1. Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this Soil Vapor Monitoring Report for the former Unisys Facility ("the Site", Site No.130045) located at 1111 Marcus Avenue, Village of Lake Success, New York (Figure 1-1). This report presents data collected during the 2017 annual soil vapor monitoring event. Soil vapor samples were collected from nested wells located beneath and adjacent to the main iPark building. The soil vapor data from these nested points represent conditions at various depths, corresponding to the screened intervals of the nested wells. Paired soil vapor/indoor air samples were collected from select sub-slab monitoring points within the former foundry building, currently occupied by LA Fitness (LA Fitness building). This report presents a brief summary of site background, sampling methodology, sampling results, and an evaluation of the 2017 soil vapor from nested points under and around the main building and paired sub-slab and indoor air data at the LA Fitness building. Details of the inspection of the passive venting system installed at the LA Fitness building are included in the forthcoming quarterly OMM report, *Sub-Slab Depressurization System, Operations, Maintenance and Monitoring Report, March 1, 2017-May 31, 2017*.

The purpose of sampling the nested wells is to: (1) evaluate changes in volatile organic compound (VOC) concentrations in soil vapor at various depths; and (2) assess the levels of soil vapor contamination that may continue to exist beneath and outside the iPark building. The purpose of the paired sub-slab/indoor air sampling at the LA Fitness building is to assess the risk to building occupants from vapor intrusion. A revised *Soil Vapor and Vapor Intrusion Monitoring Work Plan 2017, Former Unisys Facility – Great Neck, Lake Success, New York* (Tetra Tech, 2017), detailing the nested well sampling, was submitted to the New York State Department of Environmental Conservation (NYSDEC) and New York State of Department of Health (NYSDOH) on January

20, 2017 and approved on February 13, 2017. This work plan is included as Appendix A of this report.

2. Site Description and Site History

2.1 SITE HISTORY

The Lockheed Martin Corporation (Lockheed Martin) former Unisys Facility ("the Site") was an active manufacturing facility from its startup in 1941 until approximately 1995, when most manufacturing activities ceased. Some activities, including limited assembly, integration, prototype development and testing, and/or engineering and administrative duties continued at the Site through early 1999. The former Unisys Facility was originally designed and built by the United States government and was operated under a contract with the Sperry Gyroscope Company (Sperry) from 1941 to 1951. In 1951, the property was sold to Sperry, which merged with Burroughs in 1986 to form the Unisys Corporation. In 1995, Loral Corporation (Loral) acquired the assets of Unisys Defense Systems, a division of Unisys Corporation. In early 1996, Loral's electronics and systems integration businesses were purchased by Lockheed Martin. The property was sold by Lockheed Martin in early 2000 to iPark, Lake Success, LLP (iPark), which converted the buildings to commercial rental space. The Former Unisys Facility occupies 90.5 acres that includes the main (iPark) building and three smaller buildings (LA Fitness, Power House, and the maintenance garage) located south of the iPark building. The iPark building and the LA Fitness building house several tenants that use the lease space for office areas, a small cafeteria, an outpatient hospital, distribution centers, maintenance spaces, and a fitness center. The site previously included 3.5 acres that were sold to the Town of North Hempstead, which are now used as soccer fields. The Power House continues to serve as the power distribution center. The majority of the garage has been converted into the active Sub-Slab Depressurization System (SSDS) process building. The remaining portions of the property consist of paved areas (parking lots), transformer

stations, and three storm water retention basins. A general layout of the Site, including major tenants occupying the first floor of the iPark building as of May 2017 is shown on Figure 2-1. Figure 2-2 shows the LA Fitness building along with monitoring locations highlighted.

In the past, the facility was used to manufacture a wide range of defense-related products including navigational systems for United States Navy nuclear submarines (Trident Program), navigational sonar equipment, radar tracking systems (North Warning System), and weather radar systems (NEXRAD). Past manufacturing processes included the following: metal casting, chemical etching, degreasing, plating, painting, metal finishing, machining, electronic circuit board manufacturing, and assembly. Chemicals used during manufacturing at the plant included halogenated and non-halogenated hydrocarbon solvents, cutting oils, paints, fuel oils, acids, caustics, and inorganic plating compounds. On May 1, 1991 New York State Department of Environmental Conservation (NYSDEC) designated the former Unisys Facility as a Class 2 site (No. 130045) in the registry of Inactive Hazardous Waste Disposal Sites in New York State.

2.2 BACKGROUND

In response to New York State Department of Health's (NYSDOHs) final Vapor Intrusion (VI) Guidance (NYSDOH, 2006), Lockheed Martin conducted an initial indoor air and sub-slab vapor investigation in 2007 (ARCADIS, 2008). In March 2008, a temporary Sub-Slab Depressurization System (SSDS), referred to as the eastern SSDS, was installed as an interim measure in the former Allstate space located in the northeast corner of the iPark building to address trichloroethene (TCE) concentrations above the NYSDOH indoor air guidance levels and elevated levels of other VOCs in the sub-slab vapor. In November 2008, another temporary SSDS, referred to as the central SSDS, was installed in the south-central portion of the iPark building (current Antech space) to address carbon tetrachloride concentrations above NYSDOH indoor air guidance levels and other elevated VOCs in the sub-slab vapor. Subsequent to these temporary SSDS installations, sub-slab

vapor and indoor air sampling events conducted between 2009 and 2013 demonstrated that VOC concentrations in indoor air were reduced to below the NYSDOH indoor guidance levels, and carbon tetrachloride, tetrachloroethene (PCE), and TCE concentrations in sub-slab vapor were either decreasing or remained constant.

To eliminate potential preferential pathways for sub-slab VOC migration into indoor air across the entire iPark building and the garage, Lockheed Martin prepared a Vapor Mitigation Conceptual Design (ARCADIS, 2010) to construct a site-wide SSDS in October 2010. Subsequent to NYSDEC approval of Vapor Mitigation Conceptual Design, the site-wide SSDS was constructed between August 2011 and June 2013. The temporary central and eastern SSDSs were connected to the site-wide SSDS, and the site-wide SSDS has been in continuous operation since September 2013. The design goal of the SSDS is to maintain a minimum of -0.004 inches of water column (in. WC) differential pressure between the sub-slab and the indoor air. The step tests conducted on selected SSDS extraction points and the 2014 annual nested well sampling results indicated that the SSDS extraction wells influence up to approximately 25 feet below ground surface (ft. bgs.) (CDM Smith, April 2014).

A passive SSDS was constructed in 2010 at the LA Fitness building. The system consists of a vent pipe and an air inlet pipe, which penetrates the basement area and extends to the roof. A wind turbine located on the top of the exhaust pipe allows for suctioning of the basement air, thereby introducing fresh air into the basement through the air inlet pipe. The inlet pipe also extends to the roof.

3. Sampling Methodology

This report presents the details of the two sampling events performed within the 2017 heating season including the soil vapor sampling event in and around the iPark, Lake Success, LLP (iPark) building, and the sub-slab vapor (SSV) and indoor air (IA) sampling event for the LA Fitness building. All sample locations and sampling methodologies are presented in the sections below. Field work for the 2017 sampling events were completed between February 15th and March 7th, 2017. All field activities conducted during the 2017 soil vapor, sub-slab, and indoor air sampling events were completed in accordance with the approved *Soil Vapor and Vapor Intrusion Monitoring Work Plan 2017, Former Unisys Facility – Great Neck, Lake Success, New York* (Tetra Tech, 2017) and the Tetra Tech, Inc. (Tetra Tech) site-specific Health and Safety Plan (HASP) (Tetra Tech, 2016).

3.1 SOIL VAPOR SAMPLING (IPARK BUILDING)

Between February 15th and March 7th, 2016, a total of 96 soil vapor and 11 duplicate samples were collected from 20 nested wells, located inside and outside of the IPark building (Figure 2-1). All samples were collected in accordance with the standard operating procedure (SOP) included in the *Soil Vapor and Vapor Intrusion Monitoring Work Plan 2017, Former Unisys Facility – Great Neck, Lake Success, New York* (Tetra Tech, 2017, included as Appendix A). Table 3-1 presents a summary of the soil vapor samples collected from nested wells. Each nested well contains two to eight distinct sampling intervals located at varying depths. Each sampling interval is constructed of a 1-inch diameter, 6-inch long vapor screen connected to a piece of Teflon tubing which runs to the surface. A sand pack fills the annular space around the sampling intervals and a bentonite plug creates a seal between the sampling intervals and the surface. Field duplicate samples were

collected at a frequency of 10 percent. A total of 11 field duplicate samples were collected. The primary and duplicate samples were obtained simultaneously using a "T" connection. All samples were collected with 6-liter Summa canisters collecting the sample over a 4-hour time period. Helium leak tests were conducted at 5 percent of total sample locations. Sample collection times were contingent on access from individual tenants for nested wells located inside the iPark building. Per the tenant request, nested wells within Northwell Health (Northwell) spaces were sampled over the weekend (February 26, 2017).

Vapor samples were collected using 6-liter, batch-certified stainless-steel Summa canisters equipped with 4-hour flow controllers, in-line particulate filters, and vacuum gauges. The samples were shipped with completed chain-of-custody forms to Pace Analytical Laboratories (Pace) in Minneapolis, Minnesota. The samples were analyzed for VOCs by modified Environmental Protection Agency (EPA) Method TO-15 on a standard turn-around-time basis. Analysis for Freon 22 and Freon 115 were added to the standard TO-15 list, consistent with previous sampling events. Sample results are discussed in Section 4.

3.2 PAIRED SUB-SLAB VAPOR AND INDOOR AIR SAMPLING (LA FITNESS)

The SSV and IA sampling event at LA Fitness was completed in accordance with the approved Work Plan, SOPs, and Tetra Tech site-specific HASP (Tetra Tech, 2016). On February 15, 2017 (while the passive venting system was in operation) 6 SSV, 6 IA, one basement air, one ambient air, and two duplicate samples were collected to evaluate concentrations of VOCs present in indoor air and sub slab soil vapor. The paired SSV and IA sample locations are shown on Figure 2-2.

SSV samples were collected using 6-liter, batch-certified stainless-steel Summa canisters equipped with 8-hour flow controllers, in-line particulate filters, and vacuum gauges. IA samples were collected using 6-liter, individually-certified stainless-steel Summa canisters equipped with 8-hour flow controllers, in-line particulate filters, and vacuum gauges. The samples were shipped with completed chain-of-custody forms to Pace in Minneapolis, Minnesota. The samples were analyzed for VOCs by the modified EPA TO-15 identified above.

4. Soil Vapor Results

The analytical results for the nested well soil vapor samples collected in 2017 are provided in Table 4-1. All of the laboratory data generated during the soil vapor sampling event were reviewed and validated by Tetra Tech, Inc. (Tetra Tech) in accordance with the New York State Department of Environmental Conservation (NYSDEC) guidance for Data Usability Reports (DUSR) and United States Environmental Protection Agency (USEPA) guidelines. Holding times, blank contamination, Gas Chromatography/Mass Spectrometry performance check (Tuning) summaries, internal standard area performance, initial and continuing calibration results, matrix duplicate/laboratory control samples and target compound identification, and quantitation were reviewed during this process. The quality assurance/quality control review did not result in the rejection or alteration of any sampling results, although some data are qualified as "estimated" and data qualifiers were added to the data when necessary. Overall, the data were found to be acceptable for evaluating indoor air quality when used with the appropriate qualifiers with the exception of non-detect sample results for the analyte chloropentafluoroethane in the laboratory deliverable 10381335. The complete set of analytical results and data validation forms are included in Appendix B. Sample collection logs completed during the sampling events are included in Appendix C.

Out of the 107 soil vapor samples (including duplicate samples) collected during the 2017 sampling event, tetrachloroethene (PCE) and trichloroethene (TCE) were detected in 94 and 95 samples, respectively. PCE concentrations ranged from non-detect to 430,000 microgram per cubic meter ($\mu g/m^3$), while TCE concentrations ranged from non-detect to 1,310,000 $\mu g/m^3$. One

sample interval, VP-105_32, was unable to be sampled due to water in line. This interval was not sampled in 2016 due to similar issues.

The annual soil vapor sampling results for PCE and TCE concentrations detected from 2011 to 2017 are shown on Figure 4-1. The 2014 to 2017 results represent soil vapor concentrations measured after the site-wide sub-slab depressurization system (SSDS) operation began in September 2013 with the SSDS operating at the time of sampling events. The lowest concentrations of PCE and TCE detected in soil vapor in 2017 were collected from sample locations outside of the iPark building, and beneath the iPark building, west of column 6.

Select locations outside of the iPark Building and away from the presumed source have generally exhibited low level detections of TCE and PCE. Comparable to historical sampling results, PCE and TCE were detected in 2017 at relatively low concentrations at nested wells FPM-20, VP-1, VP-4, and VP-103. However, the May 2017 revision of the NYSDOH Vapor Intrusion Guidance lowered the mitigation threshold for TCE in subslab soil vapors to 60 ug/m^3 (previously 250 ug/m^3). Deep interval samples below 25 ft. bgs. collected from VP-1 and VP-103 have TCE concentrations exceeding the new 60 ug/m^3 mitigation threshold for TCE.

PCE and TCE were not detected or detected at very low concentrations at samples collected from shallow depths (< 25 feet) in nested wells VP-102 and VP-103 located beneath the iPark building west of column 6. Concentrations increase at sample intervals beyond twenty feet (the approximate effective depth of the SSDS), and, aside from PCE detections at VP-102 in intervals between 51ft. bgs. and 61ft. bgs., remain below their respective NYSDEC mitigation threshold. The VOC concentrations were well below the DOH VI Guidance for sub slab mitigation for all shallow sampling intervals.

Consistent with previous sampling events, PCE and TCE concentrations are elevated near the center and toward the southeast corner of the building. The soil vapor concentrations of PCE and TCE in the upper vadose zone (0.0- 25 ft. bgs.) detected in 2017 are generally similar to results from 2016. Concentrations of PCE and TCE detected in 2017 remain lower than pre-SSDS concentrations, confirming the effectiveness of the SSDS at removing these VOCs in soil vapor. The highest PCE and TCE concentrations remain within the deeper vadose zone, generally around the 30 to 50 ft. bgs. interval. Generally, PCE and TCE concentrations in the deeper vadose zone are higher in 2017 than in the 2016 sampling event. The vertical distribution of PCE and TCE below the central portion of the building is shown on the cross-sections provided on Figures 4-2 to 4-6.

Within the deep vadose zone, 2017 results indicate a reduction in TCE and PCE concentrations at LIJ-VP-7 at the 30-, 40-, and 50-foot interval when compared to data from 2016. An additional decrease in TCE concentration was reported at VP-107 at the sample intervals deeper than 20 feet.

As shown on Figure 4-1, increases in PCE and TCE concentration in the deep vadose zone were reported in 2017 when compared to 2016. The largest concentration increases were reported at the 40-foot interval at VP-9 and the 40- and 50-foot interval at VP-NYSDEC-5. As demonstrated in the Perched Water Investigation (Arcadis, 2011), various fine–grained, low permeability soils and perched water exist at these depths, and may be limiting vertical migration of vapors to the upper vadose zone. As a result, a pooling of chlorinated VOCs (CVOCs) in soil vapor may exist at these locations.

5. Indoor Air and Sub-Slab Vapor Results – LA Fitness

Results of the 2017 heating season sub-slab vapor (SSV) and Indoor Air (IA) sampling event in LA Fitness are presented in Table 5-1 and Figure 5-1. All laboratory data were reviewed and validated by Tetra Tech, Inc. (Tetra Tech) in accordance with the New York State of Environmental Conservation (NYSDEC) guidance for Data Usability Reports (DUSR) and United State Environmental Protection Agency (USEPA) guidelines. Holding times, blank contamination, Gas Chromatography/Mass Spectrometry performance check (Tuning) summaries, internal standard area performance, initial and continuing calibration results, matrix duplicate/laboratory control samples and target compound identification, and quantitation were reviewed during this process. The quality assurance/quality control review did not result in the rejection or alteration of any sampling results, although some data are qualified as "estimated" and data qualifiers were added to the data when necessary. Overall, the data were found to be acceptable when used with the appropriate qualifiers. Non-detected results were reported to the reporting limits. The complete set of analytical results and data are included in Appendix D. Sample collection logs completed during the sampling event are included as Appendix E. The results were provided to the building owner and tenants on May 31, 2017, within 30 days of data validation. A copy of the summary letters provided to the building owner and tenants is provided in Appendix F.

The analytical results for SSV samples indicate that tetrachloroethane (PCE) and trichloroethene (TCE) were detected above the reporting limits in all SSV samples collected in 2017. PCE and TCE concentrations ranged from 8.9 micrograms per cubic meter ($\mu g/m^3$) to 644 $\mu g/m^3$ and 2.3

µg/m^3 to 90.9 µg/m^3, respectively. TCE detections at locations SS-C1 and SS-D7 are above the May 2017 mitigation threshold for TCE in subslab soil (60 ug/^{3}).

TCE was not detected in any IA or ambient air samples collected during the 2017 SSV and IA sampling event. PCE was detected at all six of the IA samples. The detections ranged from 1.2 µg/m^3 and to 1.4 µg/m^3, all of which are below the New York State Department of Health (NYSDOH) Matrix 1/Matrix 2 indoor air mitigation threshold of 30 µg/m^3 and 2 µg/m^3, respectively. PCE was also detected in the ambient air sample (collected during the indoor air sampling event) at a concentration of 1.2 µg/m^3. The presence of PCE detected in the ambient air means that the measured indoor air concentration is likely the result of background conditions.

In basement air sample IA-12 (previously labeled SS-12 in 2016), PCE and TCE were detected at 8.4 µg/m^3 and 4.0 µg/m^3, respectively, both well below the NYSDOH mitigation thresholds for sub-slab vapor of 1,000 µg/m^3 and 60 µg/m^3, respectively. The continued detection of low levels of PCE and TCE in basement air confirms the effectiveness of the passive venting system at venting basement air and mitigating the potential for vapor intrusion in the LA Fitness building.

The evaluation of PCE and TCE levels in SSV and IA samples in accordance with the NYSDOH Matrices recommendation is presented in Table 5-2. NYSDEC and NYSDOH have required to continue sampling the LA Fitness sampling locations on an annual basis during the winter heating season, consistent with NYSDOH guidance.

6. Recommendations

6.1 SOIL VAPOR SAMPLING (IPARK)

Tetrachloroethene (PCE) and trichloroethene (TCE) concentrations detected in the shallow vadose zone (shallower than 25 ft. bgs.) have significantly decreased since the start-up and continuous operation of the site-wide sub-slab depressurization system (SSDS) in September 2013. Results from the 2017 soil vapor sampling event and historical data have proven the effectiveness of the SSDS system at reducing VOC concentrations at shallow depths. Tetra Tech, Inc. (Tetra Tech) recommends continued operation of the SSDS to reduce risk of exposure to CVOCs and remain protective of human health and continued sampling of the nested well locations sampled in 2017 (excluding VP-1) during the 2018 heating season.

Sample results indicate that a significant mass of CVOCs remain in the deep vadose zone (deeper than 25 ft. bgs.). Previous investigations have determined that residual soils and/or impacted groundwater beneath the iPark building may be the likely sources. Alternative remedies including an expansion of the soil vapor extraction system should be investigated to remediate contamination in the source area.

A Remedial Alternatives Analysis (RAA) was submitted to NYSDEC on May 25, 2017 for NYSDEC's review. The RAA provides several alternatives for improvements to the existing soil vapor extraction system, currently part of the OU-1 groundwater treatment system. Tetra Tech recommended the implementation of two new SVE wells, an air sparging system, and connection to the SSDS facility based the RAA assessment. The RAA determined that connection of the SVE system in the former drywell area to the SSDS system is a viable option for long term operations.

The implementation of the recommended alternative will be conducted with approval from NYSDEC.

Monitoring of nested well VP-1 should be discontinued due to consistently low PCE and TCE concentrations.

PCE and TCE concentrations in nested wells in the western portion of the iPark facility (VP-102 and VP-103) continue to remain low in both shall and deep intervals. A temporary rebound study (shutting off select extraction points near these wells) should be performed in 2018. A draft work plan can be provided based upon NYSDEC's approval. Annual samples will continue to be taken at VP-102 and VP-103 during and subsequent to the rebound test in order to monitor any rebound in soil vapor concentrations.

6.2 SSV AND IA SAMPLING (LA FITNESS)

Tetra Tech recommends continued monitoring of all sub-slab vapor (SSV) and indoor air (IA) locations at LA Fitness during the 2018 heating season. Additionally, Tetra Tech recommends installing additional monitoring points between SS-C1 and SS-D7 to evaluate elevated TCE concentrations in subslab soil vapor. The evaluation would involve additional subslab soil vapor sampling outside of the heating season. Data from the sampling would be used to develop a mitigation strategy for this area of the LA Fitness building.

MRL - Minimum reporting limit
ND - Not detected
J - Value detected below the minimum detection limit
Bold values indicate compound was detected
Highlighted values indicate that compound was detected above NYSDOH air guidance value

1. Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this 2017 Soil Vapor (SV) Sampling Work Plan for the annual soil vapor monitoring program for the former Unisys Facility in Lake Success, New York. The Work Plan defines the scope of work proposed for 2017 and details the proposed sampling locations, sampling methodologies, standard operating procedures, sample analysis, and reporting requirements.

The scope of work detailed in this plan includes collection of soil vapor samples from nested well locations inside and around the iPark building and pair sub-slab and indoor air sampling in the LA Fitness building. The purpose of sampling the nested wells is to: (1) evaluate changes in volatile organic compound (VOC) concentrations in soil vapor at various depths; and (2) assess the lateral and vertical distribution of soil vapor contamination that may continue to exist beneath and outside the iPark building. The data will be used to assess the historic and current effectiveness of the Sub-Slab Depressurization System (SSDS) and the OU-1 Soil Vapor Extraction System (SVE). Lockheed Martin discontinued indoor air monitoring in the main building in 2015 based on the New York State Department of Health Vapor Intrusion (VI) Guidance (NYSDOH 2006) which states that *"Generally, air monitoring is not recommended if the [mitigation] system has been installed properly and is maintaining a vacuum beneath the entire slab."* The purpose of the LA Fitness paired sub-slab and indoor air sampling is to: (1) assess the effectiveness of the passive venting system in reducing VOC concentrations in the unused partial basement, (2) identify current VOC concentrations in sub-slab soil vapor and in indoor air, and (3) evaluate the potential for vapor intrusion into indoor air.

2. Site Description and Site History

2.1. Site History

The Lockheed Martin former Unisys Facility ("the Site") was an active manufacturing facility from its startup in 1941 until approximately 1995, when most manufacturing activities ceased. Some activities, including limited assembly, integration, prototype development and testing, and/or engineering and administrative duties continued at the Site through early 1999. The former Unisys Facility was originally designed and built by the United States government and was operated under a contract with the Sperry Gyroscope Company (Sperry) from 1941 to 1951. In 1951, the property was sold to Sperry, which merged with Burroughs in 1986 to form the Unisys Corporation. In 1995, Loral Corporation (Loral) acquired the assets of Unisys Defense Systems, a division of Unisys Corporation. In early 1996, Loral's electronics and systems integration businesses were purchased by Lockheed Martin. The property was sold by Lockheed Martin in early 2000 to iPark, Lake Success, LLP (iPark), which converted the buildings to commercial rental space. The current owners of the property are WRD Marcus Avenue A, LLC c/o Waterstone Development, LLC and Marcus Avenue Unit Two Owner, LLC.

The Former Unisys Facility occupies 90.5 acres that includes the main (iPark) building and three smaller buildings (former foundry referred to herein as the LA Fitness building, Power House, and the former maintenance garage, now the SSDS facility) located south of the iPark building. The iPark building houses several tenants that use the lease space for office areas, a small cafeteria, an outpatient hospital, distribution centers, and maintenance spaces. The former foundry has been converted to a fitness center operated by LA Fitness. The site previously included 3.5 acres that were sold to the Town of North Hempstead, which are now used as soccer fields. The Power House continues to serve as the power distribution center. The majority of the former maintenance garage has been converted into the active SSDS process building, while the remainder is leased for vehicle

storage. The remaining portions of the property consist of paved areas (parking lots), transformer stations, and three storm water retention basins. A general layout of the Site, including major tenants occupying the first floor of the iPark building is shown on Figure 2. Figure 3 shows the LA Fitness building along with monitoring locations highlighted.

In the past, the facility was used to manufacture a wide range of defense-related products including navigational systems for United States Navy nuclear submarines (Trident Program), navigational sonar equipment, radar tracking systems (North Warning System), and weather radar systems (NEXRAD). Past manufacturing processes included the following: metal casting, chemical etching, degreasing, plating, painting, metal finishing, machining, electronic circuit board manufacturing, and assembly. Chemicals used during manufacturing at the plant included halogenated and non-halogenated hydrocarbon solvents, cutting oils, paints, fuel oils, acids, caustics, and inorganic plating compounds. On May 1, 1991 New York State Department of Environmental Conservation (NYSDEC) designated the former Unisys Facility as a Class 2 site (No. 130045) in the registry of Inactive Hazardous Waste Disposal Sites in New York State.

2.2. Site Background

In response to NYSDOHs final VI Guidance (NYSDOH, 2006), Lockheed Martin conducted an initial indoor air and sub-slab vapor investigation in 2007 (ARCADIS, 2008). In March 2008, a temporary SSDS (referred to as the eastern SSDS) consisting of two extraction points (now referred to as EP-E17 & EP-E18 in the site-wide SSDS) was installed as an interim measure in the former Allstate space located in the northeast corner of the iPark building to address trichloroethene (TCE) concentrations above the NYSDOH indoor air guidance levels and elevated levels of other VOCs in the sub-slab vapor. In November 2008, a second temporary SSDS (referred to as the central SSDS) consisting of two extraction points (now referred to as EP-O11 and EP-K11 in the site-wide SSDS) was installed in the south-central portion of the iPark building (current Antech space) to address carbon tetrachloride concentrations above NYSDOH indoor air guidance

levels and other elevated VOCs in the sub-slab vapor. Subsequent to these temporary SSDS installations, sub-slab vapor and indoor air sampling events conducted between 2009 and 2013 demonstrated that VOC concentrations in indoor air were reduced to below the NYSDOH indoor guidance levels, and carbon tetrachloride, tetrachloroethene (PCE), and TCE concentrations in sub-slab vapor were either decreasing or remained constant.

To mitigate potential pathways for sub-slab VOC migration into indoor air across the entire iPark building and the garage, Lockheed Martin prepared a Vapor Mitigation Conceptual Design (ARCADIS, 2010) to construct a site-wide SSDS. Subsequent to NYSDEC approval of Vapor Mitigation Conceptual Design, the site-wide SSDS was constructed between August 2011 and June 2013. The temporary central and eastern SSDSs were connected to the site-wide SSDS during construction, and the site-wide SSDS has been in continuous operation since September 2013. The design goal of the SSDS is to maintain a minimum of -0.004 inches of water column (in. WC) differential pressure between the sub-slab and the indoor air. The step tests conducted on selected SSDS extraction points and the 2014 annual nested well sampling results indicated that the SSDS extraction wells influence up to approximately 25 feet below ground surface (ft. bgs.) (CDM Smith, April 2014).

A passive SSDS was constructed in 2010 at the LA Fitness building. The system consists of a vent pipe and an air inlet pipe, which penetrates the limited basement area along the south/central portion of this building and extends to the roof. A wind turbine located on the top of the exhaust pipe allows for suctioning of the basement air, thereby exhausting the basement air to the building exterior and introducing fresh air into the basement through the air inlet pipe. The inlet pipe also extends to the roof.

2.3. Previous Vapor Intrusion Sampling

2.3.1. iPark Building

Lockheed Martin has performed multiple vapor sampling events between 2007 and 2016 since the publication of NYSDOH final VI Guidance (NYSDOH, 2006), and has presented the results to NYSDEC and NYSDOH. A summary of these sampling events and VI reports is presented below:

- March 2007: 19 sub-slab soil gas samples, 27 indoor air samples, and four ambient air samples were tested and results were submitted to NYSDEC in the Vapor Intrusion Sampling Report and Sampling Work Plan (ARCADIS, 2008).

- October 2007: 4 sub-slab soil gas samples were tested and results were included in the Vapor Intrusion Sampling Report and Sampling Work Plan (ARCADIS, 2008).

- December 2007: 25 sub-slab soil gas samples, 33 indoor air samples, and four ambient air samples were tested and results were included in the Vapor Intrusion Sampling Report and Sampling Work Plan (ARCADIS, 2008).

- January 2008: 13 indoor air samples were tested and results were submitted to NYSDEC in the Vapor Intrusion Sampling Report (ARCADIS, 2009a).

- March 2008: 42 sub-slab soil gas samples and 13 indoor air samples were tested and results were included in the Vapor Intrusion Sampling Report (ARCADIS, 2009a).

- September – November 2008: 52 sub-slab soil gas samples and 24 indoor air samples were tested and results were included in the Vapor Intrusion Sampling Report (ARCADIS, 2009a).

- January 2009: 46 sub-slab soil gas samples, 38 indoor air samples, six ambient air samples, and seven duplicate samples were tested.

- March 2009: 22 sub-slab soil gas samples, 28 indoor air samples, six ambient air samples, and four duplicate samples were tested. The results from January and March

2009 were submitted to NYSDEC in Perched Water and Vapor Intrusion Source Investigation (ARCADIS, 2009b).

- December 2009 – January 2010: 85 sub-slab soil vapor samples, 89 indoor air samples, 17 ambient air samples, and 18 duplicate samples were tested.

- March 2010: 12 sub-slab soil vapor samples, 18 indoor air samples, four ambient air samples, and three duplicate samples were tested. The results for December 2009 to January 2010 and March 2010 events were reported to NYSDEC in Vapor Intrusion Sampling Report (ARCADIS, 2011a).

- March 2011: 68 sub-slab soil vapor samples, 68 indoor air samples, eight ambient air samples, and 16 duplicate samples were tested, and the results were reported to NYSDEC in Vapor Intrusion Sampling Report (ARCADIS, 2011b).

- February – March 2012: 76 sub-slab soil vapor samples, 95 indoor air samples, 13 ambient air samples, and 18 duplicate samples were tested, and the results were summarized in Vapor Intrusion Sampling Report (ARCADIS, 2012).

- February – March 2013: 79 sub-slab soil vapor samples, 98 indoor air samples, 20 ambient air samples, and 19 duplicate samples were tested, and the results were summarized in Vapor Intrusion Sampling Report (ARCADIS, 2013).

- February – March 2014: 61 sub-slab vapor samples, 97 indoor air samples, 13 ambient air samples, and 18 duplicate samples were tested, and the results were presented in the 2014 Soil Vapor/Vapor Intrusion Report (URS 2014a).

- February 11 - March 31, 2015: A total of 108 soil vapor samples were collected from 19 nested wells located inside and outside of the main building and the results were presented in the 2015 Soil Vapor/Vapor Intrusion Report (URS 2015a).

- February 2 - February 28, 2016: A total of 108 soil vapor samples were collected from 19 nested wells, located inside and outside of the iPark building and the results were presented in the 2016 Soil Vapor/Vapor Intrusion Report (Tetra Tech 2016b).

2.3.2. LA Fitness

Vapor intrusion investigations began in 2007 at the LA Fitness building with a collection of SSV and IA samples. In 2008, the LA Fitness basement was entered to collect basement SSV samples, and identify if any vapor intrusion mitigation was needed. The 2008 basement vapor sampling results indicated the presence of low levels of VOCs in the basement space (URS 2015b). Subsequently, a passive SSDS venting system was installed for the basement area in 2010 to reduce the likelihood of SS soil vapor entering in the building. Between 2011 and 2013, two SSV samples (SS-LAC8 and SS-14) were collected and results indicated no elevated VOC concentrations under the building. Between 2011 and 2014, three IA samples (IA-13, IA-LAC8, and IA-14) were collected, and the results indicated that indoor air levels of VOCs in the building were often below detection limits or at concentrations comparable to ambient air (URS 2015b).

In 2015, DEC requested more sub slab points be installed at LA Fitness to finalize site closure activities. An additional VI assessment was performed through the comparison of eight co-located IA and SSV samples collected before and after temporary shutdown of the passive SSDS. This rebound analysis suggested that the passive SSDS should be kept in operation in the unused partial basement of the LA Fitness building. On February 8, 2016, 11 SSV, 12 IA, one basement air, one ambient air, and four duplicate samples were collected from the LA Fitness building to evaluate concentrations of VOCs present in indoor air and sub slab soil vapor. Based upon these results, a reduced VI monitoring was recommended in an email dated 5/13/16 from DEC & DOH for this heating season in 2017. The scope of work proposed herein is a continuation of the 2016 sampling program with reductions described below.

3. Sampling Objectives and Methodologies

This work plan presents the details of the two proposed sampling events to be performed during the 2017 heating season, including the soil vapor sampling event in and around the iPark building, and the paired SSV and IA sampling event for the LA Fitness building. All sample locations and sampling methodologies are presented in the sections below.

3.1. Soil Vapor Sampling (iPark Building)

The primary intent of the 2017 SV sampling plan is to assess the lateral and vertical distribution of contaminants of concern (COCs) beneath and outside the existing buildings at the former Unisys facility. The data will be used to assess the current effectiveness of the SSDS and the SVE, and will provide data to substantiate recommendations for future optimization.

3.1.1. Sampling of Existing Nested Multi-Level Sampling Ports

The SV sampling will entail sampling soil vapors from the 97 nested SV points (with 11 duplicate samples representing approximately 10%) at 14 locations both inside and outside the iPark Building. The event will sample and analyze soil vapor to assess the vertical and lateral distribution of COCs in soil vapor under and surrounding the iPark Building down to a depth of 84 feet (VP-106) at or just above the water table through the network of existing nested multi-level SV sampling points. The SV locations with their nested sampling depths are provided in Table 1: these sampling locations and depths are consistent with those sampled as part of the 2016 SV monitoring program with the exception of points VP-5, VP-6 and VP-101. These locations have had consistently low concentrations for TCE and PCE (e.g. <210 ug/m^3 at all depths prior to SSDS operation, <160 ug/m^3 since the SSDS has been in operation). Additionally, these points are

located outside of the iPark building and a considerable distance from the source area. The locations of the nested SV points are presented in Figure 2. SV sampling from nested SV points will be in accordance with Standard Operating Procedure (SOP) SSDS-28 included in Appendix A, and will be consistent with previously used methods. The SV sampling event will be conducted during the heating season as required. The samples per nested wells are summarized in the tables below and displayed on Figure 2.

3.2. Sub-Slab and Indoor Air Sampling for the LA Fitness Building

The purpose of the 2017 vapor intrusion sampling is to: (1) assess the effectiveness of the passive venting system in reducing VOC concentrations in the unused partial basement, (2) identify current

VOC concentrations in sub-slab soil vapor and in indoor air, and (3) evaluate the potential for vapor intrusion into indoor air. The 2017 sampling plan for LA Fitness will build on the 2016 plan and will include sampling sub-slab soil vapor under the building slab, and indoor air sampling at sample locations from previous years. After review of the 2016 sampling results, NYSDEC and NYSDOH indicated in an email from May 5, 2016 that only six locations require continued monitoring (Appendix B).

3.2.1. Sampling Locations

Six IA samples will be collected from the LA Fitness building while the passive SSDS is operational. These paired SS-IA samples will be consistent with the May 5, 2016 letter from NYSDEC regarding continued monitoring at the LA Fitness building. These locations are summarized in the table below.

Indoor Air (IA)	Sub-Slab Vapor (SSV)
IA-C1	SS-C1
IA-C20	SS-C20
IA-D7	SS-D7
IA-E16	SS-E16
IA-D13	SS-D13
IA-G18	SS-G18
IA-12	
**Locations D13 and G18 were previously labeled "Prop1 and Prop3" in the 2016 Annual Monitoring Report*	
***IA-12 is taken from the basement area of LA Fitness*	

One duplicate SS-IA sample and one ambient air sample will be collected. The SSV, IA, and ambient samples will be collected in accordance with SOPs SSDS-25 and SSDS-26, respectively (Appendix A), and will be consistent with previously used methods. The locations of the LA

Fitness samples are shown in Figure 3. Additional details for LA Fitness sampling locations is included in Table 2.

3.3. Sample Collection and Leak Testing

SV samples (iPark and LA Fitness) will be collected in accordance with the SOPs (SSDS-25 and SSDS 28)[1], which are included in Appendix A of this Work Plan. SV samples will be collected under normal working conditions with heating, ventilation and cooling (HVAC) systems operational where applicable. All SV samples inside the building will be collected while the SSDS is operational. All samples will be collected in batch certified 6-liter SUMMA canisters equipped with a flow controller. SV samples will be collected over at least a four-hour period.

Additional specifications that will be met before, during and after sample collection include:

- Canisters with initial vacuum less than 25 inches of mercury recorded at the time of sampling will be rejected,
- Samples will be drawn at the rate specified for the prescribed sampling duration,
- Sample collection will be complete when the remaining vacuum is less than 10 inches of mercury; no samples will be analyzed by the laboratory unless there is a vacuum of at least 6 inches of mercury.
- Duplicates will be sampled concurrently through a split flow connector to ensure both canisters receive the same extracted vapor.

The canister and flow controller numbers will be recorded as will final helium concentrations (shroud and sampling train) from the leak-test (if conducted). Also, temperature and pressure will be measured using a portable weather gauge accompanying each sampling crew at the beginning

[1] SSDS-25 "Lockheed Martin Corporation SOP for Sub-Slab Soil Vapor Sampling" and SSDS-28 "*Lockheed Martin Corporation SOP for SSDS – Soil Vapor Sampling from Nested Well Sampling Ports"*

and end of each sampling event. Outdoor conditions will also be recorded. Tetra Tech will generate site-specific field logs for each sample; an example of the field sampling log is provided as Table 3.

Canister pressures will be documented at the start and end of each sampling event; date and time that sampling began and ended will also be recorded along with any observations pertinent to the sampling event. Tetra Tech will have a dedicated photoionization detector (PID) during the sampling event and this will be periodically used to monitor conditions during the event. The PID will be calibrated daily to manufacturer's specifications. Sampling locations will be photo-documented at the time of sampling and will include photos of the sampling train (including duplicate set-ups if required).

Sub-slab, ambient air samples and indoor air samples will be collected using batch certified, 6-litre stainless steel Summa canisters equipped with 8-hour flow controls, in-line particulate filters and vacuum gauges. The procedure for indoor air and ambient air sample collected is detailed in Appendix A.

Leak tests will be performed on a minimum of 5% of the sampling locations. iPark sampling locations and LA Fitness sampling locations will be considered separate sampling events, each with unique leak detections. An additional consideration will be given to nested wells that may have been compromised. Tetra Tech will use leak-test shrouds specifically designed for this event. The shroud design is consistent with the design presented in SOP SSDS-27[2] which is included in Appendix A of this Work Plan. Laboratory grade helium will be used for leak-testing which will be conducted using calibrated helium meters with probes. The shroud will have dedicated fittings

[2] SSDS-27 *"Lockheed Martin Corporation SOP for Helium Tracer Gas Leak Test for SS Soil Vapor Sampling"*

for helium flow into and evacuated flows out of the shroud as well as a means to sample the helium concentration within the shroud.

Given that many of the areas within the building have finished floors, a compressive rubber seal will be used to seal the shroud with the floor surface. Additional weights will be placed on the shroud to ensure a proper seal. For outdoor sampling, the conditions surrounding the port will determine the type of seal used; bentonite clay has been successfully used in the past and is well suited for grass-covered and asphalt areas. Tetra Tech will remove any materials added to restore the site to its original condition, if necessary, once the sampling is completed.

Per SOP SSDS-27, the helium content within the shroud will be greater than 60% prior to testing. The level of helium in the shroud will be measured through a purpose-built sample port in the shroud using a MGD 2002 Multi-Gas Detector (or equivalent) helium meter. The sample line will then be purged into a Tedlar bag using a low pressure pump that allows better control of the purge rates (typically less than 100 mL/minute as required by the SOP) and reduces pressure changes in the port, which prevents over pressurization due to low-flow conditions. If low-flow conditions are encountered the sampling train will be replaced and the leak test repeated. Once the seal has been verified, the sample train will then be purged of three volumes with the low flow pump. If greater than 10% helium is detected in the purge air, the fitness of the shroud and sample train will be examined and additional sealing material will be added or pressure applied to the shroud to complete the seal. Once the concentration of helium in the purge air is less than 10%, the leak-test will be considered complete and the helium will be evacuated from the shroud. Details of the leak test will be documented on the field sampling log (Table 3).

The shroud will remain in place to minimize disturbance of the sampling port after the leak-test has been completed. A "T" quick connect fitting (stainless steel or other non-reactive material) with a check-valve will be fitted to the tubing that runs from the port, through the shroud to the

pump. The "T" will allow for connections to both the pump and the SUMMA canister. Once the leak-test is complete, the "T" will be switched over to SUMMA canister so that the sample train is complete. Once the "T" has been switched to the SUMMA canister, the canister's flow controller will be used to control the sample flow into the canister. The flow controller gauge will be checked periodically during sample collection to ensure that the sampling rate has remained stable. For samples were leak testing is not required, the "T" fitting will connect to both the pump (for purging) and the SUMMA canister.

4. Laboratory Analysis and Data Validation

The sample canisters (SV, SSV, IA and ambient) will be picked up by the laboratory for analysis at the end of each sampling day. Laboratory-provided chain of custodies will be completed and field observations made during sampling will be documented. Samples will be submitted to a New York State accredited laboratory for analysis using USEPA Method TO-15 (modified) and will include analyses for Freon 22 and Freon 115. A list of analytical parameters is provided in Table 4; this list is consistent with prior sampling events with the inclusion of Freon 115 (chloropentafluoroethane).

Tetra Tech will maintain custody of the canisters during each sampling event. A chain of custody will be created following the completion of each sample. Sample results will be validated by Tetra Tech for the QA/QC parameters in accordance with New York State Analytical Services Protocol (NYS ASP) Category B/USEPA Level IV data deliverables. The Data Usability Summary Report (DUSR) will be prepared using the applicable State and site-specific documents for this project. The objective of data validation is to identify any questionable or invalid laboratory measurements. One DUSR will be prepared for each sample data package or group issued by the designated laboratory for the vapor intrusion sampling event. The sample validation will be completed within four weeks of receipt of sample results from the laboratory.

Once validated, Tetra Tech will submit the data to NYSDEC in an electronic data deliverable in the NYSDEC required format.

5. Reporting

Following the completion of field work and the receipt of all validated analytical data, Tetra Tech will generate updates to all sampling results tables, letters to property owners and tenants (LA Fitness only), and an Annual Monitoring Report.

5.1. Updated Sampling Results Tables

Tetra Tech will update historical data tables from past sampling events with data from the 2017 event. The historical data is to include all nested SVs along with the SSV, IA and ambient data. Currently, data for iPark and LA Fitness are maintained separately, and will continue to be in 2017. Data will be integrated into a database and will include the results for the 2017 sampling event once the data has been validated. The database will be parsed to generate tables for the report that present the results of past and current sampling events for both iPark and LA Fitness. In addition, the data will be parsed by tenant space to generate tables to accompany owner and tenant letters. Similarly, site figures that were included in the 2016 Vapor Intrusion Reports for iPark and LA Fitness (Tetra Tetch 2016b) will be updated.

5.2. Letters to property owners and tenants

Letters will be prepared that summarize the vapor intrusion sampling results for both tenants and property owners. Letters prepared for each property owner will only include the results of the 2017 SV Sampling Event. The letters will include a site figure that shows the location of the SV sampling points and the accompanying table will present the results for the 2017 SV Sampling Event for each location.

Letters will also be prepared for each tenant where an indoor air sample was collected. Only IA data for samples collected in the leased space for that particular tenant will be presented. The letter

will include a site figure that shows the IA sampling location and an accompanying table will present the IA results for those locations identified as being within the tenant's leased space.

The draft letters (for owners and tenants) will be submitted to NYSDEC and NYSDOH for review and comment. Final letters will be reviewed by both agencies before submittal to the owners and tenants. Submittal of the tenant letters to owners and tenants will occur within 30 days of the data has been validated.

5.3. Annual Monitoring Report – iPark and LA Fitness

The Annual Monitoring Report will present and discuss the results of the 2017 SV sampling event and will also include the SSV and IA results (along with ambient sampling results) used to assess COC concentration trends in the LA Fitness building. Results of the nested SV sampling will be compared with previous sampling events. SSV and IA samples from the LA Fitness building will be compared to previous sampling events and to NYSDOH VI guidance for evaluation.

A detailed description of each sampling event will be provided within separate sections of the report. Each section will summarize the requirements of the approved SV Work Plan and discuss the activities conducted for each sampling event. The section will highlight the sampling activities, field observations, SSDS operations (both the active system at iPark and the passive system at LA Fitness) and any other information pertinent to establishing the multiple lines of evidence (MLE) necessary to interpreting the results.

A description of the sampling location and its environs including the condition of the sampling port and any pertinent observations from the leak-test (if conducted for that location) can help identify any issues that may have a bearing on the result. Observations may help identify potential background sources which could influence IA and ambient results and identify changes in physical characteristics that may introduce variability from previous sampling events. For IA sampling

locations, the NYSDOH *"Indoor Air Quality Questionnaire and Building Inventory"* form (NYSDOH 2006) will be completed and any pertinent observations will be discussed. Other significant factors to be documented and discussed may include:

1. A reconnaissance of infrastructure in the vicinity of the sampling location including any indications of recent construction.
2. An understanding of the area's current uses particularly any changes since the last sampling event such as the presence of sensitive populations (e.g., child care).
3. Identify any ongoing construction or operations that could influence air flow or introduce potential background sources.
4. Identify potential preferential pathways for vapor to migrate into the building including cracks, floor penetrations, or discontinuities in the floor that are unobtrusively visible and evident.
5. Identify and document any materials used by tenants that could represent a potential background source. This information will be used in the MLE approach when reviewing the IA and ambient results. Field screening instrument (e.g. PID) will be used to scan for any background sources at the time of sampling.
6. Performance data for the EPs (including recorded vacuum conditions) for the days of the sampling event will also be reviewed as representative of conditions under the slab.
7. A review of the operation and performance of the SSDS (both the active system at iPark and the passive system at LA Fitness) prior to and during the sampling event. This may include information from the maintenance and monitoring tasks of the SSDS operations that could be of importance.

A field log will be prepared to provide a detailed recording of the parameters of importance from the sampling event, and observations will be summarized and included in the report if there are any significant issues. The canister and flow controller numbers will be recorded. Also noted will be temperature and pressure readings measured by a portable weather gauge at the beginning and end of each sampling event. Canister pressures will be documented at the start and end of each

sampling event; the date and time that sampling began and ended will also be recorded along with any observations pertinent to the sampling event. A dedicated PID will be available during the sampling event and this will be used to periodically monitor conditions.

5.4. Data Presentation

Once all the sampling data has been received and validated, site figures will be generated that show all the nested SV sampling locations and their results. Along with the current sampling data, historical SV data will be included in the report and presented in the accompanying figures. For simplicity, the results presented in the figures will be limited to TCE and PCE, which are the primary COCs; the tables will include all parameters listed in Table 4. The details of the database have been discussed above and these will be used to generate the figures and tables for the report. Tables in the report will present the nested SV sampling results from previous and current sampling events.

6. Data Analysis and Recommendations

A comparative analysis of the results of the 2017 sampling events and data from past sampling events will be conducted and included in an annual report to NYSDEC and NYSDOH. The intent is to assess changes in the lateral and vertical distribution of COCs beneath and outside the existing buildings at the former Unisys facility. The data will be used to assess the effectiveness of the SSDS and to provide data and analyses to substantiate recommendations for future optimization.

All available data will be analyzed to:

1. Compare with the appropriate NYSDOH criteria for evaluating soil vapor intrusion including comparison of results with Matrix 1 and Matrix 2 of NYSDOH VI Guidance (NYSDOH 2006).
2. Present both lateral and vertical extent of the primary COC concentrations under and adjacent to the former Unisys facility. The extents will be compared with historical data to evaluate potential changes.
3. Along with the historical data, temporal trends for the primary COCs by sampling location will be assessed. The assessment may include the use of statistical analysis assuming that there are sufficient data to be statistically relevant.

In addition to the presentation of data, an assessment of trends (if the sample sizes are viable) using available data from all past sampling events to better understand changes will be conducted. The report will address the effectiveness of the SSDS and provide recommendations for additional optimization.

APPENDICES

Appendix A: Lockheed Martin Standard Operating Procedures (SOPs)

Lockheed Martin Corporation SOP for Sub-Slab Soil Vapor Sampling

SOP Author:	Tetra Tech, Inc.
SOP #	SSDS-25
Revision #	2
Date	9/21/2016

Description

This SOP provides instructions for collecting SS soil vapor samples from the existing sampling ports for the analysis of VOCs by USEPA Method TO-15.

Abbreviations

COC: Chain of Custody
SOP: Standard Operating Procedure
SS: Sub-Slab
SSDS: Sub-Slab Depressurization System
USEPA: United States of Environmental Protection Agency
VOC: Volatile Organic Compounds

NOTE: WHEN ENTERING THE TENANT LEASEHOLD, ALL PERSONNEL WILL INFORM THE SPECIFIED TENANT RESPRESENTATIVE THAT WORK IS BEING COMPLETED IN THE TENANT LEASEHOLD.

SS Soil Vapor Sampling

1. SS soil vapor samples are collected from existing sample ports to help assess the levels of VOC under the LA Fitness building and Powerhouse building slab.
2. The locations of SS soil vapor samples to be collected are presented in Table 1 and Figures 1, 2, and 3 of the Work Plan.
3. The SS soil vapor samples will be collected in 6-liter batch certified, passivated stainless SUMMA® canisters. The samples will be collected through 8-hour flow controllers with in-line particulate filters and vacuum gauges.
4. All SUMMA canisters shall have an initial vacuum of 29 inches of mercury prior to sample collection.
5. Sampling shall be complete when the canister vacuum is less than 10 inches of mercury and no canister shall be shipped to the laboratory unless it has a vacuum of at least 6 inches of mercury.
6. Sampling personnel should not handle hazardous substances (such as gasoline), permanent marking pens, wear/apply fragrances, or smoke cigarettes before and/or during the sampling event.
7. Equipment List:
    - 6-liter, stainless steel SUMMA® canisters (order one extra, if feasible); 8-hour flow controllers with in-line particulate filters and vacuum gauges (order an extra set for each extra SUMMA® canister)
    - 1/4-inch ID tubing (Teflon, or similar)
    - Decontaminated extra small Swage-Lock (or equivalent) fittings
    - Stainless steel “T” fitting (if collecting duplicate [i.e., split] samples)
    - Portable vacuum pump capable of producing very low flow rates (e.g., 100 to 200 mL/min) with vacuum gauge. Purging flow rate should also be selected based on expected soil type (see below).
    - Rotameter or an electric flow sensor if vacuum pump does not have an accurate flow gauge (Bios DryCal or equivalent).
    - Tracer gas testing supplies if applicable (refer to SOP for “Administering Tracer Gas”).
    - Appropriate sized open-end wrench (typically 9/16-inch and ½ inch)

- Portable weather meter, if appropriate
- Chain-of-custody (COC) forms
- Sample collection log
- Digital camera

Initiation of Sample Collection

1. Record the following information on the sample log, if appropriate (contact the local airport or other suitable information source [e.g., site-specific measurements using the portable weather meter, or [weatherunderground.com] to obtain the information):
    a. wind speed and direction;
    b. ambient temperature;
    c. barometric pressure; and
    d. relative humidity
2. Connect "T" fitting and needle valve to allow for isolation of purge pump.
3. Remove the brass plug from the SUMMA canister and connect the flow controller with in-line particulate filter and vacuum gauge to the SUMMA canister. Do not open the valve on the SUMMA canister. Record on the sample log and COC form the flow controller number with the appropriate SUMMA canister number.
    - Perform a leak-down test by replacing the nut which secures sample tubing with the cap from the canister. This will create a closed system. Open the canister valve and quickly close it; the vacuum should increase approaching 30" Hg. If there are no leaks in the system this vacuum should be held. If vacuum holds proceed with sample collection; if not attempt to rectify the situation by tightening fittings.
4. Connect the Teflon sample collection tubing to the flow controller. Leave the SUMMA canister valve closed at this point.
5. Connect a portable vacuum pump to the purge leg of sample tubing. Purge 3 volumes of air from the vapor probe and sampling line using a portable pump [purge volume = 1.5 Pi r2h] at a rate of approximately 100 mL/min. Excessive vacuums should be avoided.
6. If low-flow conditions are encountered (when air flow rate is less than 10 mL/min or when vacuum is greater than 10" mercury), notify the RTO representative to discuss the option of installing a new vapor point.
7. If necessary, check the seal established around the soil vapor probe by using a tracer gas (e.g., helium) or other method established in the state guidance documents. [Refer to the Administering Helium Tracer Gas SOP, adapted from NYSDOH 2006]
8. At completion of purge, close the needle valve to isolate sample canister.
9. Open the SUMMA canister valves. Record on the sample log the time sampling began and the canister pressure. If the initial vacuum pressure registers less than -25 inches of Hg or greater, then the SUMMA canister is not appropriate for use and another canister should be used.
10. Take photographs of the SUMMA® canister and surrounding area, as appropriate.
11. Check the SUMMA canister approximately half way through the sample duration and note progress on sample logs.

Termination of Sample Collection

1. Arrive at the SUMMA® canister location at least 30 minutes prior to the end of the sampling interval (e.g., 8-hour).
2. Stop collecting the sample when the canister vacuum reaches approximately 6 inches of Hg (leaving some vacuum in the canister provides a way to verify if the canister leaks before it reaches the laboratory) or when the desired sample time has elapsed, whichever occurs first.
3. Record the final vacuum reading. Stop collecting the sample by closing the SUMMA® canister valve.

Record the date and local time (24-hour basis) of valve closing in the field notebook, sample collection log, and COC form. Additionally, record the parameters outlined in step 1 of the Initial Sample Collection Section.

4. Close the valve on the sampling port tubing and secure the well cover (if applicable).
5. Remove the particulate filter and flow controller from the SUMMA® canister, re-install brass plug on canister fitting, and tighten with wrench.
6. Package the canister and flow controller in the shipping container supplied by the laboratory for return shipment to the laboratory. The SUMMA® canister does not require preservation with ice or refrigeration during shipment.
7. Complete the appropriate forms and sample labels as directed by the laboratory (e.g., affix card with string).
8. Complete COC form and place requisite copies in shipping container. Close shipping container and affix custody seal to container closure. Ship to laboratory via overnight carrier (e.g., Federal Express) for analysis.

Safety Considerations

- Wear all necessary PPE and follow all associated procedures as outlined in the Health and Safety Plan.

Quality Assurance

SS soil vapor sample analysis will be performed using USEPA TO-15 methodology. This method uses a quadrupole or ion-trap GC/MS with a capillary column to provide optimum detection limits. The GC/MS system requires a 1-liter gas sample (which can easily be recovered from a 6-liter canister). The 6-liter canister also provides several additional 1-liter samples in case subsequent re-analyses or dilutions are required. This system also offers the advantage of the GC/MS detector, which confirms the identity of detected compounds by evaluating their mass spectra in either the SCAN or SIM mode.

Duplicate samples should be collected in the field as a quality assurance step. Generally, duplicates are taken of 10% of samples, but project specific requirements should take precedence.

Lockheed Martin Corporation SOP for Indoor and Ambient Air Sampling

SOP Author:	Tetra Tech, Inc.
SOP #	SSDS-26
Revision #	2
Date	9/21/2016

Description

This SOP provides instructions for performing indoor and outdoor air sampling using USEPA Method TO-15 for VOC analyses.

Abbreviations

COC: Chain of Custody
SOP: Standard Operating Procedure
SSDS: Sub-Slab Depressurization System
USEPA: United States of Environmental Protection Agency
VOC: Volatile Organic Compounds

NOTE: WHEN ENTERING THE TENANT LEASEHOLD, ALL PERSONNEL WILL INFORM THE SPECIFIED TENANT RESPRESENTATIVE THAT WORK IS BEING COMPLETED IN THE TENANT LEASEHOLD.

Indoor Air Sampling

1. One ambient air sample will be collected during each day of indoor air sampling.
2. Duplicate samples will be collected at 10% frequency of total indoor air samples.
3. The indoor air sample locations are presented in Table 1 and Figures 1, 2, and 3 of the Work Plan.
4. The indoor air samples will be collected in 6-liter, batch certified stainless SUMMA® canisters. The samples will be collected through 8-hour flow controllers with in-line particulate filters and vacuum gauges.
5. Sampling personnel **should not** handle hazardous substances (such as gasoline), permanent marking pens, wear/apply fragrances, or smoke cigarettes before and/or during the sampling event.
6. Equipment List:
   - 6-liter, stainless steel SUMMA® canisters (order at least one extra);8-hour flow controllers with in-line particulate filters and vacuum gauges (order an extra set for each extra SUMMA® canister)
   - Appropriate sized open-end wrench (typically 9/16-inch)
   - Sample collection log
   - Digital Camera
   - Building survey and product inventory form (attached)
   - PID (photo-ionization detector) (for use identifying potential background sources during building survey)
   - 5-gallon bucket, box, chair, or similar to hold canister above the ground surface
   - Lock and Chain
   - Caution tape

Initiation of Sample Collection

1. Record the following information on the sampling form (use a hand-held weather meter, or contact the local airport or other suitable information source [e.g., weatherunderground.com] to obtain the following information):
   - ambient temperature
   - barometric pressure
   - wind speed
   - relative humidity
2. For each sample location, place the SUMMA® canister on a surface 3 to 5 feet above ground or floor surface. If the canister will not be overseen for the entire sampling period, secure the canister as appropriate (e.g., locks and chain, caution tape).
3. Record sample point location, SUMMA® canister serial number, gauge ID and flow controller number in the field

notebook, sample collection log, and COC form.

4. Remove the brass dust cap from the SUMMA® canister. Attach the flow controller with in-line particulate filter and vacuum gauge (leave swage-lock cap on the vacuum gauge during this procedure) to the SUMMA® canister with the appropriate-sized wrench. Tighten with fingers first, then gently with the wrench.
5. Connect the extra brass dust cap included with the sample equipment to the open end of the flow controller. Tighten the dust cap. Test the integrity of the SUMMA® canister by performing a leak test as follows:
    a. Open the canister with the brass dust cap connected to the end of the flow controller. If the pressure gauge indicates ZERO pressure loss, the SUMMA® canister has passed the leak test. If a drop in pressure is noted during the leak test, the integrity of the canister is no good. Send the canister back to the laboratory, indicating on the COC that the canister did not pass the leak test.
6. Once the canister has passed the leak test, close the canister and remove the brass dust cap from the end of the flow controller. Open the SUMMA® canister valve to initiate sample collection. Record the date and local time (24-hour basis) of valve opening in the field notebook, sample collection log, and COC form.
7. If the initial vacuum pressure does not register less than -28 inches of Hg, then the SUMMA® canister is not appropriate for use and another canister should be used. If another canister is required, repeat steps 2 through 6 of this SOP as necessary.

Termination of Sample Collection

1. Arrive at the SUMMA® canister location at least 10 to 15 minutes prior to the end of the sampling interval (e.g., 8-hour).
2. Stop collecting the sample when the canister vacuum reaches approximately 6 inches of Hg (leaving some vacuum in the canister provides a way to verify if the canister leaks before it reaches the laboratory) or when the desired sample time has elapsed, whichever occurs first.
3. Record the final vacuum reading. Stop collecting the sample by closing the SUMMA® canister valve. Record the date and local time (24-hour basis) of valve closing in the field notebook, sample collection log, and COC form. Additionally, record the parameters outlined in step 1 of this SOP.
4. Remove the particulate filter and flow controller from the SUMMA® canister, re-install brass plug on canister fitting, and tighten with wrench.
5. Package the canister and flow controller in the shipping container supplied by the laboratory for return shipment to the laboratory. The SUMMA® canister does not require preservation with ice or refrigeration during shipment.
6. Complete the appropriate forms and sample labels as directed by the laboratory (e.g., affix card with string).
7. Complete COC form and place requisite copies in shipping container. Close shipping container and affix custody seal to container closure. Ship to laboratory via overnight carrier (e.g., Federal Express) for analysis.

Safety Considerations

- Wear all necessary PPE and follow all associated procedures as outlined in the Health and Safety Plan.

Quality Assurance

Indoor air or ambient air sample analysis will be performed using USEPA Method TO-15. This method uses a quadrupole or ion-trap GC/MS with a capillary column to provide optimum detection limits. The GC/MS system requires a 1-liter gas sample (which can

easily be recovered from a 6-liter canister) to provide a 0.5 ppbv detection limit. The 6-liter canister also provides several additional 1-liter samples in case subsequent re-analyses or dilutions are required. This system also offers the advantage of the GC/MS detector, which confirms the identity of detected compounds by evaluating their mass spectra in either the SCAN or SIM mode.

Duplicate samples should be collected in the field as a quality assurance step. Generally, duplicates are taken of 10% of samples, but project specific requirements should take precedence.

General Observations/Notes:

Lockheed Martin Corporation SOP for – Helium Tracer Gas Leak Test for SS Soil Vapor Sampling

SOP #	SSDS-27
Revision #	2
Date	9/21/2016

Description

This SOP provides instructions for conducting helium trace gas leak test around soil vapor sampling points.

Abbreviations

SOP: Standard Operating Procedure
SS: Sub-slab

NOTE: WHEN ENTERING THE TENANT LEASEHOLD, ALL PERSONNEL WILL INFORM THE SPECIFIED TENANT RESPRESENTATIVE THAT WORK IS BEING COMPLETED IN THE TENANT LEASEHOLD.

1. A helium tracer gas serves as a quality assurance/quality control device to verify the integrity of the vapor port seal and to ensure the sample is not diluted by ambient or indoor air.
2. Trace gas administering includes the following basic steps: (1) enrich the atmosphere in the immediate vicinity where the port or sample tubing intersects the surface with the tracer gas; and (2) measure a vapor sample from the sample tubing for the presence of high concentrations (> 10%) of the tracer. A plastic pail, bucket, garbage can or even a plastic bag can serve to keep the tracer gas in contact with the port during the testing.
3. This SOP focuses on monitoring helium using a portable sampling device, although helium can also be analyzed by the laboratory along with other volatile organic compounds (VOCs). Real-time tracer sampling is generally preferred as the results can be used to confirm the integrity of the port seals prior to formal sample collection.
4. Leak test will be conducted at 5% of sample locations.
5. Equipment List:

- Helium (laboratory grade)
- Regulator for helium tank
- Shroud (plastic bucket, garbage can, etc)
    - The size of the shroud should be sufficient to fit over the sample port. It is worth noting that using a smaller shroud uses less helium which may be important when projects require a large number of helium tracer tests.
    - The shroud will need to have three small holes in it. These holes will include one on the top (to accommodate the sample tubing), and two on the side (one for the helium detector probe, and one for the helium line).
    - The shroud should ideally enclose the sample port and most of the sampling train.
- Helium detector capable of measuring from 1 - 100% (Dielectric MGD-2002, Mark Model 9522, or equivalent)
- Tedlar bags
- Seal material for shroud (rubber gasket, modeling clay, bentonite, etc) to keep helium levels in shroud high in windy conditions. Although the sealing material is not in direct contact with the sample if no leak occurs, sealing materials with high levels of VOC emissions should be avoided, since they could easily contaminate a sample from a point in which a trace leak occurs.
- Sample collection logs

Cautions

1. Helium is an asphyxiant. Be cautious with its use indoors.
2. Compressed gas cylinders should be handled with caution.

SOP Author:	Tetra Tech, Inc.

3. Care should be taken not to pressurize shroud while introducing helium. If the shroud is completely air tight and the helium is introduced quickly, the shroud can be over-pressurized and helium can be pushed into the ground.

Procedure

The procedure used to conduct the helium tracer test should be specific to the shroud being used and the methods of vapor port installation. The helium tracer test can be conducted when using temporary or permanent sample point installs and from inside or outside a facility. However when using the tracer gas within indoor areas you must provide adequate ventilation because helium is an asphyxiant.

1. Attach Teflon or nylon sample tubing to the sample point. This can be accomplished utilizing a number of different methods depending on the sample install (i.e., barbed fitting, Swage-Lok fitting, ball valve, etc.).
2. Place the shroud over the sample point and tubing.
3. Pull the tubing through hole in top of shroud. Seal opening at top of shroud with modeling clay.
4. Place weight on top of shroud to help maintain a good seal with the ground.
5. Insert helium tubing into hole in side of shroud, seal with modeling clay to prevent leaks.
6. Fill shroud with helium. While filling shroud allow atmospheric air to escape either by leaving a crack with the surface or by providing a release value on the side of the shroud.
7. Use the helium detector to test level of helium gas from the lowest hole drilled in the shroud (bottom of the shroud nearest where the sample tubing intersects the ground). Helium should be added until the environment inside the shroud has > 60% helium.
8. Purge the sample point through the sample tubing into a Tedlar bag using a hand held sampling pump. The sample pump should be operating at a rate of approximately 100 ml/minute (the purge rate should typically not exceed the sample collection rate). Test the air in the Tedlar bag for helium using portable helium detector. If the port has been installed properly there should be zero helium in purge air.
9. If > 10% helium is noted in purge air, add more clay or other material to the seal the sample port and repeat the testing procedure. If the seal cannot be fixed, reinstall sample point.
10. Monitor and record helium level in shroud before, during and after tracer test.
11. Monitor and record helium level in purge exhaust.
12. At successful completion of tracer test and sample point purging, the soil vapor sample can be collected (if the helium shroud must be removed prior to sample collection be mindful not to disturb the sample tubing and any established seals).

Safety Considerations

- Wear all necessary PPE and follow all associated procedures as outlined in the Health and Safety Plan.

Lockheed Martin Corporation SOP for SSDS – Soil Vapor Sampling from Nested Well Sampling Ports

SOP Author:	Tetra Tech, Inc.
SOP #	SSDS-28
Revision #	2
Date	9/21/2016

Description

This SOP provides instructions for collecting SV samples from the existing Nested Points for the analysis of VOCs by USEPA Method TO-15.

Abbreviations

COC: Chain of Custody
RTO: CDM Smith
SOP: Standard Operating Procedure
SSDS: Sub-Slab Depressurization System
SV: Soil Vapor
USEPA: United States of Environmental Protection Agency
VOCs: Volatile Organic Compounds

NOTE: WHEN ENTERING THE TENANT LEASEHOLD, ALL PERSONNEL WILL INFORM THE SPECIFIED TENANT RESPRESENTATIVE THAT WORK IS BEING COMPLETED IN THE TENANT LEASEHOLD.

SV Sampling

1. SV samples are collected from nested points within building footprint and in the immediate vicinity of the building to determine the distribution of VOCs on an annual basis.
2. The locations SV samples to be collected are presented in Table 1 and Figure 1.
3. The SV samples will be collected in 6-liter batch certified, passivated stainless SUMMA® canisters. The samples will be collected through 4-hour flow controllers with in-line particulate filters and vacuum gauges.
4. All SUMMA canisters shall have an initial vacuum of 29 inches of mercury prior to sample collection.
5. Sampling shall be complete when the canister vacuum is less than 10 inches of mercury and no canister shall be shipped to the laboratory unless it has a vacuum of at least 6 inches of mercury.
6. Sampling personnel should not handle hazardous substances (such as gasoline), permanent marking pens, wear/apply fragrances, or smoke cigarettes before and/or during the sampling event.
7. Equipment List:
    - 6-liter, stainless steel SUMMA® canisters (order one extra, if feasible) ;4-hour flow controllers with in-line particulate filters and vacuum gauges (order an extra set for each extra SUMMA® canister)
    - 1/4-inch ID tubing (Teflon, or similar)
    - Decontaminated extra small Swage-Lock (or equivalent) fittings
    - Stainless steel “T” fitting (if collecting duplicate [i.e., split] samples)
    - Portable vacuum pump capable of producing very low flow rates (e.g., 100 to 200 mL/min) with vacuum gauge. Purging flow rate should also be selected based on expected soil type (see below).
    - Rotameter or an electric flow sensor if vacuum pump does not have an accurate flow gauge (Bios DryCal or equivalent).
    - Tracer gas testing supplies if applicable (refer to SOP for “Administering Tracer Gas”).
    - Appropriate-sized open-end wrench (typically 9/16-inch and 1/2-inch).
    - Portable weather meter, if appropriate.

- Chain-of-custody (COC) forms.
- Sample collection logs (attached).
- Digital camera

Initiation of Sample Collection

1. Record the following information on the sample log using the portable weather meter; if appropriate (contact the local airport or other suitable information source [e.g., site-specific measurements,weatherunderground.com] to obtain the information).
    a. wind speed and direction;
    b. ambient temperature;
    c. barometric pressure; and
    d. relative humidity
2. Connect “T” fitting and needle valve to allow for isolation of purge pump.
3. Remove the brass plug from the SUMMA canister and connect the flow controller with in-line particulate filter and vacuum gauge to the SUMMA canister. Do not open the valve on the SUMMA canister. Record on the sample log and COC form the flow controller number with the appropriate SUMMA canister number.
    - Perform a leak-down test by replacing the nut which secures sample tubing with the cap from the canister. This will create a closed system. Open the canister valve and quickly close it; the vacuum should increase approaching 30” Hg. If there are no leaks in the system this vacuum should be held. If vacuum holds proceed with sample collection; if not attempt to rectify the situation by tightening fittings.
4. Connect the Teflon sample collection tubing to the flow controller. Leave the SUMMA canister valve closed at this point.
5. Connect a portable vacuum pump to the purge leg of sample tubing. Purge 3 volumes of air from the vapor probe and sampling line using a portable pump [purge volume = 1.5 Pi r2h] at a rate of approximately 100 mL/min. Excessive vacuums should be avoided.
6. If low-flow conditions are encountered (when air flow rate is less than 10 mL/min or when vacuum is greater than 10” mercury), notify the RTO representative to discuss the option of installing a new vapor point.
7. If necessary, check the seal established around the soil vapor probe by using a tracer gas (e.g., helium) or other method established in the state guidance documents. [Refer to the Administering Helium Tracer Gas SOP, adapted from NYSDOH 2006]
8. At completion of purge, close the needle valve to isolate sample canister.
9. Open the SUMMA canister valves. Record on the sample log the time sampling began and the canister pressure. If the initial vacuum pressure registers less than -25 inches of Hg or greater, then the SUMMA canister is not appropriate for use and another canister should be used.
10. Take photographs of the SUMMA® canister and surrounding area, as appropriate.
11. Steps 2 through10 should be repeated for each of the nested soil vapor ports; samples can be collected concurrently.
12. Check the SUMMA canister approximately half way through the sample duration and note progress on sample logs.

Termination of Sample Collection

1. Arrive at the SUMMA canister location at least 30 minutes prior to the end of the sampling interval.
2. Record the final vacuum pressure. Stop collecting the sample by closing the SUMMA canister valves. The canister should have a minimum amount of vacuum (approximately 6 inches of Hg or slightly greater).
3. Record the date and time of valve closing on the sample log and COC form.
4. Close the valve on the nested soil vapor sample tubing.
5. Once all the nested samples have been collected, be sure the well cover (if

applicable) is properly re-installed and secured.
6. Remove the particulate filters and flow controllers from the SUMMA canisters, re-install the brass plugs on the canister fittings, and tighten with the appropriate wrench.
7. Package the canisters and flow controllers in the shipping container supplied by the laboratory for return shipment to the laboratory. The SUMMA canisters should not be preserved with ice or refrigeration during shipment.
8. Complete the appropriate forms and sample labels as directed by the laboratory (e.g., affix card with a string).
9. Complete the COC form and place the requisite copies in a shipping container. Close the shipping container and affix a custody seal to the container closure. Ship the container to the laboratory via overnight carrier (e.g., Federal Express) for analysis.

Safety Considerations

- Wear all necessary PPE and follow all associated procedures as outlined in the Health and Safety Plan.

Quality Assurance

SV sample analysis will be performed using USEPA TO-15 methodology. This method uses a quadrupole or ion-trap GC/MS with a capillary column to provide optimum detection limits. The GC/MS system requires a 1-liter gas sample (which can easily be recovered from a 6-liter canister). The 6-liter canister also provides several additional 1-liter samples in case subsequent re-analyses or dilutions are required. This system also offers the advantage of the GC/MS detector, which confirms the identity of detected compounds by evaluating their mass spectra in either the SCAN or SIM mode.

Duplicate samples should be collected in the field as a quality assurance step. Generally, duplicates are taken of 10% of samples, but project specific requirements should take precedence.

Attachments:	image001.png image002.png Draft LA Fitness Letter for WinthropDOH05122016 (2).docx Draft LA Fitness Tenant LetterDOH05122016.docx

Dallas,
The New York State Departments of Environmental Conservation (Department) and Health (NYSDOH) have reviewed the draft tenant letters for the above referenced site and offer the following comments below and also edits are provided on the attached draft letters.

1) Based on her comparison of the March 2016 sub-slab soil vapor to the indoor air data, a total of six locations require monitoring. Specifically:

   SS-C20
   SS-E16
   SS-P1 (Prop1)
   Ss-P3 (prop3)
   SS-C1
   SS-D7

2) In lieu of monitoring (potentially on an annual basis), the option for a mitigation system can be evaluated.

3) In the past cracks were developed in the floors of LA Fitness facility and were fixed. Floors and permanent sampling points should be inspected for leaks.

   Please submit revised letters to the NYSDOH and the Department for review.

Subject: Draft LA Fitness Tenant Letters

ATTENTION: This email came from an external source. Do not open attachments or click on links from unknown senders or unexpected emails.

Girish,

Attached you will find the draft tenant letters for the LA Fitness sampling event. One letter is addressed to LA Fitness and the other letter is addressed to Winthrop Management. I have included the tables and figures for each of these submittals to designate which letter they correspond. The data is being validated at this time.

I have also included a copy of a recent leak test field form performed at SS-C20 in LA Fitness. The results of that leak test indicate the point is competent and no leaks were found.

Please review and let me know if you have questions or comments. Please also advise if you would like me to forward this information to NYSDOH directly.

Thank you,

Dallas

RE: Project: 117-0507644 LMC Great Neck
Pace Project No.: 10379929

Dear Dallas Mellott:
Enclosed are the analytical results for sample(s) received by the laboratory on February 23, 2017. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

This report was revised on March 13, 2017 to report MDLs for TO15 compounds.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nathan Boberg

PROJECT NARRATIVE

Project: 117-0507644 LMC Great Neck
Pace Project No.: 10379929

Method: **TO-15**
Description: TO15 MSV AIR
Client: Tetra Tech GeoTrans
Date: March 13, 2017

General Information:
18 samples were analyzed for TO-15. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:
The samples were analyzed within the method required hold times with any exceptions noted below.

Initial Calibrations (including MS Tune as applicable):
All criteria were within method requirements with any exceptions noted below.

Continuing Calibration:
All criteria were within method requirements with any exceptions noted below.

Internal Standards:
All internal standards were within QC limits with any exceptions noted below.

Method Blank:
All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:
All laboratory control spike compounds were within QC limits with any exceptions noted below.

Duplicate Sample:
All duplicate sample results were within method acceptance criteria with any exceptions noted below.

Additional Comments:

Analyte Comments:

QC Batch: 462461

1M: This compound was run under calibration with the requirements outlined in the EPA Compendium Method TO-15. Analysis does not meet the requirements for second source verification outlined in the Pace Analytical Standard Operating Procedure

- LCS (Lab ID: 2528756)
  - 1,2-Dibromo-3-chloropropane
  - Chloropentafluoroethane
  - Freon 123
  - Methyl acetate

QC Batch: 462564

1M: This compound was run under calibration with the requirements outlined in the EPA Compendium Method TO-15. Analysis does not meet the requirements for second source verification outlined in the Pace Analytical Standard Operating Procedure

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

Pace Analytical Services, LLC
1700 Elm Street - Suite 200
Minneapolis, MN 55414
(612)607-1700

QUALIFIERS

Project: 117-0507644 LMC Great Neck
Pace Project No.: 10379929

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

SAMPLE QUALIFIERS

Sample: 10379929001
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929002
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929003
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929004
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929005
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929006
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929007
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929008
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929009
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929010
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.

SAMPLE QUALIFIERS

Sample: 10379929011
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929012
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929013
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929014
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929015
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929016
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929017
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.
Sample: 10379929018
[1] 1,2 Difluoroethane (CAS #624-72-6) was not detected in this mass spectral analysis.

ANALYTE QUALIFIERS

1M This compound was run under calibration with the requirements outlined in the EPA Compendium Method TO-15. Analysis does not meet the requirements for second source verification outlined in the Pace Analytical Standard Operating Procedure
A3 The sample was analyzed by serial dilution.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
D - User disabled compound identification.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.
D - User disabled compound identification.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
D - User disabled compound identification.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
D - User disabled compound identification.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.
D - User disabled compound identification.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
D - User disabled compound identification.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
D - User disabled compound identification.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
D - User disabled compound identification.

Pace Analytical Services, Inc.

INTERNAL STANDARD COMPOUNDS
AREA AND RT SUMMARY

Instrument ID: 10airB.i
Lab File ID: 06323.D
Lab Smp Id: 10379929015
Analysis Type: VOA
Quant Type: ISTD
Operator: MJL
Method File: \\192.168.10.12\chem\10airB.i\030417.b\TO15_061-17.m
Misc Info: 27836

Calibration Date: 04-MAR-2017
Calibration Time: 06:56
Level: LOW
Sample Type: AIR

Test Mode:
Use Initial Calibration Level 5.
If Continuing Cal. use Initial Cal. Level 5

		AREA LIMIT			
COMPOUND	STANDARD	LOWER	UPPER	SAMPLE	%DIFF
47 1,4-Difluorobenze	1414114	848468	1979760	1333780	-5.68
67 Chlorobenzene - d	951026	570616	1331436	844483	-11.20

		RT LIMIT			
COMPOUND	STANDARD	LOWER	UPPER	SAMPLE	%DIFF
47 1,4-Difluorobenze	5.61	5.28	5.94	5.63	0.23
67 Chlorobenzene - d	8.65	8.32	8.98	8.65	0.04

AREA UPPER LIMIT = + 40% of internal standard area.
AREA LOWER LIMIT = - 40% of internal standard area.
RT UPPER LIMIT = + 0.33 minutes of internal standard RT.
RT LOWER LIMIT = - 0.33 minutes of internal standard RT.

95	Hexachlorobutadiene	225	Compound Not Detected.						

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.
D - User disabled compound identification.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.
D - User disabled compound identification.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.

QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount
exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.

QC Flag Legend

Q - Qualifier signal failed the ratio test.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
D - User disabled compound identification.

INTERNAL STANDARD COMPOUNDS
AREA AND RT SUMMARY

Instrument ID: 10airB.i
Lab File ID: 06202.D
Lab Smp Id: CCV
Analysis Type: VOA
Quant Type: ISTD
Operator: MLS
Method File: \\192.168.10.12\chem\10airB.i\030317.b\TO15_061-17.m
Misc Info:

Calibration Date: 02-MAR-2017
Calibration Time: 13:10
Level: LOW
Sample Type: AIR

Test Mode:
Use Initial Calibration Level 5.
If Continuing Cal. use Initial Cal. Level 5

		AREA LIMIT			
COMPOUND	STANDARD	LOWER	UPPER	SAMPLE	%DIFF
47 1,4-Difluorobenze	1414114	848468	1979760	1420913	0.48
67 Chlorobenzene - d	951026	570616	1331436	965665	1.54

		RT LIMIT			
COMPOUND	STANDARD	LOWER	UPPER	SAMPLE	%DIFF
47 1,4-Difluorobenze	5.61	5.28	5.94	5.61	-0.06
67 Chlorobenzene - d	8.65	8.32	8.98	8.65	-0.00

AREA UPPER LIMIT = + 40% of internal standard area.
AREA LOWER LIMIT = - 40% of internal standard area.
RT UPPER LIMIT = + 0.33 minutes of internal standard RT.
RT LOWER LIMIT = - 0.33 minutes of internal standard RT.

Injection Date: 04-MAR-2017 06:56
Instrument: 10airB.i
Lab Sample ID: CCV

Compound: 1,4-dichlorobenzene-d4 (S)
CAS Number:

Equation 1: Concentration of each component in the flask (Static Dilution Technique, section 10.4.1. S-MN-A-013 rev. 19).

$$\text{Concentration}(\text{mg/L}) = \frac{(V_i)(d)}{V_f}$$

where:

V_i =Volume of liquid neat standard injected into the flask in mL;
d=Density of the liquid neat standard in mg/mL;
V_f =Volume of the flask in liters.

Caution: In the preparation of standards by this technique, make sure that the volume of neat standard injected into the flask does not result in an overpressure due to the higher partial pressure produced by the standard compared to the vapor pressure in the flask.

Equation 2: First determine the volume of the compound as a gas.

$$V = \frac{nRT}{P} \quad \text{where,} \quad n = \frac{(V_i)(d)}{M}$$

where,
V=Volume of injected compound at STP in liters;
n=Moles;
R=Gas constant (0.08206 L-atm/mole ^{o}K);
T=Ambient temperature in ^{o}K;
P=Ambient pressure in atm;
V_i=Volume of liquid neat standard injected into the flask in mL;
d=Density of the neat standard in g/mL;
M=Molecular weight of the compound in g/mole.

Equation 3: Now calculate the concentration in the flask in ppbv.

$$\text{ppbv} = \frac{V}{V_f}(10^9)$$

where:
V=Gas volume of compound as determined in Eq. 8 in liters;
V_f=Volume of static dilution flask in liters.

Equation 4*:* The concentration in ppbv of each compound in the canister can be determined.

$$\text{ppbv} = \frac{(V_i)(C_x)}{V_c}$$

where:
V_i=Volume removed from static dilution flask and injected into the canister in liters;
C_x=Concentration of compound *x* in the static dilution flask in ppbv;
V_c=Final canister volume in liters.

Equation 5: Calculate the relative response factors (RRF) for each compound.

$$\text{Relative Response Factor (RRF)} = \frac{(A_x)(C_i)}{(A_i)(C_x)}$$

where,
A_x=Area of the primary ion for compound *x* to be measured;
A_i=Area of the primary ion for the internal standard associated with compound *x*;
C_i=Concentration of the internal standard in ppbv;
C_x =Concentration of compound *x* to be measured in ppbv.

Equation 6: Calculate the mean RRF for each compound.

$$\overline{R_f} = \frac{\sum_{n=5} R_f}{n}$$

where,
$\overline{R_f}$ =Average relative response factor;
R_f=Relative response factor from calibration curve;
n=Number of data points.

Equation 7: Standard Deviation.

$$\sigma_{(n-1)} = \sqrt{\sum_{i-1}^{n} \frac{(x_i - \bar{x})^2}{(n-1)}}$$

Equation 8: %Relative Standard Deviation (%RSD).

$$\%RSD = \frac{s_{(n-1)}}{\bar{R}_f} x100$$

Equation 9: Mean area response for Internal Standard.

$$\bar{y} = \sum_{i=1}^{n} \frac{y_i}{n}$$

where,

$\bar{y}$ = mean area response

y = Area response for the internal standard for each initial calibration standard

Equation 10: If a linear regression is used, the regression produces the slope and intercept terms for a linear equation.

y = ax + b

where:

y = instrument response (peak area or height)

a = Slope of the line (also called the coefficient of x)

x = Concentration of the calibration standard

b = the intercept, do not include the origin (0) as a calibration point

Equation 11: To calculate the sample concentration by the internal standard method using the linear regression.

$C_s=[(A_sC_{is}/A_{is})-b]/a$

where:

As = Area of the peak for the target analyte in the sample

Ais = Area of the peak of the internal standard

Cs = Concentration of the target analyte in the calibration standard

Cis = Concentration of the internal standard

a = Slope of the line (also called the coefficient of Cs)

b = The intercept

Equation 12: To calculate the coefficient of determination (or r^2) for a quadratic curve fit.

$$COD = \frac{\sum_{i=1}^{n}(y_{obs} - \bar{y})^2 - \left(\frac{n-1}{n-p}\right)\sum_{i=1}^{n}(y_{obs} - Y_i)^2}{\sum_{i=1}^{n}(y_{obs} - \bar{y})^2}$$

where:
y_{obs} = Observed response for each concentration from each initial calibration standard
y = Mean observed response from the initial calibration (See equation 6)
Y_i = Calculated response at each concentration from the initial calibration (See Equation 5)
n = Total number of calibration points in the equation, 6 points for quadratic
p = Number of adjustable parameters in the polynomial equation

Equation 13: Calculate the sample concentration by the internal standard method using the quadratic regression by comparing peak heights to the calibration curve.

Regression equation (quadratic):

$y = ax^2 + bx + c$

Equation 14: Percent Difference (%D). The % D in the RRF of the daily RRF of an individual compound compared to the mean RRF for that compound in the most recent calibration curve.

$$\%D = \frac{|R_i - R_c|}{R_i}(100)$$

where,

R_i=The average RRF from the initial calibration curve for compound *x*;
R_c=RRF for compound *x* from the CCV standard.

Equation 15: Calculate the percent recovery of the LCS.

$$\text{Percent Recovery} = \frac{C_q}{C_a}(100)$$

where:
C_q=Quantitated concentration of compound *x* in ppbv;
C_a=Actual concentration of compound *x* in ppbv.

Equation 16: Calculate the resultant dilution factor.

DF = (Pf + 14.7) / Pi + 14.7)

Pi = Pressure reading of canister prior to pressurization (psig)
Pf = Pressure reading of canister after pressurization (psig)
DF = Dilution factor

To convert Hg to psig:
Multiply by 0.491559 or divide by 2.036

PSIG reading is converted to One Atmosphere:
One Atmosphere = 14.7 psig = 29.21 inches of Hg

Equation 17: Calculate the concentration of the sample component.

$$C_x = \frac{(A_x)(C_i)(D_f)}{(A_i)(R_f)}$$

where:

C_x=Concentration of compound *x* in ppbv;
A_x=EICP area of the quantitation ion for compound *x*;
C_i=Concentration of the internal standard associated with compound *x* in ppbv;
D_f=Dilution factor from Equation 12 (if no dilution was performed, D_f equals 1.)
A_i=EICP area of the quantitation ion for the internal standard associated with compound *x*;
R_f=Average RRF for compound *x* from the most recent calibration curve.

Equation 18: The RPD between the sample and the sample duplicate.

$$RPD = \frac{|A - B|}{(A + B)/2} \times 100$$

Where:

RPD = Relative Percent Difference
A = Sample Value
B = Duplicate Value

Equation 19: Convert ppbv to µg/m³.

$$\frac{(x\ ppbv \times MW\frac{g}{mol})}{24.055\frac{L}{mol}} = y\frac{\mu g}{m^3}$$

Where:

MW = Molecular Weight
24.055 L/mol = Molar Volume of an ideal Gas

$$PV = nRT$$

$$V = \frac{nRT}{P}$$

Where:

V = Volume in liters
N = mols of ideal Gas (1 mol)
R = Ideal gas constant
T = Temperatire in Kelvin

$$V = \frac{(1mol) \times (0.082\ \frac{(L \times atm)}{(mol \times K)} \times 293.15K}{1\ atm}$$

$$V = 24.055\frac{L}{mol}$$

Equation 20: Preparation of Working TO15 Standard.

$$\frac{X}{Y} \times C = Z$$

Where:

X = Volume (L) spiked from stock
Y = Volume (L) of container
C = Concentration (ppbv) of Stock
Z = Concentration (ppbv) of working standard

DATA USABILITY SUMMARY REPORT
FEBRUARY/MARCH 2017 AIR SAMPLES
LOCKHEED MARTIN CORPORATION: GREAT NECK SITE
NEW YORK
DATE SAMPLES COLLECTED: FEBRUARY 21, 2017

LAB REPORT No. 10379929

1.0 INTRODUCTION

Eighteen air samples were collected by Tetra Tech, Inc., at the Lockheed Martin Corporation Great Neck site, on February 21, 2017. The samples were sent to Pace Analytical Services, LLC in Minneapolis, Minnesota. All analyses were conducted in accordance with USEPA TO-15 analytical and reporting protocols.

The data package deliverables provided by the laboratory included a Category B deliverable as outlined in the New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocols.

Data validation was performed on the aforementioned samples in accordance with EPA Region II data validation guidelines and USEPA Method TO-15. Data validation was conducted using USEPA Region II Standard Operating Procedure (SOP) HW-31, September 2016, Revision 6.

The Data Usability Summary Report (DUSR) was prepared after the process of data validation was completed and summarizes the overall data quality and usability in accordance with the NYSDEC Technical Guidance for Site Investigation and Remediation (NYSDEC 2010).

The DUSR review is based on the following parameters:

- Data completeness
- * Hold times/Sample Preservation
- * GC/MS System Tuning and Performance
- Initial/continuing calibrations
- * Laboratory Method Blank Results
- * Internal Standard Results
- * Laboratory Control Sample Results
- * Laboratory Duplicate Precision
- Field Duplicate Precision
- * Compound Identification/Quantitation
- * Tentatively Identified Compounds Results
- Detection Limits

The symbol (*) indicates that all quality control criteria were met for this parameter.

This report was prepared to provide a critical review of the laboratory analysis and reported chemical results. Overall, the data quality is acceptable. The results of the DUSR are presented in Section 3.0. Summary tables are provided. Attachments 1, 2, and 3 are provided so that the data user can review the qualified analytical results, results reported by the laboratory and the supporting documentation associated with data findings and data quality.

2.0 SAMPLES INCLUDED IN REVIEW

Lab Report No. 10379929

Sample ID	Lab ID	Date Collected	Test Requested

Legend:

VOCs = Volatile Organic Compounds in accordance with EPA TO-15 Method

3.0 RESULTS

3.1 DATA COMPLETENESS

With the exception of clean canister certification batch samples, the data package deliverables were complete and the format requirements were met. Clean canister certification samples should be included in every data package to verify the canister cleaning was performed according to method requirements. The laboratory was contacted and described that they perform canister cleaning on all sample containers but only provide analysis on a single canister on a batch basis. The lab was asked to provide the clean canister results but the results were not available at the time this report was completed.

3.2 ORGANIC QUALIFIERS

Hold Times/Sample Preservation: Technical hold times and preservation were assessed by comparing the sample dates and preservation code on the sample Chain of Custody (COC) with that of the analysis dates.

- All project samples were properly preserved and analyzed within the required hold time for VOC analyses.

GC/MS Performance Check (Tuning) Summary: Gas chromatograph/mass spectrometer (GC/MS) instrument tuning and performance checks are performed to ensure the instrument's ability to provide appropriate mass-resolution, identification and sensitivity.

- The BFB tuning compound mass-ion abundance criteria for the VOC analyses were reported within control limits.

Initial and Continuing Calibration Results: Control limits for initial and continuing instrument calibrations are established to ensure that the instrument is capable of producing accurate quantitative data. The following issues were noted:

- The continuing calibration performed on 03/05/2017 @ 10:57 had a Percent Difference (%D) for cis-1,2-dichloroethene above the quality control limit. Samples VP-8D_72.5_20170221-DL, VP-8D_62.5_20170221-DL and VP-8D_53.5_20170221-DL were affected. The detected results reported for this compound in the affected samples were qualified as estimated, (J).

- All other initial and continuing calibration response factors and percent relative standard deviations were within acceptable quality control limits for the parameters reviewed.

Laboratory Method Contamination:

- No target compound contaminants were detected in the laboratory method blank associated with the reviewed parameters in this data set.

- Methylene chloride was detected in 17 of 18 samples. Methylene chloride was not reported or detected in the associated laboratory method blanks. Despite the absence of methylene chloride in the method blanks, the data reviewer has qualified all methylene chloride detections as estimated, (J) considering them suspected laboratory contaminants.

Internal Standards Area Performance:

- The internal standard area counts and retention times fell within control limits for the project samples received and reviewed.

Laboratory Control Spike (LCS) Results:

- All LCS recoveries were compliant.

Laboratory Duplicate Precision: Laboratory duplicates provide information on laboratory precision.

- The laboratory duplicate precision Relative Percent Differences (RPDs) fell within control limits, thereby satisfying laboratory precision.

Field Duplicate Precision: Field duplicates are collected to provide information on sampling precision.

- FPM-20_5_20170221DUP was collected as a field duplicate sample of FPM-20_5_20170221. The RPDs associated with these two samples fell within quality control limits, thereby satisfying precision.

- VP-8D_62.5_20170221DUP was collected as a field duplicate sample of VP-8D_62.5_20170221. The RPDs exceeded the 50% quality control limit or the difference was greater than 2X the reporting limit for 1,1,2-trichloroethane, 1,1,2-trichlorotrifluoroethane, 1,1-dichloroethene, chlorodifluoromethane, chloroform, trans-1,2-dichloroethene, trichlorofluoromethane, cis-1,2-dichloroethene, tetrachloroethene, trichloroethene, methylene chloride and toluene. The detected results reported for these compounds in the field duplicate pair were qualified as estimated, (J).

- The remaining results associated with these two samples fell within quality control limits, thereby satisfying precision.

Target Compound Identification and Quantitation: The laboratory calculations are verified and compound identifications are reviewed and assessed by the data reviewer.

- The GC/MS raw data (quantitation reports and chromatograms) were provided for review. No laboratory calculation errors were noted for the sample selected for verification during data validation.

Tentatively Identified Compounds (TIC) Results: A targeted TIC library search was conducted for each sample for the compound 1,2-difluoroethane.

- 1,2-Difluoroethane was not detected in the targeted TIC library search in the reviewed samples. No Reporting Limit (RL) was assigned. This compound was not included on the sample Form Is or the electronic deliverable.

Detection Limits: Non-detected results were reported to the RL.

- Methylene chloride exceeded the calibration range of the instrument in sample VP-8D_53.5_20170221. The laboratory reanalyzed the sample at a 1569X dilution resulting in a nondetected result. The original result was chosen and qualified as estimated, (J).

- The following samples were further diluted due to concentrations of target compounds:

Sample	Compound	Dilution
VP-104_50_20170221	tetrachloroethene	35X
	trichloroethene	35X
VP-104_62_20170221	trichloroethene	17.5X
VP-104_73_20170221	tetrachloroethene	35X
	trichloroethene	35X
VP-8D_53.5_20170221	cis-1,2-dichloroethene	1569X
	tetrachloroethene	1569X

	trichloroethene	1569X
VP-8D_62.5_20170221	cis-1,2-dichloroethene	560X
	tetrachloroethene	560X
	trichloroethene	560X
VP-8D-72.5-20170221	cis-1,2-dichloroethene	585.6X
	tetrachloroethene	585.6X
	trichloroethene	585.6X
VP-8D_62.5_2017022DUP	tetrachloroethene	292.8X
	trichloroethene	292.8X

The results from the diluted analyses were used in the data review.

- Detected result reported below the RL but above the MDL were qualified as estimated, "J".

Additional Comments: According to the laboratory, the sample canisters were batch certified. All sample canisters contained an initial vacuum of approximately -30 psig (-27 to -30 psig) and finished at sub atmospheric pressures (-8 to -10).

4.0 CONCLUSIONS

Overall, based on the outcome of data validation as summarized in the DUSR, and with exception to the presence of methylene chloride which may be a laboratory contaminant in the opinion of the data reviewer, the data quality is acceptable with the qualifiers noted in this report.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

ANALYTICAL RESULTS

Project: 117-0507644 LMC Great Neck
Pace Project No.: 10379929

Sample: FPM-20_5_20170221 **Lab ID: 10379929009** Collected: 02/21/17 13:47 Received: 02/23/17 09:50 Matrix: Air

Parameters	Results	Units	PQL	MDL	DF	Prepared	Analyzed	CAS No.	Qual
TO15 MSV AIR	Analytical Method: TO-15								
2-Propanol	**51.8**	ug/m3	4.6	0.44	1.83		03/04/17 13:23	67-63-0	
Styrene	**1.4J**	ug/m3	1.6	0.35	1.83		03/04/17 13:23	100-42-5
