (4500 PSI)
3. WALL REINFORCEMENT FOR BASE UNITS, RISER UNITS AND ECCENTRICAL CONE UNITS SHALL BE REINFORCEMENT BARS OR WELDED WIRE FABRIC WITH A MINIMUM AREA OF 0.15 IN./2 FT. FOR THE 60" DIAMETER MANHOLES. WELDED WIRE FABRIC SHALL CONFORM TO ASTM A185 AND A82. REINFORCEMENT BARS SHALL MEET ASTM A615 GRADE 60.
4. BASE REINFORCEMENT TO BE REINFORCEMENT BARS OR WELDED WIRE FABRIC WITH A MINIMUM AREA OF 0.17 IN/2 FT. THE BASE SHALL BE CAST MONOLITHIC WITH THE BASE UNIT OR JOINTED PER MANUFACTURER'S DESIGN.
5. THE MANUFACTURER SHALL FORM MALE AND FEMALE ENDS OF JOINTS USING THEIR OWN DESIGN. THE JOINTS SHALL BE SEALED BY THE CONTRACTOR AND MADE WATERTIGHT USING (WHERE APPLICABLE) MORTAR, RUBBER O-RING GASKETS MEETING ASTM C361 AND C443 OR FLEXIBLE PLASTIC GASKETS MEETING AASHTO M 198 TYPE B.
6. LADDER RUNGS SHALL BE INSTALLED IN VERTICAL ALIGNMENT AT 1'-4" MAXIMUM C/C. RUNG TYPES SHALL BE IN ACCORDANCE WITH STANDARDS MD-383.91 OR MD-383.92. LADDER RUNGS SHALL BE INCIDENTAL TO THE COST OF THE MANHOLE.
7. WHEN THE DISTANCE BETWEEN MULTIPLE OPENINGS IN THE BASE UNIT OR ANY RISER UNIT IS LESS THAN 6", ADDITIONAL NO. 3 BARS ARE REQUIRED AROUND OPENINGS.
8. LIFT HOLES OR LIFT EYES SHALL BE PROVIDED IN EACH SECTION FOR HANDLING.
9. MIX NO. 2 CONCRETE OR BRICK CHANNEL SHALL BE PROVIDED IN THE FIELD AND SHALL SLOPE 2" PER FOOT TOWARD OUTLET OR AS DIRECTED BY THE ENGINEER.
10. THE DRIP STONE LANDING SHALL BE USED ONLY WHEN THERE ARE PIPES CONNECTED TO THE RISER UNITS. SEE STD. MD-384.13 FOR DETAILS.
11. MINIMUM DEPTH PAVEMENT PER EACH SHALL BE 5'-1" MEASURED FROM THE BOTTOM OF THE BASE UNIT TO THE TOP OF THE MANHOLE COVER. VERTICAL DEPTH PAVEMENT PER LINEAR FOOT SHALL INCLUDE ALL DEPTHS IN EXCESS OF 5'-1". THE COST OF THE DRIP STONE LANDING, NO. 57 AGGREGATE, GROUT, SEALANT AND ALL NECESSARY APPURTENANCES SHALL BE INCIDENTAL TO THE PRICE BID.

AS-BUILTS

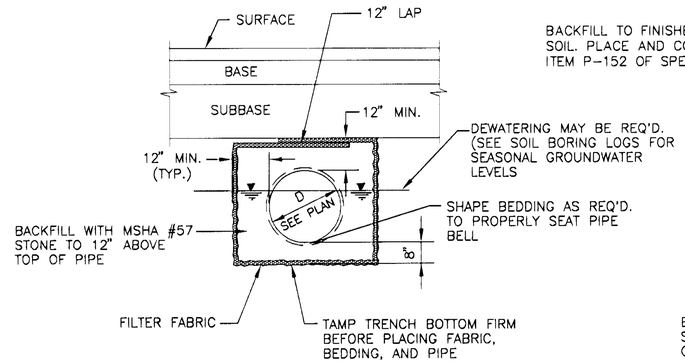
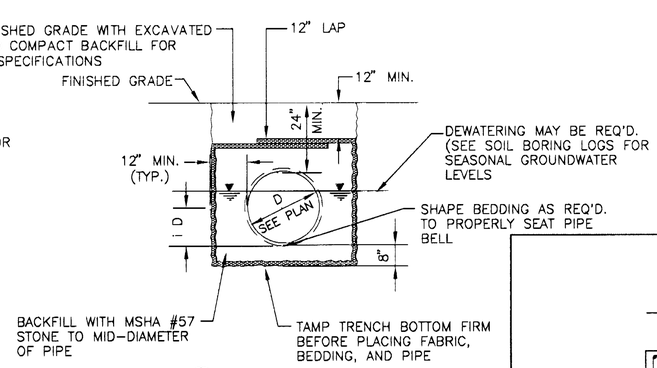
DRAINAGE STRUCTURE TYPE 1 AND AIRSIDE MANHOLE
NOT TO SCALE

NOTES:

1. PIPE INSTALLED UNDER THIS CONTRACT WILL BE INSTALLED AS SHOWN IN DETAIL (A) THIS SHEET, EXCEPT AS NOTED ON THE PLANS.
2. TEMPORARY SHEETING, SHORING, DEWATERING, AND OTHER METHODS OF PREVENTING OR PROTECTING AGAINST CAVE IN OR OTHER HAZARDS SHALL BE THE CONTRACTOR'S SOLE RESPONSIBILITY AND SHALL BE IN ACCORDANCE WITH APPLICABLE FEDERAL, STATE, AND LOCAL LAWS.
3. DEWATERING SHALL BE MAINTAINED THROUGH THE INSTALLATION OF THE DRAINAGE SYSTEM AS REQUIRED.
4. PIPE UP TO AND INCLUDING 24" DIAMETER SHALL BE C-WALL CLASS IV PIPE MEETING THE REQUIREMENTS OF ASTM C 76. PIPE 27" IN DIAMETER AND LARGER SHALL BE THIKEST-WALL CLASS B-25 PIPE MEETING THE REQUIREMENTS OF ASTM C 361.



(A) **UNDER PAVEMENT**



(B) **UNDER TURFED AREAS**

TYPICAL STORMDRAIN PIPE BEDDING DETAILS
NOT TO SCALE

NOTES:

1. CONCRETE SHALL MEET THE REQUIREMENTS OF ITEM P-610. CONCRETE USED FOR INVERT SHAPING ONLY MAY BE 3000 PSI AT CONTRACTOR'S OPTION.
2. STRUCTURE LOCATIONS AND APPROXIMATE ORIENTATIONS ARE SHOWN ON SHEETS C-04 AND C-05. STRUCTURES SHALL BE ORIENTED TO MINIMIZE THE ANGLES BETWEEN THE STRUCTURE AND INCOMING PIPE. THE MAXIMUM SKEW BETWEEN THE RISER AXIS AND MAJOR AXIS SHALL BE 15°.
3. FOR MH OPENING, SIZE SHALL BE 24" x 24". MH FRAME AND COVER (NEENAH R-6662-HR OR APPROVED EQUAL).
4. PROVIDE OPENINGS OR KNOCK-OUT PANELS FOR FUTURE PIPE AS SHOWN ON PLANS.

PROJECT NO. MAA-CO-97-019

SHEET NO. M-03

STANDARD EROSION AND SEDIMENT CONTROL NOTES

1. THE CONTRACTOR SHALL NOTIFY THE MDE WATER MANAGEMENT ADMINISTRATION (MDE) AT (410) 631-3510 SEVEN (7) DAYS BEFORE COMMENCING ANY LAND DISTURBING ACTIVITY AND, UNLESS WAIVED BY THE ADMINISTRATION, SHALL BE REQUIRED TO HOLD A PRE-CONSTRUCTION MEETING BETWEEN PROJECT REPRESENTATIVES AND A REPRESENTATIVE OF THE MDE.

2. THE CONTRACTOR MUST NOTIFY THE MDE IN WRITING AND BY TELEPHONE AT THE FOLLOWING TIMES DURING THE PROJECT:

   A. THE REQUIRED PRE-CONSTRUCTION MEETING;
   B. FOLLOWING INSTALLATION OF SEDIMENT CONTROL MEASURES;
   C. DURING THE INSTALLATION OF SEDIMENT BASINS (TO BE CONVERTED INTO PERMANENT STORMWATER MANAGEMENT STRUCTURES) AT THE REQUIRED INSPECTION POINTS (SEE INSPECTION CHECKLIST ON PLAN). NOTIFICATION PRIOR TO COMMENCING CONSTRUCTION OF EACH STEP IS MANDATORY;
   D. PRIOR TO REMOVAL OR MODIFICATION OF ANY SEDIMENT CONTROL STRUCTURE(S);
   E. PRIOR TO REMOVAL OF ALL SEDIMENT CONTROL DEVICES; AND
   F. PRIOR TO FINAL ACCEPTANCE OF THE PROJECT.

3. THE CONTRACTOR SHALL CONSTRUCT ALL EROSION AND SEDIMENT CONTROL MEASURES IN ACCORDANCE WITH THE APPROVED PLAN AND CONSTRUCTION SEQUENCE AND SHALL HAVE SUCH INSTALLATIONS INSPECTED AND APPROVED BY THE AGENCY OR SSA INSPECTOR PRIOR TO BEGINNING ANY OTHER LAND DISTURBANCES. MINOR SEDIMENT CONTROL DEVICE LOCATION ADJUSTMENTS MAY BE MADE IN THE FIELD WITH THE APPROVAL OF THE SSA INSPECTOR. THE CONTRACTOR SHALL ENSURE THAT ALL RUNOFF FROM DISTURBED AREAS IS DIRECTED TO THE SEDIMENT CONTROL DEVICES AND SHALL NOT REMOVE ANY EROSION OR SEDIMENT CONTROL MEASURE WITHOUT PRIOR PERMISSION FROM THE AGENCY OR MDE INSPECTOR. THE CONTRACTOR MUST OBTAIN PRIOR AGENCY AND SSA APPROVAL FOR CHANGES TO THE SEDIMENT CONTROL PLAN AND/OR SEQUENCE OF CONSTRUCTION.

4. THE CONTRACTOR SHALL PROTECT ALL POINTS OF CONSTRUCTION VEHICLE ACCESS TO THE SITE TO PREVENT THE DEPOSITION OF MATERIALS ONTO PUBLIC ROADS. ALL MATERIALS DEPOSITED ONTO PUBLIC ROADS SHALL BE REMOVED IMMEDIATELY.

5. THE CONTRACTOR SHALL INSPECT DAILY AND MAINTAIN CONTINUOUSLY IN AN EFFECTIVE OPERATING CONDITION ALL EROSION AND SEDIMENT CONTROL MEASURES UNTIL SUCH TIME AS PERMISSION FOR THEIR REMOVAL IS OBTAINED FROM THE AGENCY AND MDE INSPECTORS.

6. ALL SEDIMENT BASINS, TRAP EMBANKMENTS AND SLOPES, PERIMETER DIKES, SWALES, AND ALL DISTURBED SLOPES 3:1 OR STEEPER SHALL BE STABILIZED WITH SOD OR SEED AND ANCHORED STRAW MULCH OR OTHER APPROVED STABILIZATION MEASURES AS SOON AS POSSIBLE BUT NO LATER THAN SEVEN (7) CALENDAR DAYS AFTER ESTABLISHMENT. ALL AREAS DISTURBED OUTSIDE OF THE PERIMETER SEDIMENT CONTROL SYSTEM MUST BE MINIMIZED. MAINTENANCE MUST BE PERFORMED AS NECESSARY TO ENSURE CONTINUED STABILIZATION. IN SENSITIVE AREAS STABILIZATION MAY BE REQUIRED WITHIN THREE (3) DAYS, AS DIRECTED BY THE ENGINEER.

7. THE CONTRACTOR SHALL APPLY SOD OR SEED AND ANCHORED STRAW MULCH OR OTHER APPROVED STABILIZATION MEASURES TO ALL DISTURBED AREAS AND MATERIAL STOCKPILES WITHIN FOURTEEN (14) CALENDAR DAYS AFTER STRIPPING AND GRADING ACTIVITIES HAVE CEASED IN THE AREA. MAINTENANCE SHALL BE PERFORMED AS NECESSARY TO ENSURE CONTINUED STABILIZATION. IN SENSITIVE AREAS STABILIZATION MAY BE REQUIRED WITHIN SEVEN (7) DAYS, AS DIRECTED BY THE ENGINEER.

8. PRIOR TO REMOVAL OF SEDIMENT CONTROL MEASURES, THE CONTRACTOR SHALL STABILIZE AND HAVE ESTABLISHED PERMANENT STABILIZATION FOR ALL CONTRIBUTORY DISTURBED AREAS USING SOD OR AN APPROVED PERMANENT SEED MIXTURE WITH REQUIRED SOIL AMENDMENTS AND AN APPROVED ANCHOR MULCH. WOOD FIBER MULCH MAY BE USED ONLY IN SEEDING SEASON (AS DEFINED IN THE SPECIFICATIONS) WHERE THE SLOPE DOES NOT EXCEED TEN (10) PER CENT AND GRADING HAS BEEN DONE TO PROMOTE SHEET FLOW DRAINAGE. AREAS BROUGHT TO FINISHED GRADE DURING THE SEEDING SEASON SHALL BE PERMANENTLY STABILIZED AS SOON AS POSSIBLE BUT NO LATER THAN FOURTEEN (14) CALENDAR DAYS AFTER ESTABLISHMENT. WHEN GRADING IS COMPLETED DURING THE MONTHS OF NOVEMBER THROUGH FEBRUARY, AND PERMANENT STABILIZATION IS FOUND TO BE IMPRACTICAL, TEMPORARY SEEDING AND ANCHORED STRAW MULCH SHALL BE APPLIED TO DISTURBED AREAS. THE FINAL PERMANENT STABILIZATION OF SUCH AREAS SHALL BE APPLIED BY MARCH 15 OR EARLIER AS GROUND AND WEATHER CONDITIONS PERMIT.

9. THE SITE'S APPROVAL CERTIFICATION, APPROVED EROSION AND SEDIMENT CONTROL PLANS, DAILY LOG BOOKS, AND TEST REPORTS SHALL BE KEPT ON THE SITE AND SHALL BE AVAILABLE FOR INSPECTION BY AUTHORIZED AGENTS OF WMA AND THE OWNER.

10. SURFACE DRAINAGE FLOWS OVER UNSTABILIZED CUT AND FILL SLOPES SHALL BE CONTROLLED BY EITHER PREVENTING DRAINAGE FLOWS FROM TRAVERSING THE SLOPES OR BY INSTALLING PROTECTIVE DEVICES TO CONTROL THE VELOCITY OF SUCH FLOWS TO NON-EROSIVE. DIVERSION DIKES SHALL BE INSTALLED AND MAINTAINED AT THE TOPS OF CUT AND EMBANKMENT SECTIONS (AND AT BENCHES AS DIRECTED BY THE ENGINEER) UNTIL THE SLOPES AND AREAS DRAINING TO THEM ARE FULLY STABILIZED, AT WHICH TIME THEY SHALL BE REMOVED AND REGRADED TO PROMOTE SHEET FLOW DRAINAGE. PROTECTIVE METHODS SHALL BE INSTALLED AT POINTS OF CONCENTRATED FLOW WHERE EROSION IS LIKELY TO OCCUR.

11. PERMANENT SWALES OR OTHER POINTS OF CONCENTRATED WATER FLOW SHALL BE STABILIZED WITH SOD OR SEEDING WITH AN APPROVED EROSION CONTROL MATTING, RIP RAP, OR OTHER APPROVED STABILIZATION MEASURES.

12. TEMPORARY SEDIMENT CONTROL DEVICES MAY BE REMOVED WITH THE PERMISSION OF THE MDE AND OWNER'S INSPECTORS WITHIN THIRTY (30) CALENDAR DAYS FOLLOWING ESTABLISHMENT OF PERMANENT STABILIZATION IN ALL CONTRIBUTORY DRAINAGE AREAS. STORMWATER MANAGEMENT STRUCTURES USED FOR TEMPORARY SEDIMENT CONTROL SHALL BE CONVERTED TO THEIR PERMANENT CONFIGURATIONS WITHIN THIS THIRTY (30) DAY PERIOD.

13. NO PERMANENT CUT OR FILL SLOPES STEEPER THAN 3:1 WILL BE PERMITTED IN LAWN MAINTENANCE AREAS. SLOPES OF 2:1 AND FLATTER WILL BE PERMITTED IN NON-MAINTENANCE AREAS PROVIDED THOSE AREAS ARE SHOWN ON THE EROSION AND SEDIMENT CONTROL PLAN TO BE TREATED WITH A LOW-MAINTENANCE GROUND COVER SPECIFIED FOR PERMANENT STABILIZATION. VEGETATIVE COVER WILL NOT BE PERMITTED ON SLOPES STEEPER THAN 2:1.

14. ALL COMPLETED AREAS SHALL BE GRADED IN ACCORDANCE WITH THE CONTRACT GRADING AND DRAINAGE PLANS. IN NO CASE SHALL FINISHED GRADING PERMIT WATER TO STAND ON THE SURFACE FOR MORE THAN TWENTY-FOUR (24) HOURS FOLLOWING A RAINFALL EVENT, EXCEPT THAT DESIGNATED DRAINAGE COURSES AND SWALES MAY CARRY WATER UP TO FORTY-EIGHT (48) HOURS FOLLOWING A RAINFALL EVENT. AREAS SHOWN ON THE PLANS TO HOLD STANDING WATER, SUCH AS STORMWATER DETENTION BASINS, SHALL BE EXEMPT FROM THIS REQUIREMENT.

15. SEDIMENT TRAPS AND BASINS SHALL NOT BE CONSTRUCTED WITHIN TWENTY (20) FEET OF AN EXISTING OR PROPOSED FOUNDATION. NO STRUCTURE MAY BE CONSTRUCTED WITHIN TWENTY (20) FEET OF AN ACTIVE SEDIMENT TRAP OR BASIN.

16. THE SSA INSPECTOR SHALL HAVE THE AUTHORITY TO ORDER THE INSTALLATION OF ADDITIONAL SAFETY OR SEDIMENT CONTROL MEASURES AS HE DEEMS NECESSARY. SUCH ADDITIONAL MEASURES SHALL BE CONSTRUCTED AND PAID FOR AS PROVIDED BY THE CONTRACT DOCUMENTS.

17. ALL TRAP DEPTH DIMENSIONS SHOWN ARE RELATIVE TO THE OUTLET ELEVATION. THE CONTRACTOR SHALL MAINTAIN THE STABILITY OF ALL INFLOW AND OUTFALL POINTS.

18. VEGETATIVE STABILIZATION SHALL BE PERFORMED IN ACCORDANCE WITH THE STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL. REFER TO THE APPROPRIATE SPECIFICATIONS FOR TEMPORARY SEEDING, PERMANENT SEEDING, MULCHING, SODDING, AND GROUND COVERS.

19. TEMPORARY SEDIMENT TRAPS SHALL BE CLEANED OUT AND RESTORED TO THE CONFIGURATIONS SHOWN ON THE PLANS WHEN SEDIMENT HAS ACCUMULATED TO HALF THE TRAP DEPTH (TRAP BOTTOM TO OUTLET CREST). SEDIMENT BASINS SHALL BE CLEANED OUT AND RESTORED TO PLAN CONFIGURATIONS WHEN SEDIMENT HAS ACCUMULATED TO HALF THE BASIN DEPTH (BASIN BOTTOM TO DEWATERING ELEVATION).

20. SEDIMENT REMOVED FROM TRAPS AND BASINS SHALL BE PLACED AND STABILIZED IN APPROVED AREAS, BUT NOT WITHIN A DESIGNATED FLOOD PLAIN, WETLAND, OR TREE-SAVE AREA. WHEN PUMPING SEDIMENT-LADEN WATER THE DISCHARGE MUST BE DIRECTED TO A SEDIMENT TRAPPING DEVICE PRIOR TO RELEASE FROM THE SITE.

21. WHERE SHOWN ON THE PLANS OR REQUIRED BY THE ENGINEER OR MDE INSPECTOR, SEDIMENT BASINS AND/OR TRAPS MAY REQUIRE ENCLOSURE WITH AN APPROVED SAFETY FENCE WHICH SHALL CONFORM WITH LOCAL ORDINANCES AND REGULATIONS. WHERE LOCAL ORDINANCES AND REGULATIONS DO NOT SPECIFY FENCING TYPES AND SIZES, FENCES SHALL BE AT LEAST FORTY-TWO (42) INCHES TALL WITH POSTS SPACED AT EIGHT (8) FEET, WITH FOURTEEN (14) GAUGE WELDED WIRE FABRIC WITH OPENINGS OF TWO (2) INCHES BY FOUR (4) INCHES. SAFETY FENCE SHALL BE MAINTAINED IN GOOD CONDITION AT ALL TIMES.

22. SEDIMENT CONTROL FOR UTILITY CONSTRUCTION IN AREAS OUTSIDE OF DESIGNATED CONTROLS SHALL BE ACCOMPLISHED AS FOLLOWS OR AS DIRECTED BY THE ENGINEER OR MDE INSPECTOR: MATERIAL EXCAVATED FROM TRENCHES SHALL BE PLACED ON THE HIGH SIDE OF THE TRENCH AND SHALL BE BACKFILLED, COMPACTED, AND STABILIZED AT THE END OF EACH WORK DAY. UNLESS OTHERWISE AUTHORIZED BY THE ENGINEER, NO MORE TRENCH SHALL BE OPENED THAN CAN BE BACKFILLED THE SAME DAY. TEMPORARY SILT FENCE SHALL BE PLACED IMMEDIATELY DOWNSTREAM OF ANY DISTURBED AREA INTENDED TO REMAIN DISTURBED FOR MORE THAN ONE (1) DAY.

23. OFF-SITE SPOIL OR BORROW AREAS ON STATE OR FEDERAL PROPERTY SHALL BE APPROVED PRIOR TO THEIR USE BY THE SSA AND/OR LOCAL AUTHORITIES, AS APPLICABLE. CONTRACT EROSION AND SEDIMENT CONTROL REQUIREMENTS SHALL APPLY TO ALL THE CONTRACTOR'S ACTIVITIES IN OFF-SITE BORROW AND WASTE AREAS, AND SHALL BE FOLLOWED AS DIRECTED BY THE ENGINEER AND/OR THE MDE INSPECTOR.

24. WHERE INFILTRATION DEVICES ARE USED FOR THE CONTROL AND MANAGEMENT OF STORMWATER, EXTREME CARE SHALL BE TAKEN TO PREVENT RUNOFF FROM UNSTABILIZED AREAS FROM ENTERING SUCH STRUCTURES. SEDIMENT CONTROL MEASURES INSTALLED IN INFILTRATION DEVICES MUST HAVE BOTTOM ELEVATIONS AT LEAST TWO (2) FEET HIGHER THAN THE FINISHED GRADE BOTTOM ELEVATION OF THE DEVICES. WHEN CONVERTING A SEDIMENT TRAP TO AN INFILTRATION DEVICE ALL ACCUMULATED SEDIMENT SHALL BE REMOVED AND DISPOSED OF BEFORE FINAL GRADING OF THE DEVICE.

25. WHERE RUNOFF FROM A STORM DRAINAGE SYSTEM OUTFALL IS DIRECTED TO A SEDIMENT TRAP OR BASIN AND THE SYSTEM IS TO BE USED FOR TEMPORARILY CONVEYING SEDIMENT-LADEN RUNOFF, TEMPORARY ASPHALT BERMS SHALL BE CONSTRUCTED AROUND ALL STORM DRAINAGE INLETS IN NON-SUMP AREAS. THESE BERMS SHALL BE INSTALLED AT THE TIME OF BASE PAVING TO DIRECT GUTTER FLOW INTO THE INLETS TO AVOID SURCHARGING AND OVERFLOW OF INLETS IN SUMP AREAS.

26. SITE INFORMATION:

TOTAL SITE AREA	43.10 ACRES
DISTURBED AREA	29.85 ACRES
PAVED OR ROOFED AREA	13.25 ACRES
TOTAL EXCAVATION	43,750 CUBIC YARDS
TOTAL EMBANKMENT	10,000 CUBIC YARDS
OFFSITE WASTE/BORROW AREA	TO BE DETERMINED PRIOR TO START OF CONSTRUCTION

27. MDE INSPECTORS SHALL BE NOTIFIED PRIOR TO THE BEGINNING OF ANY LAND DISTURBANCE.

28. EROSION AND SEDIMENT CONTROL MEASURES SHALL NOT BE REMOVED UNTIL FINAL LAND STABILIZATION AND APPROVAL OF THE MDE INSPECTOR.

STANDARD STABILIZATION NOTE

FOLLOWING INITIAL SOIL DISTURBANCE OR REDISTURBANCE, PERMANENT OR TEMPORARY STABILIZATION SHALL BE COMPLETED WITHIN SEVEN (7) CALENDAR DAYS AS TO THE SURFACE OF ALL PERIMETER CONTROLS, DIKES, SWALES, DITCHES, PERIMETER SLOPES, AND ALL SLOPES GREATER THAN THREE HORIZONTAL TO ONE VERTICAL; AND FOURTEEN (14) DAYS AS TO ALL OTHER DISTURBED OR GRADED AREAS ON THE PROJECT SITE.

ADDITIONAL NOTES

1. PONDS 1, 2A, AND/OR 2B SHALL NOT BE USED AS TEMPORARY SEDIMENT BASINS DURING CONSTRUCTION. ALL RUNOFF ENTERING THESE PONDS SHALL BE CLEAN AND FREE OF SEDIMENT AT ALL TIMES.
2. MAINTENANCE SCHEDULES FOR PERMANENT STORMWATER MANAGEMENT PONDS, SEDIMENTATION CHAMBERS, ENDWALLS, AND OTHER STRUCTURES ARE SHOWN ON SHEET R-10.
3. FOR CONSTRUCTION SEQUENCING SEE SHEETS A-01 THROUGH A-07.
4. FOR EROSION AND SEDIMENT CONTROL MEASURES REQUIRED FOR POND CONSTRUCTION SEE SHEETS C-11 THROUGH C-20.

DESIGN CERTIFICATION

"I hereby certify that this plan has been designed in accordance with the 1994 Standards and Specifications for Soil Erosion and Sediment Control or current revisions thereto, and the Maryland Department of the Environment Stormwater Management Regulations."

NTS

LOAMING, SEEDING AND FERTILIZING

1.) If required the contractor shall furnish all topsoil or additional topsoil needed to complete the job. If the existing topsoil is sufficient to complete the job, any excess topsoil will remain on site. An area will be provided on site for final storage.

2.) The topsoil shall be uniformly distributed on the designated areas and it shall be a minimum depth of six inches after firming. Spreading shall be performed in such a manner that seeding can proceed with a minimum of additional soil preparation and tillage. Any irregularities in the surface resulting from topsoiling or other operations shall be corrected in order to prevent the formation of depressions or water pockets. Topsoil shall not be placed while in a frozen or muddy condition, when the subgrade is excessively wet, or in a condition that may otherwise be detrimental to proper grading or proposed seeding.

3.) After loam has been placed, lime and fertilizer shall be uniformly mixed into the top four inches of soil by discing, harrowing or using other approved methods.

4.) Any undulations or irregularities in the surface resulting from fertilizing, liming, surface roughening or other causes shall be leveled prior to seeding. Flooded, washed-out or otherwise damaged areas shall be reconstructed and all grades re-established by the contractor in accordance with the drawings and/or other applicable specifications.

5.) Prior to seeding, the surface shall be cleared of all trash, debris and stones larger than one and one-half inches in diameter, and of all roots, brush, wire, grade stakes and other objects that would interfere with planting or maintenance operations.

6.) Broadcast seed and mulch. Place straw and anchor it to topsoil. If soil moisture is deficient, supply new seedings with adequate water for plant growth (1/2"-1" every 3-4 days depending on soil texture) until they are firmly established.

REPAIRS AND MAINTENANCE

Inspect all seeded areas for failures and make necessary repairs, replacements, and reseedings within the planting season.

1.) Once the vegetation is established, the site shall have 95% groundcover to be considered adequately stabilized.

2.) if the stand provides less than 40% ground coverage, reestablish following original lime, fertilizer, seedbed preparation and seeding recommendations.

3.) If the stand provides between 40% and 94% ground coverage, overseeding and fertilizing using half of the rates originally applied may be necessary.

SURFACE PREPARATION

1.) Strip and stockpile all existing loam from proposed work areas. Protect loam from erosion. All loam will remain on site unless the owner approves of off site removal.

2.) Set field grades in accordance with the contract documents. Provide proper survey control and maintain throughout construction. Provide engineer with copies of all survey notes and locations of both vertical and horizontal control.

3.) Bring base material to finish grade. Provide engineer with as-built drawings showing finish elevations and contours prior to placement of loam.

4.) Soil test shall be made to determine the exact requirements for both lime and fertilizer. Soil tests shall be conducted by a state laboratory or recognized commercial laboratory. Provide engineer with copy of test results and recomendations for liming and fertilizing.

5.) After the areas to be topsoiled have been approved by the owner or engineer, and immediately prior to dumping and spreading the topsoil, the subgrade shall be loosened by roughening to a depth of at least two inches to permit bonding of the topsoil to the subsoil and to incorporate lime.

6.) Acceptance shall be given by the owner or engineer upon satisfactory completion of each section or area as indicated on the drawings or as otherwise specified before placement of topsoil.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED. IN EVERY DETAIL, THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

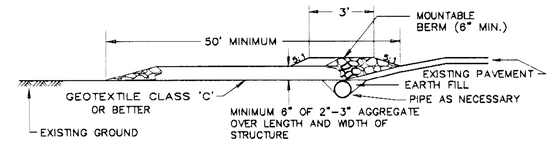
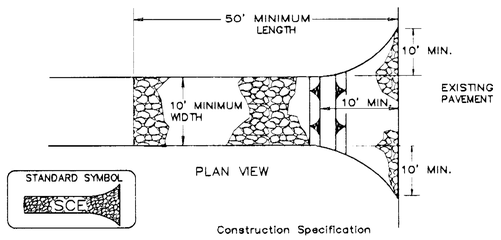
DETAIL 24 – STABILIZED CONSTRUCTION ENTRANCE



PROFILE



PLAN VIEW

Construction Specification

1. Length – minimum of 50' (*30' for single residence lot).

2. Width – 10' minimum, should be flared at the existing road to provide a turning radius.

3. Geotextile fabric (filter cloth) shall be placed over the existing ground prior to placing stone. **The plan approval authority may not require single family residences to use geotextile.

4. Stone – crushed aggregate (2" to 3") or reclaimed or recycled concrete equivalent shall be placed at least 6" deep over the length and width of the entrance.

5. Surface Water – all surface water flowing to or diverted toward construction entrances shall be piped through the entrance, maintaining positive drainage. Pipe installed through the stabilized construction entrance shall be protected with a mountable berm with 5:1 slopes and a minimum of 6" of stone over the pipe. Pipe has to be sized according to the drainage. When the SCE is located at a high spot and has no drainage to convey a pipe will not be necessary. Pipe should be sized according to the amount of runoff to be conveyed. A 6" minimum will be required.

6. Location – A stabilized construction entrance shall be located at every point where construction traffic enters or leaves a construction site. Vehicles leaving the site must travel over the entire length of the stabilized construction entrance.

Construction Specifications

1. Fence posts shall be a minimum of 36" long driven 16" minimum into the ground. Wood posts shall be 11/2" x 11/2" square (minimum) cut, or 13/4" diameter (minimum) round and shall be of sound quality hardwood. Steel posts will be standard T or U section weighting not less than 1.00 pond per linear foot.

2. Geotextile shall be fastened securely to each fence post with wire ties or staples at top and mid–section and shall meet the following requirements for Geotextile Class F:

Tensile Strength	50 lbs/in (min.)	Test: MSMT 509
Tensile Modulus	20 lbs/in (min.)	Test: MSMT 509
Flow Rate	0.3 gal ft ⁄ minute (max.)	Test: MSMT 322
Filtering Efficiency	75% (min.)	Test: MSMT 322

3. Where ends of geotextile fabric come together, they shall be overlapped, folded and stapled to prevent sediment bypass.

4. Silt Fence shall be inspected after each rainfall event and maintained when bulges occur or when sediment accumulation reached 50% of the fabric height.

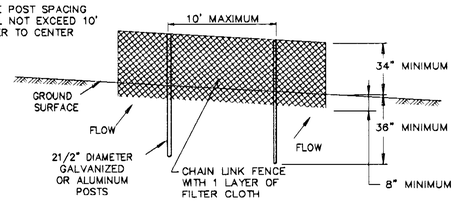
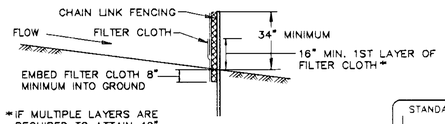
DETAIL 33 – SUPER SILT FENCE

NOTE: FENCE POST SPACING SHALL NOT EXCEED 10' CENTER TO CENTER





*IF MULTIPLE LAYERS ARE REQUIRED TO ATTAIN 42"

STANDARD SYMBOL
SSF

Construction Specifications

1. Fencing shall be 42" in height and constructed in accordance with the latest Maryland State Highway Details for Chain Link Fencing. The specification for a 6' fence shall be used, substituting 42" fabric and 6' length posts.

2. Chain link fence shall be fastened securely to the fence posts with wire ties. The lower tension wire, brace and truss rods, drive anchors and post caps are not required except on the ends of the fence.

3. Filter cloth shall be fastened securely to the chain link fence with ties spaced every 24" at the top and mid section.

4. Filter cloth shall be embedded a minimum of 8" into the ground.

5. When two sections of filter cloth adjoin each other, they shall be overlapped by 6" and folded.

6. Maintenance shall be performed as needed and silt buildups removed when "bulges" develop in the silt fence, or when silt reaches 50% of fence height

7. Filter cloth shall be fastened securely to each fence post with wire ties or staples at top and mid section and shall meet the following requirements for Geotextile Class F:

Tensile Strength	50 lbs/in (min.)	Test: MSMT 509
Tensile Modulus	20 lbs/in (min.)	Test: MSMT 509
Flow Rate	0.3 gal/ft ⁄minute (max.)	Test: MSMT 322
Filtering Efficiency	75% (min.)	Test: MSMT 322

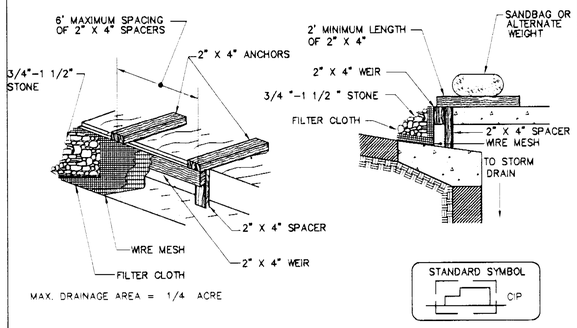
SHEET NO.: R-07

DETAIL 23C – CURB INLET PROTECTION (COG OR COS INLETS)



Construction Specifications

1. Attach a continuous piece of wire mesh (30" minimum width by throat length plus 4') to the 2" x 4" weir (measuring throat length plus 2') as shown on the standard drawing.

2. Place a continuous piece of Geotextile Class E the same dimensions as the wire mesh over the wire mesh and securely attach it to the 2" x 4" weir.

3. Securely nail the 2" X 4" weir to a 9" long vertical spacer to be located between the weir and the inlet face (max. 4' apart).

4. Place the assembly against the inlet throat and nail (minimum 2' lengths of 2" x 4" to the top of the weir at spacer locations). These 2" x 4" anchors shall extend across the inlet top and be held in place by sandbags or alternate weight.

5. The assembly shall be placed so that the end spacers are a minimum 1' beyond both ends of the throat opening.

6. Form the 1/2 " x 1/2 " wire mesh and the geotextile fabric to the concrete gutter and against the face of the curb on both sides of the inlet. Place clean 3/4 " x 1 1/2 " stone over the wire mesh and geotextile in such a manner to prevent water from entering the inlet under or around the geotextile.

7. This type of protection must be inspected frequently and the filter cloth and stone replaced when clogged with sediment.

8. Assure that storm flow does not bypass the inlet by installing a temporary earth or asphalt dike to direct the flow to the inlet.

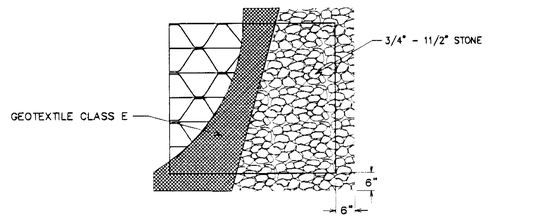
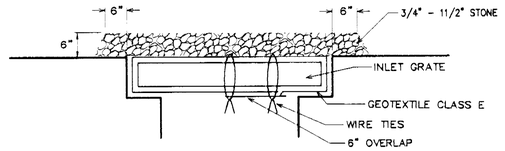
DETAIL 23B – AT GRADE INLET PROTECTION



PLAN/CUT AWAY VIEW



CROSS SECTION

MAX. DRAINAGE AREA = 1/4 ACRE

STANDARD SYMBOL
AGIP

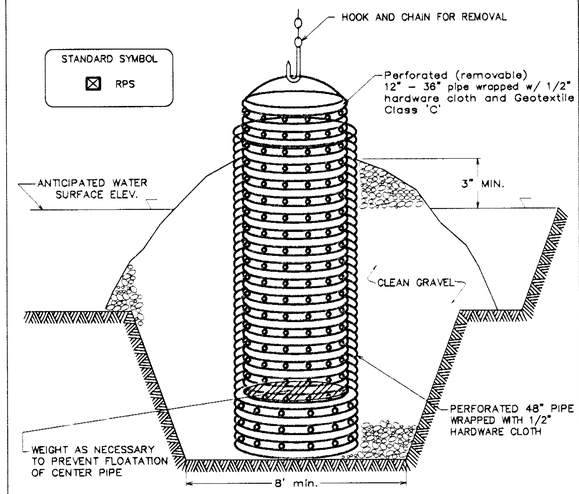
Construction Specifications

1. Lift grate and wrap with Geotextile Class E to completely cover all openings, then set grate back in place.

2. Place 3/4" to 11/2" stone, 4"–6" thick on the grate to secure the fabric and provide additional filtration.

U.S. DEPARTMENT OF AGRICULTURE SOIL CONSERVATION SERVICE	PAGE E – 16 – 5A	MARYLAND DEPARTMENT OF ENVIRONMENT WATER MANAGEMENT ADMINISTRATION

DETAIL 20A – REMOVABLE PUMPING STATION



ELEVATION

CONSTRUCTION SPECIFICATION

1. The outer pipe should be 48" dia. or shall, in any case, be at least 4" greater in diameter than the center pipe. The outer pipe shall be wrapped with 1/2" hardware cloth to prevent backfill material from entering the perforations.

2. After installing the outer pipe, backfill around outer pipe with 2" aggregate or clean gravel.

3. The inside stand pipe (center pipe) should be constructed by perforating a corrugated or PVC pipe between 12" and 36" in diameter. The perforations shall be 1/2" X 6" slits or 1" diameter holes 6" on center. The center pipe shall be wrapped with 1/2" hardware cloth first, then wrapped again with Geotextile Class C.

4. The center pipe should extend 12" to 18" above the anticipated water surface elevation or riser crest elevation when dewatering a basin.

U.S. DEPARTMENT OF AGRICULTURE SOIL CONSERVATION SERVICE	PAGE D – 12 – 4	MARYLAND DEPARTMENT OF ENVIRONMENT WATER MANAGEMENT ADMINISTRATION

AS-BUILTS

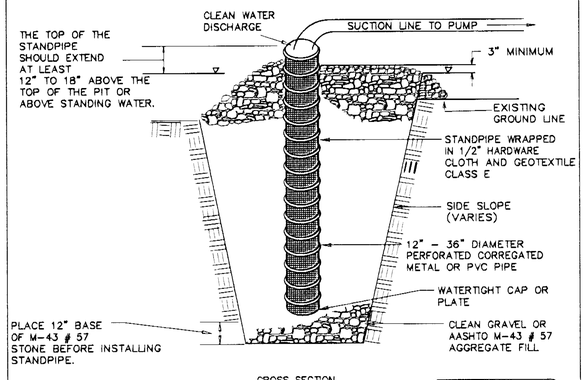
DETAIL 20B – SUMP PIT



CROSS SECTION

STANDARD SYMBOL

⊠ SP

SUMP PIT

Construction Specifications

1. Pit dimensions are variable, with the minimum diameter being 2 times the standpipe diameter.

2. The standpipe should be constructed by perforating a 12" to 24" diameter corrugated or PVC pipe. Then wrapping with 1/2" hardware cloth and Geotextile Class E. The perforations shall be 1/2" x 6" slits or 1" diameter holes.

3. A base of filter material consisting of clean gravel or #57 stone should be placed in the pit to a depth of 12". After installing the standpipe, the pit surrounding the standpipe should then be backfilled with the same filter material.

4. The standpipe should extend 12" to 18" above the lip of the pit or the riser crest elevation (basin dewatering only) and the filter material should extend 3" minimum above the anticipated standing water elevation.

2.1% to 4%	40'
4.1% to 7%	25'
7.1% to 10%	15'
over 10%	use lined waterway design

Construction Specifications

1. Swales and ditches shall be prepared in accordance with the construction specifications described in Section A–2, Standards and Specifications for Temporary Swale.

2. The check dam shall be constructed of 4"–7" stone. The stone shall be placed so that it completely covers the width of the channel and keyed into the channel banks.

3. The top of the check dam shall be constructed so the the center is approximately 6" lower than the outer edges, forming a weir that water can flow across.

4. The maximum height of the check dam at the center shall not exced 2".

5. The upstream sideof the check dam shall be lined with approximately 1" of 3/4" to 11/2" crushed aggregate.

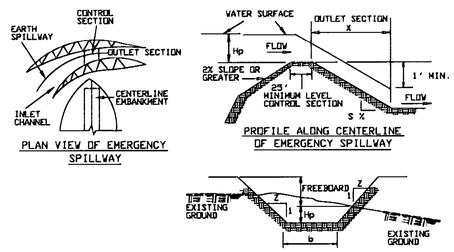
PROJECT NO. **MAA-CO-97-019**

SHEET NO. **R-09**

DETAIL 12 - EMERGENCY SPILLWAY



LEGEND

n= manning's Coefficient of Roughness.
Hp= Difference in elevation between the crest of the emergency spillway and the control section and water surface of the reservoir, in Feet.
b= Bottom width of emergency spillway at the control section, in feet. (8' Minimum)
Q= Total discharge, in cfs.
V= Velocity, in feet per second, that will exist in the channel below the control section, at design Q, if constructed to slope (S) that is shown. (Vmax = 5 fps.)
S= Flattest slope (S), in %, allowable for the channel below the control section.
X= Minimum length of the channel below the control section, in feet.
Z= Side slope ratio.

Minimum Z = 2

NOTES

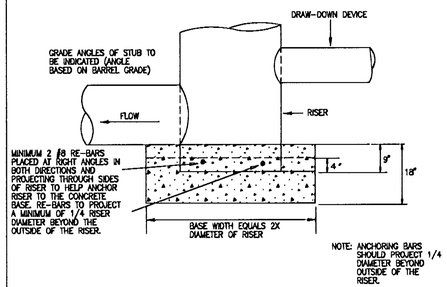
1. For a given Hp a decrease in the exit slope from S as given in the table decreases the spillway discharge but increasing the exit slope from S does not increase the discharge. If an exit slope (Se) steeper than S is used, then the velocity (Ve) in the exit channel will increase according to the following relationship:

$$Ve = V\left(\frac{Se}{S}\right)^{0.3}$$

2. Data to the right of the heavy vertical lines on Table 14 should be used with caution, as the resulting sections will be either poorly proportioned or have velocities in excess of 5 Ft./sec.

U.S. DEPARTMENT OF AGRICULTURE SOIL CONSERVATION SERVICE	PAGE C - 10 - 26	MARYLAND DEPARTMENT OF ENVIRONMENT WATER MANAGEMENT ADMINISTRATION

DETAIL 15 - RISER BASE DETAIL



Construction Specifications

The riser shall have a base attached with a watertight connection and shall have sufficient weight to prevent flotation of the riser. Two approved bases for risers 10' or less in height are:

1. A concrete base 18" thick with the riser embedded 9" in the base.

2. A 1/4" minimum thickness steel plate attached to the riser by a continuous weld around the circumference of the riser to form a watertight connection. The plate shall have 2' of stone, gravel, or compacted earth placed on it to prevent flotation. In either case, each side of the square base shall be twice the riser diameter.

The riser installation shall include the basin vertical draw-down device installed at the wet storage elevation shown in the table on Sheet R-02. Provide a water-tight connection between the riser and the draw-down pipe.

Note: For risers greater than ten feet high computations shall be made to design a base which will prevent floatation. The minimum factor of safety shall be 1.20 (downward forces = 1.20 x upward forces).

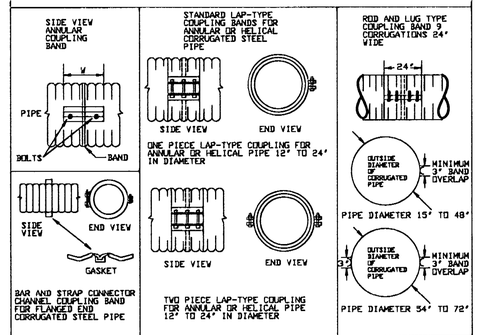
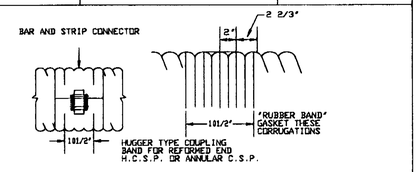
DETAIL 17 - TYPES OF COUPLERS FOR CORRUGATED STEEL PIPE

(ALL CONNECTOR BANDS REQUIRE NEOPRENE GASKETS)





NOTE: UNDER NO CIRCUMSTANCES WILL THE DIMPLE (UNIVERSAL) CONNECTOR BAND BE ACCEPTABLE FOR USE IN ANY SEDIMENT CONTROL OR STORMWATER MANAGEMENT STRUCTURE

U.S. DEPARTMENT OF AGRICULTURE SOIL CONSERVATIEN SERVICE	PAGE C - 10 - 27	MARYLAND DEPARTMENT OF ENVIRONMENT WATER MANAGEMENT ADMINISTRATION

MAINTENANCE SCHEDULE FOR DRAINAGE AND STORMWATER MANAGEMENT FACILITIES

ROUTINE MAINTENANCE

1. THE FACILITIES SHALL BE INSPECTED AT LEAST ANNUALLY AND AFTER MAJOR STORMS (1" OR MORE RAINFALL IN 24 HOURS). INSPECTIONS OF EACH COMPONENT OF A FACILITY SHOULD BE PERFORMED DURING WET WEATHER WHEN POSSIBLE TO VERIFY THAT THE FACILITIES ARE FUNCTIONING PROPERLY.

2. TOP AND SIDE GRASSED SLOPES INSIDE PONDS SHALL BE MOWED AT LEAST TWICE ANNUALLY, IN JUNE AND SEPTEMBER. MAINTENANCE ACCESS AND OTHER ADJACENT AREAS SHOULD BE MOWED AS REQUIRED. PERMANENT WETLAND VEGETATION SHOULD BE DISTURBED ONLY WHEN ABSOLUTELY NECESSARY TO PERFORM OTHER MAINTENANCE AS REQUIRED.

3. DEBRIS AND LITTER WHICH ACCUMULATES IN THE PONDS, ESPECIALLY NEAR OUTLETS SHALL BE REMOVED AS REQUIRED, AND WITH EACH MOWING AT A MINIMUM.

4. VISIBLE SIGNS OF EROSION, EXCESSIVE SEDIMENT ACCUMULATION, OR OTHER IMPEDIMENTS PROPER FACILITY FUNCTION SHALL BE REPAIRED WITHOUT DELAY. THIS REQUIREMENT SHALL APPLY TO POND INTERIORS AND OUTLETS. VISIBLE EROSION OR SEDIMENT ACCUMULATION OF SEDIMENT IN DRAINAGEWAYS AND WETLANDS DOWNSTREAM OF POND OUTLETS SHALL BE REPAIRED OR REMOVED AS REQUIRED.

NON-ROUTINE MAINTENANCE

1. FACILITIES WHICH SUFFER STRUCTURAL DAMAGE SHALL BE REPAIRED IMMEDIATELY ON DETECTION OF THE DAMAGE.

2. ACCUMULATED SEDIMENT SHOULD BE REMOVED FROM A FACILITY WHEN IT SIGNIFICANTLY REDUCES ITS EFFICIENT FUNCTIONING CAPABILITY. SEDIMENT SHOULD BE REMOVED WHEN IT REACHES THE FOLLOWING DEPTH IN FACILITIES AND STRUCTURES AS FOLLOWS:

INLETS AND MANHOLES:	3"
SEDIMENTATION CHAMBERS:	12"
WINGWALLS AND ENDWALLS:	3"
STILLING BASINS (AT ENDWALLS):	6"

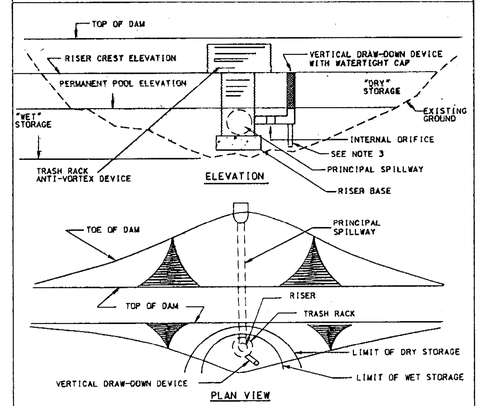
SEQUENCE FOR CONVERTING TEMPORARY SEDIMENT BASINS TO PERMANENT STORMWATER MANAGEMENT PONDS

1. DRAIN POND.
2. REMOVE ACCUMULATED SEDIMENT AND DISPOSE OF OFF AIRPORT PROPERTY IN ACCORDANCE WITH THE PROVISIONS OF SHEET R-01 AND ITEM P-152.
3. CLEAN SEDIMENT FROM ENDWALLS, SEDIMENTATION CHAMBERS, AND OTHER STRUCTURES, AND FLUSH THE STORM DRAINAGE SYSTEM AS DIRECTED BY THE ENGINEER.
4. REGRADE AND/OR FINE GRADE POND BOTTOM AND SLOPES TO PLAN GRADES (SEE SHEET C-03) AS REQUIRED. CONSTRUCT BERMS, SEEPAGE MECHANISMS, STRUCTURES, AND SPILLWAYS AS SHOWN ON THE CIVIL PLANS.
5. REPLACE TOPSOIL, EROSION CONTROL NETTING, AND OTHER DAMAGED ITEMS AS DIRECTED BY THE ENGINEER.
6. PERFORM THE AS-BUILT SURVEY IN ACCORDANCE WITH ITEM P-152 AND SUBMIT TO THE ENGINEER FOR APPROVAL. COMPLETE THE CERTIFICATION ON SHEET R-01.
7. PLANT PERMANENT POND VEGETATION AS SHOWN ON SHEETS V-01 THROUGH V-05. SEED AND MULCH UPPER POND SLOPES.
8. AFTER POND CONSTRUCTION IS APPROVED BY THE ENGINEER NOTIFY MDE INSPECTOR AND SCHEDULE FINAL INSPECTION. AFTER FINAL INSPECTION, COMPLETE PUNCH LIST ITEMS AS SOON AS POSSIBLE. ARRANGE FOR RE-INSPECTIONS AS REQUIRED.

AS-BUILTS

THESE DRAWINGS DATED 07/01/2001 AND TITLED 'AS-BUILTS' HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED, IN EVERY DETAIL. THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

BASIN DRAWDOWN SCHEMATIC VERTICAL DRAW-DOWN DEVICE



CONSTRUCTION SPECIFICATIONS

1. PERFORATIONS IN THE DRAW-DOWN DEVICE MAY NO EXTEND INTO THE WET STORAGE.
2. THE TOTAL AREA OF THE PERFORATIONS MUST BE GREATER THAN 2 TIMES THE AREA OF THE INTERNAL ORIFICE.
3. THE PERFORATED PORTION OF THE DRAW-DOWN DEVICE SHALL BE WRAPPPED WITH 1/2" HARDWARE CLOTH AND GEOTEXTILE FABRIC. THE GEOTEXTILE FABRIC SHALL MEET SPECIFICATIONS FOR GEOTEXTILE CLASS E.
4. PROVIDE SUPPORT OF DRAW-DOWN DEVICE TO PREVENET SAGGING AND FLOTATION. AN ACCEPTABLE PREVENTATIVE MEASURE IS TO STAKE BOTH SIDES OF DRAW-DOWN DEVICE WITH 1" STEEL ANGLE, OR BY 1"X4" OR 2" ROUND WOODEN POSTS SET 3' MINIMUM INTO THE GROUND THEN JOINING THEM TO THE DEVICE BY WRAPPING WITH 12-GUAGE MINIMUM WIRE.

ELECTRICAL NOTES

1. FURNISH CONDUIT SYSTEMS FOR ELECTRIC POWER, TELEPHONE, AND CABLE TV UTILITY SERVICES, AND CONDUIT SYSTEMS FOR AIRPORT COMMUNICATION\CONTROL AND POWER WIRING. COORDINATE WITH UTILITY COMPANIES AND PROVIDE SERVICES AS OUTLINED UNDER SPECIFICATION ITEM 16000.
2. FURNISH ELECTRIC SERVICE TO SEWAGE PUMP STATION No. 1, STATION No. 2, AND STATION No. 3. THIS WORK TO INCLUDE COMPLETE INSTALLATION OF LOCAL AND REMOTE ALARM SYSTEM FOR THE SEWAGE LIFT STATIONS.
3. FURNISH COMPLETE ELECTRICAL SYSTEMS FOR THE FIRE PUMP HOUSE INCLUDING ELECTRIC POWER AND TELEPHONE SERVICES.
4. FURNISH AREA LIGHTING SYSTEM FOR PARKING LOTS AND ACCESS ROAD IN ACCORDANCE WITH BASE PROJECT, ADD ALTERNATE 1, AND ADD ALTERNATE 2 WORK.
5. FURNISH TAXIWAY EDGE LIGHTING & SIGNAGE IN ACCORDANCE ADD ALTERNATE 1 AND ADD ALTERNATE 2 WORK.
6. CONDUIT SYSTEMS SHALL INCLUDE EQUIPMENT PADS, GROUNDING COMPONENTS, CABLE RACKS, ETC., AS SHOWN ON THESE DRAWINGS AND AS REQUIRED BY THE UTILITY COMPANIES. FURNISH CONDUIT STUBS, CAPPED AT 15 FEET FORM THE EDGE OF PROPOSED HANGAR/OFFICE COMPLEXES AS SHOWN ON THESE DRAWINGS.
7. SHOP DRAWINGS FOR PRECAST MANHOLES AND HANDHOLES SHALL BE SUBMITTED FOR APPROVAL. MANHOLES AND HANDHOLES SHALL BE DESIGNED FOR H20 LOADING, UNLESS OTHERWISE NOTED. SHOP DRAWINGS SHALL BE SIGNED BY A REGISTERED PROFESSIONAL ENGINEER.
8. FURNISH SPARE (UNSPLICED) FIBEROPTIC CABLE AS SPECIFIED UNDER SPECIFICATION ITEM 16120 INSTALLED IN THE AIRPORT COMMUNICATION/CONTROL DUCTBANK BETWEEN HANDHOLES HH216 AND HH234. COIL 20 FEET OF SPARE CABLE AT EACH HANDHOLE. CAP EACH CABLE END WATERTIGHT.

12" 9" 6" 3" 0 1' 3'

1/16"=1'-0"
0 2" 8" 16" 32'
12" 4'

DEMOLITION NOTES:

1. REMOVE THE EXISTING LIFT PUMP #4 IN ITS ENTIRETY, MANHOLE TO REMAIN.
2. REMOVE THE EXISTING LIFT PUMP #4 CONTROL PANEL IN ITS ENTIRETY AND HANDOVER TO OWNER.
3. REMOVE AND DEMOLISH ALL THE EXISTING CONDUCTORS FROM LIFT PUMP STATION #4 TO PANEL "ELP" - CIRCUITS 1,3,5.
4. REMOVE EXISTING SURFACE MOUNTED CONDUITS USED FOR CIRCUITING OF LIFT PUMP STATION #4, FOR BURIED CONDUITS, CUT THE CONDUITS 6" ABOVE THE FLOOR LEVEL, SEAL AND CAP THE CONDUITS AND ABANDON THE CONDUITS IN ITS PLACE.
5. REVISE THE PANEL SCHEDULES FOR EXISTING PANEL "ELP".

NEW WORK NOTES:

1. PROVIDE AND INSTALL 70A, 208V, 2 POLE BREAKER IN EXISTING SPACES AT CIRCUITS 2 & 4 (FOR PUMP POWER) & 30A, 1 POLE BREAKER IN EXISTING SPACE CIRCUIT 6 (FOR PUMP CONTROL) AT PANEL "ERP". REVISE PANEL SCHEDULE ACCORDINGLY.
2. PROVIDE AND INSTALL 2#4 (CIRCUITS 2 & 4 – 208V), 2#10 (CIRCUIT #6 – 120V – CONTROLS) AND #8G. – THWN WIRE IN 1½" CONDUIT. RUN THE CONDUIT ON SURFACE INSIDE THE HANGAR AND DIRECT BURIED OUTDOORS. INDOOR CONDUITS SHALL BE RIGID GALVANIZED STEEL. OUTDOOR CONDUIT SHALL BE P.V.C. COATED RIGID GALVANIZED STEEL. (OCAL BLUE). PROVIDE JUNCTION BOXES AS REQUIRED.
3. PROVIDE AND INSTALL GALVANIZED STEEL CHANNEL FRAME AS SHOWN IN DETAIL, THIS SHEET.
4. PROVIDE AND INSTALL HEAVY DUTY NON-FUSED, 2 POLE, 600V, 100 AMP DISCONNECT (SQUARE D CAT. #H223DS) IN NEMA-3R ENCLOSURE. DISCONNECT SHALL BE LOCKABLE IN OPEN/CLOSE POSITION.
5. PROVIDE AND INSTALL HEAVY DUTY NON-FUSED, 2 POLE, 240V, 30 AMP DISCONNECT (SQUARE D CAT. #H221DS) IN NEMA-3R ENCLOSURE. DISCONNECT SHALL BE LOCKABLE IN OPEN/CLOSE POSITION.
6. PROVIDE AND INSTALL A 11.25 KVA BOOST TRANSFORMER WITH 208V PRIMARY AND 230V SECONDARY IN NEMA-3R ENCLOSURE (MODEL #T-1-13074, MANUFACTURED BY ACME TRANSFORMER CO.).
7. PROVIDE AND INSTALL AUTO DIALER AND CONTROL PANEL AS PER MANUFACTURER RECOMMENDATIONS.
8. PROVIDE AND INSTALL 3/4"C. FOR WIRING OF LEVEL SWITCHES. WIRING FOR LEVEL SWITCHES SHALL MEET ALL THE REQUIREMENTS OF N.E.C. ARTICLE 501.
9. THE CONDUITS ENTERING THE PUMP ENCLOSURE SHALL BE PROVIDED WITH SEALS AS PER REQUIREMENTS OF N.E.C. ARTICLE 501.
10. PROVIDE AND INSTALL 3/4" PVC COATED RGS CONDUIT BETWEEN TELEPHONE/ELECT. RM. – UPPER LEVEL – NEW HANGAR AND LIFT PUMP STATION #4. PROVIDE AND INSTALL NUMBER AND TYPE OF WIRES AS PER MANUFACTURERS RECOMMENDATIONS.
11. PROVIDE AND INSTALL A LABEL ON THE FACE OF THE CONTROL PANEL WITH THE FOLLOWING CAUTION:
    "THIS PANEL HAS DIFFERENT POWER SOURCES FOR PUMP CONTROLS AND PUMP POWER. DE-ENERGIZE BOTH POWER SOURCES BEFORE OPENING PANEL."

AS-BUILTS

THESE DRAWINGS DATED JULY 1, 2001 AND TITLED AS-BUILTS HAVE BEEN DEVELOPED FROM THE CONTRACTOR'S RECORD OF CHANGES MADE AND MAY NOT REPRESENT THE FINAL PROJECT AS CONSTRUCTED. IN EVERY DETAIL, THE RECORD DRAWINGS HAVE BEEN PREPARED BASED ON THE INFORMATION SUPPLIED BY OTHERS AND THE ENGINEER HAS NOT VERIFIED THE ACCURACY OR COMPLETENESS OF THE INFORMATION.

- INDICATES VINYL ASBESTOS FLOOR TILE

GENERAL NOTES

1. THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFYING LOCATION OF ALL EXISTING UTILITIES PRIOR TO BEGINNING THE WORK.
2. THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING EXISTING CONSTRUCTION OF ALL ASPHALT PAVING AROUND SITE AND PATCH/REPAIR TO MATCH ANY DAMAGE INCURRED DURING THE WORK.
3. CONTRACTOR SHALL PROVIDE DUST AND SOUND BARRIERS FOR CONSTRUCTION AREAS.
4. TEMPORARY ELECTRICITY
   A. COMPLY WITH NEC AND OSHA.
   B. PROVIDE AND MAINTAIN SPECIFIED MINIMUM TEMPORARY ELECTRIC POWER SYSTEM FOR CONSTRUCTION NEEDS THROUGHOUT CONSTRUCTION PERIOD.
   C. PROVIDE SECONDARY POWER CENTERS FOR MISCELLANEOUS TOOLS AND EQUIPMENT USED IN ASBESTOS ABATEMENT WORK.
      1) PROVIDE MINIMUM OF ONE PER SEALED ABATEMENT AREA
      2) LOCATE SO THAT POWER IS AVAILABLE AT ANY DESIRED POINT WITH NO MORE THAN 30 METERS EXTENSION.
      3) PROVIDE WEATHERPROOF DISTRIBUTION BOXES WITH MINIMUM OF FOUR (4) GROUNDED OUTLETS EACH.
      4) PROVIDE CIRCUIT PROTECTION FOR EACH CIRCUIT.
      5) PROVIDE GROUND FAULT PROTECTION FOR EACH CIRCUIT IN ACCORDANCE WITH APPLICABLE FEDERAL AND STATE REQUIREMENTS.
      6) EACH CONTRACTOR AND SUBCONTRACTOR USING THE SECONDARY POWER CENTERS SHALL PROVIDE THEIR OWN GROUNDED, UL LISTED EXTENSION CORDS AND OTHER ACCESSORIES FROM SECONDARY POWER CENTERS TO POINT OF OPERATION.
   D. PROVIDE ADDITIONAL SERVICE CONNECTIONS REQUIRED FOR:
      1) TEMPORARY LIGHTING
      2) TEMPORARY HEATING
      3) TEMPORARY VENTILATING
      4) TEMPORARY FIRE ALARM SYSTEM
      5) PUMPING
      6) TESTING AND CHECKING ALL PERMANENT MECHANICAL, ELECTRICAL, ELEVATOR AND HOISTING EQUIPMENT
   E. ALL CONTRACTORS WHO REQUIRE PRIMARY OR SECONDARY POWER CENTERS OR SERVICE CONNECTIONS IN EXCESS OF THE SPECIFIED MINIMUM SHALL MAKE ARRANGEMENTS WITH THE CONTRACTING OFFICE.
5. TEMPORARY LIGHTING
   A. PROVIDE TEMPORARY LIGHTING AS REQUIRED FOR SAFE AND ADEQUATE WORKING CONDITIONS THROUGHOUT PROJECT FOR PUBLIC SAFETY, SECURITY LIGHTING, AND ABATEMENT NEEDS.

GENERAL NOTES (CONT.)

   B. REQUIRED MINIMUM LIGHTING LEVELS: (USE INCANDESCENT LIGHTING, UNLESS OTHERWISE SPECIFIED.)
      1) 150 WATTS SPACED 6 METERS ON CENTERS EACH WAY THROUGHOUT THE BUILDING(S).
      2) 150 WATTS AT EACH LANDING AND STORY IN EACH STAIRWAY.
      3) 200 WATTS SPACED 9 METERS ON CENTERS IN ALL CORRIDORS.
      4) ADDITIONAL LIGHTING REQUIRED FOR SAFETY PURPOSES
   C. UNLESS OTHERWISE INDICATED, MOUNT TEMPORARY LIGHTING AT A MAXIMUM HEIGHT OF 3 METERS ABOVE EACH FLOOR LEVEL.
   D. SECURITY LIGHTING
      1) WITHIN THE BUILDING, ILLUMINATE ALL STAIRWAYS, CORRIDORS AND ENTRANCES INVOLVED IN ABATEMENT WORK ON A 24 HOUR PER DAY BASIS. CONTRACTOR MAY USE CONSTRUCTION LIGHTING FOR THIS PURPOSE.
   E. SAFETY LIGHTING
      1) PROVIDE 150 WATTS OVER ALL EXCAVATIONS, BARRIERS AND OTHER OBSTACLES WHICH ARE NOT APPARENT AS SAFETY HAZARDS.
      2) PROVIDE SAFETY LIGHTING WITHIN PROJECT SITE AT ALL TIMES AUTHORIZED PERSONS ARE PRESENT.
      3) PROVIDE SAFETY LIGHTING IN PUBLIC AREAS AT ALL TIMES.
   F. PROVIDE WORK LIGHTING CONTINUOUSLY FROM 15 MINUTES PRIOR TO AND 15 MINUTES PAST SCHEDULED WORK HOURS ON SCHEDULED WORK DAYS.
   G. ALL LAMPS SHALL BE COVERED WITH SAFETY GUARD OR DEEPLY RECESSED IN REFLECTOR. DO NOT SUSPEND BY THEIR ELECTRIC CORDS UNLESS CORD AND FIXTURE ARE DESIGNED FOR THAT PURPOSE.
6. TEMPORARY TELEPHONE
   PROVIDE TEMPORARY TELEPHONE SERVICE FOR CONSTRUCTION PERIOD, AS NEEDED.
7. TEMPORARY WATER
   A. PROVIDE AND MAINTAIN TEMPORARY WATER SERVICE CONNECTION THROUGHOUT CONSTRUCTION PERIOD.
      1) FOR CONSTRUCTION PURPOSES:
         A) PROVIDE A MINIMUM OF ONE 20 MM WATER SERVICE CONNECTION TO EACH AREA
         B) MINIMUM DISCHARGE AT WATER SERVICE CONNECTION NOT REQUIRED FOR FIRE PROTECTION: 20 PSI
         C) EACH CONTRACTOR AND SUBCONTRACTOR SHALL SUPPLY ADEQUATE WATER HOSES FROM HOSE BIBS TO POINT OF HIS OPERATIONS.

GENERAL NOTES (CONT.)

      2) FOR OTHER PURPOSES:
         A) TEMPORARY FIRE PROTECTION
         B) CLEANING
         C) DUST CONTROL
   B. MAINTAIN ADEQUATE VOLUME OF WATER FOR ALL PURPOSES.
   C. EACH CONTRACTOR AND SUBCONTRACTOR SHALL PROVIDE DRINKING WATER FOR HIS OWN FORCES.
8. TEMPORARY FIRE PROTECTION
   A. SCHEDULE MEANS OF FIRE PROTECTION OF ALL CONSTRUCTION, MATERIALS AND PERSONNEL PRIOR TO STARTING WORK IN ACCORDANCE WITH GOVERNING AUTHORITY.
   B. SECURE APPROVAL OF THE LOCAL FIRE DEPARTMENT AND OTHER GOVERNING AUTHORITY, AS REQUIRED.
   C. PROVIDE AND PERFORM PROTECTION AND PREVENTION DURING THE CONSTRUCTION PERIOD IN ACCORDANCE WITH THE CONTRACTING OFFICER'S RECOMMENDATIONS FOR PROTECTION OF BUILDINGS UNDER CONSTRUCTION AND ALL OTHER LAWS AND REGULATIONS.
9. TEMPORARY ENCLOSURES
   IN AREAS REQUIRING TEMPORARY HEATING OR COOLING, PROVIDE SUFFICIENT PRELIMINARY ENCLOSURE TO PREVENT ENTRANCE OR INFILTRATION OF RAINWATER, WIND AND OTHER ELEMENTS AND TO PREVENT UNDUE HEAT LOSS OR HEAT GAIN FROM WITHIN ENCLOSED AREAS.
10. SITE SECURITY
    THE CONTRACTOR SHALL BE RESPONSIBLE FOR CONTROLLING ACCESS TO THE WORK AREA AND SURROUNDING CONTROLLED AREAS. THE CONTRACTOR SHALL SUBMIT A LIST OF DOORS AND OTHER OPENINGS THAT MUST BE SECURED TO ISOLATE THE WORK AREA, INCLUDE ON THIS LIST ALL DOORS OR OPENINGS INDICATED AS EMERGENCY EXITS. AFTER RECEIVING WRITTEN AUTHORIZATION FROM THE CONTRACTING OFFICER LOCK ALL DOORS AND OPENINGS INTO THE WORK AREA, IF DOORS CANNOT BE LOCKED, CHAIN THE DOOR OR OPENING SHUT. COVER ALL SIGNS THAT DIRECT EMERGENCY EXITING TO LOCKED DOORS, EITHER OUTSIDE OR INSIDE THE WORK AREA. DO NOT OBSTRUCT DOORS REQUIRED FOR EMERGENCY EXIT FROM THE WORK AREA. ARRANGE THE WORK AREA SO THAT THE ONLY ACCESS INTO THE WORK AREA IS CONTROLLED BY THE CONTRACTOR AT ALL TIMES. PROVIDE WARNING SIGNS (IN ALL RELEVANT LANGUAGES) AT EACH DOOR LEADING TO THE WORK AREA READING AS FOLLOWS:

GENERAL NOTES (CONT.)

KEEP OUT
BEYOND THIS POINT
ASBESTOS ABATEMENT WORK
IN PROGRESS
BREATHING ASBESTOS DUST MAY
BE HAZARDOUS TO YOUR HEALTH

IMMEDIATELY INSIDE DOORS AND OUTSIDE CRITICAL BARRIERS POST MANUFACTURED SIGNS (IN ALL RELEVANT LANGUAGES) APPROXIMATELY 356 MM BY 508 MM AS REQUIRED BY 29 CFR 1926 READING AS FOLLOWS:

SITE SECURITY TWENTY-FOUR HOURS A DAY FOR THE DURATION OF THE PROJECT.

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD
RESPIRATORS AND PROTECTIVE CLOTHING ARE REQUIRED
IN THIS AREA

THE CONTRACTOR SHALL PROTECT THE WORK AREA AND SURROUNDING AREAS AGAINST VANDALISM OF ALL KINDS. CONTRACTOR SHALL BE RESPONSIBLE FOR

11. PCB CONTAINING FLUORESCENT LIGHT BALLASTS. CONTRACTOR TO REMOVE EXISTING FLUORESCENT LIGHTS FROM EACH WORK AREA, HEPA VACUUM EACH FIXTURE AND STORE IN AN AREA DESIGNATED BY THE CONTRACTING OFFICER FOR REMOVAL. BALLASTS SHALL BE PROPERLY CONTAINERIZED, MANIFESTED, SHIPPED AND DISPOSED BY THE CONTRACTOR AT HIS OWN EXPENSE.
12. CONTRACTOR TO LIMIT BREAKAGE OF FLUORESCENT LIGHT TUBES TO GREATEST EXTENT POSSIBLE. CONTRACTOR IS TO PACKAGE ALL FLUORESCENT LIGHT TUBES FOR SHIPPING TO PREVENT BREAKAGE DURING SHIPPING.
13. CONTRACTOR TO IDENTIFY, REMOVE AND DISPOSE ALL FIRE DOORS WITH ASBESTOS-CONTAINING INSULATING MATERIALS AND/OR LEAD-BASED PAINT.
14. CONTRACTOR SHALL BE REQUIRED TO REMOVE ASBESTOS-CONTAINING ELECTRICAL WIRE AND /OR ASBESTOS-CONTAINING MATERIALS LOCATED IN SUBSURFACE DUCT BANKS WHEN LOCATED.
15. CONTRACTOR SHALL COORDINATE CLEARING OF ACCESS AND WORK AREAS.
16. AS THE EXISTING STRUCTURES ARE IN DISREPAIR, THE CONTRACTOR SHALL TAKE SAFETY PRECAUTIONS RELATIVE TO THE SOUNDNESS OF THE STRUCTURES.
17. ROOFING MATERIALS NOT SAMPLED DUE TO THE SOUNDNESS OF THE STRUCTURES. DUE TO THE STRUCUTRAL SOUNDNESS, REMOVAL OF ROOFING MATERIALS ARE NOT REQUIRED.

DRAWING NOTES

1. THIS DRAWING IS NOT AN "AS BUILT" DRAWING OR REPRESENTATION OF THE BUILDING. IT IS PREPARED FOR THE PURPOSE OF DEPICTING AREAS OF ASBESTOS CONTAINING MATERIALS IN THE BUILDING AND FOR THAT PURPOSE ONLY. IT IS NOT TO BE RELIED UPON BY OTHER THAN THOSE INTENDED WITHIN THE STATED PURPOSE OF OUR SCOPE OF WORK.
2. QUANTITIES GIVEN ARE APPROXIMATES, FOR ESTIMATING PURPOSES ONLY, CONTRACTORS ARE URGED TO VERIFY QUANTITIES. ALL ACM IN WORK AREAS, INDICATED OR NOT, ARE TO BE REMOVED.
3. QUANTITIES OF ASBESTOS CONTAINING PIPE INSULATION AND DUCT INSULATION CONCEALED WITHIN EXISTING WALLS CANNOT BE FULLY DETERMINED UNTIL EXPOSED. CONTRACTOR IS RESPONSIBLE FOR REMOVAL OF ALL ACM'S FROM CONCEALED SPACES.

CODED NOTES

(1) INDICATES FULL SCALE CONTAINMENT FOR GROSS REMOVAL OR GLOVE BAG WITH CRITICAL BARRIERS. NEGATIVE AIR AND CONTIGUOUS DECON UNIT REQUIRED. PCM CLEARANCE.

(○) SAMPLE LOCATION, BUILDING, NUMBER MATERIAL TYPE, % AND TYPE ASBESTOS

NOTES:

1. BORINGS WERE PERFORMED BY STRAUGHAN ENVIRONMENTAL SERVICES, INC. ON JULY 25, 28 AND 30, 1997.
2. BORINGS LABELED B-1, B-2, B-3 AND B-4 WERE PERFORMED FOR THE PURPOSE OF CHARACTERIZING SOIL TEXTURES AND DEPTHS. BORINGS LABELED GW-1, GW-2, GW-3 AND GW-4 WERE PERFORMED FOR THE PURPOSE OF INSTALLING SHALLOW GROUND WATER MONITORING WELLS. THE SOIL TEXTURES AND DEPTHS WERE ALSO RECORDED FOR THOSE BORINGS.
3. BORING LOGS ARE PROVIDED FOR THE PURPOSE OF SHOWING THE NATURE OF THE MATERIAL TO BE STRIPPED, STOCKPILED AND REPLACED IN THE MITIGATION AREA; FOR SHOWING THE NATURE OF THE MATERIALS TO BE EXCAVATED AND REMOVED FROM THE SITE; AND FOR SHOWING THE NATURE OF THE MATERIAL AT THE FINAL PROPOSED ELEVATION.
4. IF SOIL MATERIALS ARE FOUND BY THE CONTRACTOR DURING THE EXCAVATION WORK TO BE OTHER THAN AS SHOWN, THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE ENGINEER.

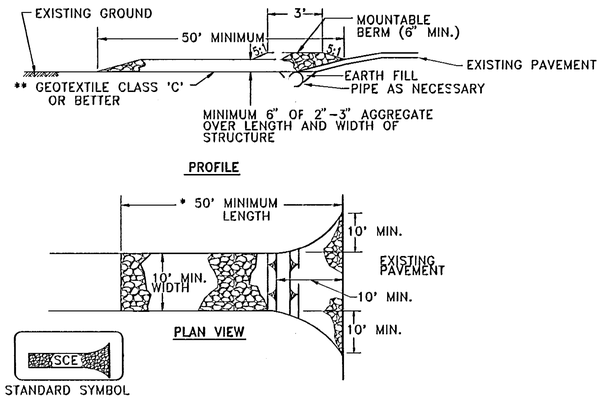
F:\910050.C\WETLAND\FSO\WET.DWG



CONSTRUCTION SPECIFICATION

1. LENGTH – MINIMUM OF 50' (*30' FOR SINGLE RESIDENCE LOT).

2. WIDTH – 10' MINIMUM, SHOULD BE FLARED AT THE EXISTING ROAD TO PROVIDE A TURNING RADIUS.

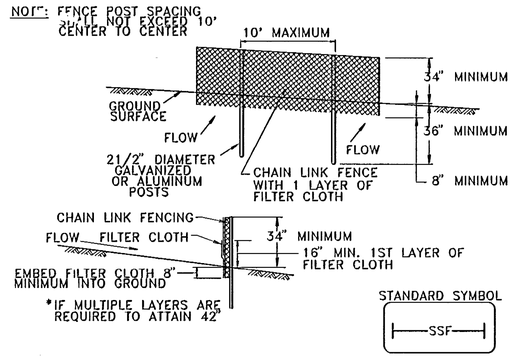
3. GEOTEXTILE FABRIC (FILTER CLOTH) SHALL BE PLACED OVER THE EXISTING GROUND PRIOR TO PLACING STONE. **THE PLAN APPROVAL AUTHORITY MAY NOT REQUIRE SINGLE FAMILY RESIDENCES TO USE GEOTEXTILE.

4. STONE – CRUSHED AGGREGATE (2" TO 3") OR RECLAIMED OR RECYCLED CONCRETE EQUIVALENT SHALL BE PLACED AT LEAST 6" DEEP OVER THE LENGTH AND WIDTH OF THE ENTRANCE.

5. SURFACE WATER – ALL SURFACE WATER FLOWING TO OR DIVERTED TOWARD CONSTRUCTION ENTRANCES SHALL BE PIPED THROUGH THE ENTRANCE, MAINTAINING POSITIVE DRAINAGE. PIPE INSTALLED THROUGH THE STABILIZED CONSTRUCTION ENTRANCE SHALL BE PROTECTED WITH A MOUNTABLE BERM WITH 5:1 SLOPES AND A MINIMUM OF 6" OF STONE OVER THE PIPE. PIPE HAS TO BE SIZED ACCORDING TO THE DRAINAGE. WHEN THE SCE IS LOCATED AT A HIGH SPOT AND HAS NO DRAINAGE TO CONVEY A PIPE WILL NOT BE NECESSARY. PIPE SHOULD BE SIZED ACCORDING TO THE AMOUNT OF RUNOFF TO BE CONVEYED. A 6" MINIMUM WILL BE REQUIRED.

6. LOCATION – A STABILIZED CONSTRUCTION ENTRANCE SHALL BE LOCATED AT EVERY POINT WHERE CONSTRUCTION TRAFFIC ENTERS OR LEAVES A CONSTRUCTION SITE. VEHICLES LEAVING THE SITE MUST TRAVEL OVER THE ENTIRE LENGTH OF THE STABILIZED CONSTRUCTION ENTRANCE.

SCE WM 4 | WM 5 — STABILIZED CONSTRUCTION ENTRANCE



CONSTRUCTION SPECIFICATIONS

1. FENCING SHALL BE 42" IN HEIGHT AND CONSTRUCTED IN ACCORDANCE WITH THE LATEST MARYLAND STATE HIGHWAY DETAILS FOR CHAIN LINK FENCING. THE SPECIFICATION FOR A 6' FENCE SHALL BE USED, SUBSTITUTING 42" FABRIC AND 6' LENGTH POSTS.

2. CHAIN LINK FENCE SHALL BE FASTENED SECURELY TO THE FENCE POSTS WITH WIRE TIES. THE LOWER TENSION WIRE, BRACE AND TRUSS RODS, DRIVE ANCHORS AND POST CAPS ARE NOT REQUIRED EXCEPT ON THE ENDS OF THE FENCE.

3. FILTER CLOTH SHALL BE FASTENED SECURELY TO THE CHAIN LINK FENCE WITH TIES SPACED EVERY 24" AT THE TOP AND MID SECTION.

4. FILTER CLOTH SHALL BE EMBEDDED A MINIMUM OF 8" INTO THE GROUND.

5. WHEN TWO SECTIONS OF FILTER CLOTH ADJOIN EACH OTHER, THEY SHALL BE OVERLAPPED BY 6" AND FOLDED.

6. MAINTENANCE SHALL BE PERFORMED AS NEEDED AND SILT BUILDUPS REMOVED WHEN "BULGES" DEVELOP IN THE SILT FENCE, OR WHEN SILT REACHES 50% OF FENCE HEIGHT

7. FILTER CLOTH SHALL BE FASTENED SECURELY TO EACH FENCE POST WITH WIRE TIES OR STAPLES AT TOP AND MID SECTION AND SHALL MEET THE FOLLOWING REQUIREMENTS FOR GEOTEXTILE CLASS F:

TENSILE STRENGTH	50 LBS/IN (MIN.)	TEST: MSMT 509
TENSILE MODULUS	20 LBS/IN (MIN.)	TEST: MSMT 509
FLOW RATE	0.3 GAL/FT /MINUTE (MAX.)	TEST: MSMT 322
FILTERING EFFICIENCY	75% (MIN.)	TEST: MSMT 322

PROJECT TITLE: MIDFIELD TERMINAL COMPLEX SITE DEVELOPMENT PHASE I

SHEET TITLE: WETLAND MITIGATION EROSION & SEDIMENT CONTROL DETAILS

SCALE: AS SHOWN

DATE: APRIL, 1998

CONTRACT NO.: MAA-AE-96-001

SHEET NO.: WM-5

P:\D100551.07\WETLAND\PSSWETL.DWG

STANDARD EROSION AND SEDIMENT CONTROL NOTES

1. THE CONTRACTOR SHALL NOTIFY THE WATER MANAGEMENT ADMINISTRATION (WMA) AT (410) 631-3510 SEVEN (7) DAYS BEFORE COMMENCING ANY LAND DISTURBING ACTIVITY AND, UNLESS WAIVED BY THE ADMINISTRATION, SHALL BE REQUIRED TO HOLD A PRE-CONSTRUCTION MEETING BETWEEN PROJECT REPRESENTATIVES AND A REPRESENTATIVE OF WMA.
2. THE CONTRACTOR MUST NOTIFY WMA IN WRITING AND BY TELEPHONE AT THE FOLLOWING POINTS:
   A. THE REQUIRED PRE-CONSTRUCTION MEETING.
   B. FOLLOWING INSTALLATION OF SEDIMENT CONTROL MEASURES.
   C. DURING THE INSTALLATION OF SEDIMENT BASINS (TO BE CONVERTED INTO PERMANENT STORMWATER MANAGEMENT STRUCTURES) AT THE REQUIRED INSPECTION POINTS (SEE INSPECTION CHECKLIST ON PLAN). NOTIFICATION PRIOR TO COMMENCING CONSTRUCTION OF EACH STEP IS MANDATORY.
   D. PRIOR TO REMOVAL OR MODIFICATION OF ANY SEDIMENT CONTROL STRUCTURE(S).
   E. PRIOR TO REMOVAL OF ALL SEDIMENT CONTROL DEVICES.
   F. PRIOR TO FINAL ACCEPTANCE.
3. THE CONTRACTOR SHALL CONSTRUCT ALL EROSION AND SEDIMENT CONTROL MEASURES PER THE APPROVED PLAN AND CONSTRUCTION SEQUENCE AND, SHALL HAVE THEM INSPECTED AND APPROVED BY THE AGENCY INSPECTOR OR WMA INSPECTOR PRIOR TO BEGINNING ANY OTHER LAND DISTURBANCES. MINOR SEDIMENT CONTROL DEVICE LOCATION ADJUSTMENTS MAY BE MADE IN THE FIELD WITH THE APPROVAL OF THE WMA INSPECTOR. THE CONTRACTOR SHALL ENSURE THAT ALL RUNOFF FROM DISTURBED AREAS IS DIRECTED TO THE SEDIMENT CONTROL DEVICES, AND SHALL NOT REMOVE ANY EROSION OR SEDIMENT CONTROL MEASURE WITHOUT PRIOR PERMISSION FROM WMA INSPECTOR AND AGENCY INSPECTOR. THE CONTRACTOR MUST OBTAIN PRIOR AGENCY AND WMA APPROVAL FOR CHANGES TO THE SEDIMENT CONTROL PLAN AND/OR SEQUENCE OF CONSTRUCTION.
4. THE CONTRACTOR SHALL PROTECT ALL POINTS OF CONSTRUCTION INGRESS AND EGRESS TO PREVENT THE DEPOSITION OF MATERIALS ONTO PUBLIC ROADS. ALL MATERIALS DEPOSITED ONTO PUBLIC ROADS SHALL BE REMOVED IMMEDIATELY.
5. THE CONTRACTOR SHALL INSPECT DAILY AND MAINTAIN CONTINUOUSLY IN AN EFFECTIVE OPERATING CONDITION ALL EROSION AND SEDIMENT CONTROL MEASURES UNTIL SUCH TIMES AS THEY ARE REMOVED WITH PRIOR PERMISSION FROM WMA INSPECTOR AND AGENCY INSPECTOR.
6. ALL SEDIMENT BASINS, TRAP EMBANKMENTS AND SLOPES, PERIMETER DIKES, SWALES AND ALL DISTURBED SLOPES STEEPER OR EQUAL TO 3:1 SHALL BE STABILIZED WITH SOD OR SEED AND ANCHORED STRAW MULCH, OR OTHER APPROVED STABILIZATION MEASURES, AS SOON AS POSSIBLE BUT NO LATER THAN SEVEN (7) CALENDAR DAYS AFTER ESTABLISHMENT. ALL AREAS DISTURBED OUTSIDE OF THE PERIMETER SEDIMENT CONTROL SYSTEM MUST BE MINIMIZED. MAINTENANCE MUST BE PERFORMED AS NECESSARY TO ENSURE CONTINUED STABILIZATION. (REQUIREMENT FOR STABILIZATION MAY BE REDUCED TO THREE (3) DAYS FOR SENSITIVE AREAS.)
7. THE CONTRACTOR SHALL APPLY SOD OR SEED AND ANCHORED STRAW MULCH, OR OTHER APPROVED STABILIZATION MEASURES TO ALL DISTURBED AREAS AND STOCKPILES WITHIN FOURTEEN (14) CALENDAR DAYS AFTER STRIPPING AND GRADING ACTIVITIES HAVE CEASED IN THE AREA. MAINTENANCE SHALL BE PERFORMED AS NECESSARY TO ENSURE CONTINUED STABILIZATION. (REQUIREMENT MAY BE REDUCED TO SEVEN (7) DAYS FOR SENSITIVE AREAS.)
8. PRIOR TO REMOVAL OF SEDIMENT CONTROL MEASURES, THE CONTRACTOR SHALL STABILIZE AND HAVE ESTABLISHED PERMANENT STABILIZATION FOR ALL CONTRIBUTORY DISTURBED AREAS USING SOD OR AN APPROVED PERMANENT SEED MIXTURE WITH REQUIRED SOIL AMENDMENTS AND AN APPROVED ANCHOR MULCH. WOOD FIBER MULCH MAY ONLY BE USED IN SEEDING SEASON WHERE THE SLOPE DOES NOT EXCEED 10 PERCENT AND GRADING HAS BEEN DONE TO PROMOTE SHEET FLOW DRAINAGE. AREAS BROUGHT TO FINISHED GRADE DURING THE SEEDING SEASON SHALL BE PERMANENTLY STABILIZED AS SOON AS POSSIBLE, BUT NO LATER THAN FOURTEEN (14) CALENDAR DAYS AFTER ESTABLISHMENT. WHEN PROPERTY IS BROUGHT TO FINISHED GRADE DURING THE MONTHS OF NOVEMBER THROUGH FEBRUARY, AND PERMANENT STABILIZATION IS FOUND TO BE IMPRACTICAL, TEMPORARY SEED AND ANCHORED STRAW MULCH SHALL BE APPLIED TO DISTURBED AREAS. THE FINAL PERMANENT STABILIZATION OF SUCH PROPERTY SHALL BE APPLIED BY MARCH 15 OR EARLIER IF GROUND AND WEATHER CONDITIONS ALLOW.
9. THE SITE'S APPROVAL LETTER, APPROVED EROSION AND SEDIMENT CONTROL PLANS, DAILY LOG BOOKS, AND TEST REPORTS SHALL BE AVAILABLE AT THE SITE FOR INSPECTION BY DULY AUTHORIZED OFFICIALS OF WMA AND AGENCY RESPONSIBLE FOR PROJECT.
10. SURFACE DRAINAGE FLOWS OVER UNSTABILIZED CUT AND FILL SLOPES SHALL BE CONTROLLED BY EITHER PREVENTING DRAINAGE FLOWS FROM TRAVERSING THE SLOPES OR BY INSTALLING PROTECTIVE DEVICES TO LOWER THE WATER DOWNSLOPE WITHOUT CAUSING EROSION. DIKES SHALL BE INSTALLED AND MAINTAINED AT THE TOP OF CUT OR FILL SLOPES UNTIL THE SLOPE AND DRAINAGE AREA TO IT ARE FULLY STABILIZED, AT WHICH TIME THEY MUST BE REMOVED AND FINAL GRADING DONE TO PROMOTE SHEET FLOW DRAINAGE. PROTECTIVE METHODS MUST BE PROVIDED AT POINTS OF CONCENTRATED FLOW WHERE EROSION IS LIKELY TO OCCUR.
11. PERMANENT SWALES OR OTHER POINTS OF CONCENTRATED WATER FLOW SHALL BE STABILIZED WITH SOD OR SEED WITH AN APPROVED EROSION CONTROL MATTING, RIPRAP, OR OTHER APPROVED STABILIZATION MEASURES.
12. TEMPORARY SEDIMENT CONTROL DEVICES MAY BE REMOVED, WITH PERMISSION OF WMA INSPECTOR AND AGENCY INSPECTORS, WITHIN THIRTY (30) CALENDAR DAYS FOLLOWING ESTABLISHMENT OF PERMANENT STABILIZATION IN ALL CONTRIBUTORY DRAINAGE AREAS. STORMWATER MANAGEMENT STRUCTURES USED TEMPORARILY FOR SEDIMENT CONTROL SHALL BE CONVERTED TO THE PERMANENT CONFIGURATION WITHIN THIS TIME PERIOD AS WELL.
13. NO PERMANENT CUT OR FILL SLOPE WITH A GRADIENT STEEPER THAN 3:1 WILL BE PERMITTED IN LAWN MAINTENANCE AREAS. A SLOPE GRADIENT OF UP TO 2:1 WILL BE PERMITTED IN NON-MAINTENANCE AREAS PROVIDED THAT THOSE AREAS ARE INDICATED ON THE EROSION AND SEDIMENT CONTROL PLAN WITH A LOW-MAINTENANCE GROUND COVER SPECIFIED FOR PERMANENT STABILIZATION. SLOPE GRADIENT STEEPER THAN 2:1 WILL NOT BE PERMITTED WITH VEGETATIVE STABILIZATION.
14. FOR FINISHED GRADING, THE CONTRACTOR SHALL PROVIDE ADEQUATE GRADIENTS SO AS TO: PREVENT WATER FROM STANDING ON THE SURFACE MORE THAN TWENTY-FOUR (24) HOURS AFTER THE END OF A RAINFALL EXCEPT IN DESIGNATED DRAINAGE COURSES AND SWALE FLOW AREAS WHICH MAY DRAIN AS LONG AS FORTY-EIGHT (48) HOURS AFTER THE END OF A RAINFALL. AREAS DESIGNED TO HAVE STANDING WATER SHALL NOT BE REQUIRED TO MEET THIS REQUIREMENT.
15. SEDIMENT TRAPS OR BASINS ARE NOT PERMITTED WITHIN 20 FEET OF A FOUNDATION WHICH IS EXISTING OR UNDER CONSTRUCTION. NO STRUCTURE MAY BE CONSTRUCTED WITHIN 20 FEET OF AN ACTIVE SEDIMENT TRAP OR BASIN.
16. THE WMA INSPECTOR HAS THE OPTION OF REQUIRING ADDITIONAL SAFETY OR SEDIMENT CONTROL MEASURES, IF DEEMED NECESSARY.
17. ALL TRAP DEPTH DIMENSIONS ARE RELATIVE TO THE OUTLET ELEVATION. ALL TRAPS MUST HAVE A STABLE OUTFALL. ALL TRAPS AND BASINS SHALL HAVE STABLE INFLOW POINTS.
18. VEGETATIVE STABILIZATION SHALL BE PERFORMED IN ACCORDANCE WITH THE STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL. REFER TO APPROPRIATE SPECIFICATIONS FOR TEMPORARY SEEDING, PERMANENT SEEDING, MULCHING, SODDING, AND GROUND COVERS.
19. TEMPORARY SEDIMENT TRAP(S) SHALL BE CLEANED OUT AND RESTORED TO THE ORIGINAL DIMENSIONS WHEN SEDIMENT HAS ACCUMULATED TO A POINT ONE HALF (1/2) THE DEPTH BETWEEN THE OUTLET CREST AND THE BOTTOM OF THE TRAP. SEDIMENT BASINS SHALL BE CLEANED OUT AND RESTORED TO THE ORIGINAL DIMENSIONS WHEN SEDIMENT HAS ACCUMULATED TO ONE HALF (1/2) THE DEPTH BETWEEN THE DEWATERING ELEVATION AND THE BOTTOM OF THE BASIN.
20. SEDIMENT REMOVED FROM TRAPS (AND BASINS) SHALL BE PLACED AND STABILIZED IN APPROVED AREAS, BUT NOT WITHIN A FLOODPLAIN, WETLAND, OR TREE-SAVE AREA. WHEN PUMPING SEDIMENT LADEN WATER, THE DISCHARGE MUST BE DIRECTED TO A SEDIMENT TRAPPING DEVICE PRIOR TO RELEASE FROM THE SITE.
21. WHERE DEEMED APPROPRIATE BY THE ENGINEER OR INSPECTOR, SEDIMENT BASINS AND TRAPS MAY NEED TO BE SURROUNDED WITH AN APPROVED SAFETY FENCE. THE FENCE MUST CONFORM TO LOCAL ORDINANCES AND REGULATIONS. THE DEVELOPER OR OWNER SHALL CHECK WITH LOCAL BUILDING OFFICIALS ON APPLICABLE SAFETY REQUIREMENTS. WHERE SAFETY FENCE IS DEEMED APPROPRIATE AND LOCAL ORDINANCES DO NOT SPECIFY FENCING SIZES AND TYPES, THE FOLLOWING SHALL BE USED AS A MINIMUM STANDARD: THE SAFETY FENCE MUST BE MADE OF WELDED WIRE AND AT LEAST 42 INCHES HIGH, HAVE POSTS SPACED NO FARTHER APART THAN 8 FEET, HAVE MESH OPENINGS NO GREATER THAN 2 INCHES IN WIDTH AND 4 INCHES IN HEIGHT WITH A MINIMUM OF 14 GAUGE WIRE. SAFETY FENCE MUST BE MAINTAINED AND IN GOOD CONDITION AT ALL TIMES.
22. SEDIMENT CONTROL FOR UTILITY CONSTRUCTION FOR AREAS OUTSIDE OF DESIGNED CONTROLS OR AS DIRECTED BY ENGINEER OR WMA INSPECTOR:
   A. CALL "MISS UTILITY" AT 1-800-257-7777 48 HOURS PRIOR TO THE START OF WORK.
   B. EXCAVATED TRENCH MATERIAL SHALL BE PLACED ON THE HIGH SIDE OF THE TRENCH.
   C. TRENCHES FOR UTILITY INSTALLATION SHALL BE BACKFILLED, COMPACTED, AND STABILIZED AT THE END OF EACH WORKING DAY. NO MORE TRENCH SHALL BE OPENED THAN CAN BE COMPLETED THE SAME DAY, UNLESS OTHERWISE DIRECTED.
   D. TEMPORARY SILT FENCE SHALL BE PLACED IMMEDIATELY DOWNSTREAM OF ANY DISTURBED AREA INTENDED TO REMAIN DISTURBED FOR MORE THAN ONE DAY.
23. OFF-SITE SPOIL OR BORROW AREAS ON STATE OR FEDERAL PROPERTY MUST HAVE PRIOR APPROVAL BY WMA, OTHERWISE, APPROVAL MUST BE GRANTED BY THE LOCAL AUTHORITIES. ALL WASTE AND BORROW AREAS OFF-SITE MUST BE PROTECTED BY SEDIMENT CONTROL MEASURES AND STABILIZED.
24. SITES WHERE INFILTRATION DEVICES ARE USED FOR THE CONTROL OF STORMWATER, EXTREME CARE MUST BE TAKEN TO PREVENT RUNOFF FROM UNSTABILIZED AREAS FROM ENTERING THE STRUCTURE DURING CONSTRUCTION. SEDIMENT CONTROL DEVICES PLACED IN INFILTRATION AREAS MUST HAVE BOTTOM ELEVATIONS AT LEAST TWO (2) FEET HIGHER THAN THE FINISH GRADE BOTTOM ELEVATION OF THE INFILTRATION PRACTICE. WHEN CONVERTING A SEDIMENT TRAP TO AN INFILTRATION DEVICE, ALL ACCUMULATED SEDIMENT MUST BE REMOVED AND DISPOSED OF PRIOR TO FINAL GRADING OF INFILTRATION DEVICE.
25. ALL POINTS OF CONSTRUCTION INGRESS AND EGRESS IN UNPAVED AREAS SHALL BE STABILIZED AND PROTECTED TO PREVENT TRACKING OF MUD ONTO PUBLIC WAYS.
26. WHEN A STORM DRAIN SYSTEM OUTFALL IS DIRECTED TO A SEDIMENT TRAP OR SEDIMENT BASIN AND THE SYSTEM IS TO BE USED FOR TEMPORARILY CONVEYING SEDIMENT LADEN WATER, ALL STORM DRAIN INLETS IN NON-SUMP AREAS SHALL HAVE TEMPORARY ASPHALT BERMS CONSTRUCTED AT THE TIME OF BASE PAVING TO DIRECT GUTTER FLOW INTO THE INLETS TO AVOID SURCHARGING AND OVERFLOW OF INLETS IN SUMP AREAS.
27. SITE INFORMATION:

TOTAL AREA OF SITE	3.59	ACRES
AREA DISTURBED	3.59	ACRES
AREA TO BE ROOFED OR PAVED	0	ACRES
TOTAL CUT	15,400	CU. YDS.
TOTAL FILL	0	CU. YDS.
OFFSITE WASTE/BORROW AREA LOCATION	TO BE DETERMINED	

DESIGN CERTIFICATION

"I HEREBY CERTIFY THAT THIS PLAN HAS BEEN DESIGNED IN ACCORDANCE WITH THE 1994 STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL OR CURRENT REVISIONS THEREOF, AND DEPARTMENT OF THE ENVIRONMENT STORMWATER MANAGEMENT REGULATIONS.

DATE _____ DESIGNER'S SIGNATURE _____

MD. REGISTRATION NO.
P.E., R.L.S. OR R.L.A. (CIRCLE) _____ PRINTED NAME

OWNER'S/DEVELOPER'S CERTIFICATION

"I/WE HEREBY CERTIFY THAT ALL CLEARING, GRADING, CONSTRUCTION, AND/OR DEVELOPMENT WILL BE DONE PURSUANT TO THIS PLAN AND THAT ANY RESPONSIBLE PERSONNEL INVOLVED IN THE CONSTRUCTION PROJECT WILL HAVE A CERTIFICATE OF ATTENDANCE AT A MARYLAND DEPARTMENT OF THE ENVIRONMENT APPROVED TRAINING PROGRAM FOR THE CONTROL OF SEDIMENT AND EROSION BEFORE BEGINNING THE PROJECT. I HEREBY AUTHORIZE THE RIGHT OF ENTRY FOR PERIODIC ON-SITE EVALUATION BY STATE OF MARYLAND, DEPARTMENT OF THE ENVIRONMENT, COMPLIANCE INSPECTORS."

DATE _____ OWNER/DEVELOPER SIGNATURE _____

CARD NO. _____ PRINTED NAME AND TITLE _____

ENFORCEMENT

ALL EROSION AND SEDIMENT CONTROL IS DESIGNED AND SHALL BE CONSTRUCTED IN ACCORDANCE WITH THE "1994 MARYLAND STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL". ALL EROSION AND SEDIMENT CONTROL WILL BE STRICTLY ENFORCED.

STANDARD STABILIZATION NOTE:

FOLLOWING INITIAL SOIL DISTURBANCE OR REDISTURBANCE, PERMANENT OR TEMPORARY STABILIZATION SHALL BE COMPLETED WITHIN SEVEN (7) CALENDAR DAYS AS TO THE SURFACE OF ALL PERIMETER CONTROLS. DIKES, SWALES, DITCHES, PERIMETER SLOPES, AND ALL SLOPES GREATER THAN 3 HORIZONTAL TO 1 VERTICAL (3:1); AND FOURTEEN (14) DAYS AS TO ALL OTHER DISTURBED OR GRADED AREAS ON THE PROJECT SITE.

SEQUENCE OF CONSTRUCTION

1. NOTIFY WATER MANAGEMENT ADMINISTRATOR (WMA) AT (410) 631-3510 OF INTENT TO BEGIN CONSTRUCTION AND ARRANGE FOR A PRE-CONSTRUCTION MEETING ON SITE IF REQUESTED.
2. INSTALL STABILIZED CONSTRUCTION ENTRANCES, PERIMETER CONTROLS AS REQUIRED BY PLANS AND/OR INSPECTOR.
3. PERFORM SITE WORK WITHIN INITIAL PHASE LIMIT OF DISTURBANCE.
4. APPLY PERMANENT SEEDING AND MULCHING IN THE AREAS ABOVE ELEVATION 2.4.
5. PERFORM WORK IN FINAL PHASE LIMIT OF DISTURBANCE.
6. LEAVE SITE IN THIS CONDITION FOR SEVEN DAYS TO ALLOW TIDES TO CONSOLIDATE THE SOILS.
7. PLANT AREAS BELOW ELEVATION 2.4 (LOW MARSH AND HIGH MARSH AREAS).
8. REMOVE EROSION AND SEDIMENT CONTROL MEASURES AFTER UPLAND AREAS ARE STABILIZED AND AS DIRECTED BY THE MDE INSPECTOR.
9. STABILIZE AREAS DISTURBED DURING REMOVAL OF THE EROSION AND SEDIMENT CONTROLS.

Liquid Metal Loop Gets Under Way

Martin will collect engineering data on molten lithium at high temperatures for help in designing nuclear reactors for space

Martin Co.'s nuclear division is putting the finishing touches on a new facility near Baltimore, Md., for getting engineering data on liquid metal coolants for reactors. Molten lithium above 1800 F. will be the first liquid metal studied. The company is seeking data on corrosion, mass transfer, heat transfer, fluid flow, and purification techniques, as well as other information needed in high temperature liquid metal coolant systems.

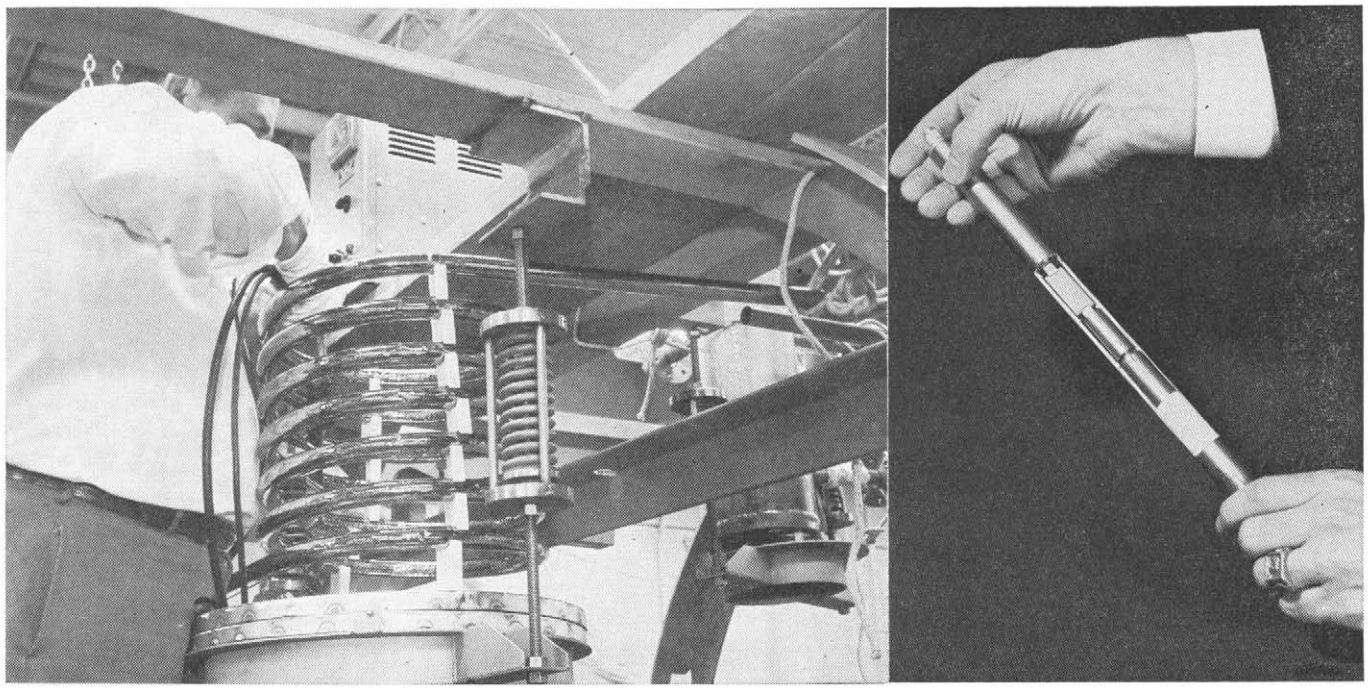
The work is part of a three-pronged research and development program for direct conversion nuclear reactors for use in space. The other two approaches involve experimental investigations on thermionic conversion of heat directly to electricity, and preparation of conceptual engineering designs of thermionic reactor systems.

While a great deal of information has been collected on such liquid metal systems as molten sodium or NaK at temperatures of around 1400 F., little is available at the higher temperatures Martin is investigating, or on lithium.

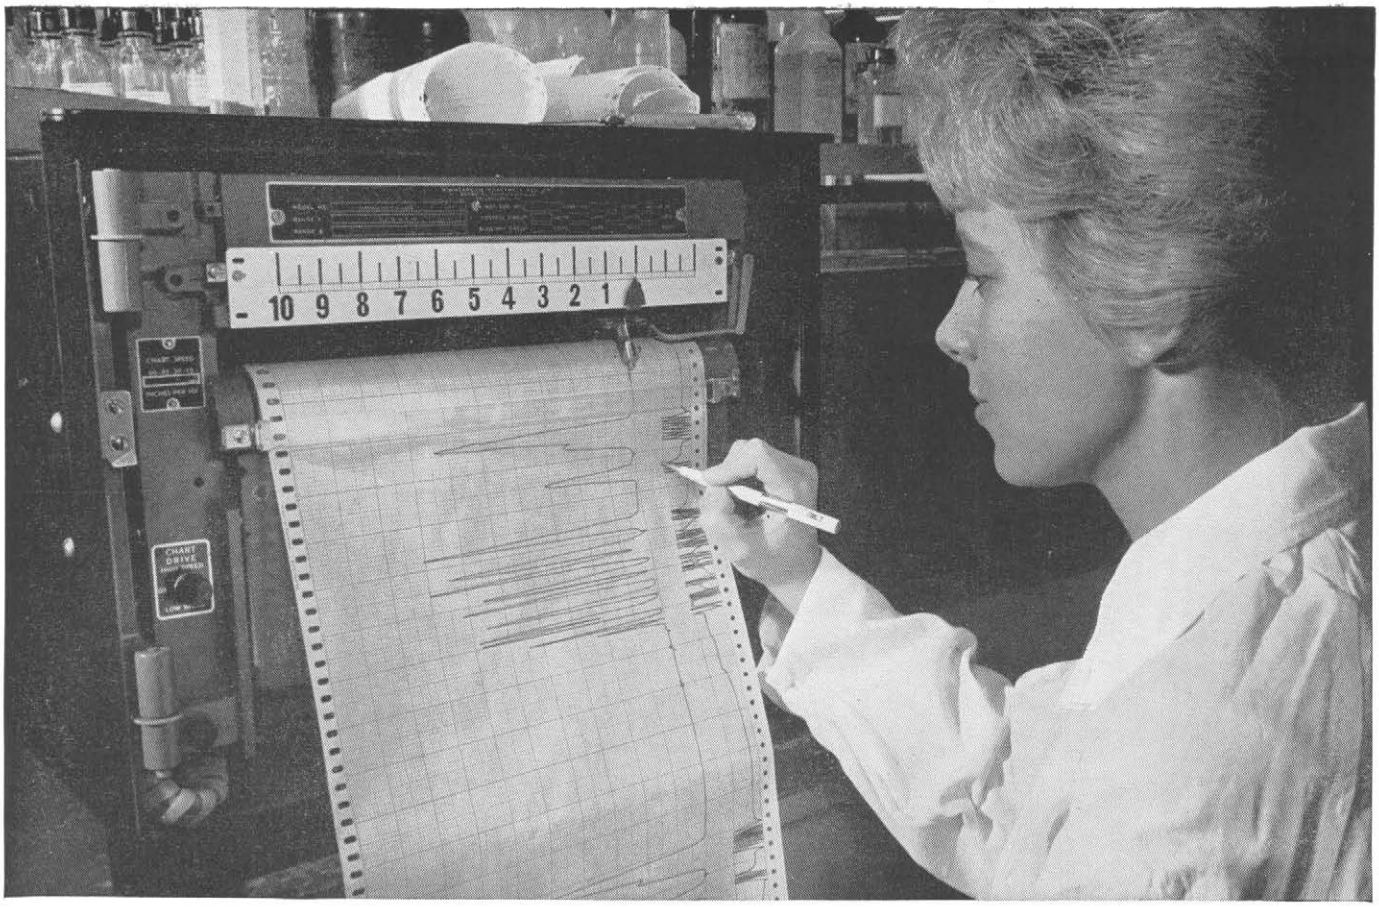
Heart of the facility is a large, 1-in. diameter, forced convection loop of niobium alloy. Liquid metal will circulate through the various pumps, heat exchangers, and other components of the loop, while numerous thermocouples give the data needed for determining heat transfer rates under various conditions. Containing the hot, reactive lithium is a tough engineering problem. Also, the niobium picks up nitrogen and oxygen from the air under certain conditions.

To keep air away, the loop is placed in a horizontal, cylindrical environmental chamber 19 ft. long and 7 ft. in diameter. The chamber can be evacuated to about 10^{-3} mm. Hg, or it can be filled with an inert gas—argon—at 1 atm. Evacuations are alternated with refilling with argon several times to ensure that the trace of residual gases left in the evacuated chamber is chiefly argon, and the quantity of oxygen and nitrogen present is extremely low. For ease of maintenance and modification, the loop is mounted within a framework which can be rolled out of the chamber, and moved about on a wheeled stand.

Niobium alloy has good corrosion and creep resistance qualities. It is, however, expensive—nearly $100 per foot for 1-in. o.d. tubing with 4-mil wall thickness. And it's difficult to weld in such a way that welds will resist liquid metal corrosion. Physical specifications for a material with such a relatively small volume of sales are much less detailed than those for a big volume material such as stainless steel. A small defect in an ingot shows up as a weak spot or hole when it is rolled into a thin sheet.



NIOBIUM LOOP. Technician assembles heat exchanger which is part of the 1-in. diameter niobium tubing test loop. Nickel foil is used for reflective insulation. Data are for design of a nuclear reactor with elements of the type at the right. Each element contains a thermionic generator for converting heat directly to electricity



NEW HONEYWELL CHROMATOGRAPHY RECORDER

The new Honeywell Chromatography Recorder offers true versatility in a quality recorder. Specifically designed to meet demanding chromatography needs, the new unit provides the high impedance, high gain, and high stray rejection required for all available detection methods.

Here are the operating and service features that make the new chromatography recorder the ultimate in reliable instrumentation:

- **high impedance**—up to 25,000 ohm source
- **high gain, high torque servo drive**—one second pen speed, spans from one to 100 millivolts
- **high stray rejection**—transverse 5000:1 (5 times span); longitudinal 10,000,000:1 (10V ac); d-c longitudinal 12,000,000:1 (12V dc)
- **true modular design**—amplifier, constant voltage unit, measuring circuit contained in separate modules for maximum flexibility and ease of servicing

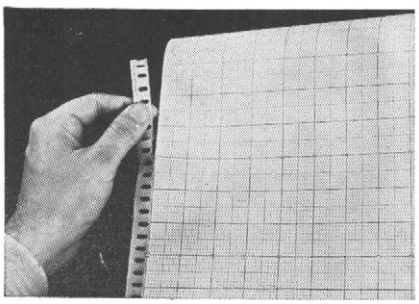


Chart paper for the new Honeywell Chromatography Recorder is available with special easy-tear edge perforations to facilitate trimming of laboratory chart records to fit standard 8½" x 11" report format.

- **quick-change range cards**—have integral zero and span adjustments; cards interchangeable after initial calibration
- **Zener diode constant voltage standardizing**—eliminates batteries, standard cells, and standardization mechanisms
- **all-new remote reservoir capillary pen**
- **adaptable for auxiliary devices**—integrators, alarm switches, retransmitting slidewires, digital encoder, etc.
- **flush, surface, or bench-top (lab feet) mounting**
- **optional 4-speed manual shift chart drive**—base speeds from one inch per hour to one inch per second in 1:2:3:4 ratio
- **optional dual speed chart drive mechanism** — reduces base speeds 6:1, 10:1, 30:1 or 60:1.

And with the new recorder goes the big plus of *Honeywell fast, expert service.* More than four hundred factory-trained service engineers are spotted strategically throughout 125 service centers in the United States and Canada. No matter where you are, you're sure of getting the service you need.

For complete details on the New Chromatography Recorder, contact your nearby Honeywell field engineer. MINNEAPOLIS-HONEYWELL, Wayne and Windrim Aves., Philadelphia 44, Pa. In Canada, Honeywell Controls, Ltd., Toronto 17, Ontario

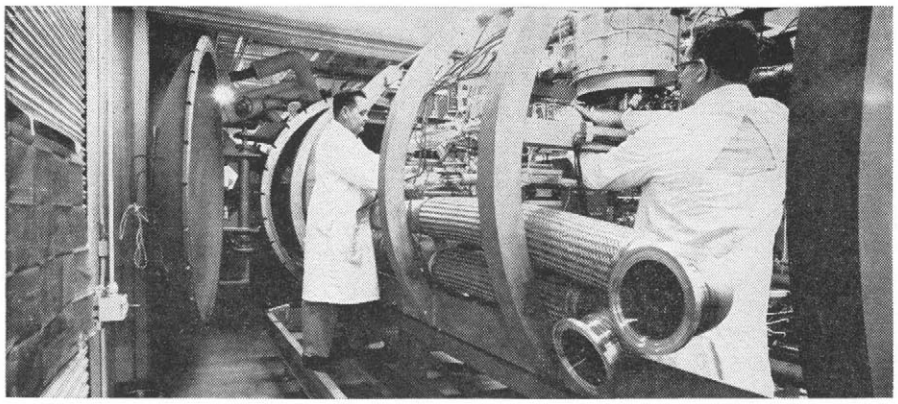
HONEYWELL INTERNATIONAL Sales and Service offices in principal cities of the world. Manufacturing in United States, United Kingdom, Canada, Netherlands, France, Japan.



METAL ENVIRONMENT. The test loop at the left is mounted on a framework which can roll on a track into the environmental chamber at the rear. The chamber can be either evacuated or filled with argon at 1 atm.

Metal Heated. Schematically, the loop is in the form of a figure 8—with an economizer at the central point, where the line crosses over itself. This heat exchanger heats up liquid metal from the first part of the loop from 1750° F. to 2050° F. as it passes through. On the return journey through the other side of the heat exchanger the stream is cooled a similar amount. The exchanger is a simple, annular type.

A radiant heater with three tantalum heating elements adds another 50° F. to the temperature of the hot leg stream.

The thermocouples used are generally of chromium and alumel. Some have stainless steel sheathing, others tantalum. However, at temperatures of 2150° F., nickel-cadmium thermocouples are used.

An electromagnetic pumping system is used. The magnetic field set up in a conducting coil wound around a pipe containing the liquid metal moves it along. The flow meter is a magnetic unit.

Lines of the loop are insulated with reflective material. An ordinary insulator, such as magnesite powder, retains gases which would gradually release, making it difficult to keep a high vacuum in the environmental chamber. Reflective insulation consists of a number of layers of nickel foil wrapped around the piping. These are separated by a nickel knitted wire. Each of the nickel foil layers tends to reflect heat back to the pipe.

Big Problem. Purification is a big problem in any liquid metals system. A continuous system must be used to eliminate impurities picked up. Lithium oxide and lithium nitride, from reactions with minute quantities of air and which somehow find their way into the system, are the most important impurities. To remove the oxide—usually present at 3000 to 4000 p.p.m. in lithium as it is purchased—part of the metal in the loop is made to flow through a cold trap. This reduces the temperature to 400° F., causing the oxide to settle out.

The argon system must also contain a purification setup. An argon blanket is used in the surge tank for the molten metal. Molecular sieves remove moisture, a hot trap removes oxygen and nitrogen.

In addition to the large facility, Martin has a number of smaller loops which it has used in screening materials of construction and determining corrosion resistance. The small loops use ¼-in. i.d. piping, and liquid metal circulates by thermal convection rather than by pumping. The cold legs run about 1000° F., and the hot ones 2100° F. A great many runs of several hundred hours have been made in loops of this type.

The ultimate aim of the liquid metal research, together with that on thermionic generators—which produce electricity directly from a diode surrounded by hot cesium vapor—is to develop fast reactors suitable for space. The main object is to cut down weight in the reactor. By using a fast, rather than a thermal neutron reactor, the need for bulky moderator is eliminated. Lithium metal is a light, efficient heat transfer medium. By placing a small thermionic generator in each fuel element, the need for boilers and other bulky equipment for conversion of heat into electricity disappears.

So far, Martin has conceptually designed a 60-kw. reactor system, a 300-kw. system, and is developing a conceptual design of a 2000-kw. system. The company expects these reactors to be very useful in the space program during 1970 to 1975.

Foxboro Adds Digital Systems

Company forms digital division, will use RCA electronic equipment on a nonexclusive basis

Foxboro has formed a new digital systems division which will design and make automation systems for industrial process control. The move gives Foxboro complete in-house capability to engineer and manufacture integrated digital and analog systems for both measurement and control.

The digital systems division will call Natick, Mass., its home. Richard W. Sonnenfeldt, formerly with Radio Corporation of America at Natick, moves next door to head Foxboro's new division.

Coincidentally, RCA will provide Foxboro with some of the equipment which it will need for its new, integrated systems. Principally, Foxboro will use, on a nonexclusive basis, RCA computers made at Van Nuys, Calif., and West Palm Beach, Fla. Also included will be RCA's industrial data transmission link.

Three-Year Program. Until three years ago, Foxboro concentrated on mechanical, pneumatic, and electronic analog-type industrial instruments. Then, realizing the major role that electronic data processing could play in industrial telemetry and remote supervisory control, it formed a systems team to study specific industrial applications for digital computers and allied equipment. Out of these studies came the entry into the digital field.

The next step came last year when Foxboro bought Waugh Engineering of Van Nuys, Calif. Waugh broadened Foxboro's capabilities with such systems as fully automatic blending control.

At its Natick plant, the new division is cranking up to make input-output equipment, including analog-to-digital converters and other equipment used in the interfaces between process instruments and computers. Foxboro has already outfitted the division with experienced programers and systems project teams. Now it's training its service people to handle the completed installations.

The chemical industry has been Foxboro's best customer, responsible for about a third of its $54 million sales in 1960. But for the digital systems division, the prime target—for the moment, at least—will be the power plant field.

Illustrations/Remarks:

Perform gamma walkover surveys to establish radiation levels for personnel performing geophysical survey in areas where research and development facilities were once located for nuclear reactor fuel elements.

Background gamma count rates were taken in a nearby shopping center which had grassy areas, ashphalt areas, and concrete areas similar to those near the airport.

- Gamma count rates were between 4200 and 5900 counts per minute.
- The average count rate was around 4500 counts per minute.

Gamma count rates were taken at one meter intervals in the area of concern.

- Gamma count rates were between 3856 and 5752 counts per minute in all areas.
- The average count rate was around 4700 counts per minute.

A map is attached showing the Area of Concern and buildings with radiological history.

There were no areas where readings exceeded levels where an individual could receive more than 25 mrem/yr (millirem per year), which is the federal limit for maximum annual radiation exposure to a member of the public.

RE: Geophysical Survey – Metallic Target Detection/Delineation
~ 4-Acre Area – REC 11, Greater Strawberry Point
Middle River Complex
Middle River, MD
Enviroscan Reference Number 031443

Dear Ms. McGivney:

Pursuant to your request, Enviroscan, Inc. (Enviroscan) has completed a geophysical survey of the above-referenced site. The survey consisted of a reconnaissance-level electromagnetic (EM) survey. The methods and results of the survey are described below.

Survey Purpose and Site Description

The primary purpose of the survey was to determine whether there is evidence of buried metallic debris (e.g. tanks, drums, building foundations, etc.) beneath a 4-acre client-designated area centered on the REC 11 Area.

Survey Methods

In order to provide detection of large subsurface metallic targets, while minimizing interference from surficial debris and structures, Enviroscan performed an electromagnetic (EM) survey using a Geonics, Ltd. EM-61 MK2 instrument. Ground penetrating radar (GPR) was then utilized to further characterize targets identified with the EM-61 MK2. The principles of each technique are described below.

EM-61 MK2

The EM-61 MK2 uses a one-meter by ½-meter coil to transmit 150 electromagnetic pulses per second into the ground at each measurement station. During the off-time between transmitted pulses, a receiver coil measures the decay of transient electrical currents induced by the transmitted pulses. The decay is characterized by recording the strength of the transient electrical currents (in milliVolts) at four different delays or time gates following shut-off of the applied field. Electrical currents in moderately conductive earth materials (e.g. electrolytic soils) dissipate rapidly, leaving the more prolonged currents due to buried metallic objects. The EM-61 MK2 measures the surficial electrical potential due to the prolonged subsurface currents, providing a digital read-out of the relative metallic content of the subsurface.

To complete the EM-61 MK2 survey, a system of profiles (at approximately 5-foot intervals) was surveyed by towing the EM-61 MK2 with a low metallic profile Yamaha Rhino UTV. Data were collected at a rate of eight readings per second (for an average station spacing of approximately one foot). Location control was maintained using a Topcon GMS-110 global positioning system (GPS) receiver. The GPS positions were collected with real-time differential correction, using the corrections from a coastguard beacon in Annapolis, MD. The resulting differential GPS (DGPS) positions have an accuracy of better than two feet. GPS and EM data were fed simultaneously to a Juniper System Allegro data logger running Trackmaker 61 software by Geomar, Inc. This software allows display of the data coverage in real time to ensure complete site coverage.

The EM-61 MK2 records four measurements spaced by time (time gates) after the initial transmit pulse. Gate 1 reads responses from metal targets of all depth and size within the range and sensitivity of the instrument. Gate 2 filters out the smallest targets. Gates 3 and 4 read responses from large targets, with Gate 4 showing the least interference from smaller targets. The purpose of this survey was to detect and delineate possible individual buried metallic targets of a size comparable to drums and USTs; therefore, Gate 3 was selected for the best display of possible targets of interest. Results of the EM-61 MK2 survey are depicted as contours of the individual EM-61 MK2 station measurements in millivolts on Figure 1. The color contours depicted in Figure 1 show increasing metallic response from green to yellow to orange to red to pink colors.

TW-6

In order to re-acquire the location of identified metallic anomalies detected in the EM-61 MK2 survey, Enviroscan employed a GPS and a Fisher TW-6 pipe and cable locator and tracer. In pipe and cable search mode, the TW-6 is essentially a deep-sensing metal detector that detects any highly electrically conductive materials (e.g. metals) by creating an electromagnetic field with a transmitting coil. A receiving coil at a fixed separation from the transmitter measures the field strength. As the instrument is swept along the ground surface, subsurface metallic bodies distort the transmitted field. The change in field strength/orientation is sensed by the receiver, setting off an audible alarm and/or causing deflection of an analog meter. The TW-6 can nominally detect a 2-inch metal pipe to a depth of 8 feet and a 10-inch metal pipe to a depth of 14 feet.

Ground Penetrating Radar Survey

Anomalies in the EM-61 MK2 data that indicated the presence of subsurface metallic objects indicative of building debris, USTs, or drums (see Figure 1) were re-located using DGPS and the TW-6, and then scanned with GPR to identify any high-amplitude parabolic reflections of the type indicative of intact tanks, utilities, or buried debris. GPR systems produce cross-sectional images of subsurface features and layers by continuously emitting pulses of radar-frequency energy from a scanning antenna as it is towed along a survey profile. The radar pulses are reflected by interfaces between materials with differing dielectric properties. The reflections return to the antenna and are displayed on a color monitor as a continuous cross section in real time. Since the electrical properties of metal are distinctly different from soil and backfill materials, metallic pipes and other structures produce dramatic and characteristic reflections. Fiberglass, plastic, concrete, and terra-cotta pipes and structures also produce recognizable, but less dramatic, reflections.

Enviroscan performed GPR scanning of the survey area using a GSSI UtilityScan DF GPR controller, along with a dual frequency 800/300 MHz scanning antenna. During data collection, the GPR images were inspected in real-time for any GPR reflections that are characteristic of metallic USTs such as high-amplitude parabolic reflections. Anomalies identified in the field were marked with semi-permanent marking paint and flags. The EM anomalies further investigated with GPR are depicted in Figure 1 overlain on the EM-61 MK2 data as blue- and purple-outlined rectangles/ovals. Blue rectangles/ovals indicate that GPR images of the target anomalies showed no characteristic shapes matching those expected for USTs, drums, or building remnants. These EM anomalies were noted as scattered metallic debris. Purple rectangles/ovals indicate that the GPR images show some characteristic shapes matching those expected for USTs, drums, or building remnants.

Results

The EM survey results are depicted in Figure 1, showing the Channel 3 EM-61 MK2 results in millivolts from this survey. The wooded area to the south of Taxiway Foxtrot and east of the Black and Decker Hanger (see Building labeled "8", Figure 1) could not be surveyed due to poor GPS reception and underbrush. The fenced and paved area directly east of the Black and Decker Hanger (see green-hatched area, Figure 1) was scanned with TW-6 and GPR, and no anomalies were found.

The EM survey shows numerous small low- to moderate-amplitude and several large varying-amplitude EM anomalies. Enviroscan identified 18 anomalous areas with the possibility of containing remnant building structures, USTs, or drums. Of the remaining small low- to moderate-amplitude anomalies, Enviroscan randomly chose 10 of them for relocation and GPR scanning. The resulting scans of these smaller anomalies showed all of them to be small pieces of metal comparable in size to a one-gallon paint can or smaller.

All 18 of the larger anomalous areas were further scanned with GPR. Each area was scanned multiple times in a variety of directions to insure that the source objects were fully imaged. The GPR scan of 14 of the anomalies showed no characteristic shapes matching those expected for USTs, drums, or building remnants (see blue polygons, Figure 1). These EM anomalies were noted as scattered metallic debris. In several cases the GPR images revealed that larger/higher response EM anomalies within these debris areas were caused by buried pipe remnants (see "Pipe" label, Figure 1). The remaining four areas had one or more GPR/EM characteristics that mark them as possible remnant buildings or drums. No EM anomalies showed GPR images characteristic of USTs.

Anomaly of Interest 1 shows no GPR images consistent with drums or remnant structures; however, further review of the EM-61 MK2 data shows a clear linear anomaly, not associated with a utility, located on the outer edges of the area, indicating a possible remnant wall (see black dash dot line, Figure 1).

Anomaly of Interest 2, depicted in Figure 2, was scanned with GPR and the images revealed a long high-amplitude parabolic anomaly that could result from buried drums. Please note the location of this anomaly is between the storm water retention pond and a drainage swale to the southeast, which are known to be connected further south by a culvert. The high amplitude response portion of the anomaly, see pink shaded area, is noticeably linear in the northwest to southeast direction. Anomaly of Interest 2 could be a large-diameter drain pipe or the remnants of one.

GPR scanning of Anomaly of Interest 3 showed images consistent with possible buried drums in a 6-foot by 6-foot area. The images of these scans are shown in Figure 2. The left most radargram is across the short access of the GPR anomalies imaged within the EM Anomaly of Interest 3. Two parabolic reflections are visible in this scan, labeled 1 and 2, both have a rounded shape. The right most radargram is across long axis of GPR Anomaly 1, perpendicular to previous direction. This radargram reveals a longer, flat, tilted surface, indicative of a box like shape in the long axis. These two scans together indicate that Parabolic Anomaly 2 has a cylindrical shape that is approximately 2 feet by 4 feet. GPR Anomaly 1 has similar characteristics

GPR scanning of Anomaly of Interest 4 delineated several objects consistent with buried construction/demolition debris. All four Anomalies of Interest should be further investigated to discover the source material for the EM and GPR anomalies.

Limitations

The geophysical survey described above was completed using standard and/or routinely accepted practices of the geophysical industry and equipment representing the best available technology. Enviroscan does not accept responsibility for survey limitations due to inherent technological limitations or site-specific conditions. However, we make every effort to identify and notify the client of such limitations or conditions.

As always, we have appreciated this opportunity to have worked with you. If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,
Enviroscan, Inc.
