Subject: Submittal of the *Semiannual Groundwater Monitoring Report, Third Quarter and Fourth Quarter 2010, Potrero Canyon Unit (Lockheed Martin Beaumont Site 1), Beaumont, California*

Dear Mr. Zogaib:

Please find enclosed one hard copy of the body of the report and two compact disks with the report body and appendices of the *Semiannual Groundwater Monitoring Report, Third Quarter and Fourth Quarter 2010, Potrero Canyon Unit (Lockheed Martin Beaumont Site 1), Beaumont, California* for your review and approval or comment.

In the meantime, if you have any questions regarding this submittal, please contact me at 408.756.9595 or denise.kato@lmco.com.

Sincerely,

Denise Kato, Project Lead

Enclosure: *Semiannual Groundwater Monitoring Report, Third Quarter and Fourth Quarter 2010, Potrero Canyon Unit (Lockheed Martin Beaumont Site 1), Beaumont, California*

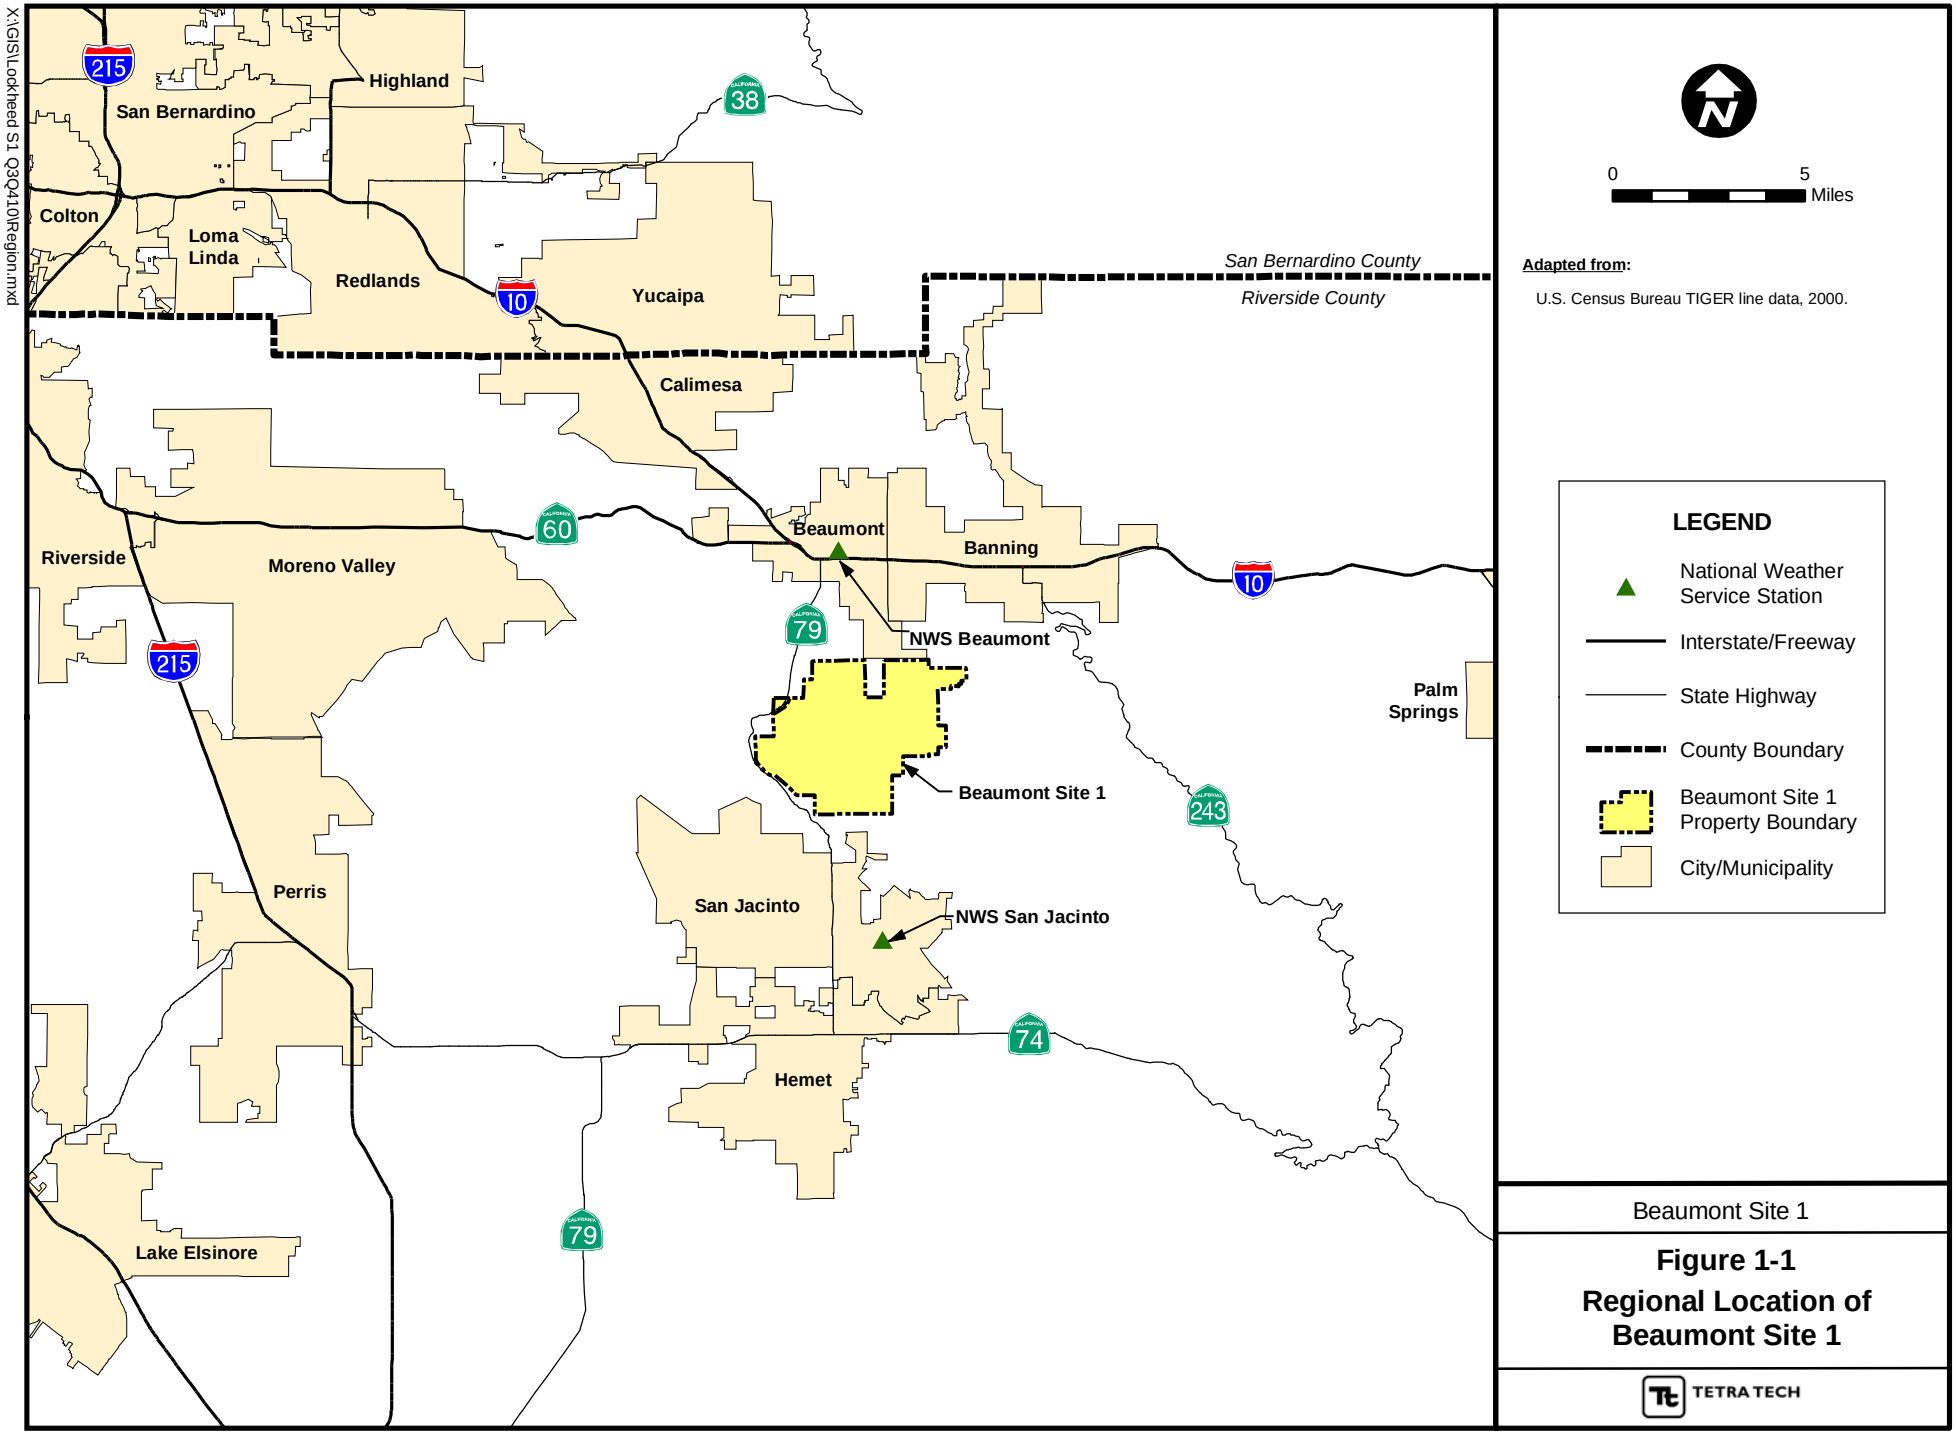
SECTION 1 INTRODUCTION



This Semiannual Groundwater Monitoring Report (Report) has been prepared by Tetra Tech, Inc. (Tetra Tech), on behalf of Lockheed Martin Corporation (LMC), and presents the results of the Third Quarter 2010 and Fourth Quarter 2010 water quality monitoring activities of the Potrero Canyon Unit (Lockheed Martin Beaumont Site 1) (Site) Groundwater Monitoring Program (GMP). The Site is located south of the City of Beaumont, Riverside County, California (Figure 1-1). Currently, the Site is inactive with the exception of remedial activities performed under Consent Order 88/89-034 and Operation and Maintenance Agreement 93/94-025 with the Department of Toxic Substances Control. The State of California owns the 9,117 acre site which includes a 565 acre conservation easement maintained by LMC (Figure 1-2).

The GMP includes quarterly, semiannual, annual, and biennial monitoring tasks with both groundwater and surface water collected and sampled as shown in Appendix A, Table 1-1. The annual and biennial events are larger major monitoring events, and the quarterly and semiannual events are smaller minor events. All new wells are sampled quarterly for one year. The semiannual wells are sampled second and fourth quarter of each year, annual wells are sampled the second quarter of each year, and the biennial wells are sampled during the second quarter of even numbered years.

The objectives of this Report are to:

- Briefly summarize the site history;
- Document water level and water quality monitoring procedures and results; and
- Analyze and evaluate the groundwater elevation and water quality monitoring data generated.

This Report is organized into the following sections: 1) Introduction, 2) Summary of Monitoring Activities, 3) Groundwater Monitoring Results, 4) Summary and Conclusions, and 5) References. A brief description of the previous site environmental investigations and the current conceptual site model (CSM) can be found in Appendix A.

Beaumont Site 1

Figure 1-2
Historical Operational Areas, Site Features, and Conservation Easement

TETRA TECH

1.1 SITE BACKGROUND

The Site is a 9,117 acre parcel located south of Beaumont, California. The Site was primarily used for ranching prior to 1960. From 1960 to 1974, the Site was used by Lockheed Propulsion Company (LPC) for solid rocket motor and ballistics testing (Tetra Tech, 2003a). Activities at the Site also included burning of process chemicals and waste rocket propellants in an area commonly referred to as the burn pit area (BPA).

Nine primary historical operational areas have been identified at the Site. A site historical operational areas and features map is presented as Figure 1-2. Historical operational areas were used for various activities associated with rocket motor assembly, testing, and propellant incineration. A brief description of each historical operational area follows:

Historical Operational Area A – Eastern Aerojet Range

Between 1970 and 1972, Aerojet leased an area (referred to as the Eastern Aerojet Range) along the eastern portion of the Site. The Eastern Aerojet Range was used periodically for ballistics research and development experimentation on several types of 30-millimeter projectiles. Avanti, a highly classified project, utilized the land directly east of the Eastern Aerojet Range, including several U-shaped revetments for the storage of explosive materials and rocket motors. Due to its classified status, the purpose of the Avanti project and its operational procedures are unknown (Radian, 1986).

Historical Operational Area B – Rocket Motor Production Area

The Rocket Motor Production Area (RMPA), also known as the Propellant Mixing Area, was used for the processing and mixing of rocket motor solid propellants. The rocket motor production process consisted of: 1) a fuel slurry station, 2) a mixing station, and 3) a cast and curing station.

If a defect was found in the solid propellant mix, the rocket motor was scrapped. The solid propellant was removed from the casings by water jetting at the motor washout located south of the mixing station (Radian, 1986).

In 1973, an area east of the mixing station, known as the Blue Motor Burn Pit, was utilized for the destruction of four motors, which included a motor with "Malloy blue" solid propellant, also referred to as milori blue or Prussian blue (Radian, 1986).

Historical Operational Area C – Burn Pit Area

The BPA consisted of three primary features: 1) the chemical storage area, 2) burn pits, and 3) the beryllium test stand. Hazardous wastes generated at the Site were stored in 55-gallon drums on a concrete pad east of the burn pits at the chemical storage area until enough material was accumulated for a burning event. The hazardous materials burned in the pits included: ammonium perchlorate, wet propellant from motor washout, dry propellant, batches of out-of-specification propellant, various kinds of adhesives, resin curatives such as polybutadiene acrylonitrile/acrylic acid copolymer, burn rate modifiers such as ferrocene, pyrotechnic and ignition components, packaging materials (e.g., metal drums, plastic bags, and paper drums), and solvents (Radian, 1986).

On the south side of the bedrock outcrop where the burn pit instrumentation bunker was located, there was a one-time firing of small beryllium research motors.

Historical Operational Area D – LPC Ballistics Test Range

The LPC Ballistics Test Range facilities included gun mounts, a ballistic tunnel, and storage buildings and trailers. Guns were tested by firing through the tunnel toward a terraced hill. Live rounds were not used although projectiles were often specially shaped and weighted to simulate actual live rounds (Radian, 1986). Another major project conducted in this area was experimentation on a rocket-assisted projectile to test penetration capability. Additional experiments included impact testing of various motors and pieces of equipment (Radian, 1986).

Class A explosives were reportedly stored in two or three 10-foot by 10-foot buildings located behind a berm. A small canyon behind the hill to the south of the former storage buildings was reportedly used as a small test area for incendiary bombs. An incendiary bomb was detonated in the center of drums containing various types of fuel (e.g., jet fuel, gasoline, and diesel) set in circles of different radii to observe shrapnel and penetration patterns. (Alternatively, this test may have been conducted in Area I.) At a small area near the bend in the road, acetone was used to dissolve 2,4,6-trinitrotoluene (TNT) out of projectiles before they were fired (Radian, 1986).

Historical Operational Area E – Radioactive Waste Disposal Site

During 1971, low-level radioactive waste was buried in one of four canyons southeast of the LPC test services area as reported by former site employees. In 1990, the radioactive waste was located

and removed. The analytical results indicated that detected radiation levels were within the range of naturally occurring levels (Radian, 1990). Maps from the removal action report suggest the waste was removed from Canyon 2.

Historical Operational Area F – LPC Test Services Area

The LPC Test Services Area included the following features: 1) three bays for structural load tests, 2) a 13-foot-diameter spherical pressure vessel, 3) six temperature conditioning chambers, 4) four environmental chambers, 5) a 25-million electron volt (MeV) Betatron for X-raying large structures, 6) personnel and instrumentation protection bunkers, and 7) supporting workshops and storage areas (Radian, 1986).

If defects were identified during the integrity and environmental testing activities, the rocket motors were taken to a secondary washout area located south of the conditioning chambers adjacent to Potrero Creek (Radian, 1986).

Rocket motor structural load testing under static and captive firing conditions occurred at the LPC test bays. During several of the initial tests conducted at Bay 309, the readied motor exploded instead of firing (Radian, 1986).

Historical Operational Area G – Helicopter Weapons Test Area

The helicopter weapons test area was used to develop equipment for handling helicopter weapons systems. The facilities within this area included a hanger (Building 302), helicopter landing pad, stationary ground-mounted gun platforms, and a mobile target suspended between towers. The primary project at this test area was testing of both stationary guns and guns mounted on helicopters. Experimentation also was performed on the solid propellant portion of an armor-piercing round. The majority of rounds were fired into the side of the creek wash, about 100 yards to the south of the hanger. A longer impact area labeled with distance markers was located in the canyon to the south of the wash. Projectiles were steel only; warheads were not used during tests at this facility (Tetra Tech, 2003a).

Historical Operational Area H – Sanitary Landfill

A permitted sanitary landfill was located along the western side of the Site. The permit for the landfill authorized LPC to dispose of trash such as paper, scrap metal, concrete, and wood generated during routine daily operations. Lockheed policy strictly dictated that hazardous

materials were not to be disposed of at this landfill. The trenches were later covered and leveled, with only an occasional tire, metal scrap, or piece of wood remaining on the surface (Tetra Tech, 2003a).

Historical Operational Area I – Western Aerojet Range

Between 1970 and 1972, Aerojet leased an area (referred to as the Western Aerojet Range) along the western portion of the Site. LPC conducted an incendiary test with a 500-pound bomb at the southwest end of the Western Aerojet Range. This test was reportedly similar to testing performed at the LPC Ballistics Test Area. According to Radian's historical report, the Western Aerojet Range was originally leveled to be used as an airstrip (Radian, 1986). Based on employee interviews, the airstrip may have been used only on one occasion (Tetra Tech, 2003a). During Munitions and Explosives of Concern investigations performed in 2006, it was discovered that inert 27.5 millimeter projectiles were tested in this area.

Post LPC and Aerojet Facility Usage

LMC leased portions of the Site to several outside parties for use in various activities (Radian, 1986; Tetra Tech, 2003a). The International Union of Operating Engineers (IUOE) utilized the Site from 1971 through 1991 for surveying and heavy equipment training. The main office of the IUOE was formerly located within Bunker 304 of Historical Operational Area F (LPC Test Services Area). The IUOE earth-moving activities involved maintaining roads and reshaping various parts of the Site, primarily within Historical Operational Areas F and G.

On several occasions, General Dynamics utilized Historical Operational Area B (RMPA) for testing activities (Radian, 1986). In 1983 and 1984, General Dynamics conducted weapons testing of a Viper Bazooka and Phalanx Gatling gun.

Structural Composites used the steep terrain of the Site for vehicle rollover tests on a number of occasions. Structural Composites also conducted heat and puncture tests on pressurized fiberglass and plastic reinforced cylinders. The tests involved shooting a single 30-caliber round at the cylinders and recording the results (Radian, 1986).

SECTION 2 SUMMARY OF MONITORING ACTIVITIES

Section 2 summarizes the Third Quarter 2010 and Fourth Quarter 2010 groundwater monitoring events conducted at the Site. The results from these monitoring events are discussed in Section 3.

2.1 GROUNDWATER LEVEL MEASUREMENTS

Groundwater level measurements are collected at the Site on a quarterly basis from all available wells. Water level measurements for 172 wells were proposed for the Third Quarter 2010 monitoring event and 179 wells were proposed for the Fourth Quarter 2010 monitoring event. The Third Quarter 2010 groundwater level measurements were collected from 171 of the Site's wells between August 30 and September 2, 2010. One well was unable to be measured due to an obstruction in its casing. The Fourth Quarter 2010 groundwater level measurements were collected from 179 of the Site's wells between December 15 and December 20, 2010. The seven additional wells measured during Fourth Quarter 2010 were installed as part of the Site 1 Plant Uptake Study (Tetra Tech, 2010c). Copies of field data sheets from the water quality monitoring events are presented in Appendix B. A summary of well construction details is presented in Appendix C.

In order to correlate observed changes in groundwater levels with local precipitation, precipitation data is collected from the local weather station in Beaumont. Between June 2010 (Second Quarter 2010) and September 2010 (Third Quarter 2010), the Beaumont National Weather Service (NWS) station reported approximately 0.06 inches of precipitation. Between September 2010 (Third Quarter 2010) and December 2010 (Fourth Quarter 2010), the Beaumont NWS reported approximately 15.50 inches of precipitation.

2.2 SURFACE WATER FLOW

The Site is primarily drained by Potrero Creek, an ephemeral stream which follows the valley from north to south before turning southwest to pass through Massacre Canyon toward its convergence with the San Jacinto River. Potrero Creek is fed by local tributary drainage and storm water runoff from the city of Beaumont as well as other ephemeral streams in the southern and eastern portions of the Site. The largest of the tributary drainages is Bedsprings Creek, which is located southwest of the former RMPA and former BPA. In general, creeks are dry except during

and immediately after periods of rainfall. However, springs and seeps occur in and adjacent to Potrero Creek in the western portion of the Site. Surface water flow is not continuous through most of Potrero Valley. In Massacre Canyon, while perennial surface water flow is present, during dryer periods surface water flow becomes limited to two reaches, 50 to 100 feet in length, along the western portion of the Northern Potrero Creek Area (NPCA). In general, creeks are dry except during and immediately after periods of heavy rainfall. The areas within Potrero and Bedsprings Creek where surface water was present were mapped during the Third Quarter 2010 and Fourth Quarter 2010 groundwater monitoring events. The four previously identified fixed locations were checked for flowing water and, if present, the flow rate and volume were determined through field observation and measurements.

2.3 GROUNDWATER AND SURFACE WATER SAMPLING

The frequency of groundwater monitoring is dependent on the monitoring well's classification within the network and intended purpose. Groundwater is sampled as frequently as quarterly and surface water samples are collected semiannually. The Third Quarter 2010 monitoring event consisted of water level monitoring, the quarterly sampling of newly installed wells, and natural attenuation sampling of the Large Motor Washout Area (F-33) wells. The Fourth Quarter 2010 monitoring event consisted of water level monitoring; surface water sampling; the quarterly sampling of newly installed wells; and the semiannual sampling of increasing contaminant trend wells, guard wells, natural attenuation sampling of the Large Motor Washout Area (F-33) monitoring wells, and wells included in the focused data collection phase of the Site 1 contaminant attenuation study. Tables 2-1, 2-2, and 2-3 list the locations sampled during the Third Quarter 2010 and Fourth Quarter 2010 monitoring events, and the locations sampled for contaminant attenuation parameters, respectively. Contaminant attenuation parameters include: total organic carbon (TOC), dissolved organic carbon (DOC), total iron, ferrous iron, sulfide, sulfate, methane, ethane, ethane, hydrogen, and volatile fatty acids (VFAs). Additionally locations selected for the focused data collection phase were sampled for alkalinity, chlorate, chloride, dissolved manganese nitrate, and nitrite during the Fourth Quarter 2010 sampling event. Seven of the focused data study wells that had indications of perchlorate and/or solvent biodegradation had samples collected for quantitative polymerase chain reaction assay (qPCR) sampling for perchlorate reductase and Dehalococcoides spp. The tables summarize analytical methods, sampling dates, Quality Assurance/Quality Control (QA/QC) samples collected, and field notes.

Surface water samples are collected from 17 fixed locations. One designated alternate surface water location is sampled if flowing water is not encountered at the southern end of Massacre Canyon at Gilman Springs Road (Figure 2-1).

Because of the ephemeral nature of the streams on the Site, certain locations are generally sampled only during or shortly after periods of precipitation. Sampling, analytical, and QA/QC procedures for the monitoring events are described in the Beaumont Sites 1 and 2, Programmatic Sampling and Analysis Plan (Tetra Tech, Inc., 2010a).

Table 2-1 Sampling Schedule - Third Quarter 2010

Monitoring Well or Storm Water Location	Sample Date	VOCs (1)	1,4-Dioxane (2)	Perchlorate (3)	Contaminant Attenuation Parameters (4)	Comments and QA / QC Samples

2.3.1 Proposed and Actual Surface Water and Well Locations Sampled

A total of 10 monitoring wells, as shown in Figure 2-2, were proposed and sampled for the Third Quarter 2010 monitoring event.

For the Fourth Quarter 2010 monitoring event, a total of 37 sampling locations (17 surface water, 1 alternate surface water, and 19 monitoring wells) were proposed for water quality monitoring. Additionally, as part of the focused data collection phase of the Site 1 contaminant attenuation study, 25 monitoring wells were proposed for enhanced contaminant attenuation sampling. Seven of the 25 monitoring wells selected for the contaminant attenuation focused data collection were previously scheduled for sampling during the Fourth Quarter 2010 monitoring event. In addition to the already scheduled suite of site analytical parameters, these wells were sampled for the focused data collection contaminant attenuation parameters. The remaining 18 wells were sampled as part of the contaminant attenuation study for both the focused data collection contaminant attenuation parameters and the normal suite of site parameters.

Three proposed surface water sample locations, SW-04, SW-11, and SW-12, were not sampled because the locations were dry. SW-16 was sampled so SW-17, an alternate surface water location sampled when SW-16 is dry, was not sampled. Therefore, water quality data was collected from 14 surface water and 37 monitoring well locations during this event. Figure 2-3 presents groundwater and surface water locations sampled for the Fourth Quarter 2010 monitoring event.

2.3.2 Field Sampling Procedures

The following water quality field parameters were measured and recorded on field data sheets (Appendix B) during well purging activities: water level, temperature, pH, electrical conductivity (EC), turbidity, oxidation reduction potential (ORP), and dissolved oxygen (DO). Groundwater samples were collected from monitoring wells by low-flow purging and sampling through dedicated double-valve pumps, a portable bladder pump, or a peristaltic pump.

Collection of water quality parameters was initiated when at least one discharge hose / pump volume had been removed and purging was considered complete when the above parameters had stabilized, or the well was purged dry (evacuated). Stabilization of water quality parameters was used as an indication that representative formation water had entered the well and was being purged. The criteria for stabilization of these parameters are as follows: water level ± 0.1 foot, pH ± 0.1, EC ± 3 percent, turbidity < 10 nephelometric turbidity units (NTUs) (if > 10 NTUs ± 10%), DO ± 0.3 milligrams per liter (mg/L) and ORP ± 10 millivolts (mV). Sampling instruments and equipment were maintained, calibrated, and operated in accordance with the manufacturer's specifications, guidelines, and recommendations. If a well was purged dry, the well was sampled with a disposable bailer after sufficient recharge had taken place to allow sample collection.

Groundwater samples were collected in order of decreasing volatilization potential and placed in appropriate containers. A sample identification label was affixed to each sample container and sample custody was maintained by chain-of-custody record. Groundwater samples collected were chilled and transported to a state accredited analytical laboratory, via courier, thus maintaining proper temperatures and sample integrity. Lockheed trip blanks were collected for the monitoring events to assess cross-contamination potential of water samples while in transit. Lockheed equipment blanks were collected when sampling with non-dedicated equipment to assess cross-contamination potential of water samples via sampling equipment.

Surface water sampling locations were previously located using a global positioning satellite (GPS) system and marked in the field. Surface water samples were collected at previously GPS-mapped locations either using a disposable bailer with the sample transferred to the laboratory supplied water sample containers, or the water sample was collected directly in the laboratory supplied water sample containers. Temperature, pH, EC, turbidity, ORP, and DO were measured and recorded on field data sheets at surface water sampling locations.

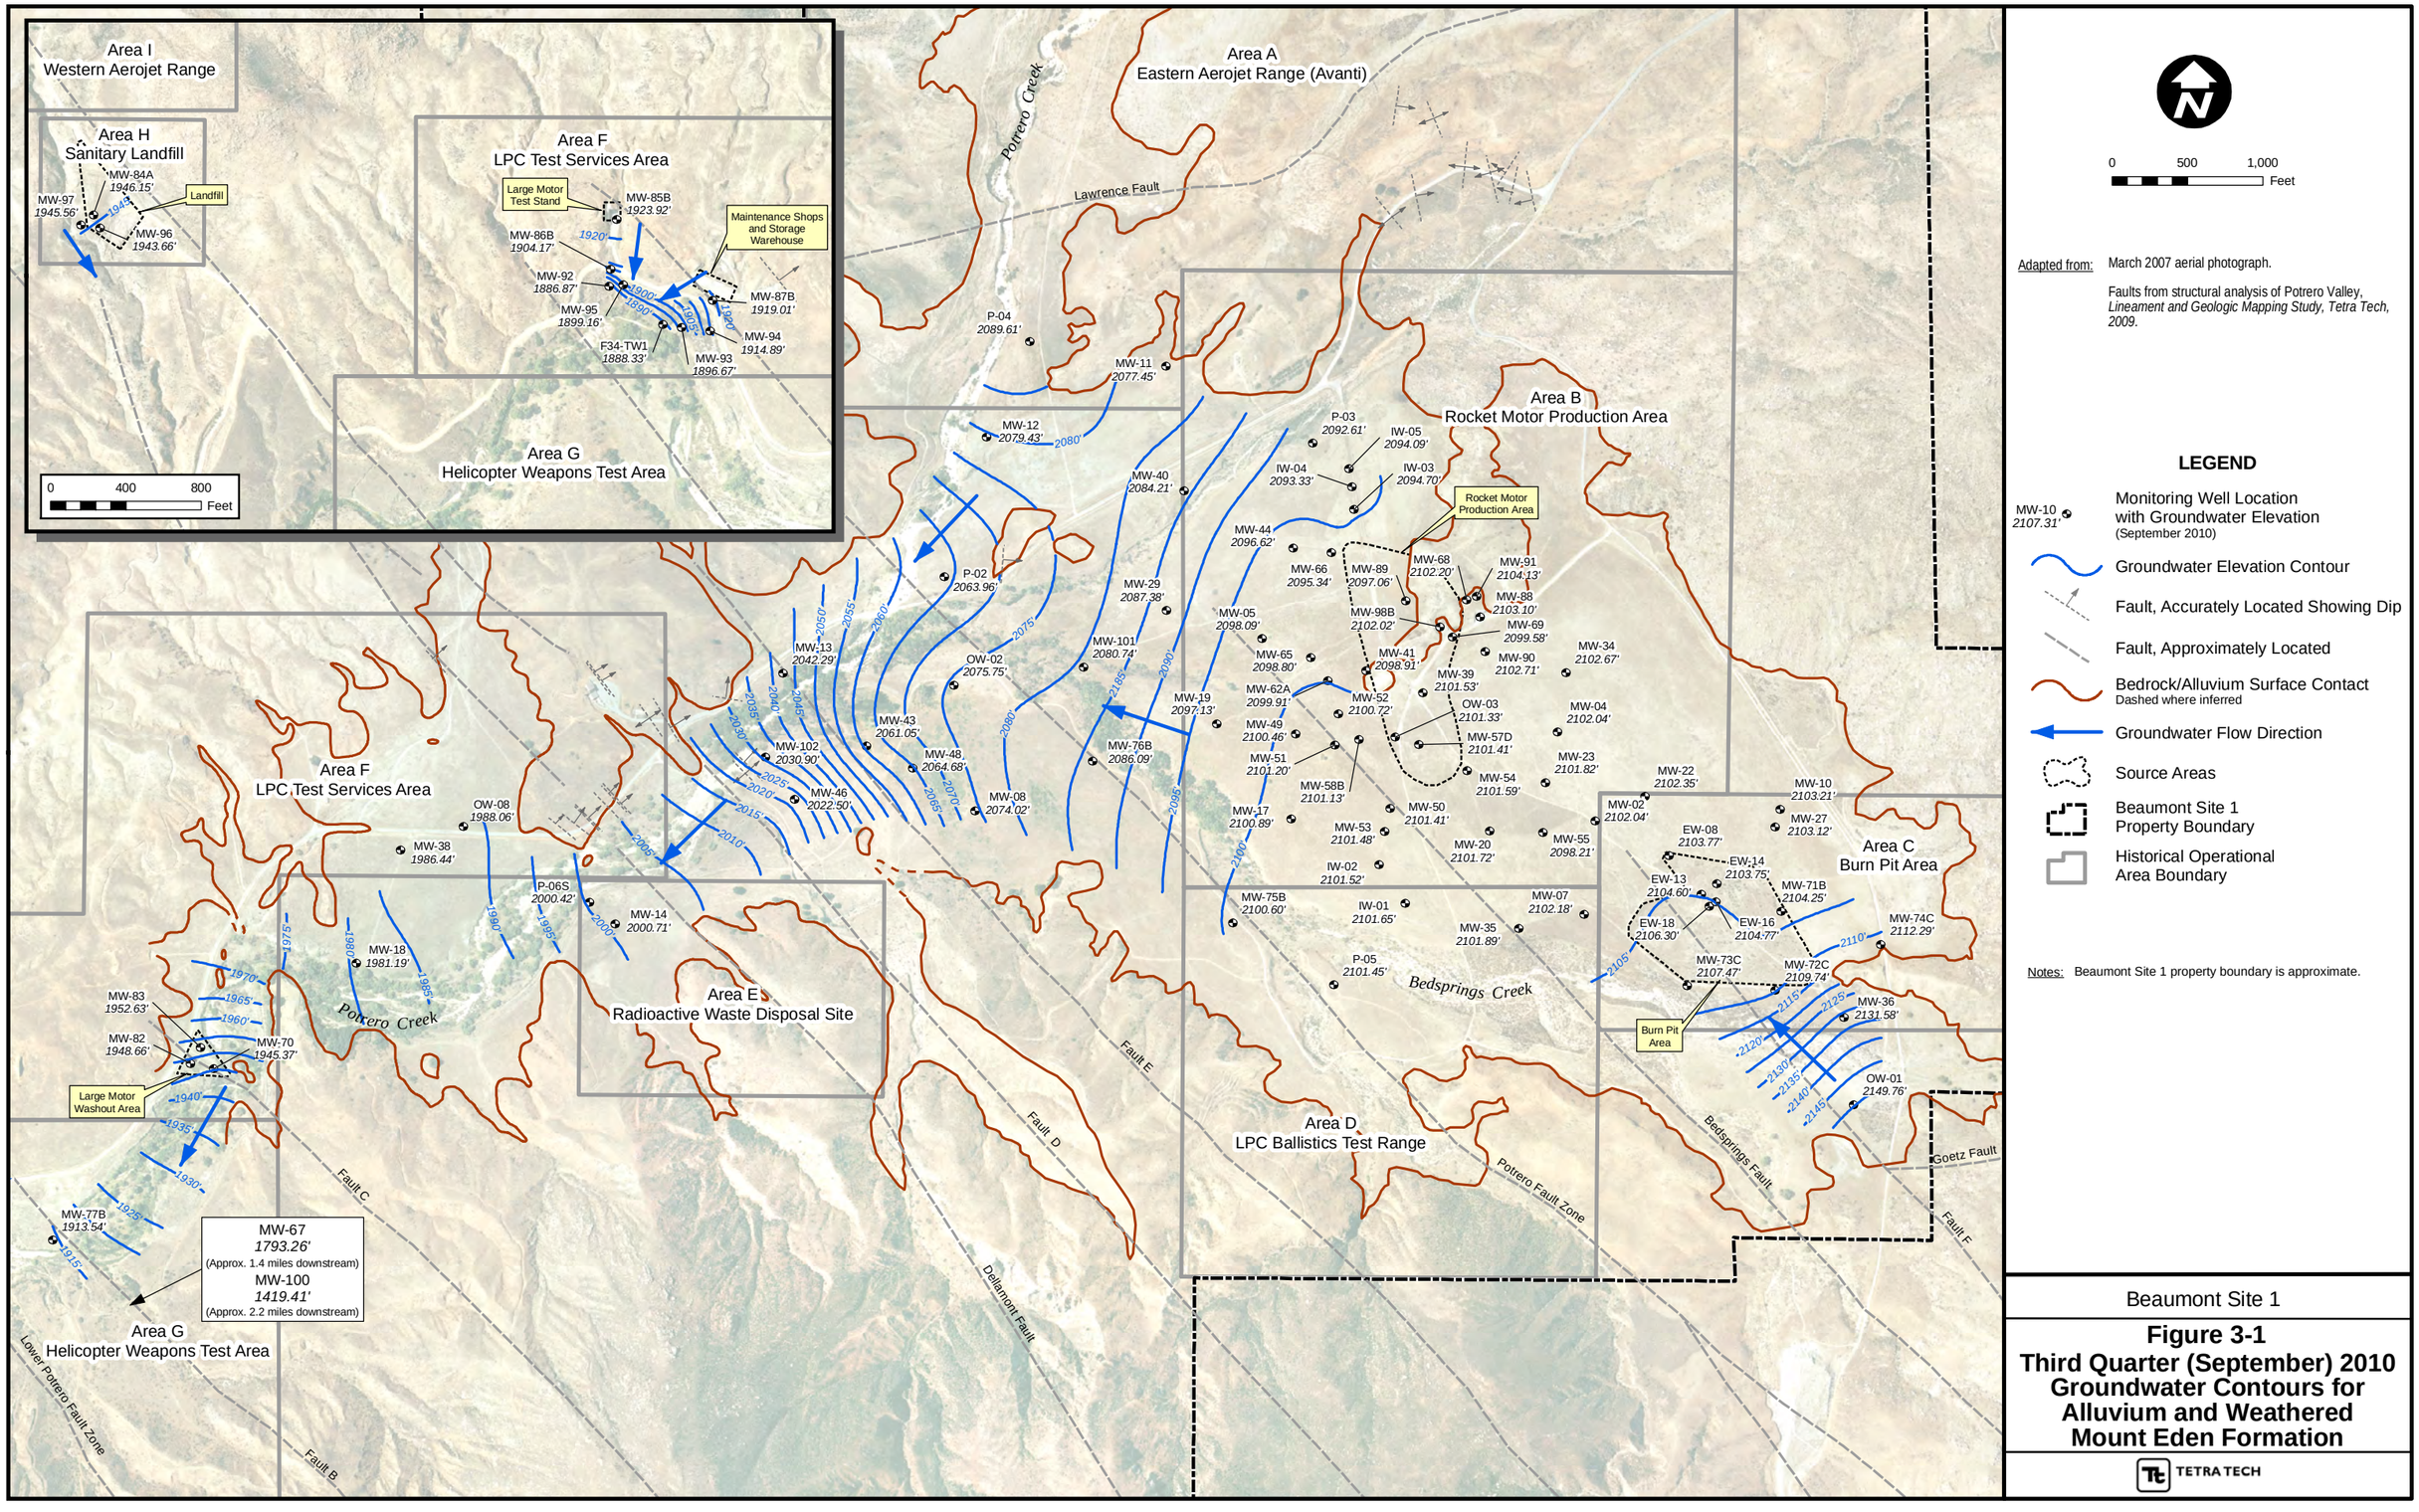
2.4 ANALYTICAL DATA QA/QC

The samples were tested using approved United States Environmental Protection Agency (EPA) methods. Since the analytical data was obtained by following EPA approved method criteria, the data was evaluated by using the EPA approved validation methods described in the National Functional Guidelines (EPA, 2008 and EPA, 2010). The National Functional Guidelines contain instructions on method-required quality control parameters and on how to interpret these parameters to confer validation to environmental data results.

Quality control parameters used in validating data results include: holding times, field blanks, laboratory control samples, method blanks, duplicate environmental samples, spiked samples, and surrogate and spike recovery data.

2.5 HABITAT CONSERVATION

All monitoring activities were performed in accordance with the U.S. Fish and Wildlife Service approved Habitat Conservation Plan (HCP) [USFWS, 2005] and subsequent clarifications (LMC, 2006a and 2006b) of the HCP. Groundwater sampling activities were conducted with light duty vehicles and were supervised by a United States Fish and Wildlife Service (USFWS) approved biologist as specified in the Low Effect HCP.



SECTION 3 GROUNDWATER MONITORING RESULTS

Section 3 presents the results and interpretations of the Third Quarter 2010 and Fourth Quarter 2010 groundwater monitoring events. The following subsections include tabulated summaries of groundwater elevation and water quality data, contour maps, and primary chemicals of potential concern (COPC) analyte results. Plots of groundwater elevation versus time (hydrographs) and concentration versus time (time series graphs) for primary and secondary COPC analytes are presented in Appendices D and E, respectively.

3.1 GROUNDWATER ELEVATION

Groundwater elevations during the Third Quarter 2010 and Fourth Quarter 2010 monitoring events ranged from approximately 2,149 feet mean sea level (msl) upgradient of the former BPA to approximately 1,794 feet msl in the Massacre Canyon Entrance Area (MCEA). A total of 172 monitoring wells were identified for groundwater level measurements for the Third Quarter 2010 monitoring event and a total of 179 monitoring wells were identified for groundwater level measurements for the Fourth Quarter 2010 monitoring event. For the Third Quarter 2010 monitoring event, four wells were dry (OW-05, OW-06, OW-07, and VRW-01), and measurements from one well could not be collected due to an obstruction in its casing (EW-02). EW-01 and EW-02 are former extraction wells with pumps and associated wiring and piping still in place. Whereas these down-hole items make water level measurements difficult, the wells may be needed for future site remediation and/or monitoring activities and therefore continue to be included in the monitoring well network. However, if water level measurements cannot be collected from either of these wells, several monitoring wells are located in close proximity to these former extraction wells which can be utilized for contouring and temporal trends in their absence. Water level elevations will continue to be monitored from these two former extraction wells and recorded when possible. For the Fourth Quarter 2010 monitoring event, five wells were dry (OW-05, OW-06, OW-07, P-06S, and VRW-01). Monitoring wells that have previously been identified as artesian wells are fitted with pressure caps to prevent groundwater flow onto the ground surface and pressure gauges for measurement of shut-in head for calculation of static water level. Groundwater elevations for the Third Quarter 2010 and Fourth Quarter 2010 monitoring events from wells screened in the alluvium and weathered Mount Eden formation are shown on Figures 3-1 and 3-2, respectively. A tabulated summary of groundwater elevations for all the wells measured during the Third Quarter 2010 and Fourth Quarter 2010 monitoring events are presented in Table 3-1. Hydrographs for individual wells and for well groups are presented in Appendix D.

Notes:

BPA - Burn Pit Area.
MCEA - Massacre Canyon Entrance Area.
NPCA - Northern Potrero Creek Area.
RMPA - Rocket Motor Production Area.
UG - Upgradient
DG - Downgradient
BTOC - Below top of casing.
msl - Mean sea level.
NA - Not available.
PSI - pounds per square inch
"-" Formation screened not defined.
QAL - Quaternary alluvium.
QAL/MEF - Quaternary alluvium / Mt Eden.
MEF - Mount Eden formation.

Table 3-1 Groundwater Elevation - Third Quarter 2010 and Fourth Quarter 2010 (continued)

Well ID	Site Area	Formation Screened	Measuring Point Elevation (feet msl)	September 2010 Groundwater Elevation Data				December 2010 Groundwater Elevation Data			
				Date Measured	Depth to Water (feet BTOC)	Groundwater Elevation (feet msl)	Groundwater Elevation Change from Second Quarter 2009	Date Measured	Depth to Water (feet BTOC)	Groundwater Elevation (feet msl)	Groundwater Elevation Change from Third Quarter 2010

Notes:

BPA - Burn Pit Area.
MCEA - Massacre Canyon Entrance Area.
NPCA - Northern Potrero Creek Area.
RMPA - Rocket Motor Production Area.
UG - Upgradient
DG - Downgradient
BTOC - Below top of casing.
msl - Mean sea level.
NA - Not available.
PSI - pounds per square inch
"-" Formation screened not defined.
QAL - Quaternary alluvium.
QAL/MEF - Quaternary alluvium / Mt Eden.
MEF - Mount Eden formation.

Between June 2010 (Second Quarter 2010) and September 2010 (Third Quarter 2010), the Beaumont NWS reported approximately 0.06 inches of precipitation, and the average site-wide groundwater elevation decreased approximately 1.50 feet. Between September 2010 (Third Quarter 2010) and December 2010 (Fourth Quarter 2010), the Beaumont NWS reported approximately 15.50 inches of precipitation and the average site-wide groundwater elevation decreased approximately 0.92 feet. Generally the groundwater elevations in Site wells show a one-season lag before responding to seasonal precipitation. Table 3-2 presents the range and average change in groundwater elevation by area. Figures 3-3 and 3-4 present elevation differences between the Second Quarter 2010 and Third Quarter 2010, and between the Third Quarter 2010 and Fourth Quarter 2010 groundwater monitoring events respectively.

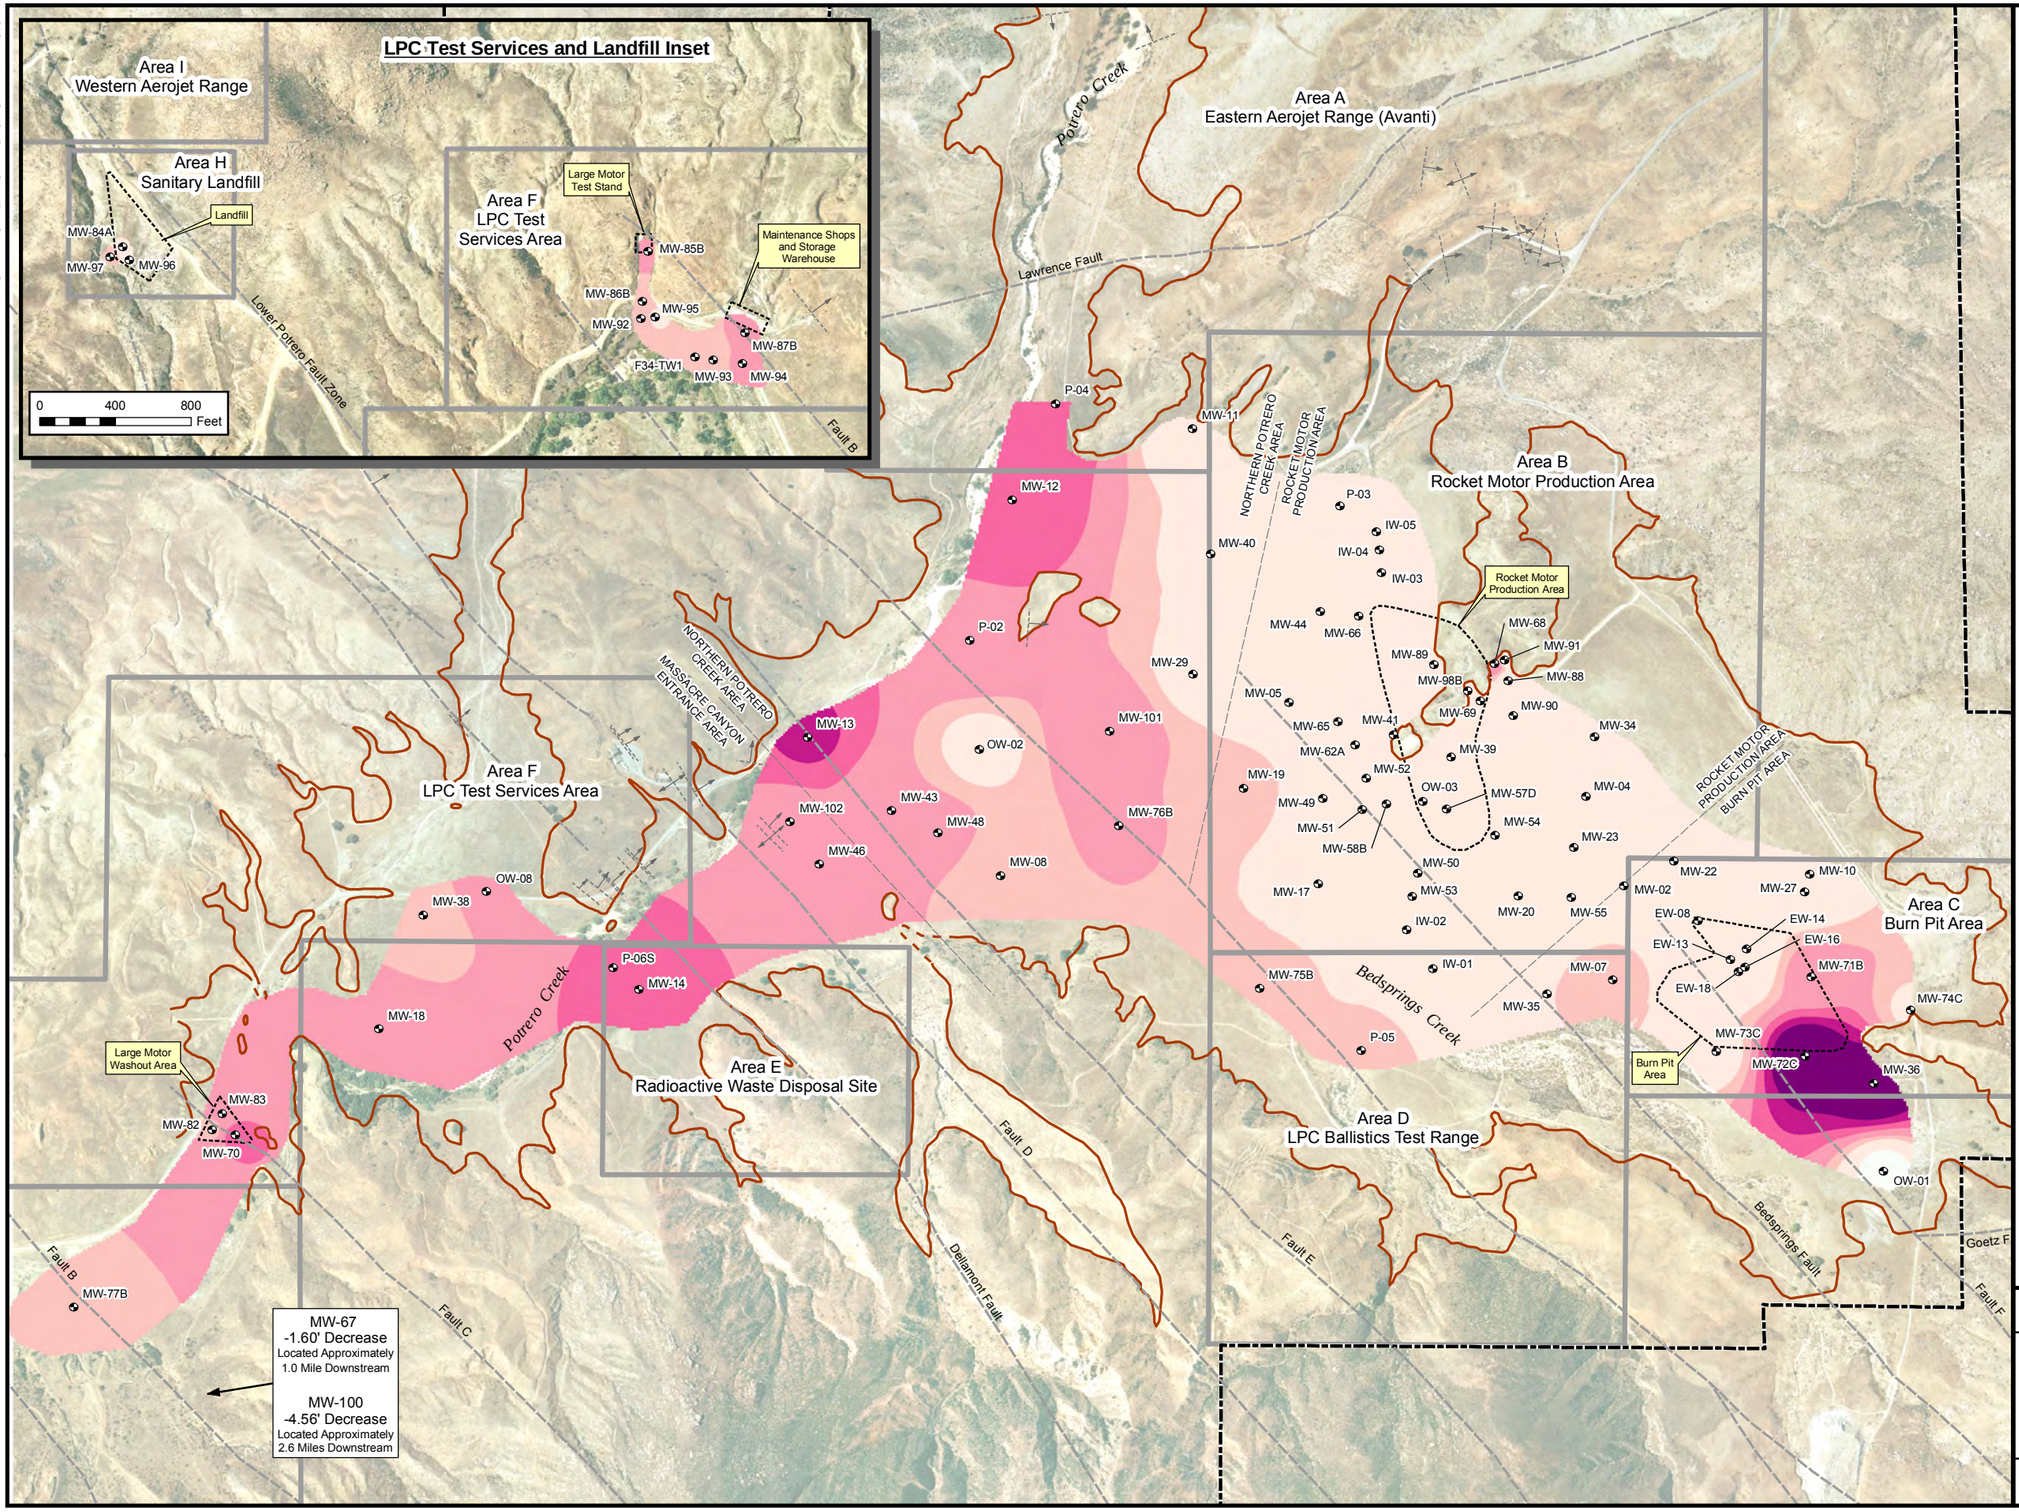

Table 3-2 Groundwater Elevation Change - Third Quarter 2010 and Fourth Quarter 2010

Site Area	Range of Groundwater Elevation Change - Third Quarter 2010		Average Change By Area	Range of Groundwater Elevation Change - Fourth Quarter 2010		Average Change By Area
BPA	-10.29	0.34	-1.56	-5.78	0.76	-1.20
MCEA	-4.73	-0.41	-2.20	-3.55	1.48	-0.94
NPCA	-6.25	-0.26	-1.93	-1.46	0.98	-0.10
RMPA	-4.31	0.41	-0.77	-5.33	2.35	-1.06

Notes:
BPA - Burn Pit Area.
MCEA - Massacre Canyon Entrance Area.
NPCA - Northern Potrero Creek Area.
RMPA - Rocket Motor Production Area.

Groundwater elevations and seasonal responses to changes in recharge for select shallow and deeper wells are shown on Figures 3-5 through 3-7. The selected wells represent a groundwater flow path from upgradient of the former BPA, through the former BPA, through the former RMPA, and southwestward (downgradient) through the NPCA and MCEA. Groundwater elevations in shallow wells (alluvium and shallow MEF) upgradient of the BPA and at the BPA show a rapid and significant response to rainfall, with a more dampened response observed further out in the valley through the RMPA, NPCA, and MCEA (Figures 3-5 and 3-7). The deeper MEF and bedrock wells show a response very similar to the shallow wells during the periods of increased precipitation (Figure 3-6).

3.2 SURFACE WATER FLOW

During Third Quarter 2010 and Fourth Quarter 2010, the Potrero and Bedsprings creek riparian corridors were walked to determine the presence, nature, and quantity of surface water within the creek beds. The locations where surface water was encountered were plotted and a determination was made whether the water was flowing or stagnant. Where flowing water was encountered, the flow rate was determined using a modified version of the EPA Volunteer Stream Monitoring: Methods Manual (USEPA 1997).

Four fixed stream locations, SF-1 through SF-4, were previously chosen for stream flow measurements. SF-1 is located near Gilman Hot Springs at the southeast border of the Site, SF-2 is located in the vicinity of MW-67, SF-3 is located in the vicinity of MW-15 and MW-18, and SF-4 is located near MW-101.

At each location a section of stream that is relatively straight for at least 20 feet was chosen for measurement. This 20-foot section was marked and width measurements were taken at various points to determine the average width. Depth measurements were collected at five points along the width of the stream to determine the average depth of the stream. The average width and depth measurements were multiplied together to obtain an average cross sectional area. Velocity was measured by releasing a float upgradient and recording the time it took to float through the 20-foot marked section.

Three velocity measurements were taken and averaged. The length of the measured section was divided by the average velocity and the answer was multiplied by a correction factor of 0.9 to correct for friction between the water and stream bed. The average cross sectional area was then multiplied by the corrected average surface velocity to obtain the average cubic feet per second (cfs) for water flowing through that section of the stream.

A summary of the surface water flow rates is presented in Table 3-3, and the measurement locations and the locations where surface water was encountered are shown on Figures 3-8 and 3-9.

Table 3-3 Surface Water Flow Rates

Location ID	Description of Location	Date Measured	Length of Measured Section (ft)	Width of Measured Section (ft)	Depth of Measured Section (ft)	Float Travel Time (seconds)	Cross-Sectional Area (ft2)	Surface Velocity (ft /sec)	Stream Flow Rate (cfs)	Site Stream Flow Rate (cfs)
Third Quarter (September) 2010										
SF-1	Near Gilman Hot Springs Road	09/03/10	Dry	Dry	Dry	Dry	Dry	Dry	Dry	0.40
SF-2	Near MW-67	09/03/10	Dry	Dry	Dry	Dry	Dry	Dry	Dry	
SF-3	Near MW-15 and 18	09/03/10	20	3.58	0.10	16.21	0.36	1.11	0.40	
SF-4	Near MW-42	09/03/10	Dry	Dry	Dry	Dry	Dry	Dry	Dry	
Fourth Quarter (December) 2010										
SF-1	Near Gilman Hot Springs Road	12/28/10	20	10.10	0.15	8.51	1.48	2.12	3.13	1.70
SF-2	Near MW-67	12/28/10	20	5.71	0.13	6.26	0.72	2.88	2.06	
SF-3	Near MW-15 and 18	12/28/10	20	15.90	0.07	12.14	1.08	1.48	1.60	
SF-4	Near MW-42	12/28/10	20	0.98	0.02	22.17	0.02	0.81	0.01	

Notes: Measurements are averaged. NA - insufficient flow for measurement
cfs - cubic feet per second

3.3 GROUNDWATER FLOW

Groundwater flow directions from Third Quarter 2010 and Fourth Quarter 2010 (Figures 3-1 and 3-2 respectively) were similar to previously observed patterns for a dry period (Appendix A, Figure 2-14). Generally, groundwater flowed northwest from the southeastern limits of the valley (near the former BPA) beneath the former RMPA, towards Potrero Creek where groundwater flow then changes direction and begins heading southwest, parallel to the flow of Potrero Creek, into Massacre Canyon.

3.3.1 Horizontal and Vertical Groundwater Gradients

Horizontal groundwater gradients are calculated using a segmented path from well to well that approximates the overall site flowline. The horizontal gradient is a measure of the change in the hydraulic head over a change in distance between wells (the slope of the water table). The overall horizontal groundwater gradient (approximating a flowline from MW-36, upgradient of the BPA, through the RMPA and NPCA to MW-18, in the MCEA) decreased to 0.013 ft/ft between Third Quarter 2010 and Fourth Quarter 2010.

Vertical groundwater gradients are calculated from individual clusters of wells. Well clusters are used to measure the difference in static water level at different depths within the aquifer. The vertical gradient is a comparison of static water level between wells at different depths within the aquifer and is an indication of the vertical flow (downward - negative gradient; upward - positive gradient), of groundwater. The vertical groundwater gradients at the Site are generally negative in the BPA, negative in the RMPA, negative in the NPCA, and positive in the MCEA.

A summary of horizontal and vertical groundwater gradients is presented in Table 3-4. A complete listing of historical horizontal and vertical groundwater gradients and associated calculations is presented in Appendix F.

Table 3-4 Summary of Horizontal and Vertical Groundwater Gradient

Horizontal Groundwater Gradients (feet / foot), approximating a flowline from MW-36 to MW-18 and subsections

Notes:

BPA - Burn Pit Area.
RMPA - Rocket Motor Production Area
NPCA - Northern Potrero Creek Area.
MCEA - Massacre Canyon Entrance Area.
QAL - Quaternary alluvium.
MEF - Mount Eden formation.

3.4 ANALYTICAL DATA SUMMARY

Summaries of validated laboratory analytical results for organic (VOCs, 1,4-dioxane) and inorganic (perchlorate, natural attenuation and general minerals parameters) analytes detected above their respective method detection limits (MDLs) from the Third Quarter 2010 and Fourth Quarter 2010 water quality monitoring events are presented in Tables 3-5, 3-6, and 3-7, respectively. A complete list of analytes tested, along with validated sample results by analytical method, are provided in Appendix G.

Sample results detected above the published California Department of Public Health maximum contaminant level (MCL) or the California Department of Public Health drinking water notification level (DWNL) are bolded in Tables 3-5, 3-6, and 3-7. Laboratory analytical data packages, which include environmental, field QC, and laboratory QC results, are provided in Appendix H, and consolidated analytical data summary tables are presented in Appendix I. Tables 3-8 and 3-9 present summary statistics of the organic and inorganic analytes detected during the Third Quarter 2010 and Fourth Quarter 2010 monitoring events, respectively.

Notes: Only analytes positively detected are presented in this table. For a complete list, refer to the laboratory data package.

µg/L - micrograms per liter.

MDL - Method detection limit.

DWNL - California Department of Public Health drinking water notification level.

MCL - California Department of Public Health Maximum Contaminant Level

(1) - DWNL

"-" - MCL or DWNL not available.

Bold - MCL or DWNL exceeded.

<# - Analyte not detected, method detection limit concentration is shown.

J - The analyte was positively identified, but the analyte concentration is an estimated value.

q - The analyte detection was below the Practical Quantitation Limit (PQL).

Notes: Only analytes positively detected are presented in this table. For a complete list, refer to the laboratory data package.

µg/L - micrograms per liter.

MDL - Method detection limit

DWNL - California Department of Public Health drinking water notification level.

MCL - California Department of Public Health Maximum Contaminant Level

(1) DWNL

"-" - MCL or DWNL not available.

Bold - MCL or DWNL exceeded.

<# - Analyte not detected, method detection limit concentration is shown.

B - The result is < 5 times the blank contamination. Cross contamination is suspected and the data are considered unusable

J - The analyte was positively identified, but the analyte concentration is an estimated value.

a - The analyte was found in the method blank.

e - A holding time violation occurred.

k - The analyte was found in a field blank.

q - The analyte detection was below the Practical Quantitation Limit (PQL).

Table 3-6 Summary of Validated Detected Organic Analytes - Fourth Quarter 2010 (continued)

Notes: Only analytes positively detected are presented in this table. For a complete list, refer to the laboratory data package.

µg/L - micrograms per liter.

MDL - Method detection limit

DWNL - California Department of Public Health drinking water notification level.

MCL - California Department of Public Health Maximum Contaminant Level

(1)- DWNL

"-" - MCL or DWNL not available.

Bold - MCL or DWNL exceeded.

<# - Analyte not detected, method detection limit concentration is shown.

B - The result is < 5 times the blank contamination. Cross contamination is suspected and the data is considered unusable

J - The analyte was positively identified, but the analyte concentration is an estimated value.

a - The analyte was found in the method blank.

e - A holding time violation occurred.

k - The analyte was found in a field blank.

q - The analyte detection was below the Practical Quantitation Limit (PQL).

Notes: Only analytes positively detected are presented in this table. For a complete list, refer to the laboratory data package.

Sulfide and ferrous iron sample analysis was performed in the field using a Hach DR 850 colorimeter.

MDL - Method detection limit

MCL - California Department of Public Health Services Maximum Contaminant Level

DWNL - California Department of Public Health Services drinking water notification level.

"-" - MCL or DWNL not available.

(1) DWNL

µg/L - micrograms per liter.

mg/L - milligrams per liter

Bold - MCL or DWNL exceeded.

NA - not analyzed

<# - Analyte not detected, method detection limit concentration is shown.

B - The result is < 5 times the blank contamination. Cross contamination is suspected and the data is considered unusable

J - The analyte was positively identified, but the analyte concentration is an estimated value.

a - The analyte was found in the method blank.

k - The analyte was found in a field blank.

q - The analyte detection was below the Practical Quantitation Limit (PQL).

3.4.1 Data Quality Review

The quality control samples were reviewed as described in the Beaumont Sites 1 and 2, Programmatic Sampling and Analysis Plan (Tetra Tech, Inc., 2010a). The data for the groundwater sampling activities was contained in analytical data packages generated by E.S. Babcock and Sons Laboratories Inc, Microbial Insights Inc, and Microseeps Laboratories Inc. These data packages were reviewed using the latest versions of the National Functional Guidelines for Organic and Inorganic Data Review documents from the EPA (EPA, 2008 and EPA, 2010).

Preservation criteria, holding times, field blanks, laboratory control samples (LCS), method blanks, duplicate environmental samples, spiked samples, and surrogate and spike recovery data were reviewed. Within each environmental sample the sample-specific quality control spike recoveries were examined. These data examinations included comparing statistically calculated control limits to percent recoveries of all spiked analytes and duplicate spiked analytes. Relative percent difference (RPD) control limits are compared to actual spiked (MS / MSD) RPD results. Surrogate recoveries were examined for all organic compound analyses and compared to their control limits.

Environmental samples were analyzed by the following methods: Method SM2320 for alkalinity, Method AM23G for volatile fatty acids, Method AM20GAX for hydrogen, Method E300.0 for nitrate, sulfate, and chloride, Method SM4500B for nitrite, Method E332.0 for perchlorate, Method A5310 for total organic carbon, Method RSK-175 for methane, ethane, ethene, Method SW8270C SIM for 1,4-dioxane, Methods SW6010B and E200.7 for total iron and dissolved manganese, respectively, and Method SW8260B for VOCs.

Analyses for dechlorinating bacteria Dehalococcoides spp and perchlorate reductase were performed by Microbial Insights Inc. These analyses do not have standard QC samples as provided by the EPA in SW-846. These microbiology results are expressed in cells per milliliter units.

Unless otherwise noted below, all data results met required criteria, are of known precision and accuracy, did not require qualification, and may be used as reported.

Method SW8270C SIM for 1,4-dioxane had holding time errors causing 5.3 percent (4 of 76 samples) to be qualified as estimated. The samples were analyzed one day past holding time which

would have little or no impact on the data quality. The data qualified as estimated is usable for the intended purpose.

The holding time errors for Method SW8270C SIM (1,4-dioxane) were due to instrument failure that caused the instrument to be unavailable for two days. In order to achieve the low level analysis for 1,4-dioxane a dedicated instrument is utilized. This prevented the laboratory from analyzing the samples on a different instrument. Method SM5310B for dissolved organic carbon had field blank contamination that caused 13.6 percent (9 of 66 samples) to be qualified for blank contamination. The blank qualified results should be considered not detected at elevated detection levels.

Method SW8260B for VOCs had trip blank contamination for methylene chloride that caused 1.3 percent of the data to be qualified for blank contamination. The blank qualified results should be considered not detected at elevated detection levels.

Methods SW6010B and E200.7 for total iron and dissolved manganese, respectively, had field blank contamination that caused 6.5 percent (4 of 62 samples) to be qualified for field blank contamination, and method blank contamination that caused 3.2 percent (2 of 62 samples) to be qualified for method blank contamination. The blank qualified results should be considered not detected at elevated detection levels.

Method RSK-175 had field blank contamination that caused 4.8 percent (5 of 105 samples) to be qualified for field blank contamination, and method blank contamination that caused 11.4 percent (12 of 105) to be qualified for method blank contamination. The blank qualified results should be considered not detected at elevated detection levels.

Method AM23G for volatile fatty acids had field duplicate RPD errors that qualified as estimated 0.6 percent (2 of 315 samples) of the total AM23G data. The data qualified as estimated is usable for the intended purpose. Method AM23G had field blank contamination that caused 6.0 percent (19 of 315 samples) to be qualified for field blank contamination. The blank qualified results should be considered not detected at elevated detection levels.

Method E300.0 for common anions (chloride, nitrate, and sulfate) had LCS and holding time errors that qualified as estimated 1.0 percent (1 of 97 samples) of the total E300.0 data. The data

qualified as estimated is usable for the intended purpose. Method E300.0 had field blank contamination that caused 6.2 percent (6 of 97 samples) to be qualified for field blank contamination. The blank qualified results should be considered not detected at elevated detection levels.

3.5 CHEMICALS OF POTENTIAL CONCERN

The identification of COPCs is an ongoing process that takes place annually and is reported in the First and Second Quarter Semiannual Groundwater Monitoring Report. The purpose of identifying COPCs is to establish a list of analytes that best represents the extent and magnitude of affected groundwater and to focus more detailed analysis on those analytes. The analytes were organized and evaluated in two groups, organic and inorganic, and divided into primary and secondary COPCs. Tables 3-5, 3-6, and 3-7 present summaries of the organic and inorganic analytes detected during the Third Quarter 2010 and Fourth Quarter 2010 monitoring events. Data that is "B" qualified because of associations with either laboratory blank or field cross contamination is not included in the COPC evaluation.

The COPC process does not eliminate analytes from testing but reduces the number of analytes that are evaluated and discussed during reporting. While all of the secondary COPCs will continue to be tested for in future monitoring events because of their association with other analytes that are listed as primary COPCs, these secondary COPCs are detected on a more limited or inconsistent basis, and/or their detection falls below a regulatory threshold. Therefore, the secondary COPCs will not be discussed further in the later sections of this report. Additionally, the standard list of analytes for each method will continue to be tested for and screened annually to insure that the appropriate COPCs are being identified and evaluated as specified in the Beaumont Sites 1 and 2, Programmatic Sampling and Analysis Plan (Tetra Tech, Inc., 2010a).

3.5.1 Identification of Chemicals of Potential Concern

As indicated above, COPCs are evaluated annually and reported in the First and Second Quarter Semiannual Groundwater Monitoring Report. COPCs have been selected to include compounds that consistently have been detected in groundwater samples collected from the Site at concentrations above regulatory limits and that can be used to assess the extent of affected groundwater. Primary COPCs are parent products such as trichloroethene (TCE) and 1,1,1-trichloroethane (1,1,1-TCA) and are always present with a secondary COPC. Secondary COPCs are breakdown products such as 1,1-dichloroethane (1,1-DCA) and 1,1-dichloroethene (1,1-DCE)

and are detected at lower concentrations than their parent products. At this site 1,1-DCE, a breakdown product of 1,1,1-TCA, is detected at higher concentrations than 1,1,1-TCA so 1,1-DCE is considered a primary COPC, and 1,1,1-TCA is considered a secondary COPC.

An annual evaluation of COPCs based on the results of the Second Quarter 2010 water quality monitoring event was presented in the First and Second Quarter 2010 Semiannual Groundwater Monitoring Report (Tetra Tech, 2010b). Based on the results of water quality monitoring and the screening of those results against the existing COPCs, the MCLs, and DWNLs, no additional COPCs were identified nor was there evidence to remove an analyte from the existing COPC list. Table 3-10 presents those groundwater analytes that have been identified as COPCs. Time-series graphs of primary and secondary COPCs are provided in Appendix E.

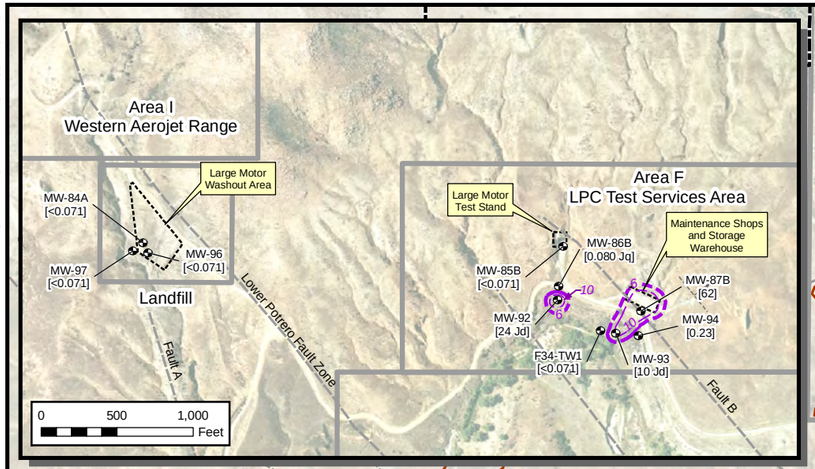

Table 3-10 Groundwater Chemicals of Potential Concern

Analyte	Classification	Comments
Perchlorate	Primary	Parent product (propellant), widely detected at Site
1,1-Dichloroethene	Primary	Breakdown product of 1,1,1-TCA, detected at higher concentrations than 1,1,1-TCA at Site
Trichloroethene	Primary	Parent product (solvent), widely detected at Site
1,4-Dioxane	Primary	Stabilizer in 1,1,1-TCA, widely detected at Site.
1,1-Dichloroethane	Secondary	Breakdown product of 1,1,1-TCA
1,2-Dichloroethane	Secondary	Breakdown product of 1,1,1-TCA
1,1,1-Trichloroethane	Secondary	Parent product (solvent), detected at lower concentrations than breakdown product (1,1-DCE) at Site
1,1,2-Trichloroethane	Secondary	Isomeric impurity of 1,1,1-TCA
cis-1,2-Dichloroethene	Secondary	Breakdown product of TCE
Vinyl chloride	Secondary	Breakdown product of TCE and/or 1,1,1-TCA

3.6 DISTRIBUTION OF THE PRIMARY CHEMICALS OF POTENTIAL CONCERN

The Third Quarter 2010 and Fourth Quarter 2010 monitoring events are minor events. Only guard wells, wells with increasing contaminant trends, new wells, surface water locations, and natural attenuation sampling of F-33 wells are sampled and tested during these events (Tetra Tech, 2003b). Therefore, only those wells and surface water sampled and tested during this event will be discussed. Interpretation of the data collected as part of the focused data collection phase of the Site 1 contaminant attenuation study will be presented in the Site 1 Contaminant Attenuation Summary Report currently in preparation. Figures 3-10 through 3-13 present COPC isoconcentration maps for the alluvium and shallow Mount Eden formation wells sampled during the Second Quarter 2010 sampling event, with updated data from wells sampled during the Fourth Quarter 2010 monitoring event. A figure illustrating the extent of the primary COPCs based on the recent data is presented in Figure 3-14.

3.6.1 Guard Wells

Guard wells are wells that are used as an early warning to protect private and municipal wells by detecting any upgradient contaminants. Guard wells are also used to monitor any migration of contaminants offsite.

Four monitoring wells, MW-15, MW-18, MW-67, and MW-100, were designated as guard wells during the semiannual event conducted during the second quarter of the year. Wells MW-15 and MW-18 are a clustered well pair. Well MW-18 is completed near the top of the alluvial aquifer and MW-15 is completed near the bottom of the alluvial aquifer. Well MW-67 is the furthest downgradient site well and is located approximately 0.9 miles upgradient of the southern edge of the Site. MW-100 is located offsite approximately 500 feet from the southern property boundary just south of Gilman Springs Road near the mouth of Potrero Creek. Table 3-11 presents a summary of the detected COPCs reported in guard well samples collected during Fourth Quarter 2010, and previous monitoring events. In general, the COPC concentrations during this reporting period have remained stable in the guard wells.

Table 3-11 Summary of Detected COPCs in Guard Wells

MCL/DWNL (µg/L)			1 (1)	5	6	6	5	6

Notes: Only analytes positively detected are presented in this table. For a complete list, refer to the laboratory data package.

MCEA - Massacre Canyon Entrance Area.

DG - Downgradient

MCL - California Department of Public Health Maximum Contaminant Level

DWNL - California Department of Public Health drinking water notification level.

(1) DWNL

µg/L - micrograms per liter.

Bold - MCL or DWNL exceeded.

<# - Analyte not detected, method detection limit concentration is shown.

J - The analyte was positively identified, but the analyte concentration is an estimated value.

R - The sample result is rejected and not usable for any purpose. The presence or absence of the analyte cannot be verified.

c - The Matrix Spike (MS) and/or Matrix Spike Duplicate (MSD) recoveries were outside control limits.

d - The Laboratory Control Sample (LCS) recovery was outside control limits.

e - A holding time violation occurred.

q - The analyte detection was below the Practical Quantitation Limit (PQL).

3.6.2 Increasing Trend Wells

During the Second Quarter 2010 statistical trend analyses, (Tetra Tech, 2010b), 24 monitoring wells and one surface water location were designated as having increasing or probably increasing trends. Based on the magnitude of the trend and the wells' location, eight of these wells were included in the Fourth Quarter 2010 semiannual sampling event. The portion of the site where these wells are located, the location identification, and the COPC that has the increasing trend are listed below:

Three wells located in the BPA:

- MW-07: TCE;
- MW-60A: perchlorate, TCE, 1,1-DCE, and 1,4-dioxane; and
- MW-60B: 1,4-dioxane.

Four wells located in the RMPA:

- IW-04: TCE and 1,1-DCE;
- MW-68: perchlorate and 1,4-dioxane;
- MW-90: TCE; and
- MW-98B: TCE and 1,1-DCE.

One well located in the NPCA:

- MW-76A: 1,4-dioxane.

Table 3-12 presents a summary of the detected COPCs reported in increasing trend well samples collected during Fourth Quarter 2010, and previous monitoring events. In general, the COPC concentrations in the increasing trend wells are consistent with previous results.

Table 3-12 Summary of Detected COPCs in Increasing Trend Wells

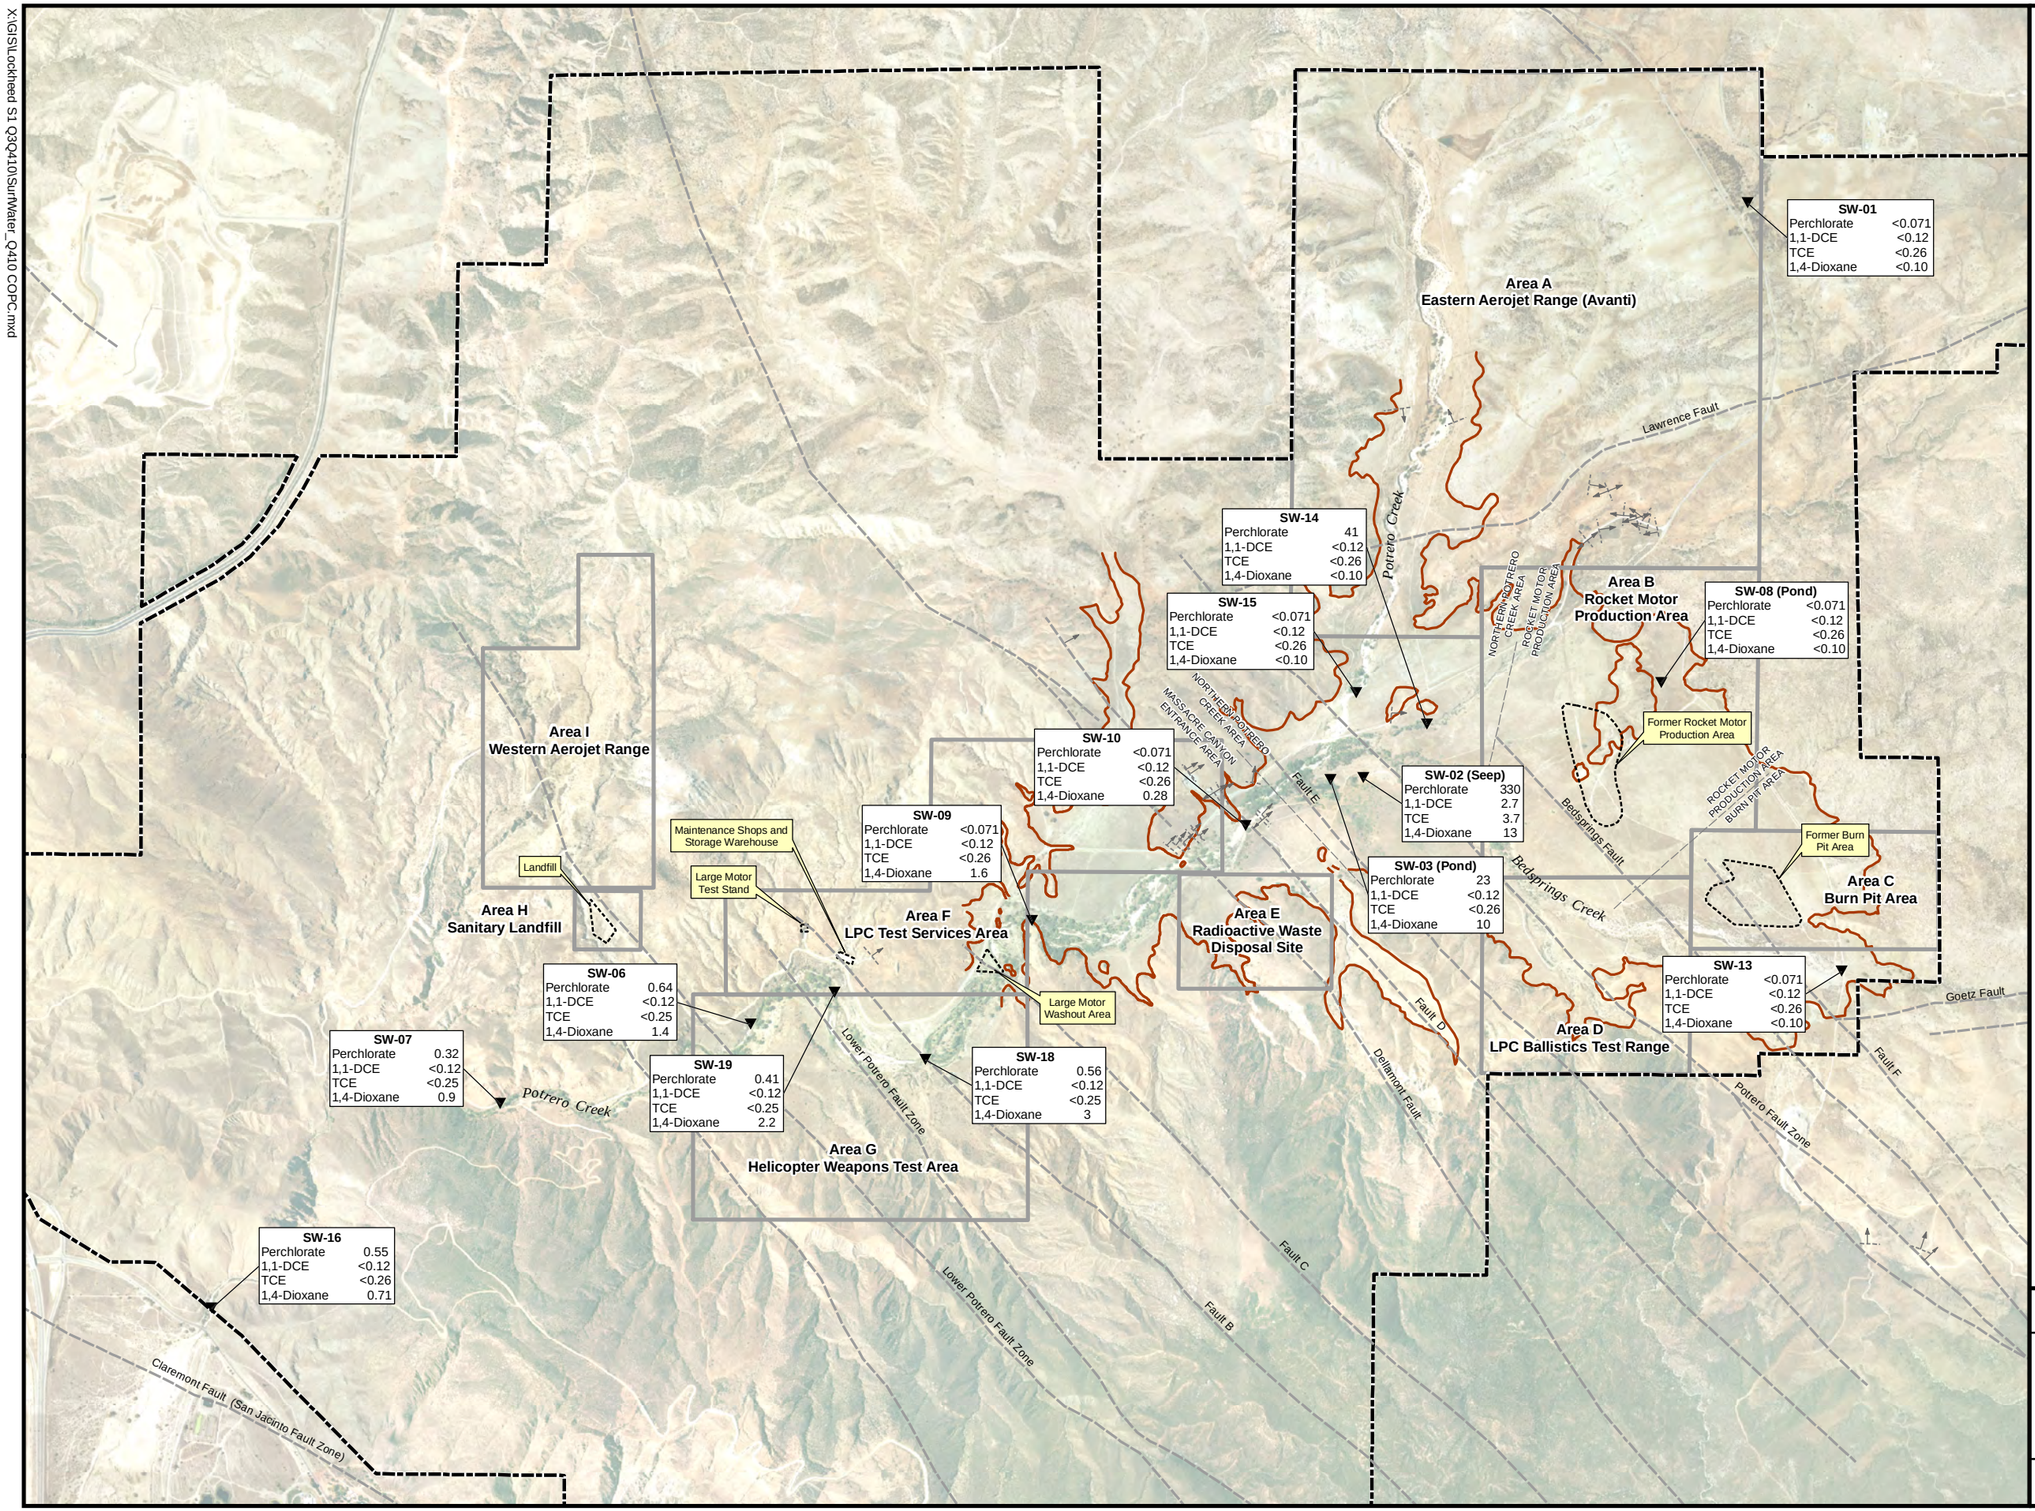
RMPA - Rocket Motor Production Area.
<# - Analyte not detected, method detection limit concentration is shown.
J - The analyte was positively identified, but the analyte concentration is an estimated value.
d - The Laboratory Control Sample (LCS) recovery was outside control limits.
f - The duplicate Relative Percent Difference was outside the control limit.
q - The analyte detection was below the Practical Quantitation Limit (PQL).

3.6.3 New Wells



New monitoring wells MW-103 through MW-109 were installed and sampled as part of the Site 1 Plant Uptake Study (Tetra Tech, 2010c). The wells were installed in the vicinity of the confluence of Bedsprings and Potrero Creeks where the previously mapped perchlorate and 1,4-dioxane plumes migrate through the riparian area (Figure 3-15). The objective of this phase of the study was to determine the relationship of perchlorate and 1,4-dioxane found in shallow groundwater samples and in plant tissue collected from phreatophytes (riparian trees and deep-rooted shrubs). A complete description of the work performed will be presented in the Site 1 Plant Uptake Study currently in preparation. COPC sample results from the initial groundwater sampling event for MW-103 through MW-109 can be found in Table 3-13.

Table 3-13 Summary of Detected COPCs in New Wells

Sample Location	Sample Date	Per-chlorate	1,4-Dioxane	1,1-Dichloro-ethane	1,2-Dichloro-ethane	1,1-Dichloro-ethene	cis-1,2-Dichloro-ethene	Trichloro-ethene	Vinyl Chloride

3.6.4 Surface Water

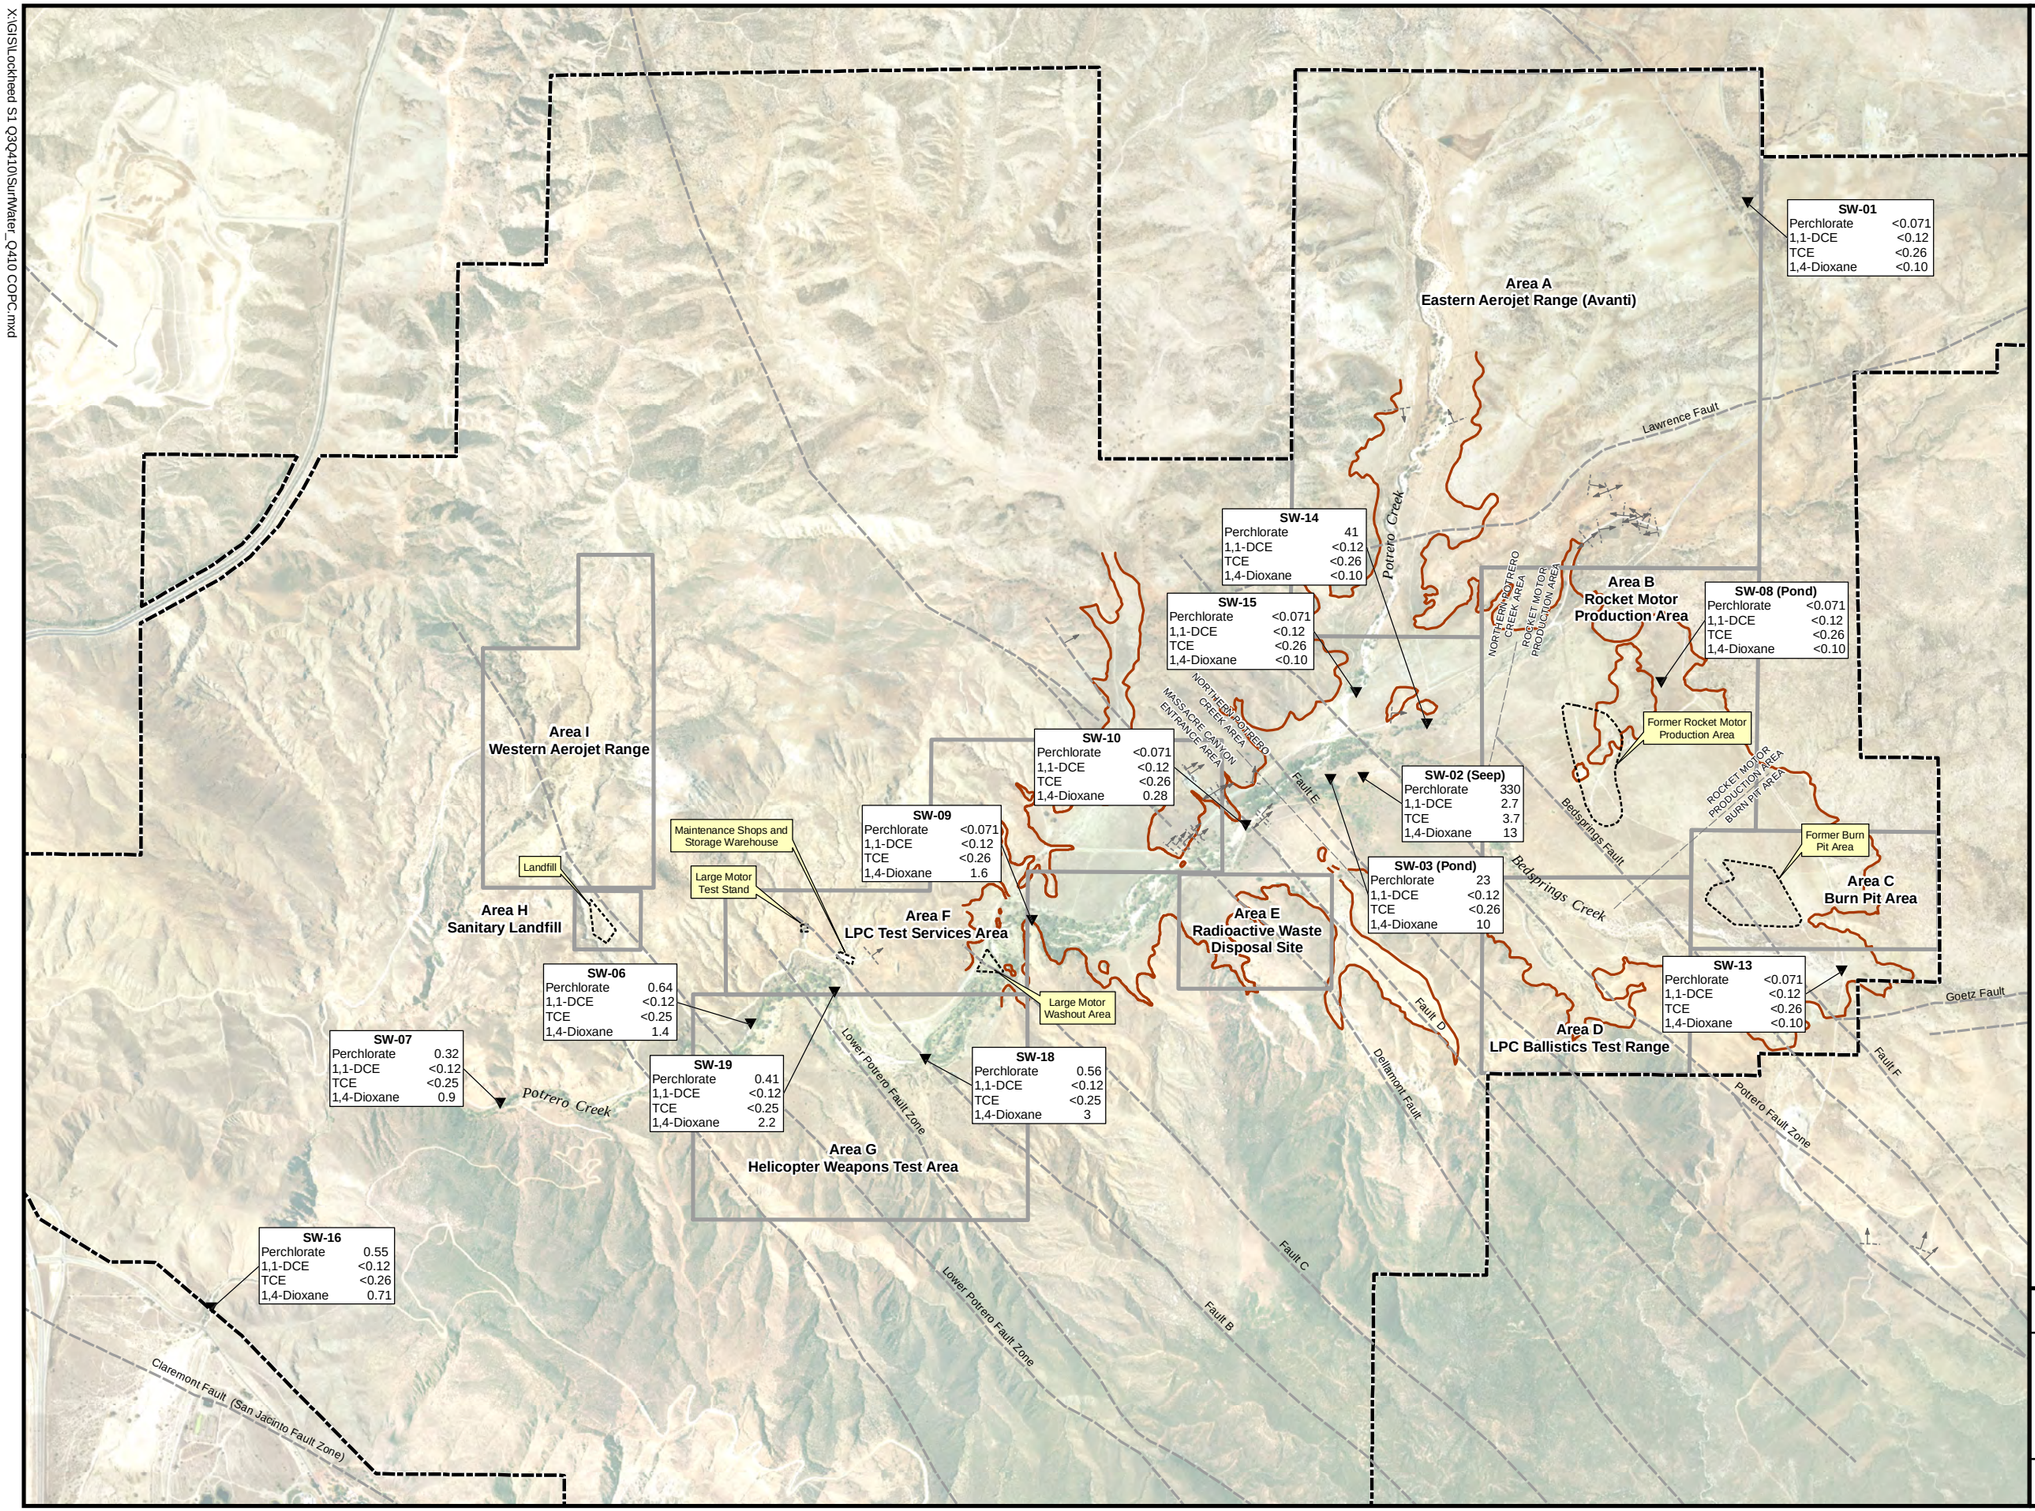
Surface water samples were collected in Fourth Quarter 2010 during the routine groundwater sampling event. Table 3-14 presents concentrations of COPCs reported in surface water samples collected from this sampling event.

During Fourth Quarter 2010 surface water samples were collected from 14 locations along the Potrero and Bedsprings Creek drainages. The remaining three locations were dry at the time of sampling. Because surface water location SW-16 was sampled, the alternate location, SW-17, was not sampled. No primary or secondary COPCs were detected in surface water locations SW-01 (a pond near the main gate), SW-08 (a pond north of the building 315), SW-13 (in Bedsprings Creek near the eastern property boundary), or SW-15 (in Potrero Creek north of its intersection with Bedsprings Creek).

The four primary COPCs (1,4-dioxane, 1,1-DCE, TCE, and perchlorate) and no secondary COPCs were detected in surface water samples collected from locations SW-02 and SW-03. These samples were collected from springs and or spring-fed ponds located outside of the stream beds but near the intersection of Bedsprings and Potrero Creeks.

Two of the primary COPCs (1,4-dioxane and perchlorate) and no secondary COPCs were detected in the surface water samples collected from locations SW-06, SW-07, SW-09, SW-10, SW-16, SW-18, and SW-19. These samples were collected from water flowing in Potrero Creek and are located topographically downgradient of the springs discussed in the previous paragraph. Figure 3-16 presents concentrations of COPCs reported in surface water samples collected from the Fourth Quarter 2010 monitoring event.

Due to heavy precipitation during Fourth Quarter, surface water samples were collected for the first time from location SW-14. SW-14 is located in an unnamed drainage east of the intersection of Potrero and Bedsprings Creek at the entrance to the riparian corridor downgradient from the RMPA. Perchlorate was detected at a concentration of 41 µg/L at this location, which is the highest perchlorate concentration detected to date in surface water samples collected from within the stream channels. However, the concentration detected in the stream channel at SW-14 is consistent with perchlorate concentrations detected in nearby shallow monitoring wells (MW-108 and MW-109) which range from 47 to 430 µg/L. Perchlorate was not detected above the MDL at sample location SW-10, located 2,500 feet southwest of SW-14, which is the next closest stream



sample location downstream from SW-14. The reduction in perchlorate between SW-14 and SW-10 is most likely a result of the phytoremediation and biodegradation of perchlorate through the riparian area. Concentrations of perchlorate in groundwater have shown a decrease of 1-2 orders of magnitude across this area. A contaminant attenuation study is being conducted to better understand the natural processes active at the Site that are reducing contaminant concentrations including perchlorate especially in the riparian area.

3.7 F-33 CONTAMINANT ATTENUATION SAMPLING

Seven monitoring wells (F33-TW2, F33-TW3, F33-TW6, F33-TW7, MW-70, MW-82, and MW-83) located in the F-33 area were sampled for contaminant attenuation parameters during the Third and Fourth Quarter 2010 monitoring events. Samples for laboratory analysis were collected for total organic carbon (TOC), dissolved organic carbon (DOC), total iron, ferrous iron, sulfide, sulfate, methane, hydrogen, and volatile fatty acids (VFAs). DO and ORP were monitored with field instruments during purging and sampling, and ferrous iron and sulfide were analyzed using a field instrument prior to sample collection during these sampling events. Figure 3-17 presents monitoring well locations sampled for contaminant attenuation during the Third Quarter 2010 and Fourth Quarter 2010 monitoring events. Table 3-15 presents a summary of detected analytes and field measurements.

As part of the contaminant attenuation focused data collection, five F-33 wells and 20 additional wells were sampled for alkalinity, chlorate, chloride, DOC, hydrogen, ferrous iron, total iron, dissolved manganese methane, ethane, ethene, nitrate, nitrite, sulfate, sulfide, and VFAs during the Fourth Quarter 2010 sampling event. Additionally, quantitative polymerase chain reaction assay (qPCR) sampling for perchlorate reductase and Dehalococcoides spp was conducted in seven of the study wells that had indications of perchlorate and/or solvent biodegradation. Interpretation of the data will be presented in the Site 1 Contaminant Attenuation Summary Report currently in preparation. The focused study data will be used to help determine which areas of the site may be conducive to natural biodegradation of perchlorate, chlorinated solvents, and 1,4-dioxane, and will help further refine the CSM.

Perchlorate

Historically, perchlorate concentrations have been at or below detection limits in all monitoring wells within the F-33 area except for MW-70 where concentrations appear to increase seasonally with increased rainfall and higher groundwater levels (Figure 3-18). During Fourth Quarter 2010 perchlorate was detected in F33-TW3 and MW-83 at 0.34 µg/L and 1.5 µg/L respectively. During Third Quarter 2010 and Fourth Quarter 2010 perchlorate concentrations in MW-70 were 2.2 µg/L and 3.1 µg/L respectively. In MW-70, perchlorate concentrations have ranged from below the MDL to 48.5 µg/L (First Quarter 2008).

TETRA TECH

The high concentrations of perchlorate in the Feature F-33 vadose zone soil and the fact that perchlorate was below the detection limit in all other area wells support the conclusion that geochemical conditions in groundwater are generally conducive to natural biodegradation. The concentration of perchlorate in soil samples collected in the vicinity of the surrounding and downgradient wells is much lower than the perchlorate concentrations in soil samples collected adjacent to MW-70. Therefore, even though geochemical conditions appear to support natural attenuation in the entire vicinity, seasonal increases in surface water infiltration and groundwater elevation result in an increase in perchlorate concentrations in groundwater in the vicinity of MW-70. Perchlorate movement from soil into groundwater appears to be limited or halted completely by biodegradation, as perchlorate is not observed in the surrounding and downgradient wells.

Nitrate

Nitrate was not detected above the MDL during the Third Quarter 2010 monitoring event. Nitrate was detected during the Fourth Quarter 2010 monitoring event at concentrations at or near the MDL. Nitrate is often considered the most critical electron acceptor competitor to perchlorate. Its absence in the aquifer permits native groundwater microorganisms to utilize perchlorate as an electron acceptor in the respiratory process. The absence of nitrate is also significant because it means that natural organic carbon that exists in the aquifer does not get consumed for denitrification.

DO and ORP

DO measurements are used to assess whether the aquifer is aerobic or anaerobic. In F-33 monitoring wells the DO concentrations have generally been less than 1.0 mg/L, which is considered to be anaerobic and provides an environment that could sustain natural perchlorate biodegradation. However, following periods of precipitation, DO levels greater than 1.0 mg/L have been recorded. This increase in DO measurements corresponds with elevated perchlorate detections.

ORP values in the F-33 monitoring wells are generally measured below 50 mV. These results are indicative of anaerobic conditions. Therefore, the DO and the ORP values are in tandem, suggesting a redox environment that encourages natural perchlorate biodegradation.

Notes: Only analytes positively detected are presented in this table. For a complete list, refer to the laboratory data package.

(1) - Sulfide and ferrous iron sample analysis was performed in the field using a Hach DR 850 colorimeter.

MCL - California Department of Public Health Maximum Contaminant Level

DWNL - California Department of Public Health drinking water notification level.

<# - Analyte not detected, method detection limit concentration is shown.

B - The result is < 5 times the blank contamination. Cross contamination is suspected and the data is considered unusable.

J - The analyte was positively identified, but the analyte concentration is an estimated value.

a - The analyte was found in the method blank.

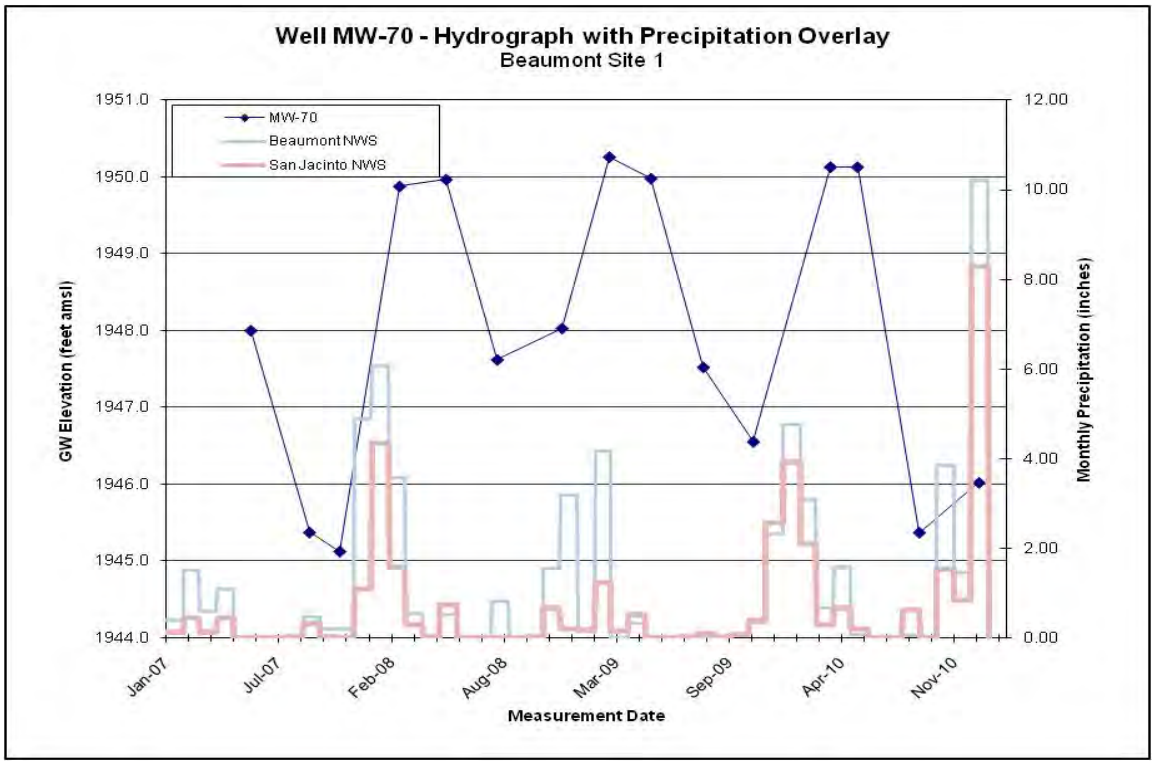
q - The analyte detection was below the Practical Quantitation Limit (PQL).

DHC - Dehalococcoides spp

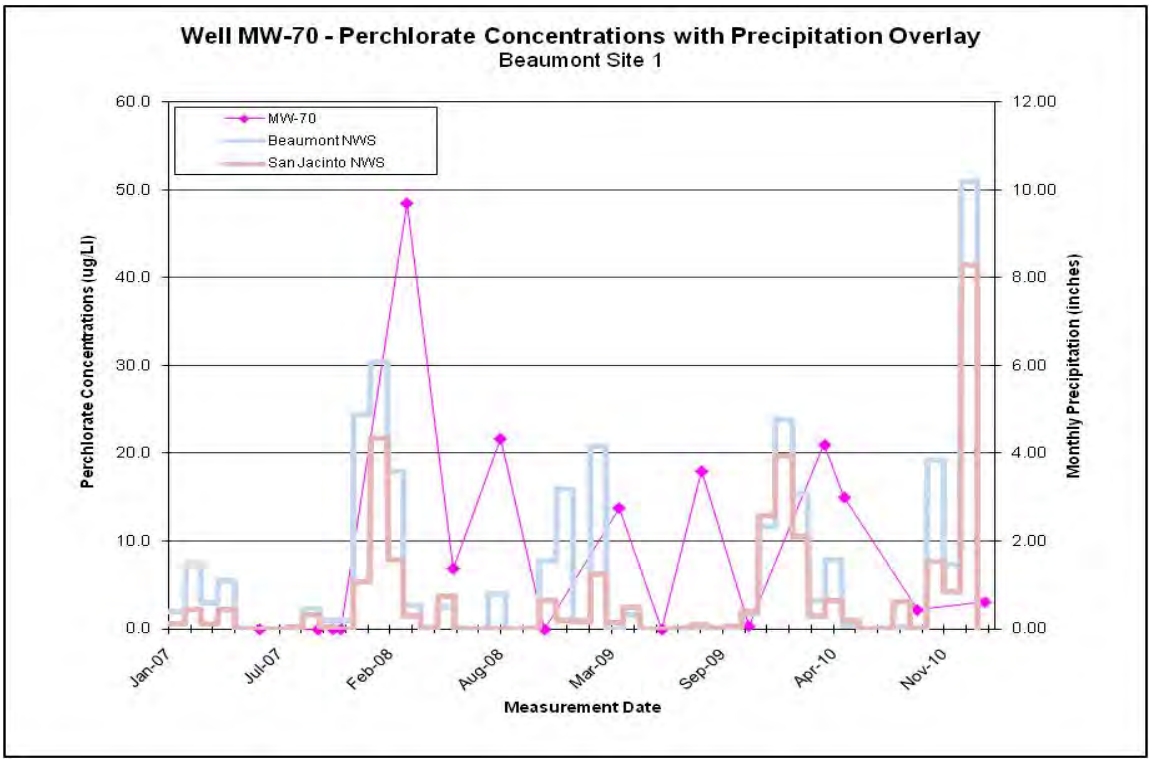
MDL - Method detection limit

mg/L - milligrams per liter

µg/L - micrograms per liter.



nM - nanomoles



Bold - MCL or DWNL exceeded

"-" - Not available.

NA - not analyzed

Figure 3-18 Water Level Elevation and Perchlorate Concentrations with Precipitation Overlay

NWS – National Weather Service

Total Iron and Ferrous Iron

Both forms of iron were measured during Third Quarter 2010 and Fourth Quarter 2010. Generally, total iron and ferrous iron are either not detected or detected at very low levels in the groundwater samples collected from monitoring wells MW-70, MW-82, and MW-83. Therefore, it appears that there is almost no oxidized or reduced iron in the aquifer in this area. Oxidized iron could have consumed natural organic carbon in the process of biological iron reduction. In the vicinity of F-33 this does not appear to be the case, leaving the available organic carbon for direct consumption by native perchlorate reducing microorganisms. Total iron and ferrous iron are detected in temporary wells F33-TW2, F33-TW3, F33-TW6, and F33-TW7 located in Potrero Creek below F33.

Sulfate and Sulfide

During Third Quarter 2010 and Fourth Quarter 2010 sulfate was detected at concentrations up to 81 mg/L in F-33 monitoring wells, and sulfide was generally absent or detected at very low concentrations. Very little biological sulfate reduction appears to be occurring in the vicinity of F-33, primarily because redox conditions do not strongly support such an occurrence. In general, sulfate is not a major competitor for perchlorate as an electron acceptor, in comparison with nitrate. However, it is important to note that sulfate does exist at high enough concentrations where it could consume natural organic carbon that would otherwise be used for perchlorate biodegradation.

Methane

Methane concentrations ranged from below the MDL to a high of 170 µg/L in F33-TW7 located below F-33 in Potrero Creek. Methanogenesis generally occurs when the aquifer becomes strongly anaerobic and, as a result, methane is found in the 1,000 µg/L range. Under moderately anaerobic conditions, methane may generally be greater than 500 µg/L; and under mildly methanogenic conditions, methane is generally measured at concentrations greater than 100 µg/L. These results indicate that conditions are mildly anaerobic and sufficiently reducing to support perchlorate biodegradation.

Hydrogen

Hydrogen concentrations were greater than 1.0 nanoMoles (nM) in all monitoring wells where it was analyzed during Third Quarter and Fourth Quarter 2010. Hydrogen above 1.0 nM is indicative of anaerobic conditions with the likelihood of the onset of mildly sulfate-reducing conditions. This level of hydrogen is supportive of natural perchlorate biodegradation. Hydrogen is considered a more reliable indicator of redox conditions than ORP because it is easier to measure to a high degree of accuracy, and ORP measurements using field instruments can be impacted by the various redox pairs in the groundwater. In this area, redox measurements from ORP field instruments and hydrogen concentrations match fairly closely, making deductions about the geochemical environment in the aquifer more accurate. In general, hydrogen measurements in the F-33 monitoring wells point to anaerobic conditions that are reducing enough to support perchlorate biodegradation.

TOC and DOC

TOC and DOC in the F-33 monitoring wells were both generally measured at concentrations ranging from 1.4 mg/L to 4.4 mg/L. Although these levels are not suggestive of an aquifer rich in natural organic carbon, they are likely to be sufficient to sustain natural biodegradation of low levels of perchlorate. However, as seen in MW-70, perchlorate concentrations tend to increase in groundwater following periods of heavy precipitation as perchlorate from the vadose zone migrates into the aquifer. Increasing perchlorate concentrations in the groundwater do not appear to coincide with higher amounts of organic carbon, which would be required to keep perchlorate concentrations below detectable levels. Hence, we see perchlorate in MW-70 where the natural processes are not able to degrade the increased perchlorate with fluctuating groundwater levels, and a continuing absence in surrounding and downgradient wells where perchlorate degradation can still be sustained.

Therefore, the current natural biodegradation potential may not be sufficient to sustain perchlorate degradation in the immediate vicinity of MW-70 during periods of heavy precipitation or elevated groundwater levels, but it is attenuated before it can migrate to other F-33 monitoring wells. This may be the case even though other electron acceptors such as iron and nitrate do not appear to be competing for organic carbon in the aquifer.

VFAs

VFAs are a more direct indication of the carbon substrate form which is immediately available to native microorganisms involved in biodegradation. Perhaps the most important of the VFAs is acetic acid, which plays a key and direct role in metabolism and energy generation. Acetic acid, when present even in small amounts, indicates that there is an excess that is available for consumption by perchlorate reducing microorganisms. In the Feature F-33 vicinity, acetic acid concentrations generally range up to 0.16 mg/L. These concentrations appear to be sufficient to sustain natural biodegradation of perchlorate except during periods of heavy precipitation.

3.8 HABITAT CONSERVATION

Consistent with the U.S. Fish and Wildlife Service approved HCP (USFWS, 2005) and subsequent clarifications (LMC, 2006a, 2006b and 2006c) of the HCP describing activities for environmental remediation at the Site, field activities were performed under the supervision of a USFWS approved biologist. As a result, no impact to the Stephens' Kangaroo Rat occurred during the performance of field activities related to the Third Quarter 2010 and Fourth Quarter 2010 monitoring events.

SECTION 4 SUMMARY AND CONCLUSIONS

Groundwater level measurements were collected for the Third Quarter 2010 and Fourth Quarter 2010 water quality monitoring events. A total of 171 groundwater level measurements were collected for the Third Quarter 2010 monitoring event and a total 179 groundwater level measurements were collected during the Fourth Quarter 2010 monitoring event. For the Third Quarter 2010 monitoring event, four wells were observed to be dry and measurements from one other well could not be collected due to obstructions in its casing. For the Fourth Quarter 2010 monitoring event, five wells were observed to be dry.

For the Third Quarter 2010 monitoring event, a total of 10 sampling locations (10 well locations) were proposed and sampled for water quality monitoring.

For the Fourth Quarter 2010 monitoring event, a total of 37 sampling locations (17 surface water, one alternate surface water, and 19 monitoring wells) were proposed for water quality monitoring. Additionally, as part of the focused data collection phase of the Site 1 contaminant attenuation study, 25 monitoring wells were proposed for enhanced contaminant attenuation sampling. Seven of the 25 monitoring wells selected for the contaminant attenuation focused data collection were previously scheduled for sampling during the Fourth Quarter 2010 monitoring event. In addition to the normal suite of site analytical parameters these wells were sampled for the focused data collection contaminant attenuation parameters. The remaining 18 wells were sampled for both contaminant attenuation parameters and the normal suite of site parameters as part of the contaminant attenuation study. Interpretation of the data collected as part of the focused data collection phase of the Site 1 Natural Attenuation Study will be presented in the Site 1 Contaminant Attenuation Summary Report, which is currently in preparation.

Three proposed surface water sample locations, SW-04, SW-11, and SW-12, were not sampled because the locations were dry. Because SW-16 was sampled, SW-17, an alternate surface water location sampled when SW-16 is dry, was not sampled. Therefore, water quality data was collected from 14 surface water locations, and 37 monitoring wells locations.

4.1 GROUNDWATER ELEVATIONS

The Beaumont NWS reported approximately 0.06 inches of precipitation between June 2010 (Second Quarter 2010) and September 2010 (Third Quarter 2010) and approximately 15.50 inches of precipitation between September 2010 (Third Quarter 2010) and December 2010 (Fourth Quarter 2010). During this time period groundwater elevations generally decreased across the site. During Third Quarter 2010, groundwater elevation decreases were seen in wells located in all areas. During Fourth Quarter 2010 groundwater elevation decreases were also seen in wells located in all areas.

Groundwater elevations during the Third Quarter 2010 monitoring event ranged from approximately 2,150 feet above msl upgradient of the former BPA to approximately 1,793 feet msl in the MCEA. Groundwater elevations during the Fourth Quarter 2010 monitoring event ranged from approximately 2,149 feet msl upgradient of the former BPA to approximately 1,794 feet msl in the MCEA.

Groundwater elevation differences in all wells from quarter to quarter appear to depend on the short- and long-term weather patterns. In general, the greatest differences in quarterly groundwater elevations occur during periods of seasonal precipitation. Wells located within the NPCA and the MCEA appear to respond most quickly to precipitation compared to the former BPA and RMPA, which generally show a one-season lag before responding to seasonal precipitation. The response also diminishes within each area with depth and distance from the Potrero and Bedsprings Creeks. The Site has experienced overall groundwater level declines since 2005.

4.2 SURFACE WATER FLOW

During the Third Quarter 2010 and Fourth Quarter 2010, the Potrero and Bedsprings creek riparian corridors were walked to determine the presence, nature, and quantity of surface water within the creek beds. The locations where surface water was encountered were plotted and a determination was made whether the water was flowing or stagnant. At specific locations where flowing water was encountered, the flow rate was determined using a modified version of the EPA Volunteer Stream Monitoring: Methods Manual (USEPA 1997).

Four fixed stream locations were chosen for stream flow measurements: SF-1, located near Gilman Hot Springs at the southwest border of the Site; SF-2, located in the vicinity of MW-67; SF-3, located in the vicinity of MW-15 and 18; and SF-4, located near MW-101.

During Third Quarter 2010 SF-1, SF-2, and SF-4 had insufficient flow for measurement, and SF-3 had an average flow rate of 0.40 cfs. The average site flow rate for Third Quarter 2010 was 0.40 cfs.

During Fourth Quarter 2010 SF-1 had an average flow rate of 3.13 cfs, SF-2 had an average flow rate of 2.06 cfs, SF-3 had an average flow rate of 1.60 cfs, and SF-4 had an average flow rate of 0.01 cfs. The average site flow rate for Fourth Quarter 2010 was 1.70 cfs.

4.3 GROUNDWATER FLOW AND GRADIENTS

Groundwater flow directions from Third Quarter 2010 and Fourth Quarter 2010 were similar to previously observed patterns for a dry period. Generally, groundwater flows northwest from the southeastern limits of the valley (near the former BPA) beneath the former RMPA, towards Potrero Creek where groundwater flow then changes direction and begins heading southwest, parallel to the flow of Potrero Creek, into Massacre Canyon.

Between June 2010 (Second Quarter 2010) and September 2010 (Third Quarter 2010), the overall groundwater gradient (approximating a flowline from MW-36, upgradient of the BPA, through the RMPA and NPCA to MW-18, in the MCEA) decreased to 0.013 ft/ft. Between September 2010 (Third Quarter 2010) and December 2010 (Fourth Quarter 2010), the overall groundwater gradient through the same flow path remained the same at 0.013 ft/ft. In general the horizontal gradient is lowest between the BPA and the RMPA with a greatly increased flow through the NPCA and the MCEA. The flattening of the gradient in the BPA and RMPA appears to be attributed to the lithology, aquifer transmissivity, and aquifer thickness in these areas.

Vertical groundwater gradients between shallow and deeper monitoring well pairs are generally downward (negative) in the BPA, RMPA, and the NPCA, and upward (positive) in the MCEA. The response to seasonal changes in groundwater recharge, although dampened by depth, are consistent within the different vertical well pairs installed at the Site. This suggests that there is vertical hydraulic communication within the aquifer.

4.4 WATER QUALITY

Both groundwater and surface water are collected and sampled as part of the GMP. The GMP has a quarterly/semiannual/annual/biennial frequency. The annual and biennial events are larger major monitoring events and the quarterly and semiannual events are smaller minor events. All new

wells are sampled quarterly for one year. The semiannual wells are sampled second and fourth quarter of each year, annual wells are sampled second quarter of each year and the biennial wells are sampled second quarter of even numbered years.

A COPC evaluation is performed annually, and reported in the First and Second Quarter Semiannual Groundwater Monitoring Report. The primary COPCs identified for the Site during the 2010 evaluation, (Tetra Tech, 2010b), were: perchlorate, 1,1-DCE, TCE and 1,4-dioxane. The secondary COPCs identified for the Site during 2010 monitoring were: 1,1-DCA, 1,2-dich1,2-DCA), 1,1,1-TCA, 1,1,2-TCA, cis-1,2-DCE, and vinyl chloride. 1,1,2-TCA and vinyl chloride were added as secondary COPCs to the list of COPCs identified, due to the frequency and concentration of their detections becoming more consistent and widespread. The results of surface and groundwater samples collected and tested during the Third and Fourth Quarter 2010 monitoring events are discussed below.

4.4.1 Surface Water

Surface water samples are collected semiannually during the second and fourth quarter sampling events, and during a storm event. Seventeen surface water sample locations and one alternate sample location have been identified for semiannual surface water sampling at the Site. Sample locations have been chosen to include springs and spring-fed ponds, ephemeral ponds, and locations in the Bedsprings and Potrero Creek drainages. Twelve locations within the active drainages have been identified for surface water sampling during a storm event. Due to the ongoing drought conditions and the ephemeral nature of the ponds and creeks, it is common for many of the locations to be dry at the time of sampling.

During the Fourth Quarter 2010 sampling event, surface water samples were collected from 14 locations. The remaining three locations were dry at the time of sampling. Because surface water location SW-16 was able to be sampled, the alternate location, SW-17, was not sampled. The sample results from the locations sampled are consistent with previous sample results obtained at the Site.

No primary or secondary COPCs were detected in upgradient surface water locations SW-01 (a pond near the main gate), SW-13 (in Bedsprings Creek near the eastern property boundary), or SW-15 (in Potrero Creek north of its intersection with Bedsprings Creek). Additionally, no

COPCs were detected in surface water location SW-08 (an ephemeral pond north of the building 315).

Perchlorate was detected at surface water location SW-14 at a concentration of 41 µg/L. Sample location SW-14 is located in an unnamed drainage east of the intersection of Potrero and Bedsprings Creek and downgradient of the RMPA.

The four primary COPCs (1,4-dioxane, 1,1-DCE, TCE, and perchlorate) and no secondary COPCs were detected in surface water samples collected from locations SW-02 and SW-03. These samples were collected from springs and or spring fed-ponds located outside of the stream beds but near the intersection of Bedsprings and Potrero Creeks, downgradient from the RMPA. Surface water location SW-04, located in this same area, had insufficient water for sample collection at the time of sampling. During Fourth Quarter 2010, only 1,4-dioxane and perchlorate were detected above their respective MCL or DWNL at these locations. The MCL for perchlorate and the DWNL for 1,4-dioxane are 6 µg/L and 1 µg/L respectively.

Surface water sample locations SW-06, SW-07, SW-09, SW-10, SW-16, SW-18, and SW-19 are located in areas of flowing water in Potrero Creek, topographically downgradient of the springs discussed in the previous paragraph. Two of the primary COPCs, 1,4-dioxane, and perchlorate, and no secondary COPCs were detected in the surface water samples collected from these locations. During Fourth Quarter 2010, 1,4-dioxane was the only COPC to be detected above the MCL or DWNL in these locations.

1,4-Dioxane has been intermittently detected in surface water samples collected at location SW-16 located at the mouth of Massacre Canyon and Gilman Hot Springs Road during or following periods of rainfall. During Fourth Quarter 2010 1,4-dioxane was detected at a concentration of 0.71 µg/L. Additionally, perchlorate was detected Fourth Quarter 2010 at a concentration of 0.55 µg/L respectively. Perchlorate has only recently been detected at this location. This is likely a result of a lower detection limit. During previous monitoring events the detection limit for perchlorate was 0.5 µg/L. In 2010 a more sensitive method for testing perchlorate was used and the detection limit was lowered to 0.07 µg/L.

4.4.2 Groundwater

Only guard wells, wells with increasing contaminant trends, new wells, and select wells for natural attenuation parameters were sampled and analyzed during Third Quarter 2010 and Fourth Quarter 2010 (Tetra Tech, 2003b).

Guard Wells

Four monitoring wells are designated as guard wells: MW-15, MW-18, MW-67, and MW-100. Wells MW-15 and MW-18 are a clustered well pair. All guard wells are located along Potrero Creek, downgradient of the BPA and RMPA source areas. Well MW-18 is completed near the top of the alluvial aquifer and MW-15 is completed near the bottom of the alluvial aquifer. These wells are located approximately 3 miles from the southern site boundary and are located upgradient of the secondary sources identified at F-33, F-34, and F-39. Well MW-67, the furthest downgradient site well, is located approximately 0.9 miles upgradient of the southern site boundary, and MW-100, an offsite well, is located approximately 500 feet south of the southern site boundary near the mouth of Potrero Creek. Both of these wells are located below the secondary sources identified at F-33, F-34, and F-39. The analyte 1,4-dioxane was detected in monitoring wells MW-15, MW-18, and MW-100 at concentrations of 5.9 µg/L, 3.7 µg/L, and 0.17 µg/L respectively. It was not detected above the MDL in MW-67. The analyte 1,4-dioxane is the only COPC to be detected above the MCL or DWNL in these guard wells during the Fourth Quarter 2010 sampling event. The MCLs for 1,1-DCE, TCE, and perchlorate are 6 µg/L, 5 µg/L, and 6 µg/L respectively. The DWNL for 1,4-dioxane is 1 µg/L. Sample results for the guard wells from Fourth Quarter 2010 are consistent with results from previous sampling events.

Increasing Trend Monitoring Wells

The number of increasing or probably increasing trend wells went up from 12 wells in 2009 to 24 wells and one surface water location in the 2010 temporal trend analyses. The temporal trend analyses were performed using data from Second Quarter 2002 to Second Quarter 2010. This period was chosen because operation of the RMPA groundwater pump and treat system was discontinued in 2002. The 2010 temporal trend analysis updates the analysis performed following completion of the Second Quarter 2009 monitoring event (Tetra Tech, 2009). The temporal trends were analyzed using Mann-Kendall and linear regression methods. A summary of the trend analysis results for the 24 increasing or probably increasing trend locations is presented in Table 4-1. The percent change that these increases represent with respect to the mean of the data used to

calculate each trend is also presented in Table 4-1. Sixteen of the wells and the one surface water location had trend magnitudes with less than a 20 percent change. Based on magnitude of the trend (greater than a 20 percent change with respect to the mean) and the wells' location, eight of these wells were included in Fourth Quarter 2010 semiannual sampling event. These locations are shaded in Table 4-1.

Possible reasons for the change in the number of increasing trend wells are: 1) the number of new wells that have been installed in the last several years (60 new wells since 2006); 2) with longer monitoring histories at the individual locations, trends become more noticeable due to the ability to better define outliers; and 3) as time passes, changes created by operation of the former extraction system are dissipating.

The number of decreasing trend, probably decreasing trend, and stable trend wells have increased during this period as well. In general, the plume morphology has remained stable with only slight modifications due to new wells better defining the lateral extent of the plume. The majority of the wells and the surface water locations display a stable trend or no trend over time.

In general, the COPC concentrations in the sampled increasing trend wells are consistent with previous results. These wells will continue to be sampled on a semiannual basis until the magnitude of the trend is less than a 20 percent change, or the well is reclassified in the annual temporal trend analysis.

Table 4-1 Summary of Increasing COPC Trends

MW-70	No Trend			No Trend			Stable			Probably Increasing	0.24	8.4

Notes:

Shading indicates the well was included in the Fourth Quarter 2010 sampling event based on the magnitude of the trend and the well location.

µg/L/yr - microgram per liter per year

%/yr - Percent change per year with respect to the mean

New Wells

Monitoring wells MW-103 through MW-109 were installed as part of the Site 1 Plant Uptake Study (Tetra Tech, 2010c) to determine the relationship between the concentration of perchlorate and 1,4-dioxane found in shallow groundwater and the concentrations found in leaf tissue. Perchlorate was detected in four of the seven wells at concentrations ranging from 5.6 µg/L to 440 µg/L, and 1,4-dioxane was detected in all wells ranging in concentration from 12 µg/L to 32 µg/L. A complete description of the work performed can be found in the Site 1 Plant Uptake Study Report currently in preparation. Quarterly sampling for four quarters is proposed, after which the sampling frequency will be evaluated.

4.5 CONTAMINANT ATTENUATION SAMPLING

The objective of the contaminant attenuation sampling and analyses effort is to understand the geochemical characteristics that appear to be contributing to the natural attenuation of the low level perchlorate in groundwater in two areas: the Potrero Creek area that has migrated into the area from the BPA and the RMPA and the area around the Large Motor Washout Area (F-33). In the F-33 area, elevated perchlorate concentrations (up to 302 mg/kg at 16 feet below ground surface in F33-DP20, July 2008) have been detected in soil samples, while groundwater concentrations in nearby monitoring well MW-70 have fluctuated from below detection limits up to 48.5 µg/L.

The contaminant attenuation sampling results confirm that the various geochemical parameters (redox conditions, the absence of electron acceptor competition, and the availability of low levels of useable organic carbon), as well as the environmental conditions in the aquifer, are within the required range to promote biodegradation of perchlorate in groundwater in the area. It appears this riparian area and its organic-rich lithologic layers observed in the area are contributing to the TOC, which is in turn creating the small amounts VFAs that provide the carbon substrate for perchlorate-reducing microorganisms. Seasonal detections of perchlorate in MW-70 may indicate that during periods of heavy rainfall, perchlorate contamination from the overlying soil is being flushed into the aquifer. However, the organic carbon in the aquifer does not appear to be sufficient to completely degrade the increased amount of perchlorate migrating from the vadose zone during periods of heavy rainfall, which results in temporary increases in perchlorate concentrations at MW-70. Perchlorate has not been detected in the wells downgradient of MW-70. Therefore, it would appear biodegradation conditions are sufficient to control the temporary

increases observed near MW-70. It is likely that seasonal and long-term changes in precipitation have an influence on the geochemical conditions observed, impacting the perchlorate reducing conditions. This is likely the reason for the fluctuation in perchlorate concentrations at MW-70.

The data obtained from the F-33 contaminant attenuation sampling will be combined with the data obtained during the Fourth Quarter 2010 focused data collection phase of the Site 1 contaminant attenuation study to help refine the CSM and help determine which areas of the site may be conducive to natural attenuation of perchlorate, chlorinated solvents, and 1,4-dioxane. The data will be presented in the Beaumont Site 1 Contaminant Attenuation Summary Report currently in preparation.

4.6 PROPOSED CHANGES TO THE GROUNDWATER MONITORING PROGRAM

4.6.1 Groundwater Sampling Frequency

The sampling frequency of a monitoring well is based on the well's classification (i.e., function) (Tetra Tech, Inc., 2003b). Groundwater monitoring well classifications are based on the evaluation of the temporal trends, spatial distribution, and other qualitative criteria. There are seven potential well classifications. Because there are not currently any remedial actions, there are no wells designated as remedial monitoring wells. A summary of the sampling frequency by well classification is presented in Table 4-2.

Table 4-2 Well Classification and Sampling Frequency

Classification	Sampling Frequency
Horizontal Extent (Plume) Wells	Annual
Vertical Distribution Wells	Biennial
Increasing Trend Wells	Semiannual
Remedial Monitoring Wells	Semiannual
Guard Wells	Semiannual
Redundant Wells	Suspend
New Wells	Quarterly

4.6.2 Proposed Changes

Generally, the groundwater monitoring program is reviewed and modified as necessary during the second quarter of each year in conjunction with the annual temporal trend analyses. Wells MW-104 through MW-109 were installed after the second quarter as part of the plant uptake study and will be sampled quarterly for four quarters for VOCs, 1,4-dioxane, and perchlorate. Following that, the sampling frequency for these wells will be re-evaluated.

No other unusual events or observations occurred during this reporting period that require modification of the monitoring program.

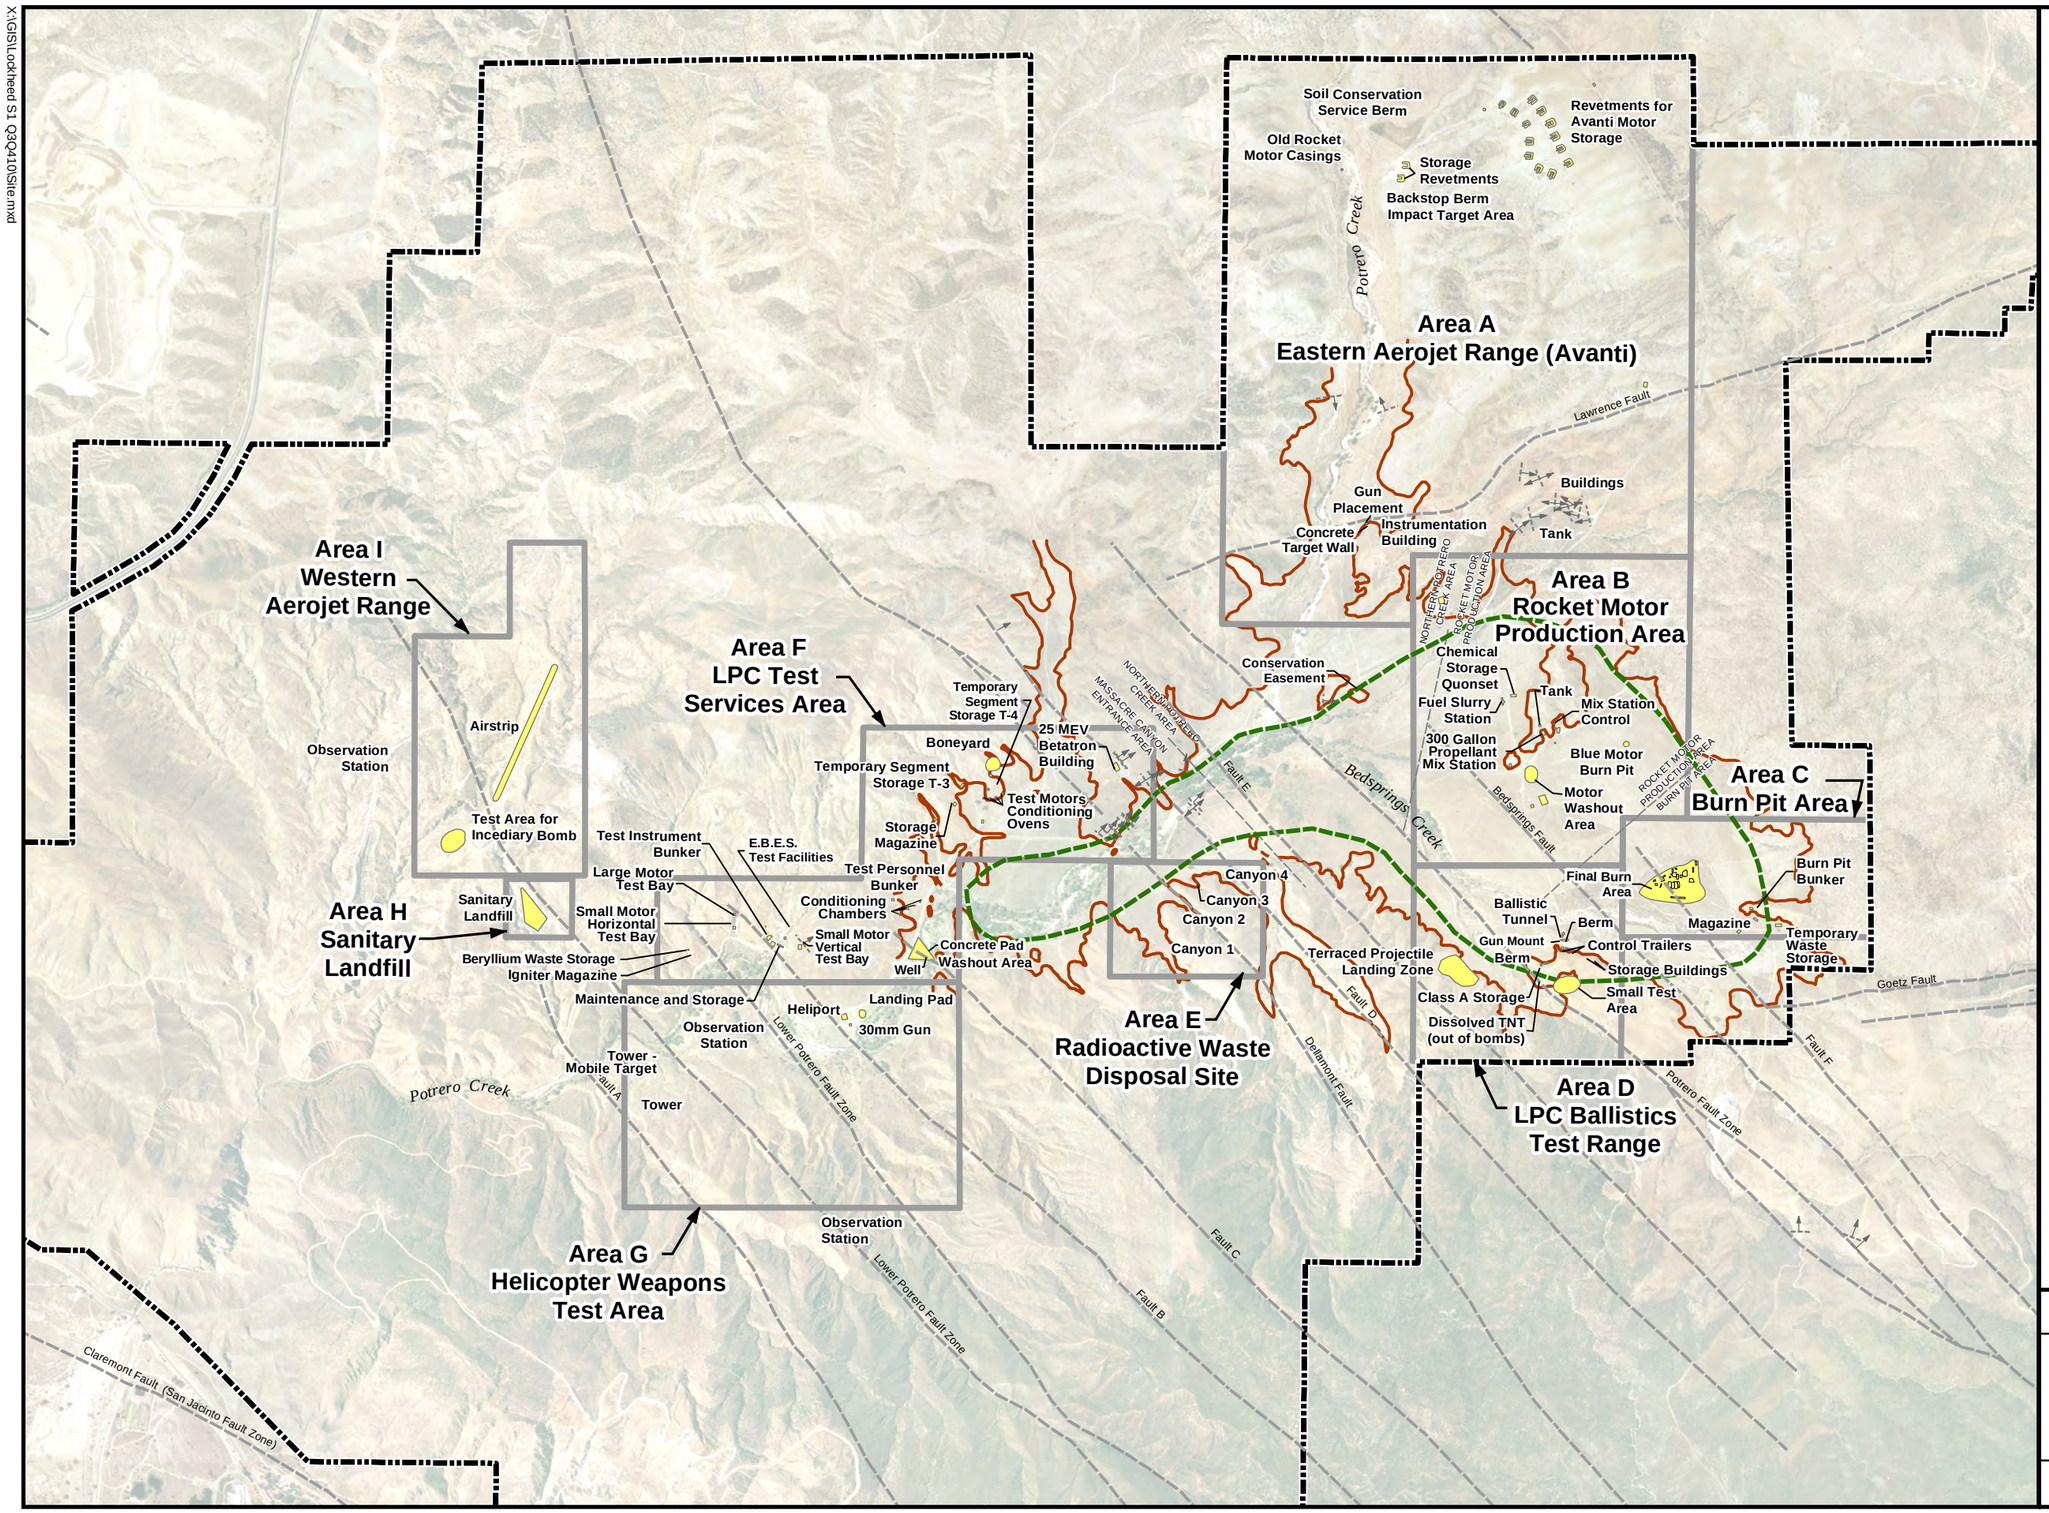
1.0 ENVIRONMENTAL ACTIVITIES

Water level measurements have been collected at the Site since 1983 (Tetra Tech, 2003b). Monthly water level measurements were collected between 1991 and 1992. Between 1993 and 1994, water level measurements from wells at the Site were collected periodically. During 1995 water level measurements from wells at the Site were collected on a monthly basis. Quarterly water level measurements were collected between 1996 and 1998, and semiannual water level measurements were collected between 1999 and 2002. From 2003 onward, quarterly water level measurements have been collected.



Water quality monitoring has been conducted at the Site since 1986. A summary of remedial investigations, including associated well installation and monitoring activities, was provided in the Groundwater Monitoring Well Installation Work Plan (Tetra Tech, 2006b). Baseline groundwater sampling was performed on 111 wells between February 1993 and March 1993. Since 1993 various subsets of the well network have been sampled semiannually at a minimum.

1.1 PREVIOUS ENVIRONMENTAL ACTIVITIES

In 2002 soil, soil vapor, and groundwater sampling was performed to further evaluate potential source areas and monitor groundwater (Tetra Tech, 2002). A total of 52 groundwater monitoring wells were installed, sampled, and analyzed for volatile organic compounds (VOCs), 1,4-dioxane, perchlorate, and Title 22 metals. Overall, temporal trend analysis indicated decreases in VOC concentrations in areas immediately downgradient of the former Burn Pit Area (BPA) and former Rocket Motor Production Area (RMPA). The concentration change was attributed to the remedial actions conducted between 1992 and 1999, as well as plume migration over time (Tetra Tech, 2002). Three surface water samples were collected from three locations believed to be fed by groundwater and analyzed for VOCs, 1,4-dioxane, and perchlorate. Perchlorate, 1,4-dioxane, trichloroethene (TCE), and 1,1-dichloroethene (1,1-DCE) were detected at concentrations above the California Department of Public Health (CDPH) or United States Environmental Protection Agency (EPA) maximum contaminant levels (MCLs) or California drinking water notification levels (DWNLs, formerly known as action levels through 2004) in two of the three surface water locations. Analysis of the data indicated that 1,4-dioxane in groundwater extended beyond the furthest downgradient well sampled during the investigation. A total of 40 soil and soil gas samples were collected and analyzed from 20 locations in the former BPA and former RMPA at depths of five and 15 feet below ground surface (bgs). Soil gas samples were also collected from three extraction wells and ten groundwater monitoring wells. None of the detected soil concentrations were greater than the EPA Region IX Preliminary Remediation Goals (PRGs) for residential soils, and soil gas concentrations had decreased from levels detected in the 1990s (Tetra Tech, 2002).

Historical Operational Areas, Site Features, and Conservation Easement

TETRA TECH

In 2004 soil characterization was continued over two general areal divisions of the Site: Historical Operational Areas A, B, and C (Tetra Tech, 2005a); and Historical Operational Areas D, E, F, G, H, and I (Tetra Tech, 2005b). In Historical Operational Areas A, B, and C, a total of 293 samples were collected and analyzed from 64 borings at depths ranging from 0.5 to 60 feet bgs (Tetra Tech, 2005a). Soil samples were analyzed for one or more of the following constituents: VOCs, semi-volatile organic compounds (SVOCs), 1,4-dioxane, perchlorate, Title 22 metals, polychlorinated biphenyls (PCBs), total petroleum hydrocarbons (TPH), and explosive residues. PCBs, 1,4-dioxane, and explosive residues were not detected at concentrations above their respective laboratory reporting limits (RLs). VOCs were detected at concentrations ranging up to 700 microgram per kilogram (µg/kg). SVOCs were detected at concentrations ranging up to 4.5 milligrams per kilogram (mg/kg). Perchlorate was detected at concentrations ranging up to 171,000 µg/kg. Metals were detected and concentrations of arsenic were reported up to 60.8 mg/kg. In addition, soil gas concentrations of TCE, tetrachloroethene (PCE), 1,1-DCE, 1,1,2-trichloro-1,2,2-trifluoroethane (Freon-113), and 1,1,1-trichloroethane (1,1,1-TCA) were detected above RLs. In general, limited affected soil was detected in Area A. Perchlorate and VOC affected soil was further delineated in Areas B and C (Tetra Tech, 2005a).

A total of 302 samples were collected and analyzed from 78 borings at depths ranging from 0.5 to 60 feet below ground surface in Historical Operational Areas D, E, F, G, H, and I (Tetra Tech, 2005b). Soil samples were analyzed for one or more of the following constituents: VOCs, SVOCs, 1,4-dioxane, perchlorate, Title 22 metals, PCBs, TPH, and explosive residues. SVOCs, 1,4-dioxane, and explosive residues were not detected at concentrations above their respective RLs. VOCs were detected at concentrations ranging up to 958 µg/kg. PCBs were detected at concentrations up to 910 ug/kg. Perchlorate was detected at concentrations ranging up to 57,100 µg/kg. Arsenic was detected at concentrations up to 19 mg/kg. Vanadium was detected at concentrations up to 2.2 mg/kg. In general, limited affected soil was detected in Areas D, G, and I. Perchlorate and VOC affected soil was further delineated in Areas F and H (Tetra Tech, 2005b).

A total of 51 historical features have been identified as potential recognized environmental concerns (RECs) (25 within Historical Operational Areas A, B, and C, and 26 within Historical Operational Areas D, F, G, H and I [Tetra Tech, 2003a]).

No features were identified as potential RECs within Historical Operational Area E. According to the historical report (Radian, 1986), former employees at the Site reported a one-time burial of low-level radioactive waste. The radioactive waste disposal site was present in Historical Operational Area E when assessed in 1986 and was subsequently remediated during 1990.

Geophysical surveys were performed to assist with the refinement of the conceptual site model (CSM) in November and December 2005. Downhole seismic velocity surveying was performed at the Site to (1) aid in differentiating boundaries between unconsolidated alluvium and the weathered and unweathered portions of the Mount Eden Formation, and (2) help refine the CSM and aid in future groundwater monitoring well placement. Geophysical reflection surveying was performed at the Site to more accurately locate published alluvium-concealed faults along the southwestern edge of the Site. The following subsections summarize the recent geophysical activities performed at the Site. The surveys and the associated data reduction and interpretation were performed by Terra Physics.

Between November and December 2005, geophysical profiles and surveys were performed at the Site to help in refining the CSM, aid in future groundwater monitoring well placement, and help assess the location of faults mapped in and around the BPA. The profiles were used to determine formation velocities in the vicinity of selected monitoring wells with subsequent comparison of those to data collected during the drilling of each well. The surveys consisted of reflection lines situated so as to cross the locations of published faults (Leighton and Associates, 1983a). A description of the geophysical field activities and the results of the geophysical profiles and surveys were provided in the Groundwater Monitoring Well Installation Work Plan (Tetra Tech, 2006b).

In April 2007, a subsurface soil investigation was performed at 21 features located in Historical Operational Areas A, B, C, D, F, G, and H (Tetra Tech, 2008b). These were follow-on activities to investigations performed between September and November 2004. The field investigation activities conducted during this investigation included: hand auger soil sampling; drilling and sampling of soil borings using hollow-stem auger drilling techniques; soil gas probe installation and sampling; and groundwater monitoring well installation, development, and sampling. During this investigation 86 borings were installed, 190 soil samples were collected and analyzed, 54 soil gas probes were installed and sampled, three monitoring wells were installed, and nine groundwater samples were collected and analyzed.

Soil samples were analyzed for one or more of the following constituents: VOCs, SVOCs, 1,4-dioxane, perchlorate, Title 22 metals, PCBs, and explosive residues. Explosives, SVOCs, PCBs, and 1,4-dioxane were not detected above the method detection limits (MDLs) in any soil samples collected during this investigation. Metals were detected above the MDLs and are considered to be naturally occurring. Low level concentrations of VOCs (acetone, methylene chloride and toluene) were detected in soil and are most likely associated with laboratory cross-contamination.

Soil gas samples were also collected at some of the features during this investigation and analyzed for VOCs. VOCs detected in soil gas include: TCE, PCE, carbon tetrachloride, 1,1,1-TCA, benzene, toluene, ethylbenzene, and xylenes (BTEX), and acetone. TCE was detected at concentrations ranging up to 4,760 ug/m^3. PCE was detected at concentrations ranging up to 5,930 µg/m^3. 1,1,1-TCA was detected at concentrations ranging up to 10,800 ug/m^3. Carbon tetrachloride was detected at a concentration of 154 µg/m^3. Low levels of acetone and BTEX were detected in soil gas but were well below their respective residential and commercial California Human Health Screening Levels.

Groundwater grab samples and monitoring well samples were collected and analyzed for one or more of the following constituents: perchlorate, VOCs, and 1,4-dioxane. Perchlorate was detected at a concentration up to 3,270 µg/L. Low level 1,4-dioxane and VOCs including TCE and 1,1-DCE were also detected in groundwater during this investigation. 1,4-dioxane was detected at concentrations up to 2.2 µg/L and TCE was detected at concentrations up to 110 µg/L. 1,1-DCE was detected in the same locations as the TCE at concentrations up to 31 ug/L.

Based on the findings of this investigation along with the previous investigation in 2004, no further investigation of features in Historical Operational Areas A, D, E, and I is required. However, additional investigation of select features in areas B, C, F, G, and H is necessary to determine the magnitude and extent of affected soil and/or groundwater. The magnitude and extent of impacted soil and groundwater at these features are needed to estimate the mass of contaminant(s) present (above and below clean-up levels), to determine appropriate mitigation alternatives, and to understand any potential long-term impacts on groundwater from residual soil contamination remaining after remediation. A Dynamic Work Plan has been prepared for specific features requiring further investigation within Historical Operational Areas B, C, F, G, and H (Tetra Tech, 2008c). The proposed investigations utilized a dynamic soil, soil gas, and groundwater sampling strategy to better define the affected soil and groundwater at the selected features.

Between September and December 2007, 25 additional groundwater monitoring wells at 11 locations across the Site were installed as part of the continued assessment to determine the lateral and vertical extents of affected groundwater and to obtain information on the possible effects of faulting on groundwater flow. The field activities at the Site included soil boring and sampling, well installation, development and initial groundwater sampling of the groundwater monitoring wells, and surveying activities. Groundwater samples were collected from September 2007 through January 2008. The groundwater analytical results from these activities are included as part of the fourth quarter 2007 groundwater monitoring reporting period (Tetra Tech, 2009a). Details of the installation activities are discussed in the Groundwater Installation and Sampling Report (Tetra Tech, 2010b).

1.2 CURRENT GROUNDWATER MONITORING PROGRAM

The current GMP (Groundwater Monitoring Program), outlined in the Revised Groundwater Sampling and Analysis Plan (Tetra Tech, 2003b), includes groundwater level measurements from 172 wells on a quarterly basis and water quality monitoring of 22 wells biennially, 51 wells annually, 15 wells semiannually, and 29 wells quarterly. The remaining 55 wells were identified as redundant and are not sampled. In addition to groundwater monitoring, surface water samples are collected, at a minimum, semiannually (during the second and fourth quarters of each year) from up to 18 locations. Groundwater and surface water samples are analyzed for VOCs, perchlorate, and 1,4-dioxane. Selected testing for metals, general minerals, natural attenuation parameters, and emerging contaminants is also performed.

Based on groundwater evaluations described in the Revised Groundwater Sampling and Analysis Plan (Tetra Tech, 2003b), Site wells were classified using VOC sampling results based on temporal trends, spatial distribution, and other qualitative criteria. Wells were classified as horizontal extent wells, vertical distribution wells, increasing contaminant trend wells, remedial monitoring wells, guard wells, and redundant wells. The primary criterion utilized in determining the sampling frequency was the well classification, as summarized in Table 1-1:

- Horizontal extent wells are used to assess the horizontal extent of chemicals of potential concern (COPC) and their plume shape. These wells are monitored on an annual basis.
- Vertical distribution wells are used to assess the vertical migration of COPCs and are monitored on a biennial basis.
- Increasing contaminant trend wells are monitored on an annual basis. However, the relative magnitude of the change and importance of the sampling point is evaluated in determining if an increase in monitoring frequency to semiannual is warranted.
- Guard wells are those wells used as an early warning to detect contaminants for protection of private and municipal wells. Guard wells are also those wells used to monitor possible off-site migration of affected groundwater. These wells are monitored on a semiannual basis.
- Redundant wells are not required to be sampled.
- Active groundwater remedial system wells are monitored on a semiannual basis, during periods of routine (i.e. normal and stable) remediation system operation. More frequent monitoring may be required during system startup.

- All newly installed monitoring wells are sampled on a quarterly basis for a minimum of one year to evaluate sample representativeness and well classification.

The results of the monitoring program are reported in two semiannual monitoring reports prepared after the completion of the second and fourth quarter monitoring events. Temporal trend analysis using Mann-Kendall and linear regression methods is performed on the primary COPCs and is presented in the first and second quarter monitoring report. Based on the results presented in this report, the monitoring program is reevaluated. The GMP was revised, as described in the Semiannual Groundwater Monitoring Report First Quarter and Second Quarter 2010 (Tetra Tech, 2010a), and presented in Table 1-1. Figure 1-3 shows the locations and frequency of groundwater and surface water sampling at the Site. A summary of monitoring well construction details is presented in Appendix C.

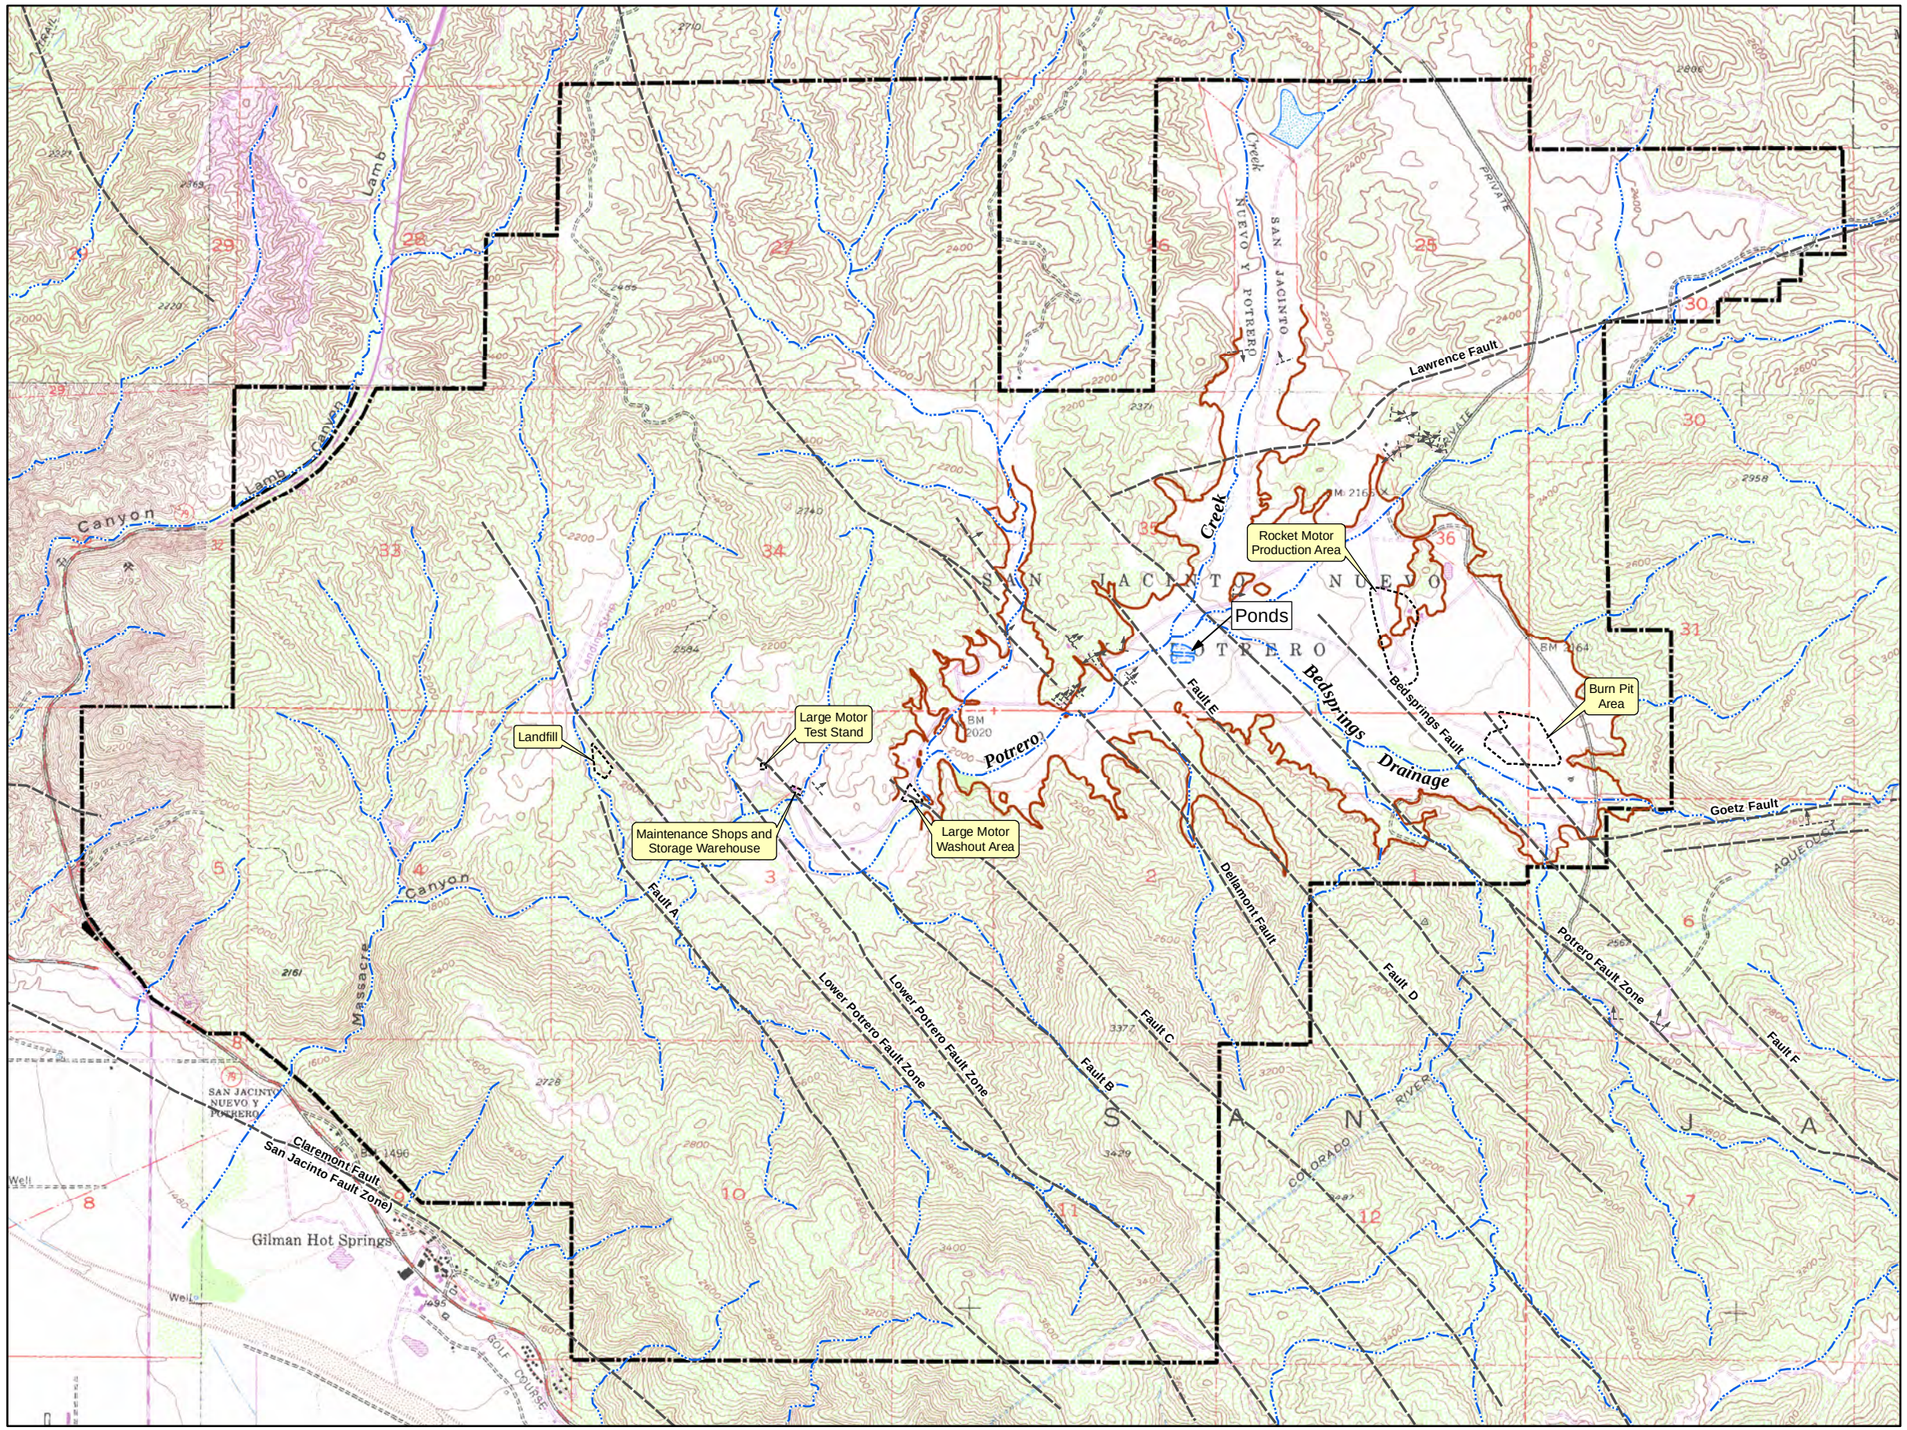
2.0 CONCEPTUAL SITE MODEL

Section 2 is divided into four subsections: physical setting, geology, hydrogeology, and distribution of affected groundwater. The following subsections describe the CSM prior to the Third Quarter 2009 groundwater monitoring event. While the current CSM is the most accurate representation based on data collected thus far, it should be noted that the CSM will be revised as necessary when additional data or information is acquired.

2.1 PHYSICAL SETTING



The Site is located south of the city of Beaumont, in a semi-arid region, at the northern end of the Peninsular Ranges Geomorphic Province (Harden, 1998). The Peninsular Ranges Province is dominated by a series of northwest-oriented mountain ranges extending from the Baja California Peninsula north to the Transverse Ranges, near the San Jacinto and San Bernardino Mountains. Locally the Site is located in a small valley (known as San Jacinto Nuevo y Potrero) in the northeastern foothills of the San Jacinto Mountains (Figure 2-1) [Radian, 1990]. The San Jacinto Nuevo y Potrero valley extends from the San Gorgonio Pass to the San Jacinto Valley and decreases approximately 1,000 feet in elevation from north to south. Southwest of San Jacinto Nuevo y Potrero valley, the topographic gradient of the valley steepens toward Massacre Canyon and flattens out when it reaches the San Jacinto Valley.

2.1.1 Precipitation

Southern California has a Mediterranean climate which is characterized by mildly wet winters and warm to hot, dry summers. The Site is located within interior climate zones characterized by continental air mass influencing the climate with little influence from the ocean. The wettest months at the Site are December through March. The Riverside County Flood Control District has two weather stations in the general area of the Site: the Beaumont National Weather Service (NWS) station and the San Jacinto NWS station. The locations of the stations are included in Figure 1-1. Table 2-1 presents a monthly and annual summary of the precipitation data. Figure 2-2 presents the long-term average and total annual precipitation for the two weather stations for the period of record. Figure 2-3 presents the long term average annual precipitation for the two weather stations for the period of record and the total annual precipitation for each station for the last ten years.

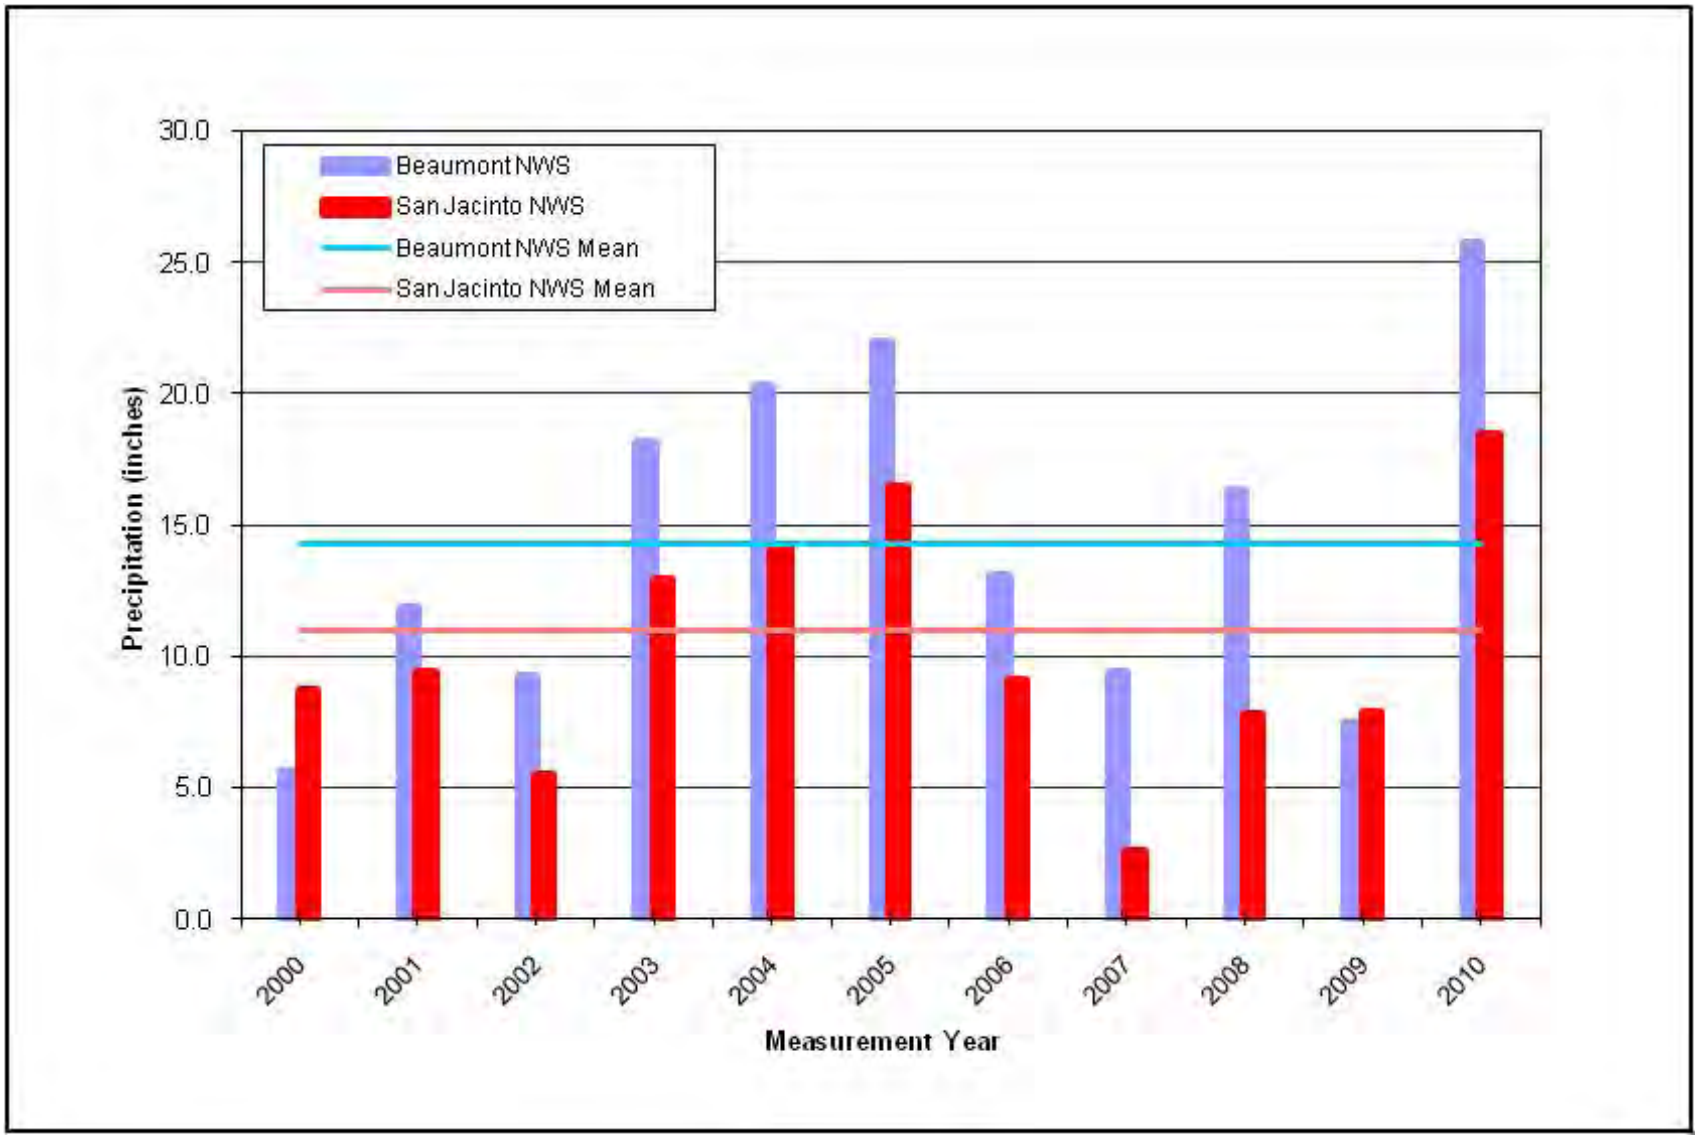
Notes:
NWS - National Weather Service.



The long term average annual precipitation for the period between 1888 and 2010 is 14.32 inches and 11.00 inches for the Beaumont and San Jacinto NWS respectively. The average annual precipitation during the period between 1888 and 1940 was 18.88 inches and 12.04 inches for the Beaumont and San Jacinto NWS respectively, and the average annual precipitation for the period between 1940 and 1980, encompassing the period of on-site activities, was 6.53 inches and 8.96 inches for the Beaumont and San Jacinto NWS respectively.

Figure 2-2 Annual Precipitation Since 1888

NWS – National weather station

Figure 2-3 Annual Precipitation For The Past Ten Years

NWS – National weather station

Since 1980 the average annual precipitation has been above the long-term average (16.31 inches and 12.13 inches for the Beaumont and San Jacinto NWS respectively) with oscillating periods of drought and heavy precipitation including the highest recorded annual rainfall in 1993 (34.8 inches Beaumont NWS).

The prolonged period of below average precipitation that existed between 1940 and 1980 would have caused the groundwater elevations on the Site to have been below their present levels during the period of Site activities between 1960 and 1974.

2.1.2 Surface Water

The San Jacinto Nuevo y Potrero valley watershed is approximately 35 square miles and drains in a southwestern direction (Tetra Tech, 2002). The valley is roughly triangular in shape, and the valley floor covers approximately 800 acres. The valley is primarily drained by Potrero Creek, an ephemeral stream which follows the valley from north to south before turning southwest to pass through Massacre Canyon toward its convergence with the San Jacinto River. Potrero Creek is fed by local tributary drainage and storm water runoff from the city of Beaumont as well as other ephemeral streams in the southern and eastern portions of the Site. The largest of the tributary drainages is Bedsprings Creek, which is located southwest of the former RMPA and former BPA. In general, creeks are dry except during and immediately after periods of rainfall. However, springs and seeps occur in and adjacent to Potrero Creek in the western portion of the Site (Figure 2-1).

Numerous springs (as many as 50) were located in the valley prior to construction of the San Jacinto tunnel (located approximately 4,000 feet southeast and 500 feet lower in elevation than the former BPA) [Ransome, 1932; Leighton and Associates, 1983b]. It was reported that the number of springs in the valley was significantly reduced following completion of the tunnel in the 1930s.

Currently, there are two man-made ponds at the Site (Figure 2-1). The ponds were constructed in an area of shallow groundwater east of the Potrero Fault and appear to be sustained by a localized upward flow of groundwater within the pond excavations (Radian, 1992; Tetra Tech, 2002).

2.2 GEOLOGY

The following subsections describe the regional and local geology in the area of the Site based on previous investigations and reports.

2.2.1 Regional Geology

Regional geology and stratigraphy in the Site vicinity was mapped by Dibblee (1981) [Figure 2-4]. Geologic units present in the area, from youngest to oldest, include: the Mesozoic granitic/Paleozoic to middle Mesozoic age metasedimentary (Granitic/Metasedimentary) basement complex rocks; sedimentary deposits of the Pliocene to Pleistocene age Mount Eden Formation; overlain by the sedimentary San Timoteo Formation; and Quaternary alluvium (Radian, 1990).

2.2.2 Local Geology

The distribution of geologic units at the Site are consistent with the regional geologic mapping performed by Dibblee (1981) and Morton (Tetra Tech, 2010a, Appendix L). In general, there are 4 stratigraphic units that exist beneath the Site which are described below from youngest to oldest: Quaternary alluvium, the San Timoteo formation, the Mount Eden formation (weathered and unweathered portions), and the Granitic/Metasedimentary basement complex. A geologic cross section location map is presented in Figure 2-5. Figure 2-6 presents a cross section situated down the axis of the contaminant plume, and illustrates the subsurface geology showing the inferred contacts between the granite/metamorphic basement complex and the Mount Eden Formation and overlying alluvium. Faults are projected through the site based on recent mapping conducted by Douglas Morton (Tetra Tech, 2010a, Appendix L). Figures 2-7 through 2-12 present cross sections of the geologic contact of the Mount Eden Formation and the overlying alluvium along lines approximately perpendicular to cross-section A-A'(Figure 2-6).

Quaternary Alluvium

Quaternary alluvium was deposited as a result of erosion and subsequent infilling of channels in older underlying rocks, predominantly the Mount Eden Formation (Radian, 1992). The present day surface of the alluvium within the valley slopes gently towards existing stream channels and is then incised about 5 to 15 feet along Bedsprings Creek and its tributaries and up to 30 feet or more in the northern portion of Potrero Creek. The alluvium extends laterally to the edges of valley and up stream channels to the north and a short distance up the stream channels on the south and east sides of the valley. To the southwest, alluvium becomes narrower along Potrero Creek towards the entrance of Massacre Canyon and is not present in lower reaches of the canyon where the stream course is less than 50-feet wide (Radian, 1992).

At the Site, alluvium is predominantly sand and silty sand with interbedded gravels, sands, silts, and clays, with the predominant lithologies being sand and silty sand (Radian, 1992). In general, the base of the alluvium is predominately coarser grained intermixed with silt and/or clay and finer grained material at shallower depths. In northern and western portions of the valley, the alluvium is finer grained where source material is the finer grained San Timoteo Formation (a very fine-grained siltstone to medium-grained silty sand). In the northeastern portion of the valley where the source material is the Mount Eden Formation or granite/metamorphic basement rocks, the alluvium is generally fine to coarse grained.

As expected with alluvial deposits, the lithology is laterally heterogeneous and inferred lenses occur which usually cannot be correlated between borings. Coarse grained materials including pebbles and gravels are present at various depths and tend to be more prominent towards the center of the valley than on the fringes. In the eastern portion of the Site, near the former RMPA and former BPA, fine grained sediments including silts and sandy silts, ranging in thickness from 10 to 25 feet, were observed in shallow alluvium. In addition, a 10- to 15-foot clay layer was observed in the central portion of the valley near the convergence of Potrero Creek and Bedsprings Creeks.

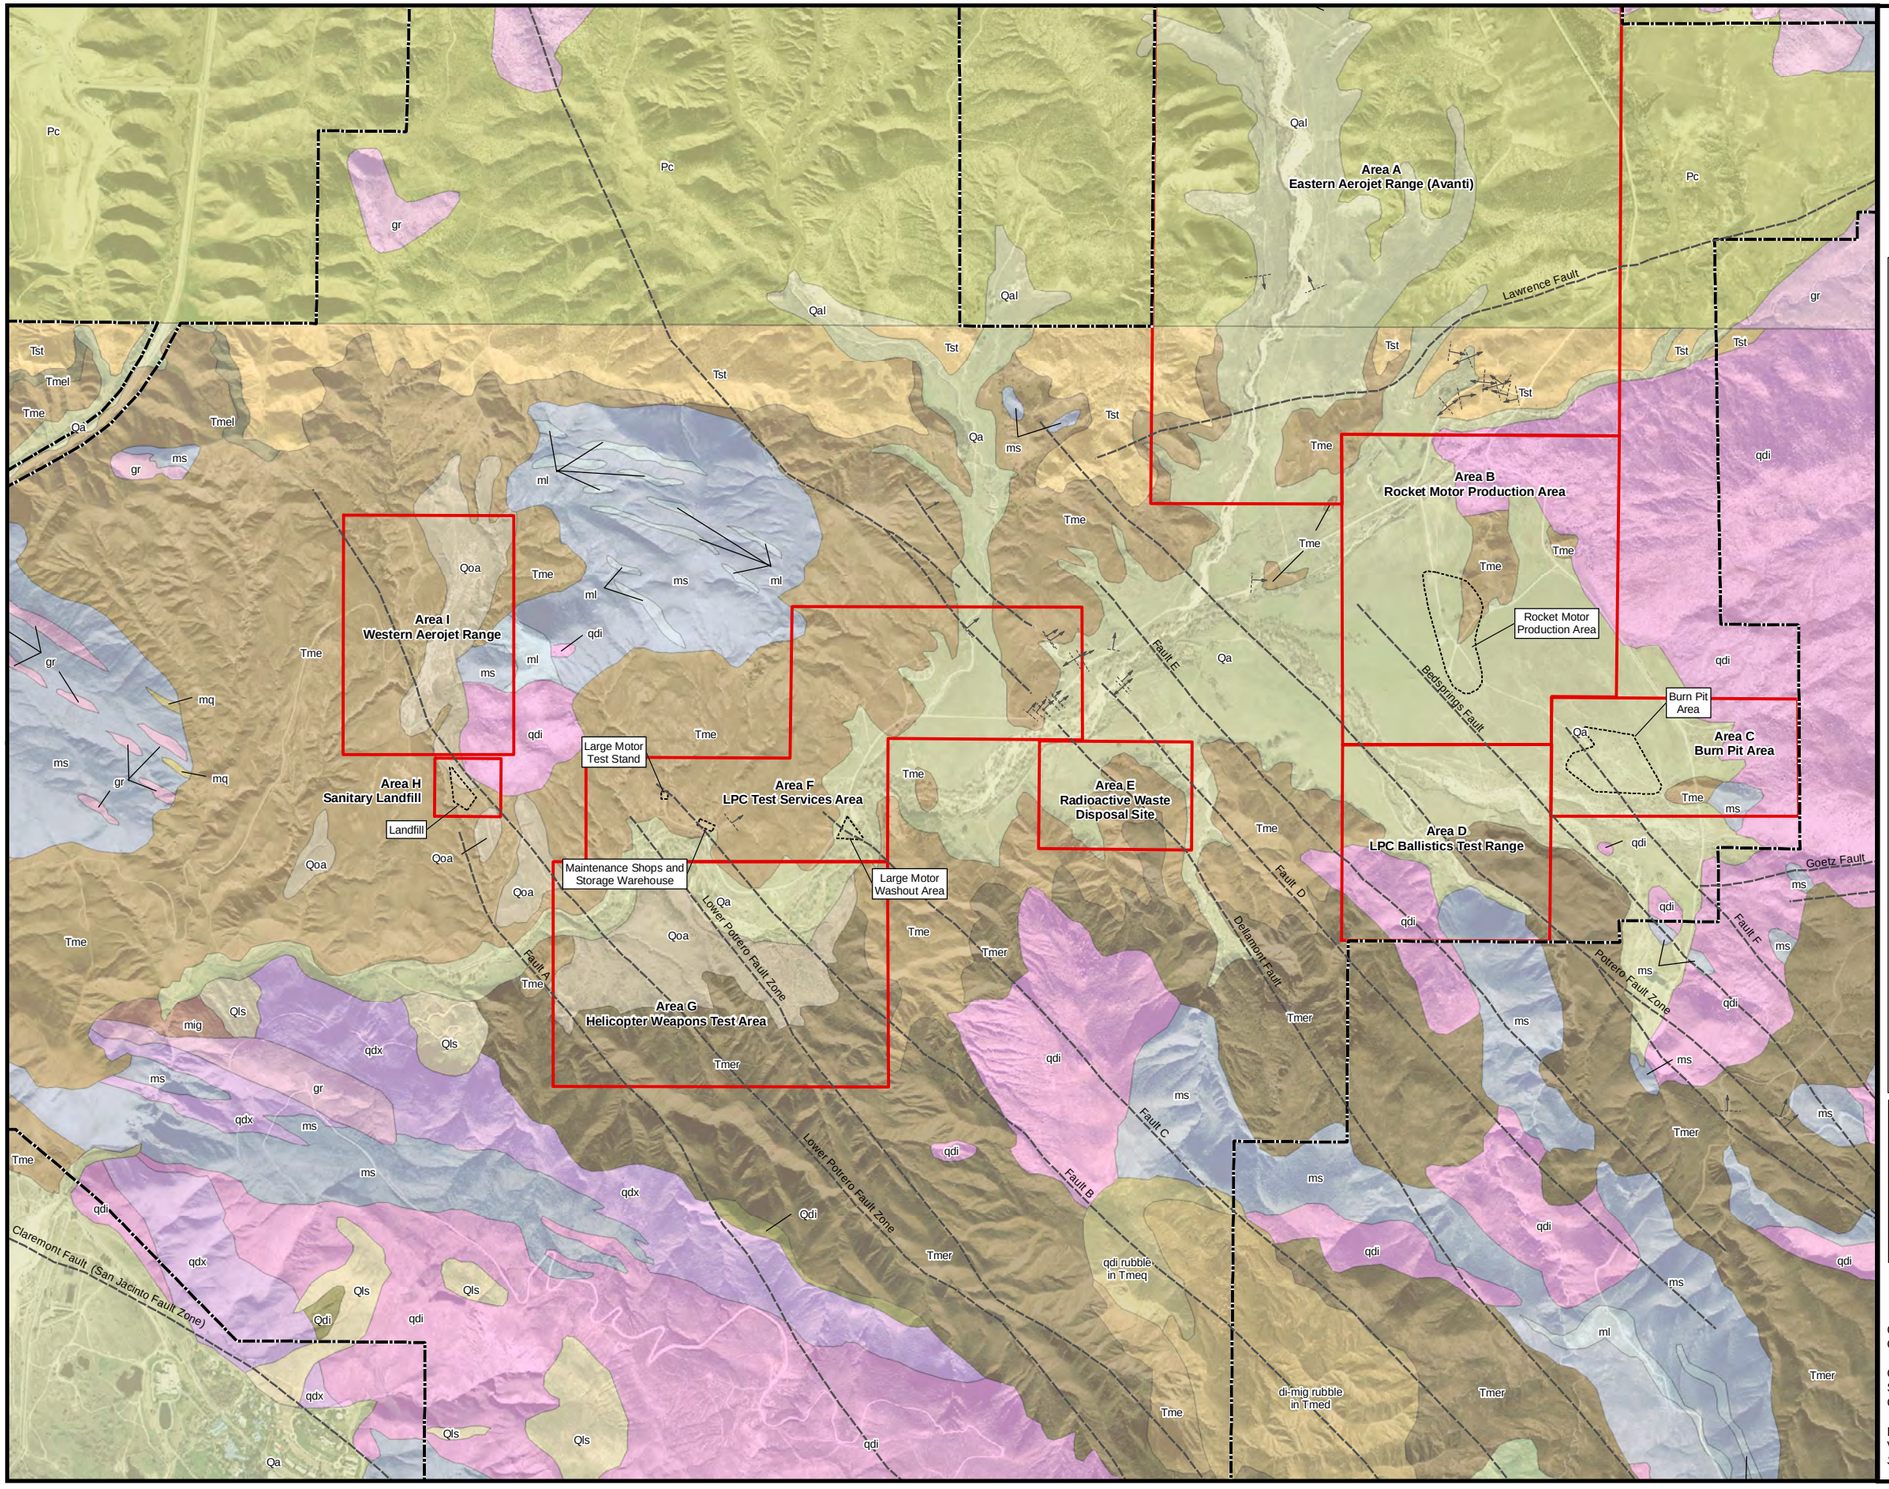
San Timoteo Formation

The San Timoteo formation (Domenico, 1931), of Upper Pliocene or Pleistocene age (Dibblee, 1981), is primarily composed of poorly indurated, greenish-gray interbedded sandstone, siltstone, shale, claystone, and minor conglomerates (Leighton and Associates, 1983a). The San Timoteo formation crops out at higher elevations north of the Potrero Valley. The San Timoteo formation is not present in the main portion of the valley and is therefore not significant in the local geologic setting of the Site.

Mount Eden Formation

The varying thickness of the Mount Eden Formation at the Site is the result of faulting and erosional topography of the pre-Pliocene bedrock surface (Radian, 1992). Similarly, the irregular Mount Eden Formation/alluvium contact is a result of erosional features combined with displacement and/or offset from faulting in the area.

Stratigraphic information for the Mount Eden Formation is primarily limited to the former BPA and former RMPA since only a few borings west of the former RMPA (topographically and hydro-geologically downgradient) have penetrated the unit. Where exposed, the Mount Eden Formation forms steep sided ridges around the perimeter of the valley. Where encountered in boreholes, the Mount Eden Formation varies from consolidated to loose and is similar to the overlying alluvium. Locally, the Mount Eden Formation is primarily fine to coarse-grained, reddish to reddish-gray sandstone with isolated



gravelly lenses. Beneath the former BPA and near the former RMPA, similar rounded or flat-topped steep-sided ridges extend into the valley in the subsurface.

Granitic and Metasedimentary Rocks

The basement complex is composed of metasedimentary and granitic rocks which underlie the entire site. The granitic and metasedimentary rocks are exposed in the hills to the north, south, and east and along the eastern side of the Potrero Valley. Previous studies in the region have reported that the metasedimentary and granitic rocks are fractured and jointed due to faulting in the area.

The metasedimentary rocks primarily consist of foliated, gray, micaceous schists and pink to gray gneiss along with some marble and quartzite (Radian, 1992). The metasedimentary rocks are the oldest rock unit at the Site and occur as isolated exposures within the granitic rocks. The metasedimentary rocks are exposed at two small areas along the southeast and northwest edges of the valley. The Mesozoic granitic basement rocks consist primarily of granodiorite and quartz diorite described by Miller (1944) as the San Jacinto Granodiorite. The granitic rocks which are exposed primarily in the eastern and southern portions of the valley originated as intrusions into the older metasedimentary rocks. The granitic rocks are directly overlain by the San Timoteo formation in the northern part of the site and by Quaternary age alluvium in the northeastern portion of the valley. In the southern and western portions of the valley, the granitic basement material is directly overlain by the Mount Eden formation.

Geology from Dibblee, 2003

SURFICIAL SEDIMENTS

Alluvial sediments, unconsolidated, undissected

- Qa — Alluvial sand and clay of valley areas, covered by gray soil, includes stream channel gravel and sand in mountain area

LANDSLIDE DEBRIS

- Qls — Landslide of rock rubble

OLDER SURFICIAL SEDIMENTS

Dissected older alluvial deposits, slightly indurated, undeformed, late Pleistocene age

- Qoa — Alluvial gravel and sand of low terrace remnants Qog Alluvial gravel and sand of high terrace remnants

SAN TIMOTEO FORMATION

(of Frick, 1921), only lowest part exposed at north border in this quadrangle, weakly lithified; age, Pliocene

- Tst — Sandstone, light gray to tan, arkosic, includes thin layers and interbeds of gray cobble - pebbled conglomerate of mostly granitic detritus

MOUNT EDEN FORMATION

(of Fraser, 1931), moderately lithified, derived from basement rocks of San Jacinto Mountains; age upper Miocene

- Tme — Sandstone, light orange - red, bedded, arkosic, includes thin layers of reddish claystone and lenses of pebble - cobble conglomerate, gray, of unsorted boulders and cobbles of granitic rocks (qdi), lower part west of Massacre Canyon includes much pebble-cobble conglomerate
- Tmer — Conglomerate - fanglomerate, reddish gray-brown of poorly to unsorted sub-granitic (qdi and qdx) detritus in sandy matrix, vaguely bedded

PLUTONIC ROCKS

Medium grained holocrystalline granitic rocks of San Jacinto Mountains, part of Peninsular Range batholith, of Cretaceous age

- gr — Granite of Mount Eden (of Morton and Matti, 2001, granite to quartz monzonite, eucocratic, graywhite, hard, massive, of quartz, potassic feldspar and sadie plagioclase feldspar in nearly equal amounts, and less than 5% mica, mostly muscovite; intrusive as large pod into unit xqd at Massacre Canyon and as small pods in ms to northwest
- qdi — Quartz diorite, ranges to granodiorite, leucocratic light gray, composed of about 1/3 quartz, 1/2 sadie plagioclase feldspar, less than 1/4 potassic feldspar, and 5-10% biotite, minor hornblende, massive to faintly gneissoid, contains few small dark gray discoid inclusions (xenoliths); most widespread rock of San Jacinto Mountains
- qdx — Quartz diorite, gray, massive to gneissoid, composed of about 1/4 quartz, 1/2 sadie plagioclase feldspar, less than 1/4 potassic feldspar, 5-15% biotite and hornblende; contains few to abundant dark gray discoid inclusions (xenoliths) oriented parallel to gneissoid structure of rock; includes migmatized remnants of schist-gneiss (ms) in many places

METASEDIMENTARY ROCKS

Rocks crystallized at depth from deformed sedimentary rocks, mostly argillaceous, of Paleozoic? of Mesozoic? age

- ml — Marble, white to light gray, fine-grained crystallized from limestone or dolomite
- ms — Schist, dark gray, fine-grained, foliated, of mica (mostly biotite), feldspar and quartz, in some areas in part crystallized to fine grained gneiss

Geology from California Division of Mines and Geology, 1966

- Qal — Alluvium
- Pc — Undivided Pliocene nonmarine
- gr — Mesozoic granitic rocks
- ms — Pre-Cretaceous metasedimentary rocks

Faulting

Beaumont Site 1 is located at the eastern end of the San Timoteo Badlands of southern California, sandwiched between the San Andreas Fault to the north and the San Jacinto fault to the south. These dominant right-lateral strike slip faults create a counter-clockwise rotation in the block between the two faults whereby subsequent faulting is created that consists predominantly of northwest-southeast oriented strike slip faults. Several studies have been conducted at the Beaumont site to determine the structural relationship of faults to groundwater flow through the site. Based on the large number of monitoring wells at the site, water levels suggests that faults likely play some role in the movement of groundwater through the basin and therefore, play a role in the movement of contaminants at the site. Based on recent geologic mapping in the Site 1 area, 11 major northwest oriented faults have been mapped across the site along with one major east-west oriented fault. The northwest striking faults are part of the right-lateral strike slip fault complex that results from the counter-clockwise rotation that occurs in this block between the San Andreas and the San Jacinto fault systems. Of the 11 major faults that cross the site, five faults are located in an area where they could have some impact on the movement of impacted groundwater at the site. These include Fault D, Fault E, the Potrero fault, the Bedsprings fault, and Fault F. Mapping conducted by Dibblee (1981) showed the distribution of bedrock units, but lacked much detail on the faulting in the area. Leighton and Associates (1983a) used the bedrock distribution and the published faults of the time to define the structural relationships that were envisioned for the site. Recent mapping conducted as part of the site characterization studies for the Beaumont Site 1 area began with a review of geologic data collected during construction of the San Jacinto Tunnel (aqueduct) in the 1930s. From this detailed tunnel map and sections, faults and fractures noted in the tunnel were projected to the surface and then projected along strike to the area of Bedsprings and Potrero Creeks. Borehole data, geophysical data, and the detailed geologic mapping provide for a much better understanding of the subsurface geology of the area. In addition to locating a number of faults that cross the site in a northwest-southeast direction, field mapping also identified several locations where recent alluvium showed evidence of offset beds within the alluvium, providing indications that at least some of the faulting in the area is younger than originally thought and may play a role in controlling groundwater flow in the area.

2.3 HYDROGEOLOGY

Several previous reports discuss in detail the occurrence and movement of groundwater at the Site (Leighton and Associates, 1983b; Radian, 1990; Radian, 1992). A summary of general findings from these reports is provided in this subsection along with an update of current conditions based on recent investigations and data collected (Tetra Tech, 2006b).

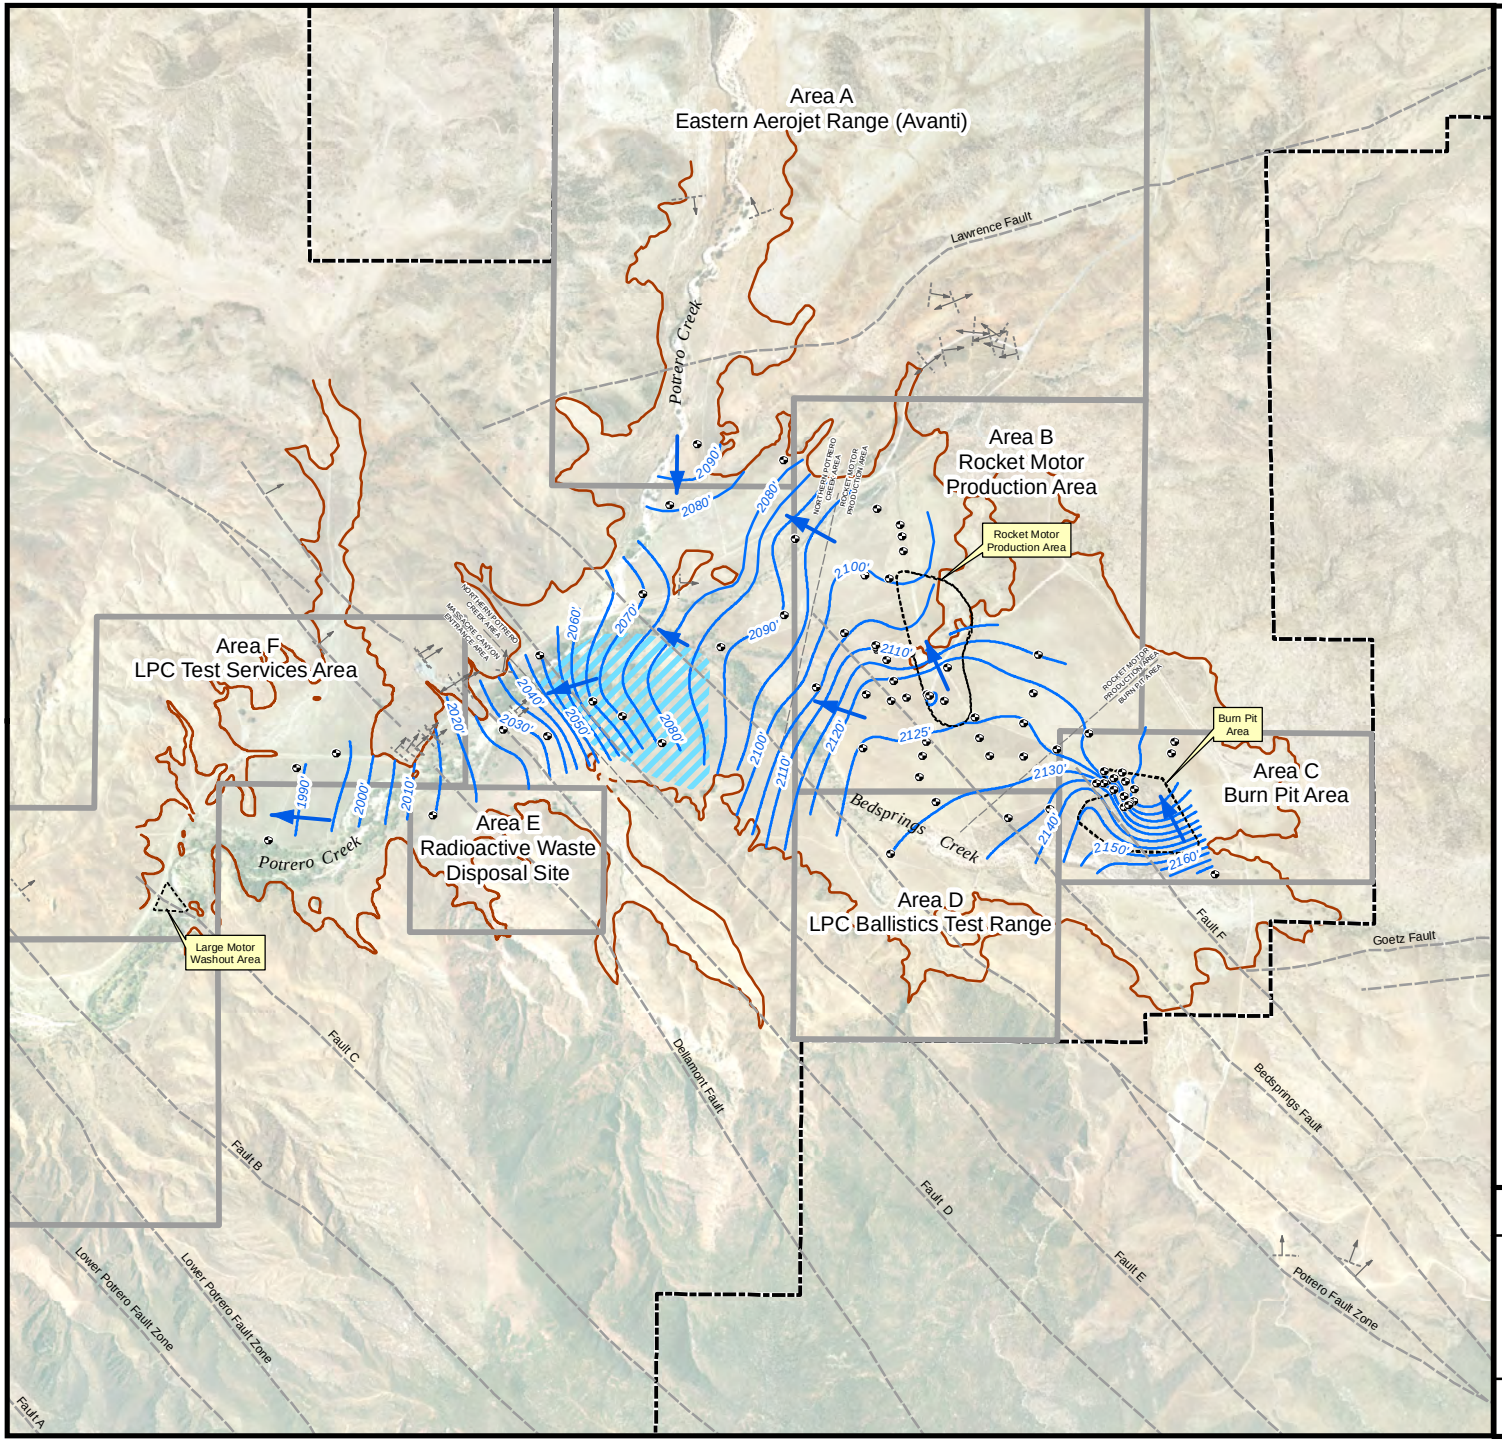
As discussed in Section 1.3, a geophysical survey was performed at the Site to help assess the possible influence of faulting on groundwater flow in and around the BPA. A complete description of the geophysical field activities and the results of the geophysical survey are provided in LMC Beaumont Site 1 Groundwater Monitoring Well Installation Work Plan (Tetra Tech, 2006b).

Groundwater occurs in each of the major geologic units beneath the Site; the Quaternary alluvium, Mount Eden Formation, and the Granitic/Metasedimentary basement complex. Groundwater is present in the alluvium in the majority of the valley except in areas where the underlying Mount Eden Formation rises above the surrounding water table. In general, groundwater is present in weathered and unweathered portions of the Mount Eden Formation, either where alluvium is not present at the water table or at depth below saturated alluvium.

Reportedly, during the drilling of deep borings into the Granitic/Metasedimentary basement complex, the groundwater encountered occurred only in fractures and joints at great depth (Radian, 1992). Based on monitoring wells screened in the Granitic/Metasedimentary basement complex rock, the water level ranges from 15 to 75 feet lower than water levels in nearby wells screened within the alluvium and weathered Mount Eden Formation. Previous studies indicated that portions of the Mount Eden Formation can act as a confining layer separating shallow unconfined groundwater from deep groundwater in the Granitic/Metasedimentary basement complex rocks (Radian, 1992).

In general, the GMP focuses on monitoring groundwater within the alluvium and the weathered Mount Eden Formation where affected groundwater is present. The highest concentrations of affected groundwater appear limited to these units and do not extend into the deeper Mount Eden Formation or Granitic/Metasedimentary basement complex.

Groundwater Flow



Shallow groundwater flow at the Site occurs mainly through alluvium and the shallow/weathered portion of the Mount Eden Formation. As indicated above, alluvium and the shallow/weathered portion of the Mount Eden Formation consist of alluvial deposits from former streambeds, floodplains, lakes, and alluvial fans. Although the alluvium and the shallow/weathered portion of the Mount Eden Formation are two different geologic units, potentiometric heads, water level responses to seasonal recharge, and water quality data indicate that the two units are in hydraulic communication.

Generally, groundwater flows northwest from the former BPA, beneath the former RMPA and towards Potrero Creek. Groundwater flow then trends southwest, and generally parallel to the flow direction of Potrero Creek, through the Northern Potrero Creek Area (NPCA) and into the Massacre Canyon Entrance

Area (MCEA). However, the groundwater flow direction from the former BPA downgradient through the former RMPA appears to change between periods of low precipitation (dry periods) and periods of high precipitation (wet periods). Groundwater contour maps for a wet period (March 2005) and a dry period (September 2006) are shown in Figures 2-13 and 2-14, respectively. As seen in Figure 2-13, during wet periods, groundwater flow from the former BPA has both westerly and north-northwesterly components. However, during dry periods the groundwater flow direction from the former BPA is more westerly (Figure 2-14). This seasonal change in flow direction likely is caused by increased recharge in the Bedsprings Creek area during wet periods and subsequent decrease in recharge during dry periods.

Since Second Quarter 2004, an additional 24 groundwater monitoring and 12 groundwater sampling events have been performed. Summarizing, subsequent groundwater monitoring and sampling results show:

- The highest concentrations of COPCs affected groundwater appear in groundwater samples collected from the former BPA, in the shallow Mount Eden Formation;
- Relatively low concentrations of COPCs have been reported in groundwater samples collected from wells screened in the deeper Mount Eden Formation, located downgradient and below wells screened in the shallow Mount Eden Formation;
- Generally, vertical groundwater gradients appear downward in the former BPA, fluctuate in the former RMPA, and upward in the NPCA and MCEA;
- Generally, COPC concentrations appear to decrease with depth in the alluvium and the shallow Mount Eden Formation; and
- Contaminants act as tracers and show the direction of groundwater flow and movement.

Hydraulic Conductivity

Hydraulic conductivity (K) values calculated for selected wells at the Site range from 0.08 to 319 feet per day (ft/day) [Tetra Tech, 2002]. Table 2-2 presents a summary of the K values. The K values for wells screened within the alluvium range from 0.24 to 319 ft/day and the average is 24 ft/day. The K values for wells screened within the Mount Eden Formation range from 0.11 to 67.8 ft/day and the average is 7.9 ft/day. The K value for well MW-32 screened in the Granitic/Metasedimentary basement complex rocks is 0.08 ft/day. The average K value for alluvium/shallow Mount Eden Formation screened wells is 19 ft/day and the average K value for deeper Mount Eden Formation/bedrock screened wells is 1.9 ft/day.

In general, higher K values were obtained from wells screened within the alluvium in the upper (eastern) and lower (western) portions of the valley and K values decrease with depth, with the exception of areas around well groups MW-05/MW-06, MW-15/MW-18 and MW-43/MW-45, which may be a result of coarser grained heterogeneities associated with stream deposits. Beneath the former BPA to the southeast terminus of the former RMPA, the Mount Eden Formation has lower K values. Beneath and immediately downgradient of the former RMPA, Mount Eden Formation K values increase and then decrease again towards the MCEA.

Table 2-2 Hydraulic Conductivity (K) Values

2.4 DISTRIBUTION OF AFFECTED GROUNDWATER

Identification of COPCs is an ongoing process that is conducted routinely to determine if the list of previously identified COPCs still meets the objectives of the GMP and regulatory requirements. The purpose for identifying COPCs is to establish a list of analytes that best represent the extent and magnitude of the affected groundwater and to focus more detailed analysis on those analytes. Every analytical method has a standard list of tested target compounds and by reducing the number of target compounds for a given analytical method, the volume of data generated can also be reduced. If sufficient historical analytical data is available, analytes that have not been detected, common laboratory and field contaminants, spurious or randomly detected analytes, and analytes associated with chlorinated potable water, can be removed from the list of target compounds. Primary COPCs are parent products such as TCE and 1,1,1-TCA and are always present with a secondary COPC. Secondary COPCs are breakdown products such as 1,1-dichloroethane (1,1-DCA) and 1,1-DCE and are detected at lower concentrations than their parent products. At this site 1,1-DCE, a breakdown product of 1,1,1-TCA, is detected at higher concentrations than 1,1,1-TCA so it is considered the Primary COPC and 1,1,1-TCA is considered a secondary COPC.

Based on Site history and the results of the groundwater monitoring performed at the Site, a list of primary COPCs was identified. Additional chlorinated compounds, which have also been routinely detected in groundwater samples, are considered secondary COPCs. Table 2-3 presents a list of those analytes detected in groundwater at the Site that are considered the primary and secondary COPCs (Tetra Tech, 2006a). The primary COPCs are considered representative of the overall Site, therefore this subsection is limited to describing the distribution of primary COPCs affected groundwater at the Site.

Table 2-3 Groundwater Chemicals of Concern (Tetra Tech, 2006a)

Analyte	Classification
Perchlorate	Primary
1,1-Dichloroethene (1,1-DCE)	Primary
Trichloroethene (TCE)	Primary
1,4-Dioxane	Primary
1,1-Dichloroethane (1,1-DCA)	Secondary
1,2-Dichloroethane (1,2-DCA)	Secondary
cis 1,2-Dichloroethene (cis 1,2-DCE)	Secondary
1,1,1-Trichloroethane (1,1,1-TCA)	Secondary
1,1,2-Trichloroethane (1,1,2-TCA)	Secondary
Vinyl chloride	Secondary

In general the Site 1 plume has remained relatively stable over time. Slight modifications to the definition of the plume over time are generally the result of newly installed wells better defining the lateral extent of

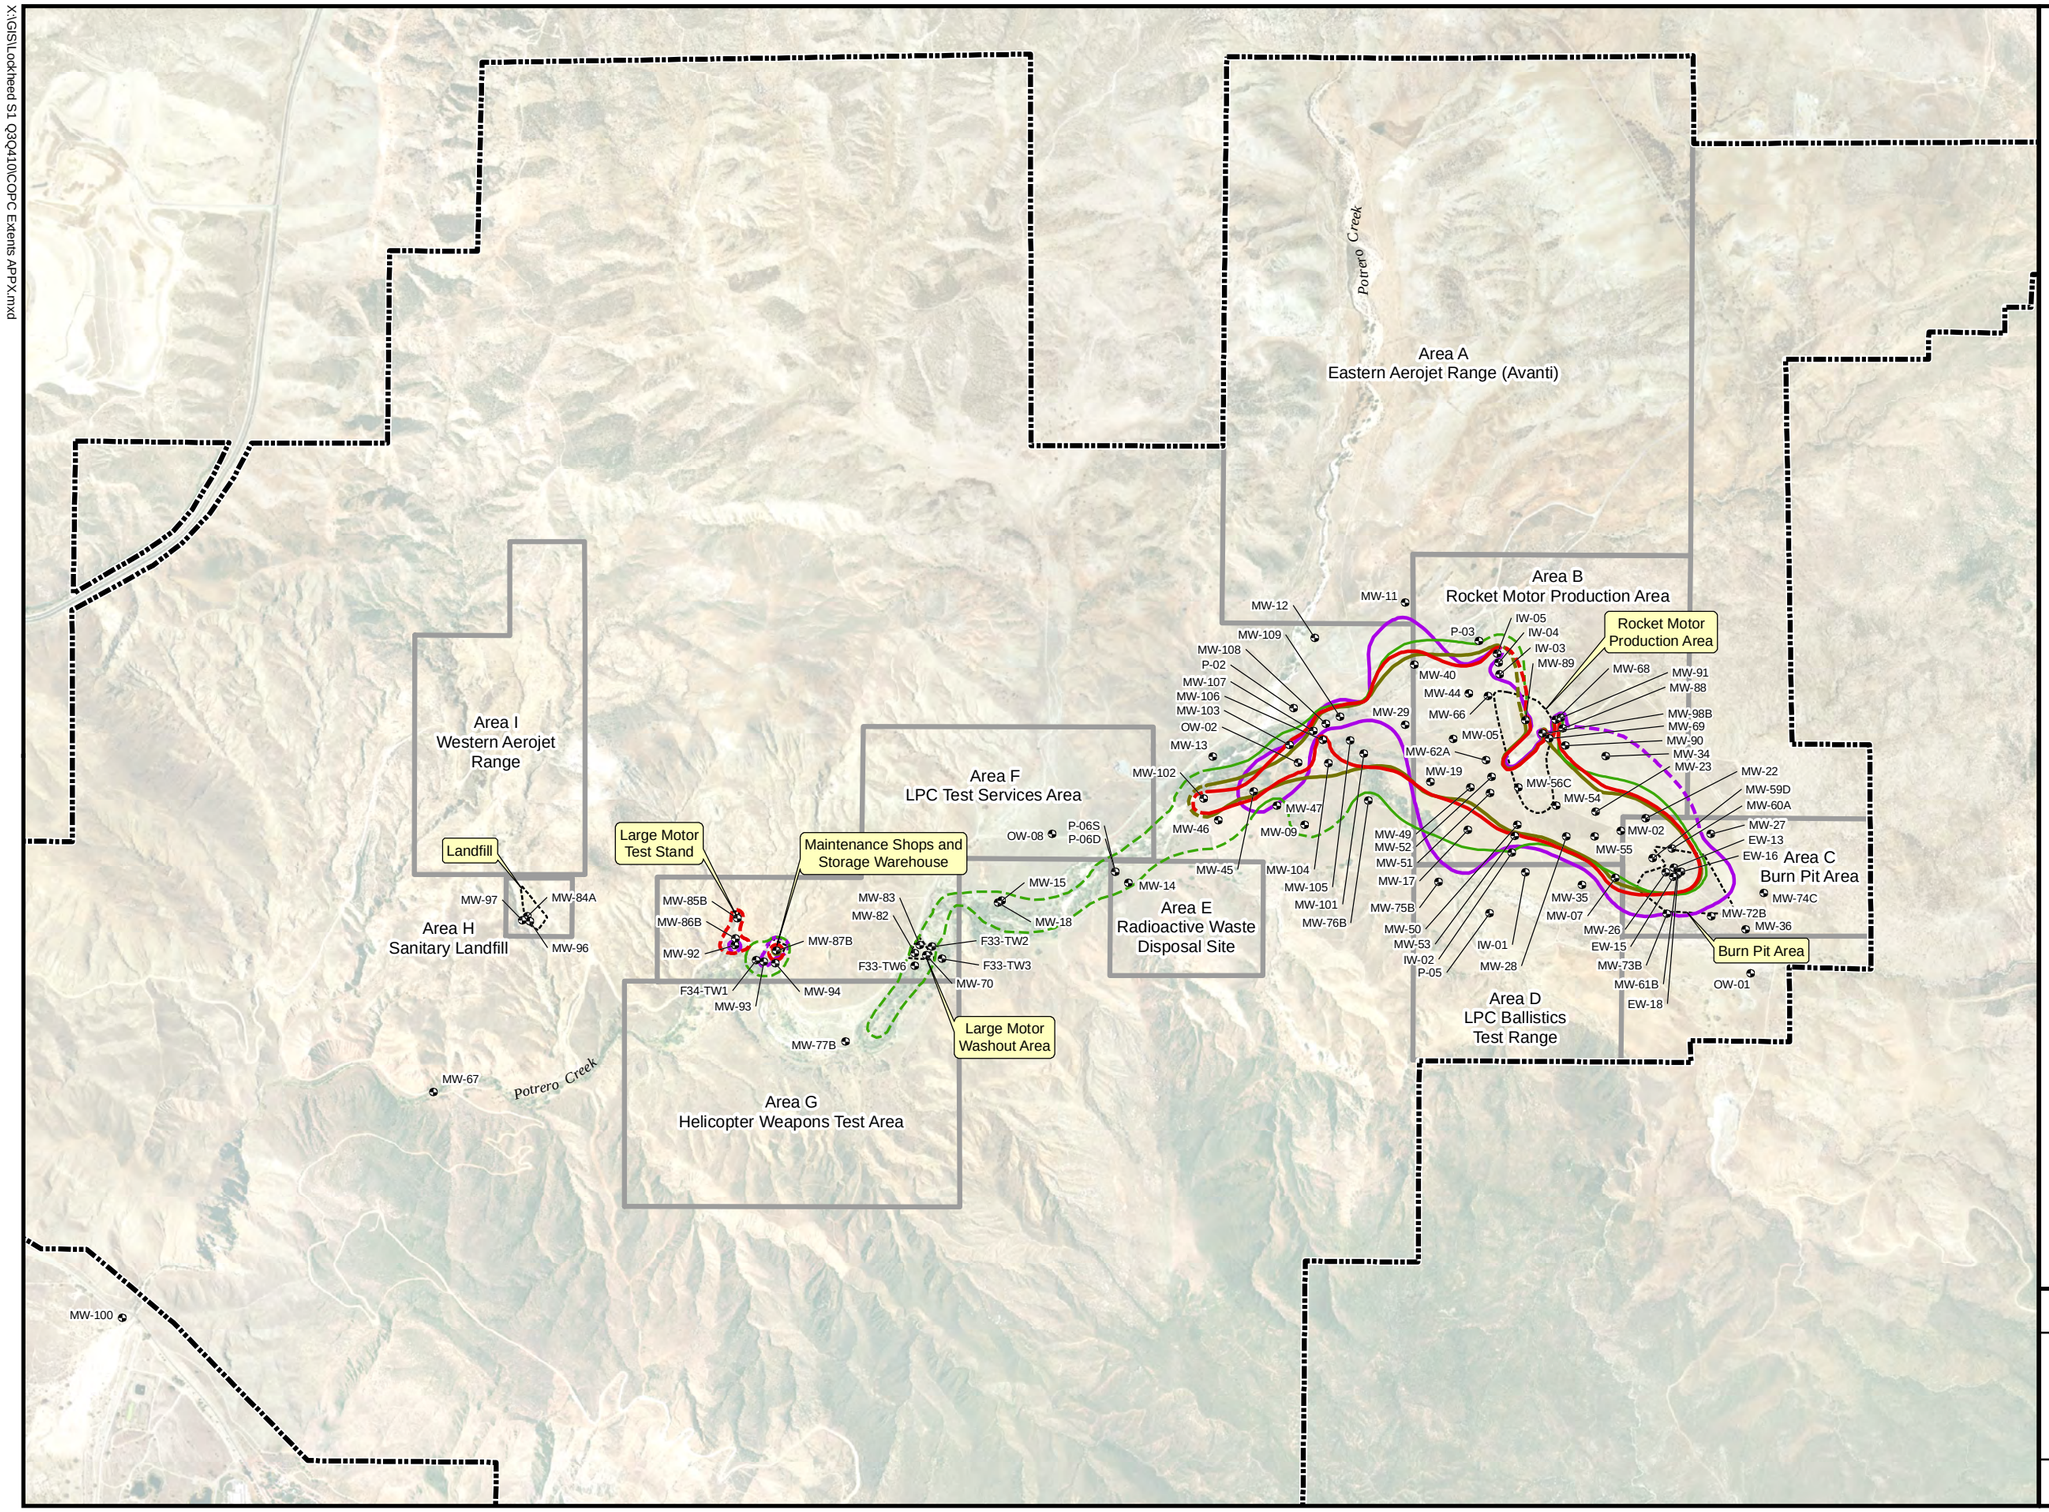
the plume. The extents of the primary COPCs are described in the following subsections and shown on Figure 2-15.

2.4.1 Perchlorate

The highest concentrations of perchlorate have consistently been reported in groundwater samples collected from shallow screened wells located in the former BPA and concentrations appear to rapidly decrease outside, and downgradient of, the footprint of the former BPA. Perchlorate was reported in groundwater samples collected from wells screened in the alluvium and shallow Mount Eden Formation. The concentration of perchlorate decreases with depth. Low level concentrations of perchlorate have been detected in groundwater samples collected from one deeper Mount Eden Formation well in the BPA. The source of perchlorate-affected groundwater appears to primarily be the former BPA. A secondary source may also be the former RMPA.

2.4.2 1,1-Dichloroethene

The highest concentrations of 1,1-DCE have consistently been reported in groundwater samples collected from shallow screened wells located in the former BPA. Groundwater concentrations appear to rapidly decrease outside, and downgradient of, the footprint of the former BPA. 1,1-DCE was reported in groundwater samples collected from wells screened in the alluvium, shallow Mount Eden Formation, and deeper Mount Eden Formation. The concentration of 1,1-DCE decreases with depth. Low level concentrations of 1,1-DCE have been detected in groundwater samples collected from all four of the deeper Mount Eden Formation wells with the highest concentrations detected in the former BPA. The source of 1,1-DCE affected groundwater appears to be the former BPA.



2.4.3 TCE

The highest concentrations of TCE have consistently been reported in groundwater samples collected from shallow screened wells located in the former BPA. Groundwater concentrations appear to rapidly decrease outside, and downgradient of, the footprint of the former BPA. TCE was reported in groundwater samples collected from wells screened in the alluvium, shallow Mount Eden Formation and deeper Mount Eden Formation. The concentration of TCE decreases with depth. Low level concentrations of TCE have been detected in groundwater samples collected from all four of the deeper Mount Eden Formation wells with the highest concentrations detected in the former BPA. The source of TCE affected groundwater appears to be the former BPA.

2.4.4 1,4-Dioxane

The highest concentrations of 1,4-dioxane have consistently been reported in groundwater samples collected from shallow screened wells located in the former BPA. Groundwater concentrations appear to rapidly decrease outside, and downgradient of, the footprint of the former BPA. 1,4-Dioxane was reported in groundwater samples collected from wells screened in the alluvium, shallow Mount Eden Formation, and deeper Mount Eden Formation. The concentration of 1,4-dioxane decreases with depth. Low level concentrations of 1,4-dioxane have been detected in groundwater samples collected from two of the deep wells with the highest concentrations detected in the RMPA. The source of 1,4-dioxane affected groundwater appears to be the former BPA.

2006b Groundwater Monitoring Well Installation Work Plan, Lockheed Martin Corporation, Beaumont Site 1. November 2006.2008b Supplemental Soil Investigation Report Historical Operational Areas A, B, C, D, F, G and H, Lockheed Martin Corporation, Beaumont Site 1. May 2008.

2008c Dynamic Site Investigation Work Plan, Lockheed Martin Corporation, Beaumont Site 1, Beaumont, California. May 2008.2009a Semiannual Groundwater Monitoring Report, Third Quarter and Fourth Quarter 2007, Lockheed Martin Corporation, Beaumont Site 1. March 2009.

2010a Semiannual Groundwater Monitoring Report, First Quarter and Second Quarter 2009, Lockheed Martin Corporation, Beaumont Site 1. October 2010.

2010b Groundwater Installation and Sampling Report, Lockheed Martin Corporation, Beaumont Site 1. 2008.

4.0 ACRONYMS AND ABBREVIATIONS

1,1 DCA	1,1 dichloroethane
1,2 DCA	1,2 dichloroethane
1,1 DCE	1,1 dichloroethene
1,1,1 TCA	1,1,1 trichloroethane
1,1,2 – TCA	1,1,2 trichloroethane
bgs	below ground surface
BPA	burn pit area
BTEX	benzene, toluene, ethylbenzene, and xylenes
CDPH	California Department of Public Health
COPC	chemical of potential concern
CSM	conceptual site model
cis 1,2-DCE	cis 1,2-dichloroethene
DO	dissolved oxygen
DWNL	California drinking water notification level
DTSC	Department of Toxic Substances Control
EPA	United States Environmental Protection Agency
Freon-113	1,1,2-trichloro-1,2,2-trifluoroethane
ft/day	feet per day
GMP	Groundwater Monitoring Program
K	hydraulic conductivity
MCL	Maximum Contaminant Level
MCEA	Massacre Canyon Entrance Area
MDLs	method detection limits
mg/kg	milligrams per kilogram
mg/L	milligrams per liter
µg/kg	micrograms per kilogram
µg/L	micrograms per liter
µg/L/yr	micrograms per liter per year
$\mu g/m^3$	micrograms per cubic meter of air

NA	not analyzed / not applicable
NPCA	Northern Potrero Creek Area
NWS	National Weather Service
PCBs	polychlorinated biphenyls
PCE	tetrachloroethene or perchloroethylene
PRG	Preliminary Remediation Goals
QA/QC	quality assurance/quality control
Radian	Radian Corporation, Inc.
RECs	recognized environmental concerns
RL	reporting limit (laboratory)
RMPA	Rocket Motor Production Area
SVOCs	semi-volatile organic compounds
Tetra Tech	Tetra Tech, Inc.
TCE	trichloroethene
TPH	total petroleum hydrocarbons
VOCs	volatile organic compounds

Colorimetric test (taken prior to sampling) Alkalinity (ppm): — Fe^{+2} (ppm): — D.O. (ppm): —

Water level at time of sampling (ft btoc): 79.37 Turbidity at time of sampling: 33.8

Pump Settings: CPM: 2 PSI: 55 Recharge: 26 Discharge: 4

Comments:

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:

If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:

If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Comments: _____

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:

If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Colorimetric test (taken prior to sampling) Sulfide (mg/L): 0.05 Fe^{+2} (mg/L): 0.0 D.O. (ppm):

Water level at time of sampling (ft btoc): 81.48 Turbidity at time of sampling: 12.30

Pump Settings: CPM: 2 PSI: 58 Recharge: 26 Discharge: 4

Comments:

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:
If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.
All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.
If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.
Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Pump Settings: CPM: 2 PSI: 45 Recharge: 22 Discharge: 8

Comments: _____

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:
If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.
All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.
If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.
Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Water level at time of sampling (ft btoc): 6.21 Turbidity at time of sampling: 1.40

Pump Settings: CPM: — PSI: — Recharge: — Discharge: —

Comments: ____

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:

If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Colorimetric test (taken prior to sampling) Sulfide (mg/L): 0.0 Fe^{+2} (mg/L): 0.03 D.O. (ppm): _____

Water level at time of sampling (ft btoc): 29.67 Turbidity at time of sampling: 0.64

Pump Settings: CPM: 3 PSI: 25 Recharge: 11 Discharge: 9

Comments: _____

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:
If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.
All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.
If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.
Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Colorimetric test (taken prior to sampling) Sulfide (mg/L): 0.01 Fe^{+2} (mg/L): 0.06 D.O. (ppm):

Water level at time of sampling (ft btoc): 81.60 Turbidity at time of sampling: 0.62

Pump Settings: CPM: 2 PSI: 50 Recharge: 25 Discharge: 5

Comments:

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:
If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.
All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.
If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.
Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:

If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Pump Settings: CPM: — PSI: — Recharge: — Discharge: —

Comments:

PARAMETERS FOR WATER QUALITY STABILIZATION	
Temperature collect readings	Conductivity ± 3 %
pH ± 0.1	DO ± 0.3 mg/L
Turbidity < 10 NTUs (if > 10 NTUs ± 10 %)	
WL ± 0.1 foot	ORP ± 10 mV

Note:

If volatiles are detected in the breathing zone during the initial screening, the breathing zone will be periodically monitored during purging and sampling activities.

All water levels and pump depths are measured from the reference point (notch) in the top of the well casing.

If no reference point is observed then the casing high point should be notched and measurements should be collected from this point.

Every attempt should be made to limit water level drawdown to less than 0.33 feet and purge rate to less than 0.5 L/min.

Notes:

HSU - Hydrostratigraphic unit
TOC - Top of casing.
TOS - Top of screen.
BOS - Bottom of screen.
PVC - Polyvinylchloride.
SS - Stainless steel.
NA - Not available
* - Well destroyed
QAL - Quaternary alluvium.
QAL/MEF - Quaternary alluvium/weathered Mt Eden formation.
MEF - Mount Eden formation.
Granite - Granite/Metamorphic Basement Material

Vapor monitoring well with permanent air line connector between TOS and well casing. Not usable for water level measurement, groundwater sampling, etcetera.

Beaumont Site 1

Notes:

HSU - Hydrostratigraphic unit
TOC - Top of casing.
TOS - Top of screen.
BOS - Bottom of screen.
PVC - Polyvinylchloride.
SS - Stainless steel.
NA - Not available
* - Well destroyed
QAL - Quaternary alluvium.
QAL/MEF - Quaternary alluvium/weathered Mt Eden formation.
MEF - Mount Eden formation.
Granite - Granite/Metamorphic Basement Material

Vapor monitoring well with permanent air line connector between TOS and well casing. Not usable for water level measurement, groundwater sampling, etcetera.

Beaumont Site 1

Notes:

HSU - Hydrostratigraphic unit
TOC - Top of casing.
TOS - Top of screen.
BOS - Bottom of screen.

PVC - Polyvinylchloride.
SS - Stainless steel.
NA - Not available
* - Well destroyed

QAL - Quaternary alluvium.
QAL/MEF - Quaternary alluvium/weathered Mt Eden formation.
MEF - Mount Eden formation.
Granite - Granite/Metamorphic Basement Material

Vapor monitoring well with permanent air line connector between TOS and well casing. Not usable for water level measurement, groundwater sampling, etcetera.

Beaumont Site 1
Well Construction Summary

Well ID	Date Installed	Formation Screened	Elevation (TOC, feet)	Depth to TOS (feet)	Depth to BOS (feet)	Screen Length (feet)	Reported Borehole Depth (feet)	Borehole Diameter (inches)	Casing Diameter (inches) & Material	Screen Slot Size (inches) & Material	Drilling Method	Filter Pack	Northing Coordinate	Easting Coordinate

APPENDIX F HORIZONTAL AND VERTICAL GRADIENTS

Beaumont Site 1
HorizontalGroundwater Gradients

Overall Groundwater Gradient (MW-36 -> BPA -> RMPA -> NPCA -> MCEA -> MW-18)

Date	MW-36 GW Elev.	MW-18 GW Elev.	Horizontal Dist. (feet)	GW Gradient (feet/foot)
Dec-04	2107.72	1989.73	11,193	0.011
Mar-05	2174.42	1986.56	11,193	0.018
Jun-05	2149.37	1985.82	11,193	0.015
Sep-05	2138.23	1984.17	11,193	0.014
Nov-05	2134.41	1983.41	11,193	0.013
Mar-06	2130.46	1983.70	11,193	0.013
May-06	2129.72	1983.66	11,193	0.013
Sep-06	2127.62	1981.57	11,193	0.013
Nov-06	2125.24	1980.96	11,193	0.013
Mar-07	2123.03	1980.75	11,193	0.013
May-07	2121.04	1980.08	11,193	0.013
Sep-07	2119.01	1979.08	11,193	0.013
Nov-07	2118.18	1979.07	11,193	0.012
Feb-08	2125.50	1984.55	11,193	0.013
May-08	2137.24	1984.18	11,193	0.014
Aug-08	2130.41	1982.39	11,193	0.013
Dec-08	2124.54	1981.49	11,193	0.013
Feb-09	2121.60	1984.21	11,193	0.012
May-09	2131.76	1983.02	11,193	0.013
Aug-09	2127.09	1981.09	11,193	0.013
Nov-09	2123.26	1980.16	11,193	0.013
Mar-10	2149.17	1984.19	11,193	0.015
Jun-10	2142.00	1983.44	11,193	0.014
Sep-10	2131.58	1981.19	11,193	0.013
Dec-10	2125.28	1980.39	11,193	0.013

BPA Groundwater Gradient (MW-36 -> MW-2)

Date	MW-36 GW Elev.	MW-2 GW Elev.	Horizontal Dist. (feet)	GW Gradient (feet/foot)
Sep-05	2138.23	2122.23	2,086	0.0077
Nov-05	2134.41	2120.51	2,086	0.0067
Mar-06	2130.46	2118.55	2,086	0.0057
May-06	2129.72	2117.15	2,086	0.0060
Sep-06	2127.62	2115.33	2,086	0.0059
Nov-06	2125.24	2113.78	2,086	0.0055
Mar-07	2123.03	2111.99	2,056	0.0054

Notes:

GW Elev. - Groundwater elevation
Top SE - Top of screen elevation
Bot SE - Bottom of screen elevation
Wet SE - Wetted screen midpoint
Dist. SE - Distance between shallow and deep wetted screen midpoint
BPA - Burn Pit Area.
MCEA - Massacre Canyon Entrance Area.
NPCA - Northern Protero Creek Area.
RMPA - Rocket Motor Production Area.
QAL - Quaternary alluvium.
QAL/MEF - Quaternary alluvium / Mt Eden.
MEF - Mount Eden Formation.

APPENDIX H LABORATORY DATA PACKAGES

E.S.BABCOCK&Sons,Inc.
Environmental Laboratories est 1906

Client Name: Tetra Tech, Inc. - San Bernardino
Contact: Mark Feldman
Address: 301 E. Vanderbilt Way Suite 450
San Bernardino, CA 92408

Report Date: 30-Sep-2010

Analytical Report: Page 1 of 32
Project Name: Tetra-Tech Lockheed
Project Number: [none]

Work Order Number: A0I1181

Received on Ice (Y/N): Yes Temp: 4 °C

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Sample Identification

Lab Sample #	Client Sample ID	Matrix	Date Sampled	By	Date Submitted	By
A0I1181-01	LTB-091310 Beaumont Site 1, GW Sampling	Liquid	09/13/10 07:00	Jose R. Santoya	09/13/10 13:10	Jose R. Santoya

Notes and Definitions

A-01	See EPA 8270-SIM result for a more accurate quantitation of 1,4-Dioxane
J	Estimated value
NCALh	The sample result(s) are estimate(s). The instrument calibration verification result(s) were above laboratory acceptance criteria.
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Lab Sample #	Client Sample ID
P1009160-01	MW-70

Microseeps test results meet all the requirements of the NELAC standards or provide reasons and/or justification if they do not.

Approved By: Heather Hauser ***Date:*** 9.24.10

Project Manager: Heather Hauser

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.

Case Narrative: EDD
The percent recoveries for the batch MS/MSD analyses for volatile fatty acids could not be calculated because of the sample matrix.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Notes and Definitions

J	Estimated value
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
PblkJ	The analyte was detected in the Method Blank at a concentration between the MDL and the MRL.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

A0I1671-09	EW-15-Dup Beaumont Site 1, GW Sampling	Liquid	09/15/10 13:15	Jose R. Santoya	09/16/10 07:20	William Bayle

Note: For the 8270-1,4 Dioxane SIM analysis, sample results for A0I1671-08 and A0I1671-09 exceeded the upper calibration range of 100 ug/L. The laboratory was unable to dilute and re-extract the samples without additional sample volume. Client was notified and instructed the laboratory to report initial estimated results.

Note: Analyses RSK-175, AM23G, and AM20GAX were subcontracted to Microseeps. Microseeps data begins to appear on page 31.

Notes and Definitions

J	Estimated value
NOcal	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument.
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
QFpas	Follow-up result within laboratory acceptance criteria.
QMout	MS and/or MSD recovery did not meet laboratory acceptance criteria.
QOcal	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Notes and Definitions

J	Estimated value
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
QM-5X	Due to analyte concentration greater than or equal to 5 times the spike concentration, recoveries for the MS and/or MSD did not meet laboratory acceptance criteria.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Notes and Definitions

J	Estimated value
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Client Name: Tetra Tech, Inc. - San Bernardino
Contact: Mark Feldman
Address: 301 E. Vanderbilt Way Suite 450
San Bernardino, CA 92408

Report Date: 18-Jan-2011

Project Name: Tetra-Tech Lockheed
Project Number: [none]

Work Order Number: A1A0458

Received on Ice (Y/N): Yes Temp: 3 °C

Notes and Definitions

J	Estimated value
QM-5X	Due to analyte concentration greater than or equal to 5 times the spike concentration, recoveries for the MS and/or MSD did not meet laboratory acceptance criteria.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Notes and Definitions

J	Estimated value
QM-5X	Due to analyte concentration greater than or equal to 5 times the spike concentration, recoveries for the MS and/or MSD did not meet laboratory acceptance criteria.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Notes and Definitions

J	Estimated value
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
PblkJ	The analyte was detected in the Method Blank at a concentration between the MDL and the MRL.
QFnt	The referenced sample did not require this QC analyte, so a follow-up is not needed.
QMout	MS and/or MSD recovery did not meet laboratory acceptance criteria.
QRPDl	Analyte concentration was below range for valid RPD determination.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Microseeps test results meet all the requirements of the NELAC standards or provide reasons and/or justification if they do not.

Approved By: Heather Hauser (DH) ***Date:*** 1-17-11

Project Manager: Heather Hauser

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.

Project Number: TC#26205-01.0101

Work Order Number: A1A0848

Received on Ice (Y/N): Yes Temp: 3 °C

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Sample Identification

Lab Sample #	Client Sample ID	Matrix	Date Sampled	By	Date Submitted	By
A1A0848-01	LTB-011011 Beaumont Site 1 GW Sampling	Liquid	01/10/11 07:00	Jose R. Santoya	01/11/11 07:40	William Bayle

Notes and Definitions

J	Estimated value
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
PblkJ	The analyte was detected in the Method Blank at a concentration between the MDL and the MRL.
QFpas	Follow-up result within laboratory acceptance criteria.
QMout	MS and/or MSD recovery did not meet laboratory acceptance criteria.
QOcal	The concentration indicated for this analyte is an estimated value above the calibration range of the instrument.
QRPDl	Analyte concentration was below range for valid RPD determination.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.

Received on Ice (Y/N): Yes Temp: 3 °C

Notes and Definitions

J	Estimated value
N_HTc	Original sample was run within holding time. Sample was reanalyzed and confirmed the original results. Reanalysis was performed outside EPA recommended holding time due to QC failure in the original batch.
N-TOCd	Sample filtered and preserved at laboratory after 15 minute regulatory holding time.
PblkJ	The analyte was detected in the Method Blank at a concentration between the MDL and the MRL.
Q_NAe	QC result not available due to lab error.
QBLK	The method blank did not meet laboratory acceptance criteria.
QFpas	Follow-up result within laboratory acceptance criteria.
QM-3x	Due to analyte concentration greater than or equal to 3 times the spike concentration, recoveries for the metal MS and/or MSD did not meet laboratory acceptance criteria.
QMout	MS and/or MSD recovery did not meet laboratory acceptance criteria.
QMSD	The MS recovery and MS/MSD RPD met laboratory acceptance criteria. MSD recovery was not within range. MSD performed to assess precision data only.
QRPDl	Analyte concentration was below range for valid RPD determination.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

The analytical results reported here are reliable and usable to the precision expressed in this report. As required by some regulating authorities, a full discussion of the uncertainty in our analytical results can be obtained at our web site or through customer service. Unless otherwise specified, all results are reported on a wet weight basis.

As a valued client we would appreciate your comments on our service.
Please call customer service at (412)826-5245 or email customerservice@microseeps.com.

Subject: RE: ESB - EDDs for A1A0860 and A1A0672

Hi Lorenzo
I will have your EDDs in the morning.

Take a look at the attached coc. Is your sample ID, F##-TW3 a typo? Should it be F33-TW3?

Notes and Definitions

J	Estimated value
QM-5X	Due to analyte concentration greater than or equal to 5 times the spike concentration, recoveries for the MS and/or MSD did not meet laboratory acceptance criteria.
QRPDl	Analyte concentration was below range for valid RPD determination.
ND:	Analyte NOT DETECTED at or above the Method Detection Limit **(if MDL is reported)**, otherwise at or above the Reportable Detection Limit (RDL)
NR:	Not Reported
RDL:	Reportable Detection Limit
MDL:	Method Detection Limit

* / (Non-NELAP): NELAP does not offer accreditation for this analyte/method/matrix combination

Approval

Enclosed are the analytical results for the submitted sample(s). Babcock Laboratories certify the data presented as part of this report meet the minimum quality standards in the referenced analytical methods. Any exceptions have been noted. Babcock Laboratories and its officers and employees assume no responsibility and make no warranty, express or implied, for uses or interpretations made by any recipients, intended or unintended, of this report.

Attached is the analytical report for the sample(s) received for your project. Below is a list of the individual sample descriptions with the corresponding laboratory number(s). Also, enclosed is a copy of the Chain of Custody document (if received with your sample(s)). Please note any unused portion of the sample(s) may be responsibly discarded after 30 days from the above report date, unless you have requested otherwise.

Thank you for the opportunity to serve your analytical needs. If you have any questions or concerns regarding this report please contact our client service department.
