Notes:

mg/kg	milligrams per kilogram
ug/kg	micrograms per kilogram
Pci/g	picocuries per gram
Pci/L	picocuries per liter
ug/L	micrograms per liter
mg/L	milligrams per liter
U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

SS	Surface soil
CB	Catch basin
RAD	Radiological sample
"D"	Field duplicate sample
AVG	Value is an average of initial and duplicate sample results.
BaPEq	Benzo(a)pyrene equivalents
PAH	Polycyclic aromatic hydrocarbons
PCB	Polychlorinated biphenyls
S.U.	A unitless scale of acidity (in pH)
TPH	Total petroleum hydrocarbons

APPENDIX F—BAPEQ CALCULATION

Appendix F
Calculation of Benzo(a)Pyrene Equivalent Concentrations
Block E Remedial Action Plan
Lockheed Martin Middle River Complex
Middle River, Maryland

Polycyclic aromatic hydrocarbons (PAHs) are typically found in the environment as mixtures. These PAHs include benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-c,d)pyrene. The individual PAH vary widely in terms of carcinogenic potency, but have a common toxicity mechanism. Using a toxicity equivalency approach, the total PAH concentrations for a group or subset of similar PAHs can be expressed in terms of their toxicity relative to benzo(a)pyrene, with concentrations expressed as *benzo(a)pyrene equivalents (BaPEq)*.

For sites contaminated with PAHs, using a standard subset of seven PAHs, the BaPEq is calculated as the sum of each individual PAH concentration times its toxicity equivalency factor (TEF). These TEFs for the seven standard PAHs are presented in Table F-1. For example, the TEF for benzo(a)anthracene is 0.1; this means that benzo(a)pyrene is ten times more toxic than benzo(a)anthracene. If the benzo(a)anthracene concentration in a soil sample is 10 micrograms per kilogram (µg/kg), this is equivalent to 1 µg/kg of benzo(a)pyrene [10 µg/kg (benzo(a)anthracene) x 0.1 (TEF) = 1 µg/kg (BaPEq)].

Table F-1
Toxicity Equivalency Factors (TEF) for Polycyclic Aromatic Hydrocarbons (PAHs)

PAH	TEF
Benzo(a)pyrene	1.0
Benzo(a)anthracene	0.1
Benzo(b)fluoranthene	0.1
Benzo(k)fluoranthene	0.01
Chrysene	0.001
Dibenz(a,h)anthracene	1.0
Indeno(1,2,3-c,d)pyrene	0.1

The application of benzo(a)pyrene TEFs to PAH concentrations and the subsequent calculation of BaPEq can provide a more accurate evaluation of environmental risk exposure to PAHs.

- A conservative approach to calculating BaPEq for environmental samples is performed using the product of the respective TEFs for each of the seven PAHs and a representative concentration using ***both*** positive results and ½ of the reported detection limit for non-detected values. This approach, given its conservative means of incorporating toxicity of all seven PAHs even if some are present below laboratory detection limits, has been used in the Block E risk-assessment estimations and related calculations of risk-based remedial goals. The

resulting BaPEq values estimated using this method are referred to as "BaPEq-Half ND" when used in risk calculations or reported in data tables and figures.

- Alternatively, sample calculations for BaPEq may be performed using ***only*** positive results as the product of the reported analyte concentrations and the respective TEFs for each of the seven reported PAHs. Non detected results within a given sample are entirely ignored and only positively reported concentrations are considered for use in summation when this latter calculation method is employed. This calculated value, referred to as "BaPEq-POS", has typically been used in reporting data from Block E for the purposes of presenting and screening data.

The reported concentration of the benzo(a)pyrene detection limit is used as the default representative value of the BaPEq in cases where ***all*** of the seven PAHs are reported as non-detected results.

APPENDIX H—TOTAL COST ANALYSIS

LMC MRC Block E Remediation
Alternatives Estimates

Description		Alternate 3 Conventional Excavation with Shoring or Sloping					
		Shoring Alt 1		Shoring Alt 2		Benching/Sloping	
		Duration	Price	Duration	Price	Duration	Price
Plans	1		$ 230,244.92		$ 230,244.92		$ 209,313.56
Remedial Action Work Plan							
Storm Drain Removal Plan							
Radiological Work Plan							
Sampling and Analysis Plan							
Health and Safety Plan/Activity Hazard Analysis							
Construction Quality Control Plan							
Spill Prevention, Control and Countermeasures Plan							
SWPPP							
Green and Sustainable Remediation Plan							
Waste Management Plan							
Traffic Control Plan							
General Conditions	2						
Home Office Mangement		10	$ 323,794.61	12	$ 388,553.53	7	$ 226,656.23
Professional Staff							
Travel associated with HO Management							
Field Management		10	$ 2,160,633.82	12	$ 2,592,760.59	7	$ 1,512,443.68
Professional Staff							
Travel Associated with Field Personnel							
Vehciles for on -site staff							
Meetings							
Erosion Controls			$ 59,958.92		$ 59,958.92		$ 59,958.92
Establish Laydown Area			$ 20,264.01		$ 20,264.01		$ 20,264.01
Develop Decon Area			$ 3,905.65		$ 3,905.65		$ 3,905.65
Construction Entrances			$ 14,225.04		$ 14,225.04		$ 14,225.04
Permits and Fees			$ 637.01		$ 637.01		$ 637.01
Craft Physicals and Training			$ 14,482.78		$ 14,482.78		$ 14,482.78
Temporary Facilites		10	$ 87,252.59	12	$ 104,703.11	7	$ 61,076.81
Bond (assume 2%) See Prime Bond Above							
Mobilization			$ 82,951.67		$ 82,951.67		$ 82,951.67
Personnel							
Equipment							
Temp Facilities							
Subs							
Demobilization			$ 44,810.87		$ 44,810.87		$ 44,810.87
Personnel							
Equipment							
Temp Facilities							
Subs							
Survey							
Initial Survey			$ 7,530.02		$ 7,530.02		$ 7,530.02
Progress Surveys		10	$ 253,703.84	12	$ 304,444.60	7	$ 177,592.68
Final As-Built Surveys			$ 18,390.63		$ 18,390.63		$ 18,390.63
Utility Locate			$ 50,682.84		$ 50,682.84		$ 50,682.84
Permanent Fence			$ 62,021.32		$ 62,021.32		$ 62,021.32
Permanent Fence Demo							
Permanent Fence Replacement							
Water Truck, Loader and Street Sweeper		10	$ 725,773.92	12	$ 870,928.70	7	$ 508,041.74
Alternative 3 Surface Soils Conventional Excavation	4						
Excavation Assuming Shoring to be Used			$ 652,594.11		$ 652,594.11		
Alternative C Surface Soils Conventional Excavation Shallow Excavations							
Alternative C Surface Soils Conventional Excavation Deep Excavations							
Excavation Assuming Sloping and Benching to be Used							
Alternative C Surface Soils Conventional Excavation Shallow Excavations							$ 74,971.22
Alternative C Surface Soils Conventional Excavation Deep Excavations							$ 153,587.48
Additional Material to be Removed for Benching							$ 88,919.07
Alternative 4 Subsurface Soils Auger Excavation	6						
Soil Amendment for Auger Excavation							
Alternative 7 In-situ Thermal Desorption	9						
Alternative 8 Ex-situ Thermal Desorption	10						
Rad Pipe Removal	11						
Establish Exclusion Zones			$ 3,368.41		$ 3,368.41		$ 3,368.41
Establish Rad Loadout Area							
Water Treatment for with RAD Concerns			$ 4,221.16		$ 4,221.16		$ 4,221.16
Pipe Removal							
Remove overburden over Pipe			$ 11,229.44		$ 11,229.44		$ 11,229.44
Drill Holes in Pipe			$ 2,438.92		$ 2,438.92		$ 2,438.92
Drill and Inspect Pipe							
RAD Scan Pipe and Look for Liquids in Piping			$ 2,438.92		$ 2,438.92		$ 2,438.92
RAD Scanning - Performed by RAD Techs - Covered under RAD Oversight							
Laborers looking for Liquid in Pipe and Spray Foam to segregate.							
Size Pipe in Place			$ 22,035.39		$ 22,035.39		$ 22,035.39
Size Pipe							
Remove Pipe			$ 11,597.48		$ 11,597.48		$ 11,597.48
Backfill Pipe Excavations as Required			$ 12,208.15		$ 12,208.15		$ 12,208.15
Rad Oversight							
License Support			$ 24,443.61		$ 24,443.61		$ 24,443.61
Project HP Field Support Monthly Support During Pipe Removal		1	$ 111,274.62	1	$ 111,274.62	1	$ 111,274.62
Project HP Support Months beyond Pipe Removal		9	$ 616,195.35	11	$ 753,127.65	6	$ 410,796.90
Rad Instrumentation		9	$ 50,501.83	11	$ 61,724.46	6	$ 33,667.89
Rad Worker Surveilance		9	$ 41,704.74	11	$ 50,972.46	6	$ 27,803.16
PPE/Dress out for Rad Work and Misc. Items			$ 30,396.17		$ 30,396.17		$ 30,396.17
Health Physics Misc. Items			$ 62,319.62		$ 62,319.62		$ 62,319.62
Radiation Project Manager							
During Pipe Removal		1	$ 58,763.14	1	$ 58,763.14	1	$ 58,763.14
During other Remediation Work		9	$ 537,991.15	11	$ 657,544.73	6	$ 358,660.76
Rad Sampling and Analysis							
Confirmation Samples			$ 26,065.46		$ 26,065.46		$ 26,065.46
Misc Rad Samples to Include Waste Profile Samples			$ 7,240.41		$ 7,240.41		$ 7,240.41
Water Treatment Component	12						
Water Treatment for PCBs only		6	$ 181,941.27	8	$ 242,588.36	4	$ 121,294.18
Mobilization							
Demobilization

SECTION 1
INTRODUCTION

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this Radiological Remediation Plan to describe the technical approach and methodology for conducting radiological surveys and sampling in support of the demolition of the former Building D footprint, Block E at the Lockheed Martin Middle River Complex (MRC) located in Baltimore County, Middle River, Maryland. The primary objective of this remediation plan is to 1) determine if any radioactively contaminated materials are below the slab or in the drains, 2) contain and remove any discovered radioactively contaminated material as appropriate, and 3) properly dispose of all material and debris.

The following activities will be conducted to support remediation:

- work area exposure surveys for personnel protection during demolition
- work area contamination surveys for personnel protection during demolition
- work area air monitoring for personnel protection during demolition
- contamination surveys of concrete, soil, and debris to identify/segregate materials and determine disposal options
- building slab and foundation demolition
- soil removal (See Section 3)
- dust control measures, such as misting of material as it is being cut, crushed, or moved, to minimize exposure to airborne contaminants.
- final status survey after removal of building structure to verify that the site can be released with no restrictions
- contamination surveys on equipment and materials for decontamination activities and for unconditional release from the site
- report results from field activities

This work plan is organized as follows:

Section 2—Site Description: Briefly describes site history, previous investigations, and subsurface conditions.

Section 3—Radiological Approach and Methodology for Site Remediation: Presents the technical approach and methodology for personnel radiation protection and site demolition surveys and the mitigation of dust emissions and radioactive particulates.

Section 4—Radioactive Waste Management: Describes the requirements for packaging, shipping, and disposing of radioactive waste generated by demolition and decontamination activities.

Section 5—Project Deliverables and Reports: Describes the final report summarizing the findings of surveys and sampling supporting the demolition and unconditional release of the site.

Section 5—References: Cites the references used to compile this report.

SECTION 2
SITE DESCRIPTION

2.1 LOCATION

Middle River Complex (MRC) covers approximately 163 acres and is comprised of 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, a trailer and parts storage lot, and numerous grassy spaces along the perimeter. The property is currently divided into eight tax parcels (Tax Blocks A, B, and D through I; see Figure 2-1). Three recognized environmental conditions (RECs) were identified in Tax Block E during the Phase I environmental site assessment (Earth Tech, Inc., 2003). REC#1 (former Building D) is the only one of the three RECs that has the potential for being radiologically impacted. This investigation takes place in Tax Block E where Building D was formerly present and where the concrete basement floor remains. Refer to Figure 2-2 for the Factory Layout of former Building D Basement.

2.2 HISTORY

Beginning in 1929, aircraft equipment fabrication and testing for the United States government and commercial clients have comprised the primary operating history at MRC. Historically, the MRC has been used to design, develop, assemble, and test aircraft and missile launching systems. Former Building D, which was built in the early 1940s for final assembly of aircraft frames, was demolished shortly after the Atomic Energy Commission (AEC) terminated the facility license, SNM-1192, on December 29, 1970. The AEC license was issued for the decontamination of the nuclear laboratories in Building D. Pre-decontamination and post decontamination surveys were performed by Martin Marietta Corporation personnel to demonstrate compliance with license conditions for license termination. An AEC close-out inspection was conducted on November 10, 1970 to verify the results of the post decontamination survey and to support license termination. The building had an assembly floor (first floor), and a basement (current concrete slab), and occupied approximately 400,000 square feet.

The former basement areas were used for welding, extrusion milling, engine preparation, and assembly. The northwestern and southwestern portions of the basement housed several offices and laboratories used for radiological research and operations. Cleaning, plating, and finishing work areas were located along the southern interior wall near the building's center.

Since the building was demolished, the concrete slab has been used for storage, including the storage of equipment, including airplane carcasses from the Martin State Airport air museum at the eastern end of the slab.

Historical operations of radiological significance involved:

- research, development, fabrication and testing of fuel assemblies for nuclear reactors using varying enrichments of uranium 235 (U-235)
- fabrication of aircraft components using magnesium-thorium alloy (4% thorium as thorium 232 [Th-232])

Therefore, residual radioactive material may have been present in portions of Building D after removal of building contents and before demolition. Radiological surveys and sampling were conducted before and after demolition to address this issue.

2.3 PAST RADIOLOGICAL INVESTIGATIONS

In early 1970's, a series of survey/sampling events were conducted before and after demolition of Building D to support AEC license termination. As part of the pre-decontamination survey, floor drains were monitored and decontaminated where possible. Residual activity levels in five of the drains (locations unknown) were estimated to be 29 microCuries (µCi) (assumed U-235) and these drains were sealed with cement as a condition of license termination. The Nuclear Regulatory Commission (NRC) later reviewed the documentation of the license termination (1982) and performed a confirmatory survey (1995) and concurred that the facility was suitable for unrestricted use.

2.3.1 Sampling and Survey Activities

Tetra Tech has performed numerous field investigations and screenings on and around the Building D slab starting in March 2004 and continuing through February 2018. Listed below is a compilation of these activities and outcomes:

- 2004 Gamma Walkover Survey
  - Isolated areas of slightly elevated activity were identified

- 2011 Storm Drain Cleanout
  - Sediment/debris was screened in roll-off bins for gamma radiation
  - All measurements were consistent with background

- 2012 Block E Soil Investigation
  - 77 samples were collected for isotopic thorium and uranium analyses
  - Collected concrete, shallow, deep and periphery samples in and around the former Building D footprint
  - No significant findings

- 2013 Offshore Sediment Sampling
  - Sediment samples analyzed for isotopic uranium and thorium in 6 locations
  - All results were consistent with background

- 2014 Offshore Sediment Sampling
  - 131 samples outside of Outfalls 005, 006 and 008 analyzed for radioisotopes
  - 11 reference background samples were also collected
  - All results were consistent with background

- 2014 – 2018 Sediment Remediation Project
  - Screened processing bins/composited samples during dewatering operations
  - Composite samples were sent offsite for laboratory analyses
  - All levels were consistent with background

- 2013 – 2018 Block E Radiological Screening Efforts
  - Radiological screening has been performed for all intrusive activities at Block E from 2013 to present
  - Soil samples and cores scanned for elevated gamma radiation levels
  - All levels, with the exception of cores E-SB-1546 and E-SB-1470, were consistent with background.

- Under-Slab Unfiltered Water Samples
  - Preliminary results collected from void spaces under Block E concrete slab were below regulatory standards (10 CFR 20, Appendix B, Table 2 and The Safe Drinking Water Act for radionuclides in water)

- Groundwater Sampling
  - Up gradient samples were collected for background reference
  - Down gradient samples were collected to determine infiltration of radiological contamination into groundwater
  - All results were consistent with background values

2.3.2 Background Soil Concentrations

The subsurface soil beneath the Building D slab consists of imported backfill material and native soil graded during pre-construction site preparation. Hundreds of soil samples and soil cores have been screened and analyzed since 2013. All soil sample concentrations collected over the course of field activities (120 samples), with the exception of two core borings (See section 2.3.3), fall within the variable ranges of natural background concentrations. Undisturbed soil samples were collected in Block F to generate a Background Reference Area value in a non-impacted area. However, the soil characteristics in Block F were decidedly different from those in Block E (undisturbed, undeveloped soil versus disturbed, developed soil) and the sample results did not reflect the ranges found in Block E. Block E soils sampled to date, with the exception to the two previously mentioned core borings, are considered to be representative of background concentrations in Block E. The Maryland Department of the Environment's Radiological Health Program has concurred with these assumptions. Table 2-1 presents the Block E background sample ranges.

2.3.3 Contaminated Core Borings

Elevated gamma readings were detected on cores collected during core boring activities in April 2016 and in January 2017. Borings E-SB-1470 and E-SB-1546 were collected in the same general location on the Building D slab. Gamma readings ranged from 16,000 counts per minute (cpm) to 25,000 cpm. Evidence of floor drain piping (cast iron pipe fragments) were observed in each of the cores, indicating that the piping had been breeched. The cores were segregated and sampled for further investigations. Samples were analyzed for isotopic thorium by alpha and gamma spectroscopy and isotopic uranium by inductively coupled plasma–mass spectrometry (ICP-MS). Sample results indicated the presence of enriched uranium in the 5 – 15-foot interval for E-SB-1470 and the 0-6-foot interval for E-SB-1546. U-235 enrichment was calculated to be 8 – 12 %. Sample results for the two cores are presented in Tables 2-2 and 2-3.

The isotope percent abundances in natural uranium are U-234 (0.0055%), U-235 (0.72%) and U-238 (>99%). During the uranium enrichment process, as the concentration of U-235 increases there is a corresponding increase in U-234 concentrations. This concentration ratio is observed in the sample results for cores E-SB-1470 and 1546. Since MRC was only licensed to possess enriched uranium (LEU [2-5%] to HEU [>90%], any uranium concentrations found in soils related to

historical operations in Building D would have U-234 to U-235 and U-238 to U-235 ratios consistent with enriched uranium. Uranium ratios observed in historical soil samples, with the exception of cores E-SB-1470 and E-SB-1546, have been consistent with natural uranium.

2.3.4 Radiological Conceptual Site Model

The following statements define the radiological conceptual site model for Block E soils:

- Enriched uranium residual contamination from historical Building D operation is contained in intact subsurface floor drain piping
- Enriched uranium residual contamination from historical Building D operations is not present in the soil column underlying the Building D slab

SECTION 3
RADIOLOGICAL APPROACH AND METHODOLOGY FOR SITE REMEDIATION

This section describes the radiological surveys and sampling required to support remediation of the former Building D footprint, Block E at the Lockheed Martin Middle River Complex (MRC). Work to be performed includes:

- demolition and radiological monitoring of the former Building D concrete slab and foundation
- removal and radiological monitoring of the current floor drain and storm water system
- removal of PCB-impacted soil under the slab
- waste segregation, packaging and disposal of contaminated concrete, soil, and floor drain/storm water system materials, as applicable
- radiological monitoring of personnel, materials, and work areas to ensure personnel safety
- performance of a Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) Final Status Survey at the completion of all remediation and removal activities

Radiological screening of personnel and equipment will be performed during all intrusive activities associated with the investigation. All work will be performed under the supervision of health physics staff. The radionuclide of concern (ROC) for remediation is isotopic uranium, in the form of U-235. A review of historical AEC licenses listed U-235 and Th-232 as the primary licensed radioactive materials, however Th-232 concentrations in soil samples collected to date have been consistent with background concentrations and it is not considered a ROC. Additional isotopes listed on the licenses were small quantity instrument-check sources and were not considered to impact the site. Action levels have been developed to meet applicable or relevant and appropriate requirements (ARARs) of state and federal regulations. These requirements are found in Table 3-1.

3.1 GENERAL SURVEY INFORMATION

3.1.1 Release Criteria

The building surface release criterion for uranium-235 (U-235) is 5,000 dpm/100 cm^2 (Regulatory Guide 1.86 – AEC, 1974). The removable contamination (loose surface contamination that can be removed and assessed using a cloth smear) release criterion is one-fifth of the total activity limits. The limits for the site-specific radionuclide in the Building D slab and underlying soils are provided in Table 3-1. Beta surveys are not required for slab surface surveys, but will be performed for personnel protection.

3.1.2 Investigation Levels

If measured levels in the field approach or exceed the alpha and beta release criteria, or if exposure rates exceed background plus three-sigma (3σ) of the survey unit, additional investigations and/or remediation will be performed and/or additional radiological controls will be employed.

3.1.3 Alpha and Beta Scan Measurements

Scan measurements are performed to identify elevated areas of radioactivity on surfaces. Alpha scans will identify elevated concentrations of U-235. Since release criteria are for alpha measurements, beta scans will not be required for release surveys. However, beta scans will be performed for personnel protection, using the release criterion set at Regulatory Guide 1.86 (AEC, 1974) values for beta-gamma emitters (5,000 dpm/100 cm^2). Alpha static measurements for concrete and debris surfaces will be obtained with the Ludlum 43-68 detector coupled to the Ludlum 2241 rate meter (or equivalent).

[Note: The following MDCR calculations are based on generic α and β-γ background levels. The calculations will be revised upon mobilization when site-specific values can be measured.]

3.1.3.1 Alpha Scan Measurements

The alpha emitting radionuclide of concern (ROC) is U-235. To achieve the sensitivity to detect U-235 at its release criterion, a Ludlum Model 2241 ratemeter/scaler coupled with a Ludlum Model 43-68 detector (or equivalent) will be used. The system will be operated at a target speed

of 1.25 centimeters per second (cm/sec) with the detector approximately 1.25 cm from the surface. The MDCR for the detector can be calculated using the following equation:

$$\text{MDCR} = d'\sqrt{b_i}(\frac{60}{i})$$

Where: d' = index of sensitivity (α and β errors [performance criteria])

b_i = number of background counts in scan time interval (counts)

i = count time interval

The equation above simplifies to:

$$\text{MDCR} = 3.28\sqrt{1}\left(\frac{60}{7}\right) = 28.1\text{cpm}$$

Where: d' = 3.28

b_i = 1 count

i = 7 sec (based on a scan speed of 1.25 centimeters per second [cm/sec] and a detector width of 8.66 cm.)

and the scan MDC is:

$$Scan\ MDC = \frac{MDCR}{\sqrt{\rho} * \varepsilon_i * \varepsilon_s * \frac{W}{100\ cm^2}}$$

Where: MDCR = as discussed above

ρ = surveyor efficiency factor

ε_i = instrument efficiency

ε_s = surface efficiency

W = area of the detector window (cm^2) [defaults to 100 cm^2 for probes greater than 100 cm^2]

Therefore:

$$Scan\ MDC = \frac{28.1}{\sqrt{.5} * 0.4 * 0.25 * \left(\frac{100}{100}\right)} = 397.4\ dpm$$

Where: ρ = 0.5

ε_i = 0.4

ε_s = 0.25

W_A = 100 cm^2

3.1.3.2 Beta Scan Measurements

Beta scan surveys will be performed for personnel protection. A Ludlum Model 2241 ratemeter/scaler coupled with a Ludlum Model 43-68 gas flow proportional counter (or equivalent) will be used. The release criterion will be based on the Regulatory Guide 1.86 (AEC, 1974) values for beta-gamma emitters (5,000 dpm/100 cm^2). The system will be operated at a target speed of 2.5 cm/sec with the detector 1.25 cm from the surface. The MDCR for beta scans is:

$$MDCR = d'\sqrt{b_i}(\frac{60}{i})$$

Where: *d'* = index of sensitivity (α and β errors [performance criteria])

b_i = number of background counts in scan time interval (counts)

i = count time interval

Therefore:

$$MDCR = 3.28\sqrt{29.17}\left(\frac{60}{3.5}\right) = 304\ cpm$$

Where: d' = 3.28

b_i = 29.17 counts (based on 500 cpm background and a 3.5 sec count interval)

i = 3.5 sec (based on a scan speed of 2.5 cm/sec; and a detector width of 8.66 cm)

and the scan MDC is:

$$Scan\ MDC = \frac{MDCR}{\sqrt{\rho} * \varepsilon_i * \varepsilon_s * \frac{W}{100\ cm^2}}$$

Where: MDCR = as discussed above

ρ = surveyor efficiency factor

ε_i = instrument efficiency

ε_s = surface efficiency

W = area of the detector window (cm^2); defaults to 100 cm^2 for probes greater than 100 cm^2]

Therefore:

$$Scan\ MDC = \frac{304}{\sqrt{1} * 0.45 * 0.5 * \left(\frac{100}{100}\right)} = 1350\ dpm$$

Where: $p = 1$

$\varepsilon_i = 0.45$

$\varepsilon_s = 0.5$

$W_A = 100\ cm^2$

3.1.4 Alpha Static Measurements

Alpha static measurements will be obtained with the Ludlum 43-68 detector coupled to the Ludlum 2241 rate meter (or equivalent). The Ludlum 43-68 detector will be used to obtain fixed measurements on concrete and debris surfaces.

The limiting alpha emitting ROC is U-235. Static measurements for alpha emissions will require a one minute count time for the Ludlum 43-68 (or equivalent) based on U-235. The MDC calculation for the specified count time is:

$$MDC = \frac{3 + 3.29\sqrt{1*1*\left(1 + \frac{1}{10}\right)}}{0.25 * 0.4 * \frac{100}{100\,cm^2} * 1} = 65.4\ \text{dpm}$$

Where:

$R_B = 1$ cpm

$T_B = 600$ second or 10 minutes

$T_{S+B} = 60$ seconds or one minute

$\varepsilon_i = 0.4$

$\varepsilon_s = 0.25$

$W_A = 126\ cm^2$ (areas greater than 100 cm^2 default to 100 cm^2)

3.1.5 Gamma Walkover Surveys

Gamma walkover surveys will be performed in remediated areas as construction sequencing permits. Surveys will be performed using a ERG Model 105G with 44-10 GPS Survey System. Survey techniques are defined in the Task Specific Plan (Attachment B).

3.2 SURVEY PROCEDURE

Screening surveys will consist of surface scans using a hand-held instrument which detects alpha contamination. A scan rate of approximately 1.25 cm/sec will be used with the detector, which will be positioned approximately 1.25 cm above the surface during the sampling interval. Removable contamination will be assessed using either a semi-portable scaler (Ludlum 2929) or a hand-held instrument to monitor survey media (disk smears and/or large area Masslin wipes). Actions levels for total and removable alpha and beta contamination will be based on Regulatory Guide 1.86 (AEC, 1974) guidance (Table 3-1). Work areas will also be monitored for exposure rate using a hand-held dose rate meter, using similar methods to those described above. If alpha contamination level is above the release criterion, the surface will be marked for segregation as radioactive waste.

Instrument information for the meters that will be used is listed in Table 3-2. Instruments will be checked for operability prior to use in accordance with Tetra Tech *Task Specific Plan Former Building D, Block E Scoping Survey, Middle River Complex, 2323 Eastern Blvd., Middle River, Maryland* (Appendix A). Daily operability checks will confirm that action levels are detectable and not below MDCR for each instrument. All survey results will be documented on radiological survey forms. Any location where the detector reading exceeds the release criteria of 5,000 dpm/100 cm^2 total α or β contamination will be marked and/or posted and a GPS location will be documented as detailed in the work plan. These areas will deconned/remediated with the resulting waste disposed of as radioactive material. Anomalous readings will also be noted on the survey map, in accordance with Tetra Tech *Radiological Protection Operating Procedures* (Appendix A).

3.3 PERSONNEL PROTECTION SURVEYS

Radiological surveys will be performed during field activities to establish that radiation and contamination levels are < 5,000 dpm/100 cm^2 total α and < 1,000 dpm/100 cm^2 removable α contamination. Radiation surveys will be performed in work areas before and during work

activities to monitor radiological conditions and maintain radiological controls to prevent the inadvertent spread of contamination. Contamination surveys will also be performed on personnel leaving a radiological area to ensure that individuals are free of contamination.

During activities that create the possibility for airborne contaminants (i.e., demolition of concrete, excavation of soils), monitoring will be performed for airborne radioactivity. Dust control measures, such as misting of material as it is being cut, crushed, or moved, will be implemented to minimize exposure to airborne contaminants.

Contamination surveys will be performed before and after decontamination on equipment leaving the controlled area to ensure that contamination levels are below limits established for the unconditional release of materials.

3.4 DEMOLITION SURVEYS

No radiological contamination is known to be present on the above-ground surface of the concrete slab that remains in the area of the former Building D. The only radiological material detected during characterization efforts are isolated to the floor drain system associated with the portion of the building where radiological operations occurred in the southwest quadrant of the slab. Since residual contamination may be present in other sections of floor drain piping, a graded approach to radiological controls during remediation will be employed with the primary focus on the southwest quadrant, however radiological monitoring will be performed for all remediation activities.

Materials and debris removed during demolition and remediation activities will be monitored for fixed and removable contamination and surface radiation levels. Exposure rate and contamination surveys will be performed on exposed areas of the drain system and surrounding soil to determine if safe conditions exist.

For remediation in the southwest quadrant, the building slab will be removed to expose the floor drain piping. Floor drain lines will be contained and removed to prevent the spread of contamination. Each section of the floor drain and the soil surrounding it will be surveyed by health physics personnel before other personnel enter the area. The results of this survey will determine how materials (concrete, piping, soil) will be packaged, removed, staged, and disposed. If piping

is undamaged, outer surfaces will be surveyed for contamination. If no exterior contamination is present, pipe sections will be sealed at the ends and staged as radioactive waste. If exterior contamination is found, the entire pipe section will be wrapped/sealed in plastic and staged as radioactive material.

Removal and Staging of Material

If no contamination is found above limits provided in Table 3-1, material will be removed and staged for disposal as non-radioactive waste. These materials will have no radiological restrictions for handling or disposal.

If contamination is found in excess of Table 3-1 values, material will be removed and staged for disposal. Care will be taken to remove as little dirt as possible when removing the drains. Prior to removal, the material will be bagged, wrapped, or containerized to prevent the spread of contamination during movement to the staging area. Staging areas for contaminated drain system pieces will also be covered with disposable materials (i.e., tarps, plastic) prior to placing of material and will be designated as a radioactive material area (RMA) until material has been removed for disposal.

3.5 SOIL SAMPLING

3.5.1 Soil Samples

Soil samples will be collected in accordance with the TSP. Sampling will be performed in accordance with applicable radiological protection operating procedures (Appendix A). All radiological samples will be analyzed by an offsite laboratory for isotopic uranium. Since the TSP addresses the performance of a MARSSIM based Scoping Survey, only surface soil samples (0-6 inches deep) will be collected.

3.5.2 Sample Handling

Radiological sample handling includes field-related considerations concerning the selection of sample containers, labeling, and analyses requested; hold-times and preservatives are not required. Proper custody procedures will be followed throughout all phases of sample collection and handling. Chain of custody (COC) protocols will be used throughout sample handling to establish the evidentiary integrity and possession history of sample containers. These protocols will

demonstrate that the samples were handled and transferred in a manner that would eliminate (or detect) possible tampering.

Sample containers will be released under signature from the laboratory and will be accepted under signature by the sampler(s) or responsible individual that maintains custody, until the sample containers are transferred to the sampler(s). Transport containers returning to the laboratory will be sealed with strapping tape and a tamper-proof custody seal. The custody seal contains the date, time, and signature of the individual releasing the transport container.

3.5.3 Data Analysis and Management

All samples collected for radiological analysis will be analyzed by inductively coupled plasma-mass spectrometry (ICP-MS). The total number of samples collected for analysis will be dependent on the number of survey units identified as a result of construction sequencing. Sample grids will be in accordance with MARSSIM guidance. Radiological samples will only be sent to a laboratory that is Agreement State– or Nuclear Regulatory Commission– (NRC–) licensed (as applicable) to receive radioactive material.

All analytical results provided by the laboratory will be validated for all quality assurance/quality control (QA/QC) parameters including accuracy, precision, completeness, and comparability in accordance with the Multi-Agency Radiological Laboratory Analytical Protocols Manual (MARLAP) (NRC, 2004). Ninety percent of the data packages will receive cursory validation and 10% will receive full validation. Oversight of the laboratory QA/QC will be proactive to ensure valid data are produced during the sampling event. Therefore, an evaluation of the methodology, method compliance, and any corrective actions will also be performed. Results of data usability reviews will be provided to Lockheed Martin Corporation (Lockheed Martin) and the managing contractor as they are received.

The Contractor will closely monitor the laboratory analysis via electronic data deliverables (EDD) and data validation of the samples to ensure that the analysis and reporting are generated as per the analytical requirements and procedures. The deliverables will include EDD and data validation summary reports. Results of data usability reviews will be transmitted to the project personnel as they are received.

Laboratory data handling procedures will meet the requirements in the laboratory subcontracts. All analytical and field data will be maintained in Tetra Tech project files, and will include copies of the COC forms, sample log forms, sampling location maps, and documentation of quality assurance and quality control.

Additionally, radiological data will be entered into a radiological sampling database for preliminary review and comparison to action levels by the project health physicist. Actions levels for soil sample results are found in Table 3-1. A review of radiological sampling data from shipping containers is required prior to shipping waste to accurately complete waste manifest forms.

3.6 CONTINGENCY

Demolition, excavation and construction progress surveys will assess radiological conditions as the project progresses. The conceptual site model assumes that the breeching of the floor drain pipe was an anomaly and that the remaining soils under the slab were not impacted by radiological operations. Additionally, suspect floor drain piping locations associated with historical radiological operations have been identified in the southwest portion of the Building D slab. The construction design will take these areas into account for increased surveillance.

However, the potential exists that contamination might be present in other portions of the floor drain system. Radiological surveillance, in the form of additional surveys and soil sampling, will be required when excavation of floor drain piping is performed. If surveys indicate the presence of enriched uranium pre- or post-excavation, the extent of the contamination will be assessed, and the extent of contaminated soil removal activities will be determined. It is expected that if these conditions are encountered, manual spot decontamination will be sufficient to reach clean up criteria. If additional excavation beyond spot decontamination is required, these activities will be coordinated with construction supervision. Waste packaging, storage and shipment will be managed using standard project procedures.

3.7 FINAL STATUS SURVEY

A radiological final status survey will be performed in accordance with the TSP (Attachment B). After completion of site remediation activities, an assessment will be made of site surveys and

sample results. This information will be supplemented, as necessary, to statistically show that no radiological contamination exist above the site release criteria in the remaining soil of the Building D footprint. This information will be presented in a formal report to be submitted to the Maryland Department of the Environment's Radiological Health Program (RHP) for review and approval.

SECTION 4
RADIOACTIVE WASTE MANAGEMENT

A waste management plan conforming to *Lockheed Martin Energy, Environment, Safety, and Health (EESH) Remediation Waste Management Procedure No. EROP-03, Revision 4 (*effective April 17, 2009) (Lockheed Martin, 2009) will be submitted as part of the Block E Remedial Design. This plan will be followed and modified to include control of radioactive (and possibly mixed) waste generated during site remediation operations, if applicable. If radioactive or mixed waste is generated, it will be packaged and staged appropriately, under the direction of the health physicist, until proper disposal arrangements can be made. Any radioactive or mixed waste generated will be shipped in accordance with state and federal regulations and disposed in a licensed disposal facility.

SECTION 5
PROJECT DELIVERABLES AND REPORTS

A radiological assessment report will be prepared to summarize the results of the remedial action. The report will be a standalone document supplemental to the main report. The report will discuss radiological activities conducted during the project and will include the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) Final Status Survey Report as an attachment. Data tables for all sampling included in the final report will be added to the Middle River Complex (MRC) environmental geographic information system (EGIS). Conclusions and recommendations will be included based on the investigation results. The report will be forwarded to applicable regulatory agencies for review and approval.

TASK-SPECIFIC PLAN FOR BUILDING D SCOPING SURVEY

This Task-specific Plan (TSP) provides the technical approach and methodology for conducting radiological scoping surveys and sampling in support of the demolition of the former Building D footprint, Block E at the Lockheed Martin Middle River Complex (MRC) located in Baltimore County, Middle River, Maryland. The survey will be conducted in accordance with the general approach, radiological controls and methodologies provided in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) [NRC, 2000] and Standard Operating Procedures (SOPs). The survey activities will conform to the requirements of the Health and Safety Plan (HASP) [Tetra Tech, 2014]. No exceptions to the SOPs or HASP are noted.

This survey is being performed to determine if residual radioactivity is present in the surface soil (0-6 inches) in the Building D footprint after foundation slab and chemically contaminated soil are removed. The survey of this area has been designed as MARSSIM Class 1, 2 and 3 surveys based on historical records and a limited potential for delivering a dose above the release criterion. This methodology will allow the use of survey data to assess the risk posed by the presence of residual radioactivity in surficial soils. Should survey results indicate that contamination exists above the site release criteria, additional radiological investigations including additional remediation will be required. Survey unit (SU) locations and sizes will be dependent on construction sequencing and will be determined during remediation activities.

SECTION 1
SITE DESCRIPTION AND HISTORICAL SUMMARY

Middle River Complex (MRC) covers approximately 163 acres and is comprised of 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, a trailer and parts storage lot, and numerous grassy spaces along the perimeter. The property is currently divided into eight tax parcels (Tax Blocks A, B, and D through I). Three recognized environmental conditions (RECs) were identified in Tax Block E during the Phase I environmental site assessment. REC#1 (Former Building D) is the only one of the three where AEC licensed material was used. This survey focuses on the soil underlying the former Building D concrete basement footprint (Figure 1).

Beginning in 1929, aircraft equipment fabrication and testing for the United States government and commercial clients have comprised the primary operating history at MRC. Historically, the MRC has been used to design, develop, assemble, and test aircraft and missile launching systems. Former Building D, which was built in the early 1940s for final assembly of aircraft frames, was demolished soon after the Atomic Energy Commission (AEC) license was terminated on December 29, 1970. The building had an assembly floor (first floor), a basement (current concrete slab), and occupied approximately 400,000 square feet.

The former basement areas were used for welding, extrusion milling, engine preparation, and assembly. The northwestern and southwestern portions of the basement housed several offices and laboratories used for radiological research and operations. Cleaning, plating, and finishing work areas were located along the southern interior wall near the building's center.

After the building was demolished the concrete slab has been used for storage, including the storage of airplane carcasses from the Martin State Airport air museum at the eastern end of the slab.

Historical operations of radiological significance involved:

- research, development, fabrication and testing of fuel assemblies for nuclear reactors using varying enrichments of uranium 235 (U-235)
- fabrication of aircraft components using magnesium-thorium alloy (4% thorium as thorium 232 [Th-232])

Therefore, residual radioactive material may have been present in portions of Building D after removal of building contents and before demolition. Radiological surveys and sampling were conducted before and after demolition to address this issue.

Since historical evidence and recent filed activities indicate that facility surfaces and systems were and are contaminated from radiological operations, a scoping survey of the underlying soil in the Building D footprint is being performed. The primary radionuclide of concern (ROC) is isotopic uranium (primarily as U-235). Soil sampling under the Building D slab has indicated that Th-232 concentrations are consistent with background and thus not considered a ROC.

SECTION 2
SCOPING SURVEY

The purpose of this section is to provide guidance for performance of a Scoping Survey (SS) under this TSP. This SS will allow the use of survey data to assess the risk posed by the presence of residual radioactivity in surficial soils.

All radiological surveys will be performed in accordance with SOP 006, *Radiation and Contamination Surveys.* One hundred percent of the Class 1, 2 and 3 survey units (if reachable by personnel after remediation efforts are complete) will be scanned using a ERG Model 105G GPS survey system coupled with a Ludlum Model 44-10 2-inch by 2-inch NaI detector for data collection and data maintenance. Additional measurements and samples will be collected if investigation levels or release criteria are exceeded during the review of data. Soil sample locations will be determined using a triangular grid system with a random start point (NRC 2000). Additional biased gamma static measurements and soil sample locations may be added based on the results of the gamma walkover survey and on professional judgment.

Soil samples will be analyzed for isotopic uranium (U) by an Environmental Laboratory Accreditation Program (ELAP) accredited laboratory using EPA Method 6020A, Inductively Coupled Plasma-Mass Spectrometry (ICP-MS).

2.1 RELEASE CRITERIA

This survey is being performed to assess whether residual radioactivity above the established release criteria, as defined on Table 2-1, is present in the area. The site will be modeled using residual radionuclide concentrations to evaluate total dose and risk.

2.2 REFERENCE AREA

While a Reference Background area in Block F has already been sampled and analyzed, sampled soils are not geologically representative of Block E and sample results were not reflective of Block

E concentrations. Sample values generated from Block E sampling will be used for reference background values.

2.3 INVESTIGATION LEVEL

The investigation level for gamma surveys will be established at the survey unit mean plus 3σ, where σ is the standard deviation of the gamma readings in the survey unit. Survey data will be evaluated using the Z-test and values above the mean will be plotted on a color-coded map. Values of 3σ or above will be investigated by 1) visual inspection (soil staining, discoloration), 2) physical inspection and 3) static gamma measurements. If the source of the elevated reading cannot be determined (i.e., geologic sources, naturally occurring observable sources, etc.), a biased soil sample from the location will be considered. Approximately 25% of the areas exceeding the 3σ value will be sampled. Areas exceeding 3σ will be marked in case laboratory analyses of soil samples indicates that further investigation is warranted.

2.4 SURVEY UNITS

The Building D survey unit locations and sizes will be determined based on construction sequencing. The general approach will be that as demolished and remediated areas become available, they will be sampled and surveyed to permit any restoration activities necessary (i.e., grading, backfilling, etc.). The category and number of survey units is displayed in Table 2-2. Since radioactive contamination was found in the southwest quadrant of the Building D slab where radiological operations were known to have occurred, that area will be considered a Class 1 area. A Class buffer 2 area will be developed around the Class 1 perimeter. The remainder of the building slab will be considered a Class 3 area. Depending on construction sequencing, one portion of a SU may be sampled and surveyed pending the completion of remediation in the remainder of the SU. The boundaries of the Survey Unit areas are shown in Figure 1.

2.5 ESTABLISHING THE NUMBER OF MEASUREMENTS

To determine the number of measurements, N, to be taken per survey unit/reference area combination when the contaminant is present in background, Equation 5-1 of MARSSIM (NRC, 2000) is used:

$$N = \left(\frac{(Z_{1-\alpha} + Z_{1-\beta})^2}{3(P_r - 0.5)^2} \right)(1.2)$$

Where:

N = Number of data points

$Z_{1-\alpha}$ = Type I decision error level, 1.645

$Z_{1-\beta}$ = Type II decision error level, 1.645

P_r = random measurement probability, 0.871014

1.2 = 20 percent increase in number of samples over the minimum

The values used in the calculation are from MARSSIM guidance (NRC, 2000) and are based on a recommended value for the relative shift (Δ/σ) of 1.6 as discussed in Section 5.5.2.2 of MARSSIM (NRC, 2000). Type I and Type II decision errors are based on 0.05 false negative and 0.05 false positive rates. The associated Z values are obtained from MARSSIM Table 5.2 (NRC, 2000). The random measurement probability, P_r, is from MARSSIM Table 5.1 (NRC, 2000).

Using the defined values, the equation becomes:

$$N = \left(\frac{(1.645 + 1.645)^2}{3(0.871014 - 0.5)^2} \right)(1.2)$$

The calculation results in a value of N = 31.45366. Therefore, a minimum of 32 measurements will be obtained in each survey unit/reference area combination (approximately half from the survey unit, half from the reference area). Sample locations will be determined using a triangular grid pattern as specified in Section 5.5.2.4 of MARSSIM (NRC, 2000).

In additional to the systematic measurements, biased sampling locations may be determined based on the results of the gamma walkover survey and field observations/investigations. Each sample location investigation will consist of:

- a soil sample from the 0-6 inch (0-15 cm) soil layer (SOP 009),

- a static 1-minute gamma measurement (SOP 006),
- an exposure rate measurement (SOP 006).

GPS coordinates will be obtained for all sample locations.

2.6 GAMMA SCANS

One hundred percent of all SUs will be scanned with a ERG Model 105G with 44-10 GPS Survey System. Gamma scans by survey instruments will be logged and included in the final report. For the ERG Model 105G with 44-10 GPS Survey System, scans will be performed at a rate of approximately 0.5 meter per second (1 second scan observation) with the detector held approximately 10 centimeters (4 inches) above the ground. The scan path will be on approximate 1-meter traverses.

2.7 GAMMA EXPOSURE RATE MEASUREMENTS

Gamma exposure rate measurements will be collected using a Bicron/Thermo MicroRem Meter from each specified sample location in the survey unit in accordance with SOP 006.

2.8 SOIL MEDIA SAMPLING

Soil samples will be collected at identified sampling locations and analyzed by an offsite laboratory for isotopic U by Inductively Coupled Plasma – Mass Spectrometry [ICP-MS] (EPA Method 6020A). Summary, statistics and data evaluation will be summarized in the SS report.

2.9 DOSE MODELING IN SUPPORT OF A RADIOLOGICAL RISK ASSESSMENT

The intent of the survey is to provide radiological risk analysis for residual contamination in surficial soils (0 – 6 inches) within the Building D footprint. To accomplish this goal, it is necessary to provide a means for calculating residual dose to the critical group; the default industrial worker scenario for RESRAD-ONSITE (version 7.2 or as updated) was selected.

After the residual dose is determined, the excess lifetime cancer risk to the critical group will also be estimated. Scoping survey soil sample results will be used to perform RESRAD dose and risk modeling for an industrial end use scenario.

SECTION 3
QUALITY CONTROL

The DQOs for field activities are provided in Table 3-1. The laboratory DQOs are in Table 3-2.

Definable features of work (DFWs) establish the measures required to verify both the quality of work performed and compliance with project requirements. The DFW for this task are radiological surveys and the associated sample results. A description of the DFW and the associated phases of quality control are presented in Table 3-3. Quality control data will be provided in the SS report.

Primary Radiation Properties and Release Criteria for Radionuclides of Concern

Radionuclide	Primary Radiation Properties		Release Criteria		
			Materials, Equipment, and Wastes		Release Criteria for Residential Reuse Solid Samples[c,d] (pCi/g)
	Half-life	Type	Total Surface Activity[a,b]	Removable Activity[ab]	
U-235	7.1e^{8} y	Alpha	5,000	1,000	4.8
Beta-gamma emitters[e]	N/A	Beta-Gamma	5,000	1,000	N/A

Notes:

[a] Units are disintegrations per minute per 100 square centimeters.

[b] These limits are based on AEC Regulatory Guide 1.86 (**AEC, 1974**). Values indicate the measured value above background as determined from the reference area. Limits for removable surface activity are 20 percent of these values.

[c] These limits are based on Nuclear Regulatory Commission document NUREG-1757, Consolidated Decommissioning Guidance (**NRC, 2006**), whose limits are deemed in compliance with the 25 mrem/y unrestricted dose limit in 10CFR20.1402. Listed values were developed by scaling the NUREG-1757 values to 15 mrem/y for unrestricted use.

[d] Criteria are above background for those radionuclides found in background soils.

e Beta-Gamma values are listed for use in the assessment of the daughter decay progeny of enriched uranium.

Building D footprint is considered an area potentially impacted by radiological activities. Radionuclide of concern for this footprint is U-235. It will be determined if residual contamination in surficial soil meet the site-specific release criteria for these radionuclides.	The primary use of the data expected to result from completion of this TSP is to support the Scoping Survey of the Building D footprint Therefore, the decision to be made can be stated as, "Do the results of the survey meet the release criteria?"	Radiological surveys required to support the Scoping Survey of the Building D footprint will include: • 100 percent gamma scan surveys of the Class 1, 2 and 3 survey units using hand-held instrumentation. Typically, a minimum of 16 biased gamma static measurements, exposure rate measurements, and solid samples will be collected in each of the survey units. • Soil samples will be analyzed for isotopic uranium.	The boundaries of the survey areas are shown in Figure 1. The spatial boundaries are consistent to assess radiological risks associated with residual contamination in surficial soil.	The results of the survey will be used to assess radiological risks from residual contamination in surficial soil.	Limits on decision errors are set at 5 percent.	Operational details for the radiological survey process have been developed. The theoretical assumptions are based on guidelines contained in MARSSIM (NRC, 2000). Specific assumptions regarding types of radiation measurements, instrument detection capabilities, quantities and locations of data to be collected, and investigation levels are contained in this TSP.

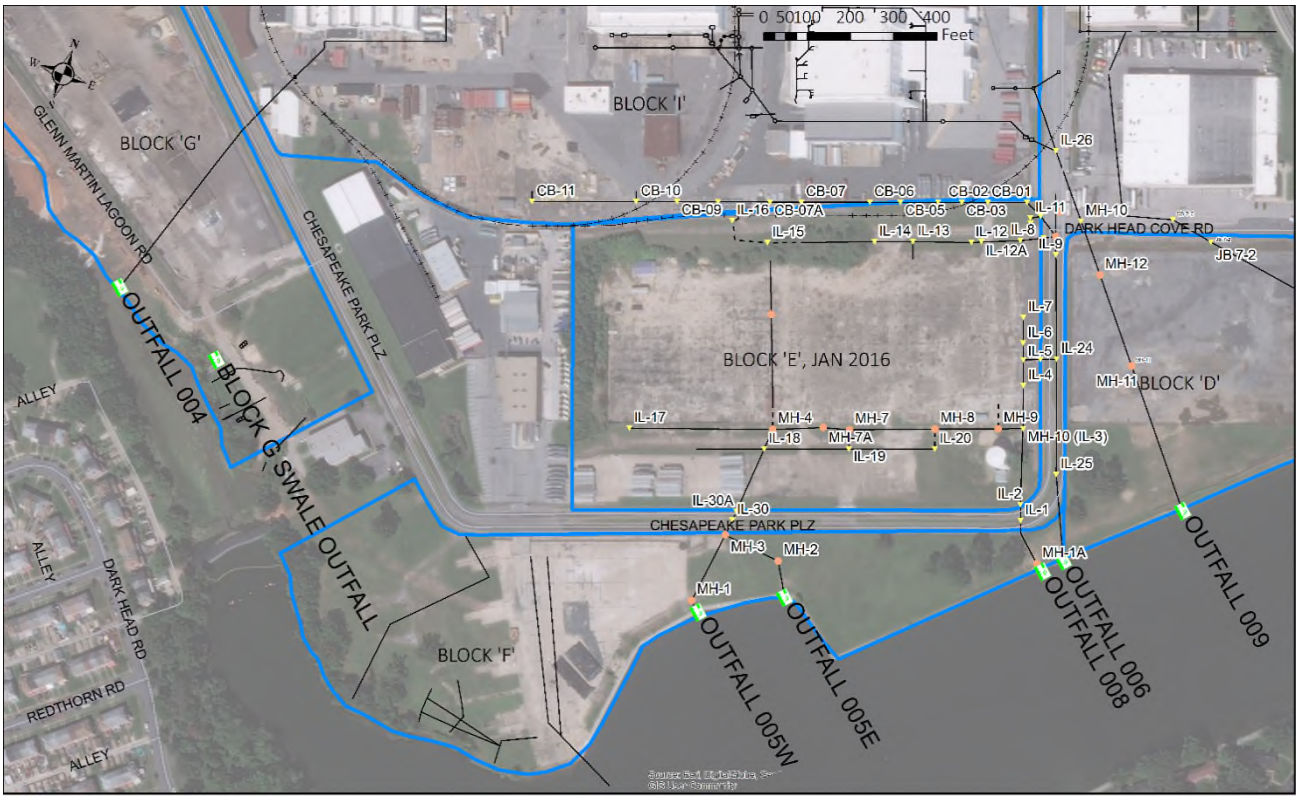
1.0 INTRODUCTION

Tetra Tech is developing of a Soil Remedial Action Plan (RAP) for Block E within Lockheed Martin's Middle River Complex. One component of the remedial action will include at least partial removal of the existing storm drain system and constructing a functional system after remediation is complete. This hydrologic modeling of Block E was prepared to support preparation of the RAP including feasibility study cost estimating of remedial action strategies. This technical memorandum discusses the development of hydrologic models to compare existing pre-remediation conditions with a conceptual model of proposed post-remediation graded site conditions.

Figure 1 shows the area analyzed. The hydrologic analysis was used to compare flows between the pre-remediation scenario (existing) and the conceptual post-restoration scenario (proposed). The analysis included Block E and adjacent parcels that flow into pipe networks carrying stormwater runoff to outfalls 005, 006, and 008. The following sections describe the data sources, drainage area delineation, hydrologic flow computations, observations, and conclusions.



1.1. Data Sources and Assumptions

Tetra Tech has been studying Block E since 2003. Information such as utility layouts, photos, observations during rain events, available plan sets of conveyance system, were obtained and used for the hydrologic analysis. In addition, Tetra Tech collected information related to precipitation, soils, and topography from available external resources.

1.1.1. Stormwater Conveyance

Design and as-built plans were studied in conjunction with known on-site modifications to understand the stormwater conveyance network in Block E and adjacent parcels. Pipe networks conveying flows towards outfalls 005, 006 and 008 were studied. This analysis was used to determine the movement of stormwater from the sub-catchments. At present, flow from Block E is prevented from flowing towards 005 due to physical placement of a plug to prevent migration of impacted sediment that will remain in place until Block E is remediated. Stormwater conveyance pipes in the south and east portions of Block E flow to 006, while the pipes to the north side flows to 008. Figure 1 shows the existing stormwater conveyance network from site plans and geospatial data. Adjacent

parcels flow to outfalls 005, 006, and 008 as shown in Figure 1. The stormwater conveyance network was important to delineate the drainage areas of interest, which were defined as areas within Block E and adjacent parcels with flows that are conveyed to outfalls 005, 006, and 008. Pipes discharging to 005 and 008 are 30-inch pipes. Pipes discharging to 006 are 18-inch from their origin to the inlet in the median of Chesapeake Park Plaza and 24-inch beyond that point.

Note: MH = manhole; IL = inlet; CB = catch-basin: Dashed lines = approx. pipe location

Figure 1. Existing parcel boundaries and stormwater conveyance network.

1.1.2. Precipitation

Precipitation information was obtained from the Precipitation Frequency Data Server (PFDS) hosted by the National Oceanographic and Atmospheric Administration (NOAA) Hydrometeorological Design Studies Center. NOAA Atlas 14 (Volume 2 Version 3) point precipitation frequency estimates were obtained for the Towson station (Latitude: 39.3833, Longitude: -76.5667) in Parkville, Maryland. Table 1 shows the precipitation information over a range of return period events for a 24-hour storm. This precipitation information was used to represent the design storm precipitation depths (inches) at the Middle River Complex. The Towson station is about 8 miles northwest of the Middle River Complex.

Table 1. Precipitation depth (inches) for a 24-hour storm for range of return periods (years).

Source: https://hdsc.nws.noaa.gov/hdsc/pfds/ Accessed: 03/05/2018

1.1.3. Soils Data

Spatial and tabular soils information for Baltimore County was obtained from the Natural Resources Conservation Service (NRCS) Web Soil Survey (WSS). Table 2 shows the composition of soils within the drainage areas

analyzed. Figure 2 shows the soils information for Block E and adjacent parcels. Most of the area of interest is classified as *Urban (*UR-D in Figure 2). Some adjacent parcels (Blocks D, F, and G) show the presence of hydrologic soils group (HSG) B and C soils. Minor soils in the *Urban* unit are also HSG C. HSG A soils are predominantly sandy loams with high infiltration rates. HSG B soils are mainly silty loam or loam and have moderate infiltration rates. HSG C soils are mainly sandy clay loam and have low infiltration rates. HSG D soils are mainly clay (or have a high-water table) and have very low infiltration rates, meaning they have the highest runoff potential.

Table 2. Soils information including surface runoff characteristics and hydrologic soils group (HSG).

Figure 2. Soils map for Block E and adjacent parcels.

1.1.4. Topographic Information

Topographic information was obtained as 2-foot contour geospatial data from Baltimore County. The topographic contours for parcels adjacent to Block E were well defined. There were no contours within Block E, as Block E originally contained a building that has been demolished. The contours in Block E do not define the areas that are the exposed part of the slab, which was below the original building. Figure 3 shows the topographic information obtained for the area of interest. The northern and western boundaries of Block E are at the 12-foot contour, while the southern and eastern boundaries are at the 10-foot contours, indicating that Block E has a very low slope. This was confirmed in field observations (section 1.2) showing that the areas are fairly flat with very shallow land slopes.

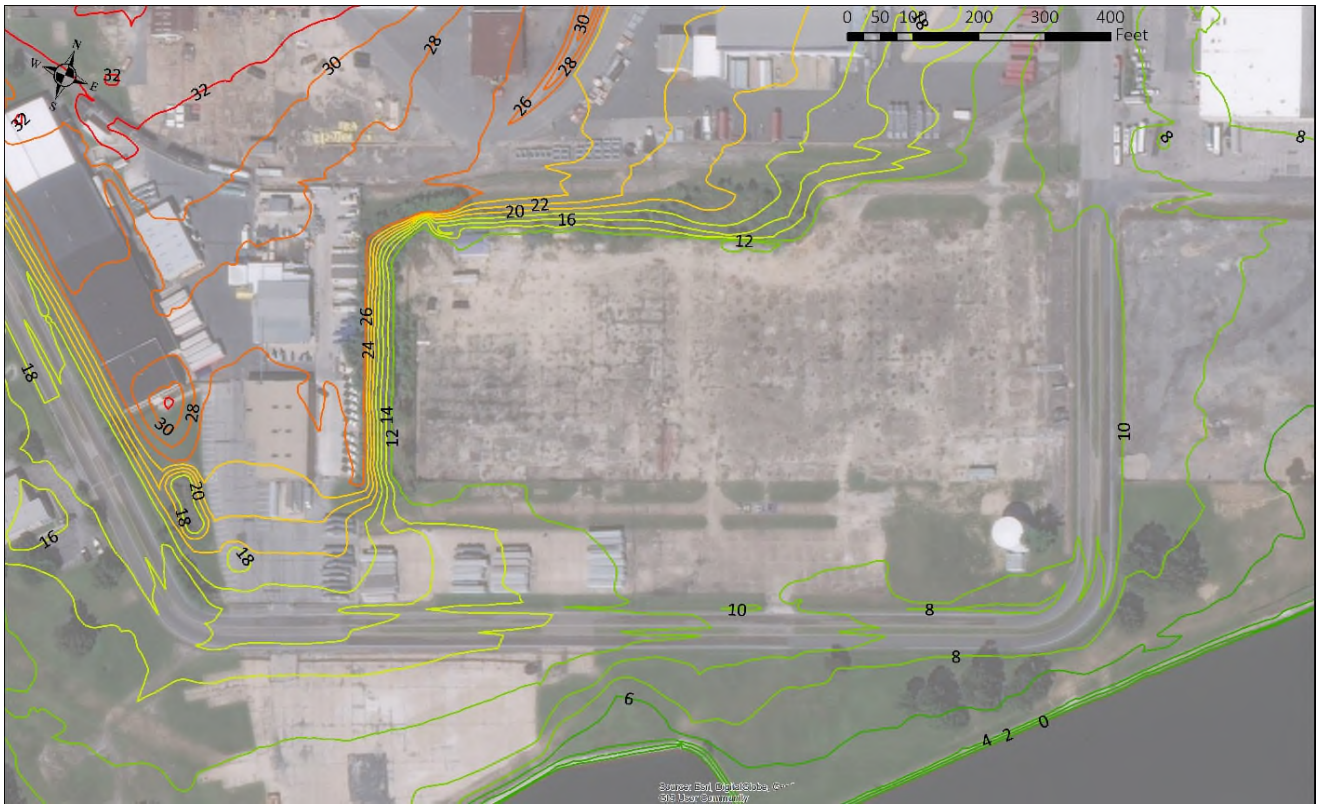

Figure 3. Topographic map of Block E and adjacent parcels with 2-foot contour intervals.

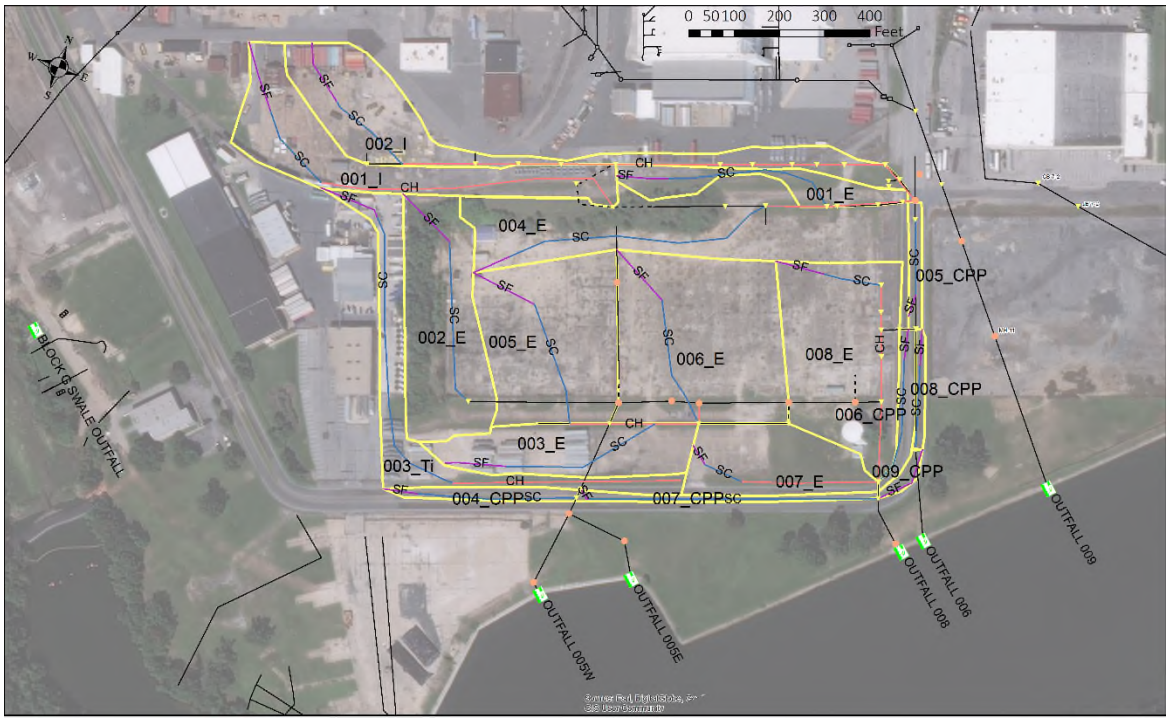
1.2. Site Visit – Observations

On March 19, 2018, Tetra Tech performed a site visit to visually assess Block E and the adjacent parcels. Observations from the site visit related to the hydrologic assessment are listed below.

- Surface channel runs to the south of Block E, with a culvert going under the Block E entrance off Chesapeake Park Plaza from west to east. This culvert is not flowing freely. Culvert exits in an eroded low spot with poor access to the surface channel conveying the flow to the inlet at the southeast corner of Block E. Surface culvert needs to be better defined and graded, along with proper installation of the culvert to provide adequate, efficient conveyance of flows.
- Western edge of the site has soil deposited over the slab from when the building was demolished and the existing soils sloughed onto the building site. Remediation solution of the sloping soils will determine final grading in this area.
- Northwest corner of Block E around the salt shed has formed a local depression and holds standing water. This area will need to be properly graded to allow the runoff to move towards the downstream inlets towards the northeast. The salt shed will be moved to an alternative location on the Middle River Complex prior to remediation.
- There are two surface inlets on the northwest side of Block E. One of the inlets is right at the fence line and is piped to receive flow from Block I. The outflow opening from this inlet has been constricted to a 1-1.5-inch square opening. The other inlet is located on the downslope. The inlet shows signs of erosion in the vicinity.
- Flows from area of Block I immediately northwest of Block E are conveyed through the surface ditch created by the railway tracks. This flow is conveyed along the fence line before it comes across into Block E and flows to the above two inlets.
- Some areas of Block I flow towards the concrete surface ditch that runs within Block I and are collected by inlets that covey flow to the 008 pipe network.

- Further north flows from Block I are carried down the depression in pavement and discharged into inlets that flow to outfall 009.
- Chesapeake Park Plaza has grassed median channel segments with inlets. Runoff from the road flow either towards the roadside channels or the median channels.

2.0 HYDROLOGIC ANALYSIS OF EXISTING CONDITIONS



The available topographic information was used to delineate all the sub-watersheds that flow into the stormwater network conveying runoff to outfalls 005, 006, and 008. Observations made during the field visit regarding local conditions—including crests, flow ditches and other flow indicators—were used to refine the delineations. Sub-catchments were separately delineated depending on whether they were within Block E or part of adjacent parcels and roads. Upstream and adjacent sub-catchments were labeled starting with 001 and a suffix characterizing the major parcel, property or road they are on (I = Block I, Ti = Tilley Chemicals, CPP = Chesapeake Park Plaza). Block E sub-catchments were similarly labeled with the suffix E.

Hydraflow Hydrographs Extension for AutoCAD was used for the hydrologic analysis. The TR-55 methodology was used to assess time of concentration (Tc) and runoff curve number (RCN) to assess runoff characteristics. Each delineated sub-catchment was characterized. Spatial imagery was used to delineate pervious areas within the sub-catchments. Using available soils data, RCNs associated with hydrologic soils group C were applied for characterization of sub-catchments. This soil classification is consistent with the average soil conditions noted in the multitude of soil borings completed in Block E. Table 3 shows the land use characteristics applied to the sub-catchments.

Table 3. Land use and runoff curve number applied for sub-catchment characterization.

Area type	Land use	HSG	RCN
Pervious areas	Idle Land - Meadow - Continuous Grass	C	71
Pervious areas	Idle Land - Woods-Grass Combination	C	76
Impervious areas	Paved parking lots, roofs, driveways	C	98
Streets and roads	Streets and Roads - Paved - Open Ditches - Inc. ROW	C	92

Figure 4 shows sub-catchment delineations (yellow outlines), pervious areas, and Tc flow paths. For Tc assessment, the longest flow path for each sub-catchment was established and separated out into components of sheet flow (SF – purple lines in Figure 4), shallow concentrated flow (SC-blue lines) and channel flow (CH-orange lines) as applicable. Sheet flow was limited to a maximum of 150 feet before transitioning to shallow concentrated flow. Shallow concentrated flow continued until the flow part was intercepted by either a defined surface channel or a stormwater inlet. Land slopes for sheet flow and shallow concentrated flow were calculated with spatial tools and available topographic information. Once intercepted by a defined conveyance system, the flow path was considered as channel flow and was calculated based on the appropriate channel type and slope of the conveyance system up to the outlet end. A minimum Tc of 6 minutes (0.1 hours) was used. Table 4 show the Manning's n for sheet flow and channel flow.

Note: SF=sheet flow; SC=shallow concentrated flow; CH=channel flow; yellow=drainage area outlines

Figure 4. Sub-catchment area delineations and time of concentration (Tc) flow paths for existing conditions.

Table 4. Manning's n for sheet flow and channels.

Landuse	Flow Type	Manning's n
Impervious - Paved parking lots, roofs, driveways	Sheet Flow	0.013
Pervious - Meadow - Continuous Grass	Sheet Flow	0.15
Earth Ditch - Fairly Uniform - Grass, some weeds	Channel	0.025
Piped Infrastructure - Concrete Pipes	Channel	0.015

2.1. Upstream Sub-Catchments

Table 5 shows the input characteristics for the hydrologic model for all upstream and adjacent sub-catchments shown in Figure 4. Hydraflow Hydrographs Extension automatically calculates the area-weighted RCN and Tc for each drainage area using the input land use and soils data. Detailed computations of input parameters are included in the Hydraflow Hydrographs input/output report (Attachment A).

Table 5. Runoff curve number (RCN) and time of concentration (Tc) for upstream and adjacent sub-catchments in existing conditions.

Drainage Area ID	Area (acre)	Imp. Area (acre)	Per. Area (acre)	RCN	Slope (%)	Tc (min)	Outfall
001_I	2.054	1.140	0.920	86	1.33	7.2	008
002_I	2.119	1.800	0.320	94	1.80	6.0	008

009_CPP	0.090	-	-	92	0.63	6.0	006

2.2. Block E – Pre-Restoration Scenario

Table 6 shows the input characteristics for the hydrologic model for all Block E sub-catchments shown in Figure 4. Detailed computations of input parameters are included in the Hydraflow Hydrographs input/output report (Attachment A). For areas within Block E without topographic information, a shallow slope of 0.2% was used for sheet flow computations.

Table 6. Runoff curve number (RCN) and time of concentration (Tc) for Block E sub-catchments in existing conditions.

Drainage Area ID	Area (acre)	Imp. Area (acre)	Per. Area (acre)	RCN	Slope (%)	Tc (min)	Outfall
001_E	0.693	0.268	0.425	82	2.20	6.0	008
002_E	2.049	1.009	1.040	87	9.50	9.7	006
003_E	1.377	1.304	0.073	97	1.90	6.0	006

008_E	2.417	1.736	0.618	90	0.20	7.9	006

2.3. Results

Although the task required analysis of the 10- and 25-year storms, the 1-, 2-, 50-, and 100-year storm analysis have also been performed to include smaller more frequent storms, as well as larger storms with large average return periods. Peak flows for precipitations events with average return periods of 1-, 2-, 10-, 25-, 50-, and 100-years were computed with Hydraflow Hydrographs. RCN and Tc input parameters were used for the peak flow analysis. Table 7 shows the calculated peak flows for all upstream and adjacent sub-catchments, while Table 8 shows calculated peak flows for all Block E sub-catchments. Runoff from 001_I and 002_I flow through the northern portion of Block E before the stormwater infrastructure.

Table 7. Peak flows for upstream and adjacent sub-catchments calculated by Hydraflow Hydrographs for existing conditions.

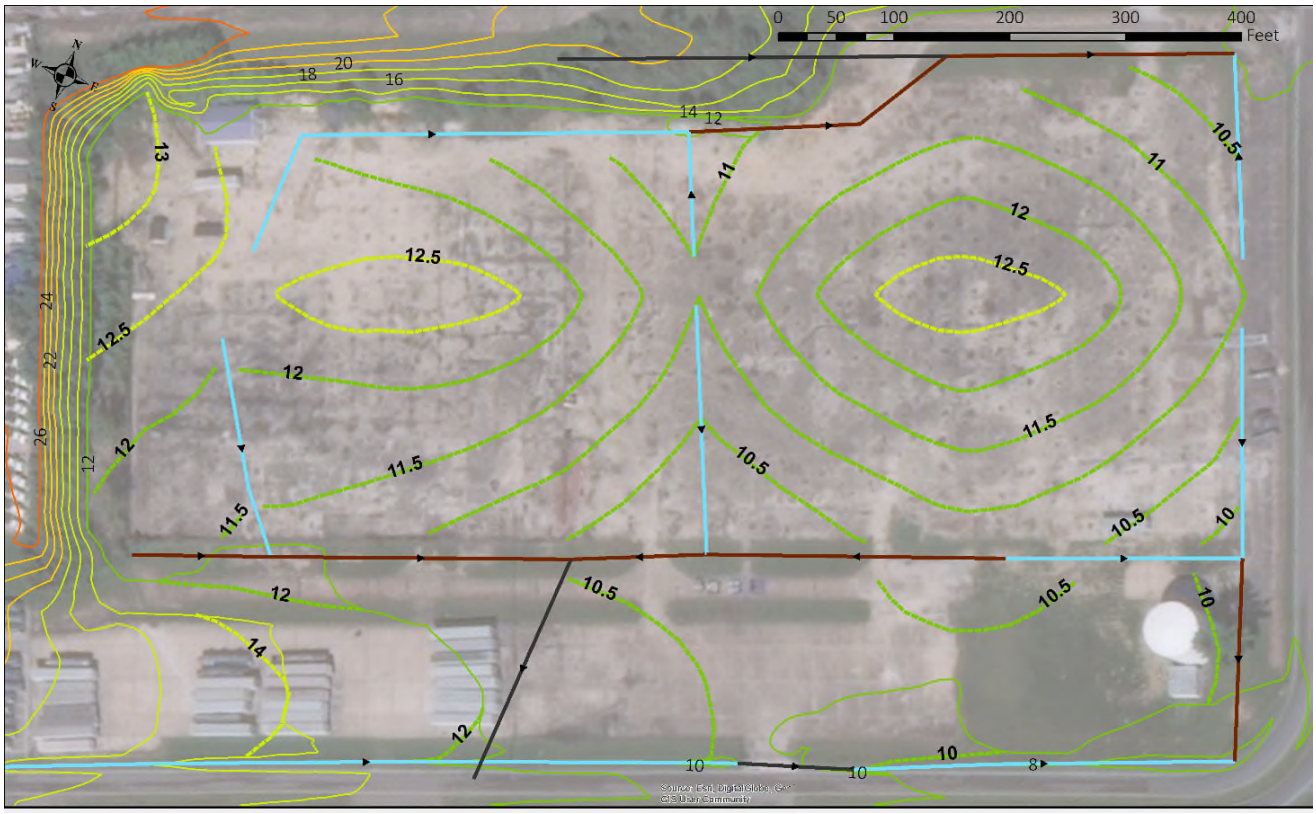
Tetra Tech calculated the combined flows for sub-catchments contributing to each of the outfalls using Hydraflow Hydrographs. It was assumed that time lag of the sub-catchment flows once they had entered the stormwater conveyance network was minimal. All runoff within Block E that could flow to 005 was diverted towards 006. Only runoff from sub-catchment 004_MB on the south side of Chesapeake Park Plaza is modeled to flow to 005. The outfalls that receive flow from the upstream sub-catchments are show in Table 5, while the outfalls that receive flow from the Block E sub-catchments are shown in Table 6. Table 9 shows the combined flows at each of the outfalls which include flows from Block E, as well as upstream and adjacent sub-catchments.

Table 9. Existing conditions - peak flows at outfalls 005, 006 and 008.

	Peak Flow (cfs) for Average recurrence interval (years)					
ID	1	2	10	25	50	100
005	0.828	1.048	1.718	2.197	2.618	3.096
006	42.59	53.9	88.54	113.45	135.4	160.27
008	20.53	26.56	45.19	58.64	70.49	83.91

3.0 PROPOSED GRADING OF BLOCK E

Tetra Tech developed a conceptual plan for proposed post-remediation grading for Block E. Field observations and input, existing topographic information, and existing layouts of stormwater conveyance network were used to define the proposed regrading.



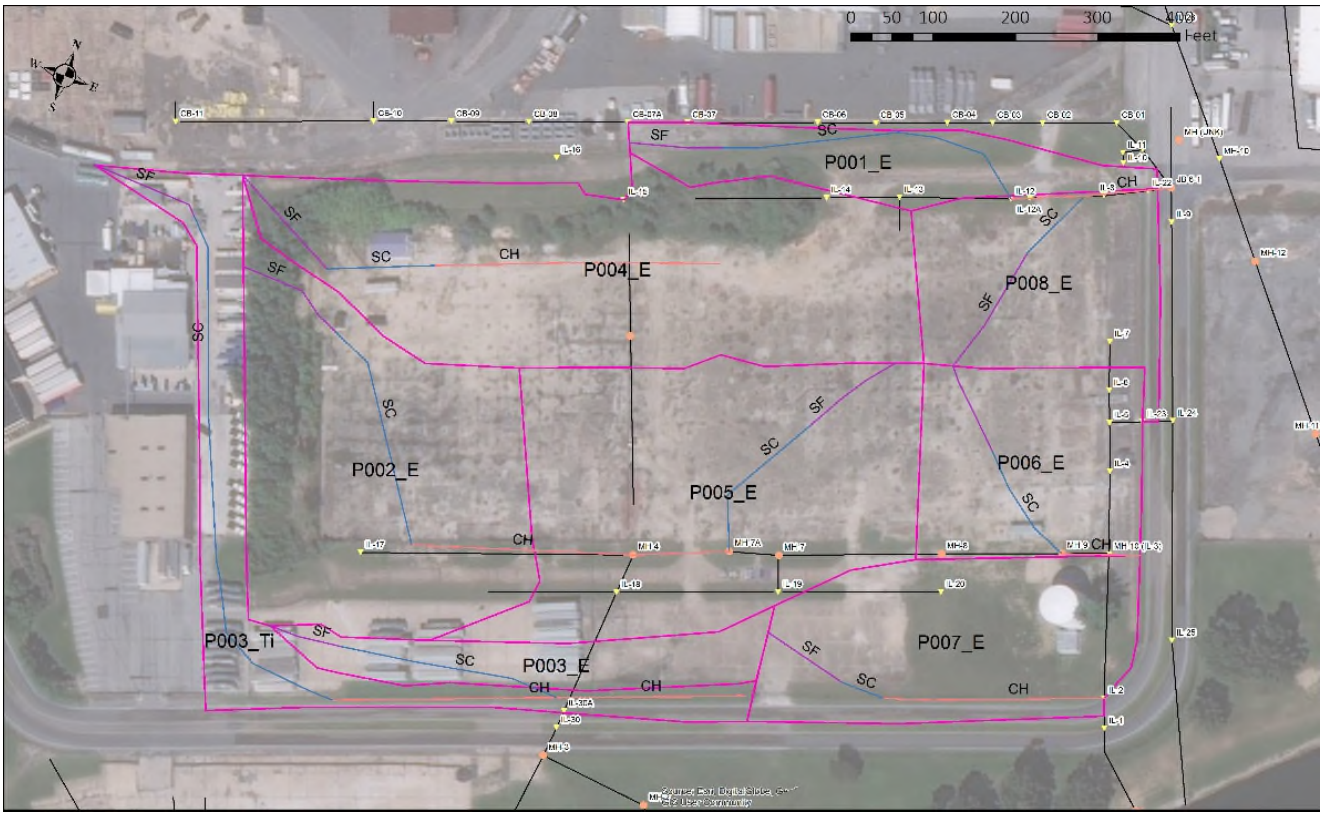
3.1. Grading Assumptions

The following assumptions were made during the development of proposed flow patterns and contour elevations.

- Proposed locations for establishing conveyance network is provided. Calculations and sizing of stormwater conveyance including proposed pipe network and surface channels were not part of the scope of work and are not included.
- Flows from Block E towards 005 will be reestablished post-remediation. This will help balance flows between stormwater conveyance discharging to 005 and 006.
- There is no proposed function for use of Block E after remediation at this time, all concrete slab surfaces will be removed and the Block E surface will be converted to a pervious grass meadow.
- Excavation for remediation will be approximately 2-feet from existing surface of the exposed slab of Block E. Deeper excavation will only occur only in areas around former Transformer Rooms 2, 3, and 4 and where existing stormwater conveyance pipe network will have to be removed.
- A cut and fill approach is not feasible because of the potential of contamination in the existing soils available to use as fill. Grading is developed to optimize quantity of fill material brought in from off-site, while providing adequate surface slopes for sheet flow of runoff.
- Shoring solutions put in place for remediation of western and northern edges of the Block E parcel may affect grading tie-ins in those areas.
- Contours at the eastern edge will tie back to elevations at the edge of the fence.

3.2. Development of Conceptual Grading Plan

A preliminary sketch illustrating flow directions for a proposed grading option was developed. A two-peak grade was selected as it could potentially minimize the amount of fill material needed after remediation. Figure 5 shows the proposed grading for Block E. In the figure, the blue channel lines illustrate surface channels and brown lines illustrate a combination of surface channel with inlets and pipes. A grade slope of 1% was defined for the proposed plan to provide proper constructability. This grade will optimize fill quantities while providing adequate, non-erosive flow paths for sheet flow and surface ditches. In this approach, 10 feet is the lowest contour elevation for the grading not within the surface channel. The removal of the existing stormwater infrastructure will create deep excavations. The paths of the proposed conveyance system will overlay these areas. Proposed channel elevations can be set between 10 feet and the excavation depths during design of conveyance network.



Note: blue lines=surface channel; brown=combination of surface channel with inlets; dark gray=pipes

Figure 5. Conceptual grading contours and conveyance for Block E.

4.0 HYDROLOGIC ANALYSIS OF PROPOSED CONDITIONS

Hydrologic analysis of proposed grading was performed based on this grading plan. The analysis was performed as the existing conditions (section 2.0). There were no changes to delineated upstream and adjacent sub-catchments. Block E sub-catchments were re-delineated per the flow patterns and contours of the proposed plan. The RCN associated with hydrologic soils group C were applied for characterization of sub-catchments. The remediated areas of Block E were modeled as a Meadow-Continuous Grass land use. Table 3 and Table 4 show the land use and flow characteristics applied to the sub-catchments. Figure 6 shows the sub-catchment delineations for Block E for proposed grading plan.

Note: SF=sheet flow; SC=shallow concentrated flow; CH=channel flow; pink=drainage area outlines

Figure 6. New sub-catchment area delineations and time of concentration (Tc) flow paths for Block E proposed regrading.

4.1. Upstream Sub-Catchments

There were no modifications made to the upstream and adjacent areas. These sub-catchments were modeled identical to existing conditions discussed in section 2.1.

4.2. Block E – Post-Restoration Scenario

Block E sub-catchments were labeled starting from P001 along with the suffix E. Table 10 shows the input characteristics for the hydrologic model for all Block E sub-catchments shown in Figure 6. Hydraflow Hydrographs Extension automatically calculates the area-weighted RCN and Tc for each drainage area using the input land use and soils data. Flow from P002_E and P005_E is directed to outfall 005. Detailed computations of input parameters are included in the Hydraflow Hydrographs input/output report (Attachment B).

Table 10. Runoff curve number (RCN) and time of concentration (Tc) for Block E sub-catchments in proposed conditions.

Drainage Area ID	Area (acre)	RCN	Tc (min)	Outfall
P001_E	0.963	71	14.0	008
P002_E	2.975	71	13.7	005
P003_E	0.759	71	12.0	006
P004_E	3.695	71	11.0	008
P005_E	3.366	71	17.5	005
P006_E	1.437	71	16.2	006
P007_E	1.930	71	28.3	006
P008_E	1.440	71	19.0	008

4.3. Results

Peak flows for precipitations events with average recurrence intervals of 1-, 2-, 10-, 25-, 50-, and 100-years were computed with Hydraflow Hydrographs. RCN and Tc input parameters were used for the peak flow analysis. Table 7 in section 2.3 shows the calculated peak flows for all upstream and adjacent sub-catchments, while Table 11 shows calculated peak flows for all Block E sub-catchments.

Table 11. Peak flows for Block E sub-catchments calculated by Hydraflow Hydrographs for proposed conditions.

	Peak flow (cfs) for average recurrence interval (years)					
Drainage Area ID	1	2	10	25	50	100
P001_E	0.694	1.131	2.724	4.018	5.21	6.596
P002_E	2.145	3.495	8.416	12.41	16.09	20.38
P003_E	0.638	1.035	2.458	3.622	4.694	5.941
P004_E	3.104	5.037	11.97	17.63	22.85	28.92
P005_E	2.184	3.596	8.716	12.89	16.75	21.24
P006_E	1.036	1.688	4.065	5.995	7.774	9.842
P007_E	0.946	1.581	3.891	5.764	7.506	9.539
P008_E	0.934	1.538	3.729	5.516	7.165	9.085

Tetra Tech calculated the combined flows for sub-catchments contributing to each of the outfalls using Hydraflow Hydrographs. Tetra Tech assumed that time lag of the sub-catchment flows once they had entered the stormwater conveyance network was minimal. All runoff within Block E is now distributed between 005, 006, and 008. Table 5 and Table 10 show the outfalls to which each of the upstream and Block E sub-catchments flow respectively. Table 12 shows the combined flows at each of the outfalls.

Table 12. Proposed Conditions - peak flows at outfalls 005, 006 and 008.

	Peak Flow (cfs) for average recurrence interval (years)					
ID	1	2	10	25	50	100
005	4.477	7.308	17.51	25.8	33.44	42.33
006	8.273	11.28	21.33	29.04	36.03	44.14
008	16.4	22.62	43.39	59.28	73.64	90.17

5.0 CONCLUSIONS

Conclusions were formed based on analysis of existing and proposed scenarios discussed in the preceding sections.

- Due to the closing of flows towards outfall 005, most of flows from Block E are directed towards outfall 006. Pipes to outfall 006 are smaller in size than those flowing to 005 and 008.
- Returning flow through 005 after remediation will provide a better distribution of flows out of Block E.
- Impervious areas within Block E will be converted to pervious meadows with continuous grass cover. This will reduce the surface runoff flows and volumes out of Block E.
- The removal of the existing stormwater infrastructure will create deep excavations. The paths of the proposed conveyance system will overlay these areas.
- Proposed 1% slope for grading will provide good constructability, while maintaining optimum fill quantities throughout Block E. The grading will develop adequate sheet flows and reduce potential of stagnation.

1.0 INTRODUCTION

Tetra Tech is evaluating treatment options for PCB- and VOC-contaminated soil at a site in Middle River, Maryland (Site). The PCB contamination is mainly Aroclor 1260, and the VOC contamination is mainly di- and trichlorobenzene compounds. Soil Stabilization (in-n situ Stabilization/Solidification (ISS) has been used to minimize contaminant migration in PCB and VOC-contaminated soil. Soil stabilization or solidification has also been performed ex-situ as warranted at some sites. ISSis the process of encapsulating the PCB- and VOC-contaminated soil to form a solid material in order to restrict contaminant migration by minimizing surface area exposed to leaching. Typical criteria to evaluate the effectiveness of the ISS process are a hydraulic conductivity equal to or less than 10^{-6} centimeters per second using the American Society for Testing and Material (ASTM) test method D 5084, and an Unconfined Compressive Strength (UCS) equal to or greater than 50 pounds per square inch (psi) after 28 days using test method ASTM D1633.

SESI has conducted a treatability study that evaluated ISS at two Site locations. The study was conducted at the GeoEnvironmental laboratory of the Civil and Environmental Engineering Department of the University of Connecticut. Soil samples from the Site were collected by Tetra Tech on 12/05/2017 in 5-gal plastic buckets from four locations (ISS-1, ISS-3, ISS-4 and ISS-5). Two soil buckets (A and B) from each location were provided to SESI. Groundwater from Site well IWE-03 was also provided in twelve 5-gal plastic cubitainers for the leachability study.

Three ISS treatments were evaluated in this study, namely, . Portland Cement (Type I), Portland Cement with Organoclay, and a mixture of Portland Cement/Lime Kiln Dust (LKD) with Organoclay. These treatments can result in significant reductions in PCB and VOC compounds leaching, depending on PCB and VOC concentrations in the soil. Organoclay was used as an additive to adsorb organic contaminants while solidifying the soils, thus minimizing the leaching potential of these contaminants. Although compressive strength (UCS) and hydraulic conductivity are primary criteria, the leachability of the various mixes were evaluated in the treatability study. The selection of the best treatment will be based on the ability of the solidified materials to minimize contaminant leachability. A non-destructive leachability test was used instead of the Toxicity Characteristic Leaching Procedure (TCLP) or Synthetic Precipitation Leaching Procedure (SPLP) to evaluate the mixtures. TheTCLP/SPLP tests destroy the solidified matrix by grinding the samples and do not adequately reflect the ability of the solidified material to prevent leaching of the contaminants. Non-destructive tests such as ANS 16.1 provide a better assessment

of leachability because the solidified sample matrix remains intact. This method evaluates the mass transfer of constituents from the surface of the solidified material over time, which represents the principal chemical exposure pathway anticipated following solidification. An intact sample of treated material is submersed in a bath of site groundwater (i.e., backgound or low contaminant concentrations) for several time increments, with the aqueous phase analyzed for the potential contaminants of concern. Because the contaminants of concern have low water solubility, a modified ANS 16.1 method was used for this study, i.e. a 5-day exposure of the solidified monoliths to clean groundwater followed by testing of the leach solution for the contaminants of concern.

2.0 TREATABILITY TESTING APPROACH

Based on the initial characterization of each homogenized soil bucket tested, Tetra Tech selected two soils for the study. The two soils (ISS#1A and ISS#4B) were treated with Portland Cement, Portland Cement with Organoclay, and Portland Cement/LKD mix (52% PC/48% LKD) with Organoclay. Each of these ISS amendments were examined at three different dosages. The amendments were first mixed with tap water to create the grout material. The grout was then mixed with the soil at the desired dosages to create a pancake batter-like mixture with no free liquids. The mixing was conducted for 2 min in a Kitchen Aid Classic Mixer at 60 rpm in order to minimize VOC volatilization. Subsequently, the mixtures were used to fill a series of 4" long by 2" dia polypropylene cylinder molds. The molds were left to cure in a humid environment in a concrete curing room before testing for the 28-day UCS and hydraulic conductivity. Shipping of the cured molds was timed so that the UCS and permeability tests were conducted at Geotesting Express in Acton, MA at 28 days. The following criteria were used as part of the evaluation process:

- Hydraulic Conductivity (K): The solidified mass needed to exhibit an average hydraulic conductivity equal to or less than 10^{-6} cm/sec with no single sample more than 10^{-5} cm/sec, using the ASTM test method D 5084.
- Unconfined Compressive Strength (UCS): The solidified mass needed to exhibit an average UCS value equal to or greater than 50 pounds per square inch (psi) with no single sample less than 40 psi utilizing test method ASTM D1633 after 28 days.

Based on the UCS and hydraulic conductivity tests (28 days), the modified ANS 16.1 leaching test was performed on test samples that had satisfied both criteria.

2.1 Receipt of Samples

Soil samples from the Site were collected by Tetra Tech on 12/05/2017 in 5-gal plastic buckets from four locations (ISS-1, ISS-3, ISS-4 and ISS-5). Two soil buckets (A and B) from each location were provided to SESI (Figure 1 below). Groundwater from well IWE-03 was also provided in twelve 5-gal plastic cubitainers for the leachability study. The soil and groundwater samples were stored in a walk-in cooler maintained at 4 °C.

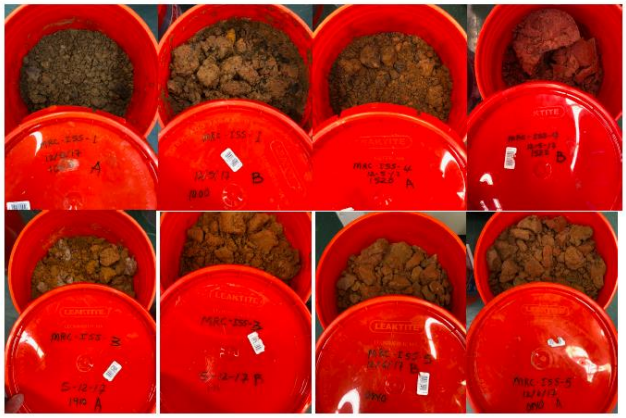

Figure 1: Soil samples received

2.2 Soil Sample Preparation and Baseline Characterization

Homogenization of the soils in each bucket was conducted using 13" long stainless steel soil mixing spoons in a walk-in cooler to reduce volatilization of organic compounds. Following homogenization, representative aliquots of the soils and groundwater were collected for characterization testing (Figure 2).

Figure 2: Soil and groundwater subsamples

The homogenized soil samples were tested for grain size, bulk density, and moisture content. Chemical testing was also conducted on the homogenized soil samples to evaluate contaminant

concentrations. The tests include PCBs, PAHs, VOCs, pH, 13 Priority Pollutant Metals(PP130 (i.e., Ag, As, Sb, Be, Cd, Cr, Cu, Pb, Hg, Ni, Se, TI, Zn) as well as Mo, Co, Va and Ba. Two soils, ISS#1A and ISS#4B, were tested for Atterberg Limits.

The amendments (Type I Portland Cement from LafargeHolcim, CETCO Nanocor SS199 Organoclay, CKD and LKD from Mintek Resources) were also tested for PP13 and Mo, Co, Va and Ba to assess potential contaminants that may be introduced in the solidified material due to either amendment. Although CKD was tested at this stage, LKD was selected for further testing and the CKD evaluation was discontinued.

The groundwater that was used for the Modified ANS 16.1 test was characterized for pH, PCBs, VOCs and PP13 and Mo, Co, Va and Ba to ensure the groundwater could be used for the leaching tests.

The soil and groundwater samples were sent for analysis to Alpha Laboratories in Mansfield, MA under chain of custody. The Atterberg Limits tests were conducted at Terrasense in Totowa, NJ.

2.3 ISS Tests

The following ISS tests were performed:

Task 1: Portland Cement Treatment

The two soils (ISS#1A and ISS#4B) were treated with Portland Cement at three dosages (5%, 10% and 13% by soil dry weight). Experimental conditions are presented in Table 1 for each dosage. The amendments were first mixed with tap water to create the grout material. The grout was then mixed with the soil at the desired dosages to create a pancake batter-like mixture with no free liquids. In order to ensure reproducibility of the ISS tests, particles larger than 0.5 inch in diameter were removed from the soil before mixing.

In order to minimize VOC losses, the mixing was minimized (conducted for 2 min in a Kitchen Aid Classic Mixer at 60 rpm). Subsequently, the mixtures were used to fill a series of 4” long by 2” dia polypropylene cylinder molds (Figure 3). Six molds were set up for each dosage (3 molds for UCS, Permeability and leaching tests and 3 molds as duplicates (-D molds)). The molds were left to cure in a humid concrete curing room before testing for the 28-day UCS and hydraulic conductivity. Shipping of the cured molds was timed so that the UCS and permeability tests were conducted at Geotesting Express at 28 days. Samples that passed the UCS criterion of 50 psi were

further tested for permeability. Samples that passed both the UCS and permeability criteria were tested for leachability.

Soil sample	Soil mass, wet weight, g	Soil mass, dry weight, g	Portland Cement added, g	Total Water added, cc	# of molds
1A-5%	2250	1937	97	232	6
1A-10%	2250	1937	194	294	6
1A-13%	2250	1937	252	362	6
4B-5%	2250	1890	94.5	576	6
4B-10%	1800	1512	151.2	536.4	6
4B-13%	1800	1512	196.6	536.4	6

Table 1: Experimental Conditions (PC tests)

Figure 3: Treated soil mixing; Molds

Task 2: Preliminary Portland Cement (PC/LKD/Organoclay(OC) Test

A preliminary test to evaluate the Portland Cement/Lime Kiln Dust/Organoclay treatment was conducted on soil ISS#1A at the highest dosage (13% PC/LKD by soil dry weight). A mixture containing 52% PC and 48% LKD was prepared. Subsequently, 2% Organoclay (OC) by dry soil weight was added to the PC/LKD mixture (Table 2). The amendments were first mixed with tap water to create the grout material. The grout was then mixed with the soil at the desired dosage (13% PC/LKD and 2% Organoclay) to create a pancake batter-like mixture with no free liquids. The mixing was conducted for 2 min in a Kitchen Aid Classic Mixer at 60 rpm. Subsequently, the mixture was used to fill a 4" long by 2" dia polypropylene cylinder mold. The mold was left to cure in a humid concrete curing room for 9 days before testing the sample for UCS) in the Soil Physics Laboratory of the University of Connecticut Civil Engineering department.

Soil sample	Soil mass, wet weight, g	Soil mass, dry weight, g	Portland Cement, g	LKD , g	Organo clay, g	Total Water, cc
1A-13%PC/LKD/OC	200	172.2	11.6	10.8	3.45	32.4

Table 2: Experimental Conditions (preliminary test)

The results indicated a UCS of 56.4 psi after 9 days of curing, which is higher than the 28-day, 50 psi threshold (note that UCS would be higher if curing was conducted for 28 days). Therefore, the PC/LKD treatment provided sufficient soil strength to warrant further investigation.

Task 3: Portland Cement/Organoclay Treatment

The two soils (ISS#1A and ISS#4B) were treated with Portland Cement at three dosages (5%, 10% and 13% by soil dry weight) and 2% Nanocor SS199 Organoclay. Experimental conditions are presented in Table 3 for each dosage. The amendments were first mixed with tap water to create the grout material. The grout was then mixed with the soil at the desired dosages to create a pancake batter-like mixture with no free liquids. In order to ensure reproducibility of the ISS tests, particles larger than 0.5 inch in diameter were removed from the soil before mixing.

The mixing was conducted for 2 min in a Kitchen Aid Classic Mixer at 60 rpm. Subsequently, the mixtures were used to fill a series of 4" long by 2" dia polypropylene cylinder molds. Six molds were set up for each dosage (3 molds for UCS, Permeability and leaching tests and 3 molds as duplicates (-D molds)). The molds were left to cure in a humid concrete curing room before testing for the 28-day UCS and hydraulic conductivity. Shipping of the cured molds was timed so that the UCS and permeability tests were conducted at Geotesting Express at 28 days. Samples that passed the UCS criterion of 50 psi were further tested for permeability. Samples that passed both the UCS and permeability criteria were tested for leachability.

Soil sample	Soil mass, wet weight, g	Soil mass, dry weight, g	Portland Cement, g	Organoclay, g	Total Water added, cc	# of molds
1A-5%-OC	2250	1937	97	45	233	6
1A-10%-OC	2250	1937	194	45	294	6
1A-13%-OC	2250	1937	252	45	332	6
4B-5%-OC	1800	1512	75.6	30	536.4	6

4B-13%-OC	1800	1512	196.6	30	536.4	6

Table 3: Experimental Conditions (PC/OC tests)

Task 4: Portland Cement/LKD/Organoclay Treatment

The two soils (ISS#1A and ISS#4B) were treated with Portland Cement/Lime Kiln Dust/Organoclay at three PC/LKD dosages (5%, 10% and 13% by soil dry weight) and 2% Nanocor SS199 Organoclay. First, a mixture containing 52% PC and 48% LKD was prepared. Then, 2% Organoclay (OC) by dry soil weight was added to the PC/LKD mixture. The amendments were mixed with tap water to create the grout material. The grout was then mixed with the soil at the desired dosage (e.g., 13% PC/LKD and 2% Organoclay) to create a pancake batter-like mixture with no free liquids. Experimental conditions are presented in Table 4 for each dosage. In order to ensure reproducibility of the ISS tests, particles larger than 0.5 inch in diameter were removed from the soil before mixing. The mixing was conducted for 2 min in a Kitchen Aid Classic Mixer at 60 rpm. Subsequently, the mixtures were used to fill a series of 4" long by 2" dia polypropylene cylinder molds. Six molds were set up for each dosage (3 molds for UCS, Permeability and leaching tests and 3 molds as duplicates (-D molds)). The molds were left to cure in a humid concrete curing room before testing for the 28-day UCS and hydraulic conductivity. Shipping of the cured molds was timed so that the UCS and permeability tests were conducted at Geotesting Express at 28 days. Samples that passed the UCS criterion of 50 psi were further tested for permeability. Samples that passed both the UCS and permeability criteria were tested for leachability.

Soil sample	Soil mass, wet weight, g	Soil mass, dry weight, g	PC/LKD *, g	Organoclay, g	Total Water added, cc	# of molds
1A-5% PC/LKD-OC	2250	1937	97	45	236	6
1A-10% PC/LKD-OC	2250	1937	194	45	294	6

4B-10% PC/LKD-OC	1800	1512	151.2	30	536.4	6
4B-13% PC/LKD-OC	1800	1512	196.8	30	536.4	6

*PC/LKD mix is 52% PC and 48% LKD by weight

Table 4: Experimental Conditions (PC/LKD/OC tests)

Task 5: Leachability Tests

Samples that passed the UCS criterion of > 50 psi and a hydraulic conductivity equal to or less than 10^{-6} cm/sec permeability were tested for leachability. A modified ANS 16.1 leaching test was performed. First, the surface area of an intact treated sample from a mold was measured. This was necessary in order to determine the volume of groundwater to place in contact with the soil sample. The ANS 16.1 Method stipulates a 10:1 water volume to sample surface area ratio. The soil sample from the mold was submersed in site groundwater in a 2-liter glass beaker while minimizing soil contact surface area with the glass (Figure 4). The beakers were covered with aluminum foil during the 5-day contact period. At the end the 5-day test, the aqueous phase was sub-sampled and analyzed for the contaminants of concern (VOCs, PCBs, metals).

Figure 4: Leaching test setup

3.0 RESULTS AND DISCUSSION

Results of the characterization and ISS tests are discussed in the following sections.

3.1 Baseline Characterization Results

The homogenized soil samples were tested for Grain Size, Bulk Density, and moisture content, PCBs, PAHs, VOCs, pH, Priority Pollutant Metals 13 (PP13 metals, i.e. Ag, As, Sb, Be, Cd, Cr, Cu, Pb, Hg, Ni, Se, TI, Zn) and Mo, Co, Va and Ba. Two soils, ISS#1A and ISS#4B were later tested for Atterberg limits. The analytical data reports are presented in Appendix A (Alpha Lab Reports- Initial Characterization). Table 5 presents a summary of the testing results. Based on the results, Tetra Tech selected two soils ISS#1A and ISS#4B for the ISS study. The Aroclor 1260 PCB concentrations were 5.56 g/kg for soil ISS#1A and 0.284 g/kg for soil ISS#4B. The total VOC concentrations were 2,255 mg/kg for soil ISS#1A and 431 mg/kg for soil ISS#4B. Note that

soil ISS#1A has a % fines of 15.6% (sandy soil) and soil ISS#4B has a % fines of 83.8% (clayey/silty soil).

Atterberg Limits test results of soils ISS#1A and ISS#4B are presented in Appendix D.

Table 5: Soil Characterization Results Summary

The amendments (Type I Portland Cement from LafargeHolcim, CETCO Nanocor SS199 Organoclay, CKD and LKD from Mintek Resources) were also tested for PP13, as well asCo, Mo, Va and Ba to assess potential contaminants that may be introduced in the solidified material due to the treatments. The analytical data reports are presented in Appendix A (Alpha Lab Reports-Initial Characterization). Table 6 presents a summary of the testing results.

The groundwater that was used for the Modified ANS 16.1 test was characterized for pH, PCBs, VOCs and PP13, as well asCo, Mo, Va and Ba metals to ensure the groundwater could be used for the leaching tests. The analytical data report is presented in Appendix A (Alpha Lab Reports-Initial Characterization). Table 7 presents a summary of the testing results. The results indicate that the groundwater chemistry is appropriate for the leachability tests, i.e. there were no detectable

levels of PCBs, there were low metals concentrations and the only VOC detected was tetrahydrofuran at 28 ug/L.

Table 7: Groundwater Characterization Results Summary

3.2 ISS Testing Results

Task 1: Portland Cement Treatment

The two soils (ISS#1A and ISS#4B) were treated with Portland Cement at three dosages (5%, 10% and 13% by soil dry weight). ISS#1A soil was labeled 1A and soil ISS#4B was labeled 4B. No excessive heat or vapors were generated during mixing. At Day 28, the samples were tested for UCS. The UCS results are presented in Appendix B (Geotesting Express Report) and summarized in Table 8. The results indicate that all the Portland Cement tests passed the UCS criterion (> 50 psi) for soil 1A except for one 5% dosage sample (40 psi). All soil 4B UCS tests failed, likely due to the high fines content of that soil. Thus, permeability tests were conducted on the 1A soil samples for all three cement dosages (5, 10 and 13%). The 1A sample that had a UCS of 40 psi was also tested to assess if it passed the permeability test at this UCS level.

The permeability results are presented in Appendix B (Geotesting Express Report) and summarized in Table 9. The results indicate that all the 1A soil samples passed the permeability test (hydraulic conductivity equal to or less than 10^{-6} cm/sec).

The samples that passed both the UCS and permeability tests (10% and 13% dosages) were further evaluated for leachability (Task 5 below).

Sample ID	Curing Age, days	Height, in	Diameter, in	Area, in2	Mass, grams	Bulk Density, pcf	Moisture Content at Break, %	Maximum Load, lbs	Compressive Strength, psi

Sample #	Hydraulic Conductivity, cm/sec
1A-5%	9.5E-07
1A-5%-D	5.1E-07
1A-10%	1.6E-07
1A-10%-D	2.1E-07
1A-13%	7.6E-07
1A-13%-D	9.3E-07

Table 9: Hydraulic conductivity (permeability) test results (Soil 1A, PC treatment)

Task 2: Preliminary Portland Cement (PC)/LKD/Organoclay(OC) Test

A preliminary test to evaluate the Portland Cement/Lime Kiln Dust/Organoclay treatment was conducted on soil ISS#1A at the highest dosage (13% PC/LKD by soil dry weight). A mixture containing 52% PC and 48% LKD was prepared. Subsequently, 2% Organoclay (OC) by dry soil weight was added to the PC/LKD mixture. The results indicated a UCS of 56.4 psi after 9 days of curing (Figure 5), which is higher than the 28-day 50 psi threshold. Therefore, the PC/LKD treatment provided sufficient soil strength to warrant further investigation.

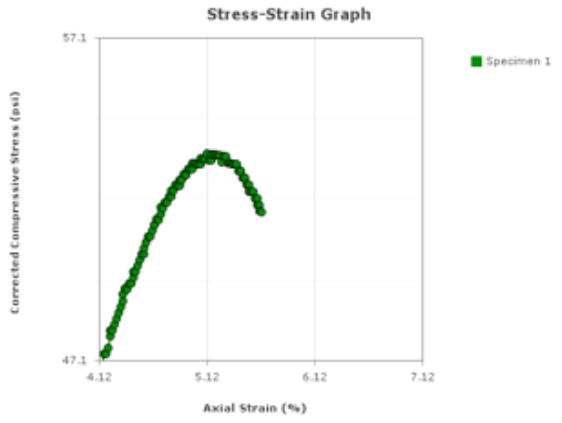

Figure 5: UCS Test Stress-Strain Graph

Task 3: Portland Cement/Organoclay Treatment

The two soils (ISS#1A and ISS#4B) were treated with Portland Cement at three dosages (5%, 10% and 13% by soil dry weight) and 2% Nanocor SS199 Organoclay (OC). No excessive heat or vapors were generated during mixing. At Day 28, the samples were tested for UCS. The UCS results are presented in Appendix B (Geotesting Express Report) and summarized in Table 10 . The results indicate that the Portland Cement/OC tests passed the UCS criterion (> 50 psi) for soil 1A except for the 5% cement dosage samples. All soil 4B UCS tests failed, likely due to the high fines content of that soil. Thus, permeability tests were conducted on the 1A soil samples for the 10% and 13% cement dosage.

The permeability results are presented in Appendix B (Geotesting Express Report) and summarized in Table 11. The results indicate that the 1A soil samples passed the permeability test (hydraulic conductivity equal to or less than 10-6 cm/sec). The 1A samples (10% dosage) were further evaluated for leachability (Task 5 below).

Although the 4B samples did not pass the UCS criterion of 50 psi, it is important to evaluate leachability of the COCs on a 4B soil sample when treated with Portland Cement and Organoclay since on-site ISS application will involve mixing soil layers. Sample 4B-5%-OC (UCS 40 psi) was selected for leachability evaluation (Task 5 below) since it is likely that in-situ ISS treatment of the 1A soil will necessitate PC/OC treatment and the adjacent layer 4B will also need to be treated in order to minimize the impact of soil 4B on the solidification of the 1A soil.

Sample ID	Curing Age, days	Height, in	Diameter, in	Area, in2	Mass, grams	Bulk Density, pcf	Moisture Content at Break, %	Maximum Load, lbs	Compressive Strength, psi

1A-13%-OC	7.3E-07
1A-13%-OC-D	8.0E-07

Table 11: Hydraulic conductivity (permeability) test results (Soil 1A, PC/OC treatment)

Task 4: Portland Cement/LKD/Organoclay Treatment

The two soils (ISS#1A and ISS#4B) were treated with Portland Cement/Lime Kiln Dust/Organoclay at three PC/LKD dosages (5%, 10% and 13% by soil dry weight) and 2% Nanocor SS199 Organoclay (OC). No excessive heat or vapors were generated during mixing. At Day 28, the samples were tested for UCS. The UCS results are presented in Appendix B (Geotesting Express Report) and summarized in Table 12. The results indicate that all the PC/LKD tests passed the UCS criterion for soil 1A (> 50 psi) except for the 5% PC/LKD dosage samples. All soil 4B UCS tests failed,(except for one 13% PC/LKD sample), likely due to the high fines content of that soil. However, the UCS was 30 psi and 50 psi for the two soil 4B 13% PC/LKD duplicate samples (4B-13%-PC/LKD/OC and 4B-13%-PC/LKD/OC-D, respectively), with an average of 40 psi, which is below the required 50 psi. Therefore, soil 4B was not evaluated for permeability. Permeability tests were only conducted on the 1A soil samples for the 10 and 13% PC/LKD dosages.

The permeability results are presented in Appendix B (Geotesting Express Report) and summarized in Table 13. The results indicate that the soil 1A 10% and 13% PC/LKD samples passed the permeability test (hydraulic conductivity equal to or less than 10^{-6} cm/sec). Thus, the soil 1A 10% and 13% PC/LKD samples were further evaluated for leachability (Task 5 below). Sample 4B-13%-PC/LKD-OC was also evaluated for leachability of the COCs from the soil 4B matrix (Task 5 below) when treated with PC/LKD/OC.

Table 13: Hydraulic conductivity (permeability) test results (Soil 1A, PC/LKD/OC treatment)

Task 5: Leachability Tests

Samples that passed the UCS criterion of > 50 psi and a hydraulic conductivity equal to or less than 10^{-6} cm/sec permeability were tested for leachability. The modified ANS 16.1 leaching test was performed as described in Section 2.3 (Task 5) above. At the end the 5-day tests, the aqueous phase from each leachability test was subsampled and analyzed for the contaminants of concern (VOCs, PCBs, metals).

The cylindrical monolith surface areas and total water volume used in the reactors are presented in Table 14. Note that a piece of core 4B-5%-OC was lost due to breakage as a result of low UCS, thus reducing the surface area of the monolith tested (153.4 cm^2).

Sample #	Monolith surface area, cm^2	Total water volume in reactor, cc

Table 18: Leachability test results (Soil 4B)

For the Portland Cement treated soils (1A) presented in Table 15, the leachate results indicate average total VOC concentrations of 1350 ug/L for the 5% dosage, 1365 ug/L for the 10% dosage and 1373 ug/L for the 13% dosage. Note that the highest VOC concentration detected was 1,2,4-trichlorobenzene at 1000 ug/L, which is much lower than the solubility limit of that compound (49,000 ug/L at 25 degC). Average PCB concentrations were 29.7 ug/L for the 5% dosage, 2.08 ug/L for the 10% dosage and 1.39 ug/L for the 13% dosage. Low concentrations of PAHs and metals were also detected in the leachate. Cylindrical monolith surface areas and volume of water used in each reactor are provided in Table 13 above. The surface areas can be used to determine the total mass of each contaminant released in 5 days in the water phase as a function of treated soil surface area. The resultingvalues can be used to estimate COC mass leached from the expected in-situ soil monolith surface area in contact with groundwater, and estimate COC flux from the monolith.

For the Portland Cement/Organoclay treated soils (1A) presented in Table 16, the 10%PC / 2% OC-dosed soil leachate results indicate an average total VOC concentrations of 851 ug/L. When compared to the 10%PC-dosed soils leachate concentrations, the total VOC concentration represents a 37.6% decrease (1365 ug/L versus 851 ug/L). Average PCB concentrations were 1.55 ug/L for the 10%PC / 2% OC-dosed soil. When compared to the 10%PC-dosed soils leachate concentrations, the PCB concentration represents a slight decrease (2.08 ug/L versus 1.55 ug/L), although these PCB concentrations are too low to draw any definitive conclusion with respect to the Organoclay impact on PCB leachability. Low concentrations of PAHs and metals were also detected in the leachate.

For the Portland Cement/LKD/Organoclay treated soils (1A) presented in Table 17, the 10%PC/LKD 2% OC-dosed soil leachate results indicate an average total VOC concentration of 985 ug/L. The 13%PC/LKD 2% OC-dosed soil leachate results indicate an average total VOC concentration of 747 ug/L. When compared to the 10%PC/LKD 2% OC-dosed soils leachate concentrations, the total VOC concentration represents a 24.1 % decrease (985 ug/L versus 747 ug/L). Note that the 10%PC / 2% OC-dosed soils leachate total VOC concentrations were higher than the 13%PC/LKD 2% OC total VOC concentrations (851 ug/L versus 747 ug/L). Average PCB concentrations were 1.55 ug/L for the 10%PC / 2% OC-dosed soils and 1.22 ug/L for the 13%PC/LKD 2% OC-dosed soils. This represents a slight decrease in PCB concentration although these concentrations are too low to draw any definitive conclusion with respect to the PC/LKD dosage impact on PCB leachability. Low concentrations of PAHs and metals were also detected in the leachate.

For soil ISS#4B, the leachability test results presented in Table 18 indicate a total VOC concentration of 160 ug/L for the 5%PC 2%OC treatment and 459 ug/L for the 13% PC/LKD 2%OC treatment. This indicates that the PC/OC treatment may be more effective than the PC/LKD/OC treatment in reducing VOC leachability, although the data is insufficient to draw a definitive conclusion. The PCB concentration was 6.1 ug/L for the PC/OC treatment and 2.07 ug/L for the PC/LKD/OC treatment. Although this may indicate that the PC/LKD/OC treatment may be more effective in limiting PCB leachability, the limited data and the ineffectiveness of the treatments in terms of UCS precludes drawing any definitive leachability conclusions. Low concentrations of PAHs and metals were also detected in the leachate.

3.3 Conclusions

- For soil ISS#1A, Portland Cement treatment was effective (UCS and permeability) at the 10% and 13% dosage and marginally effective at the 5% dosage level.
- For soil ISS#4B, Portland Cement treatment was ineffective (UCS and permeability) at all dosages, likely due to the high fines content of the soil (83.7%).
- For soil ISS#1A, Portland Cement/Organoclay treatment was effective (UCS and permeability) at the 10% and 13% dosage and ineffective at the 5% dosage level.
- For soil ISS#4B, Portland Cement/Organoclay treatment was ineffective (UCS and permeability) at all dosages likely due to the high fines content of the soil (83.7%).
- For soil ISS#1A, Portland Cement/LKD/Organoclay treatment was effective (UCS and permeability) at the 10% and 13% dosage and ineffective at the 5% dosage level.
- For soil ISS#4B, Portland Cement/LKD/Organoclay treatment was ineffective (UCS and permeability) at all dosages except for one 13% PC/LKD/OC sample,, likely due to the high fines content of the soil (83.7%).
- Based on the leachability tests, the addition of 2% Organoclay to the 10% Portland Cement treatment of soil ISS#1A resulted in a 37.6% decrease in the average total VOC concentration (1365 ug/L versus 851 ug/L).
- Based on limited ISS#4B leachability tests, total VOC concentrations were 459 ug/L for the 13%PC/LKD/OC and 160 ug/L for the 5%PC/OC treated soils.
- Based on the leachability tests, very low levels of PCBs were detected in the groundwater phase for soil ISS#1A (< 3 ug/L) and soil ISS#4B (< 7 ug/L).
- Low concentrations of PAHs and metals were detected in the leachate for both soils.
- Based on the results obtained in this study, an in-situ treatment using 8% Portland Cement with 2% Organoclay or a treatment using 10% PC/LKD with 2% Organoclay is recommended for soil ISS#1A at this site.
- ISS treatment of soil ISS#4B would have limited effectiveness at this site, unless the treatment involves sufficient mixing of soil ISS#4B with soil ISS#1A in order to reduce the negative impact of the high fines content of soil ISS#4B on the ISS treatment.

Project Number:	10017	**Report Date:**	12/29/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: TETRA TECH ISS **Lab Number:** L1746224
Project Number: 10017 **Report Date:** 12/29/17

Case Narrative (continued)

Report Submission
This is a final report and replaces the preliminary report issued on Decenber 22, 2017.
All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics
The WG1075087-5 Method Blank, associated with L1746224-09, has concentrations above the reporting limits for Hexachlorobutadiene. Since the sample(s) were non-detect to the RL for these target analytes, no further actions were taken. The results of the original analysis are reported.

Semivolatile Organics by SIM
L1746224-01, -02, -03, -04, -05, -07 and -08: The sample has elevated detection limits due to the dilution required by the sample matrix.
L1746224-01, -02, -04, -05, and -07: The surrogate recoveries are below the acceptance criteria for Nitrobenzene-d5 (0%), 2-Fluorobiphenyl (0%) and 4-Terphenyl-d14 (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.

PCBs
L1746224-01, -02, -03, -04, -05, -06, -07, and -08: The surrogate recoveries are below the acceptance criteria for 2,4,5,6-Tetrachloro-m-xylene (0%) and Decachlorobiphenyl (0%) due to the dilution required to quantitate the sample. Re-extraction was not required; therefore, the results of the original analysis are reported.
WG1074469-1: The Method Blank, associated with L1746224-01 through -08, has a concentration above the reporting limits for AR1260-AVG and Total PCBs. Since the associated sample concentrations are greater than 10x the blank concentrations for these analytes, no corrective action is required.

Total Mercury

Project Name: TETRA TECH ISS
Project Number: 10017
Lab Number: L1746224
Report Date: 12/29/17

Case Narrative (continued)

The WG1074718-3 MS recovery, performed on L1746224-01, is outside the acceptance criteria for Mercury (144%). A post digestion spike was performed and was within acceptance criteria.

Grain Size Analysis

The WG1074426-1 Laboratory Duplicate RPD for % Fine gravel (67%), Total gravel (67%) and Total fines (29%), performed on L1746224-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name:	TETRA TECH ISS	**Lab Number:**	L1746224
Project Number:	10017	**Report Date:**	12/29/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

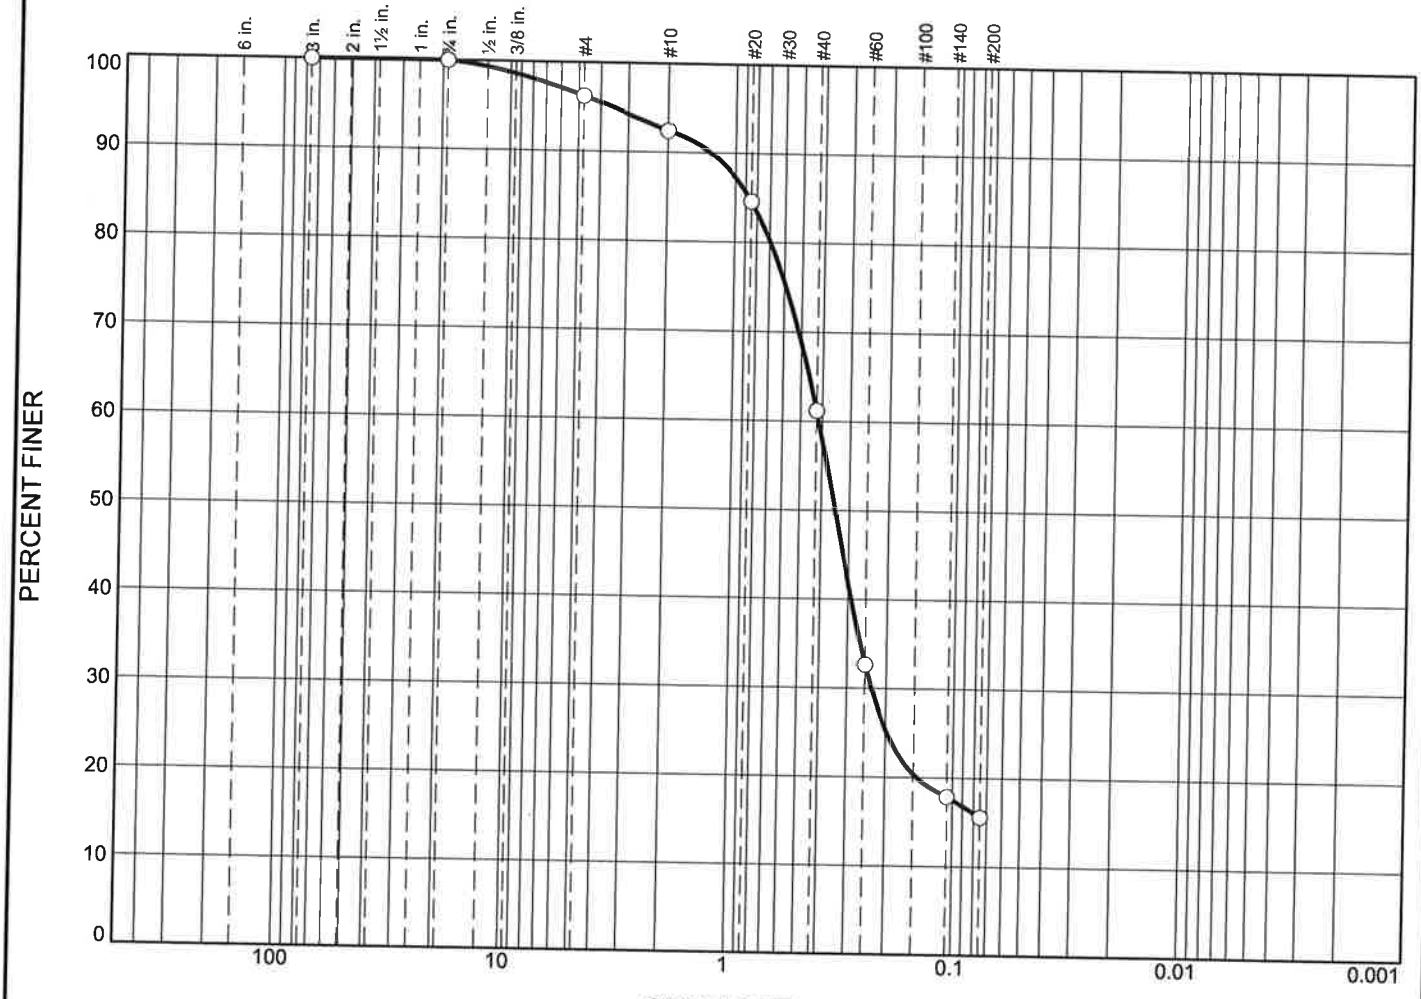
LIMITATION OF LIABILITIES



Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
EPA 300: DW: Bromide
EPA 6860: NPW and SCM: Perchlorate
EPA 9010: NPW and SCM: Amenable Cyanide Distillation
EPA 9012B: NPW: Total Cyanide
EPA 9050A: NPW: Specific Conductance
SM3500: NPW: Ferrous Iron
SM4500: NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO2, NO3.
SM5310C: DW: Dissolved Organic Carbon

Mansfield Facility
SM 2540D: TSS
EPA 3005A NPW
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

Non-Potable Water
SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH, **EPA 350.1**: Ammonia-N, **LACHAT 10-107-06-1-B**: Ammonia-N, **SM4500NO3-F, EPA 353.2**: Nitrate-N**, EPA 351.1, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.**
EPA 624: Volatile Halocarbons & Aromatics,
EPA 608: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs
EPA 625: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045**: PCB-Oil.
Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E.**

Mansfield Facility:

Drinking Water
EPA 200.7: Ba, Be, Cd, Cr, Cu, Ni, Na, Ca. **EPA 200.8:** Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, TL. **EPA 245.1** Hg.

Non-Potable Water
EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.
EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.
EPA 245.1 Hg.
SM2340B

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name:	TETRA TECH ISS	**Lab Number:**	L1747614
Project Number:	10017	**Report Date:**	01/03/18

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
EPA 300: DW: Bromide
EPA 6860: NPW and SCM: Perchlorate
EPA 9010: NPW and SCM: Amenable Cyanide Distillation
EPA 9012B: NPW: Total Cyanide
EPA 9050A: NPW: Specific Conductance
SM3500: NPW: Ferrous Iron
SM4500: NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO2, NO3.
SM5310C: DW: Dissolved Organic Carbon

Mansfield Facility
SM 2540D: TSS
EPA 3005A NPW
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water
EPA 300.0: Nitrate-N, Fluoride, Sulfate; **EPA 353.2**: Nitrate-N, Nitrite-N; **SM4500NO3-F**: Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500Cl-D, SM2320B, SM2540C, SM4500H-B**
EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.
Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D**.

RE: ISS Tetra Tech Study, Middle River, MD (GTX-307698)

Dear Amine:

Enclosed are the test results you requested for the above referenced project. GeoTesting Express, Inc. (GTX) received 36 cylinder sets from you on 2/15/2018. These samples were labeled as instructed by your test request.

GTX performed the following tests on these samples:

34 ASTM D1633 - Compressive Strength of Soil-Cement
14 ASTM D5084 - Flexible Wall Permeability (<=2.87 inch diameter)

A copy of your test request is attached.

Samples 4B-13%-LKD/PC-OC-D, 4B-5%-OC, and 4B-5%-D could not be tested. The samples fell apart when extruded from their molds.

The results presented in this report apply only to the items tested. This report shall not be reproduced except in full, without written approval from GeoTesting Express. The remainder of these samples will be retained for a period of sixty (60) days and will then be discarded unless otherwise notified by you. Please call me if you have any questions or require additional information. Thank you for allowing GeoTesting Express the opportunity of providing you with testing services. We look forward to working with you again in the future.

Respectfully yours,

Jonathan Campbell
Assistant Laboratory Manager

Sample #:	1A-13% PC/LKD -OC		
Depth:	---		
Visual Description:	Soil cement mix		

Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter by ASTM D5084

Constant Volume

Sample Type:	Intact	Permeant Fluid:	De-aired Distilled water
Orientation:	Vertical	Cell #:	---

Sample Preparation: Extruded from cylinder mold and placed into permeameter at as-received density and moisture content.

Assumed Specific Gravity: 2.50

Parameter	Initial	Final
Height, in	3.91	3.91
Diameter, in	1.99	1.99
Area, in^2	3.11	3.11
Volume, in^3	12.2	12.2
Mass, g	311.8	364.3
Bulk Density, pcf	97.5	113.9
Moisture Content, %	11.3	30.0
Dry Density, pcf	87.6	87.6
Degree of Saturation, %	36	96

B COEFFICIENT DETERMINATION

Cell Pressure, psi:	90.00	Increased Cell Pressure, psi:	95.02	Cell Pressure Increment, psi:	5.02
Sample Pressure, psi:	85.19	Corresponding Sample Pressure, psi:	89.97	Sample Pressure Increment, psi:	4.78
				B Coefficient:	0.95

FLOW DATA

Date	Trial #	Pressure, psi		Manometer Readings			Elapsed Time,	Gradient	Permeability K,	Temp,		Permeability K @ 20 °C,

GeoTesting EXPRESS

WARRANTY and LIABILITY

GeoTesting Express (GTX) warrants that all tests it performs are run in general accordance with the specified test procedures and accepted industry practice. GTX will correct or repeat any test that does not comply with this warranty. GTX has no specific knowledge as to conditioning, origin, sampling procedure or intended use of the material.

GTX may report engineering parameters that require us to interpret the test data. Such parameters are determined using accepted engineering procedures. However, GTX does not warrant that these parameters accurately reflect the true engineering properties of the *in situ* material. Responsibility for interpretation and use of the test data and these parameters for engineering and/or construction purposes rests solely with the user and not with GTX or any of its employees.

GTX's liability will be limited to correcting or repeating a test which fails our warranty. GTX's liability for damages to the Purchaser of testing services for any cause whatsoever shall be limited to the amount GTX received for the testing services. GTX will not be liable for any damages, or for any lost benefits or other consequential damages resulting from the use of these test results, even if GTX has been advised of the possibility of such damages. GTX will not be responsible for any liability of the Purchaser to any third party.

Commonly Used Symbols

A	pore pressure parameter for $\Delta\sigma_1 - \Delta\sigma_3$
B	pore pressure parameter for $\Delta\sigma_3$
CAI	CERCHAR Abrasiveness Index
CIU	isotropically consolidated undrained triaxial shear test
CR	compression ratio for one dimensional consolidation
CSR	cyclic stress ratio
C_c	coefficient of curvature, $(D_{30})^2 / (D_{10} \times D_{60})$
C_u	coefficient of uniformity, D_{60}/D_{10}
C_c	compression index for one dimensional consolidation
C_α	coefficient of secondary compression
c_v	coefficient of consolidation
c	cohesion intercept for total stresses
c'	cohesion intercept for effective stresses
D	diameter of specimen
D	damping ratio
D_{10}	diameter at which 10% of soil is finer
D_{15}	diameter at which 15% of soil is finer
D_{30}	diameter at which 30% of soil is finer
D_{50}	diameter at which 50% of soil is finer
D_{60}	diameter at which 60% of soil is finer
D_{85}	diameter at which 85% of soil is finer
d_{50}	displacement for 50% consolidation
d_{90}	displacement for 90% consolidation
d_{100}	displacement for 100% consolidation
E	Young's modulus
e	void ratio
e_c	void ratio after consolidation
e_o	initial void ratio
G	shear modulus
G_s	specific gravity of soil particles
H	height of specimen
H_R	Rebound Hardness number
i	gradient
I_S	Uncorrected point load strength
$I_{S(50)}$	Size corrected point load strength index
H_A	Modified Taber Abrasion
H_T	Total hardness
K_o	lateral stress ratio for one dimensional strain
k	permeability
LI	Liquidity Index
m_v	coefficient of volume change
n	porosity
PI	plasticity index
P_c	preconsolidation pressure
p	$(\sigma_1 + \sigma_3) / 2$, $(\sigma_v + \sigma_h) / 2$
p'	$(\sigma'_1 + \sigma'_3) / 2$, $(\sigma'_v + \sigma'_h) / 2$
p'_c	p' at consolidation
Q	quantity of flow
q	$(\sigma_1 - \sigma_3) / 2$
q_f	q at failure
q_o, q_i	initial q
q_c	q at consolidation
S_r	Post cyclic undrained shear strength
T	temperature
t	time
U, UC	unconfined compression test
UU, Q	unconsolidated undrained triaxial test
u_a	pore gas pressure
u_e	excess pore water pressure
u, u_w	pore water pressure
V	total volume
V_g	volume of gas
V_s	volume of solids
V_s	shear wave velocity
V_v	volume of voids
V_w	volume of water
V_o	initial volume
v	velocity
W	total weight
W_s	weight of solids
W_w	weight of water
w	water content
w_c	water content at consolidation
w_f	final water content
w_l	liquid limit
w_n	natural water content
w_p	plastic limit
w_s	shrinkage limit
w_o, w_i	initial water content
α	slope of q_f versus p_f
α'	slope of q_f versus p_f'
γ_t	total unit weight
γ_d	dry unit weight
γ_s	unit weight of solids
γ_w	unit weight of water
ε	strain
ε_{vol}	volume strain
ε_h, ε_v	horizontal strain, vertical strain
μ	Poisson's ratio, also viscosity
σ	normal stress
σ'	effective normal stress
σ_c, σ'_c	consolidation stress in isotropic stress system
σ_h, σ'_h	horizontal normal stress
σ_v, σ'_v	vertical normal stress
σ'_{vc}	Effective vertical consolidation stress
σ_1	major principal stress
σ_2	intermediate principal stress
σ_3	minor principal stress
τ	shear stress
φ	friction angle based on total stresses
φ'	friction angle based on effective stresses
φ'_r	residual friction angle
φ_{ult}	φ for ultimate strength

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Number:	10017	**Report Date:**	03/12/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L1807489-07: A sample identified as "TRIP BLANK" was received but not listed on the Chain of Custody. At the client's request, this sample was not analyzed.

PCBs

L1807489-01: The surrogate recoveries are outside the acceptance criteria for decachlorobiphenyl (241%/347%); however, the sample was not re-extracted due to coelution with obvious interferences.
L1807489-01: The sample has elevated detection limits due to limited sample volume available for analysis.
WG1095101-1: The surrogate recoveries were outside the acceptance criteria for 2,4,5,6-tetrachloro-m-xylene (11%/11%) and decachlorobiphenyl (15%/12%) ; however, re-extraction could not be performed due to lack of additional sample. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

Dissolved Metals

The WG1095392-4 Laboratory Duplicate RPD for arsenic (21%), performed on L1807489-01, is above the acceptance criteria; however, the sample and duplicate results are less than five times the reporting limit. Therefore, the RPD is valid.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name:	TETRA TECH ISS	**Lab Number:**	L1807489
Project Number:	10017	**Report Date:**	03/12/18

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility
EPA 624: m/p-xylene, o-xylene
EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.
EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.
EPA 300: DW: Bromide
EPA 6860: SCM: Perchlorate
EPA 9010: NPW and SCM: Amenable Cyanide Distillation
SM4500: NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility
SM 2540D: TSS
EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.
EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.
Biological Tissue Matrix: EPA 3050B

Project Name: TETRA TECH ISS
Project Number: 10017

Lab Number: L1808807
Report Date: 03/22/18

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY
For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Number:	10017	**Report Date:**	03/22/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Volatile Organics

The WG1099248-3 LCS recovery, associated with L1808807-02, is above the individual acceptance criteria for tert-butyl alcohol (132%), but within the overall method allowances. The results of the associated samples are reported; however, all positive detects are considered to have a potentially high bias for these compounds.

PCBs

L1808807-01, -02, -03, -04, -05, -07, and -08: The sample has elevated detection limits due to limited sample volume available for analysis.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature: Susan E O'Neil Susan O' Neil

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name:	TETRA TECH ISS	**Lab Number:**	L1808807
Project Number:	10017	**Report Date:**	03/22/18

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

C - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.

D - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G - The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.

H - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I - The lower value for the two columns has been reported due to obvious interference.

M - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

NJ - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P - The RPD between the results for the two columns exceeds the method-specified criteria.

Q - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

S - Analytical results are from modified screening analysis.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Section 1
Introduction

This Environmental Footprint Evaluation of remedial alternatives is provided as an Appendix to the Remedial Action Plan (RAP) for Block E, located at Middle River Complex in Middle River, MD. The purpose of the footprint evaluation is to assess the environmental impacts of the four remedial alternatives using the metrics of greenhouse gas (GHG) and criteria pollutant emissions, energy use, water consumption, and worker safety. The results of this footprint evaluation are intended to provide additional information for consideration during remedy selection, design, and to enhance the understanding of the environmental impacts throughout the remedy life-cycle for each of the proposed alternatives.

1.1 Policy Background

The environmental footprint evaluation was performed in accordance with Lockheed Martin Remedy Selection Process Manual.

Applying optimization concepts with an environmental footprint evaluation within the remedy selection and design phases allows for the following benefits:

- Determining factors in each remedial alternative with the greatest environmental impacts and gathering insight into how to reduce these impacts;
- Evaluating remedial alternatives with optimized or reduced environmental footprints in conjunction with other selection criteria;
- Designing and implementing a more robust remedy while balancing the impact to the environment; and
- Ensuring efficient, cost-effective and sustainable site closeout.

1.2 Evaluation Tools

This evaluation was performed using a hybrid model of the Navy's SiteWise™ tool supplemented with Tetra Tech developed model as appropriate for some site-specific items.

SiteWise™ is a life-cycle footprint assessment tool developed jointly by the U.S. Navy, U.S. Army Corps of Engineers (USACE), and Battelle. SiteWise™ assesses the environmental footprint of a remedial alternative/technology using a consistent set of metrics. The assessment is conducted using a building block approach, where each remedial alternative is first broken down into modules that follow the phases for most remedial actions, including remedial investigation (RI), remedial action construction (RA-C), remedial action operation (RA-O), and long-term monitoring (LTM). Once broken down by remedial phase, the footprint of each phase is calculated. The phase-specific footprints are then combined to estimate the overall footprint of the remedial alternative. This building block approach reduces redundancy in the footprint assessment and facilitates the identification of specific impact drivers that contribute to the environmental footprint. The inputs that need to be considered include (1) production of material required by the activity; (2) transportation of the required materials to the site, transportation of personnel; (3) all site activities to be performed; and (4) management of the waste produced by the activity.

GSRx builds off of SiteWise™ and allows for a flexible, detailed analysis, particularly for materials and equipment use. GSRx was used to account for materials and activities not readily input into SiteWise™ and where equipment usage assumptions built into SiteWise™ were not consistent with site-specific requirements.

1.3 Environmental Footprint Evaluation Framework and Limitations

The environmental footprint evaluation performed for the Block E RAP considered life-cycle quantitative metrics for global warming potential (through greenhouse gas emissions), criteria air pollutant emissions (through nitrogen oxides [NOx], sulfur oxides [SOx] and particulate matter [PM10] emissions), energy consumption, water usage, and worker safety.

Life cycle impacts were calculated for energy consumption, emissions of GHG (carbon dioxide [CO2], methane [CH4], and nitrous oxide [N2O]) and criteria pollutants (NOX, SOX and PM10), water usage, and energy consumption, and worker safety.

Life cycle inventory inputs in SiteWise™ were divided into four categories – 1) materials production; 2) transportation of personnel, materials and equipment; 3) equipment use and

miscellaneous; and 4) residual handling and disposal. Cost estimates from the RI/RAP and design calculations were used as a basis for inventory quantities and related assumptions. Emission factors, energy consumption, and water usage data were correlated to material quantities, equipment, transportation distances, and installation time frames in order to calculate life-cycle emissions, energy consumption, water usage, and worker safety. Default SiteWise™ emission, energy usage, water consumption, and worker fatality and accident risk factors were utilized.

Although GSRx was used to minimize limitations resulting within SiteWise™, elimination of all limitations was not possible while using a hybrid model of SiteWise™ and GSRx. For example, several materials and construction equipment inventoried were input into GSRx and these impacts were incorporated into SiteWise™ within the "Equipment Use and Miscellaneous" sector. This sector in SiteWise™ does not differentiate into the specific equipment usage or material consumption items that are input in GSRx, but rather are considered miscellaneous items. However, impact drivers for items input in GSRx can be identified and evaluated directly within the respective GSRx evaluation and output summary sheets. In addition, worker safety results in general do not include worker safety related to equipment usage that was input within GSRx because GSRx was not developed to evaluate worker safety.

Section 2
Evaluation Results

The following are the alternatives that were analyzed with SiteWise™ and GSRx for the Block E RAP:

For all alternatives, soil with PCB concentrations greater than 50 mg/kg are assumed to be landfilled rather than incinerated. Landfilling is assumed because of lower costs associated with landfilling compared to incineration. Incineration is an acceptable method of disposal and can be used if landfill space is limited.

- ***Alternative 3:*** This alternative would remove soils in the top 2 feet having Total PCB concentrations greater than 25 mg/kg and subsurface soils having Total PCB concentrations greater than 100 mg/kg. Prior to subsurface excavation, the saturated zone will be dewatered, and the extracted groundwater treated prior to discharge. Following excavation, clean soil would be placed and compacted. This alternative would require institutional controls for soils that remain on-site and for groundwater.
- ***Alternative 4:*** This alternative would remove soils in the top 2 feet having Total PCB concentrations greater than 25 mg/kg and subsurface soils having Total PCB concentrations greater than 100 mg/kg using a large-diameter auger. Free water in subsurface soil from the saturated zone will be allowed to drain, then collected, treated, and discharged. Following excavation of the surface soil, clean soil would be placed and compacted. Augered excavations would be filled with a high cement content flowable fill. Note that in order to remove all of the targeted impacted soil, a portion of the previously backfill borings will be removed and disposed of. This alternative would require institutional controls for soils that remain on-site, and for groundwater.
- ***Alternative 7:*** This alternative would remove or treat soils in the top 2 feet having Total PCB concentrations greater than 25 mg/kg and subsurface soils having Total PCB concentrations greater than 100 mg/kg. Subsurface soil would be heated to a temperature of 350 degrees Celsius (°C) or higher using conductive heating. The soils would be heated using high temperature heater wells and a vacuum applied through a soil-vapor extraction

system. The off-gas vapors would be processed through a vapor treatment system consisting of a compression, cooling, and condensation system that will condense the vapors. A sheet piling barrier around each treatment area is required to dewater the area and to minimize inflow of water to maintain the high temperature. The liquid produced will be properly disposed of. Following excavation, clean soil would be placed and compacted. This alternative would require institutional controls for soils that remain on-site and for groundwater.

- ***Alternative 8:*** This alternative does not include a point-by-point removal and treatment of all soils with PCB concentrations greater than PRGs; it would, however, remove and treat soils in the top 2 feet having Total PCB concentrations greater than 25 mg/kg and subsurface soils having Total PCB concentrations greater than 100 mg/kg. After excavation, similar to Alternative 3, impacted soils would be treated on-site in an indirect-fired thermal desorption system. Recovered PCBs would be disposed of off-site at an in incinerator. Treated soil would be used as backfill in the surface and subsurface soil excavations. Following excavation, treated soil would be placed and compacted. This alternative would require institutional controls for soils that remain on-site and for groundwater.

The following sections summarize the relative environmental impacts and primary impact drivers for the four alternatives and their respective metrics. The environmental impacts of the alternatives analyzed are summarized quantitatively in Table L-1.

2.1 Greenhouse Gas Emissions

Emissions of CO2, CH4, and N2O were normalized to CO2 equivalents (CO2e), which is a cumulative method of weighing GHG emissions relative to global warming potential. Figure L1 shows the overall GHG emissions of each of the alternatives analyzed; the x-axis represents the three alternatives evaluated and the y-axis represents the GHG emissions in metric ton of CO2e. Figure L2 shows the breakdown of the percentage that each of the main activities of each alternative (x-axis) contributes to the GHG emissions (y-axis).

The total amount of GHG emissions released to the atmosphere resulting from the activities during Alternative 3 is 2,511 metric ton of CO2e. Approximately 79.5 percent of the greenhouse gas emissions from Alternative 3 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 19.6 percent from residual

handling, 0.3 percent from transportation of equipment, and 0.6 percent from transportation of personnel.

The total amount of GHG emissions released to the atmosphere resulting from the activities during Alternative 4 is 3,237 metric ton of CO2e. Approximately 46.0 percent of the greenhouse gas emissions from Alternative 4 result from residual handling, 53.2 percent from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 0.5 percent from transportation of personnel, and 0.3 percent from transportation of equipment.

The total amount of GHG emissions released to the atmosphere resulting from the activities during Alternative 7 is 5,919 metric ton of CO2e. Approximately 87.7 percent of the greenhouse gas emissions from Alternative 7 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 11.4 percent from residual handling, 0.8 percent from transportation of personnel, and 0.1 percent from transportation of equipment.

The total amount of GHG emissions released to the atmosphere resulting from the activities during Alternative 8 is 3,579 metric ton of CO2e. Approximately 93.5 percent of the greenhouse gas emissions from Alternative 7 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 6.0 percent from residual handling, 0.5 percent from transportation of personnel, and 0.5 percent from transportation of equipment.

2.2 Criteria Pollutant Emissions

The criteria pollutant emissions evaluated during this environmental footprint evaluation for the Block E alternatives include nitrogen oxides (NO_x), sulfur oxides (SO_x), and 10 micrometer particulate matter (PM_{10}). These three pollutants are included on the list of National Ambient Air Quality Standards for pollutants that are considered harmful to public health and the environment.

2.2.1 NO_X

Figure L3 shows the breakdown of the NO_X emissions for the three alternatives evaluated. The x–axis of this figure represents the three alternatives evaluated; the y-axis represents the NO_X

emissions in metric ton. Figure L4 shows the percentage contribution from each of the main activity sectors.

The total amount of NO_X released to the atmosphere resulting from the activities during Alternative 3 is 2.92 metric ton of NO_X. Approximately 73.3 percent of the NO_X from Alternative 3 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 26.4 percent from residual handling, 0.2 percent from transportation of personnel, and 0.1 percent from transportation of equipment.

The total amount of NO_X released to the atmosphere resulting from the activities during Alternative 4 is 4.59 metric ton of NO_X. Approximately 39.7 percent of the NO_X from Alternative 4 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 60.1 percent from residual handling, 0.1 percent from transportation of personnel, and 0.0 percent from transportation of equipment.

The total amount of NO_X released to the atmosphere resulting from the activities during Alternative 7 is 7.60 metric ton of NO_X. Approximately 88.8 percent of the NO_X from Alternative 7 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 10.9 percent from residual handling, 0.2 percent from transportation of personnel, and 0.0 percent from transportation of equipment.

The total amount of NO_X released to the atmosphere resulting from the activities during Alternative 8 is 6.03 metric ton of NO_X. Approximately 93.0 percent of the NO_X from Alternative 4 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 6.8 percent from residual handling, 0.1 percent from transportation of personnel, and 0.1 percent from transportation of equipment.

2.2.2 SO_X

Figure L5 shows the distribution of the SO_X emissions resulting for the activities related to the three alternatives evaluated. The x–axis of this figure represents the three alternatives evaluated; the y-axis represents the SO_X emissions in metric ton. Figure L6 shows the percentage contribution from each of the main activity sectors.

The total amount of SO_X released to the atmosphere resulting from the activities during Alternative 3 is 0.968 metric ton of SO_X. Approximately 63.4 percent of the SO_X from Alternative 3 result from

equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), and 36.5 percent from residual handling.

The total amount of SO_X released to the atmosphere resulting from the activities during Alternative 4 is 1.75 metric ton of SO_X. Approximately 27.1 percent of the SO_X from Alternative 4 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), and 72.9 percent from residual handling.

The total amount of SO_X released to the atmosphere resulting from the activities during Alternative 7 is 25.1 metric ton of SO_X. Approximately 98.6 percent of the SO_X from Alternative 7 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), and 1.4 percent from residual handling.

The total amount of SO_X released to the atmosphere resulting from the activities during Alternative 8 is 12.7 metric ton of SO_X. Approximately 98.5 percent of the SO_X from Alternative 8 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), and 1.5 percent from residual handling.

2.2.3 PM_{10}

The breakdown of the distribution of the PM_{10} emissions resulting from the activities involved in the Alternatives is shown in Figure L7. The x-axis of this figure represents the four Alternatives evaluated, while the y-axis represents the PM_{10} emissions in metric ton. Figure L8 shows the percentage of PM_{10} emissions contributed by each of the activity sectors per alternative.

The total amount of PM_{10} released to the atmosphere resulting from the activities during Alternative 3 is 2.02 metric ton of PM_{10}. Approximately 92.8 percent of the PM_{10} from Alternative 3 result from residual handling, 7.1 percent from equipment use and miscellaneous, and 0.1 percent from transportation of personnel.

The total amount of PM_{10} released to the atmosphere resulting from the activities during Alternative 4 is 6.84 metric ton of PM_{10}. Approximately 98.3 percent of the PM_{10} from Alternative 4 result from residual handling, 1.7 percent from equipment use and miscellaneous, and 0.0 percent from transportation of personnel.

The total amount of PM_{10} released to the atmosphere resulting from the activities during Alternative 7 is 1.99 metric ton of PM_{10}. Approximately 94.2 percent of the PM_{10} from Alternative 7 result from residual handling, 5.7 percent from equipment use and miscellaneous, and 0.2 percent from transportation of personnel.

The total amount of PM_{10} released to the atmosphere resulting from the activities during Alternative 8 is 1.26 metric ton of PM_{10}. Approximately 81.7 percent of the PM_{10} from Alternative 8 result from residual handling, 18.1 percent from equipment use and miscellaneous, and 0.1 percent from transportation of personnel.

2.3 Energy Consumption

The energy consumption for each of the alternatives evaluated is shown in Figure L9. The x-axis shows the four alternatives evaluated, and the y-axis shows the amount of energy consumed in units of million British Thermal Units (MMBTU). Figure L10 shows the percentage breakdown contribution of energy consumption from the different activity groups.

The total amount of total energy consumed during the implementation of Alternative 3 is 164,000 MMBTU. Approximately 95.7 percent of the total energy from Alternative 3 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 4.1 percent from residual handling, 0.1 percent from transportation of equipment, and 0.1 percent from transportation of personnel.

The total amount of total energy consumed during the implementation of Alternative 4 is 142,000 MMBTU. Approximately 81.6 percent of the total energy from Alternative 4 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 18.2 percent from residual handling, 0.1 percent from transportation of equipment, and 0.1 percent from transportation of personnel.

The total amount of total energy consumed during the implementation of Alternative 7 is 186,000 MMBTU. Approximately 94.7 percent of the total energy from Alternative 7 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 5.0 percent from residual handling, 0.0 percent from transportation of equipment, and 0.3 percent from transportation of personnel.

The total amount of total energy consumed during the implementation of Alternative 8 is 140,000 MMBTU. Approximately 97.7 percent of the total energy from Alternative 8 result from equipment use and miscellaneous (which includes materials production and consumables evaluated in the GSRx model), 2.0 percent from residual handling, 0.2 percent from transportation of equipment, and 0.2 percent from transportation of personnel.

2.4 Water Usage

The water consumption of the evaluated alternatives is shown in Figure L11. The x-axis shows the four evaluated alternatives, and the y-axis show the amount of water consumed in thousands of gallons. Figure L12 has a representation of the percentage breakdown of the contribution of the different sectors of the water use through the lifetime of the alternatives.

The total amount of water use resulting from the activities during Alternative 3 is 12,000 gallons of water.

The total amount of water use resulting from the activities during Alternative 4 is 462,000 gallons of water.

The total amount of water use resulting from the activities during Alternative 7 is 3,490,000 gallons of water.

The total amount of water use resulting from the activities during Alternative 8 is 1,690,000 gallons of water.

One hundred percent of the water used during all three alternatives is a result of “equipment use and miscellaneous”, which includes consumables during the implementation of the alternatives.

2.5 Accident Risk Fatality

Figure L13 shows the risk of fatality between the evaluated alternatives. The x-axis represents the four alternatives evaluated, and the y-axis represents the risk of fatality.

For Alternatives 3, 4, 7, and 8, the activity with the highest risk of fatality is the residual handling operations, followed by transportation of personnel

2.6 Accident Risk Injury

Figure L14 shows the risk of injury between the evaluated alternatives. The x-axis represents the four alternatives evaluated, and the y-axis represents the risk of injury.

For Alternatives 3, 4 and 7, the activity with the highest risk of injury is the residual handling operations, followed by the equipment use.

For Alternative 8, the activity with the highest risk of injury is equipment use, followed by transportation of personnel and residual handling.

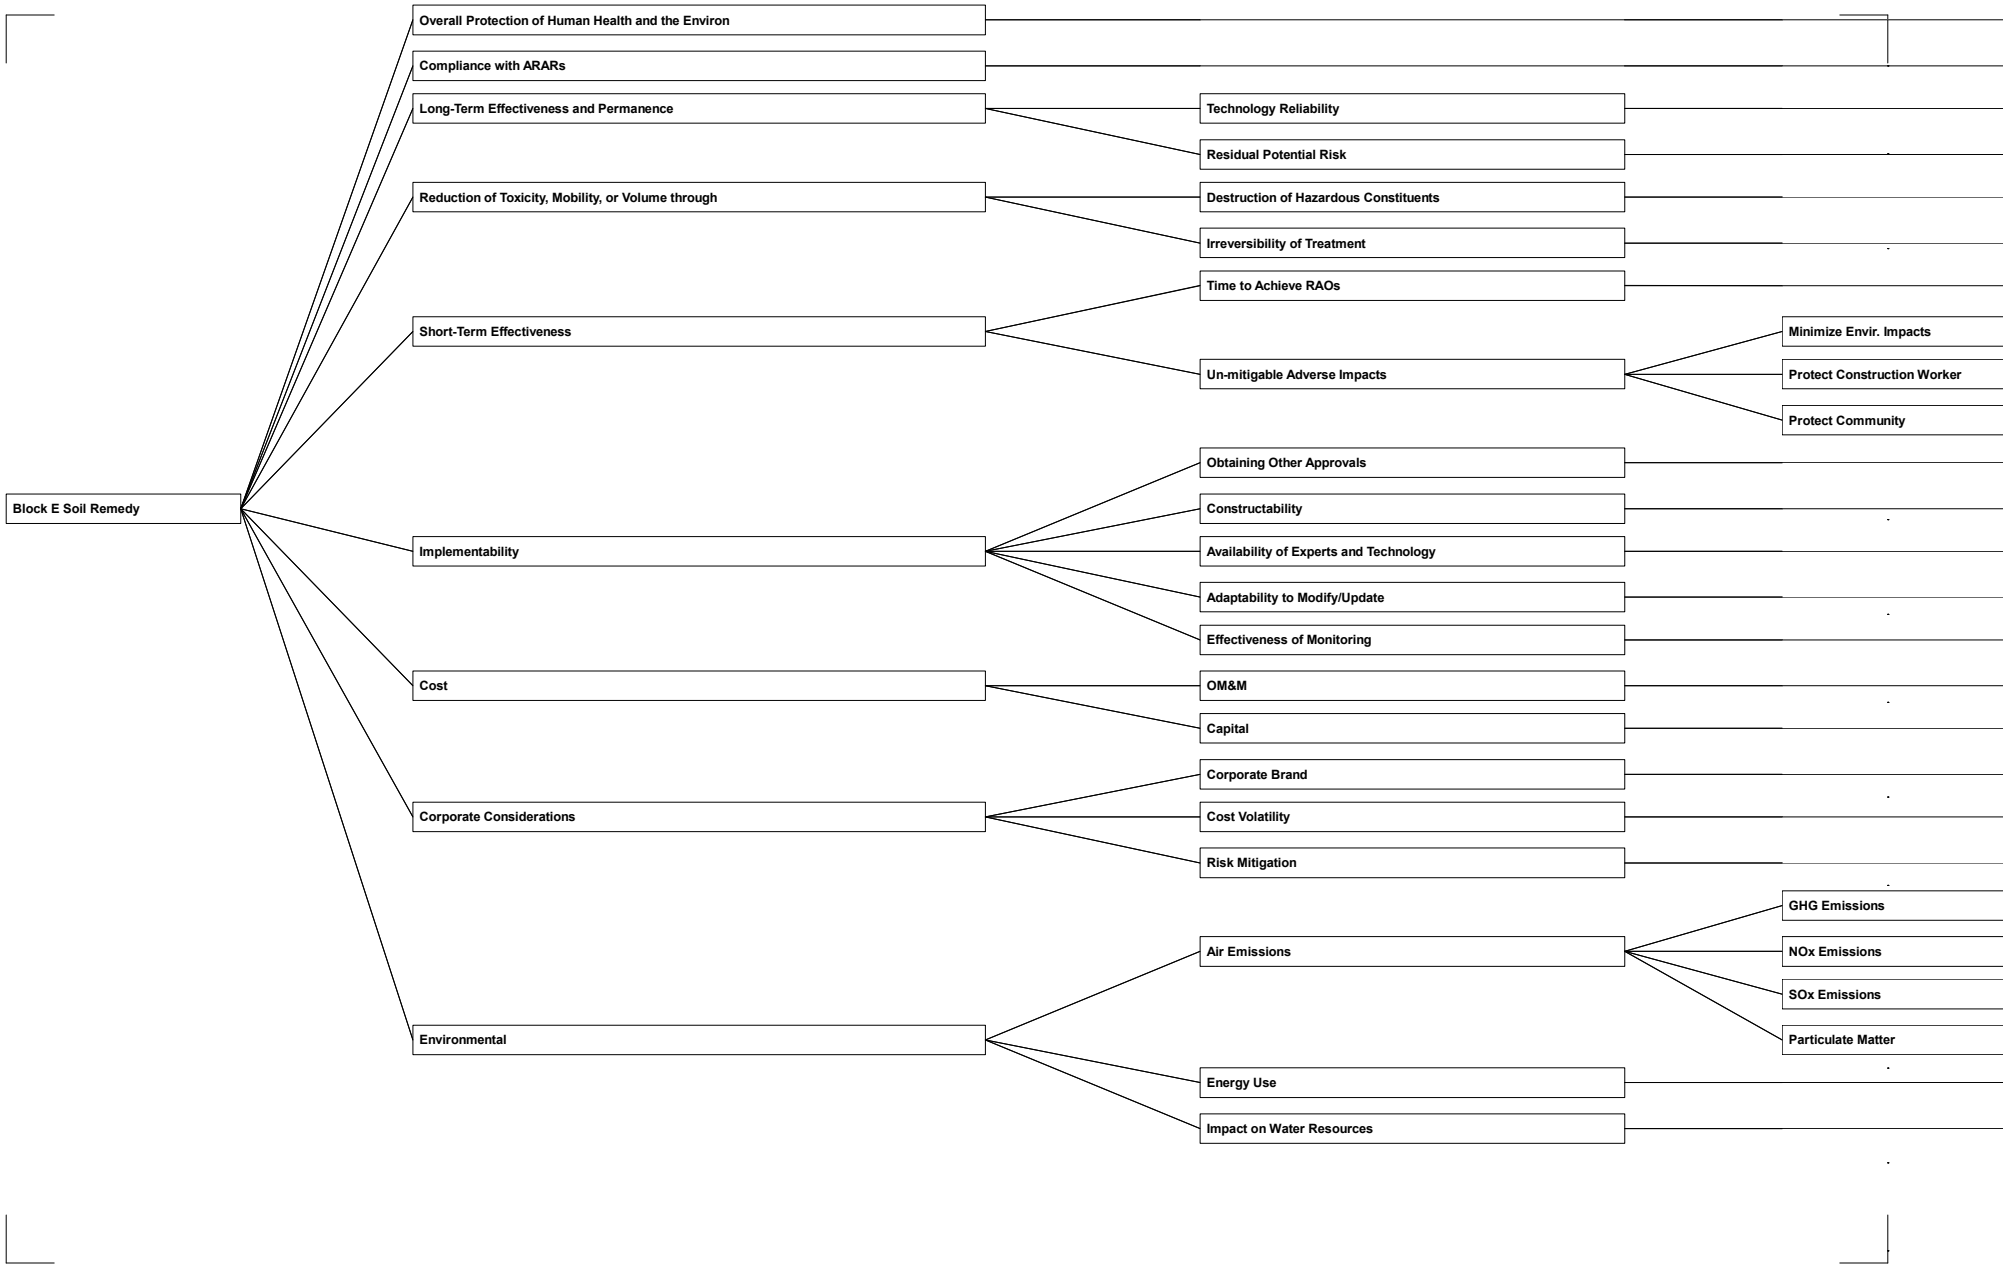
Section 3
Conclusions and Recommendations

During selection and design of the remedy, a sensitivity analysis considering elements of the remedy that have the greatest impact on remedy effectiveness, life-cycle cost, and environmental footprint metrics may provide additional insight into appropriate optimization. To aid in the sensitivity analysis, an impact analysis summary was created to qualitatively highlight the relative impact of respective metrics for the two alternatives and to identify the primary drivers of emissions, energy consumption, and water usage for each alternative (see Table L-2).

Figures L2, L4, L6, L8, L10 and L12 show the percentage breakdown of each of the sectors that take place during the remedial alternatives. In these graphs, it is easy to identify the sector whose contribution is largest from all other sectors to that impact category. An advantage to identifying where the large contributions are, the optimization process for lowering the environmental impacts is faster and could be more efficient.

Measures identified in the evaluation that may reduce the environmental footprint of the alternatives are listed below for consideration.



- All Alternatives: Consider the use of alternative transportation of wastes (if possible) to transport such material to the disposal facilities.
- Alternatives 3, 4, and 7: Consider optimization of the amount of soil that needs to be used as backfill. The amount of soil used during these Alternatives is one of the main drivers of the environmental metrics, and the reuse of excavated soil in Alternative 8 reflects the smaller amount of energy required when less backfill is brought onsite.
- For All Alternatives: Consider a more efficient mode of transportation of materials such as rail.

- Consider an optimization schedule in order to take advantage to transport materials to the site the best way possible.
- All Alternatives: Some reduction of the environmental footprint, particularly air emissions, could be obtained for all alternatives through the possible use of emission control measures such as alternate fuel sources (e.g. biodiesel), equipment exhaust controls (e.g. diesel), and equipment idle reduction.
- All Alternatives: Optimize the number of samples analyzed for disposal and quality purposes.
- All Alternatives: Consider ways to reduce vehicle mileage to reduce worker risk as well as energy use and emissions. Encourage site workers to carpool daily to the site to reduce total vehicle mileage.

Permit List
Block E Soil Remedial Action Plan
Lockheed Martin Middle River Complex, Middle River, Maryland

Regulation/Statute	Permit	Applicability	Permit Process	Cost	Approval Time	Duration	Link	Agency	Contact
Section 404 Clean Water Act (33 United States Code [U.S.C.] 1344) United State Army Corps of Engineers (USACE) Regulations 33 Code of Federal Regulation (CFR) Part 320-330	Maryland State Programmatic General Permit (MDSPGP-4) or Individual Department of the Army (DA) Permit - Note: Part of "Joint Federal/State Application for the Alteration of any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland" application.	Fill of Waters of the U.S. including non-tidal wetlands and waters and tidal wetlands and waters including all areas below the Mean High Water or landward extent of tidal wetlands	Complete the Joint Application for alteration " of any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland"" application. 2) Mail the original plus four copies of the application, plans, vicinity maps and any supporting documentation to: Regulatory Services Coordination (RSC) Office MDE, Water Management Administration 1800 Washington Boulevard, Suite 430 Baltimore, Maryland 21230-1708 3) Upon receipt of the application package, the RSC will determine what type of permit is necessary and will forward the application to the appropriate governmental agencies. The RSC receives applications for the Nontidal Wetlands and Waterways Division, Tidal Wetlands Division, and Dam Safety Division of the Maryland Department of the Environment, as well as the U.S. Army Corps of Engineers. The Department conducts the review in cooperation with local, state, and federal agencies. Although the Department often coordinates with local governments on specific applications, it is the applicant's responsibility to obtain all local approvals for the project. 4) Depending on the nature of the project, it may be advertised for comment and an opportunity for a public informational hearing. The applicant may be required to notify adjacent property owners. 5) The Department may perform a site evaluation. 6) At the conclusion of the review process, the Department will make a decision on the application. Upon receipt of final construction plans, a permit or license is issued by the Department. In some instances, a license may be issued by the Maryland Board of Public Works (BPW) based on a recommendation from the Department	No Fee	Minor projects - 6 to 9 months Major projects - 12 months Minor Projects: Projects that involve less than 1 acre and/or 2,000 lf of stream for non-tidal and less than 1/2 acre and less than 400 cy of fill in tidal wetlands/waters. Minor projects are not placed on public notice. Major Projects: Projects that propose permanent impacts to: construct, reconstruct a reservoir, dam or other waterway obstruction; construct a waterway; or, dredge, fill, bulkhead or change the shoreline. Major projects are placed on public notice.	Maximum of five years and may be extended for an additional five years. Construction must be initiated within three years.	http://www.nab.usace.army.mil/Wetlands%20Permits/permits.htm	USACE and EPA	Jon Romeo (410) 962-6079 or jon.romeo@usace.army.mil
USACE – Section 10 Rivers and Harbors Act - 33 USC 401, et seq	Maryland State Programmatic General Permit (MDSPGP-4) or Individual DA Permit - Note: Part of "Joint Federal/State Application for the Alteration of any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland" application.	Impacts including dredge and fill of navigable waters from Mean High Water Line Seaward	See above	No Fee	See above	See above	http://www.nab.usace.army.mil/Wetlands%20Permits/permits.htm	USACE and EPA	Jon Romeo (410) 962-6079 or jon.romeo@usace.army.mil
Maryland Department of the Environment (MDE) Tidal Wetlands Protection Act – Environment Article 16 of the Annotated Code of Maryland; Code of Maryland Regulations (COMAR) 26.24	Maryland State Programmatic General Permit (MDSPGP-4) or Tidal Wetland License - Note: Part of "Joint Federal/State Application for the Alteration of any Floodplain, Waterway, Tidal or Nontidal Wetland in Maryland" application.	The following activities in tidal wetlands/waters are regulated by the Department: • Filling of open water and vegetated wetlands • Construction of piers, bulkheads, revetments • Dredging • Marsh establishmentAlteration of Non-tidal Wetlands and other Jurisdictional Waters of the State	See above	A fee of up to $1000 may be assessed by the BPW, depending on the purpose of the project.	See above	Maximum of 3 years	http://www.mde.state.md.us/programs/Water/WetlandsandWaterways/PermitsandApplications/Pages/Programs/WaterPrograms/Wetlands_Waterways/permits_applications/tidal_permits.aspx	MDE Wetlands/Waterways Division	Robert Rushlow - 410-537-4023
Section 106 of the National Historic Preservation Act (Public Law 89-665; 16 U.S.C. 470 et seq)	Maryland Heritage Trust (MHT) Review and Approval is required to comply with the conditions of the MDSPGP-4 or Individual DA Permit	Section 106 regulates any direct or indirect effects on any district, site, building, structure, or object that is included in or eligible for inclusion in the National Register	Section 404 permitting triggers the need for review of the project by the Maryland Heritage Trust. If the MHT determineds that the project will have "no effect" on listed or eligible sites no further action will be required. If the MHT determines that an impact would occur avoidance, minimization, or potential mitigation measures will need to be employed	No Fee	Approximately one month	3 years	http://mht.maryland.gov/projectreview.html	Maryland Heritage Trust	Beth Cole (410) 514-7631 bcole@mdp.state.md.us

Section 7 of the Federal Endangered Species Act (ESA)	United States Fish and Wildlife Services (USFWS) review and (potentially) consultation is required to comply with the conditions of the MDSPGP-4 or Individual DA Permit	Section 7 of the ESA requires federal agencies to evaluate potential impacts on listed species and/or habitat as a result of issuance of a federal permit including a Section 404 MDSPGP-4 or Individual DA permit	Review request letter is submitted to the USFWS to request information on listed species/habitat in the proejct area. If the USACE/Lockheed determine that there is potential impacts on listed species/habitat an evaluation and preliminary determination of affect is prepared and submitted to the USFWS for concurrence. If the project will have either a "no affect" or "may affect, but not likely to adversely affect" determination then informal consultation is concluded and no further action is required. If the project will have an adverse affect formal consultation with the USFWS must be initiated to acquire an incidental take permit	No Fee	3 months for informal consultation and up to 18 months for formal consultation	5 years	http://www.fws.gov/chesapeakebay/EndSppWeb/ELEMENTS/ProjReview.html	United States Fish and Wildlife Service	Cherry Keller 410/573 4532 cherry_keller@fws.gov
National Oceanic and Atmospheric Administration (NOAA) Fisheries review Section 305(b)(2) of the Magnuson-Stevens Fishery Conservation and Management Act	NOAA Fisheries review and (potentially) consultation is required to comply with the conditions of the MDSPGP-4 or Individual DA Permit	MSA requires federal agencies to evaluate potential impacts on listed species and/or habitat as a result of issuance of a federal permit including a Section 404 MDSPGP-4 or Individual DA permit	Review request letter is submitted to NOAA Fisheries to request information on listed species and EFH in the proejct area. If NOAA/Lockheed determine that there is potential impacts on listed species/habitat an evaluation and preliminary determination of affect is prepared and submitted to NOAA for concurrence. If the project will have either a "no affect" or "may affect, but not likely to adversely affect" determination then informal consultation is concluded and no further action is required. If the project will have an adverse affect formal consultation with NOAA must be initiated to acquire approval	No Fee	3 months for informal consultation and up to 18 months for formal consultation	5 years	http://www.mde.state.md.us/programs/Water/wwp/Pages/IndustrialSurfaceDischargePermits.aspx	NOAA Fisheries	
Maryland Nongame and Endangered Species Conservation Act (Annotated Code of Maryland 10-2A-01); also, COMAR 08.03.08	Maryland DNR Review and Approval to comply with the requirements of the MDSPGP-4 or Individual DA Permit	Potential impacts to state listed species need to be evaluated as part of the Joint Permit Application review process	Review request letter is submitted to DNR to request information on listed species in the proejct area. If DNR/Lockheed determine that there is potential impacts on listed species/habitat an evaluation and preliminary determination of affect is prepared and submitted to DNR for concurrence. If the project will have either a "no affect" determination then the review is concluded and no further action is required. If the project will have an adverse affect avoidance, minimization, and possibly mitigation measures may be required to acquire approval	No Fee	3 months	N/A	http://www.dnr.state.md.us/wildlife/Habitat/er.asp	Maryland Department of Natural Resources	Lori Byrne Phone: 410-260-8573
Federal Toxic Substances Control Act (TSCA); 40 CFR 761.61(c)	Risk-Based Disposal Approval Application (This is not a true permit, but this application must be approved by USEPA prior to performing the work.)	Any person wishing to sample, cleanup, or dispose of PCB remediation waste in a manner other than prescribed in 40 CFR 761.61(a) or (b), must submit a risk-based disposal approval application in accordance with 40 CFR 761.61(c).	The Responsible Party (RP) must apply in writing to the Regional Administrator in the EPA Region where the sampling, cleanup, disposal, or storage site is located, for sampling, cleanup, disposal, or storage occurring in a single EPA Region. EPA recommends the RP also send a copy of the Application to the EPA Regional PCB Coordinator to expedite its review and approval process. No person may conduct cleanup and/or related activities under 40 CFR 761.61(c) prior to obtaining written approval from EPA.	No Fee	180 days or more	Duration of project	https://www.epa.gov/pcbs/epa-regional-polychlorinated-biphenyl-pcb-programs	USEPA PCB Regional Coordinator (Region 3)	Kelly Bunker (215) 814-2177
Federal Clean Water Act; Maryland Environment Article, Title 9, Subtitle 3; COMAR 26.08.01 through 26.08.04	National Pollutant Discharge Elimination System (NPDES) Permit	Direct discharge of the treated groundwater from dewatering to surface water must be permitted.	(1) Submit a completed application to the Department. (2) Participate in public notice events as specified in Environment Article §1-601, et seq. (3) The Department publishes notice of the application and provides and opportunity for an informational meeting. (4) The Department develops permit limits. (5) The Department publishes a notice of tentative determination and conducts a public hearing, if requested. (6) The Department issues the permit if adverse comments are not received. (7) If adverse comments are received, the Department prepares a final determination and publishes additional notice providing 15 days to request a contested case hearing. (8) The Department issues the permit if the final determination is not contested. (9) If contested, administrative procedures for the appeal process are followed.	$50 to $20,000 depending on the volume of discharge, the type of industry, and how the water is used, plus annual permit fee of $100 to $5,000 depending on the volume of the discharge.	12 months	Five years	http://www.mde.state.md.us/programs/Water/wwp/Pages/IndustrialSurfaceDischargePermits.aspx	Maryland Department of the Environment	(410) 537-3323

Regulation/Statute	Permit	Applicability	Permit Process	Cost	Approval Time	Duration	Link	Agency	Contact
Chesapeake Bay Critical Area Act, Title 8, Subtitle 18 of the Natural Resources Article of the Annotated Code of Maryland – Also, Maryland Critical Area Regulations for Development in the Critical Area Resulting from State Programs are found in Title 27, Subtitle 02 of COMAR.	Critical Area Plan and Notification	Chesapeake Bay Critical Area consists of all land within 1,000 feet of mean high tidal waters or the edge of tidal wetlands. Land use must follow criteria specific to that category of land. Furthermore, land within 100 feet of mean high tidal waters or the edge of tidal wetlands is considered to be the Tidal Buffer, (COMAR 27.01.09.01). Impacts to regulated features within the critical area such as the Tidal Buffer or forested areas must be mitigated as necessary. At the conclusion of the review process, the Department will make a decision on the application.	Prior to submission of a project to the Critical Area Commission, the following requirements must be completed: Public notice of the project was published for one business day in a newspaper of general circulation in the geographic area in which the proposed development would occur; At least 14 days were provided for public comment in the local jurisdiction in which the proposed development would occur; and The affected land was posted in accordance with the posting requirements in COMAR 27.03.01.03 D.Critical Area Project Notification Applications are submitted for review and approval by the BC DEPRM. A Critical Area Project Notification Application must be submitted for sites wholly or partially within IDAs in which the land disturbance is at least15,000 square feet. Necessary Critical Area Project Notification Application content includes the application, site plans with Buffer areas and other Habitat Protection Features shown (as applicable) on each plan,site maps with Critical Area and 100-year floodplain boundaries indicated, acreage of IDA, LDA, RCA areas, acreage of disturbed area, pre- and post-work impervious surface area, and pre- and post-work woodland/trees area.	No Fee	A Critical Area Project Notification Application will be sent for BC DEPRM review at the same time that the Erosion and Sediment Control Plan and Stormwater Management Plan are submitted for review. The time of review by the BC DEPRM is expected to be similar to the review periods for the Erosion and Sediment Control Plan and Stormwater Management Plans.	Two years plus any applicable extension	http://www.baltimorecountymd.gov/Agencies/environment/eir/index.html	Baltimore County Department of Environmental Protection and Sustainability Environmental Impact Review	Regina Esslinger 410-887-3980
Utility Clearance	N/A	Miss Utility for Maryland will be notified (1- 800-257-7777, www.missutility.net) at least 48 hours, but not more than 10 working days, before any excavation or well drilling activities are conducted.	N/A	No Fee	N/A	10 Working Days		N/A	Miss Utility of Maryland 800-257-7777
MDE/Baltimore County – Well Construction Permit	Application for Permit to Drill Well	A well construction permit is required before installing any well that will explore for water, obtain or monitor ground water, or inject water into any underground formation from which ground water may be produced. The well construction permit is obtained by the well driller from the local health department.	Permits are obtained through a well driller licensed in the State of Maryland	Environment Article Section 9-1307 allows up to $160 per permit. Each county establishes the fee, but may not exceed $160 per permit. Baltimore County indicates cost of $80 per permit.	30 days (This may vary depending on the local health department.)			Baltimore County and MDE	MDE - Barry Glotfelty Delegated Program Section bglotfelty@mde.state.md.us (410) 537-3784
MDE/Baltimore County – Well Abandonment	N/A	When a well is abandoned and sealed, the person sealing it shall submit a completed Water Well Abandonment Sealing Report form	After well is sealed by licensed well driller, the abandonment form is submitted to county and MDE.	No fee	Form must be submitted no later than 45 days after abandonment	N/A		Baltimore County and MDE	MDE - Barry Glotfelty Delegated Program Section bglotfelty@mde.state.md.us (410) 537-3784

Baltimore County – Building Permits	Baltimore County – Building Permits	Any time a building greater than 100 square feet in size is erected, altered, added to, or demolished, a permit is required. Building permits also are required for piers, bulkheads, retaining walls, swimming pools over 250 square feet, fences over 42 inches high, and accessory buildings	Develop and submit a site plan (two to ten copies, depending on the type of work) drawn to scale and showing what is to be built and how it is to be situated on the property. Construction plans (two sets) are required for buildings over 1,000 square feet and additions over 600 square feet. Commercial permit applications require a Plan Review Data Sheet (three copies). Major work and commercial work requires these plans be sealed by an architect or engineer. The tax account number of the property will also be required		Up to 30 days				Building Permit Processing Bureau 410-887-3900
Section 402 Clean Water Act (33 U.S.C. 1342) and 40 CFR 122.26; Maryland Environment Article, Title 9, Subtitle 3: COMAR 26.08.04	Notice of Intent for Coverage under the Construction General Permit for Stormwater	Required for all construction activity in Maryland with a planned total disturbance of 1 acre or more. Conditions of the permit include compliance with approved erosion/sediment control and stormwater management plans, compliance with water quality standards and TMDLs, self-monitoring and record keeping.	1) Obtain an application form for an individual permit at the website below or by calling the Department at (410)537-3510. Complete the form and mail with payment to: MDE, Water Management Administration P.O. Box 2057 Baltimore, MD 21203-2057 The individual permit can be submitted any time prior to the start of construction activity, but note that the permit issuance process takes 60 to 90 days, and may take longer in some instances. 2) The Department reviews the application to insure completion. 3) The Department then places the NOI on the publicly available database. 4) Following the public database posting period and submission to the department of the approval for erosion and sediment control from the SCD, the Department then sends the applicant a package which includes a letter verifying coverage and issuing the project a unique permit number, a copy of the individual permit, and a receipt card which must be posted at the site.	1 to less than 10 acres - $100 10 to less than 15 acres - $500 15 to less than 20 acres - $1,500 20 acres or more - $2,500	At least 60 to 90 days	Expires five years from the date the permit is issued to the project or until a Notice of Termination has been completed.	http://www.mde.state.md.us/programs/Permits/WaterManagementPermits/WaterDischargePermitApplications/Pages/permits/watermanagementpermits/water_applications/gp_construction.aspx	Maryland Department of the Environment	Karen Smith ksmith@mde.state.md .us Phone: (410) 537-3510
Section 1.04 of the Code of the Baltimore County Regulations (COBAR) Baltimore County Grading Permit (Baltimore County Code 33-4 and 33-5; COMAR 26.17.01 and 26.17.02)	Grading Plan approval. Also requires approval or variance from stormwater management from Baltimore County and approval of E&S plans from Baltimore County Soil Conservation District	If the proposed grading disturbs over 5,000 square feet of surface area or over 100 cubic yards of fill material is utilized, a permit is required. As a condition of grading permit issuance, a Stormwater Management Plan (see below) will be submitted to Baltimore County for review and approval as well as erosion and sediment control approval from SCD.	To acquire the grading permit for the MRC site, a combined Grading Plan and Erosion and Sediment Control Plan will be submitted for review and approval by the Baltimore County Soil Conservation District (BC SCD). Per BCC 33-5-202(b)(1) and COMAR 26.17.01.05F, the grading permit application must include the approved Grading Plan and the approved Erosion and Sediment Control Plan. Additionally, a grading permit may notbe issued for any site unless a performance security has been posted, an environmental agreement has been executed, and a Stormwater Management Plan has either been approved or an exemption, waiver, or variance for the Stormwater Management Plan has been granted (BCC 33-4-108).Necessary grading plan content includes the site plan and vicinity maps, limits of disturbance, existing and proposed contours reflecting changes made to topography and surface finishes, and changes in the site impervious area. Separate proposed contours maps will not be necessary for the MRC site because post construction site grades will match pre-construction grades and post-construction surface finishes will be the same as preconstruction site finishes	$0.002 per square foot of land on which grading activities occur. The minimum fee is $40 and the maximum fee is $5,000. In addition, a performance security equal to $0.05 per square foot of land area to be disturbed, not to exceed $30,000, is also required.	An estimate of the average review time is approximately 3- 6 months.	Two years from the date of issuance with an option to request an extension of up to one additional year upon written request	http://www.baltimorecountymd.gov/Agencies/environment/stormwater/index.html	Baltimore County EPS Stormwater Engineering and Baltimore County Soil Conservation District	Al Wirth/Ed Schmaus with Baltimore County Grading and Stormwater Engineering 410-887-3768 eschmaus@baltimorecountymd.gov rwirth@baltimorecountymd.gov

Baltimore County - Erosion/Sediment Control Plan	Baltimore County – Erosion/Sediment Control Plan Approvals	Erosion/Sediment Control Plan approval is required for any construction activity that disturbs 5,000 square feet or more of soil or results in the excavation of 100 cubic yards or more of soil.	An erosion and sediment control plan will be prepared in accordance with the 1994 Maryland Standards and Specifications for Soil Erosion and Sediment Control (MDE, 1994), the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control, and the Baltimore County Urban Policy and Guidelines Manual; draft standards and specifications published in early 2010 will also be considered. An initial submittal will be made that will include signed/sealed plan sheets, plan information sheet, drainage area maps, and the calculated fee. The review process will then follow the 3 stage review procedure for the stormwater management and grading plan process including concept, development, and final plan review.	Flat rate of $0.004 per square foot of disturbed area with a maximum fee of $3,000.	An estimate of the average review time is approximately 6 weeks	2 years from date of issuance	http://www.mascd.net/BCSCD/	Baltimore County Soil Conservation District	Dave Bachman with Baltimore County Soil Conservation District (410) 527-5920, ext. 115 dbachman@baltimorecountymd.gov
Baltimore County - Public Works	Utility Cut Permit	Anytime one occupies, uses or engages in any activity in a public right-of-way including: •Excavation in paved or unpaved areas •Installation of above or below ground facilities •Antenna attachment on utility poles •Activity that obstructs or impedes traffic	1) Complete the application, and sign application. 2) Attach a set of engineering drawings. 3) Clearly illustrate and highlight the proposed work. 4) Clearly identify all existing utilities. 5) Submit the application and plans via email to Bureau of Highways. 6) Upon receiving the application, the plans will be circulated for internal review by County agencies that may have information or interest in the area of the proposed work. 7) When the review is complete, the Bureau of Highways will advise the applicant of the appropriate permit fee, and share any revisions that may be required. 8) 24 hours prior to beginning construction, the Permittee must notify the Bureau of Highways.	Case-by-case	1 to 3 weeks	1 year from date of issuance	https://www.baltimorecountymd.gov/Agencies/publicworks/highways/utilitycut.html	Baltimore County, Department of Public Works, Bureau of Highways	Bonny Jasinski bjasinski@baltimorecountymd.gov 410-887-4306
Section 402 Clean Water Act (33 U.S.C. 1342) and 40 CFR 122.26; Environment Article, Title 4, Subtitle 1 for erosion and sediment control and Subtitle 2 for stormwater management (COMAR 26.17.01 and 26.17.02); Article 33 Title 4 of COBAR Baltimore County Stormwater Management	Stormwater Management Variance from Baltimore County	General stormwater discharges to waters of the US and state (Federal NPDES program adminstered by MDE); In Baltimore County this includes new stormwater discharges; Development or redevelopment of land for residential, commercial, industrial, institutional, or governmental use	A Stormwater Management Plan is required to be submitted to the Baltimore County Department of Environmental Protection and Sustainability for review and approval before a grading permit can be issued and soil response action activities can commence unless an exemption, waiver, or variance has been granted. The Stormwater Management Plan will be designed in accordance with the "2000 Maryland Stormwater Design Manual, Volumes I and II," revised in 2009.	Flat rate of $50.00 per acre of disturbed area with a minimum fee of $50.00 and a maximum fee of $450	An estimate of the average review time is approximately 6 weeks.	2 years from date of issuance	http://www.baltimorecountymd.gov/Agencies/environment/stormwater/index.html	Baltimore County EPS Stormwater Engineering	Al Wirth/Ed Schmaus with Baltimore County Grading and Stormwater Engineering 410-887-3768 eschmaus@baltimorecountymd.gov rwirth@baltimorecountymd.gov
