

KNOWLEDGEWORKS™

BRINGING SPACE DOWN TO EARTH

Our team has developed a full end-to-end solution for collecting, analyzing and processing imagery data into actionable information. We allow customers to pick and choose what products and services they need to fit a particular mission – offering either a full-cycle solution or meeting customized needs.

SPACE

Satellites offer a unique vantage point to capture imagery and data. We build satellites, design custom payloads and integrate complex sensors. Our LM900 and LM300 satellites serve as the common framework for this design and production and are based on proven, flight-tested designs.

GROUND

Ground stations and terminals are the lifeline between satellites and Earth. Our ability to build and safeguard ground architecture is based on a depth of experience and strategic investments in cybersecurity. Our services include mission planning, constellation management and data processing.

ANALYTICS

Analytics transform data into actionable information. We harvest and analyze data from multiple sources, revealing information and trends that transform hardware and static data into actionable knowledge and insight.
