Subject: Transmittal of the Groundwater Investigation South of Building C Report
Lockheed Martin Corporation – Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Schold,

For your review, please find enclosed two hard copies with a CD of the above-referenced document. This prepared report documents the investigation conducted to further investigate the extent of trichloroethene impacted groundwater directly south of Building C at the Middle River Complex in Middle River, Maryland.

If possible, we respectfully request to receive MDE's document review comments by February 22, 2021.

Please let me know if you have any questions. My office phone is (301) 548-2209.

Sincerely,

Thomas D. Blackman

SECTION 1
INTRODUCTION

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech Inc. (Tetra Tech) has prepared this report to document the investigation conducted to further investigate the extent of trichloroethene (TCE)-impacted groundwater directly south of Building C at the Middle River Complex (MRC) in Middle River, Maryland (Figure 1-1). This work was conducted in accordance with the approved work plan (*Groundwater Investigation South of Building C Work Plan* [Tetra Tech, 2020]).

Results from previous investigations indicate that trichloroethene and its degradation products are present in the groundwater beneath the southern portion of Building C basement. Several historical operational areas of concern occurred within the Building C basement; these areas were investigated in the mid-2000s (Tetra Tech, 2005 and 2006). A subslab depressurization system was installed at the south end of Building C in 2008 based on elevated concentrations of trichloroethene found in subslab vapor. This system was expanded to include the central portion of the basement. Remediation for these groundwater contaminants has successfully been conducted south of Building C within the groundwater response action area (Tetra Tech, 2019). However, the relationship between possible source areas (and associated groundwater contamination) under Building C and impacted groundwater outside the building footprint (for which a source has not been identified) has not been explored proximate to the southern perimeter of Building C.

The objectives of this investigation were to:

- refine the extent of trichloroethene-contaminated groundwater identified external to Building C (in wells MW-60A/B) and within the southern portion of the building (at soil borings SB-303 and SB-313) via installation of temporary groundwater monitoring points and the collection of vertical profiling samples for volatile organic compounds (VOCs) analysis

- advance and evaluate continuous cores for lithologic characterization to confirm the bottom of the B-zone

- complete gamma ray logging to obtain a detailed record of the existing stratigraphy in Block I wells located south of Building C, and to support interpretation of the conceptual site model (CSM)

- update Building C area cross-sections using lithology information gained from these temporary monitoring points and borings to interpret the extent of trichloroethene associated with Block I and relevant site features

- use the cross-sections to update the conceptual site model for Block I

This report is organized into the following sections: (1) Introduction, (2) Generalized Building C Conceptual Site Model, (3) Investigation Approach and Methodology, (4) Project Deliverables, and (5) References. Tables and figures are at the end of the report body following Section 5.

SECTION 2
GENERALIZED BUILDING C CONCEPTUAL SITE MODEL

This section summarizes the generalized conceptual site model (CSM) as understood before the current investigation. Building C is one of the primary manufacturing buildings in Block I and has been the subject of site characterization studies since 2004. The groundwater response action using *in situ* bioremediation was approved by the Maryland Department of the Environment (MDE) and was successfully conducted just south of Building C within the response action area. At that time, a workplan was prepared, and a 'No Further Action' determination was pending from MDE for Block I groundwater response. Other relevant onsite remediation activities include a sub-slab depressurization system (SSDS) that has been operating in Building C since March 2008 to mitigate the potential for sub-slab contaminants to move into the indoor air of Building C basement. Previous environmental characterization has identified subsurface soil and groundwater contamination from chlorinated volatile organic compounds (cVOCs), primarily trichloroethene (TCE), under and near Building C.

2.1 BUILDING C FEATURES

Building C is a large rectangular industrial building (approximately 900 feet long and 300 feet wide) constructed with a full-dimension basement level and a first floor. The first floor is generally comprised of large open work areas with some minor partitions for offices, and is suitable for large-scale airplane manufacturing and assembly. The concrete floor in the basement is typically between six to 12 inches thick, and the building has concrete footers that anchor the building into the soil beneath it. Floor drains, sumps, storm-drain lines, and other utilities run beneath the building slab. The loading dock connected to the first floor on the southern and western side of the building was added sometime after original building construction.

2.2 GEOLOGY

The Patapsco formation is directly beneath the site and is the primary formation of interest in this investigation. Detailed cross-sections of the site geology are presented and discussed in Section 4.0. The Patapsco formation is composed primarily of silty sand, fine- to medium-grained sand, silty clay, clayey silt, and plastic clay. Arundel clay beneath the Patapsco formation is composed of dark gray and maroon lignitic clay (including some interlayered silt/sand) and was found to be up to approximately 120 feet thick beneath the site. Thick sequences of low-permeability clay, silty clay, clayey silt, and silt are present in the northern two-thirds of the Middle River Complex (MRC) site. Interbedded sand, silty sand, sandy silt, and silt are encountered south of Building C. Local cut and fill material from building construction may be evident, but little evidence of fill use is generally found within Block I.

Only a limited number of soil borings have been advanced beneath the Building C basement floor relative to the size of the building, so geology is extrapolated under the building footprint in areas between historical shallow borings.

Within the building footprint, the predominant lithology is a clay/silt/sand mixture beneath the southern/southeastern portion of the basement, with some more permeable thin sand layers encountered in the upper five to seven feet. Groundwater in this area is generally encountered at depths between five and 14 feet; the elevation of the water table at the southern end of Building C is generally the same as water table elevations measured in monitoring wells located outside the building. The mixture of clay/sand/silt with interbedded sand layers continues south of Building C.

The geology east-west across Building C basement shows the lithology grading from more clay rich matrix encountered under the western side of the building to silty clay/clayey silt under the central portion of the building, and to a clay/silt/sand mix moving toward the eastern side of the building.

2.3 HYDROGEOLOGY

The hydrogeologic system beneath the MRC consists of multiple laterally and vertically discontinuous and relatively permeable units that provide the primary pathways for groundwater flow and contaminant migration. Water enters these units via natural infiltration/recharge of

precipitation (although this would be limited within the footprint of Building C and its surrounding area where the surface is mostly covered by asphalt and concrete), and via collected and redirected stormwater and snowmelt. Shallow groundwater ultimately discharges to surface waters that border the site to the southeast (Dark Head Cove) and west (Cow Pen Creek). The data obtained during this current investigation will be interpreted from an environmental sequence stratigraphy (ESS) perspective; hydrogeologic units will be identified, and where possible these units will be stratigraphically correlated with those already identified to the northwest and south to expand the site-wide ESS framework. That ESS interpretation of the area south of Building C is included in Section 4.0. Shallow groundwater wells in the study area are within relatively permeable zones of the Patapsco formation. These relatively shallow permeable zones are underlain (at depths of 70 to 100 feet below surface) by the Arundel formation, a regionally extensive, thick, dense clay confining unit.

As stated above, the more permeable units beneath the site are laterally and vertically discontinuous, making it difficult to delineate distinct aquifer layers and confining units, particularly near Building C. Permeability tests conducted at the site indicate that the hydraulic conductivity of the more permeable deposits increases with depth. The respective average hydraulic conductivities in shallow, intermediate, and deeper wells are 0.22, 0.48, and 3.82 feet per day (Tetra Tech, 2012).

Generally, shallow groundwater at the MRC follows the site topography, and flows radially from the hydraulically upgradient northern portion of the complex (immediately south of Building C) to the southeast/south toward Dark Head Cove. Shallow groundwater flow at Building C is southeasterly, toward wells MRC-MW60A-B and MRC-MW27A-B (Figure 2-1). Groundwater extraction from sump pumps in the central and northern portions of Buildings B and C may be suppressing the groundwater table beneath Building C.

2.4 WATER BUDGET AND RECHARGE

Groundwater flow at the site is generated almost exclusively by recharge (i.e., precipitation infiltration, and infiltration of redirected storm runoff and snowmelt). Recharge rates are influenced by variations in topography and surficial geology, such as the presence or absence of

paved surfaces. Most of the Building C study area is paved or covered by buildings. As such, evapotranspiration is expected to be minimal.

Runoff from precipitation likely follows topography of the site, which gently slopes from Building C to the southeast and south and toward Dark Head Cove. As stated earlier, as most surfaces are paved or covered by buildings, most of the associated runoff generated from these areas is captured and conveyed through the storm drain system.

Precipitation at MRC is approximately 42 inches per year as reported by the National Oceanic and Atmospheric Administration (https://www.weather.gov/media/lwx/climate/bwiprecip.pdf). Recharge is expected to occur primarily in the late winter and early spring months, when precipitation is relatively high and evapotranspiration minimal. Tenbus and Fleck (2001) have estimated recharge rates of 0-9 inches per year at the nearby Graces Quarters site, which is in the Edgewood Area of Aberdeen Proving Ground (and north of the MRC). Recharge to the groundwater system in MRC locations where the ground surface is not covered by buildings or pavement is expected to be at the low end of the range estimated by Tenbus and Fleck (2001), due to the low permeability of the surface soil.

2.5 BUILDING C SUMMARY OF INVESTIGATIONS

2.5.1 Data Summary for Soil

Significant observations from the soil investigations at and near Building C (Earth Tech, 2008; Tetra Tech, 2005; 2009; 2011; 2012; 2014) are discussed below:

- Although low or nondetect results for VOCs were detected at most sampling locations, the lateral distribution of sampling locations (with only a few exceptions) generally do not correlate well with identified areas of concern.

- Samples (not attributed to building materials [i.e., not asbestos-containing materials or materials containing lead-based paint]) collected during the 2008 hazardous materials study and survey (Earth Tech, 2008) demonstrated that although contaminants such as total petroleum hydrocarbons and polychlorinated biphenyls (PCBs) were found in some samples, a significant release to the surrounding subsurface soils had not occurred in sampled areas.

- Samples that did show cVOC impacts were collected in the southern end of Building C, and are generally consistent with findings in groundwater discussed below.

- Boring logs for soil under Building C reflect soil is comprised primarily of clays and silty clays, typically recorded as very dry.

2.5.2 Groundwater Data Summary

Significant observations from the groundwater investigations (Tetra Tech, 2005; 2009; 2011; 2012; 2014) include the following:

- Groundwater samples collected under the Building C foundation slab primarily show detectable COC concentrations only near the southern end of the building. However, as sampling was focused on the southern end of the building, groundwater data from areas in the northern portion of the building is limited.

- The groundwater table under Building C appears to be significantly depressed, likely due to the presence of shallow clays, the operation of the numerous sumps in the northern and northwestern areas of Buildings B and C, and the inhibition of groundwater recharge from the buildings. Although these sumps are labeled as sanitary sumps on historical drawings, they likely also pump infiltrating groundwater.

- Data from impacted groundwater on the southern end of the building (as correlated with data from monitoring wells outside the building) indicates that significant degradation of trichloroethene and carbon tetrachloride is occurring under the building.

- The vertical extent of contamination beneath the building has not been delineated but concentrations decrease rapidly moving north.

2.6 FATE AND TRANSPORT

Whether groundwater contamination at the southern end of the building is from a release inside or outside the building is currently unknown. The prevalence of shallow subsurface clay and the lack of water recharge under the building likely inhibit vertical migration unless large volumes of chemicals were released. TCE releases to shallow soil beneath known areas of concern or other operation areas may have occurred, and chemicals in the soil (and groundwater) volatilized to sub-slab vapor and migrated along preferential pathways. Some sumps within Building C that collect groundwater have been sampled, but TCE was not detected at that time. Note that soil data collected under Building C is generally inconclusive as to whether releases have occurred at identified sources, but since the historical use of the basement area has varied over time, they likely do not represent all possible source areas. The source of groundwater impacts outside the southern end of Building C has not been identified and may possibly be the result of source(s) under the building or from a historical release outside the southern side of the building.

SECTION 3
FIELD INVESTIGATION

Section 3 presents the technical approach that was used for all field activities and describes the field methodology. The Tetra Tech, Inc. (Tetra Tech) field operations leader coordinated mobilization and demobilization, procured the required subcontractors, and mobilized personnel and materials to the field. Investigation results obtained from the comprehensive field program are in Section 4 of this report.

3.1 SITE ACCESS, NOTIFICATIONS, AND PERMITS

Before starting any field work, the assigned Tetra Tech field personnel became familiar with the site-specific health and safety plan (HASP) and the respective "Safe Work" permits and emergency response plan included in the HASP. Tetra Tech conducted mandatory health and safety tailgate meetings before each day's fieldwork. The Tetra Tech site health and safety officer documented the topics covered and personnel in attendance.

Tetra Tech provided notification and coordinated access arrangements through Lockheed Martin Security and EMCOR (site maintenance) to gain access to Block I. Middle River Complex (MRC) tenants were informed and updated about the proposed investigation activities at the LMC Properties, Inc. (LMCPI) bi-weekly meeting. LMCPI was notified of the proposed tasks and schedule and approved the work and schedule before mobilization to the field. Tetra Tech submitted the standard digging authorization form and risk handling checklist through EMCOR.

3.2 UTILITY CLEARANCE

Before starting any intrusive field activities, each soil boring, groundwater profiling, and monitoring well location was screened for the presence of subsurface utilities. In addition to calling in a Miss Utility ticket, Tetra Tech obtained the available MRC facility engineering and utility maps and contracted with a private utility locating service (RETTEW [formerly Enviroscan, Inc.]) to locate and mark underground utilities.

Tetra Tech complied with all federal, state, and local laws, regulations, and ordinances relating to the performance of this work. Any required permit, certification, and license applications were made in advance and the sought-after documentation was obtained before field operation. No site operations were affected due to the location of the work. Boring and monitoring well locations were concentrated south of Building C in Block I, and away from Lockheed Martin personnel. During field work, pedestrian and vehicle traffic (golf carts) were present in the near vicinity but the work area was enclosed by safety cones and caution tape.

On May 22, 2020, RETTEW walked the area, noting presence of valves, manholes, and visible outfall piping, and completed utility clearance using a Fisher TW-6 electromagnetic pipe and cable locator/tracer, a cable detector, cable locator, and cable avoidance passive locator, and a ground penetrating radar (GPR) system. Located utilities were marked on the ground with the appropriate paint color corresponding to each unique utility. Copies of permits, Miss Utility tickets, and the report prepared by the utility locating company are included as Appendix A.

3.3 FIELD ACTIVITIES

3.3.1 Soil Boring Advancement

On June 1, 2020, before groundwater profiling and monitoring well installation were completed, a Maryland-licensed driller used a direct push technology (DPT) drill rig to collect a continuous soil core at two locations (I-SB-315 and I-SB-316) to determine the approximate depths for groundwater screening sampling (Figure 3-1). Soil cores were screened for volatile organic compounds (VOCs) using a portable photoionization detector (PID) and a consistent headspace screening methodology (i.e., sealable plastic bag technique). Headspace sampling in the field consisted of cutting the soil core along its long axis, instantly placing one side of the core sample into a sealable plastic bag, and immediately closing the top of the bag. A qualified Tetra Tech field geologist performed lithologic logging and all pertinent information, including boring location, soil/lithology descriptions, and PID readings were recorded electronically into gINT professional boring log software. The information from these electronic records were used to determine screening intervals for each groundwater profiling boring location. Soil boring logs from I-SB-315 and I-SB-316 are included as Appendix B.

3.3.2 Groundwater Profiling

On June 2-5, 2020, vertical groundwater profiling (GWP) was conducted using a reusable, three-foot-long stainless-steel probe fitted with a one-foot screen at six boring locations (I-GWP-1A through I-GWP-1F on Figure 3-1). Boring locations 1E and 1F were drilled underneath the ramp with a smaller geo-probe unit due to access restrictions.

Groundwater was collected using a peristaltic pump and disposable polyethylene tubing, at a pumping rate of 100-300 milliliters per minute, and was field analyzed for trichloroethene (TCE) by experienced Tetra Tech personnel using a FROG 5000™ field gas chromatograph calibrated to detect TCE. Twenty percent (three samples) of the groundwater intervals screened by the Frog 5000™ were also submitted to an offsite laboratory (TestAmerica Canton, Ohio) for volatile organic compounds (VOCs) analysis of TCE on a standard turnaround time. FROG 5000™ field graphs are included as Appendix C. Field graphs for borings 1E and 1F are not available as no water was encountered in those borings.

After sampling was concluded at each interval, all down-hole equipment was decontaminated using a mild detergent (Alconox) solution wash and a potable water rinse. The above procedure was then repeated for each successive interval. Each borehole was abandoned with bentonite upon completion.

3.3.3 Monitoring Well Installation, Development, and Sampling

Tetra Tech installed, developed, and sampled monitoring well (MW) MW164B. The shallower well of the proposed well pair (MW164A) was not installed because the shallower interval of the boring lacked a permeable zone in which to install a well screen, as shown in the boring log (Appendix D).

3.3.3.1 Borehole Drilling and Soil Sampling

One groundwater monitoring well was installed in Block I, South of Building C (Figure 3-1) on July 16, 2020. Per the work plan, the estimated bottom depth of the A-zone well was to be 25 feet below ground surface (bgs) while the estimated bottom depth for the B-zone well was to be 40 feet

bgs. However, the typical permeable zone was not observed when drilling in the shallow interval (around 25 feet bgs), so a well was not installed in the upper (A)-zone.

A thick confining layer was observed from approximately 4 feet bgs to 33 feet bgs. The lower permeable B-zone was clearly defined from 33 to 40 feet bgs; therefore, a well was installed in this interval to capture information from this zone. The well was installed to its targeted depth of 30 to 40 feet bgs using a roto-sonic drill rig under the supervision and direction of a Maryland-licensed driller, with a four-inch by six-inch drill-rod/override-casing configuration (with temporary casing). Soil was continuously screened by a qualified Tetra Tech field geologist while drilling; lithologic logging was performed using the four-inch-diameter, 10-foot-long cores obtained from the borehole. One soil sample was collected from the 15-20 foot interval and sent to the laboratory for volatile organic compound analysis as it was associated with a PID headspace reading of 21.8 parts-per-million (ppm), which was the highest reading observed at the boring location. All pertinent information, including boring location, soil/lithology descriptions, and PID readings were recorded on a soil boring log form electronically using *gINT professional* software; these forms are in Appendix D. Log sheets for soil samples collected from monitoring well borehole drillings are also in Appendix D.

3.3.3.2 Well Construction

Groundwater monitoring well MW164B was installed on July 16, 2020, and was constructed of two-inch-diameter flush-threaded Schedule-40 polyvinyl chloride (PVC) well casing with a manufactured 10-foot-long PVC well-screen with 0.010-inch wire-wrapped openings. A sand filter-pack of washed #1 filter sand was placed around the well screen and up to at least two feet above the top of the screen. Following placement of the sand pack, the wells were pre-developed using the drill rig and a combination of surging and air lifting to settle the sand pack around the well screens.

A two-foot thick bentonite seal was installed above the sand pack using bentonite pellets and was allowed to hydrate during installation. The bentonite was vibrated in place using the sonic drill stem to promote pellet hydration and settlement. Grout, consisting of Type II Portland cement and powdered bentonite, was placed above the bentonite seal to approximately two feet below grade.

Grout was made by mixing a 94-pound bag of Type II Portland cement, nine pounds of powdered sodium bentonite, and no more than eight gallons of water per bag of cement.

A protective, locking, flush-mounted well cover was secured over the well casing to protect the well. The PVC well casing was cut below grade and made watertight by installing a locking, expandable, sanitary seal in the well casing top. Concrete was installed above the grout in the annular space between the well borehole and outer well casing, and up to approximately six-inches below grade, to provide a surface seal for the well, and to provide support for the flush-mounted cover. The flush-mounted cover was set in a two-by-two-foot square concrete pad.

The highest point on the top of the PVC well casing was marked using a file (i.e., filing a small groove in the casing). Precision Survey, LLC surveyed the marked location of the well on October 27, 2020; this information will be used to measure the depth to groundwater at the well. Well construction details were recorded in the field logbook and electronically using *gINT professional* software. The completed well construction log is included with the boring logs in Appendix D, while the professional surveying report is in Appendix E.

3.3.3.3 Well Development

The newly installed well was developed to remove fines from the well filter pack and casing, and to ensure a hydraulic connection between the well and the geologic formation. Well development was completed on July 22, 2020 (six days after well installation) to allow the grout to fully set. The well was developed by hand bailing to remove heavy sediments, then by gentle surging and purging with a submersible pump and/or air lifting to remove fines and sediment from the sand pack and well screen.

Development began at the bottom of the well screen, worked up incrementally to the top of the screened interval, and then back down to the bottom of the well. During well development, water level drawdown measurements and groundwater parameters (including pH, temperature, specific conductance, dissolved oxygen [DO], oxidation reduction potential [ORP], and turbidity) were collected every five minutes until pumping was complete. These data were recorded in the appropriate site-specific logbook and on a well development record (see Appendix D). Water quality parameters were measured using a Horiba U-52 water quality meter. Turbidity readings

were collected using a separate LaMotte 2020e turbidity meter (due to the instability of turbidity meters on multi-meters) and recorded in the field logbook and on a well development record. Development continued until groundwater ran clear and was free of suspended solids, or for a maximum of three hours, whichever occurred first. All development water was collected in United States Department of Transportation (USDOT)-approved, properly labeled, 55-gallon steel drums in a facility-approved location.

3.3.3.4 Well Sampling

On August 11, 2020, MW164B was sampled using the United States Environmental Protection Agency (USEPA) low flow purging/sampling method (USEPA, 1996; updated 2017), whereby water is pumped from the well at a low flow rate and water quality parameters are monitored and recorded during the purging. Wells were purged via a peristaltic pump using disposable polyethylene tubing, at a pumping rate of 100-300 milliliters per minute. The final adjustment of the purge rate depended on water stabilization, and how fast the well recharged (without drawdown below the initial static water level occurring).

During groundwater purging, water level drawdown measurements and groundwater parameters, including pH, temperature, specific conductance, DO, ORP, and turbidity were collected every five minutes until purging was complete. These parameters were recorded in the appropriate site-specific logbook, as well as on "Low Flow Purge Data Sheets." Water quality parameters were measured using an in-line water quality meter (Horiba U-52). Turbidity readings were collected using a separate turbidity meter (LaMotte 2020e) and were recorded in the field logbook and on low flow purge data sheets.

Purging was considered complete when the monitored water quality parameters stabilized, the well was purged dry, or the well had been purged for 90 minutes. Stabilization was considered achieved when three consecutive readings, taken at five-minute intervals were within ±0.1 standard units for pH, ±3% for specific conductance, and ±10% for ORP and turbidity.

Groundwater samples for VOCs and metals were collected first, followed by samples to be analyzed for the remaining analyses. Samples for each analytical parameter were placed in a cooler containing ice immediately upon collection and shipped to the appropriate laboratory for analysis

at the end of the day. All pertinent field logs including low flow purge data sheet, sample log sheet, and calibration records are in Appendix D.

3.3.3.5 Laboratory Analysis and Data Validation

Tetra Tech completed groundwater sampling to be collected for laboratory analysis. This included preparation of all chain-of-custody forms and required paperwork relating to sample transport. Tetra Tech used laboratories accredited in the State of Maryland (Eurofins TestAmerica Canton, Ohio and TestAmerica Chicago, Illinois) for chemical analyses, as well as Microbial Insights, (in Knoxville, Tennessee) for *dehalococcoides* (DHC) analysis. Groundwater samples collected from the newly installed well was analyzed for the following parameters:

- VOCs by SW846 Method 8260C
- Sulfate by USEPA Method 9056A
- Bromide by USEPA Method 300.0
- Nitrates by USEPA Method 4500-NO3E
- Iron/manganese by USEPA Method 6010C
- Alkalinity by USEPA Method 2320B
- Total dissolved solids by USEPA Method 2540C
- Salinity by USEPA Method 2520B
- Hardness (ions) by USEPA Method 2340C
- Dissolved gasses (methane, ethane, ethene) by Method RSK-175
- *Dehalococcoides* (DHC) bacterial species and functional genes (Microbial Insights standard method)
- Polychlorinated biphenyls (PCBs) by USEPA Method 680
- Total metals by USEPA Method 6020A
- Hexavalent chromium by USEPA Method 218.6 (TestAmerica Chicago)
- Ferrous iron (field kit)

As stated earlier, groundwater VOC and metal samples were collected first, followed by samples to be analyzed for the remaining analyses. All samples were placed in a cooler containing ice immediately upon collection (for example, VOC containers were placed in a cooler containing ice immediately after the VOC containers were filled and closed). Aqueous trip blanks were placed in cooler(s) used to store and ship VOC samples at the beginning of each sampling day; this trip blank accompanied the VOC samples throughout the day and were sent along with the samples to the laboratory. The trip blank(s) were analyzed for VOCs by SW846 Method 8260C. Samples were analyzed on a standard turnaround of 21 calendar days. Full data packages from Eurofins TestAmerica (covering soil, water screening, and monitoring well sampling data) from Microbial Insights (DHC population monitoring well data) are in Appendix F.

All data provided by the laboratory was validated for all quality assurance (QA)/quality control (QC) parameters, including accuracy, precision, completeness, and comparability, in accordance with USEPA national functional guidelines for inorganic and organic data (USEPA, 2017a and 2017b, respectively), and in accordance with the USEPA *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (USEPA, 2009a). Oversight of laboratory QA/QC was as proactive as possible to ensure valid data are produced during the sampling event. An evaluation of laboratory methodology, method compliance, and any corrective actions was also performed. Data validation reports are also in Appendix F.

3.3.4 Gamma Ray Logging

Gamma ray logging was conducted in selected existing monitoring wells within Block I and in the newly installed monitoring well (MW-164B) to obtain a detailed record of borehole lithostratigraphy. Note that 12 of the identified wells located west of Building A are not associated with the objectives of this investigation; rather, gamma logging was opportunistically conducted there to further investigate that area and to capitalize on the presence of the logging contractor. Gamma ray logging was conducted using passive instruments (scintillation meters) that count the number of natural gamma ray emissions emitted by minerals in the adjacent geologic formation. The major source of the gamma rays in the subsurface are clay particles containing the potassium

isotope. Therefore, when lowered and raised through the borehole at a constant rate, the abundance of gamma ray peaks is indicative of finer-grained formation materials, particularly silts and clays.

Gamma rays contain sufficient energy that, although somewhat attenuated, can easily pass through polyvinyl chloride (PVC) well materials; therefore, gamma ray logs are one of the few geophysical instruments that can be run within a cased and completed monitoring well. Because the well casing is of uniform vertical thickness, the degree of signal attenuation is relatively constant, thereby permitting a peak-to-peak comparison and evaluation.

Information gathered from gamma ray logs was used to further characterize and refine the stratigraphic interpretations for Block I, specifically for the area south of Building C and west of Building A. The high resolution obtained from the gamma ray logs were combined with direct observations of lithology available from the boring logs to yield a high-resolution interpretation of the subsurface lithostratigraphy and hydrogeology within Block I.

Gamma ray logging was performed by the geophysical subcontractor Earth Data Northeast, Inc. (EDN), of Exton, Pennsylvania on October 13, 2020. The gamma scintillation meter was run up and down the well's casing on a wireline extending from the EDN field vehicle, and results were viewable in real time and stored digitally on EDN software. EDN provided a hard-copy field log after each well was logged, electronic copies of the final composite field logs in portable document format (PDF), and the digital results for each well in Microsoft Excel® format. A compilation of each PDF printout of gamma readings is included as Appendix G.

All downhole equipment (scintillation meters and their cables) was decontaminated with Alconox and potable water rinse to eliminate cross-contamination between well locations. Decontamination water was containerized in a five-gallon bucket and will be combined with decontamination water generated on-site and handled following protocols described in Section 3.5.

3.4 SURVEYING

A professional field surveyor from a qualified, state-licensed, land-surveying firm (Precision Survey and Mapping, LLC) surveyed the horizontal and vertical coordinates of the newly installed well on October 27, 2020. Surveyed locations are accurate to the nearest 0.01 foot for vertical

elevations in the North American Vertical Datum 1988, and to the nearest 0.1 foot for horizontal coordinates in the North American Datum 1983. Ground elevations and top of PVC elevations at the wells were surveyed within a vertical accuracy of 0.1 foot. This information was also used to update the MRC environmental geographic information system (EGIS). The full survey report from Precision Survey and Mapping, LLC is included as Appendix E.

3.5 INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW) consisting of all drill cuttings and soil cuttings, decontamination rinse water, purge water, tubing, and personal protective equipment (PPE) was generated during this investigation. PPE and tubing IDW were placed in trash bags which were placed in a facility trash receptacle to be disposed of as general refuse. Soil cuttings and water were collected and stored in USDOT-approved 55-gallon drums. All drums were appropriately labeled and logged on a drum inventory form. Wastes were characterized and were disposed of in accordance with applicable state and federal regulations. After generation, the drums were relocated to a drum staging area (located in Building C basement) as identified by Lockheed Martin personnel. Samples of IDW were collected on June 6, 2020 and submitted for analysis of VOCs, polychlorinated biphenyls (PCBs), toxicity characteristic leaching procedure (TCLP) metals, ignitability, and per- and poly-fluoroalkyl substances. All waste was classified as nonhazardous waste. On August 28, 2020, Tetra Tech and the authorized waste removal representative from Lockheed Martin oversaw drum removal by Clean Harbors to the designated removal facility. Signed waste manifests are included as Appendix H. The minimal decontamination water generated during the gamma ray logging in October 2020 was collected in a five-gallon bucket and combined with decontamination water waste at the site, and will be removed from the site in the same manner as described above.

3.6 SAMPLE NOMENCLATURE

Each groundwater screening sample collected from groundwater profiling borings during this investigation was identified with a unique sample identification tag consisting of the site designation (i.e., Block I), sample-type designation (i.e., GWP for groundwater profiling), followed by the transect number (1, 2, or 3) and letter (A, B, C…) for the transect location,

followed by the depth of the sample. For example, a groundwater screening sample collected at location A in transect 1, at a depth of 20 to 25 feet bgs, was identified as "I-GWP-1A-20-25."

Each groundwater sample collected during this investigation was identified with a unique sample identification tag consisting of the site designation (i.e., MRC for Middle River Complex), followed by the sample-type designation (i.e., MW for monitoring well) and well location number (i.e., 164B), followed by the date of the sample. For example, a groundwater sample collected at well location 164B on August 11, 2020 was identified as "MRC-MW164B-081120."

The lone soil sample collected during the investigation was identified with a unique sample identification tag consisting of the sample-type designation (i.e., SB for soil boring), followed by the well boring number, followed by the depth of the sample.

Trip blanks for groundwater samples sent to the laboratory were identified as "TB-mm/dd/yyyy" and were sent with each cooler containing samples to be analyzed for VOCs.

SECTION 4
INVESTIGATION RESULTS

4.1 SOIL BORING INSTALLATION

Two soil borings, I-SB-315 and I-SB-316, were drilled to a depth of 40 feet below ground surface (bgs) in Block I south of Building C to provide lithology information which was used to determine approximate target depths for groundwater profiling (Figure 4-1). Boring I-SB-315, located on the western edge of the project area, consisted of sandy permeable lithology at 3–5.5 feet bgs, 23–29 feet bgs, and 30–32 feet bgs. Lithology observed in the same boring at 5.5–23 feet bgs and at 32-–40 feet bgs was impermeable clay. Boring I-SB-316, on the eastern edge of the target area (west of the ramp), consisted of permeable zones at 3–5.5 feet bgs, 7–23 feet bgs, and 25-38 feet bgs, while impermeable clay-rich zones were observed at 23-25 feet bgs and 38-40 feet bgs. No soil samples were collected from I-SB-315 or I-SB-316 for laboratory chemical analysis.

The zones of higher permeability were targeted for discrete groundwater sampling and field screening of trichloroethene to develop a high-resolution vertical profile of the chemical stratigraphy at each boring location.

4.2 GROUNDWATER PROFILING

Discrete samples for vertical groundwater profiling were obtained using a Geoprobe rig at borings 1A through 1D, via low-flow pumping through a stainless-steel probe fitted with a one-foot screen. Boring locations 1E and 1F were located under the ramp at the eastern edge of the project area. Probe refusal occurred 2 feet bgs at location 1E, and at 18 feet bgs at location 1F; neither boring yielded water. Aqueous samples from borings 1A through 1D were analyzed in the field by Tetra Tech using a calibrated FROG 5000™ gas chromatograph calibrated to trichloroethene (TCE). For quality control, a subset of the field samples (three samples) was submitted to an offsite laboratory (Eurofins TestAmerica Canton, Ohio) for volatile organic compounds (VOCs) analysis.

Trichloroethene concentrations detected in the field and analyzed in the laboratory during groundwater profiling activities are summarized in Table 4-1 and Table 4-2 and are illustrated in cross-section on Figure 4-2. The individual gas chromatograms generated for each FROG 5000™ sample are included in Appendix C. Groundwater samples were successfully obtained from most intervals identified as zones of higher permeability. Samples could not be obtained from some zones of marginal permeability as water was not available to be collected.

Table 4-1 summarizes field results obtained during groundwater profiling (GWP), TCE results from field screening using the FROG 5000™, and laboratory results for TCE collected at specific intervals for quality control (QC). As shown in Table 4-1, the highest TCE screening concentrations (18.70 micrograms per liter [µg/L], 13.83 µg/L, and 10.58 µg/L) detected via FROG 5000™ were observed at the following borings and depths, respectively: GWP-1C (30-35 feet bgs), GWP-1A (20-25 ft bgs), and GWP-1D (30-35 feet bgs).

Table 4-2 summarizes the VOCs detected in the three groundwater samples collected as QC duplicate samples and sent to the laboratory for full VOC analysis; these samples were collected from three borings at groundwater intervals in which TCE was detected during field screening (via FROG 5000™), and include locations GWP-1B (collected at 25-30 feet bgs), GWP-1C (collected at 25-30 feet bgs), and GWP-1D (collected at 30-35 feet bgs). TCE was detected in all three QC samples, at concentrations of 74 µg/L (GWP-1D), 19 µg/L (GWP-1B), and 8.2 µg/L (GWP-1C).

Eleven other VOCs were detected at low concentrations in the laboratory-analyzed GWP samples, notably including *cis*-1,2-dichloroethene (*cis*-1,2-DCE), benzene, and toluene. Benzene and *cis*-1,2-DCE were detected in all three samples, and toluene was detected in two of three samples (GWP-1B and GWP-1D).

Also shown on Tables 4-1 and 4-2, all groundwater detections were compared to federal maximum contaminant levels (MCLs) for drinking water (USEPA, 2009b), noting that these samples are from groundwater not used as a drinking water source. Maryland groundwater cleanup standards (MDE, 2018) are also used for comparison. TCE concentrations in five field groundwater screening samples and in all three laboratory analyzed samples, exceed the drinking water

maximum concentration level (MCL) and Maryland groundwater cleanup standard (both are 5 µg/L).

Groundwater profiling indicated that the concentrations of trichloroethene are present in the area directly south of Building C, and supported monitoring well installation to evaluate groundwater chemical concentrations.

GWP sampling results prompted the field team to install well MW164B targeted in-between GWP locations 1C and 1D, located on the eastern portion of the project area and west of the ramp.

4.3 MONITORING WELL DRILLING AND INSTALLATION

A continuous soil core was obtained from the ground surface to 40 feet below ground surface (bgs) at the monitoring well location for MRC-MW164. The completed boring log as well as the well construction details are in Appendix D.

As summarized on Table 4-3, one soil sample was collected and analysed for VOCs from the MW164B well installation boring at a depth of 15-20 feet bgs based on an elevated PID reading of 21.8 ppm. Trichloroethene was the only VOC detected, at a concentration of 50 micrograms per kilogram (µg/kg). The TCE concentration detected was well below the Maryland residential soil screening criteria of 410 µg/kg (MDE, 2018).

The lithology described in the boring log of well MRC-MW164 was not consistent with the boring (I-SB-316) drilled in the same area. I-SB-316 consisted of permeable sandy layers at 6.5-23 feet bgs and at 33-35 feet bgs, with impermeable clay-rich layers at 23-25 feet bgs and 35-40 feet bgs. MW-164 was drilled approximately 5 feet to the west of I-SB-316 and consisted of a varying lithology including a thick clay-rich impermeable zone starting at 14 feet bgs and continuing to 33 feet bgs. This impermeable zone hindered the proposed installation of a shallow monitoring well in this boring from 15 feet bgs to 25 feet bgs. The sandy permeable zone in the boring was from 33 to 40 feet bgs, which allowed for the B-zone well to be installed and screened from 30-40 feet bgs.

4.4 GROUNDWATER SAMPLING

The newly installed monitoring well in Block I was sampled for multiple parameters (see Section 3.3.3.5). The analytical data are tabulated and reported in Table 4-4 and volatile organic compound concentrations are illustrated in the tag map included as Figure 4-3. The complete laboratory data packages and data validation reports are in Appendix F. Data validation procedures were completed for all available data packages. Hexavalent chromium was sampled and arrived at the laboratory within hold time requirements of 24 hours; the sample was preserved upon receipt by the laboratory. The non-detection of 2-chloroethyl vinyl ether from two data packages were qualified as rejected due to the laboratory narrative indicating the sample was acid preserved.

4.4.1 Volatile Organic Compound Results

Four volatile organic compounds were detected in the newly installed monitoring well MW-164B in Block I, including a trichloroethene (TCE) concentration (9.9 µg/L) above the screening level (5 µg/L). Benzene (4.6 µg/L), cis-1,2-dichloroethene (1.7 µg/L), and isopropylbenzene (0.52 µg/L) were also detected at MW164B below their respective screening levels.

Groundwater from MW164B was also sampled and detected for volatile gases via method RSK-175; three volatile gases were detected, with concentrations of methane (11 µg/L), ethane (1.2 µg/L), and ethene (0.83 µg/L). The presence of methane may be, but is not necessarily, indicative of reductive dechlorination occurring in groundwater, as degradation of any organic matter often leads to methane generation. Therefore, the elevated methane detection observed could be an indication that bioactivity is occurring at this well location.

VOCs samples collected during this investigation were compared to the federal maximum concentration levels (MCLs) for drinking water, noting that these samples are from groundwater and not used as a drinking water source. TCE exceeded its respective federal drinking water MCL (USEPA, 2009b) and Maryland Groundwater Cleanup Standard (MDE, 2018), both of which are 5 µg/L, with a groundwater concentration of 9.9 µg/L. All other detected VOCs were below their respective federal drinking water MCLs.

TCE was also detected during groundwater sampling conducted at intermediate monitoring wells in 2020 (AECOM, 2020) near the newly installed well (MW164B) south of Building C. MW164B

is upgradient of MW92C, MW60B, and MW76B, and appears to confirm TCE contours in the area, because the 9.9 µg/L concentration at MW164B, is located near the inferred 10 µg/L logarithmic concentration contour line for TCE (Figure 4-3).

4.4.2 Polychlorinated Biphenyl Results

MW164B was sampled for polychlorinated biphenyls (PCBs) via USEPA Method 680, but all results were nondetect. PCB samples were not collected at monitoring wells near MW164B during the 2020 groundwater sampling event (AECOM, 2020), so no comparison/trend analysis can be conducted.

4.4.3 Metals Results

Seventeen total metals were detected from the newly installed monitoring well MW164B, as summarized in Table 4-4. Detected metals were compared to federal drinking water MCLs (USEPA, 2009b), noting that these samples are from groundwater not used as a drinking water source, and Maryland groundwater cleanup standards (MDE, 2018). All metals detections were lower than their respective drinking water MCLs, except for iron (24,000 µg/L), manganese (2,700 µg/L), and nickel (42 µg/L); their respective MCLs are 1,400 µg/L, 43 µg/L, and 39 µg/L. Manganese and nickel were also detected at nearby well MW60B during the 2020 annual groundwater sampling event, at concentrations of 2,300 µg/L and 46 µg/L, respectively. MW60B is located downgradient of MW164B and south of Building C (AECOM, 2020).

Hexavalent chromium was sampled from MW164B but yielded nondetect results.

4.4.4 Microbial DHC Results

MW164B was also sampled (but was nondetect) for microbial *Dehalococcoides* (DHC) and functional genes. DHC gene sampling detects bacterial species that are capable of a complete degradation of chlorinated ethenes (PCE, TCE, DCE and VC) to ethene. Low levels of TCE were detected at MW164B. DHC are usually associated with elevated levels of chlorinated VOCs such as TCE and thus the result that DHC were not detected in this location appear reasonable.

4.4.5 Miscellaneous Results

As shown on Table 4-4, groundwater from MW164B was also sampled at the laboratory for alkalinity (98 m/L), bromide (0.21 mg/L), hardness as calcium carbonate (96 mg/L), specific conductance (250 umhos/cm), sulfate (9 mg/L), and total dissolved solids (120 mg/L). These parameters are consistent with similar analysis of wells in this area of the MRC.

4.5 GAMMA RAY LOGGING RESULTS

Gamma ray logging was performed by the geophysical subcontractor Earth Data Northeast, Inc. (EDN), of Exton, Pennsylvania on October 13, 2020 at 21 monitoring wells (Table 4-5, Figure 4-4). Nine monitoring wells were logged in Block I south of Building C, while 12 wells were logged in Blocks G, H, and I, but west of Building A. The gamma scintillation meter was run up and down the well's casing on a wireline extending from the EDN field vehicle, and results were viewable in real time and stored digitally on EDN software. EDN provided a hard-copy field log after each well was logged, electronic copies of the final composite field logs in portable document format (PDF), and the digital results for each well in Microsoft Excel® format. A compilation of each PDF printout of gamma readings is included as Appendix G. Gamma logs were utilized to support the updated interpretation of the conceptual site model (CSM), as described below.

4.6 UPDATE TO THE CONCEPTUAL SITE MODEL

The generalized conceptual site model (CSM) upon which this investigation was scoped is presented in Section 2. As discussed, one objective of the investigation was to integrate the newly acquired hydrogeological information with the historical data to develop a revised CSM within the framework of an environmental sequence stratigraphy (ESS) model that is similar to the model that has been developed immediately to the south in Blocks E and F, where chlorinated benzenes and chlorinated solvents are also present in groundwater.

The primary goal of reinterpreting the project area hydrogeology within the ESS framework is to reconstruct the local paleoenvironment, including the lateral (facies) changes within the depositional sequences (chiefly highstand or lowstand), and to vertically stack sequential reconstructions to identify and map the three-dimensional distribution and continuity of the

primary aquifers (the fluvial paleochannels) at the site. These paleochannels often created incised valleys that filled with coarser and well-sorted fluvial sediment, forming highly transmissive aquifers that represent the current preferred groundwater migration pathways at the site.

4.6.1 General Geology

The project area is underlain by the unconsolidated sediments of the Patapsco and Arundel Formations that overall represent a thick sequence of fluvial-deltaic sedimentary deposits. The Patapsco Formation is composed primarily of plastic clays, silts, and fine- to medium-grained sands of variable thickness that are mixed or interbedded to varying degrees. The underlying Arundel Clay is chiefly composed of dark gray and maroon lignitic clay with thin to significantly thicker intervals of silt and fine- to coarse-grained sand. Based on the boring log for monitoring well MRC-MW94D, which is located near the border of Block C and Block E (Figure 4-1), the top of the Arundel Clay in the project area occurs at an elevation of approximately 0 feet relative mean sea level, roughly 30 to 40 feet below the ground surface.

4.6.2 Groundwater Conditions and TCE Plume

The project area south of Building C lies between two investigational site areas (Blocks E/F to the south and the area west of Building A in Block I to the west) where hydrogeologic units have been identified and integrated into an ESS framework. Figure 4-2, and Figures 4-5 through 4-7 show cross-sections of area-specific ESS interpretations south of Building C. The general footprint of the TCE plume within the study area and within the northern portion of Block E is illustrated on Figure 4-8; this figure vertically collapses the plume into one plane to define its total lateral extent and does not capture its three-dimensional distribution. This figure indicates:

- The plume is elongated and narrow, and is oriented and migrates in a generally northwest-to-southeast direction.
- The highest concentrations of TCE (> 2,000µg/L) are detected at monitoring wells MW60B (2,320 µg/L).
- The plume extends into the northern portion of Block E and does not appear to significantly dissipate in the downgradient direction, as a TCE concentration of 968 µg/L was detected at monitoring well MW79B, which is nearly 500 feet downgradient from MW60B.

- The plume exhibits a chemical stratigraphy, as wells completed at different depths within the same geographic location contain varying concentrations of TCE. In general, the TCE concentrations increase with depth with increasing distance downgradient of Building C.

The results of the high-resolution site characterization (HRSC) investigation conducted immediately south of Building C is presented in cross-section A-A′ (Figure 4-2). The HRSC, developed using groundwater profiling (GWP) and two soil borings, indicates that the lateral and vertical distributions of the primary sand-prone intervals are highly heterogeneous. The cross-sectional geometries illustrate how sand-prone intervals can be relatively narrow, how they do not necessarily consist entirely of sand, and how they can contain discrete zones of low hydraulic conductivity within zones or sequences of overall higher conductivity. Conclusions drawn from the HRSC include:

- In general, the dominant lithology is clay.
- The amount of sand varies both laterally and vertically in the eastern half of the section, but no thick or laterally continuous sand beds were encountered.
- Saturated conditions were encountered as shallow as 15 feet bgs in sand encountered in soil boring SB-316. However, clay encountered at similar depths in adjacent borings was dry, indicating that the sand is the preferential pathway for groundwater occurrence and migration.
- TCE concentrations detected across the A-A′ section from both field and laboratory samples are generally similar (<100 µg/L) and two orders of magnitude lower than those detected immediately downgradient.
- The soil sample taken from a depth of 15–20 feet bgs in boring MW164B contained TCE at 50 µg/kg, which is consistent with the concentrations detected in the groundwater.
- Some TCE appears to originate along the immediate southern side or beneath the footprint of Building C, but the concentrations do not suggest that the primary source of the TCE plume in the project area lies beneath the building.

4.6.3 ESS Framework for South of Building C and Northern Portion of Block E

The hydrogeological and chemical data obtained during this current investigation and past investigations were interpreted using ESS theory and methods for this project area. Hydrogeologic units were identified and mapped, and their extent on the project area's TCE plume were assessed. This interpretation includes the area south of Building C only, and the lateral and vertical extent of the stratigraphic units will be defined only as they exist within the project area. Where possible, the stratigraphic equivalence of the Block I units with those previously defined in Blocks E/F and west of Building A are identified or discussed.

The ESS framework was developed through the construction of four hydrogeologic cross-sections that traverse through the project area (Figures 4-2, and 4-5 through 4-7). The passive gamma geophysical logs, where available, are posted next to the boring log. The hydraulic head and detected TCE concentrations for each well, as reported for the 2020 annual sampling event (AECOM, 2020), are posted next to the well screens.

Cross-section A-A′ (Figure 4-2) extends along the southern boundary of Building C and includes data obtained from the HRSC GWP program, soil borings, and the installation of new monitoring well MW-164B. Cross-section B-B′ (Figure 4-5) extends from Building C in Block I to monitoring well MW-79B in Block E, and represents a northwest-to-southwest section that is oriented along the axis of the TCE plume. Cross-section C-C′ (Figure 4-6) is a southwest-to-northeast section that is oriented perpendicular to the TCE plume. Cross-section D-D′ (Figure 4-7) is a southwest-to-northeast section that is oriented perpendicular to the TCE plume within the northern portion of Block E.

Three hydrogeologic units have been identified through the construction of the hydrogeologic cross-sections. These consist of two units within the Patapsco Formation (hydrogeologic units C-1 and C-2) that are separated by a sequence boundary (SQB-C1) and one hydrogeologic unit within the Arundel Clay (hydrogeologic unit C-3) that is separated from the lower Patapsco Formation by an older sequence boundary (SQB-C2). The following ESS observations are noted through the construction of these cross-sections:

- The subsurface area immediately adjacent to Building C (cross-section A-A′) is lithologically characterized by clays and clayey sediments to the west that become somewhat coarser-grained or sandier to the east. Although the lithologic information is limited (no lithologies were available for the GWP points), the sandier units overall are interpreted to be laterally discontinuous. For example, a saturated sand was encountered in soil boring SB-316 between the elevations of zero to ten feet above mean sea level. In the adjacent GWP point 1D, no water was obtained from the same vertical interval, which implies that the sand is not present in the GWP point. Also, the saturated sand encountered at the base of MW-164B does not have a laterally equivalent unit.

  — The two eastern-most GWP points (1E and 1F) could not be completed to total depth due to logistical constraints. GWP-1E encountered refusal due to construction materials just below the surface. GWP-1F encountered refusal at 18 feet because the smaller drilling rig required at this location could not penetrate what was believed to be a tough clay, which supports the observation that the sand encountered in SB-316 is not laterally continuous.

- Similar to the conditions noted adjacent to the building, the area just to the south (near MW-92C) is lithologically characterized by clays and finer-grained sediments that also include interbedded and laterally discontinuous sands. Sand and coarser-grained deposits become thicker and more widespread in the area south of the location of MW92C.

- Hydrogeologic unit C-1 is mostly characterized by a high gamma log response that displays a stacked or aggrading signal. Generally, this response in a fluvial-deltaic setting is indicative of a low-energy depositional environment such as a floodplain.

- In the southern (downgradient) portion of (cross-section B-B′) and in the eastern portion of downgradient section D-D′, hydrogeologic unit C-1 contains thick sand displaying "blocky" gamma log signatures that are suggestive of high-energy, paleochannel depositional conditions. The sand occurs at the base of unit C-1 and just above sequence boundary SQB-C1, which is consistent with ESS theory. The sand is best developed and evident at borehole locations MW48A and MW79B.

- Although not consistent or well developed, hydrogeologic unit C-2 is generally characterized by a "fining-upward" gamma log response that reflects a "coarsening-upward" distribution of sediment grain size. This signal is typically indicative of a pro-grading, delta-front environment.

- The overall lithology within hydrogeologic unit C-2 is similar to that of unit C-1, with clay dominating to the north and west of the project area, and sand increasing in abundance to the south and east. Thick sand displaying "blocky" gamma log signatures is strongly

suggestive that high-energy, paleochannel depositional conditions occurs at the base of hydrogeologic unit C-2 and just above sequence boundary SQB-C2. The sand is best developed and evident at borehole locations MW27A/B/C, MW79B, and MW102A/B (cross-sections B-B′ and D-D′), but it is also present and well developed near Building C and the former drum storage area, as noted at locations MW164B and MW60A/B (section B-B′).

- Hydrogeologic unit C-3 (the Arundel Clay) is encountered only in the deepest borings within the project area. The unit is characterized by a thick sequence of stiff, black, organic-rich clay. In the southern, most downgradient portion of the project area (at MW27C and MW94D), the unit contains several sequences of thick sand displaying blocky gamma log signatures and representing significant high-energy channeling events. Note that the stratigraphic equivalence of these paleochannels was not evaluated due to their limited presence and the distance between the monitoring wells.

The following hydraulic observations were noted through the construction of the cross-sections:

- The hydraulic head elevation in newly installed monitoring well (MW164B) appears to be abnormally high. The static water level in the well is near the top of casing, even though saturated conditions were not encountered until the bottom of the well boring, at depths of about 30–40 feet bgs. The reason(s) for this elevated head reading is not known; conditions in this well will continue to be monitored and evaluated during future sampling events. The hydraulic head elevation suggests that the sand may be recharged hydraulically upgradient (north) of the well location (potentially under Building C) and that the building slab is creating locally confining conditions for this sand unit.

- The hydraulic head elevations within hydrogeologic units C-1 and C-2 at well cluster locations in the northern and western portions of the project area are similar and indicate that the units are hydraulically interconnected and likely function as a common hydrogeologic unit in this area (cross-sections B-B′ and C-C′). The hydraulic gradient is low and is mostly oriented vertically downward (for example, MW60A/B, MW76A/B, MW81A/B, MW101A/B).

- The vertical hydraulic gradient between hydrogeologic units C-1 and C-2 increases in the southeastern portion of the project area, where the presence of the paleochannels (as revealed by the presence of sands and silts) is best defined. The lithologic character of the clays and their ability to function as an aquitard is not significantly different throughout the project area, so it is hypothesized that the gradients result from the lower hydraulic heads created within the highly transmissive paleochannels present within both units (for example, at MW102A/B and MW27A/B/C). Note that at monitoring well cluster MW27,

groundwater flow converges into hydrogeologic unit C-2 from both above (unit C-1) and below (unit C-3), suggesting that the unit C-2 sand at this location is highly transmissive.

The following chemical (TCE plume) observations were noted through the construction of the cross-sections:

- The TCE concentrations detected adjacent to Building C are relatively low, with the highest detection of 74 ug/L obtained from GWP-1D.
- The overall highest TCE concentrations occur south of Building C to the east of the drum storage facility and (with the exception of MW-48A) are associated with hydrogeologic unit C-2, even near a possible source area (cross-section B-B′, monitoring well location MW60A/B). This is interpreted to reflect the interconnectedness of hydrogeologic units C-1 and C-2 and the downward vertical hydraulic gradient.
- The lateral extent of the plume is restricted, which is interpreted to reflect the highly channelized nature of the plume's migration pathway.

4.6.4 Conclusions

The ESS investigation for the area south of Building C has detected and defined the presence and orientation of sand-prone paleochannels within the dominantly clay-rich subsurface environment. The transmissive paleochannels serve as primary migration pathways for groundwater migration, and consequently, the TCE groundwater plume. The geometry of the sand-prone paleochannels results in the elongated length and narrow width of the TCE plume.

The highest TCE concentrations are found within both hydrogeologic unit C-1 (2,160 ug/L at MW-48A and unit C-2 (2,320 ug/L at MW-60B. Overall, the highest TCE groundwater concentrations, and the presumably highest TCE mass concentrations, occur mostly within hydrogeologic unit C-2. The hydraulic heads posted on the cross-sections indicate that groundwater flow also converges into hydrogeologic unit C-2 from both above (hydrogeologic zone C-1) and potentially in isolated areas from below (hydrogeologic zone C-3), if there is a high presence of interbedded sands such as those present at well cluster location MW-27). Although the lateral distribution of hydraulic head within the units was not mapped or contoured (because many of the wells are not yet tied into the ESS framework), it is likely that groundwater flow also converges laterally into the sand-prone paleochannels.

The HRSC did not identify high concentrations of TCE flowing downgradient from beneath the footprint of Building C. Although a migration pathway (a paleochannel) was possibly missed, the limited lateral and vertical extent of permeable sand immediately south of the building supports the conclusion that this pathway is not present. If true, this indicates that a relatively minor source of TCE exists within the footprint of Building C, and a second, more significant source of TCE exists within the vicinity of MW-60A/B and MW-48A.

It is possible that the downgradient extent of the TCE plume has not been fully defined, as the most downgradient plume well (MW-79B in Block E) contains TCE at 968 µg/L, and groundwater in that area is migrating within a well-defined channel in hydrogeologic unit C-2.

Risk Handling Checklist

Project Manager: Use this checklist to develop risk handling plans before the dig starts. You must also review Enterprise Operations Procedure EO-28, Digging Projects.

General Questions	☒	What Lockheed Martin processes could be affected by the dig? **No Lockheed Martin processes or operations are expected to be impacted as all work will be conducted outside the factory south of Building C. Tetra Tech will work with Lockheed Martin and their tenants to minimize potential impacts, if present.**
	☒	What are the safety hazards? **Utilities, slips/trips/falls, vehicle traffic, DPT rig hazards, pinch points**
	☒	What could fail? **Mechanical components on excavator and auger equipment**
	☒	How could it fail? **A component of the drilling rig and or equipment could potentially fail. An inspection of the equipment will be conducted on arrival at the site and daily to ensure proper working condition. Approved Health and Safety Plan in place (reviewed by corporate EESH)**
	☒	Does the area need to be returned to its normal state when the work is complete? **Yes, soil borings will be grouted to surface upon completion.**
	☐	How could the dig affect operations/test/production? **No operations will be affected, work has been conducted in these areas many times without any impact to facility operations.**
	☐	Have potential risks been addressed with area management? **No risks identified**
	☒	Am I comfortable with any risk handling plans, understanding the potential impact? **Yes**
Traffic Control	☒	Ensure proper signage and communication. **Existing security fencing separates roads from proposed work areas.**
	☒	Coordinate road or access closures through Industrial Security before starting the dig. **Existing fencing separates roads from proposed work areas.**
	☒	Ensure the work area is isolated from foot traffic by placing barriers and warning lights as required by EO-28.
	☒	Ensure that vehicle traffic will be safe. **Access to Chesapeake Park Plaza will proceed with caution.**
	☒	Ensure that product transport will be safe. **Access to Chesapeake Park Plaza will proceed with caution.**
Excavation	☒	Review facility drawings to identify utilities. Research old drawings as necessary. **Available site engineering and utility maps were reviewed.**
	☒	Discuss the project with Facility Engineering/Maintenance staff that may have unique knowledge about the construction area not documented in facility drawings. **Work has been completed in this area many times in the past. All third party utility clearance was completed.**
	☒	Process form EO-28-1, Dig Permit. Use this opportunity to explain the process and relate expectations to the contractor/LM organization that will perform the dig.
	☒	Have LM Telecommunications and the local utility identification service locate and mark utilities/underground obstacles.
	☒	Coordinate with other ongoing projects in the affected area. **N/A**
	☒	Make every effort not to excavate around live utilities in service. Schedule an outage in advance or have Maintenance temporarily shut down and isolate the utilities while excavating. **Underground utilities marked by Miss Utility and private utility locating service. All utilities will be avoided.**
	☒	If live utilities cannot be shut down while excavating, know where to isolate or shut them down if they are damaged while excavating**. No utilities will be encountered**
	☒	Have a spotter(s) work with the equipment operator. Hand dig when necessary. **Spotters will always be utilized**
	☒	Excavate along the side of the utility; not on top. **No utilities will be encountered**
	☐	Weather may affect the dig. Ensure water pipes are protected during freezing weather, especially if the trench will be left open over night. Rain may cause the side of the trench to slough, which can undermine and break pipes/conduit. **N/A**
	☐	Ensure care when moving trench boxes in and out of trenches so pipes/conduit aren't damaged by the boxes. **N/A**
	☒	Ensure surface drainage is controlled so that water doesn't get into the excavation and undermine soil supporting utilities. **Protections will be incorporated as necessary to protect storm drain piping and outlets.**
	☐	Ensure stocked material is kept far enough back (minimum 2 feet) so that material and rocks don't fall on utilities in the open hole. **N/A.**
	☒	Ensure backfilling is done carefully: Re-bed utilities with proper material, filling all voids below. Keep inappropriate material from falling on or being placed in the trench. Be careful when compacting backfill in the two feet directly above the utility. **Site restoration consisting of backfilling all auger holes will be completed when each boring is done as well as asphalt replacement (cold patch).**
	☒	Keeps the as-built utility drawing in the field while the excavation site is open. Take pictures if possible (horizontal alignment and elevations), if known utilities deviate from facility drawings or if utilities are found that are not on facility drawings. Give the modified as-built drawings to the Building/Facility Manager, who will update the drawing database.
	☒	Ensure that the equipment operator digs slowly and remains in control. **All site activities will be monitored by Tetra Tech.**

Personal Safety	☐	Ensure that trenching and shoring methods comply with the applicable OSHA regulations and are overseen by a "Competent Person," as defined in those regulations. **NA**
	☒	Regularly inspect methods to prevent violations. **All construction is monitored by Tetra Tech, all personnel have stop work authority.**
	☒	Ensure LM employees do not dig or enter any excavation that is more than four feet deep. **All work is being completed by Tetra Tech and its subcontractors.**

SUBSURFACE UTILITY ENGINEERING PROJECT COMPLETION REPORT

RETTEW

TO: Mike Martin, Tetra Tech

FROM: Bill Steinhart, RETTEW Field Services, Inc.

CC: John B. Stipe III, RETTEW Associates, Inc.

DATE: June 17, 2020

CLIENT: Tetra Tech	PROJECT LOCATION: Middle River Complex Middle River, MD
PROJECT NO: 019872020	
PROJECT NAME: Middle River Drop Hammer and Building C	
TECHNICIANS: Bill Steinhart	
UTILITIES LOCATED:	**EQUIPMENT:**

SCOPE OF WORK

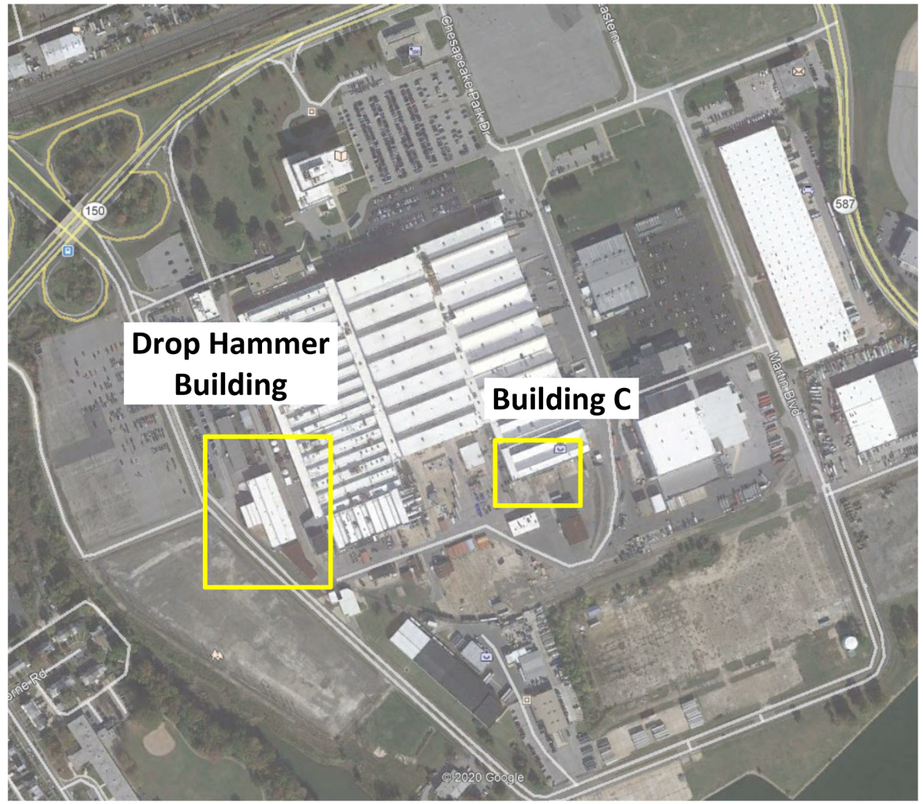
RETTEW completed a subsurface utility survey to mark-out utilities near eight proposed soil boring locations south of Building C, and 10 proposed soil vapor test locations in and around the Drop Hammer Building.

METHODOLOGIES

RETTEW first traced utilities with visible surface features (i.e. manhole covers, valves, utility poles, hydrants) utilizing the EM locator. RETTEW then searched the site for unknown utilities with GPR, the M-scope, and the passive utility locator.

RESULTS/CONCLUSIONS

On May 22, 2020, Bill Steinhart of RETTEW arrived on site and with Josh Mullis of Tetra Tech. Together they identified the proposed soil boring locations and soil vapor test locations. The Drop Hammer Building had a reinforced concrete floor. The only instruments utilized in the Drop Hammer building were the C.A.T. and GPR. The soil vapor testing, proposed by Tetra Tech, requires a small penetration through the concrete inside and the asphalt outside; marking the utility locations in these areas was not necessary. At each soil vapor testing location, a small area clear of utilities was marked on the floor or asphalt. The soil vapor test locations are depicted on **Figure 1**, bottom left panel.



The soil borings south of Building C were cleared for utilities. A storm sewer line and fire protection line run adjacent to the array of soil borings. The concrete was wet from rain, and the utility locations could not be marked. The client was shown ground surface storm inlets that were coincident with the storm line. It was determined that the water line would not be encountered by the soil borings. The soil boring locations and utilities are depicted in **Figure 1**, upper right corner.

Enclosures: Annotated map is provided in **Figure 1**. Photos taken at the site are included in **Attachment A**.

RETTEW strives to provide quality and accurate locating services to all of its clients, but due to the nature of underground facilities, RETTEW will not be held liable for any damaged facilities. All clients are advised that they are required to follow their state's One-Call-Law before beginning excavation. The marks placed during this investigation are temporary markings for utility mapping purposes. The marks are not intended, nor should they be used, for construction; legal and/or recommended construction tolerance zones associated with the identified utilities were not marked by RETTEW. Prior to construction activities, RETTEW should be contacted for re-marking of the utilities and construction tolerance zones.

RETTEW will not guarantee the longevity of utility markings, due to activities on site that may destroy, or otherwise alter, the markings that were placed on the ground by RETTEW. If the marks have been altered or destroyed, the client is advised to contact RETTEW for re-markings. Any electronically determined depths provided to the client are estimates only, and due to equipment limitations, cannot be guaranteed. The client acknowledges that due to the limitations of the equipment used, safe exposure and measurements are the only methods which can precisely determine location and depth of structures marked.

Re: Chesapeake Park (LMC) Well Monitoring Report

Attn: Mr. Josh Mullis

Dear Mr. Mullis,

In accordance with your request, I am providing this letter and attachment which represents the measurements associated with the MRC Monitoring Well Locations performed in October 2020. The datum used for the measurements are based on the Maryland Coordinate System NAD83/2011 epoch 2011 for horizontal position and NAVD88 for vertical position.

Overview

The sample set for LMC-MRC BLDG.C, SDG 240-131288-1, consisted of one (1) aqueous sample and one (1) trip blank. All samples were analyzed for volatile organic compounds (VOCs) as referenced above.

The samples were collected by Tetra Tech, Inc. on June 3, 2020 and analyzed by Eurofins – Canton. All analyses were conducted in accordance with SW-846 Method 8260B analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, GC/MS tuning, laboratory method/trip blank results, surrogate spike recoveries, laboratory control sample results, matrix spike / matrix spike duplicate recoveries, internal standard areas, field duplicate results, chromatographic resolution, compound identification, compound quantitation and detection limits. Areas of concern are listed below.

- None.

Minor

- The VOC Initial calibration verification (ICV) performed on instrument A3UX16 on 5/18/2020 @ 12:38 had %Ds for dichlorodifluormethane and chloromethane which exceeded the 20% quality control limit. All samples were affected. The detected and non-detected results reported for dichlorodifluormethane and chloromethane in the affected samples were qualified as estimated, (J) and (UJ), respectively.

- The VOC continuing calibration verification (CCV) performed on instrument A3UX16 on 6/10/2020 @ 09:28 had %Ds for bromomethane, 1,1-dichloroethane, cyclohexane, toluene, trans-1,3-dichloropropene, and styrene which exceeded the 20% quality control limit. All samples were affected. The detected and non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (J) and (UJ), respectively.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

Notes

Non-detected results were reported to the method detection limit (MDL).

The VOC batch QC MS/MSD had percent recoveries greater than the QC limit for 1,1-dichloroethane, 1,2-dichloropropane, and chloroform. No action was taken on this basis as the MS/MSD was not performed on a Tetra Tech sample.

Executive Summary

Laboratory Performance: VOC CCV %D exceedance of the 20% quality control limit resulted in qualification of the data.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

2. Were tamper/custody seals on the outside of the cooler(s)? If Yes Quantity 1 (Yes) No
   -Were the seals on the outside of the cooler(s) signed & dated? (Yes) No NA
   -Were tamper/custody seals on the bottle(s) or bottle kits (LLHg/MeHg)? Yes (No)
   -Were tamper/custody seals intact and uncompromised? (Yes) No NA
3. Shippers' packing slip attached to the cooler(s)? (Yes) No
4. Did custody papers accompany the sample(s)? (Yes) No
5. Were the custody papers relinquished & signed in the appropriate place? (Yes) No
6. Was/were the person(s) who collected the samples clearly identified on the COC? Yes (No)
7. Did all bottles arrive in good condition (Unbroken)? (Yes) No
8. Could all bottle labels be reconciled with the COC? (Yes) No
9. Were correct bottle(s) used for the test(s) indicated? (Yes) No
10. Sufficient quantity received to perform indicated analyses? (Yes) No
11. Are these work share samples? Yes (No)
    If yes, Questions 12-16 have been checked at the originating laboratory.
12. Were all preserved sample(s) at the correct pH upon receipt? Yes No (NA) pH Strip Lot# HC902937
13. Were VOAs on the COC? (Yes) No
14. Were air bubbles >6 mm in any VOA vials? ● ⬅ Larger than this. Yes (No) NA
15. Was a VOA trip blank present in the cooler(s)? Trip Blank Lot # NA (Yes) No
16. Was a LL Hg or Me Hg trip blank present? Yes (No)

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC South of Building C

Report Number: 240-131288-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, Canton attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 6/4/2020 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.7º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples I-GWP-1B-25-30 (240-131288-1) and TB-060320 (240-131288-2) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 06/10/2020.

The continuing calibration verification (CCV) analyzed in batch 240-437675 was outside the method criteria for the following analytes: Multiple Analytes. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Overview

The sample set for LMC-MRC BLDG.C, SDG 240-131413-1, consisted of one (1) aqueous sample and one (1) trip blank. All samples were analyzed for volatile organic compounds (VOCs) as referenced above.

The samples were collected by Tetra Tech, Inc. on June 4, 2020 and analyzed by Eurofins – Canton. All analyses were conducted in accordance with SW-846 Method 8260B analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, GC/MS tuning, laboratory method/trip blank results, surrogate spike recoveries, laboratory control sample results, matrix spike / matrix spike duplicate recoveries, internal standard areas, field duplicate results, chromatographic resolution, compound identification, compound quantitation and detection limits. Areas of concern are listed below.

Major

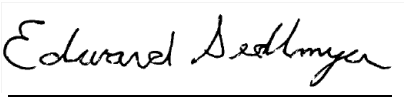
- None.

Minor

- The VOC continuing calibration verification (CCV) performed on instrument A3UX12 on 6/15/2020 @ 17:06 had a %D for dichlorodifluoromethane which exceeded the 20% quality control limit. All samples were affected. The non-detected results reported for dichlorodifluoromethane in the affected samples were qualified as estimated, (UJ).

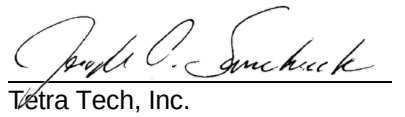
- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

Notes



Non-detected results were reported to the method detection limit (MDL).

Executive Summary



Laboratory Performance: VOC CCV %D exceedance of the 20% quality control limit resulted in qualification of the dichlorodifluoromethane data.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC South of Building C

Report Number: 240-131413-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, Canton attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 6/5/2020 9:40 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 4.2º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples I-GWP-1C-25-30 (240-131413-1) and TB-060420 (240-131413-2) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 06/16/2020.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-438414.

The continuing calibration verification (CCV) analyzed in batch 240-438414 was outside the method criteria for difluorodichloromethane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte is considered estimated.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

OVERVIEW

The sample set for MRC – Block E, SDG 240-133597-1, consists of one (1) soil environmental sample and one (1) trip blank. Samples were analyzed for volatile organic compounds (VOC). No field duplicate pairs are included in this SDG.

The samples were collected by Tetra Tech on July 16, 2020 and analyzed by Eurofins TestAmerica. Analyses were conducted in accordance with SW-846 Method 8260B analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method/trip blank results, surrogate spike recoveries, laboratory control sample results, internal standard recoveries, analyte identification, analyte quantitation, and detection limits. Areas of concern with respect to data quality are listed below.

MAJOR PROBLEMS

- The laboratory case narrative indicates that sample TB-071620 was preserved with hydrochloric acid, and the VOC analyte 2-chloroethyl vinyl ether is an acid-labile compound that degrades in an acidic medium. The non-detected result for 2-chloroethyl vinyl ether was rejected (UR) in sample TB-071620.

MINOR PROBLEMS

- The VOC continuing calibration verification performed on 07/23/2020 at 12:58 on instrument A3UX10 had percent differences (%Ds) that were greater than the 20% quality control limit for the following analytes: dichlorodifluoromethane, chloromethane, trichlorofluoromethane, 1,1,2-trichlorotrifluoroethane, tertiary-butyl alcohol, 2,2-dichloropropane, 1,1,1-trichloroethane, carbon tetrachloride, 2-chloroethyl vinyl ether, tetrachloroethene, 1,1,2,2-tetrachloroethane, 1,2,3-trichloropropane, tert-butylbenzene, sec-butylbenzene, 4-isopropyltoluene, n-butylbenzene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, and naphthalene. Sample TB-071620 was affected. Non-detected results for the aforementioned analytes were qualified as estimated (UJ) in the affected sample.

- The VOC continuing calibration performed on 07/22/2020 at 13:03 on instrument A3UX14 had %Ds that were greater than the 20% quality control limit for bromomethane, chloroethane, acetone, tertiary-butyl alcohol, vinyl acetate, 1,2-dichloroethane, dibromomethane, bromoform, 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane, and 1,2,3-trichlorobenzene. Sample MRC-MW-164B-15-20 was affected.

Non-detected results for the aforementioned analytes were qualified as estimated (UJ) in the affected sample.

- One VOC compound was detected in the laboratory blanks at the following maximum concentration:

Analyte	Maximum Concentration	< or > Reporting Limit (RL)
Carbon disulfide	1.37 ug/kg(1)	< RL

1 - Maximum concentration detected in method blank associated with batch 240-443733 affecting sample MRC-MW-164B-15-20.

The detected result for carbon disulfide in sample MRC-MW-164B-15-20 was less than the RL and was qualified as non-detected (U) due to laboratory blank contamination.

NOTES

Non-detected results were reported to the MDL.

The laboratory control sample (LCS) 240-443947/4 associated with 240-443947 had percent recoveries (%Rs) for carbon tetrachloride, 1,1,1-trichloroethane, 1,1,2-trichlorotrifluoroethane, 1,2,4-trichlorobenzene, 4-isopropyltoluene, tetrachloroethane, hexachlorobutadiene, n-butylbenzene, trichlorofluoromethane, and sec-butylbenzene that were greater than the laboratory quality control limit. Sample TB-071620 was associated with this LCS. No qualification was necessary because results for these analytes were non-detected in sample TB-071620.

The laboratory LCS forms did not include tert-amyl methyl ether. The laboratory case narrative noted that the LCS associated with preparation batch 240-443751 recovered outside control limits for tert-amyl methyl ether and was biased high in the LCS. No qualification is necessary on this basis because the result for tert-amyl methyl ether is non-detected in the associated sample, MRC-MW-164B-15-20. The associated laboratory quantitation report for the LCS has been included in this validation report.

The laboratory case narrative noted the following associated with sample TB-071620: The reporting limit (RL) provided for the following analyte (Hexachlorobutadiene) falls below the laboratory's verified standard quantitation limit: Results reported below the verified standard quantitation limit have less certainty (i.e., are estimated) and must be used at the clients discretion. The continuing calibration blanks and method blanks may not support the lower RL." The result for hexachlorobutadiene in sample TB-071620 was qualified as estimated due to calibration noncompliance; no additional qualification was added.

The laboratory case narrative notes the following associated with sample TB-071620: "LCS was above calibration limit but passed percent recovery limits for 1,2,3-trichlorobenzene. Sample was ND and a low-level standard (MRL) was analyzed and the affected compound was detected." No qualification was necessary on this basis.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Several non-detected results were qualified due to calibration noncompliance. One result was qualified due to method blank noncompliance.

Other Factors Affecting Data Quality: The non-detected result for 2-chloroethyl vinyl ether in the trip blank was rejected due to preservation noncompliance.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to

address only those problem areas affecting data quality.

QUALIFIED ANALYTICAL RESULTS

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC Block E

Report Number: 240-133597-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, Canton attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 7/17/2020 10:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.2º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Sample MRC-MW-164B-15-20 (240-133597-2) was analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The sample was prepared on 07/22/2020 and analyzed on 07/23/2020.

Carbon disulfide was detected in method blank MB 240-443733/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Method 8260B: The continuing calibration verification (CCV) associated with batch 240-443733 recovered above the upper calibration limit for Carbon Disulfide. The samples associated with this CCV were below the reporting limit for the affected analytes; therefore, the data have been reported. The associated samples are impacted: MRC-MW-164B-15-20 (240-133597-2), (CCV 240-443733/4), (CCVIS 240-443733/3), (LCS 240-443733/5), (LCS 240-443733/6), (MB 240-443733/7), (240-133595-C-3-A), (240-133595-C-3-B MS) and (240-133595-C-3-C MSD).

Method 8260B: The laboratory control sample (LCS) for preparation batch 240-443751 and 240-443751 and analytical batch 240-443733 recovered above the upper calibration limits for the following analytes: Carbon Disulfide. These analytes were biased high in the LCS and were not detected above the reporting limit in the associated samplesMRC-MW-164B-15-20 (240-133597-2), (LCS 240-443733/5), (LCS 240-443733/6), (MB 240-443733/7), (240-133595-C-3-A), (240-133595-C-3-B MS) and (240-133595-C-3-C MSD) ; therefore, the data have been reported.

Method 8260B: The laboratory control sample (LCS) for preparation batch 240-443751 and 240-443751 and analytical batch 240-443733 recovered outside control limits for the following analytes: tert-Amyl Methyl Ether. These analytes were biased high in the LCS and were not detected in the associated samplesMRC-MW-164B-15-20 (240-133597-2), (LCS 240-443733/6), (MB 240-443733/7), (240-133595-C-3-A), (240-133595-C-3-B MS) and (240-133595-C-3-C MSD) ; therefore, the data have been reported.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Sample TB-071620 (240-133597-1) was analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The sample was analyzed on 07/23/2020.

Several analytes failed the recovery criteria high for LCS 240-443947/4. Refer to the QC report for details.

Several analytes failed the recovery criteria high for the MS and the MSD of sample 240-133570-1 in batch 240-443947.

Refer to the QC report for details.

Method 8260B: The preservative used in the sample containers received is not compatible with the analytes requested. 2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample. TB-071620 (240-133597-1)

Method 8260B: The laboratory control sample (LCS) for analytical batch 240-443947 recovered outside control limits for multiple analytes: These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. TB-071620 (240-133597-1) and (LCS 240-443947/4)

Method 8260B: The reporting limit (RL) provided for the following analyte (Hexachlorobutadiene) falls below the laboratory's verified standard quantitation limit: Results reported below the verified standard quantitation limit have less certainty (i.e., are estimated) and must be used at the clients discretion. The continuing calibration blanks and method blanks may not support the lower RL. TB-071620 (240-133597-1)

Method 8260B: LCS was above calibration limit but passed percent recovery limits for 1,2,3-Trichlorobenzene. Sample was ND and a low level standard (MRL) was analyzed and the affected compound was detected.
TB-071620 (240-133597-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT SOLIDS

Sample MRC-MW-164B-15-20 (240-133597-2) was analyzed for percent solids in accordance with ASTM Method D2216-80. The sample was analyzed on 07/22/2020.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

MIDDLE RIVER CENTER (MRC) BUILDING C
SAMPLE DELIVERY GROUP (SDG) 240-134814-1

SAMPLES: 1/ Aqueous

MRC-MW-164B-081120

OVERVIEW

The sample set for MRC SDG 240-134814-1 consists of one (1) aqueous environmental sample. No field duplicate pairs are included in this SDG.

The sample was collected by collected by Tetra Tech on August 11, 2020 and analyzed by Eurofins TestAmerica. Analyses were conducted in accordance with Method 8260B EPA Method 218.6 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibration data, laboratory method/preparation blanks, laboratory control sample results, detection limits, and analyte quantitation. Areas of concern with respect to data quality are listed below.

MAJOR PROBLEMS

- The nondetected result for 2-chloroethylvinyl ether was qualified as unreilable because of acid preservation during sample collection. The result is qualified (UR).

MINOR PROBLEMS

- None.

NOTES

Non-detected results were reported to the method detection limit (MDL).

EXECUTIVE SUMMARY

Laboratory Performance Issues: Some blank spike recoveries were high in the VOC and PCB fractions.

Other Factors Affecting Data Quality: The result for 2-chloroethyl vinyl ether was qualified as rejected because of acidic sample preservation..

The data for these analyses were reviewed with reference to the USEPA “National Functional Guidelines for Organic Superfund Methods Data Review” (January 2017) and “National Functional Guidelines for Inorganic Superfund Methods Data Review” (January 2017). The text of this report has been formulated to address only those problem areas affecting data quality.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
U	Indicates the analyte was analyzed for but not detected.

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

No additional comments.

Receipt
The sample was received on 8/12/2020 11:00 AM; the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.2º C.

GC/MS VOA
Method 8260C: The laboratory control sample (LCS) for analytical batch 240-447281 recovered outside control limits for 2-chloroethyl vinyl ether. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260C: The preservative used in the sample containers provided is not compatible with one of the Method 8260 analytes requested. The following sample was received preserved with hydrochloric acid: MRC-MW-164B-081120 (240-134814-1). The requested target analyte list includes 2-Chloroethyl vinyl ether, an acid-labile compound that degrades in an acidic medium.

Method 8260C: The continuing calibration verification (CCV) analyzed in batch 240-447281 was outside the method criteria for some analytes. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260C: Batch analytical batch 240-447281 is reported without a matrix spike/matrix spike duplicate (MS/MSD), because the batch MS/MSD was canceled. This MS/MSD result does not have immediate bearing on any samples except for the actual sample spiked. The associated laboratory control sample (LCS) met acceptance criteria and provides long-term precision and accuracy for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin
Method 680: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 410-34321 and analytical batch 410-34909 recovered outside control limits for the following analytes: DCB Decachlorobiphenyl, Total Dichlorobiphenyls Total Monochlorobiphenyls Total Tetrachlorobiphenyls Total Trichlorobiphenyls. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

SUBJECT: **INORGANIC DATA VALIDATION – HEXAVALENT CHROMIUM**
MIDDLE RIVER CENTER (MRC) BUILDING C
SAMPLE DELIVERY GROUP (SDG) 500-186280

SAMPLES: 1 / Aqueous / Hexavalent Chromium

MRC-MW-164B-081120

OVERVIEW

The sample set for MRC SDG 500-186280-1 consists of one (1) aqueous environmental sample. No field duplicate pairs are included in this SDG.

The sample was collected by collected by Tetra Tech on August 11, 2020 and analyzed by Eurofins TestAmerica. Analyses were conducted in accordance with EPA Method 218.6 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibration data, laboratory method/preparation blanks, laboratory control sample results, detection limits, and analyte quantitation. Areas of concern with respect to data quality are listed below.

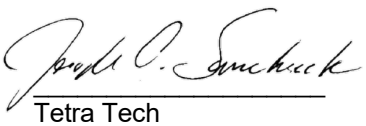
MAJOR PROBLEMS

- The holding time of 24 hours from collection to analysis was grossly exceeded and the nondetected result in the affected sample was qualified unreliable, (UR). The chain of custody record indicated that the sample was not preserved with buffering agent.

MINOR PROBLEMS

- None.

NOTES



Non-detected results were reported to the method detection limit (MDL).

EXECUTIVE SUMMARY

Laboratory Performance Issues: The 24 hour holding time was exceeded by seven days.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the USEPA “National Functional Guidelines for Inorganic Superfund Methods Data Review” (January 2017). The text of this report has been formulated to address only those problem areas affecting data quality.

OVERVIEW

The sample set for MRC SDG 240-131486-1 consists of one (1) aqueous environmental sample, one trip blank, and two waste samples. No field duplicate pairs are included in this SDG.

The sample was collected by collected by Tetra Tech on June 5, 2020 and were analyzed by Eurofins TestAmerica. Analyses were conducted in accordance with Method 8260B, 8082A, 6010B 7470A, 1010C, 1030, analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibration data, laboratory method/preparation blanks, laboratory control sample results, detection limits, and analyte quantitation. Areas of concern with respect to data quality are listed below.

MAJOR PROBLEMS

- None

MINOR PROBLEMS

- The continuing calibration analyzed on 6/10/20 contained percent differences for bromomethane, 1,1,-dichloroethane, toluene, trans 1,3-dichloropropene, styrene, and cyclohexane, were greater than 20%. The nondetected result was qualified as estimated, (UJ).

- Detected results below the reporting limit were qualified as estimated, (J).

NOTES

Non-detected results were reported to the method detection limit (MDL).

The waste samples were not validated because these samples were collected for characterization and for disposal.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Six analytes were outside of the VOC CCV %D criterion.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and "National Functional Guidelines for Inorganic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those problem areas affecting data quality.

Qualifiers

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative

Comments
No additional comments.

Receipt
The sample was received on 8/12/2020 9:45 AM; the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.1° C.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
U	Indicates the analyte was analyzed for but not detected.

GC VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

No additional comments.

Receipt
The sample was received on 8/12/2020 11:00 AM; the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.2º C.

GC/MS VOA
Method 8260C: The laboratory control sample (LCS) for analytical batch 240-447281 recovered outside control limits for 2-chloroethyl vinyl ether. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 8260C: The preservative used in the sample containers provided is not compatible with one of the Method 8260 analytes requested. The following sample was received preserved with hydrochloric acid: MRC-MW-164B-081120 (240-134814-1). The requested target analyte list includes 2-Chloroethyl vinyl ether, an acid-labile compound that degrades in an acidic medium.

Method 8260C: The continuing calibration verification (CCV) analyzed in batch 240-447281 was outside the method criteria for some analytes. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Method 8260C: Batch analytical batch 240-447281 is reported without a matrix spike/matrix spike duplicate (MS/MSD), because the batch MS/MSD was canceled. This MS/MSD result does not have immediate bearing on any samples except for the actual sample spiked. The associated laboratory control sample (LCS) met acceptance criteria and provides long-term precision and accuracy for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin
Method 680: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 410-34321 and analytical batch 410-34909 recovered outside control limits for the following analytes: DCB Decachlorobiphenyl, Total Dichlorobiphenyls Total Monochlorobiphenyls Total Tetrachlorobiphenyls Total Trichlorobiphenyls. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Single-Element Aqueous CRM

Product #: G34-S4400-10M76

Boron (B) – 10,000 µg/mL

Lot #: 999843-1

Matrix: NH_4OH

Element	Certified Concentration & Uncertainty
B	10,020 ± 30 µg/mL (w/v)
	9843 ± 28 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO Guide 34**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 10,000 µg/mL by gravimetric methods using 99.9995% pure boric acid (H_3BO_3) dissolved in high purity ammonium hydroxide (NH_4OH) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3107, lot #110830**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Health and Safety Information: Refer to the Safety Data Sheet (SDS).

Homogeneity: This solution was determined to be homogeneous by procedures consistent with the requirements of ISO Guide 34 and ISO Guide 35. Replicate samples of the finished solution were analyzed to confirm its homogeneity, in accordance with QSP 6-13 Assessment of Homogeneity and Stability. To ensure homogeneity, users should not take a smaller sub-sample than specified in the Instructions for Use, as doing so will invalidate the certified values and uncertainties.

Product Description: Mercury

Product Number: **S1-Hg-10-100**

Lot Number: **2013412-100**

Matrix: 5% HNO3

Certified Value:

Element	µg/mL	SRM ID
Hg	10.0 ± 0.2	3133

The Certified Value is based on gravimetric and volumetric preparation, and verified against NIST SRM 3100 series when available via inductively coupled plasma optical emission spectrometry (ICP-OES) and/or inductively coupled plasma mass spectrometry (ICP-MS) using an internal laboratory-developed method. The uncertainty in the certified value is calculated for a 95% confidence interval and coverage factor k is about 2.
* Refer to Traceability Information, Section 4

Packaging and Storage Conditions:

The standard is packaged in a pre-cleaned polyethylene bottle. To maintain the integrity of this product, the solution should be kept tightly capped and stored under normal laboratory conditions.

Expiration Information:

The expiry date is guaranteed to be valid for one year from the shipping date provided and is guaranteed through the month of expiration. For this reason, standards from the same lot may have different expiration dates.

Shipped Date: May 2020

Expiration Date: May 31, 2021

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to, **ISO 17034**, **ISO/IEC 17025** and **ISO 9001**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Health and Safety Information: Refer to the Safety Data Sheet (SDS).

Homogeneity: This solution was determined to be homogeneous by procedures consistent with the requirements of ISO 17034 and ISO Guide 35. Replicate samples of the finished solution were analyzed to confirm its homogeneity, in accordance with internal procedures for assessment of homogeneity and stability. To ensure homogeneity, users should not take a smaller sub-sample than specified in the Instructions for Use, as doing so will invalidate the certified values and uncertainties.

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Health and Safety Information: Refer to the Safety Data Sheet (SDS).

Homogeneity: This solution was determined to be homogeneous by procedures consistent with the requirements of ISO Guide 34 and ISO Guide 35. Replicate samples of the finished solution were analyzed to confirm its homogeneity, in accordance with QSP 6-13 Assessment of Homogeneity and Stability. To ensure homogeneity, users should not take a smaller sub-sample than specified in the Instructions for Use, as doing so will invalidate the certified values and uncertainties.

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3), trace hydrofluoric acid (HF) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

VHG-MEEP-5-40	1061825	2°C - 8°C	Water	10-Nov-2020	Certified Reference Materials for Dissolved Gas Analysis: Methane, Ethane, Ethene, and Propane, 5 mg/L (Nom.) Laboratory Control Sample (LCS), 40 ml

Certified Values

Analytical concentration is based on gravimetric and volumetric preparation of this CRM. This CRM is certified by gas chromatography (GC). The uncertainty value is calculated for a 95% confidence interval with a *k* value of 2.

Compound	CAS No.	Purity (%)	Neat Material Lot No.	Concentration, mg/L
methane	74-82-8	99.97	2457.152.1P	5.11 ± 1.32
ethene	74-85-1	99	2459.152.1P	4.35 ± .66
ethane (C2)	74-84-0	99	2458.152.1P	4.71 ± .94
n-propane	74-98-6	100	4643.1.1P	5.20 ± .71

Intended Uses

This Certified Reference material (CRM) is intended for use as a laboratory control sample (LCS); but can be used as a calibration standard. Appropriate techniques for measurement include chromatographic instrumentation with appropriate detection systems; such as gas chromatography (GC/FID and GC/MS) or other techniques suitable for these analytes and matrix.

This CRM is intended to be used at the time of analysis by aliquot collection using the lined rubber septum vial. It is not recommend that the CRM be stored or left open for an extended period of time after cap removal.

It may be used for various EN, ISO, EPA, and ASTM methods.

Method of Preparation

All weights are traceable through N. I. S. T. test method 822/264157-00.

Packaging and Storage

The solution should be stored according to the following storage requirements: 2 °C - 8 °C, unopened non-pierced septum. If uncapped, the expiration is determined by user specification.

Glassware Calibration

Volumetric glassware required for the manufacture or certification of this CRM were Class A grade and calibrated using NIST calibrated weights.

Weights and Balance Calibration

Weights used to perform daily checks on balances are calibrated annually within a calibration laboratory recognized by NIST as Echelon I. Balances are checked daily in accordance to in house procedures. Balances are calibrated annually by an ISO/IEC 17025:2005 and ISO 17034:2016 accredited metrology service.

Catalog No.: VHG-MEEP-5-40 **Lot No.:** 1061825 **Expiration Date:** 10-Nov-2020

Homogeneity

Random replicate samples of the final packaged CRM have been analyzed to prove homogeneity in accordance with internal procedures. This is consistent with the intended use of this CRM. The homogeneity of this product has been confirmed by procedures consistent with ISO/IEC guide 17025:2005 and ISO 17034:2016

Calculation of Uncertainty

The following equations are used to calculate the value of the expanded uncertainty: $U=ku_c$:

U=Expanded Uncertainty, k= the coverage factor at the 95% confidence level, k=2, u_c = the combined uncertainty u = $(u_m+u_t+u_l+u_h)^{1/2}$ with the uncertainty of characterization, transportation, homogeneity, and shelf life are considered.

Expiration Information

The expiration of this product is based on rigorous testing of short term and long term factors utilizing conditions stated in the Packaging and Storage section of this document.

Accreditation

This CRM was manufactured by an ISO 17025:2005 chemical testing lab (Certificate number 3031.01) and ISO 17034:2016 Reference Material Producer (RMP) Certificate number 3031.02 accredited by The American Association of Laboratory Accreditation (A2LA).

The solution should be stored according to the following storage requirements: 2 °C - 8 °C, unopened non-pierced septum. If uncapped, the expiration is determined by user specification.

Glassware Calibration

Volumetric glassware required for the manufacture or certification of this CRM were Class A grade and calibrated using NIST calibrated weights.

Weights and Balance Calibration

Weights used to perform daily checks on balances are calibrated annually within a calibration laboratory recognized by NIST as Echelon I. Balances are checked daily in accordance to in house procedures. Balances are calibrated annually by an ISO/IEC 17025:2005 and ISO 17034:2016 accredited metrology service.

Homogeneity

Random replicate samples of the final packaged CRM have been analyzed to prove homogeneity in accordance with internal procedures. This is consistent with the intended use of this CRM. The homogeneity of this product has been confirmed by procedures consistent with ISO/IEC guide 17025:2005 and ISO 17034:2016

Hazardous Information

Refer to MSDS

Calculation of Uncertainty

The following equations are used to calculate the value of the expanded uncertainty: $U=ku_c$:
U=Expanded Uncertainty, k= the coverage factor at the 95% confidence level, k=2, u_c = the combined uncertainty u $= (u_m+u_t+ u_l+ u_h)^{1/2}$ with the uncertainty of characterization, transportation, homogeneity, and shelf life are considered.

Expiration Information

The expiration of this product is based on rigorous testing of short term and long term factors utilizing conditions stated in the Packaging and Storage section of this document.

Accreditation

This CRM was manufactured by an ISO 17025:2005 chemical testing lab (Certificate number 3031.01) and ISO 17034:2016 Reference Material Producer (RMP) Certificate number 3031.02 accredited by The American Association of Laboratory Accreditation (A2LA).

Intended Uses

This Certified Reference material (CRM) is intended for use as a laboratory control sample (LCS); but can be used as a calibration standard. Appropriate techniques for measurement include chromatographic instrumentation with appropriate detection systems; such as gas chromatography (GC/FID and GC/MS) or other techniques suitable for these analytes and matrix.

This CRM is intended to be used at the time of analysis by aliquot collection using the lined rubber septum vial. It is not recommend that the CRM be stored or left open for an extended period of time after cap removal.

It may be used for various EN, ISO, EPA, and ASTM methods.

Method of Preparation

All weights are traceable through N. I. S. T. test method 822/264157-00.

Packaging and Storage

The solution should be stored according to the following storage requirements: 2 °C - 8 °C, unopened non-pierced septum. If uncapped, the expiration is determined by user specification.

CERTIFICATE OF ANALYSIS

Single-Element Aqueous CRM

Product #: TA-1000511

SE Std Silver (Ag) – 1000 µg/mL

Lot #: 975475-22

Matrix: 5% HNO_3

Element	Certified Concentration & Uncertainty
Ag	996 ± 3 µg/mL (w/v)
	987 ± 3 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure silver (Ag) metal dissolved in high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3151, lot #992212**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Lot #: 975475-22

Element	Certified Concentration & Uncertainty
Ag	996 ± 3 µg/mL (w/v)
	987 ± 3 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure silver (Ag) metal dissolved in high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3151, lot #992212**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Matrix: 5% HNO3

ISO 17034:2016 (RMP) Accreditation Certificate Number AR-1436

ISO/IEC 17025:2005 Accreditation Certificate Number AT-1529

Certified Value:

Element	µg/mL	SRM ID
Hg	10.0 ± 0.2	3133

The Certified value is based on gravimetric and volumetric preparation, and verified against NIST SRM 3100 series when available via inductively coupled plasma optical emission spectrometry (ICP-OES) and/or inductively coupled plasma mass spectrometry (ICP-MS) using an internal laboratory-developed method. The uncertainty in the certified value is calculated for a 95% confidence interval and coverage factor k is about 2.

The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3), trace hydrofluoric acid (HF) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

CPI International waives all responsibility for any damages resulting from the usage and/or implementation of the products/data described herein.

Health and Safety Information: Refer to the Safety Data Sheet (SDS).

Homogeneity: This solution was determined to be homogeneous by procedures consistent with the requirements of ISO 17034 and ISO Guide 35. Replicate samples of the finished solution were analyzed to confirm its homogeneity, in accordance with internal procedures for the assessment of homogeneity and stability. To ensure homogeneity, users should not take a smaller sub-sample than specified in the Instructions for Use, as doing so will invalidate the certified values and uncertainties.

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: TA-1000291

SE Std Lithium (Li) – 1000 µg/mL

Lot #: 751942-43

Matrix: 5% HNO_3

Element	Certified Concentration & Uncertainty
Li	1002 ± 3 µg/mL (w/v)
	993 ± 3 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure lithium carbonate (Li_2CO_3) dissolved in high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3129a, lot #100714**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

CERTIFICATE OF ANALYSIS

Single-Element Aqueous CRM

Product #: TA-100023

SE Std Antimony (Sb) – 1000 µg/mL

Lot #: 201251-11

Matrix: 5% HNO_3/tr. HF

Element	Certified Concentration & Uncertainty
Sb	**999 ± 3 µg/mL (w/v)**
	979 ± 3 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure antimony (Sb) metal dissolved in high purity nitric acid (HNO_3), trace hydrofluoric acid (HF) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3102a, lot #140911**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: G34-4400-10M23

Antimony (Sb) – 10,000 µg/mL

Lot #: 978317-2

Matrix: 10% HNO_3/2% HF

Element	Certified Concentration & Uncertainty
Sb	10,050 ± 30 µg/mL (w/v)
	9366 ± 27 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO Guide 34**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 10,000 µg/mL by gravimetric methods using 99.999% pure antimony (Sb) metal dissolved in high purity nitric acid (HNO_3), hydrofluoric acid (HF) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3102a, lot #140911**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

CERTIFICATE OF ANALYSIS

Multi-Element Aqueous CRM

Product #: TA-SPIKE3

Spike Mix # 3

Lot #: 982745-1

Matrix: 5% HNO_3/tr. HF

Element	Certified Concentration & Uncertainty	Element	Certified Concentration & Uncertainty
P	2000 ± 10 mg/L	U	200.0 ± 1.0 mg/L
S	1000 ± 5 mg/L	W	100.0 ± 0.5 mg/L

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to the certified concentrations shown above by gravimetric methods, using single-element concentrates that were certified using the "High Performance ICP-OES" protocol developed by NIST and are directly traceable to **NIST SRMs (see reverse side)**. The solution was stabilized using high purity nitric acid (HNO_3), trace hydrofluoric acid (HF) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentrations were determined based upon gravimetric procedures. Secondary verification of the certified concentrations was performed using ICP-OES that was calibrated and/or referenced against **NIST SRMs (see reverse side)**. The uncertainty associated with each certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Health and Safety Information: Refer to the Safety Data Sheet (SDS).

Homogeneity: This solution was determined to be homogeneous by procedures consistent with the requirements of ISO Guide 34 and ISO Guide 35. Replicate samples of the finished solution were analyzed to confirm its homogeneity, in accordance with QSP 6-13 Assessment of Homogeneity and Stability. To ensure homogeneity, users should not take a smaller sub-sample than specified in the Instructions for Use, as doing so will invalidate the certified values and uncertainties.

Further Information: Please contact CPI International for further information about this CRM.

Quality Certifications: This CRM was prepared under a quality management system that is registered/accredited to the following:

- ISO 9001 – Quality Management Systems – Requirements (TUV NORD Cert. No. 44 100 16560231)
- ISO/IEC 17025 – General Requirements for the Competence of Testing and Calibration Laboratories (A2LA Cert. No. 2848.01)
- ISO Guide 34 – General Requirements for the Competence of Reference Material Producers (A2LA Cert. No. 2848.02)
    - ISO Guide 34 references additional requirements specified in ISO Guide 31 and ISO Guide 35.

This CRM is traceable to the following NIST SRMs:

Tech Tips:

Vinyl acetate is a volatile organic ester included in the target lists of several US EPA and other methods. Under acidic conditions, esters react with alcohols to form new esters (transesterification). Methanol-based mixes containing halogenated compounds are slightly acidic, so it is important to minimize exposure of vinyl acetate to mixes of halogenated compounds in methanol. For this reason, we offer vinyl acetate in individual solution, and suggest that it be introduced into the working level calibration solution immediately before use. This will minimize problems and ensure more consistent results.

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 571992 **Lot No.:** A0143774

Description : 8260 List 1 / Std #1 MegaMix (2017)

8260 List 1 / Std #1 MegaMix (2017) 1,250-62,500µg/mL, P&T Methanol, 1mL/ampul

Container Size : 2 mL **Pkg Amt:** > 1 mL

Expiration Date : June 30, 2021 **Storage:** 0°C or colder

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 571992.sec **Lot No.:** A0123775

Description : 8260 List 1 / Std #1 MegaMix (2017)

8260 List 1 / Std #1 MegaMix (2017) 1250-62500 µg/ml, P&T Methanol, 1 ml/ampul

Container Size : 2 mL **Pkg Amt:** > 1 mL

Expiration Date : December 31, 2018 **Storage:** 0°C or colder

Temp. Program:
40°C (hold 6 min.) to 240°C
@ 6°C/min. (hold 10 min.)

Inj. Temp:
200°C

Det. Temp:
250°C

Det. Type:
MSD

This chromatogram represents a general set of testing conditions chosen for product acceptance. For optimal results in your lab, conditions should be adjusted for your specific instrument, method, and application.

Certificate #3222.02

FOR LABORATORY USE ONLY-READ SDS PRIOR TO USE.

This Reference Material is intended for Laboratory Use Only as a standard for the qualitative and/or quantitative determination of the analyte(s) listed.

Catalog No. : 571992.SEC **Lot No.:** A0144202

Description : 8260 List 1 / Std #1 MegaMix (2017)

8260 List 1 / Std #1 MegaMix (2017) 1,250-62,500µg/mL, P&T Methanol, 1mL/ampul

Container Size : 2 mL **Pkg Amt:** > 1 mL

Expiration Date : June 30, 2021 **Storage:** 0°C or colder

- The Calculated Value is a value calculated from the weight of a starting material that has been certified directly vs. a National Institute of Standards and Technology (NIST) SRM/RM. See Sec 4.2 for balance traceability.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2\,(u_{char\ i})^2)]^{½}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)\,(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 CHROMATOGRAM

N/A

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit **www.inorganicventures.com/TCT**

8.0 HAZARDOUS INFORMATION

- Please refer to the Safety Data Sheet for information regarding this CRM/RM.

9.0 HOMOGENEITY

- This solution was mixed according to an in-house procedure and is guaranteed to be homogeneous. Homogeneity data indicate that the end user should take a minimum sample size of 0.2 mL to assure homogeneity.

10.0 QUALITY STANDARD DOCUMENTATION

10.1 ISO 9001 Quality Management System Registration

- QSR Certificate Number QSR-1034

10.2 ISO/IEC 17025 "General Requirements for the Competence of Testing and Calibration Laboratories"

- Chemical Testing - Accredited / A2LA Certificate Number 883.01

10.3 ISO 17034 "General Requirements for the Competence of Reference Material Producers"

- Reference Material Producer - Accredited / A2LA Certificate Number 883.02

11.0 CERTIFICATION, LOT EXPIRATION AND PERIOD OF VALIDITY

11.1 Certification Issue Date

April 22, 2020

- The certification is valid within the measurement uncertainty specified provided the CRM/RM is stored and handled in accordance with instructions given in Sec 7.1. This certification is nullified if instructions in Sec 7.1 are not followed or if the CRM/RM is damaged, contaminated, or otherwise modified.

11.2 Lot Expiration Date

- **April 22, 2024**

- The date after which this CRM/RM should not be used.

- The lot expiration date reflects the period of time that the stability of a CRM/RM can be supported by long term stability studies conducted on properly stored and handled CRM/RMs. Lot expiration is limited primarily by transpiration (loss of water from the solution) and infrequently by chemical stability.

11.3 Period of Validity

- Sealed TCT Bag Open Date: _____

- This CRM/RM should not be used longer than one year (or six months in the case of a 30 mL bottle) from the date of opening the aluminized bag or after the date given in Sec. 11.2, whichever comes first. This is contingent upon the CRM/RM being stored and handled in accordance with the instructions given in Sec. 7.1.

Certified values are based on gravimetric and volumetric preparation, and verified against NIST SRM 3100 series when available via ion chromatography (IC) using an internal laboratory-developed method. The uncertainty in the certified value is calculated for a 95% confidence interval and coverage factor *k* is about 2.
* Refer to Traceability Information, Section 4

Packaging and Storage Conditions:

The standard is packaged in a pre-cleaned polyethylene bottle. To maintain the integrity of this product, the solution should be kept tightly capped and stored under normal laboratory conditions.

Expiration Information:

The expiry date is guaranteed to be valid for twelve months from the shipping date provided and is guaranteed through the month of expiration. For this reason, standards from the same lot may have different expiration dates.

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 CHROMATOGRAM

N/A

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit **www.inorganicventures.com/TCT**

8.0 HAZARDOUS INFORMATION

- Please refer to the Safety Data Sheet for information regarding this CRM/RM.

9.0 HOMOGENEITY

- This solution was mixed according to an in-house procedure and is guaranteed to be homogeneous. Homogeneity data indicate that the end user should take a minimum sample size of 0.2 mL to assure homogeneity.

10.0 QUALITY STANDARD DOCUMENTATION

11.0 CERTIFICATION, LOT EXPIRATION AND PERIOD OF VALIDITY

11.1 Certification Issue Date

April 22, 2020

- The certification is valid within the measurement uncertainty specified provided the CRM/RM is stored and handled in accordance with instructions given in Sec 7.1. This certification is nullified if instructions in Sec 7.1 are not followed or if the CRM/RM is damaged, contaminated, or otherwise modified.

11.2 Lot Expiration Date

- April 22, 2024

- The date after which this CRM/RM should not be used.

- The lot expiration date reflects the period of time that the stability of a CRM/RM can be supported by long term stability studies conducted on properly stored and handled CRM/RMs. Lot expiration is limited primarily by transpiration (loss of water from the solution) and infrequently by chemical stability.

11.3 Period of Validity

- Sealed TCT Bag Open Date: _____

- This CRM/RM should not be used longer than one year (or six months in the case of a 30 mL bottle) from the date of opening the aluminized bag or after the date given in Sec. 11.2, whichever comes first. This is contingent upon the CRM/RM being stored and handled in accordance with the instructions given in Sec. 7.1.

Certified Values = "100% true concentration" of each analyte as determined from gravimetric and volumetric measurements made during standard manufacture.

Acceptance Limits = Generated based on the criteria established by The NELAC Institute (TNI) Fields of Proficiency Testing tables using regression equations and/or fixed percentage limits, historical data and other criteria distributed by accrediting agencies as applicable. Please note that regression based acceptance criteria are based on the Assigned Value and may have different criteria at different concentrations.

Matrix: Deionized Water — Store at 20-25°C.
Expiration Date: 01/21 — Catalog #QC-MINSET-WP

Preparation Instructions: The WP Minerals and Conductivity standards are provided as whole volume standards that do not require a dilution prior to use. The standards are ready for preparation and analysis as received using your normal procedures. The standards should be stored at 20-25°C.

Notes: It is suggested that the lab analyze for Alkalinity first as soon as the Minerals 1 bottle has been opened. If the lab does not analyze Alkalinity, recap the bottle tightly as soon as possible after each use. This will minimize possible CO_2 absorption. Homogenize the Minerals 2 standard well by shaking immediately prior to taking an aliquot. The Minerals 1 and 2 standards contain no acid, so follow your normal procedures for checking and, if needed, adjusting the pH. A separate Conductivity bottle has been provided for the determination of conductivity (WP Conductivity). Do not analyze conductivity from the WP Minerals standards.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compound it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products are compared to older lots in the same manner, which further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

2. **Intended Use:** The product covered by this certificate is designed for calibration or for use in quality control procedures for the specified chemical compounds listed on the reverse side. This product can be used for quantification and/or identification. This product can also be used as a reference material to validate analytical procedures, subject to the conditions under Section 7.

3. **Manufacturing:** All balances are calibrated daily using an in-house procedure with weights that are compared annually to master weights and traceable to NIST. The balances are also calibrated annually by an ISO/IEC 17025 accredited calibration laboratory. Please refer to the NIST test number listed on the front of this certificate. Class A glassware is used in the manufacture and quality control of all standards and calibrated using an in-house procedure. Good Laboratory Practices have been used throughout the preparation of this Standard.

4. **Homogeneity:** This product is sufficiently homogeneous and any sample size would be within the uncertainty budget.

5. **Stability:** The manufacturer guarantees the stability of this solution through the expiration date stated on the label, when handled and stored according to the conditions stated on the label

6. **Uncertainty:** The uncertainty values as stated on the face of this certificate have been determined using the EURACHEM/CITAC Guide. We report a combined expanded uncertainty equal to the positive square root of the total variance of the uncertainty of the components using the following formula: $u_a = \sqrt{(u(\mathrm{V}))^2 + (u(\mathrm{m}))^2 + (u(\mathrm{IV}))^2 + (u(\mathrm{RO}))^2}$ This formula represents uncertainty components from the mass, volume, short-term stability, long-term stability and homogeneity factors associated with the production of this product. The expanded uncertainty, assumes a normal distribution and a coverage factor of k=2 is chosen using approximately a 95% confidence level.

7. **Legal Notice and Limit of Liability:** This product is for routine laboratory analysis and research purposes only. The company's liability will be limited to replacement of product or refund of purchase price. Notice of claims must be made within thirty (30) days from date of delivery.

2. **Intended Use:** The product covered by this certificate is designed for calibration or for use in quality control procedures for the specified chemical compounds listed on the reverse side. This product can be used for quantification and/or identification. This product can also be used as a reference material to validate analytical procedures, subject to the conditions under Section 7.

3. **Manufacturing:** All balances are calibrated daily using an in-house procedure with weights that are compared annually to master weights and traceable to NIST. The balances are also calibrated annually by an ISO/IEC 17025 accredited calibration laboratory. Please refer to the NIST test number listed on the front of this certificate. Class A glassware is used in the manufacture and quality control of all standards and calibrated using an in-house procedure. Good Laboratory Practices have been used throughout the preparation of this CRM.

4. **Homogeneity:** This product is sufficiently homogeneous and any sample size would be within the uncertainty budget.

5. **Stability:** The manufacturer guarantees the stability of this solution through the expiration date stated on the label, when handled and stored according to the conditions stated on the label

6. **Uncertainty:** The uncertainty values as stated on the face of this certificate have been determined using the EURACHEM/CITAC Guide. We report a combined expanded uncertainty equal to the positive square root of the total variance of the uncertainty of the components using the following formula: $u_a = \sqrt{(u(\mathrm{V}))^2 + (u(\mathrm{m}))^2 + (u(\mathrm{IV}))^2 + (u(\mathrm{RO}))^2}$ This formula represents uncertainty components from the mass, volume, short-term stability, long-term stability and homogeneity factors associated with the production of this product.
