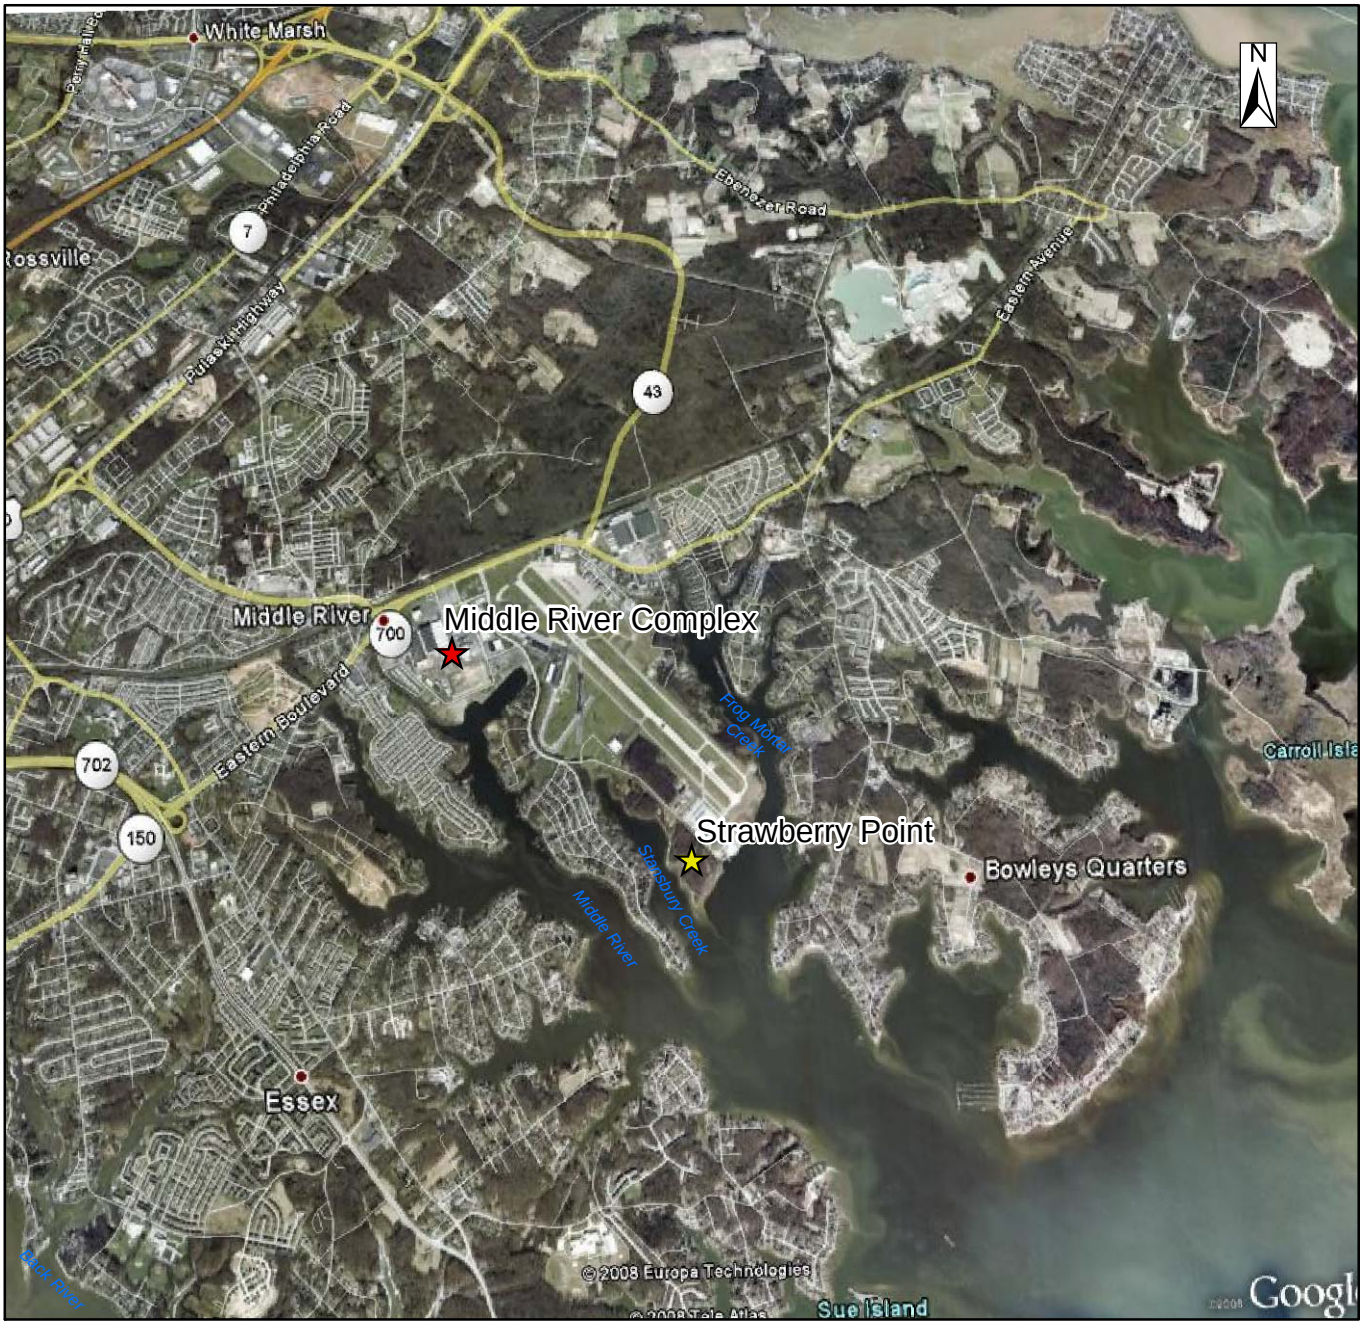
Section 1
Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this data summary report characterizing the sediments of waterways adjacent to the Middle River Complex (MRC) located at 2323 Eastern Boulevard in Middle River, Maryland (see Figure 1-1). The objectives of this investigation program were to (1) finalize characterization of Dark Head Cove and Cow Pen Creek with respect to area-wide environmental conditions and (2) to establish the basis for risk assessment and, if necessary, evaluation of cleanup goals and potential remediation alternatives. Data from this investigation supplement and enhance sediment data collected during the 2005 and 2008 sediment investigations in the Cow Pen Creek and Dark Head Cove areas. The objectives were met by collecting an array of chemical, environmental, geotechnical, and physical data and conducting bathymetric surveys and hydraulic analyses of sediment stability. This summary report is organized as follows:

Section 2—Site Background: Briefly describes the site history and previous investigations



Section 3—Sediment Characterization: Presents the technical approach and field methodologies used for chemical sampling and analysis, hydraulic analysis of sediment stability, bathymetric surveying, benthic assessment, and pre-design testing

Section 4—Investigation Results: Presents the investigation results

Section 5—Summary and Conclusions: Summarizes the investigation findings

Section 6—References: Cites references used in compiling this document

Section 2
Site Background

2.1 SITE DESCRIPTION

The Middle River Complex (MRC) is at 2323 Eastern Boulevard in Middle River, Maryland. A facility layout map is provided as Figure 2-1. The site consists of approximately 180 acres of land and 12 main buildings. The property includes an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete covered lot, a trailer and parts storage lot, and numerous grassy areas along the facility perimeter. Locked chain-link fences surround all exterior lots and the main industrial area. The site is bounded by Eastern Boulevard (Route 150) to the north, Dark Head Cove to the south, Cow Pen Creek to the west, and Martin State Airport (MSA) to the east.

Lockheed Martin activities at the site are primarily facility and building management and maintenance. Two main tenants occupy the site: Middle River Aircraft Systems (MRAS) and Mission Systems & Sensors (MS2). MRAS designs, manufactures, fabricates, tests, overhauls, repairs, and maintains aeronautical structures, parts, and components for military and commercial applications. MS2 fabricates, assembles, tests, and otherwise supports vertical-launch systems. The property has been used historically for aircraft- and missile launching-systems design, development, and sales.

2.1.1 Physical Setting

2.1.1.1 Land Use

The MRC is an industrial facility within the broader Chesapeake Industrial Park. The area surrounding the property primarily consists of commercial, industrial, and residential establishments. Six other facilities, comprising the remainder of the Chesapeake Industrial Park, lie adjacent to the MRC. These include Tilley Chemical Company, Inc. (a distributor of food- and pharmaceutical chemicals for the personal care and other industries), North American Electric (an industrial and commercial electrical contractor), Johnson and Towers (a heavy-duty

diesel equipment, truck, and boat repair and maintenance company), Poly-Seal Corp. (a producer of flexible packaging for various items), Exxon (a gasoline filling station and convenience store), and the Middle River Post Office. Residential developments lie on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek (not shown in the figures but flowing from Dark Head Cove to Middle River, which is a tributary to Chesapeake Bay), as well as north of Eastern Boulevard (Route 150).

2.1.1.2 Physiography

The site lies in the Western Shore of the Coastal Plain Physiographic Province. Coastal Plain topography is generally characterized by low relief. MRC topography slopes gently, ranging from sea level to approximately 32-feet above mean sea level (Cassell, July 1977). The topography slopes from Eastern Boulevard to the southwest and south, toward Cow Pen Creek and Dark Head Cove.

2.1.1.3 Hydrology

The MRC lies at the junction of Cow Pen Creek and Dark Head Cove. Both are tidal surface water bodies that feed into Dark Head Creek, a tributary to Middle River, which is a tributary to Chesapeake Bay. The facility lies approximately 3.2 miles upstream of Chesapeake Bay. No surface water bodies lie in or cross the MRC.

Excluding areas immediately adjacent to Cow Pen Creek and Dark Head Creek, surface water runoff discharges from the facility via storm drains, soil infiltration, and evaporation. Nine stormwater drain-systems at the facility that discharge to Cow Pen Creek and Dark Head Cove were mapped by TAI Consulting Engineers in 2001 (see Figure 2-1). Other outfalls may have been used historically but are no longer in service. Stormwater runoff from the Chesapeake Industrial Park and a portion of MSA (across Wilson Point Road), as well as from some of the area along Eastern Avenue, is collected through a stormwater conveyance system and discharged to Cow Pen Creek and Dark Head Cove.

MRC maintains a State of Maryland National Pollutant Discharge Elimination System (NPDES) permit (State discharge permit No.: 00-DP-0298, NPDES permit No.: MD0002852) issued by Maryland Department of the Environment (MDE) Industrial Discharge Permits Division, Water Management Administration (Earth Tech, February 2003). MRAS generates sanitary- and

process-wastewater and is categorized as an Industrial User. The facility pre-treats and discharges its wastewater under the Industrial User Discharge Permit (permit No.: WWDP#1390), issued to MRAS by the Baltimore County Department of Public Works, Bureau of Utilities (Earth Tech, February 2003). The permit authorizes the facility to discharge its processed and sanitary wastewater from seven permitted discharge points (i.e., outfalls).

2.1.2 Subsurface Conditions

2.1.2.1 Soils

Soils underlying the MRC have been mapped as Mattapex-Urban Land Complex and Sassafras-Urban Land Complex by the United States Department of Agriculture (USDA) Soil Conservation Service. Mattapex-Urban Land soils consist of deep, well-drained silty soils, the original texture of which has been disturbed, graded over, or otherwise altered before construction. Sassafras-Urban Land soils consist of deep, well-drained sandy soils, the original texture of which has been disturbed, graded over, or otherwise altered before construction (USDA, 1993). MRC site assessment activities, however, indicate that a high percentage of these soils contain a very high clay and silt content, with poor surface drainage.

2.1.2.2 Geology

Geologic maps of Baltimore County show that the MRC is underlain by the Potomac Group, a Cretaceous-age interbedded gravel, sand, silt, and clay unit ranging in thickness from 0–800 feet. The Potomac Group is composed of three units: the Raritan and Patapsco Formations, the Arundel Clay, and the Patuxent Formation. The Raritan and Patapsco Formations range up to 400 feet thick and are composed of a gray, brown, and red variegated silt and clay unit with lenticular lenses of sand and few gravels. The Arundel Clay is composed of dark gray and maroon lignitic-clays ranging from 25–200 feet thick. The Patuxent Formation is described as a white or light-gray to orange-brown, moderately sorted sand unit with quartz gravels, silts, and clays ranging up to 250 feet thick (Reinhardt, 1977).

The Geologic Map of the Middle River Quadrangle (Reinhardt, 1977) maps the entire survey area as either the clay or the sand facies of the Patapsco Formation. The sands are more concentrated on the peninsulas east of MSA and in areas north of Eastern Boulevard, whereas all of the peninsulas (except for the Wilson Point Road area) west of the airport are mapped as

belonging to the clay facies. The Arundel Clay is mapped as outcropping northwest of the MRC facility (Reinhardt, 1977).

Logging of soils beneath the MRC (conducted during extensive site characterization activities) have identified a very heterogeneous substrate. The underlying soils are composed primarily of silty sands, fine-grained to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primary lithology being clay to silty clay. Sand lenses were encountered but in general do not appear to be continuous beneath the facility. Shallow groundwater tends to flow in the more sandy lenses toward the surface water bodies, and the water table is generally a subdued representation of the surface topography.

2.2 PREVIOUS INVESTIGATIONS

Numerous environmental investigations have been conducted at the MRC. These include underground storage tank closures and abandonments, soil excavations, and Phase I and II environmental site assessments (ESAs). In 2003, a facility-wide Phase I ESA was conducted at the MRC. The Phase I ESA investigation identified 13 Recognized Environmental Conditions (RECs) at the facility that are associated primarily with current site conditions (Earth Tech, February 2003). Subsequent review of historical site activities identified another 18 RECs at the facility (Tetra Tech, August 2004).

Many of the RECs are in the southern portion of the facility along the waterfront. Soil and groundwater sampling at the RECs identified sporadic soil and groundwater impacts to environmental media underlying the facility. The MRC has entered into the MDE Voluntary Cleanup Program (VCP), and studies of soil and groundwater at the MRC are ongoing.

With respect to surface water and sediment studies, on March 17–18, 2005, surface water and sediment samples were collected from the surface water bodies (i.e., Cow Pen Creek, Dark Head Cove, and Dark Head Creek) adjacent to the facility's southern and western property boundaries. Ten additional surface water and 50 additional sediment samples were collected in October 2005 to further characterize and delineate chemicals identified during the March sampling event. The later event included much more extensive investigation of Dark Head Cove, as well as vertical profiling of chemical concentrations in sediments.

In March 2005, seven surface water samples (SW-1 through SW-7) and 12 sediment samples (SD-1 through SD-12) were collected from Cow Pen Creek and Dark Head Cove. Two (SW/SD-1 and SW/SD-2) were collected as background reference samples, one (SW/SD-1) was hydraulically upgradient of the facility's first outfall (along Cow Pen Creek), and one (SW/SD-2) was from a cove in Dark Head Creek. The remaining sampling locations were positioned along the facility waterfront approximately 10 feet from the shoreline and spaced to generally coincide with outfall locations.

In October 2005, 10 surface water samples (SW-8 through SW-17) and 50 sediment samples were collected from 30 locations (SD-13 through SD-42) in Cow Pen Creek and Dark Head Cove. Surface-water sampling locations were distributed to provide data sufficient to broadly evaluate surface water quality. Sediment sampling locations were chosen to evaluate the horizontal distribution of chemicals of concern (COC) previously identified in March 2005.

Surface sediments were collected from all 30 sediment sampling locations (approximately the top six inches of unconsolidated material). At nine of the 30 sampling locations (SD-13, -14, -16, -19, -27, -28, -29, -40, and -42), samples were collected at depths of approximately 1–2 feet below the sediment/surface water interface. Sampling locations selected for coring were relatively close to the MRC shoreline and were intended to confirm previous sampling results and evaluate the vertical distribution of chemicals.

The 2006 human health risk assessment (HHRA) evaluated incidental ingestion and dermal contact with surface waters and sediments as direct-contact exposure-pathways based on data from the 2005 sampling events. Risks associated with consumption of fish from the study area were not evaluated in the 2006 HHRA. The 2006 HHRA concluded that non-carcinogenic effects for both surface water and sediment are regulatorily acceptable because the Hazard Index calculated for a hypothetical recreational receptor is less than 1.0. Carcinogenic risks of exposures to surface water (incidental ingestion, dermal contact) are less than the MDE threshold limit of 1^{-05} (i.e., a one–in-100,000) probability of developing cancer (Tetra Tech, 2006). Carcinogenic risks for exposures to sediment exceeded this MDE threshold for carcinogenic effects; however, the estimated risks are within the U.S. Environmental Protection Agency (USEPA) acceptance range of 1E-04 to 1E-06, (i.e., a one-in-10,000 to one-in-one-million) probability of developing cancer.

Moreover, the risk assessment overstates exposure to sediments, as the water depth of the surface water bodies will minimize direct exposure to contaminated sediments. Arsenic, polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyls (PCBs) were identified as the primary COC in sediment. Arsenic concentrations in sediment are likely attributable to naturally occurring background concentrations. The HHRA's estimates of potential risk are presumed conservative. The 2006 ecological risk assessment (ERA) (likewise based on the 2005 data) identified cadmium in surface water and barium, silver, benzo(a)pyrene, benzo(g,h,i)perylene, and indeno(1,2,3-cd)pyrene as the primary chemicals of potential concern (COPC) in sediment. Food-chain modeling also identified mercury in sediment as a concern (Tetra Tech, 2006).

Additional sediment sampling in November 2008 generated analytical data to better define the distribution of PCBs and other potential COPC, primarily PAHs and metals (identified during the March and October 2005 sampling events). The samples were also collected to better delineate the horizontal and vertical extent of the sediment impacts. The November 2008 sampling focused on areas where initial sampling had indicated that concentrations of potential site COPC were elevated, as well as on adjacent areas. Additional locations were also sampled due to the lack of data for deeper sediment (depths >6 inches). All 2005 and 2008 sampling locations are shown in Figure 2-2.

Section 3
Sediment Characterization

Sediment samples were collected from selected locations in Cow Pen Creek, Dark Head Cove, Dark Head Creek, and three reference locations (Marshy Point, Bowleys Quarters, and Middle River at a location removed from possible Middle River Complex [MRC] influences). The sampling program began in summer 2010. These sampling locations are new locations that vary from previous work in the associated surface water bodies. These additional data were collected to supplement the data collected in earlier investigations. The sampling program's multiple objectives were as follows:

- chemical sampling for polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), and metals, focused on areas lacking sufficient data
- additional chemical sampling and analyses for alkylated PAHs were conducted on a subset of samples to forensically evaluate possible sources of these compounds
- porewater was sampled in areas with elevated concentrations of metals, PAHs, and PCBs, aiding in the evaluation of steady state concentrations of the potentially bioavailable fractions of these contaminants in affected sediments
- porewater was sampled adjacent to the shoreline at areas of potential groundwater discharge where documented land based concentrations of volatile organic compounds (VOCs) are moving toward surface water bodies via contaminated groundwater at the MRC
- sediment-age dating was conducted to evaluate sediment stability, estimating the period during which chemicals of potential concern (COPC) may have been released to the sediments and to assess rates of natural recovery
- upstream samples were collected to evaluate what chemicals may be moving into Cow Pen Creek and Dark Head Cove from off-site areas along Eastern Avenue and Martin State Airport (MSA), respectively
- physical characterization sampling and testing was conducted to evaluate characteristics of the various sedimentary environments that may affect remedial activities and factor into feasibility studies

- benthic macroinvertebrates were sampled to assess the diversity and abundance of indigenous organisms in Cow Pen Creek and Dark Head Cove relative to three reference areas near Middle River

- a bathymetric survey accurately mapped the sediment bed

3.1 CHEMISTRY-CHARACTERIZATION SAMPLING

Sediment samples were collected from 24 site locations (SD-83 through SD-106) and three reference locations: Marshy Point (Marshy Point–SS, -01, -02, -04), Bowleys Quarters (Bowleys Quarters-SS, -01, -02, -04), and a Middle River location believed to be removed from possible MRC influences (Middle River Downstream-SS, -01, -02, -04). Sampling locations were selected primarily to better delineate the lateral and vertical distribution of COPC in sediments offshore of the MRC. Figure 3-1 presents the sediment sampling locations and Figure 3-2 depicts the three reference locations.

The areas for the reference locations were selected based on their similarity to the 24 sediment locations that were sampled. Criteria such as water depth, similar sediment substrate and the lack of easily discernable potential sources of impacts were determining factors in selecting reference locations (see Appendix A for field documentation). For example, if sediment samples were collected in three feet of water in a sandy substrate, the reference location would be collected in a location with similar conditions (as opposed to an area of six feet of water and a more silty or clayey sediment).

3.1.1 Sample Collection

Normandeau Associates, Inc. (Stowe, Pennsylvania) was subcontracted to provide vessels, equipment, and personnel necessary to collect sediment cores. Core-sampling tubes were advanced by manual and mechanical (i.e., vibrating head) means, depending on the sampling location's accessibility, sediment substrate, and the sediment resistance of creek bottom materials. Samples were collected primarily from Normandeau's coring vessel using a Rossfelder Corp. P-3 electric powered underwater vibracoring device. Several different sampling tubes were used depending on the type of sample collected.

The vibracorer was equipped with a four inch inside-diameter cellulose-acetate butyrate (CAB) sampling tube for the sediment cores. An aluminum Shelby type sampling tube was used to collect the geotechnical samples and a stainless-steel tube was used to collect bulk sediment

samples. In areas where water depths prohibit the use of the vibracoring vessel, surface water/sediment interface samples were collected by manually driving a CAB tube into the subsurface using manual methods (a wooden block and a hammer). All reusable equipment contacting sediments was decontaminated between sampling locations, as described in Section 3.1.3.

Samples were logged to describe sediment characteristics, such as color, grain size, sorting, texture, and any other pertinent soil characteristics. The sediment's textural properties were determined using tables specified in the American Society for Testing and Materials (ASTM) D2488-00 method. Sorting was determined by observing grain size distribution. Grain size was determined by comparing sediment grains to a grain size chart. Sediment color was determined by comparing core samples to Munsell® Soil Color Charts. All sediment characterization data are presented on the sediment sampling forms in Appendix A (Field Documentation).

Sediment samples were collected from each location at four depths: 0–6, 6–18, 18–30, and 30-52 inches below the surface water/sediment interface. These intervals are consistent with depths sampled during previous investigations and allow for consistency in data evaluation and risk assessment. Samples from all four depth intervals could not be collected at several sediment sampling locations (SD-84, SD-91, and SD-92) because core refusal was encountered before reaching the target depth. Only two depth intervals were collected from SD-91 (0–6 and 6-17 inches) and SD-92 (0–6 and 6–14 inches). Three depth intervals were collected from SD-84 (total depth 32 inches). Core refusal was due to encountering substrate, such as compacted sediment and shell deposits.

Each sampling location was surveyed using a portable Trimble Geo XH global positioning system (GPS) with sub-meter accuracy. The GPS unit uses the North American Datum (NAD) 83 coordinate system. Tide stage at the time of the survey was recorded and the depth to the top of the surface water/sediment interface was measured using a weighted tape. Sampling intervals and the total depth of the vibracore borings were also recorded. All information was documented on the sediment sampling forms (see Appendix A).

All sediment samples were analyzed for PAHs by U.S. Environmental Protection Agency (USEPA) SW846 Method 8270 gas-chromatography/selective-ion monitoring (GC/SIM), for PCBs by USEPA SW846 Method 8082, and for priority pollutant metals by USEPA SW864

Method 6010C/6020 (including analysis for mercury by Method 7471A). Seven of the 24 sampling locations were analyzed for acid volatile sulfides/simultaneously extracted metals (AVS/SEM). Five of the 24 locations were also analyzed for total petroleum and saturated hydrocarbons based on the following methods: USEPA 8015D, USEPA 8100, and USEPA 8000C and for parent and alkylated PAHs, selected heterocyclic compounds, steranes, triterpanes, and triaromatic steroids based on USEPA Method 8270C. Table 3-1 presents the samples collected and the analyses performed.

Additional samples were collected for quality assurance purposes at a frequency of approximately 10%. Five duplicate samples (SD-DUP1-01, SD-DUP2-04, SD-DUP3-SS, SD-DUP4-02, and SD-DUP5-01) were also collected and submitted for PAHs, PCBs, and priority pollutant metals analyses. All sample analyses, except for alkylated PAHs, were analyzed by TestAmerica Laboratories in Knoxville, Tennessee. Alkylated PAH analysis was performed by META Environmental, Inc. (META) in Watertown, Massachusetts. Samples were analyzed on a standard 15-business-day turnaround. Table 3-1 presents the samples collected and the analyses performed.

3.1.2 Sample Nomenclature and Handling

Samples submitted to the laboratory were labeled with an "SD" prefix identifying the sampled medium as sediment, followed by a two digit numeral to identify the sampling location, followed by an indication of the depth interval: "SS" for surface sediment (0–6 inches), "01" for the 6-18 inch depth sample, "02" for the 18–30 inch depth sample, and "04" for the 30–52 inch depth sample. For example, SD-83-SS would identify a surface sediment sample collected at location 83 and SD-85-02 would be for the 18–30 inch depth sample from location 85. Porewater samples (as discussed in Section 3.2) were designated with a "PW" prefix and then a sequential number.

Sediment cores were processed onshore, and care was taken to avoid disturbing the sediment during transport. Sediment from each specific sampling interval was homogenized in disposable aluminum pans using disposable plastic spatulas. After the sediment was homogenized, a representative sample was placed in the sampling containers supplied by the analytical laboratory and packed with ice (when necessary) for sample preservation.

Proper custody procedures were followed throughout all phases of sample collection and handling. Chain of custody protocols were used throughout sample handling to establish the

evidentiary integrity of sample containers. Sample containers were released under signature to the laboratory. Transport containers were sealed with strapping tape and a tamper-proof custody seal. The custody seal contains the signature of the individual releasing the transport container, along with the date and time.

3.1.3 Equipment Decontamination

Reusable sampling equipment was decontaminated between sampling locations before each use as follows:

- Alconox® and potable water wash
- potable water rinse
- rinsing and thoroughly wetting the equipment with reagent grade isopropanol
- analyte-free water rinse
- air drying
- decontamination solutions were collected for disposal as discussed in Section 3.1.4

3.1.4 Waste Management

Investigation derived waste (IDW) (consisting of equipment rinse water, residual sample cores, and personal protective equipment) was generated during this sediment sampling event. Personal protective equipment was dry brushed to remove any gross soil/sediment, placed in trash bags, and disposed of in a Lockheed Martin-designated trash container. Residual sample cores and equipment rinse water were collected and stored in U.S. Department of Transportation approved 55-gallon drums. Three drums of IDW (one drum of sediment and two of decontamination/rinse water) were generated during the sediment investigation. All drums were appropriately sealed, secured, labeled, and logged on a drum inventory form.

Samples of the IDW were collected and submitted for characterization analyses. Upon receipt of the IDW analytical data, the generated IDW was removed from the facility and properly disposed of at a Lockheed Martin-approved disposal facility in accordance with federal, state, and local regulations. All IDW was disposed of as non-hazardous waste. The IDW documentation and records are in Appendix B.

3.2 SEDIMENT POREWATER SAMPLING

Sediment-porewater samples were collected to determine the equilibrium concentrations of COPC in porewater laterally and vertically near the MRC. These data will be used to evaluate the potential risk posed to sediment dwelling organisms by estimating the steady state concentrations of COPC in porewater at areas with elevated COPC concentrations in sediment. Samples were also collected to quantify concentrations of VOCs in porewater that may be affected by discharge from groundwater plumes at the MRC.

3.2.1 *In situ* Porewater and Surface Water Sampling

Eight porewater samples were collected for VOC analysis from locations immediately offshore and oriented to the inferred location of the two VOC plumes at the MRC. The eastern plume is inferred to discharge into Dark Head Cove (DHC-PW-VOC-1, -2, -3, -4, and -5) and the western plume is inferred to discharge into Cow Pen Creek (CPC-PW-VOC-1, -2 and -3). Samples were collected along transects of the eastern and western plumes. Sampling locations were spaced to provide a combination of both near shore and offshore (approximately 50 feet offshore) locations, bracketing the identified land based dimensions of the plume (Figure 3-1).

Porewater and surface water samples were collected from the five proposed locations in Dark Head Cove. Porewater and surface water samples were collected from three of the five proposed locations in Cow Pen Creek. Samples were not collected from two of the Cow Pen Creek locations because the dense nature and clayey consistency of the substrate and low porewater flow rates prohibited collection of adequate volumes for analysis.

3.2.1.1 *In situ* Porewater Sampling

In situ porewater samples were collected during two sampling events. During the initial event, a Solinst Model 615 drive-point piezometer was used to collect sediment porewater for VOC analysis. The piezometer has a six-inch long, stainless steel, 50-mesh cylindrical filter screen in a ¾-inch (20 millimeter [mm]) stainless-steel drive-point body and screen support. The strengthened connector at the top of the drive point acts as an annular seal. The drive point was attached to sections of ¾-inch galvanized-steel drive pipe of appropriate length to reach the target sampling depth. A 2-inch diameter polyvinyl chloride (PVC) pipe sealed at the bottom with a plastic bag was driven approximately 18 inches into the sediment to act as a seal for the

outer casing preventing surface water intrusion before installation of the temporary piezometers. The piezometer was manually inserted into the center of the PVC casing and pushed through the plastic bag seal into the sediment to a maximum depth of 36 inches below the surface water/sediment interface.

The piezometer was purged using a peristaltic pump and, when possible (depending on production of porewater), conductivity, temperature, dissolved oxygen, salinity, and pH were measured using a YSI 556 field meter to determine the interface between groundwater and the brackish surface water (see Appendix A for field documentation). Sediment-porewater samples were collected from the fresh groundwater zone in the sediment. The piezometers and drive pipe were manually retrieved and decontaminated between each sampling location before each use as follows:

- Liquinox® and deionized water
- deionized water
- air drying

Not all of the proposed *in situ* porewater samples could be collected during the initial sampling event due to insufficient recovery of porewater in fine-grained sediments. Additional sampling was done using a modified sampling approach that replaced the six-inch Solinst Model 615 S drive-point piezometer with a 12-inch model fitted with a hose barb. The increased length was intended to provide additional sampling surface area. A hose attached to the barb on the piezometer extended through the ¾-inch pipe to the vessel where, if necessary, a hand operated vacuum pump was used to create a negative pressure in an effort to induce flow of porewater into the piezometer. Samples were collected during periods of rising tide during the first event on September 1–2, 2010 and during an already low tide exacerbated by the approach of a strong tropical system during the second event on September 29, 2010. Samples were analyzed for VOCs by TestAmerica Laboratories in Knoxville, Tennessee.

3.2.1.2 Surface Water Sampling

Eight co-located surface water samples (DHC-SW-VOC-1, -2, -3, -4, and -5 and CPC-SW-VOC-1, -2, and -3) were collected along with the porewater VOC samples offshore from the two VOC plumes in MRC groundwater. Two surface water samples (DHC-SW-6 and -7) were also collected at locations away from plume discharge areas, in a presumably unaffected

area across Dark Head Cove at the Wilson Point Park public boat launch and dock. Surface water samples were collected as grab samples from approximately one foot above the surface water/sediment interface, using a weighted-glass sampling vial.

The surface water samples were transferred to 40-milliliter (ml) glass sampling vials and preserved with hydrochloric acid. Surface water samples from Dark Head Cove and Cow Pen Creek (10 samples, plus one quality assurance/quality control [QA/QC] sample) were analyzed for VOCs. Inadequate sample volume prohibited analysis for 1,4-dioxane in porewater, so this analysis was not performed for surface water samples.

3.2.2 *Ex situ* Porewater Sampling

To evaluate the equilibrium concentrations of COPC in porewater both laterally and vertically near the MRC, sediment was collected from seven locations throughout the site using a four-inch vibracore aluminum-core sampling tube. Two cores were collected for chemical analyses at each sampling location (PW-01 through PW-07). Cores were collected from a minimum depth of 30 inches below the surface water/sediment interface at two locations in Cow Pen Creek (PW-01 and -02), from three locations in Dark Head Cove (PW-03, -04, and -05), and from two locations at the confluence of Dark Head Cove and Cow Pen Creek (PW-06 and -07) (see Figure 3-1). The cores for porewater analysis were separated into three incremental sections corresponding to the top three intervals sampled for chemical compounds in sediments (0–6, 6–18, and 18–30 inches below the surface water/sediment interface). At one porewater sampling location (PW-01), the depths from the cores were 16 and 24 inches, which represent the total target depth. Porewater could not be extracted at two of the five proposed sampling locations in Cow Pen Creek.

All sample cores were capped, sealed, and shipped in ice-cooled containers under appropriate chain of custody documentation to TestAmerica Laboratories in Knoxville, Tennessee for analysis. Porewater was extracted at the laboratory by centrifugation. All porewater samples were analyzed for priority pollutant metals. Per the sampling plan, PAHs and PCBs in porewater were only to be evaluated from two intervals in samples from Dark Head Cove where elevated concentrations of these compounds have been found in sediments. All three intervals in samples collected from Dark Head Cove (PW-03, -04, and -05) were analyzed for PAHs and PCBs.

3.3 SEDIMENT AGE DATING

Sediment cores were collected at three locations between August 23–25, 2010 for evaluation of sediment age, stability, and sedimentation rate. The sediment cores were collected from identified depositional areas in Dark Head Cove (DHC-3, -8, -16, -26, -38, and -55), from the confluence of Dark Head Cove and Cow Pen Creek (CPC-3, -10, -21, -35, -50, -70, -71, and -72), and in Dark Head Creek near Middle River (CON-3, -8, -16, -27, -39, and -57). Sediment cores were collected and handled in a manner to minimize disturbance and preserve sediment stratification in the cores. To meet sample volume requirements for age dating analyses, a three-inch diameter core was collected to provide at least 20 grams of dry material equivalent from the smallest sections collected. Following collection, the cores were processed for shipment to the analytical laboratory for selected radioisotope age dating analyses.

The collected cores were brought onshore and sectioned into discrete 2 centimeter (cm) intervals using a specially designed sampling device. The transverse sections of core were transferred in the field to pre-cleaned, wide-mouth glass sample jars, and shipped to Mass Spec Services laboratory in Orangeburg, New York for age dating. Appropriate steps were taken to minimize leakage, which could affect dry bulk density determinations. No special storage requirements were needed. Six sample jars from selected depths in each core were sent to Mass Spec Services laboratory. Two additional samples were included as matrix spike and matrix spike duplicates, for quality control.

The suite of sediment samples was analyzed for lead-210 (Pb-210) and cesium-137 (Cs-137). The results were plotted and used to recommend analysis of six additional sections from each core to refine the chronology study. These samples, plus two quality control samples, were submitted to the laboratory and received on September 22, 2010 and September 27, 2010. The second suite of samples was analyzed at the laboratory and the results were added to the plots for each core.

3.4 STORMWATER SAMPLING AND ANALYSIS

Two stormwater samples and one sediment sample were collected from the head of Cow Pen Creek (including runoff from Eastern Boulevard) and from the outfalls of MSA (a composite from the two outfalls). The stormwater and sediment samples were collected to evaluate whether stormwater may be transporting land based contaminants not associated with the MRC to

sediments in Cow Pen Creek and Dark Head Cove. Samples were collected during a rain event and sampling was consistent with the protocols outlined in USEPA's National Pollution Discharge Elimination System (NPDES) Stormwater Sampling Guidance Document (EPA 833-8-92-001).

One sediment sample (MRC-SED-1) and two stormwater samples (MRC-SW-1 and MSA-SW-1) were analyzed for total metals and alkylated PAHs. The sediment sample from Cow Pen Creek was collected from outside the pipe in the outfall basin, directly below where the water exits the pipe. No sediment sample was collected from the MSA outfall due to the pipe being submerged.

3.5 BENTHIC MACROINVERTEBRATE SAMPLING

Benthic macroinvertebrate samples were collected to evaluate the status of benthic communities residing in sediment at the site. Benthic invertebrate samples from three reference locations (Marshy Point, Bowleys Quarters, and Middle River) were be used to evaluate the results from the site samples (Cow Pen Creek and Dark Head Cove).

3.5.1 Sample Collection

Benthic macroinvertebrate samples were collected from seven site locations and three reference locations. These include two locations in Cow Pen Creek (BN-CPC-1, and -2) and five in Dark Head Cove (BN-DHC-1, -2, -3, -4, and -5) (see Figure 3-1 and Table 3-1). To compare these locations with similar environments in the Middle River area, Tetra Tech performed identical diversity and abundance assessments at the three reference areas.

The reference areas include one with little to no shoreline development (Marshy Point [BN-MP-1]), one with typical regional waterfront development (e.g., Bowleys Quarters [BN-BQ-1]), and the Middle River (BN-MRC-1) at a location presumed removed from potential MRC influences. Reference locations are shown in Figure 3-2. Reference locations were originally selected before mobilization to be representative of sediment conditions in an urbanized coastal area reflecting non-point runoff. The final sampling locations in each reference area were selected in the field to avoid potential effects associated with any recognized industrial point sources. Reference locations were confirmed with GPS readings during field reconnaissance in the initial stages of fieldwork to ensure that the specific reference sampling locations are similar in nature to the sampling locations in Cow Pen Creek and Dark Head Cove.

Criteria to assess the similarity of the reference locations to the site locations include grain size, water depth, salinity, temperature, and pH. Field instrumentation measured salinity, temperature, dissolved oxygen, and pH. Depth was measured with a tape and grain size was evaluated qualitatively by comparison to a grain size chart. To compare substrate from the reference locations, a composite sample was collected from each sampling location and analyzed for grain size, total organic carbon (TOC), PCBs, PAHs, and total priority pollutant metals.

Some effort was needed to minimize spatial variability of analytical results due to the heterogeneity (patchiness) of the benthic macroinvertebrate fauna in tidally influenced brackish water. To assist in this, five individual grab samples were collected at each sampling location. The individual grab samples at each location were collected from within an approximately 25-foot circle, taking care to avoid sampling the same sediment twice. The five individual grab samples for each sampling location were processed at the laboratory as a single sample.

3.5.2 Sampling Protocols

Samples of benthic macroinvertebrates were collected at each location from a boat using a Petite Ponar® grab sampler. Sediment from each sample was placed in a 500-micron-sieve bucket and wet sieved to remove all sediment particles smaller than 500 microns. Sediment remaining on the sieve was placed in sampling containers filled with 90% ethanol to preserve the organisms. The sampling containers were labeled with the following information:

- sample number
- sampling location
- number of containers comprising the sample
- replicate number
- sampling date
- sampler's initials

Samples were taken to Tetra Tech, Inc's. (Tetra Tech's) Biological Research Facility in Owings Mills, Maryland and held for analysis. No holding times apply once the samples are preserved. Analysis of the benthic macroinvertebrate samples was deemed necessary based on the outcome of the other evaluations described herein; therefore, the following steps were conducted:

1. All primary sample processing (sorting and taxonomic identifications) was performed by a subcontract laboratory. Taxonomic identifications for QC analysis were performed by Cove Corporation and Versar laboratories

2. Samples were sorted (that is, separating organisms from the sampled material) in the laboratory, and all samples were sorted in their entirety (i.e., no sub-samples were taken), with the aid of magnification

3. Taxonomic determinations could remain at a coarser level if specimen characteristics such as damage or fragmentation, and early instar (newly hatched) or juvenile specimens, precluded greater specificity, since the target hierarchical level for taxonomic identification was primarily genus. The taxonomist entered the data electronically into an *Excel*® spreadsheet in a standard format that allowed straightforward uploading to the database described below

4. This project used the Microsoft *Access*®-based *Ecological Data Application System* database to facilitate data entry, management, and analysis.

3.5.3 Quality Assurance and Quality Control

After primary taxonomy and delivery of the data to Tetra Tech, 10% of the samples (five) were randomly selected for QC analysis of taxonomic precision. Those samples were sent to an independent taxonomist for blind re-identification. Tetra Tech compared the results directly, on a spreadsheet, quantified error rates (taxonomic precision to proportion of disagreements), and implemented corrective actions as necessary. Measurement quality objectives were used for two aspects of taxonomic precision: counting and identification. Taxonomic results were considered acceptable if there was a percent difference in enumeration <5% and percent taxonomic disagreement <15%. If performance characteristics exceeded these values, corrective actions were recommended and implemented so the analyses could proceed.

3.6 PRE-DESIGN TESTING

Three samples were collected for physical characterization of sediment from Cow Pen Creek, Dark Head Cove, and Dark Head Creek. Physical characterization data were used for the hydraulics analysis and will also be used during the development of a feasibility study, if remediation is necessary. Pre-design analyses are discussed in Appendix I. Minimally disturbed sediment cores were collected from three locations: one from Dark Hard Cove (DHC-SED), one from Cow Pen Creek (CPC-SED), and one at the confluence of the two areas (CON-SED). Samples were also collected for vertical hydraulic conductivity testing.

Sediment cores extended four feet below the surface water/sediment interface and were collected in straight thin-walled Shelby tubes. Acquired cores remained upright and were handled in a manner to minimize disturbance of the sediment during transfer to Findling, Inc., Baltimore Maryland, for testing. Three vertical-permeability tests were run on each core using flex wall permeameter methods (ASTM Method D-5084-03). In addition, grain size and percent-solids analyses were performed on three intervals per core, with the intervals corresponding to the permeability tests. Table 3-1 presents the samples collected and the analysis performed.

3.7 BATHYMETRIC SURVEY

A bathymetric survey was performed in Dark Head Cove, in accessible portions of Cow Pen Creek, and at the confluence of the two water bodies. This survey documented tide-relative water depth, mud line surface topography, and solids, utilities, or obstructions that may influence investigation location selection and/or future remediation activities. Tetra Tech conducted a multi-beam echo-sounder (MBE) survey on August 3–4, 2010 with the *Research Vessel Storm*, a 21-foot jet boat configured with dual MBE systems. The Middle River bathymetry survey mapped in high detail the morphology of Dark Head Cove and, to the extent possible due to dense vegetation, Cow Pen Creek. The following equipment was used to survey the MRC project area:

- ***Survey vessel:*** a 21-foot shallow draft (≤1.5 feet) boat equipped with a data acquisition and processing lab, custom mounts for the MBE, and davit systems. The survey vessel was operated by a U.S. Coast Guard- (USCG) licensed captain
- ***RESON multi-beam sonar:*** flexible plan RESON SeaBat 7125 dual 200/400 kHz
- ***Position, heading, and motion reference system:*** Applanix position and orientation systems for marine vessels
- ***Sound-velocity profiler:*** Seabird 19
- ***Data processing:*** Hypack/Hysweep®, CARIS *HIPS*, *Fledermaus Pro*, and *ArcMap*®
- ***Secondary positioning system:*** Trimble Ag132 differential GPS receiver with USCG differential beacon

3.8 HYDRAULIC ANALYSIS

The area's hydraulic characteristics were studied to evaluate sediment stability and, in turn, the potential for contaminant mobility in Cow Pen Creek, Dark Head Cove, and Dark Head Creek

near the MRC. The *Environmental Fluids Dynamics Code* (EFDC) surface water modeling system simulated hydrodynamics and their effects on sediment stability in the three water bodies. The EFDC model was configured to simulate tidal- and runoff driven circulation in the study area and to predict maximum bed stress, which will likely be associated with spring tide conditions. The bed stress was used to evaluate the sediment bed stability or potential for erosion. If significant erosion potential was identified, the model was extended to simulate sediment transport to evaluate possible sediment bound contaminants.

3.8.1 Data Assembly and Analysis

All historical and new data for the hydrodynamic modeling based analysis of sediment stability in Cow Pen Creek, Dark Head Cove, and Dark Head Creek was assembled, processed, and analyzed. Data groups include local watershed topography and land use, water body bathymetry, sediment bed physical properties, and hydrodynamic forcing data.

3.8.2 Watershed and Runoff Modeling

Estimates of watershed and site stormwater inflows to the receiving water bodies under rainfall event conditions were calculated, including a 100-year-recurrence event. Specifically, the contributing watershed and its runoff characteristics were identified and modeled to develop storm-flow hydrographs. The site storm-drain system was represented by discharging the runoff from the portion of the watershed occupied by the site into identified storm drain discharge locations along the boundary of the receiving water body.

3.8.3 Configuration of the Hydrodynamic- and Sediment Transport Model

The EFDC-based hydrodynamic- and sediment-transport model was configured for the study area using provided bathymetry and sediment-bed physical-property data, including grain-size distribution and bulk density with depth in the bed. External, non-tidal, inflows to modeled region were based on watershed and stormwater-runoff flows from events developed during the watershed and runoff modeling. Additional forcing functions included wind-forcing consistent with the modeled storms and astronomical and storm tides. Since tide gauge and current meter data were not collected in the study area, a formal calibration was not conducted. Instead, conservative forcing functions were used to ensure that expected conditions were bounded.

Calibration of the model to known conditions permits observation of water level fluctuations recorded at the site and any nearby tide gauge stations.

3.8.4 Sediment Stability Analysis

The hydrodynamic- and sediment transport model was used to evaluate the stability of the sediment under extreme or maximum bed stress conditions incorporated into the model during the configuration and calibration phase. As previously discussed, conditions included 100-year storm inflow conditions at critical tide phases and maximum wind and storm tide conditions. Sediment erosion potential was evaluated throughout the spatial domain by comparing the model's predicted bed stresses with critical stresses for erosion and corresponding erosion rates.

Spatially variable critical stresses and erosion rates were specified based on sediment bed physical characteristics and literature or on site-specific erosion studies. Studies at sites in the Chesapeake Bay region with similar bed characteristics were referenced as necessary. In areas with stresses in excess of critical stresses, erosion mass and depth were estimated. Maximum depth of erosion in the upper end of Cow Pen creek is estimated to be on the order of 10 cm due to the 100-year event, as described in Appendix G.

Section 4
Investigation Results

The objectives of the 2010 field investigation were to finalize the characterization of Dark Head Cove and Cow Pen Creek with respect to environmental conditions and to establish the basis for risk assessment and, if necessary, for evaluation of cleanup goals and potential remediation alternatives. To meet these objectives, a variety of chemical, environmental, geotechnical, and physical data were collected. This section presents the results of the 2010 field investigation.

4.1 SEDIMENT CHEMISTRY

Chemical characterization had the aim of providing analytical data that could be used to refine understanding of the horizontal and vertical distribution chemicals of potential concern (COPC) in sediment. Thus, the 2010 investigation focused on areas lacking sufficient data from previous investigations. Sediment samples were collected in 2010 from 24 site locations and three reference locations, and samples were collected from each location at four depths: 0–6, 6–18, 18-30, and 30–52 inches below the surface water/sediment interface. Sediment samples were analyzed for polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and metals. In addition, seven sediment samples were analyzed for acid volatile sulfides/simultaneously extracted metals (AVS/SEM) to assess chemical bioavailability.

4.1.1 Background Locations

The dataset used to represent background regional conditions in this report consists of sediment collected from two previously-sampled background locations (SD-1 and SD-78) and sediment collected in 2010 from two sampling locations (Marshy Point and Bowleys Quarters). SD-1 and SD-78 were collected from the upper portion of Cow Pen Creek, up gradient of the Middle River Complex's (MRC's) first outfall (slightly south of Eastern Boulevard), and are well upstream of the tidally influenced portion of the creek (see Figure 2-2). Sediment data were collected at SD-1 in 2005, and at SD-78 in 2008. The Marshy Point and Bowley's Quarters locations are discussed below.

Sediment samples were collected in 2010 from three locations distant from possible MRC influences to determine background conditions reflective of an urbanized coastal area (see Figure 3-2). Benthic invertebrate samples were also collected from the same three reference locations for comparison to site samples. The three reference locations consisted of one area with little to no shoreline development (Marshy Point), and two areas with typical regional waterfront development (Bowleys Quarters and Middle River).

Marshy Point is located approximately 4 miles east-northeast of the MRC and Bowleys Quarters is located approximately 2.6 miles east-southeast of the MRC. The third background reference location sampled in 2010 (Middle River) was approximately 4,000 feet south of MRC. Sediment analytical data indicate that concentrations of some metals in the surface and 6–18 inch depths for this sample (identified in Appendix C as "Middle River Downstream") are elevated relative to sediment concentrations in the Bowleys Quarters and Marshy Point samples. Whether the metals concentrations in this sample are due to MRC sources or other sources is unclear; the important point is that data from this sample suggest that this location might not represent regional-background conditions. Therefore, data from this location were excluded from the background data set.

In summary, the data set representing background reference-conditions herein consists of samples from four locations: Bowleys Quarters, Marshy Point, and sampling locations SD-1 and SD-78. None of the four background locations are near any known industrial point-sources of contamination, and all had substrates that were similar to the sample locations near the MRC site.

4.1.2 Extent of Sediment Impacts

Sediment analytical data were compared to ecological screening-values and to human health screening-levels (Tables 4-1A and 4-1B). Under U.S. Environmental Protection Agency (USEPA) guidelines, freshwater ecological screening values are applicable where the salinity is less than 1 part per thousand (ppt), saltwater screening values apply where salinity is greater than 10 ppt, and if the salinity is between 1–10 ppt, the more stringent of fresh or saltwater screening values should be used. The salinity of the overlying surface water in Cow Pen Creek and Dark Head Cove where sediment samples were collected in 2010 range from 2.4–3.9 ppt. Therefore, the ecological screening values for sediment used herein are the lower of the USEPA Region III

Freshwater Sediment-Screening Benchmarks (USEPA, 2006a) or USEPA Region III *Marine Sediment-Screening Benchmarks* (USEPA, 2006b). Additional sources of ecological screening values were used when USEPA Region III ecological screening values were not available.

The human health sediment-screening levels are based on USEPA regional screening-levels (RSLs) for residential soil (USEPA, 2010). To account for the reduced human exposure to sediment, soil-screening criteria are 10 times those typically used for residential soil. The 10 times adjustment is appropriate and conservative because human exposure to submerged sediment is anticipated to be much less frequent than human exposure to residential soil. This approach has been consistently used and accepted in USEPA Region III.

Sediment data are provided in Tables 4-2 through 4-9 and are grouped according to the four depth intervals (0–6, 6–18, 18–30, and 30–52 inches below the surface water/sediment interface). Tables 4-3, 4-5, 4-7, and 4-9 summarize the analytical results for chemicals detected at least once in either the 2010 or historical samples. Tables 4-2, 4-4, 4-6, and 4-8 provide the analytical results for individual sediment samples.

Figures 4-1 through 4-11 summarize the horizontal and vertical extent of cadmium, chromium, copper, lead, mercury, zinc, total Aroclors, total PAHs, and benzo(a)pyrene equivalent (BaPEq) concentrations in sediment. These chemicals represent possible site COPC to humans and/or ecological receptors in MRC sediments (Tetra Tech, 2009). These figures also display Thiessen polygons around the sampling locations, the boundaries of which define the area closest to each point relative to all other points or physical site features (e.g., shoreline). Therefore, sampling locations close to one another have smaller polygons and locations with samples farther apart have larger polygons.

The chemical concentration assigned to each polygon is the concentration of the sample taken within the polygon boundary. The Thiessen figures were used to determine which samples and areas exceed criteria and background concentrations. Background concentrations are shown in the legends of Figures 4-1 through 4-11 (where available) and consist of the maximum detected concentrations in the background sediment samples for each depth interval.

PAH concentrations are typically evaluated by converting them to BaPEq concentrations, then comparing the result to human health risk based values. The BaPEq is the sum of PAH

concentrations after applying toxicity equivalence factors to each PAH compound. Figures 4-10 and 4-11 summarize BaPEq concentrations compared to 1E-05 (i.e., a one–in-100,000) risk based values. Total Aroclor concentrations are shown in Figure 4-8 in relation to 1,000 µg/kg, which is a Toxic Substances Control Act soil cleanup level for high occupancy areas (USEPA, 2005).

Figures 4-1 through 4-7 and Figure 4-9 summarize chemical concentrations compared to ecological benchmarks for sediment invertebrates. The ecological benchmarks consist of threshold effects concentrations (TECs) and probable effects concentrations (PECs) derived by MacDonald *et al.* (2000), or threshold effects levels (TELs) and probable effects levels (PELs) derived by MacDonald *et al.* (1996). The Thiessen figures also include comparisons to twice the PEC (or PEL) and five times the PEC (or PEL). The TEC and TEL are the concentrations below which adverse effects on sediment invertebrates are not expected, whereas PECs and PELs are defined as concentrations above which adverse effects to sediment invertebrates are probable (MacDonald *et al*., 1996, 2000). The significance of exceeding ecological benchmarks will be discussed in the ecological risk assessment (ERA).

4.1.2.1 Inorganics (Metals)

Several metals were detected in sediment at concentrations in excess of ecological screening values, but concentrations of most metals tend to be less than or slightly greater than regional background-concentrations. Thus, Thiessen polygons were generated for the metals posing the highest potential of risk to ecological receptors: cadmium, chromium, copper, lead, mercury, and zinc (Figures 4-1 through 4-6). Ecological risk due to other metals in sediment is minor, and will be discussed in greater detail in the ERA.

Cadmium concentrations in surface sediment are highest in Cow Pen Creek and along the shoreline of MRC in Dark Head Cove near Outfalls 05 and 08 (Figure 4-1). The area near Outfall 05 is also the area with the greatest concentrations of total Aroclors (see Section 4.1.2.2). Several samples had cadmium concentrations in excess of the PEL (4.21 milligram per kilogram [mg/kg]). Cadmium concentrations in Dark Head Cove sediments tend to be higher in the >6-18 inch and >18–30 inch intervals than in surface sediments, and the highest concentrations are found in these intervals. The highest cadmium concentrations in the >18–30 inch interval were away from the MRC Dark Head Cove and Dark Head Creek shorelines.

Elevated chromium concentrations (Figure 4-2) follow a similar pattern to that of cadmium, with the highest concentrations in the two middle depth intervals of Dark Head Cove. Several samples had chromium concentrations in excess of the PEC (111 mg/kg). The highest chromium concentration in surface sediment was 699 mg/kg in SD-43. The highest concentration in the >6-18 inch interval was 2,460 mg/kg (SD-46), the highest in the >18–30 inch interval was 2,060 (SD-86) and the highest in the >30-52 inch interval was 597 mg/kg (SD-105).

Copper concentrations follow a different pattern than cadmium and chromium, with concentrations decreasing with increasing depth (Figure 4-3). Most samples with concentrations exceeding the PEL were in surface sediments either south of Outfall 05 or in Dark Head Creek. No copper detections exceeded the PEL in the two deepest intervals.

The highest lead concentration was greatly elevated, at 31,500 mg/kg in surface sediment sample SD-84, from the upper reaches of Cow Pen Creek. Most surface sediment concentrations were less than background (Figure 4-4). Most of the elevated (i.e., greater than the PEL and background) lead concentrations were in the two middle depth intervals, and tended to be in Dark Head Cove and Dark Head Creek. In the deepest interval, lead concentrations exceeded the PEL in one sample (SD-105 at 163 mg/kg).

Most mercury concentrations were less than background in surface sediment samples (Figure 4-5). Mercury concentrations are highest in the >6–18 inch and >18–30 inch intervals, with some concentrations in the >18–30 inch interval in Dark Head Cove being more than twice the PEL. In the deepest interval (>30–52 inches), mercury concentrations exceeded the PEL in sample SD-105 in Dark Head Creek, which is the same sampling location where copper and lead were highest at this depth.

Zinc concentrations in surface sediment were similar to those in the >6–18 inch interval; concentrations in these two intervals exceeded the PEC in few samples, with PEC exceedances in samples near the MRC shoreline (Figure 4-6). More samples exceeded the zinc PEC in the >18-30 inch interval than in the shallower intervals. The deepest interval (>30–52 inches) had the fewest PEC exceedances but the highest overall zinc concentration at 4,370 mg/kg in SD-88.

In summary, the highest concentrations of metals were generally found in the samples collected from the >6–18 inch and >18–30 inch intervals, which indicates that the sediment with higher

concentrations is being buried under cleaner sediments and the highest concentrations are probably due to historical releases. Some exceptions were observed in Cow Pen Creek, which is to be expected because the deposition rate is probably lower in the creek than in the cove. This conclusion is supported by the age-dating analysis discussed in Section 4.3 and the hydraulic analysis discussed in Section 4.6, which indicates that the highest bed stresses are in Cow Pen Creek. Cadmium and chromium generally had the greatest concentrations with respect to their sediment guidelines, as compared to the other metals detected.

4.1.2.2 PCBs

Three Aroclors (Aroclor-1248, -1254, and -1260) were detected in sediment. Aroclor-1254 was detected in only one of 101 surface sediment samples and was not detected at other sediment depths. Aroclor-1248 was not detected in surface sediment nor in the >30–52 inch interval. It was detected in two of 71 samples at >6–18 inches and in one of 68 samples at >18–30 inches. Therefore, although positive detections of all Aroclors were summed to derive concentrations of total Aroclors, total Aroclor concentrations predominately represent concentrations of Aroclor-1260.

Total Aroclor concentrations were highest in surface sediments, and decrease with increasing depth (Figure 4-7). Surface sediment concentrations were highest in the middle of Dark Head Cove and adjacent to the shoreline of the MRC complex (i.e., near Outfall 05). The maximum surface sediment concentration was 54,000 micrograms per kilogram (µg/kg) (SD-9) and the next highest was 20,000 µg/kg (SD-27). The maximum total Aroclor concentration in subsurface sediments in the >6–18 inch depth interval was 14,000 µg/kg at SD-58 near Outfall 05.

Total Aroclor concentrations in only one sample in the >18–30 inch interval exceeded 1,000 µg/kg (SD-89 at 1,300 µg/kg), and all concentrations in the >30–52 inch interval were less than 1,000 µg/kg. Table 4-10 summarizes concentrations of PCBs reported in the literature for various locations in the Chesapeake Bay region. The studies used to generate Table 4-10 include areas of elevated PCBs, so some of the values in Table 4-10 do not represent background concentrations; the table is included for informational purposes only. PCBs were not detected at the reference locations for this investigation.

4.1.2.3 Semivolatile Organics

Sediment samples collected in 2005 were analyzed for semivolatile organic compounds (SVOCs). No SVOCs were detected in sediment above human health screening criteria. Although a few SVOCs exceed ecological criteria, ecological risks are minor and the 2005 data indicate that PAHs are the primary SVOCs of interest in terms of frequency of detection and the magnitude of the concentrations detected. As a result, sediment samples collected in 2008 and 2010 were analyzed only for PAHs and not for other SVOCs.

The highest concentrations of total PAHs (used to evaluate potential ecological risk) were in samples collected along the shoreline of MRC and in Dark Head Cove (Figure 4-9). In surface sediment, the highest PAH concentrations were in samples from the eastern portion of Dark Head Cove (near Martin State Airport [MSA]) and in the middle of the cove adjacent to the MRC property (near Outfall 05). Elevated PAH concentrations (greater than the PEC of 22,800 µg/kg for total PAHs) were detected in four surface sediment samples, nine samples from the >6-18 inch interval, eight samples from the >18–30 inch interval, and in no samples from the >30–52 inch interval.

PAH concentrations tend to be higher in the middle two depth intervals (>6–18 inches and >18-30 inches) than in surface sediment. PAH concentrations in most samples from the top two intervals were less than the maximum background concentration, as indicated by the cross-hatched polygons in Figure 4-9. Total PAH concentrations in nearly all sediment samples from the deepest sediment interval are less than screening criteria.

Concentrations of BaPEq tend to show the same trends as were observed for total PAHs. The BaPEq concentrations depicted in Figures 4-10 and 4-11 are compared to human health risk based concentrations (RBCs) specifically calculated for a recreational-user scenario hypothetically exposed to the sediment. The 700 µg/kg RBC assumes that the recreational user is exposed even as a small child. The 1,600 µg/kg RBC assumes that the recreational user is not exposed as a small child (exposure is assumed to occur as an adolescent and adult). The benchmarks represent the one-in-100,000 cancer risk level.

As displayed in Figures 4-10 and 4-11, BaPEq concentrations calculated for several polygons primarily in the shallower zones exceed these benchmarks. Concentrations exceeding the

1,600 µg/kg benchmark are most frequently reported for polygons abutting the MRC shoreline. This pattern of concentrations is as expected given the fact that PAHs are typically bound to sediment particles which would tend to settle out quickly once introduced into a surface water body.

4.1.2.4 Volatile Organics

Sediment samples collected in 2005 were analyzed for volatile organic compounds (VOCs), whereas sediment samples collected in 2008 and 2010 were not analyzed for VOCs because the 2005 data indicate that VOCs do not pose significant risks. Most VOCs were detected infrequently in sediment, and most detections were less than screening benchmarks. Methyl tert-butyl ether (MTBE) was the most frequently detected VOC, being detected in 24 of 41 surface sediment samples in 2005 at concentrations ranging from 3–9 µg/kg. The human health screening benchmark for direct contact with MTBE is 39,000 µg/kg.

No VOCs were detected in sediment above human-health screening criteria. For ecological receptors, carbon disulfide is the only VOC with a screening level exceedance. Detected concentrations of carbon disulfide in surface sediment exceeded the ecological screening value in two samples (SD-9 and SD-29). Carbon disulfide can occur naturally in sediments since it is a natural product of anaerobic biodegradation.

4.1.3 Bioavailability Parameters

4.1.3.1 Acid Volatile Sulfides/Simultaneously Extracted Metals

AVS/SEM analysis was conducted on sediment samples from seven locations. At each location, all four depth intervals were analyzed for AVS/SEM. AVS binds, on a molar basis, some cationic metals of environmental concern. In sediment samples where the AVS molar concentrations are greater than SEM molar concentrations, the SEM metals are not expected to be bioavailable or directly toxic to benthic invertebrates. However, in sediment samples where the AVS molar concentrations are less than SEM molar concentrations, the SEM metals are not necessarily bioavailable or directly toxic to benthic invertebrates because other parameters such as total organic carbon (TOC) may reduce the bioavailability and toxicity of metals in the sediment. Anoxic sediments typically have greater AVS concentrations than sediments that are well

aerated. The 2010 SEM analysis included the metals cadmium, chromium, copper, lead, nickel, silver, and zinc.

The results of the AVS/SEM analyses are presented in Tables 4-2 through 4-9. In general, the concentrations of AVS were higher than SEM in most samples. AVS was not detected in one sample. The AVS/SEM data will be evaluated further in the ERA.

4.1.3.2 *Ex situ* Porewater

Sediment porewater was collected to determine the equilibrium concentrations of COPC in porewater both horizontally and vertically near the MRC to determine whether the chemicals in the sediment are bioavailable. These data will be used to evaluate the potential for risk posed to sediment dwelling organisms by estimating the steady state concentrations of COPC in porewater at areas with elevated COPC concentrations in sediment. Porewater was extracted at the laboratory from core depths corresponding to the top three intervals sampled for chemical compounds in sediments (0–6, >6–18, and >18–30 inches).

Porewater data are provided in Tables 4-11 through 4-16 and are grouped according to the three depth intervals 0–6, >6–18, and >18–30 inches below the surface water/sediment interface). Tables 4-11, 4-13, and 4-15 provide the porewater analytical results for individual samples. Tables 4-12, 4-14, and 4-16 provide a summary of the analytical data.

Porewater concentrations of various metals (arsenic, cadmium, and selenium) and PAHs exceeded surface water ecological screening values at all three intervals in one or more samples, and Aroclor-1260 concentrations exceeded surface water ecological screening values in all porewater samples in which it was detected (Tables 4-10, 4-12, and 4-14). Porewater concentrations of lead exceeded surface water ecological screening values in one interval. The significance of these exceedances will be discussed in the ERA.

4.2 ALKYLATED PAHs

Nineteen sediment samples were submitted to META from the MRC site. META received 15 sediment samples from the MRC site on August 19, 2010, and four additional MRC sediment samples on August 24, 2010. Two stormwater runoff samples and one stormwater sediment sample were also received on October 15, 2010. These samples were analyzed for hydrocarbon

fingerprints and an expanded list of mono-aromatic hydrocarbons (MAHs) and PAHs. This section summarizes the analytical findings. A copy of the complete report, including tables and graphs, is in Appendix D.

All of the samples contained various amounts of MAHs and PAHs in patterns consistent with mixtures of pyrogenic and petrogenic sources. Distinguishing features of these samples include relatively more high molecular weight PAHs (HPAHs) than MAHs and low molecular weight PAHs; relatively low total PAH concentrations (0.011–107 mg/kg); late eluting unresolved complex mixtures, petroleum biomarkers, high molecular weight, and odd carbon normal-alkane distributions; and molecular sulfur and elevated perylene in some samples. These features are consistent with general background in urban sediments. Urban background includes PAHs from many sources, including smoke from natural and industrial fires, motor vehicle exhaust, roadway paving and driveway sealants, construction debris and fill materials, and petroleum spills, among others. Often more than one of these sources contributes to an urban background signature.

Samples SD-90-02, collected at the northeastern side of Dark Head Cove between Outfalls 07 and 09 and SD-87-02 approximately one third of the way up Cow Pen Creek, contained total PAH concentrations (107 mg/kg and 103 mg/kg, respectively) somewhat higher than expected for urban background. The PAH patterns are pyrogenic, not petroleum derived, although both samples contained severely weathered high molecular-weight petroleum residuals consistent with urban background. The PAH ratios suggest that the principal PAH source is combustion related and is more similar to urban background surface soil than to tar sources derived from coal tar and coal tar products, based on a comparison to META's archive of reference samples.

Various PAH ratios for the samples were calculated to provide an indication of potential source(s). As discussed above for samples SD-90-02 and SD-87-02, the PAH ratios indicate that much of the PAH mass is pyrogenically derived, even though there are indications of petrogenic materials in the samples. Common historical sources of pyrogenic PAHs include manufactured-gas plants (MGP) and carbureted-water gas plants (CWG), neither of which has been present at the site. The fluoranthene/pyrene (Fl/Py) ratios of all the samples are higher than what is typically found for MGP and CWG plants, but lower than those typical of commercial coal tars (from byproduct coke plants) and their derivatives, such as road tar and creosote. Although the Fl/Py ratios of the sediment samples are in the range normally associated with

some coal tar residues and materials containing such residues, such as some older building materials and some paving materials, the benzofluorenes/methylpyrene (BF/MP) ratios are somewhat lower than expected for coal tars and coal tar products and wastes from former gas plants.

When compared with PAH ratios from a large set of urban-background surface soil samples collected and analyzed by META, the MRC sediments cluster more closely to most urban-background surface soil samples than the tar samples (or even more so than the petroleum reference samples). The higher concentration samples (SD-90-02 and SD-87-02) also plot near the urban-background surface soil samples. These samples could contain some contribution from pavement, sealants, or other tar derived products. Sources may include roadways, creosote treated pilings, and runoff from MSA.

(Fl+Py/PP HPAHs) can help distinguish between background sources of PAHs and tar derived PAHs. Most MRC sediment samples have Fl+Py/PP HPAHs ratios lower than most of the tar reference samples. Sample SD-94-01 appears to be an outlier, likely due to the very low concentrations of PAHs detected in that sample.

Two samples of water and one sediment sample were analyzed at a later date in association with a stormwater event at the site. The two stormwater samples did not contain PAHs at concentrations high enough to interpret. The stormwater sediment sample did contain PAHs at low concentrations. The stormwater sediment sample and its laboratory duplicate plot similarly to the cove sediment samples and other PAH background samples, suggesting the PAHs originated from similar urban runoff sources.

4.3 AGE DATING

Sediment chronology is based on the analysis and interpretation of the radioactive nuclides lead-210 (Pb-210) and cesium-137 (Cs-137) in samples taken at various depths in sediment cores (Appendix E). The analytical results are used to derive sedimentation rates and calendar dates in the sediments. The methods are described in a paper by Hewitt W. Jeter (Jeter, 2000).

Lead-210 is a natural radioactive form of lead produced as atmospheric fallout by the radioactive decay of natural radon-222 (Rn-222) gas. This nuclide accompanies sediments that accumulate at the bottoms of natural water systems. Under conditions of steady deposition, profiles of Pb-210

concentration in sediments (after subtracting the constant Pb-210 background of the sediment itself) often decrease logarithmically with increasing depth because of radioactive decay (with a half-life of 22.3 years).

To derive a sedimentation rate, transverse sections are taken at intervals from a sediment core and are analyzed for Pb-210. The background concentration is subtracted to derive the "excess Pb-210" caused by atmospheric fallout. The logarithms of these excess Pb-210 concentrations are plotted against depth, and regression lines are fitted to straight portions of the plots. The slopes of these lines are used to calculate sedimentation rates. When base 10 logarithms are used and the depths are expressed in centimeters, the sedimentation rate in centimeters per year equals -0.01352/slope. Calendar dates at various depths in the core can then be calculated from the sedimentation rate using a known reference date, such as the core collection date at the sediment surface.

Cesium-137 is a fission product that is a component of fallout derived from atmospheric testing of nuclear weapons. The Cs-137 method is fundamentally different from the Pb-210 method in that it provides date "markers" rather than concentration slopes that can be interpreted. The first appearance of Cs-137 in sediments generally marks the year 1954. Another marker is often found in the form of a concentration maximum at the year 1963, caused by an increase and then a decrease in nuclear testing.

To derive a sedimentation rate, transverse sections are taken at intervals from a core and analyzed for Cs-137. The resulting concentrations are plotted against depths and the markers are identified visually. A sedimentation rate can be calculated as the depth of the 1954 marker divided by the time interval between core collection date and the year 1954. Another sedimentation rate can be calculated as the depth of the 1963 marker divided by the time interval between the core collection date and the year 1963. Still another sedimentation rate can be calculated as the difference in depths between the two markers divided by the nine-year interval between 1954–1963. These calculations may yield different sedimentation rates because they represent different time intervals and different depths. Calendar dates at different depths in the core can be calculated from the sedimentation rates using known reference points, such as the marker depths and years, or the core collection date at the sediment surface.

The suite of sediment samples was analyzed for Pb-210 and Cs-137 at the laboratory and the results were plotted and used to recommend the analysis of six additional sections from each core to refine the chronology study. These samples, plus two additional quality control samples, were sent to the laboratory. The second suite of samples was analyzed at the laboratory and the results added to the plots for each core.

A sediment chronology report was written for each core. The laboratory completed a full Level 4 documentation of the analyses and sent it to Tetra Tech on November 10, 2010. Data plots used in the chronology interpretation of Dark Head Cove, Cow Pen Creek, and Dark Head Creek below confluence of Dark Head Cove and Cow Pen Creek cores, as well as measurements of Pb-210 and Cs-137 and details of the analyses, are in Appendix E.

Sedimentation rates derived by the three chronology methods described above are shown below:

- ***Dark Head Cove inferred sedimentation rate:***
  - Pb-210 chronology 0.99 centimeter per year (cm/yr)
  - Cs-137 chronology (1963 maximum) 0.57 cm/yr
  - Cs-137 chronology (1954 horizon) 0.80 cm/yr
- ***Dark Head Creek inferred sedimentation rate:***
  - Pb-210 chronology 1.7 cm/yr
  - Cs-137 chronology (1963 maximum) 1.1 cm/yr
  - Cs-137 chronology (1954 horizon) 1.1 cm/yr
- ***Cow Pen Creek mouth inferred sedimentation rate:***
  - Pb-210 chronology 0.51 cm/yr
  - Cs-137 chronology (1963 maximum) 0.34 cm/yr
  - Cs-137 chronology (1954 horizon) 0.30 cm/yr

Age profiles for the three sediment cores, calculated at 5 cm depth intervals, are included in Appendix E. Ages at intermediate depths can be calculated using the equations in Appendix E, however, extrapolating ages beyond the depths shown would involve assumptions of constant sedimentation rates beyond the range of useful chronology measurements.

The highest sedimentation rate is found in Dark Head Creek, followed by Dark Head Cove, and then Cow Pen Creek. These results are consistent with what would be expected for these types of

water bodies. Dark Head Creek is deep, receives flow from multiple sources and has a large surface area. Dark Head Cove has a deep and large confined surface area, whereas Cow Pen Creek is shallow, narrow, and confined, with a smaller overall surface area. The intervals where impacts have typically been found in these water bodies support the findings of the age dating and hydraulic analysis (Section 4.6). Contaminants were found at deeper intervals at locations with higher sedimentation rates, as mentioned in Section 4.1.2. In Cow Pen Creek (where the deposition rate is lowest and sediment scouring is highest), contaminants were typically found at shallower intervals than in the other two water bodies.

The data plots for Dark Head Cove and Dark Head Creek indicate that the Pb-210 data are closely grouped around the logarithmic regression lines, and the Cs-137 profiles clearly show the 1963 maxima and the 1954 horizons. Chronology calculations for these cores may be appropriate. The Cow Pen Creek plots are less regular, resulting in less certainty in the chronology interpretation. Pb-210 data at 18–20, 22–24, and 26–28 cm depths are not plotted because the concentrations are near the supported concentration of 0.44 picocuries per gram (pCi/g) dry. This suggests that steady sedimentation is periodically interrupted, perhaps through transport by water flow. The Cs-137 profile for this core also has poorer definition of a 1963 maximum than the other cores. The high bottom shear at this location (discussed further in Section 4.6, "Hydraulic Analysis") is consistent with interruption of steady deposition by sediment transport processes. Bottom shear could also lead to lower net sedimentation rates because of periodic removal of sediments by water flow.

The regularity of Pb-210 plots for Dark Head Cove and Dark Head Creek implies an absence of sedimentation interruption in the first 50 or 60 centimeter (cm) of these cores, respectively. Deeper levels cannot be interpreted because they are below the level of useful chronology measurements. The irregular profiles at the Cow Pen Creek location indicate interruption of steady sedimentation, caused by water flow and/or other processes.

4.4 ANALYSIS OF GROUNDWATER DISCHARGE OF VOCS

The objective of *in situ* porewater and surface water sampling was to quantify sediment porewater and surface water concentrations of VOCs that may be present as a consequence of the VOC groundwater plumes discharging into adjacent surface water bodies at the MRC. Several VOCs were detected in samples from three locations in Cow Pen Creek and five locations in

Dark Head Cove. All VOC concentrations detected in porewater are less than Safe Drinking Water Act (SDWA) maximum contaminant levels (MCLs), when available, and less than RSLs for tap water when a SDWA MCL was not available. Table 4-17 shows positive detections of chemicals from Cow Pen Creek.

The concentration of carbon disulfide exceeded the ecological freshwater surface-water criterion (0.92 µg/L) in one sample (0.95 µg/L at CPC-PW-1) from Cow Pen Creek. Carbon disulfide was not detected at the other two locations in Cow Pen Creek. 2-Butanone was detected in all three samples from Cow Pen Creek, whereas other VOCs were detected in only one of the three samples. Chlorinated VOCs (1,1-dichloroethane, cis-1,2-dichloroethene, and vinyl chloride) were detected in sample CPC-PW-3. Summary statistics for samples from Cow Pen Creek are presented in Table 4-18.

No chemical concentrations reported for samples collected from Dark Head Cove exceed ecological criteria (see Table 4-19). 2-Butanone and acetone were detected in all five samples from Dark Head Cove. Carbon disulfide was detected in three samples and cis-1,2-dichloroethene in two. 4-Methyl-2-pentanone, methylene chloride, tetrachloroethene, toluene, and trichloroethene (TCE) were detected in single samples from Dark Head Cove at concentrations well below ecological criteria. Summary statistics for samples from Dark Head Cove are presented in Table 4-20. Human health criteria are presented in Tables 4-17 and 4-19 solely as points of reference, as the ecological criteria are generally the more relevant criteria for porewater data.

No chlorinated VOCs were detected in any surface water sample co-located with the porewater VOC samples (Table 4-21). Very low concentrations of acetone and 2-butanone were detected in the co-located surface water samples. DHC-SW-VOC-1 had a 2-butanone concentration of 0.65 microgram per liter (µg/L) that was J-qualified, indicating an estimated result. Results in all other samples were reported as non-detected. Acetone was identified in seven surface water samples at concentrations ranging from 2.3–12 µg/L. All positive detections were J-qualified; two samples were reported as blank contaminated (CPC-SW-VOC-2, CPC-SW-VOC-3), and the remaining samples were reported as non-detected. Whereas VOCs were detected in porewater at low concentrations, the discharge of impacted groundwater to surface water is limited due to the

low groundwater flux to surface water caused by the low permeability soil at the site and very slow groundwater flow rates.

As part of preparation of the *Groundwater Response Action Plan* (RAP) (to be submitted under separate cover), extensive groundwater modeling was conducted to determine groundwater and contaminant flow patterns at the site. Modeled scenarios include active remediation and monitored natural-attenuation. One of the model outputs for each scenario was a determination of the mass of contaminants discharged to Dark Head Cove and Cow Pen Creek. For example, for a no action or monitored natural-attenuation scenario, the total mass of TCE discharged to the surface water was calculated as just 7.5 pounds over a 100-year period.

The maximum yearly flux to the surface water was just 0.03 pounds for the eastern TCE area and 0.02 pounds for the western TCE area. Inputting a flux 100 times higher than that determined in the model still results in surface water concentrations well below the relevant Maryland standard for TCE (300 μg/L for surface water bodies not used for drinking water) (*Code of Maryland Regulations* 26.08.03.02-2). That is also less than the federal Ambient Water Quality Criteria (AWQC) of 30 μg/L for those surface water bodies. The water-quality modeling calculations are in the groundwater RAP. The results of the porewater VOC analyses described above confirm those modeling results.

4.5 STORMWATER EVALUATION

Stormwater sediment was sampled to evaluate whether stormwater may be transporting land based contaminants to sediments in Cow Pen Creek and Dark Head Cove. The locations sampled were selected to capture flow into Cow Pen Creek and Dark Head Cove unrelated to the MRC. The sediment sample collected during the rainstorm (MRC-SED-1) was analyzed for metals and alkylated PAHs. Two surface water samples (one co-located with the sediment sample) were also analyzed for metals and alkylated PAHs. The concentrations of metals detected in the sediment sample are presented in Table 4-2 and surface water samples are presented in Table 4-21 (surface water table). Alkylated PAHs were evaluated in the *Environmental Forensic Report MRC Sediment and Storm Event Sample* (see Appendix D).

Concentrations of chromium, copper, iron, manganese, and nickel in the stormwater sediment sample exceed ecological screening criteria. Concentrations of chromium and copper in the

stormwater sediment sample are similar to concentrations in an off-site downstream Middle River surface sediment sample and several site sediment samples. Iron and manganese were not analyzed for in other site samples. The concentration of nickel was lower than the concentration in several background samples. The concentrations of metals in the surface water samples were generally low.

The stormwater sediment sample contained low concentrations of PAHs with a total PAH concentration of 1.47 mg/kg. The stormwater sediment sample contained a wide-ranging distribution of parent and alkylated PAHs with 4-, 5-, and 6-ring parent PAHs most abundant. PAHs often are classified in sub-groups based on their structures. PAHs that consist of fused benzene rings with no substitutions, such as aliphatic side chains or oxygen containing functional groups attached are called "parent" PAHs.

When aliphatic side chains are added to a particular parent PAH, such as naphthalene, the resulting compounds are termed alkylated PAHs. Thus, methylnaphthalene, ethylnaphthalene, trimethylnaphthalene, and many others are alkylated PAHs of the parent, naphthalene. The relative amount of alkylated PAHs to their respective parent is determined by several factors, including the temperature and pressure of formation. Hence, petroleum contains substantially more alkylated PAHs than parent PAHs, whereas coal tar and combustion sources contain more parent than alkylated PAHs.

PAHs were only detected at low concentrations in the co-located surface water sample (MRC-SW-1). PAHs were not detected in the other surface water sample (MSA-SW-1). PAHs in the surface water samples could not be characterized due to insufficient PAH concentrations. The *Environmental Forensic Report* suggests that the stormwater sediment sample and other sediment samples analyzed from the site contain PAHs that originated from similar urban runoff sources (see Appendix D).

4.6 HYDRAULIC ANALYSIS

A modeling analysis estimated the stability of bed sediment in Cow Pen Creek, Dark Head Cove, and aspects of Dark Head Creek. The analysis considered two extreme events that might affect sediment in the study area: high rainfall in the Cow Pen Creek and Dark Head Creek watersheds

and a historical storm surge and accompanying period of high wind. This section summarizes that analysis. The complete analysis, including figures and tables, is in Appendix G.

The *Environmental Fluid Dynamic Code* (Hamrick, 1992; Tetra Tech, 2007; USEPA, 2007) was used for the modeling analysis, which involved determining bed stresses during simulated events. Model forcing-functions include runoff into Cow Pen Creek and Dark Head Cove, tidal water surface elevation at the mouth of Dark Head Creek, and wind forcing over the entire model domain. The high rainfall runoff event is based on a 100 year annual-recurrence interval 24-hour rainfall of 8.7 inches (24.7 cm) resulting in a 49 cubic feet per second (cfs) (1.39 cubic meter per second [cms]) flow into Cow Pen Creek and a 66 cfs (1.88 cms) flow into Dark Head Cove. A spring tide range of 0.48 (National Oceanic and Atmospheric Administration [NOAA], 2010) meters was assumed to occur during the rainfall event.

Maximum sediment bed stresses for this event were evaluated. Bed stresses are less than 0.1 Newton per square meter (N/m^2) over most of the study area except for the upstream area of Cow Pen Creek, where maximum stresses reach 4 N/m^2. Field investigations of critical bed stresses for the erosion of cohesive sediments in the Chesapeake Bay region (Maa, *et al*., 1998, 2002, 2008) indicate that 0.1 N/m^2 is a lower boundary for the critical erosion stress. Sand and noncohesive-behaving silt beds are also stable at stresses below 0.1 N/m^2 (Garcia, 2008).

The second event is based on the historical storm surge and winds associated with Hurricane Isabella in September 2003. Surface water elevation at the NOAA monitoring station in Baltimore Harbor was used for the tidal boundary condition. The wind forcing is based on observed wind speed and direction at Baltimore Washington International Airport. Stresses are less than 0.1 N/m^2 over much of the area, with high stresses again occurring in the upstream area of Cow Pen Creek. Bands of high stress occur along the southwest shoreline of Dark Head Cove and in Dark Head Creek.

To determine the relative importance of the wind forcing, the surge simulation was repeated without wind stresses associated, with only the surge below 0.03 N/m^2 over the entire area, indicating that high wind speeds in excess of 16 meters per second (36 miles per hour) are primarily responsible for the higher stresses. Since local sheltering effects are not accounted for, the wind-induced stresses can be viewed as conservative. The general conclusion of the analysis is that the sediment bed in the area of interest is stable, except for the upstream area of Cow Pen

Creek. Limited potential for long-term contaminate accumulation in the area exists since this area is susceptible to erosion during high rainfall-generated flow events,

4.7 BATHYMETRIC SURVEY

The Middle River bathymetry survey mapped in high detail the morphology of Dark Head Cove and, to the extent possible due to dense vegetation, Cow Pen Creek. Water depths in the survey area range from 0.5–13.7 and average 8.8-U.S.-survey feet (as referenced to NAVD88). These data, which are gridded at 3 feet by 3 feet, provide surface water/sediment elevations for the site for use in sediment transport modeling. The surface water/sediment elevations can also support dredge- or capping-design efforts, design dredge cuts, and to calculate dredge and capping volumes. Obstructions protruding off the bottom can be identified in the data, including docks, aquatic vegetation and boat ramps. A copy of the bathymetric survey including data, figures, and images is included in Appendix F.

4.8 BENTHIC MACROINVERTEBRATE SAMPLING

Benthic macroinvertebrate samples were collected from two locations in Cow Pen Creek, five in Dark Head Cove (Figure 3-1), and three reference locations. The three reference locations (Marshy Point, Bowleys Quarters, and Middle River) were described in Section 4.1.1 and are shown in Figure 3-2. Five Petite Ponar® sediment samples were collected at each location.

The samples were sieved and sorted at the laboratory, where benthic macroinvertebrates were identified and counted. A suite of benthic assemblage-level characteristics (i.e., metrics) were calculated for each of the ten sampling locations. Biological metrics from the seven site locations were compared to those from the reference locations to determine the relative health (biological condition) of different site locations. The metrics are based on the *Chesapeake Bay Benthic Index of Biotic Integrity* for oligohaline estuaries. The results of the macroinvertebrate sampling are in Appendix H and will be evaluated in the ERA.

4.9 PRE-DESIGN TESTING

Tetra Tech completed bench scale testing of sediment-dewatering technologies and associated dewatering and performance characteristics as a starting point for future analysis of remedial alternatives if remediation is ultimately required. The testing evaluated whether sediment-tube dewatering technology is feasible for Cow Pen Creek and Dark Head Cove sediments.

4.9.1 Sediment Dewatering Test Objectives

Sediments may be dredged from Cow pen Creek and Dark Head Cove as part of possible future remediation. Dredged sediments will require dewatering before being transferred to a landfill. Dewatering sediment reduces its volume, which can reduce transport and disposal costs. Treatability testing focused on passive sludge-dewatering technology using a geotextile fabric. The objectives associated with the sediment-dewatering-bag test (SDBT) and associated analytical and geotechnical tests were to:

- define optimal chemical conditioning agent(s) that can enhance sediment dewatering in a sediment tube/bag
- represent sediment dewatering on a pilot scale
- define sediment dewatering rates and dewatering cycle time based upon test data evaluation
- quantify passage of sediment solids (suspended solids) through the geotextile container (tube or bag) containing the dredged sediment
- define dewatered sediments final total-solids concentration (achievable percent-solids) and determine if geotextile containers can generate a final product that meets client dewatering goals
- define sediment-porewater chemical characterization to develop management alternatives
- define physical and geotechnical characteristics of dewatered sediment
- define which chemical solidification/stabilization (CSS) agent (fly ash, Portland cement, kiln dust, or slaked lime) can produce a sediment matrix with sufficient strength for landfill disposal and define the CSS-agent dosages needed to achieve the required matrix strength

Relatively few geotextile types are designed and commercially available for sediment dewatering applications. TenCate Geosynthetics' Geotube GT500 dewatering fabric is one of the few identified specifically for and proven effective in dewatering dredged sediments. GT500 geotextile container material is a specially engineered dewatering geotextile manufactured from high tenacity polypropylene multifilament and monofilament yarns.

4.9.2 Sediment-Dewatering-Bag Test Procedures

The following phases and associated test procedures were implemented during sediment-dewatering-bag testing to accomplish the test objectives:

1. *Preliminary sediment-conditioning evaluation testing:* Testing procedures outlined in Appendix I, Section 4.1.1.

2. *Confirmation sediment-conditioning evaluation testing:* Testing procedures outlined in Appendix I, Section 4.2.1.

3. *Sediment-dewatering-bag testing:* Testing procedures outlined in Appendix I, Section 5.1.

4. *CSS testing:* Testing procedures outlined in Appendix I, Section 6.1.

4.9.3 Sediment-Dewatering-Bag Test Results

SDBT results/conclusions/recommendations generated during the study are as follows:

- Of the various polymers tested during the preliminary and confirmation sediment conditioning evaluations, the dual polymer system of Solve 426 and Solve 127 produced the optimum results for coagulating and flocculating sediment slurry solids. Optimal dosages for these polymers were: (1) Solve 426 = 33 ml/gallon (milliliters per gallon) sediment slurry at 1% polymer solution; (2) Solve 127 = 47.2 mls/gallon sediment slurry at 1% polymer solution. In this dual polymer system, Solve 426 is added to the sediment slurry before adding Solve 127.

- Sediment dewatering with the GT500 geotextile fabric produced dewatered sediment cakes with acceptable solids content (CON-SED = 36%; CPC-SED = 49%; DHC-SED = 49%), which passed paint filter tests and released minimal solids into the porewater generated. The sediment solids-content recorded throughout dewatering for the tested sediments were as follows:

Sediment identification	*In situ* solids (%)	Conditioned slurry (%)	Final dewatered solids (%)
CON-SED	35.3	10	36
CPC-SED	42.9	8	49
DHC-SED	47.3	8	49

- Sediment classifications based on geotechnical results obtained throughout dewatering were as follows:

Sediment identification	*In situ* solids	Conditioned slurry	Final dewatered solids
CON-SED	Fat Clay	Elastic Silt	Elastic Silt
CPC-SED	Elastic Silt	Elastic Silt with Sand	Elastic Silt with Sand
DHC-SED	Clayey Sand	Elastic Silt with Sand	Sandy Lean Clay

- Porewater generated during the SDBTs was relatively clear with respect to solids and turbidity but still contained constituents at levels exceeding applicable USEPA AWQC.

Therefore, porewater may require treatment on-site before it can be discharged back to CPC or DHC, or require some other management approach such as disposal of the porewater at a publicly owned treatment work or a commercial waste-management facility.

- In most cases, filtered parameter concentrations (dissolved fraction) were less than their total concentrations, particularly in relation to metals concentrations. In some cases, the resulting filtered concentration was reduced below AWQC. Therefore, on-site pretreatment of porewater with filtration may be an option before discharging the porewater back to Cow Pen Creek or Dark Head Cove.

- The results of the CSS evaluations identified Portland cement as the CSS agent demonstrating the greatest unconfined compressive (UCC) strength in each of the three sediments. As would be expected, the highest dose (CSS agent: wet-sediment ratio) added the most strength to the sediment matrix. The unconfined compression strength of a specimen tends to increase with an increase in density and solids content. The highest UCC test recorded during the study was 11.2 pounds per square inch in the 21-day specimen for the CON-SED sediment, using 15% Portland cement. Both slaked lime and fly ash added some strength to the sediment matrices, but not as much as that demonstrated by the Portland cement. Kiln dust additions produced specimens that did not harden and remained soft to the point that the geotechnical laboratory declared the specimen unacceptable for testing. Therefore, this CSS agent (at least as a standalone agent) may be eliminated from any potential further evaluation.

The favorable results generated during the SDBT testing suggest that the dual polymer system (Solve 426 and Solve 127) and sediment-dewatering tubes constructed with GT500 geotextile fabric should be considered for dewatering sediment before disposal, if required.

Porewater chemical characterization should be compared to the existing Cow Pen Creek and Dark Head Cove water quality to determine whether an untreated discharge might degrade existing water quality. Additional CSS tests using higher CSS-agent-to-sediment ratios should be considered if greater sediment-matrix strength is required for landfill disposal. Possible candidates for further evaluation would include Portland cement, slaked lime, and possibly fly ash.

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).
2 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.
3 - TCEQ Ecological Benchmarks for Sediment. January 2006.
4 - Value for trans-1,2-dichloroethene used as a surrogate for cis-1,2-dichloroethene.
5 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.
6 - The value for acenapthene is used as a surrogate for acenaphthylene.
7 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
8 - Value for Total PCBs used as a surrogate for Aroclor-1248, Aroclor-1254, and Aroclor-1260.
9 - One tenth the noncarcinogenic value is less than the carcinogenic value; the noncarcinogenic value is presented.
10 - The value is for high risk PCBs.

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).
2 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.
3 - Concentrations exceeding the ESV are shaded black with white font. Concentrations exceeding the adjusted RSL for residential soil are shaded blue with black font. Concentrations exceeding both the ESV and the RSL are shaded red with white font.
4 - TCEQ Ecological Benchmarks for Sediment, January 2006.
5 - Value for trans-1,2-dichloroethene used as a surrogate for cis-1,2-dichloroethene.
6 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.
7 - The value for acenapthene is used as a surrogate for acenaphthylene.
8 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
9 - Value for Total PCBs used as a surrogate for Aroclor-1248, Aroclor-1254 and Aroclor-1260.
10 - One tenth the noncarcinogenic value is less than the carcinogenic value; the noncarcinogenic value is presented.
11 - The value is for high risk PCBs.
12 - The value is for trivalent chromium.
13 - The value is for hexavalent chromium.
14 - The value is for mercuric chloride.
15 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.
16 - Value is for marine sediment.

Definitions:
B = Blank contamination
C = Carcinogenic
J = Estimated
K = Biased high
L = Biased low
N = Non-carcinogenic
NA = Not applicable or not available
R = Rejected
SD = Sediment
SS = Surface sediment
U = Non-detected

Notes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.

2 - Average of positive analytical results only.

3 - Average of all analytical results are calculated using half of the detection limit for nondetects.

4 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).

5 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.

6 - TCEQ Ecological Benchmarks for Sediment, January 2006.

7 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.

8 - The value for acenapthene is used as a surrogate for acenaphthylene.

9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.

10 - Value for Total PCBs used as a surrogate for Aroclor-1254 and Aroclor-1260.

11 - One tenth the noncarcinogenic value is less than the carcinogenic value; the noncarcinogenic value is presented.

12 - The value is for high risk PCBs.

13 - The value is for trivalent chromium.

14 - The value is for hexavalent chromium.

15 - The value is for mercuric chloride.

16 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.

17 - Value is for marine sediment.

Definitions:

C = Carcinogenic
J = Estimated
L = Biased low
N = Non-carcinogenic
NA = Not applicable or not available

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).
2 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.
3 - Concentrations exceeding the ESV are shaded black with white font. Concentrations exceeding the adjusted RSL for residential soil are shaded blue with black font. Concentrations exceeding both the ESV and the RSL are shaded red with white font.
4 - TCEQ Ecological Benchmarks for Sediment, January 2006.
5 - Value for trans-1,2-dichloroethene used as a surrogate for cis-1,2-dichloroethene.
6 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.
7 - The value for acenapthene is used as a surrogate for acenaphthylene.
8 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
9 - Value for Total PCBs used as a surrogate for Aroclor-1248, Aroclor-1254 and Aroclor-1260.
10 - One tenth the noncarcinogenic value is less than the carcinogenic value; the noncarcinogenic value is presented.
11 - The value is for high risk PCBs.
12 - The value is for trivalent chromium.
13 - The value is for hexavalent chromium.
14 - The value is for mercuric chloride.
15 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.
16 - Value is for marine sediment.

Definitions:
B = Blank contamination
C = Carcinogenic
J = Estimated
K = Biased high
L = Biased low
N = Non-carcinogenic
NA = Not applicable or not available
R = Rejected
SS = Surface sediment
SD = Sediment
U = Non-detected

Notes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.

2 - Average of positive analytical results only.

3 - Average of all analytical results are calculated using half of the detection limit for nondetects.

4 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).

5 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.

6 - TCEQ Ecological Benchmarks for Sediment, January 2006.

7 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.

8 - The value for acenapthene is used as a surrogate for acenaphthylene.

9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.

10 - Value for Total PCBs used as a surrogate for Aroclor-1248 and Aroclor-1260.

11 - The value is for high risk PCBs.

12 - The value is for trivalent chromium.

13 - The value is for hexavalent chromium.

14 - The value is for mercuric chloride.

15 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.

16 - Value is for marine sediment.

Definitions:

C = Carcinogenic
J = Estimated
L = Biased low
N = Non-carcinogenic
NA = Not applicable or not available

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).
2 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.
3 - Concentrations exceeding the ESV are shaded black with white font. Concentrations exceeding the adjusted RSL for residential soil are shaded blue with black font. Concentrations exceeding both the ESV and the RSL are shaded red with white font.
4 - TCEQ Ecological Benchmarks for Sediment, January 2006.
5 - Value for trans-1,2-dichloroethene used as a surrogate for cis-1,2-dichloroethene.
6 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.
7 - The value for acenapthene is used as a surrogate for acenaphthylene.
8 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
9 - Value for Total PCBs used as a surrogate for Aroclor-1248, Aroclor-1254 and Aroclor-1260.
10 - One tenth the noncarcinogenic value is less than the carcinogenic value; the noncarcinogenic value is presented.
11 - The value is for high risk PCBs.
12 - The value is for trivalent chromium.
13 - The value is for hexavalent chromium.
14 - The value is for mercuric chloride.
15 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.
16 - Value is for marine sediment.

Definitions:
B = Blank contamination
C = Carcinogenic
J = Estimated
K = Biased high
L = Biased low
N = Non-carcinogenic
NA = Not applicable or not available
R = Rejected
SB = Subsurface sediment
SD = Sediment
U = Non-detected

Notes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.

2 - Average of positive analytical results only.

3 - Average of all analytical results are calculated using half of the detection limit for nondetects.

4 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).

5 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.

6 - TCEQ Ecological Benchmarks for Sediment, January 2006.

7 - Value for trans-1,2-dichloroethene used as a surrogate for cis-1,2-dichloroethene.

8 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.

9 - The value for acenapthene is used as a surrogate for acenaphthylene.

10 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.

11 - Value for Total PCBs used as a surrogate for Aroclor-1248 and Aroclor-1260.

12 - The value is for high risk PCBs.

13 - The value is for trivalent chromium.

14 - The value is for mercuric chloride.

15 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.

16 - Value is for marine sediment.

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).
2 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.
3 - Concentrations exceeding the ESV are shaded black with white font. Concentrations exceeding the adjusted RSL for residential soil are shaded blue with black font. Concentrations exceeding both the ESV and the RSL are shaded red with white font.
4 - Value for 2-methylnaphthalene used as a surrogate for 1-methylnaphthalene.
5 - The value for acenapthene is used as a surrogate for acenaphthylene.
6 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
7 - Value for Total PCBs used as a surrogate for Aroclor-1248, Aroclor-1254 and Aroclor-1260.
8 - One tenth the noncarcinogenic value is less than the carcinogenic value; the noncarcinogenic value is presented.
9 - The value is for high risk PCBs.
10 - The value is for trivalent chromium.
11 - The value is for mercuric chloride.
12 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.
13 - Value is for marine sediment.

Definitions:
B = Blank contamination
C = Carcinogenic
J = Estimated
K = Biased high
L = Biased low
N = Non-carcinogenic
NA = Not applicable or not available
R = Rejected
SD = Sediment
SB = Subsurface sediment
U = Non-detected

Notes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection.

2 - Average of positive analytical results only.

3 - Average of all analytical results are calculated using half of the detection limit for nondetects.

4 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater sediment (USEPA, August 2006).

5 - Screening criteria for sediment are based on USEPA Regional Screening Levels (RSLs) for residential soil (November, 2010). To account for the anticipated reduced exposure to sediment, the screening criteria presented in the table for sediment are 10 times those typically used for soil (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the sediment are set at 10 times the RSL for residential soil. The screening criteria for non-carcinogens in the sediment are set equal to the RSL for residential soil.

6 - The value for acenapthene is used as a surrogate for acenaphthylene.

7 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
8 - Value for Total PCBs used as a surrogate for Aroclor-1260.
9 - The value is for high risk PCBs.
10 - The value is for trivalent chromium.
11 - The value is for mercuric chloride.
12 - NOAA Quick Reference Tables (Buchman, 2008); value is for marine sediment.
13 - Value is for marine sediment.

Definitions:
C = Carcinogenic
J = Estimated

Sparrow Point Shipyard in Baltimore Harbor/ Patapsco River	22.6-202	Kodish (2007)
Washington DC	68-2203	Wade, et al. (1994)

Notes:
Units: µg/kg
Blank cell: No value available

Footnotes:
1 - Value of 1508 µg/kg calculated for 95% UCL using the maximum concentration from each location.
2 - Maximum value not included in the 95% UCL calculation.
3 - Values obtained from Wade et al (1994).
4 - Sectioned into separate areas by reviewer based on sampling location map.

Acronyms:
COPC = Chemical of Potential Concern
NOAA = National Oceanic and Atmospheric Administration
UCL = Upper Confidence Limit

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater surface water (USEPA, August 2006).
2 - Concentrations exceeding the ESV are shaded black with white font.
3 - Screening criteria for pore water are based on USEPA Regional Screening Levels (RSLs) for tap water (November, 2010). To account for the anticipated reduced exposure to pore water, the screening criteria presented in the table for pore water are 10 times those typically used for tap water (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the pore water are set at 10 times the RSL for tap water. The screening criteria for non-carcinogens in the pore water are set equal to the RSL for tap water.
4 - Presented for informational purposes only.
5 - 2009 Edition of the Drinking Water Standards and Health Advisories (USEPA, October 2009).
6 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
7 - The value for total PCBs is used as a surrogate for Aroclor-1260.
8 - Value is for total chromium.
9 - The value is for trivalent chromium.
10 - The chemicals listed are those detected at least once in the pore water samples collected at the three depth intervals (0-6", 6-18", 18-30").

Definitions:
B = Blank contamination
J = Estimated
K = Biased high

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater surface water (USEPA, August 2006).
2 - Concentrations exceeding the ESV are shaded black with white font.
3 - Screening criteria for pore water are based on USEPA Regional Screening Levels (RSLs) for tap water (November, 2010). To account for the anticipated reduced exposure to pore water, the screening criteria presented in the table for pore water are 10 times those typically used for tap water (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the pore water are set at 10 times the RSL for tap water. The screening criteria for non-carcinogens in the pore water are set equal to the RSL for tap water.
4 - Presented for informational purposes only.
5 - 2009 Edition of the Drinking Water Standards and Health Advisories (USEPA, October 2009).
6 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
7 - The value for total PCBs is used as a surrogate for Aroclor-1260.
8 - Value is for total chromium.
9 - The value is for trivalent chromium.
10 - The chemicals listed are those detected at least once in the pore water samples collected at the three depth intervals (0-6", 6-18", 18-30").

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater surface water (USEPA, August 2006).
5 - The value for 1,2-dichloroethene is used as a surrogate for cis-1,2-dichloroethene.

Notes:
1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater surface water (USEPA, August 2006).
2 - Concentrations exceeding the ESV are shaded black with white font (there were no exceedances).
3 - Screening criteria for pore water are based on USEPA Regional Screening Levels (RSLs) for tap water (November, 2010). To account for the anticipated reduced exposure to pore water, the screening criteria presented in the table for pore water are 10 times those typically used for tap water (which are also based on RSLs). Therefore, the screening criteria for carcinogens in the water are set at 10 times the RSL for tap water. The screening criteria for non-carcinogens in the pore water are set equal to the RSL for tap water.
4 - Presented for informational purposes only.
5 - 2009 Edition of the Drinking Water Standards and Health Advisories (USEPA, October 2009).
6 - The value for 1,2-dichloroethene is used as a surrogate for cis-1,2-dichloroethene.
7 - The chemicals listed are those detected at least once in the in-situ pore water samples collected from Cow Pen Creek or Dark Head Cove.

Section 5
Summary and Conclusions

Tetra Tech, Inc (Tetra Tech) completed additional characterization of sediment from Dark Head Cove, Cow Pen Creek, and the confluence of these two water bodies to identify and describe the nature and extent of impacts resulting from current and past Middle River Complex (MRC) activities. The objectives of this sediment and biological sampling program were to finalize characterization of Dark Head Cove and Cow Pen Creek with respect to area-wide environmental conditions, to establish the basis for risk assessment and, if necessary, for the evaluation of remedial action alternatives. This section presents an overall summary and the conclusions of this investigation.

5.1 NATURE AND EXTENT OF CONTAMINATION

This nature and extent of contamination summary includes a discussion of the previous sediment data collected at the site (in 2005 and 2008), as well as of the sediment data collected in 2010. The 2010 sediment investigation focused on areas where insufficient data are available from previous investigations. Sediment samples were collected in 2010 from 24 site locations and three reference locations. Sediment samples were collected from 0–6, 6–18, 18–30, and 30-52 inches below the surface water/sediment interface. Sediment samples were analyzed for polycyclic aromatic hydrocarbons, polychlorinated biphenyls (PCBs), and metals. In addition, some sediment samples were analyzed for acid volatile sulfides (AVS)/simultaneously extracted metals (SEM).

The highest concentrations of total polycyclic aromatic hydrocarbons (PAHs) were in samples collected along the shoreline of the Middle River Complex and in Dark Head Cove. In surface sediment, the highest polycyclic aromatic hydrocarbons concentrations were in samples collected from the eastern portion of Dark Head Creek (near Martin State Airport [MSA]) and in the middle of the cove adjacent to the Middle River Complex. Polycyclic aromatic hydrocarbon concentrations tend to be higher in the middle two depth intervals than in surface sediment,

although the upper reaches of Cow Pen Creek demonstrate elevated polycyclic aromatic hydrocarbon concentrations in the 0–6, 6–18, and 18–30 inch intervals. Polycyclic aromatic hydrocarbon concentrations in excess of the screening level for total polycyclic aromatic hydrocarbons were also detected in a few samples from the middle two intervals in a small area near Outfall 09. Overall, the results for polycyclic aromatic hydrocarbon are consistent with previous findings.

Total Aroclor concentrations were highest in surface sediments, and decreased with increasing depth. Surface sediment polychlorinated biphenyl concentrations were highest in the middle of Dark Head Cove and adjacent to the shoreline of the Middle River Complex. The areas with the most elevated concentrations were well bounded by other samples. These findings are similar to the conclusions of the previous investigation.

Several metals were detected in sediment at concentrations in excess of screening values, but concentrations of most metals tend to be less than or only slightly greater than regional background concentrations. Metals of particular interest include cadmium, chromium, copper, lead, mercury, and zinc. However, cadmium and chromium generally had the greatest (as compared to the other metals) concentrations with respect to their sediment guidelines.

The greatest concentrations of metals in Dark Head Cove were generally found in samples collected from the >6–18 inch and >18–30 inch intervals, which indicates that the sediment with higher concentrations is being buried under cleaner sediments. Some exceptions were observed in Cow Pen Creek, which is to be expected because the deposition rate (as estimated from the age-dating analysis) is probably lower in the creek, and the scour appears to be greater than in the cove.

5.2 BIOAVAILABILITY PARAMETERS

Various samples were collected and analyses conducted to evaluate whether the chemicals in the sediment might be bioavailable to ecological receptors. Tasks performed include comparison of sediment acid volatile sulfides to simultaneously extracted metals, sediment-porewater chemistry analyses, and a benthic macroinvertebrate-community study. Sediment samples from seven locations were collected from each depth interval and analyzed for acid volatile sulfides/simultaneously extracted metals, an index of potential bioavailability.

The simultaneously extracted metals analysis included the metals cadmium, chromium, copper, lead, nickel, silver, and zinc. In general, concentrations of acid volatile sulfides were higher than simultaneously extracted metals in most samples, indicating the simultaneously extracted metals are not expected to be bioavailable or directly toxic to benthic invertebrates. The acid volatile sulfides/simultaneously extracted metals data will be further evaluated in the ecological risk assessment (ESA).

Sediment porewater was extracted from a subset of the collected sediments to determine the equilibrium concentrations of chemicals of potential concern (COPC) in porewater both horizontally and vertically near the Middle River Complex. Porewater concentrations of various metals (arsenic, cadmium, selenium) and polycyclic aromatic hydrocarbons exceeded surface water ecological screening-values at all three intervals in one or more samples. Porewater concentrations of lead exceeded surface water ecological screening-values in one interval.

Aroclor-1260 concentrations exceeded surface water ecological screening-values in all porewater samples in which it was detected, indicating a potential for ecological risk. Aroclor-1260 was reported as not detected in the 18–30 inch interval, however the detection limit for Aroclor-1260 is greater than its screening level. Although this may introduce uncertainty, biological activity is typically minimal below depths of 18 inches in sediment environments such as those at the Middle River Complex. The significance of these results will be discussed in detail in the ecological risk assessment.

Benthic macroinvertebrate samples were collected to help evaluate the status of benthic communities residing in sediment at the site to get a direct measure of the bioavailability of the chemicals in the surface sediment. Benthic invertebrate samples were collected from two background/reference locations to be used to evaluate the results from site samples. One local reference site (Marshy Point) had relatively good benthic conditions. The other local reference site (Bowleys Quarters) and the proposed reference site (Middle River Downstream) had indications of some type of stressful conditions for the benthic macroinvertebrates. All of the test sites had indications of stress to benthic organisms. The results of the macroinvertebrate sampling will be further evaluated and discussed in the ecological risk assessment (ERA).

5.3 OTHER EVALUATIONS

Data were collected as part of the sampling investigation in support of other evaluations to better characterize the site and aid in preparing the feasibility study if remedial action is necessary. *In situ* porewater samples were collected for analysis for volatile organic compounds (VOCs) to determine whether volatile organic compounds in groundwater are discharging through the sediment in Dark Head Cove and Cow Pen Creek, and if so, at what levels. Volatile organic compounds were detected in sediment porewater, but all concentrations were less than their respective screening values (except for carbon disulfide in one sample).

Volatile organic compounds in sediment porewater in two samples collected in Dark Head Cove and one sample from Cow Pen Creek indicate groundwater discharge is affecting porewater. However, the detected concentrations were extremely low and porewater recovery was very slow, suggesting that the low permeability soil underlying the site and identified in sediment and the low groundwater flux limit groundwater discharge. This result is consistent with current modeling of groundwater discharge to surface water at the Middle River Complex.

Some of the sediment samples were analyzed for alkylated polycyclic aromatic hydrocarbons to provide data on the source(s) of polycyclic aromatic hydrocarbons. The results of the alkylated polycyclic-aromatic hydrocarbon analyses indicate the types and concentrations of monoaromatic hydrocarbons (MAH) and polycyclic aromatic hydrocarbons identified in the sediment are consistent with those found in urban soils and associated runoff. Although stormwater samples did not contain detectable levels of polycyclic aromatic hydrocarbons, the sediment associated with the stormwater display a signature similar to that found in Cow Pen Creek and Dark Head Cove sediments, which is deemed associated with urban runoff. This indicates that the water bodies adjacent to the Middle River Complex receive contributions of polycyclic aromatic hydrocarbons from other on-site sources, such as Eastern Avenue and other roadways.

Age-dating analyses measured radioactive decay to estimate sedimentation rates for Dark Head Cove, Cow Pen Creek, and the confluence of the two water bodies downstream of the site. These analyses indicate that the highest sedimentation rates are found in the confluence of Dark Head Cove and Cow Pen Creek downstream of the site, which is not surprising as it receives

contributions from two sources. The next highest sedimentation rate is found in Dark Head Cove, and the lowest sedimentation rate among the three sites is at the mouth of Cow Pen Creek.

These findings are consistent with chemical analyses where locations with higher deposition rates generally had impacts at deeper intervals than in Cow Pen Creek, where the deposition rate is the lowest and sediment scour the highest. A bathymetric survey of the study area mapped in high detail the morphology of Dark Head Cove and Cow Pen Creek, as well as their confluence (Dark Head Creek). Dense vegetation in Cow Pen Creek affected the data collection in portions of the creek. Adequate data were obtained to support dredge- or capping-design efforts, design dredge cuts, or to calculate dredge and capping volumes. Bathymetric data were also used as input for hydraulic modeling.

A hydraulic analysis evaluated possible sediment and consequent contaminant transport in the Cow Pen Creek and Dark Head Cove watersheds. Using 100-year storm events and historical data, the model indicates that the sediment bed is stable in the area of interest, except for the upstream area of Cow Pen Creek. Since this area is susceptible to erosion during high rainfall-generated flow events, the potential for long-term accumulation of contaminates in the area is limited. Pre-design testing was performed on sediment collected from Dark Head Cove, Cow Pen Creek, and Dark Head Creek. Testing included treating sediment with a range of polymer adjuncts that enhance sediment dewatering, followed by dewatering pilot-tests using geotextile-fabric bags. The tests identified the dual polymer system (Solve 426 and Solve 127) and sediment-dewatering tubes constructed with GT500 geotextile fabric as a viable approach for dewatering dredged sediment before disposal.

The results of the additional characterization and sediment sampling investigation will be used as input to update the sediment risk-assessment for the Middle River Complex and in support of a feasibility study to establish the basis of cleanup goals and potential remediation alternatives if remediation is ultimately necessary.

Project Name:	**TTNUS-LOCKHEED MARTIN MIDDLE RIVER COMPLEX**		**Proj. #: 22007.000**
Site Name:	**Dark Head Cove / Dark Head Creek / Cow Pen Creek**		**Task #: N/A**
City:	**Middle River**	**State: MD Zip:**	**Date: 8/23/10**

Field Team Leader(s): **RMK, MKM, T. Apanavage (TT)**
Field Team Safety Coordinator: **MKM / RMK**
Field Crew: RCB / HIS RAB (TT)
Arrival/Departure Times: 1140 –
Station ID #: ~~AGE-03~~ DHC-SED
Weather: (Clear) Cloudy Rain Other _____
Photos: Y N Roll No./Exposure No.: _____
Wind Conditions (Speed/Direction): 10-15 mph N

FIELD DATA

Water Depth: 11-5 Tide: (Ebb) Flood Low Slack High Slack Other ____ NA
PID: NA Redox Potential: NA pH: NA H^2O Temp.: NA Air Temp.: NA

SAMPLE/PUSH #1

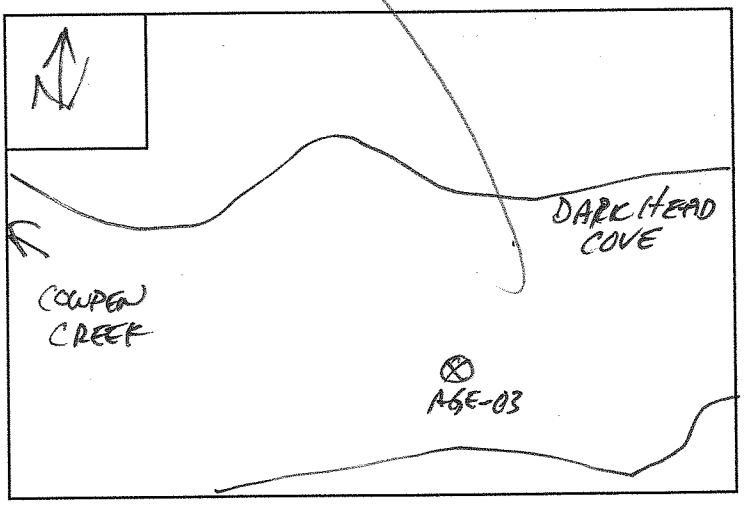
Core ID#: _____ Coring Time: _____ Penetration Depth: _____ Core Recovery: _____
Collection Method: Ponar / Vibracore / Manual Liner Material: CAB / Alum / SS / PE Core Diameter (OD): 2" 3" 4"
Vibracore Type: Rossfelder / PVL / Portable Clamp-on / NA Sampling Equipment Deconned or Replaced: Y N

SAMPLE/PUSH #2

Core ID#: _____ Coring Time: _____ Penetration Depth: _____ Core Recovery: _____
Collection Method: Ponar / Vibracore / Manual Liner Material: CAB / Alum / SS / PE Core Diameter (OD): 2" 3" 4"
Vibracore Type: Rossfelder / PVL / Portable Clamp-on / NA Sampling Equipment Deconned or Replaced: Y N

SAMPLE/PUSH #3

Core ID#: _____ Coring Time: _____ Penetration Depth: _____ Core Recovery: _____
Collection Method: Ponar / Vibracore / Manual Liner Material: CAB / Alum / SS / PE Core Diameter (OD): 2" 3" 4"
Vibracore Type: Rossfelder / PVL / Portable Clamp-on / NA Sampling Equipment Deconned or Replaced: Y N



DGPS DATA

Operator: RMK
File Name: AGE-03-1
Lat / N: 604696.92
Lon / E: 1474492.76
PDOP: 8.0

Remediation Shipping Paper/Transportation Checklist **Hazardous Waste Manifest No.** 006288140 FLE

A. DESCRIPTION

A1. N/A UN/NA Identification Number, Proper Shipping Name, Hazard Class/Division Number, Packing Group
A2. | Subsidiary hazard class(es) or division number(s), if any, in parenthesis
A3. | Total Quantity of Material
A4. | 24-Hour Emergency Phone Number and Response Information ERG No.: _____
A5. | Page of Pages, *for multiple shipping papers/EPA Manifest/Air Decs.*
A6. | Shipper's Certification, *as applicable*
A7. ↓ Small Quantity Exception/Dangerous Goods In Excepted Quantities/Diagnostic Specimen/Sample

B. ADDITIONAL DESCRIPTIONS - GENERAL

NOTE: Shipment consists of 10 drums non DOT non RCRA regulated waste (low soil cuttings/water)

B1. N/A Exemptions "DOT-E-*ex.#*"
B2. | "Limited Quantity" (*not to exceed 66 lb gross weight*)
B3. | "X" or "RQ" (if RQ, Hazardous Substance Contact @ 1-800-424-8802)
B4. | "Waste" for RCRA regulated material
B5. | "Residue: Last contained..." - *required for empty tank cars with hazmat residue*
B6. | "Mixture" or "Solution" - as appropriate.
B7. | *(technical names), for poisons/mixtures/n.o.s./generic proper shipping names*
B8. | "Hot" - *for elevated temperature materials only*
B9. | "Marine Pollutant" and constituent in ( ), *for bulk shipments only*
B10. | *(hazardous substance names) per 172.101 appendix if not contained in proper shipping name*
B11. | *(EPA waste identification numbers)- used to identify the hazardous substance*
B12. | "Shipment Contains Oil" (*see 130.11 for applicability*)
B13. | "Poison" - *if not identified in proper shipping name or hazard class*
B14. ↓ "Poison-Inhalation Hazard" & Zone A, Zone B, Zone C, or Zone D, as appropriate*
(**Note Special Provisions 1-6 and 13 in Column 7 of 172.101*)

C. MARKING FOR NON-BULK PACKAGINGS

C1. N/A Proper Shipping Name, UN/NA Identification Number
C2. | (*technical name*)
C3. | (*EPA waste identification number*)
C4. | "RQ"
C5. ↓ Exemption Packagings "DOT-E-*ex.#*"
C6. ✓ Consignee's Name & Address
C7. N/A Net or Gross quantity for non-rad Dangerous Goods (adjacent to PSN & UN#)
C8. | Ltd. Qty - PSN only *per 172.301(a)(1) or* UN ID# placed in square-on-point border *per 172.315*
C9. | Package Orientation Arrows, *for liquids in inner packagings*
C10. | "Inhalation Hazard", unless these words appear on the label prescribed in *172.416* or *172.429*
C11. | ORM-D Marking
C12. | EX-number, *for Class 1 (Explosives) only*
C13. | "Overpack" adjacent to proper shipping name marking [*see 173.25(a)(4)*]
C14. ↓ TSCA PCB Marking (*for actual or source concentration greater than or equal to 50 ppm* *)
(* Note Potential Vehicle Marking Requirements in *40 CFR 761.40*)

D. MARKING FOR BULK PACKAGINGS (DUMP TRUCKS OR ROLL-OFFS)

D1. N/A UN/NA Identification Number on orange panel or placard or white square-on-point display configuration as prescribed by 172.302 and 172.332

E. LABELING

E1. N/A Primary Hazard Label(s): _____
E2. | Subsidiary Hazard Label(s) with class/division: _____
E3. | Hazardous Wastes Label(s)
E4. ↓ Cargo Aircraft Only

F. PLACARDING

F1. 172.504 Table 1 Materials - Any Amount
F1.1. N/A Explosives (1.1)
F1.2. | Explosives (1.2)
F1.3. | Explosives (1.3)
F1.4. | Poison Gas (2.3)
F1.5. | Dangerous When Wet (4.3)
F1.6. | Organic Peroxide (5.2, Type B, liquid or solid, temperature controlled)
F1.7. ↓ Poison (6.1, Inhalation Hazard, Zone A or B)* (Primary or Subsidiary _____)

*(*Materials subject to the "Poison-Inhalation Hazard" notation must be placarded with a POISON INHALATION HAZARD or POISON GAS placard , as appropriate, and also placarded for any other hazard class required for that material in 172.504)*

F. PLACARDING (continued)

F2. N/A 172.504 Table 2 Materials - 1,001 lb: _____

G. PACKAGING

G1. _____ Container Type: (Inner Pkg) _____

G2. _____ Container Type: (Outer Pkg) _____

G3. _____ Container Type: (Bulk Pkg) 55 gallon steel drum

H. PAPERWORK AND MISCELLANEOUS ITEMS

H1. N/A Shipping Paper/Hazardous Waste Manifest/Bill of Lading/Airway Bill/Shipper's Declaration

H2. ___ Instructions for Maintenance of Exclusive Use Shipments

H3. ___ Small Quantity/Excepted Quantity Statement on Package, *for 173.4 shipments* / **DGEQ** statement per *2.7.7.2* noted on Airway Bill

H4. ___ Photograph, *if applicable*

H5. ✓ Vehicle Inspection

H6. N/A Check Driver's Qualifications

H7. N/A Emergency Telephone Number Notification, if required, see 172.604(b)

H8. ✓ LMC Notification Instructions

I. ADDITIONAL REQUREMENTS FOR RADIOACTIVE MATERIAL SHIPMENTS

I1. SHIPPING PAPER DESCRIPTIONS

I1.1. N/A Radionuclide Symbol(s), *per 173.435*

I1.2. ___ Physical & Chemical Form, *if not special form*

I1.3. ___ Activity per Package

I1.4. ___ "Highway Route Controlled Quantity" *or* "HRCQ"

I1.5 ___ Radioactive Labels

I1.6. ___ Transport Index, *if Yellow-II or Yellow-III*

I1.7. ___ CSI, if fissile shipment

I1.8. ___ Fissile Excepted, *if applicable*

I1.9. ✓ Package Identification (NRC CoC, IAEA CoCA)

I1.10. ___ "Exclusive Use Shipment"

I2. MARKING FOR NON-BULK PACKAGINGS

I2.1. N/A Gross Weight, *for radioactive material packages in excess of 110 lb*

I2.2. ___ "TYPE A" or "TYPE B" - *for radioactive material packages, as appropriate*

I2.3. ___ Trefoil Symbol for Type B packages

I2.4. ___ "Radioactive"; "Radioactive – LSA" ; "Radioactive – SCO"

I2.5. ___ Package Certification Number, *for radioactive material packages, as appropriate*

I2.6. ___ IP-1, IP-2, IP-3 markings

I2.7. ___ "USA" on all IP and Type A packagings

I2.8. ✓ Packaging manufacturer marking on Type A

I3. LABELING

I3.1. N/A Radioactive Labels

I3.2. ___ "EMPTY" Label

I3.3. ___ CSI (Fissile) label

I3.4. ✓ "Radioactive Material, Excepted Package" handling label

I4. PLACARDING (172.504 TABLE 1 MATERIALS - ANY AMOUNT)

I4.1. N/A Radioactive (7, Yellow-III Label or LSA/SCO Exclusive Use Shipments)

I4.2. ✓ Radioactive - Highway Route Controlled Quantity

I5. PAPERWORK AND MISCELLANEOUS ITEMS

H1. N/A Certificate of Compliance

H2. ___ Special Form Certification

H3. ___ Instructions for Maintenance of Exclusive Use Shipments

H4. ___ Radioactive Excepted Package statement per *10.8.8.3.3* on Airway Bill

H7. ___ Limited Quantity Radioactive Material" *for multiple hazard limited quantity Class 7.*

H8. ___ Health Physics Information

H8. ✓ NRC Manifest #540 for radioactive waste shipment for land disposal.

Remediation Shipping Paper/Transportation Checklist **Hazardous Waste Manifest No.** 004288140 1 PLE

A. DESCRIPTION

A1. N/A UN/NA Identification Number, Proper Shipping Name, Hazard Class/Division Number, Packing Group
A2. ___ Subsidiary hazard class(es) or division number(s), if any, in parenthesis
A3. ___ Total Quantity of Material
A4. ___ 24-Hour Emergency Phone Number and Response Information ERG No.: ___
A5. ___ Page of Pages, *for multiple shipping papers/EPA Manifest/Air Decs.*
A6. ___ Shipper's Certification, *as applicable*
A7. ___ Small Quantity Exception/Dangerous Goods In Excepted Quantities/Diagnostic Specimen/Sample

B. ADDITIONAL DESCRIPTIONS - GENERAL

NOTE: Shipment consists of 1 drum non-DOT non RCRA regulated waste (IDW soil/cuttings/water

B1. N/A Exemptions "DOT-E-*ex.#*"
B2. ___ "Limited Quantity" (*not to exceed 66 lb gross weight*)
B3. ___ "X" or "RQ" (if RQ, Hazardous Substance Contact @ 1-800-424-8802)
B4. ___ "Waste" for RCRA regulated material
B5. ___ "Residue: Last contained..." - *required for empty tank cars with hazmat residue*
B6. ___ "Mixture" or "Solution" - as appropriate.
B7. ___ *(technical names), for poisons/mixtures/n.o.s./generic proper shipping names*
B8. ___ "Hot" - *for elevated temperature materials only*
B9. ___ "Marine Pollutant" and constituent in ( ), *for bulk shipments only*
B10. ___ *(hazardous substance names) per 172.101 appendix if not contained in proper shipping name*
B11. ___ *(EPA waste identification numbers)- used to identify the hazardous substance*
B12. ___ "Shipment Contains Oil" (*see 130.11 for applicability*)
B13. ___ "Poison" - *if not identified in proper shipping name or hazard class*
B14. ___ "Poison-Inhalation Hazard" & Zone A, Zone B, Zone C, or Zone D, as appropriate*
(**Note Special Provisions 1-6 and 13 in Column 7 of 172.101*)

C. MARKING FOR NON-BULK PACKAGINGS

C1. N/A Proper Shipping Name, UN/NA Identification Number
C2. ___ (*technical name*)
C3. ___ (*EPA waste identification number*)
C4. ___ "RQ"
C5. ___ Exemption Packagings "DOT-E-*ex.#*"
C6. ___ Consignee's Name & Address
C7. ___ Net or Gross quantity for non-rad Dangerous Goods (adjacent to PSN & UN#)
C8. ___ Ltd. Qty - PSN only *per 172.301(a)(1) or* UN ID# placed in square-on-point border *per 172.315*
C9. ___ Package Orientation Arrows, *for liquids in inner packagings*
C10. ___ "Inhalation Hazard", unless these words appear on the label prescribed in *172.416* or *172.429*
C11. ___ ORM-D Marking
C12. ___ EX-number, *for Class 1 (Explosives) only*
C13. ___ "Overpack" adjacent to proper shipping name marking [*see 173.25(a)(4)*]
C14. ___ TSCA PCB Marking (*for actual or source concentration greater than or equal to 50 ppm* *)
(* Note Potential Vehicle Marking Requirements in *40 CFR 761.40*)

D. MARKING FOR BULK PACKAGINGS (DUMP TRUCKS OR ROLL-OFFS)

D1. N/A UN/NA Identification Number on orange panel or placard or white square-on-point display configuration as prescribed by 172.302 and 172.332

E. LABELING

E1. N/A Primary Hazard Label(s): ___
E2. ___ Subsidiary Hazard Label(s) with class/division: ___
E3. ___ Hazardous Wastes Label(s)
E4. ___ Cargo Aircraft Only

F. PLACARDING

F1. 172.504 Table 1 Materials - Any Amount
F1.1. N/A Explosives (1.1)
F1.2. ___ Explosives (1.2)
F1.3. ___ Explosives (1.3)
F1.4. ___ Poison Gas (2.3)
F1.5. ___ Dangerous When Wet (4.3)
F1.6. ___ Organic Peroxide (5.2, Type B, liquid or solid, temperature controlled)
F1.7. ___ Poison (6.1, Inhalation Hazard, Zone A or B)* (Primary or Subsidiary ___)

*(*Materials subject to the "Poison-Inhalation Hazard" notation must be placarded with a POISON INHALATION HAZARD or POISON GAS placard , as appropriate, and also placarded for any other hazard class required for that material in 172.504)*

Remediation Shipping Paper/Transportation Checklist **Hazardous Waste Manifest No.** 00288140l FLE

F. PLACARDING (continued)

F2. N/A 172.504 Table 2 Materials - 1,001 lb: _____

G. PACKAGING

G1. _____ Container Type: (Inner Pkg) _____

G2. _____ Container Type: (Outer Pkg) _____

G3. _____ Container Type: (Bulk Pkg) 55 Gallon Metal Drum

H. PAPERWORK AND MISCELLANEOUS ITEMS

H1. ✓ Shipping Paper/Hazardous Waste Manifest/Bill of Lading/Airway Bill/Shipper's Declaration

H2. NA Instructions for Maintenance of Exclusive Use Shipments

H3. _____ Small Quantity/Excepted Quantity Statement on Package, *for 173.4 shipments* / **DGEQ** statement per *2.7.7.2* noted on Airway Bill

H4. _____ Photograph, *if applicable*

H5. ✓ Vehicle Inspection

H6. ✓ Check Driver's Qualifications

H7. NA Emergency Telephone Number Notification, if required, see 172.604(b)

H8. ✓ LMC Notification Instructions

I. ADDITIONAL REQUREMENTS FOR RADIOACTIVE MATERIAL SHIPMENTS

I1. SHIPPING PAPER DESCRIPTIONS

I1.1. NA Radionuclide Symbol(s), *per 173.435*

I1.2. ___ Physical & Chemical Form, *if not special form*

I1.3. ___ Activity per Package

I1.4. ___ "Highway Route Controlled Quantity" *or* "HRCQ"

I1.5 ___ Radioactive Labels

I1.6. ___ Transport Index, *if Yellow-II or Yellow-III*

I1.7. ___ CSI, if fissile shipment

I1.8. ___ Fissile Excepted, *if applicable*

I1.9. ___ Package Identification (NRC CoC, IAEA CoCA)

I1.10 ___ "Exclusive Use Shipment"

I2. MARKING FOR NON-BULK PACKAGINGS

I2.1. ___ Gross Weight, *for radioactive material packages in excess of 110 lb*

I2.2. ___ "TYPE A" or "TYPE B" - *for radioactive material packages, as appropriate*

I2.3. ___ Trefoil Symbol for Type B packages

I2.4. ___ "Radioactive"; "Radioactive – LSA" ; "Radioactive – SCO"

I2.5. ___ Package Certification Number, *for radioactive material packages, as appropriate*

I2.6. ___ IP-1, IP-2, IP-3 markings

I2.7. ___ "USA" on all IP and Type A packagings

I2.8. ___ Packaging manufacturer marking on Type A

I3. LABELING

I3.1. ___ Radioactive Labels

I3.2. ___ "EMPTY" Label

I3.3. ___ CSI (Fissile) label

I3.4. ___ "Radioactive Material, Excepted Package" handling label

I4. PLACARDING (172.504 TABLE 1 MATERIALS - ANY AMOUNT)

I4.1. ___ Radioactive (7, Yellow-III Label or LSA/SCO Exclusive Use Shipments)

I4.2. ___ Radioactive - Highway Route Controlled Quantity

I5. PAPERWORK AND MISCELLANEOUS ITEMS

H1. ___ Certificate of Compliance

H2. ___ Special Form Certification

H3. ___ Instructions for Maintenance of Exclusive Use Shipments

H4. ___ Radioactive Excepted Package statement per *10.8.8.3.3* on Airway Bill

H7. ___ Limited Quantity Radioactive Material" *for multiple hazard limited quantity Class 7.*

H8. ___ Health Physics Information

H8. ✓ NRC Manifest #540 for radioactive waste shipment for land disposal.

Tetra Tech NUS **INTERNAL CORRESPONDENCE**

TO: **M. MARTIN** **DATE: NOVEMBER 16, 2010**

FROM: **TERRI L. SOLOMON** **COPIES:** **DV FILE**

SUBJECT: **INORGANIC DATA VALIDATION – SELECT TOTAL METALS**
MIDDLE RIVER CENTER
SAMPLE DELIVERY GROUP (SDG) – A0J150598

SAMPLES: 2/Aqueous/

MRC-SW-1 MSA-SW-1

1/Sediment/

MRC-SED-1

Overview

The sample set for Middle River Center, SDG A0J150598, consists of one (1) sediment and two (2) aqueous environmental samples. No field duplicate pairs were included within this SDG.

All samples were analyzed for select total metals. The samples were collected by Tetra Tech on October 14, 2010 and analyzed by Test America. Metals analyses were conducted using SW-846 method 6020. Mercury analyses were conducted using SW-846 method 7471A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, MS tuning, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike / matrix spike duplicate recoveries, internal standards, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems – None.

Minor Problems

- The contract required detection limit (CRDL) percent recoveries for cadmium were < 90% quality control limit and copper, iron, manganese, nickel, silver and thallium were > 110% quality control limit affecting samples MRC-SW-1 and MSA-SW-1. The nondetected results reported for cadmium were qualified as biased low, "UL". No validation actions were required for copper, iron, manganese, nickel, silver and thallium as all sample results were either > 2X CRDL, nondetects or were qualified as a result of blank contamination.

- The CRDL percent recoveries for iron and silver were > 110% quality control limit and selenium was < 90% quality control limit affecting sample MRC-SED-1. The positive results < 2X CRDL for selenium and silver were qualified as estimated, "J". No validation actions were required for iron as the sample result was > 2X CRDL.

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Affecting samples MRC-SW-1 and MSA-SW-1:

Analyte	Maximum Concentration	Action Level
Antimony	0.045 ug/L	0.225 ug/L
Barium[(1)]	0.84 ug/L	4.2 ug/L
Beryllium	0.038 ug/L	0.19 ug/L
Cadmium	0.042 ug/L	0.21 ug/L
Cobalt	0.027 ug/L	0.135 ug/L
Copper[(1)]	0.52 ug/L	2.6 ug/L
Iron	10 ug/L	50 ug/L
Lead	0.038 ug/L	0.19 ug/L
Silver	0.032 ug/L	0.16 ug/L
Thallium	0.6 ug/L	3.0 ug/L
Zinc[(1)]	5.8 ug/L	29 ug/L

Affecting sample MRC-SED-1:

Analyte	Maximum Concentration	Action Level
Antimony	0.052 ug/L	0.026 mg/kg
Barium[(1)]	0.091 mg/kg	0.455 mg/kg
Beryllium	0.029 ug/L	0.0145 mg/kg
Cadmium	0.034 ug/L	0.017 mg/kg
Chromium[(1)]	0.062 mg/kg	0.31 mg/kg
Cobalt	0.034 ug/L	0.017 mg/kg
Copper[(1)]	0.18 mg/kg	0.9 mg/kg
Lead	0.11 ug/L	0.055 mg/kg
Iron[(1)]	3.9 mg/kg	19.5 mg/kg
Manganese[(1)]	1.3 mg/kg	6.5 mg/kg
Nickel[(1)]	0.032 mg/kg	0.16 mg/kg
Silver	0.035 ug/L	0.0175 mg/kg
Thallium	0.27 ug/L	0.135 mg/kg

[(1)] Maximum concentration present in a preparation blank.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot, percent solids and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level reported for thallium were qualified "B" as a result of laboratory blank contamination.

- The interfering analyte iron was present in sample MRC-SED-1 at a concentration comparable to the concentration of iron in the interference check sample (ICS) solution. Several analytes namely, antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, silver and vanadium were present in the ICS solution at a concentration that exceeded the absolute value of the instrument detection limit (IDL). Interference effects exist for cadmium and silver in the affected sample. The positive results reported for cadmium and silver were qualified as estimated, "J", as a result of conflicting noncompliances.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated, "J".

Notes

The CRDL percent recovery for mercury was > 120% quality control limit affecting samples MRC-SW-1 and MSA-SW-1. No validation actions were required as all results were nondetects.

Executive Summary

Laboratory Performance: Several CRDL percent recoveries were outside the 90-110% quality control limits. Several contaminants were present in the method / preparation blanks.

Other Factors Affecting Data Quality: The interfering analyte iron was present in sample MRC-SED-1. Positive results reported below the RL but above the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS-GFAA MSA's r < 0.995 / ICP PDS Recovery Noncompliance
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O - Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DOT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

APPENDIX C
SUPPORT DOCUMENTATION

CASE NARRATIVE

A0J150598

The following report contains the analytical results for one solid sample and two water samples submitted to TestAmerica North Canton by Tetra Tech NUS, Inc from the MRC/MSA STORMWATER/SEDIMENT Site, project number 112IC02903. The samples were received October 15, 2010, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to Dev Murali, Kelly Carper, and Tobrena Skeen on October 26, 2010. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Patrick J. O'Meara, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 2.0°C.

METALS

The sample(s) that contain results between the MDL and the RL were flagged with "B". There is the possibility of false positive or mis-identification at these quantitation levels. The acceptance criteria for the ICB, CCB, and Method Blank are +/- the standard reporting limit (SRL).

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "J". Refer to the sample report pages for the affected analyte(s).

Matrix spike recovery and relative percent difference (RPD) data were not calculated for some analytes for batch(es) 0291016 and 0292022 due to the sample concentration reading greater than four times the spike amount. See the Matrix Spike Report for the affected analytes which will be flagged with "NC, MSB".

The matrix spike/matrix spike duplicate(s) for batch(es) 0292022 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

No ICP MS Form IX provided for batch(es) 0291016 and 0292022. The serial dilutions were performed on a different sample from the same QC batch(es).

Based on SW846 6020 method requirements an IDL must be analyzed quarterly. The quarterly IDL study was analyzed but the ICPMS IDL form in this data package reflects the previous quarter IDL study. A current IDL can be provided upon request.

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190),NAVY, ARMY, USDA Soil Permit

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

NOTE(S):

Calculations are performed before rounding to avoid round-off errors in calculated results.

Results and reporting limits have been adjusted for dry weight.

N Spiked analyte recovery is outside stated control limits.

NC The recovery and/or RPD were not calculated.

MSB The recovery and RPD may be outside control limits because the sample amount was greater than 4X the spike amount.

Overview

The sample set for Lockheed Middle River Complex (MRC) SDG C0H180480 consists of 14 sediment samples. Fourteen (14) samples were analyzed for semivolatile organic compounds (for poly-aromatic hydrocarbons (PAHs)) by Method 8270C, for metals by Method 6020 Inductively Coupled Plasma Mass Spectrometry (ICP-MS), for mercury by Method 7471A, and for polychlorinated biphenyls (PCBs) by Method 8082. Four (4) samples were analyzed for acid volatile sulfide (AVS) and simultaneously extractable metals (SEM), and three samples were analyzed for total organic carbon (TOC) by Lloyd Kahn methodology .

The samples were collected by Tetra Tech on August 17, 2010 and analyzed by Test America Pittsburgh Laboratory. All analyses were conducted in accordance with SW-846 Methods 6020, 7471A, 8270C, and 8082, EPA (AVS/SEM) and EPA TOC by Lloyd Kahn analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, ICP interference check sample results, surrogate spike recoveries, blank spike results, matrix spike/matrix spike duplicate results, internal standard recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B.

Major Problems – None.

Minor Problems

- The chrysene-d12 and perylene-d12 internal standard area counts were greater than the upper quality control (QC) limits for sample SD-90-02. The positive results reported for pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene and benzo(g,h,i)perylene were qualified as estimated, "J".

- The internal standare perylene-d12 area count was greater than the upper QC limit for samples SD-90-04, SD-97-02 and SD-97-04. The positive results reported for benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene and benzo(g,h,i)perylene were qualified as estimated, "J". No positive results were reported in sample SD-97-02 so no action was required.

- The relative percent difference (RPD) value was greater than 25% for Aroclor-1260 results between column 1 and 2 for samples SD-90-01(29.5%) and SD-97-SS (27.8%). The positive results were qualified as estimated, "J".

- The MS/MSD Batch #C0H180480-001 had percent recoveries (%Rs) below the QC limits for antimony, therefore, the positive results were qualified as estimated, "J" in all affected samples as a result of conflicting directional bias.

- The percent difference (%D) value in the serial dilution test was greater than 10% for antimony, lead and thallium, the positive results were qualified as estimated, "J" in all samples.

- The positive results reported below the reporting limit (RL) were qualified as estimated "J", due to uncertainty near the detection limit.

Notes

The MS/MSD batch #C0H180480-001 had percent recoveries (%Rs) not calculated because the analyte concentrations were greater than 4 times of the spike concentrations for lead, zinc and mercury, no qualification was required.

The MS percent recovery (%R) of copper was below the QC limit, but the MSD %R was within the QC limit, no qualification was required.

The method blank (batch #0239078) contained chromium [0.025 milligrams per kilogram (mg/kg)] and copper (0.15 mg/kg). However, the analyte concentrations in the associated samples were greater than the five times of the blank concentration, no qualification was required.

Chromium and zinc were detected in the SEM preparation blank. No action was required because all sample concentrations exceeded the 5X action level for blank contamination.

The CRDL standard for lead and zinc were greater than the 110% upper quality control limit on 8/25/2010 @12:53. No action was required because all results were greater than two times the CRDL.

Executive Summary

Laboratory Performance: The chrysene-d12 and perylene-d12 internal standard area counts in PAH fraction were greater than the upper QC limits for several samples. The RPD value was greater than 25% for Aroclor-1260 results between column 1 and 2 in PC fraction for two samples.

The metal MS/MSD had %Rs below the QC limits for antimony, therefore, the positive results were qualified as biased low, "L" for all affected samples. The %D value in the serial dilution test was greater than 10% for antimony, lead and thallium, the positive results were qualified as estimated, "J" for sample SD-90-SS.

Other Factors Affecting Data Quality: The matrix spike/matrix spike duplicate %Rs for antimony fell below 75% affecting all samples. The serial dilution %D for antimony, lead, and zinc exceeded the 10% criterion. All samples were affected.

The data for the analysis were reviewed with reference to the "Region III Modifications to National Functional Guidelines for Organic Data Review, Multi-Media, Multi-Concentration, September 1994 and EPA Region III modifications to the National Functional Guidelines for Inorganic Data Review, April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified above."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

J - The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

U - Nondetected result

B - Not detected substantially above the level reported in the laboratory method blanks and trip blank.

UR - Unreliable result. Analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can be any number of issues; e.g. poor chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

CASE NARRATIVE
TETRA TECH NUS, INC.
Middle River, MD

Lot #: C0H180480

Sample Receiving:
TestAmerica's Pittsburgh laboratory received one sample on August 18, 2010. The cooler was received within the proper temperature range.

If project specific QC was not required for samples contained in this report, when batch QC was completed on these samples, anomalous results will be discussed below.

GC/MS Semivolatiles :
All non-CCC compounds that have >15% RSD were evaluated to see if a better curve could be drawn using a quadratic curve. All compounds <30% RSD will use an average response factor curve if no visible improvement is accomplished using a quadratic curve. A quadratic curve will be used for a compound where it is determined to be the "best-fit" evaluation.

The continuing calibrations had the %D > 25% but were within expected performance range for these compounds.

The samples were analyzed at a dilution due to matrix interference and/or concentration of compounds detected. Surrogates were diluted out for SD-90-02.

Several samples had internal area counts outside the daily control limits due to matrix interference. The samples analyzed before and after these samples had the internal area counts within the control limits verifying the instrument was operating in control.

PCBs:
There were no problems associated with the analysis.

Metals:
The serial dilution percent difference was outside the control limit for lead, antimony, and thallium for sample SD-90-SS.

Several samples were over the calibration range for mercury and required a dilution.

Sample SD-90-02 was diluted for SEM zinc.

The method blanks had analytes detected at concentrations between the MDL and the reporting limit. The results were flagged with a "B" qualifier. Any sample associated with a method blank that had the same analyte detected had the result flagged with a "J" qualifier. Copper recovered above the reporting limit in batch 0239078. All associated samples had copper >10X the amount detected in the sample, therefore the results were reported.

CASE NARRATIVE
TETRA TECH NUS, INC.
Middle River, MD

Lot #: C0H180480

Metals cont.:
The matrix spikes of sample SD-90-SS recovered below the control limit for antimony. The matrix spike recovered below the control limit for copper.

For the matrix spikes of sample SD-90-SS, lead and zinc recoveries were not calculated due to the concentration of analyte in the sample being >4 times the concentration of spike added.

For the matrix spikes of sample SD-90-01, mercury recoveries were not calculated due to the concentration of analyte in the sample being >4 times the concentration of spike added.

General Chemistry:
There were no problems associated with the analysis.

METHODS SUMMARY

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

Overview

The sample set for Middle River Center, SDG C0H190588, consists of forty (40) environmental sediment samples. The samples were analyzed for polycyclic aromatic hydrocarbons (PAH) and polychlorinated biphenyls (PCBs). There are three field duplicate pairs within this SDG: SD-95-01/SD-DUP1-01, SD-102-04/SD-DUP2-04 and SD-104-SS/SD-DUP3-SS.

The samples were collected on August 17 and 18, 2010 and analyzed by Test America. PAH analyses were conducted in accordance with SW-846 Method 8270C and PCBs Method 8082 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial and continuing calibration results, laboratory method blank results, surrogate spike recoveries, internal standard recoveries, matrix spike/ matrix spike duplicate recoveries, laboratory control standard recoveries, detection limits, compound quantitation, field duplicate precision and compound identification. Areas of concern with respect to data quality are listed below.

Major- None.

Minor

- The percent solids was less than 30% in the following samples: SD-101-SS, SD-102-SS, SD-105-SS and SD-95-SS. Positive and nondetected results were qualified as estimated (J) and (UJ), respectively.

- Field duplicate imprecision was noted in the field duplicate pair SD-102-04 and SD-DUP2-04 for several analytes. The relative percent difference (RPD) was greater than the 50% quality control limit for acenaphthylene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene and phenanthrene. The difference in absolute values was greater than 2X the reporting limit for indeno(1,2,3-cd)pyrene. The positive result and nondetected indeno(1,2,3-cd)pyrene results were qualified as estimated (J) and (UJ), respectively.

- Field duplicate imprecision was noted in the field duplicate pair SD-104-SS and SD-DUP3-SS for several anlaytes. The RPD was greater than the 50% quality control limit for acenaphthene, benzo(g,h,i)perylene, dibenzo(a,h)anthracene, fluorene, indeno(1,2,3-cd)pyrene and naphthalene. The difference in absolute values was greater than 2X the reporting limit for benzo(g,h,i)perylene, dibenzo(a,h)anthracene and indeno(1,2,3-cd)pyrene. The positive results for the aforementioned analytes were qualified as estimated (J) in the field duplicate pair.

Executive Summary

Laboratory Performance: None.

Other Factors Affecting Data Quality: The percent solids was less than 30% in several samples. Field duplicate imprecision was noted in field duplicate pairs: SD-102-04/SD-DUP2-04 and SD-104-SS/SD-DUP3-SS for several PAHs.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994). The text of this report has been formulated to address only those problem areas affecting data quality.
