Land Management Administration
Maryland Department of the Environment
1800 Washington Boulevard, Suite 625
Baltimore, Maryland 21230

Subject: Transmittal of the Construction Completion Report and Request for No Further Action
Block H Soil Remedial Action
Lockheed Martin Corporation; Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Carroll:

Please find enclosed two hard copies with a CD of the above-referenced document. This document presents the results of the soil remediation activities completed in Block H at the Lockheed Martin Corporation Middle River Complex in Middle River, Maryland. As presented in Section 4.4 of the referenced report, the soil remediation has satisfied the Remedial Action Objective (RAO) of the Block H Soil Remedial Action Plan (RAP), as amended. In accordance with Section VI of Administrative Consent Order and Settlement Agreement ACO-SAR-MDE0746-2015-1-01, Lockheed Martin requests a No Further Action letter or equivalent determination with respect to the Block H Soil RAP and associated RAO.

We respectfully request a response by March 25, 2016.

Please let me know if you have any questions. My office phone is (301) 548-2209.

Sincerely,

Thomas D. Blackman
Project Lead, Environmental Remediation

Section 1
Introduction

Tetra Tech, Inc. (Tetra Tech) has prepared this *Construction Completion Report* on behalf of Lockheed Martin Corporation (Lockheed Martin) to document completion of the Block H soil remedial action in May 2015 at the Lockheed Martin Corporation Middle River Complex (MRC) in Middle River, Maryland (Figure 1-1). The location of Block H within the Middle River Complex is shown on Figure 1-2.

1.1 BACKGROUND

Block H consists of 7.88 acres in the northwestern portion of the Middle River Complex. It is bounded to the north by Eastern Boulevard (Route 150), to the east by the industrial portion of the Middle River Complex (Block I), to the south by Parking Lot No. 3 (Block G), and to the west by Cow Pen Creek. Block H consists of Parking Lot No. 2, which is currently and has historically been used as an employee automobile parking lot. The parking lot is paved with asphalt, and a paved access road and a grass covered strip of land lie between the parking lot and Cow Pen Creek. Access to the parking lot is from Chesapeake Park Plaza. Historical aerial photographs suggest that Parking Lot No. 2 was constructed before 1954; it remains in use today for employee parking. No structures are known to have ever stood on Block H.

Numerous environmental studies, including soil sampling, have chemically characterized Block H soil. A soil remedial action plan (RAP) was prepared to outline the alternatives and objectives for remediating Block H soil (Tetra Tech, Inc., 2013). The remedial action plan was subsequently amended twice. The first addendum presented the results of additional sampling to support the soil-remediation design (Tetra Tech, Inc., 2014). The second addendum included a revision to the remedial action objective (RAO) and presented an updated implementation schedule (Tetra Tech, Inc., 2015a). The remedial action objective developed in the Block H soil remedial action plan (and amended in the second addendum) to mitigate risks associated with potential exposure pathways identified in the conceptual site model for industrial workers is as follows:

Soil remedial action objective— *Reduce site-related chemicals of concern in Block H soil to not exceed a cumulative human health cancer-risk limit of 1×10^{-5} for industrial workers via ingestion, dermal contact, and inhalation.*

The remedial action objective and previous soil sampling results were incorporated into the *100% Soil Remedial Action Design for Blocks D, D Panhandle, F, G, and H* (Tetra Tech, Inc., 2015b) prepared by Tetra Tech, Inc. in January 2015 and approved by the Maryland Department of the Environment (MDE) on January 18, 2015.

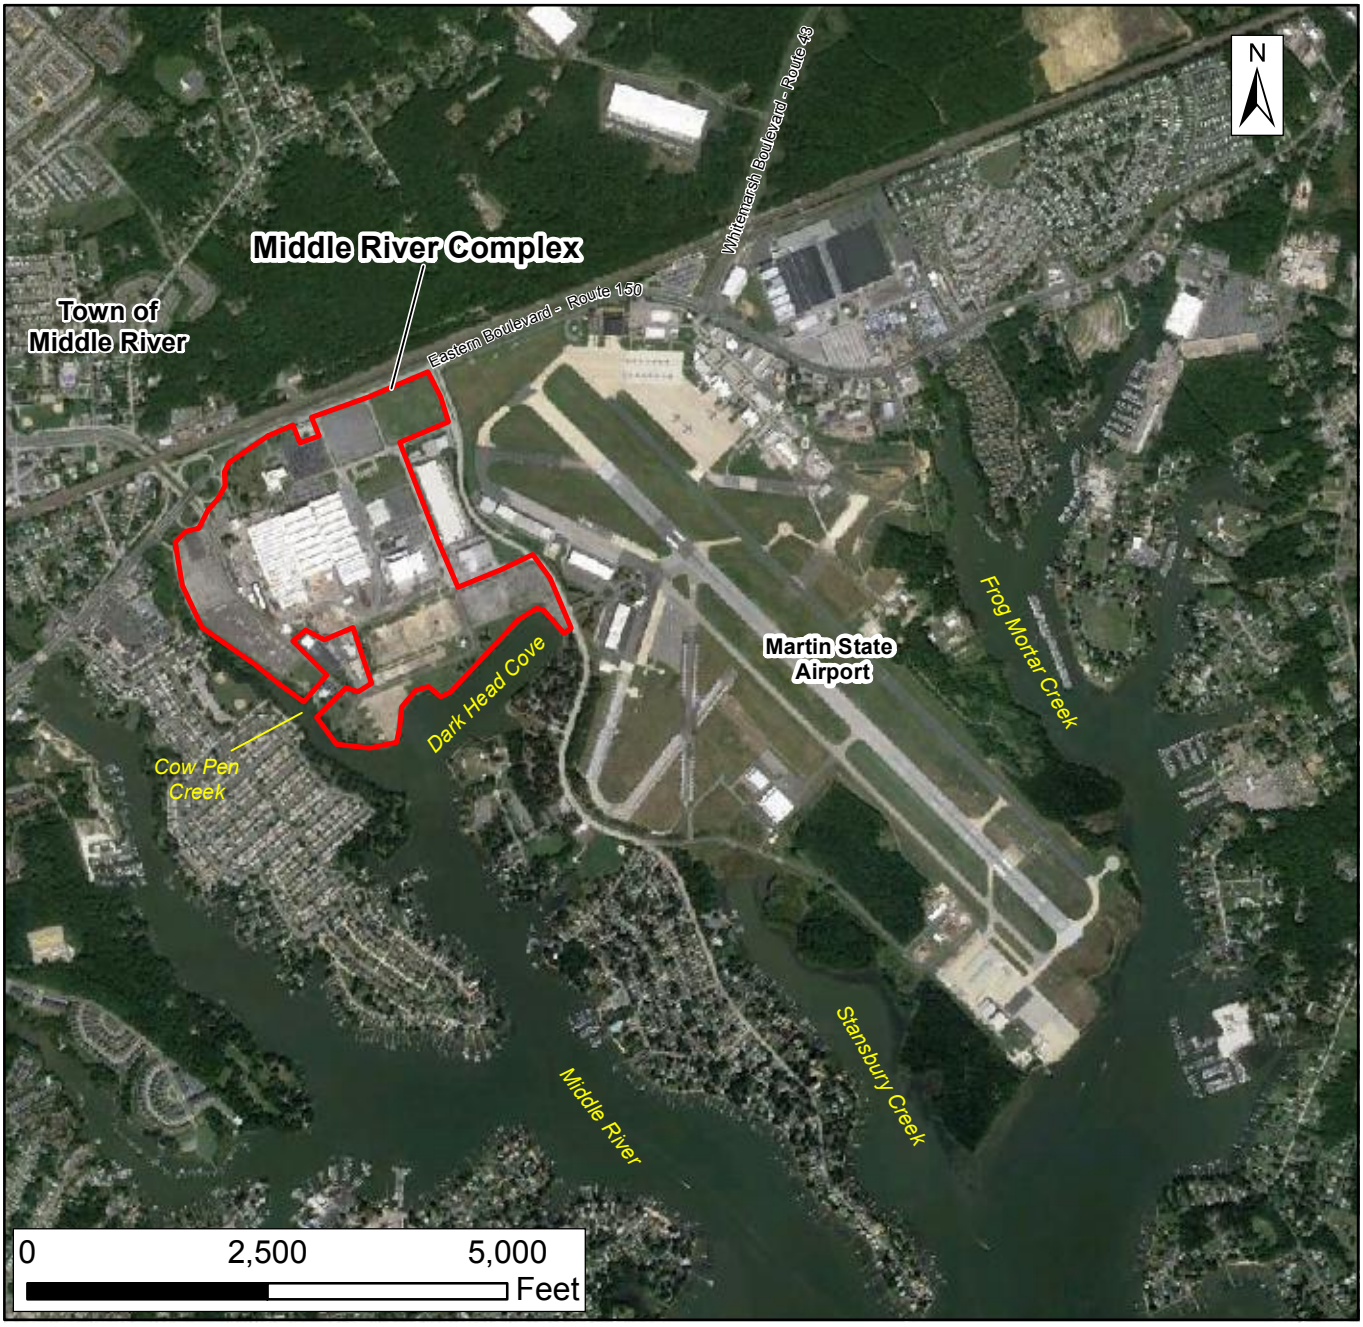
These documents form the basis for the Block H soil remedial action, which removed and disposed of 396 tons of benzo[a]pyrene-equivalent (BaPEq)-impacted soil. This report documents the successful execution and completion of the soil remedial action in Block H in May 2015. Daily reports that were completed during field activities are in Appendix A.

1.2 ORGANIZATION

This report is organized as follows:

Section 1—Introduction: Presents the background and organization of the construction completion report.

Section 2—Permitting and Site Setup: Describes the remedial action design, permits obtained before construction, and site setup.



Section 3—Health, Safety, and the Environment: Describes the procedures used to ensure the health and safety of personnel.

Section 4—Remedial Action Implementation: Describes the soil removal activities and the achievement of the remedial action objective.

Section 5—Transportation and Disposal: Presents waste transportation and disposal details.

Section 6—Decontamination, Site Restoration, and Demobilization: Presents details of decontamination, site restoration, and demobilization.

Section 7—References: Lists references and citations used in compiling this report.

Section 2
Design, Permitting, and Site Setup

Permitting and site setup to implement the remedial action for Block H soil included:

- completing the remedy design
- obtaining necessary permits and approvals
- clearing utilities
- installing temporary facilities

2.1 DESIGN AND PERMITS

Tetra Tech Inc. (Tetra Tech) completed and submitted the *100% Soil Remedial Action Design for Blocks D, D Panhandle, F, G, and H* (Tetra Tech, 2015b) to state regulators in January 2015. The design was approved by the Maryland Department of the Environment (MDE) on January 18, 2015. Tetra Tech has secured all necessary permits, approvals, and authorizations from state, federal, and local agencies for activities in Block H. Copies of the permits and authorization letters are in Appendix B. Note that work authorization for Block H is part of the work authorizations issued for Blocks D, F, G, and H, and that certain provisions therein do not apply to the specific activities performed in Block H. Permits/approvals secured specifically for the work in Block H include:

- Baltimore County grading permit
- Baltimore County Soil Conservation District erosion and sediment-control plan approval
- Baltimore County critical area and natural-resource variance
- Baltimore County stormwater-management variance
- Maryland Historical Trust determination
- Maryland Department of Natural Resources review
- MDE “Construction General Permit”

- Lockheed Martin Corporation Middle River Complex digging permit

Baltimore County approved a standard grading permit for ground disturbance (in the upland areas of Block H) on April 23, 2015 as part of the grading application submittal for Blocks D, F, G, and H. The erosion and sediment-control (E&SC) plans for controlling stormwater runoff during construction were likewise approved by the Baltimore County Soil Conservation District (SCD) on April 23, 2015. MDE required approval of E&SC plans by SCD for final authorization of the Maryland State "Construction General Permit" (CGP) that MDE approved on May 6, 2015.

This project qualified for a stormwater-management variance because final site grades remained unchanged and the project involved no post-construction stormwater-management features. This variance was approved on July 23, 2014 by the stormwater management office of the Baltimore County Department of Environmental Protection and Sustainability (DEPS). The project also qualified for a variance (approved on February 22, 2014) from the DEPS Environmental Impact Review office, because the project remedied previously developed/industrial areas that lack any wetlands, forest, or other natural habitats.

The Maryland Historical Trust (MHT) and the Maryland Department of Natural Resources (DNR) were consulted to determine if historical or special-status species/habitats would be affected by the proposed action. The MHT indicated in a letter dated December 9, 2013 that the project would have no effect on historical resources. The DNR stated in a letter dated December 18, 2013 that no listed species or habitats are known to occur in the project area, but cautioned that this letter should not be interpreted as meaning that rare, threatened, or endangered species are not present, and if appropriate habitats are available, certain species could be present without documentation since adequate surveys have not been conducted.

2.2 UTILITY CLEARANCE

A pre-construction utility-locating survey was conducted before any activities requiring ground disturbance began. Enviroscan, Inc. of Lancaster, Pennsylvania was contracted to perform a geophysical survey of the work area to identify possible underground utilities. This survey was completed on April 15, 2015 and identified utilities were marked on the ground using spray paint. These marks were refreshed as required throughout the project. The project team also inspected the area for overhead utilities, noting where utilities might interfere with operations.

Maryland's "Miss Utility" clearinghouse was notified of project activities and approved the ticket request on April 15, 2015. The Miss Utility ticket was updated as required throughout the project. Tetra Tech followed Lockheed Martin Corporation (Lockheed Martin) *Enterprise Operations-28* (EO-28) and Lockheed Martin *Minimum Requirements for Intrusive Fieldwork Work Plans*, in addition to completing the LMC Properties, Inc. (LMCPI) digging authorization form and obtaining required signatures before conducting any intrusive activities. The completed digging authorization form and utility clearance report are in Appendix B.

2.3 INSTALLATION OF TEMPORARY FACILITIES AND SITE CONTROL

One project trailer for site personnel was placed in Block G in April 2015; this trailer will be used for the duration of the soil remedial actions in all tax blocks. Power was connected to the trailer through the existing power-supply lines in Block G. Portable toilets and a storage container for tools were also provided. Temporary fences were installed around the Block H excavation areas in May 2015 to limit access to the work area (in accordance with discussions with LMCPI). Signs installed at the entrance to the construction site provided emergency contact information for the project. Erosion and sediment-control (E&SC) measures were not required per the MDE-approved E&SC plan, as the site was stabilized at the end of each workday.

Section 3
Health, Safety, and the Environment

A dust control plan and a health and safety plan (HASP) were prepared before starting soil remedial-action activities to specify the measures taken to control airborne dust and ensure personnel safety. The following sections describe how these plans were implemented during construction in Tax Block (Block) H.

3.1 AIR MONITORING

Real-time dust (RTD) monitoring and visual observations were conducted to determine (quantitatively and qualitatively) if measures were needed to control airborne dust levels and avoid dispersion or inhalation of contaminated dusts or particulate during excavation, stockpiling, load-out, backfilling, and compaction. RTD equipment (Dust Trak II air-monitoring stations) was deployed during these operations and recorded dust concentrations from one upwind and two downwind positions on the perimeter of the Block H work areas. RTD equipment was calibrated each morning before use.

Data were continuously downloaded to data analysis software that was programed in the device to alert field personnel via (email and text message) of 15-minute average dust concentrations. All dust readings recorded during construction were well below the Block H-specific dust action-level (five milligrams per cubic meter) specified in the dust control plan; dust suppression measures were therefore not needed. Air monitoring data are in Appendix C.

3.2 HEALTH AND SAFETY MONITORING

All employees complied with the requirements of the federal Occupational Safety and Health Administration (29 *Code of Federal Regulations* [CFR] 1910 and 29 CFR 1926). All employees involved in intrusive fieldwork were 40-hour hazardous waste operations and emergency response (HAZWOPER)-certified, eight-hour annual-refresher certified, and had current medical clearance.

Safety meetings were held before the start of each workday. All field personnel reviewed and signed a site-safety briefing form before beginning any work on site. Hazard-analysis worksheets were prepared as part of the site-specific HASP and were reviewed by all personnel before each new task.

Section 4
Remedial Action Implementation

This section details the soil remedial activities that were completed in Block H of the Middle River Complex in May 2015.

4.1 ASPHALT REMOVAL

Soil excavation area limits were surveyed by a licensed Maryland land surveyor, as described in the *100% Soil Remedial Action Design for Blocks D, D Panhandle, F, G, and H* (Tetra Tech Inc. [Tetra Tech], 2015b). Asphalt within excavation areas A and B was saw-cut and removed using a backhoe. Asphalt was moved from Block H with a front-end loader and stockpiled in Block G to await recycling at an off-site Lockheed Martin Corporation (Lockheed Martin)-approved facility.

4.2 IMPACTED SOIL EXCAVATION

Impacted soil was excavated from excavation areas A and B to a depth of two feet below ground surface using a hydraulic excavator. On May 20–21, the impacted soil was directly loaded into 17 tri-axle dump trucks for transport to and recycling at the Soil Safe, Inc. facility in Brandywine, Maryland. Excavated soil was visually inspected to ensure it was similar to the previously identified conditions. Shipping documentation accompanied each truckload (see Appendix D). Approximately 396 tons of Block H soil was transported to the recycling facility.

4.3 VERIFICATION SAMPLING

Once excavation had been completed in an area, verification sidewall-samples were collected at a minimum frequency of one sample per 100-feet of sidewall. These samples were collected to determine if additional lateral excavation would be required. Four composite verification sidewall-samples were collected around each excavation area in Block H.

Verification samples at the base of the excavations were also collected, at a minimum frequency of one sample per 625-square feet of excavation bottom. Three verification base-samples were collected from excavation area A, and two verification base-samples were collected from excavation area B (Figure 4-1). Verification base-samples were collected for informational purposes only, and were not used to determine whether additional vertical excavation would be required. Verification samples were analyzed for polycyclic aromatic hydrocarbons (PAHs) by United States Environmental Protection Agency (USEPA) Method 8270D.

Each verification sidewall-sample result was directly compared to the benzo[a]pyrene equivalent (BaPEq) remedial goal (RG) of 2,900 micrograms per kilogram. The following criteria were used to determine if additional excavation would be required:

- if the maximum detected confirmation sidewall-sample concentration in an excavation area exceeded twice the block-specific RG
- if two or more sampling results per excavation area exceeded the block-specific RG (only one sampling result per excavation area could exceed the block-specific RG, but must be less than twice the block-specific RG)
- if the arithmetic-mean concentration for the confirmation samples exceeded the block-specific RG

Following these criteria, additional excavation was not required in Block H. Figure 4-2 depicts the sampling results of each verification sidewall-sample. Verification sampling results are also listed in Tables 4-1 and 4-2 for excavation areas A and B, respectively. Copies of the verification sampling logs and chain of custody forms are in Appendix E. Laboratory reports are in Appendix F.

4.4 RESIDUAL-RISK ANALYSIS

A post-excavation residual-risk analysis (RRA) calculated the final Block H cancer and noncancer risk to industrial workers following soil removal to determine if the Block H remedial action objective (RAO) had been achieved. The post-excavation RRA data set consists of data from the verification sidewall-samples, along with historical surface-soil data (at 0–2 foot depth) for all locations that were not excavated. Backfill material was analyzed before being delivered to the site, in accordance with the *100% Soil Remedial Action Design for Blocks D, D Panhandle, F, G, and H* (Tetra Tech, 2015b), and was approved for use. Chemical concentrations in excavated samples were replaced in the RRA calculation with the concentrations of chemicals in the backfill material. Verification base samples were considered subsurface soil because they were collected

at the bottom of the two-foot excavation area, and thus were inaccessible to industrial workers (i.e., an incomplete exposure pathway). Appendix G includes a technical memorandum with details regarding the RRA and associated calculations. The following paragraphs summarize the post-excavation RRA.

The RRA first identified chemicals of potential concern (COPC) to be evaluated in the RRA by comparing the maximum detected chemical concentrations in the post-excavation database to current USEPA regional screening levels (RSLs). Chemicals detected at concentrations exceeding screening levels were retained in the RRA for quantitative evaluation. Chemicals retained as COPC in the 2012 HHRA were also retained in the RRA as COPC so that the pre-excavation soil-risk estimates could be compared to the post-excavation soil-risk estimates.

The exposure assessment assumptions used in the RRA are those presented in the USEPA Office of Solid Waste and Emergency Response Directive 9200.1–120, *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors* (USEPA, 2014). Exposure-point concentrations were calculated using the current version of USEPA's *Pro-UCL* software (Version 5.0.00). The toxicity criteria (e.g., cancer slope-factors, reference doses) used to estimate cancer and noncancer risks are from the June 2015 RSL table published by USEPA. The equations used to calculate receptor intake and risk are the same as those used in the original baseline human health risk assessment prepared for Block H. The RRA concluded that BaPEq concentrations in remaining Block H soil do not exceed a lifetime cancer risk of 1×10^{-5} for industrial workers exposed to BaPEq via ingestion, dermal contact, and inhalation; thus, the remediation effort meets the Block H RAO.

4.5 SOIL BACKFILL AND COMPACTION TESTING

Excavation areas were backfilled and final surfaces were graded to match existing grades. Material similar in grain size to the removed soil and obtained from an off-site borrow source (Aggregate Transport Corporation in Hanover, Maryland) was used as fill. Fill material was analyzed before being delivered to the site, in accordance with the *100% Soil Remedial Action Design for Blocks D, D Panhandle, F, G, and H* (Tetra Tech, 2015b), and was approved for use. Analytical data for the borrow-source sample is in Appendix H.

Backfill in the Block H excavation areas consisted of approximately 13 inches of No. 2 stone covered with a geotextile, followed by approximately six-inches of compacted crushed stone

(CR-6). Backfill materials were placed via excavator and dozer and compacted with a single-drum soil compactor or mechanical tamper, depending on the size and depth of the excavation. In-place compaction testing was done via nuclear moisture-density methods during backfill placement. Compaction-test data are in Appendix H. Final restoration, including paving, is discussed in Section 6.

Section 5
Transportation and Disposal

Transportation and disposal (recycling) for the Block H soil remedial action included the following waste streams:

- benzo[a]pyrene-equivalent (BaPEq)-impacted soil
- asphalt
- general refuse

5.1 IMPACTED SOIL

Waste characterization samples were collected from each excavation area before soil removal at a frequency of one sample per 1,000 tons, as directed by the disposal facility; therefore, one sample was collected from each removal area. All samples were collected and analyzed for total petroleum-hydrocarbon gasoline-range and diesel-range organics by United States Environmental Protection Agency (USEPA) SW-846 Method 8015/9017B, for volatile organic compounds by USEPA SW-846 Method 8260, for polychlorinated biphenyls by USEPA SW-846 Method 8082, and for toxicity characteristic leaching procedure metals by USEPA SW-846 Method 1311/6010, in accordance with recycling facility requirements. Sampling results indicated that all batches were suitable for recycling at Soil Safe. Copies of the laboratory reports are in Appendix F.

Upon receipt of the sampling results, Profile W5-4001 was prepared to support the requested disposal-facility acceptance of the BaPEq-impacted soil. Profile W5-4001, which included transportation provided by the disposal facility, was submitted, and approved by the disposal facility in May 2015. Copies of the waste profile and approval sheet are in Appendix D.

Impacted soil was loaded into tri-axle dump trucks for transport to Soil Safe, Inc., in Brandywine, Maryland. Each truck had appropriate licensing, registration, and placarding, and was tarped and inspected before and after loading to ensure that it was in suitable condition for road transport. A uniform shipping-manifest was completed for each load. Seventeen dump-truck loads of impacted soil were sent to the recycling facility for the Block H remediation. Approximately 396 tons were

transported to Soil Safe, with an average truck carrying 23 tons. A predefined truck-traffic route was established in the means-and-methods work plan to minimize inconvenience to the public, while ensuring safe conditions for roadway users (including pedestrians and bicyclists) and personnel in work zones.

5.2 ASPHALT

Approximately 93 cubic yards of asphalt were removed from the Block H excavation areas. The asphalt was stockpiled in Block G and covered with plastic sheeting. The asphalt was transported off-site for recycling at P. Flanigan & Sons, Baltimore, Maryland on October 1, 2015.

5.3 GENERAL REFUSE

General refuse generated during the project was collected in a dumpster that was emptied as necessary and disposed of at the local municipal-waste landfill. Dumpster service was provided by Waste Management of Maryland, Inc.

Section 6
Decontamination, Site Restoration, and Demobilization

The following sections detail the final construction activities, which include decontamination, site restoration, and demobilization.

6.1 DECONTAMINATION

Equipment that contacted impacted soil was decontaminated before being removed from Block H. Equipment that required decontamination included one excavator bucket, a rubber-tire loader-bucket, and a holding tank for water. Decontamination consisted of removing residual soil from equipment-contact surfaces through a combination of scraping, rinsing, and scrubbing. Decontamination pads were built to capture decontamination water. That water was stored in frac tanks before being transported off-site for disposal. The wash and rinse water was disposed at Clean Harbors, Inc. in Baltimore, Maryland.

6.2 SITE RESTORATION

The Block H excavation areas were paved to match pre-existing conditions following backfill and compaction (as described in Section 4.3). The base course underlying the bituminous-concrete pavement consisted of crusher-run aggregate (CR-6) that meets the grading and physical property requirements of the Maryland State Highway Administration (MDSHA)Standard Specifications for Construction and Materials Section 901.01, Tables 901A and 901B(MDSHA, 2008). The bituminous-concrete base-course consists of a minimum two inches of hot-mix asphalt Superpave, 19mm, PG 64 22, Level 2 meeting MDSHA specification (Section 901.01, Tables 901C and 901D and Sections 904.01, 904.02, and 904.04) (MDSHA, 2008). The bituminous-concrete surface-course was constructed in accordance with MDSHA CM Sections 504.03.01 through 504.03.14

(MDSHA, 2008). Parking stripes were painted in the Block H excavation areas after the newly paved asphalt had cured.

6.3 DEMOBILIZATION

Temporary fences, equipment, and personnel were demobilized from Block H as tasks were completed and services no longer required. Final demobilization occurred after the parking stripes were painted on June 25, 2015. The project trailer and general refuse dumpster remain in Block G and will be used during soil remedial-action activities in other tax blocks.

APPENDIX A—DAILY REPORTS

TETRA TECH, INC.

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 11, 2015	Start Work at:	6:50 AM	Depart Site at:	5:30 PM

Weather Conditions

Temperature (°F):	70 to 80	Skies:	Overcast	Wind:	Light	Precipitation:	Light Rain

Weather Comments:

Summary of Work/Major Activities

1. Remobilize to site, mobilize additional supplies to site.
2. Renew one call dig permit.
3. ACF Supply delivers material for installation of erosion and sediment controls.
4. Site Specific Health and Safety Training, Lockheed Martin EHS Training, Tom and Jeremy Vernotzy.
5. Met with Jim Brendell (Baltimore County Soil Conservation District). Reviewed erosion and sediment control documents.
6. Hertz Equipment Rental delivers trac-hoe, bobcat, PC-200lc Komatsu excavator and gator.
7. Renew One Call dig notification (15243316-old ticket), new ticket # 15280549, expires May 28th.

Personnel On-Site

Name:	Company:
Jim Ferguson	Tetra Tech, Inc.
Josh Mullis	Tetra Tech, Inc.
Larry Macher	Elite Environmental
Ben King	Elite Environmental
Mike Munzert	ACF Supply, Inc.
Gary Norris	Elite Environmental
Tom Vernotzy	Elite Environmental
Jeremy Vernotzy	Elite Environmental
Jim Brendell	Baltimore Co. SCD
Ivanna Goldsberry	Tetra Tech, Inc.
Michael Martin	Tetra Tech Inc.

Health & Safety Topics or Issues

Completed site specific health and safety training with Elite Env. employees Jeremy and Tom Vernotzy. Also completed Lockheed-Martin Contractor Safety training. Reviewed equipment operation safety, emergency notification procedures, hand signals and general safe work practices.

QC Procedures/Inspections/Testing to be Performed Today

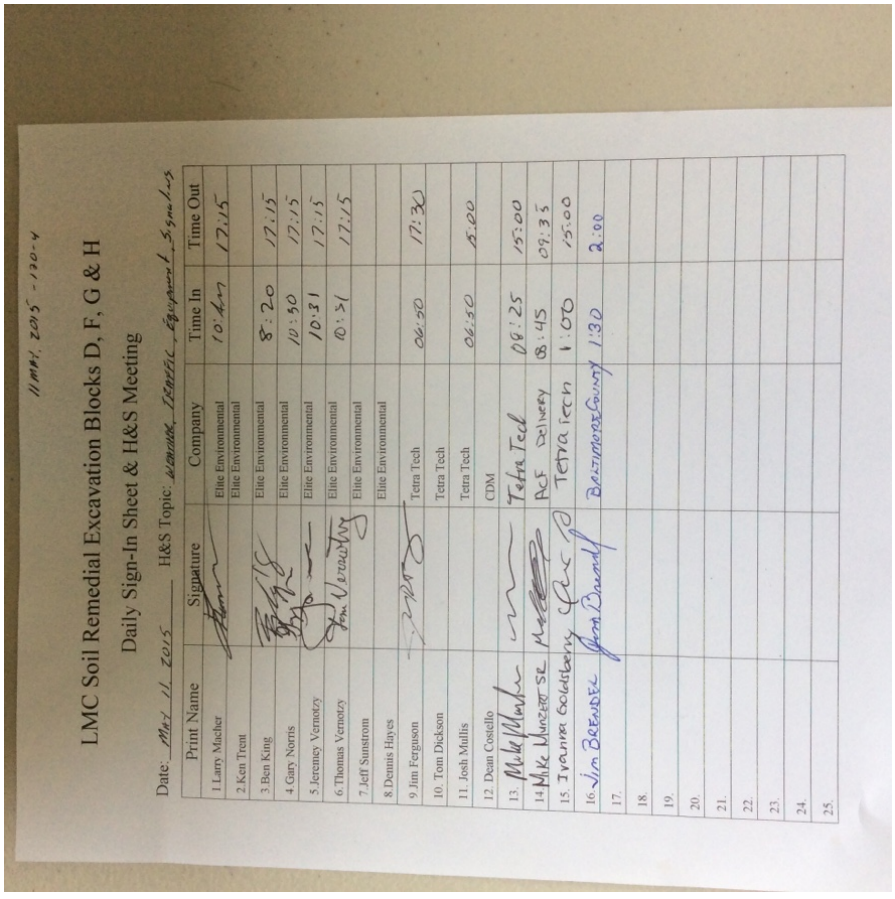
None.

Planned Week Schedule

1. Remobilize to site.
2. Meet with Baltimore County Soil Conservation District representative.
3. Begin installation of erosion and sediment controls in Block G and fencing in Bock H.
4. Saw cut Excavation areas A and B within Block H.
4. Pull back fencing along Cow Pen Creek to allow for installation of super silt fence near the UST Area.

Photos of Select Daily Activities

Comments: Bob-cat mini-excavator and ditch-witch attachment. Ditch-witch attachment will be utilized for installation of silt fencing.



Comments: Komatsu Ecavator and Bob-cat skid steer.

Photos of Select Daily Activities (continued)

Comments: Silt fence and super-silt fence materials delivered by ACF Supply.

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 12, 2015	Start Work at:	6:50 AM	Depart Site at:	

Weather Conditions

Temperature (°F):	70 to 80	Skies:	Partly Cloudy	Wind:	Light	Precipitation:	None

Weather Comments: Humid.

Summary of Work/Major Activities

1. Tailgate safety meeting, discussed heat related issues, equipment checks, ditch-witch operations /safety, hand dig when approaching utilities during silt fence installation, equipment safety zones / swing radii, and communications (visual and portable radios).
2. Silt fence installation (north to south) across Block G. (Ditch-witch, bobcat mini-excavator).
3. Clearing of heavier brush in Block G excavation areas H and I. (Komatsu Excavator)
4. Silt fence installation approaching Bock G excavation areas H and I was complicated by multiple layers of asphalt, Elite had to excavate approximately 1.5' to get through asphalt.
5. Cones were placed in Block H to channel traffic away from saw it locations.

Personnel On-Site

Name:	Company:
Jim Ferguson	Tetra Tech
Larry Macher	Elite Environmental
Gary Norris	Elite Environmental

Tom Vernotzy	Elite Environmental
Jeremy Vernotzy	Elite Environmental

Health & Safety Topics or Issues

Equipment swing radii, heat related issues, ditch-witch operation / safety, communications (hand signals and radios),

QC Procedures/Inspections/Testing to be Performed Today

Verify depth of trenching for silt fence installation

Planned Week Schedule

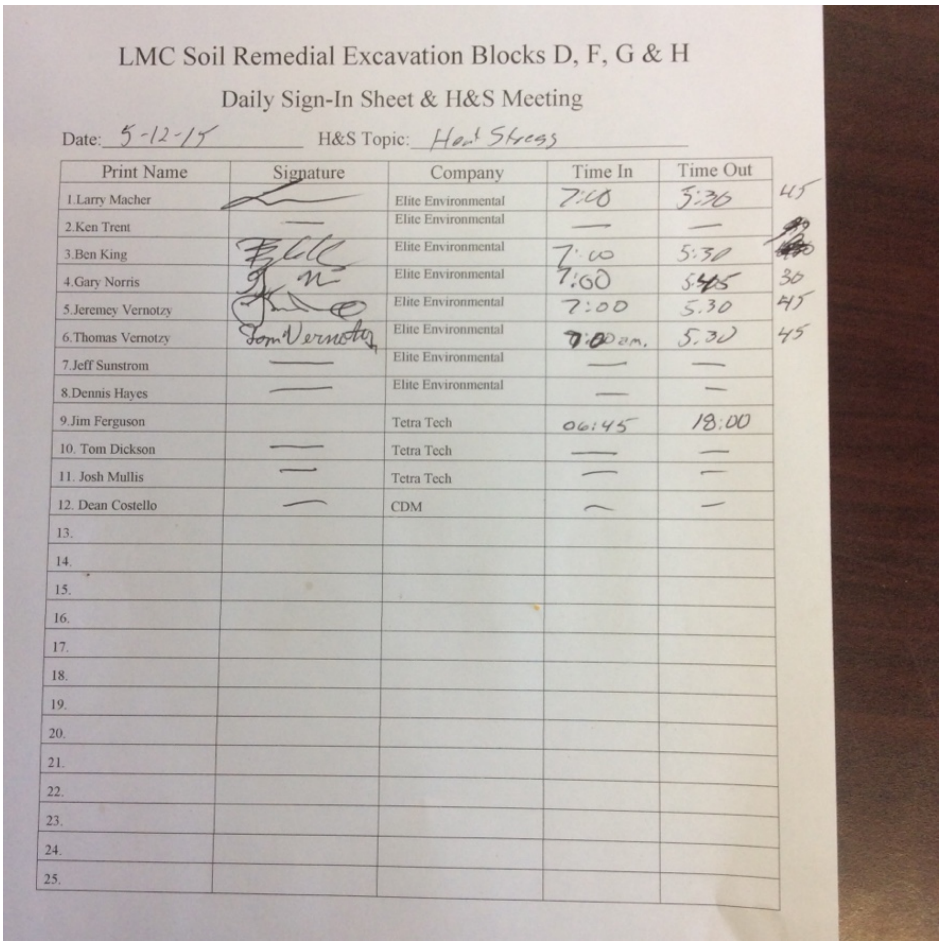
Install erosion and sediment controls in Block G.
Continue clearing of heavier brush in Block G excavation ares H and I.
Roll back fence along cow pen creek to allow for installation so super silt fence.

Photos of Select Daily Activities

Comments: Installation os silt fence across Block G. View looking south.

Comments: Silt fence installed in Block G (looking north), Block H in the background.

Photos of Select Daily Activities (continued)



Comments: Bob-cat skid steer with trenching (ditch-witch) attachment cutting surgical materials for silt fence installation.

Comments: Komatsu excavator clearing heavy brush in Block G UST area.

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 13, 2015	Start Work at:	6:22 AM	Depart Site at:	6:00 PM

Weather Conditions

Temperature (°F):	60 to 70	Skies:	Partly Cloudy	Wind:	Moderate	Precipitation:	None

Weather Comments: Overcast, breezy and cool.

Summary of Work/Major Activities

1. Tailgate safety meeting, discussed scope of work, traffic controls, emergency signaling, reviewed Site communications plan and equipment inspection documentation.
2. Erect fencing around Block H excavation areas A and B.
3. Hertz Equipment mechanic onsite to perform routine equipment maintenance checks and to install fire extinguishers on Bobcat mini-excavator and skid steer.
Mason Inc. on Site to move Con-Ex trailer to location behind office trailer in Block G.
4. Install public information signage adjacent to existing information circular boxes.
5. AV Burke LLC (surveyor) on Site to re-establish excavation corners in Block G areas where clearing and grubbing obscured previous markings. Additional tasks included layout of excavation areas in Blocks D and F so waste characterization sampling could be performed in addition to Utility clearance prior to mobilizing into those areas.
6. Complete silt fence installation in Block G and begin super silt fence installation in Block G.

Personnel On-Site

Health & Safety Topics or Issues

Traffic control, site communication plans, equipment inspection, emergency alert signals.

QC Procedures/Inspections/Testing to be Performed Today

1. Monitor silt fence and super silt fence installation as per Erosion and sediment control plan sheets C-15 and C-16.
2. Need to verify location of super silt diversion fence on the extreme east side of Block G. AV Burke Surveyor has LOD marked off LM property on North American Electrics property.
3. Need to clarify excavation procedures for Block G Area J since storm water drainage ditch transepts the southeast corner of the subject area.

Planned Week Schedule

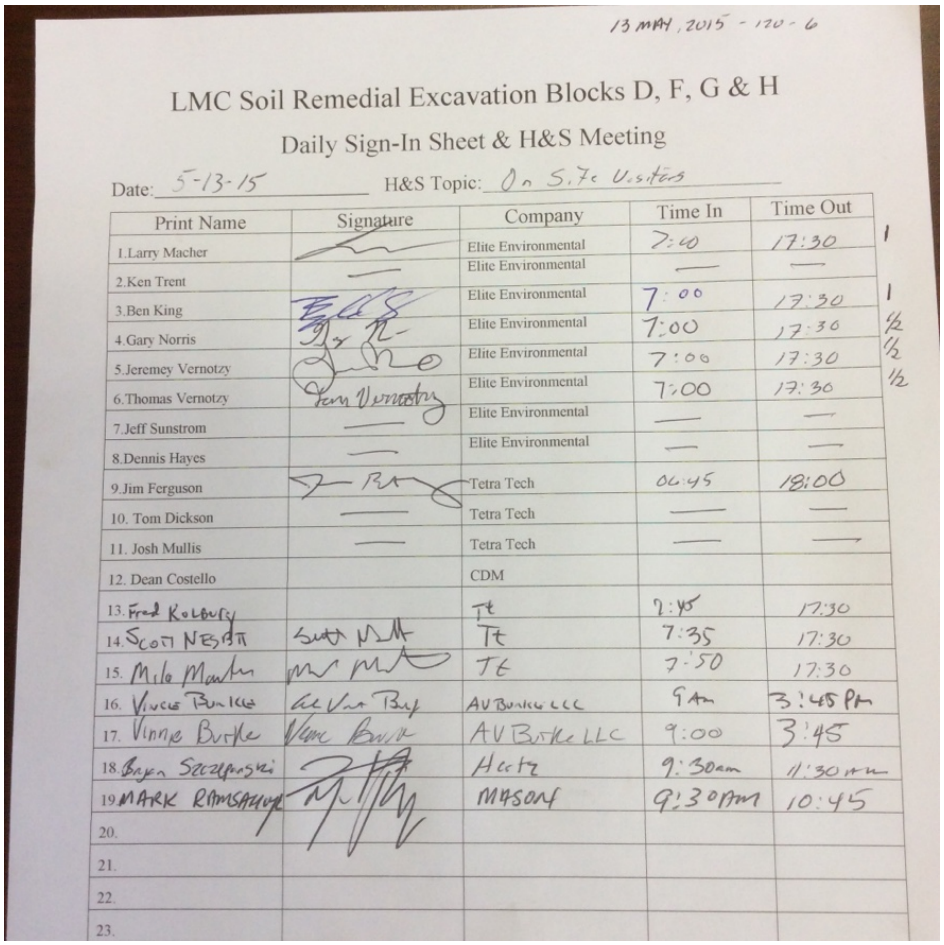
1. Install erosion and sediment controls in Block G.
2. Continue clearing brush in Block G, prep excavation areas H and I.
3. Roll back fence along Cow Pen Creek to allow installation of super silt fence.
4. Install temporary fencing in Block H around excavation areas A and B.
5. Surveyors locate excavation areas in Block F in preparation of utility location by Enviroscan also for waste characterization sampling.

Photos of Select Daily Activities

Comments: Temporary fencing installed in Block G Excavation Area B. Similar fencing installed around Block H excavation Area A.

Comments: Installation of super silt fence on east side of Block G excavation area H. Cow Pen Creek visible behind excavator.

Photos of Select Daily Activities (continued)



Comments: View looking south at Block G excavation area J. Storm water ditch transecting the eastern side of the excavation area.

Comments: View looking south at stakes delineating the location of the super silt diversion fence. Location of SSD fence crosses on to North American Electric property.

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 19, 2015	Start Work at:	7:00 AM	Depart Site at:	6:30 PM

Weather Conditions

Temperature (°F):	70 to 80	Skies:	Overcast	Wind:	None	Precipitation:	Light Rain

Weather Comments: Overcast, humid, intermittent rain showers.

Summary of Work/Major Activities

1. Meadows Paving crew on site to install Temporary Asphalt Berm (TAB).
2. Performed Lockheed Martin Contractors ESH briefing in addition to Site Specific Health and Safety Training for Meadows Asphalt Paving.
3. Meadows Paving installed TAB along north and west sides of Block G.
4. Complete installation of super silt diversion fence in Block G north of UST area.
5. Set up truck queue on west side of Block H.

Health & Safety Topics or Issues

1. Heat related issues, hydration and frequent breaks.
2. Equipment safety, spotters, hand signals, safe work distances and approaching strangers.
3. Use appropriate lifting techniques when moving steel fencing in place.
4. Use of appropriate PPE when installing fencing with an emphasis on hand protection.

QC Procedures/Inspections/Testing to be Performed Today

1. Inspection of super silt diversion fencing.
2. Inspection of TAB.

Planned Week Schedule

1. Installation of TAB.
2. Installation of super silt diversion fence in Block G.
3. Enviroscan to perform utility location in Block F.
4. Complete waste excavation, confirmation sampling, and backfill placement within Areas A and B of Block H.

Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 20, 2015	Start Work at:	6:30 AM	Depart Site at:	6:30 PM

Weather Conditions

Temperature (°F):	70 to 80	Skies:	Partly Cloudy	Wind:	Light	Precipitation:	None

Weather Comments: Partly cloudy, winds out of the north.

Summary of Work/Major Activities

1. Tailgate safety meeting, discussed soil load out logistics, safety precautions. Discussed spotters for truck load out, cleanup around excavations and traffic control.
2. Stopped by MRC security to provide security personnel with a courtesy notification about work to be done in Block H today.
3. Additional Elite crew will be finishing super silt diversion fence on east side of Block G in addition to construction entrance at Block G.
4. Bill Steinhart of Enviroscan on site in Block F to perform geophysical survey of excavation areas.
5. Completed loadout of 14 triaxial dump trucks in Block H. Ten trucks from excavation area A and four trucks at excavation area B.
6. Verification sampling completed for Block H Area A, partially complete for Block H Area B.
7. Air monitoring completed throughout the day.

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 21, 2015	Start Work at:	6:30 AM	Depart Site at:	5:00 PM

Weather Conditions

Temperature (°F):	50 to 60	Skies:	Overcast	Wind:	Moderate	Precipitation:	Light Rain

Weather Comments: Light to moderate rain from 10am through the rest of the day, some periods of heavy rain in afternoon

Summary of Work/Major Activities

1.Tailgate safety meeting, discussed soil load out logistics, safety precautions. Discussed spotters for truck load out, cleanup around excavations and traffic control. Proper PPE required when entering shallow excavations (if necessary), weather hazards due to rain.
2. Complete excavation and verification sampling of Block H Area B.
3. Three triaxial dump trucks loaded from Block H Area B excavation.
4. Block H Areas A and B excavation limits surveyed.
5. Equipment deliveries: front end loader, roller, and frac tank.
6. Use front end loader to move asphalt stockpiles from Block H Areas A and B to stockpile area inside Block G.
7. Surveyor marked excavation limits in Block D Panhandle.
8. Enviroscan completed geophysical survey of Block D and D Panhandle.
9. Air monitoring completed in Block H Area B during excavation.
10. Baltimore County inspector completed E&S inspection of Block G controls.
11. Begin to backfill Area B with crusher run 6 fill material, to be completed 5/22.
12. Place plastic liners in Areas A and B due to rain, will backfill on Friday due to rain/wet conditions interfering with compaction.

Dean Costello	CDM Smith

Health & Safety Topics or Issues

1. Vehicle loadout procedures. Safety protocols for truck drivers. Spotters for trac hoe operator, trucks, and overhead utility line in Block H excavation Area B.
2. Weather hazards due to light to moderate rainfall (slips, trips, and falls), possibility for lightning (not forecasted).
3. PPE requirements involving entering shallow excavations if necessary, tyvek booties must be worn.

QC Procedures/Inspections/Testing to be Performed Today

1. Baltimore County E&S Inspection of Block G controls, inspector notes minor issues involving revegetation of areas outside the super silt diversion fence in Block G disturbed during installation, those areas will be reseeded. The inspector will reinspect on Wednesday, May 27th.
2. DUSTTRAK air monitoring stations placed around Block H Area B.
3. Verification sidewall and base sampling of Block H Area B.

Planned Week Schedule

1. Installation of TAB (completed 5/20).
2. Installation of super silt diversion fence in Block G (completed 5/20).
3. Enviroscan to perform utility clearance for excavation areas in Block F (completed 5/20), Block D and Block D Panhandle (completed 5/21).
4. Complete waste excavation (Area A completed 5/20, Area B completed 5/21).
5. Complete confirmation sampling (Area A completed 5/20, Area B completed 5/21).
6. Finish soil load out in Block H (completed 5/21).
7. Survey Block H Areas A and B (completed 5/21).
8. Complete backfill placement within Areas A and B of Block H.
8. Stage asphalt from Block H in Block G.
9. Baltimore County E&S inspection scheduled for 13:00 on 5/21 in Block G (completed 5/21).
10. Surveyors mark excavation limits in Block D and D Panhandle (completed 5/21).

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 22, 2015	Start Work at:	7:00 AM	Depart Site at:	6:00 PM

Weather Conditions

Temperature (°F):	60 to 70	Skies:	Clear	Wind:	Moderate	Precipitation:	None

Weather Comments:

Summary of Work/Major Activities

1.Tailgate safety meeting, discussed backfill material dumping logistics, safety precautions. Discussed spotters for truck dumping, cleanup around excavations and traffic control. Proper PPE required when entering shallow excavations, wear rubber booties due to wet soil and potential slip hazards, 3 points of contact. Stay hydrated and wear sun block.
2. Complete relocating asphalt from Block H Area A to stockpile location in Block G.
3. Remove and roll up plastic liners placed in Areas A and B due to rain.
4. Pump out water (~200 gal) from Block H Area B and transfer to frac tank staged in Block G.
5. Delivery of smaller roller machine used to compact backfilled areas.
6. Four trucks of CR-2 dumped (Two each to Area A and Area B in Block H).
7. Ten trucks of CR-6 dumped (Nine to Area A and One to Area B in Block H).
8. Backfill Areas A and B in Block H with bottom layer of CR-2, then fabric, then CR-6 to grade. Area A requires 20 tons CR-6 to complete (to be completed 5/26). Area B completed 5/22.

Health & Safety Topics or Issues

1. Vehicle dumping procedures. Safety protocols for truck drivers. Spotters for trac hoe operator, trucks, and overhead utility line in Block H excavation Area B.
2. Weather: warmer temperatures forecasted, stay hydrated and wear sun block.
3. PPE requirements involving entering shallow excavations if necessary, tyvek booties must be worn.
4. Slip, trip, fall hazards resulting from rainfall yesterday, always have three points of contact and never walk backwards, rubber booties must be worn when soil is muddy.
5. General site cleanliness, keep work area clean, place PPE in designated areas away from possible cross contamination.

QC Procedures/Inspections/Testing to be Performed Today

1. DUSTTRAK Air Monitoring stations set up for operational controls, only backfilling activities conducted.

Planned Week Schedule

1. Installation of TAB (completed 5/20).
2. Installation of super silt diversion fence in Block G (completed 5/20).
3. Enviroscan to perform utility clearance for excavation areas in Block F (completed 5/20), Block D and Block D Panhandle (completed 5/21).
4. Complete waste excavation (Area A completed 5/20, Area B completed 5/21).
5. Complete confirmation sampling (Area A completed 5/20, Area B completed 5/21).
6. Finish soil load out in Block H (completed 5/21).
7. Survey Block H Areas A and B (completed 5/21).
8. Complete backfill placement within Areas A and B of Block H (Area A to be completed week of 5/26, Area B completed 5/22).
8. Stage asphalt from Block H in Block G (completed 5/22).
9. Baltimore County E&S inspection scheduled for 13:00 on 5/21 in Block G (completed 5/21).
10. Surveyors mark excavation limits in Block D and D Panhandle (completed 5/21).

Planned Activities for week of 5/26
1. Minor fixes to E&S controls in Block G (revegetation of area around SSDF).
2. Completion of backfill placement in Block H Area A.
3. Installation of silt fence in Block F.
4. Baltimore County inspection of E&S in Block G scheduled for 1100 on 5/27.
5. Begin excavation in Block G (tentative start date Thursday 5/28).

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 27, 2015	Start Work at:	7:00 AM	Depart Site at:	5:40 PM

Weather Conditions

Temperature (°F):	70 to 80	Skies:	Few Clouds	Wind:	Moderate	Precipitation:	Other (explain)

Weather Comments: Heavy rain start @1630, last 30 mins, no lightning.

Summary of Work/Major Activities

1. Tailgate safety meeting, discussed safety hazards resulting from silt fence installation including pinch points, lifting heavy objects, operator and on the ground personnel safety. Fire extinguisher refresher information and possible thunderstorms in the afternoon also covered.
2. Continue to install super silt fence (SSF) and super silt diversion fence (SSDF) in Block F.
3. Minor brush clearing required for SSF installation in southwest corner of Block F.
4. Complete compaction testing in Block H Areas A and B.
5. Baltimore County E&S inspection by Jim Brendel, minor fixes that were addressed have been approved, work may start in Block G.
6. Air monitoring completed in Block F during silt fence installation activities.

Personnel On-Site

Laura Burbage	CDM Smith

Health & Safety Topics or Issues

1. Slips, trips, and falls related to materials/objects on the ground (fence posts, shallow trench) on ground.
2. Fire extinguisher refresher (how to use, how to classify).
3. Pinch points involved with metal fencing and stapling geotextile.
4. Operator safety in heavy machinery and on the ground safety when in heavy machinery (use spotters, blind spots).
5. Be proactive and vigilant on the safety front.
6. Weather: warmer temperatures, possible thunderstorms in the afternoon, stay hydrated and wear sun block.

QC Procedures/Inspections/Testing to be Performed Today

1. DUSTTRAK Air Monitoring stations set up in Block F during super silt fence installation.
2. Compaction testing of backfill completed and passed in Block H Areas A and B.
3. Approval from Baltimore County E&S Inspector Jim Brendell to start work in Block G.

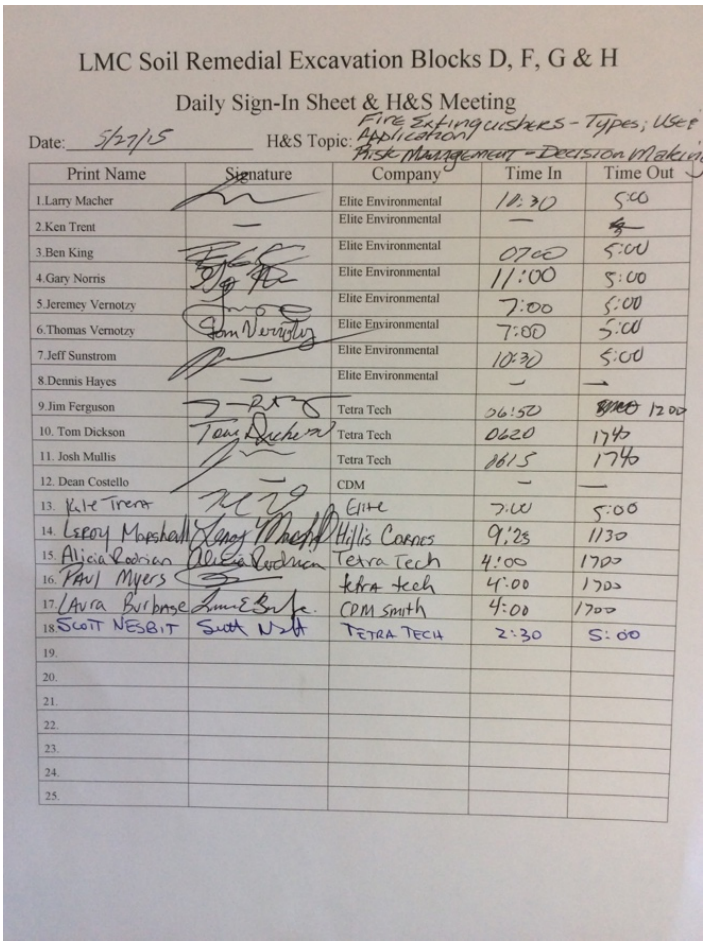
Planned Week Schedule

1. Install construction entrance in Block G (completed 5/26).
2. Minor fixes to E&S controls in Block G (revegetation of area around SSDF, completed 5/26).
3. Completion of backfill in Block H Area A (completed 5/26), followed by compaction testing in Block H Areas A and B (completed 5/27).
4. Installation of silt fence in Block F.
5. Baltimore County inspection of E&S controls in Block G scheduled for 1100 on 5/27 (completed and approved 5/27).
6. Begin excavation in Block G (tentative start date Monday 6/1).
7. Asphalt restoration in Block H Areas A and B.
8. Waste characterization sampling in Block F, D, and D Panhandle (scheduled for 5/29).

Photos of Select Daily Activities

Comments: Compaction testing performed in Block H Area B.

Comments: Super silt diversion fence installed in Block F.



Photos of Select Daily Activities (continued)

Comments: Minor vegetation clearing required to install super silt fence in Block F.

DAILY CONSTRUCTION REPORT
Middle River Complex
Soil Remediation Blocks D, D Panhandle, F, G, and H

Duration of Site Activities

Date:	May 28, 2015	Start Work at:	7:00 AM	Depart Site at:	5:00 PM

Weather Conditions

Temperature (°F):	80 to 90	Skies:	Few Clouds	Wind:	Light	Precipitation:	None

Weather Comments: Thunderstorms begin @1530.

Summary of Work/Major Activities

1. Tailgate safety meeting, discussed safety hazards resulting from silt fence installation including pinch points, lifting heavy objects, operator and on the ground personnel safety. Possibility for heat stress due to high temps.
2. Continue to install super silt fence (SSF) and super silt diversion fence (SSDF) in Block F.
3. Install modified rock outfall in western corner of Block F super silt fence.
4. Air monitoring completed in Block F during silt fence installation.
5. Ground wire uncovered 8" below surface in southwestern corner of Block F during silt fence installation trenching. Wire is inactive and from previous structures, Lockheed approved cutting wire and moving on with trenching.
6. Stop work @ 1530 due to thunderstorms.

Personnel On-Site

Name:		Company:	

Health & Safety Topics or Issues

1. Slips, trips, and falls related to materials/objects on the ground (fence posts, shallow trench) on ground.
2. Pinch points involved with metal fencing and stapling geotextile.
3. Operator safety in heavy machinery and on the ground safety when in heavy machinery (use spotters, blind spots).
4. Be proactive and vigilant on the safety front.
5. Weather: warmer temperatures, possible thunderstorms in the evening, stay hydrated and wear sun block.

QC Procedures/Inspections/Testing to be Performed Today

1. DUSTTRAK Air Monitoring stations set up in Block F during super silt fence installation.

Planned Week Schedule

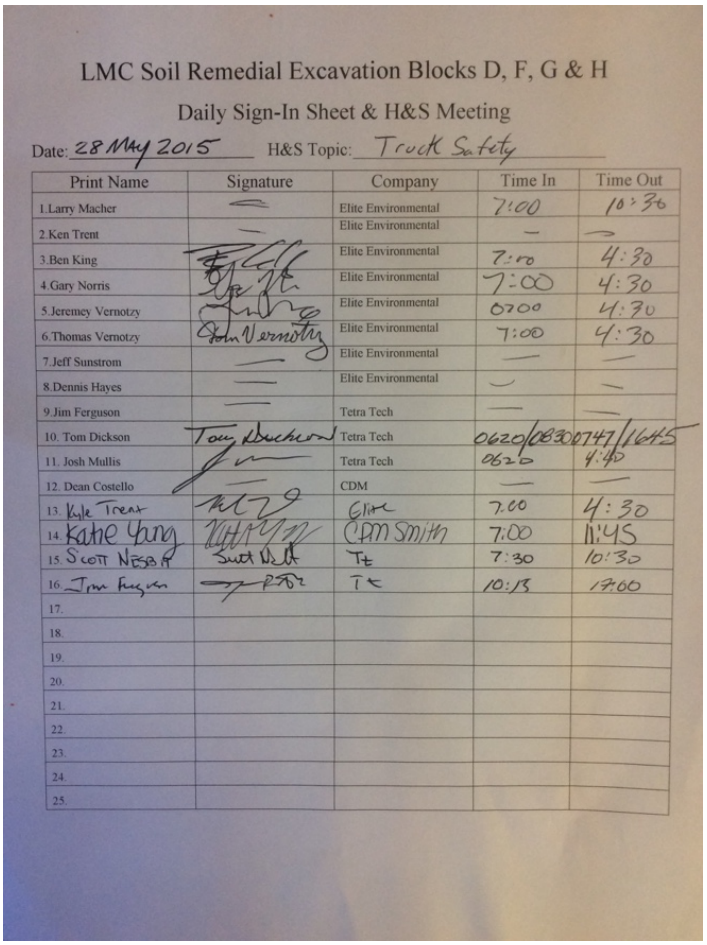
1. Install construction entrance in Block G (completed 5/26).
2. Minor fixes to E&S controls in Block G (revegetation of area around SSDF, completed 5/26).
3. Completion of backfill in Block H Area A (completed 5/26), followed by compaction testing in Block H Areas A and B (completed 5/27).
4. Installation of silt fence in Block F.
5. Baltimore County inspection of E&S controls in Block G scheduled for 1100 on 5/27 (completed and approved 5/27).
6. Begin excavation in Block G (tentative start date Monday 6/1).
7. Asphalt restoration in Block H Areas A and B.
8. Waste characterization sampling in Block F, D, and D Panhandle (scheduled for 5/29).

Photos of Select Daily Activities

Comments: Ground wire uncovered in southwestern corner of Block F during super silt fence installation. Wiring is no longer active and was therefore cut and removed from the trench after Lockheed approval.

Comments: Modified rock outfall installed in the western area of Block F.

Photos of Select Daily Activities (continued)



Comments: Super silt fence installation in the western portion of Block F.

Comments: Caution tape identifying a possible fall hazard (hole) in Block F.

Health & Safety Topics or Issues

1. Discussed performance of routine daily operations in the current rainy weather conditions and hazards that result due to decreased visibility, slips, trips and falls related to muddy or wet ground conditions.

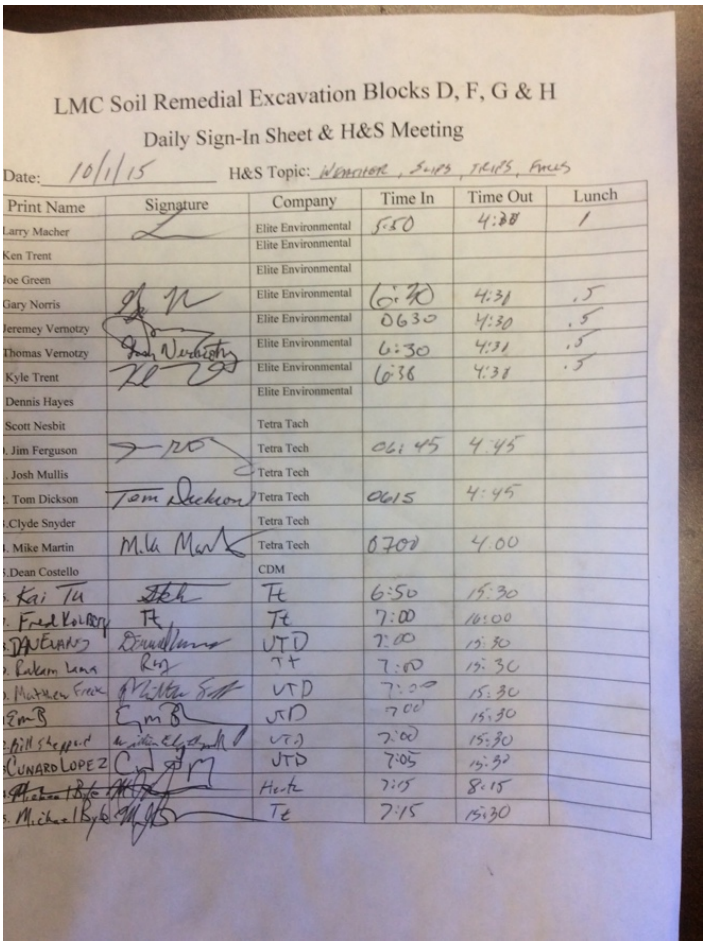
QC Procedures/Inspections/Testing to be Performed Today

1. Monitor reinforcement of erosion and sediment controls.
2. Monitor concrete and asphalt loadout in Block G.

Planned Week Schedule

1. Backfill and compact Block D Panhandle Areas A and B (9/28-9/29).
2. Strip asphalt from Block D Panhandle (9/29).
3. Test pits for Block D storm water conveyance repairs (to be completed 10/7-10/8).
4. Complete Block D Area F-1 tie back repair (9/29, ongoing).
5. Remove rubble and storm water conveyance structure behind Block D Panhandle bulkhead (to be completed 10/7-10/8).
6. Install turbidity curtain in Block D Panhandle (9/28).
7. Complete density testing in Block D Panhandle Areas A and B (to be completed week of 10/5).
8. Baltimore County erosion and sediment control inspection (9/30).
9. Load-out 3 trucks of asphalt from Block D Panhandle (9/30).
10. Load-out 3 trucks of concrete rubble from Block F (9/30).
11. Load-out 11 trucks of concrete rubble from Block G (10/1).
12. Load-out 3 trucks of asphalt from Block G (asphalt derived from Block H Areas A and B (10/1)).

Photos of Select Daily Activities



Comments: 1. Block G asphalt load-out (asphalt source was Block H areas A and B). Asphalt is being delivered to Flannigans for recycling.

Comments: 2. Block D Panhandle pre-storm surface water runoff early in day 10/1.

RE: **MDRCC01CX**

Dear Mr. Thomas Blackman:

Please find enclosed documentation of coverage under the 2014 General Permit for Stormwater Associated with Construction Activity (MDRC) for:

MRC Blocks D,F,G, and H Soil Remediation

issued to

Lockheed Martin Corporation

Please note that the effective date of coverage under the General Permit is the date on the attached cover sheet. If the current erosion and sediment control plan approval covers only part of the entire site covered by this permit, be advised that this permit does not authorize discharges from the other portions of the site until the appropriate erosion and sediment control approval authority approves the erosion and sediment control plan for those portions. The permit also requires that the site have an approved stormwater management plan (unless exempt or waived by the stormwater approval authority) prior to earth disturbance. Part IV.C.3 of the permit requires the permittee to use the standard written report form as provided by MDE. The form is available on MDE's website at the following location both as a fillable Microsoft Word form and as an Adobe Acrobat file.

http://go.usa.gov/gFMW

Print this letter and the cover sheet and keep them with your permit file. In addition, download the 2014 General Permit from the above website, print it for your permit file, and refer to it to ensure compliance with its terms. Submit any modifications to this coverage, Transfers of Authorization, or Notices of Termination via the ePermits portal. If your contact information changes, update it through the ePermits portal.

Your cooperation in this matter is appreciated. If you have any questions, please call the administrative team for the General Permit at (410) 537-3019.

Sincerely,

Heather L. Nelson

GENERAL PERMIT FOR STORMWATER ASSOCIATED WITH CONSTRUCTION ACTIVITY

State Discharge Permit Number:	**Effective Date:** 5/6/2015
MDRCC01CX	**Expiration Date:** 12/31/2019
	NOTE: If site work is complete per Part II. I. prior to the expiration date, the permittee must submit a Notice of Termination and terminate the permit.

Pursuant to the provisions of Title 9 of the Environment Article, Annotated Code of Maryland, and regulations promulgated thereunder, and the provisions of the Clean Water Act, 33 U.S.C., Section 1251 et. seq., and implementing regulations 40 CFR Parts 122, 123, 124 and 125, the Department of the Environment hereby establishes conditions and requirements pertinent to stormwater associated with construction activity at the site described below and authorizes:

Lockheed Martin Corporation
6801 Rockledge Drive
MP:CCT-246
Bethesda, Maryland 20817

TO DISCHARGE STORMWATER FROM:

MRC Blocks D,F,G, and H Soil Remediation
construction project on
2.15 acres
at property located at
Tax Blocks D, F, G, and H within Lockheed Martin Corporation's Middle River Complex (MRC)
2323 Eastern Boulevard, Middle River, Maryland 21220

If the current erosion and sediment control plan approval covers only part of the entire site covered by this permit, this permit does not authorize discharges from the other portions of the site until the appropriate erosion and sediment control approval authority approves the erosion and sediment control plan for those portions.

TO:
Surface waters -- Cow Pen Creek and Dark Head Cove

which is
Waters protected for Support of Estuarine and Marine Aquatic Life and Shellfish Harvesting

in accordance with the 2014 General Permit. The vicinity map submitted with the Notice of Intent is considered incorporated herein and made a part hereof.

Ms. Beth Cole
Maryland Historical Trust
Maryland Department of Planning
100 Community Place
Crownsville, MD 21032

Dear Ms. Cole:

This letter is to request Maryland Historical Trust (MHT) project review for the Lockheed Martin soil remediation project in Blocks D, E, F, G and H at the Middle River property located in Baltimore County, Maryland (see attached Figures 1 and 2). The purpose of the soil remediation in Blocks D, E, F, G and H is to reduce the levels of contaminants of concern (COCs) in existing soils to meet standards under Maryland Department of the Environment's (MDE's) Controlled Hazardous Substances Program.

Activities proposed for the soil remediation work include excavation and removal of approximately 3,884 cubic yards (cy) of overlying soil in Block D (including 579 cy in the panhandle portion of Block D), 9,837 cy in Block E, 912 cy in Block F, 1,645 cy in Block G, and 332 cy in Block H (see Figure 3). The soil remediation work will also include removal of existing impervious pavement/concrete in Block E and the panhandle portion of Block D. Volume estimates of soil to be excavated in each block are currently preliminary and may be revised. Excavated soil and pavement/concrete will be loaded in trucks on-site and taken to an appropriate disposal facility or will be recycled.

Middle River

Additional activities proposed for the soil remediation work will include the removal of the floor drains in the Block E basement foundation, and the removal and relocation of the storm drain system in Block E. The new storm drain system will be designed based on the final grading plan selected for the site.

All excavated areas, including areas of pavement/concrete, will be replaced with in-kind clean fill material and topsoil and revegetated, Excavated areas in Blocks D, F, G, and H will be graded back to original contours; however, Block E is expected to be graded to drain with a minimum 2% grade.

Other areas of ground disturbance will include truck traffic and staging areas, as well as E&S control locations. These areas will be graded back to original contours.

TETRA TECH

Standard best management practices will be employed during all work at the site, including seeding all exposed areas with a standard seed mix, restoring wetland areas as appropriate, following an approved erosion and sediment control plan, and obtaining a Construction General Permit for construction stormwater runoff.

Expected federal and state permits include a United States Army Corps of Engineers (USACE) Section 404 Maryland State Programmatic General Permit for minor work in wetlands, an Erosion/Sediment Control Approval from the Baltimore County Soil Conservation District, a site Grading Permit from Baltimore County Department of Environmental Protection and Sustainability, and a General Permit for Construction Activity (Stormwater) from MDE.

Included with this request is the MHT Project Review Form. I appreciate your input on this matter and if you have any questions or need additional information please contact me at (301) 528-3022.

Sincerely,

Michael Martin, PG
Regional Manager

RE: Environmental Review for Lockhead Martin property, jct. of Eastern Blvd and Wilson Point Rd., Middle River, soil remediation project, Blocks D, E, F, G, and H, Baltimore County, MD.

Dear Mr. Martin:

The Wildlife and Heritage Service has determined that there are no State or Federal records for rare, threatened or endangered species within the boundaries of the project site as delineated. As a result, we have no specific comments or requirements pertaining to protection measures at this time. This statement should not be interpreted however as meaning that rare, threatened or endangered species are not in fact present. If appropriate habitat is available, certain species could be present without documentation because adequate surveys have not been conducted.

Thank you for allowing us the opportunity to review this project. If you should have any further questions regarding this information, please contact me at (410) 260-8573.

Sincerely,

Lori A. Byrne

Germantown, MD 20874-7114

RE: LOCKHEED MARTIN MIDDLE RIVER COMPLEX
Soil Remediation In Blocks D, F, G & H
Stormwater Management Variance
Middle River Watershed
EPS Project I.D. M140086
EPS Tracking Number: 07-14-1848

Dear Mr. Myers:

This office has reviewed the information submitted and finds that a stormwater management variance can be granted for this project under Section 33-4-113 (a) (2) of Title 4 of the Baltimore County Code. This section of the regulations allows a stormwater management variance to be granted if there are exceptional circumstances such that strict adherence to the provisions of this article would result in unreasonable hardship or practical difficulty and not fulfill the intent of the regulations. The proposed project is for the removal of contaminated soil and replacing it with clean soil. The existing grades will be reestablished once the contaminated soil is removed. There will be a reduction in impervious area as a result of this project. Since there will be a slight reduction in impervious area and water quality will be improved by the removal of contaminated soil, a stormwater management variance can be granted for this project.

Please contact Ed Schmaus of my staff at 410-887-3768 should you have any questions.

Very truly yours,

Thomas L. Vidmar, P.E., Deputy Director
Department of Environmental Protection
& Sustainability

RE: Geophysical Survey
Utility/Structure Clearance for Soil Remediation Excavations
Middle River Complex
Blocks G and H
Middle River, MD
Enviroscan Reference Number 031548

Dear Mr. Apanavage:

Pursuant to your request for a proposal on April 2, 2015, Enviroscan, Inc. has conducted a multi-technique geophysical survey at the above-referenced site. The fieldwork was performed on April 15 and 16, 2015. The purpose of the survey was to perform utility clearance at client-designated proposed soil remediation excavations.

Methods

The utility survey was completed using standard and/or routinely accepted practices of the geophysical industry and equipment representing the best available technology, including:

- a Radiodetection RD8000 Multi-Frequency pipe and cable tracer;
- a Radiodetection C.A.T. and Genny pipe and cable locator/tracer;
- a Fisher TW-6 electromagnetic (EM) pipe and cable locator/tracer;
- a GSSI SIR-4000 ground penetrating radar (GPR) system.

The principles of these techniques are detailed below.

RD8000

Utility tracing was conducted using a Radiodetection RD8000 digital cable and pipe tracer. The transmitter can be directly coupled to exposed portions of a metallic pipe, cable, or wire or indirectly (inductively) to a subsurface metallic utility of known location/orientation. The transmitter remains stationary and energizes the metallic utility at a frequency selected by the operator (512 Hz, 8 kHz, 33 kHz, or 65 kHz), which is received at the ground surface by the digital locator. When the transmitter is directly coupled to the metallic utility, the digital receiver can also calculate the depth of the utility to an accuracy of ±10% of the actual depth of the utility. Please note the close proximity to bends in the traced line or poor signal strength can result in erroneous depth estimations.

C.A.T. and Genny

The survey areas were also scanned with a Radiodetection C.A.T. and Genny pipe and cable locator and tracer. In Power mode, the C.A.T. detects the 50 to 60 Hertz (Hz) electromagnetic field generated by live power cables and other metallic utilities to which a live line is grounded. In Radio mode, the C.A.T. detects buried conductors (cables or metallic pipes) as they conduct and re-transmit commercial broadcast radio energy. In Genny mode, the C.A.T. detects signal generated by the Genny transmitter. The Genny transmitter can be coupled directly (conductively) to exposed portions of a metallic pipe, cable, or wire or inductively to a subsurface metallic utility with known location and orientation.

TW-6

In order to detect unknown utilities, Enviroscan employed a Fisher TW-6 pipe and cable locator and tracer. In pipe and cable search mode, the TW-6 is essentially a deep-sensing metal detector that detects any highly electrically conductive materials (e.g. metals) by creating an electromagnetic field with a transmitting coil. A receiving coil at a fixed separation from the transmitter measures the field strength. As the instrument is swept along the ground surface, subsurface metallic bodies distort the transmitted field. The change in field strength/orientation is sensed by the receiver, setting off an audible alarm and/or causing deflection of an analog meter. The TW-6 can nominally detect a 2-inch metal pipe to a depth of 8 feet and a 10-inch metal pipe to a depth of 14 feet.

In pipe and cable tracing mode, the TW-6 transmitter can be coupled directly (conductively) to exposed portions of a metallic pipe, cable, or wire or inductively to a subsurface metallic utility with known location and orientation. The transmitter remains stationary and energizes or excites the metallic utility to be traced with an 81.92-kilohertz signal that can be traced at the ground surface using the mobile TW-6 receiver wand or probe.

GPR

GPR systems produce cross-sectional images of subsurface features and layers by continuously emitting pulses of radar-frequency energy from a scanning antenna as it is towed along a survey profile. The radar pulses are reflected by interfaces between materials with differing dielectric properties. The reflections return to the antenna and are displayed on a video monitor as a continuous cross section in real time. Since the electrical properties of metal are distinctly different from soil and backfill materials, metallic pipes and other structures commonly produce dramatic and characteristic reflections. Fiberglass, plastic, concrete, and terra-cotta pipes and structures also produce recognizable, but less dramatic reflections. Scanning was performed using a GSSI SIR-4000 GPR controller with an internal hard drive and a color display, and both a high-frequency, high-resolution 400 megaHertz (MHz) antenna or transducer, and a lower frequency deep-penetrating 200 MHz transducer.

Results Summary

The utility clearance survey results are depicted in Figures 1 through 3. The mapped utilities located during the survey are overlain on a base map of the site. The outlines of the proposed excavations appear as yellow polygons. Several utilities were found and marked in the field to pass through or near the proposed excavations.

The Results for H Block are depicted in Figure 1. Please note that the northern proposed excavation is near (and partially includes) a conductive soil anomaly detected in the EM-31 results from a survey performed for Tetra Tech in 2005. The southern proposed excavation is within an area of high conductivity soil. Neither area shows any metallic interference, indicating that the high conductivity is not from buried metal. Additionally, both proposed excavations are near a suspected metallic pipe or line, also delineated with the 2005 EM-31 data. This line was not detected during the field survey.

On Figure 2, the northern section of the G Block survey area is shown. Several GPR radargrams are depicted in the upper right hand corner of the map. These radargrams represent an anomaly found coincident with the southern proposed excavation in this figure. The radargrams are labeled A-A', B-B', and C-C'. Three magenta lines with similar labels are depicted on the map showing the locations of the radargrams. The radargrams show a highly disturbed area containing many radar reflective targets, suggesting buried debris. Scanning with the TW-6 metal detector found no metal in this area, indicating that the GPR anomaly is non-metallic.

Figure 3 depicts the southern section of G Block. Many of the proposed excavations in this figure have unknown utilities running near or through their boundaries. Examination of historic EM data for these excavations showed nothing of note.

Limitations

The above-referenced geophysical survey was completed using standard and/or routinely accepted practices of the geophysical industry and equipment representing the best available technology. Enviroscan does not accept responsibility for survey limitations due to inherent technological limitations or unforeseen site-specific conditions. However, we make every effort to identify and notify the client of such limitations or conditions. In particular, please note the following specific limitations and recommendations:

- Enviroscan's field markings should be considered accurate to within approximately +/-18 inches for single lines. In contrast, since electromagnetic tracing of duct banks provides only a centerline, the bank itself may extend for 2 to 3 feet beyond the marked trace.

- The completion of this survey does not relieve any party of applicable legal obligations to notify the appropriate One-Call center prior to digging or drilling.

As always, we appreciate this opportunity to have worked with you. If you have any questions, please do not hesitate to contact me.

Sincerely,
Enviroscan, Inc.

Section 1
Introduction

This dust control and air monitoring and sampling plan describes the monitoring procedures that will be used during soil excavation and remediation activities to control airborne and air-driven dusts. Airborne dusts can be generated during the following excavation and remediation activities:

- Excavation of contaminated soil within identified tax blocks –Potential dust generation is anticipated to be low to moderate, and easily controlled via water misting.

- Loading and unloading of transportation vehicles – Potential dust generation is anticipated to be low to moderate, and can occur during transfer of excavated material from the excavator or loader into the transportation vehicle, or during restoration when trucks dump backfill material on-site. Loading at a higher vantage point increases mechanical agitation, thereby increasing potential dust generation. Dust generation is expected to decrease as more material is loaded into the vehicle and drop distance decreases. Dust generated during loading activities can be easily controlled by misting soil with water, and by soil transit.

- Degradation of haul roads or construction entrance resulting from heavy traffic use – Potential dust generation is anticipated to be moderate to high. As the road surface pulverizes it becomes more easily airborne. However, travel distances are minimal, and generated dust can be easily controlled via water misting.

- Tracking soils from tax blocks onto improved and unimproved roadways – Potential for dust generation is anticipated to be low. To minimize this potential, trucks will be examined prior to leaving the Tax block for residual soils (mud on the tires). In these cases, the trucks will be routed through the adjacent decontamination unit for pressure washing wheels, tires, and undercarriage before exiting onto in-plant and public thoroughfares.

Airborne dusts may also result from high winds. In addition, any eroded soil or sediment resulting from rainfall can also dry out and become airborne if agitated. The implementation of the Erosion and Sediment Control Plan (Tetra Tech, March 2015) is designed to prevent this from occurring.

In general, dust generation can be controlled by misting dry soil and road surfaces, by keeping soil stockpiles covered and/or vegetated (based on anticipated storage time) and by managing soil excavation, dumping and grading operations.

Section 2
Dust Suppression Methods

Dust generation is mitigated by applying water to knock down or pre-saturate media, thereby preventing particulates from becoming airborne during mechanical action. Substances that draw or retain water (e.g., calcium chloride) can be added to the water to extend the suppression period. Calcium chloride can also be applied to road or other exposed soil surfaces directly, either as a solid or as a 30% solution. Dust generation can be minimized as follows:

- Water trucks with spray nozzles and hose attachments will be used to mist surfaces used by vehicles; a hose can be used for spot treatment and where necessary during loading and unloading operations.

- Separate portable tanks and systems can be placed at the decontamination pad, at the wheel wash and stabilized construction entrance.

- Power brooms can be used to collect and remove soil and sediment from improved surfaces and from paved travel routes. These devices are equipped with water tanks to minimize dust generation during sweeping/collection.

- Correct placement of the stabilized construction entrance and decontamination pad in relationship to public roadways can help limit construction dust to the work area. Vehicles will be decontaminated by washing to remove stuck on soil and sediment. The stabilized construction entrance will shake off material on wheels and tires, and provide a final soil collection point within the tax block (in the contamination reduction zone).

- Housekeeping – Prompt cleanup of soil spilled during loading/transport helps prevent spread and cross contamination both within, and the spread of contamination outside of the tax block.

- Soil staging areas/soil stockpiles – Excavated soil will be staged in piles and covered to prevent erosion including dust spread by overland transport of soil by runoff. Backfill soil can be stockpiled and vegetated to minimize erosion until it is needed.

2.1 DUST SUPPRESSION ON IMPROVED ROAD SURFACES

As stated in previous text, efforts to reduce dust on improved road surfaces will be made through:

- Vigilant inspections of vehicles leaving the construction sites
- Diligent employment of the decontamination process to remove visual soils from trucks/trailers and
- Through proper construction and maintenance of engineered temporary control measures including stabilized construction entrances and erosion and sediment control traps to control migration of soils from trucks to these areas.

Normal travel areas such as paved on-facility roads and improved surfaces (e.g., parking lots) will be visually monitored to ensure soil and sediment are not tracked onto these surfaces. If it is, the following actions will take place:

1. Load outs and deliveries will be temporarily suspended until source is identified and cleaned.
2. The frequency of housekeeping measures will be increased to minimize and, if possible, eliminate reoccurrence. The frequency of wheel washing before leaving the tax block will also be increased if necessary, as will the frequency of wet sweeping paved on-facility roads and parking lots.
3. Power broom affected areas will be wet to remove residual accumulation. If necessary, a combination of the water truck and power broom can be used.

2.2 DUST SUPPRESSION ON AGGREGATE BASED HAUL ROADS

The degradation of on-site haul roads can be one of the largest contributors to airborne dusts during remediation activities. Quarried limestone will be used to stabilize the construction entrance, and as a construction aggregate for driving surfaces. Dust generation if it occurs would be expected to be higher at turnaround points, sharp turns, and changes in elevation, where the surface is worn due to repeated traffic patterns that pulverize surface materials. As traffic moves over the surface, particulates are reduced in size and can become airborne more easily. To combat these effects, the following dust control measures will be used on haul roads:

- As the surface becomes more worn and pulverized, dust will become more of an issue. The water truck will be used more frequently to control dust emissions as the road degrades. Note that over-watering can cause slurry conditions that will result in tracking the material onto roadways, and therefore must be prevented. It should be noted that with the length of the planned haul roads within the tax blocks and the sizes of the stone to be used in the stabilized construction entrances, the slurrying aspect is considered negligible but recognized.

- To further control fugitive dust production on unpaved haul roads, solid calcium chloride or a calcium chloride solution (in water) can be applied. Calcium chloride attracts and retains moisture and helps keep the road surface slightly damp, thus reducing dust production. A 30% calcium chloride solution can also be applied. Calcium chloride binds with lime due to its chemical composition; the magnesium within the limestone/dolomite forms a crust that helps to retain fines and minimize dust generation and erosion.

- Areas of more vulnerable to severe pulverization may be resurfaced with additional aggregate and watered and re-compacted more frequently to maintain the surface.

Haul roads and impervious areas are used to provide a travel surface, but also provide separation from the underlying contaminated soil in the exclusion zone. Therefore, the following controls must be diligently applied

- Good housekeeping - Personnel must diligently clean up contaminated soil spills on pervious and impervious surfaces to avoid potential cross-contamination through construction vehicles tracking the materials into unaffected areas.

- Decontamination - Trucks/Trailers will be routed through the decontamination pad so that wheels and tires can be pressure-washed before exiting over the stabilized construction entrance as an additional control measure to prevent contaminated and uncontaminated construction materials from leaving the exclusion and/or contamination reduction zone.

- Visual inspection – Only trucks/trailers visually inspected and approved as clean will be released from the site.

Public or private roadways within the facility will be visually monitored for the presence of tracked construction materials (limestone residue; surface soil, etc.), and will be addressed according to procedures outlined in Section 2.1, which would be to wet broom any indication of limestone residue from the affected roadways. The plan view drawing for each tax block indicates wheel wash locations, vehicle exit points, and excavation limits. These are provided in Appendix A.

2.3 CRYSTALLINE SILICA

To assess the potential for exposure to crystalline silica (quartz), bulk samples will be collected to evaluate percentage composition to determine if silica is present in greater than 1% composition. In addition, respirable air samples will be collected to determine if airborne concentrations of crystalline silica within airborne dusts also are present in concentrations greater than 0.05mg/m^3. Dolomitic limestone will be used as a construction aggregate in construction entrances and as a wear surface for haul roads and is a potential source for crystalline silica. Table 2-1, LaFarge Material Safety Data Sheet excerpt contains a list of dolomitic limestone geochemical constituents and associated percent concentrations.

Additionally, the soils to be excavated may also contain crystalline silica and will serve as a potential source contributor.

2.4 DUST DETECTION USING REAL-TIME DETECTION (RTD) MONITORING EQUIPMENT

Dust control efforts for larger particles (greater than 7.0 microns [µm] in concentrations greater than 3.0 milligrams per cubic meter [mg/m^3] air) will be assessed visually, but dust outside the visible spectrum (less than 7.0 µm in size and less than 3.0 mg/m^3 in concentration) will be assessed via real time detection (RTD) monitoring instrumentation that measures airborne concentrations of respirable particulates.

Respirable fractions can pass deeper into the lungs and can pose a potential local (acute) and systemic (chronic) hazard and affect human health.

Respirable particulates may be expelled during exhalation; trapped within the mucus and expelled through the mucociliary tract, or become lodged in the lungs. Because respirable dusts due to their size cannot be seen by the naked eye, visual observations cannot be used for its control. Frequent water application during any dust generating activities, and/or in response to traffic density, will be used as a precautionary control measure. However, RTD readings must be used to assess the effectiveness of (respirable) dust control. The RTD monitor will be linked via telemetry to transmit alerts or texts when action levels are being approached, so that controls can be instituted before action levels are exceeded.

Permissible Exposure Limits (PELs)/Time Weighted Averages (TWAs)

Through an evaluation of previous soil media sampling results of the materials to be excavated, mathematical evaluations were conducted to determine potential airborne concentrations (worst case scenario) based on source concentrations of various identified contaminants. These values were compared to PELs/TWAs to determine if an exceedance of these limits were theoretically possible. The following information are the PELs/TWAs for the contaminants of concern:

- Crystalline silica [American Conference of Industrial Hygienists (ACGIH) — 0.025 mg/m^3 (used to screen the limestone used for haul roads [up to 20% may be comprised of crystalline silica – quartz] and soil components) from a selected representative excavation.

- Polycyclic aromatic hydrocarbons (PAHs) — 0.2 mg/m^3 as coal tar pitch volatiles — used to screen the excavated soil components from selected representative tax blocks.

- Metals (arsenic and hexavalent chromium) (0.01 mg/m^3 and 0.005mg/m^3, respectively) were reported in very low concentrations within bulk samples collected on the surface. Mathematical calculations indicate there are insufficient source concentrations to present an inhalation exposure concern. However, as these materials are a solid, they will be captured in the RTD result.

RTD Action Levels

The following action levels will be used for all PAHs laden soils (including BaPEq) (as determined by the evaluation of soil concentrations) and percent silica:

Tax Block D:—5 mg/m^3 - Based on the highest reported concentration (22,517µg/kg) of Benzo(a)pyrene Equivalent (BaPEq); dust concentrations would have to exceed over 2,000 mg/m^3 to represent an exposure concern to this specific BaPEq compound. Of this Total dust value, the respirable dust faction will represent only a small fraction. Therefore this action level is considered very conservative.

Tax Block D-Panhandle:—5 mg/m^3 - Based on the highest reported concentration (6,008 µg/kg) of Benzo(a)pyrene Equivalent (BaPEq); hexavalent chromium 1.2 µg/kg. Airborne dust concentrations would have to be well in excess of 600,000 mg/m^3 to exceed the mixture PEL/TWA for these compounds. Of this Total dust value, the respirable dust faction will represent only a small fraction. Therefore this action level is considered very conservative.

Tax Block F:—5 mg/m^3 - Based on the highest reported concentration (38,098µg/kg) of Benzo(a)Pyrene Equivalent (BaPEq), dust concentrations would have to exceed 1,315 mg/m^3 in order to represent an exposure concern to exceed the PEL/TWA for this compound. Of this Total dust value, the respirable dust faction will represent only a small fraction. Therefore this action level is considered very conservative.

Tax Block G:—5 mg/m^3 - Based on the highest reported concentration (24,698µg/kg) of Benzo(a)pyrene Equivalent (BaPEq), dust concentrations would have to exceed 1315 mg/m^3 in order to represent an exposure concern to exceed the PEL/TWA for this compound. Note: One sample G-TP-D-N with a reported concentration of 230,000µg/kg, would require airborne dust levels to exceed 217 mg/m^3 in order to present an exposure concern to this compound. Of this Total dust value, the respirable dust faction will represent only a small fraction. Therefore this action level is considered very conservative.

Tax Block H:—5 mg/m^3 Based on the highest reported concentration (460,008µg/kg) of Benzo(a)Pyrene Equivalent (BaPEq), dust concentrations would have to exceed 1,087 mg/m^3 in order to represent an exposure concern to exceed the PEL/TWA for this compound. Of this Total dust value, the respirable dust faction will represent only a small fraction. Therefore this action level is considered very conservative.

Given the reported soil concentrations and excavation dimensions, it is unlikely that exceedances greater than a chemical-specific time-weighted average - threshold limit values (TWA-TLVs) or permissible exposure limits (PELs) will be observed In addition, these action levels represent 50% of the concentration associated with overexposure, making the action levels even more conservative and protective of human health. These action levels also provide protection from total and respirable dust particulates not otherwise classified.

Table 2-1

LaFarge Materials Safety Data Sheet Excerpt,
Chemical Composition – Limestone and Dolomite
Lockheed Martin, Middle River Complex

Component	Percent (By Weight)	CAS Number	OSHA PEL -TWA (mg/m^3)	ACGIH TLV-TWA (mg/m^3)	LD_{50}	LC_{50}
Calcium Carbonate*	50-100	1317-65-3	15 (T), 5 (R)	10 (T)	NA	NA
Magnesium Carbonate*	0-50	546-93-0	15 (T), 5 (R)	3 (R); 10 (T)	NA	NA
Crystalline Silica (as Quartz)	0-15	14808-60-7	[(10) / (%SiO_2+2)] (R); [(30) / (%SiO_2+2)] (T)	0.025 (R)	NA	NA
Particulate Not Otherwise Regulated	-	NA	5 (R) 15 (T)	3 (R); 10 (T)	NA	NA

Note: Exposure limits for components noted with an * contain no asbestos and <1% crystalline silica

The following table describes the mineral composition of Limestone and Dolomite.

Rock Type	Rock	Mineral	Mineral Formula	Mineral Composition
Sedimentary Rocks	Limestone	Calcite and Aragonite	$CaCO_3$	Calcium Carbonate
		Clay Minerals	(Mg, Al) Si_3O_{12}	Magnesium Aluminum Silicate
		Chert or Diatomite	SiO_2	Silicon Dioxide
	Dolomite (Dolostone)	Dolomite	$CaMg(CO_3)_2$	Calcium Magnesium Carbonate
		Clay Minerals	(Mg, Al) Si_3O_{12}	Magnesium Aluminum Silicate
		Chert or Diatomite	SiO_2	Silicon Dioxide
Crystalline silica content: Sedimentary types 1-20%; Quartz 100%.

Section 3
Real Time Detection (RTD) Monitoring Instrumentation

Area and personal real-time detection (RTD) monitoring instrumentation will be used during remediation activities for at-risk populations, including ground personnel and equipment operators, to assess whether working in the excavation areas are potentially being overexposed to dust generated from contaminated soil. Perimeter air monitoring will be conducted to determine if dust control measures are performing as desired, or if dust concentrations greater than acceptable limits are putting others at risk. Perimeter monitoring will use RTD monitoring instrumentation at multiple locations (one location upwind, and two to three downwind) at identified cardinal points. Area monitors will be placed at or near the fence lines and/or associated tax block demarcations. Final placement will be determined in the field based on existing (real time) environmental conditions.

3.1 SELECTED INSTRUMENTATION

The Dust Trak II, Aerosol Monitor PM 2.5 8530 Desk Top Model will be used to monitor airborne dusts/particulates. This instrument comes with an environmental enclosure and tripod unit that permits the air intake to be set at varying vertical elevations. The environmental enclosure is equipped with a wireless modem to permit real time notification and alerts.

The SidePak AM510 Personal Aerosol Monitor is a personal monitor that can be worn on a belt with the air intake positioned within the breathing zone of high risk personnel. High-risk personnel are those based on their assigned tasks would place them in areas where dust exposure would have the potential to be the greatest. These persons would include ground support personnel employed to direct and oversee truck loading, survey personnel and equipment operators. Specification sheets for RTD air monitoring instrumentation are in Appendix B.

3.2 RTD POSITIONING

Monitoring instrumentation for RTD will be spatially positioned to detect, measure, and display dust concentrations from the one upwind and 2-3 selected downwind positions on the perimeter of each tax block, based on wind direction and variability in wind direction. Variations in placement are possible based on actual field conditions.

Each tax block will be marked for 15 cardinal positions (north, north-northeast, east-northeast, east, east-southeast, etc.). The final distance or placement of the instrument from the source will be determined in the field, based on wind direction (along with site orientation), wind speed, and visual observations. If visible dust appears to be carrying over established stations, monitors may be moved.

3.3 FREQUENCY OF MONITORING

Air monitoring will be performed within each tax block to measure airborne dust concentrations at the perimeter of the work area, and for personnel occupying potential high exposure risk locations (selected ground personnel and equipment operators) in addition to assessing the efficacy of the dust control measures.

- **Base Monitoring Frequency** - Air monitoring using RTDs will be conducted daily to monitor generation of dust and potential off site migration. RTDs will be positioned and monitored continuously during activities that could potentially generate airborne dusts.

- If predetermined action levels as specified in section 2.4 are approached, the frequency of dust-control measures will be increased, as will monitoring intensity, to reduce airborne dust levels and to quantify success.

- The highest concentrations of polycyclic aromatic hydrocarbons (PAHs/BaPEq) in soil were in Block F. Therefore, additional air sampling will be conducted in this tax block during remediation activities.

- The frequency of the dust monitoring may be reduced if sufficient data establish contaminant concentrations below action levels.

- Monitoring for airborne dusts/particulates will not be conducted during rain events, because rain washes dust and particulates from the air. Monitoring during heavy rains may also damage instrumentation.

3.4 METEOROLOGICAL DATA

Meteorological data will be gathered from a portable meteorological station positioned at each tax block during remediation activity. Additional meteorological data will also be obtained from a station at the Martin State Airport. Wind socks will be placed at two locations at each tax block during remediation activities as these provide visual indication of wind direction and speed. Meteorological data for each work day will be downloaded and maintained as part of the project record.

3.5 RECORDKEEPING

All particulate monitors will be set to record data (data logging) as it is collected during potential dust generating activities as defined in Section 1. Data will be downloaded periodically to avoid overwriting any data collected during instrument operation. The placement of the instruments (based on meteorological data), distances from potential dust and particulate sources, and any information that may affect the outcome of the data or derived results will also be recorded either electronically or written within a logbook.

This page intentionally left blank.

Section 4
Air Sampling

Air sampling (the collection of analytical air samples for PAHs and crystalline silica) will be conducted to:

- Assess personal exposure of those persons working within high exposure risk job classifications including ground support personnel and equipment operators.
- Gather information to support the validity of air monitoring results obtained through the use of RTDs.
- Obtain data to support the efficacy of dust control measures employed.

Air sampling will not be conducted at each tax block. It will however be conducted at:

- The start of the project in an effort to correlate real-time detection (RTD) instrumentation data with collected sample data.
- Air samples will also be collected at Tax Block F, as it has the highest reported polycyclic aromatic hydrocarbon (PAH) concentrations in soil.
- Air samples shall be collected to quantify dust generation during those activities as defined in Section 1.

The SSHO will determine when and where additional air samples shall be collected based on derived field data and field observations.

4.1 POLYCYCLIC AROMATIC HYDROCARBONS (PAHS)

PAHs, including BaPEq, represent the most abundant contaminant within the soils for all of the tax blocks. Air sampling for PAHs (including BaPEq) will be conducted using:

- **NIOSH Manual of Analytical Methods (NMAM) Number 5506** – uses a 37 millimeter (mm), 2-micron (µm) polytetrafluoroethylene (PTFE, i.e., Teflon®) filter + washed XAD sorbent tube (100 milligram [mg] front section; 50 mg back section); during collection, the XAD tube is placed in a tube holder to protect against ultraviolet (UV) light and temperature degradation.

- **Sample flow rate:** two liters per minute for a preferred eight-hour time frame. Shorter sample runs may be collected provided minimum volume is obtained.
- **Pump calibration** - with a representative media in line.
    - volume (minimum): 200 liters
    - volume (maximum): 1000 liters
- **Shipment:** transfer filters to culture tubes; wrap sorbent and culture tubes in aluminum foil; ship at 0 degrees Centigrade (C).
- **Sample stability**: protect from heat and UV light.

The NIOSH methodology used for PAH sampling is in Appendix C.

4.2 CRYSTALLINE SILICA

We have determined that silica is contaminant that best represents the potential exposure scenario for total dust or respirable dust particulates, not otherwise classified. The NIOSH methodology used for silica sampling is in Appendix C. Air sampling for crystalline silica will be conducted using:

- **NIOSH Method 7500:** silica is present in excavated or backfilled soil band can be liberated from degrading dolomitic limestone placed on haul roads.
- **Sampler:** cyclone + filter (10-mm nylon cyclone, Higgins-Dewell cyclone, or aluminum cyclone + 5-µm polyvinyl chloride membrane)
- **Flow rate:** nylon cyclone: 1.7 L/min; HD cyclone: 2.2 L/min; aluminum cyclone: 2.5 L/min
    - Volume (minimum): 400 liters
    - Volume (maximum): 1000 liters
- **Shipment:** routine
- **Sample stability:** stable

4.3 QUALITY ASSURANCE/QUALITY CONTROL

The site safety and health officer (SSHO) or the industrial hygiene (IH) technician will conduct quality assurance/quality control (QA/QC) by ensuring that proper sampling, collection, and chemical analysis procedures were followed. QA/QC procedures assess the precision, accuracy, representativeness, and comparability of monitoring results.

4.4 SAMPLE NUMBERING AND MANAGEMENT

The SSHO or the IH technician will record all air samples on chain-of-custody (COC) forms. Each COC form will include:

- the identification numbers of the samples collected on a given day
- time(s) (on- and off-duration) of collection
- estimated flow rate
- total volume of air collected
- names of the samplers
- any pertinent information regarding the sampling event that may affect sampling results

The COC form will identify the requested chemical analyses, and the record of the release and custody to document sample possession. The SSHO, IH technician, or appropriate designee is responsible for the care and custody of the samples collected until they are delivered to the analytical laboratory or entrusted to a carrier. Transfer of custody to another party is formally documented on the COC form. Sample logs or other records will be signed and dated according to protocol. Containers used to ship samples will be sealed according to United States Environmental Protection Agency (USEPA) requirements to maintain sample integrity, and the shipments will be accompanied by the COC record identifying the contents. The COC may be carbon copy or electronic, providing the necessary information is provided. One copy of the COC record will accompany the shipment, and the SSHO or the IH Technician will retain another copy of each COC. A sample of the COC custody form is in Appendix D.

4.4.1 Nomenclature for Ambient Air Samples

Perimeter air samples will be collected at up to four of 15 cardinal positions (north, north-northeast, northeast, east-northeast, east, east-southeast, etc.). Sample nomenclature used to identify air samples will be identified by the facility (Middle River Complex [MRC]), followed by the tax block, followed by the media type (AS for air sample) and its sequential number, followed by the sample category (perimeter, operator, or ground support), the analytical code (PAH-low volume [PAHL] or crystalline silica [CSLO]), followed by the sampling date. For

example, sample MRC-BLDA-S01-PER-PAHL-022615 represents the first air sample collected at Block D along the perimeter, for PAHs-low volume on February 26, 2015.

4.4.2 Quality Control (QC) Sample Numbering

The QC code will consist of a three- to four-segment alpha-numeric code that identifies the sample QC type, the date the sample was collected, and the number of this type of QC sample collected on that date. QC types are identified as field duplicate (FD) or method blanks (MB), and the valid matrix code is air sample (AS). The sampling time recorded for duplicate samples on the COC form and labels will be "0000" so that the samples are "blind" to the laboratory. Notes detailing the duplicate sample number, time, date, and type will be recorded on the sample log sheet and in the field log book to document its location. The time on blind samples will always be recorded as "0000" on the COC. Sample log sheets are not provided to the laboratory.

4.4.2.1 Field Duplicates

Field duplicates are collected to check the laboratory accuracy under identical conditions. Duplicate samples will be collected side by side with the original. Duplicate nomenclature will consist of QC type (FB or MB), followed by sample type (AS), followed by analytical code (PAH-L or CSLO), followed by the date, followed by a sequential number. For example, sample FD-AS-PAHL-021615-001 indicates a field duplicate for an air sample analyzed for PAHs and collected on February 16, 2015, with a sequential number (001) assigned by the SSHO and/or the IH technician. Field duplicates will be collected for each analysis at Blocks D, D-Panhandle, F, G, and H at a frequency of one QC sample per ten analytical air samples.

4.5 RECORDKEEPING

4.5.1 Air Sample Log Sheets

Each sample will be recorded on a sample log sheet or multi-sample log sheet. These forms are used to document daily air sampling activities and other pertinent on-site information that may impact the collection of samples. Examples of log sheets are in Appendix D.

4.5.2 Calibration Record

Calibration of the air sampling pumps will be recorded on the "Air Sample/Multi-Air Sample Log Sheet" provided in Appendix D.

4.6 DATA MANAGEMENT

Data management procedures used in this dust control and air monitoring/sampling plan are designed to ensure that all sampling and analytical data are collected, stored, and maintained in an efficient and secure environment, so the data quality meets the plan objectives. The efficiency of the data management process will be maximized by using standardized data collection and review procedures.

4.7 DATA QUALITY REVIEW

Data quality review will be conducted on all ambient samples to determine whether analytical laboratory data collected are of acceptable quality for use in decision-making. This review begins with data validation, which is a comparison of data quality indicators (DQIs) to prescribed acceptance criteria. The DQIs are measures used to assess the completeness, sensitivity, accuracy, precision, comparability, and representativeness of the sample collection and sample analysis process. The output of this review is a set of alphabetic flags such as "U" – not detected, "J" - estimated, "R" - rejected, or combinations thereof that may apply to individual results based on its validation. These flags infer the general quality of the data.

4.7.1 Certified Industrial Hygienist (CIH) Review

All data collected during air sampling efforts will be submitted to a CIH, who will approve or identify discrepancies within sample collection, analytical screening, and/or laboratory reporting. Data analyzed will include air sample log sheets, COC forms, calibration records, calculations of air volumes, and laboratory-provided information.

Table 4-1

Sample Summary Table
Lockheed Martin Middle River Complex

GENERAL NOTES:

1. GRID COORDINATES REFERENCE MARYLAND STATE PLANE COORDINATE SYSTEM, NORTH AMERICAN DATUM OF 1983 (MDSPCS NAD83). ELEVATIONS REFERENCE NORTH AMERICAN VERTICAL DATUM, 1988 (NAVD88).
2. UNLESS OTHERWISE NOTED, GROUND SURFACE TOPOGRAPHY OBTAINED FROM DRAWING NO. 22042C01 TITLED "SITE PLAN, CHESAPEAKE PARK, LMC PROPERTIES, INC." (REV C DATED 10/02/02) PREPARED BY TAI CONSULTING ENGINEERS, OWINGS MILLS, MARYLAND AND NOTED THEREON AS BEING OBTAINED FROM FIELD RUN SURVEY CONDUCTED BY DMW, INC. DURING JUNE 1999 FLOATED TO STATE GRID. GROUND SURFACE TOPOGRAPHY BETWEEN COW PEN CREEK AND CHESAPEAKE PARK PLAZA AND DELINEATED WETLAND LIMITS SURVEYED BY TETRA TECH, NEWARK, DELAWARE DURING NOVEMBER AND DECEMBER 2009.
3. ADDITIONAL HORIZONTAL INFORMATION OBTAINED FROM TAI DRAWING NOTED ABOVE AND NOTED THEREON AS BEING OBTAINED FROM BALTIMORE COUNTY OFFICE OF INFORMATION TECHNOLOGY GIS SERVICES UNIT WITH MARCH 1995 DATE OF CAPTURE.
4. EXISTING UTILITIES OBTAINED FROM TAI DRAWING NOTED ABOVE AND NOTED THEREON AS BEING OBTAINED FROM DMW FIELD RUN SURVEY AND LOCKHEED MARTIN PROPERTIES, INC. DRAWING TITLED "EXHIBIT #6 EXISTING UTILITIES PLAN."
5. BOUNDARY LINES OBTAINED FROM TAI DRAWING NOTED ABOVE AND NOTED THEREON AS BEING OBTAINED FROM RECORDED PLAT E.H.K., JR. 51 FOLIO 43 "1ST AMENDED CHESAPEAKE PARK RE-SUBDIVISION" PREPARED BY MARYLAND SURVEYING AND ENGINEERING CO., INC. 4/24/84 WITH BOUNDARY ORIENTED TO BALTIMORE COUNTY METROPOLITAN DISTRICT GRID, BUT SHOULD NOT BE CONSIDERED A BOUNDARY SURVEY.
6. 1% ANNUAL CHANCE FLOOD (100-YEAR FLOOD) ELEVATION IS 8.5-FT NAVD88 BASED ON "FLOOD INSURANCE STUDY, BALTIMORE COUNTY, MARYLAND (UNINCORPORATED AREAS)" FLOOD INSURANCE STUDY NUMBER 240010V000C [FEMA, SEPTEMBER 2009 (PRELIMINARY)].
7. CHESAPEAKE BAY CRITICAL AREA BOUNDARY OBTAINED FROM MARYLAND DEPARTMENT OF NATURAL RESOURCES WEBSITE. AREAS WITHIN THE CHESAPEAKE BAY CRITICAL AREA ARE INTENSELY DEVELOPED AREA (IDA) CATEGORY.
8. TWO FOOT CONTOUR INTERVAL FOR GROUND SURFACE TOPOGRAPHY UNLESS OTHERWISE NOTED.
9. FIGURED DIMENSIONS TAKE PRECEDENCE OVER SCALED DIMENSIONS. CHECK GRAPHIC SCALE BEFORE SCALING DRAWING.
10. UNDERGROUND UTILITY LOCATIONS SHOWN ARE APPROXIMATE. VERIFICATION OF UTILITY LOCATIONS MUST BE MADE PRIOR TO WORK ON-SITE. NOTIFY MISS UTILITY OF MARYLAND (1-800-257-7777; www.missutility.net) AT LEAST 48 HOURS, BUT NOT MORE THAN 10 WORKING DAYS, PRIOR TO THE DAY EXCAVATION WILL COMMENCE. MISS UTILITY OF MARYLAND IS NOT EXPECTED TO HAVE COMPLETE RECORD OF UTILITIES FOR THE MIDDLE RIVER COMPLEX. IN ADDITION TO NOTIFYING MISS UTILITY OF MARYLAND, VERIFY UTILITY LOCATIONS PRIOR TO BEGINNING ANY WORK USING A MINIMUM OF TWO PASSIVE METHODS (E.G., ELECTROMAGNETIC INDUCTION, GROUND PENETRATING RADAR, MAGNETIC LOCATORS, ACOUSTIC SURVEY, ETC.).
11. INSPECT INDIVIDUAL AREAS PRIOR TO CONSTRUCTION TO VERIFY EXISTING SITE CONDITIONS.
12. PROVIDE HORIZONTAL AND VERTICAL CONTROL FOR CONSTRUCTION.
13. STAKE THE LOCATION OF REMOVAL AND DISTURBED AREAS PRIOR TO ACTUAL WORK.
14. THE SOLE LOCATION FOR INGRESS AND EGRESS TO INDIVIDUAL AREAS SHALL BE VIA CONSTRUCTION ENTRANCE(S) WHICH SHALL BE CONSTRUCTED ACCORDING TO THE APPROVED EROSION AND SEDIMENT CONTROL PLAN. PROVIDE INGRESS/EGRESS CONTROL INTO INDIVIDUAL AREAS AS PART OF AREA-SPECIFIC MOBILIZATION ACTIVITIES.
15. PROVIDE PROTECTION FOR EXISTING UTILITIES TO REMAIN IN SERVICE.
16. LIMIT WORK TO INDIVIDUAL AREAS WITHIN THE APPROVED LIMITS OF DISTURBANCE.
17. MAINTAIN WORK AREAS FREE FROM DUST AND ODORS.
18. PROPERTY LINE INFORMATION TAKEN FROM RECORDED PLAT E.H.K., JR 51 FOLIO 43 "1ST AMENDED CHESAPEAKE PARK RE-SUBDIVISION" PREPARED BY MARYLAND SURVEYING AND ENGINEERING CO. INC. 4/24/84. PROPERTY LINES HAVE BEEN ORIENTED TO THE BALTIMORE COUNTY METROPOLITAN DISTRICT GRID. SHOULD NOT BE CONSIDERED A BOUNDARY SURVEY.
19. IN ACCORDANCE WITH THE CODE OF MARYLAND REGULATIONS 26.17.04.11 (5) ALL IN-STREAM CONSTRUCTION IN DARK HEAD COVE WHICH MAY ADVERSELY AFFECT ANADROMOUS FISH SPAWNING AREAS, SHALL BE PROHIBITED FROM MARCH 15 THROUGH JUNE 15.

TRAFFIC AND STOCKPILE NOTES:

ALL CONSTRUCTION TRAFFIC SHALL ENTER AND EXIT VIA A STABILIZED CONSTRUCTION ENTRANCE. CONTRACTOR SHALL REMOVE OR IMPORT DIRT AS REQUIRED. ANY STOCKPILE AREA CREATED FOR THIS MATERIAL SHALL BE MANAGED BY A SEDIMENT CONTROL DEVICE AT ALL TIMES.
TEMPORARY STOCKPILES SHALL BE:

1. LOCATED WITHIN THE LIMIT OF DISTURBANCE (LOD).
2. DRAIN TO A FUNCTIONING SEDIMENT CONTROL DEVICE.
3. POSITIONED TO NOT IMPEDE UPON, OR IMPAIR THE FUNCTION OF SAID DEVICE.
4. POSITIONED TO NOT ALTER DRAINAGE DIVIDES.

GENERAL GRADING NOTES AND CERTIFICATIONS:

1. THE PROPOSED GRADING SHOWN ON THIS PLAN MEETS THE REQUIREMENTS SET FORTH BY BALTIMORE COUNTY DEPARTMENT OF ENVIRONMENTAL PROTECTION AND SUSTAINABILITY AND COMPLIES WITH ARTICLE 33, TITLE 5 OF THE BALTIMORE COUNTY CODE. HOWEVER, DUE TO BUILDING TYPES AND LAYOUT, SOME FIELD ADJUSTMENTS MAY BE REQUIRED. ALL CHANGES MUST COMPLY WITH THE ABOVE MENTIONED REQUIREMENTS.
2. ALL SWALES HAVE BEEN DESIGNED BY THE ENGINEER TO CONVEY RUNOFF ACCORDING TO BALTIMORE COUNTY DEPARTMENT OF PUBLIC WORKS DESIGN STANDARDS.
3. THERE SHALL BE NO CLEARING, GRADING, CONSTRUCTION OR DISTURBANCE OF VEGETATION IN THE FOREST BUFFER EASEMENT OR OTHER FOREST RETENTION AREAS, EXCEPT AS PERMITTED BY THE BALTIMORE COUNTY DEPARTMENT OF ENVIRONMENTAL PROTECTION AND SUSTAINABILITY.
4. STORMWATER MANAGEMENT HAS BEEN ADDRESSED BY A STORMWATER MANAGEMENT VARIANCE.

BALTIMORE COUNTY SPECIFIC EROSION AND SEDIMENT CONTROL PLAN GENERAL NOTES:

1. REFER TO "2011 MARYLAND STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL" FOR STANDARD DETAILS AND DETAILED SPECIFICATIONS OF EACH PRACTICE SPECIFIED HEREIN.
2. WITH THE APPROVAL OF THE SEDIMENT CONTROL INSPECTOR, MINOR FIELD ADJUSTMENTS CAN AND WILL BE MADE TO INSURE THE CONTROL OF ANY SEDIMENT. CHANGES IN SEDIMENT CONTROL PRACTICES, REQUIRE PRIOR APPROVAL OF THE SEDIMENT CONTROL INSPECTOR AND THE BALTIMORE COUNTY SOIL CONSERVATION DISTRICT.
3. AT THE END OF EACH WORKING DAY, ALL SEDIMENT CONTROL PRACTICES WILL BE INSPECTED AND LEFT IN OPERATIONAL CONDITION.
4. FOLLOWING INITIAL SOIL DISTURBANCE OR REDISTURBANCE, PERMANENT OR TEMPORARY STABILIZATION SHALL BE COMPLETED WITHIN: A.) THREE (3) CALENDAR DAYS AS TO THE SURFACE OF ALL PERIMETER CONTROLS, DIKES, SWALES, DITCHES, PERIMETER SLOPES, AND ALL SLOPES GREATER THAN THREE HORIZONTAL TO ONE VERTICAL (3:1), AND B.) SEVEN (7) DAYS AS TO ALL OTHER DISTURBED OR GRADED AREAS ON THE PROJECT SITE NOT UNDER ACTIVE GRADING.
5. ANY CHANGE TO THE GRADING PROPOSED ON THIS PLAN REQUIRES RE-SUBMISSION TO BALTIMORE COUNTY SOIL CONSERVATION DISTRICT FOR APPROVAL.
6. DUST CONTROL WILL BE PROVIDED FOR ALL DISTURBED AREAS. REFER TO "2011 MARYLAND STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL", PG. H-30-1, FOR ACCEPTABLE METHODS AND SPECIFICATIONS FOR DUST CONTROL.
7. ANY VARIATIONS FROM THE SEQUENCE OF OPERATIONS STATED ON THIS PLAN REQUIRES THE APPROVAL OF THE SEDIMENT CONTROL INSPECTOR AND THE BALTIMORE COUNTY SOIL CONSERVATION DISTRICT PRIOR TO THE INITIATION OF THE CHANGE.
8. EXCESS CUT OR BORROW MATERIAL SHALL GO TO, OR COME FROM, RESPECTIVELY, A SITE WITH AN OPEN GRADING PERMIT.
9. THE FOLLOWING ITEM MAY BE USED AS APPLICABLE: REFER TO MARYLAND'S GUIDELINES TO WATERWAY CONSTRUCTION" BY THE WATER MANAGEMENT ADMINISTRATION OF THE MARYLAND DEPARTMENT OF THE ENVIRONMENT,REVISED NOVEMBER,2000, FOR THE STANDARD DETAILS AND DETAILED SPECIFICATIONS OF EACH PRACTICE SPECIFIED WEREIN FOR WATERWAY CONSTRUCTION.
10. PUMPING SEDIMENT-LADEN WATER INTO WATERS OF THE STATE IS STRICTLY PROHIBITED. ANY PORTABLE DEWATERING DEVICE MUST BE LOCATED WITHIN THE LIMIT OF DISTURBANCE.

ADDITIONAL STATE OF MARYLAND EROSION AND SEDIMENT CONTROL PLAN GENERAL NOTES:

1. THE CONTRACTOR SHALL NOTIFY BALTIMORE COUNTY DEPARTMENT OF PERMITS, APPROVALS, AND INSPECTIONS – SEDIMENT CONTROL (PAI-SC) AT (410) 887-3226 AT LEAST 48 HOURS BEFORE COMMENCING ANY LAND DISTURBANCE ACTIVITY TO HOLD A PRE-CONSTRUCTION MEETING BETWEEN PROJECT REPRESENTATIVES AND THE PAI-SC INSPECTOR.
2. THE CONTRACTOR MUST NOTIFY PAI-SC IN WRITING AND BY TELEPHONE AT THE FOLLOWING POINTS:
   a. THE REQUIRED PRE-CONSTRUCTION MEETING
   b. FOLLOWING INSTALLATION OF SEDIMENT CONTROL MEASURES.
   c. PRIOR TO REMOVAL OR MODIFICATION OF ANY SEDIMENT CONTROL STRUCTURE(S).
   d. PRIOR TO REMOVAL OF ALL SEDIMENT CONTROL DEVICES.
   e. PRIOR TO FINAL ACCEPTANCE.
3. THE CONTRACTOR SHALL CONSTRUCT ALL EROSION AND SEDIMENT CONTROL MEASURES PER THE APPROVED PLAN AND CONSTRUCTION SEQUENCE AND SHALL HAVE THEM INSPECTED AND APPROVED BY THE PAI-SC INSPECTOR PRIOR TO BEGINNING ANY OTHER LAND DISTURBANCES.
4. THE CONTRACTOR SHALL PROTECT ALL POINTS OF CONSTRUCTION INGRESS AND EGRESS TO PREVENT THE DEPOSITION OF MATERIALS ONTO PUBLIC ROADS. ALL MATERIALS DEPOSITED ONTO PUBLIC ROADS SHALL BE REMOVED IMMEDIATELY.
5. THE CONTRACTOR SHALL APPLY SOD OR SEED AND ANCHORED STRAW MULCH, OR OTHER APPROVED STABILIZATION MEASURES TO ALL DISTURBED AREAS AND STOCKPILES WITHIN SEVEN (7) CALENDAR DAYS AFTER STRIPPING AND GRADING ACTIVITIES HAVE CEASED IN THE AREA. MAINTENANCE SHALL BE PERFORMED AS NECESSARY TO ENSURE CONTINUED STABILIZATION. (REQUIREMENT MAY BE REDUCED TO THREE (3) DAYS FOR SENSITIVE AREAS.)
6. PRIOR TO REMOVAL OF SEDIMENT CONTROL MEASURES, THE CONTRACTOR SHALL STABILIZE AND HAVE ESTABLISHED PERMANENT STABILIZATION FOR ALL CONTRIBUTORY DISTURBED AREAS USING SOD OR AN APPROVED PERMANENT SEED MIXTURE WITH REQUIRED SOIL AMENDMENTS AND AN APPROVED ANCHORED MULCH. WOOD FIBER MULCH MAY ONLY BE USED IN SEEDING SEASON WHERE THE SLOPE DOES NOT EXCEED 10% AND GRADING HAS BEEN DONE TO PROMOTE SHEET FLOW DRAINAGE. AREAS BROUGHT TO FINISHED GRADE DURING THE SEEDING SEASON SHALL BE PERMANENTLY STABILIZED AS SOON AS POSSIBLE, BUT NO LATER THAN SEVEN (7) CALENDAR DAYS AFTER ESTABLISHMENT. WHEN PROPERTY IS BROUGHT TO FINISHED GRADE DURING THE MONTHS OF NOVEMBER THROUGH FEBRUARY, AND PERMANENT STABILIZATION IS FOUND TO BE IMPRACTICAL, TEMPORARY SEED AND ANCHORED STRAW MULCH SHALL BE APPLIED TO DISTURBED AREAS. THE FINAL PERMANENT STABILIZATION OF SUCH PROPERTY SHALL BE APPLIED BY MARCH 15 OR EARLIER IF GROUND AND WEATHER CONDITIONS ALLOW.
7. THE SITES APPROVAL LETTER, APPROVED EROSION AND SEDIMENT CONTROL PLANS, DAILY LOG BOOKS, AND TEST REPORTS SHALL BE AVAILABLE AT THE SITE FOR INSPECTION BY DULY AUTHORIZED OFFICIALS OF WMA AND THE AGENCY RESPONSIBLE FOR PROJECT.
8. SURFACE DRAINAGE FLOWS OVER UNSTABILIZED CUT AND FILL SLOPES SHALL BE CONTROLLED BY EITHER PREVENTING DRAINAGE FLOW FROM TRAVERSING THE SLOPES OR BY INSTALLING PROTECTIVE DEVICES TO LOWER THE WATER DOWN SLOPE WITHOUT CAUSING EROSION. DIKES SHALL BE INSTALLED AND MAINTAINED AT THE TOP OF A CUT OR FILL SLOPE UNTIL THE SLOPE AND DRAINAGE AREA TO IT ARE FULLY STABILIZED, AT WHICH TIME THEY MUST BE REMOVED AND FINAL GRADES DONE TO PROMOTE SHEET FLOW DRAINAGE. PROTECTIVE METHODS MUST BE PROVIDED AT POINTS OF CONCENTRATED FLOW WHERE EROSION IS LIKELY TO OCCUR.
9. PERMANENT SWALES OR OTHER POINTS OF CONCENTRATED WATER FLOW SHALL BE STABILIZED WITH SOD OR SEED WITH AN APPROVED EROSION CONTROL MATTING, RIP-RAP, OR BY OTHER APPROVED STABILIZATION MEASURES.
10. TEMPORARY SEDIMENT CONTROL DEVICES MAY BE REMOVED, WITH PERMISSION OF THE PAI-SC INSPECTOR, WITHIN THIRTY (30) CALENDAR DAYS FOLLOWING ESTABLISHMENT OF PERMANENT STABILIZATION IN ALL CONTRIBUTORY DRAINAGE AREAS. STORMWATER MANAGEMENT STRUCTURES USED TEMPORARILY FOR SEDIMENT CONTROL SHALL BE CONVERTED TO THE PERMANENT CONFIGURATIONS WITHIN THIS TIME PERIOD AS WELL.
11. NO PERMANENT CUT OR FILL SLOPE WITH A GRADIENT STEEPER THAN 3:1 WILL BE PERMITTED IN LAWN MAINTENANCE AREAS. A SLOPE GRADIENT OF UP TO 2:1 WILL BE PERMITTED IN NON-MAINTENANCE AREAS PROVIDED THAT THOSE AREAS ARE INDICATED ON THE EROSION AND SEDIMENT CONTROL PLAN WITH A LOW-MAINTENANCE GROUND COVER SPECIFIED FOR PERMANENT STABILIZATION. SLOPE GRADIENT STEEPER THAN 2:1 WILL NOT BE PERMITTED WITH VEGETATIVE STABILIZATION.
12. FOR FINISHED GRADING, THE CONTRACTOR SHALL PROVIDE ADEQUATE GRADIENTS TO PREVENT WATER FROM PONDING FOR MORE THAN TWENTY FOUR (24) HOURS AFTER THE END OF THE RAINFALL EVENT. DRAINAGE COURSES AND SWALE FLOW AREAS MAY TAKE AS LONG AS FORTY-EIGHT (48) HOURS AFTER THE END OF A RAINFALL EVENT TO DRAIN. AREAS DESIGNATED TO HAVE STANDING WATER SHALL NOT BE REQUIRED TO MEET THIS REQUIREMENT.
13. SEDIMENT TRAPS AND BASINS ARE NOT PERMITTED WITHIN 20 FEET OF A FOUNDATION THAT EXISTS OR IS UNDER CONSTRUCTION. NO STRUCTURE MAY BE CONSTRUCTED WITHIN 20 FEET OF AN ACTIVE SEDIMENT TRAP OR BASIN.
14. THE PAI-SC INSPECTOR HAS THE OPTION OF REQUIRING ADDITIONAL SAFETY OR SEDIMENT CONTROL MEASURES, IF DEEMED NECESSARY.
15. ALL TRAP DEPTH DIMENSIONS ARE RELATIVE TO OUTLET ELEVATION. ALL TRAPS MUST HAVE A STABLE OUTFALL. ALL TRAPS AND BASINS SHALL HAVE STABLE INFLOW POINTS.
16. VEGETATIVE STABILIZATION SHALL BE PREFORMED IN ACCORDANCE WITH THE STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL. REFER TO APPROPRIATE SPECIFICATIONS FOR TEMPORARY SEEDING, PERMANENT SEEDING, MULCHING, SODDING, AND GROUND COVERS.
17. SEDIMENT SHALL BE REMOVED AND THE TRAP OR BASIN RESTORED TO ITS ORIGINAL DIMENSIONS WHEN THE SEDIMENT HAS ACCUMULATED TO ONE QUARTER OF THE TOTAL DEPTH OF THE TRAP OR BASIN. TOTAL DEPTH SHALL BE MEASURED FROM THE TRAP OR BASIN BOTTOM TO THE CREST OF THE OUTFALL.

ADDITIONAL STATE OF MARYLAND EROSION AND SEDIMENT CONTROL PLAN GENERAL NOTES (CONTINUED):

18. SEDIMENT REMOVED FROM TRAPS (AND BASINS) SHALL BE PLACED AND STABILIZED IN APPROVED AREAS, BUT NOT WITHIN A FLOODPLAIN, WETLAND, OR TREE-SAVE AREA. WHEN PUMPING SEDIMENT LADEN WATER, THE DISCHARGE MUST BE DIRECTED TO A SEDIMENT TRAPPING DEVICE PRIOR TO RELEASE FROM THE SITE. A SUMP PIT MAY BE USED IF SEDIMENT TRAPS THEMSELVES ARE BEING PUMPED OUT.
19. ALL WATER REMOVED FROM EXCAVATED AREAS SHALL BE PASSED THROUGH AN APPROVED DEWATERING PRACTICE OR PUMPED TO A SEDIMENT TRAP OR BASIN PRIOR TO DISCHARGE FROM THE SITE
20. WHERE DEEMED APPROPRIATE BY THE ENGINEER OR INSPECTOR, SEDIMENT BASINS AND TRAPS MAY NEED TO BE SURROUNDED WITH AN APPROVED SAFETY FENCE. THE FENCE MUST CONFORM TO LOCAL ORDINANCES AND REGULATIONS. THE DEVELOPER OR OWNER SHALL CHECK WITH LOCAL BUILDING OFFICIALS ON APPLICABLE SAFETY REQUIREMENTS. WHERE SAFETY FENCE IS DEEMED APPROPRIATE AND LOCAL ORDINANCES DO NOT SPECIFY FENCING SIZES AND TYPES, THE FOLLOWING SHALL BE USED AS A MINIMUM STANDARD: THE SAFETY FENCE MUST BE MADE OF WELDED WIRE AND AT LEAST 42 INCHES HIGH, HAVE POSTS SPACED NO FARTHER APART THAN 8 FEET, HAVE MESH OPENINGS NO GREATER THAN 2 INCHES IN WIDTH AND 4 INCHES IN HEIGHT WITH A MINIMUM OF 14 GAUGE WIRE. SAFETY FENCE MUST BE MAINTAINED AND IN GOOD CONDITION AT ALL TIMES.
21. OFF-SITE SPOIL OR BORROW AREAS ON STATE OR FEDERAL PROPERTY MUST HAVE PRIOR APPROVAL BY WMA AND OTHER APPLICABLE STATE, FEDERAL, AND LOCAL AGENCIES; OTHERWISE APPROVAL MUST BE GRANTED BY THE LOCAL AUTHORITIES. ALL WASTE AND BORROW AREAS OFF-SITE MUST BE PROTECTED BY SEDIMENT CONTROL MEASURES AND STABILIZED.
22. SITES WHERE INFILTRATION DEVICES ARE USED FOR THE CONTROL OF STORMWATER, EXTREME CARE MUST BE TAKEN TO PREVENT RUNOFF FROM UNSTABILIZED AREAS FROM ENTERING THE STRUCTURE DURING CONSTRUCTION. SEDIMENT CONTROL DEVICES PLACED IN INFILTRATION AREAS MUST HAVE BOTTOM ELEVATIONS AT LEAST TWO (2) FEET HIGHER THAN THE FINISH GRADE BOTTOM ELEVATION OF THE INFILTRATION PRACTICE. WHEN CONVERTING A SEDIMENT TRAP TO AN INFILTRATION DEVICE, ALL ACCUMULATED SEDIMENT MUST BE REMOVED AND DISPOSED OF PRIOR TO FINAL GRADING OF INFILTRATION DEVICE.
23. WHEN A STORM DRAIN SYSTEM OUTFALL IS DIRECTED TO A SEDIMENT TRAP OR SEDIMENT BASIN AND THE SYSTEM IS TO BE USED FOR TEMPORARILY CONVEYING SEDIMENT LADEN WATER, ALL STORM DRAIN INLETS IN NON-SUMP AREAS SHALL HAVE A TEMPORARY ASPHALT BERMS CONSTRUCTED AT THE TIME OF BASE PAVING TO DIRECT GUTTER FLOW INTO THE INLETS TO AVOID SURCHARGING AND OVERFLOW OF INLETS IN SUMP AREAS.
24. SITE INFORMATION:
   a. TOTAL AREA OF FACILITY = 205.94 ACRES
   b. TOTAL AREA OF PROJECT SITE = 80.29 ACRES
   c. AREA WITHIN LIMITS OF DISTURBANCE = 24.41 ACRES
   d. AREA TO BE ROOFED OR PAVED = 0 ACRES OF NEWLY PAVED AREAS
   e. EXCAVATION AREA = 2.37 ACRES
   f. TOTAL CUT = 6,979 CUBIC YARDS
   g. TOTAL FILL = 6,979 CUBIC YARDS
   h. OFF-SITE WASTE / BORROW AREA LOCATION – KING AND QUEEN LANDFILL, PLYMOUTH VIRGINIA

REFER TO DRAWINGS C-9 THROUGH C-14 FOR LIMITS OF DISTURBANCE, EXCAVATION AREAS, AND CUT/FILL VOLUMES RELATED TO INDIVIDUAL AREAS.

INLET PROTECTION NOTE:

THE CONTRACTOR IS REQUIRED TO INSTALL INLET PROTECTION ON ALL STORM DRAIN INLETS WITH THE EXCEPTION OF THE FOLLOWING:

1. ANY INLET OUTFALLING DIRECTLY INTO A SEDIMENT TRAPPING DEVICE.*
2. INLETS ON PRIVATE OR PUBLIC PAVED ROADWAYS OPEN TO THE PUBLIC.

ALL INLET PROTECTION WILL BE INSTALLED AS DIRECTED BY THE INSPECTOR IN ACCORDANCE WITH THE 2011 MARYLAND STANDARDS AND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL, PAGE E-23 (OR AS MAY BE AMENDED). THE REMOVAL OF ANY INLET PROTECTION DEVICES WILL REQUIRE APPROVAL FROM THE INSPECTOR.

*STORM DRAINS SHALL BE FLUSHED PRIOR TO TRAPPING DEVICE REMOVAL.

MAINTENANCE NOTE:

SILT FENCE ON PAVED AREAS, SUPER SILT FENCE, AND INLET PROTECTION SHALL BE INSPECTED AND MAINTAINED EACH DAY AND AFTER EACH STORM EVENT. MAINTENANCE INCLUDES, BUT IS NOT LIMITED TO, REMOVAL OF ALL ACCUMULATED SEDIMENT. GEOTEXTILE FABRIC SHALL BE REPLACED AS NEEDED TO ENSURE PROPER FUNCTION. ANY DAMAGED OR REMOVED SUPER SILT FENCE SHALL BE REPAIRED OR REPLACED BY THE END OF EACH DAY.

SEQUENCE OF OPERATIONS FOR EACH AREA:

1. NOTIFY BALTIMORE COUNTY DEPARTMENT OF PERMITS, APPROVALS, AND INSPECTIONS – SEDIMENT CONTROL (PAI-SC) AT (410) 887-3226 AT LEAST 48 HOURS PRIOR TO BEGINNING WORK.
2. NOTIFY MARYLAND DEPARTMENT OF THE ENVIRONMENT (MDE), INSPECTION AND COMPLIANCE PROGRAM (410) 537-3510 AT LEAST 7 DAYS PRIOR TO BEGINNING WORK.
3. CONTACT MISS UTILITY TO LOCATE ALL SITE UTILITIES WITHIN LIMITS OF DISTURBANCE. FOLLOWING UTILITY LOCATION, VISIT SITE TO VERIFY SITE CONDITIONS
4. IF APPLICABLE, ORANGE HIGH VISIBILITY FENCE SHALL BE MANUALLY INSTALLED ALONG THE LIMIT OF DISTURBANCE, WHERE THE LIMIT IS WITHIN 50 FEET OF THE FOREST BUFFER/CONSERVATION EASEMENT. THIS SHALL BE COMPLETED BY AND INSPECTED AT, THE PRECONSTRUCTION MEETING.
5. CLEAR AND GRUB FOR SEDIMENT & EROSION CONTROL MEASURES OR DEVICES ONLY.
6. INSTALL SEDIMENT & EROSION CONTROL MEASURES AND DEVICES IN BLOCK G. SEDIMENT AND EROSION CONTROL MEASURES WILL BE INSTALLED ONE BLOCK AT A TIME IN THE ORDER OF SEQUENCE NOTED IN ITEM NUMBER 8 BELOW.
7. NOTIFY PAI-SC, INSPECTION AND COMPLIANCE DIVISION UPON COMPLETION OF SEDIMENT AND EROSION CONTROL MEASURES AND DEVICES INSTALLATION.
8. WITH THE APPROVAL OF THE SEDIMENT CONTROL INSPECTOR, CLEAR REMAINDER OF PROPOSED EXCAVATION AREAS. EXCAVATION ACTIVITIES WILL BEGIN IN BLOCK H AND PROCEED TO BLOCKS G, F, D PANHANDLE, AND D. PRIOR TO BEGINNING NEXT BLOCK, CURRENT BLOCK MUST BE STABILIZED. SILT FENCE ON PAVED AREAS, SUPER SILT FENCE, AND INLET PROTECTION SHALL BE INSPECTED AND MAINTAINED EACH DAY AND AFTER EACH STORM EVENT. MAINTENANCE INCLUDES, BUT IS NOT LIMITED TO, REMOVAL OF ALL ACCUMULATED SEDIMENT. GEOTEXTILE FABRIC SHALL BE REPLACED AS NEEDED TO ENSURE PROPER FUNCTION. ANY DAMAGED OR REMOVED FILTER FENCE SHALL BE REPAIRED OR REPLACED BY THE END OF EACH DAY.
9. EXCAVATE SOIL IDENTIFIED IN THE RESIDUAL RISK ANALYSIS AS NEEDING TO BE REMOVED TO MEET A SITE-WIDE 95% UPPER CONFIDENCE LIMIT OF 1 X 10 -5 CANCER RISK, AND TRANSPORT SOIL OFF-SITE FOR DISPOSAL WITHIN A PERMITTED LANDFILL (LANDFILL TO BE IDENTIFIED PRIOR TO EXCAVATION). PERFORM VERIFICATION SAMPLING TO VERIFY REMOVAL OF SOIL TO MEET A SITE-WIDE 95% UCL BELOW THE PRELIMINARY REMEDIAL GOALS. IF SOIL WITH COC CONCENTRATIONS GREATER THAN THE PRG REMAINS, ADJUST EROSION AND SEDIMENT CONTROLS AS REQUIRED, OBTAIN ADJUSTMENT APPROVAL FROM THE SEDIMENT CONTROL INSPECTOR, THEN CONTINUE EXCAVATION. REPEAT THIS PROCESS UNTIL VERIFICATION SAMPLES INDICATE REMOVAL OF SOIL TO MEET THE SITE-WIDE 95% UCL AND BACKFILL EXCAVATION. UPON COMPLETION PERMANENTLY STABILIZE ALL DISTURBED AREAS.
10. DUE TO CONTAMINANT DISTRIBUTION IN BLOCK H AND THE REQUIREMENT TO MAINTAIN PUBLIC PARKING DURING IMPLEMENTATION OF REMEDIAL ACTIVITIES, THE REMEDIAL ACTIVITIES IN BLOCK H WILL BE PERFORMED IN 2 PHASES. PHASE 1 WILL INCLUDE INSTALLING AND MAINTAINING EROSION CONTROL MEASURES WHILE EXCAVATION IS CONDUCTED WITHIN THE SOUTHERN HALF OF BLOCK H. ONCE THESE EXCAVATIONS ARE BACKFILLED AND STABILIZED, EROSION CONTROL MEASURE WILL BE MOVED TO ESTABLISH EROSION CONTROL FOR PHASE 2. DURING IMPLEMENTATION OF PHASE 2 THE EROSION CONTROL MEASURES WILL BE MAINTAINED. EROSION CONTROL MEASURES WILL BE REMOVED FROM BLOCK H FOLLOWING STABILIZATION.
11. UPON STABILIZATION OF SITE WITH ESTABLISHED VEGETATION AND WITH PERMISSION OF THE SEDIMENT CONTROL INSPECTOR, REMOVE SEDIMENT CONTROL MEASURES AND STABILIZE THOSE AREAS DISTURBED BY THIS PROCESS.

STANDARD STABILIZATION NOTE:

FOLLOWING INITIAL SOIL DISTURBANCE OR REDISTURBANCE, PERMANENT OR TEMPORARY STABILIZATION SHALL BE COMPLETED WITHIN THREE (3) CALENDAR DAYS AS TO THE SURFACE OF ALL PERIMETER CONTROLS, DIKES, SWALES, DITCHES, PERIMETER SLOPES, AND ALL SLOPES GREATER THAN 3 HORIZONTAL TO 1 VERTICAL (3:1) AND SEVEN (7) DAYS AS TO ALL OTHER DISTURBED OR GRADED AREAS ON THE PROJECT SITE.

CONSULTANT'S CERTIFICATION:

I CERTIFY THAT THIS PLAN OF EROSION AND SEDIMENT CONTROL REPRESENTS A PRACTICAL AND WORKABLE PLAN BASED ON MY PERSONAL KNOWLEDGE OF THE SITE, AND THAT THIS PLAN WAS PREPARED IN ACCORDANCE WITH THE REQUIREMENTS OF THE BALTIMORE COUNTY SOIL CONSERVATION DISTRICT AND THE CURRENT STATE OF MARYLAND SPECIFICATIONS FOR SOIL EROSION AND SEDIMENT CONTROL. I HAVE REVIEWED THIS EROSION AND SEDIMENT CONTROL PLAN WITH THE OWNER/DEVELOPER.

MD. LICENSE NO. _____ PRINTED NAME _____

OWNER'S / DEVELOPER'S CERTIFICATION:

I/WE HEREBY CERTIFY THAT ANY CLEARING, GRADING, CONSTRUCTION AND/OR DEVELOPMENT WILL BE DONE PURSUANT TO THIS PLAN AND THAT ANY RESPONSIBLE PERSONNEL INVOLVED IN THIS CONSTRUCTION WILL HAVE A CERTIFICATE OF ATTENDANCE AT A MARYLAND DEPARTMENT OF THE ENVIRONMENT APPROVED TRAINING PROGRAM FOR THE CONTROL OF SEDIMENT AND EROSION BEFORE BEGINNING THE PROJECT. I/WE ALSO CERTIFY THAT THE SITE WILL BE INSPECTED AT THE END OF EACH WORKING DAY, AND THAT ANY NEEDED MAINTENANCE WILL BE COMPLETED SO AS TO INSURE THAT ALL SEDIMENT CONTROL PRACTICES ARE LEFT IN OPERATIONAL CONDITION. I/WE AUTHORIZE THE RIGHT OF ENTRY FOR PERIODIC ON-SITE EVALUATIONS BY THE BALTIMORE COUNTY SOIL CONSERVATION DISTRICT BOARD OF SUPERVISORS OR THEIR AUTHORIZED AGENTS.

LEGEND:
REFER TO DRAWING T–2 FOR GENERAL LEGEND
➡ CONSTRUCTION TRAFFIC

NOTES:
1. REFER TO DRAWING C–8 FOR EROSION AND SEDIMENT CONTROL NOTES AND DRAWING C–18 FOR SEED MIXTURES
2. STORM DRAINS LOCATED WITHIN THE LIMITS OF EXCAVATION WILL BE PROTECTED AND SUPPORTED DURING EXCAVATION AND BACKFILL ACTIVITIES
3. PERVIOUS AREAS TO BE STABILIZED WITH PERMANENT SEED MIXTURE PROVIDED ON DRAWING C–18.
4. ASPHALT WILL BE REMOVED IN THE AREAS DESIGNATED FOR PLACEMENT OF THE CONSTRUCTION ENTRANCE PRIOR TO THE CONSTRUCTION ENTRANCE INSTALLATION.
5. FOR ACCESS PURPOSES THE EASTERNMOST EXCAVATION AREAS WILL BE EXCAVATED FIRST. AFTER RESTORATION OF THE EASTERNMOST EXCAVATION AREAS EXCAVATION WILL PROCEED WEST.
6. THE FENCE SOUTH OF THE PAVED SURFACE WILL BE CUT TO GAIN ACCESS TO THE EXCAVATION AREAS IN THE GRASS.
7. NO NEW UTILITIES PROPOSED.
8. ALL WORK PERFORMED WITHIN LOCKHEED MARTIN PROPERTY LINES.
9. EXISTING CONTOURS AND SURFACE CONDITIONS WILL BE RE–ESTABLISED ONCE THE CONTAMINATED SOIL HAS BEEN REMOVED.
10. CONSTRUCTION VEHICLES SHALL ENTER AND EXIT THE DISTURBED AREA ONLY VIA THE STABILIZED CONSTRUCTION ENTRANCE.

NOTES:
1. REFER TO DRAWING C-8 FOR EROSION AND SEDIMENT CONTROL NOTES AND DRAWING C-18 FOR SEED MIXTURES
2. STORM DRAINS LOCATED WITHIN THE LIMITS OF EXCAVATION WILL BE PROTECTED AND SUPPORTED DURING EXCAVATION AND BACKFILL ACTIVITIES
3. STORM DRAIN REPAIR WILL BE COMPLETED BEFORE ANY OTHER INTRUSIVE WORK BEGINS IN THE BLOCK D PANHANDLE.
4. ALL IMPERVIOUS SURFACES WITHIN THE LIMITS OF DISTURBANCE IN THE BLOCK D PANHANDLE WILL BE REMOVED AND MADE PERVIOUS.
5. PERVIOUS AREAS TO BE STABILIZED WITH PERMANENT SEED MIXTURE PROVIDED ON DRAWING C-18.
6. FOR ACCESS PURPOSES THE SOUTHERNMOST EXCAVATION AREA WILL BE EXCAVATED FIRST. AFTER RESTORATION OF THE SOUTHERNMOST EXCAVATION AREAS EXCAVATION WILL PROCEED NORTH.
7. ACCESS TO THE BLOCK D PANHANDLE WILL BE THROUGH THE BLOCK D CONSTRUCTION ENTRANCE.
8. NO NEW UTILITIES PROPOSED.
9. ALL WORK PERFORMED WITHIN LOCKHEED MARTIN PROPERTY LINES.
10. EXISTING CONTOURS WILL BE RE-ESTABLISED ONCE THE CONTAMINATED SOIL HAS BEEN REMOVED.
11. SINKHOLE BACKFILL WILL BE USED AS NEEDED AS SINKHOLES ARE ENCOUNTERED. SINKHOLE BACKFILL WILL ALSO BE USED TO BACKFILL STORM DRAIN REPAIR AREA.
12. THE TURBIDITY CURTAIN WILL BE REMOVED UPON COMPLETION OF THE STORM DRAIN REPAIR AND RELOCATED TO ADDRESS ANY SINKHOLE REPAIRS NEEDED ALONG THE BULKHEAD WALL.
13. CONSTRUCTION VEHICLES SHALL ENTER AND EXIT THE DISTURBED AREA ONLY VIA THE STABILIZED CONSTRUCTION ENTRANCE.

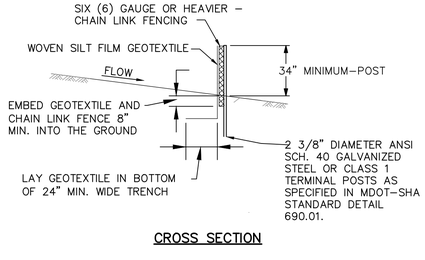
CONSTRUCTION SPECIFICATIONS



1. USE NONWOVEN GEOTEXTILE AS SPECIFIED IN SECTION H–1 MATERIALS.
2. LIFT GRATE AND WRAP WITH NONWOVEN GEOTEXTILE TO COMPLETELY COVER ALL OPENINGS. SECURE WITH WIRE TIES AND SET GRATE BACK IN PLACE.
3. PLACE CLEAN ¾ TO 1½ INCH STONE OR EQUIVALENT RECYCLED CONCRETE 6 INCHES THICK ON THE GRATE.
4. STORM DRAIN INLET PROTECTION REQUIRES FREQUENT MAINTENANCE. REMOVE ACCUMULATED SEDIMENT AFTER EACH RAIN EVENT TO MAINTAIN FUNCTION AND AVOID PREMATURE CLOGGING. IF INLET PROTECTION DOES NOT COMPLETELY DRAIN WITHIN 24 HOURS AFTER A STORM EVENT, IT IS CLOGGED. WHEN THIS OCCURS, REMOVE ACCUMULATED SEDIMENT AND CLEAN, OR REPLACE GEOTEXTILE AND STONE.

AT GRADE INLET PROTECTION DETAIL

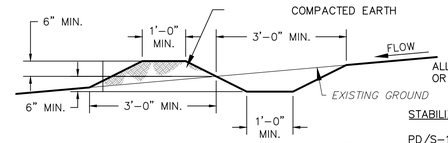
PERSPECTIVE VIEW



CROSS SECTION

CONSTRUCTION SPECIFICATIONS

1. INSTALL 2⅜ INCH DIAMETER GALVANIZED STEEL POSTS OF 0.095 INCH WALL THICKNESS AND SIX FOOT LENGTH SPACED NO FURTHER THAN 10 FEET APART. DRIVE THE POSTS A MINIMUM OF 36 INCHES INTO THE GROUND.
2. FASTEN 6 GAUGE OR HEAVIER GALVANIZED CHAIN LINK FENCE (2⅜ INCH MAXIMUM OPENING) 42 INCHES IN HEIGHT SECURELY TO THE FENCE POSTS WITH WIRE TIES OR HUG RINGS.
3. FASTEN WOVEN SLIT FILM GEOTEXTILE AS SPECIFIED IN SECTION H–1 MATERIALS, SECURELY TO THE UPSLOPE SIDE OF CHAIN LINK FENCE WITH TIES SPACED EVERY 24 INCHES AT THE TOP AND MID SECTION. EMBED GEOTEXTILE AND CHAIN LINK FENCE A MINIMUM OF 8 INCHES INTO THE GROUND. LAY THE GEOTEXTILE IN THE BOTTOM OF THE 24 INCH WIDE TRENCH.
4. WHERE ENDS OF THE GEOTEXTILE COME TOGETHER, THE ENDS SHALL BE OVERLAPPED BY 6 INCHES, FOLDED, AND STAPLED TO PREVENT SEDIMENT BY PASS.
5. EXTEND BOTH ENDS OF THE SUPER SILT FENCE A MINIMUM OF THREE VERTICAL FEET TO PREVENT RUNOFF FROM GOING AROUND THE ENDS OF THE SUPER SILT FENCE.
6. PROVIDE MANUFACTURER CERTIFICATION TO THE INSPECTION/ENFORCEMENT AUTHORITY SHOWING THAT GEOTEXTILE USED MEETS THE REQUIREMENTS IN SECTION H–1 MATERIALS.
7. REMOVE ACCUMULATED SEDIMENT AND DEBRIS WHEN BULGES DEVELOP IN FENCE OR WHEN SEDIMENT REACHES 25% OF FENCE HEIGHT. REPLACE GEOTEXTILE IF TORN. IF UNDERMINING OCCURS, REINSTALL CHAIN LINK FENCING AND GEOTEXTILE.

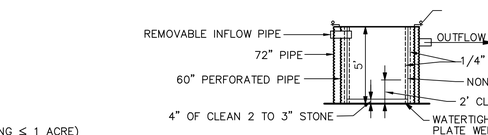
STABILIZATION

PD/S–1: SEED AND MULCH (DRAINING ≤ 1 ACRE) (NOT ALLOWED FOR CLEAR WATER DIVERSION)

PD/S–2: SEED AND COVER WITH SOIL, STABILIZATION MATTING OR LINE WITH SOD (DRAINING BETWEEN 1 AND 2 ACRES)

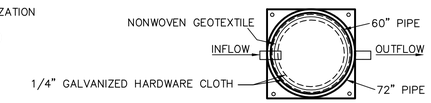
CONTINUOUS GRADE 0.5% MIN. TO 10% MAX SLOPE

PLAN VIEW



CONSTRUCTION SPECIFICATIONS

1. REMOVE AND DISPOSE OF ALL TREES, BRUSH, STUMPS, OBSTRUCTIONS, AND OTHER OBJECTIONABLE MATERIAL SO AS NOT TO INTERFERE WITH PROPER FUNCTION OF DIKE/SWALE.
2. EXCAVATE OR SHAPE DIKE/SWALE TO LINE, GRADE, AND CROSS SECTION AS SPECIFIED. BANK PROJECTIONS OR OTHER IRREGULARITIES ARE NOT ALLOWED.
3. COMPACT FILL.
4. CONSTRUCT DIKE/SWALE ON AN UNINTERRUPTED, CONTINUOUS GRADE, ADJUSTING THE LOCATION DUE TO FIELD CONDITIONS AS NECESSARY TO MAINTAIN POSITIVE DRAINAGE.
5. PROVIDE OUTLET PROTECTION AS REQUIRED ON APPROVED PLAN.
6. STABILIZE DIKE/SWALE WITHIN 3 DAYS OF INSTALLATION. STABILIZE DIKE/SWALES USED FOR CLEAR WATER DIVERSION WITHIN 24 HOURS OF INSTALLATION.
7. MAINTAIN LINE, GRADE, AND CROSS SECTION. REMOVE ACCUMULATED SEDIMENT AND DEBRIS, AND MAINTAIN POSITIVE DRAINAGE. KEEP PERIMETER DIKE/SWALE AND POINT OF DISCHARGE FREE OF EROSION AND CONTINUOUSLY MEET REQUIREMENTS FOR ADEQUATE VEGETATIVE ESTABLISHMENT IN ACCORDANCE WITH SECTION B–4 VEGETATIVE STABILIZATION.
8. UPON REMOVAL OF DIKE/SWALE, GRADE AREA FLUSH WITH EXISTING GROUND. WITHIN 24 HOURS OF REMOVAL STABILIZE DISTURBED AREA WITH TOPSOIL, SEED, MULCH, OR AS SPECIFIED ON APPROVED PLAN.



NOTE: MAXIMUM DRAINAGE AREA FOR THIS PRACTICE IS 2 ACRES.

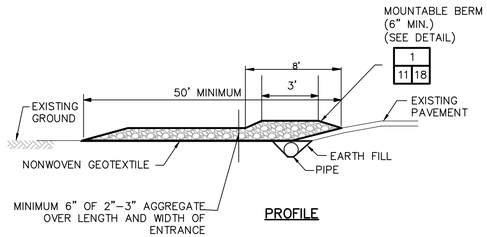
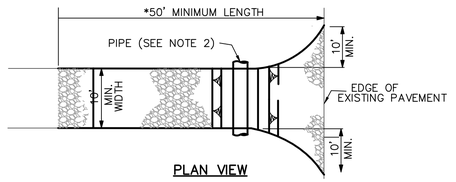
ELEVATION



PLAN VIEW

CONSTRUCTION SPECIFICATIONS



1. PROVIDE 1 CUBIC FOOT OF STORAGE FOR EACH GALLON PER MINUTE OF PUMP CAPACITY. REQUIRED STORAGE VOLUME MAY BE ATTAINED BY PLACEMENT OF TANKS IN PARALLEL WITH INFLOW EVENLY DISTRIBUTED AMONG TANKS. OVERTOPPING OF TANKS IS NOT PERMITTED.
2. USE 60 INCH CORRUGATED METAL OR PLASTIC PIPE WITH 1 INCH DIAMETER PERFORATIONS, 6 INCHES ON CENTER FOR THE INNER PIPE. LINE PIPE WITH NONWOVEN GEOTEXTILE, AS SPECIFIED IN SECTION H–1 MATERIALS, SANDWICHED BETWEEN, AND ATTACHED TO, ¼ INCH HARDWARE CLOTH.
3. OVERLAP GEOTEXTILE 8 INCHES MINIMUM AT VERTICAL SEAM AND AT THE BOTTOM PLATE.
4. ANCHOR GEOTEXTILE AT BOTTOM OF TANK WITH 4 INCHES OF 2 TO 3 INCH CLEAN STONE OR EQUIVALENT RECYCLED CONCRETE.
5. USE 72 INCH CORRUGATED METAL OR PLASTIC OUTER PIPE WITH PERMANENT OUTFLOW PIPE WITH INVERT LOWER THAN INFLOW PIPE
6. INFLOW PIPE MUST DISCHARGE INTO INNER PIPE AND BE REMOVABLE.
7. PLACE TANK ON LEVEL SURFACE AND DISCHARGE TO A STABLE AREA AT A NONEROSIVE RATE.
8. A PORTABLE SEDIMENT TANK REQUIRES FREQUENT MAINTENANCE. REMOVE ACCUMULATED SEDIMENT FROM INNER PIPE WHEN IT REACHES TWO FEET IN DEPTH. IF SYSTEM CLOGS, PULL OUT INNER PIPE, REMOVE ACCUMULATED SEDIMENT, AND REPLACE GEOTEXTILE. KEEP POINT OF DISCHARGE FREE OF EROSION.

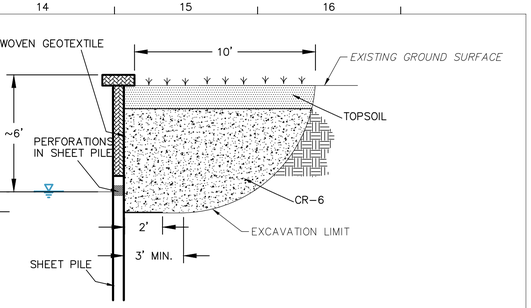
PROFILE



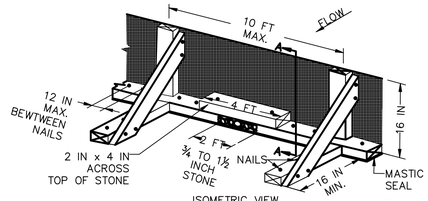
PLAN VIEW

CONSTRUCTION SPECIFICATIONS

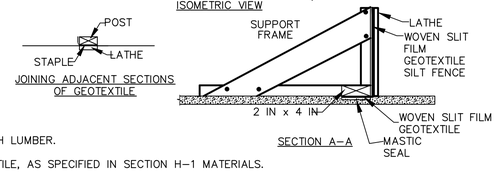
1. PLACE STABILIZED CONSTRUCTION ENTRANCE IN ACCORDANCE WITH THE APPROVED PLAN. VEHICLES MUST TRAVEL OVER THE ENTIRE LENGTH OF THE SCE. USE MINIMUM LENGTH OF 50 FEET (*30 FEET FOR SINGLE RESIDENCE LOT). USE MINIMUM WIDTH OF 10 FEET. FLARE SCE 10 FEET MINIMUM AT THE EXISTING ROAD TO PROVIDE A TURNING RADIUS.
2. PIPE ALL SURFACE WATER FLOWING TO OR DIVERTED TOWARD THE SCE UNDER THE ENTRANCE, MAINTAINING POSITIVE DRAINAGE. PROTECT PIPE INSTALLED THROUGH THE SCE WITH A MOUNTABLE BERM WITH 5:1 SLOPES AND A MINIMUM OF 12 INCHES OF STONE OVER THE PIPE. PROVIDE PIPE AS SPECIFIED ON APPROVED PLAN. WHEN THE SCE IS LOCATED AT A HIGH SPOT AND HAS NO DRAINAGE TO CONVEY, A PIPE IS NOT NECESSARY. A MOUNTABLE BERM IS REQUIRED WHEN SCE IS NOT LOCATED AT A HIGH SPOT.
3. PREPARE SUBGRADE AND PLACE NONWOVEN GEOTEXTILE, AS SPECIFIED IN SECTION H–1 MATERIALS.
4. PLACE CRUSHED AGGREGATE (2 TO 3 INCHES IN SIZE) OR EQUIVALENT RECYCLED CONCRETE (WITHOUT REBAR) AT LEAST 6 INCHES DEEP OVER THE LENGTH AND WIDTH OF THE SCE.
5. MAINTAIN ENTRANCE IN A CONDITION THAT MINIMIZES TRACKING OF SEDIMENT. ADD STONE OR MAKE OTHER REPAIRS AS CONDITIONS DEMAND TO MAINTAIN CLEAN SURFACE, MOUNTABLE BERM, AND SPECIFIED DIMENSIONS. IMMEDIATELY REMOVE STONE AND/OR SEDIMENT SPILLED, DROPPED, OR TRACKED ONTO ADJACENT ROADWAY BY VACUUMING, SCRAPING, AND/OR SWEEPING. WASHING ROADWAY TO REMOVE MUD TRACKED ONTO PAVEMENT IS NOT ACCEPTABLE UNLESS WASH WATER IS DIRECTED TO AN APPROVED SEDIMENT CONTROL PRACTICE.

STABILIZED CONSTRUCTION ENTRANCE WITH MOUNTABLE BERM DETAIL

NOT TO SCALE — 6 | 11 17



CONSTRUCTION SPECIFICATIONS



1. CR–6 WILL HAVE COMPRESSIVE STRENGTH OF 50 TO 100 PSI.
2. CR–6 WILL BE PLACED IN MAX 12–INCH LIFTS. THE NEXT LIFT WILL NOT BE PLACED UNTIL THE UNDERLYING LIFT IS STRONG ENOUGH TO HAVE A ONE FOOT VERTICAL FACE UNDER LOAD OF THE NEXT LIFT (I.E. APPROXIMATELY 2 PSI OR 288 PSF OF COMPRESSIVE STRENGTH).
3. BOTTOM OF THE EXCAVATION LIMIT NEAR THE SHEET PILE WILL BE 3 FEET HORIZONTAL OR SLOPING AWAY FROM THE SHEET PILE.

JOINING ADJACENT SECTIONS OF GEOTEXTILE

SECTION A–A

1. USE NOMINAL 2 INCH X 4 INCH LUMBER.
2. USE WOVEN SLIT FILM GEOTEXTILE, AS SPECIFIED IN SECTION H–1 MATERIALS.
3. PROVIDE MANUFACTURER CERTIFICATION TO THE AUTHORIZED REPRESENTATIVE OF THE INSPECTION/ENFORCEMENT AUTHORITY SHOWING THAT THE GEOTEXTILE USED MEETS THE REQUIREMENTS IN SECTION H–1 MATERIALS.
4. SPACE UPRIGHT SUPPORTS NO MORE THAN 10 FEET APART.
5. PROVIDE A TWO FOOT OPENING BETWEEN EVERY SET OF SUPPORTS AND PLACE STONE IN THE OPENING OVER GEOTEXTILE.
6. KEEP SILT FENCE TAUT AND SECURELY STAPLE TO THE UPSLOPE SIDE OF UPRIGHT SUPPORTS. EXTEND GEOTEXTILE UNDER 2x4.
7. WHERE TWO SECTIONS OF GEOTEXTILE ADJOIN: OVERLAP, FOLD, AND STAPLE TO POST IN ACCORDANCE WITH THIS DETAIL. ATTACH LATHE.
8. PROVIDE A MASTIC SEAL BETWEEN PAVEMENT, GEOTEXTILE, AND 2x4 TO PREVENT SEDIMENT–LADEN WATER FROM ESCAPING BENEATH SILT FENCE INSTALLATION.
9. SECURE BOARDS TO PAVEMENT WITH 40D 5 INCH MINIMUM LENGTH NAILS.
10. REMOVE ACCUMULATED SEDIMENT AND DEBRIS WHEN BULGES DEVELOP IN SILT FENCE OR WHEN SEDIMENT REACHES 25% OF FENCE HEIGHT. REPLACE GEOTEXTILE IF TORN. MAINTAIN WATER TIGHT SEAL ALONG BOTTOM. REPLACE STONE IF DISPLACED.

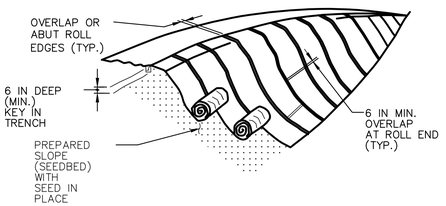
PLAN VIEW

FILTER FABRIC SHALL BE EMBEDDED A MIN. OF 4" AND SHALL EXTEND AT LEAST 6" BEYOND THE EDGE OF THE RIP–RAP

SECTION B–B



CONSTRUCTION SPECIFICATIONS

1. RIPRAP AND STONE MUST CONFORM TO THE SPECIFIED CLASS.
2. USE NONWOVEN GEOTEXTILE, AS SPECIFIED IN SECTION H–1 MATERIALS, AND PROTECT FROM PUNCTURING, CUTTING, OR TEARING. REPAIR ANY DAMAGE OTHER THAN AN OCCASIONAL SMALL HOLE BY PLACING ANOTHER PIECE OF GEOTEXTILE OVER THE DAMAGED PART OR BY COMPLETELY REPLACING THE GEOTEXTILE. PROVIDE A MINIMUM OF ONE FOOT OVERLAP FOR ALL REPAIRS AND FOR JOINING TWO PIECES OF GEOTEXTILE TOGETHER.
3. PREPARE THE SUBGRADE FOR GEOTEXTILE OR STONE FILTER (⅜ TO 1½ INCH MINIMUM STONE FOR 6 INCH MINIMUM DEPTH) AND RIPRAP TO THE REQUIRED LINES AND GRADES. COMPACT ANY FILL REQUIRED IN THE SUBGRADE TO A DENSITY OF APPROXIMATELY THAT OF THE SURROUNDING UNDISTURBED MATERIAL.
4. EXTEND GEOTEXTILE AT LEAST 6 INCHES BEYOND EDGES OF RIPRAP AND EMBED AT LEAST 4 INCHES AT SIDES OF RIPRAP.
5. CONSTRUCT RIPRAP OUTLET TO FULL COURSE THICKNESS IN ONE OPERATION AND IN SUCH A MANNER AS TO AVOID DISPLACEMENT OF UNDERLYING MATERIALS. PLACE STONE FOR RIPRAP OUTLET IN A MANNER THAT WILL ENSURE THAT IT IS REASONABLY HOMOGENOUS WITH THE SMALLER STONES AND SPALLS FILLING THE VOIDS BETWEEN THE LARGER STONES. PLACE RIPRAP IN A MANNER TO PREVENT DAMAGE TO THE FILTER BLANKET OR GEOTEXTILE. HAND PLACE TO THE EXTENT NECESSARY.
6. WHERE NO ENDWALL IS USED, CONSTRUCT THE UPSTREAM END OF THE APRON SO THAT THE WIDTH IS TWO TIMES THE DIAMETER OF THE OUTLET PIPE, AND EXTEND THE STONE UNDER THE OUTLET BY A MINIMUM OF 18 INCHES.
7. CONSTRUCT APRON WITH 0% SLOPE ALONG ITS LENGTH AND WITHOUT OBSTRUCTIONS. PLACE STONE SO THAT IT BLENDS IN WITH EXISTING GROUND.
8. MAINTAIN LINE, GRADE, AND CROSS SECTION. KEEP OUTLET FREE OF EROSION. REMOVE ACCUMULATED SEDIMENT AND DEBRIS. AFTER HIGH FLOWS INSPECT FOR SCOUR AND RIPRAP DISLODGED RIPRAP. MAKE NECESSARY REPAIRS IMMEDIATELY.

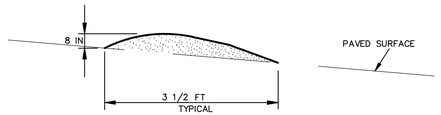
TEMPORARY SOIL STABILIZATION MATTING SLOPE APPLICATION

NOT TO SCALE



3 | 11 | 18

CONSTRUCTION SPECIFICATIONS

1. USE MATTING THAT HAS A DESIGN VALUE FOR SHEAR STRESS EQUAL TO OR HIGHER THAN 1.5 LB/FT^2.
2. USE TEMPORARY SOIL STABILIZATION MATTING MADE OF DEGRADABLE (LASTS 6 MONTHS MINIMUM) NATURAL OR MAN–MADE FIBERS (MOSTLY ORGANIC). MAT MUST HAVE UNIFORM THICKNESS AND DISTRIBUTION OF FIBERS THROUGHOUT AND BE SMOLDER RESISTANT. CHEMICALS USED IN THE MAT MUST BE NON–LEACHING AND NON–TOXIC TO VEGETATION AND SEED GERMINATION AND NON–INJURIOUS TO THE SKIN. IF PRESENT, NETTING MUST BE EXTRUDED PLASTIC WITH A MAXIMUM MESH OPENING OF 2x2 INCHES AND SUFFICIENTLY BONDED OR SEWN ON 2 INCH CENTERS ALONG LONGITUDINAL AXIS OF THE MATERIAL TO PREVENT SEPARATION OF THE NET FROM THE PARENT MATERIAL.
3. SECURE MATTING USING STEEL STAPLES, WOOD STAKES, OR BIODEGRADABLE EQUIVALENT. STAPLES MUST BE "U" OR "T" SHAPED STEEL WIRE HAVING A MINIMUM GAUGE OF NO. 11 AND NO. 8 RESPECTIVELY. "U" SHAPED STAPLES MUST AVERAGE 1 TO 11/2 INCHES WIDE AND BE A MINIMUM OF 6 INCHES LONG. "T" SHAPED STAPLES MUST HAVE A MINIMUM 8 INCH MAIN LEG, A MINIMUM 1 INCH SECONDARY LEG, AND A MINIMUM 4 INCH HEAD. WOOD STAKES MUST BE ROUGH–SAWN HARDWOOD, 12 TO 24 INCHES IN LENGTH, 1x3 INCH IN CROSS SECTION, AND WEDGE SHAPED AT THE BOTTOM.
4. PERFORM FINAL GRADING, TOPSOIL APPLICATION, SEEDBED PREPARATION, AND PERMANENT SEEDING IN ACCORDANCE WITH SPECIFICATIONS. PLACE MATTING WITHIN 48 HOURS OF COMPLETING SEEDING OPERATIONS UNLESS END OF WORKDAY STABILIZATION IS SPECIFIED ON THE APPROVED EROSION & SEDIMENT CONTROL PLAN.
5. UNROLL MATTING DOWNSLOPE. LAY MAT SMOOTHLY AND FIRMLY UPON THE SEEDED SURFACE. AVOID STRETCHING THE MATTING.
6. OVERLAP OR ABUT ROLL EDGES PER MANUFACTURER RECOMMENDATIONS. OVERLAP ROLL ENDS BY 6 INCHES (MINIMUM), WITH THE UPSLOPE MAT OVERLAPPING ON TOP OF THE DOWNSLOPE MAT.
7. KEY IN THE UPSLOPE END OF MAT 6 INCHES (MINIMUM) BY DIGGING A TRENCH, PLACING THE MATTING ROLL END IN THE TRENCH, STAPLING THE MAT IN PLACE, REPLACING THE EXCAVATED MATERIAL, AND TAMPING TO SECURE THE MAT END IN THE KEY.
8. STAPLE/STAKE MAT IN A STAGGERED PATTERN ON 4 FOOT (MAXIMUM) CENTERS THROUGHOUT AND 2 FOOT (MAXIMUM) CENTERS ALONG SEAMS, JOINTS, AND ROLL ENDS.
9. ESTABLISH AND MAINTAIN VEGETATION SO THAT REQUIREMENTS FOR ADEQUATE VEGETATIVE ESTABLISHMENT ARE CONTINUOUSLY MET IN ACCORDANCE WITH SECTION B–4 VEGETATIVE STABILIZATION.

PLAN VIEW

CROSS SECTION

CONSTRUCTION SPECIFICATIONS

1. CONSTRUCT BERM ON AN UNINTERRUPTED, CONTINUOUS GRADE.
2. INSTALL BERM TO CONFORM TO CROSS SECTION DIMENSIONS OF A UNIFORM HEIGHT OF 8 INCHES MINIMUM AND APPROXIMATE WIDTH OF 3½ FEET.
3. PROVIDE OUTLET PROTECTION AS REQUIRED ON PLAN.
4. COMPACT ASPHALT BERM.
5. REPAIR DAMAGED ASPHALT. REMOVE ACCUMULATED SEDIMENT AND DEBRIS. MAINTAIN POSITIVE DRAINAGE.
6. UPON REMOVAL OF ASPHALT BERM, RETURN TO ORIGINAL CONDITIONS OR AS SPECIFIED ON APPROVED PLAN.

TEMPORARY ASPHALT BERM

MARYLAND AVIATION ADMINISTRATION SEEDING SPECIFICATIONS

REFERENCES TO ITEM #S NOTED BELOW ARE FOUND IN MARYLAND AVIATION ADMINISTRATION'S MANUAL ENTITLED SPECIFICATIONS FOR PERFORMING LANDSCAPING ACTIVITIES FOR THE MARYLAND AVIATION ADMINISTRATION DATED JANUARY 2008.

ITEM 903 SEEDING

DESCRIPTION

903–1.1 GENERAL. This item provides specifications for seeding of areas as designated on plans or as directed by the MAA Engineer. The species, mixtures, and methods of application provided in this item have been designed to reduce the attractiveness of airport grounds to wildlife. Only MAA–approved species, mixtures, and rates of application provided in this item may be used to establish vegetation. All activities associated with seeding including soil preparation, seed application, fertilization, and maintenance shall also conform to these approved standards.

MATERIALS

903–2.1 SEED. All seed shall comply with the Maryland Seed Law (Agricultural Article of the Annotated Code of Maryland). Only MAA–approved species, mixtures, and rates of application provided in this item may be used to establish vegetation. Seed will be sampled and tested by an inspector from the Turf and Seed Section, Maryland Department of Agriculture (MDA), Annapolis, Maryland. All lawn and turf seed and mixtures shall be free from the following state–listed restricted noxious weeds:

corn cockle (agrostemma githago),
bentgrass (Agrostis spp.),*
redtop (Agrostis gigantea) *
wild onion (Allium canadense),
wild garlic (Allium vineale),
bindweed (Calstegia spp.),
dodder (Cuscuta spp.),
Bermuda grass (Cynodon dactylon),
orchardgrass (Dactylis glomerata),
tall fescue (Festuca arundinacea) *
meadow fescue (Festuca pratensis) *,
velvetgrass (Holcus lanatus),
annual bluegrass (Poa annua),
rough bluegrass (Poa trivialis),*
timothy (Phleum pratense), and
Johnson grass (Sorgum halepense).

* These species may be included as a labeled component of a mixture when each is present in excess of five percent of the mixture by weight.

Restricted noxious–weed seed may not exceed 0.5 percent by weight of any seed mixture. In addition, all seeds sold in Maryland shall be free from the following listed prohibited noxious weeds: balloonvine (Cardiospermum halicacabum), quackgrass (Elytrigia repens), sicklepod (Senna obtusifolia), sorghum (Sorghum spp.), Canada thistle (Cirsium arvense), plumeless thistle (Carduus spp.–includes musk thistle and curled thistle), and serrated tussock (Nassella trichotoma).

903.2.1.1 APPROVED SPECIES. The following table contains species that are approved by MAA for use in seed mixtures. Purity requirements and germination requirements are also provided.

APPROVED PLANT SPECIES
MMA SEED MIXTURES

	PURITY* NOT LESS THAN %	MINIMUM % GERMINATION**	PURE LIVE SEED FACTOR
CERTIFIED TURF–TYPE TALL FESCUE (Festua arundinacea)	98	90	1.1300
CERTIFIED KENTUCKY BLUE GRASS (poa pratensis)	90	80	1.3900
FOWL BLUEGRASS (Poa Palustris)	90	80	1.3900
HARD FESCUE (Festuca longifolia)	98	90	1.1300
CHEWING RED FESCUE (Festuca rubra commutata)	98	90	1.1300
ANNUAL RYEGRASS (Lolium multiflorum)	95	85	1.2400
PERENNIAL RYEGRASS (Lolium perenne)	90	80	1.3900
CREEPING BENTGRASS (Agrostis Stolonifera)	90	80	1.3900
SWITCHGRASS (Panicum Virgatum)	90	80	1.3900
LITTLE BLUESTEM (Andropogon scoparius)	62	94	1.7100

*THE PERCENTAGE WEIGHT OF PURE SEED PRESENT SHALL BE FREE OF ANY AGRICULTURE SEEDS, INERT MATTER, AND OTHER SEEDS DISTINGUISHABLE BY THEIR PERCENTAGE.

**THE PERCENTAGE OF GERMINATION SHALL BE ACTUAL SPROUTS AND SHALL NOT INCLUDE HARD SEEDS UNLESS SPECIFICALLY PERMITTED BY THE MAA ENGINEER.

903–2.1.2 PURITY. All seed shall be free of all state–designated noxious weeks listed in Paragraph 2.1.1 and conform to MAA specifications. To ensure compliance, MAA requires sampling and testing of seed by the Turf and Seed Section, Maryland Department of Agriculture (MDA). The Contractor shall furnish the MAA Engineer with duplicate signed copies of a statement by the Turf and Seed Section certifying that each lot of seed has been laboratory tested within six months of date of delivery. This statement shall include the following information:

- name and address of laboratory,
- date of test,
- lot number,
- the results of tests as to name, percentages of purity and of germination,
- percentage of weed content for the seed furnished,
- and, in the case of a mixture, the proportions of each kind of seed.

Seed shall be furnished in standard containers with the seed name, lot number, net weight, percentages of purity, germination rate and hard seed, and percentage of maximum weed seed content clearly marked. All seed containers shall be tagged with a MDA supervised mix program seed tag.

903–2.1.3 MIXTURES AND APPLICATION RATES. Only seed mixtures and application rates described in this item may be used unless otherwise approved by the MAA Engineer. seed mixtures shall meet criteria detailed in Paragraph 903–2.1.2. Seed mixtures have been formulated to minimize the attractiveness of areas to wildlife of common landscape scenarios. The appropriate seed mixture for application will be designated based on environmental conditions and may vary from site to site. All planting rates listed are in pounds of Pure Live Seed (PLS) per acre.

Seed mixtures, application scenarios, and rates for permanent cool–season grasses are as follows:

a. Seed Mixture No. 1 – relatively flat areas (grade less than 4:1) subject to normal conditions and regular mowing (Application rate = 234 lbs PLS/acre)
b. Seed Mixture No. 2 – sloped areas (grade greater than 4:1) not subject to regular mowing (Application Rate = 115 lbs PLS/acre); and
c. Seed Mixture No. 3 – wetlands and their associated buffer zones (Application rate = 131 lbs PLS/acre).

Seed Mixture No. 1: Relatively flat areas regularly mowed and exposed to normal conditions (Application rate = 234 lbs PLS/acre)

Seed		Rate of Application (lbs of PLS/acre)
85%	Certified Turf–Type Tall Fescue	192
10%	Certified Kentucky Bluegrass	28
5%	Perennial Ryegrass	14
Supplemental Seed		
	Annual Ryegrass	25

Seed Mixture No. 2: Sloped areas not subject to regular mowing (Application rate = 115 lbs PLS/acre)

Seed		Rate of Application (lbs of PLS/acre)
75%	Hard Fescue	85
20%	Chewing Fescue	23
5%	Kentucky Bluegrass	7
Supplemental Seed		
	Redtop	3

Seed Mixture No. 3: Wetland areas and their associated buffer zones (Application rate = 131 lbs PLS/acre)

Seed		Rate of Application (lbs of PLS/acre)
60%	Creeping Bentgrass	83
30%	Fowl Bluegrass	34
10%	Switchgrass	14
Supplemental Seed		
	Redtop	3

903.2.1.4 SEEDING SEASON. Application of seed and seed mixtures shall occur within a specified seeding season unless otherwise approved by the MAA Engineer. No seed or seed mixtures are to be applied on frozen ground or when the temperature is at or below 35 degrees Farenheit (7.2 degrees Centigrade). Under these conditions, a layer of mulch should be applied in accordance with Item 905, Mulching, to stabilize the site, and permanent seeding should occur in the subsequent seeding season. Seed application may occur during the seeding season dates listed below. Seeding performed after October 20 should be a temporary cover of annual ryegrass and followed by overseeding of the appropriate seed mixture during the spring seeding season.

SEEDING SEASONS

PERMANENT COOL–SEASON GRASSES	MARCH 1 TO APRIL 20 AND AUGUST 1 TO OCTOBER 20, INCLUSIVE
TEMPORARY COVER OF ANNUAL RYE/REDTOP	MARCH 1 TO APRIL 30 AND AUGUST 1 TO NOVEMBER 30, INCLUSIVE
TEMPORARY COVER OF WARM–SEASON GRASSES (LITTLE BLUESTEM ONLY)	MAY 1 TO JULY 31, INCLUSIVE. RATE OF APPLICATION SHOULD BE 13.6 LBS. PLS PER ACRE

903–2.2 LIME. Lime shall consist of ground limestone and contain at least 85 percent total carbonates. Lime shall be ground to a fineness so that at least 90 percent will pass through a No. 20 mesh sieve and 50 percent will pass through a No. 100 mesh sieve. Dolomitic lime or a high magnesium lime shall contain at least 10 percent magnesium oxide. Lime shall be applied by approved methods detailed in Section 903–3.3 of this item. The rate of application will be based on results of soil tests.

903–2.3 FERTILIZER. Fertilizer shall be standard commercial fertilizer (supplied separately or in mixtures) and meet the requirements of applicable state and federal laws (O–F–241) as well as standards of the Association of Official Agricultural Chemists. Nitrogen–Phosphorus–Potassium (N–P–K) concentrations shall be determined from analysis of soil samples. Methods of fertilizer application shall conform to standards described in Section 903–3.3 of this item. Fertilizer shall be furnished in standard containers that are clearly labeled with name, weight, and guaranteed analysis of the contents (percentage of total nitrogen, available phosphoric acid, and water–soluble potash). Mixed fertilizers shall not contain any hydrated lime or cyanamide compounds. Fertilizers failing to meet the specified analysis may be approved by the MAA Engineer, providing sufficient materials are applied to conform with the specified nutrients per unit of measure without additional cost to MAA.

The fertilizers may be supplied in the following forms:
a. A dry, free–flowing fertilizer suitable for application by a common fertilizer spreader;
b. A finely ground fertilizer soluble in water, suitable for application by power sprayers; or
c. A granular or pellet form suitable for application by blower equipment.

The rate of application will be based on results of soil tests performed by the University of Maryland Soil Testing Laboratory. By law, persons applying fertilizer to State–owned land shall follow the recommendations of the University of Maryland as set forth in the "Plant Nutrient Recommendations Based on Soil Tests for Turf Maintenance" and the "Plant Nutrient Recommendations Based on Soil Tests for Sod Production". Application of the fertilizer shall be in a manner that is consistent with the recommendations of the University of Maryland Cooperative Extension.

CONSTRUCTION METHODS AND EQUIPMENT

903–3.1 GENERAL. This section provides approved methods for the application of and includes standards for seedbed preparation, methods of application, and equipment to be used during the process. Lime and fertilizer shall be applied to seeded areas before the seed is spread. The mixture of seed will be determined for sites based on environmental conditions as described in Paragraph 903–2.1.3.

903–3.2 ADVANCE PREPARATION. Areas designated for seeding shall be properly prepared in advance of seed application. The area shall be tilled and graded prior to application of lime and fertilizer, and the surface area shall be cleared of any stones larger than 1 inch in diameter, sticks, stumps, and other debris that might interfere with sowing of seed, growth of grasses, or subsequent maintenance of grass–covered areas. Damage caused by erosion or other forces that occur after the completion of grading shall be repaired prior to the application of fertilizer and lime. The Contractor will repair such damage, which may include filling gullies, smoothing irregularities, and repairing other incidental damage before beginning the application of fertilizer and ground limestone.

If an area to be seeded is sparsely sodded, weedy, barren and unworked, or packed and hard, all grass and weeds shall first be cut or otherwise satisfactorily disposed of, and the soil then scarified or otherwise loosened to a depth not less than 5 inches (125 mm). Clods shall be broken and the top 3 inches (75 mm) of soil shall be worked into a satisfactory condition by discing or by use of cultipackers, rollers, drags, harrows, or other appropriate means.

An area to be seeded shall be considered a satisfactory seedbed (without requiring additional treatment) if it has recently been thoroughly loosened and worked to a depth of not less than 5 inches; the top 3 inches of soil is loose, friable, and is reasonably free from large clods, rocks, large roots, or other undesirable matter; appropriate amounts of fertilizer and lime have been added; and, if it has been shaped to the required grade immediately prior to seeding. For slope areas steeper than 3:1 (three horizontal to one vertical), the subsoil shall be loose to a depth of 1 inch.

After completion of tilling and grading, lime and fertilizer shall be applied within 48 hours according to the specified rate (Paragraphs 903–2.2 and 2.3) and methods (Paragraphs 903–3.3.1 and 903–3.3.2) approved by MAA. The seeding mixture shall be applied within 48 hours after application of lime and fertilizer. To firm the seeded areas, cultipacking shall occur immediately after seeding.

903–3.3 METHODS OF APPLICATION. Lime, fertilizer, and seed mixes shall be applied by either the dry or wet application methods that have been approved by MAA and are detailed below.

903–3.3.1 DRY APPLICATION METHOD

a. Liming. If soil test results indicate that lime is needed, the following procedures will be used: following advance preparation of the seedbed, lime shall be applied prior to the application of any fertilizer or seed and only on seedbeds that have been prepared as described in paragraph 903–3.2. The lime shall be uniformly spread and worked into the top 2 inches of soil, after which the seedbed shall be properly graded again.
b. Fertilizing. Following advance preparations (and liming if necessary), fertilizershall be spread uniformly at the specified rate to provide no less than the minimum quantity stated in Paragraph 903–2.3.
c. Seeding. Seed mixtures shall be sown immediately after fertilization of the seedbed. The fertilizer and seed shall be lightly raked to a depth of 1 inch for newly graded and disturbed areas.
d. Rolling. After the seed has been properly covered, the seedbed shall be immediately compacted using a cultipacker or an approved lawnroller.

903–3.3.2 WET APPLICATION METHOD/HYDROSEEDING

A. GENERAL.The contractor may elect to apply seed and fertilizer as per paragraphs c and d of this section in the form of an aqueous mixture by spraying over the previously prepared seedbed using methods and equipment approved by MAA. The rates of application shall be as specified in paragraphs 903–2.1 through 903–2.3.

B. SPRAYING EQUIPMENT. The spraying equipment shall have a container or water tank equipped with a liquid level gauge capable of reading increments of 50 gallons or less over the entire range of the tank capacity. The liquid level gauge shall be mounted so as to be visible to the nozzle operator at all times. The container or tank shall also be equipped with a mechanical power–driven agitator capable of keeping all the solids in the mixture in complete suspension at all times until used.

The spraying equipment shall also include a pressure pump capable of delivering 100 gallons per minute at a pressure of 100 pounds per square inch. The pressure pump assemblage shall be configured to allow the mixture to flow through the tank when not being sprayed from the nozzle. All pump passages and pipelines shall be capable of providing clearance for 5/8–inch solids. The power unit for the pump and agitator shall have controls mounted so as to be accessible to the nozzle operator. A pressure gauge shall be connected to and mounted immediately behind the nozzle.

The nozzle pipe shall be mounted on an elevated supporting stand in such a manner that it can be rotated through 360 degrees horizontally and inclined vertically from at least 20 degrees below to at least 60 degrees above the horizontal. There shall be a quick–acting, three–way control valve connecting the recirculating line to the nozzle pipe and mounted so that the nozzle operator can control and regulate the amount of flow of mixture to be supplied so that mixtures may be properly sprayed over a distance varying from 20 feet to 100 feet. One shall be a close–range ribbon nozzle, one a medium–range ribbon nozzle, and one a long–range jet nozzle. for ease of removal and cleaning, All nozzles shall be connected to the nozzle pipe by means of quick–release couplings. In order to reach areas inaccessible to the regular equipment, an extension hose at least 50 feet in length shall be provided to which the nozzles may be connected.

C. MIXTURES. Lime shall be applied separately in the quantity specified, prior to the fertilizing and seeding operations. Lime should be added to and mixed with water at a concentration not to exceed 220 pounds of lime for every 100 gallons of water. After lime has been applied, the tank should be emptied and rinsed with fresh water. Seed and fertilizer shall be mixed together in the relative proportions specified, but the resulting concentration should not exceed 220 pounds of mixture per 100 gallons of water and should be applied within 30 minutes to prevent fertilizer burn of the seeds.

All water used shall be obtained from fresh water sources and shall be free from injurious chemicals and other toxic substances harmful to plant life. Brackish water shall not be used at any time. The contractor shall identify all sources of water to the MAA engineer at least two weeks prior to use. The engineer may take samples of the water at the source or from the tank at any time and have a laboratory test the samples for chemical and saline content. The contractor shall not use any water from any source that is disapproved by the engineer following such tests.

All mixtures shall be constantly agitated from the time they are mixed until they are finally applied to the seedbed. All such mixtures shall be used within 30 minutes from the time they were mixed or they shall be wasted and disposed of at a location acceptable to the engineer.

D. SPRAYING. Lime shall be sprayed upon previously prepared seedbeds on which the lime, if required, shall have been worked in already. The mixtures shall be applied using a high–pressure spray which shall always be directed upward into the air so that the mixtures will fall to the ground in a uniform spray. Nozzles or sprays shall never be directed toward the ground in such a manner that might produce erosion or runoff. Particular care shall be exercised to ensure that the application is made uniformly, at the prescribed rate, and to guard against misses and overlapped areas. Predetermined quantities of the mixture shall be used in accordance with specifications to cover specified sections of known areas. To checks the rate and uniformity of application, the applicator will observe the degree of wetting of the ground or distribute test sheets of paper or pans over the area at intervals and observe the quantity of material deposited thereon.

On surfaces that are to be mulched as indicated by the plans or designated by the MAA engineer, seed and fertilizer applied by the spray method need not be raked into the soil or rolled. however, on surfaces on which mulch is not to be used, the raking and rolling operations will be required after the soil has dried.

903–3.4 MAINTENANCE OF SEEDED AREAS. The contractor shall protect seeded areas against traffic or other use by warning signs or barricades, as approved by the engineer. Surfaces gullied or otherwise damaged following seeding shall be repaired by regrading and reseeding as directed. The contractor shall mow, water as directed, and otherwise maintain seeded areas in a satisfactory condition until final inspection and acceptance of the work.

When either the dry or wet application method outlined above is used for work performed out of season, the contractor will be required to establish a good stand of grass of uniform color and density to the satisfaction of the engineer. If at the time when the contract has been otherwise completed it is not possible to make an adequate determination of the color, density, and uniformity of such stand of grass, payment for the unaccepted portions of the areas seeded out of season will be withheld until such time as these requirements have been met.

ITEM 904 SODDING

DESCRIPTION

904–1 This item provides standards for furnishing, hauling, and placing approved live sod on prepared areas as indicated on site plans. Sod will only be applied to landscape areas and shall be mowed frequently. All sodding activities shall conform to these specifications at the locations shown on site plans or as directed by the MAA Engineer.

MATERIALS

904–2.1 SOD. Sod furnished by the Contractor shall have a good cover of living or growing grass. This includes grass that is seasonally dormant during the cold or dry seasons and capable of renewing growth after the dormant period. All sod shall be obtained from areas in which the soil is reasonably fertile and contains a high percentage of loamy topsoil. Sod shall be cut or stripped from living, thickly matted turf relatively free of weeds or other undesirable foreign plants, large stones, roots, or other materials that might be detrimental to the development of the sod or to future maintenance. Grass sod shall be Maryland–certified or approved and shall comply with the Maryland Sod Law of the Annotated Code of Maryland (Agricultural Article Sections

9–101 through 9–110). Each load of sod shall bear a Maryland State Approved or Certified label at the time of delivery on the job. Sod shall be either: (1) Bluegrass sod containing not less than 80 percent Kentucky bluegrass (Poa pratensis) and not more than 20 percent Red Fescue (Festuca rubra); or (2) certified turf type–tall fescue (Festuca arundinacea) sod containing not less than 80 percent certified turf type–tall fescue (Festuca arundinacea) grass and not more than 20 percent Kentucky Bluegrass (Poa pratensis) and Red Fescue (Festuca rubra). Any vegetation more than 6 inches in height shall be mowed to a height of 3 inches or less before sod is lifted. Sod, including the soil containing the roots and the emergent plant growth, shall be cut uniformly to a thickness not less than that specified in Section 904–3.4.

904–2.2 LIME. Lime shall conform to standards described in Section 903, 'Seeding.'

904–2.3 FERTILIZER. Fertilizers and application methods shall conform to the standards previously described in Section 903, 'Seeding.'

904–2.4 WATER. All water shall conform to the standards previously described in Paragraph 902–2.4, 'Water.'

904–2.5 SOILS FOR REPAIR. All soils for repairs shall conform to the standards previously described in Paragraph 901–2.3, 'Soils for Repair.'

CONSTRUCTION REQUIREMENTS

904–3.1 GENERAL. Areas to be sodded shall be clearly indicated by site plans. Areas requiring special ground surface preparation, such as tilling, and those areas in a satisfactory condition that are to remain undisturbed shall also be shown on the plans.

Suitable equipment necessary for proper preparation of the ground surface and for the handling and placing of all required materials shall be on hand, in good condition, and shall be approved by the MAA Engineer before sodding operations begin. The Contractor shall demonstrate to the MAA Engineer, before starting the various operations, that the application of required materials, such as fertilizer and limestone, will be made at the specified rates.

904–3.2 ADVANCE PREPARATION. If the area to be sodded is sparsely vegetated, weedy, barren and unworked, or packed and hard, all existing herbaceous vegetation shall be removed. The soil shall then be scarified or otherwise loosened to a depth of at least 5 inches (125 mm). Clods shall be pulverized, and the top 3 inches (75 mm) of soil shall be worked into a satisfactory bed by discing or use of cultipackers, rollers, drags, harrows, or other equipment approved by the MAA Engineer. The area shall then be properly graded as indicated by site plans.

After grading of areas is complete and prior to the application of fertilizer and limestone, areas to be sodded shall be raked or otherwise cleared of stones larger than 1 inch in diameter, sticks, stumps, and other debris which might interfere with sodding, growth of grasses, or subsequent maintenance of grass–covered areas. If any damage by erosion or other causes has occurred after grading of areas and before beginning the application of fertilizer and ground limestone, the Contractor shall repair such damage. This may include filling gullies, smoothing irregularities, and repairing other incidental damage.

An area to be sodded will be considered a satisfactory seedbed without requiring additional treatment if it recently has been thoroughly loosened and worked to a depth of not less than 5 inches as a result of grading operations and, if immediately prior to sodding, the top 3 inches of soil is loose, friable, reasonably free from large clods, rocks, large roots, or other undesirable matter, and is shaped to the required grade. For slope areas steeper than 3:1 (three horizontal to one vertical) the subsoil shall be loosened to a depth of 1 inch. Lime and fertilizer shall be applied within 48 hours after tilling as described in 903–3.3 and 3.4. The sod shall be applied immediately after the lime and fertilizer have been worked into the soil.

904–3.3 APPLICATION OF FERTILIZER AND LIME. Following ground surface preparation, fertilizer shall be uniformly spread as described in Section 903–3.3 at a rate that will provide at least the minimum quantity of fertilizer required. If the use of ground limestone is specified, it shall be spread as described in Section 903–3.3, 'Methods of Application'; at a rate that will provide at least the minimum quantity of lime required. These materials shall be incorporated into the soil to a depth of at least 2 inches by discing, raking, or other methods approved by the MAA Engineer. Any stones larger than 1 inch in diameter, large clods, roots, and other litter brought to the surface by this operation shall be removed.

904–3.4 OBTAINING AND DELIVERING SOD. The sod shall be well rooted, grown in the State of Maryland, and field grown for a minimum of 12 months. After inspection and approval of the sod by the MAA Engineer, the sod shall be cut with approved sod cutters to such a thickness that after placement on the prepared bed, but before compaction, it shall have a uniform attached soil thickness of at least 0.75 inch. Sod sections or strips shall be cut in uniform widths of at least 14 inches and in lengths of at least 18 inches, but not to lengths that might inhibit placement without breaking, tearing, or loss of soil. Where strips are required, the sod shall be rolled or folded undamaged, with the grass facing inward. The Contractor may be required to mow high grass before cutting sod.

Sod shall be transplanted within 24 hours from the time of harvest unless circumstances beyond the Contractor's control make storage necessary. In such cases, sod shall be stacked, kept moist, protected from exposure to the air and sun, and shall be kept from freezing. Sod shall only be harvested and mowed when soil moisture conditions are such that favorable results can be expected. Where soil is too dry, permission to cut sod may be granted only after it has been sufficiently watered to moisten the soil to the depth at which the sod will be cut.

904–3.5 PLACING SOD. Sodding shall only be performed during seasons when satisfactory results can be expected. Frozen sod shall not be used and sod shall not be placed upon frozen soil. Sod may be transplanted during periods of drought with the approval of the MAA Engineer, provided the sod bed is watered to moisten the soil to a depth of at least 4 inches immediately prior to laying the sod.

The sod shall be moist and shall be placed on a bed, prepared according to Paragraphs 904–3.2 'Advance Preparation', and 904–3.3, 'Application of Fertilizer and Lime'by hand. Pitchforks shall not be used to handle sod, and dumping from vehicles shall not be permitted. The sod shall be placed carefully by hand, edge to edge and with staggered joints, in rows at right angles to the slopes, starting at the base of the area to be sodded and working upward. The sod shall immediately be pressed firmly into contact with the sod bed by tamping or rolling with approved equipment to provide a true and even surface, and ensure knitting without displacement of the sod or deformation of the surfaces of sodded areas. Where the sod has been displaced during sodding operations, the workmen replacing it shall work from ladders or treaded planks to prevent further displacement. Where the grades are such that the flow of water will be from paved surfaces across sodded areas, the surface of the soil in the sod after compaction shall be set approximately 1.5 inches below the pavement edge. Where the flow will be over the sodded areas and onto the paved surfaces around manholes and inlets, the surface of the soil in the sod after compaction shall be placed flush with pavement edges.

On slopes steeper than 1:2.5 and in V–shaped or flat–bottom ditches or gutters, the sod shall be secured with wooden pegs at least 18 inches long and a cross–sectional area of at least 0.75–square inch, or by other methods of securing sod approved by the MAA Engineer. The pegs shall be driven flush with the surface of the sod. The pegs shall be of sufficient number and at adequate spacing to secure sod from displacement. The use of sod staples or other means of securing the sod from displacement may be approved by the MAA Engineer provided satisfactory results are expected.

904–3.6 WATERING. Adequate water and watering equipment shall be on hand before sodding begins, and sod shall be kept moist until it has become established and its continued growth assured. In all cases, watering shall be done in a manner that will avoid erosion from the application of excessive quantities and will avoid damage to the finished surface.

904–3.7 ESTABLISHING TURF.

904–3.7.1 GENERAL. The Contractor shall provide general care for the sodded areas as soon as the sod has been laid and shall continue to provide such care until final inspection and acceptance of the work.

904–3.7.2 PROTECTION. All sodded areas shall be protected against traffic or other use by warning signs and barricades approved by the MAA Engineer.

904–3.7.3 MOWING. The Contractor shall mow the sodded areas with approved mowing equipment, depending upon climatic and growth conditions and the needs for mowing of specific areas. in the event that weeds or other undesirable vegetation establishes to such an extent that, either cut or uncut, they threaten to smother the sodded species, the weeds shall be mowed and the clippings raked and removed from the area. Spot applications of an appropriate herbicide by a licensed applicator shall be approved by the MAA Engineer to remove invasive species. The appropriate herbicide shall be determined on a case–by–case basis, depending on the location and type of weed.

904–3.7.4 REPAIR. When the surface has become gullied or otherwise damaged during the period covered by this contract, the affected areas shall be repaired to re–establish the grade and the condition of the soil and shall then be re–sodded as specified in Paragraph 904–3.5, 'Placing Sod', at the Contractor's expense

ITEM 905 MULCHING

DESCRIPTION

905–1.1 GENERAL. This item provides the Contractor with MAA–approved specifications for mulch and the application of mulch including distribution of mulch and securing of mulched areas. Areas to be mulched will be clearly shown on site plans or otherwise designated by the MAA Engineer.

MATERIALS

905–2.1 TYPES OF MULCH. Acceptable mulch shall be composed of the materials listed below or composed of any locally available materials that are similar to those specified and approved by the MAA Engineer. Low–grade, shalely, soiled, partially rotted hay, straw, or other materials unfit for animal consumption will not be acceptable for use as mulch. Straw or other material that is fresh, excessively brittle, or is in such an advanced stage of decomposition as to smother or retard the planted grass, is not acceptable. Clean, weed–free straw may be used. Mulch materials containing matured seed with the potential to establish and be detrimental to the project or the surrounding area is not acceptable.

a. Shredded Hardwood Bark. Shredded hardwood bark shall consist of hardwood tree bark that has been milled and screened to ensure a maximum 4–inch (100–mm) particle size, provide a uniform texture, and be free from sawdust, toxic substances, and other foreign materials.

b. Wood Chips. Wood chips shall be produced by a chipping machine to a size specified by the MAA Engineer. Chips may not have been subjected to any conditions that would shorten their useful life or cause them to lose any of their value as mulch. Wood chips shall be free from bark, leaves, twigs, wood shavings, sawdust, toxic substances, and other foreign material.

c. Wood Cellulose Fiber. Wood cellulose fiber shall consist of a processed wood product with uniform fiber characteristics. The fiber shall be capable of remaining in a uniform suspension under agitation in water and blending with seed, fertilizer, and other additives to form a homogeneous slurry. The fiber shall perform satisfactorily in hydraulic seeding equipment without clogging or damaging the system. The slurry shall contain a green dye to provide easy visual inspection for uniformity of application.

Certification showing that the fiber material conforms to the following specifications shall be provided by the manufacturer:

Wood Cellulose Fiber Requirements

Particle Length, in. (mm)	Approximately 1/2 (13)
Particle Thickness, in. (mm)	Approximately 1/16 (1.5)
Net dry Weight Content	Minimum as stated on bag
TAPPI* T 509, pH	4.0 to 8.5
Ash Content, TAPPI* Standard T 413, % max	7.0
Water Holding Capacity, % min	90

*Technical Association of Pulp and Paper Industry

The material shall be delivered in packages of uniform net weight of 75 lbs (34 kg) or less and shall be clearly labeled with the name of the manufacturer, net weight, and a supplemental statement of the net weight content.

905–2.2 INSPECTION. Within five days after acceptance of the bid, the Contractor shall provide representative samples of mulch material to be used to the MAA Engineer and identify the source of the material and quantities of mulch materials available. The samples provided may be used as standards with the approval of the MAA Engineer and any materials brought on the site that do not meet these standards may be rejected.

CONSTRUCTION REQUIREMENTS

905–3.1 ADVANCE PREPARATION. Before spreading mulch, all large clods, stumps, stones, brush, roots, and other foreign material shall be removed from the area to be mulched. Mulch shall be applied immediately after seeding unless otherwise specified. The application and spreading of mulch may be by hand methods, blower, or other mechanical methods, provided a uniform covering is obtained.

905–3.2 APPLICATION OF MULCH. The Contractor shall evenly apply mulch materials to areas indicated by site plans or otherwise designated by the MAA Engineer. Cellulose–fiber or wood–pulp mulch shall be applied at the rate of 1,500 pounds (dry weight) per acre. Mulch may be blown on the slopes and use of cutters in the equipment for this purpose will be permitted to the extent that at least 95 percent of the mulch in place on the slope is 6 inches or more in length. When mulch applied by the blowing methods is cut, the loose depth in place shall be 1 to 2 inches. Cellulose fiber or wood–pulp mulch shall be applied as an aqueous mixture by spraying at the rate of 1,500 pounds (dry weight) per acre using spraying equipment approved by the MAA Engineer.

905–3.3 SECURING MULCH. Mulch shall be held in place by light discing, a thin coating of topsoil, pins, stakes, wire mesh, or other methods approved by the MAA Engineer. If the 'peg and string'method is used, the mulch shall be secured with stakes or wire pins driven into the ground on 5–foot centers or less. Binder twine shall be strung between adjacent stakes in straight lines and crossed diagonally over the mulch. The stakes shall be firmly driven nearly flush to the ground to draw the twine tightly onto the mulch.

905–3.4 MAINTENANCE OF MULCHED AREAS. The Contractor shall care for mulched areas until final acceptance of the project. Care required may consist of providing protection against traffic or other disturbances by placement of warning signs and/or barricades before or immediately after mulching has been completed.

The Contractor may be required to repair or replace any mulching that is defective or becomes damaged before the project is finished and deemed satisfactory by the MAA Engineer. When, in the judgment of the MAA Engineer, defects or damage result from poor workmanship or failure to meet the requirements of the specifications, the cost of the necessary repairs or replacement will be borne by the Contractor. However, once the Contractor has completed the mulching of an area in accordance with the provisions of the specifications and to the satisfaction of the Engineer, no additional work at his expense will be required. Any subsequent repairs and/or replacements deemed necessary by the Engineer may be made by the Contractor and will be paid for as additional or extra work.

APPENDIX B—RTDS SPECIFICATION SHEETS

HEALTH AND SAFETY

Exposure Monitoring

Features and Benefits

- Easy to program, easy to operate
- New graphical user interface with color touch-screen
- Perform in-line gravimetric analysis for custom reference calibrations
- Automatic zeroing (with optional zero module) minimizes the effect of zero drift
- Measure aerosol concentrations corresponding to PM_1, $PM_{2.5}$, PM_{10}, or Respirable size fractions

DustTrak™ II Aerosol Monitor

Models 8530, 8531, and 8532

Desktop or Handheld Units for Any Environment, Any Application

The new DustTrak II Aerosol Monitors are battery-operated, data-logging, light-scattering laser photometers that give you real-time aerosol mass readings. They use a sheath air system that isolates the aerosol in the optics chamber to keep the optics clean for improved reliability and low maintenance. Suitable for clean office settings as well as harsh industrial workplaces, construction and environmental sites and other outdoor applications. DustTrak II monitors measure aerosol contaminants such as dust, smoke, fumes and mists.

Applications

- Industrial/occupational hygiene surveys
- Indoor air quality investigations
- Outdoor environmental monitoring
- Baseline trending and screening
- Point source monitoring
- Engineering control evaluations
- Engineering studies
- Remote monitoring
- Process monitoring
- Emissions monitoring
- Aerosol research studies

TRUST. SCIENCE. INNOVATION.

Easy to Program and Operate

The new graphical user interface with color touch-screen puts everything at your fingertips. The easy-to-read display shows real-time mass concentration and graphical data as well as other statistical information along with instrument pump, laser and flow status, and much more. Perform quick walk-through surveys or program the instrument's advanced logging modes for long-term sampling investigations. Program start times, total sampling times, logging intervals, alarm setpoints and many other parameters. You can even set up the instrument for continuous unattended operation.

Desktop Models: Ideal for Long-Term Surveys and Remote Monitoring Applications

Manual and programmable data logging functions also make DustTrak II desktop monitors ideal for unattended applications. They come with USB (device and host), Ethernet, and analog and alarm outputs allowing remote access to data. User adjustable alarm setpoints for instantaneous or 15-minute short-term excursion limit (STEL) are available on desktop models. The alarm output with user-defined setpoint alerts you when upset or changing conditions occur.

All DustTrak II desktop monitors have three unique features:

- Gravimetric sampling capability using a 37-mm filter cassette which can be inserted in-line with the aerosol stream allowing you to perform an integral gravimetric analysis for custom reference calibrations.
- They can be zeroed automatically using the external zeroing module. This optional accessory is used when sampling over extended periods of time. By zeroing the monitor during sampling, the effect of zero drift is minimized.
- STEL alarm feature for tracking 15-minute average mass concentrations when alarm setpoint has been reached for applications like monitoring fugitive emissions at hazardous waste sites.

Handheld Models: Perfect for Walk-Through Surveys and Single-Point Data Collection Applications

DustTrak II handheld models are lightweight and portable. They're perfect for industrial hygiene surveys, point source location monitoring, indoor air quality investigations, engineering control evaluations/validation, and for baseline trending and screening. Like desktop models, they have manual and programmable data logging functions. In addition, they have single-point data logging capability. Single-point data collection is used for walk-through industrial hygiene surveys and indoor air quality investigations.

New Software Makes Monitoring Easier than Ever

TrakPro™ Data Analysis Software allows you to set up and program directly from a PC. A new feature is the ability for remote programming and data acquisition from your PC via wireless (922 MHz or 2.4 GHz) communications or over an Ethernet network. As always, you can print graphs, raw data tables, and statistical and comprehensive reports for recordkeeping purposes.

DustTrak II Aerosol Monitor Features

All Models

- Li-Ion rechargeable batteries
- Internal and external battery charging capabilities
- Outlet port for isokinetic sampling applications
- User serviceable sheath flow and pump filters
- Logged test pause and restart feature
- Logged test programming
  - Color touch screen—either manual mode or program mode
  - TrakPro™ Data Analysis Software via a PC
- User adjustable custom calibration settings
- Instantaneous alarm settings with visual and audible warnings
- Real-time graph display
- View statistical information during and after sampling
- On-screen instrument status indicators: FLOW, LASER and FILTER
- Filter service indicator for user preventative maintenance

All Desktop Models

- Hot swappable batteries
- Gravimetric reference sample capability
- Long life 10,000-hour internal pump
- TrakPro Data Analysis Software
- Auto zeroing module (optional accessory)
- STEL alarm setpoint

All Handheld Models

- Long life 2,500-hour internal pump
- Single-point data collection for walk through surveys
- TrakPro Data Analysis Software

Battery Performance

Models 8530/8531 (typical) 6600 mAH Li-Ion Battery Pack (P/N 801680)	1 Battery	2 Batteries
Battery Runtime (hours)	up to 6	up to 12
Charge Time * (hours) in DustTrak	4	8
Charge Time* (hours) in external battery charger (P/N 801685)	4	8

Model 8532 (typical) 3600 mAH Li-Ion Battery Pack (P/N 801681)	Battery
Battery Runtime (hours)	up to 6

Charge Time* (hours) in external battery charger (P/N 801686)	4

*of a fully depleted battery

Specifications

Models 8530, 8531, and 8532
DustTrak™ II Aerosol Monitor

Sensor Type
90° light scattering

Particle Size Range
0.1 to 10 µm

Aerosol Concentration Range

8530 Desktop	0.001 to 150 mg/m^3
8531 Desktop High Conc.	0.001 to 400 mg/m^3
8532 Handheld	0.001 to 150 mg/m^3

Resolution
±0.1% of reading or 0.001 mg/m^3, whichever is greater

Zero Stability
±0.002 mg/m^3 per 24 hours at 10 sec time constant

Flow Rate
3.0 L/min set at factory, 1.40 to 3.0 L/min, user adjustable

Flow Accuracy
±5% of factory set point, internal flow controlled

Temperature Coefficient
+0.001 mg/m^3 per °C

Operational Temp
32 to 120°F (0 to 50°C)

Storage Temp
-4 to 140°F (-20 to 60°C)

Operational Humidity
0 to 95% RH, non-condensing

Time Constant
User adjustable, 1 to 60 seconds

Data Logging
5 MB of on-board memory (>60,000 data points)
45 days at 1 minute logging interval

Log Interval
User adjustable, 1 second to 1 hour

Physical Size (HWD)

Handheld	4.9 x 4.8 x 12.5 in. (12.5 x 12.1 x 31.6 cm)
Desktop	5.3 x 8.5 x 8.8 in. (13.5 x 21.6 x 22.4 cm)

Weight

Handheld	2.9 lb (1.3 kg), 3.3 lb (1.5 kg) with battery
Desktop	3.5 lb (1.6 kg), 4.5 lb (2.0 kg)–1 battery, 5.5 lb (2.5 kg)–2 batteries

Communications

8530/31	USB (host and device) and Ethernet. Stored data accessible using flash memory drive
8532	USB (Hose and device). Stored data accessible using flash memory drive

Power–AC
Switching AC power adapter with universal line cord included, 115–240 VAC

Analog Out

8530/31	User selectable output, 0 to 5 V or 2 to 20 mA User selectable scaling range

Alarm Out

8530/31	Relay or audible buzzer Relay Non-latching MOSFET switch User selectable set point –5% deadband Connector 4-pin, Mini-DIN connectors
8532	Audible buzzer

Screen

8530/31	5.7 in. VGA color touchscreen
8532	3.5 in. VGA color touchscreen

Gravimetric Sampling

8530/31	Removable 37 mm cartridge (user supplied)

CE Rating

Immunity	EN61236-1:2006
Emissions	EN61236-1:2006

SidePak™ AM510 Personal Aerosol Monitor

The SidePak AM510 Personal Aerosol Monitor for industrial hygiene and safety professionals displays and data logs aerosol concentration in real time. The rugged, belt-mountable laser photometer is compact and quiet, minimizing interference and worker discomfort. The built-in sampling pump lets you attach a wide variety of size-selective aerosol inlet conditioners for breathing zone or area measurements with a respirable cyclone or one of the three integrated impactors.

The SidePak monitor incorporates TSI's Smart Battery Management System. This system utilizes a built-in "gas gauge" in the battery packs to monitor battery condition and provide precise run time information.

The SidePak monitor's easy-to-read display shows your data as both real-time aerosol mass-concentration and 8-hour time-weighted average (TWA). The monitor's intrinsic safety rating makes it ideal for hazardous/explosive environments. With its convenient data logging and long battery life, the SidePak is also ideal for extended sampling. The easy-to-use TrakPro™ Data Analysis Software lets you create effective graphs and reports.

User Friendly

- Small, lightweight and quiet to maximize worker acceptance
- Rugged design with secure belt clip
- Easy-to-understand user interface with only four keys
- Lockable keypad prevents tampering while sampling
- User-adjustable sample flow rate
- Define, label and store multiple calibration constants
- Easy-to-read LCD display
- Convenient, threaded tripod socket accommodates area sampling

Advanced Features

- Smart Battery Management System provides precise run time information, maximizes battery capacity and speeds charging
- Integrated pump allows use of size-selective aerosol inlet conditioners
- Built-in impactors let you choose "none," 1.0, 2.5 or 10-micron cut off
- Display shows real-time concentrations (mg/m^3) and "on-the-fly" TWA as you data log
- Display statistics: max, min and average readings, elapsed time and 8-hour TWA

Quick and Easy Reports

- Convenient preprogramming for occupational exposure sampling
- Data log for long periods and store multiple tests
- Analyze data, print graphs and create reports with TrakPro software
- USB port lets you conveniently connect to your computer

Power to Spare

- Long-lasting NiMH rechargeable battery packs eliminate "memory" issues
- Choice of rechargeable NiMH smart battery packs or AA-cell pack

TSI.

Specifications

SidePak AM510 Personal Aerosol Monitor

Sensitivity

Sensor type	90° light scattering, 670 nm laser diode
Aerosol concentration range	0.001 to 20 mg/m³ (calibrated to respirable fraction of ISO 12103-1, A1 test dust)
Particle size range	0.1 to 10 micrometer (µm)
Minimum resolution	0.001 mg/m³
Zero stability	±0.001 mg/m³ over 24 hours using 10-second time-constant
Temperature coefficient	Approximately +0.0005 mg/m³ per °C (for variations from temperature at which instrument was last zeroed)

Flow Rate

Range	User-adjustable, 0.7 to 1.8 liters/min (lpm)

Temperature Range

Operating range	0 to 50°C (32 to 120°F)
Storage range	-20 to 60°C (-4 to 140°F)

Time Constant (LCD display)

Range	User-adjustable, 1 to 60 seconds

Data Logging

Data points	Approx. 31,000 (21 days logging once per minute)
Logging interval	User-adjustable, 1 second to 1 hour

User-Select Calibration Factors

Factory setting	1.0 (non-adjustable)
User-defined settings	3, with user-defined labels
Range	0.1 to 10.0, user-adjustable

Physical

External Dimensions	106 mm × 92 mm × 70 mm (4.2 in. × 3.7 in. × 2.8 in.) with 801724 battery 130 mm × 92 mm × 70 mm (5.1 in. × 3.7 in. × 2.8 in.) with 801722 or 801708 battery
Weight	0.46 kg (16 oz) with 801724 battery 0.54 kg (19 oz) with 801722 battery 0.54 kg (19 oz) with 801708 battery
Display	2 line × 12 character LCD
Tripod socket	1/4–20 female thread

Power Supply/Charger (P/N 2613210)

Input voltage range	100 to 240 VAC, 50 to 60 Hz
Output voltage	9 VDC @ 1.0 A
Battery charge time	6.5 hours

Specifications are subject to change without notice.
Windows is a registered trademark of Microsoft Corporation.

Maintenance

Factory clean/calibrate	Recommended annually
User zero calibration	Before each use
User flow calibration	As needed

Battery Information

Battery Option	Charge Time*	Intrinsically Safe
1650 mAH NiMH Pack (P/N 801724)	3.5 Hours	Yes**
2700 mAH NiMH Pack (P/N 801722)	5.5 Hours	Yes**
6-Cell AA-size Pack (P/N 801708)	NA	No

* Of a fully depleted battery
** All dust plugs and gaskets must be installed.

Typical Battery Life

Battery Pack	Cell Type	Hours @ 0.7 lpm	Hours @ 1.7 lpm
1650 mAH NiMH Pack (P/N 801724)	NiMH (4.8 V, 1650 mAH)	11.5	9.2
2700 mAH NiMH Pack (P/N 801722)	NiMH (4.8 V, 2700 mAH)	19.8	15.6
6-Cell AA-size Pack	AA Alkaline Cells	29.6	22.5
(P/N 801708, with six user-supplied AA cells)	AA NiMH Cells (1600 mAH per cell. Cells cannot be charged while inside AA Pack)	8.8	6.7

Communications Interface

Type	USB 1.1
Connector, instrument	USB Mini-B (socket)

Minimum Computer Requirements for TrakPro Software

Communications port	Universal Serial Bus (USB) v1.1 or higher
Operating system	Microsoft Windows® 98, Me, 2000, XP (USB not supported in Windows 95 or NT)

Approvals

Intrinsic Safety Rating Information	TSI Battery Pack P/Ns: 801722 or 801724 INTRINSICALLY SAFE CSA Exia Class I Groups A, B, C, D T2A with 801724 T2C with 801722 File: 200507 TSI Battery Pack P/N: 801708 NOT INTRINSICALLY SAFE

APPENDIX C—NIOSH ANALYTICAL AIR SAMPLING METHODOLOGY

POLYNUCLEAR AROMATIC HYDROCARBONS by HPLC 5506

Formulae: Table 1 MW: Table 1 CAS: Table 2 RTECS: Table 2

METHOD: 5506, Issue 3 **EVALUATION:** PARTIAL **Issue 1:** 15 May 1985
Issue 3: 15 January 1998

OSHA: Table 3
NIOSH: Table 3
ACGIH: Table 3

PROPERTIES: Table 1

Compounds

acenaphthene	benzo[ghi]perylene	fluorene
acenaphthylene	benzo[a]pyrene	indeno[1,2,3-cd]pyrene
anthracene	benzo[e]pyrene	naphthalene
benz[a]anthracene	chrysene	phenanthrene
benzo[b]fluoranthene	dibenz[a,h]anthracene	pyrene
benzo[k]fluoranthene	fluoranthene	

NAMES & SYNONYMS: Polycyclic aromatic hydrocarbons, PAHs; also see Table 2.

SAMPLING

SAMPLER: FILTER + SORBENT TUBE (37-mm, 2-µm, PTFE + washed XAD-2, 100 mg/50 mg)

FLOW RATE: 2 L/min

VOL-MIN: 200 L
-MAX: 1000 L

SHIPMENT: transfer filters to culture tubes; wrap sorbent and culture tubes in Al foil; ship @ 0 °C

SAMPLE STABILITY: unknown; protect from heat and UV light

FIELD BLANKS: 3 to 10 field blanks per set
MEDIA BLANKS: 6 to 10 media blanks per set

ACCURACY

RANGE STUDIED: not determined

BIAS: not determined

OVERALL PRECISION ($\hat{S}_{rt}$): not determined

ACCURACY: not determined

MEASUREMENT

TECHNIQUE: HPLC, FLUORESCENCE/UV DETECTION

ANALYTE: compounds listed above

EXTRACTION: 5 mL acetonitrile; ultrasonic bath, 30 to 60 minutes

INJECTION VOLUME: 10 to 50 µL

MOBILE PHASE: acetonitrile/water gradient @ ambient temperature, 1 mL/min

COLUMN: 250 x 4.6-mm, reversed-phase, 5-µm C_{18}

DETECTOR: UV @ 254 nm; fluorescence @ 340 nm (excitation), 425 nm (emission)

CALIBRATION: standards in acetonitrile

RANGE: see EVALUATION OF METHOD

ESTIMATED LOD: see EVALUATION OF METHOD

PRECISION ($\hat{S}_r$): see EVALUATION OF METHOD

APPLICABILITY: This method is applicable to samples that can be extracted with acetonitrile. This method is not applicable to samples that require a different extraction solvent or contain large amounts of highly adsorptive particulate matter, e.g., fly ash or diesel soot; also, this method is not applicable to asphalt fume samples.

INTERFERENCES: Any compound that elutes at the same HPLC retention time may interfere. Heat, ozone, NO_2, or UV light may cause sample degradation.

OTHER METHODS: This revises P&CAM 206 and 251 [1]. Method 5515 uses the same sampling technique, with gas chromatographic measurement [2]. Method 5800 uses the same sampling technique, and a flow-injection method to determine total polycyclic aromatic compounds at two different sets of fluorescent wavelengths [3].

REAGENTS:

1. Water, distilled, deionized, degassed.
2. Acetonitrile, HPLC grade, degassed.
3. PAH test mixture,* a liquid standard containing the PAHs except benzo[e]pyrene (EPA 610 Polynuclear Aromatic Hydrocarbons,Supelco, Cat. No. 4-8743; or equivalent).
4. Benzo[e]pyrene,* solid (Supelco, Cat. No. 44-2475; or equivalent).

* See SPECIAL PRECAUTIONS

EQUIPMENT:

1. Sampler:
   a. Filter. 37-mm, 2-µm pore size, PTFE membrane filter laminated to PTFE, (Zefluor, Pall Gelman Sciences, Cat. No. P5PJ037;SKC Inc., Cat. No. 225-17-07; or equivalent filter), cellulose spacer ring, 37-mm OD, 32-mm ID, (SKC Inc., Cat. No. 225-23; or equivalent) in a 37-mm cassette filter holder.
      NOTE: If sampling is to be done in bright sunlight, use opaque or foil-wrapped cassettes to prevent sample degradation.
   b. Sorbent tube, washed XAD-2 resin (front = 100 mg; back = 50 mg) (ORBO 43, Supelco, Cat. No. 2-0258; or equivalent), connected to filter with minimum length of PVC tubing. Plastic caps are required after sampling.
      NOTE: If pressure drop is excessive or pump fails, use a larger diameter sorbent tube with XAD-2 resin (ORBO 42 Large, Supelco, Cat. No. 2-0264U; or equivalent).
2. Personal sampling pump capable of operating for 8 h at 2 L/min, with flexible connecting tubing.
3. Aluminum foil.
4. Refrigerant, bagged.
5. Culture tubes, PTFE-lined screw cap, 13-mm x 100-mm.
6. Forceps.
7. Syringe filters, 0.45-µm, 25-mm, PTFE (Acrodisc-CR, Pall Gelman Sciences, Cat. No. 4219; or equivalent).
8. Pipet, 5-mL.
9. Syringe or micropipets, 1- to 100-µL.
10. Ultrasonic bath.
11. HPLC, with gradient capability, fluorescence (excitation @ 340 nm, emission @ 425 nm) and UV (254 nm) detectors in series, electronic integrator, and a 250 x 4.6-mm C_{18} column (Vydac 201TP, The Separations Group, Hesperia, CA, Cat. No. 201TP54; or equivalent).
12. Volumetric flasks, 10- and 100-mL.
13. Recommendation: lighting in laboratory should be incandescent or UV-shielded fluorescent.

SPECIAL PRECAUTIONS: Treat all polynuclear aromatic hydrocarbons as carcinogens. Samples and unused standards are considered toxic waste. Dispose of in an appropriate manner. Counter tops and equipment should be checked regularly with a "black light" for fluorescence as an indicator of contamination by PAHs.

SAMPLING:

1. Calibrate each personal sampling pump with a representative sampler in line.
2. Take personal samples at 2 L/min for a total sample size of 200 to 1000 L.
3. Immediately after sampling, transfer the filter carefully with forceps to a culture tube. Hold filter at edge to avoid disturbing the collected sample. Cap the tube and wrap in aluminum foil.
   NOTE: This step is necessary to avoid loss of analytes by sublimation.
4. Cap the sorbent tube and wrap in aluminum foil.
5. Ship to laboratory in insulated container with bagged refrigerant.

SAMPLE PREPARATION:

NOTE: UV light may degrade PAHs; therefore, recommend using yellow, UV-absorbing shields for fluorescent lights or use incandescent lighting.

6. Refrigerate samples upon receipt at laboratory.
7. Extract PAH from filters.
   a. Add 5.0 mL of acetonitrile to each culture tube containing a filter. Similarly, add 5.0 mL of acetonitrile to each culture tube containing the media and reagent blanks. Cap the tubes.
   b. Place capped tubes in an ultrasonic bath for 30 to 60 min.
8. Desorb PAH from sorbent.
   a. Score each sorbent tube with a file in front of the front (larger) sorbent section. Break tube at score line.
   b. Transfer front glass wool plug and front sorbent section to a culture tube. Transfer back sorbent section, and the middle glass wool plug to a second culture tube.
   c. Add 5.0 mL acetonitrile to each culture tube. Cap the tubes.
   d. Place capped tubes in an ultrasonic bath for 30 to 60 min.
9. Filter all sample extracts through an 0.45-µm syringe filter.

CALIBRATION AND QUALITY CONTROL:

10. Calibrate daily with at least six working standards.
    NOTE: If a benzo[e]pyrene standard is needed, weigh desired amount and add to a known volume of the PAH test mixture.
    a. Dilute aliquots of the PAH test mixture (containing benzo[e]pyrene if needed) with acetonitrile in 10-mL volumetric flasks. The concentration range should cover most of the PAH concentrations in the samples.
    b. During analysis, intersperse working standards with samples and blanks.
    c. Prepare calibration graphs (peak area vs. µg of each PAH per sample).
11. Recovery and desorption efficiency.
    a. Determine recovery (R) from filters and desorption efficiency (DE) from sorbent tubes at least once for each lot of filters and sorbent tubes used in the range of interest.
       (1) Filters. Using a microliter syringe or a micropipette, spike four filters at each of five concentration levels with a mixture of the analytes. Allow the filters to dry in the dark overnight. Analyze the filters (steps 7, 9, and 13 through 15). Prepare graphs of R vs. amounts found.
       (2) Sorbent tubes. Transfer an unused front sorbent section to a culture tube. Prepare a total of 24 culture tubes in order to measure DE at five concentration levels plus blank in quadruplicate. Using a microliter syringe or micropipette, add calibration stock solution directly to sorbent. Cap culture tubes and allow to stand overnight. Desorb and analyze (steps 8, 9, and 13 through 15). Prepare graphs of DE vs. amounts found.
    b. Check R and DE at two levels for each sample set, in duplicate. Repeat determination of R or DE graphs if checks do not agree to within ±5% of R or DE graph.
12. Analyze at least three field blanks for each sample medium.

MEASUREMENT:

13. Set HPLC according to manufacturer's instructions, conditions on page 5506-1, and steps 14 and 15.
14. Inject sample aliquot (10 to 50 µL). Start mobile phase gradient:
    a. Linear gradient from 60% acetonitrile/40% deionized water to 100% acetonitrile at 1 mL/min over 20 min.
    b. Hold at 100% acetonitrile for 20 min.
    c. Linear gradient to initial condition, 5 min.
15. Measure peak areas for each analyte using the appropriate detector as specified in Table 1.
    NOTE 1: The order of elution for the PAHs appears in Table 4.
    NOTE 2: If peak area is above the calibration range, dilute with acetonitrile, reanalyze, and apply dilution factor in calculations.
    NOTE 3: If sample has many interferences, additional sample cleanup may be necessary.

CALCULATIONS:

16. Read the mass, µg (corrected for R or DE) of each analyte found on the filter (W) and front sorbent (W_f) and back sorbent (W_b) sections, and on the average media blank filter (B) and front sorbent (B_f) and back sorbent (B_b) sections from the calibration graphs.
17. Calculate concentration, C (mg/m^3), as the sum of the particulate concentration and the vapor concentration in the actual air volume sampled, V (L).

$$C = \frac{\left\{ W + W_f + W_b - B - B_f - B_b \right\}}{V}, \ mg/m^3$$

NOTE 1: µg/mL = mg/m^3

NOTE 2: W_f and W_b include analyte originally collected on the filter as particulate, then volatilized during sampling. This can be a significant fraction for many PAHs (e.g., anthracene, fluoranthene, fluorene, naphthalene, phenanthrene).

EVALUATION OF METHOD:

The UV detector is used to analyze for some PAHs (see Table 1), and the remaining PAHs are analyzed by a fluorescent detector, which gave better sensitivity for some PAHs. The ranges of the limit of detection (LOD) and the limit of quantitation (LOQ) values for the 17 PAHs are reported in Table 4 [4]. The LOD and LOQ values varied because of differences in the detectors used and the concentrations of the standards. Therefore, it is important that the LOD and LOQ values be determined for each set of samples. The LOQs are the lower end of the analytical ranges. The upper end of the analytical ranges were not determined.

This method was evaluated by means of a user check [5]. An independent laboratory prepared spiked filters and sorbent tubes for a recovery and desorption efficiency study (see Table 4). For the filters, except naphthalene, the recovery results were greater than or equal to 75%. Since naphthalene is fairly volatile under ambient conditions, this may account for the poor recovery results. For the sorbent tubes, only four of the 17 analytes had desorption efficiencies that were greater than or equal to 75%. During the user check, the sorbent tubes were extracted by adding 5 mL acetonitrile and were allowed to stand for 30 minutes with occasional swirling. In more recent quality control experiments, the desorption efficiencies were often better for some analytes (see Table 4) [4]. These results were achieved using an ultrasonic bath for 30 to 60 minutes. The results indicated the importance of preparing media spikes for recovery and desorption efficiency studies for each set of samples; moreover, the results reenforce this need when using new lots of media.

Figure 1. Structure of the PAHs.

SILICA, CRYSTALLINE, by XRD (filter redeposition) 7500

SiO_2 MW: 60.08 CAS: 14808-60-7 (quartz) RTECS: VV7330000 (quartz)
14464-46-1 (cristobalite) VV7325000 (cristobalite)
15468-32-3 (tridymite) VV7335000 (tridymite)

METHOD: 7500, Issue 4 **EVALUATION: FULL** **Issue 1: 15 August 1990**
Issue 4: 15 March 2003

OSHA : quartz (respirable) 10 mg/m³/(%SiO_2+2); cristobalite and tridymite (respirable) ½ the above
NIOSH: 0.05 mg/m³; carcinogen
ACGIH: quartz (respirable) 0.1 mg/m³
cristobalite (respirable) 0.05 mg/m³
tridymite (respirable) 0.05 mg/m³

PROPERTIES: solid; d 2.65 g/cm³ @ 0 °C; crystalline transformations: quartz to tridymite @ 867 °C; tridymite to cristobalite @ 1470 °C; α-quartz to ß-quartz @ 573 °C

SYNONYMS: free crystalline silica; silicon dioxide

SAMPLING

SAMPLER:	CYCLONE + FILTER (10-mm nylon cyclone, Higgins-Dewell (HD) cyclone, or aluminum cyclone + 5-µm PVC membrane) *see sampling section
FLOW RATE:	Nylon cyclone: 1.7 L/min; HD cyclone: 2.2 L/min; aluminum cyclone: 2.5 L/min
VOL-MIN:	400 L
-MAX:	1000 L
SHIPMENT:	Routine
SAMPLE STABILITY:	Stable
BLANKS:	2 to 10 per set (see step 13.g.)
BULK SAMPLE:	High-volume or settled dust; to identify interferences

ACCURACY

RANGE STUDIED:	25 to 2500 µg/m³ [1] (800-L sample)
BIAS:	None known
OVERALL PRECISION ($\hat{S}_{rT}$):	0.09 (50 to 200 µg) [1]
ACCURACY:	± 18%

MEASUREMENT

TECHNIQUE:	X-RAY POWDER DIFFRACTION
ANALYTE:	Crystalline SiO_2
ASH:	Muffle furnace or RF plasma asher or dissolve in tetrahydrofuran
REDEPOSIT:	On 0.45-µm Ag membrane filter
XRD:	Cu target X-ray tube, graphite monochromator Optimize for intensity; 1° slit Slow step scan, 0.02°/10 sec Integrated intensity with background subtraction
CALIBRATION:	NIST SRM 1878a quartz, NIST SRM 1879a cristobalite, USGS 210-75-0043 tridymite suspensions in 2-propanol.
RANGE:	0.02 to 2 mg SiO_2 per sample [2]
ESTIMATED LOD:	0.005 mg SiO_2 per sample [2]
PRECISION ($\hat{S}_r$):	0.08 @ 0.05 to 0.2 mg per sample [1]

APPLICABILITY: The working range is 0.025 to 2.5 mg/m³ for an 800-L air sample.

INTERFERENCES: Micas, potash, feldspars, zircon, graphite, and aluminosilicates. See APPENDIX.

OTHER METHODS: This is similar to the method in the Criteria Document [3] and P&CAM 259 [4] which has been collaboratively tested [1]. This method is similar, except for sample collection, to S315 [5,6]. Method P&CAM 109 [7,8,9], which incorporates an internal standard, has been dropped. XRD can distinguish the three silica polymorphs and silica interferences can be eliminated by phosphoric acid treatment. IR (methods 7602 and 7603) can also quantify quartz, cristobalite and tridymite if amorphorous silica and silicates are not present in large amounts. However sensitivity is reduced if multiple polymorphs are present and secondary peaks must be used. Crystalline silica can also be determined by visible absorption spectrophotometry (e.g., Method 7601), but polymorphs can not be distinguished. Visible absorption methods also have larger laboratory-to-laboratory variability than XRD and IR methods and therefore are recommended for research use only [10].

REAGENTS:

1. Silica Standards.
   a. Quartz* (SRMs 1878a, 2950, 2951, 2958) and Cristobalite* (SRMs 1879a, 2960, 2957), available from Standard Reference Materials Program, Rm. 204, Bldg. 202, National Institute of Standards and Technology (NIST), Gaithersburg, MD 20899; www.nist.gov.
   b. Tridymite* (210-75-0043) available from U.S. Geological Survey, Box 25046, MS 973, Denver, CO 80225.
2. 2-Propanol*, reagent grade.
3. Desiccant.
4. Glue or tape for securing Ag filters to XRD holders.
5. Optional: tetrahydrofuran (THF)* (if LTA or muffle furnace are unavailable).
6. 1.5 % parlodion solution. (Dissolve 1.5 g of parlodion* in isopentyl acetate* and dilute to 100 mL with isopentyl acetate.)
7. Optional (if calcite present): 25% v/v concentrated hydrochloric acid* (ACS reagent grade) in distilled water and 25-mm filters of PVC or cellulose ester with pore size of 1 µm or less.

* See SPECIAL PRECAUTIONS.

EQUIPMENT:

1. Sampler:
   a. Filter: Polyvinyl chloride (PVC) filter, 37-mm, 5.0-µm pore size supported with backup pad in a two-piece, 37-mm cassette filter holder (preferably, conductive) held together by tape or cellulose shrink band.
      NOTE: Check each new lot of PVC filters by analyzing one or more by this method. For example, Gelman VM-1 filters (all lots) were found to be unacceptable because of high ash and background. If THF is used, check for complete dissolution by dissolving a blank PVC filter and following steps 5c through 8.
   b. Cyclone: 10-mm nylon, Higgins-Dewell (HD), Aluminum (Al), or equivalent [11].
2. Area air sampler: PVC membrane filter, 37-mm diameter, 5-µm pore size; three-piece filter cassette.
3. Sampling pumps with flexible connecting tubing, capable of the following flow rates: nylon cyclone, 1.7 L/min; HD cyclone, 2.2 L/min; Al cyclone, 2.5 L/min; and bulk sampler, 3 L/min.
4. Silver membrane filters, 25-mm diameter, 0.45-µm pore size, available from Sterlitech Corp., 22027 70th Ave S, Kent, WA 98032-1911; www.sterlitech.com.
5. X-ray powder diffractometer (XRD) equipped with copper target X-ray tube, graphite monochromator, and scintillation detector.
6. Reference specimen (mica, Arkansas stone, or other stable standard) for data normalization.
7. Low-temperature radio-frequency plasma asher (LTA) or muffle furnace, or ultrasonic bath (≥150 W), for filter preparation.
8. Vacuum filtration assembly and side-arm vacuum flask with a 25-mm filter holder.
9. Sieve, 10-µm, for wet sieving.
10. Analytical balance (0.001 mg); magnetic stirrer with thermally insulated top; ultrasonic bath or probe; volumetric pipettes and flasks; Pyrex crucibles with covers (muffle furnace); 40-mL wide-mouth or 50-mL centrifuge tubes (THF method); desiccator; reagent bottles with ground glass stoppers; drying oven; polyethylene wash bottle.
11. Explosion-resistant hot plate.
12. Teflon sheet, 0.3 to 1 mm thick.

SPECIAL PRECAUTIONS: Avoid inhaling silica dust [3]. THF is extremely flammable and should be used in a fume hood. 2-Propanol, parlodion and isopentyl acetate are flammable. Hydrochloric acid is corrosive and should be used in a fume hood.

SAMPLING:

1. Calibrate each personal sampling pump with a representative sampler in line.
2. Sample at 1.7 ± 5% L/min with nylon cyclone or 2.2 ± 5% L/min with HD cyclone for a total sample size of 400 to 1000 L. Do not exceed 2 mg dust loading on the filter.
   NOTE 1: Do not allow the sampler assembly to be inverted at any time when using a cyclone. Turning the cyclone to anything other than a horizontal orientation may deposit oversized material from the cyclone body onto the filter.
   NOTE 2: A single sampler/flow rate should be used for a given application. Sampling for both crystalline silica and coal mine dust should be done in accordance with the ISO/CEN/ACGIH/ASTM respirable aerosol sampling convention. Flow rates of 1.7 L/min for the Dorr-Oliver nylon cyclone and 2.2 L/min for the Higgins-Dewell cyclone have been found to be optimal for this purpose. Outside of coal mine dust sampling, the regulatory agencies currently use these flow rates with the Dorr-Oliver cyclone in the United States and the Higgins-Dewell sampler in the United Kingdom. Though the sampling recommendations presented in a NIOSH Criteria Document have been formally accepted by MSHA for coal mine dust sampling, the Dorr-Oliver cyclone at 2.0 L/min with 1.38 conversion factor is currently used in the United States for the purpose of matching an earlier sampling convention [12]. In any case, a single sampler/flow rate should be used in any given application so as to eliminate bias introduced by differences between sampler types and sampler conventions [11].
3. Take an area air sample or collect a settled dust sample, if dust in the work environment has not been previously characterized.

SAMPLE PREPARATION:

4. Samples may be characterized by one of the following methods, as appropriate.
   a. **Interference check.** Prepare area dust sample or settled dust bulk sample for XRD analysis by mounting the collection sample directly on an XRD sample holder, or by depositing or redepositing the dust on another filter for mounting, or by packing an XRD powder holder. Proceed to step 11.
   b. **Qualitative Analysis.** Prepare the area air sample or settled dust sample for qualitative analysis by grinding and/or wet sieving to best match the airborne dust particle size. Wet sieve with a 10-µm sieve, 2-propanol, and an ultrasonic bath [13], followed by evaporation of excess alcohol, drying in an oven for 2 hours, and overnight storage in a desiccator. Deposit the end product on a filter (steps 7-8) or pack in a conventional XRD powder holder.
      NOTE 1: For quantitative determination of % SiO_2, weigh out, in triplicate, 2 mg sieved dust, transfer to a 50-mL beaker, add 10 mL 2-propanol, and continue with step 6.
      NOTE 2: In a bulk sample, if there is an interfering compound(s) that renders the identification and quantitation of quartz very difficult, the sample will need to be carefully treated in hot phosphoric acid [14] to dissolve the interfering compound(s) and avoid the loss of quartz. This treatment can be used to dissolve several 50-mg sample aliquots in order to concentrate the quartz content for the purpose of lowering the LOD.
5. Use one of the following methods to prepare filter samples and blanks:
   a. **Low Temperature Ashing:** Place the filters in 50-mL beakers within the low temperature asher so that the sample exposure to the plasma is optimized. Ash according to manufacturer's instructions. After ashing, carefully add 15 mL 2-propanol to each beaker; or
   b. **Muffle Furnace Ashing:**
      i. If the samples contain a significant amount of calcite (>20% of total dust loading), silica may be lost due to formation of $CaSiO_3$. Remove the calcite by the following procedure: Place a 0.5-µm, 25-mm PVC filter in the filtration apparatus and clamp the filter funnel over it. Remove the sample filter from the cassette, fold, and drop it on the 25-mm filter. Add 10 mL 25% v/v HCl and

5 mL 2-propanol to the filter funnel and allow to stand for 5 min. Apply vacuum and slowly aspirate the acid and alcohol in the funnel, washing with three successive 10-mL portions of distilled water. Release the vacuum. Carry both filters through the ashing step together.

ii. Place the filter samples in porcelain crucibles, loosely cover and ash in muffle furnace for 2 h at 600 °C (800 °C if graphite is present). Add several mL 2-propanol to the ash, scrape the crucible with a glass rod to loosen all particles and transfer the residue to a 50-mL beaker. Wash the crucible several more times and add wash to beaker. Add 2-propanol to the beaker to bring the volume to about 15 mL; or

c. **Filter Dissolution:** Using forceps and a spatula, remove the filter from the cassette, fold the filter three times, and place in the bottom of a 40- or 50-mL centrifuge tube. Add 10 mL THF and allow to stand for at least 5 min. Cap the centrifuge tube with aluminum foil to prevent contamination. Gently agitate the centrifuge tube by hand or with a vortex mixer making sure the THF does not go near the top of the tube. Place the tube in an ultrasonic bath (water level 2.5 cm from top) for at least 10 min. (The filter should be totally dissolved.) Just prior to filtering, agitate the sample for 10 to 20 sec on a vortex mixer. Continue with step 6, substituting THF for 2-propanol and centrifuge tube for beaker.

6. Cover the beaker with a watchglass and agitate in an ultrasonic bath for at least 3 min. Observe the suspension to make sure that the agglomerated particles are broken up. Wash the underside of the watchglass with 2-propanol, collecting the washings in the beaker.

7. Place a silver filter in the filtration apparatus. Attach the funnel securely over the entire filter circumference. With no vacuum, pour 2 to 3 mL 2-propanol onto the filter. Pour the sample suspension from the beaker into the funnel. After the transfer, rinse the beaker several times and add rinsings to the funnel for a total volume of 20 mL. In order to minimize feathering of the sample outside the deposition area, allow the suspension to settle for a few minutes prior to applying vacuum. Do not rinse the chimney after the material has been deposited on the silver filter. Rinsing the chimney can disturb the thin layer deposition.

8. Leave the vacuum on after filtration to produce a dry filter. Place 2 drops of 1.5% parlodion solution on a glass slide. Remove the silver filter with forceps and fix the material to the filter by placing the bottom side of the filter in the parlodion solution. Place the saturated filter on top of the Teflon sheet which has been heated on the hot plate at a low temperature setting. When thoroughly dry, mount the silver filter in the XRD sample holder.

CALIBRATION AND QUALITY CONTROL:

9. Prepare and analyze at least 6 levels of standard filters.

NOTE 1: Calibration standards are limited to NIST and USGS certified standards of known purity, particle size, and sample-to-sample homogeneity. At least 12 materials, including 5-µm Min-U-Sil, previously used by laboratories throughout the United States and Canada, have been evaluated, and none have been found to be acceptable alternatives to the certified standards cited within this method [10]. Standard reference materials should be corrected for phase purity.

NOTE 2: Crystalline silica methods require calibration standards of known purity, specific particle size and distribution, and sample-to-sample homogeneity. Establishing traceability of secondary calibration standards to the specified NIST and USGS primary standards requires the use of measurement methods with better precision and accuracy than the XRD, IR and visible absorption spectrophotometry methods commonly used in the industrial hygiene field can provide. In addition, particle size distribution measurements have considerable error. Therefore, the use of secondary calibration standards that are traceable to NIST and USGS certified standards is not appropriate.

NOTE 3: NIST SRM 2950 calibration set (α-quartz) and NIST SRM 2960 calibration set (cristobalite) may be useful for preparing working standards at known concentrations.

a. Prepare two suspensions of each analyte in 2-propanol by weighing 10 and 50 mg of the standard material to the nearest 0.01 mg. Quantitatively transfer each to a 1-L glass-stoppered bottle using 1.00 L of 2-propanol.

b. Suspend the powder in 2-propanol with an ultrasonic probe or bath for 20 min. Immediately move the bottle to a magnetic stirrer with thermally insulated top and add a stirring bar. Allow the solution to return to room temperature before withdrawing aliquots.

c. Mount a silver filter on the filtration apparatus. Place several mL of 2-propanol on the filter. Turn off the stirrer and shake vigorously by hand. Immediately remove the stopper and withdraw an aliquot from the center at half-height of the 10 mg/L or 50 mg/L suspension. Do not adjust the volume in the pipet by expelling part of the suspension. If more than the desired aliquot is withdrawn, discard the aliquot in a beaker, rinse and dry the pipet, and take a new aliquot. Transfer the aliquot from the pipet to the silver filter, keeping the tip of the pipet near the surface but not submerged in the delivered suspension.

d. Rinse the pipet with several mL 2-propanol, draining the rinse into the funnel. Repeat the rinse several times.

e. Allow the suspension to settle for a few minutes prior to applying vacuum. Apply vacuum and rapidly filter the suspension. Do not wash down the sides of the funnel after the deposit is in place since this will rearrange the material on the silver filter. Leave vacuum on until filter is dry. Place 2 drops of 1.5% parlodion solution on a glass slide. Remove the silver filter with forceps and fix the material to the filter by placing the bottom side of the filter in the parlodion solution. Place the saturated filter on top of the heated Teflon sheet. When thoroughly dry, mount the silver filter in the XRD sample holder. Prepare working standard filters, in triplicate, at e.g., 10, 20, 50, 100, 250, and 500 µg.

f. Analyze the working standards together with samples and blanks (step 12). The XRD intensities for the working standards (step 12.d) are designated I_x^o and are then normalized (step 12.e) to obtain $\bar{I}_x^o$. Correct the intensities of working standards >200 µg for matrix absorption (steps 12.f and 13).

g. Prepare a calibration graph ($\bar{I}_x^o$, vs µg of each standard).

NOTE: Poor repeatability (>10% above 0.04 mg silica) at any given level indicates that new standards should be made. The data should lie along a straight line. A weighted least squares ($1/\sigma^2$ weighting) is preferable.

h. Determine the slope, m, of the calibration graph in counts/µg. The intercept, b, on the abscissa should be within ± 5 µg of zero.

NOTE: A large intercept indicates an error in determining the background, i.e., an incorrect baseline or interference by another phase.

10. NOTE: The following procedure for absorption correction is not necessary in situations that have been previously documented as requiring no corrections.

Select six silver membrane filters as media blanks randomly from the same box of filters to be used for depositing the samples. These will be used to test for sample self-absorption. Mount each of the media blanks on the filtration apparatus and apply vacuum to draw 5 to 10 mL 2-propanol through the filter. Remove, let dry, and mount on XRD holders. Determine the net normalized count for the silver peak, I_{Ag}, for each media blank (step 12.g). Obtain an average value for the six media blanks, $\bar{I}_{Ag}^o$.

NOTE: The analyst is a critical part of this analytical procedure [12]. A high level of analyst expertise is required to optimize instrument parameters and correct for matrix interferences either during the sample preparation phase or the data analysis and interpretation phase [15]. The analyst should have some training (university or short course) in mineralogy or crystallography in order to have a background in crystal structure, diffraction patterns and mineral transformation. In addition, an intensive short course in the fundamentals of X-ray diffraction can be useful.

MEASUREMENT:

11. Obtain a qualitative X-ray diffraction scan (e.g., 10 to 80 °2θ) of the area air sample (or bulk settled dust) to determine the presence of free silica polymorphs and interferences (see APPENDIX). The diffraction peaks are:

Mineral	Peak (2-Theta Degrees)		
	Primary	Secondary	Tertiary
Quartz	26.66	20.85	50.16
Cristobalite	21.93	36.11	31.46
Tridymite	21.62	20.50	23.28
Silver	38.12	44.28	77.47

NOTE: There is an alternative to scanning an area air sample, settled dust sample, or ground bulk sample to prove lack of contamination. A slow scan of the three main peaks of quartz (also cristobalite and tridymite if their absence has not been previously confirmed) on a personal air sample, with verification that their intensity ratios are within 15% of pure quartz, is sufficient evidence that other materials are not interfering in the silica determination.

12. Perform the following for each sample, working standard, and blank filter:
    a. Mount the reference specimen. Determine the net intensity, I_r, of the reference specimen before and after each filter is scanned. Use a diffraction peak of high intensity that can be rapidly but reproducibly (S_r <0.01) measured.
    b. Mount the sample, working standard, or blank filter. Measure the diffraction peak area for each silica polymorph. Scan times must be long, e.g., 15 min (longer scan times will lower the limit of detection).
    c. Measure the background on each side of the peak for one-half the time used for peak scanning. The sum of these two counts is the average background. Determine the position of the background for each sample.
    d. Calculate the net intensity, I_x, (the difference between the peak integrated count and the total background count).
    e. Calculate and record the normalized intensity, I_x, for each peak:

$$I_x = \frac{I_x}{I_r} \cdot N$$

NOTE: Select a convenient normalization scale factor, N, which is approximately equivalent to the net count for the reference specimen peak, and use this value of N for all analyses. Normalizing to the reference specimen intensity compensates for long-term drift in X-ray tube intensity. If intensity measurements are stable, the reference specimen may be run less frequently and the net intensities should be normalized to the most recently-measured reference intensity.

    f. Determine the normalized count, I_{Ag}, of an interference-free silver peak on the sample filter following the same procedure. Use a short scan time for the silver peak (e.g., 5% of scan time for analyte peaks) throughout the method.
    g. Field blanks may be analyzed by scanning the 2-theta range used for the analyte and silver peaks to verify that contamination of the filters has not occurred. The analyte peak should be absent. The normalized intensity of the silver peak should match that of the media blank. Each laboratory should determine the specifics of field blank use for its application. When contamination does occur, the reason should be investigated and appropriate action taken. In practice, contamination of field blanks is extremely rare and usually is not consistent across filters. The analysis of blanks may be abbreviated if experience indicates that contamination is not likely with current field and laboratory operations; however, occasional confirmation of non-contamination is prudent.

CALCULATIONS:

13. Calculate the concentration of crystalline silica, C (mg/m^3), in the air volume sampled, V (L):

$$C = \frac{I_x \cdot f(t) - b}{m \cdot V}, mg/m^3$$

I_x = normalized intensity for sample peak
b = intercept of calibration graph (I_x^o vs. µg)
m = slope of calibration graph, counts/µg
f(t) = $-R \ln T/(1 - T^R)$ = absorption correction factor (Table 1)

R = $\sin(\Theta_{Ag})/\sin(\Theta_x)$
T = $I_{Ag}/(\text{average } I^o_{Ag})$ = transmittance of sample
I_{Ag} = normalized silver peak intensity from sample
I^o_{Ag} = normalized silver peak intensity from media blanks (average of six values)

EVALUATION OF METHOD:

This method is based on P&CAM 259 which was collaboratively tested [1]. The testing included a ruggedization step to test the effects of the use of muffle furnace or plasma asher (but not the use of THF), shipment of samples, ashing time, and ultrasonication time. None of these factors was found to have an effect. The method was shown to have no bias when referenced to the Talvitie spectrophotometric method [14] and when all standards and samples were Min-U-Sil 5. The relative standard deviations (S_r) for intralaboratory, total measurement and overall (including sampling) variability are:

	Analyte Level (µg)	Measurement Precision (S_r)	Overall Precision (S_{rT})
Intralaboratory	50-200	0.08 [1]	
	20	0.20 [5]	
	10	0.28 [9]	
Total (intra- and interlaboratory)	50-200	0.17 [1]	0.29 [1]

METHOD REVISED BY:

Rosa Key-Schwartz, Ph.D., Dawn Ramsey, M.S., and Paul Schlecht, NIOSH/DART.

APPENDIX: INTERFERENCES

Interferences include barite, micas (muscovite, biotite), potash, feldspars (microcline, plagioclase), montmorillonite, sillimanite, zircon, graphite, iron carbide, clinoferrosilite, wollastonite, sanidine, leucite, orthoclase, and lead sulfide.

The patterns for three forms of aluminum phosphate [JCPDS 10-423, 11-500, 20-44] are practically identical to those of quartz, cristobalite and tridymite, respectively. The quartz secondary and cristobalite primary peaks are close; cristobalite secondary peak is overlapped by a quartz peak; tridymite, if present in sufficient quantity, will interfere with all of the main (primary, secondary and tertiary) quartz and cristobalite peaks. Silver chloride, if present on the silver filter, interferes slightly with the primary quartz peak. Many of these interferences occur in the presence of quartz; however, in a study of samples collected in 11 different industries, Altree-Williams [20] found no significant interferences.

The presence of elements such as iron can result in appreciable X-ray fluorescence which leads to high background intensity. A diffracted-beam monochromator will minimize this problem.

If calcite is present, loss of quartz will occur when samples are ashed in a muffle furnace. See SAMPLE PREPARATION (step 5.b) for procedure to remove calcite.

If interferences with the primary silica peak are present, use a less sensitive peak. When overlaps are not severe, a smaller receiving slit or chromium radiation may be used; however, a new calibration curve will be necessary.

Table 1. Absorption correction factor as a function of transmittance for some silica-silver peak combinations [16-21].

APPENDIX D—TRANSPORTATION AND DISPOSAL DOCUMENTATION

Soil Safe

Material Characterization Report
Brandywine, Maryland

Please complete all sections of the form, sign where indicated and return completed form to:

Soil Safe, Inc.
6700 Alexander Bell Dr., Suite 300, Columbia MD 21046
Phone: 410 872-3990 Fax: 410 872-9082

Project Information

Site Name: Lockheed Martin Middle River

Address: 195 Chesapeake Park Plaza Road

City, State Zip: Middle River, MD 21220 | County: Baltimore

Contact: Mike Musheno

Phone: 610-656-4012 | Fax: 410-682-0854

Approximate Quantity: ~~6700~~ KST 564 - BLOCK "H" 2,457 - BLOCK "G" | Unit of Measure: (Check One) KST ☐ Drums ☑ Tons ☐ Yards

Type of Contamination: ☑ Gasoline ☑ Diesel ☐ Fuel Oil ☐ Hydraulic Oil ☐ Heating Oil ☐ Kerosene ☐ Jet Fuel ☑ Motor Oil ☑ Used Oil

☑ Other (explain):

Contamination Source: ☐ UST ☐ AST ☐ Spill ☑ Historic

Other (explain): PAHs

Past Use of Site: ☑ Industrial ☐ Commercial ☐ Residential

Describe Past Use of Site: Currently vehicle parking and equipment storage, former WWTP and wind tunnel.

Certifications

I, the undersigned, understand that any soil delivered to Soil Safe's facility that is found to be non-conforming will not be accepted for processing. I further understand that the Client shall be solely responsible for its removal. In the event that the Client does not remove the soils in a timely manner, Soil Safe, acting as agent for the Client, may arrange to have the soil removed and disposed of at a properly permitted facility at the Client's sole expense.

I, the undersigned, Certify that, to the best of my knowledge, the soil submitted for acceptance to Soil Safe does not contain Polychlorinated Biphenyl's (PCB's), as defined by 40 CFR761, at levels greater than 5 ppm. I further certify that, to the best of my knowledge, the soil does not contain herbicides, pesticides, or any other constituents at levels which would cause the soil to be characterized as toxic or hazardous as defined by 40 CFR 261. I further certify that all documentation, including all soil analysis, that has been performed on the subject site has been provided to Soil Safe and that the soils have not been or are not presently the focus of a remediation for contaminants other than those that are being disclosed to Soil Safe, Inc.

I, the undersigned, am the generator or a properly authorized agent for the generator. By signing below I certify that I have been granted the authority to execute this document.

Title: Project Lead | Signature: Tom Blackman

Soil Safe

Material Characterization Report
Brandywine, Maryland

The Brandywine Facility requires the following analysis for approval of material into the facility.

Analysis	Method	Acceptance Criteria
TPH – As appropriate for the type of contamination	8015 / 9071B	Less than 25,000 ppm
BTEX	By an EPA Approved Method	Less than 500 ppm
PCB's	8082	Less than 5 ppm
TCLP Metals *Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Silver*	1311/6010	Less than RCRA

Note: Other tests may be required depending on type of contamination. Soil not specifically exempted under 40CFR261.4 (b) (10) will require a Full TCLP List instead of TCLP Metals.

- Analytical requirements can be reduced if both of the following conditions are met:
  - A. Soils are impacted with only virgin oil(s).
  - B. One of the following Reduced Analytical Documents is provided: (check the applicable document provided)
    - ☐ MDE UST document completed by MDE Representative
    - ☐ Another Maryland document or form completed by a Department Representative
    - ☐ An MDE equivalent document from another State
    - ☐ Spill response document completed by or for a Government Agency
    - ☐ A UST document completed by a Soil Safe Employee
    - ☐ Single family home affidavit
    - ☐ Commercial transportation spill affidavit

- Reduced analytical are:
  - A. BTEX
  - B. TPH – As appropriate for the type of oil that was discharged.

Site Diagram (please sketch or attach drawing showing source of soil on project site)

Sample and Analysis Certification

I certify that soils were sampled as noted above and the results are representative of the stated volume to be shipped to Soil Safe, Inc.

Chain of Payment

The information below must be provided for billing purposes and is required for project approval.

Instructions
In order, starting with the generator and ending with Billing Company please provide the chain of payment for the project that you wish to have approved for acceptance by Soil Safe. Please contact Soil Safe with any questions you may have.

Generator Information

Generator: Lockheed Martin Corp — Contact: Mike Musheno
Address: 195 Chesapeake Park Plaza Road — City, State Zip: Middle River, MD 21220
Phone: 610-656-4012 — Fax: 410-682-0854

Company: _____ — Contact: _____
Address: _____ — City, State Zip: _____
Phone: _____ — Fax: _____

Company: _____ — Contact: _____
Address: _____ — City, State Zip: _____
Phone: _____ — Fax: _____

*If additional space is needed, please attach a separate sheet providing the information requested.

Billing Information

Company: Elite Environmental — Contact: Kenneth Trent
Address: 1814 Turkey Point Road — City, State Zip: Baltimore, MD 21901
Phone: (877) 202-4448 — Fax: _____

Chain of Payment Certification

I, the undersigned verify that the information provided above is true and accurate. The information is complete and follows the Chain of Payment, as it will occur upon invoice for the project. Any changes to this Chain will be reported to Soil Safe as soon as possible.

Print Name: Kenneth Trent — Company: Elite Environmental

SOIL SAFE INCORPORATED CERTIFICATE OF RECYCLE

Soil Safe Incorporated has accepted 396.03 tons of non-hazardous, petroleum contaminated soil, transported or 17 truck(s) from:

195 Chesapeake Park Plaza Road
Middle River MD 21220

Under approval number W5-4001 and billed under invoice # 66844

This material was contracted by and between Soil Safe, Inc. and
Elite Environmental Broker, Generator, or Agent, representing
Lockheed Martin Middle River , generator.

This material was analyzed prior to acceptance by a certified soils technician to determine soil components and specific product usage. Soil Safe Incorporated has taken full responsibility for this material: including safe handling, processing, storage, and reuse. We hereby certify that all of the above was executed in accordance with all existing laws and regulations.

Soil Safe certified on 23 September 2015 that this material has been recycled into an environmentally benign product.

State of Maryland
My commission expires December 7, 2018
As sworn to me this 23 September 2015

Notary

CERTIFICATE ISSUED TO:
Elite Environmental
P.O. Box 615
Cape Canavaral FL 32920

GENERATOR:

Lockheed Martin Middle River

Soil Safe Incorporated is a corporation committed to the safe handling, processing and recycling of non-hazardous petroleum contaminated soil.

APPENDIX F—LABORATORY REPORTS

LABORATORY REPORTS

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 240-51073-1

Job Description: MRC Soil Remediation (Block H)

For:
Tetra Tech, Inc.
Foster Plaza 7
661 Anderson Drive
Pittsburgh, PA 15220-2745

Attention: Mr. Scott Nesbit

Approved for release.
John McFadden
Project Manager I
5/27/2015 5:07 PM

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC Soil Remediation (Block H)

Report Number: 240-51073-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 5/22/2015 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.6º C.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples H-US-A-1-1 (240-51073-1), H-US-A-2-1 (240-51073-2), H-US-A-3-1 (240-51073-3), H-US-A-4-1 (240-51073-4), H-UB-A-1-2 (240-51073-5), H-UB-A-2-2 (240-51073-6), H-UB-A-3-2 (240-51073-7) and H-DUP01 (240-51073-8) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 05/22/2015 and analyzed on 05/26/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT SOLIDS

Samples H-US-A-1-1 (240-51073-1), H-US-A-2-1 (240-51073-2), H-US-A-3-1 (240-51073-3), H-US-A-4-1 (240-51073-4), H-UB-A-1-2 (240-51073-5), H-UB-A-2-2 (240-51073-6), H-UB-A-3-2 (240-51073-7) and H-DUP01 (240-51073-8) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 05/22/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-51073-1

Lab Section	Qualifier	Description
GC/MS Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Tetra Tech, Inc. Job Number: 240-51073-1

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC Soil Remediation (Block H)

Report Number: 240-51061-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 5/22/2015 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.6º C.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples H-VS-B-1-1 (240-51061-1), H-VS-B-2-1 (240-51061-2), H-VS-B-4-1 (240-51061-3), H-VS-B-3-1 (240-51061-4), H-VB-B-1-2 (240-51061-5) and H-VB-B-2-2 (240-51061-6) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 05/22/2015 and analyzed on 05/24/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT SOLIDS

Samples H-VS-B-1-1 (240-51061-1), H-VS-B-2-1 (240-51061-2), H-VS-B-4-1 (240-51061-3), H-VS-B-3-1 (240-51061-4), H-VB-B-1-2 (240-51061-5) and H-VB-B-2-2 (240-51061-6) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 05/22/2015.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-51061-1

Lab Section	Qualifier	Description
GC/MS Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Tetra Tech, Inc. Job Number: 240-51061-1

APPENDIX G—POST-EXCAVATION RESIDUAL-RISK ANALYSIS

TECHNICAL MEMORANDUM

POST-EXCAVATION RISK ANALYSIS FOR TAX BLOCK H SOILS

LOCKHEED MARTIN MIDDLE RIVER COMPLEX

MIDDLE RIVER, MARYLAND

NOVEMBER 2015

1.0 Introduction

This memorandum provides the results of the risk analysis for the concentrations of chemicals of potential concern (COPC) remaining in soils after the implementation of the remedial action (soil excavation) in Block H. The remedial action was completed in May 2015 in accordance with the remedial action plan prepared for Block H. The soil excavation was necessary because risk estimates for Block H presented in the *Human Health Risk Assessment (HHRA) for Blocks D, E, F, G, and H Soils, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard, Middle River, Maryland* (Tetra Tech, 2012) for a hypothetical industrial worker population exceeded risk management benchmarks established by the Maryland Department of the Environment (MDE). The MDE cumulative cancer risk management benchmark is 1×10^{-5} (i.e., a one in one-hundred thousand excess chance of developing cancer). The MDE cumulative non-cancer risk benchmark is a hazard index of 1. Potential adverse non-carcinogenic health effects may occur if the hazard index (calculated on a target organ specific basis) exceeds one. The overall objective of this post-excavation analysis is to demonstrate that with the excavation of soils from the removal areas, the risk assessment of the final exposure point concentrations (EPCs) for the COPC from all remaining soils in Block H result in industrial worker cancer and non-cancer risk estimates less than MDE risk management benchmarks.

The 2012 HHRA indicated that the group of polycyclic aromatic hydrocarbons (PAHs) typically evaluated as benzo(a)pyrene equivalents (BaPEqs) were the predominant chemicals of concern (COCs) for an industrial worker hypothetically exposed to soils in Block H. The remedial action plan and associated residual risk assessment recommended that surface soils at locations SB-604D, SB-282A, and SB-282D be excavated (to a depth of 2 feet below ground surface [bgs]) so that risk estimates for an industrial worker exposed to Block H surface soils would not exceed the MDE risk management benchmarks. In addition surface soils at SB-282, which is adjacent to SB-282A and SB-282D were also excavated. The locations recommended for remediation are depicted on Figure 1 (i.e., within Block H sub-areas A and B) and the associated concentrations are in Table 2-1 of the residual risk analysis (an appendix to the remedial action plan, included as Attachment A of this document). The remedial action plan and residual risk analysis also

present the remedial goals established for BaPEq and the rationale for each location (and depth) recommended for excavation.

The following sections briefly discuss the post-excavation (i.e., confirmation) soils data and present the results of the final Block H risk assessment of the post excavation soils dataset for Block H (i.e., the updated HHRA). The post-excavation soils dataset is defined as all data for the side-wall confirmation soil samples collected in 2015 as well as historical surface soil data for all locations not excavated. The original surface soil data for locations SB-604D, SB-282, SB-282A, and SB-282D [i.e., the excavated soils] have been replaced with chemical concentrations from the replacement backfill soil in the post-excavation soils dataset. The reader is referred to Section 4 of the Block H construction completion report for detailed description of the soil excavation and post excavation soil sampling conducted in Block H.

2.0 Analytical Results for Post Excavation Soil Samples

Post excavation soils samples were collected from Block H sub-area A (addressing surficial contamination at locations SB-282, SB-282A, and SB-282D) and Block H sub-area B (addressing surficial contamination at location SB-604D), and analyzed for PAHs using United States Environmental Protection Agency (USEPA) SW-846 Method 8270D. Four side-wall and three floor (or excavation base) samples were collected from Block H sub-area A. Four side-wall and two base samples were collected from Block H sub-area B. The side-wall samples were composites of soils from the side-walls of the excavation. The base samples were grab samples from the floor of the excavation (2 feet bgs). Sample locations are depicted on Figure 2. All data collected were validated in accordance with USEPA Region 3 protocols and found acceptable for use in the human health risk assessment (Attachment B).

Analytical results for the post excavation samples are in Table A and B for Block H sub-areas A and B, respectively. None of the calculated BaPEq concentrations exceed the remedial goal established in the remedial action plan for an industrial worker exposed to soils (2,900 micrograms per kilogram [µg/kg], representing the 1×10^{-5} cancer risk level). In fact, none exceed the risk-based concentration representing the 1×10^{-6} cancer risk level for an industrial worker exposed to soils (290 µg/kg). Benzo(a)pyrene and dibenzo(a,h)anthracene were the only target analyte PAHs detected at a concentration exceeding the USEPA residential regional screening level (RSL) representing the 1×10^{-6} cancer risk level (Table C).

3.0 Risk Assessment of Block H Post Excavation Soils Dataset

The risk assessment of the post-excavation soils dataset for Block H was conducted using the USEPA and MDE methodologies presented in the 2012 HHRA, updated as necessary based on recent USEPA risk assessment guidance documents. The reader is referred to the 2012 HHRA for a detailed explanation of the risk assessment process and all equations used to calculate exposure dose and risk.

The updated HHRA results are presented in USEPA Risk Assessment for Superfund (RAGS) Part D format tables in Attachment C. The chemicals highlighted in Table D were selected as COPCs because their maximum detected concentration exceeded current RSL(s) for residential exposures to soils. The exposure assessment assumptions (e.g., days per year exposed) are those presented in the Office of Solid Waste and Emergency Response (OSWER) Directive 9200.1-120, *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors*. (USEPA, 2014) or other USEPA references specified in Attachment D. The EPCs were calculated using the current version of the USEPA's Pro-UCL software (Version 5.0.00). The toxicity criteria (e.g., cancer slope factors, reference doses) used to estimate cancer and non-cancer risks are those in the June 2015 RSL table published by USEPA.

The results of the risk assessment of the post-excavation surface soils dataset for Block H are in Table E. The cancer and non-cancer risk estimates do not exceed the MDE cumulative risk management benchmarks (i.e., an excess lifetime cancer risk of 1×10^{-5} or a total target organ specific hazard index of 1). The cumulative risk estimates do not include estimates for arsenic because the maximum detected arsenic concentration in the post-excavation soil samples (6.1 mg/kg) was less than the Middle River Complex background value (12 mg/kg) documented in the approved remedial action plan for Block B (see background concentrations for arsenic in soils in Appendix I of the Tetra Tech, 2009). However, the cumulative risk estimates do include risk estimates for all other COPCs identified in the 2012 HHRA so that the reader can compare pre-excavation soil risk estimates to post-excavation soil risk estimates. It should be noted that the COPC list for the 2012 HHRA was not specific to Block H. It was a global COPC list, based on chemical concentrations detected in *all* of the tax blocks evaluated in the 2012 HHRA (i.e., Blocks D, E, F, G, and H).

The maximum BaPEq concentration detected in the post-excavation surface soil data set for Block H (620 µg/kg) does not exceed the remedial goal established in the remedial action plan.

4.0 Summary and Conclusions

The soil remediation for Block H consisted of the excavation of soils (to a depth of 2 feet bgs) at sub-areas A and B within the tax block. The BaPEq concentrations detected in the side-wall and base post-excavation soil samples did not exceed the remedial goal established in the remedial action plan. The cancer and non-cancer risk estimates calculated for the post-excavation soils dataset for Block H do not exceed MDE cumulative risk management benchmarks verifying that risk reduction has been achieved for site closure under current and future industrial site use. The soil remediation at Block H has been completed successfully.

Notes:

Bolded results exceed the Residential RSL.

No results exceed the Industrial RSL or the RG.

[1] USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, June 2015. The noncarcinogenic values (denoted with a "N" flag) correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).

[2] Value is for acenaphthene.

[3] Calculated using one-half the detection limit for non-detected results.

[4] Calculated using a value of zero for non-detected results.

[5] cPAHs have been used in calculating the benzo(a)pyrene equivalents and therefore are not screened against the RG.

U: Non-detect

J: Estimated result

RG: remedial goal

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - No background data are available.
5 - United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites (June 2015). Values correspond to a cancer risk level of 1E-06 or a hazard quotient (HQ) of 0.1.
6 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
7 - Value is for pyrene.
8 - Value is for trivalent chromium.
9 - Value is for mercuric chloride (and other mercury salts).

Definitions:
ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value
N = Noncarcinogen
NA = Not Applicable/Not Available
Rationale Codes:
For selection as a COPC:
ASL = Above Screening Level
For elimination as a COPC:
BSL = Below COPC Screening Level NTX = No toxicity criteria

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC for the post-excavation soils dataset except that the ***post-soil excavation risk estimates do not include arsenic*** because the maximum detected arsenic concentrations is less than the background (12 mg/kg).

The chemicals highlighted in yellow are ***additional COPCs*** identified in the original 2012 risk assessment for the tax blocks soils as a whole (i.e., the COPC list for the 2012 risk assessment was not tax block specific; it selected COPCs across all of the tax blocks).
The post soils excavation risk assessment evaluated these chemicals as well as those shaded as described above so that the reader could compare post-soil excavation risk estimates to pre-soil excavation risk estimates and to verify that risk reduction has been achieved for site closure.
The pre- and post-soils excavation risk assessments also evaluated chromium assuming that the hexavalent chromium was present at 5 percent of the total chromium concentration.

ATTACHMENTS

Attachment A

Table 2-1

Summary of Residual Risk Analysis Results - Tax Block H
Lockheed Martin, Middle River Complex
Middle River, Maryland

Location	BaPeq Concentration (µg/kg)	Industrial - Recommended for Removal	Comments
Surface Soil (See detailed Table B-1)			
SB-604D	46,000	X	Necessary to meet industrial preliminary remedial goals
SB-282A	24,000	X	Necessary to meet industrial preliminary remedial goals
SB-282D	21,000	X	Necessary to meet industrial preliminary remedial goals
Three of the 66 sampling locations (4.5 percent) and 3 of 72 samples (4.2 percent) recommended for removal for the industrial land use scenario. The desired remedial goal for the BaPeqs is 2.9 mg/kg for industrial exposures. The residual site 95% UCL would be 0.136 mg/kg.			
Samples located near samples identified for removal to meet cleanup goals for Industrial workers.			
SB-282	170	X	Added due to proximity of SB-282A and SB-282D
Subsurface Soil (See detailed Table B-2)			
No samples need to be removed to achieve industrial preliminary remedial goals			

Only sampling locations located in the vadose zone are included in the tables. Depth to groundwater is 7 feet at Block H.

Executive Summary

On behalf of Lockheed Martin Corporation, Tetra Tech, Inc. has prepared this human health risk assessment of detected concentrations of chemicals in soil at a number of tax blocks (specifically, Blocks D, E, F, G, and H) at Lockheed Martin's Middle River Complex in Middle River, Maryland. This human health risk assessment is an update to the risk evaluations in the May 2006 *Site Characterization Report* (Tetra Tech, 2006b) and is based on the environmental data presented therein as well as on the significant volume of data collected during the 2007, 2009, and 2010 investigations to further characterize the nature and extent of impacts to soil in these tax blocks. The objective of this report is to determine if the detected chemical concentrations in soil pose a significant threat to potential human receptors under current and/or future land uses. Potential risks to human receptors are estimated on the assumption that no actions will be taken to control contaminant releases.

Primary guidance sources used to prepare this report include the Maryland Department of the Environment *Cleanup Standards for Soil and Groundwater* (State of Maryland, 2008) and *Voluntary Cleanup Program Guidance* (State of Maryland, 2006). Current guidance and reports published by U.S. Environmental Protection Agency and U.S. Environmental Protection Agency Region 3 were also considered in preparing the human health risk assessment. Risk estimates provided herein are based on analytical data collected during the following environmental investigations:

- Phase II site investigation (fall/winter 2003)
- site-wide Phase II investigation (2004)
- Phase II soil investigation (summer 2005)
- additional soil characterization (fall 2007)
- supplemental soil and storm-drain-sediment characterization (Block E fall 2008)
- final soil delineation (Blocks D, F, G, and H fall 2009)
- data gap investigation (fall 2010)

Current and potential/hypothetical future land uses suggest the following potential receptors could be exposed to impacted soils at the Middle River Complex:

- construction workers
- industrial workers
- commercial land-use receptors
- child, adolescent, and adult recreational users
- future child, adolescent, and adult residents

Consequently, cancer and non-cancer risk estimates were calculated for these receptors using reasonable maximum exposure assumptions and assuming that human exposure may occur via incidental ingestion, dermal contact, and inhalation exposure routes.

Cancer risk estimates are presented in terms of incremental lifetime-cancer risks; the non-cancer risks are presented in terms of hazard indices. The cancer and non-cancer risk estimates were interpreted using the Maryland Department of the Environment cancer risk benchmark (1×10^{-5} [i.e., a one-in-100,000 probability of developing cancer]) for cumulative risk and the U.S. Environmental Protection Agency's target cancer risk range (1×10^{-4} to 1×10^{-6}); hazard indices are evaluated using a value of 1.0 (adverse non-cancer health effects are not anticipated when the estimated hazard index is equal to or less than 1). As shown on Table ES-1, the following chemicals of concern were identified for surface and subsurface soils in each of the tax blocks based on a comparison of the cancer and non-cancer risk estimates to the Maryland Department of the Environment risk benchmarks.

The chemicals of concern listed in Table ES-1 will be further evaluated in the response action plans being prepared for the tax block soils. Additionally, although a refined evaluation conducted for diesel range organics and gasoline range organics did not indicate that they are major contributors to risk, detected diesel range organics concentrations at two locations in Block E soil exceed a risk-based concentration calculated for the industrial worker. Therefore, diesel range organics are also retained as chemicals of concern for Block E soil.

Table ES-1

Summary of Chemicals of Concern Identified for Tax Block Soils
Lockheed Martin, Middle River Complex
Middle River, Maryland

Tax block	Acreage	Do risk estimates for current/future construction workers exceed risk benchmarks? (chemicals of concern[1])	Do risk estimates for hypothetical future full-time industrial workers exceed risk benchmarks? (chemicals of concern[1])	Do risk estimates for current/future commercial receptors exceed risk benchmarks? (chemicals of concern[1])	Do risk estimates for current/future recreational users exceed risk benchmarks? (chemicals of concern[1])	Do risk estimates for hypothetical future resident exceed risk benchmarks? (chemicals of concern[1])	Recommendation
Block D	12.76	No	No	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As[2], CrVI[3])	MDE response action plan
Block E	15.97	Yes (PCBs)	Yes (PCBs, BaPEq, 124-TCB, 123-TCB, 14-DCB, DRO[5])	Yes (PCBs, BaPEq, As[2], 124-TCB, CrVI[3])	Yes (PCBs, BaPEq, As[2], 123-TCB, 124-TCB, CrVI[3])	Yes (PCBs, BaPEq, As[2], 123-TCB, 124-TCB, CrVI[3], 14-DCB)	MDE response action plan
Block F	11.94	No	Yes (BaPEq, Nap)	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As[2], CrVI[3], Nap)	Yes (BaPEq, As[2], CrVI[3], Nap)	MDE response action plan
Block G	13.46	No	Yes (BaPEq, As)	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As, CrVI[3], Co[4])	MDE response action plan
Block H	7.88	No	Yes (BaPEq)	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As[2], CrVI[3])	Yes (BaPEq, As[2], CrVI[3])	MDE response action plan

[1] BaPEq (benzo(a)pyrene equivalents); arsenic (As); hexavalent chromium (CrVI); diesel range organics (DRO); polychlorinated biphenyls (PCBs); 1,2,3-trichlorobenzene (123-TCB); 1,2,4-trichlorobenzene (124-TCB); 1,4-dichlorobenzene (14-DCB); naphthalene (Nap); cobalt (Co).

[2] Arsenic concentrations likely represent background concentrations.

[3] The limited amount of available hexavalent chromium data for the tax block soils suggests that low concentrations only (typically less than 1 mg/kg) are present. Reported concentrations do not exceed U.S. Environmental Protection Agency (USEPA) regional screening-level (RSL) for the industrial worker. Reported concentrations for by far most soil samples are also less than the USEPA RSL for the hypothetical future resident if the USEPA RSL were to be set at the 1×10^{-5} cancer risk level.

[4] Isolated elevated detections only.

[5] DRO was selected as a COC for Block E based on an additional evaluation.

This page intentionally left blank.

Section 1
Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this human health risk assessment (HHRA) of detected concentrations of chemicals in soil at a number of tax blocks (specifically, Blocks D, E, F, G, and H) at Lockheed Martin Corporation's Middle River Complex (MRC), Middle River, Maryland (see Figure 2-1). The human health risk assessment is an update to the risk evaluations presented in the May 2006 *Site Characterization Report* (Tetra Tech, 2006b) and is based on the environmental data presented therein as well as on data collected during the 2007, 2009, and 2010 investigations to further characterize the nature and extent of soil impacts in the tax blocks. The objective of this report is to determine if the chemical concentrations detected in soil pose a significant threat to potential human receptors under current and/or future land uses. Potential risks to human receptors are estimated on the assumption that no actions will be taken to control contaminant releases.

This report is organized as follows:

Section 1—Introduction: Presents the objective of the human health risk assessment and the report organization

Section 2—Site Overview: Briefly describes the facility, its history, and physical conditions, including each tax block. It also identifies recognized environmental conditions (RECs) in each tax block and briefly summarizes the environmental investigations to determine the nature and extent of soil contamination in the tax blocks.

Section 3—Human Health Risk Assessment General Methodology: Presents the approach and protocols used in the human health risk assessment for soil, including identification of chemicals of potential concern (COPC) in soils, exposure assessment, toxicity assessment, and characterization of risk and uncertainty. A "global" set of chemicals of potential concern for soils in the tax blocks is also presented. These chemicals of potential concern are evaluated quantitatively in the human health risk assessment.

Section 4—Risk Characterization Results: Provides the risk characterization results, recommendations, and conclusions for each tax block. Chemicals of concern (COC) for soil are identified in each tax block based on the risk characterization results. These chemicals of

concern are then recommended for further evaluation in the feasibility study (FS) that will be prepared for the tax block soil.

Section 5—Uncertainty Analysis: Presents the uncertainty analysis component of the human health risk assessment, including a summary of uncertainties inherent in the risk assessment and a discussion of how they may affect the quantitative risk estimates and conclusions of the risk analysis.

Section 6—Remedial Goal Options: Presents remedial goal options (also often referred to as preliminary remediation goals [PRGs]) for the chemicals of concern.

Appendix A provides data summary tables for each tax block. Appendix B presents historical aerial photographs from 1938–2005. Appendix C presents Maryland background data for arsenic. Appendix D provides all of the detailed human health risk assessment tables, spreadsheets, and figures. Appendix E provides the location-by-location risk characterization results tables and associated maps for each tax block.

Section 2
Site Background

2.1 SITE DESCRIPTION

The Middle River Complex (MRC), part of the Chesapeake Industrial Park, is at 2323 Eastern Boulevard in Middle River, Maryland, approximately 11.5 miles northeast of downtown Baltimore. The MRC covers approximately 180 acres and consists of 12 main buildings. The property includes an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, a trailer and parts storage lot, and numerous grassy green spaces along the perimeter. Locked chain-link fences surround all exterior lots and the main industrial area. The MRC is bounded by Eastern Boulevard (Route 150) to the north, Dark Head Cove to the south, Cow Pen Creek to the west, and Martin State Airport (MSA) to the east. The location of the MRC is shown in Figure 2-1.

Lockheed Martin Corporation (Lockheed Martin) activities at the site are primarily facility and building management and maintenance. The main tenant at the site, Middle River Aircraft Systems (MRAS), a subsidiary of General Electric Company, designs, manufactures, fabricates, tests, overhauls, repairs, and maintains aeronautical structures, parts, and components for military and commercial applications. Lockheed Martin Mission Systems & Sensors—Littoral Ships & Systems (a Lockheed Martin business segment) conducts engineering activities, and fabricates, assembles, tests, and otherwise supports vertical-launch systems). A subsidiary of Lockheed Martin, Applied NanoStructured Solutions LLC, also occupies a portion of MRC, engaging in research and design of nanotechnology applications. Historically, the property has been used for aircraft and missile-launching systems design, development, and sales.

2.2 LAND USE

The MRC is an industrial facility within the broader Chesapeake Industrial Park. The area surrounding the property primarily consists of commercial, industrial, and residential establishments. Six other facilities, comprising the remainder of the Chesapeake Industrial Park,

lie adjacent to the MRC. These include Tilley Chemical Company, Inc. (a distributor of food- and pharmaceutical-chemicals for the personal care and other industries), North American Electric (an industrial and commercial electrical contractor), Johnson and Towers (a heavy-duty diesel equipment, truck, and boat repair and maintenance company), ACE Logistics (a warehouse, packaging, and shipping provider), Poly-Seal Corp. (a producer of flexible packaging for various items), Exxon (a gasoline filling station and convenience store), and the Middle River Post Office. Residential developments lie on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek, as well as north of Eastern Boulevard (Route 150). The MRC is comprised of several tax blocks. Figure 2-2 presents the MRC tax block layout.

2.2.1 Block D

Block D, consisting of 12.76 acres, is in the southeastern portion of the MRC. Block D is bounded to the north by Dark Head Cove Road and Johnson and Towers, to the east by Wilson Point Road, MSA, and Dark Head Cove, and to the west by Former Building D (now known as Block E). Block D (along with the adjacent portion of Block F) comprises Recognized Environmental Condition (REC) #6. Limited information in the Phase I environmental site assessment (ESA), MRC records and historical aerial photographs suggests that a portion of Parking Lot No. 6 and the waterfront was backfilled between 1938 and 1949, raising the topography to its current elevations and extending the MRC's property to its current layout. During filling, a steel bulkhead was constructed and a 100-foot-wide swath of the cove along the bulkhead was proposed for dredging. Dredging was completed as planned to lower the bottom of Dark Head Cove near the shoreline to eight feet below sea level. Dredging and filling facilitated use of the creek as an anchor basin. After the shoreline was reconstructed, Parking Lot No. 6 was paved with asphalt.

No structures are known to have ever stood on this asphalt parking lot, which is today surrounded on all sides by a chain-link fence. Locked gates stand along Dark Head Cove Road, Chesapeake Park Plaza, and the Block F Waterfront Lot. Access is restricted to authorized personnel. The pavement is in poor condition, with widespread cracking and visible subsoil.

2.2.2 Block E

Block E (comprised of Block E and E Lot 3) consists of 15.97 acres in the southern portion of the MRC. Block E is bounded on the north by the industrial portion of the MRC (Block I), to the east by Parking Lot No. 6 (Block D), to the south by the Waterfront Lot (Block F), and to the west by the Tilley Chemical Company. Block E consists of the three RECs: Former Building D (REC #1), Product Pipeline (REC #2), and the Former 500,000-gallon above-ground storage tank (AST) and associated tanks (REC #3).

Former Building D (REC #1) encompasses approximately half of the Block E area. Although Building D was demolished in the early 1970s, the building's foundation and ground floor slab remain. The floor slab consists of concrete slabs with ceramic tiles overlaying the concrete in several locations, with construction or expansion joints and associated cracking between the slabs.

The Product Pipeline (REC #2) is a 1,815-foot long, 2-inch-diameter pipe running underground from the former 500,000–gallon fuel oil AST (REC #3) to the MRC's Power Plant (in Block I). The pipeline once supplied fuel oil to the Power House. It coincides with a drainage ditch running along the western and southern boundary of Block E. A small portion of the pipeline has been removed, but most of the run was abandoned in place.

The former 500,000-gallon AST and associated tanks (REC #3) were in a grassy shoulder in the southwestern portion of Block E near the Fire Pump Building. The 500,000-gallon AST was surrounded by a shallow, grassy, earthen berm. A large water tower and Fire Pump Building were adjacent to the AST. Block E is bounded on all four sides by a chain-link fence. Several unlocked interior gates stand in the northeastern corner of the unit, allowing MRC employees unrestricted access from the active industrial portion of the MRC.

2.2.3 Block F

Block F, consisting of 11.94 acres, is in the southern portion of the MRC. It is bounded to the north by the Former Building D (Block E), the Tilley Chemical Company, and North American Electric, to the east by Parking Lot No. 6 (Block D) and Dark Head Cove, to the south by Dark Head Cove, and to the west by Cow Pen Creek. Block F consists of RECs #4, #5, #6, and #13. The Boat Launch Area (REC #4) and the Former Aviation Fuel underground storage tanks (USTs) (REC #5) are primarily covered by a concrete tarmac that defines the boundary of

REC #4. The seven USTs comprising REC #5 lie under the north-central portion of the concrete tarmac. No other structures are on the site. A chain-link fence runs along the northern edge of REC #4, along Chesapeake Park Plaza, prohibiting unauthorized access to these two RECs. Access for vehicles and personnel is through a locked gate in the fence.

The concrete tarmac is composed of smaller concrete slabs in relatively good condition, with some minor cracking and potholes developing in a few locations. Grass and soil were observed in many of the slab joints. A grassy strip of land is along the southeastern edge of REC #4, separating the southeastern portion of the tarmac from a steel bulkhead along Dark Head Cove.

The Waterfront Lot portion of Block F comprises only a portion of REC #6. Parking Lot No. 6 (Block D) is also part of REC #6. Historical information obtained during the Phase I ESA suggests that the area was backfilled to raise its elevation, to facilitate construction of a bulkhead along the waterfront of Dark Head Cove. The Waterfront Lot is a well-manicured, grassy strip of land between Chesapeake Park Plaza and Dark Head Cove. It has several trees and the grass appears in good condition. A steel bulkhead bounds the unit along most of its border with Dark Head Cove.

The Former Boat Dock Area (REC #13) is an open, relatively flat, grassy parcel of land. A chain-link fence runs along Chesapeake Park Plaza, limiting unauthorized access. Neither the boundary with North American Electric nor with the Boat Launch Area (REC #4) is fenced. Vehicle and personnel access is through a locked gate along Chesapeake Park Plaza at REC #4.

The Former Boat Dock Area (REC #13) is covered with a well-maintained grass lawn, with shrubs and trees growing thickly along the Cow Pen Creek shoreline. The REC has several trees. Although no structures are currently on the site, the severely degraded remnants of several walkways, parking areas, and a few foundations are still evident.

2.2.4 Block G

Block G consists of 13.46 acres in the southwestern portion of the MRC on the southern side of Chesapeake Park Plaza. It is bounded on the north by Parking Lot No. 2 (Block H), to the east by Chesapeake Park Plaza, to the south by North American Electric, Inc., and to the west by Cow Pen Creek. Block G has two RECs identified during a historical research investigation: REC #11 (Former Sewage Treatment Plant [STP]/Wind-Tunnel Test Building/Vibration-Test Building) and

REC #12 (the southern portion of Parking Lot No. 3). The remaining portion of Parking Lot No. 3 is also included in Block G. Figure 2-2 shows the locations of the RECs and all tax blocks at the MRC.

A former STP that consisted of five structures and two USTs (the Wind-Tunnel Test Building, the Vibration-Test Building, two fuel oil USTs immediately west of the test buildings, an unidentified structure near the STP, and the Hydraulic and Fuel-Test Building) occupied the area now defined as REC #11. Except for storm-drain Outfall V and the foundations of the former test buildings, no structures now stand on REC #11. The foundations of the former STP have mostly been removed, but the footprint of the former STP is still evident in a 1986 aerial photograph, judging from variations in grass color. REC #11 is currently an open, grassy area between Chesapeake Park Plaza and Cow Pen Creek with some remnants of building slab foundations. A chain-link fence along the REC's northern and eastern perimeter prohibits unauthorized access; however, the REC is unfenced along its southern perimeter, which is shared with North American Electric, Inc. A locked gate along Chesapeake Park Plaza provides vehicle access.

Parking Lot No. 3 is a flat parcel of land currently leased for truck-trailer storage. A chain-link fence surrounding the parking lot on all sides prohibits unauthorized access. A locked gate off of Chesapeake Park Plaza allows access to the southern portion of the parking lot.

2.2.5 Block H

Block H, consisting of 7.88 acres, is in the northwestern portion of the MRC. Block H is bounded to the north by Eastern Boulevard (Route 150), to the east by the industrial portion of the MRC (Block I), to the south by Parking Lot No. 3 (Block G), and to the west by Cow Pen Creek. Block H consists of Parking Lot No. 2, which has been used primarily as an employee parking lot. The parking lot is paved with asphalt and a grassy strip of land lies between the paved portion of the block and Cow Pen Creek. Access to the parking lot is from Chesapeake Park Plaza. Historical aerial photographs indicate that Parking Lot No. 2 was constructed before 1954. It remains in use today for employee parking. No structures are known to have ever stood on this asphalt parking area.

2.3 PHYSICAL SETTING

2.3.1 Physiography

The site lies within the Western Shore of the Coastal Plain Physiographic Province. Coastal Plain topography is generally characterized by low relief. The MRC's topography slopes gently, ranging from sea level to approximately 32-feet above mean sea level. The topography slopes from Eastern Boulevard to the southwest and south toward Cow Pen Creek and Dark Head Cove.

2.3.2 Hydrology

The MRC lies at the junction of Cow Pen Creek and Dark Head Cove. Both are tidal surface water bodies that feed into Dark Head Creek, a tributary to Middle River, which is a tributary to Chesapeake Bay. The facility lies approximately 3.2 miles upstream of Chesapeake Bay. No surface water bodies lie within or cross the MRC.

MRC maintains a State of Maryland National Pollutant Discharge Elimination System (NPDES) permit (state discharge permit No.: 00-DP-0298, NPDES permit No.: MD0002852) issued by Maryland Department of the Environment (MDE) Industrial Discharge Permits Division, Water Management Administration (Earth Tech, 2003). MRAS generates sanitary and process wastewater and is categorized as an "Industrial User." The facility pre-treats and discharges its wastewater under the "Industrial-User Discharge Permit" (permit No.: WWDP#1390) issued to MRAS by the Baltimore County Department of Public Works, Bureau of Utilities (Earth Tech, 2003). The permit authorizes the facility to discharge its processed and sanitary wastewater from seven permitted discharge points (i.e., outfalls).

2.3.3 Soils

Soils underlying the MRC have been mapped by the United States Department of Agriculture (USDA) Soil Conservation Service as Mattapex-Urban Land Complex and Sassafras-Urban Land Complex. Mattapex-Urban Land soils consist of deep, well-drained, silty soils, the original texture of which has been disturbed, graded over, or otherwise altered before construction. Sassafras-Urban Land soils consist of deep, well-drained, sandy soils, the original texture of which has been disturbed, graded over, or otherwise altered before construction (USDA, 1993). MRC site assessments, however, indicate that a high percentage of these soils contain a very high clay and silt content, with poor surface drainage.

2.3.4 Geology

Geologic maps of Baltimore County show that the MRC is underlain by the Potomac Group, a Cretaceous-age interbedded gravel, sand, silt, and clay unit ranging in thickness from 0–800 feet. The Potomac Group is composed of three units: the Raritan and Patapsco Formations, the Arundel Clay, and the Patuxent Formation. The Raritan and Patapsco Formations range up to 400 feet thick and are composed of a gray, brown, and red variegated silt and clay unit with lenticular lenses of sand and few gravels. The Arundel Clay is composed of dark gray and maroon lignitic-clays ranging from 25–200 feet thick. The Patuxent Formation is described as a white or light-gray to orange-brown, moderately sorted sand unit with quartz gravels, silts, and clays ranging up to 250 feet thick (Reinhardt, 1977).

The geologic map of the Middle River-quadrangle maps the entire survey area as either the clay or sand facies of the Patapsco Formation. The sands are more concentrated on the peninsulas east of MSA and in areas north of Eastern Boulevard, whereas all of the peninsulas (except for the Wilson Point Road area) west of the airport are mapped as belonging to the clay facies. The Arundel Clay is mapped as outcropping northwest of the MRC facility (Reinhardt, 1977).

Lithologic logging of soils beneath the MRC (conducted during extensive site characterization) has identified a very heterogeneous substrate. The underlying soils are composed primarily of silty sands, fine-grained to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primary lithology being clay to silty clay. Sand lenses were encountered but in general do not appear to be continuous beneath the facility. Shallow groundwater tends to flow in the more sandy lenses toward the surface water bodies, and the water table is generally a subdued representation of the surface topography.

2.4 PREVIOUS INVESTIGATIONS

Investigations associated with the MRC have been conducted since 2003 and include UST closures and abandonments, soil excavations, Phase I ESAs, and Phase II investigations.

2.4.1 Phase I Environmental Assessment (2003)

A Phase I ESA of the MRC was conducted in accordance with American Society for Testing and Materials (ASTM) standard E 1527 in February 2003. The Phase I ESA consisted of a historical

review of the facility (i.e., a review of facility documents, aerial photographs, and city directories), a review of federal, state, and local agency databases, interviews with site personnel, and a site visit. The Phase I ESA identified 13 specific RECs associated with the MRC. In addition to the 13 RECs, the Phase I ESA also recommended further investigation into the facility's historical site activities to identify other potential environmental concerns at the facility and creation of an operation and maintenance plan to address asbestos-containing materials (ACMs) and lead paint (Earth Tech, 2003).

2.4.2 Phase II Investigation (Fall/Winter 2003)

A Phase II investigation consisting of soil and groundwater sampling and a geophysical survey was conducted on seven of the 13 RECs identified in the Phase I ESA. The fall 2003 Phase II investigation sought to determine and evaluate environmental baseline conditions for the entire MRC. Geophysical surveys were conducted to find evidence of buried USTs, utilities, or metallic debris in the subsurface underlying the RECs.

The Phase II investigation determined baseline conditions by identifying and evaluating potential contaminants in the underlying environmental media. Six of the seven RECs investigated are in the southern portion of the MRC. The RECs investigated include Former Building D (REC #1), the Product Pipeline (REC #2), the former 500,000-gallon AST and associated tanks (REC #3), the Boat Launch Area (REC #4), seven former aviation fuel USTs (REC #5), and potential fill areas along the waterfront lot and Parking Lot No. 6 (REC #6). REC #7 consists of the five existing on-site groundwater-monitoring wells.

Thirty-two soil borings were completed on the exterior areas using direct-push technology (DPT). The completed soil borings were either adjacent to known contaminant-source areas (RECs #2, #3, and #5) or spaced throughout a REC if the potential source(s) were unknown or multiple sources were suspected (RECs #1, #4, and #6). Subsurface soil samples were collected in 30 of 32 borings, primarily from the 5–10 foot below ground surface (bgs) soil intervals. Groundwater grab samples were collected from 23 groundwater sampling points installed using a DPT hydro-punch sampler. One background soil boring, designated SB-34, was completed adjacent to the facility's athletic field, an area that, based on available historical aerial photographs, was used solely for recreational activities since the facility's construction in the late

1930s. All five existing monitoring wells, installed previously at several UST areas, were purged and sampled using low-flow techniques.

The soil and groundwater samples collected were submitted for targeted analyses if the source was known (e.g., UST and pipeline) or for a full suite of analyses if multiple sources were suspected or no information about possible contaminants was known. Full-suite analyses consisted of analysis for gasoline-range organics (GRO), diesel-range-organics-extended (DRO-extended), volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and priority-pollutant metals. Analytical results identified inorganic and organic compounds (in soil and groundwater obtained from all seven RECs) at concentrations above screening levels that were appropriate for use in 2003. Sampling locations are shown in Figures 2-3 through 2-9. Data relevant to the human health risk assessment (HHRA) that were collected during the 2003 investigation are in Appendix A.

As part of the Phase II investigation, a reconnaissance-level electromagnetic (EM) survey of REC #6 (Waterfront Lot/Parking Lot No. 6) evaluated whether waste disposal, buried drums, or other metallic debris were in the fill material. Portions of the site were further delineated wherever the survey indicated an anomaly. Nine anomalies were identified throughout the survey area.

Ground-penetrating radar (GPR) scanning results found eight of these anomalies, which are associated with utilities (primarily storm drains). GPR imaging of the remaining anomaly, designated Anomaly 6, did not identify a definitive source and was not considered consistent with any known possible subsurface metallic objects or utilities. Anomaly 6, approximately 300 feet long by 40 feet wide, is near the center of Parking Lot No. 6 and runs mostly northwest to southeast in a linear trend. The results of the geophysical survey are presented in the *Site Characterization Report* (Tetra Tech, 2006b). Evaluation of these data compelled further investigation at all seven RECs to characterize exceedances of inorganic and organic constituents and address identified data gaps.

2.4.3 Historical Survey (2004)

Tetra Tech conducted a historical investigation of the MRC in the summer of 2004 to address the lack of historical information that had been identified in the Phase I ESA (Earth Tech, February 2003). The historical survey reviewed MRC maps (e.g., as-builts,

construction plans, and plot maps), interviewed Lockheed Martin and tenant personnel, and documented site visits. The investigation identified 18 additional RECs along the facility perimeter, in the active industrial yard, and in Buildings A, B, and C (Block I). The additional RECs include a former STP, an incinerator, several plating shops, a possible historical debris storage lot, abandoned USTs, and areas associated with several environmental investigations (e.g., an area of lead removal at the Die Storage Unit and an area of elevated chromium concentrations in groundwater adjacent to Building A) (Tetra Tech, 2004). Figure 2-2 shows all of the RECs. Appendix B presents historical aerial photographs taken from 1938-2005.

2.4.4 Site-Wide Phase II Investigation (2004)

The site-wide Phase II investigation further investigated environmental concerns, including analytical results, identified at RECs investigated during the 2003 Phase II investigation and the historical research survey, and also sought to address possible data gaps (Tetra Tech, 2004). All 31 RECs were investigated during the 2004 site-wide Phase II investigation, including geophysical surveys of five areas, a soil- and groundwater-sampling program, and radiological surficial-media sampling at REC #1. A reconnaissance-level EM survey of REC #7 (Existing Monitoring Wells—MW-5 location), REC #8 (Abandoned 25,000-Gallon Fuel-Oil UST), RECs #9 and #28 (Former 2,000-Gallon Waste-Oil UST), REC #11 (Former STP/Wind-Tunnel Test Building/Vibration-Test Building), and REC #14 (Building A Northwest-Corner Pump Island) was conducted. The geophysical surveys looked for evidence of buried USTs, utilities, or metallic debris in the subsurface underlying the five RECs. Results of the survey were used to place final sampling locations.

One-hundred twenty-three soil borings were carried out in the exterior portions of the facility, using a DPT drill rig. Thirteen of the 123 borings were completed to a maximum depth of 4 feet bgs to collect and lithologically characterize surface soil samples. The remaining 110 borings were completed to the top of the local water-bearing zone. Boring depths range from 15–40 feet bgs unless groundwater was encountered. Refusal of several borings was encountered due to reinforced concrete pavement, concrete rubble in the subsurface soil, and unknown obstructions.

Geophysical survey results from RECs #8 and #11 led to inclusion of an additional 18 soil borings (eight soil borings for REC #8 and #10 for REC #11) to the investigation. The additional soil borings were specifically located to investigate soil and groundwater quality in the

immediate vicinity of the identified anomalies. Strict sample handling procedures were followed throughout the investigation. Upon collection, samples were collected in appropriate laboratory-certified-clean sample containers supplied by the labs. Proper custody procedures were followed throughout all phases of sample collection and handling. A completed chain-of-custody form accompanied each shipment of samples to the laboratory to ensure accountability for the samples from the time of collection to the time they were analyzed.

Analyses were performed on a REC-specific basis. Target analyses for benzene, toluene, ethylbenzene, and total xylene (BTEX) compounds, naphthalene, GRO, DRO, VOCs, hexavalent chromium, PCBs, pesticides, priority-pollutant metals, and gamma spectroscopy were conducted in suspected source areas. Emergent chemicals of concern, including perchlorate and hexavalent chromium, were also analyzed. Sampling locations are shown in Figures 2-3 through 2-9. Data relevant to the HHRA that were collected during the 2004 investigation are in Appendix A.

2.4.5 Phase II Soil Investigation (Summer 2005)

The Phase II soil investigation continued in the summer of 2005 to provide both a baseline characterization of areas without identified RECs (primarily Blocks A, B, and H) as well as data to further delineate possible contaminants that had been identified in specific RECs during previous investigations. Thirty soil borings were completed in areas with no identified RECs (SB-194 through SB-223) in the upper 10 feet of soil (at 0–1 feet, -5, and -10 foot bgs). Forty-five soil borings were completed to provide additional characterization at seven previously investigated RECs (RECs #1, #4, #6, #11, #12, #13, and #26). In addition to the borings referenced above, another issue was identified during the 2004 investigation that necessitated additional characterization. One background sample (SB-34A-SS), collected from the baseball field in Block B, had a reported lead concentration of 370 milligrams per kilogram (mg/kg). Although the reported concentration was below the appropriate 2005 screening level, the concentration was sufficiently elevated to warrant further investigation. Consequently, eight surface soil samples (designated SB-224-SS through SB-231-SS) were collected from 0–1 foot below grade around the previous sampling location and across the ball field to ensure that lead and other elevated metals were not a problem in this area.

Soil borings were completed using DPT or a stainless-steel hand auger (if required). After lithologic logging and field screening, soil from the designated sampling intervals was collected

and immediately placed in appropriate sample containers. The collected sample jars were labeled and placed on ice pending delivery to the analytical laboratory. All samples were analyzed for VOCs, SVOCs, total priority-pollutant metals, PCBs, BTEX-N, GRO, DRO-extended, mercury speciation (if elevated concentrations of mercury were detected), and hexavalent chromium. Sampling locations are shown in Figures 2-3 through 2-9. Data relevant to the HHRA that were collected during the summer 2005 investigation are in Appendix A.

2.4.6 Geophysical Survey/Soil Investigation (Fall 2005)

A geophysical survey and subsequent sampling provided more certainty regarding environmental conditions of areas associated with the MRC having no known or suspected contamination due to storage, management, or disposal of hazardous constituents. The fall 2005 investigation was designed to identify and characterize any anomalous geophysical responses not associated with known subsurface features (e.g., underground utilities, underground storage tanks) in the accessible (surveyable) portions of the survey areas. To that end, a geophysical survey was performed, followed by sampling and analysis of anomalies not associated with known subsurface features.

EM survey techniques screened the areas identified below (approximately 55 acres) and identified anomalous EM responses. Global positioning system (GPS) technology provided location information for EM data points. Identified anomalies were further evaluated using GPR. The following areas were surveyed:

- Block A and Block A Lot 2 in their entirety—approximately 14.3 acres
- Block B in its entirety—approximately 18.4 acres
- Block F (only the area west of the boat launch ramp)—approximately 6 acres
- Block G as accessible—approximately eight of the 13.5 acres are surveyable due to the high density of stored tractor trailers
- Lot H in its entirety—approximately 7.9 acres

Following the geophysical survey, any anomalies that could not be resolved as being associated with known features (primarily utilities) were sampled for soil contamination at multiple depths using DPT. Two locations were also sampled for groundwater at or near the water table. In

general, soil samples were collected from depths of 5 and 10 feet bgs unless more specific data on the depth to the target area was ascertained.

Following the EM survey of a given area, EM anomalies were further evaluated using GPR. The investigation depth was approximately 10–15 feet. Numerous more closely spaced and variously oriented profiles were scanned to accurately determine the footprint outline of each anomaly. Footprint outlines were defined and marked in the field. Results of the geophysical survey are reported in the *Site Characterization Report* (Tetra Tech, 2006b)

Soil borings were positioned to evaluate geophysical anomalies not associated with known subsurface features and were completed using a Geoprobe® system. Soil from the designated sampling intervals was collected and immediately placed in the appropriate sample containers. The collected sample jars were labeled and placed on ice pending delivery to the analytical laboratory. The laboratory analyses of soil and groundwater samples include analysis for VOCs, SVOC, total priority-pollutant metals, dissolved priority-pollutant metals (groundwater only), PCBs, GRO, and DRO-extended. Sampling locations are shown in Figures 2-3 through 2-9. Data relevant to the HHRA that were collected during the fall 2005 investigation are presented in Appendix A.

2.4.7 Site Characterization Report (May 2006)

The *Site Characterization Report* (Tetra Tech, 2006b) was prepared from the fall of 2005 through May 2006 summarizing data collected in all media through 2005. It included screening of the chemicals detected in soil against natural background concentrations. It also included an HHRA identifying potential adverse human health effects resulting from exposure to the detected chemicals for a number of current and hypothetical use scenarios.

The HHRA identified a number of chemicals of potential concern (COPC) by comparing maximum concentrations to appropriate 2006 screening levels. COPC detected in soil samples include metals, polycyclic aromatic-hydrocarbons (PAHs) (expressed as benzo(a)pyrene equivalents [BaPEq]; see Section 3 for calculation methodology), SVOCs, PCBs, and total petroleum hydrocarbons (TPH)-DRO, and -GRO. Results of the site-specific HHRA helped determine which COPC are the principal contributors to risk. COPC were evaluated from the perspective of prevailing background concentrations and potential adverse human health effects.

2.4.8 Additional Soil Characterization (Fall 2007)

An additional field investigation in the fall of 2007 sought to confirm previous results and refine the limits of COPC (identified in the *Site Characterization Report*) greater than potential cleanup goals. The objective of the fall 2007 investigation was to obtain sufficient soil data to delineate areas of concern in Blocks B, D, E, F, G, and H. To that end, a DPT soil characterization was executed to best define the boundaries of COPC, as defined in the *Site Characterization Report* (Tetra Tech, 2006b). Characterization was completed both laterally and vertically (as determined by the depth to groundwater).

Two-hundred-fifty borings were advanced during the 2007 additional field investigation. Soil borings were advanced to a maximum depth of 9 feet bgs. Samples were collected at two-foot increments (e.g. surface, 2–3, 5–6, 8–9 feet bgs) to a total depth of 9 feet bgs. Concrete coring was required in Blocks E and F. Continuous soil samples were collected in each boring using a 1.5-inch, 4-foot long stainless-steel macro-core sampler fitted with a disposable acetate-liner. Samples were screened in the field for lithologic description, visual observations, and then shipped to the laboratory for analysis. The samplers were analyzed for block-specific COPC including SVOCs, metals, PCBs, and TPH (GRO and DRO) compounds. Sampling locations are shown in Figures 2-3 through 2-9. Data relevant to the HHRA that were collected during fall 2007 investigation are in Appendix A.

2.4.9 Final Soil Delineation (Blocks D, F, G, and H Fall 2009)

The final delineation effort consisted of two tiers of sampling in pursuit of two goals: (1) to fill data gaps to refine estimated depths of soil impacts and (2) to allow for iterative sampling to expand the investigation area outward laterally. The sampling strategy described below advanced 385 soil borings in Blocks D, F, G, and H. No soil borings were advanced in Block E during this event. The data are presented in individual data reports for each block. Samples collected during the fall 2009 event were analyzed for block-specific COPC identified in previous studies. PAHs are the COC analyzed for throughout all blocks; PCBs (Block F), arsenic (Block G), mercury (Blocks F and H), and TPH-GRO and -DRO (Block G) were analyzed for in samples from areas of concern for that particular constituent.

The first tier of delineation sampling ("Inner Tier") collected samples from existing isolated locations where BaPEq concentrations had been calculated for samples with non-detects or less than detection limit results for BaPEq. BaPEq concentrations were calculated using USEPA's *ProUCL* software in combination with USEPA's toxicity-equivalency factors (TEF) for PAHs exceeding the screening level. Some soil data from these previous borings, therefore, exceed the screening level due to the conservative assumption that PAHs may be present above screening levels but below quantitation limits. During Inner Tier sampling, soil in the area of these borings was resampled and analyzed with a lower quantitation limit. The target quantitation limit for PAHs is 6.7 µg/kg. The BaPEq concentration from the resulting Inner Tier data was then calculated and the new BaPEq concentration was compared to the screening level.

The Inner Tier also produced samples from existing isolated sampling locations where the vertical profile did not satisfy the project objective of two clean intervals spaced at one-foot increments beneath the sample exhibiting a screening-level exceedance. In sampling locations that did not satisfy the project depth requirement, the existing location was resampled, starting below the depth of the original screening-level exceedance to define the vertical extent, along with four satellite locations. The Inner Tier sampling sought to verify the clean margin based on resampling data by collecting it from more evenly spaced depth intervals.

If Inner Tier samples exceeded screening levels, an Outer Tier location was sampled to a depth defined by the clean margin of the Inner Tier. The second tier of delineation sampling ("Outer Tier") consists of a round of borings extending outward laterally from the impacted area defined by the results of the previous tier of sampling. Samples from Outer Tier borings were collected and analyzed at two-foot intervals.

In some instances a second round of Outer Tier samples was also collected. The final delineation sampling used DPT drilling, with disposable acetate-lined core samplers. All data were considered when determining the location and depth for vertical and horizontal delineations. In some cases the limit defined by COC with concentrations above screening levels was sufficiently delineated in one or both directions such that the full scope of Inner and/or Outer Tier sampling was not necessary.

Block B characterization was deemed complete during the 2009 final delineation sampling and remediation was undertaken in fall 2010. Block B is therefore not included in this risk assessment. Sampling locations are shown in Figure 2-3 and Figures 2-5 through 2-9. Data relevant to the HHRA that were collected during the fall 2009 investigation are in Appendix A.

2.4.10 Data Gap Investigation (Fall 2010)

The objective of the data-gap soil sampling is to define with greater accuracy the vertical and lateral boundaries of soil with COPC concentrations above potential cleanup goals by collecting soil samples at locations to fill identified data gaps. A DPT drill rig advanced 82 soil borings in each block that had remaining data gaps. Soil samples were collected from each boring at two-foot intervals to a maximum depth of 15 feet. bgs using a 1.5-inch-diameter, 4-foot long stainless-steel macro-core sampler fitted with a disposable acetate-liner.

The data are presented in separate data reports for each block. Samples collected during this event were analyzed for block-specific COC. PAHs are the COC analyzed for throughout Blocks D, F, G, and H. Block F samples were analyzed for mercury. Block E samples were analyzed for PCBs.

A subset of samples was also analyzed for alkyl-PAHs to determine if the source of the impacted area is of pyrogenic or petrogenic in nature. Samples from the panhandle area of Block D were analyzed for VOCs, SVOCs and 1,4-dioxane, TPH-GRO and -DRO, total metals, hexavalent chromium, and pesticides/PCB. Samples from the area near SB-833 in Block E were also analyzed for TPH-GRO and -DRO, VOCs, SVOCs, and total metals. Sampling locations are shown in Figures 2-3 through 2-9. Data relevant to the HHRA that were collected during the fall 2010 investigation are in Appendix A.

Section 3
Human Health Risk Assessment: General Methodology

Section 3 provides the general methodologies used to develop tax-block-specific risk assessments for exposure to impacted soil. Primary guidance sources used to prepare this human health risk basement (HHRA) include the Maryland Department of the Environment (MDE) *Cleanup Standards for Soil and Groundwater* (State of Maryland, 2008) and *Voluntary Cleanup Program Guidance* (State of Maryland, 2006). Current guidance and reports published by the U.S. Environmental Protection Agency (USEPA) and USEPA Region 3 were also considered in preparing the HHRA:

- *Soil Screening Guidance: Technical Background Document* (USEPA, 1996a)
- *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (USEPA, 2002a)
- *Exposure Factors Handbook*. Office of Research and Development, National Center for Environmental Assessment, Washington, D.C. EPA/600/P-95/002Fa (USEPA, 1997a)
- *Human Health Evaluation Manual, Supplemental Guidance: Standard Default Exposure-Factors*. OSWER Directive 9285.6 03, OSWER, Washington, D.C. (USEPA, 1991)
- Distribution of *Preliminary Review Draft: Superfund's Standard Default Exposure-Factors for Central-Tendency and Reasonable Maximum Exposure*. OSWER, Washington, D.C. (USEPA, 1993a)
- *Calculating Upper Confidence-Limits for Exposure-Point Concentrations at Hazardous Waste Sites*. Office of Emergency and Remedial Response, Washington, D.C. OSWER 9285.6-10 (USEPA, 2002b)
- *Risk Assessment Guidance for Superfund (RAGS), Volume I: Human Health Evaluation Manual (Part A)* (USEPA, 1989)

- *Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment), Final*. Office of Superfund Remediation and Technology Innovation, Washington, D.C. 20460 EPA/540/R/99/005, OSWER 9285.7-02EP; PB99-963312 (USEPA, 2004a).

- *Guidelines for Carcinogen Risk Assessment*. EPA/630/P-03/001B. March 2005 (USEPA 2005a)

- *Supplemental Guidance for Assessing Susceptibility from Early Life Exposure to Carcinogens*. EPA/630/R-03/003F (USEPA, 2005b)

- *Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment), Final*. Office of Superfund Remediation and Technology Innovation, Washington, D.C. 20460 EPA-540-R-070-002, OSWER 9285.7-82 (USEPA, 2009a).

- *Updated Dermal Exposure Guidance* (USEPA Region 3, 2003a)

The risk assessment protocols in the following technical documents, which were prepared for Lockheed Martin Corporation (Lockheed Martin) sites at Martin State Airport (MSA) site as well as for the Middle River Complex (MRC), were also considered:

- *Revised Human Health Risk Assessment, MSA, Middle River, Maryland*. Prepared for Lockheed Martin Corporation (Tetra Tech, 2006a)

- *Site Characterization Report, Lockheed Martin MRC, 2323 Eastern Boulevard, Middle River, Maryland* (Tetra Tech, 2006b)

The HHRA for the tax block soils is structured and reported according to the guidelines in the *RAGS, Human Health Evaluation Manual, Part D: Standardized Planning, Reporting, and Review of Superfund Risk Assessments* (*RAGS Part D*) (USEPA, 2001). The HHRA consists of the following six components (see *RAGS* Sections 1 through 6 for a more complete discussion):

- data evaluation
- exposure assessment
- toxicity assessment
- risk characterization
- uncertainty analysis
- development of remedial goal options

3.1 DATA EVALUATION METHODOLOGY

The first step of the baseline HHRA, data evaluation, is a medium-specific task that begins with compilation of relevant analytical data and concludes with the selection of chemicals of potential

concern (COPC) to be evaluated in subsequent step of the assessment. First, the data available for the relevant study area(s) are reviewed in terms of data quality; only validated data are used in the assessment. Environmental samples selected for HHRA are summarized in the tables presented in Appendix A. Second, a medium-specific list of COPC (used to quantitatively and/or qualitatively determine potential human health risks) was selected based on a toxicity screen (i.e., a comparison of site contaminant concentrations to conservative toxicity-screening values).

3.1.1 Data Evaluated in the HHRA

Validated data collected during the following environmental investigations were used to assess risks to potential human receptors:

- Phase II site investigation (fall/winter 2003)
- site-wide Phase II investigation (2004)
- Phase II soil investigation (summer 2005)
- additional soil characterization (fall 2007)
- supplemental soil and storm-drain-sediment characterization (Block E fall 2008)
- final soil delineation (Block D, F, G, and H fall 2009)
- data gap investigation (fall 2010)

Environmental samples specifically evaluated in the HHRA are listed in Tables 3-1 through 3-15 (and Appendix A):

- *Tables 3-1 through 3-5*: Soil samples collected in the 0–2 feet below grade interval for each of the five tax blocks (collected in 2004–2010). These samples are considered surface soil samples for the purposes of the HHRA.
- *Tables 3-6 through 3-10*: Soil samples collected at depths greater than two feet below grade but less than or equal to 10 feet below grade (collected in 2003–2010) are considered shallow subsurface-soil samples for the purposes of the HHRA. Typically, subsurface soil data are evaluated to a depth of 10–15 (the depth to which human receptors could reasonably be exposed) or to the zone of saturation. The depth to groundwater in the study area is within 10 feet below grade. To be conservative, subsurface soil data from 2–10 feet below grade were included in the quantitative risk evaluation. Data for these samples are assumed to represent conditions in the unsaturated (vadose) zone and upper saturated-zone soils. The uncertainty analysis (see Section 5)

discusses uncertainty associated with potential saturated-zone samples included in the quantitative risk evaluation.

- *Tables 3-11 through 3-15*: Soil samples collected at depths greater than 10 feet below grade (collected in 2004 through 2010) are considered deep subsurface-soil samples for the purposes of the HHRA. We assume that direct contact with the deeper saturated-zone soils (i.e., soil samples greater than 10 feet below grade) is very unlikely; therefore, this HHRA does not quantitatively evaluate direct-contact exposure to deeper saturated-zone soils. The uncertainty analysis (see Section 5) presents a qualitative evaluation of contaminants detected in saturated-zone soils.

Fixed-base analytical results (i.e., results from a fixed-base laboratory and not from field analytical results) from field investigations for target analytes were used in the quantitative risk evaluation. Field measurements and data regarded as rejected (i.e., that were qualified as "R" during data validation) were not used in the quantitative risk assessment. If a chemical was not detected in an environmental medium but its reported detection limits (sample quantitation-limits [SQLs]) for the environmental samples exceeded the COPC toxicity screening-levels, that chemical is qualitatively discussed in the uncertainty analysis section.

3.1.2 Selection of Chemicals of Potential Concern

Selecting COPC is a qualitative screening process to limit the number of chemicals quantitatively evaluated in the baseline HHRA to those site-related constituents that dominate overall potential risks. Screening by risk-based concentrations focuses the risk assessment on meaningful chemicals and exposure routes. In general, a chemical was selected as a COPC in the HHRA and retained for further quantitative-risk evaluation if the maximum detection in a soil data set exceeded the lowest risk-based screening concentration. Chemicals eliminated from further evaluation are assumed to present minimal risks to potential human receptors. Tables summarizing the selection of COPC are included in the risk assessment and referenced in the following text.

3.1.2.1 Derivation of Screening Criteria

The primary COPC screening criteria for the study area soils were derived from MDE's *Cleanup Levels for Soil and Groundwater* (State of Maryland, 2008) and USEPA Regional Screening Levels (RSLs) developed by the U.S. Department of Energy's Oak Ridge National Laboratory (ORNL) on behalf of USEPA (USEPA, 2010a). The more conservative of these values were used to select COPC. These risk-based concentrations are based on exposure pathways for which generally accepted methods, models, and assumptions have been developed (i.e., ingestion,

dermal contact, inhalation) for specific land uses (residential, industrial). They do not consider effects on groundwater or ecological receptors. The COPC screening levels used in the HHRA to evaluate soil data are listed in Table 3-16 and defined in the following narrative.

Screening levels for all parameters except lead—Screening levels to select COPC for direct human-contact exposures to surface and subsurface soil are based on the following criteria:

- *Interim Final Guidance from the State of Maryland, Department of the Environment, Cleanup Standards for Soil and Groundwater* (State of Maryland, 2008)
- *Regional Screening-Levels for Residential Soil* (USEPA, 2010a)
- "Generic Soil-Screening Levels (SSL_{air}) for Transfers from Soil to Air" (published on the USEPA Web site: http://rais.ornl.gov/epa/ssl1.shtml)

COPC screening levels from the MDE cleanup standards correspond to a systemic hazard quotient (HQ) of 0.1 for noncarcinogens or an incremental lifetime cancer-risk (ILCR) of 1×10^{-6} (i.e., a one in a million probability) for carcinogens. In contrast, USEPA RSLs are based on an HQ of 1 for noncarcinogens and an ILCR of 1×10^{-6} for carcinogens. USEPA RSLs for noncarcinogens are based on an HQ of 1, so COPC screening-levels based on USEPA RSLs were adjusted to correspond to a systemic HQ of 0.1 for noncarcinogens to account for the potential cumulative effects of several chemicals affecting the same target organ or producing the same adverse noncarcinogenic effect. Soil-screening levels derived from both of these sources were used for direct-contact COPC selection. As noted above, the more conservative of the available values were used for COPC selection.

The SSL_{air} values for chemical migration from soil to outside air (published online by USEPA and ORNL at http://rais.ornl.gov/epa/ssl1.shtml) were also used to select COPC for surface and subsurface soils. These values are more recent than those in the 1996 and 2002 soil-screening level (SSL) guidance documents (USEPA, 1996a and USEPA, 2002a). The $SSLs_{air}$ values are based on an HQ of 1; however, the COPC screening values were adjusted to be based on an HQ of 0.1.

Maximum chemical concentrations in soil were also compared to MDE cleanup levels for groundwater protection (as published in State of Maryland, 2008) as well as to federal SSLs for groundwater protection, which are designed to protect groundwater at most sites (as published in

the USEPA RSL table). These groundwater-protection SSLs allow an initial qualitative evaluation of the potential for chemical migration from soil to groundwater. MDE cleanup levels for groundwater protection are based on a dilution-attenuation factor (DAF) of 20, whereas federal SSLs for groundwater protection are based on a DAF of 1. Chemicals with concentrations exceeding MDE groundwater protection criteria or the SSLs' criteria may potentially migrate from soil to groundwater in sufficient quantities to pose groundwater quality problems. Chemicals detected at concentrations exceeding MDE groundwater protection criterion or the federal SSL for groundwater protection, but at concentrations less than COPC screening levels for direct-contact risk, will not be evaluated quantitatively in the HHRA. However, these chemicals will be further evaluated qualitatively using the approach presented in Section 3.4.3.

Screening levels for lead—Guidance from the USEPA Office of Prevention, Pesticides, and Toxic Substances (OPPTS) and Office of Solid Waste and Emergency Response (OSWER) recommend 400 mg/kg as the screening level for lead impacted soil in a residential setting where children are frequently present (USEPA, 1994). To be conservative, 400 mg/kg was used as the screening level to select COPC for soil. However, guidance from the USEPA Technical Review Workgroup for Lead indicates that "a reasonable screening level for soil lead at commercial/industrial (i.e., non-residential) sites is 800 mg/kg" for a typical non-contact intensive worker (2010b); 800 mg/kg is also the current USEPA RSL for soils (2010a), assuming an industrial land use scenario.

3.1.2.2 Decision Rules for Establishing Chemicals of Potential Concern

The following decision rules were used to select COPC for tax block soils:

- A chemical detected in soil was selected as a COPC for the HHRA if the maximum detected chemical concentration exceeds its relevant screening level for soils.
- Surrogate COPC screening levels were used for some chemicals. For example, risk-based COPC screening levels are not currently available for some chemicals [e.g., acenaphthylene, benzo(g,h,i)perylene, phenanthrene] that have been detected in study area soils due to the lack of toxicity criteria. In screening COPC, acenaphthene was used as a surrogate for acenaphthylene; pyrene was used as a surrogate for benzo(g,h,i)perylene and phenanthrene.

- Some chemicals (e.g., naphthalene) are reported in both the VOC and SVOC fractions. The maximum detected concentration was evaluated for purposes of COPC selection.

- Per current USEPA guidance (USEPA, 1993b), cancer risk estimates for benzo(a)pyrene and six other PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene) were calculated in terms of benzo(a)pyrene equivalent concentrations (BaPEq) that are calculated using USEPA-recommended toxicity equivalency factors (TEFs). TEFs are based on the potency of each of these PAH compounds relative to that of benzo(a)pyrene. TEFs are used to convert each individual PAH concentration into an equivalent concentration of benzo(a)pyrene. The sum of these equivalent concentrations for the six other PAHs and benzo(a)pyrene is the BaPEq concentration. Exposure-point concentrations (EPC) for these PAHs were derived using benzo(a)pyrene equivalent concentrations calculated for each sample.

  BaPEq are calculated two ways: (1) the BaPEq-½-non-detect value is calculated using one-half of the detection limit to represent non-detect results in the calculation, and (2) the BaPEq positive-results value is calculated using a value of zero to represent non-detect PAH results. In either BaPEq calculation, if none of the PAHs were detected in a sample, then the sample quantitation-limit for benzo(a)pyrene is used as the equivalent concentration for that sample. Values for both BaPEq calculations are presented in the COPC-selection tables.

  Both values calculated for BaPEq are similar; therefore, the BaPEq-½-non-detect values were used in the risk assessment, since these values are slightly more conservative due to the incorporation of non-detects. Using one-half of the detection limit for non-detects recognizes that the concentration of a PAH in a specific sample may be greater than zero even though the result is considered non-detected (i.e., the PAH may be present at a concentration between zero and the sample-quantitation limit). The fact that the BaPEq results for both the ½-non-detect and positive-results-only calculations are similar indicates that elevated detection limits are not resulting in biased-high BaPEq results for the ½-non-detect calculation.

- For PCBs, individual Aroclors were compared to screening criteria for individual Aroclors. Total Aroclor concentrations were determined on a sample-specific basis by summing individual detected Aroclor concentrations. These results are presented in the COPC selection tables where applicable.

3.1.3 COPC Selected for the HHRA

COPC for the tax blocks were selected for surface and subsurface soil using the COPC screening levels described in the preceding narrative. COPC selection was based on samples from all blocks (i.e., Blocks D, E, F, G, and H) combined to produce a list of “global” COPC. Global COPC were further evaluated on a block-specific basis as part of the quantitative risk assessment based on whether the COPC were detected in a specific block, consistent with the global COPC

screening process. Using the global COPC screening process avoids having to evaluate and assign surrogate concentration values (e.g., SQLs) to global COPC that were never detected in the block considered. A discussion of the chemicals identified as global COPC and the rationale for their selection as global COPC is provided in the following subsections. Global COPC-selection tables for surface and subsurface soil are presented in Tables 3-17 through 3-20. Global COPC-selection for the deep subsurface soils (not evaluated quantitatively in the HHRA) is presented in Table 3-21. Chemicals retained as global COPC for the tax blocks are presented in Table 3-22. The *RAGS Part D* tables for COPC selection are in Appendix D.

3.1.3.1 Surface Soil (0–2 Feet Below Grade)

Thirty VOCs, 12 SVOCs, 17 PAHs, three pesticides, three PCBs, 19 metals, petroleum hydrocarbon compounds, methyl mercury, and hexavalent chromium were detected in the surface soil samples listed in Tables 3-1 through 3-5. A comparison of the maximum detected surface soil concentrations to screening levels (based on MDE cleanup levels, RSLs, and $SSLs_{air}$) is presented in Table 3-17. The following chemicals were detected in surface soils at maximum concentrations exceeding the direct-contact risk-based COPC screening-levels and were retained as COPC for surface soil:

- ***VOCs:*** 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, and 1,4-dichlorobenzene
- ***PAHs:*** benzo(a)pyrene equivalents, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(b+k)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- ***PCBs:*** Aroclor-1254, Aroclor-1260, and total Aroclor
- ***Metals:*** antimony, arsenic, cadmium, cobalt, iron, lead, manganese, mercury, molybdenum, nickel, and vanadium
- ***Petroleum hydrocarbons:*** DRO and GRO
- ***Miscellaneous parameters:*** hexavalent chromium

No COPC screening levels based on MDE cleanup standards or USEPA RSLs are available for 1,2,3-trimethylbenzene, n-butylbenzene, tertiary-butyl alcohol, di-n-octyl-phthalate, dimethyl phthalate, and the TPH ranges TPH C09-C36 and TPH C10-C32. Chemicals lacking screening criteria were qualitatively evaluated in the uncertainty analysis (see Section 5).

Also in Table 3-17, the maximum detected surface soil concentrations are compared to USEPA SSLs for chemical migration from soil to outdoor air. Concentrations reported for all chemicals except 1,2,4-trichlorobenzene are less than USEPA SSLs for soil to air. Since the maximum detected concentration of this chemical exceeds the SSL for contaminant migration from soil to air, receptor exposure through inhalation of fugitive dusts and VOCs was evaluated.

A comparison of the maximum detected surface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater is presented in Table 3-18. The following chemicals were detected in surface soil at maximum concentrations exceeding the COPC screening-levels for migration from soil to groundwater and were retained as global COPC for surface soil in the tax blocks:

- ***VOCs:*** 1,1-dichloroethane, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,2,4-trimethylbenzene, 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, benzene, ethylbenzene, methylene chloride, naphthalene, tetrachloroethene, and trichloroethene
- ***SVOCs:*** carbazole and dibenzofuran
- ***PAHs:*** 1-methylnaphthalene, 2-methylnaphthalene, benzo(a)pyrene equivalents, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(b+k)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene
- ***Pesticides/PCBs:*** Aroclor-1242, Aroclor-1254, Aroclor-1260, beta-BHC, and total Aroclor
- ***Metals:*** antimony, arsenic, cadmium, cobalt, copper, iron, lead, manganese, molybdenum, nickel, selenium, and silver
- ***Miscellaneous parameters:*** hexavalent chromium

The potential for chemical migration from soils to groundwater is more fully evaluated in Section 4.

3.1.3.2 Shallow Subsurface soil (Greater than 2–10 Feet Below Grade)

Thirty-six VOCs, 11 SVOCs, 18 PAHs, two pesticides, two PCBs, 19 metals, petroleum hydrocarbons, methyl mercury, and hexavalent chromium were detected in the shallow subsurface soil samples listed in Tables 3-6 through 3-10. A comparison of the maximum detected subsurface soil concentrations to screening levels (based on MDE cleanup levels and

USEPA RSLs) is presented in Table 3-19. The following chemicals were detected in shallow subsurface soils at maximum concentrations exceeding the direct-contact risk-based COPC screening-levels and were retained as global COPC for shallow subsurface soil:

- ***VOCs:*** 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, and naphthalene
- ***PAHs:*** benzo(a)pyrene equivalents, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene
- ***PCBs:*** Aroclor-1254, Aroclor-1260, and total Aroclor
- ***Metals:*** arsenic, cobalt, iron, lead, manganese, mercury, and vanadium
- ***Petroleum hydrocarbons:*** DRO and GRO
- ***Miscellaneous parameters:*** hexavalent chromium

No COPC screening levels based on MDE cleanup standards or USEPA RSLs are available for 1,2,3-trimethylbenzene, 4-isopropyltoluene, n-butylbenzene, sec-butylbenzene, tertiary-butyl alcohol, di-n-octyl phthalate, dimethyl phthalate, TPH C09-C36, and TPH C10-C32. Chemicals lacking screening criteria were qualitatively evaluated in the uncertainty analysis (see Section 5). Table 3-19 also compares the maximum detected shallow subsurface-soil concentrations to the USEPA SSLs for chemical migration from soil to air. Concentrations reported for 1,2,4-trichlorobenzene, naphthalene (analyzed as a VOC), and naphthalene (analyzed as PAH) exceed USEPA SSLs for soil to air. Consequently, receptor exposure through inhalation of fugitive dusts and VOCs was evaluated.

Table 3-20 compares the maximum detected shallow–subsurface soil concentrations to MDE cleanup goals for groundwater protection and to USEPA SSLs for chemical migration from soil to groundwater. The following chemicals were detected in subsurface soil at maximum concentrations exceeding COPC screening-levels for migration from soil to groundwater and were retained as global COPC for subsurface soil in the tax blocks:

- ***VOCs:*** 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,2,4-trimethylbenzene, 1,2-dichlorobenzene, 1,2-dichloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, acetone, benzene, carbon tetrachloride, chlorobenzene, ethylbenzene, m+p-xylenes,

methylene chloride, naphthalene, tetrachloroethene (PCE), total xylenes, trichloroethene (TCE), and vinyl chloride

- ***SVOCs:*** carbazole, dibenzofuran, and n-nitrosodiphenylamine
- ***PAHs:*** 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, benzo(a)pyrene equivalents, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene
- ***Pesticides/PCBs:*** Aroclor-1254, Aroclor-1260, beta-BHC, and total Aroclor
- ***Metals:*** antimony, arsenic, cobalt, copper, iron, lead, manganese, nickel, selenium, and silver
- ***Miscellaneous parameters:*** hexavalent chromium

A more refined evaluation of the potential for chemical migration from soils to groundwater is provided in Section 4.

3.1.3.3 Deep Subsurface Soil (Greater than 10 Feet Below Grade)

The HHRA for the tax block soils assumes that direct human-contact with deep subsurface soils is very unlikely. Therefore, risk estimates are not presented for direct contact with this medium. However, to be complete, Table 3-21 compares the maximum detected concentrations to the direct-contact COPC selection-criteria for soils. The maximum detected concentrations are not compared to USEPA SSLs for groundwater protection because the deep subsurface soils are in the saturated-soil zone. Any remediation of COPC in this zone would be based on contamination actually observed in groundwater, and not on contamination detected in deep, saturated soils.

Twenty-one VOCs, three SVOCs, 18 PAHs, one PCB (Aroclor-1260), 19 metals, petroleum hydrocarbons, and hexavalent chromium were detected in the deep subsurface soils. The following chemicals were detected at concentrations exceeding direct-contact COPC screening-levels:

- ***PAHs:*** benzo(a)pyrene equivalents, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene
- ***PCBs:*** Aroclor-1260
- ***Metals:*** arsenic, cobalt, iron, manganese, and vanadium

- ***Miscellaneous parameters:*** hexavalent chromium

The uncertainty analysis (Section 5) contains a more detailed qualitative evaluation of the global COPC selected for deep subsurface soil.

3.1.3.4 Summary

Table 3-22 summarizes the chemicals retained as global COPC for surface and subsurface soils at the tax blocks. *RAGS Part D* tables for COPC selection are included in Appendix D.

3.2 EXPOSURE ASSESSMENT METHODOLOGY

The exposure assessment component of an HHRA defines and evaluates, either quantitatively or qualitatively, the type and magnitude of human exposure to the chemicals at or migrating from a site. It is designed to depict the site's physical setting, to identify potentially exposed populations and applicable exposure pathways, to calculate concentrations of COPC to which receptors might be exposed, and to estimate chemical intakes under the identified exposure scenarios. Actual or potential exposures at a site depend on the most likely pathways of contaminant release and transport, as well as on patterns of human activity. A complete exposure pathway has four components: a source of chemicals that can be released to the environment, a route of contaminant transport through an environmental medium, an exposure or contact point for a human receptor, and an exposure route.

3.2.1 Conceptual Site Model

The HHRA includes a conceptual site-model (CSM) that identifies the exposure pathways by which human receptors may come in contact with study area soils. The CSM depicts the relationships among the following elements of a *complete* exposure pathway (i.e., a pathway that potentially results in human exposure and is evaluated [qualitatively or quantitatively] in an HHRA):

- site sources of contamination
- contaminant release mechanisms and transport/migration pathways
- exposure routes
- potential receptors

These CSM elements establish the manner and degree to which a potential receptor may be exposed to chemicals present at a site. The degree of risk incurred by a potential receptor varies

according to the means and duration of exposure and the specific chemical to which the receptor is exposed. An exposure, however long in duration, does not necessarily result in a regulatorily "unacceptable" health or environmental risk, although risks generally increase with increased frequency and/or duration of exposure.

Sources of possible contamination are discussed in Section 3.2.1.1. Sections 3.2.1.2 and 3.2.1.3 discuss contaminant release mechanisms and transport and migration pathways. Section 3.2.1.4 and Table 3-23 provide a site-specific summary of potential receptors and exposure pathways to be evaluated for the tax blocks. A summary of the exposure routes (addressed quantitatively for each human receptor) is provided in Table 3-24. Figure 3-1 illustrates the CSM for the tax blocks' HHRA.

3.2.1.1 Site Sources of Contamination

Tax Blocks D, E, F, G, and H share several common characteristics. For example, no surface water bodies cross or emanate and no wetlands have been identified in or around any of the Blocks. Additionally, excluding areas immediately adjacent to Cow Pen Creek and Dark Head Cove, surface water runoff discharges from the site via storm drains. Lockheed Martin maintains a State of Maryland NPDES permit (state discharge permit No.: 00-DP-0298, NPDES No.: MD0002852), issued by the MDE Industrial Discharge Permits Division, Water Management Administration. The permit covers storm-water discharge from the entire property rather than from individual tenants (Tetra Tech, 2006).

Finally, soil data collected from each block indicate that past activities have released contaminants to the surrounding environment. MRC site assessments indicate that a high percentage of site soils contain a very high clay and silt content, with poor surface drainage. The results of previous investigations are summarized in Section 2. See Section 2.3.3 for a detailed discussion of soil types at the MRC. Site-specific information for each block follows.

Block D is in the southeastern portion of MRC and is bounded by Wilson Point Road to the east, Chesapeake Park Plaza to the west, Dark Head Cove Road to the north, and Dark Head Cove to the south. PAH contamination in the soil at Block D may be associated with the asphalt paving or motor oil dripping from cars, or an alternative source such as urban fill may also be present, since elevated concentrations are found at depth. Detected concentrations of several metals, DRO, GRO, PAHs (represented as the BaPEq), and Aroclor-1260 in surface soil exceed their

respective screening criteria. In subsurface soil, BaPEq constituents, naphthalene, Aroclor-1260, several metals, DRO, and GRO were detected at levels exceeding screening criteria.

Block E is in the southern portion of MRC and is bounded by Chesapeake Park Plaza to the east and south, Tilley Chemical Company to the west, and Block I to the north. Soil data collected from REC #1 (Former Building D) in Tax Block E indicate that past activities have released contaminants to the surrounding environment. Contamination may be the result of historical industrial operations in Former Building D, from the former UST or product line, or from use of the building foundation for storage or management of PCB-containing materials. Detected concentrations of 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, BaPEq constituents, Aroclor-1254, Aroclor-1260, several metals, DRO, and GRO in surface soil exceed soil-screening criteria. In subsurface soil, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, BaPEq constituents, naphthalene, Aroclor-1254, Aroclor-1260, several metals, DRO, and GRO exceed their respective screening criteria.

Block F is in the southern most portion of the MRC and is bounded by Chesapeake Park Plaza to the north, North American Electric, Inc., to the north-northwest, Cow Pen Creek to the west-southwest, and Dark Head Cove to the south-southeast. Block F has four RECs: REC #4 (Boat Launch Area), REC #5 (Former Aviation Fuel USTs), a portion of REC #6 (Waterfront Lot), and REC #13 (Former Boat Dock Area). RECs #4 and #5 are covered by a concrete tarmac forming the REC #4 boundary. REC #5 consists of seven USTs underneath the north central portion of the tarmac. REC #6 (Waterfront Lot) is a well-manicured, grassy strip between Chesapeake Park Plaza and Parking Lot No. 6 along the shore of Dark Head Cove. REC #13 (Former Boat Dock Area) is an open, relatively flat grassy parcel of land. REC #13 is covered with a well-maintained grass lawn with shrubs and trees growing thickly along the Cow Pen Creek shoreline. Severely degraded remnants of several walkways, parking areas, and a few foundations are still evident (Tetra Tech, 2006b). The topography and concrete tarmac at REC #4 most likely results in surface water runoff in this area discharging directly to Dark Head Cove as overland sheet-flow. Surface water runoff from the grassy areas will generally infiltrate into the underlying soil or discharge to Dark Head Cove or Cow Pen Creek as overland sheet flow.

Block F soil data indicate that past activities have released contaminants to the surrounding environment. Block F impacts may be the result of historical activities. Detected concentrations of BaPEq constituents, Aroclor-1254, Aroclor-1260, several metals, DRO, and GRO in surface soil exceed their respective screening criteria. In subsurface soil, BaPEq constituents, naphthalene, Aroclor-1260, several metals, DRO, and GRO also exceed their respective screening criteria.

Block G is in the southwestern portion of the MRC, bounded by Chesapeake Park Plaza to the east, Cow Pen Creek to the west, North American Electric, Inc. to the south, and Block H to the north. Block G has two RECs: REC #11 (Former STP/Wind-Tunnel Test Building/Vibration-Test Building) and REC #12 (Southern Portion of Lot 3). The remaining portion of Parking Lot No. 3 is also included in Block G. Currently, REC #11 is an open, grassy area between Chesapeake Park Plaza and Cow Pen Creek, REC #12 is a gravel lot, and Parking Lot No. 3 is a flat parcel of land used for truck-trailer storage (Tetra Tech, 2006b).

Block G soil data indicate that past activities have released contaminants to the surrounding environment. Contamination may be the result of historical industrial operations that took place in this area, from USTs suspected to have been at this site or from items that may have been stored in Block G. Detected concentrations of BaPEq constituents, Aroclor-1254, Aroclor-1260, several metals, DRO, and GRO in surface soil exceed their respective screening criteria. In subsurface soil, BaPEq constituents, naphthalene, Aroclor-1260, several metals, DRO, and GRO likewise exceed their respective screening criteria.

Block H, in the northwestern portion of the MRC, is bounded to the north by Eastern Boulevard, to the east by the industrial portion of the MRC (Block I), to the south by Parking Lot No. 3 (Block G), and to the west by Cow Pen Creek. Site soils consist of a heterogeneous mix of silty sands, fine-grained to medium-grained sands, and silty clay. The topography and the asphalt paving make it likely that surface water runoff in this area would discharge to Cow Pen Creek as overland sheet flow. Surface water runoff from the grassy areas will generally infiltrate the underlying soil or discharge to Cow Pen Creek as overland sheet flow.

Block H soil data indicate that past activities have released contaminants to the surrounding environment. Detected concentrations of BaPEq constituents, several metals, DRO, and GRO in

surface soil exceed their respective screening criteria. In subsurface soil, BaPEq constituents, naphthalene, DRO, and GRO likewise exceed their respective screening criteria.

3.2.1.2 Potential Contaminant Release Mechanisms and Transport Pathways

Chemicals may migrate within an environmental medium (e.g., soil) or migrate to another environmental medium (e.g., air) once released. This section discusses potential contaminant release mechanisms and transport pathways. Potential contaminant release mechanisms and transport pathways are nearly identical for Tax Blocks D, E, F, G, and H. For example, soil data collected in each Block indicate that past activities have released contaminants to the surrounding environment.

Contaminants in surface soil could migrate to air through wind erosion or through volatile emissions. Subsurface soil is not currently exposed in any of the tax blocks; however, if future construction were to bring subsurface soil to the surface, contaminants in subsurface soil could be transported into the air through wind erosion or through volatile emissions. Finally, at each tax block, contaminants can migrate from both surface and subsurface soil to groundwater through leaching of chemicals in the soil. Chemical migration from soil to groundwater for each block was evaluated and the results of those evaluations are in Section 4.

The primary differences in potential contaminant release mechanisms and transport pathways for the tax blocks relate to overland runoff and erosion. As previously mentioned, excluding areas immediately adjacent to Cow Pen Creek and Dark Head Creek, surface water runoff discharges from these sites via storm drains for which Lockheed Martin maintains a Maryland NPDES permit. Following are descriptions of overland runoff and erosion per tax block. Overland runoff and erosion can only be potential migration pathways if contaminated soil is disturbed and exposed.

Block D—If the parking lot was removed, overland runoff and erosion at the site could be a significant contaminant transport mechanism due to the site topography, which gently slopes from Eastern Boulevard to the southwest and south toward Cow Pen Creek and Dark Head Cove.

Block E—Surface soil contaminants are not expected to be transported to surface water bodies (i.e., Dark Head Cove or Cow Pen Creek) through overland runoff and erosion because of the distance between Block E and surface water bodies, the generally low relief site topography, and

because (apart from the foundations slabs and remnants of Former Building D) much of the site is vegetated, which facilitates infiltration and evapo-transpiration. Infiltration is therefore expected to dominate surface runoff.

Block F—Surface water runoff from the concrete tarmac of REC #4 would most likely discharge directly to Dark Head Cove as overland sheet flow. Surface water runoff from the grassy areas will generally infiltrate into the underlying soil or discharge to Dark Head Cove or Cow Pen Creek as overland sheet flow.

Block G—Overland runoff at the site may be a significant contaminant transport mechanism due to drainage systems and because Cow Pen Creek borders Block G. However, those drainage systems are permitted through NPDES. In vegetated areas, which facilitate infiltration and evapo-transpiration, infiltration is expected.

Block H—Overland runoff at the site may be a significant contaminant transport mechanism if contaminated soils become exposed, due to the topography of the site and asphalt paving.

3.2.1.3 Fate and Transport of Primary Site COPC in Soil

Brief overviews of the fate and transport of metals, PAHs, and PCBs in soil follow:

Metals—The fate and transport of inorganics (metals) are controlled mainly by the mobility of soil particles and their dissolution into water present in the immediate environment. Metals do not undergo the sort of degradation reactions that most organic chemicals do; therefore, they are considered persistent. The major fate mechanisms for metals are adsorption to the soil matrix and bioaccumulation.

The mobility of metals is influenced primarily by their physical and chemical properties, in combination with the physical and chemical characteristics of the soil matrix. Factors that help predict the mobility of inorganic species are the soil/pore water pH (a measure of hydrogen ion concentration), soil/pore-water Eh (redox potential relative to the Standard Hydrogen Electrode), and cation-exchange capacity. The mobility of metals generally increases with decreasing soil pH and cation-exchange capacity.

PAHs are fairly immobile chemicals in the environment. PAHs are large molecules with low solubilities, vapor pressures, and Henry's Law constants, and have high partitioning coefficients. PAHs in soil are much more likely to bind to soil and be transported via mass-transport mechanisms than through dissolution. These compounds, when found in the surface soil, generally do not migrate vertically to a great extent. Instead, they are more likely to adhere to soil particles and be removed from the site via surface water runoff and erosional processes, especially in the absence of pavement or if erosion controls are absent or not functioning properly.

PCBs are considered very persistent organic chemicals with a great affinity for particulates and organic matter (i.e., soil). However, PCBs may be mobilized via particulate transport due to erosion of contaminated surface soil. Site surfaces are mostly covered with impermeable materials where PCBs are located, so PCBs are likely not currently mobilized via particulate transport because they will not be exposed to surface water runoff.

3.2.1.4 Potential Current and Future Receptors of Concern and Exposure Pathways

Current land use in the MRC area is commercial/industrial and expected to remain so for the foreseeable future. However, a small portion of Block D, the Block D panhandle area, may be considered for donation to the community. Potential land use scenarios for the donated Block D panhandle area could include recreational land use. Note that this HHRA evaluated the entire Block D area as a whole. The area surrounding the MRC consists of suburban developments, industrial/commercial developments, and woodlands. Groundwater is not currently used as a source of potable or industrial water at the site, and such use is not anticipated. This HHRA considers receptor exposure under non-residential (e.g., industrial, recreational) land use scenarios. Although the site is unlikely to be used for residential purposes, residential land uses are also evaluated.

Current and/or potential/hypothetical future land uses suggest the following potential receptors could be exposed to impacted environmental media at the MRC:

- *Construction workers*—Construction workers are plausible on-site adult receptors under current and future land uses. Construction workers could be exposed to chemicals in surface and subsurface soils (0–2 feet below grade and 2–10 feet below grade, respectively) through incidental ingestion and dermal contact, and through inhalation of airborne contaminants emanating from soil. Groundwater in the study area is within approximately

10 feet of the ground surface. Direct contact with the deeper (saturated-zone) soils is assumed limited and, thus, direct contact with soils deeper than approximately 10 feet bgs will not be evaluated quantitatively. Such soils (i.e., the saturated-zone soils) will be evaluated qualitatively in the uncertainty analysis.

- *Industrial workers*—Industrial workers are plausible on-site adult receptors under current and future land uses. These receptors could be directly exposed to chemicals in surface soils (0–2 feet below grade) through incidental ingestion, dermal contact, and inhalation of airborne particulates and vapors emitted from the soil. Industrial-worker exposure to subsurface soil (2–10 feet below grade) is unlikely. Exposure to subsurface soil via incidental ingestion, dermal contact, and inhalation will, however, be evaluated for this receptor to aid in risk management decisions because future construction could potentially bring subsurface soils to the surface. This receptor is expected to be exposed to soils equally as often (but less intensely) than the construction worker.

- *Commercial land use receptors*—Commercial land use receptors (adults, adolescents, small children) include members of the general public, workers, and other expected users working at or patronizing a commercial facility. Commercial facilities include shopping centers, retail businesses, vehicle service stations, medical offices, hotels, office space, religious institutions, and restaurants. Such receptors may be exposed to possibly impacted surface soils (0-2 feet below grade) through incidental ingestion, dermal contact, and inhalation of chemicals emitted from soil to the air. To aid in future risk management decisions, we assumed that these receptors could also be exposed to contaminants in subsurface soil (2-10 feet below grade) because future construction could redistribute subsurface soil to the surface.

- *Child, adolescent, and adult recreational users*—Recreational users are potential receptors of study area contaminants. A recreational user may be exposed to possibly impacted surface soils (0–2 feet below grade) through incidental ingestion, dermal contact, and inhalation of chemicals emitted from soil to the air. To aid in future risk management decisions, recreational users were evaluated for risks to subsurface soil (2-10 feet below grade) because future construction could redistribute subsurface soil to the surface.

- *Future child, adolescent, and adult residents*—The hypothetical future residential scenario is typically evaluated in a risk assessment to facilitate risk management decisions. We assume that a hypothetical resident may be exposed to chemicals in surface soils (0–2 feet below grade) through ingestion, dermal contact, and inhalation of chemicals emitted from soil to air. To aid in risk management decisions, hypothetical residents will also be evaluated for risks posed by exposure to subsurface soil (2–10 feet below grade), since future construction could potentially redistribute subsurface soil to the surface.

3.2.2 Central-Tendency Exposure versus Reasonable Maximum Exposure

Traditionally, exposures evaluated in an HHRA were based on the concept of a reasonable maximum exposure (RME), defined as “the maximum exposure that is reasonably expected to occur at a site” (USEPA, 1989). Subsequent risk assessment guidance (USEPA, 1992) stipulates

the need address an average case or central-tendency exposure (CTE). However, in this HHRA, only the RME scenario was evaluated because the RME scenario is designed to estimate the reasonable maximum exposure likely to occur, is more conservative than the CTE scenario, and is typically the basis of risk management decision-making.

3.2.3 Exposure-Point Concentrations

EPC, calculated for COPC only (both site-related and naturally occurring) are estimates of chemical concentrations in an exposure unit (EU); EPCs are used to estimate exposure intakes. An EU is the area over which receptor activity is expected. The following paragraphs discuss the EUs that will be evaluated in the HHRA, and the guidelines for calculating EPCs.

Each tax block was evaluated as a single EU. However, hypothetical future residential and industrial worker exposures to impacted soils were also evaluated on a location-by-location basis to determine if a tax block has any significant contaminant "hot spots." The additional evaluation for the industrial worker was done because the future land use for the study area is most likely to be commercial/industrial. The additional evaluation for the hypothetical resident was conducted because this is the most sensitive and restrictive receptor (e.g., at some sites, exposure units as small as 0.25 acre have been selected for this receptor). The results of the location-by-location risk assessment are discussed in Section 4. The following guidelines were used to calculate EPCs for COPC concentrations in each tax block (or sub-area of a tax block):

- For soil data sets containing at least five samples, the 95% upper confidence-limit (UCL) on the arithmetic mean, which is based on the distribution of the data set, was selected as the EPC unless the UCL value exceeded the maximum detected concentration. In this case, the maximum detected concentration was used as the EPC. The maximum concentration was also used as the EPC if an insufficient number of detections (i.e., less than four positive detections in a data set) to calculate a 95% UCL were obtained, in accordance with USEPA guidance (USEPA, 2010c). Note that MDE guidance (State of Maryland, 2008) typically requires at least 10 samples to calculate UCLs. EPCs evaluated in the HHRA were based on data sets that included 10 or more samples for all COPC. The only exceptions are for cobalt and vanadium in Block G surface soil, and DRO in Block H subsurface soil. Uncertainty associated with the EPCs used for these parameters is discussed in Section 5.2. EPCs were calculated according to USEPA's *Calculating Upper Confidence-Limits for Exposure-Point Concentrations at Hazardous Waste Sites* (USEPA, 2002b) and using USEPA's *ProUCL* software (USEPA, 2010c).

- The sample quantitation-limit was used as an input for non-detects in USEPA's *ProUCL* software to calculate the 95% UCL in accordance with *ProUCL* guidance (USEPA, 2010c). Duplicates were averaged to calculate the EPC for COPC in soils in the study area.

- Naphthalene was selected as a global COPC for subsurface soil in both the VOC and PAH fractions. EPCs were calculated for naphthalene results included in both fractions. The greater EPC for naphthalene (in either the VOC or PAH fraction) was included in the quantitative risk assessment for each specific block. Uncertainty associated with this method is discussed in the uncertainty analysis.

In accordance with USEPA's *Integrated Exposure Uptake Biokinetic (IEUBK) Model* (USEPA, 1994, 2009b) and their Technical Review Workgroup's (TRW) *Adult Lead Model* (USEPA, 2003b), average lead concentrations were used to estimate blood-lead levels resulting from exposure to lead. This is because the first step in the model calculations is to develop a central estimate of blood-lead concentrations, which requires an "appropriate average concentration" for an individual. Table 3-25 summarizes EPCs used in this HHRA.

Tables 3-1 through 3-10 list the samples used to calculate EPCs, except for some BaPEq constituents results from a few historical samples. Several sampling locations were resampled for BaPEq constituents because historical sampling results had elevated detection limits for these compounds. The uncertainty analysis discusses the samples affected, the methodology for selecting sampling results, and the uncertainty associated with these particular BaPEq sampling results. The *RAGS Part D* tables for the EPCs are in Appendix D.

3.2.4 Chemical Intake Estimation

Methodologies and techniques for estimating exposure intakes are presented in this section. Intakes for the potential receptor groups identified were calculated using current MDE and USEPA risk assessment guidance and are presented in the risk assessment spreadsheets (see Appendix D). Exposure assumptions are presented in the *RAGS Part D* Table 4s and in Table 3-26.

Noncarcinogenic intakes are typically estimated using the concept of an average annual exposure. Carcinogenic intakes are calculated as an incremental lifetime-exposure, which assumes a life expectancy of 70 years. The exposure assumptions reflect current MDE guidance (State of Maryland, 2008). Most of the exposure assumptions used to estimate chemical intakes are based on default assumptions described in the MDE (State of Maryland, 2008) guidance

document, the primary guidance used to develop exposure assumptions. Several USEPA guidance documents (e.g., USEPA, 1989, 1991, 1993a, 1997a, 2004a) were also consulted, as necessary. The following paragraphs discuss receptor-specific exposure assumptions used in the risk assessment.

3.2.4.1 Incidental Ingestion of Soil

Direct physical contact with soil in the study area may result in the incidental ingestion of chemicals. Chemical intakes for the incidental ingestion of soil are estimated as follows (USEPA, 1989):

$$\text{Intake} = \frac{(C_s)(IR)(FI)(EF)(ED)(CF)}{(BW)(AT)}$$

where:

Intake	=	chemical intake from soil (mg/kg/day)
C_s	=	chemical concentration in soil (mg/kg)
IR	=	ingestion rate (mg/day)
FI	=	fraction ingested from contaminated source (dimensionless)
EF	=	exposure frequency (days/yr)
ED	=	exposure duration (yr)
CF	=	conversion factor (1×10^{-6} kg/mg)
BW	=	body weight (kg)
AT	=	averaging time (days) for noncarcinogens, AT = ED×365 days/yr for carcinogens, AT = 70 yr×365 days/yr

Most of the exposure assumptions used to estimate chemical intakes from incidental ingestion of soil are based on default assumptions described in the MDE guidance. They are summarized in Table 3-26. The following paragraph briefly discusses the receptor-specific exposure assumptions (for incidental ingestion of soil) used in the HHRA.

The exposure frequency assumptions selected consider anticipated receptor activities at the study area. We assume that construction workers assigned to future excavation projects in the study area would be exposed to soil for 250 days a year for one year. We also assume that the site recreational user would be exposed for 250 days/year, and that child/adolescent commercial receptors would be exposed 132 days/year (State of Maryland, 2008).

3.2.4.2 Dermal Contact with Soil

Direct physical contact with soil may result in dermal absorption of chemicals. Exposure associated with dermal contact with soil is estimated as follows (USEPA, 2004a):

$$\text{Intake} = \frac{(C_s)(SA)(AF)(ABS)(CF)(EF)(ED)}{(BW)(AT)}$$

where:

Intake	=	amount of chemical absorbed during contact with soil (mg/kg/day)
C_s	=	chemical concentration in soil/sediment (mg/kg)
SA	=	skin surface area available for contact (cm^2)
AF	=	skin adherence factor (mg/cm^2-event)
ABS	=	absorption factor (dimensionless)
CF	=	conversion factor (1×10^{-6} kg/mg)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (year)
BW	=	body weight (kg)
AT	=	averaging time (days) for noncarcinogens, AT = ED×365 days/year for carcinogens, AT = 70 years×365 days/year

Most of the exposure assumptions used to estimate chemical intakes from dermal contact with soil are based on the default assumptions described in the standard MDE guidance. They are summarized in Table 3-26. The following paragraph briefly discusses the receptor-specific exposure assumptions (for dermal contact with soil) used in the HHRA. The same exposure

frequencies and durations recommended for evaluating incidental ingestion of soil are used to estimate chemical intakes for dermal contact with soil.

The exposed skin surfaces of the body available for dermal contact with soils are determined on a receptor-specific basis, since they correspond with assumed human activities and clothing worn during exposure events. All of the skin surface areas presented in Table 3-26 are based on MDE default values, and most of these are also USEPA default values. For adolescent receptors, the skin surface area available for soil contact is set at 4,320 cm^2 (based on Maryland guidance; see State of Maryland, 2008).

For chemicals identified as COPC in soil, the chemical specific dermal absorption factors in *RAGS Part E* were used to evaluate the COPC for soil. USEPA Region 3 dermal guidance (USEPA Region 3, 2003a) was consulted if chemical specific absorption factors are not available in *RAGS Part* E. Dermal-absorption factors used in this risk assessment are presented in Table 3-27.

3.2.4.3 Inhalation of Air Containing Fugitive Dust/Volatiles Emitted from Soil

Intakes of both particulates and vapors/gases are calculated using the same equation, as follows (USEPA, 2009a):

$$EC = \frac{(C_{air})(ET)(EF)(ED)}{AT \times 24\ hrs/day}$$

where:

EC	=	exposure concentration (mg/m^3)
C_{air}	=	concentration of chemical in air (mg/m^3)
ET	=	exposure time (hours/day)
EF	=	exposure frequency (days/yr)
ED	=	exposure duration (yr)
AT	=	averaging time (days) for noncarcinogens, AT = ED×365 days/year for carcinogens, AT = 70 years×365 days/year

Most of the exposure assumptions used to estimate chemical intakes from inhalation of fugitive dusts/volatile emissions from surface and subsurface soils are based on default assumptions described in the Maryland guidance or the standard USEPA guidance and are summarized in Table 3-26. The same exposure frequencies and durations used to estimate incidental ingestion of soil intakes are used to estimate exposure via inhalation of fugitive dust/volatile emissions for surface and subsurface soils.

The concentrations of chemicals in air resulting from emissions from soil are developed following procedures presented in USEPA *Soil Screening Guidance* (USEPA, 2002a). The chemical concentration in air is calculated from:

$$C_{air} = C_{soil} \times \left[\frac{1}{PEF} + \frac{1}{VF} \right]$$

where:

C_{air} = chemical concentration in air, mg/m^3

C_s = chemical concentration in soil, mg/kg

PEF = particulate emission factor, m^3/kg

VF = volatilization factor, m^3/kg

The particulate emissions factor (PEF) relates the concentration of the chemical in soil to the concentration of dust particles in air. A PEF value of $3.23 \times 10^{+9}$ m^3/kg was obtained from USEPA's soil-screening Web site (http://rais.ornl.gov/epa/ssl1.shtml). This is the default value for Philadelphia, Pennsylvania, which is the closest city to the MRC listed on the web site. A separate PEF is used for the construction scenario because air emissions resulting from fugitive dust emissions at non-construction settings differ from dust emissions generated by construction. The PEF for construction workers ($1.43 \times 10^{+6}$ m^3/kg) was calculated using the equations presented in the supplemental SSL guidance document (USEPA, 2002a). Sample calculations showing how the PEFs were calculated are presented in Appendix D.

Ambient air concentrations resulting from the volatilization of COPC from soil are chemical dependent and are calculated using the following equation from USEPA's soil-screening guidance:

$$VF = \frac{Q/C \times (3.14 \times D_a \times T)^{0.5} \times 10^{-4} \ (m^2 / cm^2)}{(2 \times \rho_b \times D_a)}$$

and

$$D_a = \frac{[(\theta_a^{10/3} \times D_i \times H' + \theta_w^{10/3} \times D_w)/n^2]}{\rho_b \times K_d + \theta_w + \theta_a \times H'}$$

where:

VF = volatilization factor (m^3-air/kg-soil)

Q/C = inverse of the mean concentration at the center of source (gm/m^2-sec per kg/m^3)

D_a = apparent diffusivity, chemical specific, (cm^2/sec)

T = exposure interval, exposure-specific, (sec)

ρ_b = dry bulk-soil-particle density (g/cm^3)

θ_a = air-filled-soil porosity (L_{air}/L_{soil})

D_i = diffusivity in air, chemical specific, (cm^2/sec)

n = total soil porosity (L_{pore}/L_{soil})

θ_w = water-filled-soil porosity (L_{air}/L_{soil})

D_w = diffusivity in water, chemical specific, (cm^2/sec)

K_d = soil-water-partition coefficient, chemical specific

H’ = dimensionless Henry’s Law constant, chemical specific

Chemical properties were obtained from the current USEPA RSL table and are presented in Table 3-28. Input assumptions for the calculation of VF are in Table 3-29.

3.2.4.4 Assessing Cancer Risks from Early Life Exposures

USEPA's *Supplemental Guidance for Assessing Susceptibility from Early Life Exposure to Carcinogens* (USEPA, 2005b) recommends adjusting the toxicity of carcinogenic chemicals that act mutagenically when evaluating early life exposures to such contaminants. The guidance recommends using age-dependent adjustment factors (ADAFs) in concert with age-specific exposure estimates when assessing cancer risks. Absent chemical specific data, the supplemental guidance recommends the following default adjustments, which reflect that cancer risks are generally higher from early life exposures than from similar exposures later in life:

- for exposures before two years of age (i.e., spanning a two-year interval from the first day of birth until a child's second birthday), a 10-fold adjustment
- for exposures between age two and less than 16 years of age (i.e., spanning a 14-year time interval from a child's second birthday until their sixteenth birthday), a three-fold adjustment
- for exposures after reaching 16 years of age, no adjustment

These adjustments were applied using the same method as that used by USEPA to develop the RSLs. Children will be evaluated in two age groups: ages 0–2 and 2–6 years old. Adolescents will be evaluated as two age groups: 6–16 and 16–18 years old. Adults (except for the adult commercial receptor, industrial worker, and construction worker) will be evaluated as one age group (18–30 years old). (For the adult commercial and industrial receptors, the MDE default exposure-duration of 25 years was used. A one-year exposure duration was used for the construction worker. No ADAFs are applied to these receptors.) Using this approach, the intakes for child and adolescent commercial receptors; child, adolescent, and adult recreational users; and hypothetical child, adolescent, and adult residents are calculated as follows:

$$\text{Intake}_{\text{Child}} = \text{Intake}_{(\text{ages 0—2 years})} \times 10 + \text{Intake}_{(\text{ages 2—6 years})} \times 3$$

$$\text{Intake}_{\text{Adolescent}} = \text{Intake}_{(\text{age 6—16 years})} \times 3 + \text{Intake}_{(\text{age 16—18 years})} \times 1$$

$$\text{Intake}_{\text{Adult}} = \text{Intake}_{(\text{ages 18—30 years})} \times 1$$

This approach is used only for chemicals identified as mutagenic in the USEPA RSL screening table (e.g., BaPEq constituents, hexavalent chromium).

Risks to receptors involving different age groups are sums of the cancer risks calculated for individual children, adolescents, and adult receptors. Therefore, lifelong cancer risks from chemicals that act via the mutagenic pathway are assessed through the lifelong recreational user, lifelong commercial receptor, and lifelong resident receptor scenarios. Note that "lifelong" cancer risks for commercial receptors were evaluated by summing the child and adolescent receptors only, since the MDE default exposure duration of 25 years was used for the adult commercial receptor, as explained above.

3.2.4.5 Exposure to Lead

The equations and methodology presented in the previous section cannot be used to evaluate exposure to lead because of the absence of published dose-response parameters. Thus, exposure to lead was assessed using the following models:

- the latest version of USEPA's *IEUBK Model for Lead*, (USEPA, 2009b), a model typically used to evaluate lead exposure assuming a residential land use scenario
- USEPA's *TRW Model for Lead* (USEPA, January 2003b; model version date: 06/21/2009), a model typically used to evaluate lead exposure assuming a non-residential land use scenario

The IEUBK model for lead (USEPA, 1994, 2009b) is designed to estimate blood levels of lead in children under seven, based on either default or site-specific input values for air, drinking water, diet, dust, and soil exposure. Studies indicate that infants and young children are extremely susceptible to adverse effects from exposure to lead. Considerable behavioral and developmental impairments have been noted in children with elevated blood lead levels. The threshold for toxic effects from this chemical is believed to be in the range of 10–15 micrograms per deciliter (µg/dL). Blood lead levels greater than 10 µg/dL are considered a "concern."

The IEUBK model for lead is used to address exposure to lead in children when detected soil concentrations exceed the OSWER soil screening level of 400 mg/kg for residential land use (USEPA, 1994). Average chemical concentrations, as well as default parameters for some input parameters, are used in the evaluation. Lead concentrations in soil data sets for each tax block are evaluated qualitatively in Section 4 to determine if using the IEUBK model would be necessary in the HHRA.

Non-residential adult exposures to lead in soil are evaluated using USEPA's TRW model for lead (USEPA, 2003a, 2009c). In this model, adult exposure to lead in soil is addressed by evaluating the relationship between lead concentration in site soil and the blood lead concentration in the developing fetuses of adult women. The adult lead model generates a spreadsheet for each exposure scenario evaluated (i.e., industrial, recreational). The spreadsheet output is the probability that blood lead concentrations in the fetus will exceed 10 µg/dL. That probability is calculated in accordance with the following USEPA guidelines:

- *Use of the TRW Interim Adult Lead Methodology in Risk Assessment* (USEPA, 1999)
- *Frequently Asked Questions (FAQs) on the Adult Lead Model* (USEPA, 2010b)

Lead concentrations in soil data sets for each tax block are evaluated qualitatively in Section 4 to determine if using the adult lead model would be necessary in the HHRA.

No models are currently available to evaluate periodic exposure of adolescent receptors to lead. Therefore, the results of the IEUBK model for children are used to qualitatively assess this receptor's exposure risk. If the evaluation in Section 4 determines that using the IEUBK model for lead is necessary for the study area, a qualitative discussion for adolescent exposures to lead in soil will assert that potential adverse effects from exposure to lead are expected to be of lesser magnitude for adolescent receptors than for young children.

3.2.4.6 Summary of Exposure Parameters

Table 3-26 summarizes exposure input-parameters for all exposure pathways for identified potential receptor groups in the study area. In general, standard default parameters from MDE guidance (State of Maryland, 2008) or USEPA guidance (e.g., USEPA, 1989, 1991, 1997a, 2004a), which combine mid-range and upper-end exposure factors, were used to assess RME conditions. Central-tendency exposure was not assessed in this HHRA.

3.3 TOXICITY ASSESSMENT

The toxicity assessment seeks to identify potential adverse health effects in exposed populations. Quantitative estimates of the relationship between the magnitude and type of exposures and the severity or probability of human health effects are defined for the identified constituents of concern (see Tables 3-30 through 3-33). Quantitative toxicity values determined during this

component of the risk assessment are integrated with exposure-assessment outputs to characterize the potential occurrence of adverse health effects for each receptor group.

The reference dose (RfD) is the toxicity value used to evaluate noncarcinogenic health effects for ingestion and dermal exposures. The reference concentration (RfC) is used to evaluate noncarcinogenic health effects for inhalation exposures. The RfD and RfC estimate a daily exposure level for a human population that is unlikely to pose an appreciable risk during a portion or for all of a human lifetime. It is based on a review of animal and/or human toxicity data with adjustments for various data uncertainties. Carcinogenic effects are quantified using the cancer slope-factor (CSF) for ingestion and dermal exposures, and using inhalation-unit risks (IURs) for inhalation exposure that are plausible upper-bound estimates of the probability of developing cancer per unit intake of the chemical over a lifetime. These are typically based on dose-response data from human and/or animal studies.

3.3.1 Toxicity Criteria for Oral and Inhalation Exposures

Oral RfDs and CSFs and inhalation RfCs and IURs used in the risk assessment of the study area were obtained from the following primary USEPA sources (USEPA, 2003c):

- ***IRIS*—**USEPA's "Integrated Risk Information System" online database
- ***USEPA's* Provisional Peer Reviewed Toxicity Values *(PPRTVs)*—**USEPA's Office of Research and Development/National Center for Environmental Assessment (NCEA) Superfund Health Risk Technical Support Center develops chemical specific PPRTVs when requested by USEPA's Superfund program
- ***Other toxicity values*—**These sources include, but are not limited to, California Environmental Protection Agency (Cal/EPA) toxicity values, federal Agency for Toxic Substances and Disease Registry (ATSDR) values, and USEPA's *Annual Health Effects Assessment Summary Tables* (HEAST) (USEPA, 1997b)

Although toxicity criteria can be found in several toxicological sources, USEPA's *IRIS* online database is the preferred source of toxicity values. This database is continuously updated and its values are verified by USEPA.

3.3.2 Toxicity Criteria for Dermal Exposure

RfDs and CSFs in the scientific literature are typically expressed as "administered" (i.e., not absorbed) doses. Therefore, these values are considered inappropriate for estimating risks

associated with dermal exposures without adjustment to account for incomplete absorption. Oral dose-response parameters based on administered doses must be adjusted to absorbed doses before they can be compared to estimated dermal-exposure intakes.

When oral absorption is essentially complete (i.e., 100%), an absorbed dose is equivalent to the administered dose, so no toxicity adjustment is necessary. Conversely, when the gastrointestinal absorption of a chemical is poor (e.g., 1%), the absorbed dose is smaller than the administered dose; thus, toxicity factors based on absorbed dose should be adjusted to account for the difference in the absorbed dose relative to the administered dose. USEPA (2004a) recommends a 50% absorption cut-off to reflect the intrinsic variability in analyzing absorption studies. Therefore, the adjustment from administered to absorbed dose was only performed when the chemical specific gastrointestinal-absorption efficiency was less than 50%. The adjustment from administered to absorbed dose was made using chemical specific gastrointestinal-absorption efficiencies published in numerous sources of guidance (e.g., USEPA 2004a [the primary reference], *IRIS*, ATSDR toxicological profiles, etc.), using the following equations:

$$RfD_{dermal} = (RfD_{oral})(ABS_{GI})$$

$$CSF_{dermal} = (CSF_{oral}) \ / \ (ABS_{GI})$$

where:

ABS_{GI}	=	absorption efficiency in the gastrointestinal tract
RfD_{dermal}	=	reference dose for dermal exposures
RfD_{oral}	=	reference dose for oral exposures
CSF_{dermal}	=	cancer slope-factor for dermal exposures
CSF_{oral}	=	cancer slope-factor of oral exposures

As noted, the preceding adjustment of the oral-toxicity criteria (i.e., reference doses, cancer slope-factors) is necessary so that the dermal route of exposure may be quantitatively evaluated in the baseline risk assessment. Further explanation of this procedure and its necessity are presented in Appendix A of USEPA *RAGS Part A.*

3.3.3 Inhalation Toxicity Values for Construction Workers

Under the guidelines established by the Superfund program, exposures to construction workers of one year or less are classified as subchronic exposures. Risks for noncarcinogenic effects associated with subchronic exposures should incorporate toxicity values for subchronic and not chronic effects. Table 3-31 displays the available subchronic RfCs that were used for the construction worker. Uncertainty associated with the lack of subchronic RfCs for many chemicals is discussed in Section 5.3.

3.3.4 Chromium Toxicity

Toxicity criteria are available for different forms of chromium, which is considered more toxic in the hexavalent state. In the USEPA's most recent RSL table, hexavalent chromium is listed as a carcinogen that has been determined to act "mutagenically" and the corresponding RSL for residential soil is less than 1 mg/kg. USEPA's *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005a) and *Supplemental Guidance on Assessing Susceptibility from Early Life Exposure to Carcinogens* (USEPA, 2005b) specify the use of ADAFs for carcinogens, such as chromium, that act mutagenically. In contrast, the RSL for residential soil for trivalent chromium (not listed as a carcinogen/mutagen) is 120,000 mg/kg. The following table provides the number of hexavalent chromium and total chromium samples collected for each block:

Tax block	Medium	Number of hexavalent chromium results	Number of total chromium results
Block D	SS	15	29
	SB	60	90
Block E	SS	0	29
	SB	0	54
Block F	SS	8	32
	SB	2	35
Block G	SS	0	14
	SB	5	24
Block H	SS	1	11
	SB	5	22

The table shows that a limited number of environmental samples collected for Tax Blocks E, F, G, and H were analyzed for hexavalent chromium. However, a number of samples from Block D were also analyzed for hexavalent chromium. Hexavalent chromium was selected as a COPC for surface soil and subsurface soil.

The limited number of hexavalent chromium results available for the tax blocks led to risks associated with chromium being assessed under the assumption that 5% of the reported total chromium result in soil can be attributed to hexavalent chromium. This assumption is based on the available analytical results of total and hexavalent chromium concentrations in study area soil. Using 5% of the total chromium concentration as the hexavalent chromium concentration is conservative, since available hexavalent chromium results in the study area soil indicate that hexavalent chromium, when detected, is most often much less than 5% of the total chromium result in soil.

As discussed in the uncertainty section, this overestimates the risks of exposure to chromium, but does not affect overall HHRA conclusions. No chemical-specific ADAFs have been derived for hexavalent chromium; therefore, the following default ADAFs were used: 10 for ages 0–2, 3 for ages 2–16, and 1 (no adjustment) for ages 16–70. These ADAFs were used to evaluate exposures to hexavalent chromium for commercial receptors, recreational users, and hypothetical residents using the approach presented in Section 3.2.4.4.

3.3.5 Toxicity of PCBs

The HHRA for PCBs was conducted per the guidance presented in USEPA's *PCBs: Cancer Dose Response Assessment and Application to Environmental Mixtures* (National Center for Environmental Assessment, Office of Research and Development, USEPA, Washington, D.C., EPA/600/P-96/001F, September 1996b). This guidance presents a tiered approach to assessing the risks of PCBs. A range of CSFs for PCBs is presented for use in HHRA according to criteria that consider the environmental media under investigation, the type of exposure, and the anticipated persistence, bioaccumulation potential, and toxicity of PCB homologues/congeners detected in the samples.

3.3.6 Toxicity Criteria for the Carcinogenic Effects of PAHs

Limited toxicity values are available to evaluate the potential carcinogenic effects from exposure to PAHs. Benzo(a)pyrene is the most extensively studied PAH and the USEPA has published a cancer slope factor for this PAH in its Integrated Risk Information System (USEPA, 1993b). However, cancer slope factors have not been published in IRIS for other PAH compounds. Alternatively, for a sub-set of related PAH chemicals (benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a)anthracene, indeno(1,2,3-cd)pyrene), USEPA recommends that risk evaluations be conducted using the toxicity-equivalency factors (TEFs) that are used by the Agency to relate the potency of each of these PAHs to that of benzo(a)pyrene (USEPA, 1993b). Specifically, the TEFs are used to convert the individual PAH concentrations into an equivalent concentration of benzo(a)pyrene, referred to as the benzo(a)pyrene equivalent concentration (BaPEq). For example, the TEF currently used by the USEPA to develop the screening levels presented for chrysene in the USEPA Regional Screening Level table is 0.001 (USEPA, 2011, USEPA, 1993). Consequently, if the detected chrysene concentration in a sediment sample is 10,000 µg/kg, the benzo(a)pyrene equivalent concentration is 10 µg/kg. If benzo(a)pyrene and chrysene were the only PAHs detected in a sample and each was detected at 10,000 µg/kg, the associated benzo(a)pyrene equivalent concentration (based on positive detections only) would be 10,010 µg/kg (10,000 µg/kg for benzo(a)pyrene and 10 µg/kg for chrysene). This equivalent concentration, calculated for each sample, is then further evaluated in the risk assessment.

As discussed above, USEPA's *Guidelines for Carcinogen Risk Assessment* (USEPA, 2005a) and *Supplemental Guidance for Assessing Susceptibility from Early Life Exposure to Carcinogens* (USEPA, 2005b) specify the use of ADAFs for carcinogens that act mutagenically. BaPEq constituents are included in the group of chemicals determined to act mutagenically. No chemical specific ADAFs have been derived for BaPEq; therefore, the following default ADAFs were used: 10 for ages 0–2, 3 for ages 2–16, and 1 (no adjustment) for ages 16–70. These ADAFs are used to evaluate exposures to BaPEq for commercial receptors, recreational users, and hypothetical residents using the approach presented in Section 3.2.4.4.

3.4 RISK CHARACTERIZATION

This section presents the methodology used to characterize risk. Potential risks (noncarcinogenic and carcinogenic) for human receptors from exposures (as outlined in the exposure assessment) are quantitatively determined in Section 4.

3.4.1 Quantitative Analysis of Constituents Other Than Lead

Quantitative estimates of risk for chemicals other than lead are calculated according to risk assessment methods outlined in USEPA guidance (USEPA, 1989). Lifetime cancer risks are expressed in the form of dimensionless probabilities referred to as ILCRs, based on CSFs and IURs. Noncarcinogenic risk estimates are presented in the form of HQs, which are determined by comparing intakes against published RfDs and RfCs. ILCR estimates for ingestion and dermal exposures were generated for each COPC using estimated exposure intakes and published CSFs, as follows:

$$\text{ILCR} = (\text{Estimated Exposure Intake})(\text{CSF})$$

If the equation above produces an ILCR greater than 0.01, the following equation was used:

$$\text{ILCR} = 1\text{-}[\exp(\text{-Estimated Exposure Intake})(\text{CSF})]$$

ILCR estimates of inhalation exposures are generated for each COPC using estimated exposure concentrations and published IURs, as follows:

$$\text{ILCR} = (\text{IUR})(\text{Exposure Concentration})(1000\ \mu\text{g/mg})$$

An ILCR of 1×10^{-6} indicates that the exposed receptor has a one in a million chance of developing cancer under the defined exposure scenario. Alternatively, such a risk may be interpreted as representing one additional case of cancer in an exposed population of one million persons.

Noncarcinogenic risks will be assessed using the concept of HQs and hazard indices (HIs). The HQ for a COPC is the ratio of the estimated intake to the RfD, and is calculated for ingestion and dermal exposures as follows:

$$\text{HQ} = (\text{Estimated Exposure Intake})/(\text{RfD})$$

For inhalation exposures, the HQ is calculated as follows:

$$HQ = (\text{Exposure Concentration})/(\text{RfC})$$

An HI was generated by summing the individual HQs for all COPC. The HI is not a mathematical prediction of the severity of toxic effects and therefore is not a true probabilistic "risk;" it is simply a numerical indicator of the possibility of the occurrence of noncarcinogenic (threshold) effects.

3.4.2 Interpretation of Risk Assessment Results

To interpret the quantitative risk estimates and aid risk managers in determining the need for remediation, quantitative risk estimates are compared to typical MDE and USEPA risk benchmarks. Calculated ILCRs are interpreted using the MDE risk benchmark (1×10^{-5}) for cumulative risk and USEPA's target cancer-risk range (1×10^{-4} to 1×10^{-6}); HIs are evaluated using a value of 1.0. Current USEPA policy regarding lead exposures is to limit the childhood risk of exceeding a 10 µg/dL blood lead level to 5%.

USEPA defines the range of 1×10^{-4} to 1×10^{-6} as the ILCR target range for hazardous waste facilities addressed under the federal Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA). Individual or cumulative ILCRs greater than 1×10^{-4} are generally considered "unacceptable" by USEPA. Risk management decisions are necessary when the ILCR is within 1×10^{-4} to 1×10^{-6}. USEPA typically does not require remediation when the cumulative ILCR is less than 1×10^{-6}. Similarly, cumulative ILCRs greater than 1×10^{-5} are generally considered "unacceptable" by MDE; remediation may or may not be necessary when the cumulative ILCR exceeds 1×10^{-5}.

An HI exceeding unity (1.0) indicates that noncarcinogenic health risks may be associated with exposure. If an HI exceeds unity, target-organ effects associated with exposure to COPC are considered. Only those HQs for chemicals affecting the same target organ(s) or exhibiting similar critical effect(s) are regarded as truly additive. Consequently, the cumulative HI could exceed 1.0, but no adverse health effects would be anticipated unless the COPC affect the same target organ or exhibit the same critical effect (i.e., unless target-organ/critical-effect-specific HIs exceed 1).

As a general guideline, a "no further action" recommendation is forwarded to MDE whenever the cancer risk estimates and total HIs (estimated on a target-organ/target-effect basis) for receptors of concern are less than 1×10^{-5} and 1, respectively, and when risks associated with lead exposure are below the USEPA risk benchmark. Otherwise, in most cases, the need for remedial action (including institutional controls) will be evaluated in a feasibility study (FS). However, the 1×10^{-5} risk benchmark should not be viewed as a discrete limit. Risks slightly greater than 1×10^{-5} may be considered "acceptable" (i.e., protective) if justified by site-specific conditions, including any uncertainties about the nature and extent of contamination and associated risks. Consequently, a "no further action" recommendation may be forwarded to MDE risk managers for review and discussion when the 1×10^{-5} risk benchmark is exceeded. Those reviews and discussions may affect the analyses in the FS. The following factors were considered in making this determination:

- the magnitude of the media-specific risk estimates
- significant uncertainties in the baseline HHRA that would overestimate baseline risk assessment results
- significant uncertainties in EPC estimates that would overestimate baseline risk assessment results

3.4.3 Refined Evaluation of Chemical Migration from Soils to Groundwater

COPC for migration from soils to groundwater were selected as detailed in Section 3.1. However, a more refined evaluation of the potential for such migration is included in Section 4 and is based on the following considerations:

- Does the maximum detected soil concentration exceed the groundwater-protection screening criterion at a DAF of 20?
- Does the mean of positive detections in soil exceed the groundwater-protection screening criterion at a DAF of 20?
- What is the frequency of detections exceeding the groundwater-protection screening criterion at a DAF of 20?
- Was the chemical selected as a COPC in groundwater?

- Does the maximum concentration in groundwater exceed the federal Safe Drinking Water Act (SDWA) maximum contaminant level (MCL)?

- What is the frequency of detections in groundwater exceeding the MDE screening level for groundwater or the USEPA RSL for tap water (based on an ILCR of 1×10^{-6} or an HI of 1)?

- What is the frequency of detections in groundwater exceeding 10 times the USEPA RSL for tap water (based on an ILCR of 1×10^{-6} or an HI of 1)?

These factors are considered when selecting COC for groundwater protection. Chemicals selected as COPC for migration from soil to groundwater in the initial screening were not retained as COC if any of the following was true:

- The maximum soil concentration is less than the groundwater-protection criteria based on a DAF of 20.

  ***Rationale*:** As mentioned previously, a DAF of 1 is conservative; a DAF of 20 is assumed more accurate at most sites. Note that the MDE groundwater-protection criteria are based on a DAF of 20 and the USEPA SSLs for groundwater protection are based on a DAF of 1. The USEPA SSLs were adjusted (i.e., multiplied by 20) for this evaluation.

- The frequency of detections greater than the groundwater-protection screening-criterion at a DAF of 20 is less than 5% (when at least 20 samples are included in the data set and no contamination "hot spot" is present). A "hot spot" is defined as a concentration that exceeds twice the screening criterion at a DAF of 20.

  ***Rationale*:** Chemicals are unlikely to pose risks to water quality through leaching from soil to groundwater if they are detected infrequently (i.e., less than 5%) in soil.

- The chemical was not selected as a COPC in groundwater.

  ***Rationale*:** If a chemical was not selected as a COPC in site groundwater, the data do not indicate that water quality has been adversely affected. This is an important consideration, because the contamination events in the study area are presumed to have occurred more than 40 years ago. Thus, given the passage of time, groundwater concentrations likely reflect the potential for chemical migration from soils to groundwater.

- The maximum concentration in groundwater is less than the SDWA MCL.

  ***Rationale*:** SDWA MCLs are federally enforceable drinking-water standards. Concentrations of chemicals in groundwater less than their corresponding SDWA MCLs indicate that groundwater has not been adversely affected.

- The frequency of detections greater than the MDE groundwater screening-level or the USEPA tap water RSL is less than 5% (when at least 20 samples are included in the data

set and no contamination “hot spot” is present). A “hot spot” is defined as a concentration twice the MDE groundwater screening-level or USEPA tap water RSL.

***Rationale*:** Chemicals are unlikely to pose risks to water quality through leaching from soil to groundwater if they are detected infrequently (i.e., less than 5%) in groundwater.

Notes:

1 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
2 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. Cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0
3 - USEPA Soil Screening Levels. EPA Internet Site at http://rais.ornl.gov/epa/ssl1.shtml.
4 - Groundwater protection criteria or soil-to-air criteria are not applicable for this chemical because this chemical was only detected in deep subsurface soil (greater than 10 feet).
5 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
6 - The value is for xylenes.
7 - The value is for xylene, mixture.
8 - The value for acenaphthene is used as a surrogate for acenaphthylene.
9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
10 - The value is for PCB (total).
11 - The value is for polychlorinated biphenyls (high risk).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - The value is for mercury (inorganic/mercuric dichloride).
15 - The value is for mercuric chloride.
16 - The value is for vanadium and compounds.
17 - The value is for benzo(b)fluoranthene.
18 - The value for total petroleum hydrocarbons (aliphatic low) is used.
19 - See Section 3 for BaP equivalent calculation methodology.

BaP = Benzo(a)pyrene
C = Carcinogenic
CAS = Chemical Abstract Service
N = Noncarcinogenic
NA = Not available/not applicable
sat = Soil Saturation Concentration

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November, 2010. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
6 - USEPA Soil Screening Levels. EPA Internet Site at http://rais.ornl.gov/epa/ssl1.shtml.
7 - The chemical is selected as a global COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
8 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
9 - The value is for xylenes.
10 - The value is for xylene, mixture.
11 - The value for acenaphthene is used as a surrogate for acenaphthylene.
12 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
13 - The value is for PCB (total).
14 - The value is for polychlorinated biphenyls (high risk).
15 - The value is for trivalent chromium.
16 - The value is for mercury (inorganic/mercuric dichloride).
17 - The value is for mercuric chloride.
18 - The value is for vanadium and compounds.
19 - The value for benzo(b)fluoranthene is used as a surrogate for benzo(b+k)fluoranthene.
20 - The value for total petroleum hydrocarbons (aliphatic low) is used.
21 - See Section 3 for BaP equivalent calculation methodology.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Associated Samples: All surface soil samples (0-2 feet) from all tax blocks (D, E, F, G, and H) were included. See Tables 3-1 through 3-5 for sample lists.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NA = Not Applicable/Not Available
sat = soil saturation concentration

Rationale Codes:
For selection as a COPC:
ASL = Above Screening Level

For elimination as a COPC:
BSL = Below COPC Screening Level
NTX = No toxicity criteria

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November, 2010. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
6 - The chemical is selected as a global COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
7 - The value is for xylenes.
8 - The value is for xylene, mixture.
9 - The value for acenaphthene is used as a surrogate for acenaphthylene.
10 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
11 - The value is for PCB (total).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - The value for benzo(b)fluoranthene is used as a surrogate for benzo(b+k)fluoranthene.
15 - See Section 3 for BaP equivalent calculation methodology.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Associated Samples: All surface soil samples (0-2 feet) from all tax blocks (D, E, F, G, and H) were included. See Tables 3-1 through 3-5 for sample lists.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NA = Not Applicable/Not Available
sat = soil saturation concentration

Rationale Codes:
For selection as a COPC:
ASL = Above Screening Level

For elimination as a COPC:
BSL = Below COPC Screening Level
NTX = No toxicity criteria

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November, 2010. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
6 - USEPA Soil Screening Levels. EPA Internet Site at http://rais.ornl.gov/epa/ssl1.shtml.
7 - The chemical is selected as a global COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
8 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
9 - The value is for xylenes.
10 - The value is for xylene, mixture.
11 - The value for acenaphthene is used as a surrogate for acenaphthylene.
12 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
13 - The value is for PCB (total).
14 - The value is for polychlorinated biphenyls (high risk).
15 - The value is for trivalent chromium.
16 - The value is for mercury (inorganic/mercuric dichloride).
17 - The value is for mercuric chloride.
18 - The value is for vanadium and compounds.
19 - The value for total petroleum hydrocarbons (aliphatic low) is used.
20 - See Section 3 for BaP equivalent calculation methodology.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Associated Samples: All subsurface soil (2-10 feet) samples from all tax blocks (D, E, F, G, and H) were included. See Tables 3-6 through 3-10 for sample lists.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NA = Not Applicable/Not Available
sat = soil saturation concentration

Rationale Codes:
For selection as a COPC:
ASL = Above Screening Level

For elimination as a COPC:
BSL = Below COPC Screening Level
NTX = No toxicity criteria

Table 3-20

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November, 2010. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
6 - The chemical is selected as a global COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
7 - The value is for xylenes.
8 - The value is for xylene, mixture.
9 - The value for acenaphthene is used as a surrogate for acenaphthylene.
10 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
11 - The value is for PCB (total).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - See Section 3 for BaP equivalent calculation methodology.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Associated Samples: All subsurface soil (2-10 feet) samples from all tax blocks (D, E, F, G, and H) were included. See tables 3-6 through 3-10 for sample lists.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NA = Not Applicable/Not Available
sat = soil saturation concentration

Rationale Codes:
For selection as a COPC:
ASL = Above Screening Level

For elimination as a COPC:
BSL = Below COPC Screening Level
NTX = No toxicity criteria

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November, 2010. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
6 - USEPA Soil Screening Levels. EPA Internet Site at http://rais.ornl.gov/epa/ssl1.shtml.
7 - The chemical is selected as a global COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
8 - The value is for xylenes.
9 - The value is for xylene, mixture.
10 - The value for acenaphthene is used as a surrogate for acenaphthylene.
11 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
12 - The value is for trivalent chromium.
13 - The value is for mercury (inorganic/mercuric dichloride).
14 - The value is for mercuric chloride.
15 - The value is for vanadium and compounds.
16 - The value for benzo(b)fluoranthene is used as a surrogate for benzo(b+k)fluoranthene.
17 - The value for total petroleum hydrocarbons (aliphatic low) is used.
18 - See Section 3 for BaP equivalent calculation methodology.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Associated Samples: All deep subsurface soil (greater than 10 feet) samples from all tax blocks (D, E, F, G, and H) were included. See Tables 3-11 through 3-15 for sample lists.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
COPC = Chemical Of Potential Concern
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NA = Not Applicable/Not Available
sat = soil saturation concentration

Rationale Codes:
For selection as a COPC:
ASL = Above Screening Level

For elimination as a COPC:
BSL = Below COPC Screening Level
NTX = No toxicity criteria
NUT = Essential nutrient

Table 3-24

Receptors and Exposure Routes for Quantitative Evaluation - Tax Block Soils
Lockheed Martin, Middle River Complex
Middle River, Maryland

Receptors	Exposure Routes
Construction Workers (current/future land use)	• Soil incidental ingestion (surface/subsurface) • Soil dermal contact (surface/subsurface) • Inhalation of air/dust/emissions
Industrial Worker (current/future land use)	• Soil ingestion (surface/subsurface[1]) • Soil dermal contact (surface/subsurface[1]) • Inhalation of air/dust/emissions (surface/subsurface[1])
Commercial Receptors (child, adolescent, and adults) (current/future land use)	• Soil ingestion (surface/subsurface[1]) • Soil dermal contact (surface/subsurface[1]) • Inhalation of air/dust/emissions (surface/subsurface[1])
Recreational Users (child, adolescent, and adults) (current/future land use)	• Soil ingestion (surface/subsurface[1]) • Soil dermal contact (surface/subsurface[1]) • Inhalation of air/dust/emissions (surface/subsurface[1])
Hypothetical Residents (child, adolescent, and adults) (future land use)	• Soil ingestion (surface/subsurface[1]) • Soil dermal contact (surface/subsurface[1]) • Inhalation of air/dust/emissions (surface/subsurface[1])

1 – These receptors are not expected to be exposed to subsurface soil, but exposure to subsurface is evaluated to aid in risk management decisions.

Table 3-25

Notes:
EPCs are the 95% UCLs recommended by ProUCL 4.00.05 unless otherwise noted.
NA - Not applicable, chemical is not a COPC for this medium.
RAGS Part D tables for the EPCs are included in Appendix D.
(1) There are less than three detected concentrations or less than five samples - reliable statistics cannot be calculated. The maximum concentration is used as the EPC.
(2) The average concentration is used as the EPC for lead.
(3) Calculated by multiplying the total chromium concentration by 0.05.
(4) See Section 3 for benzo(a)pyrene equivalents calculation methodology.

Acronym
COPC = Chemical of Potential Concern
EPC = Exposure Point Concentration
UCL = Upper Confidence Limit

NV = No value.

Table 3-29

Input Parameters for Calculation of the Volatilization from Soil to Outdoor Air Models - Tax Block Soils
Lockheed Martin, Middle River Complex
Middle River, Maryland

Parameter	Definition	Value	Reference
Q/C	Inverse of mean concentration at center of source (g/m^2-s per kg/m^3).	Receptor specific(1)	USEPA, 20010a
T	Exposure interval (seconds).	Receptor specific(2)	USEPA, 2002
pb	Dry soil bulk density (g/cm^3).	1.5	USEPA, 2002
ps	Soil particle density (g/cm^3).	2.65	USEPA, 2002
θw	Water-filled soil porosity (L_{pore}/L_{soil}).	0.15	USEPA, 2002
n	Total soil porosity (L_{pore}/L_{soil}).	0.434	USEPA, 2002
Di	Diffusivity in air (cm^2/sec).	Chemical specific(3)	USEPA, 2010b
H'	Dimensionless Henry's Law Constant.	Chemical specific(3)	USEPA, 2010b
S	Solubility limit (mg/L)	Chemical specific(3)	USEPA, 2010b
Dw	Diffusivity in water (cm^2/sec).	Chemical specific(3)	USEPA, 2010b
Koc	Soil organic carbon partition coefficient (cm^3/g).	Chemical specific(3)	USEPA, 2010b
foc	Fraction organic carbon in soil (g/g).	0.006	USEPA, 2002

Notes:
1 - Value is 14.31 for construction workers and 87.36898 for all other receptors evaluated.
2 - Value is 3.2E+07 for construction workers and 9.5E+08 for all other receptors evaluated.
3 - Chemical-specific values are presented in Table 3-28.
USEPA 2002: Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24.
USEPA, 2010a: Soil Screening Guidance calculation Internet site at http://risk.lsd.ornl.gov/calc_start.htm.

Figure 3-1

Human Health Conceptual Site Model - Tax Block Soils
Lockheed Martin, Middle River Complex
Middle River, Maryland

■ = POTENTIALLY COMPLETE EXPOSURE PATHWAY

1. Direct contact with subsurface soil (2 to 10 feet below ground surface) is not expected for industrial workers, commercial receptors, recreational users, and hypothetical residents. Direct exposure to subsurface soil would not be likely unless future construction activities brought subsurface soil to the surface. However, this pathway was evaluated to aid in risk-management decisions.
2. Exposure to media other than soils were not addressed for this risk evaluation. Groundwater will be addressed for the Middle River Complex in a Groundwater Response Action Plan provided under a separate cover. Drainage (overland flow) discharges at the Middled River Complex are permitted throught the State of Maryland NPDES.

Section 4
Risk Characterization Results

Section 4 presents risk characterization results for chemicals of potential concern (COPC) detected in soils in each of the tax blocks. Potential risks from direct-contact exposures to soil as well as a refined evaluation of the potential for chemical migration from soils to groundwater are provided. Risk assessment uncertainties common to all tax blocks are discussed in this section on a block-specific basis, as necessary. Risk assessment sample calculations are in Appendix D. The results of the risk assessment of the exposure-point concentration (EPC) for COPC detected in each tax block are summarized in this section and also presented in detail in Appendix D in the U.S. Environmental Protection Agency's (USEPA) *Risk Assessment Guidance for Superfund (RAGS) Part D* format tables. Risk estimates and hazard indices, calculated on a location-specific basis, are in Appendix E.

4.1 RISK CHARACTERIZATION RESULTS: TAX BLOCK D

4.1.1 Noncarcinogenic Risks—RME

Tables 4-1 through 4-3 summarize the chemical concentrations detected in Block D soil samples. Cumulative hazard indices (HIs) for the receptors hypothetically exposed to COPC in surface and subsurface soil in Block D are summarized below. Chemicals contributing to target-organ-specific HIs greater than one are considered chemicals of concern (COC) and are listed by environmental medium in Table 4-4. These COC will be further evaluated in the feasibility study (FS) for the tax blocks. The "risk drivers" listed in the following table are the predominant COPC contributing to the medium-specific cumulative risk estimates:

Receptor	Environmental medium	Hazard index	Primary risk drivers
Construction worker	Surface soil (SS)	1	SS: No COC[(1)]
	Subsurface soil (SB)	1	SB: No COC[(1)]
Industrial/commercial worker	Surface soil	0.05	SS: No COC[(1)]
	Subsurface soil	0.07	SB: No COC[(1)]
Child commercial receptor	Surface soil	0.4	SS: No COC[(1)]
	Subsurface soil	0.5	SB: No COC[(1)]

Receptor	Environmental medium	Hazard index	Primary risk drivers
Adolescent commercial receptor	Surface soil	0.08	SS: No COC[(1)]
	Subsurface soil	0.1	SB: No COC[(1)]
Child recreational user	Surface soil	0.8	SS: No COC[(1)]
	Subsurface soil	1	SB: No COC[(1)]
Adolescent recreational user	Surface soil	0.1	SS: No COC[(1)]
	Subsurface soil	0.2	SB: No COC[(1)]
Adult recreational user	Surface soil	0.08	SS: No COC[(1)]
	Subsurface soil	0.1	SB: No COC[(1)]
Child resident	Surface soil	1	SS: No COC[(1)]
	Subsurface soil	1	SB: No COC[(1)]
Adolescent resident	Surface soil	0.2	SS: No COC[(1)]
	Subsurface soil	0.3	SB: No COC[(1)]
Adult resident	Surface soil	0.1	SS: No COC[(1)]
	Subsurface soil	0.2	SB: No COC[(1)]

[(1)] HIs calculated on a target-organ-specific basis do not exceed 1. Therefore, no COC were identified for this medium

Hazard indices calculated on a target-organ-specific basis do not exceed 1 for any of the receptors evaluated. Consequently, adverse non-carcinogenic health effects are not anticipated under the conditions established in the exposure assessment.

Risk estimates calculated on a location-specific basis are in Appendix E. None of the location-specific HIs calculated for the typical industrial worker exposed to COPC in surface soil, shallow subsurface soils, or deeper saturated-zone soils exceed 1. HIs calculated for the hypothetical future resident for samples from five surface soil locations (maximum HI=2.1); 17 shallow subsurface soil locations (maximum HI=2.6), and 13 deeper saturated-zone soil locations (maximum HI=3.8) marginally exceed 1; arsenic, iron, and cobalt are the major contributors to risk. Most of these locations are in the panhandle portion of Block D.

4.1.2 Carcinogenic Risks—RME

Cancer risk estimates for receptors hypothetically exposed to EPC for COPC in surface and subsurface soil in Block D are summarized in the following table. Chemicals contributing an incremental lifetime-cancer risk (ILCR) greater than 1×10^{-6} are listed in Table 4-4 by environmental medium. Chemicals are considered COC if the cumulative risk estimate for the environmental medium exceeds 1×10^{-5}. Block D COC will be further evaluated in the FS. The "risk drivers" in the following table are the predominant COPC contributing to the cancer risk estimates presented here by medium:

Receptor	Environmental medium	Cancer risk estimates	Primary risk drivers[1]
Construction worker	Surface soil (SS)	3×10^{-6}	SS: No COC[2]
	Subsurface soil (SB)	2×10^{-6}	SB: No COC[2]
Industrial/commercial worker	Surface soil	1×10^{-5}	SS: No COC[2]
	Subsurface soil	5×10^{-6}	SB: No COC[2]
Child + adolescent commercial receptor	Surface soil	*1×10^{-4}*[3]	SS: BaPEq, As, Cr VI
	Subsurface soil	*3×10^{-5}*	SB: BaPEq, As, Cr VI
Lifelong recreational user	Surface soil	**2×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*5×10^{-5}*[3]	SB: BaPEq, As, Cr VI
Lifelong resident	Surface soil	**3×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*7×10^{-5}*[3]	SB: BaPEq, As, Cr VI

[1] Arsenic (As), hexavalent chromium (Cr VI), benzo(a)pyrene equivalents (BaPEq).

[2] ILCRs do not exceed 1×10^{-5}. Therefore, no COC were identified for this medium.

[3] The medium-specific ILCR exceeds 1×10^{-5} (ILCRs are italicized).

[4] The medium-specific ILCR exceeds 1×10^{-4} (ILCRs are bolded).

Cumulative cancer-risk estimates for the lifelong recreational user and the lifelong resident exposed to EPC for COPC in surface soil exceed the USEPA's target cancer-risk range. Cumulative cancer-risk estimates for these receptors and the child/adolescent commercial receptor also exceed MDE's cumulative risk benchmark of 1×10^{-5} for surface and subsurface soil. Cancer risk estimates for the construction worker and the industrial/commercial worker do not exceed either USEPA or MDE cumulative cancer risk benchmarks. The primary risk drivers are the benzo(a)pyrene equivalents (BaPEq), and, to a lesser extent, arsenic and hexavalent chromium. However, as noted earlier, hexavalent chromium is not the dominant chromium species in the limited number of soil samples specifically analyzed for hexavalent chromium. Consequently, the ILCRs for chromium for soils may be overestimated.

Cancer risk estimates calculated on a location-specific basis are in Appendix E. Although location-specific risk estimates for the typical industrial worker exposed to COPC concentrations in surface, shallow subsurface, or deeper saturated-zone soils exceed 1×10^{-5} at a limited number of Block D locations, none of the risk estimates exceed 1×10^{-4}. In contrast, risk estimates for the hypothetical future resident for several locations scattered across Block D exceed 1×10^{-4}, and estimates for four surface and one shallow subsurface-soil locations exceed 1×10^{-3}. None of the future-resident risk estimates for deeper saturated-zone soils exceed 1×10^{-3}. As noted above, BaPEq are the primary risk drivers.

4.1.3 Lead Risks/GRO/DRO

Lead was identified as a "global" COPC in surface soil and subsurface soil. However, the maximum lead concentration in subsurface soils is the only detection (SB-783 [1,010 mg/kg]) in Block D to exceed the COPC screening level. Analytical data for nearby sampling locations are all less than 120 mg/kg and the arithmetic-mean concentrations for Block F surface and subsurface soils samples are less than 50 mg/kg. Therefore, lead concentrations in Block D soils will not be further evaluated in this HHRA.

Environmental medium	Maximum detected lead concentration	Arithmetic-mean lead concentration	COPC screening level [(1)]
Surface soil	75 mg/kg	20.6 mg/kg	400 mg/kg
Subsurface soil	1,010 mg/kg	22.9 mg/kg	400 mg/kg

[(1)] COPC screening levels are defined and referenced in Section 3

Maximum detected GRO concentrations in Block D surface and subsurface soil do not exceed residential or non-residential MDE soil cleanup standards. However, the maximum detected DRO concentrations in the surface soil (1,800 mg/kg; SB-32A) exceed both MDE standards (230 mg/kg and 620 mg/kg, respectively).

4.2 RISK CHARACTERIZATION RESULTS: TAX BLOCK E

4.2.1 Noncarcinogenic Risks—RME

Tables 4-5 through 4-7 summarize chemical concentrations detected in Block E soil samples. Cumulative HIs for the receptors hypothetically exposed to EPC for COPC for surface and subsurface soil in Block E are summarized below. Chemicals contributing to target-organ-specific HIs greater than one (i.e., COC) are listed by environmental medium in Table 4-8. These COC will be further evaluated in the FS for the tax blocks. The "risk drivers" listed in the following table are the predominant COPC contributing to the medium-specific cumulative risk estimates:

Receptor	Environmental medium	Hazard index	Primary risk drivers[1][5]
Construction worker	Surface soil (SS)	**13**[4]	SS: A-1254
	Subsurface soil (SB)	**4**[4]	SB: A-1254
Industrial/commercial worker	Surface soil	**3**[4]	SS: A-1254
	Subsurface soil	*2*[2]	SB: No COC[3]
Child commercial receptor	Surface soil	**12**[4]	SS: A-1254
	Subsurface soil	**5**[4]	SB: A-1254
Adolescent commercial receptor	Surface soil	**4**[4]	SS: A-1254
	Subsurface soil	*2*[2]	SB: No COC[3]
Child recreational user	Surface soil	**24**[4]	SS: A-1254
	Subsurface soil	**11**[4]	SB: 123-TCB, 124-TCB, A-1254
Adolescent recreational user	Surface soil	**5**[4]	SS:A-1254
	Subsurface soil	*3*[2]	SB: No COC[3]
Adult recreational user	Surface soil	**3**[4]	SS: A-1254
	Subsurface soil	*2*[2]	SB: No COC[3]
Child resident	Surface soil	**34**[4]	SS: A-1254
	Subsurface soil	**18**[4]	SB: 123-TCB, 124-TCB, A-1254
Adolescent resident	Surface soil	**7**[4]	SS: A-1254
	Subsurface soil	**7**[4]	SB: 123-TCB, 124-TCB, A-1254
Adult resident	Surface soil	**5**[4]	SS: A-1254
	Subsurface soil	**6**[4]	SB: 124-TCB

[1] Aroclor-1254 (A-1254), 1,2,3-trichlorobenzene (123-TCB), 1,2,4-trichlorobenzene (124-TCB)

[2] The medium-specific hazard index exceeds one, but target-organ-specific hazard indices do not exceed one (HIs are italicized)

[3] HIs calculated on a target-organ-specific basis do not exceed 1. Therefore, no COC were identified for this medium

[4] The medium-specific hazard index exceeds one and target-organ-specific hazard indices exceed one (HIs are bolded)

[5] DRO was also selected as a COC as discussed in Section 4.2.3.

Except for the target-organ-specific HIs calculated for industrial workers, adolescent commercial receptors, or adolescent and adult recreational users exposed to subsurface soils, HI calculations based on the EPC for COPC exceed 1 for all receptors evaluated. Consequently, adverse non-carcinogenic health effects would be anticipated for these receptors under the conditions established in the exposure assessment. The primary risk drivers are Aroclor-1254, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene. As discussed below, the EPC, and thus the risk estimates, are strongly influenced by the maximum detected concentrations of these COPC in surface and subsurface soils:

COPC	Maximum detected surface soil concentration (mg/kg)	Maximum detected subsurface soil concentration (mg/kg)
Aroclor-1254	36	9.8
1,2,3-trichlorobenzene	43	2,200
1,2,4-trichlorobenzene	210	9,600

Risk estimates calculated on a location-specific basis are in Appendix E. When significant figures are taken into consideration for the estimated HI results, none of the location-specific HIs calculated for the deeper saturated-zone soils exceed unity. However, the HIs calculated for the typical industrial worker and the hypothetical future resident for samples from a single shallow sub-surface soil location (SB-833) exceed 10. Risk drivers for that location are Aroclor-1254, 1,2,3-trichlorobenzene, and 1,2,4-trichlorobenzene. No other location-specific risk estimates for the industrial worker exposed to subsurface soils exceed one.

Location-specific risk estimates for eight other locations for the hypothetical future resident exposed to shallow subsurface soils range from 1–10; Aroclor-1254, cobalt, and iron are the primary risk drivers. Location-specific risk estimates for the typical industrial worker for one surface location (SB-353) and for eight surface locations scattered across the block exceed an HI of 10 and 1, respectively. As indicated in the risk estimate figures in Appendix E, risk estimates for the hypothetical future resident for several Block E surface locations exceed 10, one of which (SB-353) had an HI of 330; Aroclor-1254, cobalt, and iron are the primary contributors to the non-cancer risks.

In reviewing the location-specific risk estimates in Appendix E, note that Aroclor-1254 was only actually detected in samples from boring location SB-555 (maximum concentration = 36 mg/kg). Risk estimates for this compound were calculated for other locations assuming that half of the sample quantitation-limit (SQL) reported for this chemical was present at those locations. However, SQLs reported for Aroclor-1254 for several locations are elevated (many exceed 1 mg/kg) because of the Aroclor-1260 detections at these locations. Aroclor-1254 may or may not be at these locations; detection of this compound is potentially “masked” by Aroclor-1260 in these samples.

4.2.2 Carcinogenic Risks—RME

Cancer risk estimates for receptors hypothetically exposed to EPC for COPC in surface and subsurface soil in Block E are summarized in the following table. Chemicals contributing an ILCR greater than 1×10^{-6} are listed by environmental medium in Table 4-8. Chemicals are considered COC if the cumulative risk estimate for the environmental medium exceeds 1×10^{-5}. Block E COC will be further evaluated in the FS. The "risk drivers" in the following table are the predominant COPC contributing to the cancer risk estimates, presented here by medium:

Receptor	Environmental medium	Cancer risk estimates	Primary risk drivers[(1)]
Construction worker	Surface soil (SS)	*3×10^{-5}*[(2)]	SS: A-1254, A-1260
	Subsurface soil (SB)	*1×10^{-4}*[(2)]	SB: A-1254, A-1260
Industrial/commercial worker	Surface soil	**2×10^{-4}**[(3)]	SS: A-1254, A-1260, BaPEq
	Subsurface soil	**7×10^{-4}**[(3)]	SB: A-1254, A-1260, BaPEq, 124-TCB
Child + adolescent commercial receptor	Surface soil	**3×10^{-4}**[(3)]	SS: A-1254, A-1260, BaPEq, As, Cr VI
	Subsurface soil	**1×10^{-3}**[(3)]	SB: A-1254, A-1260, BaPEq, 124-TCB
Lifelong recreational user	Surface soil	**6×10^{-4}**[(3)]	SS: A-1254, A-1260, BaPEq, 124-TCB, As, Cr VI
	Subsurface soil	**3×10^{-3}**[(3)]	SB: A-1254, A-1260, BaPEq, 124-TCB, As, Cr VI
Lifelong resident	Surface soil	**8×10^{-4}**[(3)]	SS: A-1254, A-1260, BaPEq, 124-TCB, As, Cr VI
	Subsurface soil	**4×10^{-3}**[(3)]	SB: A-1254, A-1260, BaPEq, 124-TCB, 14-DCB, As, Cr VI

[(1)] Aroclor-1254 (A-1254), 1,2,4-trichlorobenzene (124-TCB), Arsenic (As), hexavalent chromium (Cr VI), benzo(a)pyrene equivalents (BaPEq), 1,4-dichlorobenzene (14-DCB)

[(2)] The medium-specific ILCR exceeds 1×10^{-5} (ILCRs are italicized)

[(3)] The medium-specific ILCR exceeds 1×10^{-4} (ILCRs are bolded)

Except for the construction worker, cumulative cancer risk estimates for the receptors listed above exceed the USEPA's target cancer risk range. Cumulative cancer risk estimates for the construction worker exceed MDE's cumulative risk benchmark of 1×10^{-5}. The primary risk drivers are the Aroclors (particularly, Aroclor-1260), BaPEq, chlorobenzene compounds, and, to a lesser extent, arsenic and hexavalent chromium. However, as noted earlier, hexavalent chromium is not the dominant chromium species in the limited number of soil samples specifically analyzed for hexavalent chromium. Consequently, the ILCRs for chromium for soils may be overestimated. As discussed below, cancer risk estimates are strongly influenced by the maximum detected concentrations of these COPC in surface and subsurface soils.

Risk estimates calculated on a location-specific basis are in Appendix E. Aroclor-1260 is the predominant risk driver. With three exceptions (SB-503, SB-833, SB-827), cancer risk estimates for the industrial worker exposed to the deeper saturated-zone soils (greater than 10 feet bgs) do not exceed 1×10^{-5}; none of these estimates exceed 1×10^{-4}. Except for samples from locations SB-503 and SB-833, none of the cancer risk estimates for the hypothetical future resident exposed to the deeper saturated-zone soils exceed 1×10^{-4}. However, as detailed in Appendix E, risk estimates for both industrial workers and future residents being exposed at several surface and subsurface (2–10 feet bgs) sampling locations exceed 1×10^{-4}, one of which even exceeds 1×10^{-1} (i.e., a one in 10 probability). Of particular note are the risk estimates for samples associated with boring locations SB-353 and -833, which had the greatest concentrations of Aroclor-1260 in surface and subsurface soil samples, respectively.

4.2.3 Lead Risks/GRO/DRO

Lead was identified as a "global" COPC in surface soil and subsurface soil. However, the maximum lead concentrations in surface and subsurface soils do not exceed the COPC screening level. Therefore, lead concentrations in the Block E soils are not further evaluated in this HHRA.

Environmental medium	Maximum detected lead concentration	Arithmetic-mean lead concentration	COPC screening-*level*[(1)]
Surface soil	278 mg/kg	21.6 mg/kg	400 mg/kg
Subsurface soil	14.4 mg/kg	3.6 mg/kg	400 mg/kg

[(1)] COPC screening levels are defined and referenced in Section 3

Maximum detected GRO concentrations in Block E surface and subsurface soil do not exceed residential or non-residential MDE soil-screening levels. However, the maximum detected DRO concentrations in the surface (8,900 mg/kg; SB-833) and subsurface (28,000 mg/kg; SB-833) soils exceed the MDE residential soil-screening level (230 mg/kg) and also exceed the MDE non-residential soil-screening level (620 mg/kg). Additionally, as discussed in Section 5.3, two detected DRO concentrations in Block E soil exceed the calculated industrial risk-based concentration (6,100 mg/kg) based on an HQ of 0.1 and MDE risk assessment methodology. Because DRO concentrations exceed the 6,100 mg/kg risk-based concentration, DRO was selected as a COC for Block E (see Section 5.3 for a more detailed analysis).

4.3 RISK CHARACTERIZATION RESULTS: TAX BLOCK F

4.3.1 Noncarcinogenic Risks—RME

Tables 4-9 through 4-11 summarize the chemical concentrations detected in Block F soil samples. Cumulative HIs for receptors hypothetically exposed to EPC for COPC in surface and subsurface soil in Block F are summarized below. Chemicals contributing to target-organ-specific HIs greater than one (i.e., COC) are listed by environmental medium in Table 4-12. These COC will be further evaluated in the FS for the tax blocks. The "risk drivers" listed in the following table are the predominant COPC contributing to the medium-specific cumulative risk estimates:

Receptor	Environmental medium	Hazard index	Primary risk drivers[1]
Construction worker	Surface soil (SS)	0.5	SS: No COC[3]
	Subsurface soil (SB)	*2*[2]	SB: No COC[3]
Industrial/commercial worker	Surface soil	0.05	SS: No COC[3]
	Subsurface soil	0.2	SB: No COC[3]
Child commercial receptor	Surface soil	0.4	SS: No COC[3]
	Subsurface soil	0.5	SB: No COC[3]
Adolescent commercial receptor	Surface soil	0.08	SS: No COC[3]
	Subsurface soil	0.1	SB: No COC[3]
Child recreational user	Surface soil	0.7	SS: No COC[3]
	Subsurface soil	1	SB: No COC[3]
Adolescent recreational user	Surface soil	0.1	SS: No COC[3]
	Subsurface soil	0.4	SB: No COC[3]
Adult recreational user	Surface soil	0.08	SS: No COC[3]
	Subsurface soil	0.3	SB: No COC[3]
Child resident	Surface soil	1	SS: No COC[3]
	Subsurface soil	*2*[2]	SB: No COC[3]
Adolescent resident	Surface soil	0.2	SS: No COC[3]
	Subsurface soil	1	SB: No COC[3]
Adult resident	Surface soil	0.1	SS: No COC[3]
	Subsurface soil	0.9	SB: No COC[3]

[1] There are no primary risk drivers for any receptor.

[2] The medium-specific hazard index exceeds 1, but target-organ-specific hazard indices do not exceed 1 (HIs are italicized)

[3] HIs calculated on a target-organ-specific basis do not exceed 1. Therefore, no COC were identified for this medium.

Hazard indices calculated for the Block F EPCs on a target-organ-specific basis do not exceed 1. Consequently adverse non-carcinogenic health effects would not be anticipated for the construction worker, the industrial/commercial worker, the child/adolescent commercial receptor, the recreational user, or a resident under the conditions established in the exposure assessment. HIs were also calculated for surface soils, subsurface soils (2–10 feet bgs), and saturated-zone

soils (greater than 10 feet bgs) on a location-specific basis (Appendix E) for hypothetical future residents and industrial workers. None of the location-specific total HIs calculated for the industrial worker exceed unity (i.e., an HI of 1). Total HIs calculated for surface soil from two locations and for subsurface soils from two locations range from 1.1–1.9 for the hypothetical future resident; all other HIs calculated for the resident are less than 1. These results support the conclusion that adverse non-carcinogenic health effects would not be anticipated for the receptors evaluated.

4.3.2 Carcinogenic Risks—RME

Cancer risk estimates for receptors hypothetically exposed to EPC of COPC in surface and subsurface soil in Block F are summarized in the following table. Chemicals contributing an ILCR greater than 1×10^{-6} are listed by environmental medium in Table 4-12. Chemicals are considered COC if the cumulative risk estimate for the environmental medium exceeds 1×10^{-5}. Block F COC will be further evaluated in the FS. The "risk drivers" in the following table are the predominant COPC contributing to the cancer risk estimates presented here by medium:

Receptor	Environmental medium	Cancer risk estimates	Primary risk drivers[(1)]
Construction worker	Surface soil (SS)	5×10^{-6}	SS: No COC[(2)]
	Subsurface soil (SB)	*3×10^{-6}*	SB: No COC[(2)]
Industrial/commercial worker	Surface soil	*2×10^{-5}*[(3)]	SS: BaPEq
	Subsurface soil	9×10^{-6}	SB: No COC[(2)]
Child + adolescent commercial receptor	Surface soil	**2×10^{-4}**[(4)]	SS: BaPEq, As, Cr VI
	Subsurface soil	1×10^{-5}	SB: No COC[(2)]
Lifelong recreational user	Surface soil	**3×10^{-4}**[(4)]	SS: BaPEq, As, Cr VI
	Subsurface soil	*3×10^{-5}*[(3)]	SB: BaPEq, As, Cr VI, Nap.
Lifelong resident	Surface soil	**5×10^{-4}**[(4)]	SS: BaPEq, As, Cr VI
	Subsurface soil	*7×10^{-5}*[(3)]	SB: BaPEq, As, Cr VI, Nap.

[(1)] Arsenic (As), hexavalent chromium (Cr VI), benzo(a)pyrene equivalents (BaPEq), naphthalene (Nap.)
[(2)] ILCRs do not exceed 1×10^{-5}. Therefore, no COC were identified for this medium
[(3)] The medium-specific ILCR exceeds 1×10^{-5} (ILCRs are italicized)
[(4)] The medium-specific ILCR exceeds 1×10^{-4} (ILCRs are bolded)

Cumulative cancer-risk estimates for the child/adolescent commercial-receptor, lifelong recreational user, and the lifelong resident exposed to COPC in surface soil exceed the USEPA's target cancer-risk range. Cumulative cancer risk estimates for all receptors except the construction worker exposed to COPC in both surface subsurface soils and the industrial/commercial worker and child/adolescent commercial receptor exposed to COPC in subsurface soils exceed MDE's cumulative risk benchmark of 1×10^{-5}. In most cases, the primary

risk drivers are the BaPEq, and, to a lesser extent, arsenic and hexavalent chromium. (However, as noted earlier, hexavalent chromium is not the dominant chromium species in the limited number of soil samples specifically analyzed for hexavalent chromium. Consequently, the ILCRs for chromium for soils may be overestimated.)

Naphthalene is also a risk-driver for lifelong recreational users/residents hypothetically exposed to subsurface soils. The EPC for naphthalene (159 mg/kg) is more than an order of magnitude greater than the current USEPA RSL for industrial-worker exposure to soils (USEPA RSL = 18 mg/kg). As indicated in Table 4-12, the cancer risk estimates for naphthalene (a relatively volatile PAH compound) are driven by the inhalation exposure pathway. The naphthalene EPC evaluated is the maximum detected concentration (159 mg/kg at location SB-238, five-foot depth interval). Naphthalene concentrations at other Block F locations do not exceed COPC soil-screening levels. The naphthalene contamination detected at location SB-238 is co-located with a BaPEq concentration of approximately 3 mg/kg.

Cancer risk estimates were also calculated for surface soils, shallow subsurface soils (2-10 feet bgs), and saturated-zone soils (greater than 10 feet bgs) on a location-specific basis (Appendix E) for hypothetical future residents and industrial workers. BaPEq are the primary risk drivers. Cancer risk estimates for the typical industrial worker for samples from several locations exceed 1×10^{-5}; however, estimates for this receptor based on samples from only two surface soil locations (SB-95 and SB-268) exceed 1×10^{-4}.

Cancer risk estimates calculated for the hypothetical future resident on the basis of samples from approximately 50% of the surface soil locations exceed the 1×10^{-5} cancer risk benchmark. BaPEq contamination and, thus, cancer-risk estimates for the hypothetical future resident, are generally less in samples collected from the shallow subsurface soil. Risk estimates for the hypothetical future resident for four surface locations exceed 1×10^{-3}; risk estimates for the industrial worker do not exceed 1×10^{-3}. The location-specific risk estimates for saturated-zone soil samples are typically less than those calculated for the surface and shallow-subsurface zones; only the location-specific risk estimate for the hypothetical future resident for the deep saturated-zone soils at location SB-268 exceeds 1×10^{-4}.

4.3.3 Lead Risks/GRO/DRO

Lead was identified as a "global" COPC in surface soil and subsurface soil. However, the maximum lead concentration in surface soils is the only one of two detections (SB-055 [420 mg/kg] and SB-268 [447 mg/kg]) in Block F to exceed the COPC screening level. Analytical data for nearby sampling locations are all less than 100 mg/kg, and the arithmetic-mean concentrations from Block F surface and subsurface soils samples are less than 60 mg/kg. Therefore, lead concentrations in Block F soils will not be further evaluated in this HHRA.

Environmental medium	Maximum detected lead concentration	Arithmetic-mean lead concentration	COPC screening level (1)
Surface soil	447 mg/kg	58.9 mg/kg	400 mg/kg
Subsurface soil	81 mg/kg	10.4 mg/kg	400 mg/kg

(1) COPC screening levels are defined and referenced in Section 3

Maximum detected GRO concentrations in Block F surface and subsurface soil do not exceed residential or non-residential MDE soil cleanup standards. However, the maximum detected DRO concentrations in surface (271 mg/kg at SB-238) and subsurface (881 mg/kg at SB-238) soils exceed both MDE screening levels (230 mg/kg and 620 mg/kg for residential and non-residential screening levels, respectively).

4.4 RISK CHARACTERIZATION RESULTS: TAX BLOCK G

4.4.1 Noncarcinogenic Risks—RME

Tables 4-13 through 4-15 summarize the chemical concentrations detected in Block G soil samples. Cumulative HIs for receptors hypothetically exposed to EPC for COPC detected in surface and subsurface soil in Block G are summarized below. Chemicals contributing to target-organ-specific HIs greater than one (i.e., COC) are listed by environmental medium in Table 4-16. These COC will be further evaluated in the FS for the tax blocks. The "risk drivers" listed in the following table are the predominant COPC contributing to the medium-specific cumulative risk estimates:

Receptor	Environmental medium	Hazard index	Primary risk drivers[1]
Construction worker	Surface soil (SS)	*2*[2]	SS: No COC[3]
	Subsurface soil (SB)	*2*[2]	SB: No COC[3]
Industrial/commercial worker	Surface soil	0.09	SS: No COC[3]
	Subsurface soil	0.1	SB: No COC[3]
Child commercial receptor	Surface soil	1	SS: No COC[3]
	Subsurface soil	0.7	SB: No COC[3]
Adolescent commercial receptor	Surface soil	0.2	SS: No COC[3]
	Subsurface soil	0.2	SB: No COC[3]
Child recreational user	Surface soil	*2*[2]	SS: No COC[3]
	Subsurface soil	1	SB: No COC[3]
Adolescent recreational user	Surface soil	0.4	SS: No COC[3]
	Subsurface soil	0.3	SB: No COC[3]
Adult recreational user	Surface soil	0.2	SS: No COC[3]
	Subsurface soil	0.2	SB: No COC[3]
Child resident	Surface soil	**3**[4]	SS: cobalt
	Subsurface soil	*2*[2]	SB: No COC[3]
Adolescent resident	Surface soil	0.5	SS: No COC[3]
	Subsurface soil	0.4	SB: No COC[3]
Adult resident	Surface soil	0.3	SS: No COC[3]
	Subsurface soil	0.2	SB: No COC[3]

(1) Cobalt (Co)

(2) The medium-specific hazard index exceeds one, but target-organ-specific hazard indices do not exceed one (HIs are italicized)

(3) HIs calculated on a target-organ-specific basis do not exceed 1. Therefore, no COC were identified for this medium.

(4) The medium-specific hazard index exceeds one and target-organ-specific hazard indices exceed one (HIs are bolded)

With one exception, hazard indices calculated on a target organ-specific basis for the Block G EPCs do not exceed 1. However, the total HI calculated for the child resident hypothetically exposed to cobalt concentrations in surface soil does exceed 1. The maximum surface soil concentration (51.2 mg/kg at location SB-197-SS) and the EPC for surface soils (41.2 mg/kg) exceed the current USEPA RSL for residential soils (23 mg/kg). This indicates a potential for adverse non-carcinogenic health effects for this receptor under the conditions established in the exposure assessment.

Note that the calculated EPC is strongly influenced by the positive cobalt detection reported for location SB-197-SS. Location-specific HIs calculated for cobalt at other Block G locations (Appendix E) do not exceed unity. Location SB-197 is otherwise unremarkable. Consequently, the cobalt concentration detected at this location (surface and subsurface) may be somewhat anomalous.

4.4.2 Carcinogenic Risks—RME

Cancer risk estimates for receptors hypothetically exposed to EPC of COPC detected in surface and subsurface soil in Block G are summarized in the following table. Chemicals contributing an ILCR greater than 1×10^{-6} are listed by environmental medium in Table 4-16. Chemicals are considered COC if the cumulative risk estimate for the environmental medium exceeds 1×10^{-5}. Block G COC will be further evaluated in the FS. The "risk drivers" in the following table are the predominant COPC contributing to the cancer risk estimates, presented here by medium:

Receptor	Environmental medium	Cancer risk estimates	Primary risk drivers[1]
Construction worker	Surface soil (SS)	5×10^{-6}	SS: No COC[2]
	Subsurface soil (SB)	2×10^{-6}	SB: No COC[2]
Industrial/commercial worker	Surface soil	*2×10^{-5}*[3]	SS: BaPEq, As
	Subsurface soil	6×10^{-6}	SB: No COC[2]
Child + adolescent commercial receptor	Surface soil	*1×10^{-4}*[3]	SS: BaPEq, As, Cr VI
	Subsurface soil	*4×10^{-5}*[3]	SB: BaPEq, As, Cr VI
Lifelong recreational user	Surface soil	**2×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*8×10^{-5}*[3]	SB: BaPEq, As, Cr VI
Lifelong resident	Surface soil	**3×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*1×10^{-4}*[3]	SB: BaPEq, As, Cr VI

[1] Arsenic (As), hexavalent chromium (Cr VI), benzo(a)pyrene equivalents (BaPEq)

[2] ILCRs do not exceed 1×10^{-5}. Therefore, no COC were identified for this medium.

[3] The medium-specific ILCR exceeds 1×10^{-5} (ILCRs are italicized)

[4] The medium-specific ILCR exceeds 1×10^{-4} (ILCRs are bolded)

Cumulative cancer-risk estimates for the lifelong recreational user and the lifelong resident exposed to COPC in surface soil exceed the USEPA's target cancer-risk range. Cumulative cancer risk estimates for all receptors except the construction worker exposed to COPC in surface and subsurface soils and the industrial worker exposed to COPC in subsurface soils exceed MDE's cumulative risk benchmark of 1×10^{-5}. The primary risk drivers are the BaPEq, and, to a lesser extent, arsenic and hexavalent chromium. However, as noted earlier, hexavalent chromium is not the dominant chromium species in the limited number of soil samples specifically analyzed for hexavalent chromium. Consequently, the ILCRs for chromium for soils may be overestimated.

Risk estimates calculated for surface soils, subsurface soils (2–10 feet bgs), and saturated-zone soils (greater than 10 feet bgs) on a location-specific basis for hypothetical future residents and industrial workers are in Appendix E. Cancer risk estimates calculated for the typical industrial worker exposed to COPC in samples from surface or shallow sub-surface soils exceed 1×10^{-4} at

four and three locations, respectively; location-specific cancer risks for this receptor do not exceed 1×10^{-3}. Cancer risk estimates calculated for the hypothetical future resident for more than 50% of the locations evaluated exceed the 1×10^{-5} cancer risk benchmark. Risk estimates for several locations exceed 1×10^{-3}. The location-specific risk estimates for saturated-zone soil samples collected from several locations exceed 1×10^{-4}, indicating COC contamination as deep as 15 feet bgs.

4.4.3 Lead Risks/GRO/DRO

Lead was identified as a "global" COPC in surface soil and subsurface soil. However, the maximum and arithmetic-mean lead concentrations detected in Block G soils are less than the COPC screening level. Therefore, lead concentrations in Block G soils will not be further evaluated in this HHRA.

Environmental medium	Maximum detected lead concentration	Arithmetic-mean lead concentration	COPC screening level (1)
Surface soil	340 mg/kg	68.3 mg/kg	400 mg/kg
Subsurface soil	18 mg/kg	7 mg/kg	400 mg/kg

(1) COPC screening levels are defined and referenced in Section 3

Maximum detected DRO concentrations in Block G surface and subsurface soil do not exceed residential or non-residential MDE soil cleanup standards. However, the maximum detected GRO concentrations in surface (810 mg/kg at SB-734) and subsurface (980 mg/kg at SB728) soils exceed both MDE screening levels (230 mg/kg and 620 mg/kg for residential and non-residential screening levels, respectively).

4.5 RISK CHARACTERIZATION RESULTS: TAX BLOCK H

4.5.1 Noncarcinogenic Risks—RME

Tables 4-17 through 4-19 summarize the chemical concentrations detected in Block H soil sample. Cumulative HIs for the receptors hypothetically exposed to EPC for COPC in surface and subsurface soil in Block H are summarized below. Chemicals contributing to target-organ-specific HIs greater than one (i.e., COC) are listed by environmental medium in Table 4-20. These COC will be further evaluated in the FS for the tax blocks. The "risk drivers"

listed in the following table are the predominant COPC contributing to the medium-specific cumulative risk estimates:

Receptor	Environmental medium	Hazard index	Primary risk drivers
Construction worker	Surface soil (SS)	0.4	SS: No COC
	Subsurface soil (SB)	0.5	SB: No COC
Industrial/commercial worker	Surface soil	0.03	SS: No COC
	Subsurface soil	0.04	SB: No COC
Child commercial receptor	Surface soil	0.3	SS: No COC
	Subsurface soil	0.3	SB: No COC
Adolescent commercial receptor	Surface soil	0.06	SS: No COC
	Subsurface soil	0.07	SB: No COC
Child recreational user	Surface soil	0.5	SS: No COC
	Subsurface soil	0.6	SB: No COC
Adolescent recreational user	Surface soil	0.1	SS: No COC
	Subsurface soil	0.1	SB: No COC
Adult recreational user	Surface soil	0.06	SS: No COC
	Subsurface soil	0.07	SB: No COC
Child resident	Surface soil	0.7	SS: No COC
	Subsurface soil	0.9	SB: No COC
Adolescent resident	Surface soil	0.1	SS: No COC
	Subsurface soil	0.2	SB: No COC
Adult resident	Surface soil	0.08	SS: No COC
	Subsurface soil	0.09	SB: No COC

Total hazard indices and hazard indices calculated on a target organ-specific basis that is based on Block H EPCs do not exceed 1 for any of the receptors evaluated. Consequently, adverse non-carcinogenic health effects would not be anticipated under the conditions established in the exposure assessment.

HIs were also calculated for surface soils, subsurface soils (2–10 feet bgs), and saturated-zone soils (greater than 10 feet bgs) on a location-specific basis (Appendix E) for hypothetical future residents and industrial workers. None of the location-specific total HIs calculated for the industrial worker exceed unity. Total HIs calculated for surface soil from one location and subsurface soils from three locations range from 1.3–1.6 for the hypothetical future resident; all other HIs calculated for the resident are less than 1. These results support the conclusion that adverse non-carcinogenic health effects would not be anticipated for the receptors evaluated.

4.5.2 Carcinogenic Risks—RME

Cancer risk estimates for receptors hypothetically exposed to surface and subsurface soil in Block H are summarized in the following table. Chemicals contributing an ILCR greater than

1×10^{-6} are listed by environmental medium in Table 4-20. Chemicals are considered COC if the cumulative risk estimate for the environmental medium exceeds 1×10^{-5}. COC for Block H will be further evaluated in the FS. The "risk drivers" in the following table are the predominant COPC contributing to the cancer risk estimates, presented here by medium:

Receptor	Environmental medium	Cancer risk estimates	Primary risk drivers[1]
Construction worker	Surface soil (SS)	8×10^{-6}	SS: No COC[2]
	Subsurface soil (SB)	1×10^{-6}	SB: No COC[2]
Industrial/commercial worker	Surface soil	*4×10^{-5}*[3]	SS: BaPEq
	Subsurface soil	3×10^{-6}	SB: No COC[2]
Child + adolescent commercial receptor	Surface soil	**3×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*2×10^{-5}*[3]	SB: BaPEq, As, Cr VI
Lifelong recreational user	Surface soil	**6×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*3×10^{-5}*[3]	SB: BaPEq, As, Cr VI
Lifelong resident	Surface soil	**9×10^{-4}**[4]	SS: BaPEq, As, Cr VI
	Subsurface soil	*4×10^{-5}*[3]	SB: BaPEq, As, Cr VI

[1] Arsenic (As), hexavalent chromium (Cr VI), benzo(a)pyrene equivalents (BaPEq)

[2] ILCRs do not exceed 1×10^{-5}. Therefore, no COC were identified for this medium

[3] The medium-specific ILCR exceeds 1×10^{-5} (ILCRs are italicized)

[4] The medium-specific ILCR exceeds 1×10^{-4} (ILCRs are bolded)

Cumulative cancer-risk estimates (based on the Block H EPCs) for the lifelong recreational user, the lifelong resident, and the child/adolescent commercial receptor exposed to EPCs for COPC in surface soil exceed the USEPA's target cancer-risk range. Cumulative cancer risk estimates for these receptors exposed to COPC in subsurface soil and for the industrial/commercial worker exposed to COPC in surface soil exceed MDE's cumulative risk benchmark of 1×10^{-5}. Cancer risk estimates for the construction worker exposed to COPC in surface and subsurface soil and for the industrial/commercial worker exposed to COPC in subsurface soil do not exceed either USEPA or MDE cumulative cancer risk benchmarks. BaPEq are the primary risk drivers and, to a lesser extent, arsenic and hexavalent chromium. However, as noted earlier, hexavalent chromium is not the dominant chromium species in the limited number of soil samples specifically analyzed for hexavalent chromium. Consequently, the ILCRs for chromium for soils may be overestimated.

Cancer risk estimates were also calculated for surface soils, subsurface soils (2–10 feet bgs), and saturated-zone soils (greater than 10 feet bgs) on a location-specific basis (Appendix E) for hypothetical future residents and industrial workers. Cancer risk estimates developed for the hypothetical future resident for surface soils from boring locations SB-282A, -282D, and -604D,

and for subsurface soils (2–10 feet bgs) from soil-boring locations SB-282, -282B, -604B, -614, and -285 exceed 1×10^{-4}. Cancer risk estimates developed for the industrial worker for surface soils from boring location SB-604D exceed 1×10^{-4}; none of the cancer risk estimates developed for the industrial worker for subsurface soil locations exceed 1×10^{-4}. Cancer risk estimates developed for the hypothetical future resident for deeper saturated-zone soils from soil boring location SB-282 also exceed 1×10^{-4}. As summarized in Appendix E, cancer risk estimates developed for these receptors at several Block H locations exceed 1×10^{-5}. The locations exceeding 1×10^{-5} are scattered across Block H.

4.5.3 Lead Risks/GRO/DRO

Lead was identified as a "global" COPC in surface soil and subsurface soil. However, the maximum and arithmetic-mean lead concentrations detected in Block H soils are less than the COPC screening level. Therefore, lead concentrations in Block H soils will not be further evaluated in this HHRA.

Environmental medium	Maximum detected lead concentration	Arithmetic-mean lead concentration	COPC screening level [(1)]
Surface soil	18 mg/kg	6.8 mg/kg	400 mg/kg
Subsurface soil	17 mg/kg	7.2 mg/kg	400 mg/kg

[(1)]COPC screening levels are defined and referenced in Section 3

The maximum detected concentration of DRO in surface soil (242 mg/kg at SB-201) marginally exceeds the MDE residential soil-screening level (230 mg/kg). However, no other GRO or DRO concentration reported for Block H soils exceeds the MDE residential standard. None of the reported DRO/GRO concentrations exceed the MDE industrial soil-screening level (620 mg/kg). These indicators of fuel-related contamination are not significant contaminants in Block H soils.

4.6 REFINED EVALUATION OF CHEMICAL MIGRATION FROM SOILS TO GROUNDWATER

This section presents the results of the refined evaluation of the potential for chemical migration from soils to groundwater. The methodology used for the evaluation is provided in Section 3.4.3. Block-specific comparisons of soil data to MDE groundwater-protection criteria and adjusted USEPA soil-screening levels (SSLs) for groundwater protection are included in the "Occurrence and Distribution of Chemicals" tables for surface soil and subsurface soil (Tables 4-1, 4-2, 4-5,

4-6, 4-9, 4-10, 4-13, 4-14, 4-17, and 4-18). The MDE groundwater-protection criteria are based on a DAF of 20, and the USEPA criteria in these tables have been adjusted (i.e., multiplied by 20) to be based on a DAF of 20. A global COPC for the soil to groundwater migration pathway was deemed a block-specific COPC for the migration to groundwater pathway if the chemical was detected in a block-specific data set. Using this methodology, block-specific migration-to-groundwater COPC are presented in Tables 4-21 and 4-22 for surface soil and subsurface soil, respectively.

Groundwater data were not evaluated in the quantitative risk assessment. However, depth to groundwater at the Middle River Complex (MRC) is relatively shallow (i.e., groundwater is typically within 10 feet of the surface), and, as mentioned previously, site contamination presumably occurred more than 40 years ago. Therefore, evaluating groundwater data is very important in assessing possible contaminant migration to groundwater. Groundwater data collected at the MRC during the May–June 2010 sampling event were used to evaluate the migration to groundwater pathway. These groundwater data were selected because they were collected recently and can therefore be reasonably assumed to represent current conditions.

The May–June 2010 groundwater data set was evaluated as a whole to determine if any migration to groundwater COPC have negatively affected site groundwater. Table 4-23 presents positive detections of chemicals detected in the May–June 2010 sampling event. Only the samples collected from the blocks evaluated in this HHRA (i.e., Blocks D, E, F, G, and H) are included in Table 4-23. Block identifiers are also included in that table's headers.

Descriptive statistics for the groundwater data set (e.g., maximum and mean concentrations, frequency of detection), relevant screening criteria (MDE groundwater cleanup standards, USEPA tap water RSLs, and SDWA MCLs), as well as results for the frequency of detected chemicals in groundwater that exceed (1) MDE groundwater cleanup standards, (2) USEPA tap water RSLs, and (3) 10× the tap water RSLs were calculated for Blocks E and G. These results are presented in Tables 4-24 and 4-25, respectively. Descriptive statistics were not calculated for groundwater collected from Blocks D, F, and H because only three samples, two samples, and three samples, respectively, are associated with these data sets.

Note that none of the PAHs or other semivolatile organic compounds (SVOCs) selected as migration to groundwater COPC appear in Table 4-23. PAHs and other SVOCs have not been frequent analytes in the groundwater sampling at the MRC in recent years because past sampling determined that PAHs are not significant COC in groundwater at these tax blocks. Therefore, PAHs and other SVOCs are not retained as COC for the migration from soil to groundwater pathway for these tax blocks and are not discussed further in this section. Pesticides and polychlorinated biphenyls (PCBs) were not analytes in the groundwater data set. Therefore, COC for pesticides and PCBs are selected using only the available soil data.

No filtered metals results are included in the groundwater data set used for evaluation. Therefore, the analysis is based on total metals results. However, concentrations of total metals in groundwater may be artificially elevated if sample turbidity was high during groundwater collection. Therefore, filtered groundwater results from prior sampling events (July–August 2008 and July–August 2009) (Appendix D) were considered to assess if metals results for groundwater were likely attributable to sample turbidity. However, in most cases, metals with total groundwater concentrations exceeding criteria in the 2010 data set had similar exceedances in the 2008 and 2009 groundwater data sets. Thus, incorporating filtered groundwater results into the evaluation would not greatly affect overall conclusions.

Numerous metals were retained as block-specific migration-to-groundwater COPC in both surface soil and subsurface soil. However, as Table 4-23 shows, only the metals migration-to-groundwater COPC arsenic, cobalt, iron, manganese, and nickel had detected concentrations in groundwater exceeding the USEPA tap water RSL. Therefore, these constituents are considered groundwater COPC for this evaluation, and other metals will not be further discussed. No results are available for the miscellaneous parameter hexavalent chromium in groundwater. Therefore, hexavalent chromium is discussed below where applicable.

Block D surface soil—Volatiles, pesticides/PCBs, metals, and hexavalent chromium were selected as "global" migration-to-groundwater COPC and were detected in Block D surface soil. Of the volatiles selected as "global" migration-to-groundwater COPC, 1,2,4-trimethylbenzene, benzene, ethylbenzene, and methylene chloride were not detected in soil at concentrations exceeding MDE groundwater-protection criterion or the USEPA SSL at a DAF of 20. They are therefore eliminated as COC.

Naphthalene is the only volatile organic compound (VOC) detected at a concentration exceeding these criteria (in one of 29 samples). The maximum concentration of naphthalene is greater than twice the SSL. However, note that the maximum concentration of naphthalene is less than twice the MDE criterion. Of the pesticides/PCBs, only beta-BHC had detections exceeding MDE and USEPA criteria; therefore, Aroclor-1260 and total Aroclor are eliminated from COC selection. Beta-BHC exceeded criteria in only two of 17 samples. Of the metals, arsenic exceeded criteria in 27 of 29 samples, cobalt exceeded the SSL in three of 15 samples, iron exceeded the SSL in five of 15 samples, and manganese and nickel did not exceed applicable criteria in any samples. Therefore, manganese and nickel are eliminated for COC selection.

Hexavalent chromium exceeded the USEPA SSL at a DAF of 20 in nine of 15 samples. However, hexavalent chromium concentrations did not exceed the MDE groundwater-protection criterion. Actually reported hexavalent chromium data (i.e., not predicted based on a 5% assumed ratio between hexavalent and total chromium) were used in this evaluation.

The Block D groundwater data set had only three samples. Therefore, frequency of detections exceeding criteria could not be considered in selecting COC. Naphthalene was not detected in groundwater in any Block D groundwater samples and is thus eliminated as a COC. Beta-BHC was not a target analyte for the recent groundwater samples. Arsenic, cobalt, and iron exceeded applicable groundwater criteria, including MCLs (when available) in at least one sample. Hexavalent chromium results were not available for Block D groundwater.

Summary/Conclusions for Block D surface soil— The analysis presented above suggests that beta-BHC, arsenic, cobalt, iron, and hexavalent chromium should be retained as migration to groundwater COC. However, it should be noted that beta-BHC is most likely present in the soils as a consequence of the wide-spread application of pesticides/herbicides (not as a consequence of releases in the study area) and most of the metals concentrations detected may reflect background conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Additionally, the maximum detection of beta-BHC (9.1 µg/kg) is less than the MCL-based SSL (DAFof 20) published for a related chemical, gamma-BHC (24 µg/kg). Consequently, these parameters are not recommended for further evaluation in the RAP.

Block D subsurface soil—The list of chemicals selected as "global" migration-to-groundwater COPC and detected in Block D subsurface soil is similar to that for the Block D surface soil. Of the volatiles, 1,2,4-trimethylbenzene, acetone, benzene, m+p-xylenes, and total xylenes detections in soil do not exceed MDE criteria or USEPA criteria based on a DAF of 20, and they are eliminated from COC selection. Concentrations of ethylbenzene do not exceed the MDE criterion but do exceed the SSL based on a DAF 20 in one of 84 samples. Ethylbenzene is eliminated from COC selection because the exceedances occur in less than 5% of samples and because the maximum concentration is less than twice the SSL at a DAF of 20.

Methylene chloride exceeds both the MDE criterion and adjusted SSL in two of 84 samples, and the maximum concentration of this chemical exceeds the criteria by more than 2×. Naphthalene concentrations also exceed relevant MDE and USEPA criteria in two of 84 and three of 84 samples, respectively. No concentrations of the pesticides/PCBs selected as "global" migration to groundwater COPC exceed groundwater-protection criteria in Block D subsurface soil. These chemicals are therefore eliminated as COC for Block D subsurface soil.

For the metals, arsenic, cobalt, and iron have concentrations exceeding applicable groundwater-protection criteria at frequencies greater than 5%. No concentrations of manganese or nickel exceed the available groundwater-protection criteria. These chemicals are therefore eliminated as COC. Hexavalent chromium was detected in 30 of 64 Block D subsurface soil samples. Concentrations of hexavalent chromium exceeded the USEPA SSL based on a DAF of 20 in 30 of 64 samples but do not exceed the MDE groundwater-protection criterion in any samples.

In Block D groundwater samples, ethylbenzene, methylene chloride, and naphthalene were not detected and are thus eliminated as COC. As mentioned previously, arsenic, cobalt, and iron were detected at concentrations exceeding criteria (including the MCL when available) in at least one of the three groundwater samples. Block D groundwater samples were not analyzed for hexavalent chromium.

Summary/Conclusions for Block D subsurface soil— The analysis above suggests the retention of arsenic, cobalt, iron, and hexavalent chromium as migration to groundwater COC. However, most of the metals concentrations detected likely reflect background conditions. (The reader is

referred to Section 5.1 for a further discussion of background soil concentrations.) Consequently, these parameters are not recommended for further evaluation in the RAP.

Block E surface soil—VOCs, PCBs, and metals were selected as "global" migration-to-groundwater COPC and all were detected in Block E surface soil. Of the VOCs, 1,2-dichlorobenzene in surface soil did not exceed relevant criteria in any samples and is thus eliminated from COC selection. No concentrations of tetrachloroethene (PCE) exceed the MDE criterion, and PCE detections in surface soil exceed the adjusted SSL in only one of 42 samples. No PCE hot spot is present (i.e., concentrations do not exceed twice the adjusted SSL), so PCE was eliminated from COC selection.

The rest of the VOC COPC have relatively low frequencies of detection exceeding criteria (i.e., no more than approximately 17% exceedances): 1,2,3-trichlorobenzene, 1,3-dichlorobenzene, methylene chloride, and naphthalene have frequencies of detections exceeding criteria that are less than 5%. However, all of these VOCs may have possible hot spot concentrations (i.e., concentrations greater than twice the criteria). Three PCBs and total Aroclor were selected as "global" migration-to-groundwater COPC. Aroclor-1254 exceeds both the MDE and USEPA criteria in two of 220 samples but has a maximum concentration greater than twice the criteria. Aroclor-1260/total Aroclor exceed the relevant criteria in 73 of 220 samples. Manganese and nickel were not detected in surface soil at concentrations exceeding criteria and are thus eliminated from COC selection. Arsenic, cobalt, and iron exceed criteria in more than 5% of surface soil samples.

Methylene chloride and naphthalene were not detected in Block E groundwater samples and are thus eliminated from COC selection. Neither was PCE (previously eliminated from COC selection) detected in groundwater. Concentrations of 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene exceeded the MDE groundwater protection value or USEPA tap water value and MCL (when available). Less than 20 samples were available for Block E groundwater, so these chemicals are not eliminated from COC selection based on the frequency of their detection in excess of relevant criteria.

Concentrations of arsenic, cobalt, and iron in Block E groundwater exceed the USEPA tap water criteria. However, concentrations of arsenic do not exceed the MDE groundwater standard.

Concentrations of arsenic do not exceed the MCL; therefore, arsenic is eliminated as a COC. The frequency of detections of these chemicals in excess of relevant criteria was not considered in determine COC because less than 20 samples of Block E groundwater were available.

Summary/Conclusions for Block E surface soil—The preceding analysis suggests the retention of the following chemicals as COC: 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, Aroclor-1242, Aroclor-1260, total Aroclor, cobalt, and iron. However, PCBs (i.e., the Aroclors) have already been identified as COC in the Block E surface soils because of direct contact risk. These PCB parameters do not readily migrate from soils to groundwater, and direct-contact-risk remedial goals established for these chemicals are typically more conservative (i.e., lower than) site-specific migration-to-groundwater remedial goals that may be calculated for these parameters. Note that most of the metals concentrations detected may reflect background conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Consequently, PCBs and metals are not recommended for further evaluation in the RAP. In contrast, the referenced chlorobenzene compounds (mostly associated with "hot spot" location SB-833) are recommended for further evaluation in the RAP.

Block E subsurface soil— The migration-to-groundwater "global" COPC list for Block E subsurface soil is similar to that of Block E surface soil, although a few more volatiles are COPC for subsurface soil. Of the VOCs in subsurface soil, 1,2,4-trimethylbenzene, acetone, carbon tetrachloride, m+p-xylenes, and total xylenes do not have concentrations exceeding applicable criteria and are thus eliminated from COC selection. 1,2-Dichlorobenzene, 1,2-dichloroethane, 1,3-dichlorobenzene, benzene, chlorobenzene, methylene chloride, naphthalene, PCE, trichloroethene (TCE) and vinyl chloride have less than 5% frequencies of detection exceeding the relevant criteria and are thus eliminated from COC selection. For the PCBs, Aroclor-1254 exceeds criteria in only one of 255 samples; however, the maximum concentration is greater than twice the criteria. Aroclor-1260/total Aroclor exceed criteria in more than 5% of samples and have maximum concentrations exceeding the relevant criteria. For the metals, cobalt, manganese, and nickel are eliminated from COC selection because no concentrations of these chemicals in soil exceed the applicable criteria. Concentrations of arsenic and iron exceed the criteria in more than 5% of samples.

As mentioned previously, concentrations of 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, and 1,4-dichlorobenzene in groundwater exceed applicable screening criteria, including MCLs (when available). Arsenic concentrations exceed the USEPA tap water criterion but do not exceed the MDE criterion or the MCL; arsenic is thus eliminated from COC selection. Iron concentrations do exceed the MDE cleanup standard and the USEPA tap water criterion. Fewer than 20 samples were available, so the frequency of detections exceeding criteria was not considered in selecting COC.

Summary/Conclusions for Block E subsurface soil—The preceding analysis suggests the retention of the following chemicals as migration-to-groundwater COC: 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, Aroclor-1254, Aroclor-1260, total Aroclor, and iron. The narrative provided above regarding the chlorobenzene and PCB detections in the Block E surface soils also applies to the Block E subsurface soils. Therefore, PCBs are not recommended for further evaluation in the RAP (on the basis of groundwater protection); the chlorobenzene compounds are recommended for evaluation in the RAP. Note that most of the iron concentrations detected may reflect background conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Consequently, iron is not recommended for further evaluation in the RAP.

Block F surface soil—One VOC, PCBs, metals, and hexavalent chromium are "global" COPC detected in Block F surface soil. The VOC methylene chloride was not detected at concentrations in surface soil exceeding the MDE groundwater-protection criterion or the USEPA SSL, based on a DAF of 20. Therefore, methylene chloride is eliminated from COC selection. Aroclor-1254 was not detected at concentrations exceeding criteria in surface soil and is also eliminated from COC selection. Aroclor-1260 and total Aroclor were detected in less than 5% of samples; however, their maximum concentrations exceed twice the screening criteria.

Of the metals, nickel was not detected at concentrations in surface soil exceeding criteria and thus is not a COC. One of 20 (approximately 5%) cobalt concentrations exceeded the adjusted USEPA SSL, so cobalt is not a COC. Arsenic concentrations exceeded criteria in more than 5% of surface soil samples. Hexavalent chromium concentrations exceeded the adjusted USEPA SSL in more than 5% of samples but did not exceed MDE groundwater-protection criterion.

Only two groundwater samples were available for Block F groundwater. Arsenic concentrations exceeded the USEPA tap water RSL but did not exceed the MDE groundwater-protection cleanup standard or the MCL. It should also be noted that most of the arsenic concentrations detected in the Block F surface soils appear to reflect background conditions. Thus, arsenic is not retained as a COC. Block F groundwater samples were not analyzed for hexavalent chromium, so hexavalent chromium could not be eliminated from migration-to-groundwater COC selection based on groundwater data.

Summary Conclusions for Block F surface soil— The analysis above suggests the retention of the following chemicals as migration-to-groundwater COC for Block F surface soil: Aroclor-1260, total Aroclor, and hexavalent chromium. However, PCBs (i.e., the Aroclors) were not selected as groundwater protection COC for the Block F subsurface soils suggesting limited migration from surface to subsurface soils. Additionally, the vast majority of total chromium and hexavalent chromium results suggest that chromium concentrations in the Block F soils are reflective of background conditions. Also, maximum total and hexavalent chromium concentrations do not exceed the MDE clean-up standard for groundwater protection. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Therefore, PCBs and hexavalent chromium are not recommended for further evaluation in the RAP.

Block F subsurface soil—The "global" COPC list for Block F subsurface soil is similar to Block F surface soil, with the addition of a few VOCs. In subsurface soil, the VOCs acetone, m+p-xylenes, and total xylenes do not have concentrations exceeding the MDE cleanup standard for groundwater protection or exceeding the adjusted USEPA SSL based on a DAF of 20. These chemicals are therefore not retained as COC for migration to groundwater.

Concentrations of 1,2,4-trimethylbenzene exceed the criteria in only one of 36 samples (approximately 3%); this chemical is thus not a COC. Concentrations of ethylbenzene, methylene chloride, and naphthalene in subsurface soil exceed criteria in only one of 36 samples; however, the maximum concentrations of these chemicals are greater than twice the applicable criteria.

For PCBs, concentrations of Aroclor-1260 and total Aroclor do not exceed the MDE or adjusted USEPA criteria. PCBs are therefore eliminated as COC. For the metals, concentrations of nickel did not exceed the applicable screening criteria, so nickel is likewise not a COC. Concentrations of arsenic and cobalt exceed criteria in more than 5% of samples.

Ethylbenzene, methylene chloride, and naphthalene were not detected in groundwater, so these chemicals are eliminated as migration-to-groundwater COC. As previously stated, arsenic concentrations in groundwater exceed the tap water RSL but do not exceed the MDE cleanup standard or the MCL. Therefore, arsenic is not a COC. Cobalt concentrations in groundwater exceed the tap water RSL in one of two samples. No MCL is available for cobalt.

Summary/Conclusions for Block F subsurface soil— The preceding analysis suggests the retention of cobalt as a migration-to-groundwater COC for Block F subsurface soil. However, note that most of the cobalt concentrations detected may reflect background conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Therefore, cobalt is not recommended for further evaluation in the RAP.

Block G surface soil—Volatiles, PCBs, and metals were selected as "global" migration-to-groundwater COPC and were detected in Block G surface soil. In surface soil, the VOCs 1,1-dichloroethane, 1,2,4-trimethylbenzene, methylene chloride, and naphthalene do not exceed the MDE cleanup standard for groundwater protection or the adjusted USEPA SSL based on a DAF of 20. These chemicals are therefore not retained as COC. Concentrations of TCE exceed the MDE groundwater protection cleanup standard in three of 14 samples but do not exceed the adjusted SSL. For the PCBs, Aroclor-1254 does not exceed criteria and is thus not retained as a COC. Concentrations of Aroclor-1260 and total Aroclor exceed criteria in two of 22 samples. For the metals, concentrations of nickel do not exceed criteria; nickel is thus not a COC. Concentrations of arsenic and cobalt exceed criteria in more than 5% of samples.

Nineteen samples were available for Block G groundwater. Concentrations of TCE in groundwater exceed groundwater-screening criteria in more than 5% of samples, in addition to exceeding the MCL. Concentrations of arsenic in groundwater exceed the USEPA tap water criterion in more than 5% of samples and also exceed the MDE groundwater cleanup standard

and the MCL. Concentrations of cobalt exceed the USEPA tap water RSL in more than 5% of samples. No MCL is available for cobalt.

Summary/Conclusions for Block G surface soil—The preceding analysis suggests the selection of TCE, Aroclor-1260, total Aroclor, arsenic, and cobalt as migration-to-groundwater COC for Block G surface soil. However, the maximum TCE detection does not exceed the MCL-based SSL calculated using a DAF of 20. PCBs (i.e., the Aroclors) were not selected as groundwater protection COC for the Block G subsurface soils suggesting limited migration from surface to subsurface soils. Most of the metals concentrations detected may reflect background conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Therefore, these parameters are not recommended for further evaluation in the RAP.

Block G subsurface soil—Global migration-to-groundwater COPC for Block G subsurface soil include VOCs, PCBs, and metals. For the VOCs in subsurface soil, 1,2,4-trimethylbenzene, acetone, methylene chloride, and total xylenes do not have concentrations exceeding the MDE groundwater-protection standard or the adjusted SSL based on a DAF of 20. These chemicals are therefore eliminated from COC selection. Additionally, concentrations of benzene exceed criteria in less than 5% of samples; therefore, benzene is not a COC. Concentrations of ethylbenzene exceed criteria in less than 5% of samples; however, the maximum concentration of ethylbenzene is more than twice the adjusted SSL.

Concentrations of naphthalene and TCE exceed criteria in more than 5% of samples. Concentrations of PCBs do not exceed criteria; PCBs are therefore not retained as COC. Concentrations of the metals manganese and nickel do not exceed criteria and are thus not retained as COC. In contrast, concentrations of arsenic, cobalt, and iron exceed criteria in more than 5% of samples.

Ethylbenzene and naphthalene were not detected in groundwater, so these chemicals are eliminated from COC selection. Groundwater concentrations of TCE exceed the screening criteria in more than 5% of samples and also exceed the MCL. As mentioned previously, concentrations of arsenic in groundwater exceed the USEPA tap water criterion in more than 5% of samples and exceed the MDE groundwater cleanup standard and the MCL. Concentrations of

cobalt exceed the USEPA tap water RSL in more than 5% of samples. No MCL is available for cobalt. Concentrations of iron also exceed criteria in more than 5% of samples.

Summary/Conclusions for Block G subsurface soil—The preceding analysis suggests the retention of the following constituents as migration-to-groundwater COC for Block G subsurface soil: TCE, arsenic, cobalt, and iron. However, the maximum TCE detection does not exceed the MCL-based SSL calculated using a DAF of 20. Also, note that most of the metals concentrations detected may reflect background conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Therefore, these parameters are not recommended for further evaluation in the RAP.

Block H surface soil—VOCs and metals were selected as "global" migration-to-groundwater COPC and were detected in Block H surface soil. Of the VOCs, ethylbenzene, and methylene chloride were not detected at concentrations exceeding the MDE groundwater protection standard or the adjusted USEPA SSL at a DAF of 20. These constituents are therefore not COC. Concentrations of naphthalene exceed the adjusted SSL in two of 11 samples. For the metals, no concentrations of nickel exceeded applicable criteria, so nickel is not retained as a COC. At least one concentration each of arsenic and cobalt exceed criteria. The frequency of detections exceeding criteria was not considered in determining COC because less than 20 samples of arsenic and cobalt were available.

Three groundwater samples were available for Block H. Naphthalene was not detected in Block H groundwater and is therefore eliminated as a migration-to-groundwater COC. TCE was detected in groundwater at a concentration exceeding criteria, including the MCL. Arsenic was detected in groundwater at detections exceeding the USEPA tap water criterion; however, arsenic concentrations did not exceed the MDE groundwater-protection criterion and did not exceed the MCL. Therefore, arsenic is not retained as a COC. Concentrations of cobalt did exceed the USEPA tap water criterion. No MDE groundwater-protection criterion or MCL is available for cobalt.

Summary/Conclusions for Block H surface soil—The preceding analysis suggests the retention of TCE and cobalt as migration-to-groundwater COC for Block G subsurface soil. However, the maximum TCE detection does not exceed the MCL-based SSL calculated using a DAF of 20. Also,, note that most (if not all) of the cobalt concentrations detected may reflect background

conditions. (The reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Therefore, these parameters are not recommended for further evaluation in the RAP.

Block H subsurface soil—VOCs, metals, and hexavalent chromium were selected as "global" migration-to-groundwater COPC and were detected in the Block H subsurface soil. Of the VOC COPC, only naphthalene and TCE were detected at concentrations exceeding the screening criteria. Therefore, the remaining VOCs, 1,2,4-trimethylbenzene, acetone, ethylbenzene, m+p-xylenes, and methylene chloride are eliminated from COC selection. Of the metals, nickel was not detected at concentrations exceeding criteria and is thus eliminated from COC selection. Concentrations of arsenic and cobalt exceed criteria in more than 5% of samples. One of five concentrations of hexavalent chromium exceed the adjusted USEPA SSL, but no concentrations of hexavalent chromium exceed the MDE groundwater protection value.

The frequency of detections exceeding criteria in Block H groundwater was not considered in selecting COC because only three samples were available. Naphthalene was not detected in the Block H groundwater samples; naphthalene is thus not a COC. TCE was detected in groundwater at a concentration exceeding criteria, including the MCL. Arsenic concentrations exceeded the USEPA tap water value but did not exceed the MDE cleanup standard for groundwater protection, or the MCL. Arsenic is therefore eliminated as a migration-to-groundwater COC. Concentrations of cobalt exceeded the adjusted USEPA SSL. No MDE groundwater cleanup standard or MCL is available for cobalt. Hexavalent chromium was not an analyte in the Block H groundwater samples.

Summary/Conclusions for Block H subsurface soil—The preceding analysis suggests the retention of TCE, cobalt, and hexavalent chromium as migration-to-groundwater COC for Block H subsurface soil. However, the maximum TCE detection does not exceed the MCL-based SSL calculated using a DAF of 20. Note, also, that most of the cobalt concentrations detected may reflect background conditions. Additionally, the vast majority of total chromium and hexavalent chromium results suggest that chromium concentrations in the Block H soils are reflective of background conditions. Also, maximum total and hexavalent chromium concentrations do not exceed the MDE clean-up standard for groundwater protection. (The

reader is referred to Section 5.1 for a further discussion of background soil concentrations.) Therefore, these parameters are not recommended for further evaluation in the RAP.

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - The value is for xylenes.
7 - The value is for xylene, mixture.
8 - The value for acenaphthene is used as a surrogate for acenaphthylene.
9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
10 - The value is for PCB (total).
11 - The value is for polychlorinated biphenyls (high risk).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - The value is for mercury (inorganic/mercuric dichloride).
15 - The value is for mercuric chloride.
16 - The value is for vanadium and compounds.
17 - See Section 3 for BaP equivalent calculation methodology.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NC = No criteria

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - The value is for xylenes.
7 - The value is for xylene, mixture.
8 - The value for acenaphthene is used as a surrogate for acenaphthylene.
9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
10 - The value is for PCB (total).
11 - The value is for polychlorinated biphenyls (high risk).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - The value is for mercury (inorganic/mercuric dichloride).
15 - The value is for mercuric chloride.
16 - The value is for vanadium and compounds.
17 - See Section 3 for BaP equivalent calculation methodology.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NC = No criteria

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
6 - The value is for xylenes.
7 - The value is for xylene, mixture.
8 - The value for acenaphthene is used as a surrogate for acenaphthylene.
9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
11 - The value is for trivalent chromium.
12 - The value is for mercury (inorganic/mercuric dichloride).
13 - The value is for mercuric chloride.
14 - The value is for vanadium and compounds.
15 - See Section 3 for BaP equivalent calculation methodology.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NC = No criteria

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
7 - The value is for xylenes.
8 - The value for acenaphthene is used as a surrogate for acenaphthylene.
9 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
10 - The value is for PCB (total).
11 - The value is for polychlorinated biphenyls (high risk).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - The value is for mercury (inorganic/mercuric dichloride).
15 - The value is for mercuric chloride.
16 - The value is for vanadium and compounds.
17 - See Section 3 for BaP equivalent calculation methodology.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NC = No criteria

TOTAL ORGANIC CARBON	1/1	690 J	690 J	MRC-MW43[0910]	--	--	690	690	NC	NC	NC	NC	NC	NC	NC	NC

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
7 - The value is for xylenes.
8 - The value is for xylene, mixture.
9 - The value for acenaphthene is used as a surrogate for acenaphthylene.
10 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
11 - The value is for PCB (total).
12 - The value is for polychlorinated biphenyls (high risk).
13 - The value is for trivalent chromium.
14 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
15 - The value is for mercury (inorganic/mercuric dichloride).
16 - The value is for mercuric chloride.
17 - The value is for vanadium and compounds.
18 - See Section 3 for BaP equivalent calculation methodology.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NC = No criteria

Notes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - The value for acenaphthene is used as a surrogate for acenaphthylene.
7 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
8 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
9 - The value is for PCB (total).
10 - The value is for polychlorinated biphenyls (high risk).
11 - The value is for trivalent chromium.
12 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
3 - The value is for mercury (inorganic/mercuric dichloride).
14 - The value is for mercuric chloride.
15 - The value is for vanadium and compounds.
16 - See Section 3 for BaP equivalent calculation methodology.

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - The value for acenaphthene is used as a surrogate for acenaphthylene.
7 - The value is for benzo(b)fluoranthene.
8 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
9 - One tenth the noncarcinogenic level is less than the carcinogenic level; therefore, the noncarcinogenic level is presented.
10 - The value is for PCB (total).
11 - The value is for polychlorinated biphenyls (high risk).
12 - The value is for trivalent chromium.
13 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
14 - The value is for mercury (inorganic/mercuric dichloride).
15 - The value is for mercuric chloride.
16 - The value is for vanadium and compounds.
17 - See Section 3 for BaP equivalent calculation methodology.

Definitions:
BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
K = Biased high
L = Biased low
N = Noncarcinogen
NC = No criteria

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - The value is for xylenes.
7 - The value for acenaphthene is used as a surrogate for acenaphthylene.
8 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
9 - The value is for PCB (total).
10 - The value is for polychlorinated biphenyls (high risk).
11 - The value is for trivalent chromium.
12 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
13 - The value is for mercury (inorganic/mercuric dichloride).
14 - The value is for mercuric chloride.
15 - The value is for vanadium and compounds.
16 - See Section 3 for BaP equivalent calculation methodology.

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0.
The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.
6 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.
7 - The value is for trivalent chromium.
8 - Calculated from the EPA website (http://epa-prgs.ornl.gov/cgi-bin/chemicals/csl_search).
9 - The value is for mercury (inorganic/mercuric dichloride).
10 - The value is for mercuric chloride.
11 - The value is for vanadium and compounds.
12 - See Section 3 for BaP equivalent calculation methodology.

Notes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.

2 - Average of positive analytical results only.

3 - Average of all analytical results are calculated using half of the detection limit for nondetects.

4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.

5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010. RSL cancer (C) benchmark value = 1E-06, non-cancer (N) Hazard index (HI) = 1.0. The SSL at a DAF of 20 is 20x the SSL at a DAF of 1.

6 - The value for acenaphthene is used as a surrogate for acenaphthylene.

7 - The value for pyrene is used as a surrogate for benzo(g,h,i)perylene and phenanthrene.

Definitions:

BaP = Benzo(a)pyrene
C = Carcinogen
J = Estimated value
N = Noncarcinogen
NC = No criteria

Table 4-23

Detected Concentrations Table for Groundwater
Lockheed Martin, Middle River Complex
Middle River, Maryland

Notes:
1 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
2 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November 2010.
3 - 2009 Edition of the Drinking Water Standards and Health Advisories (USEPA, October 2009).
4 - Concentrations exceeding the MDE Cleanup Standard are shaded gray with black font. Concentrations exceeding the RSL for tap water are shaded black with white font. Concentrations exceeding both the MDE Cleanup Standard and the RSL are shaded red with white font.

Definitions: NC = no criterion available; MCL = Maximum Contaminant Level; SDWA = Safe Drinking Water Act
Qualifiers: B = present in blank; J = estimated; K = biased high; L = biased low; U = non-detected; R = rejected

A shaded chemical name indicates that at least one sample concentration exceeds at least one criterion.

Table 4-24

Notes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum detected concentrations and as one sample when determining the frequency of detection and exceedances.
2 - Average of positive analytical results only.
3 - Average of all analytical results are calculated using half of the detection limit for nondetects.
4 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
5 - USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2010.
6 - 2009 Edition of the Drinking Water Standards and Health Advisories (USEPA, October 2009).

Definitions:
J = Estimated value
L = Biased low
MCL = Maximum Contaminant Level
NC = No criteria

J = Estimated value
K = Biased high
MCL = Maximum Contaminant Level
NC = No criteria

Section 5
Uncertainty Analysis

The uncertainty analysis component of this human health risk assessment (HHRA) summarizes uncertainties inherent in the risk assessment and includes a discussion of how they may affect the quantitative risk estimates and risk analysis conclusions. The baseline HHRA for the study area was done in accordance with current U.S Environmental Protection Agency (USEPA) guidance. However, varying degrees of uncertainty are associated with any baseline HHRA. A brief discussion of uncertainty issues that must generally be considered in an HHRA is provided in the following narrative.

Uncertainty in selecting chemicals of potential concern (COPC) is related to the status of the available databases, the grouping of samples, the numbers, types, and distributions of samples, data quality, and the procedures used to include or exclude constituents as COPC. Uncertainty associated with the exposure assessment can stem from the values used as input variables for a given intake route or scenario, the assumptions made to determine exposure-point concentrations (EPCs), and the predictions made regarding future land uses and population characteristics. Uncertainty in the toxicity assessment stems from the quality of the existing toxicity data needed to support dose-response relationships and the weight of evidence used to determine the carcinogenicity of COPC. Uncertainty in risk characterization is associated with receptor exposure to multiple chemicals and the cumulative uncertainty arising from combining conservative assumptions made in earlier steps of the risk assessment.

Whereas various sources of random uncertainty and bias exist, the magnitude of bias and uncertainty and the direction of bias are influenced by the assumptions made throughout the risk assessment, including selection of COPC and of values for dose-response relationships. Throughout the risk assessment, assumptions that consider safety factors must be made to overestimate the final calculated risks. Risk assessments generally carry two types of uncertainty: *measurement* and *informational* uncertainty.

Measurement uncertainty refers to the usual variance that accompanies scientific measurements. For example, this type of uncertainty is associated with the analytical data collected for each site. The risk assessment reflects the accumulated variances of the individual values used.

Informational uncertainty stems from inadequate availability of information needed to complete the toxicity and exposure assessments. This gap is often significant, such as the absence of information on the effects of human exposure to low doses of a chemical, the biological mechanism of chemical action, or the behavior of a chemical in soil. After the risk assessment is complete, the results must be reviewed and evaluated to identify the type and magnitude of uncertainty involved. Relying on risk assessment results without considering the uncertainties, limitations, and assumptions inherent in the process can be misleading. For example, to account for uncertainties in developing exposure assumptions, conservative estimates must be made to ensure that the particular assumptions protect sensitive subpopulations or maximally exposed individuals.

If a number of conservative assumptions are combined in an exposure model, the resulting calculations can propagate the uncertainties associated with those assumptions, thereby producing much larger uncertainty in the results. This uncertainty is biased toward over predicting both carcinogenic and noncarcinogenic risks. Thus, both the results of the risk assessment and the uncertainties associated with them must be considered when making risk management decisions.

This interpretation of uncertainty is especially relevant when the risks exceed the point of departure for defining regulatorily "acceptable" risk. For example, when risks calculated using a high degree of uncertainty are less than an "acceptable" risk level (i.e., 10^{-6}), the interpretation of "no significant risk" is typically straightforward. However, when risks calculated with a high degree of uncertainty exceed a regulatorily acceptable risk level (i.e., 10^{-4}) reaching a conclusion can be difficult unless uncertainty is considered. The HHRA was prepared using the November 2010 regional screening-levels (RSLs). However, the RSLs are "evergreen" screening values and subject to change as new toxicity information becomes available and is evaluated by USEPA. Consequently, the COPC could change if the RSLs change.

5.1 UNCERTAINTY IN COPC SELECTION

The most significant issues related to uncertainty in COPC selection at the subject tax blocks are the usability of existing databases (only validated data were used in the risk assessment), the COPC screening levels used, the selection of COPC using USEPA generic soil screening-levels (SSLs) for transfers from soil to air, and the absence of screening levels for a few chemicals detected in site environmental media. A brief discussion of each of these issues is provided in the remainder of this section.

Usability and completeness of existing databases—As discussed in Section 3, data from samples collected in previous field investigations (2003–2009), as well as data collected during field investigations in 2010, were used to assess risks to potential human receptors from exposure to contaminated environmental media. These data were validated according to USEPA data-validation guidelines. Only fixed-base analytical results (i.e., results from a fixed-base laboratory, as opposed to field analytical results) from the field investigations for the lists of target analytes were used in the quantitative risk evaluation. Data regarded as rejected (i.e., qualified as "R" during data validation) were not used in the quantitative risk assessment. Elimination of data qualified as "R" may increase uncertainty in the risk assessment.

Naphthalene results were analyzed and reported in both the volatile organic compound (VOC) and polycyclic aromatic-hydrocarbon (PAH) fractions. The extraction and analytical methods used in either VOC or PAH methods may provide more accurate naphthalene results. However, both the VOC and PAH naphthalene results were included in selecting COPC. This is particularly important because not all samples were analyzed for naphthalene in both fractions. For subsurface soil, naphthalene was selected as a COPC in both the VOC and PAH fractions. For EPCs in the quantitative risk assessment, the maximum EPC of naphthalene from either the VOC or the PAH fractions was used for each tax block. In subsurface soil, the maximum EPC for naphthalene is from the VOC fraction for Blocks D, F, and G, and from the PAH fraction for Blocks E and H. Using the higher concentration ensures that risks due to naphthalene are not underestimated.

Several sampling locations were resampled for benzo(a)pyrene and related chemicals to obtain lower detection limits (see table below). To avoid including elevated detection limits in the risk

calculations, resampled results were used instead of the original results if the original results were all non-detects. However, to be conservative, no positive detections were removed from the data sets. Therefore, if positive results were included in the original sampling, those results were included in the risk calculations along with the resampling results. This may overestimate risks from BaPEq at locations where resampling occurred.

Soil samples collected from 0–10 feet below ground surface (bgs) were included in the quantitative risk evaluation. Some uncertainty is associated with some samples included in the subsurface soil data because groundwater is relatively shallow at these tax blocks (i.e., within 10 feet of ground surface). Therefore, some of the samples included in the subsurface data set for the quantitative risk assessment may be saturated. The following table presents average and maximum groundwater depths for each tax block:

Sampling date	Average depth to groundwater (feet)				
	Block D	Block E	Block F	Block G	Block H
6/5/2005	1.87	2.92	4.00	2.42	0*

Maximum depth:	7	9	13	9	11

The deepest average or maximum depth for each block is in **bold**

*Data from only one well were available

The average depths to groundwater are less than 10 feet for all wells, and the maximum depths to groundwater for Blocks D, E, and G are less than 10 feet. However, all subsurface soil samples from 2–10 feet bgs were included in the quantitative risk evaluation, to be conservative.

Data for soil samples collected at depths greater than 10 feet bgs (i.e., deep subsurface soil) were excluded from the quantitative risk assessment because these samples are likely saturated; however, COPC were selected for informational purposes. Table 3-21 shows the results of the COPC selection for deep subsurface soil. The list of COPC is similar to those for surface soil and subsurface soil. COPC are the BaPEq and its constituents, Aroclor-1260, arsenic, cobalt, iron, manganese, vanadium, and hexavalent chromium.

Maximum concentrations of all of these chemicals except for iron and vanadium are greater in the shallower depths than in the deep subsurface soil, and the concentration of vanadium in deep subsurface soil is not significantly greater than that found in shallower soil depths. Only the maximum concentration of iron in deep subsurface soil is significantly greater (i.e., more than an

order of magnitude greater) than concentrations detected in the shallower intervals. Thus, excluding deep subsurface soil from the quantitative risk evaluation should not add much uncertainty.

Numerous chemicals in surface and subsurface soil have detection limits that exceed screening criteria. This adds uncertainty to the risk assessment because these constituents may be present in site media at concentrations below the detection limit (i.e., below the concentration that may be seen by the analytical technique) and above screening criteria. However, the effort was made to achieve detection limits below screening levels for notable risk drivers (such as benzo(a)pyrene and related chemicals). Other chemicals not detected in the tax blocks are assumed not to contribute significantly to overall risks.

COPC screening levels—Using risk-based screening values based on conservative land use scenarios (i.e., residential land use for soil), corresponding to incremental lifetime-cancer risks (ILCRs) of 10^{-6} and hazard indices (HIs) of 0.1, the risk analyst must ensure that all significant contributors to risk at a site are evaluated. Eliminating chemicals present at concentrations that correspond to ILCRs less than 10^{-6} and HIs less than 0.1 should not affect the risk assessment's final conclusions, because those chemicals are not expected to pose potential health concerns at the concentrations detected.

Background soil database—Comprehensive site-specific databases on background soil are not available for the subject tax blocks. The lack of site-specific background levels for various chemicals may overestimate site-related risks for the tax blocks, since no chemical was eliminated as a COPC based on a background screen (i.e., a comparison of site concentrations to site-specific background concentrations). The lack of such data may affect the selection of remedial goals for inorganics typically detected at background concentrations above common risk benchmarks (e.g., arsenic). Arsenic was noted as a risk driver in soil for several receptors and in several data sets. Appendix C presents Maryland background data for arsenic.

Arsenic, cobalt, and hexavalent chromium were noted in Section 4 as risk drivers for direct-contact risk posed to several receptors and for several tax blocks. Concentrations of arsenic and cobalt and predicted concentrations of hexavalent chromium (i.e., concentrations calculated by assuming 5% of total chromium) in surface and subsurface soil produced risk estimates that

were less than the 1×10^{-5} cancer risk level for most tax block data sets. Exceptions are arsenic and cobalt for Block G surface soil and hexavalent chromium for Block F surface soil. Arsenic, cobalt, and chromium are metals occurring naturally in soil.

Anticipated typical concentrations (ATCs) are available from the State of Maryland for arsenic and total chromium (State of Maryland, 2008). ATCs for arsenic are 3.6 mg/kg, 4.9 mg/kg, and 11 mg/kg for Eastern, Central, and Western Maryland, respectively. EPCs (i.e., the 95% upper confidence-limits [UCLs]) calculated for arsenic do not exceed the central Maryland ATC in any data set except for Block G surface soil. No 95% UCLs for arsenic exceed the Western Maryland ATC. ATCs for total chromium are 28 mg/kg, 30 mg/kg, and 42 mg/kg for Eastern, Central, and Western Maryland, respectively. The 95% UCLs calculated for total chromium (i.e., the calculated hexavalent chromium 95% UCL divided by 0.05) are all less than the Western Maryland ATC except for the Block F surface soil data set. All other data sets are likewise less than the Central Maryland ATC, except for Block H subsurface soil, which slightly exceeds the Central Maryland ATC with a 95% total chromium UCL of 36 mg/kg. Given that arsenic and total chromium concentrations in the tax blocks are, in most cases, similar to background values and are not significant risk drivers, most metals concentrations probably represent background conditions.

The inorganics arsenic, cobalt, iron, and hexavalent chromium were retained as chemicals of concern (COC) for migration to groundwater, based on the analysis in Section 4.6. As noted earlier, not all of the subject tax bocks had frequent detections of hexavalent chromium. Hexavalent chromium was conservatively included as a migration-to-groundwater COC based on the limited data available. As discussed above, most detections of arsenic and cobalt likely reflect background concentrations. Most concentrations of iron observed in the tax block soils also likely reflect background. The EPCs used for iron (95% UCL or maximum concentration) are within the range of ATCs (15,000 mg/kg, 26,000 mg/kg, and 39,000 mg/kg for Eastern, Central, and Western Maryland, respectively) for all surface and subsurface soil data sets in which iron was analyzed.

Contaminants without established direct-contact screening levels—Risk-based screening levels are currently not available for some constituents detected at the tax blocks. Appropriate surrogates for some of these chemicals, based on similar chemical structures, were selected if available. In the COPC screening, acenaphthene was used as a surrogate for acenaphthylene and pyrene was

selected as a surrogate for benzo(g,h,i)perylene and phenanthrene. Applying the toxicity values of one compound to another increases uncertainty in the risk assessment, both with regard to COPC selection and the calculated risks. The direction of the uncertainty is unknown.

Appropriate screening levels or surrogates were not available for several organic chemicals detected in tax block soils. The list of chemicals lacking COPC-selection criteria includes 1,2,3-trimethylbenzene, n-butylbenzene, tert-butyl alcohol, di-n-octyl phthalate, dimethyl phthalate, 4-isopropyltoluene, and sec-butylbenzene. In most cases, these chemicals were detected at concentrations and detection frequencies significantly less than those reported for the primary site contaminants. For all chemicals except 1,2,3-trimethylbenzene and tert-butyl alcohol, the frequency of detection was less than 5% across the tax blocks. Given that risk-based screening levels are available for most of the primary contaminants (in terms of concentration and frequency of detection), the lack of risk-based screening levels for some contaminants should not affect risk management decisions for the tax block soils.

Many constituents have no USEPA SSLs for the soil to air migration pathway. This uncertainty is probably small, because for most chemicals potential risks associated with exposures via inhalation are typically orders of magnitude lower than those associated with exposures via incidental ingestion and dermal contact with soil. Comparing the screening criteria for direct-contact exposures with the screening criteria for migration from soil to air shows that, in most cases, the direct-contact screening criteria are at least an order of magnitude lower than the soil to air migration screening-criteria for the same compound. If regulatorily unacceptable risks result from inhalation exposures, then regulatorily unacceptable risks are usually also posed by exposures via the incidental-ingestion and dermal-contact exposure pathways.

Use of USEPA generic SSLs for transfers from soil to groundwater for COPC selection— Several chemicals were selected as COPC because their maximum concentrations exceed USEPA generic SSLs for soil to groundwater contaminant migration (dilution-attenuation factor [DAF] = 1.0). However, USEPA's *Soil Screening Guidance* (USEPA, 1996a) states that "the USEPA has selected a default DAF of 20 to account for contaminant dilution and attenuation during transport through the saturated zone to a compliance point (i.e., a receptor well). At most sites, this adjustment will more accurately reflect a contaminant's threat to groundwater resources than assuming a DAF of 1 (i.e., no dilution or attenuation)." The guidance further

states that “a DAF of 20 is protective for sources up to 0.5 acres in size” and “can be protective of larger sources as well." Consequently, the use of SSLs based on a DAF of 1 is very conservative. A more refined evaluation of the potential for chemical migration from soils is provided in Section 4.6 for surface and subsurface soils, respectively. COC were selected based on that analysis.

5.2 EXPOSURE ASSESSMENT UNCERTAINTY

Uncertainty in the exposure assessment arose because of the methods used to calculate EPCs, the determination of land use conditions, the selection of receptors and scenarios, and the selection of exposure parameters. Each of these is discussed below:

Land use—Current land use patterns for the subject tax blocks are well established, thereby limiting uncertainty associated with land use assumptions. Land use is currently limited to industrial/commercial, and the area will most likely remain commercial/industrial in the future. To be conservative, receptors were considered for all possible future land uses, and risks to potential and future construction workers, industrial workers, commercial receptors, recreational users, and on-site residents were evaluated.

Exposure-point concentrations—Uncertainty is associated with the use of the 95% UCL on the mean concentration as the EPC. As a result of using the 95% UCL, estimations of potential risk for the reasonable maximum exposure (RME) scenario are most likely overstated because it represents the upper limit that potential receptors would be exposed to over the entire exposure period. In some cases (because data sets contained less than five samples, because less than four positive detections occurred, or because the UCL was greater than the maximum concentration), the maximum concentration was used as the EPC. Using the maximum concentration tends to overestimate potential risks because receptors are assumed to be continuously exposed to the maximum concentration for the entire exposure period.

MDE guidance (State of Maryland, 2008) typically requires at least 10 samples to calculate UCLs. As noted above, this guidance differs from that provided by the USEPA. However, this difference has limited impact on the HHRA because most EPCs presented in the HHRA are based on data sets that included 10 or more samples. The only exceptions are EPCs for cobalt and vanadium in Block G surface soil, and DRO in Block H subsurface soil. Cobalt and vanadium in Block G

surface soil were both detected in 6 of 6 samples, and DRO in Block H subsurface soil was detected in 6 of 8 samples. If the maximum concentrations of cobalt and vanadium were used as EPCs for the Block G surface soil data set, cobalt would become a COC for the child recreational user. However, cobalt was already identified as a risk driver for Block G surface soil based on the hypothetical residential receptor. (Vanadium would not become a COC for any receptor; the maximum concentration of vanadium in Block G surface soil is less than the regional screening level [RSL] for residential soil.) DRO concentrations were evaluated both qualitatively and quantitatively in this HHRA. The HHRA also acknowledges when any detected concentration exceeds MDE benchmarks for a residential or industrial land use scenario (regardless of the EPC value). Therefore, overall HHRA conclusions are not expected to be significantly impacted by the EPCs selected for these parameters.

One-half the detection limit was used for non-detected results for the location-by-location risk estimates in Appendix E. Using one-half the detection limit for non-detects can result in elevated risk estimates if detection limits are elevated. An example of this is noted for Aroclor-1254 in Block E surface soil. The maximum non-detect result (i.e., the greatest reported sample detection limit [i.e., sample quantitation limit]) for Aroclor-1254 in Block E surface soil is 740,000 µg/kg, which exceeds the actual maximum detected concentration of 36,000 µg/kg. As a result, some of the risk estimates and hazard indices for Aroclor-1254 in Block E surface soil exceed USEPA and or Maryland Department of the Environment (MDE) target levels at locations where Aroclor-1254 was non-detected (e.g., location SB-353). Therefore, risk results for Aroclor-1254 are likely overestimated in samples with elevated detection limits and results should be interpreted with caution.

Exposure routes and receptor identification—Determination of various receptor groups and exposure routes of potential concern is based on observed current and anticipated future land use at the site. Therefore, uncertainty associated with selecting exposure routes and potential receptors is minimal because they are considered well defined.

Exposure parameters—Each exposure factor selected for use in the risk assessment had some associated uncertainty. Exposure factors are generally based on surveys of physiological and lifestyle profiles across the United States. The attributes and activities studied in these surveys are generally broadly distributed. In most cases, to avoid underestimating exposure, USEPA

guidelines on the RME receptor were used. These generally specify using the 95th-percentile value for most parameters. Therefore, the values selected for the RME receptor represent an upper bound of the observed or expected habits of most of the population. MDE exposure assumptions were used when available.

The value used for exposure frequency for recreational users (the MDE exposure frequency Level 1 of 250 days per year) corresponds with high-frequency use. MDE provides two other exposure frequencies: a Level 2 value of 182 days per year and a Level 3 value of 52 days per year. The Level 1 was chosen for this HHRA to be protective of all possible future land use scenarios.

Uncertainty can generally be assessed quantitatively for many of the assumptions made in determining factors with which to calculate exposures and intakes. Many of these parameters were determined from statistical analyses of human population characteristics. Often, the database used to derive a particular exposure parameter (e.g., body weight) is relatively large. Consequently, the values chosen for such variables in the RME scenario have low uncertainty.

Many of the exposure parameters used to calculate exposures and risks in this report were selected from a distribution of possible values, including MDE guidance (State of Maryland, 2008) and USEPA guidance (USEPA, 1989, 1991, 1993, 1997a, 2004). For the RME scenario, the value representing the 95th percentile was generally selected for each parameter to ensure that the assessment bounds most actual risks posed by a postulated exposure. This risk number is used in risk management decisions, but it does not indicate what an average and more-representative exposure might be, or what risk range might be expected for individuals in the exposed population.

5.3 UNCERTAINTY IN THE TOXICOLOGICAL EVALUATION

Uncertainties associated with the toxicity assessment (determination of RfDs and CSFs and use of available criteria) are below.

Derivation of toxicity criteria—Uncertainty associated with the toxicity assessment is related to the hazard assessment and dose-response evaluations for the COPC. The hazard assessment characterizes the nature and strength of causal evidence or the likelihood that a chemical that induces adverse effects in animals will do likewise in humans. A hazard assessment of

carcinogenicity was evaluated as a weight-of-evidence determination using USEPA methods. Positive animal-cancer test data suggest that humans contain tissue(s) that may manifest a carcinogenic response; however, animal data cannot necessarily be used to predict the target tissue in humans. In the hazard assessment of noncarcinogenic effects, however, positive animal data often suggest the nature of the effects (i.e., the target tissues and type of effects) to be anticipated in humans.

Uncertainty in hazard assessment arises from the nature and quality of the animal and human data. Uncertainty is reduced when:

- similar effects are observed across species, strain, sex, and exposure route
- the magnitude of the response is clearly dose related
- pharmacokinetic data indicate a similar fate in humans and animals
- postulated mechanisms of toxicity are similar for humans and animals
- the COC are structurally similar to other chemicals for which toxicity is more completely characterized

Uncertainty in the dose-response evaluation includes determining a cancer-slope factor (CSF) for the carcinogenic assessment and deriving a reference dose (RfD) for the noncarcinogenic assessment. Uncertainty is introduced from interspecies (animal to human) extrapolation, which, in the absence of quantitative pharmacokinetic or mechanistic data, is usually based on consideration of interspecies differences in basal metabolic rate. Uncertainty also results from intraspecies variation. Most toxicity experiments are performed on animals similar in age and genotype to minimize intragroup biological variation.

In contrast, the human population of concern may reflect a great deal of heterogeneity, including unusual sensitivity or tolerance to the COPC. Even toxicity data from human occupational exposures reflect a bias, because only those individuals sufficiently healthy to regularly attend work (the “healthy worker effect”) and those not unusually sensitive to the chemical are likely to be occupationally exposed. Finally, uncertainty arises from the quality of the key study from which the quantitative estimate is derived and which produced the database used. For cancer effects, the uncertainty associated with dose-response factors was mitigated by assuming the 95% upper bound for the slope factor.

Another source of uncertainty in carcinogenic assessment is the method by which data from high doses in animal studies are extrapolated to the dose range expected for environmentally exposed humans. The linearized multi-stage model, which is used in nearly all quantitative estimations of human risk based on animal data, is based on a nonthreshold assumption of carcinogenesis. Evidence suggests, however, that epigenetic carcinogens, as well as many genotoxic carcinogens, have a threshold below which they are noncarcinogenic. Therefore, using the linearized multi-stage model is conservative for chemicals that exhibit a threshold for carcinogenicity.

For noncarcinogenic effects, additional uncertainty factors may have been applied to derive the RfD to mitigate the poor quality of the key study or gaps in the resultant database. Additional uncertainty for noncarcinogenic effects arises from using an effect level in estimating an RfD, because this estimate is predicated on the assumption of a threshold less than that at which adverse effects are not expected. Therefore, an uncertainty factor is usually applied to estimate a no effect level.

Additional uncertainty arises in estimating an RfD for chronic exposure from subchronic data. Unless empirical data indicated that effects do not worsen with increasing exposure duration, an additional uncertainty factor was applied to the no effect level in the subchronic study. Uncertainty in deriving RfDs was mitigated by using uncertainty and modifying factors that normally range from 3–10. The resulting combination of uncertainty and modifying factors may have reached 1,000 or more. Deriving dermal RfDs and CSFs from oral-exposure values may also have caused uncertainty. This is particularly the case when no gastrointestinal absorption rates are available in the literature, or when only qualitative statements regarding absorption are available.

Use of chronic toxicity values for construction workers – Under the guidelines established by the Superfund program, exposures to construction workers of one year or less are classified as subchronic exposures. Risks for noncarcinogenic effects associated with subchronic exposures should incorporate toxicity values for subchronic and not chronic effects. Subchronic toxicity values are not as widely available as chronic values. Subchronic toxicity values used in this HHRA were obtained from USEPA's PPRTV internet site. Also, ATSDR Minimal Risk Levels (MRLs) were used as subchronic toxicity values when PPRTV values were not available. Chronic toxicity values were used when subchronic toxicity values were not available. Using

chronic toxicity criteria to evaluate subchronic exposures for construction workers tends to overestimate potential noncarcinogenic risks. However, no construction worker noncarcinogenic HIs for the inhalation pathway exceeded 1. Therefore, uncertainty due to the use of chronic toxicity values for construction workers does not affect overall risk assessment conclusions.

Uncertainty in the toxicity criteria for chromium—Toxicity criteria are available for different forms of chromium, which is considered more toxic in the hexavalent state. The following table compares the maximum total- and hexavalent-chromium concentrations reported for the tax block soil samples to available USEPA RSLs:

Environmental medium (maximum concentration)	USEPA RSL residential scenario (assuming hexavalent chromium)	USEPA RSL residential scenario (assuming trivalent chromium)
Surface soil: Total = 185 mg/kg Cr VI = 3.6 mg/kg	0.29 mg/kg	120,000 mg/kg
Subsurface soil: Total = 120 mg/kg Cr VI = 1.1 mg/kg		

Cr VI—hexavalent chromium

As indicated in Section 3.3.3, in most of the subject tax blocks a limited number of surface and subsurface soil samples were analyzed for hexavalent chromium. The available hexavalent/total chromium data sets led to the conservative assumption that 5% of the chromium detected in the soils is in the hexavalent state. Risks calculated for chromium in soil, assuming 5% of total chromium is in the hexavalent form, are therefore likely overestimated.

Refined risk evaluation of GRO/DRO concentrations in tax block soils—The risk evaluation in Section 4 includes a qualitative comparison of gasoline-range organics (GRO) and diesel-range organics (DRO) concentrations to MDE's *Generic Numeric Cleanup Standards for Soil*. The evaluation is qualitative only because USEPA has not published toxicity criteria (e.g., reference doses or cancer slope-factors) for these parameters. However, as noted in the 2008 MDE *Guidance for Cleanup Standards for Soil and Groundwater*, some state regulators have established protocols for the quantitative risk assessment of these parameters.

An example of such protocols is found in Massachusetts' final policy #WSC-02-411 (*Characterizing Risks Posed by Petroleum Contaminated Sites: Implementation of the MADEP VPH/EPH Approach*) (State of Massachusetts, 2002). This methodology is cited in the referenced MDE guidelines as the basis of the published generic standards for soil. Although quantitative risk estimates based on this methodology (and the associated toxicity criteria) are more uncertain than those based on USEPA recommended toxicity criteria, for purposes of completeness, the following tables provide non-cancer risk estimates (hazard indices) for GRO/DRO based on a simple comparison of EPCs to risk-based concentrations developed using the methodology endorsed by MDE to develop the generic standards (see Appendix D). The calculated RBC values incorporate MDE exposure assuptions and are based on a hazard quotient (HQ) of 1.

The hazard indices presented in the tables are less than or approximately equal to 1; therefore, the results suggests that adverse noncarcinogenic effects are not expected for the receptors evaluated. The evaluation indicates that although some isolated detections of GRO/DRO clearly exceed the MDE generic standards (see Section 4), risk estimates based on the EPCs do not indicate that these parameters are major contributors to noncancer risk for receptors hypothetically exposed to the tax block soils. The evaluation is limited in that it does not consider the potential carcinogenic effects of the GRO/DRO constituents (e.g., benzo(a)pyrene and related chemicals). However, the chemical-specific risk assessment in Section 4 for a number of these constituents does.

Block D—Refined Evaluation of GRO/DRO (Hazard Indices)

Block D	Surface soil GRO	Subsurface soil GRO	Surface soil DRO	Subsurface soil DRO
EPC (mg/kg)	0.81	0.25	550	40.3
Ratio of EPC to residential RBC [2,300 mg/kg]	<0.1	<0.1	**0.2**	<0.1
Ratio of EPC to commercial RBC [6,200 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ratio of EPC to industrial RBC [61,000 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ration of EPC to recreational RBC [3,300 mg/kg]	<0.1	<0.1	0.2	<0.1

Block E—Refined Evaluation of GRO/DRO (Hazard Indices)

Block E	Surface soil GRO	Subsurface soil GRO	Surface soil DRO	Subsurface soil DRO
EPC (mg/kg)	0.48	81.1	2340	2010
Ratio of EPC to residential RBC [2,300 mg/kg]	<0.1	<0.1	**Approximately 1**	0.9
Ratio of EPC to commercial RBC [6,200 mg/kg]	<0.1	<0.1	0.4	0.3
Ratio of EPC to industrial RBC [61,000 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ration of EPC to recreational RBC [3,300 mg/kg]	<0.1	<0.1	<0.1	0.6

Block F—Refined Evaluation of GRO/DRO (Hazard Indices)

Block F	Surface soil GRO	Subsurface soil GRO	Surface soil DRO	Subsurface soil DRO
EPC (mg/kg)	1.2	21.2	91.8	522
Ratio of EPC to Residential RBC [2,300 mg/kg]	<0.1	<0.1	<0.1	0.2
Ratio of EPC to commercial RBC [6,200 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ratio of EPC to industrial RBC [61,000 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ration of EPC to recreational RBC [3,300 mg/kg]	<0.1	<0.1	<0.1	0.2

Block G—Refined Evaluation of GRO/DRO (Hazard Indices)

Block G	Surface soil GRO	Subsurface soil GRO	Surface soil DRO	Subsurface soil DRO
EPC (mg/kg)	131	131	77.4	21.7
Ratio of EPC to residential RBC [2,300 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ratio of EPC to commercial RBC [6,200 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ratio of EPC to industrial RBC [61,000 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ration of EPC to recreational RBC [3,300 mg/kg]	<0.1	<0.1	<0.1	<0.1

Block H—Refined Evaluation of GRO/DRO (Hazard Indices)

Block H	Surface soil GRO	Subsurface soil GRO	Surface soil DRO	Subsurface soil DRO
EPC (mg/kg)	12	2.6	240	130
Ratio of EPC to residential RBC [2,300 mg/kg]	<0.1	<0.1	Approximately 0.1	<0.1
Ratio of EPC to commercial RBC [6,200 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ratio of EPC to industrial RBC [61,000 mg/kg]	<0.1	<0.1	<0.1	<0.1
Ration of EPC to recreational RBC [3,300 mg/kg]	<0.1	<0.1	<0.1	<0.1

In addition to the evaluation presented in the tables above, based on discussion with MDE, the industrial RBC–based benchmark (presented above, based on MDE 2008 guidance) was decreased from a value of 61,000 mg/kg to 6,100 mg/kg. The 61,000 mg/kg value is based on an HQ of 1 whereas the 6,100 mg/kg value is based on an HQ of 0.1. DRO/GRO concentrations detected in the soils were then compared to 6,100 mg/kg, to be conservative. This additional analysis was conducted because:

- RBCs based on an HQ of 0.1 account for the potential cumulative effects of several chemicals affecting the same target organ or producing the same adverse noncarcinogenic effect. Consequently, they are more conservative than RBCs based on an HQ of 1.
- The industrial screening value of 61,000 mg/kg, while risk-based, represents six percent petroleum product. Therefore, MDE requested that the industrial benchmark be decreased to a value of 6,100 mg/kg (i.e., be established at an HI of 0.1).

Although the tables above do not indicate that GRO and DRO parameters are major contributors to noncancer risk for receptors hypothetically exposed to the tax block soils, two detected DRO concentrations in Block E soil exceed the more conservative, calculated industrial risk-based concentration (6,100 mg/kg) based on an HQ of 0.1 and MDE risk assessment methodology (calculations are presented in Appendix D).The Block E locations where concentrations exceeding 6,100 mg/kg were detected are SB-833A, with a detected DRO concentration of 8,900 mg/kg in surface soil (0–2 feet), and SB-833, with a detected DRO concentration of 28,000 mg/kg in subsurface soil (9–9 feet). No other DRO concentrations exceed the industrial

risk-based concentration based on an HQ of 0.1. Because two DRO concentrations exceed the 6,100 mg/kg risk-based concentration, DRO was selected as a COC for Block E.

5.4 UNCERTAINTY IN THE RISK CHARACTERIZATION

Uncertainty in risk characterization resulted from assumptions made regarding additivity of effects from exposure to multiple COPC via various exposure routes. High uncertainty exists when summing noncarcinogenic risks for several substances across different exposure pathways. This assumes that each substance has a similar effect and/or mode of action. Even when compounds affect the same target organs, they may have different mechanisms of action or differ in their fate in the body, so additivity may not be an appropriate assumption in all cases. However, the assumption of additivity was considered because in most cases it represents a conservative estimate of risk. Risks to any individual may also have been overestimated by summing multiple assumed exposure pathway risks for any single receptor. Although every effort was made to develop reasonable scenarios, not all individual receptors may be exposed via all pathways considered.

Finally, the risk characterization does not consider antagonistic or synergistic effects. Little or no information is available to determine the potential for antagonism or synergism among the COPC. The likelihood of over- or under-predicting risks could not be defined because chemical-specific interactions could not be predicted; however, the methodology used is based on current USEPA guidance.

This page intentionally left blank.

Section 6
Remedial Goal Options

Cleanup goals were developed for those environmental media with incremental lifetime-cancer risk (ILCRs) greater than 1×10^{-5} and a total hazard index (HI) greater than 1.0. Cleanup goals were derived for those contaminants of concern (COC) that contribute significantly to the cancer risk and/or hazard index for each exposure pathway in a given land-use scenario for a receptor group. Chemicals were not considered significant contributors to risk, and were therefore not included as COC, if their individual carcinogenic risk contribution was less than or equal to 1×10^{-6} and their non-carcinogenic hazard quotient (HQ) was less than or equal to 0.1. Cleanup goals were calculated using the following equation:

$$\text{Cleanup Goal [chemical i]} = \text{EPC[chemical i]} \times \text{Target Risk/Calculated Risk[chemical i]}$$

where:

Cleanup goal [chemical i]	=	chemical specific cleanup goal
EPC [chemical i]	=	exposure point concentration used in risk assessment calculations
Target risk	=	target risk for carcinogens or the target hazard quotients for noncarcinogens
Calculated risk [chemical i]	=	total risk calculated for a specific chemical in the risk assessment

Cleanup goals calculated for soil for each tax block are presented in Tables 6-1 through 6-5. These tables include potential U.S. Environmental Protection Agency (USEPA) regional screening-level (RSL) criteria, when available.

Figures displaying the concentrations of the COC selected for each tax block compared to relevant benchmark concentrations such as commercial receptor, industrial worker, and resident Remedial goal options (RGOs) and Maryland Department of the Environment (MDE) cleanup standards are presented in Appendix E.

As noted in Section 5.3, diesel range organics (DRO) and gasoline range organics (GRO) were evaluated qualitatively only in Section 4, because USEPA has not published toxicity criteria for these parameters. Although the refined evaluation presented in Section 5.3 did not indicate that DRO and GRO are major contributors to risk, detected DRO concentrations at two locations in Block E soil exceed a risk-based concentration (6,100 mg/kg) calculated for the industrial worker. Therefore, DRO are also retained as COC for Block E soil. The RGO recommended for DRO is conservatively set at 6,100 mg/kg to account for potential cumulative effects of multiple chemicals impacting the same target organ.
