CLIENT	JOB NUMBER	
Middle River Center	COI020508	
SUBJECT: Sample Calculation		
BASED ON	DRAWING NUMBER	
BY: Ann Cognetti	CHECKED BY	APPROVED BY: 11-2-10 DATE: 10-26-10

I. VOC; Sample PW-01 Composite; Acetone ✓

$$\frac{229954}{1190380} * \frac{1}{10} * \frac{2 \text{ (dilution factor)}}{2.5} * \frac{500 \text{ 50ng}}{0.08417} = 45.9 \text{ ug/L acetone}$$

(ng conversion)

II. PAH; Sample PW-05 6-18"; Acenaphthene ✓

$$\frac{9570}{191392} * 1 * \frac{1}{4 \text{ mL}} * \frac{500 \text{ mL}}{200 * 2 \text{ mL}} * \frac{8 \text{ ng}}{1.14694} = 0.44 \text{ ug/L acenaphthene}$$

III. Aroclor 1260; Sample PW-05 6-18" ✓

$$\frac{30737 \text{ AREA}}{1679493 \text{ AREA/ng}} * 1 * \frac{8000 \text{ mL}}{1 \text{ mL} * 200 \text{ mL}} = 0.73$$

$$\frac{43238}{2200150} * 1 * \frac{8000}{200} = 0.79$$

$$\frac{13135}{1899762} * 1 * \frac{8000}{200} = 0.28$$

$$\frac{24549}{2002313} * 1 * \frac{8000}{200} = 0.49$$

$$\frac{10757}{920548} * 1 * \frac{8000}{200} = 0.47$$

$$\frac{0.73+0.79+0.28+0.49+0.47}{5} = 0.55 \text{ ug/L Aroclor 1260}$$ ✓

1/water
Rinsate Blank

Overview

The sample set for Middle River Complex, SDG C0I020508, consists of twenty one (21) sediment pore water samples and one (1) rinsate blank.

All samples were analyzed for select metals including antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc. All samples were also analyzed for pH, hardness, and dissolved organic carbon (DOC). The samples were collected by Tetra Tech NUS on August 22nd, 2010 and analyzed by Test America. Metals analyses were conducted using SW-846 method 6020. Mercury analyses were conducted using SW-846 method 7470A. DOC analyses were conducted using method SM 5310C. Hardness analyses were conducted using method SM 2340B. pH analyses were conducted by using method 9040.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike recoveries, laboratory duplicate results, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems – None.

Minor Problems-

- The following contaminants were detected in blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Chromium (1)	0.97 ug/L	4.85 ug/L
Chromium (2)	1.2 ug/L	6.0 ug/L

Antimony [3]	0.35 ug/L	1.75 ug/L
Beryllium [3]	0.06 ug/L	0.3 ug/L
Lead [3]	0.05 ug/L	0.25 ug/L
Nickel [3]	0.20 ug/L	1.0 ug/L
Selenium [3]	0.54 ug/L	2.7 ug/L
Silver [3]	0.18 ug/L	0.9 ug/L
Thallium [3]	0.09 ug/L	0.45 ug/L

(1) Maximum concentration present in a preparation blank affecting samples in preparation batch 0252358.
(2) Maximum concentration present in a preparation blank affecting samples in preparation batch 0252362.
(3) Maximum concentration present in a continuing calibration blank affecting all samples analyzed for select metals

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level reported for were qualified "B" as a result of laboratory blank contamination.

- The CRDL standard analyzed on 9/23/10 had a percent recovery > 110% for arsenic, lead, nickel, selenium, silver, and thallium. All samples in the SDG were affected. Positive results <2X CRDL for arsenic, lead and selenium were qualified as estimated (J) due to conflicting directional bias. Nickel and thallium results were not qualified as sample results were already qualified for blank contamination.

- All mercury results were analyzed beyond the 28 day hold time. Non-detect samples results were qualified as biased low (UL).

- Positive results greater than the MDL but less than the RL were qualified as estimated (J).

Notes

The samples were collected as sediments in a core sampling device. The samples were separated into incremental sections at the laboratory and were centrifuged. The laboratory centrifuged the samples and analyzed the water which was displaced from the sediment. The sampling date on the form 1s reflects is date which samples were centrifuged. The sampling date listed on the chain of custody was used to evaluate hold time.

The laboratory indicated that the pore water samples for metals, hardness, pH and DOC were filtered and preserved (metals and DOC) prior to analysis. This item is noted for completeness.

The lab did not include the quality control data for hardness.

Executive Summary

Laboratory Performance: Preparation and calibration blanks resulted in the qualification on several samples. CRDL standard non-compliances for lead, arsenic and selenium resulted in the qualification of sample results. Mercury results were qualified for a hold time non-compliance.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	GFAA PDS - GFAA MSA's $r < 0.995$
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (e.g. base-line drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can be any number of issues; e.g. poor chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	% Difference between columns/detectors >25% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient $r < 0.995$
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is greater than sample activity

APPENDIX C

SUPPORT DOCUMENTATION

CASE NARRATIVE
TETRA TECH NUS, INC.
Middle River, MD

Lot #: C0I020508

Sample Receiving:
TestAmerica's Pittsburgh laboratory received samples on August 24, 2010. The coolers were received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
TestAmerica's North Canton laboratory performed the VOA analysis. All data is included in the package.

Due to the concentration of target compounds detected, PW-01 Composite was analyzed at a dilution.

The method blank had compounds detected below the reporting limit but above the MDL. The result was flagged with a "J" qualifier. Any sample associated with this blank that had the same compounds detected had the result flagged with a "B" qualifier.

GC/MS Semivolatiles:
Due to the concentration of target compounds detected and/or matrix, all samples were analyzed at a dilution.

Sample PW-05 18-30" had nitrobenzene-d5 surrogate recover below the control limit. The sample was analyzed at a dilution.

The RPD between the LCS and LCSD recovered above the control limit for 4-nitrophenol.

All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

The continuing calibrations had the %D > 25% but were within expected performance range for these compounds.

PCBs:
There were no problems associated with the analysis.

CASE NARRATIVE
TETRA TECH NUS, INC.
Middle River, MD

Lot #: C0I020508

Metals:
The serial dilution percent difference was outside the control limits for antimony in sample PW-07 18-30".

The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier.

General Chemistry:
pH is a field parameter. Laboratory pH analysis was completed at the request of the client.

METHODS SUMMARY

C0I020508

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
pH Aqueous	SW846 9040	SW846 9040
Dissolved Organic Carbon 5310C	SM20 5310C	
ICP-MS (6020)	SW846 6020	SW846 3005A
Mercury in Liquid Waste (Manual Cold-Vapor)	SW846 7470A	SW846 7470A
PCBs by SW-846 8082	SW846 8082	SW846 3510C
Semivolatile Organics GCMS BNA 8270C	SW846 8270C	
Total Hardness	SM18 2340B	
Volatile Organics by GC/MS	SW846 8260B	SW846 5030B

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com.FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery,misdelivery,or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim.Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic valueof the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental,consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss.Maximum for items of extraordinary value is $500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our ServiceGuide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal
☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months (A fee may be assessed if samples are retained longer than 1 month)

Turn Around Time Required
☐ 24 Hours ☐ 48 Hours ☐ 7 Days ☐ 14 Days ☐ 21 Days ☐ Other Standard

QC Requirements (Specify)

	Relinquished By	Date	Time	Received By	Date	Time
1.	[signature]	8/23/10	1530	[signature]	8/23/10	1530
2.	[signature]	8/23/10	1630	[signature]		
3.				[signature]	8/24/10	1015

Comments

DISTRIBUTION: WHITE - Returned to Client with Report; CANARY - Stays with the Sample; PINK - Field Copy

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

SUBJECT:	**ORGANIC DATA VALIDATION- VOC LOCKHEED MIDDLE RIVER CENTER SDG C0I080421**		

SAMPLES: 15/Water/

CPC-PW-VOC-1	CPC-SW-VOC-1	DHC-PW-VOC-1
DHC-PW-VOC-2	DHC-PW-VOC-3	DHC-PW-VOC-4
DHC-PW-VOC-5	DHC-SW-VOC-1	DHC-SW-VOC-2
DHC-SW-VOC-3	DHC-SW-VOC-4	DHC-SW-VOC-5
DHC-SW-VOC-6	DHC-SW-VOC-7	DHC-SW-VOC-DUP

Overview

The sample set for Middle River Complex, SDG C0I080421, consists of fifteen (15) aqueous environmental samples. This SDG contained one field duplicate pair: DHC-SW-VOC-DUP/ DHC-SW-VOC-7.

All samples were analyzed for volatile organic compounds (VOC). The samples were collected by Tetra Tech NUS on September 1st, 2nd, and 3rd, 2010 and analyzed by Test America. VOC analyses were performed by method 8260B.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial and continuing calibration results, laboratory method blank results, surrogate spike recoveries, internal standard recoveries, matrix spike/ matrix spike duplicate recoveries, laboratory control standard recoveries, detection limits, compound quantitation, field duplicate precision and compound identification. Areas of concern with respect to data quality are listed below.

Areas of concern with respect to data quality are listed below.

Major Problems –

- The initial calibration analyzed on 9/13/10 had a relative response factor (RRF) < 0.05 for tert-butyl alcohol. All samples in the SDG were affected. Non-detect results were qualified as rejected (UR).
- The continuing calibration analyzed on 9/15/10 had a relative response factor (RRF) < 0.05 for tert-butyl alcohol. All samples in the SDG were affected. Non-detect results were qualified as rejected (UR).

Minor Problems-

- The initial calibration analyzed on 9/13/10 had a relative percent difference > 15% but <50% for acetone. All samples in the SDG were affected. Positive acetone results were qualified as estimated (J). Non-detects were not qualified because the percent difference was <50%.
- Positive results greater than the method detection limit but less than the reporting limit were

qualified as estimated (J).

Notes

LCS percent recovery report only included 1,1-dichloroethene, trichloroethene, benzene, toluene, and chlorobenzene.

No MS/MSD was performed on a sample from this SDG.

Executive Summary

Laboratory Performance: tert-butyl alcohol was rejected in all samples because of a low RRF. Calibration noncompliances for acetone resulted in the qualification of positive results.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994). The text of this report has been formulated to address only those problem areas affecting data quality.

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	GFAA PDS - GFAA MSA's $r < 0.995$
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (e.g. base-line drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can be any number of issues; e.g. poor chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	% Difference between columns/detectors >25% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient $r < 0.995$
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is greater than sample activity

APPENDIX C

SUPPORT DOCUMENTATION

CASE NARRATIVE
TETRA TECH NUS, INC.
Middle River, MD

Lot #: C0I080421

Sample Receiving:
TestAmerica's Pittsburgh laboratory received samples on September 4, 2010. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
TestAmerica's North Canton laboratory performed the VOA analysis. All data is included in the package.

412 963-2435

METHODS SUMMARY

C0I080421

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Volatile Organics by GC/MS	SW846 8260B	SW846 5030B

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

VOLATILE ORGANIC GC/MS TUNING AND MASS CALIBRATION - BROMOFLUOROBENZENE (BFB)

Lab Name: NORTH CANTON Contract:

Lab Code: TACAN Case No.: SAS No.: SDG No.: C0I080421

Lab File ID: BFB472 BFB Injection Date: 09/15/10

Instrument ID: A3UX11 BFB Injection Time: 0750

Matrix: (soil/water) WATER Level: (low/med) LOW Column: (pack/cap) CAP

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	17.2
75	30.0 - 60.0% of mass 95	46.8
95	Base Peak, 100% relative abundance	100.0
96	5.0 - 9.0% of mass 95	7.2
173	Less than 2.0% of mass 174	0.2 (0.3)1
174	50.0 - 100.0% of mass 95	83.6
175	5.0 - 9.0% of mass 174	5.8 (6.9)1
176	Greater than 95.0%, but less than 101.0% of mass 174	79.9 (95.6)1
177	5.0 - 9.0% of mass 176	5.2 (6.6)2

1-Value is % of mass 174 2-Value is % of mass 176

THIS TUNE APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS, AND STANDARDS:

Tetra Tech NUS **INTERNAL CORRESPONDENCE**

TO:	**M. MARTIN**	**DATE:**	**NOVEMBER 5, 2010**
FROM:	**TERRI SOLOMON**	**COPIES:**	**DV FILE**
SUBJECT:	**ORGANIC DATA VALIDATION- VOC LOCKHEED MIDDLE RIVER CENTER SDG C0J010569**		
SAMPLES:	5/Aqueous		

CPC-PW-VOC-2 CPC-PW-VOC-3 CPC-SW-VOC-2
CPC-SW-VOC-3 TB

Overview

The sample set for Lockheed Middle River Center, SDG C0J010569, consists of four (4) aqueous environmental samples and one (1) trip blank (TB). No field duplicate samples were included in this SDG.

All samples were analyzed for volatile organic compounds (VOC). The samples were collected by Tetra Tech on September 29, 2010 and analyzed by Test America (Pittsburgh). All analyses were conducted in accordance with SW-846 Methods 8260B.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method/trip blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike / matrix spike duplicate recoveries, internal standard recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- The initial calibration relative response factors on 09/09/10 and continuing calibration relative response factors on 10/10/10 at 8:50 and 10/11/10 at 10:44 on instrument A3UX15 were < 0.05 quality control limit for tert-butyl alcohol and vinyl acetate affecting all samples. The nondetected results reported for tert-butyl alcohol and vinyl acetate were qualified as rejected, "UR".

Minor

- The continuing calibration percent differences (%Ds) on 10/10/10 at 8:50 on instrument A3UX15 were > 20% but < 50% quality control limits for 4-methyl-2-pentanone, 2-hexanone, 1,1,2,2-tetrachloroethane, hexachlorobutadiene, chloroethane, acetone, carbon disulfide, methyl tert-butyl ether, tert-butyl alcohol, 2-butanone and 2,2-dichloropropane affecting samples CPC-PW-VOC-3, CPC-PW-VOC-2, CPC-SW-VOC-3 and TB. The positive results reported for 2-butanone were qualified as estimated, "J". No validation actions are required for nondetected results.

- The continuing calibration %D on 10/11/10 at 10:44 on instrument A3UX15 was > 50% quality control limit for methyl tert-butyl ether affecting sample CPC-PW-VOC-2. The nondetected result reported for methyl tert-butyl ether was qualified as estimated, "UJ".

- The continuing calibration percent differences (%Ds) on 10/11/10 at 10:44 on instrument A3UX15 were > 20% but < 50% quality control limits for acetone, carbon disulfide, tert-butyl alcohol, 2-butanone, 2,2-dichloropropane, cis-1,3-dichloropropene, 4-methyl-2-pentanone, trans-1,3-dichloropropene, 2-hexanone, 1,2,4-trichlorobenzene and hexachlorobutadiene affecting sample CPC-PW-VOC-2. The positive result reported for 2-butanone was qualified as estimated, "J". No validation actions are required for nondetected results.

- The following compounds were detected in the method/trip blank at the maximum concentrations indicated below:

Compound	Concentration	Action Level
tert-Butyl alcohol	10 ug/L	50 ug/L
Acetone[(1)]	27 ug/L	270 ug/L

(1) Maximum concentration present in a trip blank.

An action level of 10X the maximum contaminant concentration was established for common laboratory contaminants; 5X for all other compounds to evaluate laboratory contamination. Dilution factors, and sample aliquots were taken into consideration during the application of all action levels. The positive results for acetone were qualified "B" due to blank contamination.

- The laboratory control sample / laboratory control sample duplicate (LCSLCSD) percent recoveries were below the quality control limits for chlorobenzene associated with sample CPC-PW-VOC-2. The nondetected result reported for chlorobenzene was qualified as biased low, "UL".

- Positive results less than the reporting limit (RL) but greater than the method detection limit (MDL) were qualified as estimated, "J".

Notes

The initial calibration percent relative standard deviations (%RSDs) on 09/09/10 on instrument A3UX15 were > 15% but < 50% quality control limits for acetone and methylene chloride affecting all samples. No validation actions were warranted as the sample results for acetone were qualified as a result of blank contamination and the sample results for methylene chloride were nondetects.

The LCSD percent recovery was below the quality control limit for toluene associated with sample CPC-PW-VOC-2. No validation actions were warranted as the LCS was within quality control limits.

Nondetected results are reported to the method detection limit (MDL).

Sample CPC-PW-VOC-2 was analyzed at a 2.5 dilution.

Executive Summary

Laboratory Performance: Several initial and continuing calibration RRFs were < 0.05 quality control limit. Several continuing calibration %Ds were > 20% quality control limit. The LCSLCSD percent recoveries were below the quality control limits for chlorobenzene associated with sample CPC-PW-VOC-2.

Other Factors Affecting Data Quality: Acetone was present in the trip blank. Positive results less than the RL but greater than the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994). The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:
Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS-GFAA MSA's r < 0.995 / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O - Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DOT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Support Documentation

CASE NARRATIVE
TETRA TECH NUS, INC.
Middle River, MD

Lot #: C0J010569

Sample Receiving:
TestAmerica's Pittsburgh laboratory received samples on October 1, 2010. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Volatiles:
TestAmerica's North Canton laboratory performed the VOA analysis. All data is included in the package.

Due to the concentration of target compounds detected, sample CPC-PW-VOC-2 was analyzed at a dilution.

The laboratory control standard for batch 0285139 was flagged as being outside of the control limits for chlorobenzene. The laboratory control duplicate for this batch was flagged as being outside of the control limits for toluene and chlorobenzene. The limits in the data system were updated prior to data entry. The compounds did recover within the control limits prior to the update.

The method blank for batch 0285220 had tert-butyl-alcohol and acetone detected between the MDL and the reporting limits. The results were flagged with a "J" qualifier. Any sample in this batch that had these compounds detected had the results flagged with a "B" qualifier.

METHODS SUMMARY

C0J010569

PARAMETER	ANALYTICAL METHOD	PREPARATION METHOD
Volatile Organics by GC/MS	SW846 8260B	SW846 5030B

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

VOLATILE ORGANIC GC/MS TUNING AND MASS CALIBRATION - BROMOFLUOROBENZENE (BFB)

Lab Name: NORTH CANTON Contract:

Lab Code: TACAN Case No.: SAS No.: SDG No.: C0J010569

Lab File ID: BFB494 BFB Injection Date: 09/09/10

Instrument ID: A3UX15 BFB Injection Time: 0915

Matrix: (soil/water) WATER Level: (low/med) LOW Column: (pack/cap) CAP

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	22.8
75	30.0 - 60.0% of mass 95	45.9
95	Base Peak, 100% relative abundance	100.0
96	5.0 - 9.0% of mass 95	6.4
173	Less than 2.0% of mass 174	0.5 (0.5)1
174	50.0 - 100.0% of mass 95	87.4
175	5.0 - 9.0% of mass 174	6.0 (6.8)1
176	Greater than 95.0%, but less than 101.0% of mass 174	84.2 (96.3)1
177	5.0 - 9.0% of mass 176	5.3 (6.2)2

1-Value is % of mass 174 2-Value is % of mass 176

THIS TUNE APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS, AND STANDARDS:

	EPA SAMPLE NO.	LAB SAMPLE ID	LAB FILE ID	DATE ANALYZED	TIME ANALYZED

VOLATILE ORGANIC GC/MS TUNING AND MASS CALIBRATION - BROMOFLUOROBENZENE (BFB)

Lab Name: NORTH CANTON Contract:

Lab Code: TACAN Case No.: SAS No.: SDG No.: C0J010569

Lab File ID: BFB512 BFB Injection Date: 10/10/10

Instrument ID: A3UX15 BFB Injection Time: 0805

Matrix: (soil/water) WATER Level: (low/med) LOW Column: (pack/cap) CAP

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	29.7
75	30.0 - 60.0% of mass 95	52.0
95	Base Peak, 100% relative abundance	100.0
96	5.0 - 9.0% of mass 95	6.7
173	Less than 2.0% of mass 174	0.5 (0.7)1
174	50.0 - 100.0% of mass 95	74.9
175	5.0 - 9.0% of mass 174	5.4 (7.3)1
176	Greater than 95.0%, but less than 101.0% of mass 174	71.3 (95.2)1
177	5.0 - 9.0% of mass 176	4.2 (5.9)2

1-Value is % of mass 174 2-Value is % of mass 176

VOLATILE ORGANIC GC/MS TUNING AND MASS CALIBRATION - BROMOFLUOROBENZENE (BFB)

Lab Name: NORTH CANTON Contract:

Lab Code: TACAN Case No.: SAS No.: SDG No.: C0J010569

Lab File ID: BFB513 BFB Injection Date: 10/11/10

Instrument ID: A3UX15 BFB Injection Time: 1001

Matrix: (soil/water) WATER Level: (low/med) LOW Column: (pack/cap) CAP

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
50	15.0 - 40.0% of mass 95	29.2
75	30.0 - 60.0% of mass 95	51.5
95	Base Peak, 100% relative abundance	100.0
96	5.0 - 9.0% of mass 95	6.5
173	Less than 2.0% of mass 174	0.5 (0.7)1
174	50.0 - 100.0% of mass 95	75.7
175	5.0 - 9.0% of mass 174	5.0 (6.6)1
176	Greater than 95.0%, but less than 101.0% of mass 174	72.3 (95.6)1
177	5.0 - 9.0% of mass 176	4.8 (6.7)2

1-Value is % of mass 174 2-Value is % of mass 176

Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or state specific certification programs as applicable.

New York Certification Number: 11886

Certification

This certifies that this package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed herein. The results included in this data report relate only to the samples as received and analyzed by the laboratory.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager and Quality Assurance Officer, as verified by the following signatures.

James A. Roush — December 1, 2010
Environmental Scientist, Laboratory Manager

David M. Mauro — December 1, 2010
Senior Scientist, Quality Assurance Officer

Sample Delivery Group Narrative

Project:	MRC Sediments and Storm Event Sampling
Client	Tetra Tech NUS, Inc. 20251 Century Blvd., Suite 200 Germantown, MD 20874
Report Contact:	Mike Martin
Dates of Receipt:	8/19/2010, 8/24/2010, 10/15/2010
Sample Summary:	The samples received for this project are summarized in the attached sample login forms in Appendix A.
META Project Number:	T04015
SDG No.:	TT100819, TT100824, TT101015
Total Pages in Report:	400

Chain of Custody

The samples were received in good condition. The internal temperature of the shipping containers was within the recommended 0-6°C range and was as follows:

Samples received:	8/19/2010	0°C	Ice present
	8/24/2010	2.3°C	Ice present
	10/15/2010	0°C	Ice present

Internal chain of custody procedures were followed after sample receipt. Samples were stored in a locked refrigerator. A sample custody logbook contains the record of sample removal from the secure sample storage area to the sample preparation laboratory. The custody record for the sample extracts is present on the sample extraction logbook page. The disposal of samples and extracts will be authorized one month after the release of this data report. Sample disposal will be documented.

Methods

The sediment samples were prepared by solvent extraction (EPA 3570) using dichloromethane (DCM). The water samples were prepared by liquid/liquid solvent extraction (EPA 3511) also using DCM. The extracts were spiked with internal standard and analyzed by GC/FID (EPA 8100M) for fingerprinting and by GC/MS/SIM (EPA 8270M) for mono- and polycyclic aromatic hydrocarbons (MAHs and PAHs), alkyl PAH homologues and other selected compounds.

Results

Sample results are presented in several appendices which follow this narrative.

Appendix B: GC/FID Fingerprints
Appendix C: MAH/PAH Concentrations
Appendix D: Extended MAH/PAH Profiles - Histograms
Appendix E: Extracted Ion Current Profiles (EICPs)

Quality Control

Analyte Flags

The detection limits were determined as the sample equivalent of the lowest linear initial calibration standard. Analytes measured between 50% and 100% of the lowest standard were reported as "estimated" and flagged with the letter "J." Undetected analytes were reported as null and flagged with the letter, "U." Analytes marked with a "B" were detected in the associated blank and should be reviewed for a possible positive bias.

Holding Times

All samples were extracted within holding times. The samples and extracts were stored at 4°C ± 2°C prior to extraction and analysis. The extracts were analyzed within 40 days of sample preparation.

Surrogate Spikes

Extraction surrogates were added to all samples prior to extraction. All surrogate compounds were recovered within the 50%-120% acceptable criterion with the following exceptions: perylene-d12 was over-recovered in all quality control and field samples in the aqueous batch. Recoveries ranged from 126-137%. Toluene-d8 was under-recovered in MRC-SED-1 and the laboratory duplicate of that sample at 48% and 40% respectively. The laboratory duplicate of sample MRC-SED-1 also had phenanthrene-d10 under-recovered at 45%. Finally soil blank QC101022-SB and soil blank spike QC101022-SBS had benzo(a)pyrene-d12 over-recovered at 132% and 128% respectively.

Blanks

Benzene, toluene, and styrene were detected just above the reporting limit (RL) in soil blank QC100824-SB, aqueous blank QC101020-AB1, and soil blank QC101022-SB. In addition, soil blank QC101022-SB had m/p-xylenes and heptadecane detected slightly above the RL. Detections of these compounds in field samples should be reviewed for potential positive bias.

Blank Spikes

A blank spike sample was extracted with each analytical batch. All spiked compounds were recovered within the 70 – 120% criterion in soil blank spike QC100824-SBS and aqueous blank

spike QC101020-ABS1. Soil blank spike QC101022-SBS has several MAHs under-recovered between 50-70%.

Duplicates

Samples SD-90-SS, MRC-SW-1, and MRC-SED-1 were extracted and analyzed in duplicate. Relative percent differences are reported with the sample results in Appendix C.

Internal Standards

GC/MS internal standards were recovered within acceptable QC limits (50%-200%) relative to the continuing calibration standards.

Interpretation

Introduction

Fifteen sediment samples were received by META from the MRC Sediments site on August 19, 2010, and four additional sediment samples were received from the MRC Sediments site on August 24, 2010. Additionally, two stormwater runoff samples and one stormwater sediment sample were received on October 15th, 2010. The samples were analyzed for hydrocarbon fingerprints and an expanded list of MAHs and PAHs. This report summarizes the findings and compares the samples.

Sources of MAHs and PAHs in the Environment

Aromatic hydrocarbons include MAHs such as benzene, toluene, xylenes, and alkylated benzenes, and PAHs such as naphthalene, phenanthrene, and pyrene. MAHs and PAHs originate from many sources and exist at many sites. This section briefly reviews the sources of MAHs and PAHs in urban soils and sediment.

Crude petroleum, many of its refined products, coal, coal tar, and many coal tar products consist primarily of hydrocarbons. Hydrocarbons are organic molecules that are made up of only carbon and hydrogen atoms. Some simple hydrocarbons include hexane and benzene. There are several types of hydrocarbons that are commonly grouped by similar chemical structures, such as alkanes, cyclic alkanes, and aromatic hydrocarbons.

MAHs and PAHs are one group of hydrocarbons that are present at high relative amounts in crude oil, coal, coal tar, and many of their products. In environmental forensic chemistry and geochemistry, MAHs and PAHs are placed in subgroups according to their origins. These groups include diagenic, or recently produced, petrogenic, produced at relatively low temperatures over long periods of time, and pyrogenic, produced at high temperatures with a shortage of oxygen. Petrogenic PAHs are those found in crude oil and similar materials. Pyrogenic PAHs are those found in coal tar and related substances, and from the incomplete combustion of organic matter.

Some PAHs can be formed by natural biological and chemical processes at ambient temperatures. When present, these PAHs are found at very low concentrations. Further, these

PAHs are rarely the subjects of environmental investigations and few, if any, are regulated.

PAHs also can be formed at relatively low temperatures. In particular, crude oils contain MAHs and PAHs that formed over millions of years at temperatures as low as 100°C to 150°C. MAHs and PAHs formed during crude oil maturation and similar processes are called petrogenic. Similarly, coal was formed at low temperatures over long periods of time and therefore is included in the petrogenic group. Both crude oil and coal contain hundreds of different MAH and PAH compounds, including many that are the subject of environmental investigations and are regulated.

Petrogenic MAHs and PAHs have been released into urban environments from numerous anthropogenic sources over the past two centuries. For example, it has been a common practice to spray roads with oil to manage dust. Asphalt is produced from petroleum and the small particles that are created as roads wear away contain PAHs. Cars and trucks drip fuels and lubricating oils that contain petrogenic MAHs and PAHs. Many industries have stored and ultimately spilled petroleum products that range from gasoline to heavy oils. Further, the potential impacts from coal cannot be ignored. For many years, residential and commercial buildings were heated with coal and small amounts of coal and coal dust accumulated wherever coal was handled. All of these sources of petrogenic PAHs, and many others, contributed to a pervasive background of PAHs in urban settings. Because many releases occurred years ago at unanticipated locations and because soil was moved around as the urban environment expanded and was modified for various uses, it is difficult to predict where and at what levels MAHs and PAHs might be found.

Finally, MAHs and PAHs are formed whenever organic substances are exposed to high temperatures under low oxygen or no oxygen conditions in a process called pyrolysis. Pyrolytic processes occur intentionally, such as in the destructive distillation of coal into coke and coal tar, or the thermal cracking of petroleum residuals into lighter hydrocarbons and oil tar. Similar processes occur unintentionally, such as the incomplete combustion of motor fuels in cars and trucks, the incomplete combustion of wood in forest fires and fireplaces, and the incomplete combustion of fuel oils in heating systems. These processes occur at temperatures that range from about 350°C to more than 1200°C, and their products are called pyrogenic.

Like petrogenic MAHs and PAHs, pyrogenic MAHs and PAHs have been released into urban environments from numerous sources. These include some obvious sources, such as building fires and industrial smoke stacks. They also include less obvious sources, such as debris from coal tar-treated roofing and building materials. The incomplete combustion of gasoline and diesel fuel in cars, trucks, and buses produces substantial amounts of pyrogenic PAHs that attach to small particles and accumulate along roadsides. Any industry that utilized high temperatures in their operation probably produced PAHs. These included such industries as foundries, steel mills, coke plants, smelters, and others. Similar to petrogenic MAHs and PAHs, pyrogenic MAHs and PAHs accumulated in soil and are found throughout all urban areas.

Much modern gasoline is unusual in that it contains both petrogenic substances (the light distillate of crude oil) and pyrogenic substances (the light hydrocarbons from thermal cracking of oil). For the purposes of this report, all motor gasoline is considered petrogenic.

Composition of Pyrogenic and Petrogenic Materials

Both pyrogenic and petrogenic sources of PAHs have been found to contain hundreds of individual MAHs and PAH compounds in generally predictable patterns. For example, it is known that the temperature of formation of MAHs and PAHs largely determines the distribution of the various parent and alkylated PAHs. Variations in these MAH and PAH distributions are measured using gas chromatography (GC) methods, particularly GC/MS. The visual interpretation of the results from GC/MS testing is a chromatogram. Variations in chromatograms are used to identify the sources of those MAH and PAHs.

Of particular importance to environmental forensic chemistry is the fact that petrogenic and pyrogenic substances from different sources can have measurably different amounts of MAHs and PAHs. For example, crude oils from different reservoirs can exhibit notably different ratios of trialkylated dibenzothiophenes to trialkylated phenanthrenes. Similarly, the ratio of dialkylated chrysene to chrysene varies among certain pyrogenic sources. Consequently, the determination of PAH profiles forms an important component of environmental forensic studies where hydrocarbon releases, either petrogenic or pyrogenic, are known or suspected to be involved.

In addition to MAHs and PAHs, pyrogenic and petrogenic substances can contain paraffinic hydrocarbons, olefinic hydrocarbons, naphthenic hydrocarbons, and other types of compounds. The presence and relative amounts of these compounds also is used to identify the nature and source of hydrocarbon-based materials in environmental samples.

Description of Chemical Fingerprinting Methodology

PAHs commonly form the basis for source attribution and allocation at sites involving petrogenic or pyrogenic materials. Studies have shown that the pattern of PAHs clearly distinguishes petrogenic from pyrogenic substances and can be used to identify and classify petrogenic or pyrogenic substances of different origins. For example, ASTM Method D 5739-95 is the method used extensively by the U.S. Coast Guard to determine the source of oil spilled in public waterways. That method relies on the determination of selected PAHs in oil, soil, or water samples by gas chromatography with mass spectrometric detection (GC/MS) and the use of the qualitative patterns and quantitative ratios of those PAHs to determine which oil samples have a common origin. Similarly, work by META Environmental, Inc. (META) has shown that the same methodology can be used to identify the sources of PAHs at former MGP sites, coke plants, tar refineries and wood treating facilities. Further, META has modified the typical sample preparation and analysis procedures for hydrocarbon fingerprinting to include MAHs as well as PAHs.

An approach based on MAH/PAH profiling has been used to investigate the sources of hydrocarbons at the MRC Sediments site, which is the topic of this report. Therefore, a more detailed discussion of the forensic methods used is presented in the next subsection as background.

GC/FID Fingerprinting

All sediment samples in this study were analyzed by gas chromatography with flame ionization detection (GC/FID). With GC/FID, organic compounds in a sample are vaporized and then separated in a long, narrow fused silica capillary column. Separation follows boiling point approximately with the most volatile compounds exiting the column first followed by increasingly less volatile compounds. Therefore, certain refined petroleum products, generated by the distillation of crude oil and which differ in their boiling point ranges, are distinguishable by where they appear on a chromatogram. Once they exit the column, the compounds are detected using the flame ionization technique. As the compounds exit and are detected, their responses are recorded and shown as peaks on a continuous plot. The height and area of a peak are proportional to the concentration of that compound in the sample. When done in a controlled and reproducible manner, the GC/FID method produces a "fingerprint" of a sample where the presence and relative amounts of the compounds are immediately visible as peaks of varying height appearing at different times. GC/FID fingerprints for the samples analyzed are provided in Appendix B.

GC/FID methods are commonly used for fingerprinting in a number of forensic fields. The patterns of individual peaks and the sizes and shapes of any baseline features are examined qualitatively for similarities and differences among samples.

The instrumental conditions for the GC/FID analyses in this study were adjusted so that compounds with boiling points between about hexane (C6) and n-tetracontane (C40) were detectable in one analytical run. This range includes most of the VOCs and all of the SVOCs commonly measured in environmental investigations. In particular, it includes benzene, toluene, ethylbenzene, xylenes, and the 16 priority pollutant PAHs that comprise a major portion of MGP tars and other pyrogenic substances. It also includes the range of compounds that are measurable in pyrogenic substances by gas chromatographic methods. Finally, META's GC/FID conditions detect most of the constituents of gasoline, as well as all of the constituents of higher boiling petroleum products (e.g., kerosene, diesel, refined oils).

Source identification using GC/FID is mostly qualitatively applied. An experienced chemist examines the chromatograms, compares them to those of reference materials, and makes a judgment regarding the nature and source of the contamination in the sample. The chemist might go "peak-by-peak" looking for similarities and differences, comparing peak ratios, and looking for indicator compounds.

For some samples, GC/FID fingerprinting is accurate and sufficient. However, the reliability of GC/FID fingerprinting decreases when multiple sources are present in a sample and when the sample composition becomes extensively altered by environmental weathering processes. Other testing methods, such as GC/MS, are complementary for source identification under these conditions.

Extended PAH Profiles (EPPs) by GC/MS

Samples from the MRC Sediments site also were analyzed by GC/MS for an expanded list of MAHs and PAHs (EPPs). Separation was accomplished with gas chromatography using a method similar to the GC/FID method discussed previously. However, in GC/MS, once

compounds exit the column, they are detected using a mass spectrometer. In the mass spectrometer, the molecules of each compound are ionized at high temperature and vacuum. The ionic fragments are unstable and fragment into smaller ions. The ions are then counted and the mass spectrum recorded. Thus, the mass spectrum for a compound is the pattern of ionic fragments that forms when that compound is ionized. Mass spectra vary widely and are characteristic of their source compound. For example, the mass spectrum of hexane is very different from the mass spectrum of benzene even though both compounds contain six carbon atoms plus hydrogen atoms.

In GC/MS, one obtains both a chromatogram of peaks and additional compound-specific information in the mass spectrum. When executed in a controlled and reproducible manner, the GC/MS method produces multiple "fingerprints" of a sample when specific fragment ions are isolated.

GC/MS is utilized in two general ways in environmental forensic chemistry. First, samples are analyzed under the conditions required by various standard methods, particularly EPA Methods 8260 and 8270 (U.S. EPA SW-846). The concentrations of certain target compounds are determined and the mass spectrum of each peak in the chromatogram is generated and stored. These mass spectra can be used to identify non-target compounds or to generate extracted ion current profiles (EICPs). Second, various specialty methods are utilized where the GC/MS operating conditions are setup to measure only certain groups of compounds. For example, the method described in 40 CFR Subchapter J Part 300 Subpart L Appendix C for PAHs, alkylated PAHs, and biomarkers is used extensively in oil spill and UST release analyses. This method is similar to ASTM Method D 5739-95, "Standard Practice for Oil Spill Source Identification by Gas Chromatography and Positive Ion Electron Impact Low Resolution Mass Spectrometry."

GC/MS data are used both qualitatively and quantitatively. An experienced chemist examines the chromatograms, compares them to those of reference materials, and makes judgments regarding the nature and source of the contamination in the sample. The chemist might go "peak-by-peak" looking for similarities and differences, comparing peak ratios, and looking for indicator compounds. This process is described in detail in ASTM Method D 5739-95.

GC/MS data are more commonly used quantitatively by calculating the concentrations of selected compounds, by comparing peak area ratios, or by applying chemometric or pattern recognition techniques to the raw or adjusted data. These data analysis methods are used extensively with extended PAH profiles (MAHs, PAHs and alkylated PAHs) and with biomarker compound data. Various degrees of statistical confidence can be achieved by examining chemical concentrations and compound ratios or patterns from multiple samples and replicate samples. This characteristic of GC/MS quantitative data is particularly valuable when assessing the degree of similarity or difference between samples, particularly when multiple sources of hydrocarbons are present in the sample or when environmental weathering has altered the original distributions of hydrocarbons.

Finally, the mass spectra of selected compounds also can be examined to determine whether any diagnostic or indicator chemicals are present in the sample. For example, the PAH retene (1-methyl-7-isopropylphenanthrene) is present in significant concentrations in coal, but at much lower concentrations in coal tar or petroleum products. Thus, the ratio of retene to chrysene can be used to determine whether coal fines are present in a soil sample and to explain some of the

hydrocarbon patterns observed at sites where coal was used extensively. Further, unknown compounds can be identified and their presence used as clues to the source(s) of the chemicals.

The GC/MS data in this study were reported and utilized both qualitatively and quantitatively. First, the concentrations of MAHs, PAHs and alkylated PAHs were calculated and included in Appendix C. These concentrations were utilized to estimate contaminant levels in samples, to generate bar graphs (Appendix D) and compare compound ratios. The ratios were used to generate plots for identifying samples with similar compositions.

The GC/MS data also were used qualitatively by generating extracted ion current profiles (EICPs) for selected compounds and compound groups of forensic value (Appendix E). For example, the EICPs for selected "biomarker" compounds including normal alkanes, isoprenoid hydrocarbons, alkylcyclohexanes, triterpanes and steranes are shown on the first page of the EICP report for each sample. These compound groups are commonly used in hydrocarbon source identifications and weathering evaluations. For example, the estimated boiling point range of a refined petroleum product, as indicated by the location of the alkanes and unresolved complex mixture (UCM) on the chromatogram, can be used to determine whether the material is kerosene, diesel, No. 6 fuel oil, or some other product. Similarly, triterpanes and steranes are known to be present in crude oils and some refined petroleum products, but not found in coke oven tars and rarely found in MGP tars. Therefore, the presence of triterpanes and steranes is monitored to confirm and refine the petrogenic verses pyrogenic assessment conducted with the PAH profiles.

Sample-Specific Observations

GC/FID fingerprints (where available), GC/MS EICPs, histograms and concentration data were examined and the important features summarized in Table 1. The PAH class (pyrogenic or petrogenic) was indicated based on the relative amounts of parent and alkylated PAHs; the fluoranthene to pyrene ratio (Fl/Py) calculated; evidence of petroleum and other hydrocarbon sources noted; and a tentative source identification provided.

Table 1. Summary of Observations and Tentative Identification

TT100824-03	MRC-SED-1	Wide-range distribution of low concentration parent and alkylated PAHs; 4-, 5-, and 6-ring parent PAHs most abundant. Broad, irregularly-shaped UCM with odd-carbon alkane series, triterpanes and steranes present.	1.47	1.150	Pyrogenic/ Petrogenic	Background

1 - Fl/Py – ratio of fluoranthene/pyrene; this ratio has been shown to vary among PAH sources, typically low for petrogenic sources and higher for pyrogenic sources. further, tars derived from oil often exhibit lower Fl/Py ratios than tars derived from coal.

2 – general urban background is characterized by relatively low concentrations of PAHs, often pyrogenically formed, mixed with an accumulation of severely weathered petroleum products and/or coal. There is a wide range of compositions and therefore chemical patterns of urban background that reflect the history of land uses in the area where the samples were collected.

UCM – unresolved mixture of hydrocarbons

HPAHs – high molecular weight PAHs

PAH(16) – sum of the 16 EPA priority pollutant PAHs

Discussion

Nineteen sediment samples were received by META from the MRC Sediments site. The samples were analyzed for hydrocarbon fingerprints and an expanded list of MAHs and PAHs. The data were compared to samples of tars, tar-derived materials, and petroleum products from META's sample archive.

All of the samples contained various amounts of MAHs and PAHs in patterns consistent with mixtures of pyrogenic and petrogenic sources. As summarized in Table 1, distinguishing features included relatively more HPAHs than MAHs and low molecular weight PAHs (LPAHs); relatively low total PAH concentrations (0.011 mg/kg – 107 mg/kg); late-eluting UCMs, petroleum biomarkers, high molecular weight, odd-carbon normal alkane distributions; and the presence of molecular sulfur and elevated perylene in some samples. These features are consistent with general background in urban sediments. Urban background includes PAHs from many sources including smoke from natural and industrial fires, motor vehicle exhaust, roadway paving and driveway sealcoating materials, construction debris and fill materials, and petroleum spills among others. Often more than one of these sources contributes to an urban background signature.

Samples SD-90-02 and SD-87-02 contained total PAH(16) concentrations (107 mg/kg and 103 mg/kg, respectively) somewhat higher than expected for urban background. However, an examination of PAH ratios suggested that the PAH source was more similar to background than to tar sources, as discussed below.

Various PAH ratios for the samples were calculated and are listed in Table 2 and shown in Figures 1 through 5. For example, the ratios of fluoranthene/pyrene (Fl/Py) and benzofluorenes/methylpyrenes (BF/MP) are weathering-resistent PAH ratios that vary significantly among PAH sources. The PAH ratios indicate that much of the PAH mass is pyrogenically-derived, even though there are indications of petrogenic materials in the samples.

Figure 1 shows that the fluoranthene/pyrene (Fl/Py) ratios of all the samples were higher than expected for MGP tarry materials from carbureted water gas (CWG) plants, but lower than those typical for commercial coal tars from byproduct coke plants and some MGP tarry materials from coal carbonization (CC) plants. While the Fl/Py ratios of the sediment samples are in range normally associated with MGP CC residues, the benzofluorenes/methylpyrenes (BF/MP) ratios are somewhat lower than expected for MGP tars.

Figure 2 shows the same data as in Figure 1, but with the PAH ratios from a large set of urban background surface soil samples collected and analyzed by META. The MRC sediments cluster more closely to the majority of urban background surface soil samples than the tar samples (or even more so than the petroleum reference samples). The higher concentration samples, SD-90-02 and SD-87-02 also plot near the urban background surface soil samples.

For some sample sets, the ratio of fluoranthene + pyrene divided by the sum of HPAHs (Fl+Py/PP HPAHs) can help distinguish between background sources of PAHs and tar-derived PAHs. Figure 3 shows that most of the MRC sediment samples have Fl+Py/PP HPAHs ratios lower than the majority of tar reference samples. Sample SD-94-01 appears to be an outlier, likely due to the very low concentrations of PAHs detected in that sample.

When the urban background surface soil samples are added to Figure 3 (i.e., Figure 4) the distinction is more dramatic.

Two samples of water and one sample of sediment were later received in association with a stormwater event at the site. The two stormwater samples did not contain PAHs at concentrations high enough to interpret. The stormwater sediment sample did contain PAHs at low concentrations. Figures 1 to 4 show that the stormwater sediment sample and its laboratory duplicate comingle with the cove sediment samples and other PAH background samples suggesting the PAHs originated from similar urban runoff sources.

Definitions

Pyrogenic substances are complex mixtures of primarily hydrocarbons produced from organic matter subjected to high temperatures but with insufficient oxygen for complete combustion. Pyrogenic materials are produced by fires, internal combustion engines, and furnaces. They also are formed when coke or gas are produced from coal or oil. Coal-tar based products, such as roofing, pavement sealers, waterproofing, pesticides, and some shampoos contain pyrogenic materials.

Petrogenic substances include crude oil and crude oil derivatives such as gasoline, heating oil, and asphalt.

Pitch is the semi-solid or solid material consisting of high molecular weight hydrocarbons that remain following coal tar distillation.

Sample Receipt Checklist

Receipt date: 8/19/10

Login date: 8/19/10

Login personnel: SO

Client Information:.

Company Name: TetraTech

Project Manager: Mike Martin

Project Name: MRC Sediment Sampling

Shipping Information:

How were samples received? UPS (FedEx) DHL Other:

Number of coolers: 1

Internal temperature of coolers: 0°C

Was ice present? (Yes) / No

Note: if cooler is outside the 2-6° range, META's project manager should be notified.

Documentation:

Was a Chain of Custody present? (Yes) / No

Was it signed? (Yes) / No

Was all project information present on the COC? (Yes) / No

Was a bill of lading or shipping label retained? (Yes) / No

Sample Information:

Number of sample containers: 15

Does this match the COC? (Yes) / No

Were all sample containers Intact? (Yes) / No

If no, list samples and problems:

Note: if samples are damaged, META's project manager should be notified.

For aqueous 40ml Voas; was headspace present? Yes / No / (NA)

		Analysis Method:	EPA 8270M
Lab ID	TT100819-03		
File ID:	E090311.D	Matrix:	Sediment
		Preservation:	None
Date Sampled:	8/17/2010	Decanted:	None
Date Received:	8/19/2010		
Date Prepared:	8/24/2010	Sample Size (g):	4.12
Date Cleanup:	NA	Percent Solid:	42.3%
Date Analyzed:	9/4/2010	Extract Volume (µl):	2000
Instrument:	El Camino	Prep DF:	1
Operator:	CAM	Analysis DF:	1
		Injection Volume (µl):	1.00
Batch QC:	QC100824-SB		

Analyte	Concentration (mg/kg dry wt.)	RL	EDL	Comments
2,6,10-trimethyldodecane	U	0.006	0.003	
2,6,10-trimethyltridecane	0.201	0.006	0.003	
Norpristane	0.115	0.006	0.003	
Total PAH (16)	107	0.006	0.003	
Total PAH (42)	164	0.006	0.003	

Extraction Surrogate Recoveries (%)		Limits
Toluene-d8	80	50 - 120
Phenanthrene-d10	82	50 - 120
Benzo(a)pyrene-d12	101	50 - 120
Perylene-d12	104	50 - 120

NA - Not applicable.
B - Analyte detected in the Blank.
J - Estimated value; detected between the RL and DL.
U - Analyte not detected above DL.
D - Analyte reported from a diluted extract.
E - Estimate, result detected above calibration range.
I - Concentration/Peak ID uncertain due to potential interference.
RL - Reporting limit is the sample equivalent of the lowest linear calibration concentration.
EDL - Estimated detection limit is 50% of RL.
* - Triphenylene is known to coelute with this compound.

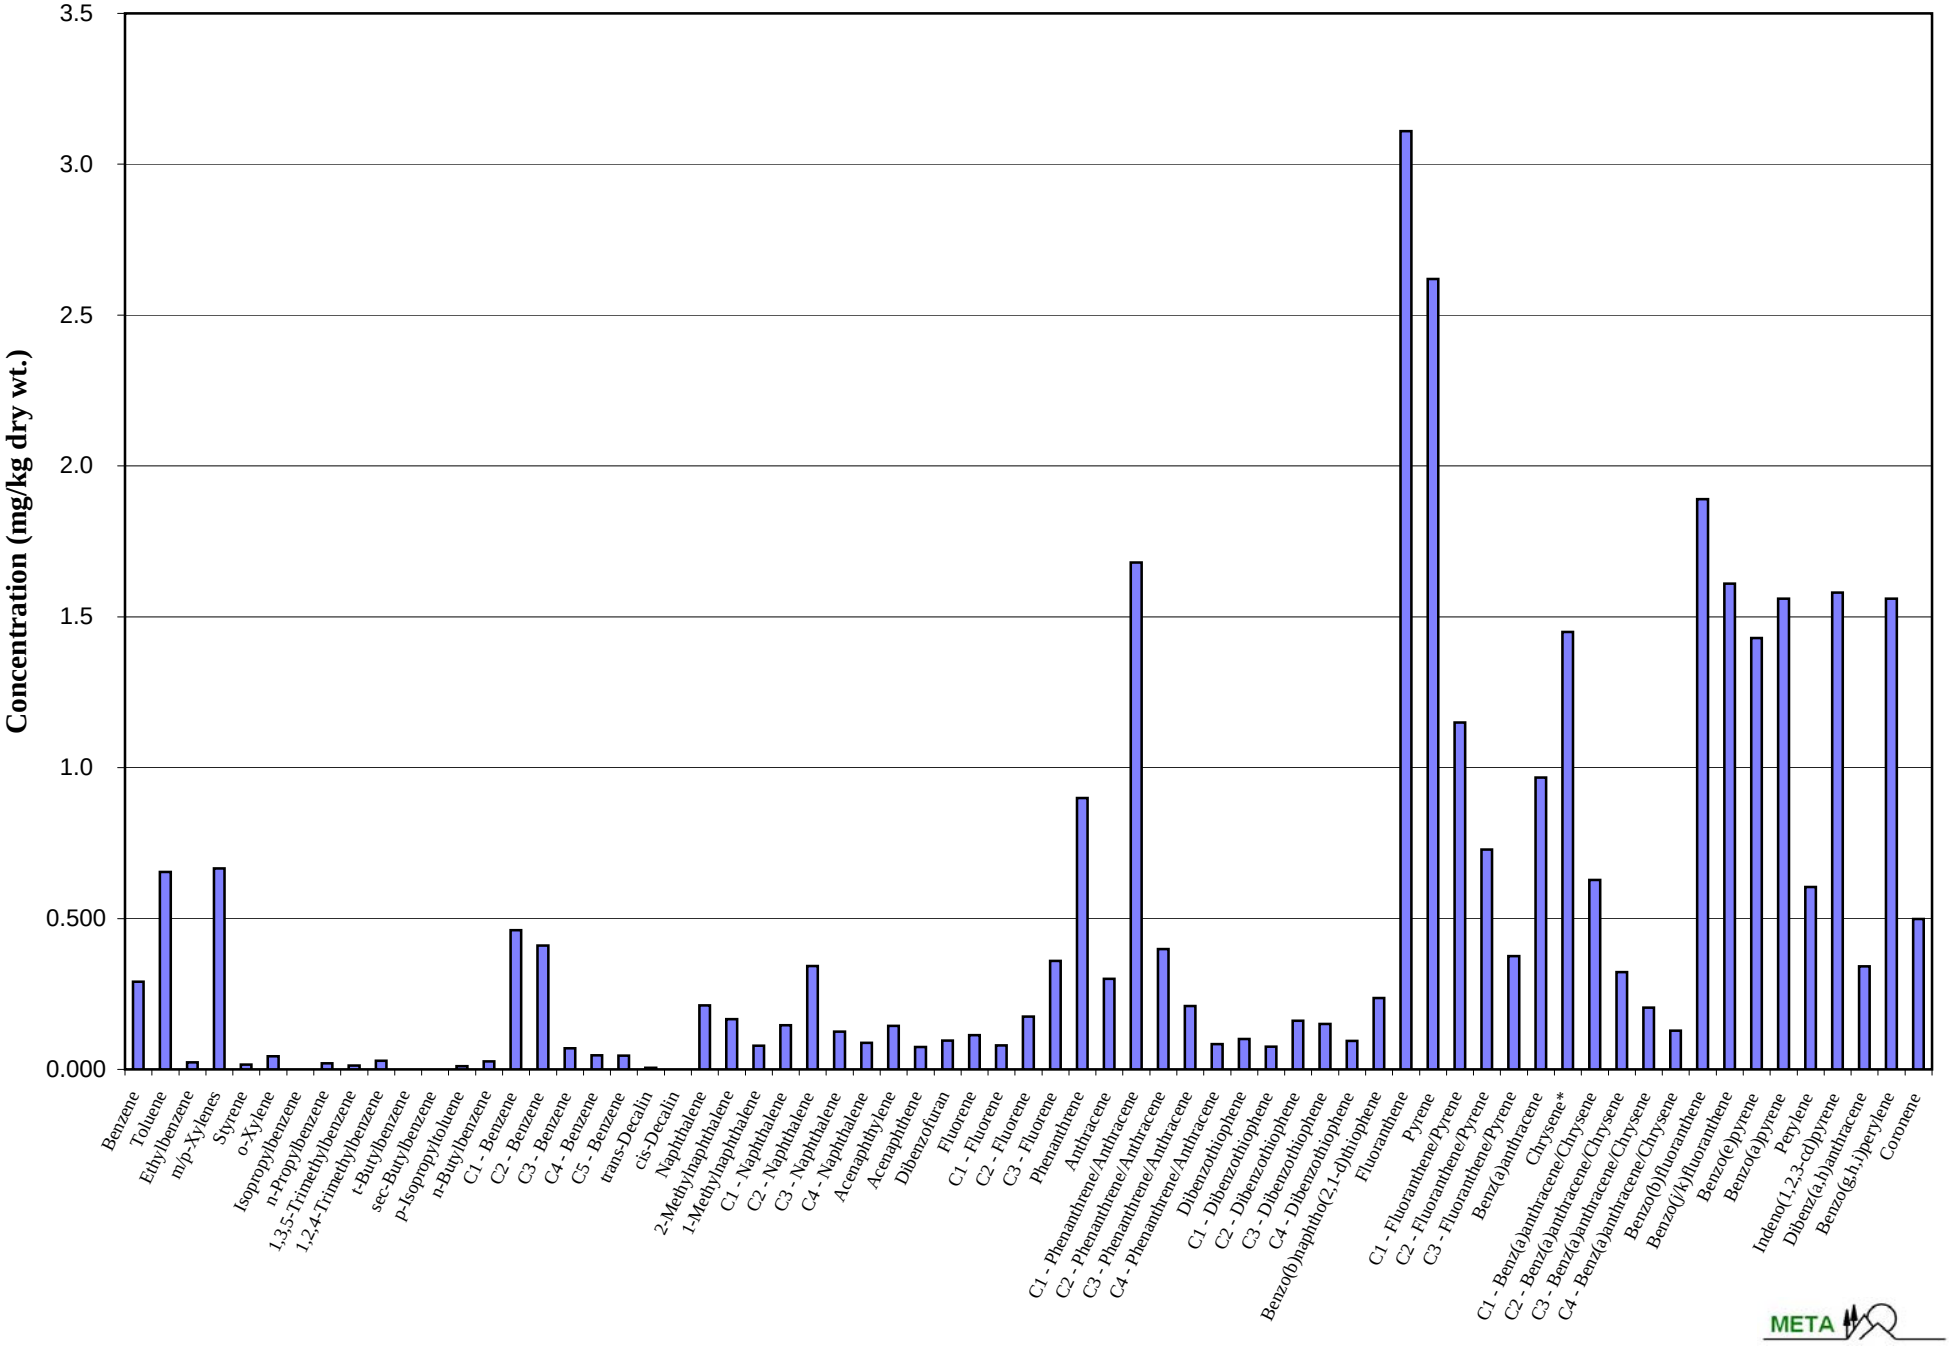
Total PAH (42)	2.17	0.003	0.002	15.7

Extraction Surrogate Recoveries (%)		Limits
Toluene-d8	40	50 - 120
Phenanthrene-d10	45	50 - 120
Benzo(a)pyrene-d12	63	50 - 120
Perylene-d12	52	50 - 120



NA - Not applicable.
B - Analyte detected in the Blank.
J - Estimated value; detected between the RL and DL.
U - Analyte not detected above DL.
D - Analyte reported from a diluted extract.
E - Estimate, result detected above calibration range.
I - Concentration/Peak ID uncertain due to potential interference.
RL - Reporting limit is the sample equivalent of the lowest linear calibration concentration.
EDL - Estimated detection limit is 50% of RL.
* - Triphenylene is known to coelute with this compound.

APPENDIX E—
SEDIMENT-AGE DATING

SEDIMENT CHRONOLOGY

Methods

Sediment chronology work is based on the analysis and interpretation of the radioactive nuclides Pb-210 (lead-210) and Cs-137 (cesium-137) in samples taken at various depths in sediment cores. The analytical results are used to derive sedimentration rates and calendar dates in the sediments. The methods are described in a paper by Hewitt W. Jeter which was published in the year 2000: Determining the Ages of Recent Sediments Using Measurements of Trace Radioactivity, Terra et Aqua 78, pp 21-29, March 2000.

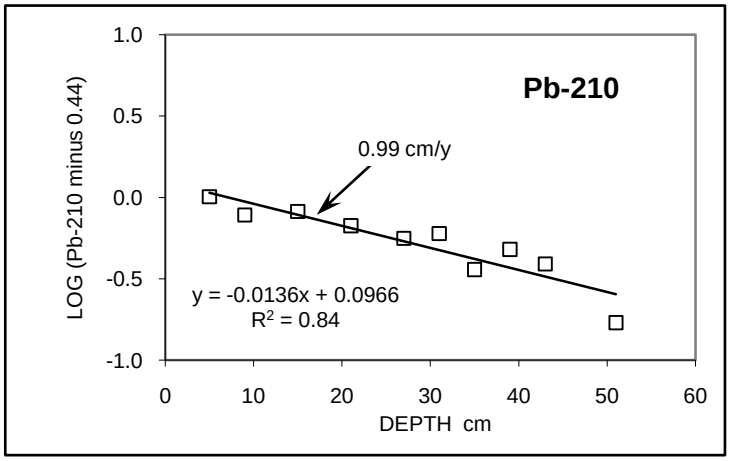
Lead-210 is a natural radioactive form of lead which is produced as fallout from the atmosphere by radioactive decay of natural Rn-222 (radon-222) gas. This nuclide accompanies sediments which accumulate at the bottoms of natural water systems. Under conditions of steady deposition, profiles of Pb-210 concentration in sediments (after subtracting the constant Pb-210 background of the sediment itself) often decrease logarithmically with increasing depth because of radioactive decay with a half-life of 22.3 years. To derive a sedimentation rate, transverse sections (often 2 cm thick) are taken at intervals from a sediment core and are analyzed for Pb-210. The background concentration, often found by analysis of a deep sample in the core, is subtracted to derive the "excess Pb-210" caused by fallout from the atmosphere. The logarithms of these excess Pb-210 concentrations are plotted against depth, and regression lines are fitted to straight portions of the plots. The slopes of these lines are used to calculate sedimentation rates. When base 10 logarithms are used and the depths are expressed in cm, the sedimentation rate in cm per year equals -0.01352/slope. Calendar dates at various depths in the core can then be calculated from the sedimentation rate using a known reference date such as the core collection date at the sediment surface.

Cesium-137 is a fission product which is a component of fallout derived from atmospheric testing of nuclear weapons. The Cs-137 method is fundamentally different from the Pb-210 method in that it provides date "markers" rather than concentration slopes which can be interpretated. The first appearance of Cs-137 in sediments generally marks the year 1954. Another marker is often found in the form of a concentration maximum at the year 1963, caused by an increase and then a decrease in nuclear testing. To derive a sedimentation rate, transverse sections are taken at intervals from a core and are analyzed for Cs-137. The resulting concentrations are plotted against depths and the markers are identified visually. A sedimentation rate can be calculated as the depth of the 1954 marker divided by the time interval between core collection date and the year 1954. Another sedimentation rate can be calculated as the the depth of the 1963 marker divided by the time interval between the core collection date and the year 1963. Still another sedimentation rate can be calculated as the difference in depths between the two markers divided by the 9 year interval between 1954 and 1963. These calculations may yield different sedimentation rates because they represent different time intervals and different depths. Calendar dates at different depths in the core can be calculated from the sedimentation rates using known reference points such as the marker depths and years, or the core collection date at the sediment surface.

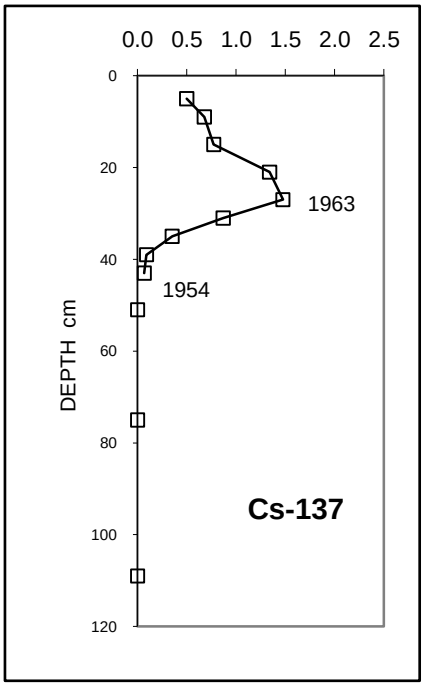
The analysis of Pb-210 was performed by radiochemical separation and beta assay of its daughter product Bi-210 (bismuth-210) according to Method 7.2.3 of the Oak Ridge National Laboratory Master Analytical Manual. A weighed portion of sediment sample is digested in an acid solution containing measured quantities of stable lead and bismuth carriers. The solution is passed through an ion exchange column to perform chemical separation. Bismuth is eluted from the column and is then precipitated as the oxychloride. This precipitate is collected by vacuum filtration on a pre-weighed filter disk. The disk is dried, then weighed again to determine the precipitate mass in order to determine chemical recovery. The disk containing the precipitate is mounted on a nylon planchet and is covered with aluminum foil to absorb any alpha particles emitted by the sample. The sample planchet is analyzed for beta activity in a gas-flow proportional detector system calibrated with Bi-210 standards of varying precipitate mass. Pb-210 concentration of the sediment sample is then calculated from the observed beta count rate, the background and efficiency of the detector, the sample mass, chemical recovery, and the decay fraction of Bi-210 (5.01 day half life) over the time interval between chemical separation and beta analysis.

Cs-137 was measured by direct gamma spectral analysis using high purity germanium detectors calibrated with multiple nuclide standards. It is method Ga-01-R of the Environmental Measurements Laboratory, U.S. Department of Energy, HASL-300 Manual. A portion of the sediment sample is weighed into a standard analysis container and placed in a standard position relative to the detector within a heavy metal shield to reduce ambient radiation. Gamma spectral data are acquired over a period near 1000 minutes, after which the spectrum is analyzed by computer. Cs-137 concentration of the sediment is calculated by integrating the spectral region at 662 KeV which contains gamma emissions produced by the short lived daughter product Ba-137m.

Sampling and Results

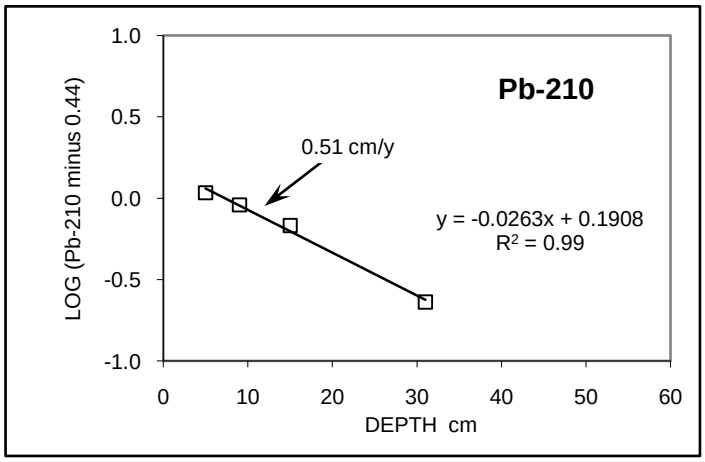


Sediment cores were collected at 3 locations in the Middle River from 8/23/10 to 8/25/10. Transverse sections, 2 cm thick, were extracted fom each core and were transferred in the field to glass sample jars. Six sample jars from selected depths in each core were sent to the Mass Spec Services laboratory on 8/26/10. Two additional samples were included to be analyzed as matrix spike and matrix spike duplicates for quality control purposes.

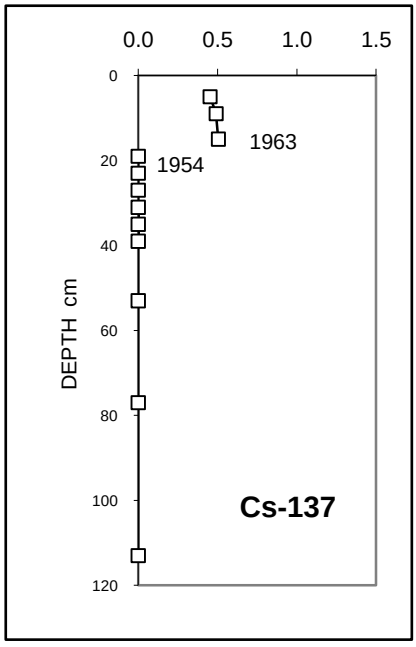


The suite of sediment samples was analyzed for Pb-210 and Cs-137 at the laboratory and the results were reported to Tetra Tech by Email attachment on 9/17/10. The results were plotted and were used to recommend 6 additional samples from each core to refine the chronology study. These samples, plus two additional quality control samples, were sent to the laboratory and received on 9/22/10 and 9/27/10.

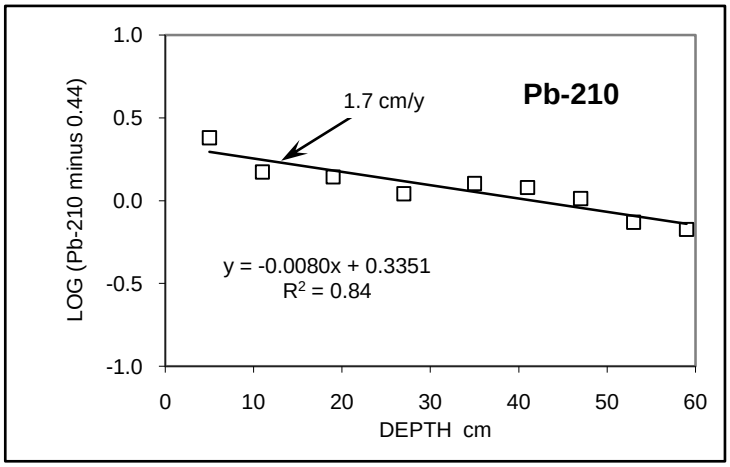
The second suite of samples was analyzed at the laboratory and the results were added to the plots for each core. A sediment chronology report was written for each core and was sent to Tetra Tech by Email attachment on 10/21/10. A complete Level 4 documentation of the analyses was completed by the laboratory and was sent to Tetra Tech on 11/10/10.

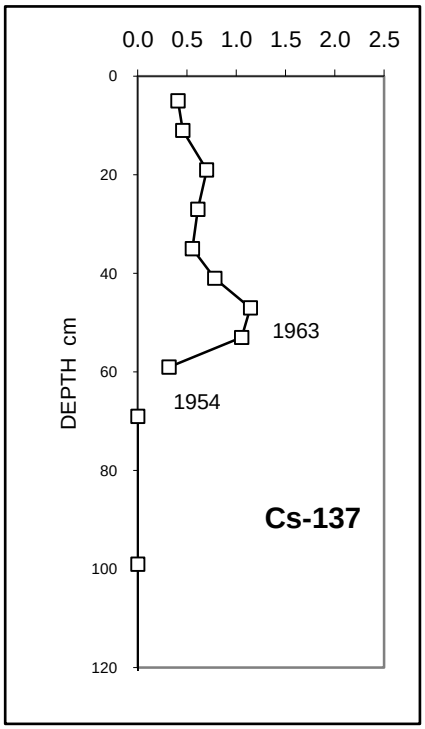


Data plots used in chronology interpretation of Cores DHC, CPC, and CON are shown below. Measurements of Pb-210 and Cs-137, and details of the analyses, are shown in Appendix 1.



Core DHC
Collected 08/23/10





Core CPC
Collected 08/24/10

Core CON
Collected 08/25/10

Conclusions

Sedimentation rates derived by the 3 chronology methods (Appendix 1) are shown in Table 1. Average sedimentation rates are used in equations for calculating ages at given depths.

Age profiles for the 3 sediment cores, calculated at 5 cm depth intervals, are shown in Table 2. Ages at intermediate depths can be calculated using the equations in Table 1. Extrapolating ages beyond the depths shown in Table 2 would involve assumptions of constant sedimentation rates beyond the range of useful chronology measurements.

TABLE 1
Sedimentation Rates and Age Profile Equations

	Sedimentation Rates cm/y				
Core	Pb-210 Method	1963 Marker	1954 Marker	Average	Age Equations
DHC	0.99	0.57	0.80	0.79	year = 2010 - depth/0.79
CPC	0.51	0.34	0.30	0.38	year = 2010 - depth/0.38
CON	1.7	1.1	1.1	1.3	year = 2010 - depth/1.3

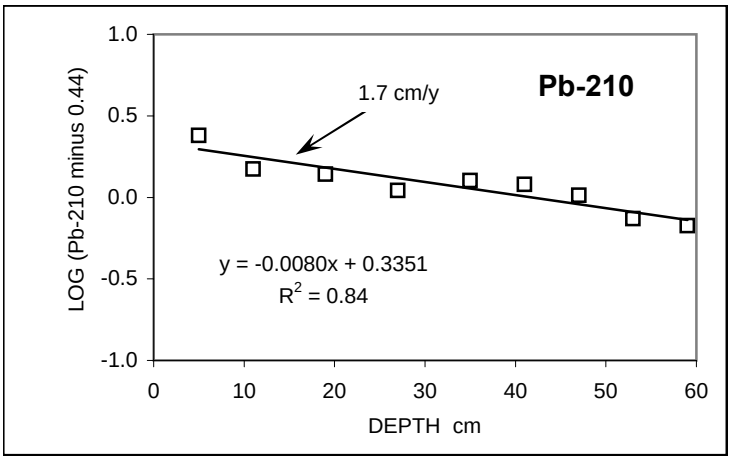
Core DHC
Collected 08/23/10

Pb-210 Chronology
Supported Pb-210 is measured at 0.44 pCi/g dry, the average of the deepest Pb-210 results in cores DHC, CPC, and CON. These three measurements are in agreement when their tolerances are considered. Measured Pb-210 concentrations which are not significantly greater than the supported level are not plotted.

Fitted curve: y = -0.0136x + 0.0966 Correlation R square: 0.84

Inferred sedimentation rate: -0.01352 / -0.0136 = **0.99 cm/y**

Cs-137 Chronology
A 1963 maximum is found near 27 cm depth, resulting in a calculated sedimentation rate:
27 cm / (47 y between 1963 and 2010) = **0.57 cm/y.**



The 1954 Cs-137 horizon lies near 45 cm depth, resulting in a calculated sedimentation rate:
45 cm / (56 y between 1954 and 2010) = **0.80 cm/y**

Section 1
Overview

This document describes a survey that was conducted for Lockheed Martin in Middle River, Maryland, by Tetra Tech (Tt) in August 2010. The primary survey equipment included dual multibeam echosounder (MBE) sonar systems and associated vessel navigation and attitude measurement equipment. These systems were used to map site bathymetry and characterize bottom conditions of Dark Head Cove, Cow Pen Creek, and their confluence area to support sediment studies and potential remedial actions at Lockheed Martin's Middle River Complex. Table 1-1 lists the personnel that supported the bathymetric survey and their roles.

Table 1-1 Survey Team

Name	Project Role
Robert Feldpausch	Project Manager/Principal Hydrographer
Brent Johnston	Project Field Lead
Burton Bridge	ACSM Certified Hydrographer
Eric Taylor	Survey Vessel Captain
Chris Burt	RTK GPS Technician/Data Analyst

Section 2
System Setup

Tt conducted the survey with the Research Vessel (R/V) Storm, a 21 foot jet boat (Figure 2-1). Tt configured the R/V Storm with dual MBE systems. The sonar heads were installed with roll offsets of approximately 30 degrees, one to port and one to starboard, allowing survey of structures and shoreline areas up to near the water surface, geometry permitting. This dual-head configuration provided wider swath coverage and eliminated the need to change the mounting angle of the sonar head for different parts of the survey, with the attendant requirement to re-do the patch test calibration each time the sonar head is installed.

The equipment used for the survey is shown in Table 2-1. Data sheets for the main survey systems are included in Appendix C. Data collection and navigation software for the bathymetry survey was HYPACK®/HYSWEEP® v2010 sp1.

The sonars used for the survey were dual RESON SeaBat 7125, currently the highest resolution commercial multibeam sonars available. The 400 kHz 7125 ultra-high-resolution multibeam systems provide a 1-degree beamwidth along track and a 0.5-degree beamwidth across track, at nadir. The SeaBat 7125 uses 256 dynamically focused receiver beams covering a 128-degree swath, with a depth resolution of 6 millimeters (0.24 inches). These systems provide extremely high-resolution data that, when used in conjunction with comparable accuracy motion, heading, and position sensors, can show very fine detail in the morphology of the river bottom and in the structure of man-made objects.

Tt used a high quality motion reference unit (MRUs), the Applanix POS MV WaveMaster on the R/V Storm. This device is a high resolution and high accuracy sensor that combines an inertial measurement unit (IMU) and two real-time kinematic (RTK) global positioning system (GPS) antennas to aid in the measurement of vessel roll, pitch, heave, position and heading. The Applanix POS MV WaveMaster is capable of maintaining usable position data during short GPS dropouts.

These systems were used in conjunction with Leica 1230 RTK GPS systems, which provided the primary elevation data. The Leica antenna was mounted directly over the sonar.

2.1 INTERCONNECTIONS

Figure 2-2 shows the data flow and communications setup for the devices that made up the survey system on the R/V Storm.

2.2 OFFSETS

2.2.1 Device Offsets

Spatial offsets are precisely defined for the multibeam sonar, attitude sensor, and GPS antennas, so that the HYPACK/HYSWEEP acquisition software can accurately combine and convert the sonar and support sensor relative data into the survey coordinate system and units (XYZ positions on the earth) during collection.

These offsets are also used to establish a vessel configuration file (VCF) for data processing in CARIS®. The offsets stored in the VCF are used by CARIS to do its conversion of raw sensor data to soundings in the survey coordinate system. The equipment locations on the Tt survey vessel were measured using total stations. All equipment installed was measured relative to the location and orientation of the inertial measurement unit (IMU) of the Applanix POS MV WaveMaster. Verification was performed by comparing the results and through use of the POS MV WaveMaster's GPS Azimuth Measurement Subsystem (GAMS) calibration (refer to Section 2.2.2).

2.2.2 Vessel Offsets

The IMU location was used to define the origin and orientation of the X, Y, and Z axes of the vessel's local reference frame. Table 2-2 shows the offsets, measured in feet, which were used for the HYPACK and HYSWEEP hardware setup on the vessel. These measurements were also applied to the VCF for multibeam data processing using CARIS HIPS 6.1 software.

2.3 SONAR MOUNT CONFIGURATION

The dual SeaBat 7125 sonar heads were installed on a retractable bow mount on the on the R/V Storm (Figure 2-3). The sonars were rotated 30 degrees from nadir to allow for both port and starboard riverbank surveys without the need to reconfigure hardware and re-analyze the installation

with a new patch test. This allowed for increased efficiency and greater swath coverage resulting from the separation between the two heads, while at the same time providing approximately 35 degrees of overlap between the two sonars in the nadir region. As seen in Figure 2-3, the bow mount system allows the sonar to be rotated up to allow for quick transit between survey locations, or if necessary, to make adjustments or repairs to the system.

2.4 GEODESY SETTINGS

Horizontal (X, Y) positioning and sounding data for the project were converted to NAD-83 State Plane, Maryland and elevation data were referenced to the NAVD-88 geoid. Table 2-3 presents the geodesy settings used for the project.

2.5 GPS CONTROL AND VALIDATION

Vertical and horizontal positioning on the survey vessel was achieved using high accuracy GPS systems with RTK corrections, provided via base station (Figure 2-4). A Leica 1230 GPS identical to the system utilized on the survey boat was used daily to verify the functionality and accuracy of the RTK GPS positioning. One or more control points were occupied each survey day and the RTK GPS provided positional data were logged. Table 2-4 presents the control points used for GPS control and validation. Also included in this table are the results from initial checks on the control point locations, which were conducted on August 2 and 3, 2010, prior to survey operations. Survey control MIDR14 was used as the primary control point. The RTK GPS base station was setup on this control point daily. The coordinate system is NAD83 Maryland State Plane; the unit of measurement is US survey feet, and the reference height is the NAVD-88. Appendix B lists the points occupied by Tt for the purpose of quality control (QC) throughout the duration of the multibeam survey.

Section 3
Survey Procedures

A bathymetry survey was conducted to document the elevation of bottom sediments in Middle River. Dual RESON SeaBat 7125 multibeam sonars were used to provide the highest possible resolution and survey coverage.

The support sensors used to measure vessel attitude (roll, pitch, and heave), position, heading, and sound speed through the water column were selected to ensure that the associated accuracies were commensurate with the accuracy and resolution of the sonar. The specifications and accuracies for primary survey systems can be found in Appendix C.

RTK GPS was used for height (Z), as well as position (X and Y), to compensate for changes in water surface elevation, vessel squat and settlement (the general difference between the elevations of a vessel when at rest and when making may, caused by a local depression of the water surface), and varying draft caused by vessel loading. Use of RTK GPS for height is typically known as "RTK tides." With RTK tides any changes in the elevation of the water surface are recorded and compensated for in real time and in the post-processed sounding data.

3.1 MOTI ON SENSOR CALIBRATION

Prior to performing a multibeam system installation calibration test (i.e., a "patch test") and whenever necessary, as automatically detected and advised by the Applanix software (POSView), an alignment calibration was performed of the Applanix motion and heading sensor. This procedure, which Applanix refers to as a GPS Azimuth Heading Measurement Subsystem (GAMS) calibration, utilizes software integrated into the motion sensors. The GAMS calibration procedure is initiated while the survey vessel maneuvers in a figure 8 pattern. This calibration procedure allows the POSView software to calculate offsets between the motion sensor's two GPS antennae and align the measured heading with the vessel, resulting in achievement of the POS MV WaveMaster specified heading accuracies, which range from 0.02 to 0.06 degree (refer to Appendix C).

3.2 MULTIBEAM CALIBRATION — PATCH TEST RESULTS

A standard patch test also known as an installation calibration test was carried out to calculate the angular offsets between the multibeam echosounders and the MRU. The installation calibration process is used to derive the roll, pitch, and yaw angular offsets between the multibeam sonar and the local reference frame defined by the MRU's IMU. The installation calibration test is also used to determine latency (i.e. mismatches in time synchronization) in the positioning equipment). The sonar and acquisition computer are time-synchronized by the MRU's GPS; as a result, no latency was detected between sensors.

For dual-head systems, such as those used for this project, each sonar head is independently calibrated to determine its roll, pitch, and yaw offsets from the motion/heading system.

The offsets shown in Table 3-1 were calculated from a patch test conducted on August 1, 2010. The calculated angular offsets were applied in the HYPACK for accurate data acquisition and during data post processing in the CARIS VCF.

The sonars on the vessel were calibrated in Chesapeake Bay; a line comparison was conducted at the survey site to confirm the calibration values established during the above mentioned patch test. When the patch test was conducted, data were collected as follows to determine roll, pitch, and yaw angular offsets between the sonars and MRU:

- **Roll—**reciprocal lines surveyed over a flat bottom
- **Pitch—**reciprocal lines surveyed over a sloping bottom, or a distinct linear feature
- **Yaw—**offset lines surveyed over a sloping bottom, or a distinct linear feature

Table3-1 Multibeam Patch Test Results

Vessel	Sonar Head	Latency	Roll	Pitch	Yaw	Dates Valid
R/V Storm	1	0.00	28.9	0.6	0.0	Entire Survey
R/V Storm	2	0.00	-31.3	1.1	0.0	Entire Survey

The data were processed and the calibration offsets calculated using the patch test toolkits included in CARIS software. Data were collected so that at least two independent data sets could be used to derive each measurement, thus providing additional confidence in the final result.

3.3 DAILY QUALITY CONTROL PROCEDURES

Each day two types of QC procedures were performed on the boat: a bar check to confirm the sonar's ability to record accurate depth measurements, and a water level check to verify accurate vertical referencing of the data. The bar check was carried out by suspending a flat aluminum plate on a calibrated line directly below the sonar. The depth of the plate below the water surface was recorded and compared to the value reported by the HYSWEEP Bar Check Utility. Results for this test are summarized in Appendix B. The water level check compares the water level reported by the HYPACK acquisition software to the value measured at the same time at the river bank by a field technician using a Leica 1230 RTK GPS rover identical to the model installed on the survey boat. This test verifies proper installation offsets on the vessel and that the GPS is configured properly and receiving accurate real-time corrections. The results of the water level check are provided in Appendix B.

3.4 SOUND SPEED CASTS

Changes in sound speed through the water column affect the MBE's individual beams in both the angle and distance calculated from the propagation times. To compensate for these effects, data processing must model the effects as a function of beam launch angle and time. To implement these calculations, sound speed profiles are recorded through the water column using conductivity, temperature, depth (CTD) sensors from which sound speeds versus depths are derived.

Sound speed casts were performed at various times throughout the survey, including at the beginning and end of the each day of sonar surveying.

3.5 DATA ACQUISITION AND PROCESSING QUALITY CONTROL

Data quality is established when data are collected through proper setup and operation of the survey systems, and cannot be enhanced during processing other than to remove obviously invalid data.

Data quality can be assessed explicitly: a single data element is compared directly with a standard or known control. Alternatively, quality can be assessed implicitly: combinations of data elements are compared with members of their own set for internal consistency. Additionally, quality can be

measured quantitatively (numerically) or qualitatively, requiring interpretation on the part of an operator.

Where possible, a quantitative measurement of data quality is identified for each data type acquired. Procedures are constructed to measure this quantity as near as practicable to the point of acquisition. These measurements of quality are continuously assessed throughout the acquisition and processing phases of the project. In addition, an interpretive or qualitative method is contrived to estimate data quality where a quantitative measure of data quality cannot be developed.

Data that fail to meet minimum quality standards are discarded and re-acquired. A number of individual data elements are required to calculate a sounding. These elements include sounder data, vessel attitude, sound velocity profile, water surface elevation, draft, and position. The failure of any data element to meet minimal quality requirements will result in the dismissal of the entire concurrent data set.

Field methods used for measuring data quality begin with position accuracy. At the completion of each survey line, the lead acquisition hydrographer reviews the positions of identifiable features in the online HYPACK®/HYSWEEP® coverage plots. This software allows the user to compare the results of the positions measured for consistency within the lines and against external references. Positions of well-defined features, mapped on overlapping lines, should agree to within a few decimeters. Lines that contain positions that exceed contract specifications are flagged for complete or partial reruns as appropriate.

Motion data are also scrutinized. These data are more difficult to assess for quality than vessel position because data are acquired using only one system and it cannot be checked against itself. Consequently, the heave component of the motion data set is merged with the soundings from the vertical beam. A timing error in either of these systems will result in a residual oscillation in the measured depth. Amplitude errors in the heave record will have a similar effect.

Sounding data from the MBE are subject to interpretive and quantitative measurements of data quality. During acquisition, sonar operators monitor data quality on the multibeam monitor and HYPACK acquisition screens. The general noise level of the soundings and useable swath width are visible on the SeaBat monitor. Custom screens in HYPACK and HYSWEEP allow the operator

to view a digital terrain model (DTM) of average depths, waterfall displays, and individual profiles. These displays require interpretation and are used as the first quality check on multibeam data.

The data are viewed again as they are cleaned (flagged for exclusion from the final data set) and edited. In CARIS, lines can be examined for obvious errors. By this time, however, the multibeam data are bundled with all their ancillary data elements: sound velocity profiles, tide, static draft, squat and settlement, heave, pitch, and roll.

All bathymetry data are processed in CARIS and Fledermaus, with final charts produced using Fledermaus and ArcGIS.

The visualization tools available in the processing software provide clear indications of any problems in the motion sensor data, or in the time correlation of the echosounder and motion data. Any errors in these areas will result in identifiable data artifacts. Conducting at least preliminary processing of the bathymetry data on the vessel allows any problems to be detected and corrected quickly, and will ensure that a full, high-quality data set is collected.

This page intentionally left blank.

Section 4
Bathymetry Results

The multibeam sonar used for this survey provides extremely high-resolution data, which, when used in conjunction with comparable accuracy motion, heading, and position sensors, can show fine detail in the morphology of the river bottom. Sample results of the multibeam bathymetry are shown in Figures 4-1 through 4-3.

4.1 BATHYMETRY REPEATABILITY/ACCURACY

Accuracy and precision are a function of the positioning and attitude measurements errors, timing errors, water depth, and water sound velocity profile.

One of the key variables in this equation is the RTK GPS. This component of the system is evaluated for accuracy by occupying a known benchmark with a GPS rover unit. Real-time corrections were broadcast by a Pacific Crest Modem connected to the base station. Occupying a known benchmark verifies the accuracy of these corrections that are used during data collection.

Errors are minimized through good survey procedures, as defined in the U.S. Army Corps of Engineering and Design Hydrographic Surveying manual (EM 1110-2-1003), equipment manufacturers' documentation, and other references. Invalid data are identified and eliminated through appropriate processing and visualization tools. The effects of any remaining outlier data are minimized by collecting massively redundant measurements. In shallow water, even with a small, 3 foot grid size, the systems employed for this survey typically provide tens to hundreds of individual soundings in each grid cell.

The most influential factor on being able to repeat the survey with the same accuracy was the presence of dense aquatic vegetation. Due to the extremely high density of vegetation it clogged the vessel's jet intake, the sonar heads and the sound velocity profiler attached to the heads (Figures 4-5 through 4-7) and required breaks in the survey for removal. Dense vegetation can lead to misrepresentations of the bottom's morphology causing a false bathymetric appearance. Vegetation

caught on the sonar projector or receiver can give the sonar operator a misleading speed of sound which can lead to the operator adjusting the sonar incorrectly for the bottom type. To limit the impact of vegetation on data quality soundings resulting from vegetation rather than the bottom were removed, to the extent possible, during data processing.

4.2 BATHYMETRY SURVEY DATA SUMMARY

The Middle River bathymetry survey mapped in high detail the morphology of Dark Head Cove and, to the extent possible with the present of dense vegetation, Cow Pen Creek. The water depths within the survey area ranged from 0.5 to 13.7 and averaged 8.8 U.S. survey feet as referenced to NAVD88. This data, which has been gridded at 3x3 feet, provides mudline elevations for the site which can be used for sediment transport modeling. The mudline elevations can also be used to support dredge or capping design efforts, design dredge cuts and to calculate dredge and capping volumes. Obstructions proud of the bottom can be identified within the data, including docks, aquatic vegetation and boat ramps (refer to Figure 4-4).

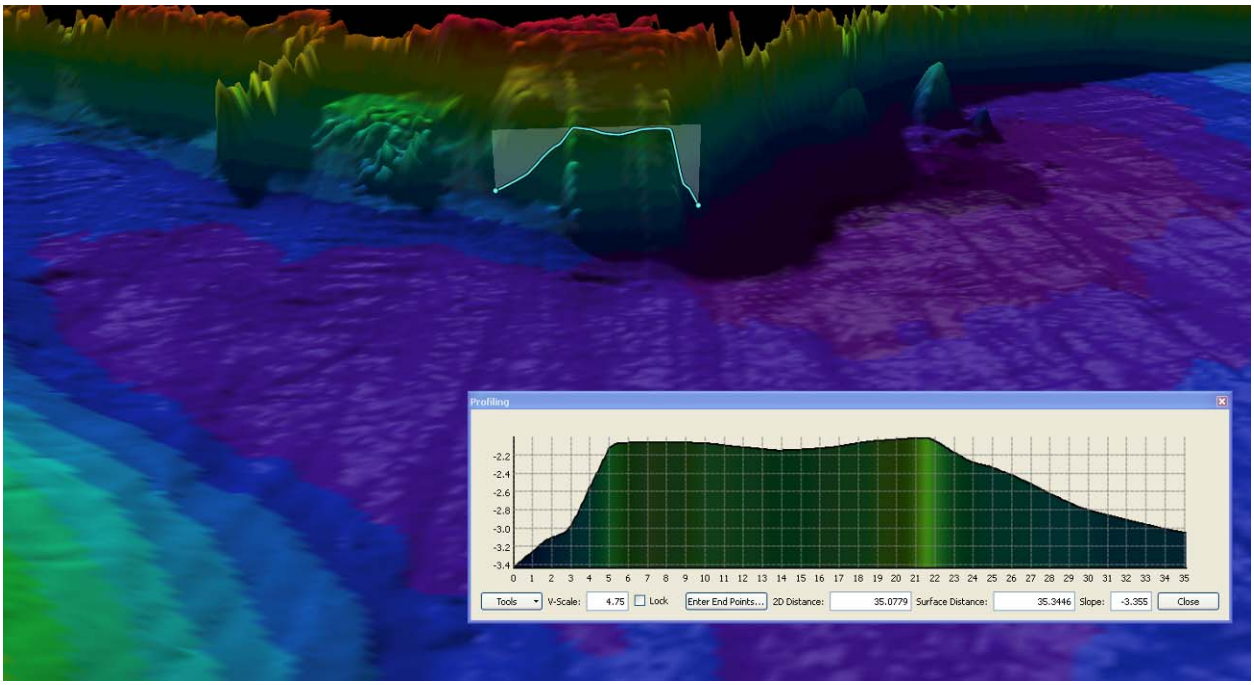

Figure 4-1 Fledermaus bathymetry surface of a boat ramp in the northwest section of the survey area, with a 2-D profile. 3-D view is from the southwest, looking towards the northeast. Vertical exaggeration is 10x.

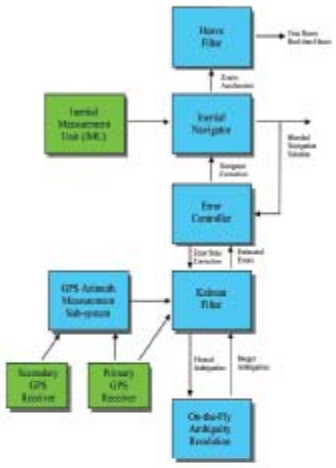
Equipment Data Sheets

Equipment Data Sheets

The following are copies of the equipment data sheets provided by the manufacturers of the primary systems used during the bathymetry survey.



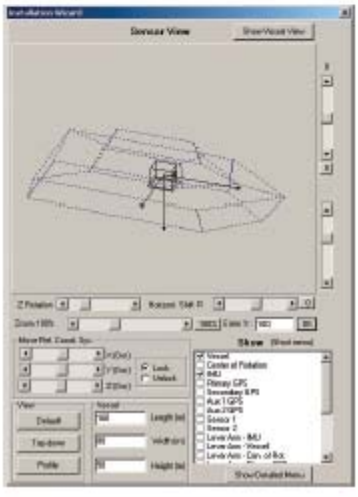
POS MV™ WaveMaster

Providing the Marine Industry with robust, reliable, and repeatable position and orientation solutions in all dynamics

Accurate Position and Orientation Solution
POS MV WaveMaster maintains positioning accuracy under the most demanding conditions. With its high data update rate, the system delivers a full six degree-of-freedom position and orientation solution to provide the following:

- Position (latitude, longitude and elevation)
- Velocity (north, east and vertical)
- Attitude (roll, pitch and true heading)
- Heave (real-time, delayed)
- Acceleration Vectors
- Angular Rate Vectors

The new POS MV WaveMaster generates a tightly-integrated solution, which means the system's Inertial Navigator will provide continuous positioning information while surveying in areas where GPS reception is compromised by multipath effect and signal loss. Raw GPS data from as few as one satellite can now be processed directly within the WaveMaster.



Tightly Coupled POS MV WaveMaster

Tightly-coupled integration offers the following advantages:

Advantage – Strengthens the system's ability to provide continuous, accurate data in areas with intermittent GPS reception
Advantage – Reduces position drift
Advantage – Enables almost instantaneous RTK re-acquisition (with internal RTK option)

WaveMaster Features and Benefits:

- Uses the latest GPS receiver technology from Trimble:
  - Maxwell™ chip technology
  - Everest™ multipath elimination technology
  - 10Hz raw observables for post-processing
  - Outstanding positioning performance and low elevation satellite tracking accuracy
- TrueHeave - Applanix's ground breaking delayed time heave processor
  - Removes processing artifacts but not real motion
  - No tuning required for varying sea conditions
  - Provides online quality measurement
- Faster CPU (700Mhz)
  - Low system loading allows for enhanced capabilities in the future
  - Runs at less than 10% of its total capacity to allow for upgrades and additional features
- TCP/IP protocol for raw data logging
  - Reliable logging of all raw data with microsecond-accurate time stamping
  - POSPac ready (for post-mission analysis)
- Firmware migration path
  - Access to new releases with new features as they become available
- New small, compact form-factor
- New Graphical User Interface
  - Makes installation and setup intuitive
  - Reduces operator error

SYSTEM COMPONENTS

POS Computer System (PCS)
A rugged, compact computer system contains the core POS processor and IMU interface electronics, plus two GPS receivers. The PCS provides all motion variables and timing data at high rate and/or provides motion compensation and georeferenceing data to all multibeam systems.

POS Inertial Measurement Unit
The system's primary sensor is a Ring Laser Gyro (RLG) manufactured by one of the world's experts in inertial technology. This high performance, low drift rate gyro ensures that the attitude data remains robust as the dynamics increase.

Primary and Secondary GPS Antennas
Dual frequency antennas for use with GAMS and/or RTK.

APPLANIX
A TRIMBLE COMPANY

POS MV™ WaveMaster

POS MV WAVEMASTER MAIN SPECIFICATIONS (with Differential Corrections)

Roll, Pitch accuracy:	0.03° (1 sigma with GPS or DGPS) 0.02° (1 sigma with RTK)
Heave Accuracy:	5 cm or 5% (whichever is greater) for periods of 20 seconds or less
Heading Accuracy:	0.06° (1 sigma) with 1 m antenna baseline, 0.03 (1 sigma) with 2 m baseline, 0.015 (1 sigma) with 4 m baseline
Position Accuracy:	0.5 - 2 m (1 sigma) depending on quality of differential corrections 0.02 - 0.10 m (RTK) with input from auxiliary RTK or optional internal RTK receiver
Velocity Accuracy:	0.05 m/s horizontal

POS MV WAVEMASTER DURING GPS OUTAGES

Roll, Pitch accuracy:	0.04° (1 sigma)
Heave accuracy:	5 cm or 5% (whichever is greater) for wave periods of 18s or less
Heading accuracy:	Drift less than 2° per hour
Position accuracy degradation:	3 m (1 sigma) for 30 s outages <10 m (1 sigma) for 60 s outages

5 COM Ports	User assignable to: NMEA output, Binary output, Auxiliary GPS input (2), Base GPS correction input (2)

NMEA ASCII Output

Parameters	NMEA Standard ASCII messages: Position ($INGGA, $INGGK), Heading ($INHDT), Track and Speed ($INVTG), Statistics ($INGST), Attitude ($PASHR, $PRDID), Time and Date ($INZDA, $UTC).
Rate	Up to 50 Hz (user selectable)

High Rate Attitude Output

Parameters	User selectable binary messages: attitude, heading, speed
Rate	Up to 100 Hz (user selectable)

Auxiliary GPS Inputs

Parameter	NMEA Standard ASCII messages: $GPGGA, $GPGST, $GPGSA, $GPGSV. Uses Aux input with best quality.
Rate	1 Hz

Base GPS Correction Inputs

Parameter	RTCM 1, 9, 18, 19, CMR and CMR+ input formats accepted. Combined with raw GPS observables in tightly-coupled navigation solution.
Rate	1 Hz

Digital I/O

1PPS Output	1 pulse-per-second Time Sync output, normally high, active low pulse
Event Input (2)	Time mark of external events. TTL pulses > 1 msec width, rising or falling edge, max rate 200 Hz.

SeaBat 7125

High-Resolution Multibeam Echosounder System

SeaBat 7125

- **Unparalleled Resolution and Installation Flexibility**
- **Single or Dual-Frequency Operation (200 and/or 400kHz)**
- **256 or 512 Focused 0.5° Beams at 400kHz (1° at 200kHz)**
- **128° Swath Coverage (4x Water Depth)**
- **400 meter Depth Rated (6000 meter option)**
- **Built-in test environment (BITE)**
- **Complies to IHO SP44 Special Order + USACE Class 1**

The new generation SeaBat 7125 represents yet another technological breakthrough in high quality performance. With unparalleled resolution and installation flexibility, the SeaBat 7125 is ideal for a great variety of hydrographic, offshore, military, bathymetric, sidescan & snippets applications from a surface vessel, ROV to 6000 meter depth.

The SeaBat 7125 is a single and / or dual frequency (200/400kHz) multibeam echosounder system. In the 200kHz configuration, the receiver forms 256 equi-angle or equi-distant dynamically focused 1° receive beams to cover a 128° swath, with a maximum range of 500 meters. In the 400kHz configuration, the receiver forms 256 equi-angle focused 0.5° receive beams or 512 in equi-distant mode, to cover a 128° swath, with ultra high resolution and a typical range of 200 meters.

The SeaBat 7125 is controlled by the 7-P, a high performance Sonar Processor that manages data flow and signal processing using a state-of-the-art FPGA architechture. The 7-P provides a Windows®-based GUI user interface, allowing system configuration, control, data output, storage and built-in test environment (BITE) displays to assist the operator.

Equi-distant or equi-angular beam spacing across the entire swath is selectable by the operator to provide uniform sounding density and maximize usable outer swath. Data logging of beamformed water column data or pre-beamformed stave data to a RAID disk system is also optionally provided.

The SeaBat 7125 receiver sonar head design provides increased bandwidth, improved dynamic range and noise immunity over earlier models and makes full use of Commercial-off-the-Shelf (COTS) hardware and software to increase cost effectiveness with a well defined path for future upgrades and expansion.

Specifications

Below are the general specifications for the NXIC CTD along with the specifications for the conductivity, temperature and pressure sensors.

Note: These specifications are subject to change without notice.

General

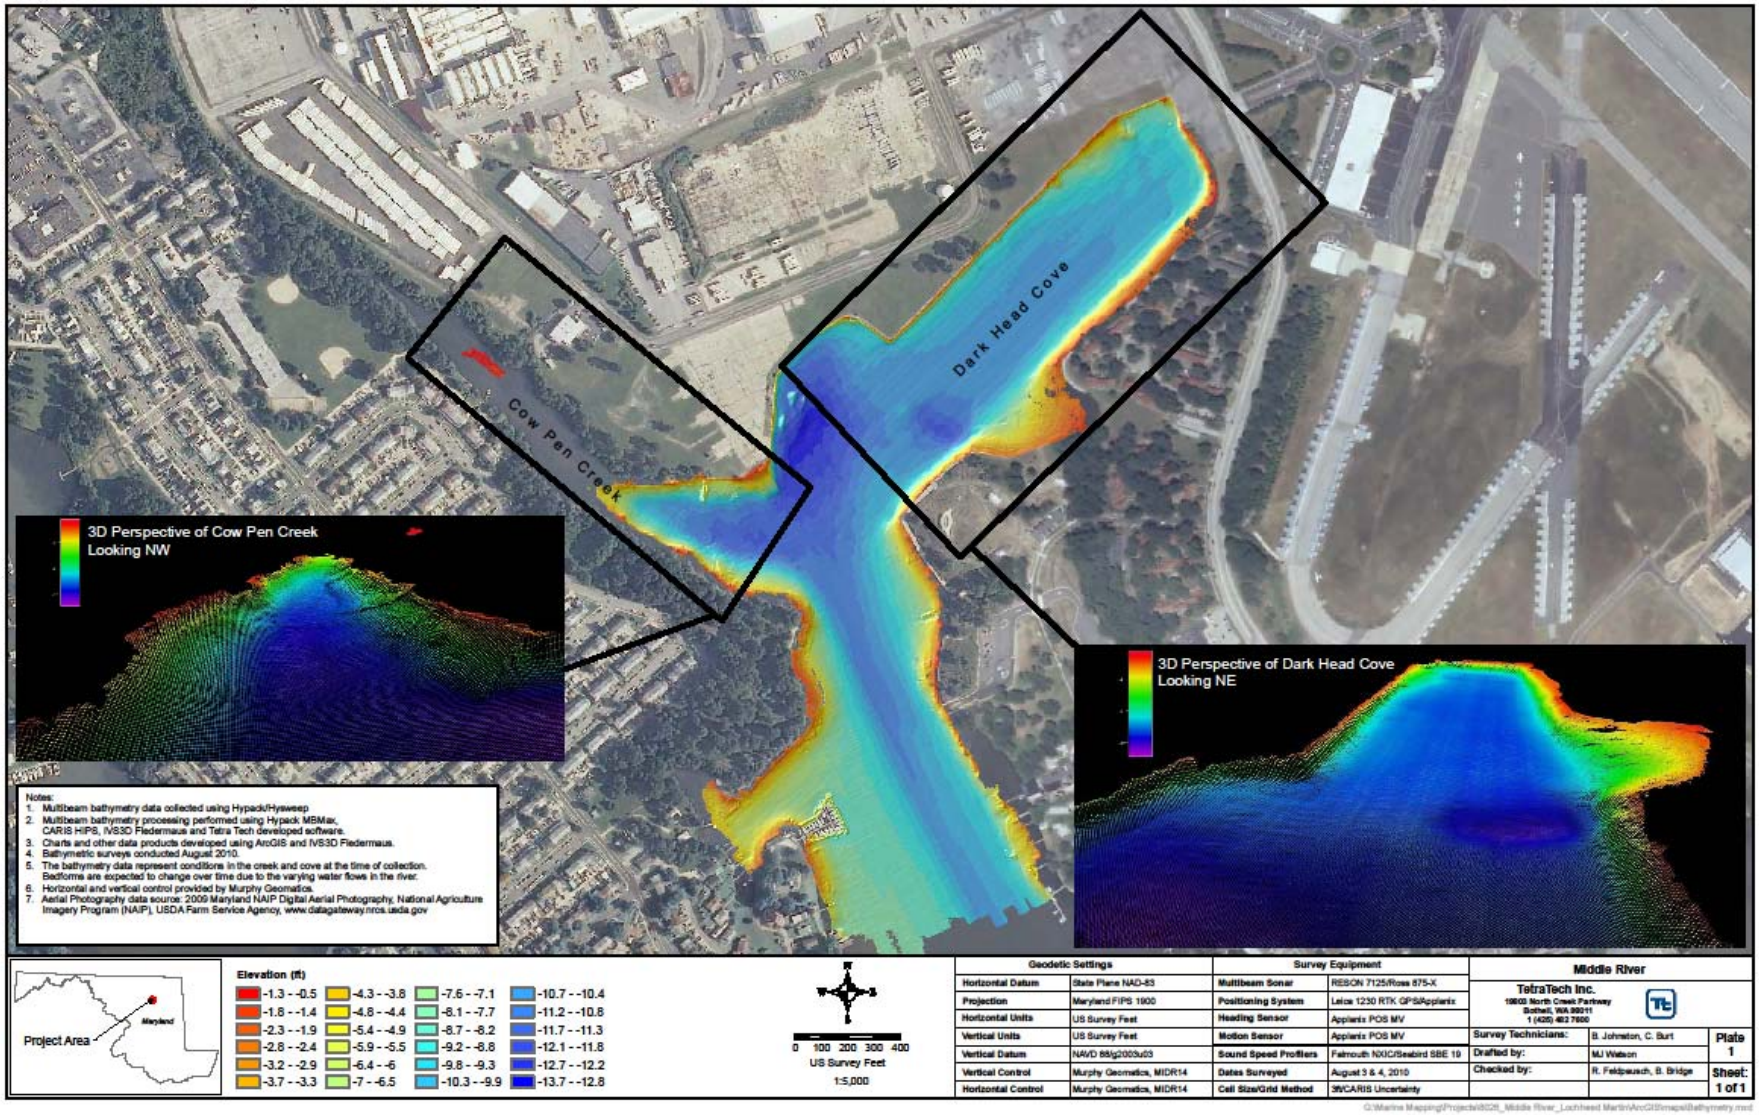
Power requirements:	Internal battery pack or 7–35 VDC @ 500 mA maximum when externally powered
External sensor power:	11 VDC nominal @ 50 mA maximum for any sensor; 150 mA maximum total for all the sensors
Depth rating:	500 m standard, Delrin housing
	7000 m optional, 64-AVL titanium housing
Sample rate:	1–15 S/sec, selectable
Resolution:	20 bits
Bulkhead connector:	Subconn MCBH4F, mates with MCIL4M
Real time clock:	Programmable alarm/sleep functions
Real time clock stability:	±5 ppm initial accuracy, ±12 ppm/year
Communication interface:	RS-232, RS-485 or CMOS TTL
Baud rate:	1200, 9600, 19200, 38400, 57600, and 115200
Data format:	8 data bits, 1 stop bit

Salinity calculation:	PSU-78
Sound velocity calculation:	UNESCO44
Warm up:	3 seconds after power up
Internal memory:	128 MB; 256 MB optional
Battery pack:	16 welded alkaline "C" cells; 3.2 V (nominal) at 40 A·h

Conductivity

Sensor type:	Non-external inductive cell
Range:	0–9.0 S/m (0–90 mS/cm)
Accuracy:	±0.0002 S/m (±0.002 mS/cm)
Stability:	±0.00005 S/m/month (±0.0005 mS/cm/month)
Resolution:	0.00001 S/m (0.0001 mS/cm)

Temperature



Sensor type:	Aged thermistor
Range:	-2–32°C standard, -5–45°C optional
Accuracy:	±0.002°C
Stability:	±0.0005°C/month
Resolution:	0.0001°C
Response:	100 msec

Pressure

Sensor type:	Precision micro-machined silicon transducer
Range:	Customer specified
Accuracy:	±0.02% of full scale
Stability:	±0.004% of full scale/month
Resolution:	0.001% of full scale
Response:	25 msec

SEDIMENT STABILITY ANALYSIS

INTRODUCTION

A modeling analysis was conducted to estimate the stability of bed sediment in the Cow Pen Creek and Dark Head Cove forks of Dark Head Creek, a tributary of the Middle River in Baltimore County Maryland. The analysis considered two extreme events: a high rainfall event in the Cow Pen Creek and Dark Head Creek watersheds and a historical storm surge and accompanying period of high wind. The *Environmental Fluid Dynamic Code* (EFDC) [Hamrick, 1992; Tetra Tech, 2007; United States Environmental Protection Agency (USEPA), 2007] was used for the modeling analysis, which involved determining bed stresses during simulated events. This appendix documents the modeling analysis, including model configuration, event selections, and presentation and discussion of the model predictions of sediment stability.

MODEL CONFIGURATION

The EFDC model was configured to simulate flow in the study region, which includes Cow Pen Creek, Dark Head Cove, and Dark Head Creek. The model grid is shown in Figure 1 and has approximately 50 feet (15 meter) square grid-cells. Bathymetric and topographic data for model configuration include a recent bathymetric survey conducted by Tetra Tech during August, 2010 and National Oceanic and Atmospheric Administration (NOAA) “Coastal Relief” bathymetry and topography. Figure 2 shows the extent of the bathymetric survey, and Figure 3 shows the interpolated and estimated bathymetry over the entire grid. Site vegetation precluded collecting bathymetric data in the upstream area of Cow Pen Creek, so a minimum water depth of one foot [30 centimeters (cm)] was used for this area and blended with the measured bathymetry. For the downstream area of Dark Head Creek, an open boundary bathymetric profile consistent with the NOAA “Coastal Relief” was developed for the open boundary row of cells and blended with the measured bathymetry upstream in the creek.

The model was further configured to simulate two extreme events. The first is a high rainfall-runoff event based on a 100-year annual recurrence interval 24-hour rainfall of 8.7 inches (24.7 cm). The runoff volumes from the Cow Pen Creek and Dark Head Cove watersheds were estimated using the "Simple Method" for estimating runoff from urban areas (SMRC, 2010). Data requirements for this approach include the sub-watershed drainage area, impervious cover, and precipitation.

The sub-watersheds of the study area were delineated using available data sources. Elevation contours derived from U.S. Geological Survey (USGS) 10-meter digital elevation models (USGS, 2009) of the study area were the primary source of information. The watershed delineation also incorporated site utility information for Chesapeake Park, owned by LMC Properties, Inc. The sub-watershed delineations of Cow Pen Creek and Dark Head Cove are shown in Figure 4.

General land use/land cover data sets for the sub-watersheds were extracted from the *National Land Cover Dataset* (NLCD) database (MRLC, 2001). NLCD data were derived from satellite imagery taken circa 2001 and provide detailed categorization of urban and natural areas. Land use categories were divided into separate pervious and impervious land units based on the impervious percentages description provided in the NLCD metadata. Table 1 presents the land use distributions of the Cow Pen Creek and Dark Head Cove sub-watersheds.

Rainfall totals were taken from rainfall frequency data released by the NOAA "Precipitation Frequency Data" server. Rainfall frequency data for the study area are presented in Table 2 and may be accessed at http://hdsc.nws.noaa.gov/. Using the data sets described above, peak runoff volumes were estimated for the two watersheds for a 24-hr 100-year storm. These runoff volumes result in a 49 cubic feet per second (cfs) [1.39 cubic meters per second (cms)] flow into Cow Pen Creek and a 66 cfs (1.88 cms) flow into Dark Head Cover. A spring tide with range of 1.58 feet (0.48 meter) (NOAA, 2010) was applied to the model at the open boundary at the mouth of Dark Head Creek for this event.

500	0.83	1.32	1.66	2.64	3.79	4.92	5.47	7.26	9.72	12.33
1,000	0.88	1.39	1.74	2.82	4.12	5.43	6.07	8.18	11.15	14.27

The second modeled event is based on the historical storm surge and winds associated with Hurricane Isabella in September 2003. Figure 5 shows the water surface elevation at the NOAA station in Baltimore Harbor, which was used for the tidal boundary condition. In addition to the surge, the September period includes a spring tide. The wind forcing is based on observed wind speed (Figure 6) and direction at Baltimore Washington International (BWI) Airport.

EVENT SIMULATION RESULTS

The high rainfall-runoff event was simulated as a continuous inflow of 49 cfs (1.39 cms) into Cow Pen Creek and 66 cfs (1.88 cms) into Dark Head Cove, accompanied by a 1.58 foot (0.48 m)-range spring tide at the mouth of Dark Head Creek. The resulting distribution of maximum sediment-bed stresses is shown in Figure 7. Bed stresses are less than 0.1 Newtons per square meter (N/m^2)over most of the study area except for the upstream area of Cow Pen Creek, where the maximum stresses reach 4 N/m^2. Field investigations of critical bed stresses for the erosion of cohesive sediments in the Chesapeake Bay region (Maa, et al., 1998, 2002, 2008) indicate 0.1 N/m^2 as a lower boundary for the critical erosion stress for surface sediments, with the critical stresses increasing with depth in the sediment bed. Maa (2008) observed maximum sediment erosion rates on the order of 0.0001 gram per square meters per second (gm/cm^2-sec). Sand and noncohesive-behaving silt beds are also stable at stresses below 0.1 N/m^2, as shown in Figure 8 (Garcia, 2008).

The storm surge and wind simulation was executed for the entire month of September 2003 and maximum bed stresses in each model grid cell were determined from the model output. The distribution of maximum bed stresses is shown in Figure 9. Stresses are less than 0.1 N/m^2 over much of the area, with high stresses again occurring in the upstream area of Cow Pen Creek. Bands of high stress occur along the southwest shoreline of Dark Head Cove and in Dark Head Creek. To determine the relative importance of the wind forcing, the surge simulation was repeated without wind, using the stress distribution shown in Figure 10. Stresses associated with only the storm surge are below 0.03 N/m^2 over the entire area, indicating that the high wind speed in excess of 16 meters per second (m/s) [36 miles per hour (mph)] is primarily responsible for the higher stresses. This also confirms that normal tidal conditions, including monthly spring tides do not pose the potential for erosion. Since local sheltering effects are not accounted for, the wind-induced stresses can be viewed as conservative.

The general conclusion of the analysis is that the sediment bed is stable in the area of interest, except for the upstream area of Cow Pen Creek. This area has probably been eroded and renewed by new deposits relatively frequently, since shorter duration rainfall events with a lower annual recurrence interval can produce similar peak discharges at the 100-year 24-hour event. The 100-year 24-hour event was selected in this case since its duration could transport eroded material outside of the study area. This was confirmed by a dye simulation, which indicates that the mean travel time to the mouth of Dark Head Creek is about 0.5 days, with a dilution factor of 5. For settling velocities ranging from 0.01–0.001 cm/sec, and accounting for the 1 to 5 dilution to the mouth, the sediment concentration at the mouth of Dark Head Creek would range from 2–15% of the concentration of sediment suspended in the upstream area of Cow Pen Creek.

If the maximum erosion rate of 0.0001 gm/cm^2-sec occurred over the duration of the event and approximately 10,000 square meters (m^2) were affected, suspended sediment concentrations on the order of 7,000 milligrams per liter (mg/L) could occur for the 1.39 cms flow into Cow Pen Creek. The corresponding concentration range at the mouth of Dark Head Creek would be from 140–1,000 mg/L. For a sediment-bed dry density of approximately 1 gm/cm^3, an estimate of the depth of erosion from the one day event would be 10 cm.

Section 1
The Middle River Biological Assessment

Benthic macroinvertebrate samples were collected from 10 sites near Lockheed Martin's Middle River Complex in Middle River, Maryland. Two sites (Bowleys Quarters and Marshy Point) are in relatively undisturbed areas and considered to be of reference quality (see **Table 1**). Another site (Middle River Downstream) was intended to be a reference site, but was later discounted because of elevated levels of some metals in the surficial sediment. The test sites include two sites in Cow Pen Creek and five in Dark Head Cove.

Table 1—Site numbers, water body names, and related comments

Site	Water body	Comments
BN-BQ-1	Bowleys Quarters	Reference
BN-MP-1	Marshy Point	Reference
BN-MRD-1	Middle River Downstream	Initial reference—*discounted because of elevated metals*
BN-CPC-1	Cow Pen Creek (test)	Relatively large amounts of detritus
BN-CPC-2	Cow Pen Creek (test)	Relatively large amounts of detritus
BN-DHC-1	Dark Head Cove (test)	Relatively large amounts of detritus
BN-DHC-2	Dark Head Cove (test)	Relatively large amounts of detritus
BN-DHC-3	Dark Head Cove (test)	
BN-DHC-4	Dark Head Cove (test)	
BN-DHC-5	Dark Head Cove (test)	

The five replicate Petite Ponar® dredge samples taken at each site were combined for biological metric calculations (see **Attachment A**). The metrics include those of the *Chesapeake Bay Benthic Index of Biotic Integrity* (CB-B-IBI; Weisberg et al. 1997, Llansó and Dauer 2002) for oligohaline estuaries. These sites have salinities ranging from 2.4–4.5 parts per trillon (ppt), which is within the oligohaline range. Other commonly applied metrics were also calculated (Llansó et al. 2009), including percent tubificid oligochaetes and percent spionid polychaetes, which are used in the EMAP-Virginia Province benthic index (Paul et al. 2001).

Metrics were calculated based on the laboratory identifications and, except for worms of the subfamily Tubificinae, the genera and species of Tubificinae were reassigned to the subfamily level before metric calculation because of taxonomic uncertainty (see section 2). Taxon attributes (**Attachment B**) were taken primarily from the CB-B-IBI application manual (Llansó and Dauer 2002). Tolerance ratings for taxa not addressed by the manual were copied from the United States Geological Survey (USGS) *Traits* database (**http://pubs.usgs.gov/ds/ds187/**), using an average of values when multiple sources were cited. For the Tubificinae, attributes at the subfamily level were derived from the average or mode of values for two related groups: Tubificidae with capiliform chaetae and Tubificidae without capiliform chaetae.

The CB-B-IBI is calculated by scoring six metrics of benthic community structure and function according to established thresholds (see **Table 2**). The scores (on a 1–5 scale) are then averaged to form the index for each site. Samples with index values of 3.0 or more are considered to have good benthic conditions, indicative of good habitat quality. Metrics in the index were calculated according to Llansó and Dauer (2002), which calls for eliminating certain taxa from the calculations (**Attachment B**).

Table 2—
Metrics and scoring thresholds for calculating the CB-B-IBI in oligohaline sites (Llansó and Dauer 2002)

Metric	Metric code	5	3	1
1. Abundance [number per square meter (#/m^2)]	Density.m^2	≥450–3350	180–450 or ≥3350–4050	<180 or ≥4050
2. Abundance of oligohaline pollution-indicative taxa (%)	OPIpct	≤27	27–95	>95
3. Abundance of oligohaline pollution-sensitive taxa (%)	OPSpct	≥26	0.2–26	<0.2
4. Abundance of carnivores and omnivores (%)	pctCO	≥35	15–35	<15
5. HBI value*	HBI	≤6	6–9.05	>9.05
6. Tanypodini to Chironomidae abundance (%)	pctTnypni_Chir	≤17	17–64	>64

** Equivalent to Tolerance Score of Llansó and Dauer (2002)*

RESULTS

Metrics vary by site and some show better conditions in the two reference sites, the one initial reference site, and the three Dark Head Cove sites with lower amounts of detritus (see **Figure 1** and **Table 3**). Of the six metrics in the CB-B-IBI, one results in scores that do not vary among

sites (**Figure 2**). The metric "Abundance of oligohaline pollution-sensitive taxa" was scored 1 point for each sample because sites had no or low numbers of pollution-sensitive taxa. The metric "Abundance of oligohaline pollution-indicative taxa" results in scores of 3 points for all but one site DHC-1, which scored 1 point for having 99% pollution-indicative individuals. The numbers of individuals and densities are highest in test sites, especially those with greater amounts of detritus. Densities in the reference sites are moderate, resulting in scores of 5 points. Very high and very low densities were given lower scores. Test site scores range from 1–5.

The HBI is a tolerance metric where higher values indicate a greater abundance of pollution-tolerant individuals in a sample (and thus degraded conditions); conversely, lower values indicate a greater abundance of pollution-sensitive individuals (and thus less-degraded conditions). It is calculated as the average of tolerance values for all individuals in a sample. The calculated HBI values are then converted to scores on the 1, 3, 5 scale (Llansó and Dauer 2002), where higher scores indicate more pollution-sensitive individuals and better conditions. The converted HBI score is lowest in the two reference sites, indicating that pollution tolerant organisms are less abundant at these sites. Several test sites had HBI values >9 (and consequently low scores of 1), indicating that most of the organisms in those samples are pollution-tolerant, and that conditions are unfavorable for survival and reproduction of pollution-sensitive individuals.

HBI values and pollution indicative ratings are not always in agreement within the Llansó and Dauer (2002) taxa list. This results in a situation where the HBI value is low in both reference sites, yet the percent pollution indicators are relatively high in all sites (all >80%). Pollution indicator traits were derived independently from the tolerance values and may be differently sensitive to toxicants. One oligohaline pollution-sensitive taxon was identified (*Marenzellaria viridis* [Annelida: Polychaeta]) at DHC-2. Even when adding two other taxa considered sensitive in mesohaline habitats (*Rangia cuneata* and *Cyathura polita*; found in MP-1, DHC-2, and DHC-3), the percentages are never high enough to yield metric scores greater than 1 point in any individual sample. Values for the metric "Percent Tanypodini of Chironomidae" are variable and create opposite expectations, being higher in reference sites than in some test sites. Percent carnivore/omnivore values are high in one reference site and low in another, but are relatively low in all test sites, scoring 1 or 3 points.

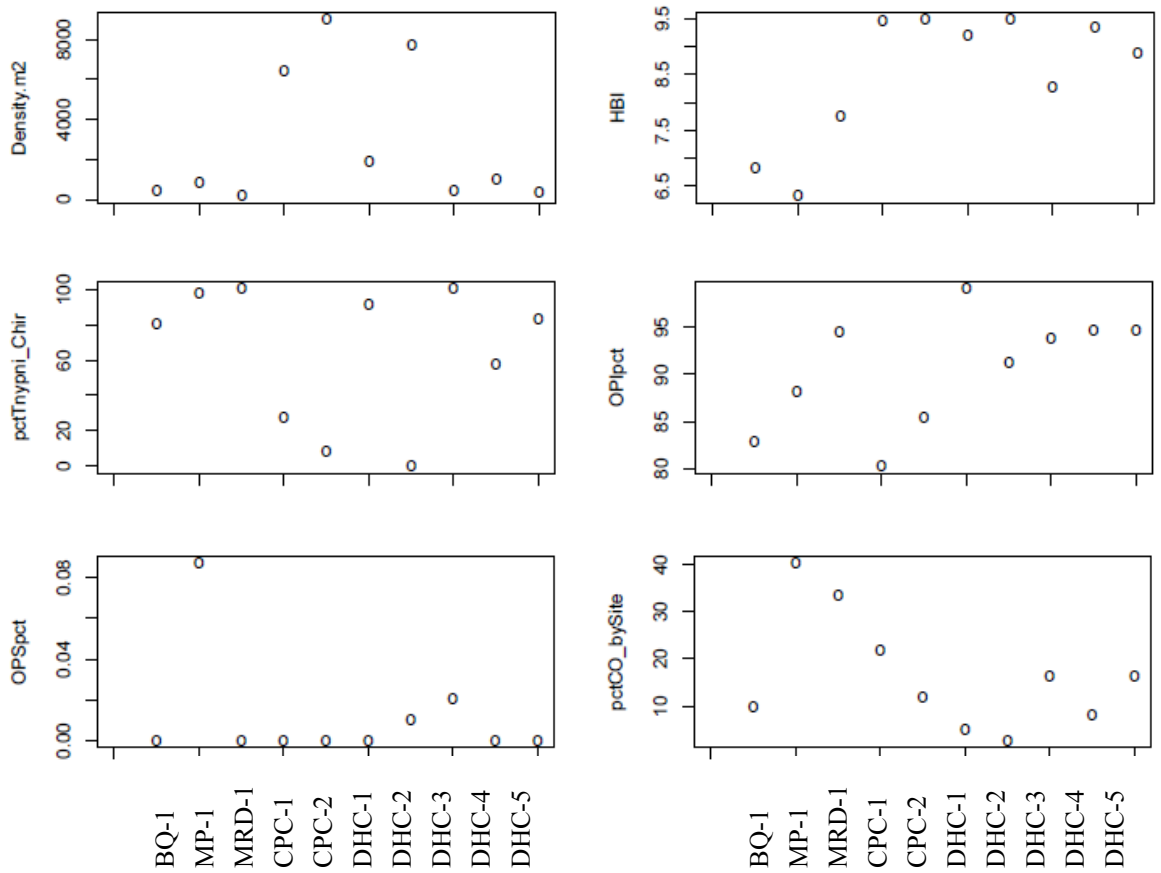

Figure 1—Calculated metric values of the Chesapeake Bay B-IBI. Metric codes (*y*-axis) are as in Table 2.

When the CB-B-IBI scores were calculated from the six metrics, only one reference site (Marshy Point) had a score of 3.0, indicating good benthic conditions (**Figure 3**). The other reference site (Bowleys Quarters [BN-BQ-1]) had a B-IBI score of 2.33. All test sites had scores in the range of 1.67–2.33. The lowest value is in site DHC-1 and the highest scores of the test sites are in sites DHC-3, -4, and -5.

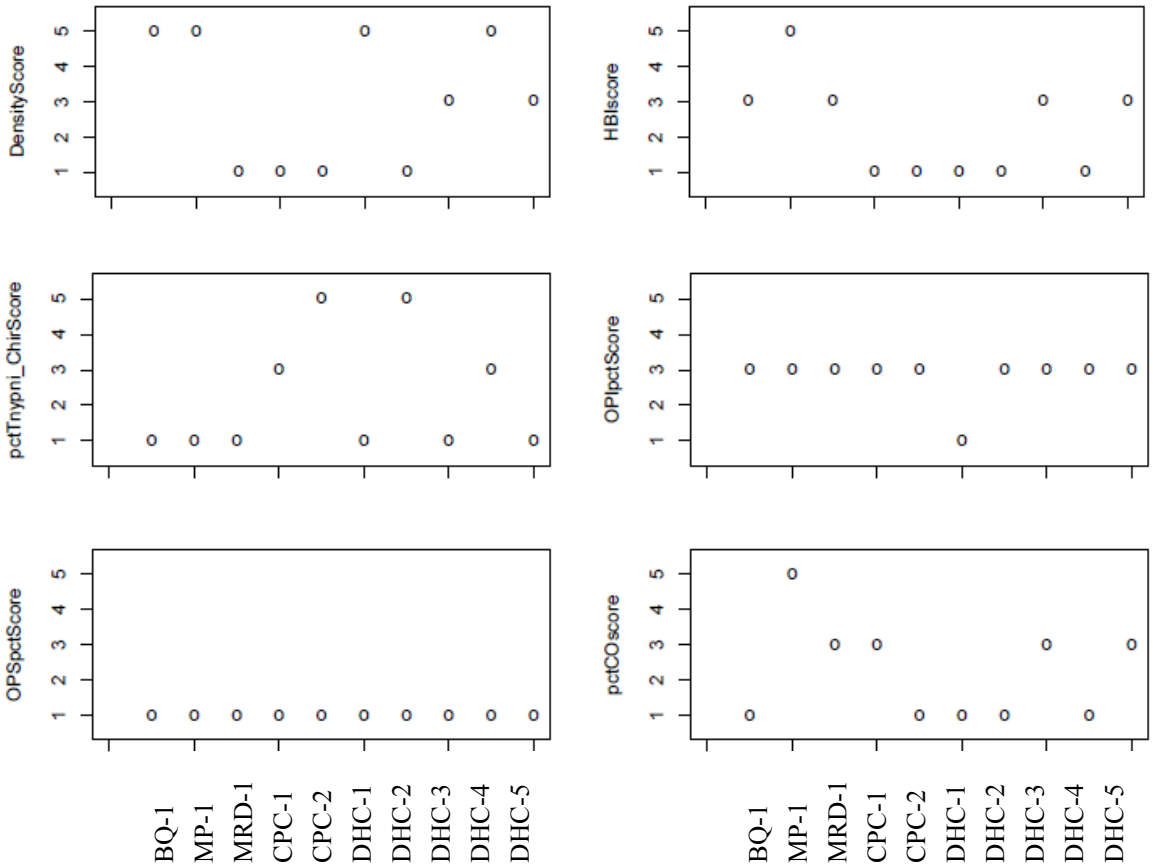

Figure 2—Metric scores for the six metrics in the CB-B-IBI. Metric codes (*y*-axis) are as in Table 2.

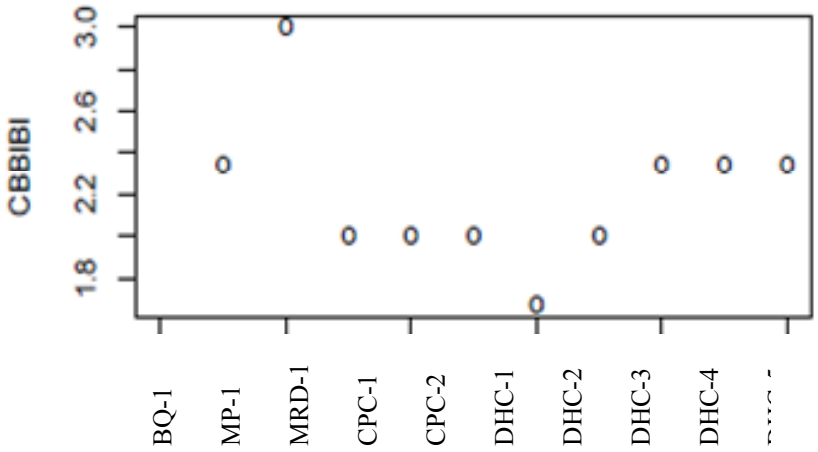

Figure 3—Chesapeake Bay B-IBI (CB-B-IBI) scores. Values ≥3.0 and greater are considered to have good benthic conditions.

Tubificid oligochaetes are absent or sparse in reference sites as compared to test sites (**Figure 4A**). Spionid polychaetes are sparse in one reference site and moderately prominent in the other (**Figure 4B**). When these two metrics are considered in combination, tubificids and

spionids appear to comprise less than 50% of all references sites and more than 65% of all test sites. Metrics related to feeding mechanisms do not show discernable patterns among sites.

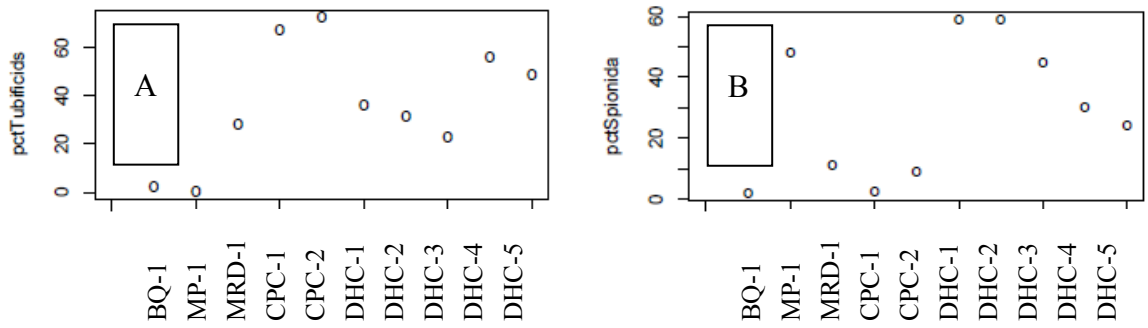

Figure 4—Percent tubificid oligochaetes (A) and percent spionid polychaetes (B)

DISCUSSION

One local reference site (Marshy Point) has good benthic conditions according to the CB-B-IBI. The other local reference site (Bowleys Quarters) and the proposed reference site (Middle River Downstream) have values below the 3.0 threshold, indicating some type of stressful conditions for the benthic macroinvertebrates even in these relatively unexposed locations. The 3.0 threshold is based on a wider distribution of reference sites throughout the Chesapeake Bay and probably includes mostly sites with less local disturbance and input than the local reference sites selected for this study. Therefore, it is assumed that some background disturbances or inputs negatively affect benthic organisms in the general study area. The average CB-B-IBI score for the two reference sites is 2.7.

All of the test sites have CB-B-IBI scores below the 3.0 threshold, indicating some stress to the benthic organisms. Both Cow Pen Creek sites had CB-B-IBI scores of 2.0, which is lower than either of the local reference-site scores. In Darkhead Cove, sites DHC-1 and DHC-2 appear to have worse biological conditions than the other three. However, all scores are below the 3.0 CB-B-IBI threshold, and the sites are very close to each other. The average of the CB-B-IBI scores in the five sites in Darkhead Cove is 2.1, indicating that the biological community is somehow stressed. Statistical comparisons among reference and test sites do not show significant differences in IBI values (*t*-test, $p>0.05$), though the sample sizes are so small that statistical results lack power (two reference sites, two to five test sites).

The CB-B-IBI (Weisberg et al. 1997) is the most appropriate overall benthic index we could apply in these analyses. It was calibrated for the entire Chesapeake Bay, we used the metric suite

and scoring criteria specific to oligohaline conditions, and we could calculate the index from the collected data. Although other metrics show some patterns among sites, we do not have as strong a basis for interpretation as we do for the overall, composite index, the CB-B-IBI. We interpret the percentage of tubificids and spionids to confirm results of the IBI (based on general knowledge of benthic organisms) and to suggest that the local reference sites have somewhat better benthic conditions than the test sites.

The reference sites have low percentages of pollution-tolerant tubificid oligochaetes and spionid polychaetes relative to the test sites (**Figure 4**). These organisms can persist and thrive in locations too stressful for sensitive organisms. They can also do well in locations with abundant detritus because they collect small food particles from the carbon-rich environment.

Tubificids are commonly among the taxa known to indicate pollution in oligohaline estuarine environments (Pelletier et al. 2010). They are generally tolerant of a wide range of pollutant types, including low dissolved-oxygen, heavy metals, physical habitat conditions, and low-level toxicants. Spionid polychaetes are known to tolerate relatively low dissolved oxygen even in the presence of hydrogen sulfide (Llansó 1991). Tubificids and spionids are prey resources for predators such as crabs and benthic-feeding fish. Although one reference site had a relatively high percentage of spionids (48% in Marshy Point), the combination of tubificids and spionids in reference sites was always lower than that combination in test sites. This pattern is in agreement with the HBI tolerance metric and suggests that some competitive advantage exists for one or the other tolerant organism when site stresses came into effect.

In a study of sediment toxicity throughout the Chesapeake Bay, higher benthic-macroinvertebrate densities were negatively correlated with contaminant concentrations (Hartwell and Hameedi 2007). However, among the Middle River sites in this study, densities of individuals are moderate in reference sites (where stressors are relatively low) and highest in some test sites (**Figure 1)**. This suggests that the effects of contaminant concentrations on densities of individuals are weak or absent among the Middle River study sites. Habitat or nutrient conditions may outweigh any potential contaminant effects and allow higher benthic productivity in sites where higher levels of detritus were observed (especially Cow Pen Creek and DHC-2). Despite these observations, contaminant effects should not be discounted because the higher productivity was achieved by pollution-tolerant taxa.

Table 3—Metric values and scores, by site. Metrics numbered and highlighted by boxes are used in the CB-B-IBI (Llansó and Dauer 2002). The overall CB-B-IBI score is the mean of the six metrics.

Section 2

Quality Control of Benthic-Macroinvertebrate Taxonomic Data

After the primary taxonomic laboratory identified the taxa in all 50 samples, five samples were randomly selected (10%) and sent to independent quality control (QC) laboratories for re-identification (**Table 4**). The duplicate results were directly compared to quantify rates of differences in sample counts (percent difference in enumeration [PDE]), percent taxonomic disagreement [PTD]), and consistency of effort (percent taxonomic completeness [PTC]). Note that neither primary nor QC taxonomists were given detailed standard operating procedures (SOP), but were instructed in writing to complete identifications to the genus level if specimen condition would allow. Excessively damaged or immature specimens could be left at coarser hierarchical levels of identification, such as subfamily, family, or higher, if necessary.

Table 4—Summary of taxonomic comparison results, by individual sample. Primary and QC taxonomists are T1 and T2, respectively. See Stribling et al. (2008) for a description of the QC procedure. Detailed results are in Attachment C.

	No. individuals					Taxonomic completeness (%)		
Sample ID	T1	T2	Matches	PDE	PTD	T1	T2	PTC_absdiff*
BN-CPC-1-3	104	99	18	2.5	82.7	100	35.4	64.6
BN-CPC-2-1	355	348	60	1	83.1	100	60.6	39.4
BN-CPC-2-3	187	210	110	5.8	47.6	100	67.1	32.9
BN-DHC-1-3	65	55	40	8.3	38.5	100	72.7	27.3
BN-DHC-1-5	55	39	24	17	56.4	100	59.0	41.0

**PTC_absdiff* is the absolute difference between the % taxonomic completeness attained by each of the taxonomists; low numbers indicate greater equivalency in level of effort

The mean PTD is 61.7%, substantially higher than the standard programmatic measurement-quality objective (MQO) for freshwater systems, 15% (Stribling et al. 2008). Overall, the comparisons are primarily affected by the hyper-abundance of tubificid worms (Oligochaeta: Naididae: Tubificinae) and associated straight taxonomic disagreements and hierarchical differences. The sample with the highest PTD of 83.1% is primarily due to its being dominated

by tubificids (83% of the full sample) and the differences/disagreements. Corrective actions (CA) are required because the error rate is so high. Specifically, the CA is to combine all tubificine identifications to the subfamily level for analysis. By doing so, mean PTD drops 44 percentage points from 61.7% to 17.5%. Note too that apparent errors are very low for mussels (Mollusca: Bivalvia), crustaceans, midges (Diptera: Chironomidae), and caddisflies (Trichoptera). With this corrective action, the rate of error in this data set should be considered acceptable for additional analyses.

Test conditions and narrative summary – There were 5 benthic macroinvertebrate samples of variable counts, randomly selected as 10% of the sample lot, for a biological assessment of the Middle River (n=50 samples). Samples were taken by petite ponar dredge from a brackish water zone near the mouth of the river at the Chesapeake Bay, Maryland. These taxonomic comparison (taxcomp) results represent a direct comparison of identification results by independent taxonomists in separate laboratories. The mean percent taxonomic disagreement (PTD) is 61.7%, substantially higher than standard programmatic measurement quality objective (MQO) for freshwater systems, 15%. Overall, the comparisons were primarily affected by the hyper-abundance of tubificid worms (Oligochaeta: Naididae: Tubificinae), and associated straight taxonomic disagreements and hierarchical differences. Sample PTD ranged from 38.5-83.1%; the sample with the highest PTD of 83.1%, was primarily due to its being dominated by these worms (83% of the full sample) and the previously-mentioned differences. Corrective actions are required, and, specifically, are combining all tubificine identifications to the subfamily level for analysis. With these corrective actions, the rates of error in this dataset should be considered acceptable for additional analyses. *Additional notes* – By combining all tubificines for the T2 data, including *Limnodrilus*, *Tubificoides*, and specimens identified as Tubificinae, the mean error rate (PTD) drops 44 percentage points from 61.7% to 17.5%. Also, errors were very low for mussels (Mollusca: Bivalvia), crustaceans, midges (Diptera: Chironomidae), and caddisflies (Trichoptera).

Standard operating procedures (SOP) for identifications documented and provided to all primary and QC taxonomists? No. All taxonomists were requested in writing to do whatever was necessary to attain genus level identifications, if the condition of the specimens would allow.

Additional comments: None.

The following table provides definitions for abbreviations and columns headers in tables found in subsequent pages:

Abbreviations/column headers	
A - no_ind_T1	number of individuals counted by primary taxonomist
B - no_ind_T2	number of individuals counted by QC taxonomist
C - Matches	number of agreements between the two taxonomists
D - PDE	percent difference in enumeration
E - PTD	percent taxonomic disagreement
F - Target_T1	number of individuals identified to target level, primary taxonomist
G - Target_T2	number of individuals identified to target level, QC taxonomist
H - PTC_T1	percent taxonomic completeness, primary taxonomist
I - PTC_T2	percent taxonomic completeness, QC taxonomist
J - PTC (abs diff)	percent taxonomic completeness (absolute difference)
K - Diff_strt	number of straight disagreements
L - Diff_hier	number of hierarchical differences
M - Diff_miss	number of apparently missing specimens

Corrective actions

1. For this dataset, prior to any metric or index calculations or site assessments, combine all tubificine worms at the subfamily level.
2. Future analyses should provide more explicit written standard operating procedures (SOP) to primary and QC laboratories and taxonomists.

ATTACHMENT B

LABORATORY TAXONOMIC IDENTIFICATION RESULTS FOR BENTHIC MACROINVERTEBRATES

Attachment B. Laboratory taxonomic identification results for benthic macroinvertebrates samples taken using Petite Ponar dredges, from tidally-influence brackish water at the mouth of the Middle River (Maryland) at the Chesapeake Bay. Sample data shown are composites of 5 ponar grabs at each site location.

1.0 Introduction/Study Objectives

As part of the Middle River Complex (MRC) sediment-sampling program, sediment from Cow Pen Creek (CPC) and Dark Head Cove (DHC) was collected and a pre-design testing program performed to evaluate dewatering methodologies that may be used during future sediment remediation. This section focuses on the pre-design testing phase of the project (i.e., passive sediment-dewatering testing using sediment-dewatering-bag technology).

1.1 Pre-Design Testing Description

If, in the future, the Maryland Department of the Environment (MDE) or other regulator requires removal of contaminated sediments from CPC or DHC, Lockheed Martin will need information on sediment-dewatering technologies and associated dewatering and performance characteristics (e.g., achievable sediment percent-solids) as a starting point for sediment remediation. This project task evaluates if sediment-tube dewatering technology can dewater CPC and DHC sediments so that the final sediment product may be further treated [via chemical solidification/stabilization (CSS)] and managed before disposal.

1.2 Treatment Technology Description

Technology alternatives for dewatering dredged sediments include:

- centrifuges (mechanical dewatering)
- belt presses (mechanical dewatering)
- sediment-drying beds
- plate-and-frame filter presses (mechanical dewatering)
- geotextile bags/containers and tubes (passive dewatering)

This testing assessed, through treatability-study testing, the passive dewatering alternative, since it is a relatively low-cost, high-volume dewatering-alternative that has been used successfully on

numerous environmental dredging projects. In addition, geotextile tubes allow for flexible operations (e.g., tubes can be stacked; filtrate can be drained directly to surface stream or collected in containment structures) at remediation sites where space for remedial activities may be limited and not suitable for mechanical dewatering facilities/equipment.

The sediment dewatering cycle associated with geotextile tubes/containers has three phases:

1. ***Phase 1—Sediment Filling/Containment:*** Sediment, typically pre-treated with one or more sediment/sludge-conditioning polymers, is pumped into the geotextile bag/tube. The sediment bag/tube, constructed of high-strength permeable geotextile, is uniquely designed to retain sediment or solids and release pore water so that it flows from the sediment bag/tube.

2. ***Phase 2—Sediment Dewatering:*** Pore water, separated from sediment primarily through use of an optimal conditioning polymer, drains from pores in the geotextile bag/tube resulting in sediment dewatering and subsequent sediment volume reduction. In many cases, the water quality of pore water released will allow for its discharge to receiving water without subsequent treatment.

3. ***Phase 3—Sediment Consolidation:*** After Phases 1 and 2, sediment solids continue to consolidate and release residual moisture remaining in the sediment through the pores of the geotextile tube/container. Often, if the sediment tube is allowed to continue dewatering and consolidate, sediment volume reduction can reach as high as 90%.

Geotextile tube/bag tests (also known as pillow tests) were performed to test the applicability of geotextile tubes to dewatering site-specific sediments. Geotextile tubes (pillows) and filter material, as well as the general methodologies followed during laboratory testing, were obtained from TenCate Industrial Fabrics (TenCate) of Commerce, Georgia. The original "Statement of Work" (SOW) suggested that a hanging-bag test (HBT) to assess dewatering characteristics of MRC sediments. However, Tetra Tech performed sediment-dewatering-bag tests (SDBTs) (horizontal configuration) for the following reasons:

- SDBTs require less sediment slurry volume than the HBT
- The SDBT has constant fill pressure through a mechanical fitting where the HBT has periodic high fill pressure (head) when pumped or poured sediment falls from the top of the open bag to the bottom. The SDBT can monitor the pressure head, whereas the HBT does not measure pressure head. The ability to quantitatively monitor hydraulic head

(inlet pressure) allows assessment of the effects of fabric, slurry, and chemical (polymer) additives on passive sediment-dewatering.

- The SDBT uses a small one-cubic-foot (7.5 gallons) geotextile bag with a horizontal orientation, whereas the HBT requires a larger, bulky, vertical bag that can hold up to approximately 50 gallons of liquid. The SDBT simulates the orientation of the sediment tubes used in full-scale environmental remediation applications

- The SDBT better simulates dewatering processes that occur in full-scale sediment dewatering tubes/bags

1.3 Treatability Testing Objectives

Sediments may be dredged from CPC and DHC as part of this potential MRC remediation. Dredged sediments will require dewatering before being transferred to a landfill. Dewatering the sediment will reduce its volume, subsequently reducing transportation costs to the landfill (also known as a sediment-management unit). Treatability testing focused on passive sediment-dewatering technology using a geotextile fabric. The objectives of the SDBT and associated analytical and geotechnical tests were as follows:

1. Define optimal chemical-conditioning agent that can enhance sediment-dewatering in a sediment tube/bag

2. Represent sediment-dewatering on a pilot-scale

3. Define sediment-dewatering rates and dewatering cycle-time based upon test data

4. Quantify passage of sediment solids (suspended solids) through the geotextile container (tube or bag) holding the dredged sediment

5. Define the final total-solids-concentration (achievable percent solids) of dewatered sediments and determine if the sediment tubes can generate a final product that meets dewatering goals

6. Define sediment pore-water chemical characterization to develop management alternatives

7. Define the physical and geotechnical characteristics of dewatered sediment

8. Define which CSS agent (fly ash, Portland cement, kiln dust, or slaked lime) can produce a sediment matrix with sufficiently strong for landfill disposal and at what dosage

Relatively few geotextile types are designed and commercially available for sediment dewatering applications, based on a review of information from geotextile manufacturers/suppliers. TenCate's Geotube GT 500 dewatering fabric is one of the few specifically identified for, and proven effective in, dewatering dredged sediments. For this reason, this fabric was used in the pillow testing. GT 500 geotextile container material is a specially-engineered dewatering geotextile manufactured from high-tenacity polypropylene (PP) multifilament and monofilament yarns. These PP yarns are woven into a stable network to form the containment structure. The GT 500 geotextile container is inert to biological degradation and resistant to chemicals typically encountered in surface waters containing sediments, as well as to acidic or basic solutions.

2.0 SEDIMENT COLLECTION AT THE MIDDLE RIVER COMPLEX

Sediment samples for dewatering testing were collected August 23–26, 2010 from three different locations below surface waters surrounding the Middle River Complex (MRC). A sediment dredging barge, operated by personnel/crew from Normandeau Associates (Stowe, Pennsylvania), collected the sediment samples using a Vibracore® sediment sampler and associated equipment. Tetra Tech directed and observed the sediment sampling from onboard the barge. The three sediment-sampling locations were designated in the field as follows:

- **Confluence (CON)-sediment (SED)—**This sediment sampling location is at the confluence of DHC and CPC
- **Dark Head Cove (DHC)-SED**—This sediment sampling location is under the surface waters of DHC
- **Cow Pen Creek (CPC)-SED—**This sediment sampling location is under the surface waters of CPC

Figure 2-1 shows the general locations and coordinates where the CON-SED, DHC-SED and CPC-SED sediment samples were collected. All sediment-sampling points were recording using GPS and the "Coordinate System"—U.S. State Plane 1983; North American Datum (NAD) 83; Maryland 1900.

Actual sampling locations were selected using Thiessen polygons depicting polychlorinated biphenyls (PCBs), polycyclic aromatic-hydrocarbons (PAHs), chromium, and cadmium contamination (contaminants of concern driving possible remediation activities at the MRC) at the three horizons sampled during the last phase of the MRC sediment investigation. The overall objective behind the sampling effort was to collect representative sediment media to be used for the sediment dewatering-bag test(s) (SDBTs). Tetra Tech personnel from the Germantown, Maryland; Stone Mountain, Georgia; and Collinsville, Illinois offices made the final selection of

sediment-sampling locations to be used to generate representative samples for the sediment-dewatering tests.

In addition to the sediment samples (which were placed in clean five-gallon plastic buckets), surface water samples were also collected near the sediment sampling locations. Surface water samples were collected into five-gallon carboys for subsequent transportation to the testing laboratory, where they were used to create sediment slurry that was poured into the sediment-dewatering bags. Photo documentation of sediment sampling at the MRC is in Appendix A. After sediment and surface-water sample collection, samples were transported via truck from Baltimore to the St. Louis, Missouri area and subsequently delivered to PDC Laboratories, Inc. (PDC) for storage until the start of the sediment characterization and dewatering testing. Tetra Tech characterized the sediment and tested dewatering methods at PDC with assistance, as necessary, from PDC technicians and chemists.

3.0 Raw (*in situ*) Sediment Characterization (Geotechnical Testing)

After delivering the sediment samples to PDC Laboratories, Inc. (PDC), Tetra Tech collected representative samples of confluence sediment (CON-SED), Cow Pen Creek sediment (CPC-SED), and Dark Head Cove sediment (DHC-SED) for geotechnical characterization testing by Shively Geotechnical, Inc. (Shively) of Fairview Heights, Illinois. Geotechnical tests during raw sediment characterization were as follows:

- Moisture Content (ASTM D 2216)
- Particle Size Distribution (ASTM D422)
- Organic Content (ASTM D2974)
- Atterburg Limits (ASTM D 4318

The geotechnical testing results represent *in situ* sediment characterization before dewatering. Data sheets generated by Shively during all phases of the dewatering tests are in Appendix B.

In situ characterization results for the CON-SED, CPC-SED, and DHC-SED sediments are presented in Tables 3-1, 3-2, and 3-3, respectively. Results of the geotechnical tests led to classification of the three sediment samples as follows:

- CON-SED: fat clay at 35.8% solids
- CPC-SED: elastic silt at 43.4% solids
- DHC-SED: clayey sand at 54.3% solids

Sediment classifications used herein are defined according to the United “Unified Soil Classification System” (USCS).

In situ sediment samples were analyzed at PDC (analysis data sheets generated during this and all test phases by PDC are in Appendix C) and aliquots were sent to WaterSolve, Grand Rapids,

Michigan (a company affiliated with TenCate that performed courtesy sediment-conditioning tests; preliminary testing only for polymer-type selection) for solids-content analyses to assess the accuracy of the Shively results. Using the results from the other two laboratories, the average *in situ* percent-solids is as follows:

- CON-SED: 35.8% (Shively) + 35.7 % (PDC) + 34.4% (WaterSolve) = 35.3% average
- CPC-SED: 43.4% (Shively) + 44.3% (PDC) + 40.9% (WaterSolve) = 42.9% average
- DHC-SED: 54.3% (Shively) + 44.6% (PDC) + 42.8% (WaterSolve) = 47.2% average

Overall, the solids content (percent) results from each of the three laboratories identified above are very similar. The percent solids concentration is important in determining how to formulate the sediment-slurry volumes to be introduced into the sediment-dewatering bags. Target sediment-slurry concentrations to be introduced to the bags were approximately 10% solids (based upon typical hydraulic dredging percent-solids) for each sediment type.

4.0 Sediment-Conditioning Evaluations and Results

4.1 Preliminary Sediment-Conditioning Evaluations

In most cases, chemical conditioning is required to create a sediment slurry, comprised of a flocculated matrix that will maximize the release of pore water from the sediment slurry matrix with a minimum of fine suspended solids passing through a geotextile fabric (such as in the sediment dewatering-bag test [SDBT] scenario). During sediment-conditioning evaluations, various polymers were evaluated based on water release rate, water clarity, and flocculant (floc) appearance. After an optimal polymer-conditioning system was defined, bench-scale confirmation tests were performed on each sediment to define the performance that could be expected during the larger scale SDBTs. This section describes the sediment-conditioning evaluations and the associated results.

4.1.1 Preliminary Sediment-Conditioning Testing Procedures

Preliminary sediment-conditioning tests were conducted by WaterSolve (a polymer supplier affiliated with TenCate) as a courtesy, since Tetra Tech was using TenCate sediment-dewatering bags for the treatability tests. Twenty-four cationic and anionic polymers were diluted to a 0.5% solution for the preliminary sediment-conditioning tests. Polymers and coagulants were added to sediment-slurry samples using a 10 milliliter (ml) plastic syringe and then gently tumbled five to seven times to distribute the dewatering aids into the sediment-slurry matrix.

Observations of water release, water clarity, and floc appearance were recorded. Polymer(s) that flocculated and dewatered the sediment most effectively were re-evaluated at lower dosages to isolate the most effective sediment-conditioning agent(s). Dual polymer systems were also evaluated with the intention of achieving overall improvements in water clarity and release volume as compared with single polymer applications.

4.1.2 Preliminary Sediment-Conditioning Testing Results

Preliminary sediment-conditioning results are summarized in Tables 4-1 through 4-3. Table 4-1 shows the polymer screening results for a variety of cationic and anionic polymers with respect to water release rate, water clarity, and floc appearance. These results identified a dual-polymer system, including Solve 426 (Solve 426 and Solve 127 supplied by WaterSolve, LLC in Grand Rapids, Michigan) as producing the best results. This prompted further evaluation of dual-polymer systems. Table 4-2 shows the screening results of the dual-polymer system, including Solve 426.

The polymer system producing the best results consisted of Solve 426, followed by Solve 127. Table 4-3 shows the results of the optimum polymer system (Solve 426 and Solve 127) added to samples of confluence sediment- (CON-SED), Cow Pen Creek sediment- (CPC-SED), and Dark Head Cove sediment- (DHC-SED) slurry. In all cases, results were excellent with respect to optimal water release rate, water clarity, and floc appearance.

Chemical conditioning with a consecutive dual polymer application of Solve 426 at 88 parts per million (ppm) followed by Solve 127 at 125 ppm proved (based upon the results in Tables 4-1 though 4-3) the most effective in flocculating and dewatering the Middle River Complex (MRC) sediment slurries, as compared with other chemical conditioning programs. Water release volumes and flocculent appearance were deemed excellent during preliminary bench-scale testing. Polymer addition results were rated on a qualitative scale of 1–6, with 1 associated with the “best” performance and 6 associated with the “worst” performance as compared with other polymers. These designations are assigned by WaterSolve as a way of indicating polymer performance in subject test-media.

Performance associated with the addition of Solve 426 followed by the addition of Solve 127 was “1” for water release and “1” for floc appearance as compared to other polymer additions tested. After passing a 200-ml slurry sample (4:1 water to sediment ratio at 7.1% solids) conditioned with 88 ppm of Solve 426 and 135 ppm of Solve 127 through a GT500D filter (rapid-dewatering test-protocol), percent solids in the resultant sediment cake increased to 18.9% after an hour of drying time. From this 200-ml conditioned-sediment-slurry sample, 60 ml and

125 ml of pore water was released in one minute and 60 minutes, respectively, after passing through the geotextile filter.

Preliminary testing results helped define the specifications for the recommended dual-polymer sediment-conditioning system for the larger-scale SDBTs as follows:

- recommended polymers: Solve 426 at 88 ppm; Solve 127 at 125 ppm. "Material Safety Data Sheet" (MSDS) information on these polymers is in Appendix D
- Solve 426 solution concentration: Can be fed neat; 1.0% solution
- Solve 127 solution concentration: 0.5% solution aged in batch feed tank prior to injection into slurry stream
- water:sediment ratio: 4:1
- mixing energy: moderate to high

The recommend polymer dosages, based on the information presented above, for use during the confirmation sediment-conditioning evaluation and sediment-dewatering-bag tests are as follows:

- Solve 426: 133 ml/four-gallon batch of sediment slurry
- Solve 127: 189.25 ml/four-gallon batch of sediment slurry

4.2 Confirmation Sediment-Conditioning Evaluation

4.2.1 Confirmation Sediment-Conditioning Testing Procedures

Tetra Tech performed additional confirmation tests following the preliminary sediment-conditioning tests to ensure that the Solve 426 and Solve 127 polymer system produced an optimal product with respect to sediment dewatering and pore-water release and clarity. Tetra Tech's confirmation tests consisted of adding the optimal Solve 426 and 127 dosages, half optimal dosages, and two times (2×) optimal dosages to 200 ml of sediment slurry samples, mixing, and then filtering them through GT500 geotextile filter media. Water release volumes were recorded at one and 60 minutes to assess water release rates.

As a second test, after the sediment slurry samples were filtered, the resultant sediment filter cakes were allowed to dry for approximately three days at an ambient temperature of about 72 degrees Fahrenheit (°F). At the end of the three-day period, samples of the sediment cakes were submitted to PDC for percent-solids analyses. These results were expected to provide an insight as to the degree of dewatering that could be expected in the larger scale SDBTs. Photo documentation of Tetra Tech's sediment-conditioning confirmation testing is in Appendix E.

4.2.2 Confirmation Sediment-Conditioning Testing Results

Tables 4-4 ("Water Release Results") and 4-5 ("Sediment-Cake Percent-Solids") provide the results of the Tetra Tech sediment-conditioning confirmation tests. The results in these tables indicate that the medium polymer dosages, which were the optimal polymer dosages in the WaterSolve tests, released water at a relatively fast rate with an associated clear supernatant. In addition, the medium polymer dosage (88 ppm for Solve 426 and 125 ppm for Solve 127) produced a sediment cake with relatively high percent-solids. For these reasons, Tetra Tech concurred with the WaterSolve sediment-conditioning results and implemented the recommended polymer dosages in the larger scale SDBTs using geotextile fabric bags/tubes. As a reminder, the recommended polymer dosages, which eventually became the actual polymer dosages during the sediment-bag dewatering tests, are as follows:

- Solve 426: 133 ml/four-gallon batch of sediment slurry
- Solve 127: 189.25 ml/four-gallon batch of sediment slurry

5.0 Sediment Dewatering-Bag Testing Procedures and Results

5.1 Sediment-Dewatering-Bag Testing Procedures

5.1.1 Preparation of Sediment Slurry for Introduction to Sediment-Dewatering Bags

Once the conditioning agents were selected for the sediment-dewatering tests, conditioned sediment-slurry samples were prepared for introduction into sediment-dewatering bags. The size of the equipment needed to prepare the sediment slurry volumes (up to 30 gallons) necessitated preparing the slurry in the PDC parking lot. For each of the sediments, the raw, *in situ* sediment was mixed with surface water (collected from near the sediment samples) in a pre-cleaned 45-gallon plastic container. As the sediment slurry was mixed, a four-gallon aliquot of the slurry was collected for the sediment-slurry conditioning.

Sediment-slurry conditioning consisted of adding optimal doses of Solve 426 and Solve 127 polymers into the five-gallon bucket of slurry and then mixing it using a drill mixer. After a good floc formed in the sediment slurry (typically within 30 seconds), the conditioned sediment was ready to be poured into the funnel and standpipe attached to the sediment-dewatering bag. Target percent-solids for the sediment-slurry batches was 10% solids.

Laboratory calculations called for filling the sediment-dewatering bag with, typically, five to eight batches of conditioned sediment. Note that filling the sediment-dewatering bag was stopped when the sediment slurry in the plastic standpipe attached to the bag reached a standing height of 27 inches. This sediment slurry height represents a simulated bag pressure of one pound per square inch (psi). Photo documentation of sediment slurry preparation and bag filling is in Appendix F.

One sample of each conditioned-sediment slurry was submitted to Shively for grain-size, moisture-content, and organic-content analyses. These data are considered the starting point of the dewatering tests and were compared with the final dewatered-sediment geotechnical results to define the percent-solids achievable with passive-dewatering technology, in addition to defining the achievable volume reduction. Only one sample of each sediment was submitted for geotechnical testing, not every batch of conditioned sediment. This may have resulted in slight variability in sediment-slurry percent-solids concentrations from batch to batch; however, this is not considered large enough to affect the conclusions of the analysis.

5.1.2 Sediment-Dewatering-Bag Test Procedures

As previously discussed, the purpose of the SDBTs was to: (1) visualize sediment dewatering; (2) evaluate the efficiency of the selected sediment-conditioning polymer; (3) assess the quality and clarity of the sediment-bag filtrates; and (4) predict the achievable percent-solids using passive-dewatering technology. The procedures/steps for conducting the SDBTs, some of which have been previously discussed, were as follows:

- ***Step 1:*** Assembled sediment pillow-bag frame/support structure (polyvinyl chloride piping or milk crate assembly) and placed a 35- to 45-gallon plastic container under the framing to capture the effluent from the sediment-dewatering bag. Placed the sediment-dewatering bag on top of the frame and inserted the 27-inch stand pipe into the pillow-bag fill port. (The 27-inch standpipe represents approximately 1-psi head pressure on the pillow during filling).

- ***Step 2:*** Placed up to 35 gallons of a 4:1 water-sediment slurry into a pre-cleaned 45-gallon container and mixed to create a homogeneous slurry mixture. As the slurry was being mixed, four-gallon aliquots of the slurry to be conditioned were collected.

- ***Step 3:*** The predetermined optimal conditioning-polymers were added to four-gallon batches of sediment slurry, rapidly mixed, and continually stirred to prevent sediment floc from settling before pouring the mixture into the sediment-dewatering bag.

- ***Step 4:*** Using a small bucket and funnel, filled the sediment-dewatering bag by pouring conditioned sediment into the top of the 27-inch standpipe. The volume of sediment poured into the bag was recorded.

- ***Step 5:*** Continued to fill the sediment pillow with conditioned sediment as rapidly as possible until the sediment rose in the standpipe to the 1 psi calibration mark. When that mark was reached, the bag was considered full and collection of effluent samples (filtrate) began. After sediment pouring stopped and the sediment had been emptied from the standpipe, the standpipe was carefully removed from the pillow and the fill-port plug was installed for the duration of the test.

- ***Step 6:*** Collected sediment dewatering bag effluent samples (filtrate) throughout the duration of the sediment-dewatering-bag tests for total suspended solids (TSS) and turbidity measurements. While filling up the sediment-dewatering bag, water began to flow out of the pores of the geotextile fabric into the collection reservoir. This "first flush" water (filtrate or pore water) was collected for 10 minutes after it began to flow out of the bag, analyzed for TSS and turbidity, and then pumped back into the sediment-dewatering bag (using a portable hand pump) to fill up the bag according to manufacturer's specifications.

    - Pore water collected after the first 10-minute flush of the SDBT was composited throughout the duration of the test. This pore water, not considered "first flush," was identified as the "steady-state" pore water and was composited and analyzed.

    - When collecting effluent samples from the sediment-dewatering bags, the volume of water collected was recorded so that solids mass-balance calculations could be performed during the treatability-testing data evaluation.

    - For the duration of the SDBTs, sediment pore-water volumes collected in the reservoirs under the sediment-pillow frame were recorded daily and the pore water was then transferred into a master effluent composite container for additional chemical analyses at the end of the SDBTs.

- ***Step 7:*** In addition to collecting TSS samples during the SDBTs, dewatered sediment in the geotextile bags was analyzed for moisture content, and paint-filter tests were performed. The paint-filter liquids test (SW-846 Method 9095A) involves placing a predetermined amount of waste material into a paint filter. If any portion of the material (i.e., liquid fraction) passes through and drops from the filter within five-minutes the material is deemed to contain free liquid. Since most landfills cannot accept free liquids (doing so is a violation of waste acceptance criteria), paint-filter tests were run to assess if the waste (sediment) could be accepted in a landfill without further treatment. As with the TSS samples, records of sediment mass were collected during each sediment-sampling event to use in future solids mass-balance calculations. Sediment samples were collected by removing the pillow fill-port plug and collecting the sample with a spatula or small soil-probe.

- Visual observations and measurements (i.e., estimated sediment depth in the dewatering pillow) were used to define sediment dewatering behavior and conditions signaling the completion of the dewatering tests. Photographs were taken during the SDBTs and other laboratory activities as documentation.

5.1.3 Sediment Pore-Water Characterization

As previously described, pore water was generated throughout the SDBTs and analyzed at specified times for TSS. Each day, laboratory technicians measured the volume of pore water released from the dewatering geotextile-bags. Pore water was then collected in a container under the dewatering bag and poured into the composite container dedicated for each SDBT. After the SDBTs, the dedicated composite containers were combined and representative samples were collected for TSS, polychlorinated biphenyls (PCBs), polycyclic aromatic-hydrocarbons (PAHs), and priority-pollutant-metals analyses. Results of these analyses defined subsequent sediment-pore-water management alternatives.

5.1.4 Dew atered-Sediment Characterization

Sediment-dewatering bags were weighed at the end of each dewatering test (as signaled by minimal or no release of effluent sample from the sediment pillow) and dewatered-sediment samples from the dewatering bags were then collected for the following analyses: mechanical grain-size/hydrometer test, Atterberg limits, moisture content, organics content, unconfined compression strength, and paint-filter tests. Dewatered sediments were not analyzed for any chemical parameters.

5.2 Sediment-Dewatering-Bag Testing Results

5.2.1 Conditioned-Sediment-Slurry Characterization (Geotechnical Test Results)

Tetra Tech prepared five to eight batches of conditioned sediment slurry for use during sediment dewatering bag filling operations. A representative conditioned sediment slurry batch for each of the Middle River Complex (MRC) sediments collected (CON-SED, CPC-SED, DHC-SED) was sampled and submitted for the following geotechnical characterization analyses:

- total solids content (%)
- organic content (%)

- Atterberg limits
- grain-size distribution

Tables 3-1, 3-2, and 3-3 present the geotechnical results for the conditioned-sediment slurry samples submitted to PDC and Shively. The following grain-size distribution classifications were identified based on the information presented in these tables:

- ***CON-SED sediment slurry:*** Elastic silt at 10% solids (*in situ* CON-SED sediment classified as Fat Clay)
- ***CPC-SED sediment slurry:*** Elastic silt with sand a 8% (*in situ* sediment classified as Elastic Silt)
- ***DHC-SED sediment slurry:*** Elastic silt with sand at 8% (*in situ* sediment classified as Clayey Sand)

Conditioning (i.e., adding two polymers to coagulate and flocculate the sediment) appears to modify the grain-size distribution of each sediment type and subsequently modify the sediment classification. The solids content reported in Tables 3-1 through 3-3 are from only one of the several batches of sediment slurry prepared to fill up the sediment-dewatering bags to specification. Conditioned sediment slurries could also display some variability, due to variability in the sediment samples, but not enough to affect the conclusions of the analyses.

5.2.2 Sediment Dewatering Duration

SDBTs began when sediment slurry was first introduced to the dewatering bag and ended when the bags stopped releasing water to the collection reservoir. The period between each test's start and finish is considered the sediment-dewatering-duration time, which was recorded in the laboratory notes for each of the three sediment bags.

5.2.2.1 CON-SED Sediment Dewatering Period

The CON-SED SDBT began on 9/21/10 at 10:40 a.m. It was terminated and water released on 9/24/10 at approximately 12:30 p.m., when water release from the bag approached 0 ml/day. The total duration of the active dewatering phase of the test was approximately 72 hours.

5.2.2.2 CPC-SED Sediment-Dewatering Period

The CPC-SED SDBT began on 9/21/10 at 3:25 p.m. It was terminated and water released on 9/24/10 at approximately 12:30 p.m., when water release from the bag approached 0 ml/day. The total duration of the active dewatering phase of the test was approximately 69 hours.

5.2.2.3 DHC-S ED Sediment-Dewatering Period

The DHC-SED SDBT began on 9/22/10 at 9:15 a.m. It was terminated and water released on 9/24/10 at approximately 12:30 p.m., when water release from the bag approached 0 ml/day. The total duration of the active dewatering phase of the test was approximately 51 hours.

5.2.3 Solids Release Results (TSS vs. Time)

5.2.3.1 CON-SED Sediment

Tables 5-1 and 5-2 present information and data related to solids release versus time for the CON-SED SDBT. As shown by the data in these tables, the rate of solids release from the CON-SED sediment-dewatering bag decreased from approximately 7.8 milligrams per minute (mg/min) to 0.036 mg/min in approximately three days. The average solids release rate over the duration of the dewatering test was approximately 0.59 mg/min. This solids release rate produced a relatively low turbidity in the pore-water composite container of 7.8 Nephelometric Turbidity Units (NTUs).

5.2.3.2 CPC-SED Sediment

Table 5-3 and 5-4 present information and data related to solids release vs. time for the CPC-SED SDBT. As shown by the data in these tables, the rate of solids release from the CPC-SED sediment-dewatering bag decreased from approximately 78.5 mg/min to 0.005 mg/min in approximately 2.8 days. The average solids release rate over the duration of the dewatering test was approximately 0.01 mg/min. This solids release rate produced a relatively low turbidity in the pore-water composite container of 37 NTU.

5.2.3.3 DHC-S ED Sediment

Tables 5-5 and 5-6 present information and data related to solids release vs. time for the DHC-SED SDBT. As shown by the data in these tables, the rate of solids release from the DHC-SED sediment-dewatering bag decreased from approximately 76.7 mg/min to 0.008 mg/min in approximately 2.125 days. The average solids release rate over the duration of the dewatering test was approximately 2.45 mg/min. This solids release rate produced a moderate level of turbidity in the pore-water composite container of 85 NTUs.

5.2.4 Sediment Moisture Content and Paint-Filter Test Results vs. Time (Sediment-Dewatering-Bag Test Duration)

5.2.4.1 CON-SED Sediment

Table 5-7 presents sediment moisture content and paint-filter test results generated during the CON-SED SDBT. In less than seven hours after beginning to fill the sediment-dewatering bag, sediment solids-content increased from approximately 10% to 27%, and passed the paint-filter test. From 9/21/10 to 9/27/10, solids concentrations gradually increased from 27% to 37% as the sediment-dewatering bag released pore water. The final sediment-solids concentration analyzed was 36%. All sediment samples collected throughout the CON-SED dewatering test passed the paint-filter tests.

5.2.4.2 CPC-SED Sediment

Table 5-8 presents sediment moisture content and paint-filter test results generated during the CPC-SED SDBT. In less than 17.5 hours after beginning to fill the sediment-dewatering bag, the sediment-solids content increased from approximately 8% to 42%, and passed the paint-filter test. From 9/22/10 to 9/27/10, solids concentrations gradually increased from 42% to approximately 51% as the sediment-dewatering bag released additional pore water. The final sediment-solids concentration analyzed was 49%. All sediment samples collected throughout the CPC-SED dewatering test passed the paint-filter tests.

5.2.4.3 DHC-S ED Sediment

Table 5-9 presents sediment moisture content paint-filter test results generated during the DHC-SED SDBT, which started on 9/22/10. Approximately seven hours or less after beginning to fill the sediment-dewatering bag, the sediment-solids content increased from approximately 8% to 37%, but failed the paint-filter test. From 9/22/10 to 9/27/10, solids concentrations gradually increased from 37% to 52% as the sediment-dewatering bag released additional pore water. The final sediment-solids concentration analyzed was 49%. All sediment samples collected throughout the DHC-SED dewatering test passed the paint-filter tests except for the 9/22/10 paint-filter test.

5.2.5 Solids Mass-Balance

In all three test cases, total mass recovered exceeded the total calculated mass introduced to the bags. This variability can be attributed to percent-solids bias (low) in the initial conditioned-sediment slurry due to precipitation/flocculation following the addition of polymer to the sediment solids.

5.2.5.1 CON-SED Mass Balance

The sediment slurry volume introduced to the CON-SED sediment-dewatering bag and the sediment-slurry solids content (approximately 10%) lead us to estimate that approximately 11.8 pounds of solids were poured into the bag at the start of the SDBT. After the test, the CON-SED bag was weighed and a sediment sample analyzed for percent solids. Multiplying the percent solids by the wet weight of the sediment bag indicates that the bag contained 13.6 pounds of solids (solids recovery = 86.8%).

5.2.5.2 CPC-SED Mass Balance

The sediment slurry volume introduced to the CPC-SED sediment-dewatering bag and the sediment-slurry solids content (approximately 8%) lead us to estimate that approximately 25 pounds of solids were poured into the bag at the start of the SDBT. After the test, the CPC-SED bag was weighed and a sediment sample analyzed for percent solids. Multiplying the

percent solids by the wet weight of the sediment bag indicates that the bag contained 31.2 pounds of solids (solids recovery = 80.1%).

5.2.5.3 DHC-SED Mass Balance

The sediment slurry volume introduced to the DHC-SED sediment-dewatering bag and the sediment-slurry solids content (approximately 8%) lead us to estimate that approximately 26 pounds of solids were poured into the bag at the start of the SDBT. After the test was completed, the DHC-SED bag was weighed and a sediment sample analyzed for percent solids. Multiplying the percent solids by the wet weight of the sediment bag indicates that the bag contained 28.3 pounds of solids (sediment recovery = 91.9%).

5.2.6 Dew atered-Sediment Characterization (Geotechnical Tests)

After SDBTs, a large flap was cut into the top of the three horizontal bags and samples of the dewatered sediments were collected for the following geotechnical analyses:

- total solids content (%)
- Atterberg limits
- unconfined compression (UCC) strength
- organic content (%)
- grain-size distribution

Tables 3-1, 3-2 and 3-3 present the geotechnical results for the dewatered-sediment samples submitted to PDC and Shively. The information presented in these tables helped identify the following grain-size distribution classifications:

- ***CON-SED dewatered sediment*:** Elastic silt at 36% solids (*in situ* CON-SED sediment classified as Fat Clay and conditioned-sediment slurry dewatered in the sediment bags was classified as elastic silt)
- ***CPC-SED sediment slurry*:** Elastic silt with sand at 49% (*in situ* sediment classified as elastic silt and conditioned-sediment slurry dewatered in the sediment bags was classified as elastic silt with sand)
- ***DHC-SED sediment slurry*:** Sandy lean clay at 49% (*in situ* sediment classified as clayey sand and conditioned-sediment slurry dewatered in the sediment bags was classified as elastic silt with sand)

Passive sediment dewatering appeared to modify the grain-size distribution of only the DHC-SED sediment, which consequently modified the sediment classification. One possible explanation for the classification change is that the DHC-SED dewatering-bag released the most solids through the geotextile fabric. The information in Table 3-3 indicates that the solids released from the bag appear to be primarily silt. Silt distribution in the bag decreased while the sand distribution increased. This grain-size distribution change probably contributed to the dewatered-sediment-matrix classification change. Molded specimens were submitted to Shively for UCC strength analysis for CON-SED, DHC-SED, and CPC-SED. However, UCC testing was not performed on these specimens, as they were too soft and not suitable for strength testing.

5.2.7 Pore-W ater Characterization (Comparison with "Ambient Water Quality Criteria")

As previously discussed, during SDBTs, generated pore water was collected in reservoirs underneath the filled and capped dewatering bags. As the reservoirs filled with the pore water, it was subsequently pumped into composite containers to track generated volumes and for chemical characterization purposes. Once the tests were completed, pore water in the composite containers was collected and analyzed for the following parameters:

- TSS
- total PCBs
- total PAHs
- total metals (13 "Priority Pollutant" metals)
- dissolved metals (13 "Priority Pollutant" metals)
- pH
- turbidity
- dissolved PCBs
- dissolved PAHs

Pore-water analytical results associated with the SDBTs are presented in the following subsections.

5.2.7.1 CON-SED Sediment-Pore-Water Chemical Characterization

CON-SED sediment pore-water data are summarized in Table 5-10. These data were compared with "Ambient Water Quality Criteria" (AWQC) to determine if pore-water treatment may be

required before discharging the pore-water back to CPC or DHC. Comparison of these data suggests that some pollutants of concern may be in CON-SED pore water. Whether this is the case depends as well as upon which cleanup objective is applied to this project by regulators (Maryland Department of the Environment [MDE], United States Environmental Protection Agency [USEPA]). If pollutants of concern remain in CON-SED pore water, it will need to be managed through on-site or off-site treatment.

In some cases, the filtration process used during dissolved-parameter analyses reduced some pollutant concentrations. In the CON-SED pore water, filtration removed concentrations of chromium, copper, nickel, and zinc. Further investigation and treatability testing may be required to define how CON-SED sediment-pore water will be managed.

5.2.7.2 CPC-SED Sediment-Pore-Water Chemical Characterization

CPC-SED sediment pore-water data are summarized in Table 5-11. These data were compared with AWQC to determine if pore-water treatment may be required before returning it to CPC or DHC. Comparison of these data suggests that some pollutants of concern may be in CPC-SED pore water. Whether this is the case depends as well as upon which cleanup objective is applied to this project by the regulators. If pollutants of concern remain in CPC-SED pore water, it will need to be managed through on-site or off-site treatment.

In some cases, the filtration process used during dissolved-parameter analyses reduced some pollutant concentrations. In the CPC-SED pore water, filtration removed concentrations of arsenic, cadmium, chromium, copper, lead, nickel, and zinc. Further investigation and treatability testing may be required to define how CPC-SED sediment-pore water will be managed.

5.2.7.3 DHC-S ED Sediment-Pore-Water Chemical Characterization

DHC-SED sediment pore-water data are summarized in Table 5-12. These data were compared with AWQC to determine if pore water treatment may be required before returning it to CPC or DHC. Comparison of these data suggests that some pollutants of concern may be in DHC-SED pore water. Whether this is the case depends as well as upon which cleanup objective is applied

to this project by the regulators. If pollutants of concern remain in DHC-SED pore water, it will need to be managed through on-site or off-site treatment.

In some cases, filtration during dissolved-parameter analyses reduced some pollutant concentrations. In the DHC-SED pore water, filtration removed concentrations of cadmium, chromium, copper, lead, nickel, and zinc. Further investigation and treatability testing may be required to define how DHC-SED sediment-pore water will be managed.

6.0 Chemical Solidification/Stabilization Testing

6.1 CSS Testing Procedures

At the end of the sediment dewatering-bag tests (SDBTs), a significant portion of the dewatered sediments were used to evaluate how various chemical solidification/stabilization (CSS) agents might strengthen the dewatered-sediment matrix for disposal. Tetra Tech used four CSS agents (Portland cement, lime, kiln dust, and fly ash) at three different CSS agent/sediment ratios for the three dewatered-sediment samples. Additionally, each test specimen (2-inch by 4-inch plastic mold) was prepared essentially in quadruplicate to track how the CSS agent strengthened the sediment matrix over a 28-day curing period (with four different breaks). Tables 6-1 through 6-3 identify the actual sediment specimens created using dewatered confluence sediment (CON-SED), Cow Pen Creek sediment (CPC-SED), and Dark Head Cove sediment (DHC-SED) samples, along with the results of the related unconfined compression (UCC,) density, and moisture content tests.

A literature review led to the conclusion that the appropriate quantities of CSS agents to be added to the sediments are approximately 2.5%, 7%, and 15% by weight of the wet sediment. Sediment was blended into a homogeneous matrix after the addition of CSS agent and then placed into the mold before being taken to the geotechnical laboratory for the 7-, 14-, 21-, and 28-day curing process. After curing, specimens were taken out of the molds to undergo the UCC strength tests, along with companion sediment-density and moisture content tests. The first specimen breaks were to occur at three days, but all specimens demonstrated soft surfaces and were not yet suitable for testing. Samples were allowed to cure for at least seven days before initiating any sediment-specimen breaks using the UCC testing equipment.

Tetra Tech obtained CSS agents from the following sources:

- lime (Home Depot)
- slaked lime (Lowes Home Improvement Store
- cement kiln dust (Continental Cement Company, Hannibal, Missouri)
- class C fly ash (Lafarge Concrete, Iowa)
- Portland cement (Home Depot): commercial grade Quikrete Type I Portland cement (ASTM C 150 Type I) "Material Safety Data Sheet" (MSDS) and other CSS agent specifications are included in Appendix G.

6.2 CSS Test Results

6.2.1 CON-SED CSS Test Results

Table 6-1 summarizes the CSS results associated with the CON-SED dewatered sediment. As shown in this table, the CSS agents that most strengthened the dewatered-sediment matrix are slaked lime, fly ash, and Portland cement at the higher dosages. Portland cement adds the most strength to the CON-SED matrix. Typically, matrix strength increased as sediment density and solids content increased. The addition of kiln dust as a CSS agent did not add any strength to the CON-SED matrix.

6.2.2 CPC-SED CSS Test Results

Table 6-2 summarizes the CSS results associated with the CPC-SED dewatered sediment. As shown in this table, the CSS agents that most strengthened the dewatered-sediment matrix are slaked lime, fly ash, and Portland cement. Portland cement adds the most strength to the CPC-SED matrix. Typically, matrix strength increased as sediment density and solids content increased. As was the case with the CON-SED testing, kiln dust did not add any strength to the CPC-SED matrix.

6.2.3 DHC-SED CSS Test Results

Table 6-3 summarizes the CSS results associated with the DHC-SED dewatered sediment. As shown in this table, the CSS that most strengthened the dewatered-sediment matrix are slaked lime and Portland cement. Typically, matrix strength increased as sediment density and solids content increased. As was the case with the other two sediments, Portland cement adds the most

strength to the DHC-SED matrix. As was the case with the CON-SED and CPC-SED testing, kiln dust did not add any strength to the DHC-SED matrix.

This page intentionally left blank.

7.0 Study Conclusions and Recommendations

The results of the pre-design testing led to the following conclusions and recommendations:

7.1 Stud y Conclusions

1. Of the various polymers tested during the preliminary and confirmation sediment-conditioning evaluations, the dual-polymer system of Solve 426 and Solve 127 produced the optimal results for coagulating and flocculating sediment-slurry solids and separating sediment solids from pore water.

2. Sediment dewatering with the GT500 geotextile fabric produced dewatered sediment cakes with acceptable solids content (confluence sediment [CON-SED] = 36%; Cow Pen Creek sediment [CPC-SED] = 49%; Dark Head Cove sediment [DHC-SED] = 49%), which passed paint-filter tests and released minimal solids into generated pore water.

3. Pore water generated during the sediment dewatering-bag test(s) (SDBTs) was generally clear with respect to solids and turbidity but still may contain constituents, which exceed "Ambient Water Quality Criteria" (AWQC). Therefore, pore water may require treatment on-site before being returned to CPC or DHC or require some other management approach (disposal via a publicly owned treatment-works under a pre-treatment permit).

4. In most cases, filtered parameter-concentrations (dissolved fraction) are less than their total concentrations, particularly in relation to metals concentrations. In some cases, the resulting filtered concentration was reduced to below AWQC. Therefore, on-site pre-treatment of pore water with filtration may be an option before discharging pore water back to CPC or DHC. This option would require communication and approval by the relevant regulators.

5. The results of the chemical solidification/stabilization (CSS) evaluations suggest that Portland cement is the CSS agent demonstrating the greatest unconfined compression (UCC) strength in each of the three sediments tested. As would be expected, the highest dose (CSS agent: wet sediment ratio) adds the most strength to the sediment matrix. The UCC strength of a specimen tended to increase with an increase in density and solids content. The highest UCC strength-test recorded during the study was 11.2 psi in the 21-day specimen for the CON-SED using 15% Portland cement. Both slaked lime and fly ash add some strength to the sediment matrices, but not as much as Portland cement. Kiln dust additions produced

specimens that did not cure and remained soft to the point that the geotechnical laboratory declared the specimen unacceptable for testing. Therefore, this CSS agent (at least as a standalone agent) may be eliminated from any potential further evaluation.

7.2 Stud y Recommendations

1. If dredging of CPC or DHC is required in future, use of the dual-polymer system (Solve 426 and Solve 127) and sediment-dewatering tubes constructed with GT500 geotextile fabric should be considered to dewater the sediment, due to the favorable results generated during the SDBT.

2. Pore-water chemical characterization should probably be compared to the existing water quality in CPC and DHC to see if an untreated discharge would degrade existing water quality.

3. If greater sediment matrix strength is required for disposal, additional CSS tests should be considered using higher CSS agent to sediment ratios. Potential candidates for further evaluation would include Portland cement, slaked lime, and possibly fly ash.

4. It may be of value to the project to perform some supplemental testing on generated pore water to better define management strategy. As the first step in this process, regulatory requirements associated with the pore water discharge would have to be defined and pore water characterization results compared to the effluent cleanup objectives/effluent limitations to determine if on-site or off-site treatment is required. If treatment is required, the next step in the process would be to define candidate unit operations or processes needed in a treatment train to address specific pollutants of concern. Based on a conservative approach to anticipated pore water cleanup objectives for discharge, candidate treatment operations that may be evaluated during the Feasibility Study activities could include ultrafiltration, sand filtration, and activated carbon. Additional unit operations could be evaluated to address the removal of arsenic in pore water, if necessary. Once candidate unit operations/processes are identified for screening, a work plan would be developed in conjunction with the data quality objectives and analytical plan. After approval of the work/analytical plan, screening tests would be implemented possibly followed by process confirmation testing on a laboratory bench-scale or field pilot-scale.

5. Additional chemical solidification/stabilization testing should be considered to fine-tune dewatered sediment management strategy. Tasks associated with this supplemental testing could include: (1) Identify local candidate landfills that may be able to accept processed river sediment and define sediment matrix strength specifications, (2) Perform supplemental CSS testing with CSS agents (i.e., Cement Kiln Dust, Lime kiln dust, fly ash) from several different local (Baltimore Area) suppliers, and (3) Perform CSS tests using multiple additives (i.e., low dosage of Portland cement with moderate dosages of CKD, LKD and/or fly ash).

6. To achieve acceptance of the dewatered sediments into a candidate landfill, it is recommended that dewatered sediment be characterized to define specific waste acceptance criteria parameters. Additionally, based upon the availability of finalized strength requirements of the dewatered sediments, additional testing may be required to optimize CSS agent additives to achieve defined strength and/or free liquid requirements.

CON-SED Geotextile Bag Dewatering Test Results
Total Suspended Solids and Turbidity vs. Time
Lockheed Martin Middle River Complex
Middle River, Maryland

Date	Time	TSS (mg/L)	Turbidity (NTU)	Estimated Average Solids Release Rate (mg/min)	Comments
9/21/10	10:50 am	17	2.4	--	First flush; pore water sample collected off bag before ten minute reservoir water recycle
9/21/10	11:10 am	17	2.6	7.8	Sample collected off bag
9/22/10	11:45 am	18	2.2	--	Sample collected off bag
9/23/10	9:50 am	81	6.9	0.34	Sample out of collection reservoir; dripping off bag slow
9/24/10	12:30 pm	14	7.2	0.036	Sample out of collection reservoir
9/27/10	--	--	--	--	No pore water in reservoir for analysis
9/28/10	4:03 pm	69	7.8	0.59	Pore water composite container results; not off bag

Test Conditions = Dewatering Bag Test Started 9/21/10 at 10:40 am
mg/L = milligrams per liter
mg/min = milligrams per minute
NTU = Nephelometric Turbidity Unit
TSS = Total Suspended Solids

Table 5-2
CON-SED Water Released During Sediment Dewatering Bag Tests
Lockheed Martin Middle River Complex
Middle River, Maryland

Date	Water Volume Collected (gallons)	Comments
9/21/10 to 9/22/10 (Day 1)	9.0	Majority of water generated in first few hours of sediment dewatering (about 12:45 pm).
9/22/10 to 9/23/10 (Day 2)	1.6	--
9/23/10 to 9/24/10 (Day 3)	0.1	Water release from bag drastically dropped off between Days 2 and 3.
9/24/10 to 9/27/10 (Days 4 to 6)	0	No water in sediment dewatering bag reservoir on 9/27/10.
TOTAL	9.9	Some water losses occurred during bag filtering when water sprayed out and was not captured in reservoir.

Test started 9/21/10 at 10:40 am.

Table 5-3
CPC-SED Geotextile Bag Dewatering Test Results
Total Suspended Solids and Turbidity vs. Time
Lockheed Martin Middle River Complex
Middle River, Maryland

Date	Time	TSS (mg/L)	Turbidity (NTU)	Estimated Average Solids Release Rate (mg/min)	Comments
9/21/10	3:30 pm	340	110	--	First flush out of reservoir before recirculation
9/21/10	4:45 pm	93	30	78.5	Sample collected off bag
9/22/10	11:45 am	53	24	0.26	Sample collected off bag
9/23/10	9:50 am	40	9	0.157	Sample collected off bag
9/24/10	12:30 pm	24	13	0.005	Collected out of sample reservoir
9/27/10	--	--	--	--	No pore water in reservoir for analysis
9/28/10	4:12 pm	6	37	0.01	Pore water composite container results; not off of bag

Test Conditions = Dewatering Bag Test Started 9/21/10 at 3:25 pm
mg/L = milligrams per liter
mg/min = milligrams per minute
NTU = Nephelometric Turbidity Unit
TSS = Total Suspended Solids

Table 5-4
CPC-SED Water Released During Sediment Dewatering Bag Tests
Lockheed Martin Middle River Complex
Middle River, Maryland

Date	Water Volume Collected (gallons)	Comments
9/21/10 (Day 1)	14.5	Approximately 14.5 gallons collected in reservoir before 4:30 pm.
9/22/10 (Day 2)	1.5	--
9/23/10 (Day 3)	1.5	--
9/24/10 (Day 4)	0.1	Through 11:45 am
9/24/10 to 9/27/10 (Days 4 to 6)	0	No water in sediment dewatering bag reservoir on 9/27/10. Readings on 9/24/10 started at about 11:45 am.
TOTAL	17.6	Some losses occurred during bag filling when water sprayed out of bag and was not captured in reservoir.

Test started 9/21/10 at 3:25 pm.

Table 5-5

Collinsville, Illinois 62234

Subject: Geotechnical Laboratory Testing
Sediment Dewatering Pre-Design
Chesapeake Bay Area

Dear Mr. Bessent:

Shively Geotechnical, a division of Environmental Operations, Inc. is pleased to present results of laboratory testing for material taken for the Sediment Dewatering Pre-Design project located in the Chesapeake Bay Area. Three samples were delivered to our laboratory by a representative of Tetra Tech, Inc., on September 1, 2010. Samples were submitted for gradation, moisture and organic determination, as well as Atterberg limit testing. Additionally, liquid limit was determined on two samples after being dried in the lab oven. Results can be found on the enclosed summary table and graphs.

Samples were tested in accordance with the following American Society for Testing and Materials (ASTM) procedures:

Particle Size Analysis	D 422
Moisture Content	D 2216
Organic Matter of Soils	D 2974
Liquid & Plastic Limits	D 4318

We appreciate the opportunity to be of service to Tetra Tech, Inc. Please let us know if you have any questions or if we can be of further assistance.

Sincerely,

Shively Geotechnical,
A Division of Environmental Operations, Inc.

GRAIN SIZE DISTRIBUTION

Project Number: 6335

Project: Sediment Dewatering Pre-Design

Location: Chesapeake Bay Area

US GRAIN SIZE 6335 HYDRO CURVES.GPJ SHIVELY.GDT 9/10/10

	Specimen Identification		LL	PL	PI	Fines	Classification
●	CON-SED	Not Dried	82	36	46	96	FAT CLAY(CH)
	CON-SED	Oven Dried	70				
▲	CPC-SED	Not Dried	69	35	34	86	ELASTIC SILT(MH)
	CPC-SED	Oven Dried	60				
⊙	DHC-SED		48	22	26	49	CLAYEY SAND(SC)

Notes:

A soil is considered organic if the liquid limit after oven drying is less than 75% of the liquid limit of the original specimen determined before oven drying. For both samples, the ratio was greater than 75% as seen below. Therefore, both of the matierials are considered inorganic.

Oven Dried LL / Not Dried LL (70/82) = 0.85 for CON-SED

Oven Dried LL / Not Dried LL (60/69) = 0.87 for CPC-SED

Subject: Geotechnical Laboratory Testing
Sediment Dewatering Pre-Design Material
Molded Cylinder Mixture Specimens

Dear Mr. Bessent:

Shively Geotechnical, a division of Environmental Operations, Inc. is pleased to present results of laboratory testing for material taken for the Sediment Dewatering Pre-Design project located in the Chesapeake Bay Area. One hundred and fifty-two molded specimens were delivered to our laboratory by representatives of Tetra Tech, Inc., on September 23, 2010. Samples were submitted for unconfined compressive strength testing

Samples were tested under the guidance of the following American Society for Testing and Materials (ASTM) procedures:

Unconfined Compressive Strength of Molded Cylinders	D 1633
Water (Moisture) Content	D 2216
Density (Unit Weight) of Soil Specimens	D 7263

Specimens for compressive strength testing were formed by others in 2-inch by 4-inch cylindrical molds. Upon removal of molds, it was discovered that the samples contained substantial voids, especially the part of the specimen in bottom portion of mold. It was agreed that only the top would be tested and a correction factor would be applied accordingly.

Based on our experience and observation of the specimens, we elected not to perform strength tests of specimens that appeared too soft and not suitable for strength testing. Upon request by Tetra Tech, unit weight and moisture content testing was ran only on specimens that had strength testing performed. Results can be found on the attached summary tables.

We appreciate the opportunity to be of service to Tetra Tech, Inc. Please let us know if you have any questions or if we can be of further assistance.

Sincerely,

Shively Geotechnical,
a Division of Environmental Operations, Inc.

Janet M. May
Laboratory Services Manager

This report shall not be reproduced, except in full, without the written approval of the laboratory.

PDC Laboratories participates in the following accreditation/certification and proficiency programs at the following locations. Endorsement by the Federal or State Government or their agencies is not implied.

PIA PDC Laboratories - Peoria, IL
NELAC Accreditation for Drinking Water, Wastewater, Hazardous and Solid Wastes Fields of Testing through IL EPA Lab No. 100230
State of Illinois Bacteriological Analysis in Drinking Water Certified Lab Registry No. 17553
Drinking Water Certifications: Indiana (C-IL-040); Kansas (E-10338); Missouri (00870); Wisconsin (998294430)
Wastewater Certifications: Arkansas; Iowa (240); Kansas (E-10338); Wisconsin (998294430)
Hazardous/Solid Waste Certifications: Arkansas; Kansas (E-10338); Wisconsin(998294430)
UST Certification: Iowa (240)

SPMO PDC Laboratories - Springfield, MO
EPA DMR-QA Program

STL PDC Laboratories - St. Louis, MO
NELAC Accreditation for Wastewater, Hazardous and Solid Wastes Fields of Testing through IL EPA Lab No. 100253.

The sample temperature will be measured upon receipt at the lab. By initialing this area, you request that the lab notify you, before proceeding with analysis, if the sample temperature is outside of the range of 0.1-6.0°C. By not initialing this area, you allow the lab to proceed with analytical testing regardless of the sample temperature. _____

This report shall not be reproduced, except in full, without the written approval of the laboratory.

PDC Laboratories participates in the following accreditation/certification and proficiency programs at the following locations. Endorsement by the Federal or State Government or their agencies is not implied.

PIA PDC Laboratories - Peoria, IL
NELAC Accreditation for Drinking Water, Wastewater, Hazardous and Solid Wastes Fields of Testing through IL EPA Lab No. 100230
State of Illinois Bacteriological Analysis in Drinking Water Certified Lab Registry No. 17553
Drinking Water Certifications: Indiana (C-IL-040); Kansas (E-10338); Missouri (00870); Wisconsin (998294430)
Wastewater Certifications: Arkansas; Iowa (240); Kansas (E-10338); Wisconsin (998294430)
Hazardous/Solid Waste Certifications: Arkansas; Kansas (E-10338); Wisconsin(998294430)
UST Certification: Iowa (240)
SPMO PDC Laboratories - Springfield, MO
EPA DMR-QA Program
STL PDC Laboratories - St. Louis, MO
NELAC Accreditation for Wastewater, Hazardous and Solid Wastes Fields of Testing through IL EPA Lab No. 100253.

Certified by: Barbara G. Pandolfo

ACCREDITED IN COMPLIANCE WITH nelac

DATA QUALIFIERS APPLICABLE TO THE "STANDARD QC" PROGRAM

A The presence of this analyte was confirmed using a second column but there was a disparity (> 40% RPD) between the two sets of results with no apparent chromatographic anomalies. The lower of the two results was reported.

B _____ present in the method blank at _____.

C The batch control sample failed to meet the required acceptance criteria.

D Result obtained through analysis of a sample dilution.

E Concentration exceeds the instrument calibration range.

F Internal standard area failed to meet the required acceptance criteria in repeat instrumental analyses. Results should be interpreted as estimated concentrations.

G The Method of Standard Additions (MSA) was used to quantify the concentration.

H Test performed after the expiration of the appropriate regulatory/advisory maximum allowable hold time.

J Estimated value; value between the MDL and the RDL.

M Analyte failed to meet the required acceptance criteria for duplicate analysis.

P Chemical preservation discrepancy noted at the time of analysis.

Q Analyte failed to meet the required acceptance criteria for spike recovery in the Matrix Spike (MS) and Matrix Spike Duplicate (MSD) due to apparent matrix effects.

R Analyte failed to meet the required acceptance criteria for relative percent difference (RPD) between the Matrix Spike and Matrix Spike Duplicate (MS/MSD).

S Surrogate compound diluted below a reliable quantitation level.

T Surrogate recovery failed to meet the required acceptance criteria in initial analysis. Sample was re-extracted (if applicable) and re-analyzed, and the surrogate recovery was outside of the required acceptance criteria on the second analysis, also. Results should be interpreted as estimated concentrations.

U Parameter was analyzed for, but not detected above the reporting limit.

V Verification standard recovery failed to meet the required acceptance criteria on repeat instrumental analyses.

W Surrogate recovery failed to meet the required acceptance criteria in initial analysis. Sample was re-extracted (if applicable) beyond the maximum allowable hold time, and re-analyzed. The surrogate recovery was within the required acceptance criteria on this second analysis.

NA Not analyzed.

NR Not requested.

X Miscellaneous; see comments.

WaterSolve LLC

Organic Cationic Coagulant
Solve 426

Material Safety Data Sheet

Date Issued: 08/18/08
Date Revised: 08/18/08

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME:	SOLVE 426
CHEMICAL TYPE:	Cationic polyamine
Molecular Formula:	Mixture
COMPANY:	WaterSolve, LLC, 4964 Starr St. SE, Grand Rapids, MI 49546, USA For Product information call 616-575-8693.
EMERGENCY PHONE:	For emergency involving spill, leak, fire, exposure or accident call CHEMTREC: 1-800-424-9300. Outside the USA and Canada call 708-527-3887.

2. COMPOSITION/INFORMATION ON INGREDIENTS

OSHA Regulated Components
No Permissible Exposure Limits (PEL/TLV) have been established by OSHA or ACGIH.

3. HAZARDS IDENTIFICATION

Emergency Overview

Appearance and odor:	Colorless to amber liquid, slight amine type odor.
Statement of Hazard:	**Caution! May cause eye and skin irritation** **Important! Spills of this product are very slippery when wet.**

Potential Health effects
Effects of exposure:
The acute oral (rat), acute dermal (rabbit) LD50, and 4-hour inhalation (rat) LC50 values for this material are 6,160 mg/kg, >10,000 mg/kg respectively. The 4-hour inhalation (rat) LLLLC50 value is estimated to be > 2,500 ppm. Direct contact with this material may cause mild eye and skin irritation.

4. FIRST AID MEASURES

Ingestion:
If swallowed, call a physician immediately. Only induce vomiting at the instruction of a physician. Never give anything by mouth to an unconscious person.

Skin Contact:
Wash immediately with plenty of water and soap.

Eye Contact:
Rinse immediately with plenty of water for at least 15 minutes.

Inhalation:
Material is not expected to be harmful if inhaled. Remove to fresh air.

5. FIRE FIGHTING MEASURES

Suitable Extinguishing Media:
Use water spray, carbon dioxide or dry chemical.

Protective Equipment:
Firefighters, and others exposed, wear self-contained breathing apparatus.

Special Hazards:
Keep containers cool by spraying with water if exposed to fire.
Mechanical/Static Sensitivity Statements: None

6. ACCIDENTAL RELEASE MEASURES

Personal precautions:
Where, exposure level is not known, wear approved, positive pressure, self-contained respirator. Where exposure level is known, wear approved respirator suitable for level of exposure. In addition to the protective clothing/equipment in Section 8 (Exposure Controls/Personal Protection), wear impermeable boots.

Methods For Cleaning Up:
Products may cause a slip hazard. Spilled material should be absorbed onto an inert material and scooped up. Flush spill area thoroughly with water and scrub to remove residue. If slipperiness remains apply more dry-sweeping compound.

7. HANDLING AND STORAGE

HANDLING
Precautionary Measures: Avoid contact with eyes, skin and clothing. Wash thoroughly after handling.
Special Handling Statements: None

STORAGE
To avoid product degradation and equipment corrosion, do not use iron, copper or aluminum containers or equipment.

Store Temperature: Room temperature
Reason: Integrity

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Measures:
Engineering controls are not usually necessary if good hygiene practices are followed.

Respiratory Protection:
For operations where inhalation exposure can occur, use an approved respirator recommended by an industrial hygienist after an evaluation of the operation. Where inhalation exposure can not occur, no respiratory protection is required.

Eye Protection:
Wear eye/face protection such as chemical splash proof goggles or face shield.

Skin Protection:
Avoid skin contact. Wear impermeable gloves.

Additional Advice:
Before eating, drinking, or smoking, wash face and hands thoroughly with soap and water.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance and Odor:	Colorless to amber liquid, amine type odor
Boiling Point:	212°F; 100°C
Melting Point:	-18°C, 0°F
Vapor Pressure:	Not applicable
Specific Gravity/Density:	1.1– 1.2
Vapor Density:	Not available
% Volatile (By Wt):	50 (water)
pH:	4-7
Saturation in Air (% by Vol):	Not applicable
Evaporation Rate:	Not applicable
Solubility in Water:	Complete
Volatile Organic Content:	Not available
Flammable Properties	
Flash point:	>93°C 200° F (method: Closed Cup)
Flammable Limits (% by vol):	Not applicable
Autoignition temp:	Not available
Decomposition temp:	Not available
Partition Coefficient:	Not applicable
Odor threshold:	Not available

10. STABILITY AND REACTIVITY

Stability:	Stable
Conditions to avoid:	None known
Polymerization:	Will not occur
Conditions to Avoid:	None known
Incompatible Materials:	Avoid aluminum, iron and copper. Strong oxidizers, acids.
Hazardous Decomposition Products:	Dimethylamine Carbon monoxide Carbon dioxide Ammonia Oxides of nitrogen Hydrogen chloride

11. TOXICOLOGICAL INFORMATION

Toxicological information for the product is found under Section 3.
Toxicological information on the OSHA regulated components of this product is as follows:

This product contains no OSHA regulated (hazardous) components.
This product contains no WHMIS regulated (hazardous) components.
California Proposition 65 Warning (applicable in California only) - This product contains (a) chemical(s) known to the State of California to cause cancer and birth defects or other reproductive harm.

12. ECOLOGICAL INFORMATION LC50

Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment. All ecological information provided was conducted on a structurally similar product.
This material is not classified as dangerous for the environment. Acute toxicity tests conducted on the polymer using environmentally representative water gave the following results:

Algae Test Results
Test: Growth Inhibition (OECD 201)
Duration: 72 h
Species: Green Algae (*Selenastrum capricornutum*)
IC50: >100 mg/L

Fish Test Results
Test: Acute toxicity, freshwater (OECD 203)
Duration: 96 h
Species: Zebra fish (*Brachydanio rerio*)
LC50: >100 mg/L

Invertebrate Test Results
Test: Acute Immobilization (OECD 202)
Duration: 48 h
Species: Water flea (*Daphnia magna*)
EC50: >100 mg/L

Degradation:
Test: CO2 Evolution: Modified Sturm (OECD 301B)
Duration: 28 day
<70%
Information based on a structurally similar material. This material is not readily biodegradable (OECD 301B). The large polymer size is incompatible with transport across biological membranes and diffusion. The bioconcentration factor is therefore considered to be zero.

13. DISPOSAL CONSIDERATIONS

The information on RCRA waste classification and disposal methodology provided below applies only to the product, as applied. If the material has been altered or contaminated, or it has exceeded its recommended shelf life, the guidance may be inapplicable. Hazardous waste classification under federal regulations (40 CFR Part 261 et seq) is dependent upon whether a material is a RCRA "listed hazardous waste" or has any of the four RCRA "hazardous waste characteristics." Refer to 40 CFR Part 261.33 to determine if a given material to be disposed of is a RCRA "listed hazardous waste"; information contained in Section 15 of this MSDS is not intended to indicated if the product is a "listed hazardous waste." RCRA Hazardous Waste Characteristic. There are four characteristics defined in 40 CFR Section 261.21-61.24: Ignitability, Corrosivity, Reactivity, and Toxicity. To determine Ignitability, See Section 5 of this MSDS (flash point). For Corrosivity, see sections 9 and 14 (pH and DOT corrosivity). For Reactivity, see Section 10 (incompatible materials). For Toxicity, see Section 2 (composition). Federal regulations, may also apply to the classification of the material to be disposed. WaterSolve encourages the recycle, recovery and reuse of materials classified as RCRA hazardous wastes to be disposed of by thermal treatment or incineration at EPA approved facilities. WaterSolve has provided the foregoing for information only; the person generating the waste is responsible for determining the waste classification and disposal method.

14. TRANSPORT INFORMATION

This section provides basic shipping classification information. Refer to appropriate transportation regulations for specific requirements.

15. REGULATORY INFORMATION

INVENTORY INFORMATION

USA : All components of this product are included on the TSCA Chemical Inventory or are not required to be listed on the TSCA Chemical I inventory.

Canada: All components of this product are included on the Domestic Substances List (DSL) or are not required to be listed on the DSL

European Union (EU): All components of this product are included on the European Inventory of Existing Chemical Substances (EINECS) or are not required to be listed on EINECS.

Australia: All components of this product are included in the Australian Inventory of Chemical Substances(AICA).

China: All components of this product are included on the Chinese inventory or are not required to be listed on the Chinese Inventory.

Japan: All components of this product are included on the Japanese (ENCS) inventory or are not required to be listed ion the Japanese Inventory.

Korea: All components of this product are included on the Korean (ECL) inventory or are not required to be listed on the Korean inventory

Philippines: All components of this product are included on the Philippine (PICCS) inventory or are not required to be listed on the Philippine inventory.

OTHER ENVIRONMENTAL INFORMATION

The following components of this product may be subject to reporting requirements pursuant to Section 313 of CERCLA (40 CFR 372), Section 12(b) of TSCA, or may be subject to release reporting requirements (40 CFR 307, 40 CFR 311, etc.) See Section 13 for information on waste classification and waste disposal of this product. This product does not contain any components regulated under sections of the EPA.

Product Classification under section 311 of SARA
Not applicable

16. **OTHER INFORMATION**

NFPA HAZARD RATING (National Fire Protection Association)

Health 1- Materials that, under emergency conditions, can cause temporary incapacitation or residual injury.

Fire 1 – Materials that must be preheated before ignition can occur.

Reactivity 0 –Materials that in themselves are normally stable, even under fire exposure conditions.

REASON FOR ISSUE: New Format

This information is for the specific material described only and may not be valid if the material is used in combination with any other materials or in any process. The user is responsible to determine the completeness of the information and suitability for the user's own particular use. The knowledge and belief of the company, the information is accurate and reliable as of the date indicated but the company makes no express or implied warranty of merchantability for the material or the information. The company makes no express or implied warranty of fitness for a purpose for the material or for the information. This information is given without any warranty or representation. We do not assume any legal responsibility for same, nor do we give permission, inducement, or recommendation to practice any patented invention without a license. It is offered solely for your consideration, investigation, and verification. Before using any product, read its label.

Organic Cationic Emulsion
Solve 127

Material Safety Data Sheet

Date Issued: 08/19/08
Date Revised: 08/19/08

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME: SOLVE 127
CHEMICAL TYPE: Water-in-Oil Emulsion Cationic Flocculent Polyacrylamide
MOLECULAR FORMULA Polymer

COMPANY: WaterSolve, LLC, 4964 Starr St. S.E., Grand Rapids, MI 49546, USA
For Product information call 616-575-8693.
EMERGENCY PHONE: For emergency involving spill, leak, fire, exposure or accident call CHEMTREC: 1-800-424-9300. Outside the USA and Canada call 703-527-3887.

2. COMPOSITION/INFORMATION ON INGREDIENTS

OSHA Regulated Components

Component	CAS NO.	%	OSHA (pel)	AGGIH (TLV)
Petroleum distillate Hydrotreated light	064742-47-8	22-23	500 ppm 1200mg/m3 165ppm (Supplier)	(skin)

3. HAZARDS IDENTIFICATION

Emergency Overview
Appearance and odor: Opaque greenish to milky white viscous liquid; slight hydrocarbon odor
Statement of Hazard: WARNING! Causes Skin Irritation; May cause Eye Irritation

Potential Health effects
Effects of overexposure:
The acute oral (rat), acute dermal (rabbit) LD50 values are both estimated to be greater than 5,000 mg/kg and greater than 2,000 mg/kg, respectively. The 4 hour inhalation LC50 (rat) value is estimated to be greater than 20 mg/L. Direct contact with this material may cause moderate skin and mild eye irritation. Overexposure to vapor may cause respiratory tract irritation and central nervous system depression. Refer to section 11 for toxicology information on the OSHA regulated components of this product.

4. FIRST AID MEASURES

Ingestion:
If swallowed, call a physician immediately. Only induce vomiting at the instruction of a physician. Never give anything by mouth to an unconscious person.

Skin Contact:
Remove contaminated clothing and shoes without delay. Wash immediately with plenty of water. Do not reuse contaminated clothing without laundering. Get medical attention if pain of irritation persists after washing or if signs and symptoms of overexposure appear.

Eye Contact:
Rinse immediately with plenty of water for at least 15 minutes.

Inhalation:
Remove to fresh air. If breathing is difficult, give oxygen. Obtain medical advice if there are persistent symptoms.

5 .FIRE FIGHTING MEASURES

Suitable Extinguishing Media:
Use water spray, carbon dioxide or dry chemical.

Protective Equipment:
Firefighters, and others exposed, wear self-contained breathing apparatus. Wear full firefighting protective clothing. See MSDS Section 8 (exposure Controls/Personal Protection)

Special Hazards:
Keep containers cool by spraying with water if exposed to fire.
Mechanical/Static Sensitivity Statements: None

6. ACCIDENTAL RELEASE MEASURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED
Personal precautions:
Where exposure level is not known, wear NIOSH approved, positive pressure, self-contained respirator. Where exposure level is known, wear NIOSH approved respirator suitable for level of exposure. In addition to the protective clothing/equipment in Section 8, wear impervious boots.

Methods for Cleaning Up:
Products may cause a slip hazard. Spilled material should be absorbed onto an inert material and scooped up. Flush spill area with water. If slipperiness remains apply more dry-sweeping compound.

7. HANDLING AND STORAGE

Precautionary Measures: Avoid contact with eyes, skin and clothing. Wash thoroughly after handling

Special Handling Statements: None

STORAGE
To avoid product degradation and equipment corrosion, do not use iron, copper or aluminum containers or equipment. Flashpoint determinations on materials of this type are required by certain regulations and scientific standards to be performed using a Pensky-Martens type closed cup test method. This method indicates a flash point greater than 93.3C (200F). Although there was no flashpoint detected below 93.3C (200F) by the Pensky-Martens Closed Tester method, some flammable vapors were evolved during the test as evidenced by the enlargement for the test flame. Therefore, caution should be excised during storage and handling..
Storage Temperature: Store at 4-32°C 40-90°F
Reason: integrity

8 EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Measures:
Where this material is not used in a closed system, good enclosure and local exhaust ventilation should be provided to control exposure.

Respiratory Protection:
Where exposures are below the established exposure limit, no respiratory protection is required. Where exposures exceed the established exposure limit, use respiratory protection recommended for the material and level of exposure.

Eye Protection:
Wear eye/face protection such as chemical splash proof goggles or face shield. Eyewash equipment and safety shower should be provided in areas of potential exposure.

Skin Protection:
Avoid skin contact. Wear impermeable gloves and suitable protective clothing.

Additional Advice:
Food, beverages and tobacco products should not be carried, stored or consumed where this material is in use. Before eating, drinking, or smoking, wash face and hands thoroughly with soap and water.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance and Odor:	greenish-white, viscous, opaque liquid; slight hydrocarbon odor
Boiling Point:	Aqueous phase 100 °C; 212°F
Melting Point:	Not available
Vapor Pressure:	Similar to water
Specific Gravity:	~1.02
Vapor Density:	Similar to water
% Volatile (By Wt):	~52
pH:	3-6 (upon dilution in water)
Saturation in Air (% by Vol):	Not applicable
Evaporation Rate:	no available
Solubility in Water:	Limited by viscosity
Volatile Organic Content:	25% (g/g)
Flash point:	>93°C 200°F closed cup
Flammable Limits (% by vol):	Not available
Autoignition temp:	Not available
Decomposition temp:	Not available
Odor Threshold	Not available
Partition coefficient (n-octanol/water)	Not available

10. STABILITY AND REACTIVITY

Stability:	Stable
Conditions to avoid:	None known
Polymerization:	Will not occur
Conditions to Avoid:	None known
Materials to avoid:	strong oxidizing agents This material reacts slowly with iron, copper and aluminum, resulting In corrosion and product degradation..
Hazardous decomposition Products:	carbon monoxide Carbon dioxide Ammonia Hydrogen chloride Oxides of nitrogen Sulfur dioxide

11. TOXICOLOGICAL INFORMATION

Toxicological information for the product is found under Section 3.
Toxicological information on the OSHA regulated components of this product is as follows:

Alcohols (c10-16), ethoxylated toxicological properties have not been fully investigated. Based on similar materials, the acute oral (rat) LD50 is estimated to range from 1600-2500 mg/kg and the acute dermal (rabbit) LD50 value is estimated to be >2000mg/kg. Similar materials produced severe eye irritation and moderate skin irritation in studies with rabbits.

C12-14 alcohol ethoxylated toxicological properties have not been fully investigated. The oral LD50 (rat) of this mixture is excepted to be consistent with the chemical family of ethoxylated alcohol surfactants and range from 1.6 to 2.5 g/kg. The acute dermal (rabbit) LD50 value is estimated to be >2.0 g/kg. One excepted component of this mixture was severely irritating to rabbits eyes (undiluted, Draize score=60). This mixture is expected to be moderately irritating to skin, based on data reported for C9-C11 6EO: (primary irritation index) PII=5.3/8.

California Proposition 65 Warning (applicable in California only)- This product contains (a) chemical(s) known to the State of California to cause cancer and birth defects or other reproductive harm.

12 ECOLOGICAL INFORMATION LC 50

This is not classified as dangerous for the environment. The effects on aquatic organisms are due to an external (non-systemic) mode of action, and are significantly reduce (by a factor of 7-20) within 30 minutes due to binding of the product to dissolved organic and inorganic sorbents such as clays and silts. All ecological information provided was conducted on a structurally similar product. Acute toxicity tests conducted on the polymer using environmentally representative water gave the following results:

Zebra Fish (Brachydanio rerio) 96 hr LC 50 >1-10 mg/l
Water Flea (Daphnia magna) 48hr EC 50 >10-100 mg/l

DEGRADATION
Test: CO2 Evolution: Modified Sturm (OECD 301B)
The polymeric ingredient is not readily biodegradable, but degradable by hydrolysis. The large polymer size is incompatible with transport across biological membranes and diffusion; the bioconcentration factor is therefore considered to be zero.

13. DISPOSAL CONSIDERATIONS

The information on RCRA waste classification and disposal methodology provided below applies only to the product, as applied. If the material has been altered or contaminated, or it has exceeded its recommended shelf life, the guidance may be inapplicable. Hazardous waste classification under federal regulations (40 CFR Part 261 et seq) is dependent upon whether a material is a RCRA "listed hazardous waste" or has any of the four RCRA "hazardous waste characteristics." Refer to 40 CFR Part 261.33 to determine if a given material to be disposed of is a RCRA "listed hazardous waste"; information contained in Section 15 of this MSDS is not intended to indicated if the product is a "listed hazardous waste." RCRA Hazardous Waste Characteristic. There are four characteristics defined in 40 CFR Section 261.21-61.24: Ignitability, Corrosivity, Reactivity, and Toxicity. To determine Ignitability, See Section 5 of this MSDS (flash point). For Corrosivity, see sections 9 and 14 (pH and DOT corrosivity). For Reactivity, see Section 10 (incompatible materials). For Toxicity, see Section 2 (composition). Federal regulations, may also apply to the classification of the material to be disposed. WaterSolve encourages the recycle, recovery and reuse of materials classified as RCRA hazardous wastes to be disposed of by thermal treatment or incineration at EPA approved facilities. WaterSolve has provided the foregoing for information only; the person generating the waste is responsible for determining the waste classification and disposal method.

Approval Status:	SAMPLE APPROVED	Metal Extraction Type:	Hot Plate
Remarks:	old ckd		

Parameter	Result	Units	Quant Limit
Heat Content:	NT	BTU/lb	73
Specific Gravity:	NT	g/mL	
Corrosivity:	NT	pH	
Ignitabliity:	NT	degrees F	
PCB:	NT	ppm	10
Water	NT	%	0.5
Radioactivity:	NT		
Settable Solids:	NT	%	5
Viscosity:	NT	cPs	50
Total Cyanide:	NT	ppm	100
Total Sulfide:	NT	ppm	100
Ash:	NT	%	0.5
Fluorine:	NT	%	0.02
Chlorine:	NT	%	0.1
Bromine:	NT	%	0.02
Sulfur:	NT	%	0.02

Tank Compatibility: NT

Parameter	Result	Units	Quant Limit
Arsenic:	22.68	ppm	5
Selenium:	ND	ppm	5
Copper:	10.83	ppm	10
Silver:	ND	ppm	5
Nickel:	7.96	ppm	5
Thallium:	ND	ppm	5
Lead:	50.67	ppm	5
Barium:	29.81	ppm	5
Chromium:	23.86	ppm	5
Vanadium:	14.63	ppm	5
Beryllium:	0.24	ppm	0.1
Zinc:	313.51	ppm	10
Antimony:	8.54	ppm	5
Cadmium:	ND	ppm	5
Mercury:	ND	ppm	0.1
Aluminum	6036	ppm	10
Calcium:	159149	ppm	100
Cobalt	ND	ppm	5
Iron	3850	ppm	100
Molybdenum	ND	ppm	5
Silicon	7303	ppm	100
Tin	ND	ppm	10
Titanium	280	ppm	5
Magnesium	7826	ppm	100
Manganese	345	ppm	100

ND = Non Detect
NT = Not Tested
BKG = Background
POS = Positive

Revision Date: July 15, 2009
