Re:

Section 404 Nationwide Permit Application,

Haley's Ditch Restoration Project

North of East Archwood Avenue and south of Triplett Boulevard,

Akron, Summit County, Ohio 44306

Dear Ms. Carroll:

Two copies of the Application for a Section 404 Nationwide Permit for the subject site are enclosed. The applicant is Lockheed Martin. EnviroScience, Inc. has prepared the necessary permit documents under contract with this company. As a reminder, the letter from the US EPA discussing approval is pending and is anticipated by early 2009.

Please review the 404 Application and notify me of any changes or further information the USACE may require within 20 days of receipt. If you have any questions or would like more information, please contact me by phone at (330) 688-0111, or email me at jkrejsa@enviroscienceinc.com.

Respectfully,

Jamie Krejsa

Vice President / Director of Ecological Services

INDIVIDUAL 404 PERMIT APPLICATION

APPLICATION FOR DEPARTMENT OF THE ARMY PERMIT (33 CFR-325)

OMB APPROVAL NO 0710-003 Expires October 1996

Public reporting burden for this collection of information is estimated to average 5 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Department of Defense, Washington Headquarters Service Diractorate of Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302; and to the Office of Management and Budget, Paperwork Reduction Project (0710-0003), Washington, DC 20503. Please DO NOT RETURN your form to either of those addresses. Completed applications must be submitted to the District Engineer having jurisdiction over the location of the proposed activity.

PRIVACY ACT STATEMENT

Authority: 33 USC 401, Section 10; 1413, Section 404. Principle Purpose: These laws require permits authorizing activities in, affecting, navigable waters of the United States, the discharge of dredged or fill material into the waters of the United States, and the transportation of dredged material for the purpose of dumping it into ocean waters. Routine Uses: Information provided on this form will be used in evaluating the application for a permit. Disclosure: Disclosure of requested information is voluntary. If information is not provided, however, the permit application cannot be processed nor ca a permit be issued.

One set of original drawings or good reproducible copies which show the location and character of the proposed activity must be attached to this application (see sample drawings and instructions) and be submitted to the District Engineer having jurisdiction over the location of the proposed activity. An application that is not completed in full will be returned.

that is not completed in full will be retu	med

Take a slight right at South Seiberling Street and travel approximately 0.5 mile; turn right at East Archwood Avenue and turn immediately left into an auto body business parking lot. The northern end of the project area is located just southwest of the car dealership parking lot.

ENG FORM 4345, Apr 83

EDITION OF 1 OCT 77 IS OBSOLETE

(Proponent: DAEN-CWO-N)

18. Nature of Activity (description of project, include all features)

PCB containing soil has been identified along approximately 1,800 linear feet of Haley's Ditch and the immediate surrounding floodplain area (Figure 5). Proposed remedial actions will involve site clearing, construction of material staging areas, assembly of material handling and water handling systems, and excavation and off-site disposal of targeted PCB-containing soil. Soil located adjacent to Haley's Ditch containing PCB concentrations greater than 1 mg/kg will be excavated and PCB-containing unconsolidated soft sediments will be removed from the ditch. Excavated contaminated soil will be managed as PCB remediation waste and will be transported offsite for proper disposal. An onsite water treatment system may be used to treat water generated by remediation activities. The treated water will be discharged to the local POTW under approval of the City of Akron.

Excavated areas will be backfilled, as needed, with soil containing less than 1 mg/kg total PCBs. The restored stream channel (Haley's Ditch) and wetland areas (Appendix B: Davey Resource Wetland Delineation Report; Appendix C: EnviroScience Ecological Resources Assessment Report) will be covered with suitable soil containing less than 0.5 mg/kg. Following these soil remedial actions, restoration of stream and wetland habitat will be performed in accordance to the USACE requirements. See below for additional details regarding restoration.

19. Project Purpose (Describe the reason or purpose of project, see instructions)

The purpose of the project is to remove PCB containing soil and sediment from Haley's Ditch as well as along the banks and surrounding floodplain area such that any remaining PCBs will not pose an unreasonable risk to human health or the environment.

Commencement of remedial activities is anticipated to begin in early 2009; this start date is contingent upon approvals from USEPA, Ohio EPA, USACE.

USE BLOCKS 20 - 22 IF DREDGED AND/OR FILL MATERIAL IS TO BE DISCHARGED

20. Reason(s) for Discharge

Excavation of soils in Haley's Ditch and the surrounding floodplain area is necessary to remove PCBs. Because soil excavation will occur in some stream and wetland habitat, placement of suitable soil is necessary to restore Haley's Ditch, onsite wetlands, and riparian floodplain habitat.

21. Type(s) of Material Being Discharged and the Amount of Each Type in Cubic Yards

Approximately 600 cubic yards of unconsolidated sediment will be excavated from 1,800 linear feet of Haley's Ditch; approximately 10,000 cubic yards of surface and subsurface soil containing PCBs above 1 mg/kg will be excavated from the wetland and riparian areas onsite. Suitable soil will be discharged (in lesser amounts) in the excavated areas to replace the excavated soils and to restore the stream, wetland and riparian floodplain habitats. An estimated 608 cubic yards of stream substrate will be used to create the new stream bed. Exact fill amounts will be determined during the final stages of restoration design.

22. Surface Area in Acres of Wetlands or Other Waters Filled (see instructions)

Approximately 1,800 linear feet of Haley's Ditch (0.17 acre) and 0.83 acre of onsite wetlands will be excavated and filled with suitable earthen fill.

- 23. Is Any Portion of the Work Aiready Complete? Yes No X IF YES, DESCRIBE THE COMPLETED WORK
- 24. Addresses of Adjoining Property Owners, Lessees, Etc., Whose Property Adjoins the Waterbody (If more than can be entered here, please attach a supplemental list).

See attached list.

Nationwide 404 Permit Application Haley's Ditch Restoration

Additional Information

Conceptual Restoration Plan

In conjunction with the remediation project, the applicant foresees and opportunity to enhance the long-term ecological function of the area instead of simply returning existing conditions and channel alignment. Therefore, a stream restoration project incorporating natural channel design strategies and native plantings is proposed for Haley's Ditch. The channelized ditch will be replaced with a meandering stream that is designed to improve hydraulics and habitat along the remediation corridor. Since the remediation effort is excavating materials beyond the stream channel, there is potential to expand the flood prone area for lower return interval storm events (ie. 1-2 yr storms) thereby improving hydraulics. The proposed restoration plan takes advantage of the remedial excavation to restore a new stream pattern and flood corridor within the work limits (Appendix A: Map 4). However, the exact limits of the flood plain expansion will be determined in final restoration design as this relates to additional cost of excavation, plantings and grading work.

A suitable mixture of natural sand and gravel material that will contain less than 0.5 mg/kg PCBs will be used to create the streambed. Riffle-pool characteristics will be replaced along the profile at appropriate slope and interval spacing determined in final design. The restored floodplain will be backfilled and graded to final elevation using suitable topsoil that will contain less than 0.5 mg/kg PCBs. The restoration plan will aim to establish an early successional community toward a trajectory of forest recovery. Native riparian grasses, sedges and forbs will be seeded through the corridor and floodplain. Woody vegetation will be concentrated near the restored stream banks such as willow and dogwood cuttings for long-term stability. Larger woody species such as sycamore, maple, ironwood etc. will be installed along the stream length as well.

In addition to stream restoration, wetland totaling 0.83 acre will be replaced within the project area. The wetland(s) will be similar to the existing type of wetland but will actually have increased hydrology due to their presence in the new more hydraulically active floodplain. The restored wetland(s) area will be backfilled with suitable soil and planted with native obligate or facultative species comprised of perennial grasses, sedges, rush and forb species. Wetland shrub and tree species will be planted in clusters surrounding and within the restored areas. The final restoration plan will be provided along with the final drawings and project plans.

Threatened and Endangered Species

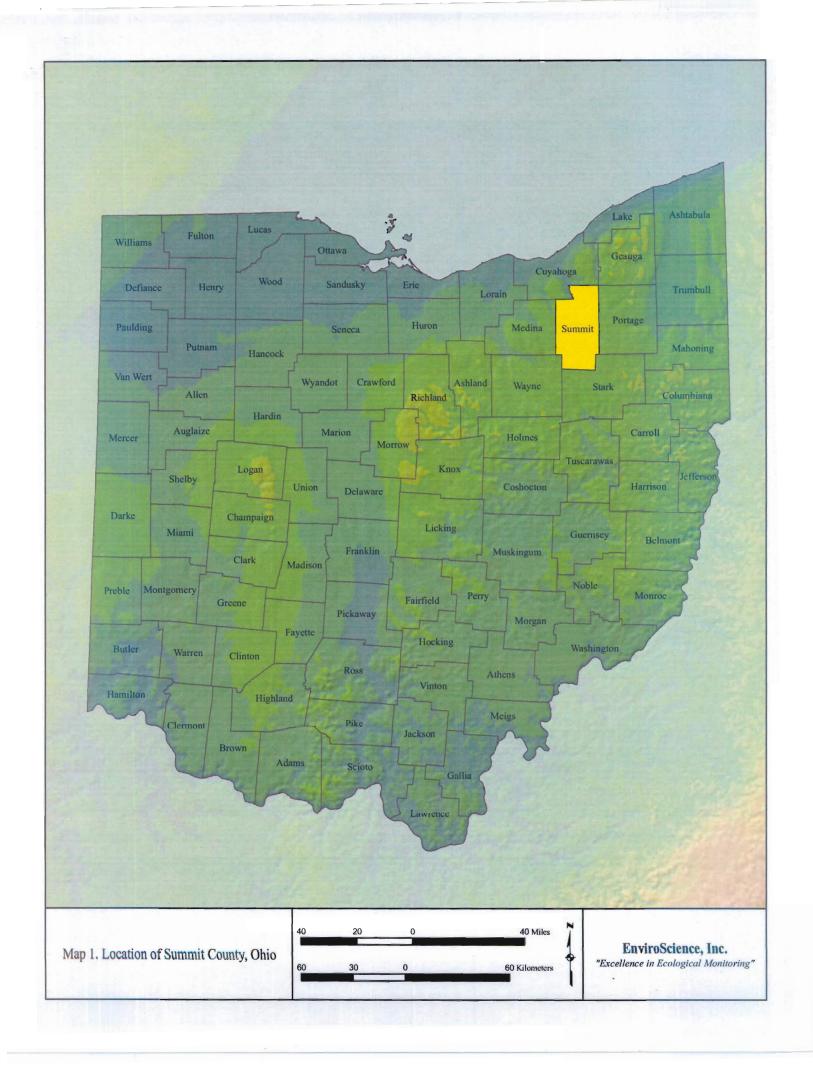

The project is located within the range of the federally endangered Indiana bat (Myotis sodalis), the federally threatened northern monkshood (Aconitum noveboracense) and the federal species of concern bald eagle (Haliaeetus leucocephalus). The site consists mainly of successional forest, scrub shrub and urban area (mowed lawn). No Potential northern monkshood or bald eagle habitat onsite; however, potential Indiana bat roost tree habitat was identified within site boundaries. A bat mist net survey was conducted by EnviroScience in July 2008; no Indiana bats were observed (Appendix C: EnviroScience Indiana Bat Survey Report).

Introduction

Site Description and Location

The 5.85-acre site is located in Akron, Ohio (Appendix A). The property is along Haley's Ditch and extends from north of Triplett Boulevard to just south of Archwood Avenue (Appendix B).

The property contains successional woods, upland old fields and shrub thickets, wet meadows, and lowland woods. These semi-natural areas surround Haley's Ditch and are located in a heavily urbanized area.

Haley's Ditch flows north through the study area, entering a culvert at the north end of the site (Photographs 4 and 5, Appendix H). Haley's Ditch continues flowing north through the Goodyear Tire and Rubber Company property, eventually entering Springfield Lake Outlet, which in turn enters the Little Cuyahoga River, a tributary to the Cuyahoga River. The Cuyahoga River has a watershed area of 809 square miles and debouches into Lake Brie in the City of Cleveland.

Secondary Source Information

The property is shown on the Akron East Quadrangle of the United States Geological Survey (USGS) map (Appendix C). Elevations range from approximately 1,030 to 1,040 feet across the site.

The National Wetlands Inventory (NWI) map (Akron East quadrangle) is in Appendix D. No wetlands are mapped for the site.

A map showing soil types from the U. S. Department of Agriculture Natural Resources Conservation Service Web Soil Survey (2007) is found in Appendix E. See Table 1 for a list of soil types mapped for the site.

Table 1. Soil Types Mapped for the Site

Map Unit	Soil Description	
Cg	Carliste muck ¹	
CuB	Chili-Urban land complex, undulating	
CuC	Chili-Urban land complex, rolling	
Ur	Urban land	

¹Hydric soil

Descriptions from the Summit County Soil Survey (Ritchie and Steiger, 1974) and lists of hydric soils and non-hydric soils with hydric inclusions for the soil types found on the site are included in Appendix E.

Methodology

The Corps of Engineers Wetlands Delineation Manual (United States Army Engineer Waterways Experiment Station Environmental Laboratory, 1987) was used in delineating wetlands within the study area. The routine on-site determination method for sites over five acres was used. This method is detailed in Section D (page 53) of the Corps of Engineers Wetlands Delineation Manual.

The wetlands were delineated and surveyed on June 25, 2008 and July 1, 2008. The wetlands delineation fieldwork, boundary mapping, and data analysis were performed by Todd Crandall and Kristen Bates. Shawn Bruzda prepared the vegetation, soils, and wetlands maps using AutoCAD Map[®] 2008 and Appendices Maps A–E using ArcGIS[®] v.9.2. Ruth Ann Sobnosky provided technical oversight and quality control.

Wetlands are identified based on three characteristics: vegetation, soils, and hydrology. An area must meet all three criteria to be considered a jurisdictional wetlands. Six sampling points were established in the field to determine wetlands boundaries. Data sheets reporting the results of soils, vegetation, and hydrology analyses were completed for each sample station.

Soil samples were obtained to determine the extent of hydric soils on the site. A standard Munsell soil color chart was used to determine the hue, value, and chroma of each soil sample. Soil samples were taken at a depth of ten inches or immediately below the A horizon. Criteria established by the National Technical Committee for Hydric Soils (1991) were used to determine hydric soils.

Wetlands hydrology was characterized during this wetlands delineation. Inundation and/or soil saturation were noted for each sample point. Secondary hydrological indicators, including watermarks, drift lines, sediment deposits, wetlands drainage patterns, blackened leaves, and morphological indicators, were also noted. Other hydrological indicators observed include iron/manganese concretions and oxidized root zones within the upper soil layers.

Quantitative vegetation data were collected at each sampling point. Dominance was estimated by percent areal cover. Four strata were considered for each sample point—trees, saplings/shrubs, herbs, and woody vines. Trees are defined as any woody plant having a diameter at breast height (DBH) greater than 3.0 inches. Saplings and shrubs are those woody plants that have a DBH of less than 3.0 inches and are greater than 3.2 feet in height. For each stratum, plant species within a quadrat were identified and percent areal cover was estimated for each species. Fifteen-foot-square quadrats were used for trees, saplings/shrubs, and woody vines. A three-foot-square quadrat was used for herbs.

Any species within a stratum comprising 20 percent or more of the total quadrat areal cover was considered to be dominant. Dominant species within all strata were then added to determine the percentage of wetlands vegetation for each sample point. The wetlands vegetation criterion was met if greater than 50 percent of the dominant vegetation was indicative of wetlands conditions.

Wet Meadows. All of Wetland C and portions of Wetland A are wet meadows (Photographs 1 and 3, Appendix H). Common species include *Impatiens capensis* (spotted touch-me-not, FACW), *Leersia oryzoides* (rice cutgrass, OBL), and *Polygonum pennsylvanicum* (Pennsylvania smartweed, FACW).

Lowland Woods. All of Wetland B and portions of Wetland A are lowland woods (Photographs 1 and 2, Appendix H). These areas contain Acer saccharinum (silver maple, FACW), Impatiens capensis (spotted touch-me-not, FACW), Lysimachia nummularia (creeping Jennie, FACW-), Populus deltoides (eastern cotton-wood, FAC), and Viburnum recognitum (northern arrow-wood, FAC).

Soils

The soils on the site are disturbed. There are areas of fill as well as soils that have been disturbed from years of stream dredging and channelization. A large area of soils mapped as Carlisle muck in the northern portion of the site could not be located in the field. A map showing the general locations of soil types as shown on the soil survey and identified in the field is included in Appendix I.

Hydrology

All three of the wetlands are fed by surface water. Wetlands A and C also receive overflow from Haley's Ditch. All of the wetlands are considered non-isolated due to their close proximity to Haley's Ditch. A summary table of sample point data and vegetation, soils, and hydrology data sheets are included in Appendix J.

Conclusions

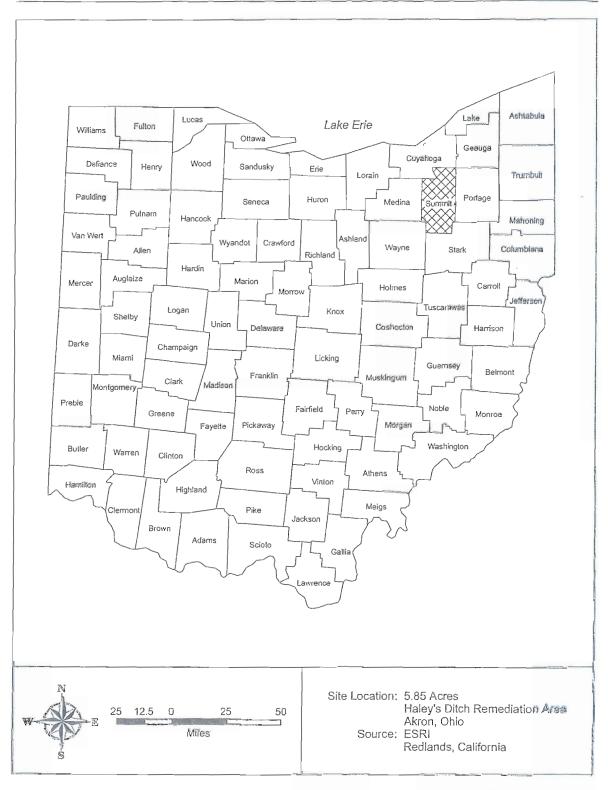

A map showing the location and size of the jurisdictional wetlands and aquatic features identified on the property, along with the locations of sample points, is shown in Appendix K. Three wetlands totaling 0.839 acre are found within the study area (Table 2). In addition to the wetlands, Haley's Ditch has a length of 1,757 linear feet.

Table 2. Jurisdictional Wetlands Delineated on the Site

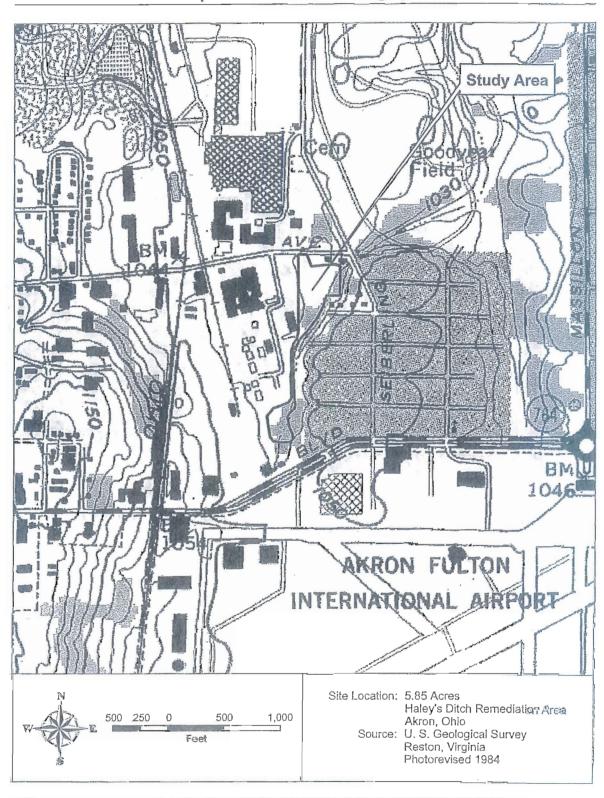

Wetlands	Туре	Connectivity to Waters of the U. S. ¹	Area (Acres)
А	Lowland woods and wet meadow	Non-isolated	0.722
В	Lowland woods	Non-isolated	0.093
С	Wet meadow	Non-isolated	0.024
Total			0.839

¹ The final determination of a wetlands' connectivity to Waters of the U. S. is made by the U. S. Army Corps of Engineers.

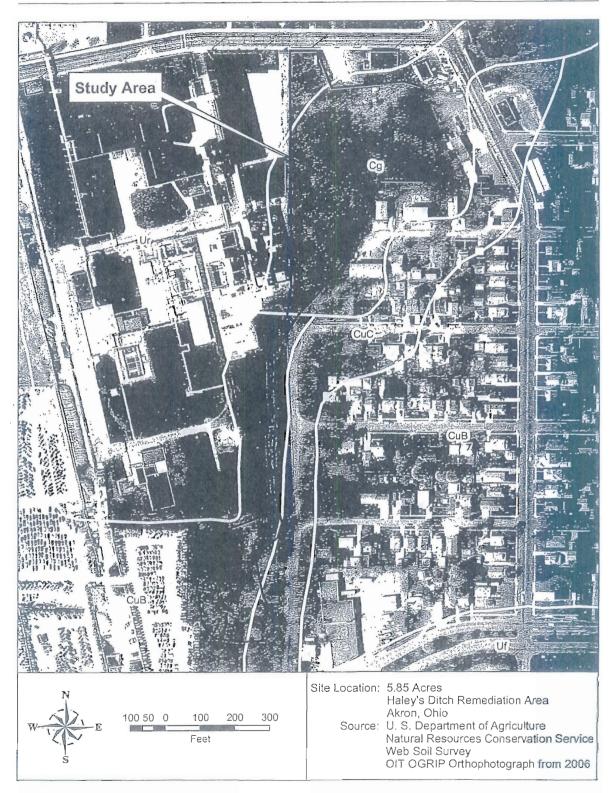

Appendix A Location of Summit County, Ohio

Appendix C Location of Study Area on USGS 7.5-Minute Topographic Map (Akron East Quadrangle)

Appendix E Soils Information for Study Area

Urban land (Ur) consists of areas 10 acres or more in size that are covered by buildings, pavement, or other manmade surfaces. Among these areas are commercial and industrial areas, large factories, shopping centers, warehouses, and railroad yards. The slope ranges from 0 to 25 percent. Most areas have a very low infiltration rate and very rapid runoff. Large areas of Urban land materially increase the volume of water flowing in nearby streams after a rain. Urban land can be a source of pollution in nearby streams unless there is careful management of these areas. Capability unit not assigned; woodland suitability group 4.

Appendix F Definition of Wetlands Vegetation Indicator Status (from Reed, 1988)

Obligate Wetlands (OBL). Occur almost always (estimated probability is greater than 99%) under natural conditions in wetlands.

Facultative Wetlands (FACW). Usually occur in wetlands (estimated probability 67–99%) but occasionally found in non-wetlands.

Facultative (FAC). Equally likely to occur in wetlands or non-wetlands (estimated probability 34–66%).

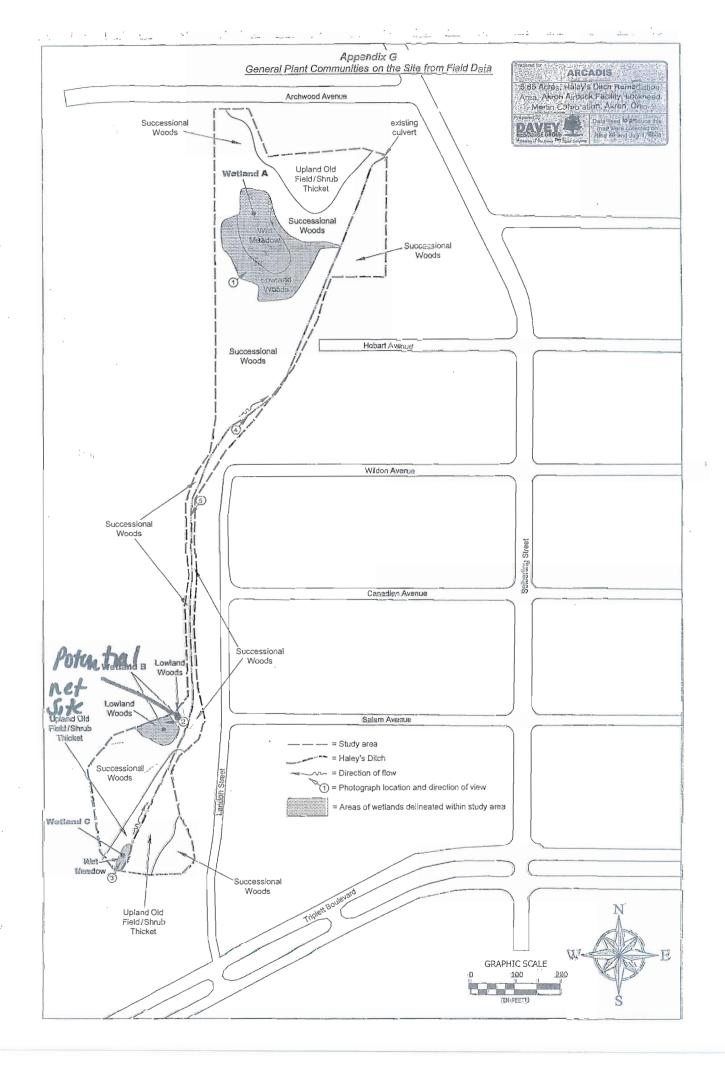

Facultative Upland (FACU). Usually occur in non-wetlands (estimated probability 67–99%) but occasionally found in wetlands (estimated probability 1–33%).

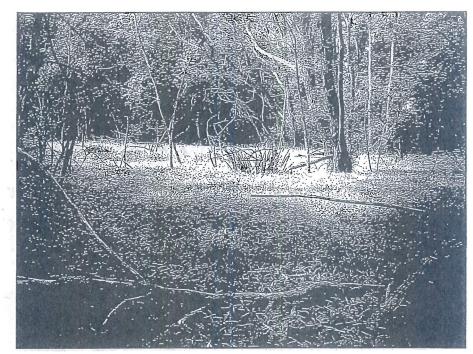

Obligate Upland (UPL). Occur in wetlands in another region, but occur almost always (estimated probability > 99%) under natural conditions in non-wetlands in the region specified. If a species does not occur in wetlands in any region, it is not on the *National List*.

Species for which little or no information was available to base an indicator status were assigned a no indicator (NI) status. An asterisk (*) after the indicator status indicates that the indicator status was based on limited ecological information.

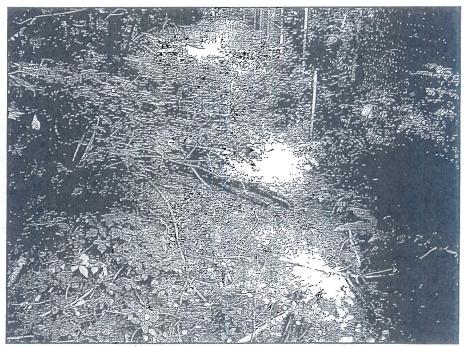

The wetlands indicator categories should not be equated to degrees of wetness. Many obligate wetlands species occur in permanently or semipermanently flooded wetlands, but a number of obligates also occur, and some are restricted to wetlands that are only temporarily or seasonally flooded. The facultative upland species include a diverse collection of plants that range from weedy species adapted to exist in a number of environmentally stressful or disturbed sites (including wetlands), to species in which a portion of the gene pool (an ecotype) always occurs in wetlands. Both the weedy and ecotype representatives of the facultative upland category occur in seasonally and semipermanently flooded wetlands.

Davey Resource Group has added two additional indicators for situations when plants can only be identified to genus. A Wetlands Indicator Species (WIS) is a plant that is most likely obligate wetlands, facultative wetlands, or facultative. An Upland Indicator Species (UIS) is a plant that is most likely indicative of upland or facultative upland conditions. These additional indicators are used when species identification is not possible. A variety of factors are part of the UIS and WIS assignments. Indicator statuses of all locally occurring members of the genus in question are considered, as are the health and size of the population and the indicator status of nearby plants.

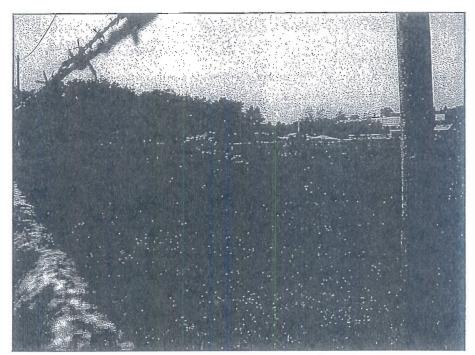

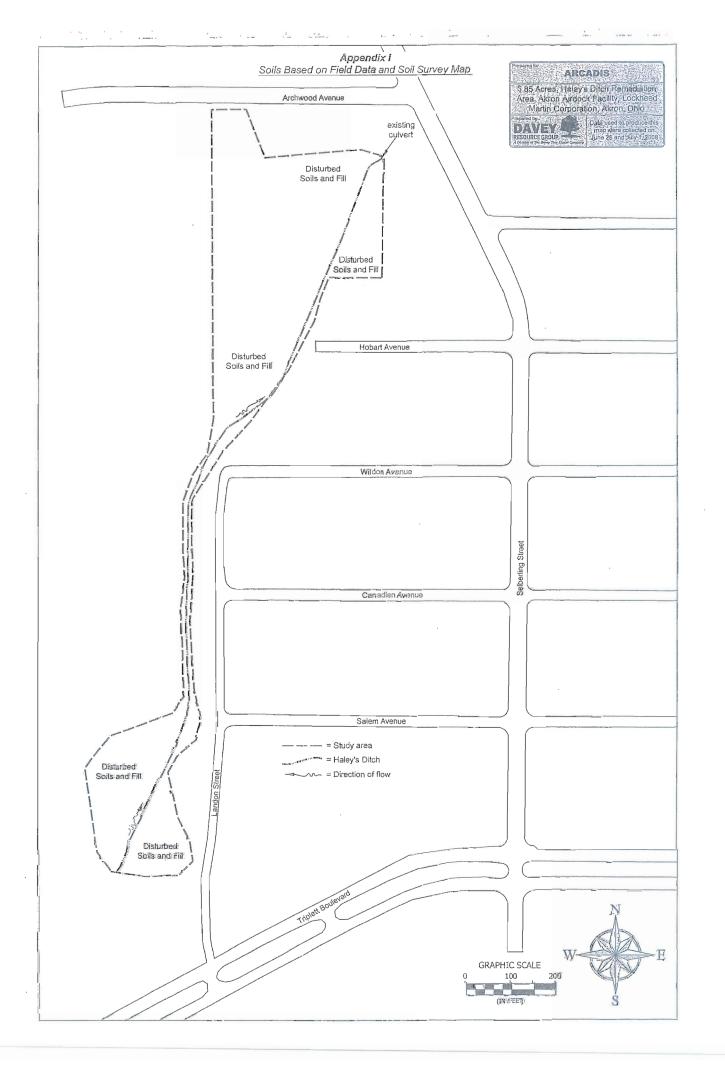

Photograph 1 (6-25-08) Wetland A is a lowland woods and wet meadow.

Photograph 2 (6-25-08) Wetland B is a lowland woods.

Photograph 5 (6-25-08) Haley's Ditch in the central portion of the site is surrounded by a narrow area of upland old field.

Ruth Ann Sobnosky, M.S., is an environmental planner and project manager for a variety of natural resource projects, including wetlands delineations, wetlands monitoring, wetlands permitting/compliance, ecological surveys, environmental planning studies and grants, and other natural resource consulting projects. Ms. Sobnosky's experience includes working as an environmental planner, public involvement specialist, and community planner. Ms. Sobnosky's responsibilities included the review, evaluation, and reporting of environmental and socioeconomic impacts to fulfill National Environmental Policy Act (NEPA) requirements. This required coordination with public agencies, working with engineers, and initiating and attending public involvement meetings necessary for the construction of new roads, bridges, and other important public infrastructure throughout Ohio. Ms. Sobnosky has completed training through the Ohio Department of Transportation for the following: Project Development Process, Categorical Exclusion, Section 106/National Register Eligibility, Section 4(f), and Managing the Environmental and Project Development Process (NEPA). Ms. Sobnosky graduated from Northern Illinois University with a Bachelor of Science degree in geography, and holds a Master of Science degree also in geography from Southern Illinois University at Edwardsville.

EXECUTIVE SUMMARY

In June and July 2008, Davey Resource Group provided wetland delineation services for ARCADIS on the Lockheed Martin Site. The site is located south of East Archwood Avenue, north of Triplett Boulevard, and west of Seiberling Avenue in Akron, Summit County, Ohio. EnviroScience, Inc. conducted an additional ecological resources site assessment in July 2008 to perform an assessment of previously delineated wetlands, a terrestrial habitat survey and a potential Indiana Bat habitat survey within site boundaries.

The site consists of three upland terrestrial habitat types: successional forest, scrub shrub, and urban area. The herbaceous habitat identified on project mapping represents the palustrine emergent portion of Wetland A delineated by Davey Resource Group. This habitat type was identified on project mapping only for the purposes of accurate calculations of all terrestrial habitat types onsite. The site also contains two types of wetland habitat: palustrine emergent and palustrine forested wetland habitat. Haley's Ditch flows north through the center of the study area. The study area is surrounded by urbanized area consisting of residential and commercial properties.

Three previously identified wetlands (Wetlands A, B and C) were assessed using the ORAM scoring forms. Wetland A was determined to be a Category 2 wetland, Wetland B was determined to fall within the Category 1 or 2 gray zone, and Wetland C was determined to be a Category 1 wetland. These wetlands are under the jurisdiction of the Ohio EPA or Corps. No filling may occur within these areas without their written permission. Please contact the Ohio EPA Division of Surface Water at (614) 644-2001 or the Buffalo District, U.S. Army Corps of Engineers, at (716) 879-4330 before working in these areas. Please refer to the Davey Resource Group Wetland Delineation Report, dated July 2008, for information regarding the previous site assessment.

Potential Indiana Bat roosting tree habitat was identified throughout the successional forest, scrub shrub and herbaceous wetland habitat portions of the study area. However, the Indiana Bat Mist Net Survey did not identify any Indiana Bats onsite. The survey identified one Big Brown Bat onsite. This species is not listed as an endangered, threatened or species of concern for Summit County, Ohio. Please refer to the EnviroScience Indiana Bat Survey Report for additional information on the Mist Net Survey.

1.0 INTRODUCTION AND SITE DESCRIPTION

In June and July 2008, Davey Resource Group provided wetland delineation services for ARCADIS on the Lockheed Martin Site. The site is located south of East Archwood Avenue, north of Triplett Boulevard, and west of Seiberling Avenue in Akron, Summit County, Ohio (Appendix A: Maps 1-3). EnviroScience, Inc. conducted an additional ecological resources site assessment in July 2008 to perform an assessment of previously delineated wetlands, a terrestrial habitat survey and a potential Indiana Bat habitat survey within site boundaries.

The site consists of three upland terrestrial habitat types: successional forest, scrub shrub, and urban area (Appendix A: Map 4) (Appendix C: Photos 1, 2, 4, and 5). The herbaceous habitat identified on project mapping represents the palustrine emergent portion of Wetland A (Appendix C: Photo 4) delineated by Davey Resource Group. This habitat type was identified on project mapping only for the purposes of accurate calculations of all terrestrial habitat types onsite. Additionally, two wetland habitat types were identified: palustrine emergent (PEM) and palustrine forested (PFO) (Appendix C: Photos 4, 6 and 7). Haley's Ditch flows north through the center of the study area (Appendix A: Map 4) (Appendix C: Photos 2 and 3). The study area is surrounded by urbanized area consisting of residential and commercial properties.

2.0 METHODS

Field surveys of the study area were conducted on July 24th and 25th, 2008. Wetland, terrestrial, and endangered species habitat were investigated. Following is a detailed discussion of specific methods employed.

2.1. Wetland Resources

The wetland resources investigation focused on three previously identified wetland systems (Wetlands A, B and C).

2.1.1. ORAM Categorization

Each previously identified wetland system was categorized in accordance with version 5.0 of the Ohio EPA's Ohio Rapid Assessment Method for Wetlands (ORAM) (Mack 2001). Each form consists of a narrative rating and a quantitative rating. The narrative rating requires ODNR Natural Heritage data, and serves to alert the rater of certain qualities that may have an obvious effect on the wetland category. The quantitative rating is based on wetland characteristics such as size, buffers, hydrology, disturbance and habitat. Scores from the quantitative rating produce a wetland category of 1-3, based on Mack (2000).

Category 1 wetlands are considered very low quality and are generally considered not restorable. They represent small emergent wetlands, which often

have a predominance of invasive/exotic species. Modified Category 2 wetlands are degraded systems that have potential to be restored, while Category 2 are medium quality systems which represent the majority of Ohio's wetlands. Category 3 wetlands are exceptional quality systems, such as large, undisturbed, forested wetlands, regionally significant ecosystems, and wetlands with known occurrences of endangered or threatened species.

2.2. Terrestrial Resources

Terrestrial resources in the study area were initially identified by examining topographic maps and aerial photos. While conducting field studies, notes were taken on plant community composition and flora. Vegetation cover types were noted on site mapping. These vegetation data were used to establish vegetation/habitat types found in the study area and to characterize quality of terrestrial habitats. Habitat boundaries were determined and these boundaries were then digitized into the base mapping and terrestrial habitat acreages were calculated.

2.2.1. Terrestrial Habitat Survey

A terrestrial habitat survey was completed to identify major plant communities. Mature nonwetland communities that had reached a stable equilibrium were classified according to Anderson (1982) and Gordon (1966, 1969). Disturbed and successional nonwetland communities were classified as one of the categories described in Table 1.

Table 1. Nonwetland Communities.

Community		Description		
Disturbed	Urban	regularly maintained land; residential; industrial		
	Agricultural	land used for producing crops or raising livestock; cropland; pastureland		
	Cleared	disturbed areas devoid of most vegetation from recent clearing, grading or filling		
Successional	New Field	herbaceous community without woody vegetation		
	Old Field	herbaceous community having woody vegetation coverage of <50%		
	Scrub Shrub	community dominated by woody vegetation <6 m (20 ft) tall		
	Forest	community dominated by woody vegetation >6 m (20 ft) tall		

3.0 ENDANGERED SPECIES

3.1. Potential Indiana Bat Habitat Survey

A potential Indiana Bat habitat survey was completed to identify habitat onsite.

3.2. ODNR Natural Heritage Database

The Ohio Department of Natural Resources, Division of Natural Areas and Preserves Natural Heritage Database was researched. No records of rare or endangered species exist within the study area; however, one record of the threatened Upland Sandpiper (*Bartramia longicauda*) was identified within a one mile radius of the study area (Appendix B: ODNR 2008).

There are no records of the federally endangered Indiana Bat (*Myotis sodalis*) capture locations or hibernacula within five miles of the site. Additionally, there are no state nature preserves or scenic rivers within the study area and no other unique ecological areas, geologic features, breeding or non-breeding animal concentrations, state parks, scenic rivers, or wildlife areas were noted.

3.3. U.S. Fish and Wildlife Service

The federally listed species whose range includes Summit County are the federally endangered Indiana Bat (*Myotis sodalis*), the federal species of concern bald eagle (*Haliaeetus leucocephalus*), and the federally threatened northern monkshood (*Aconitum noveboracense*).

The Indiana Bat is a federally endangered species with a summer range that includes Summit County. The Indiana Bat is migratory, using significantly different winter and summer habitats. Winter habitats include limestone mines and caves, where the bats hibernate. Summer habitat for the Indiana Bat includes live or standing dead trees or snags with exfoliating, peeling or loose bark, split trunks and/or branches, or cavities. Trees that support roosting habitat require an 8" diameter at breast height (dbh) or branches with a 6" diameter. Maternity trees require a 16" dbh or branches with an 8" diameter. Additionally, these trees require some solar exposure to provide thermoregulation to the young. Both maternity and roost trees require connection to a travel corridor to provide access to foraging areas. Potential Indiana Bat roosting tree habitat was identified throughout the successional forest, scrub shrub and herbaceous wetland habitat portions of the study area.

Bald eagles require foraging and perching areas, and nesting sites. Their habitat includes estuaries, large lakes, reservoirs, rivers and some seacoasts. In the winter, these birds congregate near open water in tall trees for spotting prey and night roosts for shelter. No evidence of bald eagles or their nests were found during the site visit.

Preferred habitat for northern monkshood is cool, moist, shaded cliff faces or talus slopes in wooded ravines, near water seeps; no preferred habitat was identified during field investigations.

4.0 RESULTS

The following section describes the results of the ecological resource assessment.

4.1. ORAM Categorization

Three previously identified wetlands were assessed using the Ohio Rapid Assessment Method (ORAM) for Wetlands v.5.0; scoring forms are included in Appendix D and results are given in Table 2 below.

Table 2. Wetland Results.

Wetland	Photo(s)	Classification (Cowardin et al. 1979)	ORAM Score	ORAM Category
Wetland A	4	PEM/PFO	52.5	2
Wetland B	6	PFO	31	1 or 2 gray zone
Wetland C	7	PEM	25.5	1

4.2. Terrestrial Habitat Survey

Three upland vegetative communities exist on the site: successional forest, scrub shrub and urban area habitat (Appendix A: Map 4) (Appendix C: Photos 1, 2, 4, and 5). The northern portion of the site consists primarily of successional forest as well as scrub shrub habitat. The central portion of the site consists primarily of urban area mowed grass with shrubs and herbaceous vegetation lining Haley's Ditch. The southern portion of the site consists primarily of successional forest as well as scrub shrub and urban area habitat types. The successional forest habitat type consists of approximately 4.88 acres, the scrub shrub habitat type consists of approximately 1.74 acres and the urban habitat type consists of approximately 1.52 acres. Two wetland habitat types, palustrine emergent (PEM) and palustrine forested (PFO) were also identified onsite. Please refer to the Davey Resource Group Wetland Delineation Report, dated July 2008, for information on these wetland habitats.

Common species found in the successional forest and scrub shrub habitat include Acer saccharinum (silver maple, FACW-), Populus deltoides (eastern cottonwood, FAC), Prunus serotina (black cherry, FACU), Robinia pseudoacacia (black locust, FACU-), and Acer negundo (box-elder, FAC+) in the tree canopy layer; Crataegus sp. (hawthorn), Comus foemina (gray dogwood, FAC), Lonicera tatarica (Tartarian honeysuckle, FACU), Rosa multiflora (multiflora rose, FACU), and Rhamnus frangula (glossy buckthorn, FAC) in the shrub layer; Alliaria petiolata (garlic mustard, FACU-), Impatiens capensis (spotted touch-me-not, FACW), and Toxicodendron radicans (poison ivy, FAC) in the herbaceous layer; Vitis riparia (river-bank grape, FACW) and Parthenocissus quinquefolia (Virginia creeper, FACU) in the vine layer.

Common species found in the urban area habitat include *Circium arvense* (creeping thistle, FACU), *Coronilla varia* (crownvetch, FACU), *Lonicera tatarica*, *Rosa multiflora*, and *Solidago canadensis* (Canada goldenrod, FACU).

4.3. Potential Indiana Bat Habitat Survey

Potential Indiana Bat maternity and roost tree habitat was identified throughout the successional forest, scrub shrub and herbaceous wetland habitat portions of the study area (Appendix C: Photos 8 and 9). However, no Indiana Bats were observed during the mist net survey, only one Big Brown Bat (*Eptesicus fuscus*) was observed. Please refer to the Indiana Bat Survey Report conducted by EnviroScience, Inc. in July 2008.

5.0 REGULATORY JURISDICTION

The wetlands habitats described in this document are under the jurisdiction either of the U.S. Army Corps of Engineers or the Ohio EPA. No filling may occur in these areas without their written permission. Please contact the Ohio EPA Division of Surface Water at (614) 644-2001 or the Buffalo District, U.S. Army Corps of Engineers, at (716) 879-4330 before working in these areas.

The following information is excepted and summarized from the 2007 *U.S. Army Corps Of Engineers Jurisdictional Determination Form Instructional Guidebook.*

"In 2001, the ... U.S. Supreme Court's decision in the Solid Waste Agency of Northern Cook County (SWANCC) v. Corps...held that isolated, intrastate, non-navigable waters could not be regulated under the CWA based solely on the presence of migratory birds. Following the SWANCC decision ... it generally was believed that a water body (including a wetland) was subject to CWA jurisdiction if the water body was part of the U.S. territorial seas, or a traditional navigable water, or any tributary to a traditional navigable water, or a wetland adjacent to any one of the above. In addition, isolated wetlands and other waters might be considered jurisdictional where they had the necessary link to either navigable waters or interstate commerce."

In the state of Ohio, the Ohio EPA isolated wetland permitting program was legislatively created in response to the 2001 SWANC decision. On July 17, 2001, House Bill 231 was signed into law, establishing a permanent permitting process for isolated wetlands. The provisions of House Bill 231 were incorporated in Sections 6111.021 through 6111.029 of the Ohio Revised Code.

"In 2006, the Supreme Court once again addressed the jurisdictional scope of Section 404 of the CWA, specifically the term "the waters of the

The decision provides two new analytical standards for determining whether water bodies that are not traditional navigable waters (TNWs), including wetlands adjacent to those non-TNWs, are subject to CWA jurisdiction: (1) if the water body is relatively permanent, or if the water body is a wetland that directly abuts (e.g., the wetland is not separated from the tributary by uplands, a berm, dike, or similar feature) a relatively permanent water body (RPW), or (2) if a water body, in combination with all wetlands adjacent to that water body, has a significant nexus with TNWs. CWA jurisdiction over TNWs and their adjacent wetlands was not in question in this case, and, therefore, was not affected by the Rapanos decision. In addition, at least five of the Justices in Rapanos agreed that CWA jurisdiction exists over all TNWs and over all wetlands adjacent to TNWs.

The Memo states that the [Corps and USEPA] will assert jurisdiction over the following categories of water bodies: TNWs; all wetlands adjacent to TNWs: non-navigable tributaries of TNWs that are relatively permanent (i.e., tributaries that typically flow year-round or have continuous flow at least seasonally); and wetlands that directly abut such tributaries. In addition, the agencies will assert jurisdiction over every water body that is not an RPW if that water body is determined (on the basis of a factspecific analysis) to have a significant nexus with a TNW. The classes of water body that are subject to CWA jurisdiction only if such a significant nexus is demonstrated are: non-navigable tributaries that do not typically flow year-round or have continuous flow at least seasonally; wetlands adjacent to such tributaries; and wetlands adjacent to but that do not directly abut a relatively permanent, non-navigable tributary. A significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or an insubstantial effect on the chemical, physical, and/or biological, integrity of a TNW. Principal considerations when evaluating significant nexus include the volume, duration, and frequency of the flow of water in the tributary and the proximity of the tributary to a TNW, plus the hydrologic, ecologic, and other functions performed by the tributary and all of its adjacent wetlands."

6.0 ASSUMPTIONS AND DISCLAIMERS

The results and conclusions contained in this report apply to the year and date in which the data were collected. This report is not considered officially valid until it is approved by the Corps. The report is then valid for a period of five years. Refer to the Corps' Regulatory Guidance Letter # 94-1 (23 May 1994).

Brooke Harrison EnviroScience, Inc. 3781 Darrow Rd. Stow, OH 44224

Dear Ms. Harrison:

I have reviewed our Natural Heritage maps and files for the Arcadis remediation project area, including a one mile radius, on Archwood Ave. in Akron, Summit County, and on the Akron East Quad (2613). We have no records for rare or endangered species or other significant natural features within the project area. However, we have one record within the one mile radius of the project site. The location for the Upland Sandpiper (*Bartramia longicauda*), threatened, is shown in red on the attached map.

There are no state nature preserves or scenic rivers at the project site. We are unaware of any unique ecological sites, geologic features, animal assemblages, state parks, state forests or state wildlife areas within a one mile radius of the project area. We also have no records for Indiana Bat (*Myotis sodalis*, state endangered, federal endangered) capture locations or hibernacula within a five mile radius of the project site.

Our inventory program has not completely surveyed Ohio and relies on information supplied by many individuals and organizations. Therefore, a lack of records for any particular area is not a statement that rare species or unique features are absent from that area. Please note that although we inventory all types of plant communities, we only maintain records on the highest quality areas.

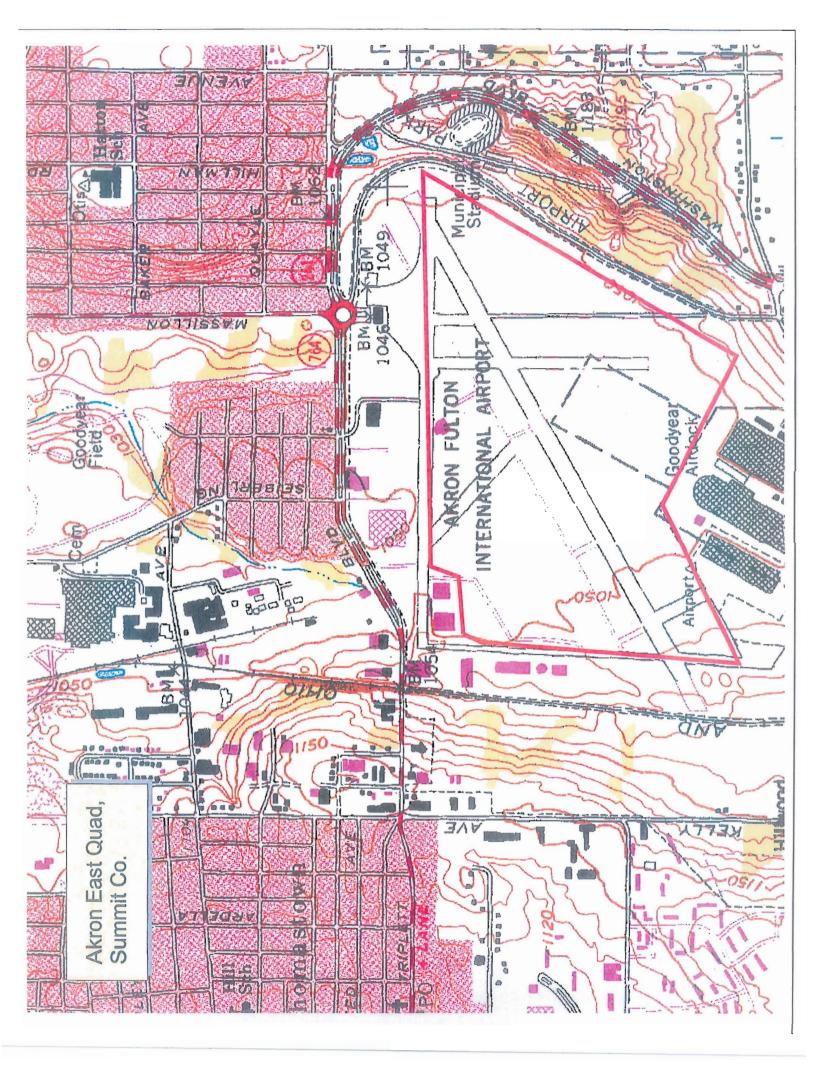

Please contact me at 614-265-6818 if I can be of further assistance.

Sincerely,

Debbie Woischke, Ecological Analyst

Natural Heritage Program

1. 0 INTRODUCTION AND SITE DESCRIPTION

EnviroScience, Inc. performed a Mist-net survey on July 26th and July 27th of 2008 for Arcadis at their Lockheed Martin Site in Summit County, Ohio (Appendix A: Map 1) in order to assess the presence of the endangered Indiana Bat (*Myotis sodalis*).

The site is located west of Landon Street, south of East Archwood Avenue, and north of Triplett Avenue, in the City of Akron, Ohio (Appendix A: Map 2). The Lockheed Martin site is approximately 8.5 acres in total size, with approximately 5 acres of second growth forest. The forested area is divided into two main sections. One is located in the northern portion of the site and the second at the southern end of the site (Appendix A: Map 3). These forested areas are connected by a narrow section of open field (Appendix C: Photos 1 and 2). The site is surrounded by commercial and residential land-use and is located just north of the Akron Fulton International Airport (Appendix A: Map 4). Haley's Ditch, a large open water channel, runs south to north through the central portion of the site (Appendix C: Photo 3). The wooded sections of the site that Haley's Ditch passes through contain thick understory woody and herbaceous vegetation much of which is lacking suitable corridors for sampling (Appendix C: Photo 4). No underground mines, mine shafts, or mine portals were noted on the site.

Two netting sites were selected under or adjacent to the closed canopy of the riparian corridor of Haley's Ditch and two net sets were placed at each site. The mist-net survey was performed by Mr. Merrill Tawse (USFWU Permit #TE157679-0) and assisted by Kristina Tawse and Jamie Willaman of EnviroScience.

2.0 SPECIES DESCRIPTION

The Indiana Bat is in the genus *Myotis* (Appendix B: Photo 1 & 2). Within the study range, two other bats from this genus are encountered, the Little Brown Bat (*Myotis lucifugus*), and the Northern Long-eared Bat (*Myotis septentrionalis*). Size, length, and habitat requirements are similar for these three species. Each of these three species could be encountered foraging in habitats like those found on the study site and each could be encountered roosting under exfoliating bark. At this time, accurate identification can only be made by capturing and direct examination of these bats.

The Indiana Bat is distinguishable from the other two *Myotis* species in that the Northern Long Eared Bat has a longer and more pointed tragus (Appendix B: Photo 5) in its ear pinna than the Indiana Bat or Little Brown Bat. The Little Brown Bat has some scattered, longer toe hairs that extend well beyond their claws, which the Indiana Bat lacks. The Indiana Bat has a "keeled calcar" (Appendix B: Photo 2) along the trailing edge of its interfemoral membrane, which the Little Brown Bat does not. The pelage color of the Indiana Bat is a dull grayish color instead of the bronze color of the other two bats (Appendix B: Photo 1). The Indiana Bat has pink lips, which are brown in the other two species (Appendix B: Photo 3 & 4).

EnviroScience Inc. 3781 Darrow Road Stow, OH 44224 (330)688-0111 Project # 34-2613

3.0 METHODS AND MATERIALS

The survey was conducted over two consecutive evenings, July 26th and 27th of 2008, by mist netting within the Lockheed Martin site. Two sites were selected and two canopy nets were stretched at each, so that they extended laterally beyond the corridor sides. The nets also extended above the closed upper canopy of the riparian corridor. Each net set was comprised of two canopy nets. The nets used were very fine black mist nets (36 mesh, 2 ply, 50 denier, 4 shelf, 12 meter long and 2.6 meter high nets from AFO Banding Supplies of Manomet MA) stacked horizontally to a height of approximately 5.2 meters and a length of 12 meters. The nets were stretched between telescoping metal poles equipped with pulley systems to facilitate raising and lowering. Each mist-net system was positioned across a potential bat corridor (flyway) in areas with a closed canopy and lateral borders approximating the net's length (12 m). The location of each net site was noted using a Global Positioning System (GPS). The nets were surveyed at a minimum surveying period of five hours each night.

The two net sites were selected were closed canopy riparian corridors formed by Haley's Ditch. Net Site 1 was in the northeastern section of the site and Net Site 2 was at the extreme southern section. The mid-section of the site is open field and was not suitable for netting. The extreme north and western portions of the site consisted of open wetland, sparsely surrounded by larger trees including a few dead cottonwoods; but no closed canopy corridors for netting. Net Site 1 was located just down the riparian corridor from these trees.

At Net Site 1, (Appendix A: Map 4), both nets were placed so that they traversed Haley's Ditch in the northeastern section of the site. This section of the channel was forested with secondary growth consisting of larger Cottonwoods (*Populus deltoides*) and various other young successional trees such as Boxelder, and Maples (Appendix C: Photo 5). Both nets completely spanned the stream corridor. Immediately east of this net site location is a parking lot.

Net Site 2 was located just north of Triplet Blvd, adjacent to a restricted concrete walkway that crosses Haley's Ditch (Appendix C: Photo 6). At this site, there was only one area with an open corridor over Haley's Ditch, where one of the nets was placed. The second net was placed in a mature wooded canopy opening with mowed grass, east of the ditch (Appendix C: Photo 7).

Nets were spread each evening at dusk (8:30pm) and lowered after over five hours of netting. Nets were checked every 20 minutes for the presence of captured individuals. At the end of the survey, all materials (nets and poles) were removed from the site.

5.0 DISCUSSION

Nets were opened at 8:30 PM on day one of the survey, July 26th 2008. The conditions at that time indicated that the evening would be acceptable for the conditions required by the US Fish and Wildlife Services (USFWS), with a starting temperature of 80° F (Table 2) and a final temperature of 68° F. A small amount of rain passed through the area in the late afternoon and skies remained cloudy until approximately midnight. After midnight, the skies were partly clear. There was no wind during the sampling period. Sampling on July 26 did not result in any captures, visual or acoustic detection of bats at the survey site.

On the second night of the survey, July 27th 2008, the nets were opened at 8:30 PM at a starting temperature of 78° F (Table 3). The conditions were partly overcast, with low

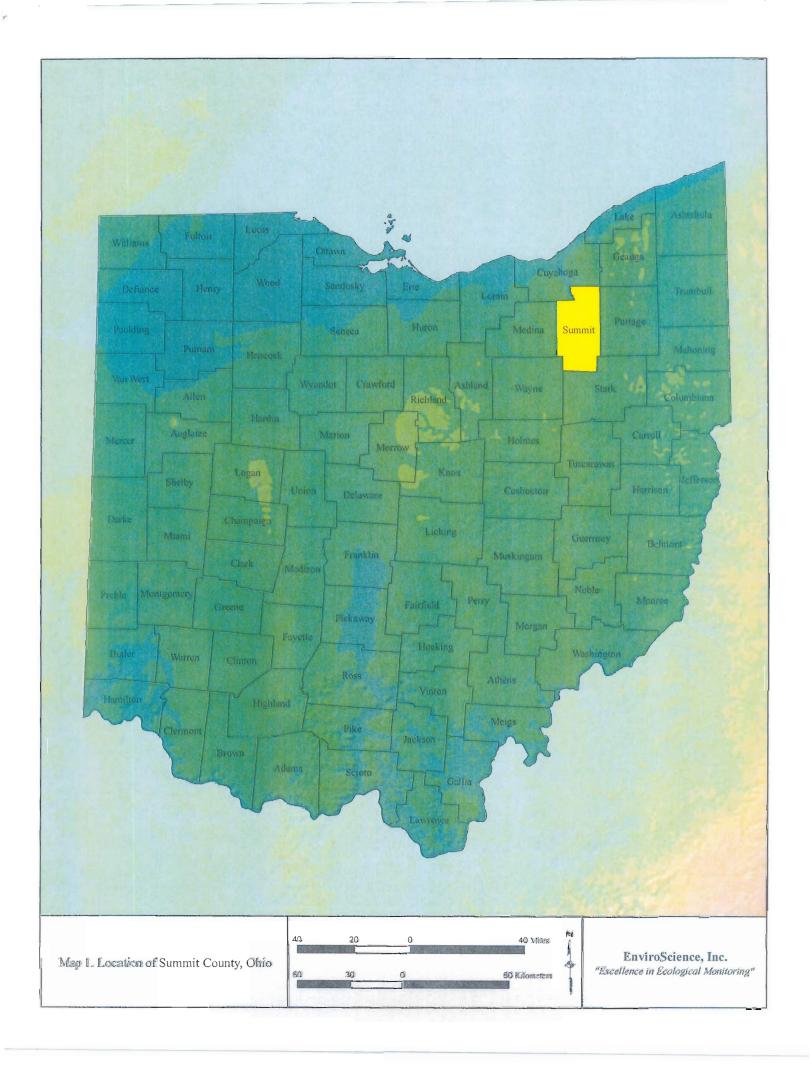

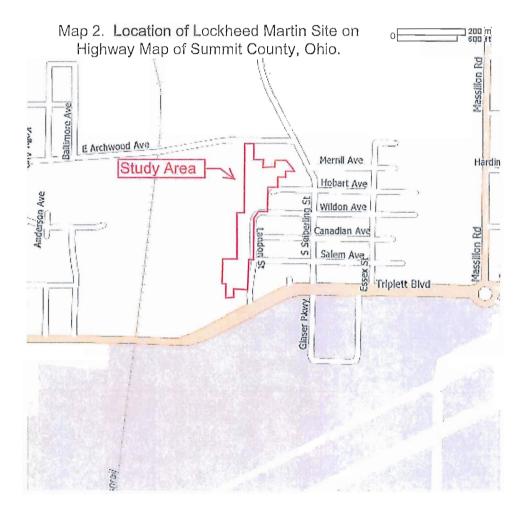

humidity and no wind. Over the five-hour survey the temperature decreased to a final reading of 67° F. All weather conditions and time intervals were in compliance with USFWS standards.

The sampling effort in this highly disturbed site resulted in only one bat capture, a Big Brown Bat (Table 4). In addition, the bat observed flying in the vicinity of Net Site 2 at dusk was visually larger than a *Myotis*. No Indiana bats were captured in this survey.
