Section 1
Introduction

This groundwater monitoring report summarizes the March–May 2013 groundwater sampling round at the Lockheed Martin Corporation (Lockheed Martin) Middle River Complex (MRC) in Middle River, Maryland. Figure 1-1 shows the location of the Middle River Complex. Sampling was conducted to provide a current round of groundwater levels and chemical data for selected wells as part of ongoing environmental investigations at the facility. These data will be used to better understand the nature and extent of chemical contamination in groundwater, evaluate the trends of on-site groundwater chemical plumes, and evaluate the natural attenuation of groundwater chemicals of concern at the Middle River Complex. Groundwater samples were analyzed for volatile organic compounds (VOCs), 1,4-dioxane (a semivolatile organic compound [SVOC]), polychlorinated biphenyls (PCBs), metals, natural-attenuation assessment (NAA) parameters, and perchlorate. Additionally, all wells were inspected during the sampling program to assess the need for repairs. Thirty-six wells were repaired in 2013. This report is organized as follows:

Section 2—Site Background: Presents an overview of the site and subsurface conditions observed in the field during previous investigations, and describes the regional and site-specific geology and hydrogeology, as determined from soil borings advanced at the site and from the scientific literature.

Section 3—Investigational Approach: Presents the technical approach to the investigation and describes the field methodologies used.

Section 4—Investigation Results: Presents the investigation results.

Section 5—Summary: Summarizes the investigation findings.

Section 6—References: Cites references used to compile this report.

Section 2
Site Background

2.1 MIDDLE RIVER COMPLEX BACKGROUND

The Middle River Complex (MRC) is part of the Chesapeake Industrial Park at 2323 Eastern Boulevard in Middle River, Maryland, approximately 11.5 miles northeast of downtown Baltimore. It comprises approximately 161 acres, including 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, trailer and parts storage lot, and numerous grassy spaces along its perimeter. It is bounded by Eastern Boulevard (Route 150) to the north, Martin State Airport (MSA) to the east, Dark Head Cove to the south, and Cow Pen Creek to the west. Figure 2-1 is a map showing the MRC layout.

MRC is owned by LMC Properties, Inc., (LMCPI) a subsidiary of Lockheed Martin Corporation (Lockheed Martin). Currently, LMCPI's primary activities at the MRC are facility and building management and maintenance. The main tenant at the site, MRA Systems, Inc., (MRAS) (a subsidiary of General Electric Company) designs, manufactures, fabricates, tests, overhauls, repairs, and maintains aeronautical structures, parts, and components for military and commercial applications. Lockheed Martin Mission Systems & Training (a Lockheed Martin business segment) conducts engineering and fabricates, assembles, tests, and otherwise supports vertical-launch systems. Applied NanoStructured Solutions LLC (a subsidiary of Lockheed Martin) also occupies a portion of MRC and is engaged in research and design of nanotechnology applications.

2.1.1 Middle River Complex History

In 1929, the Glenn L. Martin Company (GLM), a predecessor entity of Lockheed Martin, acquired large parcels of undeveloped land in Middle River, Maryland, to manufacture aircraft for United States government and commercial clients. In the early 1960s, GLM merged with American-Marietta Company to form Martin Marietta Corporation. Around 1975, the adjacent eastern airport area (currently MSA), comprised of approximately 750 acres, was transferred to the State of Maryland. In the mid-1990s, Martin Marietta Corporation merged with Lockheed to

form Lockheed Martin Corporation. Shortly after the merger, General Electric Company acquired most of Lockheed Martin's aeronautical business in Middle River, and MRAS began operations at the site.

2.1.2 Middle River Complex Characteristics

2.1.2.1 Current and Surrounding Land Use

The MRC is an industrial facility surrounded primarily by commercial, industrial, and residential establishments. Six facilities adjacent to the MRC comprise the remaining portion of the Chesapeake Industrial Park. These include Tilley Chemical Company, Inc. (a food- and pharmaceutical-chemical distributor), North American Electric, Inc. (an industrial and commercial electrical contractor), Johnson and Towers (a heavy-duty automotive and boat repair and maintenance company), Ace Logistics, Exxon (a gasoline filling station and convenience store), and the Middle River Post Office. Residential developments are on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek, and north of Eastern Boulevard (Route 150).

2.1.2.2 Physiography

The MRC is in the Western Shore of the Coastal Plain physiographic province, which is generally characterized by low relief. MRC topography slopes gently, ranging from sea level to 32 feet above mean sea level (msl) (Cassell, 1977). The topography slopes from Eastern Boulevard to the southwest and south toward Cow Pen Creek and Dark Head Cove.

2.1.2.3 Hydrology

The MRC is at the junction of Cow Pen Creek and Dark Head Cove. Both of these surface water bodies discharge into Dark Head Creek, a tributary to Middle River, which is a tributary to Chesapeake Bay. The MRC is approximately 3.24 miles (17,100 feet) upstream of Chesapeake Bay.

The MRC has no surface water bodies on site. Excluding areas immediately adjacent to Cow Pen Creek and Dark Head Cove, surface-water runoff discharges from the facility via storm drains. LMCPI maintains a National Pollutant Discharge Elimination System (NPDES) permit (state discharge permit No. 00-DP-0298, NPDES No. MD0002852). This permit is issued by the Maryland Department of the Environment (MDE) Water Management Administration Industrial

Discharge Permits Division. The permit covers stormwater discharge from the entire property, rather than from individual tenants.

2.1.2.4 Soils

Soils underlying the MRC have been mapped by the United States Department of Agriculture (USDA) Soil Conservation Service as Mattapex-Urban Land Complex and Sassafras-Urban Land Complex (USDA, 1993). Mattapex-Urban Land soils consist of deep, well-drained, silty soils, the original texture of which has been disturbed, graded over, or otherwise altered. Sassafras-Urban Land soils consist of deep, well-drained sandy soils, the original texture of which has been disturbed, graded over, or otherwise altered. Site characterization studies indicate that most soils at MRC are fine-grained (e.g., silt and clay) soils with low permeabilities.

2.1.2.5 Regional Geology

Geologic maps of Baltimore County show that the MRC is underlain by the Potomac Group, a Cretaceous-age interbedded gravel, sand, silt, and clay unit that can be up to 800 feet thick in some areas of Maryland. The Potomac Group is composed of three units: the Raritan and Patapsco Formations, the Arundel Clay, and the Patuxent Formation. The Raritan and Patapsco Formations can be up to 400 feet thick and are composed of a gray, brown, and red variegated silt and clay unit with lenses of sand and few gravels. The Arundel Clay is composed of dark gray and maroon lignitic-clays ranging from 25 to 200 feet thick. The Patuxent Formation is described as a white or light gray to orange brown, moderately sorted sand unit with quartz gravels, silts, and clays up to 250 feet thick.

Lithologic logging of the soils beneath the MRC has identified a very heterogeneous stratigraphy. Underlying soils are composed primarily of silty sands, fine-grained to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primary lithology being clay to silty clay. Areas along the waterfront have been back-filled to their present elevation over past decades.

2.1.2.6 Regional Hydrogeology

Sand and gravel zones in the unconsolidated surficial deposits, when present, may form an unconfined or water table aquifer system (Bennett and Meyer, 1952). The water table at the MRC generally conforms to the land surface, with the highest water levels in the interior land

areas and the lowest levels at approximately the surface water elevations along the shoreline. The Patuxent Formation is the most important water-bearing formation in the Baltimore area. Industrial wells in the southeastern part of the area, specifically Curtis Bay and Sparrows Point, yield between 500 and 900 gallons per minute (gpm). Transmissivities and storage coefficients in confined portions of the aquifer in these industrialized areas average about 50,000 gallons per day per foot (g/d/ft) and 0.00026 (unitless), respectively.

The Patapsco Formation is also an important water-bearing formation in the industrialized Baltimore area, where it is separated by clay into a lower and upper aquifer. Industrial wells screened in the lower aquifer yield as much as 500 to 750 gpm, with an estimated transmissivity of 25,000 g/d/ft (Bennett and Meyer, 1952). Wells in the upper aquifer yield similar quantities of water, and likely have a higher overall transmissivity because the upper aquifer is thicker than the lower aquifer.

2.1.2.7 Middle River Complex Geology

Specific wells referenced in the following sections are shown in Figure 2-2. Most of the wells sampled have names that include the "MRC" prefix, identifying its location as a well installed at the MRC. However, the "MRC" designation is dropped in this section and thereafter to enhance the readability of this document.

Lithologic data collected as part of the MRC groundwater investigations were used to construct several geologic cross-sections through the property. Figure 2-2 shows the locations of the geologic cross-sections. Figures 2-3 through 2-5 are generalized geologic cross-sections showing the materials encountered during well installation, and include the four deep wells (MW93D, MW94D, MW95D, and MW96D) installed in 2010.

Boring logs indicate complex arrangements of predominantly clay, silty clay, silt, and clayey silt, with smaller, more permeable zones of silty sand and sand. Thick sequences of low permeability clay, silty clay, clayey silt, and silt are found in the northern two-thirds of the MRC. These clayey and silty materials extend from MW03 to the area between MW60 and MW94D.

As shown in Figure 2-3, the lithologic data indicate clay up to 50 feet thick underlying the surficial aquifer at 15 to 60 feet below msl at well MW93D, and 60 to 110 feet below msl at MW94D and MW96D. Below this clay zone is a series of thinner, alternating layers of sand and clay.

Seventy-three feet of continuous clay were encountered at MW93D, beginning at 164 feet below msl and ending at approximately 237 feet below msl. Directly overlying the 73 feet of clay is seven feet of sand, followed by 11 feet of overlying clay and sand layers (clay thickness totaling eight feet) from 146 to 157 feet below msl. Below the 73-feet-thick clay layer is 14 feet of silty and clayey fine sand, followed by 15 feet of clay from 251 to 266 feet below msl. The thickness of the deep clay and interlayer sand/silt (123 feet) is consistent with that of the Arundel Formation (50 to 125 feet) in this area, as reported by Chapelle (1985) and Vroblesky and Fleck (1991). However, the basal altitude of the clay (at 266 feet below msl) is somewhat lower than the altitude (200 feet below msl) reported by Chapelle (1985) and Vroblesky and Fleck (1991).

In the northern portion of the site (Figure 2-3), clay is encountered in the first 25 feet at MW93D, thickening to approximately 40 feet to the south at well MW57 near Building C. Boring logs indicate that this thick upper zone of clayey material terminates to the south along an east–west line formed roughly by MW27, MW25, and MW22. Interbedded sands, silty sands, sandy silts, and silts are encountered south of Buildings A, B, and C (Figure 2-2). Several feet of sandy and silty materials overlie the shallow clay at MW55 and MW57 (Figure 2-3). These sandy and silty materials thicken to the south/southeast near MW60, MW27, MW79, and MW34. The sandy materials are approximately 50 to 60 feet thick between MW27 and MW34, and overlie a lower clay confining-unit at 55 to 60 feet below msl.

In the southwestern portion of the MRC (Figures 2-4 and 2-5), several feet of silty sands and sandy silts are encountered in shallow subsurface soil near wells MW12 and MW56 to the northeast. A lower sandy unit at 50 feet below msl at MW14 appears to be contiguous with sand encountered at MW12 and MW95D to the southwest. The upper silty sand unit and the lower sand unit are separated by approximately 30 to 35 feet of clay and/or silt.

Figure 2-4 also indicates that geologic sequences at well MW95D are similar to those of MW93D. Soil lithology is primarily clay from the ground surface to 50 feet below msl, followed by a thick sand zone (split by clay and silt layers) from approximately 60 feet below msl to approximately 140 feet below msl. Relatively continuous clay was encountered at MW95D at approximately 150 to 226 feet below msl, but a 14-feet-thick sand layer was encountered from approximately

190-204 feet below msl. Thick clay layers are above and below sand units in which all MRC deep wells are screened; as such, these sand zones are considered hydraulically confined.

2.1.2.8 MRC Hydrogeology

Groundwater at MRC is encountered at depths ranging from less than one foot to nearly 18 feet below ground surface (bgs). In the southeast portion of MRC, groundwater preferentially flows southeast within the sandy strata that extend from MW55 and MW57 to the thicker sandy material at MW27 and MW37. Approximately 65 to 70 feet of saturated sandy material lies above the lower confining clay in this area.

The lower portion of the aquifer near MW34 and MW37 is divided by silt and silty clay at 20 to 30 feet below msl. Deeper groundwater may be under hydraulically confined conditions in this area. To the southwest, shallow groundwater flows through the approximately 13–18 feet of saturated sandy and silty materials that extend from MW21 to MW12 and Cow Pen Creek.

Single-well permeability tests (slug tests) were conducted in 2005 at 28 wells selected to represent variability across the site. The average hydraulic conductivity (i.e., soil permeability) reported for shallow wells was low, and ranged from 0.0027 feet per day (ft/d) at MW57 to 1.25 ft/d at MW66A, with an arithmetic average hydraulic conductivity of 0.22 ft/d. These results are consistent with published permeabilities of sand and silt mixtures (Spitz and Moreno, 1996; Halford and Kuniansky, 2002). Lower hydraulic conductivities were reported for shallow wells to the south (MW55A through MW62A) and west (MW52A through MW54A, and MW64A).

Hydraulic conductivity values for intermediate wells (except for MW27B) are more consistent than those of shallow wells, with an arithmetic average of 0.48 ft/d and a geometric mean of 0.22 ft/d. Intermediate-well permeabilities are consistent with published lower values for clean sand or typical values of sand and silt mixtures. Hydraulic conductivities for the deep wells (except for well MW37C) ranged between 0.35 and 9.16 ft/d, with an average hydraulic-conductivity (3.82 ft/d) approximately 10 times higher than the value for the shallow and intermediate zones. The geometric-mean hydraulic conductivity for deep wells is 0.89 ft/d, but if the low permeability at MW37C is eliminated as an outlier, the geometric-mean hydraulic conductivity is 3.02 ft/d.

2.1.2.9 Chemicals of Potential Concern

A risk assessment (Tetra Tech, Inc., [Tetra Tech], 2006) identified trichloroethene (TCE), tetrachloroethene (PCE), vinyl chloride (VC), benzene, and certain metals as the most significant contaminants in groundwater at the MRC. The two largest groups of organic chemicals of concern are chlorinated volatile organic compounds (cVOCs) and petroleum-related hydrocarbons. Chlorinated volatile organic compounds (VOCs) detected include the commonly used solvents PCE and TCE, which degrade into a variety of other VOCs.

Petroleum-based fuels such as gasoline have numerous chemical constituents. Several VOCs associated with fuels are fairly soluble in groundwater and are therefore mobile in the subsurface. The most commonly detected petroleum VOCs at MRC are benzene, toluene, ethylbenzene, and xylenes (BTEX) and methyl *tert*-butyl ether (MTBE). 1,4-Dioxane is also a groundwater chemical of concern because it has been detected at concentrations above regulatory limits and advisory criteria set in other states, and is an emerging contaminant nationwide. Maryland currently has no drinking water or groundwater standards for 1,4-dioxane.

Metals were also detected in groundwater at concentrations above MDE cleanup standards at more than one location, and include nickel (30 locations), cobalt (22 locations), beryllium (16 locations), and zinc (five locations). Antimony, thallium, and vanadium exceeded groundwater standards at one location each. The highest concentrations of metals were found mainly in the northwest and center portions of the site, primarily in wells with low pH values (i.e., acidic groundwater with pH less than 5).

2.2 PREVIOUS INVESTIGATIONS

This section summarizes groundwater investigations at the MRC to date. Investigations related to MRC groundwater began in 1988 and are ongoing. The MRC *Groundwater Response Action Plan* (Tetra Tech, 2012a) was finalized in 2012. Construction of the groundwater remedies for Tax Blocks E, G, and I began in early summer 2013. Discussions of soil data are in documents for the individual tax blocks.

2.2.1 1988 Chromium Investigation

A groundwater investigation in August 1988 evaluated the presence of chromium immediately west of Building A (Earth Engineering and Science, Inc., 1988). Six borings were installed, three

of which (B-2, B-5, and B-6) were completed as groundwater monitoring wells screened from 10 to 20 feet below grade. Hexavalent chromium was detected in groundwater at 160 micrograms per liter (µg/L) from monitoring well B-2, and at 10 µg/L from monitoring wells B-5 and B-6. Well B-2 is between Building A and the drop hammer building. Subsequent groundwater sampling for hexavalent chromium in 2005 showed no exceedances of the MDE standard (100 µg/L) in filtered or unfiltered samples.

2.2.2 2003 Phase I Environmental Site Assessment and 2004 Historical Review

In February 2003, a Phase I environmental site assessment (ESA) of the MRC was conducted in accordance with the ASTM International (ASTM) standard E 1527 (Earth Tech, 2003). The Phase I ESA sought to identify recognized environmental conditions (RECs) at MRC. A REC is the presence, or likely presence, of any hazardous substances or petroleum products on a property, under conditions that indicate the possibility of an existing release, a past release, or a material threat of a release of those (hazardous) substances into structures on the property or into the ground, groundwater, or surface water of the property. The Phase I ESA investigation reviewed MRC historical records (e.g., facility documents, aerial photographs, and city directories) and federal, state, and local agency databases; interviewed site personnel, and included a site visit. Thirteen (13) RECs associated with the MRC were identified, and further investigation of the facility's historical activities was recommended to identify other potential environmental concerns. In 2004, a more detailed historical review identified 18 additional RECs along the facility perimeter, within the active industrial yard, and within Buildings A, B, and C (Tetra Tech, 2004). The initial 31 RECs identified in 2004 and RECs #32–#42 (identified in subsequent studies) are shown in Figure 2-6.

2.2.3 2005 Site-Wide Groundwater Investigation

The 2005 groundwater investigation advanced soil borings; installed shallow, intermediate, and deep wells; tested aquifer hydraulics; and analyzed groundwater samples to characterize the subsurface geology, hydrogeology, and groundwater quality at the MRC (Tetra Tech, 2006). The investigation objectives were to determine and evaluate environmental baseline conditions at the 31 RECs identified in 2005 (RECs #32–#42 on Figure 2-6 were identified as part of subsequent studies) and at areas within MRC where RECs were not identified. The investigation also sought to characterize risk under current and proposed land use scenarios and determine whether tax

blocks were to be closed with a "No Further Requirements Determination," or if remediation would be warranted under a response action plan.

Data from the facility-wide investigation indicated that shallow groundwater had been affected by the release of chlorinated solvents (primarily TCE) and, to a lesser extent, by the release of petroleum compounds from underground storage tank (USTs). The cVOC releases occurred within Block I, and resulted in two relatively narrow TCE plumes. The risk assessment for groundwater identified these chlorinated solvents and petroleum hydrocarbons as contaminants of concern in groundwater.

2.2.4 2007 Site-Wide Groundwater Investigation

Investigations before 2007 had identified various compounds in site groundwater at concentrations greater than MDE standards, but insufficient data were available to complete a remedial design. These earlier investigations led Tetra Tech to further investigate the surficial water-bearing unit beneath the MRC in 2007 to obtain information required for the remedial design. The remedial design study included membrane-interface probe (MIP)/soil conductivity (SC) and direct-push technologies (DPT) investigations, followed by monitoring well installation and sampling. Groundwater aquifer tests and bench- and pilot-scale studies were also performed. The overall objective of the 2007 groundwater characterization was to fill data gaps at the MRC related to known shallow groundwater plumes, and contaminant-source areas and resultant plumes were delineated. The following tasks were completed during the 2007 groundwater characterization:

- 20 borings were advanced, with soil and groundwater screening via MIP/SC
- 18 DPT soil borings were advanced, soil and groundwater were sampled, and a screening-level analysis for TCE was done using Color-Tec™ field-test kits
- 26 monitoring wells and 15 observation wells were installed to support subsequent pilot testing; four piezometers were installed to support aquifer hydraulics testing
- 80 existing monitoring wells, 26 new monitoring wells, and 15 new observation wells were sampled and monitored

Elevated readings at five of 20 MIP/SC locations indicated VOCs. MIP/SC screening results were used to position 18 confirmatory DPT soil borings. Soil and groundwater samples were

collected for confirmatory chemical analyses. The MIP/SC screening also guided new well placement.

Groundwater samples were collected from 26 new monitoring wells, 80 existing monitoring wells, and 15 newly installed observation wells. Several organic compounds were detected, with concentrations of 17 compounds exceeding Maryland groundwater standards. VOCs with the most frequent exceedances were TCE, 1,1-dichloroethene (1,1-DCE), *cis*-1,2-dichloroethene (*cis*-1,1-DCE), and VC. The maximum concentrations of these compounds were 70,000 µg/L (MW74A), 870 µg/L (OW2I), 3,470 µg/L (MW70B), and 211 µg/L (OW2I), respectively. Benzene exceeded its groundwater standard at five locations, but was generally not co-located with the TCE exceedances. Benzene plumes were detected around wells MW23 and MW50.

1,4-Dioxane was detected in groundwater at 15 locations at concentrations in excess of the California Department of Health Services action level of 3 µg/L (Maryland had no standard for 1,4-dioxane at the time of this 2007 study). 1,4-Dioxane detections were widespread in the western portion of the property, with the maximum concentration (120 µg/L) at MW12A. Detected concentrations of 1,4-dioxane were generally co-located with TCE in the western TCE plume. Eight metals were also detected in groundwater at concentrations in excess of their respective standards, as follows: nickel (48 exceedances), beryllium (37 exceedances), vanadium (19 exceedances), zinc (eight exceedances), arsenic (two exceedances), lead (two exceedances), antimony (one exceedance), and chromium (one exceedance).

2.2.5 2008 Site-Wide Groundwater Investigation

Groundwater sampling in 2008 supplemented and further refined the 2007 investigation (Tetra Tech, 2009a). Investigation activities included collecting synoptic groundwater-level measurements and obtaining groundwater samples for chemical analyses; results are summarized below:

- Groundwater samples from 114 monitoring wells were collected in July–August 2008 and analyzed for VOCs, 1,4-dioxane, total and filtered metals, and field water-quality parameters. A round of synoptic groundwater measurements was obtained from these wells on October 30, 2008.
- Groundwater flow in October 2008 was similar to that depicted by previous (December 2005 and January 2008) groundwater level data. Upper surficial-aquifer levels were lower in October than those measured in January, due to the area's low precipitation

and groundwater recharge in late summer and fall. Shallow groundwater flow was found to follow the site topography, flowing radially from the hydraulically upgradient northern portion of the MRC at Eastern Boulevard and immediately south of Buildings A, B, and C to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Groundwater in the deep surficial-aquifer flows from Eastern Boulevard to the southeast, toward Dark Head Cove.

- Concentrations of cVOCs exceeded Maryland groundwater standards at two main areas of the facility and at multiple depths. TCE, a common industrial solvent and metal degreaser, was the primary VOC exceeding the MDE groundwater standard. TCE-degradation products, such as dichloroethenes (DCEs) and VC, and the fuel-related VOC benzene, also exceeded groundwater standards at the facility. These data confirm two major TCE and TCE-degradation-product plumes: the eastern TCE plume, which originates south of Building C near former underground storage tanks (UST) adjacent to the water tanks, and the western TCE plume, originating at a former UST site south of Building A. These plumes extend southeast and southwest toward Dark Head Cove and Cow Pen Creek.

- The maximum reported TCE concentration in groundwater (12,000 µg/L) was detected in intermediate surficial-aquifer well MW74B, located west of the water tank in the southeastern portion of the property. The historical maximum TCE concentration (10,000 µg/L) before 2008 had been reported for the northern portion of the eastern TCE plume at MW81B, south of Building C. The TCE-concentration distribution in the eastern plume suggests that the elevated concentrations west of the water tank originate from a source south of former Building D in Tax Block E and west of the water tank. This was supported in 2013 by the uncovering of an underground tank containing TCE and other waste materials during pre-remediation of soil in the area of proposed groundwater-remedy injection wells. Additional contaminated soil delineation and removal of TCE-contaminated soil is in the planning phase.

- Benzene concentrations at two primary source areas exceeded the MDE groundwater standard. However, concentrations declined rapidly to levels below the standard at nearby downgradient wells. October 2008 benzene concentrations in groundwater samples were 40 to 88% less than the concentrations detected during the 2005 investigation. Benzene was not detected in 2008 at several locations where it had been detected at low concentrations in 2005.

- 1,4-Dioxane was detected primarily in groundwater samples collected from the upper and intermediate surficial-aquifer. 1,4-Dioxane was co-located with cVOCs and was detected primarily in the western TCE plume at levels ranging from 2.4 µg/L at MW17A (southwest of Building A) to 120 µg/L at MW12A (near Cow Pen Creek). 1,4-Dioxane was largely absent from the eastern TCE plume, and was only detected at low concentrations in three wells.

- Concentrations of 12 metals exceeded groundwater standards in one or more groundwater samples. Although Maryland does not have a standard for cobalt, detected cobalt concentrations frequently exceeded the United States Environmental Protection Agency (USEPA) risk-based concentration for tap water. Concentrations of iron and manganese

exceeded standards most frequently; maximum concentrations of these two metals exceeded standards by more than two orders of magnitude (i.e., 100 times). Concentrations of beryllium and vanadium exceeded the standard in approximately 20% of samples, with maximum concentrations exceeding groundwater standards by more than an order of magnitude (i.e., 10 times). Concentrations of the remaining metals (i.e., arsenic, cadmium, chromium, copper, lead, mercury, and zinc) exceeded standards in fewer than 10% of groundwater samples. Metals concentrations ranged from one exceedance each for cadmium and mercury to eight exceedances for zinc. Concentrations of arsenic, cadmium, chromium, copper, lead, mercury, and zinc exceeding groundwater standards were co-located with high concentrations of manganese, iron, and nickel.

2.2.6 2008–2009 Block I Phase II Investigation

A Phase II site investigation was conducted in Block I from August 2008 through January 2009 (Tetra Tech, 2009b). This investigation collected groundwater, subsurface soil gas, building sub-slab soil gas, and subsurface soil samples, and chemically analyzed them for the subject constituents. MIP technology was used to assess subsurface contaminants and locate new groundwater monitoring wells. Three well clusters and seven individual (or single-level) wells were installed during this investigation to monitor the shallow and intermediate zones of the surficial aquifer. Two deep wells were installed to monitor the deep zone of the surficial aquifer.

Groundwater samples were collected in November 2008 and January 2009 from the 15 newly installed monitoring wells and analyzed for VOCs, 1,4-dioxane, total and filtered metals, and field water-quality parameters. A round of synoptic groundwater measurements was obtained from these wells on February 4, 2009. Analytical results of groundwater samples from the newly installed monitoring wells confirmed TCE at concentrations ranging from non-detect to a maximum of 1,500 µg/L (detected at MW88A).

TCE concentrations exceeded the MDE groundwater standard (5 µg/L) at four locations: MW74C (6.8 µg/L), MW87B (300 µg/L), MW90B (370 µg/L), and MW88A (1,500 µg/L). The highest TCE concentration detected (1,500 µg/L at MW88A) was approximately 250 feet southeast of the northeast corner of Building C, and may represent a previously unidentified source. TCE was not detected in well MW88B, which is installed in the intermediate surficial-aquifer zone beneath MW88A.

2.2.7 2009 Site-Wide Groundwater Investigation

The 2009 groundwater investigation supplemented and refined data obtained from the 2007 and 2008 investigations (Tetra Tech, 2010a), and included the activities summarized below:

- Groundwater samples were collected from 65 monitoring wells in July–August 2009 and analyzed for VOCs, 1,4-dioxane, total and filtered metals, monitored natural-attenuation assessment (NAA) parameters, and field water-quality parameters. A round of synoptic groundwater measurements was obtained from these wells on July 22, 2009. Long-term surface

- Water and groundwater levels were obtained in July 2009 for several wells, and one surface-water gaging station was installed to collect data for use in a groundwater model in the MRC response action plan.

- Groundwater flow for October 2009 was similar to that depicted in the previous groundwater investigations. Upper surficial-aquifer levels were generally higher in July 2009 than in 2008. Shallow groundwater was found to follow the site topography and flow radially from the hydraulically upgradient northern portion of the MRC at Eastern Boulevard and immediately south of Buildings A, B, and C to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek, while groundwater in the deep surficial aquifer flowed from Eastern Boulevard to the southeast, toward Dark Head Cove.

- Concentrations of cVOCs exceeded Maryland groundwater standards at two main areas of the facility and at multiple depths. TCE-degradation products (e.g., DCEs and VC) and the fuel-related VOC benzene also continued to exceed groundwater standards at the facility. Data confirmed the eastern TCE plume and the western TCE plume that extend southeast and southwest to areas adjacent to Dark Head Cove and Cow Pen Creek.

- The maximum reported TCE concentration (17,000 µg/L) was found in a sample collected from an intermediate surficial-aquifer well: MW74B, located west of the water tanks in the southeastern portion of the property. As noted in Section 2.2.5, an underground tank of waste TCE was discovered in this area during soil pre-remediation activities associated with implementation of the groundwater remedy. Contaminated soil delineation, removal, and groundwater remediation are planned for this area.

- Benzene concentrations at two primary source areas exceeded the MDE groundwater standard, but they declined rapidly to levels below the standard at nearby downgradient wells. Benzene concentrations in all areas (except the two areas of maximum concentrations) in 2009 had generally decreased from those detected in 2008 and 2005. Benzene was not detected at several locations where benzene had been detected at low concentrations in 2005, confirming the 2008 sampling results.

- 1,4-Dioxane was primarily detected in groundwater samples from the upper and intermediate surficial-aquifer, and was co-located in areas where cVOC exceedances had occurred, primarily in the western TCE plume. 1,4-Dioxane levels ranged from 0.89 µg/L (at MW21A, south of Building A) to 136 µg/L (at MW12A, near Cow Pen Creek). 1,4-Dioxane was largely absent from the eastern TCE plume, except for its detection at low concentrations in groundwater samples from two wells.

- Concentrations of eight metals exceeded the groundwater standards in one or more groundwater samples. Concentrations of iron and manganese exceeded standards most frequently, with maximum concentrations exceeding standards by more than two orders of magnitude (i.e., a factor of 100). Concentrations of beryllium and vanadium exceeded their respective standards in nearly 20% of samples, with maximum concentrations exceeding groundwater standards by more than an order of magnitude. Concentrations of the remaining metals (such as cadmium, copper, and zinc) exceeded standards in fewer than two percent of samples.

2.2.8 2010 Deep Groundwater Investigation

In March–April 2010, four deep-soil borings were advanced to depths ranging from 216–316 feet below grade (Tetra Tech, 2010b). Four two-inch inside-diameter monitoring wells were installed to monitor groundwater levels and groundwater quality in the deep confined aquifer beneath the lower surficial aquifer and above the Arundel Formation. Well-bottom completion depths ranged from 189 to 214 feet below grade.

Lithologic data, shown in Figures 2-2 through 2-5, indicate a series of alternating sand and silt aquifers and clay aquitards beneath the surficial aquifer. Clay up to 50 feet thick underlies the surficial aquifer at 15–60 feet below msl at MW93D and at 60–110 feet below msl at MW94D and MW96D. Data from the deepest boring (MW93D, advanced to 316 feet below grade) indicate a lens of continuous clay beginning at 164 feet below msl and ending at approximately 237 feet below msl. Seven feet of sand directly overlies the clay, followed by 11 feet of overlying clay and sand layers (clay thickness totaling eight feet) from 146 to 157 feet below msl. Beneath the continuous clay layer (at a depth of 164 to 237 feet below msl) is a 14-foot layer of silty and clayey fine sand, followed by another 15 feet of clay from 251 to 266 feet below msl.

Groundwater samples were collected from the newly installed wells on June 10–11, 2010 and analyzed for VOCs, SVOCs, 1,4-dioxane, and unfiltered and filtered metals. Permeability tests were conducted on Arundel Formation clay at elevations ranging from 170 to 213 feet below msl; data indicated low vertical permeabilities (2.1×10^{-08} to 8.2×10^{-08} centimeters per second). Groundwater flow in the deep aquifer (which is hydraulically confined

above and below by thick clay layers) is southeasterly from well MW93D, in the northern boundary of the MRC, toward well MW96D and Dark Head Cove.

Chemicals of concern (cVOCs, VOC-degradation products, and the SVOC 1,4-dioxane) that had been detected in surficial-aquifer groundwater were not detected in the deep-well groundwater samples. VOCs and SVOCs detected in the deep-well samples are common laboratory contaminants, or constituents of potable water used during borehole drilling, and were less than Maryland groundwater standards.

2.2.9 2010 Site-Wide Groundwater Investigation

The May–June 2010 groundwater sampling supplemented and further refined the 2009 investigation results (Tetra Tech, 2012b). Investigation activities are summarized below:

- Groundwater samples were collected from 126 monitoring wells and analyzed for VOCs, 1,4-dioxane, total metals, NAA parameters, SVOCs, and field water-quality parameters. A round of synoptic groundwater measurements was obtained from these wells on June 28–30, 2010.

- Interpreted groundwater flow for June 2010 was similar to that depicted in previous groundwater level data. June 2010 surficial aquifer groundwater elevations were generally lower than those measured in 2009. Shallow groundwater followed site topography and flowed radially from the hydraulically upgradient northern portion of the MRC (at Eastern Boulevard and immediately south of Buildings A, B, and C) to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Groundwater flow in the deep surficial aquifer and deep confined aquifer was southeasterly from Eastern Boulevard toward Dark Head Cove.

- Concentrations of cVOCs exceeded Maryland groundwater standards at three main areas of the facility, and at multiple depths. TCE-degradation products (such as DCEs and VC) also exceeded Maryland groundwater standards, as did the fuel-related VOC benzene. These data confirm three TCE and TCE-degradation-product plumes: the eastern TCE plume, the western TCE plume, and a small TCE plume west of Building A. The eastern and western TCE plumes extend southeast and southwest to areas adjacent to Dark Head Cove and Cow Pen Creek.

- Concentrations of TCE at most source-area wells had increased or remained steady over the monitoring period. TCE concentrations at MW21B (the northern source area of the western TCE plume) and at MW37A (near the southern source area of the eastern TCE plume) had decreased since 2005.

- TCE-degradation products at 14 wells where groundwater samples had also been analyzed for NAA parameters indicated that limited anaerobic reductive-dechlorination was occurring in groundwater. VC, ethene, methane, elevated alkalinity, and chloride

concentrations detected at several well locations indicated that complete mineralization may be occurring in the hydraulically downgradient fringes of the plumes. However, relatively constant TCE concentrations over the monitoring period, low or absent concentrations of lower-chain degradation products, and the poor subsurface conditions indicated by NAA parameters (e.g., oxygen-reduction potential [ORP], sulfate, chloride, etc.) suggest that slow or incomplete reductive mineralization of lower order VOCs may have been occurring in the VOC source areas.

The maximum reported TCE concentration (19,000 µg/L) detected during the 2010 sampling round was in a sample collected from intermediate surficial-aquifer well (MW74B), located west of the water tanks in the southeastern portion of the property. The maximum concentrations of TCE reported at MW74B (19,000 µg/L), MW72B (4,200 µg/L), and MW60B (3,900 µg/L) were collected from the intermediate portion of the surficial aquifer. Source(s) of this contamination may be TCE released from the waste TCE tank discovered in 2013 during groundwater remedy pre-remediation, or may have originated from the south end of the Building C Basement (near MW60B).

- Benzene concentrations exceeded the MDE groundwater standard (5 µg/L) at three areas. However, concentrations declined rapidly to levels less than the standard at nearby downgradient wells. Benzene concentrations detected in 2010 generally decreased as compared to those measured in 2009, 2008, and 2005. Benzene was not detected at several locations where it had been detected at low concentrations in 2005, confirming the intervening sampling results.

- 1,4-Dioxane was primarily detected in groundwater samples from the upper and intermediate surficial-aquifer. 1,4-Dioxane was co-located in areas with the highest concentrations of cVOCs and occurred primarily in the western TCE plume, at levels ranging from 0.96 µg/L at MW10A (near Cow Pen Creek) to 360 µg/L at MW14B (western TCE plume source area). 1,4-Dioxane was largely absent from the eastern TCE plume, except for its detection at MW44A, where a low concentration (4.6 µg/L) was detected; this concentration was slightly above the drinking-water advisory level. 1,4-Dioxane does not appear to have been used or widely released to groundwater in the eastern portion of the MRC.

- Concentrations of 14 metals exceeded MDE groundwater standards in one or more groundwater samples. Concentrations of iron and manganese exceeded standards most frequently, with maximum concentrations exceeding standards by more than a factor of 100. Concentrations of beryllium and vanadium exceeded their standards in nearly 20% of samples, with maximum concentrations exceeding screening levels by more than an order of magnitude (i.e., 10 times). Concentrations of the remaining metals (such as cadmium, copper, lead, arsenic, antimony, barium, chromium, and zinc) exceeded screening levels in no more than 3% of samples.

2.2.10 2010 Supplemental Block I Characterization

The Block I supplemental investigation (Tetra Tech, 2011) conducted in fall/winter 2010 supplemented historical groundwater, soil, and soil-gas data obtained during the 2009 Phase II investigation (Tetra Tech, 2009b); a summary of this investigation follows:

- A round of synoptic groundwater levels was collected from MRC wells, and 25 new monitoring wells (consisting of nine shallow, 14 intermediate, and two intermediate-to-deep wells) were installed, followed by the collection of groundwater samples, which were analyzed for VOCs, SVOCs, 1,4-dioxane, and metals. Twenty-eight borings were advanced via MIP for soil, groundwater, and subsurface screening for halogenated VOCs and petroleum hydrocarbons.

- The January 2011 groundwater flow for the surficial aquifer was similar to that interpreted in previous groundwater level data: shallow groundwater flow followed the site topography, flowing radially from the hydraulically upgradient northern portion of the MRC at Eastern Boulevard and immediately south of Buildings A, B, and C. January 2011 upper- and intermediate-well groundwater elevations were lower than those measured in 2010.

- TCE concentrations detected in newly installed wells ranged from 0.65 µg/L at MW93A (east of Building C) to a maximum of 3,700 µg/L at MW96A (approximately 150 feet southwest of Building A, near the former Marform pit). Nine TCE concentrations exceeded the MDE groundwater standard (5 µg/L): 53 µg/L (MW53B), 3,700 µg/L (MW96A), 11 µg/L (MW96B), 79 µg/L (MW98A), 1,300 µg/L (MW98B), 14 µg/L (MW100A), 87 µg/L (MW100B), 81 µg/L (MW102B), and 38 µg/L (MW105A). Detected concentrations of TCE in the newly installed monitoring wells suggest an additional source of TCE in groundwater near MW96A-B, west of Building A.

- Benzene concentrations in newly installed wells ranged from 18 µg/L at MW98B (northern Tilley Chemical property) to a maximum of 340 µg/L at MW96B (west of Building A, near the Marform pit). Three newly installed wells had concentrations of benzene exceeding the standard: MW53B (60 µg/L), MW96B (340 µg/L), and MW98B (18 µg/L).

- 1,4-Dioxane was detected in MW96A (1.2 µg/L), MW53B (1.7 µg/L), MW22B (1.6 µg/L), MW98A (10 µg/L), and MW102A (0.89 µg/L).

- Eleven metals had concentrations that exceeded MDE groundwater standards in one or more groundwater samples, including: arsenic (two exceedances), beryllium (seven exceedances), cadmium (one exceedance), chromium (two exceedances), iron (23 exceedances), lead (two exceedances) manganese (25 exceedances), nickel (10 exceedances), thallium (one exceedance), vanadium (seven exceedances), and zinc (one exceedance).

2.2.11 2011 Groundwater Monitoring

The findings of the 2011 groundwater investigation (Tetra Tech, 2012c) are summarized below:

- Groundwater samples were collected from 152 monitoring wells in March–May 2011 and analyzed for VOCs, 1,4-dioxane, metals, hexavalent chromium, perchlorate, NAA parameters, polychlorinated biphenyls (PCBs), and field water-quality parameters. A round of synoptic groundwater measurements was obtained from these wells on March 23–24, 2011.

- March 2011 groundwater flow was similar to that depicted in previous groundwater level data: shallow groundwater followed site topography and flowed radially from the hydraulically upgradient northern portion of the site near Eastern Boulevard and immediately south of Buildings A, B, and C, to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Groundwater in the deep surficial aquifer and deep confined aquifer flowed southeasterly and southerly, respectively, from Eastern Boulevard toward Dark Head Cove. Surficial aquifer groundwater elevations were generally higher in March 2011 than those measured in January 2011 and June 2010.

- Concentrations of cVOCs exceeded Maryland groundwater standards at three main areas of the facility and at multiple depths. TCE was the primary VOC exceeding the Maryland groundwater standard. TCE-degradation products, such as DCEs and VC, also exceeded Maryland groundwater standards at the facility, as did the fuel-related VOC benzene. These data confirm the three TCE and TCE-degradation product plumes detected in previous investigations: the eastern TCE plume (which originates south of Building C near a former UST site adjacent to existing water tanks); the western TCE plume (originating at a former UST tank site south of Building A); and a smaller TCE plume west of Building A. The eastern and western TCE plumes extend southeast and southwest to areas adjacent to Dark Head Cove and Cow Pen Creek. TCE was also detected at several isolated locations in the western portion of the facility, south of the eastern TCE plume, and north of the eastern TCE plume.

- Concentrations of TCE at most source-area wells increased or remained steady over the monitoring period. TCE concentrations at MW21B (at the northern source area of the western TCE plume), MW27B (in the center of the eastern TCE plume), and MW37A (near the southern source area of the eastern TCE plume) decreased from 2005 through 2010, but then increased in 2011. TCE concentrations continued to increase at MW60B and MW74B, two wells near possible source areas in the eastern TCE plume.

- TCE-degradation products were detected at 16 wells where groundwater samples were analyzed for NAA parameters, indicating limited anaerobic reductive-dechlorination. Concentrations of VC, ethene, methane, chloride, and elevated alkalinity at several well locations indicate that complete mineralization may be occurring in the hydraulically downgradient fringes of the plumes. However, relatively constant or increasing TCE concentrations over the monitoring period, low or absent concentrations of lower-chain degradation products, and the poor subsurface conditions indicated by the NAA parameters suggest that slow or incomplete reductive mineralization of lower-order VOCs may be occurring in the VOC source areas.

- The maximum TCE concentration (23,000 µg/L) reported for this round of sampling had decreased from the maximum concentration (70,000 µg/L) detected in 2007 in the sample from intermediate surficial-aquifer well MW74B, west of the water tanks in the southeastern portion of the MRC. The maximum concentrations of TCE reported for wells MW74B (23,000 µg/L), MW72B (4,000 µg/L), and MW60B (5,500 µg/L) were detected in samples collected from the intermediate portion of the surficial aquifer. The source(s) of this plume may have come from the release of TCE from a waste storage tank discovered in 2013 during soil pre-remediation (associated with implementation of the groundwater remedy) near well MW74B, or may have originated from the south end of the C Basement (near MW60B).

- Benzene concentrations exceeded the state groundwater standard at three locations. However, concentrations declined rapidly to levels below the standard at nearby downgradient wells. In general, benzene concentrations detected in 2011 were slightly increased from those measured in 2010. Benzene was not detected at several locations where it had been detected at low concentrations in 2005, confirming previous sampling results.

- The SVOC 1,4-dioxane was primarily detected in groundwater samples from the upper and intermediate surficial-aquifer. 1,4-Dioxane continued to be co-located in areas with high concentrations of cVOCs, and occurred primarily in the western TCE plume, with levels ranging from 0.5 µg/L (at well MW72A in the southeast corner of D-lot) to 160 µg/L (at MW12A in the western TCE plume, downgradient, near Cow Pen Creek) and MW98B (northern Tilley Chemical property). 1,4-Dioxane was largely absent from the eastern TCE plume, except for its detection at well MW44A at a low concentration (2.7 µg/L), below the USEPA drinking-water advisory level. 1,4-Dioxane does not appear to have been used or widely released to groundwater in the eastern portion of the MRC.

- Groundwater samples from six wells (MW43A, MW44A, MW62A, MW62C, MW103A, and MW103B) were analyzed for PCBs where elevated levels of PCBs had previously been detected in soil. PCBs were detected in only one of six samples (MW43A), at a concentration (0.24 µg/L) less than the groundwater standard (0.5 µg/L).

- Concentrations of 12 metals exceeded Maryland groundwater standards in one or more groundwater samples. Concentrations of iron and manganese exceeded standards most frequently, with maximum concentrations exceeding standards by more than a factor of 100 (i.e., two orders of magnitude). Concentrations of vanadium and beryllium exceeded the standard in 13% and 21% of samples, respectively, with maximum concentrations exceeding groundwater standards by more than an order of magnitude (i.e., more than 10 times). Nickel concentrations exceeded the standard in 34% of samples, with maximum concentrations exceeding groundwater standards by more than a factor of 100. Concentrations of the remaining metals (such as cadmium, copper, lead, arsenic, barium, chromium, and zinc) exceeded standards in no more than 1.7% of samples.

- Hexavalent chromium was detected in 13 of 62 (21%) groundwater samples analyzed for hexavalent chromium. Detected concentrations ranged from 0.012 µg/L (at MW93A, east of Building C) to 35.7 µg/L (at well EXT-MW06, in the southwestern portion of the

MRC near the Tilley Chemical property). All detected hexavalent chromium concentrations were less than the groundwater standard (100 µg/L).

- Perchlorate was detected in four of 62 (6%) groundwater samples analyzed for perchlorate. Detected concentrations ranged from 1.8 µg/L (at MW38A, near Dark Head Cove) to 15.7 µg/L (at well MW53A, west of Building A). Three perchlorate concentrations exceeded the groundwater standard (2.6 µg/L): 15.7 µg/L at MW53A, 4.4 µg/L at MW96B (west of Building A), and 2.9 µg/L at MW01A (near Eastern Boulevard).

2.2.12 2012 Groundwater Monitoring

The findings of the 2012 investigation (Tetra Tech, 2012d) are summarized below:

- Groundwater samples were collected from 129 monitoring wells in March–April of 2012. Samples were analyzed for VOCs, 1,4-dioxane, metals, hexavalent chromium, perchlorate, NAA parameters, PCBs, and field water-quality parameters. A round of synoptic groundwater measurements was obtained from the wells on March 7–8, 2012.

- Groundwater flow in March 2012 was similar to that depicted by previous groundwater level data. Surficial aquifer groundwater elevations in 2012 were generally lower than those measured in 2011. Shallow groundwater flow follows site topography, flowing radially from the hydraulically upgradient northern portion of the MRC at Eastern Boulevard and immediately south of Buildings A, B, and C, to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Groundwater in the deep surficial aquifer flows southeasterly from Eastern Boulevard toward Dark Head Cove.

- Concentrations of cVOCs exceeded Maryland groundwater standards at three main areas of the facility and at multiple depths. TCE, *cis*-1,2-DCE and VC exceeded Maryland groundwater standards, as did the fuel-related VOC benzene. These data confirm three TCE and TCE-degradation-product plumes: the eastern TCE plume (originating south of Building C near a former UST adjacent to the water tanks); the western TCE plume (originating at a former UST site south of Building A); and a smaller TCE plume west of Building A. TCE was also confirmed at several isolated locations in the western portion of the facility, south of the eastern TCE plume, and north of the eastern TCE plume.

- Concentrations of TCE at most source-area wells had increased or had remained steady over the monitoring period. TCE concentrations at MW21B (at the northern source area of the western TCE plume) and well MW37A (near the southern source area of the eastern TCE plume) generally decreased from 2005–2012. TCE concentrations had continued to increase at MW74B, a source-area well in the eastern TCE plume. TCE at MW60B, a source-area well in the northern portion of the eastern TCE plume, had increased from 2007–2011, but then subsequently decreased in 2012 to a concentration comparable to the 2010 concentration.

- TCE-degradation products were detected at 16 wells where groundwater samples were analyzed for NAA parameters. Results indicate that limited anaerobic

reductive-dechlorination is occurring. Concentrations of VC, ethene, methane, chloride, and elevated alkalinity at several well locations indicate that complete mineralization may be occurring in the hydraulically downgradient fringes of the plumes. However, relatively constant or increasing TCE concentrations over the monitoring period, low or absent concentrations of lower-chain degradation products, and the poor subsurface conditions indicated by the NAA parameters suggest that slow or incomplete reductive mineralization of lower-order VOCs may be occurring in the VOC source-areas.

- The maximum reported TCE concentration (30,000 µg/L) in 2012 had increased compared to the maximum concentration detected in 2007 in the intermediate surficial-aquifer well MW74B (13,000 µg/L), located west of the water tanks in the southeastern portion of the property. The 2012 maximum TCE concentrations were reported in samples from wells MW74B (30,000 µg/L), MW72B (4,300 µg/L), and MW60B (3,500 µg/L); all are screened in the intermediate portion of the surficial aquifer. The source(s) of this plume may be from a release from the tank of waste TCE discovered in 2013 during soil pre-remediation activities associated with implementation of the groundwater remedy, or may originate from the south end of the Building C Basement (near MW60B).

- Benzene concentrations at three areas west of Building A (within the western TCE plume and near the vertical-assembly building) exceeded the state groundwater standard. However, concentrations declined rapidly to levels below the standard at nearby downgradient wells. Benzene concentrations detected in 2012 generally increased from those measured in 2011, but decreases were observed at the four wells containing maximum (or near maximum) benzene concentrations. Benzene was not detected at several locations where it had been detected at low concentrations in 2005, confirming previous sampling results.

- The SVOC 1,4-dioxane was primarily detected in groundwater samples from the upper and intermediate surficial-aquifer. 1,4-Dioxane was detected primarily in the western TCE plume, with levels ranging from 0.53 µg/L (at MW22A, southeast of Building A) to 440 µg/L (at MW14B in Tax Block G, west of the Tilley Chemical property). 1,4-Dioxane is largely absent from the eastern TCE plume, except for its detection at well MW44A (3.9 µg/L) at a concentration slightly exceeding its screening level (the California action level of 3.0 µg/L). (Maryland does not have a groundwater standard for 1,4-dioxane.) 1,4-Dioxane does not appear to have been widely used or released to groundwater in the eastern portion of the MRC.

- Groundwater samples from six wells (MW43A, MW44A, MW62A, MW62C, MW103A, and MW103B) were analyzed for PCBs in Tax Block E at D-Lot, where elevated levels of PCBs had previously been detected in soil, but PCBs were not detected. PCBs had been detected previously (in 2011) at well MW43A (0.24 µg/L), but at a concentration less than the groundwater standard (0.5 µg/L).

- Concentrations of 12 metals exceeded Maryland groundwater standards in one or more groundwater samples. Concentrations of manganese, iron, and nickel exceeded standards most frequently, with the maximum concentrations exceeding standards by more than a factor of 100. Concentrations of beryllium and vanadium exceeded the standard in 23%

and 11% of samples, respectively, with maximum concentrations exceeding groundwater standards by more than an order of magnitude (i.e., more than 10 times). Concentrations of the remaining metals (cadmium, copper, lead, arsenic, barium, chromium, and zinc) exceed standards in no more than 3% of samples.

- Hexavalent chromium was detected in two of 27 (7%) groundwater samples analyzed for hexavalent chromium. Hexavalent chromium was detected at MW80A (0.918 µg/L) and EXT-MW06 (39 µg/L). Both wells are in the southwestern portion of the MRC and downgradient of REC #9 (former 2,000-gallon waste oil UST) and the hazardous waste storage building. All hexavalent chromium concentrations are less than the MDE groundwater standard of 100 µg/L. Hexavalent chromium was not detected in newly installed wells MW109A/B, MW110A/B, MW111A/B, and MW112A. Multiple years of groundwater sampling have not shown evidence that dissolved-phase hexavalent chromium in MRC groundwater is a concern.

- Perchlorate was detected in three of seven (43%) groundwater samples analyzed for perchlorate. Detected concentrations of perchlorate ranged from 0.74 µg/L (MW110A) to 3.4 µg/L (MW110B), the latter of which exceeds the Maryland groundwater standard of 2.6 µg/L. Both of these wells are in parking lot 2 west of Building A. Perchlorate was also detected at a low concentration (0.81 µg/L) at well MW109B, which is also west of and adjacent to Building A. Perchlorate was not detected in newly installed wells MW109A, MW111A/B, and MW112A.

Section 3
Investigational Approach

This section summarizes the procedures used during the March–May 2013 round of groundwater sampling and collection of synoptic groundwater-level measurements. The investigation's overall objective was to provide a current round of groundwater levels for selected wells and to collect groundwater samples from these wells, to further delineate the nature and extent of groundwater contamination, evaluate time-series trends of on-site groundwater plumes, and evaluate the natural attenuation of chemicals of concern in groundwater at the Middle River Complex (MRC).

3.1 SYNOPTIC GROUNDWATER LEVEL MEASUREMENTS

A synoptic round of groundwater level measurements was conducted on March 12, 2013. Static water levels were measured using a graduated electronic-sounding water level meter. The static water level was determined by lowering the meter's probe into the well until the liquid level-indicator emitted an audible tone, indicating the air/water interface. The water level was read from the probe cable and recorded to the nearest 0.01 foot as the depth to water, with respect to the top of the plastic well casing. Water levels and the time of measurement were recorded for all monitoring wells. Groundwater level measurements are in Appendix A.

3.2 GROUNDWATER SAMPLING

Groundwater samples were collected from 137 on-site and 21 off-site groundwater monitoring wells from March 15–May 9, 2013. Nested wells OF09A-C could not be accessed and sampled because a private vehicle was parked over the casing. Chemical analysis of groundwater samples varied by well and depended on the data needed for that particular area. Most samples were analyzed for volatile organic compounds (VOCs) and total (i.e., unfiltered) metals. Less frequent chemical analyses included 1,4-dioxane (a semivolatile organic compound [SVOC]), perchlorate (a component of propellants), polychlorinated biphenyls (PCBs), and natural attenuation assessment (NAA) parameters.

Wells sampled for this round are shown in Figure 3-1; the chemical analyses performed for each sample are listed in Table 3-1. Monitoring wells were purged before sample collection using low-flow-purging techniques. Groundwater purging and sampling were accomplished using a

peristaltic pump fitted with dedicated, disposable, Teflon®-lined tubing, or by a submersible pump positioned in the center of the well's saturated-screen length. The pumping rate during purging ranged between 100 to 300 milliliters per minute (ml/min) and was constantly measured using a graduated cylinder. The purge rate was adjusted but was not allowed to fall below 100 ml/min, to minimize drawing the water level below its static water level.

Water level drawdown measurements and groundwater parameters were collected every five to 10 minutes until purging was complete. Groundwater parameters, including pH (a measure of acidity and alkalinity), temperature, specific conductance, dissolved oxygen (DO), oxidation-reduction potential (ORP), and turbidity, were also measured during purging. These data were recorded on low-flow purge data sheets. Water quality parameters were measured with an inline water quality meter. Turbidity readings were collected using a separate turbidity meter. Groundwater purging and sample record sheets are in Appendix B.

Purging was considered complete when the monitored water quality parameters stabilized, when three saturated well casing volumes had been removed, or the well had been purged dry. Stabilization was considered achieved when three consecutive readings, taken at five-minute intervals, were within ±0.1 standard units for pH, ±3% for specific conductance and temperature, ±10% for DO and ORP, and less than 10 nephelometric turbidity units for turbidity. If the monitoring well was purged dry, the water level was allowed to recover at least 80% of its initial static water level before groundwater sampling. All purged water was collected in United States Department of Transportation (USDOT)-approved 55-gallon steel drums that were staged in the central portion of the MRC D-lot.

The monitoring wells were sampled after purging, using the same dedicated tubing or submersible pump that had been used during purging. Groundwater was pumped directly into certified-clean sample containers supplied by the analytical laboratory. Sample containers for VOC analyses were filled directly, to minimize VOC losses. Groundwater samples for VOCs were collected first, followed by samples to be analyzed for 1,4-dioxane, PCBs, metals, perchlorate, and NAA parameters.

3.3 WELL REPAIR

In 2013, all MRC monitoring wells were inspected and repairs were completed for 36 wells. Wells were inspected during the 2013 groundwater sampling program and included a written survey of existing well conditions and a list of required repairs. Repairs completed in 2013 include replacing bolts for 29 well covers, replacing protective well covers and concrete pads for six wells, and modifying the well casing for one well. The well requiring casing replacement was resurveyed by a professional surveyor to establish the new casing elevation (i.e., vertical coordinate). Details of the well repairs are in Appendix C.

3.4 LABORATORY ANALYSES

Samples from the wells listed in Table 3-1 were analyzed for the following chemicals:

- VOCs, by United States Environmental Protection Agency (USEPA) Method 8260: samples from 99 on-site wells and 21 off-site wells
- 1,4-dioxane, by USEPA Method 8270C selected ion monitoring (SIM): samples from 56 on-site wells and 21 off-site wells
- PCBs, by USEPA Method 8082: samples from six on-site wells in Block E near elevated soil PCB concentrations, and a prior PCB detection in groundwater
- total metals, by USEPA Method 6020B: samples from 96 on-site wells
- perchlorate, by USEPA Method 314: samples from 27 on-site wells
- NAA parameters: 16 wells analyzed by USEPA SW846 protocols for the NAA parameters of nitrate/nitrite, ammonia nitrogen, orthophosphate, sulfate, total alkalinity, total calcium, total iron, total magnesium, total manganese, total potassium, total sodium, silicon dioxide, total dissolved solids, methane, ethane, ethene, total organic carbon, and chloride

Samples were analyzed by TestAmerica, Inc., of North Canton, Ohio. No duplicates were collected during this investigation, to provide a cost-effective sampling program, and because earlier MRC groundwater duplicate sampling and data validation reviews indicated satisfactory quality assurance/quality control (QA/QC). Trip blank (TB) samples were analyzed for VOCs for QA/QC purposes and submitted at a rate of one per cooler of VOCs per day. Matrix-spike/matrix-spike-duplicate samples were collected and analyzed on a 1:20 basis.

3.5 DOCUMENTATION

A master site logbook was maintained to document field activities. Sample documentation consisted of completed chain-of-custody (COC) reports and matrix-specific sample log sheets. The COC report is a standardized form summarizing and documenting pertinent sample information such as sample identification and type, matrix, date and time of collection, preservation, and requested analysis. Sample custody procedures document sample acquisition and integrity. COC are included as part of the data validation reports discussed in Section 3.9.

3.6 EQUIPMENT DECONTAMINATION

Reusable equipment (e.g., water-level meter, submersible pump) was decontaminated before and after each use. Decontamination of reusable small equipment involved the following:

- Liquinox® (a laboratory-grade, phosphate-free, ionic/anionic surfactant) and potable-water wash
- potable-water rinse
- distilled-water rinse
- air drying

Decontamination rinsate water was transferred into 55-gallon drums staged in the central portion of the MRC D-lot for subsequent disposal. Dedicated and/or disposable equipment that did not require decontamination was used for groundwater purging/sampling.

3.7 WASTE MANAGEMENT

Well purge-water was collected as investigation-derived waste (IDW) in USDOT–approved 55-gallon steel drums. The drums were stored at an approved central staging area on the facility's D-lot, pending waste-profile sampling results. Envirite, Inc. (a state-licensed waste transporter) sampled the IDW and deemed it non-hazardous. Upon receipt of the IDW analytical data, Clean Harbors, Inc. removed the IDW from the MRC, and properly disposed of it as non-hazardous waste at a Lockheed Martin Corporation (Lockheed Martin)-approved waste treatment facility in accordance with federal, state, and local regulations.

3.8 GENERAL SAMPLING PROCEDURES, NOMENCLATURE, AND HANDLING

A master site logbook was maintained for the sampling program to document field activities. Each sample collected was given a unique sample identification consisting of the well name and sampling date (e.g., MRC-MW93A-032113). Trip blanks were labeled with a "TB" prefix followed by a six-digit submittal date (e.g., TB-032113). Sample handling included field-related considerations concerning selection of sample containers, preservatives, allowable holding times, and analyses requested.

Proper custody procedures were followed throughout all phases of sample collection and handling. COC protocols were used throughout sample handling to document the integrity of sample containers. These protocols demonstrate that samples were handled and transferred in a manner that eliminates (or detects) possible tampering. Sample containers were released under signature from the laboratory and were accepted under signature by a responsible individual who maintained custody until the sample containers were transferred to the sampling team. Groundwater samples were released under signature from the sampling team and were accepted under signature by the laboratory. Transport containers returning to the laboratory were sealed with strapping tape and a tamper-resistant custody seal. The custody seal shows the signature of the individual releasing the transport container, along with the date and time. Signed COC are provided as part of the data validation reports discussed in the next section.

3.9 DATA VALIDATION

Data validation involves having a party independent of the analytical laboratory review the laboratory data to ensure that specific criteria are met. These criteria are concerned with specifications that are not sample-dependent; they specify performance requirements that should be fully under a laboratory's control. For organic data analyses, specific validation areas include blanks, performance evaluation standard materials, and instrument performance checks. For inorganic data analyses, specific validation areas include blanks, calibration standards, calibration verification standards, laboratory control standards, and interference check standards.

Chemical data were supplied by the laboratory as hard-copy reports and electronic databases. After sampling was complete, the chemical data were validated to assess their reliability and accuracy, in accordance with established USEPA protocols. This review was based on USEPA

Region 3 guidelines (USEPA, 1993 and 1994) and the specifics of the analytical method employed. Data validation reports with COC are in Appendix D.

Collectively, the data are acceptable for their intended use, except for data that have been qualified as unreliable. For this validation, the following data qualifiers (i.e., flags) were applied to the chemical results presented in this report:

B The analyte was not detected substantially above the level reported in the laboratory or field blank (i.e., the result is considered an artifact of the laboratory analysis and is not considered a site contaminant).

J The analyte is considered present in the sample. However, the value is estimated and may not be accurate or precise.

K The analyte is considered present in the sample. However, the value is biased high and the actual value is expected to be lower than the reported value.

L The analyte is considered present in the sample. However, the value is biased low and the actual value is expected to be higher than the reported value.

NJ The analyte has been tentatively identified. This qualifier indicates presumptive evidence of the presence of a compound. Special methods may be required to confirm its presence or absence in future sampling efforts.

U Not detected. The analyte is considered not detected at the reported value.

UJ The analyte was not detected. However, the quantitation or detection limit may be inaccurate or imprecise.

UL The analyte was not detected. However, the quantitation or detection limit is likely greater than the reported value.

UR The result is considered to be qualitatively or quantitatively unreliable.

Several of these flags (i.e., *J, K, L* and NJ) appear on the chemical results tables in Section 4; all flags can be found in Appendices D and E.

Common laboratory or field contaminants may occasionally be detected in the samples. Analyses of quality control blanks and other internal laboratory blanks (e.g., method blanks, etc.) are used to determine the significance of the analytical results versus possible laboratory or field contaminants. USEPA national functional laboratory guidelines require that results for common laboratory contaminants such as acetone, methylene chloride, and 2-butanone be qualified

(i.e., flagged with a *B*) when the sample concentration is less than 10 times the concentration detected in the blank. VOCs results were flagged infrequently.

In this sampling round, any compound detected in both the sample and an associated blank was qualified (i.e., flagged with a *B*) when the sample concentration was less than five times the concentration detected in the blank; ammonia nitrate, antimony, cobalt, copper, mercury, molybdenum, nickel, silver, and zinc were reported with *B* qualifiers, indicating blank contamination. Molybdenum was the most frequently *B*–qualified metal, with 14 qualified results. Blank contamination was not detected for the 1,4-dioxane and PCB analyses; therefore, no *B* flags were applied to these results. The *B*-qualified results are reported in the Section 4 tables as non-detects, because the results are considered artifacts of the laboratory analyses.

3.10 DATA MANAGEMENT

Laboratory data-handling procedures met the requirements set forth in the laboratory subcontract. All analytical and field data are maintained in the project files. The project files contain copies of the COC, samplinglog forms, sampling location maps, and data quality-assurance documentation.

3.10.1 Data Tracking and Control

A “cradle to grave” sample tracking system was used from the beginning to the end of the sampling event. The field operations leader coordinated sample tracking before field mobilization. Sample jar labels were handwritten in the field. Labels were reviewed to ensure their accuracy and adherence to work plan requirements. The project manager’s (PM) assistant coordinated with the analytical laboratory to ensure that they were aware of the number and type of samples and analyses to expect.

When field sampling was underway, the field operations leader forwarded the COC to the PM’s assistant and to the laboratory for each day that samples were collected. The PM’s assistant confirmed that the COC provided the information required by the work plan. This allowed early detection of errors made in the field so adjustments could be made while the field team was mobilized. The laboratory submitted an electronic deliverable for the sample delivery groups. When all electronic deliverables had been received from the laboratory, the PM’s assistant confirmed that the laboratory performed all analyses requested.

3.10.2 Sampling Information

Data from field measurements were recorded using the appropriate log sheets, as per Tetra Tech, Inc. (Tetra Tech) standard operating procedure SA-6.3. Reduction of field data entailed summarizing and presenting these data in tabular form. Reduction of laboratory data entailed manipulating raw data-instrument output into reportable results. Laboratory data were verified by the group supervisor and then by the laboratory's quality control/documentation department.

3.10.3 Project Data Compilation

The analytical laboratory generated an Adobe *Acrobat*® portable document format (PDF) file of the analytical data packages, as well as an electronic database deliverable. The electronic database was checked against the PDF file provided by the laboratory and updated as required, based on data qualifier flags applied during data validation. Data generated during implementation of the sampling and analysis plan were incorporated into the MRC environmental geographic information system (GIS) database. All data (such as units of measure and chemical nomenclature) were checked to maintain consistency with the project database.

3.10.4 Geographical Information System

The data management system for this effort consists of a relational database and GIS to manage environmental information pertaining to MRC. The relational database stores chemical, geological, hydrogeologic, and other environmental data collected for the MRC environmental investigations. The GIS is built from the relational database and contains subsets of the larger data pool. Using the GIS, environmental data were posted onto base maps to represent the information graphically for this report.

Section 4
Investigation Results

This section presents the March groundwater-elevation data and the analytical results of the March–May 2013 groundwater sampling effort. The field program measured static groundwater levels from Middle River Complex (MRC) monitoring wells and sampled groundwater from on-site and off-site wells for laboratory chemical analyses. Most groundwater samples (99 on-site and 21 off-site samples) were analyzed for volatile organic compounds (VOCs) and metals (96 on-site samples). Fifty-six on-site and 21 off-site samples were analyzed for 1,4-dioxane. Twenty-seven on-site samples were analyzed for perchlorate, and six on-site samples were analyzed for polychlorinated biphenyls (PCBs). Sixteen on-site samples were also analyzed for natural-attenuation assessment (NAA) parameters.

4.1 GROUNDWATER LEVEL DATA

Table 4-1 presents the March 2013 groundwater-level measurements (i.e., depth to groundwater measurements) and computed groundwater elevations at MRC. The groundwater depth measurements in the third column of Table 4-1 indicate that the groundwater table of the surficial aquifer is near the ground surface along the shorelines of Cow Pen Creek and Dark Head Cove (at wells MW08A, MW09A, MW12A, MW15A, MW39A, and MW40A) and in Block E (at wells MW30A, MW43A, MW44A, and MW62A). Groundwater depth measurements at or near 0.00 feet indicate groundwater at or near the top of the well casing, which is near the ground surface for most wells. Depth to surficial aquifer groundwater was measured at 11–19 feet deep north and west of Building A (at wells MW67A, MW50A and MW05A); approximately 15 feet deep in the northwestern corner of Block E (at well MW101A); and approximately 14 feet deep south of Building A (MW22A) and south of Building C (MW60A). The static groundwater surface (i.e., potentiometric groundwater level) is above the ground surface in intermediate and lower surficial aquifer wells MW08B (approximately three feet above the ground surface, indicated by a measurement of -3.00 feet above the casing) and MW12C (approximately one foot above the ground surface, indicated by measurement of -1.24 feet above the casing), and in the

deep confined aquifer well MW96D (approximately five feet above the well casing, indicated by measurement of -5.34 feet above the casing).

Figures 4-1 and 4-2 show the groundwater-elevation contour maps for the upper ("A" and "B") and lower ("C") surficial-aquifer wells, respectively. The March 2013 groundwater flow for the surficial aquifer is similar to that depicted in previous investigations. However, the March 2013 surficial aquifer groundwater elevations are generally higher than those collected in March 2012. As shown in Figure 4-1, shallow groundwater follows the site topography and flows radially from the hydraulically upgradient northern portion of the MRC (at Eastern Boulevard and immediately south of Buildings A, B, and C) to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Subsurface sandy zones act as preferential pathways for contaminant transport in groundwater, possibly originating from an upgradient source in the clay-rich materials. Groundwater in the lower surficial-aquifer (Figure 4-2) flows southeast from the area south of Buildings A–C toward Dark Head Cove.

4.2 GROUNDWATER CHEMICAL DATA: ON-SITE WELLS

Validated groundwater-chemical data were used to generate a statistical summary table (Table 4-2) and a "hits" table (Table 4-3) summarizing positive detections of chemical analytes for the May 2013 groundwater samples. Appendix E presents all analytical data, including non-detects. Table 4-2 lists the chemicals detected in groundwater, ranked from the most frequently detected to the least frequently detected. Gray shading in Table 4-3 indicates results exceeding Maryland groundwater standards. Chemical analysis results for the May 2013 groundwater sampling episode are discussed in the following sections.

4.2.1 Volatile Organic Compounds

Previous groundwater sampling and chemical analyses at the MRC from 2005–2012 demonstrate that trichloroethene (TCE) and benzene have formed well-defined plumes, indicating migration of these analytes from source areas. TCE is a common industrial solvent and metal degreaser, whereas benzene is a toxic constituent of petroleum fuels such as gasoline and, to a lesser extent, diesel fuel and heating oils. The 2013 results confirm TCE and benzene groundwater plumes previously identified in the central and downgradient portions of the MRC. Consistent with earlier results, current chemical data indicate that TCE and benzene are in groundwater at concentrations exceeding Maryland's groundwater standard (both are 5 micrograms per liter [µg/L]).

TCE and benzene results are discussed herein because they are primary indicators of solvent and petroleum VOC contamination, and are the VOCs in each group that most frequently exceed groundwater standards at MRC. Therefore, the distributions of TCE and benzene are evaluated to provide an overview of the primary VOC groundwater contamination at the MRC. Chlorinated VOC-degradation daughter products (e.g., dichloroethenes, vinyl chloride [VC], etc.) or other petroleum-related VOCs (e.g., methyl *tert*-butyl ether [MTBE], benzene isomers, naphthalene, etc.) are typically co-located with these primary VOCs.

Chlorinated volatile organic compounds (cVOCs)—TCE results are shown in Figure 4-3. Figure 4-3 and Table 4-2 show that in 2013 TCE was detected in shallow groundwater at several areas, with detected concentrations ranging from 0.17*J* µg/L at well MW12C (southwestern portion of MRC near Cow Pen Creek) to 40,000 µg/L at well MW74B (southeastern corner of MRC in recognized environmental condition [REC] #3), respectively. Tetrachloroethene (PCE), another chlorinated solvent and degreaser, was detected infrequently (in 5% of samples) and at concentrations ranging from 0.38 µg/L at well MW98A (near REC #9, the former 2,000-gallon waste oil underground storage tank [UST]) to 13 µg/L at MW60A (rear of Building C), with an average detected concentration of 4.69 µg/L. PCE is co-located with TCE in all cases, and exceeded its groundwater standard (5 µg/L) at wells MW16A, MW60A, and MW98B.

- *Eastern TCE plume:* As shown in Figure 4-3, the largest contiguous area containing samples with the highest concentrations of TCE in groundwater extends southeast from MW60B (5,100 µg/L) and MW81B (700 µg/L) at the southern end of Building C to well MW112A (4.3 µg/L), near Dark Head Cove. Maximum detected TCE concentrations of 40,000 µg/L, 5,100 µg/L, and 1,400 µg/L are reported for wells MW74B, MW60B, and MW74A, respectively. MW74A and MW74B are in the southeastern portion of the plume west and east (respectively) of the aboveground water tanks, while well MW60B is south of Building C.

    - The high TCE concentration at MW74B (40,000 µg/L) indicates the likely presence of dense non-aqueous-phase liquids (i.e., residual solvent product) in the general area. The discovery of a tank of waste TCE solvent during soil pre-remediation in the Tax Block E groundwater treatment area supports this theory. The tank contained full-strength TCE and appeared to be leaking. Soil under the tank was impacted by TCE. Soil that could easily be removed was removed before the excavation was stabilized. A TCE-impacted soil delineation and removal program is being developed for implementation this year, preferably before completion and startup of groundwater remediation in that area.

- The high concentrations at the north and south of the east plume, with no high concentrations between the north and south, suggest at least two distinct TCE-source areas.

- The maximum concentrations of TCE were detected in the intermediate depth of the surficial aquifer, in wells MW74B and MW60B, screened 30 feet below grade. The source(s) of this plume may originate from the south end of the Building C Basement (MW60B), or possibly from spills of material handled near MW60B and MW74A/B, or from a recently discovered UST near the former Building D foundation that was found to contain TCE product. At both areas, residual TCE may be trapped in silt and sand lenses in the clay-rich zones, and/or may be adsorbed to organic material and clays. From these source areas, dissolved TCE has presumably been released to groundwater and now moves preferentially to the southeast along the more permeable sandy and silty materials that extend from well MW48 southeastward to well MW37.

- The magnitudes and trend in TCE concentrations at MW74B suggests the well is close to non-aqueous source material (Figure 4-5 is a graph of TCE and daughter-product concentration trends for this well):

  - Year 2007 70,000 µg/L (installed Oct 11, 2007)
  - Year 2008 12,000 µg/L
  - Year 2009 17,000 µg/L
  - Year 2010 19,000 µg/L
  - Year 2011 23,000 µg/L
  - Year 2012 30,000 µg/L
  - Year 2013 40,000 µg/L

- *Western TCE plume:* As shown in Figure 4-3, the second largest contiguous area of TCE groundwater contamination extends from well MW21 (near REC #9, a former 2,000 gallon waste-oil UST), to MW12 (near Cow Pen Creek). The current maximum reported concentrations of TCE in this area are 2,300 µg/L at well MW14B (in the center of the plume) and 1,500 µg/L at well MW12A (in the southernmost portion of the plume, near Cow Pen Creek). Well MW98B (near well MW12) had a TCE concentration of 530 µg/L.

- *Other TCE areas:* As shown in Figure 4-3, TCE exceedances of the 5 µg/L groundwater standard were also detected at the western portion of the facility in wells MW96A-B (3,300 µg/L and 17*J* µg/L, respectively), MW90B (71 µg/L), MW53A (10 µg/L), MW53B (210 µg/L), MW109B (15 µg/L), MW110A-B (32 µg/L and 11 µg/L), MW50A (18 µg/L), and MW17A (9 µg/L). The maximum TCE concentration (3,300 µg/L) in this area was detected at well MW96A, located west of Building A.

- *Concentration trends for primary chlorinated VOCs:* Figures 4-4 through 4-6 are long-term time-series plots of TCE, *cis*-1,2-dichloroethene (*cis*-1,2-DCE), and vinyl chloride (VC) for eight selected MRC wells. Figure 4-4 (wells MW21B, MW14B, and MW12A) shows source and downgradient conditions in the western TCE plume. Source conditions in the eastern TCE plume are shown on Figure 4-5 (wells MW60B and

MW74B). Figure 4-6 (wells MW27B and MW37A/B) depicts downgradient conditions. Data from the 2005–2013 sampling events were used for these plots.

As shown in Figure 4-4, VOC concentrations in source areas of the western TCE plume (MW21B and MW14B) have fluctuated since 2005. In the northern portion of the plume (at well MW21B), TCE and *cis*-1,2-DCE groundwater concentrations decreased by 34-48% between 2005 and 2007. However, both TCE and *cis*-1,2-DCE concentrations have remained somewhat steady since 2007, with average fluctuations of approximately 560 µg/L and 5 µg/L, respectively. Recent TCE and *cis*-1,2-DCE concentrations (from 2009–2013) in the center of the plume at MW14B rebounded upward to the initial 2005 levels after rapidly decreasing by an order of magnitude from 2007–2008.

VOC concentrations downgradient of MW14B, at well MW12A (Figure 4-4), have been relatively stable, with slight increases since 2005; recently, however, TCE concentrations have been decreasing (1,900 µg/L in 2011, 1,800 µg/L in 2012, and 1,500 µg/L in 2013). Vinyl chloride has not been detected in either MW14B or MW12A since 2005 (Figure 4-4). These TCE trends, and the relatively low concentrations of *cis*-1,2-DCE and VC, suggest that TCE degradation is proceeding slowly in the western TCE plume.

Figure 4-5 shows VOC concentrations at two source-area wells (MW60B and MW74B) in the eastern TCE plume. Figure 4-6 shows three downgradient wells (MW27B and MW37A/B). VOC concentrations for both northern (MW60B) and southern (MW74B) source-area wells increased steadily over the six-year monitoring period (2007–2013), with a slight decrease at MW60B from 2011 to 2012. Concentrations of TCE at MW60B increased by a factor of five over four years, from 810 µg/L in 2007 to 5,500 µg/L in 2011. At well MW27B, downgradient of the well MW60B, TCE concentrations nearly doubled from 2005–2008, decreased rapidly in 2009–2010, then increased again in 2011-2012; concentrations have remained relatively steady in 2013 (Figure 4-6). VOCs at well cluster MW37, also hydraulically downgradient of MW74B, generally decreased at MW37A. From 2005 to 2009, VOC concentrations at MW37B increased, followed by a 50% decrease in 2010; concentrations then increased again in 2011–2012 to concentrations similar to 2009 levels. These TCE trends, and the relatively low concentrations of *cis*-1,2-DCE and VC, suggest that TCE degradation is proceeding slowly in the eastern TCE plume.

- *Natural-attenuation parameters:* In addition to the standard analyses for VOCs, the laboratory analyzed 16 groundwater samples for several NAA parameters. Fifteen plume wells and one background well (MW03A) were sampled for these parameters. The NAA analyses include alkalinity, ammonia nitrogen, chloride, nitrate, orthophosphate, sulfate, total dissolved solids, iron, manganese, potassium, and the dissolved gasses ethane, ethene, and methane. NAA parameters were also measured in the field. Field measurements include groundwater pH (a measure of acidity or alkalinity), oxidation-reduction potential (ORP), dissolved oxygen (DO), and temperature.

  These analyses will help evaluate whether VOCs are undergoing anaerobic reductive-dechlorination at the site, and whether site conditions can be enhanced by adding electron donor and/or pH adjustment to the groundwater to stimulate anaerobic reductive-dechlorination. These results will also be used as input for ongoing

groundwater-contaminant modeling, and in the evaluation and design of groundwater remedial alternatives. NAA results are in Tables 4-4 through 4-6, and are briefly discussed in this report.

Table 4-4 presents the VOC and NAA results for wells MW14B and MW21B, located in the central and northern portions of the western TCE plume, respectively, and NAA results for wells MW12A and MW12B, located at the southwestern edge of the western TCE plume near Cow Pen Creek. Well MW14B has historically had the highest TCE concentrations in the western plume, and represents one of the TCE source areas at MRC. Chemical and NAA results offer limited evidence of biodegradation in the central and northern portions of this plume.

The presence of TCE and degradation products such as 1,1-dichloroethene and *cis*-1,2-DCE in wells MW14B and MW21B indicate that some biodegradation is occurring; however, the lack of detectable or elevated concentrations of lower-chain degradation products such as VC, chloroethane, ethene, and ethane, suggest that complete mineralization either is not occurring or is occurring slowly. Limited evidence of biodegradation is further supported by the NAA data, which do not indicate favorable subsurface conditions in these areas. NAA results suggest unfavorable conditions for biodegradation at both wells, including alkalinity and chloride levels less than background concentrations, a high sulfate concentration (MW14B), low or marginal pH, high ORP, high DO (MW14B), and temperatures less than 20 degrees Celsius. Limited biodegradation at MW14B and MW21B is also indicated by somewhat consistent TCE concentrations over time (see Figure 4-4). Groundwater conditions at MW12A and MW12B near Cow Pen Creek are similar to conditions at MW14B and MW21B, except both wells have slightly higher (more favorable) pH levels and lower (favorable) sulfate concentrations. However, limited biodegradation is apparent at MW12A, as indicated by the constant TCE and *cis*-1,2-DCE concentrations over time (Figure 4-4).

Table 4-5 presents the VOC and NAA results for seven wells in the northern portion of the eastern TCE plume. Wells MW60B, MW48A, and MW81B are in the northern source area near the rear of Building C. Wells MW24A, MW25A, MW27A, and MW27B are south/southeast and downgradient of the source area wells. Well MW60B has historically had the highest concentrations of TCE in the northern portion of the eastern TCE plume, and represents one of the major TCE source areas at the MRC.

Chemical and NAA results for MW60B offer limited evidence of biodegradation in this part of the plume. The presence of TCE and degradation products such as *cis*-1,2-DCE and methane indicate some biodegradation is occurring; however, the relatively low concentrations of daughter products, and the lack of detectable lower-chain degradation products such as VC, chloroethane, and ethene, suggest that complete mineralization either is not occurring, or is occurring slowly. The limited evidence of biodegradation at MW60B is further supported by the NAA results, several of which do not indicate favorable subsurface conditions in this area.

The NAA analyses at MW60B that suggest unfavorable conditions for biodegradation include low alkalinity, chloride, marginal DO, and a temperature less than 20 degrees Celsius. However, iron, nitrate, sulfate, pH, and ORP within range indicate

that some favorable factors existed during this round of sampling. Figure 4-5 supports the assumption that only limited biodegradation is occurring, indicated by increasing TCE concentrations over time.

Conditions for biodegradation appear slightly more favorable away from MW60B, as indicated by the VOC and NAA results for the other wells on Table 4-5. Except for MW25A, several lower-chain degradation products (*cis*-1,2-DCE, VC, methane, ethane, and ethene) were detected, and many were found at relatively high concentrations with respect to the TCE-parent concentrations (Table 4-5). Slightly more favorable conditions for biodegradation are present at several wells: chloride concentrations greater than two times background concentration (MW81B, MW24A, and MW27A), and a low ORP at MW81B. However, high sulfate and DO at MW27A indicate less favorable conditions at this well, although limited biodegradation is indicated at MW27B by somewhat consistent or slightly increasing TCE concentrations over time (Figure 4-5).

Table 4-6 presents the VOC and NAA results for four wells in the southern portion of the eastern TCE plume. Wells MW34B and MW72B are along the northern and northeastern plume boundaries. Wells MW37A and MW37B are in the southern edge of the plume. The VOC and NAA results offer limited evidence that biodegradation is occurring in the central portion of this plume. The absence or low concentrations of degradation products such as *cis*-1,2-DCE, VC, chloroethane, ethane, and ethane at MW72B, MW37A, and MW37B suggest that complete mineralization either is not occurring, or is occurring slowly. The limited evidence of biodegradation at these wells is further supported by NAA results, several of which do not indicate favorable subsurface conditions in this area.

NAA results suggestive of unfavorable conditions for biodegradation at these wells include low alkalinity and chloride levels, and high ORP, high DO, and low temperature. High sulfate concentrations, high ORP and DO, and temperatures less than 20 degrees Celsius also suggest unfavorable conditions for biodegradation. Additionally, groundwater at wells MW72B and MW34B have low (unfavorable) pH levels. Nitrate concentrations at most wells and pH levels at MW37A and MW37B are favorable for biodegradation. Biodegradation is indicated at MW37A by significant reductions of both TCE and *cis*-1,2-DCE over time (Figure 4-6); however, TCE concentrations have steadily increased at MW74B (Figure 4-5), and have remained relatively steady at MW37B.

***Benzene*—**Figure 4-7 presents benzene results for the 2013 groundwater sampling and analyses. The highest concentrations of benzene would likely be encountered in shallow groundwater near source areas, because fuels in product form are less dense than water and, when present above the solubility limit, will float on top of the groundwater. Recharge (i.e., infiltrating precipitation) and downward hydraulic gradients may drive dissolved benzene and other petroleum-related contaminants downward in the aquifer as the contaminant travels farther from the source areas. However, dissolved oxygen in shallow groundwater provides favorable conditions for the rapid decay and mineralization of fuel-related VOCs, including benzene.

Some wells had increased benzene concentrations in 2013, while others had decreased from the 2012 levels. Increases from 2012–2013 were observed at four areas of maximum benzene concentrations, in wells MW96B (520 µg/L in 2012 to 560 µg/L in 2013), MW17A (68 µg/L to 110 µg/L), MW21B (19 µg/L to 23 µg/L), and MW77A (16 µg/L to 18 µg/L). Benzene decreased at MW53B (96 µg/L in 2012 to 0.84J µg/L in 2013), MW109B (230 µg/L to 37 µg/L), and MW110B (10 µg/L to 3.3 µg/L).

Most of these wells are west of Building A, near a former 4,000-gallon gasoline UST (REC #14) and abandoned underground wastewater lines (REC #18). Well MW21B is southeast of Building A (REC #9) and MW77A is on the east side of the vertical assembly building at REC #8, the location of an abandoned-in-place 25,000-gallon fuel oil UST. Consistent with the 2008–2012 benzene results, benzene was not detected at several locations where it had been detected at low concentrations in 2005 (e.g., MW12A, MW27B, MW34B, MW37A, and MW60A).

4.2.2 1,4-Dioxane

As shown in Table 4-2 and Figure 4-8, the SVOC 1,4-dioxane was detected in 37 groundwater samples collected in 2013 at concentrations ranging from 0.68*J* µg/L at MW111A to 270 µg/L at MW14B. 1,4-Dioxane was not detected in any of the off-site well samples. Several states (e.g., California, Colorado, Connecticut, Florida, Maine, Massachusetts, Michigan, and North Carolina) have established drinking water standards or action levels for 1,4-dioxane, ranging from 3 µg/L (California's action level) to 85 µg/L (Michigan's drinking water standard) (United States Environmental Protection Agency [USEPA], 2006 and 2009). USEPA has also published a risk-based preliminary remedial goal of 6.1 µg/L for 1,4-dioxane in tap water (USEPA 2010).

At present, Maryland has not established an advisory level or standard for 1,4-dioxane in drinking water or groundwater. Therefore, the current advisory level/standard that is most protective of human health (the California Department of Health Services action level of 3 µg/L) is used as a screening level for 1,4-dioxane concentrations in groundwater. Concentrations exceeding the California action level (3 µg/L) are shown within the contours in Figure 4-8. The average of all 1,4-dioxane detections is 24.4 µg/L, and the average of all samples (including non-detects) is 11.9 µg/L (Table 4-2). The highest concentrations occur primarily in the upper and intermediate surficial-aquifer wells, with the highest reported concentration (270 µg/L)

occurring at well MW14B, located in the western TCE plume within Block G and REC #11 (i.e., southwestern portion of the MRC).

1,4-Dioxane was detected in several wells in the western TCE plume, ranging from 0.68 µg/L at well MW111A (north of Tilley Chemical) to 270 µg/L at MW14B (in REC #11 northwest of the former sewerage treatment plant). 1,4-Dioxane in this area of the MRC extends from well MW91A near the rear of Building B to well MW12A-B, located adjacent to Cow Pen Creek. 1,4-Dioxane was also detected at concentrations exceeding the advisory level west and southwest of Building A in samples for wells MW53B (10 µg/L), MW18A (5.2 µg/L), MW90B (3.7 µg/L), and MW96A (3.5 µg/L).

Historically, 1,4-dioxane has not been detected extensively in the eastern TCE plume; an exception is well MW44A, at the southeastern end of the eastern TCE plume (Tax Block E), where the detected concentration in 2013 (2.4 µg/L) was lower than the screening level (3 µg/L). 1,4-Dioxane was not analyzed for at other wells in this portion of the MRC, in this round and other recent rounds, due to low historical concentrations (i.e., below the screening criterion and non-detects). 1,4-Dioxane was not detected in samples collected from the four deep, confined-aquifer wells (MW93D, MW94D, MW95D, and MW96D).

4.2.3 Polychlorinated Biphenyls

Groundwater samples from six wells were analyzed for PCBs (see Table 4-3) in the area where elevated PCBs have previously been detected in soil (see highlighted area in Figure 4-9). The wells sampled for PCBs include MW43A, MW44A, MW62A, MW62C, MW103A, and MW103B. Consistent with the 2012 results for these wells, PCBs were not detected in any groundwater samples collected this round. PCBs were detected in well MW43A (0.24 µg/L) in 2011; this is the well nearest the area of elevated PCBs detected in Block E soil. However, this 2011 PCB concentration was less than half the Maryland Department of the Environment (MDE) groundwater standard (0.5 µg/L).

4.2.4 Metals

Metals concentrations above MDE standards are found throughout the MRC (previous site-wide plots of beryllium, cobalt, and nickel can be found in Tetra Tech [2009a]). Table 4-3 summarizes detections of metals in the groundwater samples. As shown in Table 4-7 (a summary of metals

that exceed Maryland groundwater standards), concentrations of 12 metals exceed Maryland groundwater standards in one or more groundwater samples.

Concentrations of manganese, iron, and nickel exceed the standards most frequently (88% of 16 samples, 81% of 16 samples, and 60% of 96 samples, respectively), with the maximum concentrations of these metals exceeding standards by more than two orders of magnitude (greater than 100 times). Concentrations of beryllium and vanadium exceed their standards in 33% and 8% of samples, respectively, with the maximum beryllium (400*K* µg/L) and vanadium (81*J* µg/L) concentrations exceeding groundwater standards by more than an order of magnitude. Concentrations of the remaining metals (cadmium, zinc, antimony, barium, chromium, copper, and lead) exceeded standards in three or fewer samples, or in 1–3% of samples collected. Maximum concentrations of these metals (except chromium) exceed standards by a factor of less than five. The maximum chromium concentration exceeds its standard by a factor of less than seven.

4.2.5 Perchlorate

As shown in Table 4-2 and Figure 4-10, perchlorate was detected in 13 (48%) of 27 groundwater samples analyzed for perchlorate in 2013. Detected concentrations of perchlorate range from 0.1*J* µg/L (MW52A) to 9.3 µg/L (MW53B). Of the 13 detected concentrations of perchlorate, only two concentrations (9.3 µg/L at well MW53B and 3.6 µg/L at well MW96B) exceed the groundwater standard (2.6 µg/L). Both wells are west of Building A in the western portion of the MRC. Perchlorate had previously been detected in wells west of Building A, but most detected concentrations were less than the groundwater standard (2.6 µg/L).

4.3 GROUNDWATER-CHEMICAL DATA OFF-SITE WELLS

Twenty-one off-site wells installed in the surficial aquifer were sampled in 2013 for VOCs and 1,4-dioxane. These wells are sampled every three years to confirm that MRC groundwater constituents have not migrated to areas on the western side of Cow Pen Creek and the southern side of Dark Head Cove. Wells MRC-OF09A-C could not be sampled this round because a private vehicle was parked over the flush-mounted protective casing, which prevented access to these wells.

Results for the off-site well sampling are listed in Table 4-3 and are shown in Figures 4-3 (TCE), 4-7 (benzene), and 4-8 (1,4-dioxane). The table and figures show that major VOCs found in MRC groundwater plumes (TCE, *cis*-1,2-DCE, VC, and benzene) and 1,4-dioxane (found in the western TCE plume) were not detected in groundwater samples collected from off-site wells. Single trace concentrations each of chloroform (well MRC-OF04A), 1,4-dichlorobenzene (well MRC-OF04C), and methyl *tert*-butyl ether (MRC-OF01) were detected in off-site wells this round. However, these detections are limited to two geographic locations (wells MRC-OF01 and well cluster MRC-OF04A/C), and all VOC concentrations are less than state groundwater-screening levels. Methyl *tert*-butyl ether is a constituent of gasoline, and may be present due to fuels used for vehicles and small gasoline-powered equipment (e.g., lawn mowers, fuel storage, etc.) in the street/residential area where well MRC-OF01 is located. Acetone was also detected in three samples; however, acetone is a common laboratory contaminant, and these results are considered artifacts of laboratory analyses.

TABLE 4-2

STATISTICAL SUMMARY OF GROUNDWATER SAMPLE CHEMICAL ANALYSES, MARCH-MAY 2013[(1)]
LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND
PAGE 4 OF 4

1 Polychlorinated biphenyls (PCBs) were analyzed for six groundwater samples, but the results are not shown because PCBs were not detected in the samples. Results are in Appendix E.
2 - There are an insufficient number of samples to calculate this statistic.
For non-detects, 1/2 sample quantitation limit was used as a proxy concentration.
1/2 the detection limit was used for B qualified data.
J - Positive result is considered estimated as a result of technical noncompliance.
K - Positive result is considered to be biased high as a result of technical noncompliance. Result is expected to be lower.
L - Positive result is considered to be biased low as a result of technical noncompliance. Result is expected to be higher.
MG/L = milligrams per liter (i.e., parts per million)
NJ - positive result indicates presumptive evidence of a compound; the compound is tentatively identified and the concentration is estimated.
UG/L - micrograms per liter (i.e., parts per billion)

TABLE 4-3

ANALYTES DETECTED IN GROUNDWATER SAMPLES, MARCH-MAY 2013[(1)]
LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND
PAGE 45 OF 45

Shading indicates the concentration exceeds the groundwater standard.

-- - Not detected. See Appendix E for detection limit.

Note: Tentatively identified compounds (TICs) detected for volatile organic compound analyses are shown in Appendix E.

*Maryland does not have a groundwater standard for 1,4-dioxane. This value, the California screening level for 1,4-dioxane in groundwater, is used as proxy.

1 Polychlorinated biphenyls (PCBs) were analyzed for six groundwater samples, but the results are not shown because PCBs were not detected in the samples. Results are in Appendix E. Results for wells MW43A, MW103A and MW103B are not shown because these wells were analyzed for PCBs only; PCBs were not detected in these samples. Results are in Appendix E.

2 - Maryland Department of the Environment Soil and Groundwater Cleanup Standards, Interim Final Guidance, Update No. 2.1, June 2008 (MDE, 2008); California action level is used for 1,4-dioxane.

J - Positive result is considered estimated as a result of technical noncompliance.

K - Positive result is considered to be biased high as a result of technical noncompliance. Result is expected to be lower.

L - Positive result is considered to be biased low as a result of technical noncompliance. Result is expected to be higher.

MDE - Maryland Department of the Environment.

mg/L = milligrams per liter (i.e., parts per million)

NA - not analyzed

µg/L - micrograms per liter (i.e., parts per billion)

Section 5
Summary

The findings of the March–May 2013 groundwater sampling and analyses and the March 2013 groundwater level measurements are summarized below:

- All wells were inspected during the 2013 sampling program to assess the need for repairs; 36 wells were repaired in 2013.

- Groundwater samples were collected from 158 monitoring wells in March–May 2013. Samples were analyzed for volatile organic compounds (VOCs), 1,4-dioxane, metals, perchlorate, polychlorinated biphenyls (PCBs), natural-attenuation assessment (NAA) parameters, and field water-quality parameters. A round of synoptic groundwater measurements was obtained from the wells on March 12, 2013.

- Groundwater flow in March 2013 is similar to that depicted by previous groundwater investigations. Shallow groundwater follows site topography and flows radially from the hydraulically upgradient northern portion of the Middle River Complex (MRC) at Eastern Boulevard and immediately south of Buildings A, B, and C to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Groundwater in the deep surficial aquifer flows southeasterly from Eastern Boulevard toward Dark Head Cove. March 2013 surficial aquifer groundwater elevations were generally higher than those measured in 2012.

- Concentrations of chlorinated volatile organic compounds exceed Maryland groundwater standards at three main areas of the facility and at multiple depths. Trichloroethene (TCE), a common industrial solvent and metal degreaser, is the primary volatile organic compound exceeding the Maryland groundwater standard. Trichloroethene-degradation products, such as dichloroethenes (DCEs) and vinyl chloride (VC), also exceed Maryland groundwater standards at the facility, as does the fuel-related volatile organic compound benzene.

  These data confirm three trichloroethene and trichloroethene-degradation-product plumes: the *eastern trichloroethene plume* (originating south of Building C and the area of a former underground storage tank [UST], near the water tanks); the *western trichloroethene plume* (originating at a former underground storage tank site south of Building A); and a *smaller trichloroethene plume west of Building A*. The eastern and western trichloroethene plumes extend southeast and southwest, respectively, to areas adjacent to Dark Head Cove and Cow Pen Creek. Trichloroethene was also detected at several isolated locations in the western portion of the facility, south of the eastern trichloroethene plume, and north of the eastern trichloroethene plume.

- Concentrations of trichloroethene at source-area wells in the western trichloroethene plume have decreased slightly from the initial sampling period (2005–2007), but have remained steady (with fluctuations) over the subsequent monitoring period. Trichloroethene concentrations continue to increase at MW74B, a source-area well in the eastern trichloroethene plume. Trichloroethene at MW60B, a source-area well in the northern portion of the eastern trichloroethene plume, increased from 2007–2013, with a one-time decrease in 2011.

- Trichloroethene-degradation products were detected at 16 wells where groundwater samples were analyzed for natural attenuation assessment parameters. Results indicate that limited anaerobic reductive-dechlorination is occurring. Concentrations of vinyl chloride, ethene, methane, chloride, and elevated chloride at several well locations indicate that complete mineralization may be occurring in the hydraulically downgradient fringes of the plumes. However, relatively constant or increasing trichloroethene concentrations over the monitoring period, low or absent concentrations of lower-chain degradation products, and the poor subsurface conditions indicated by the natural attenuation assessment parameters suggest that slow or incomplete reductive mineralization of lower-order volatile organic compounds may be occurring in the volatile organic compound source-areas.

- The maximum trichloroethene concentration reported for the facility in the current round of sampling (40,000 micrograms per liter [µg/L]) was detected at intermediate surficial aquifer well MW74B; this concentration has increased compared to the maximum concentration detected in 2007 (13,000 micrograms per liter). MW74B is west of the water tanks in the southeastern portion of the property. The current round's maximum concentrations of trichloroethene reported in samples from wells MW74B (40,000 micrograms per liter) and MW60B (5,100 micrograms per liter) are detected in the intermediate portion of the surficial aquifer. The source(s) of this plume may be from spills of material handled near well MW74B, or from an underground storage tank containing trichloroethene (discovered in 2013 after the groundwater sampling at the southeastern edge of the former Building D foundation), or may originate from the south end of the Building C Basement (near MW60B).

- Benzene concentrations at three areas west and southwest of Building A (within the western trichloroethene plume and near the vertical-assembly building) exceed the state groundwater standard of five micrograms per liter. However, concentrations decline rapidly to levels below the standard at nearby downgradient wells. Some benzene concentrations detected in 2013 increased and others decreased, as compared to those measured in 2012. Increases were observed at four wells containing the maximum or near-maximum benzene concentrations. Benzene was not detected at several locations where it had been detected at low concentrations in 2005, confirming previous sampling results.

- The semivolatile organic compound (SVOC) 1,4-dioxane was primarily detected in groundwater samples from the upper and intermediate surficial-aquifer. 1,4-Dioxane is found primarily in the western trichloroethene plume, with levels ranging from 0.68 micrograms per liter at well MW111A (southeast of Building A) to 270 micrograms per liter at MW14B (in Tax Block G near a former sewerage treatment plant).

1,4-Dioxane is largely absent from the eastern trichloroethene plume, except for its detection at well MW44A (2.4 micrograms per liter) at a concentration below the California action level (3.0 micrograms per liter), which is used to screen the groundwater results. More extensive previous groundwater sampling rounds likewise do not appear to indicate that 1,4-dioxane was used or widely released to groundwater in the eastern portion of the Middle River Complex.

- Groundwater samples from six wells (MW43A, MW44A, MW62A, MW62C, MW103A, and MW103B) in the D-lot area of Block E (where elevated levels of polychlorinated biphenyls have previously been detected in soil) were analyzed for polychlorinated biphenyls. Polychlorinated biphenyls were not detected in the 2013 groundwater samples, which is consistent with the 2012 groundwater sampling results at these wells. A polychlorinated biphenyl was detected previously (in 2011) at a concentration of 0.24 micrograms per liter in well MW43A; this concentration is less than the groundwater standard of 0.5 micrograms per liter.

- Concentrations of 12 metals exceed Maryland groundwater standards in one or more groundwater samples. Concentrations of manganese, iron, and nickel exceed the standards most frequently, with the maximum concentrations of these three metals exceeding standards by more than a factor of 100. Concentrations of beryllium and vanadium exceed groundwater standards in 33% and 8% of samples, respectively, with maximum concentrations exceeding the standards by more than an order of magnitude (i.e., more than 10 times). Concentrations of the remaining metals (cadmium, zinc, antimony, barium, chromium, copper, and lead) exceed standards in no more than 3% of samples, with maximum concentrations less than seven times the standards.

- Perchlorate was detected in 13 of 27 groundwater samples (48%) analyzed for perchlorate. Detected concentrations range from 0.1*J* micrograms per liter (MW52A) to 9.3 micrograms per liter (MW53B); the latter concentration exceeds Maryland's groundwater standard of 2.6 micrograms per liter. Both of these wells are west of Building A, in parking lot 2. Of the 13 detected concentrations of perchlorate, only two concentrations (9.3 micrograms per liter at well MW53B and 3.6 micrograms per liter at well MW96B) exceed the groundwater standard (2.6 µg/L).

- Elevated concentrations of trichloroethene at well MW74B (12,000–70,000 µg/L over seven years) indicate the likely presence of dense non-aqueous phase liquids (i.e., residual solvent product) in the southeastern portion of the Middle River Complex. The subsequent discovery of a tank of waste solvent containing trichloroethene during soil pre-remediation in Tax Block E for the groundwater treatment facility area supports this theory. The tank contained full-strength trichloroethene and appeared to be leaking. Soil under the tank was impacted by trichloroethene. Soil that could easily be removed was removed before the excavation was stabilized. A soil delineation and removal program is being developed for implementation this year, preferably before completion and startup of groundwater remediation in that area.

- Major volatile organic compounds found in the Middle River Complex groundwater plumes (trichloroethene, *cis*-1,2-dichloroethene, vinyl chloride, and benzene) and 1,4-dioxane (found in the western TCE plume) were not detected in groundwater samples

analyzed for in 21 off-site wells. Single trace concentrations each of chloroform (well MRC-OF04A), 1,4-dichlorobenzene (well MRC-OF04C), and methyl *tert*-butyl ether (well MRC-OF01) were detected in off-site wells in this round. However, all VOC concentrations are less than state groundwater standards. Acetone was also detected in three samples; however, acetone is a common laboratory contaminant, and these results are considered artifacts of laboratory analyses.

	Color (Visual)	pH (S.U.)	S.C. (mS/cm)	Temp. (°C)	Turbidity (NTU)	DO (mg/l)	Salinity (%)	Other ORP
Date: 3-18-13								
Time: 1510								
Method: Peristaltic pump	Slightly	7.30	2.92	13.36	54.8	1.17	1.5	-60

PURGE DATA:

	Volume	pH	S.C.	Temp.	Turbidity	DO	Salinity	Other
Date: 3-18-13								
Method: Peristaltic pump								
Monitor Reading (ppm): 0.0								
Well Casing Diameter & Material Type: 2" PVC			See low flow purge data sheet					
Total Well Depth (TD):								
Static Water Level (WL): 8.50								
One Casing Volume(gal/L):								
Start Purge (hrs): 1333								
End Purge (hrs): 1505								
Total Purge Time (min): 92								
Total Vol. Purged (gal/L): 3.0								

SAMPLE COLLECTION INFORMATION:

Analysis	Preservative	Container Requirements	Collected
VOCs	HCl	3 - 40 ml VOA	✓
Total metals	HNO3	1 - 500 ml Poly	✓

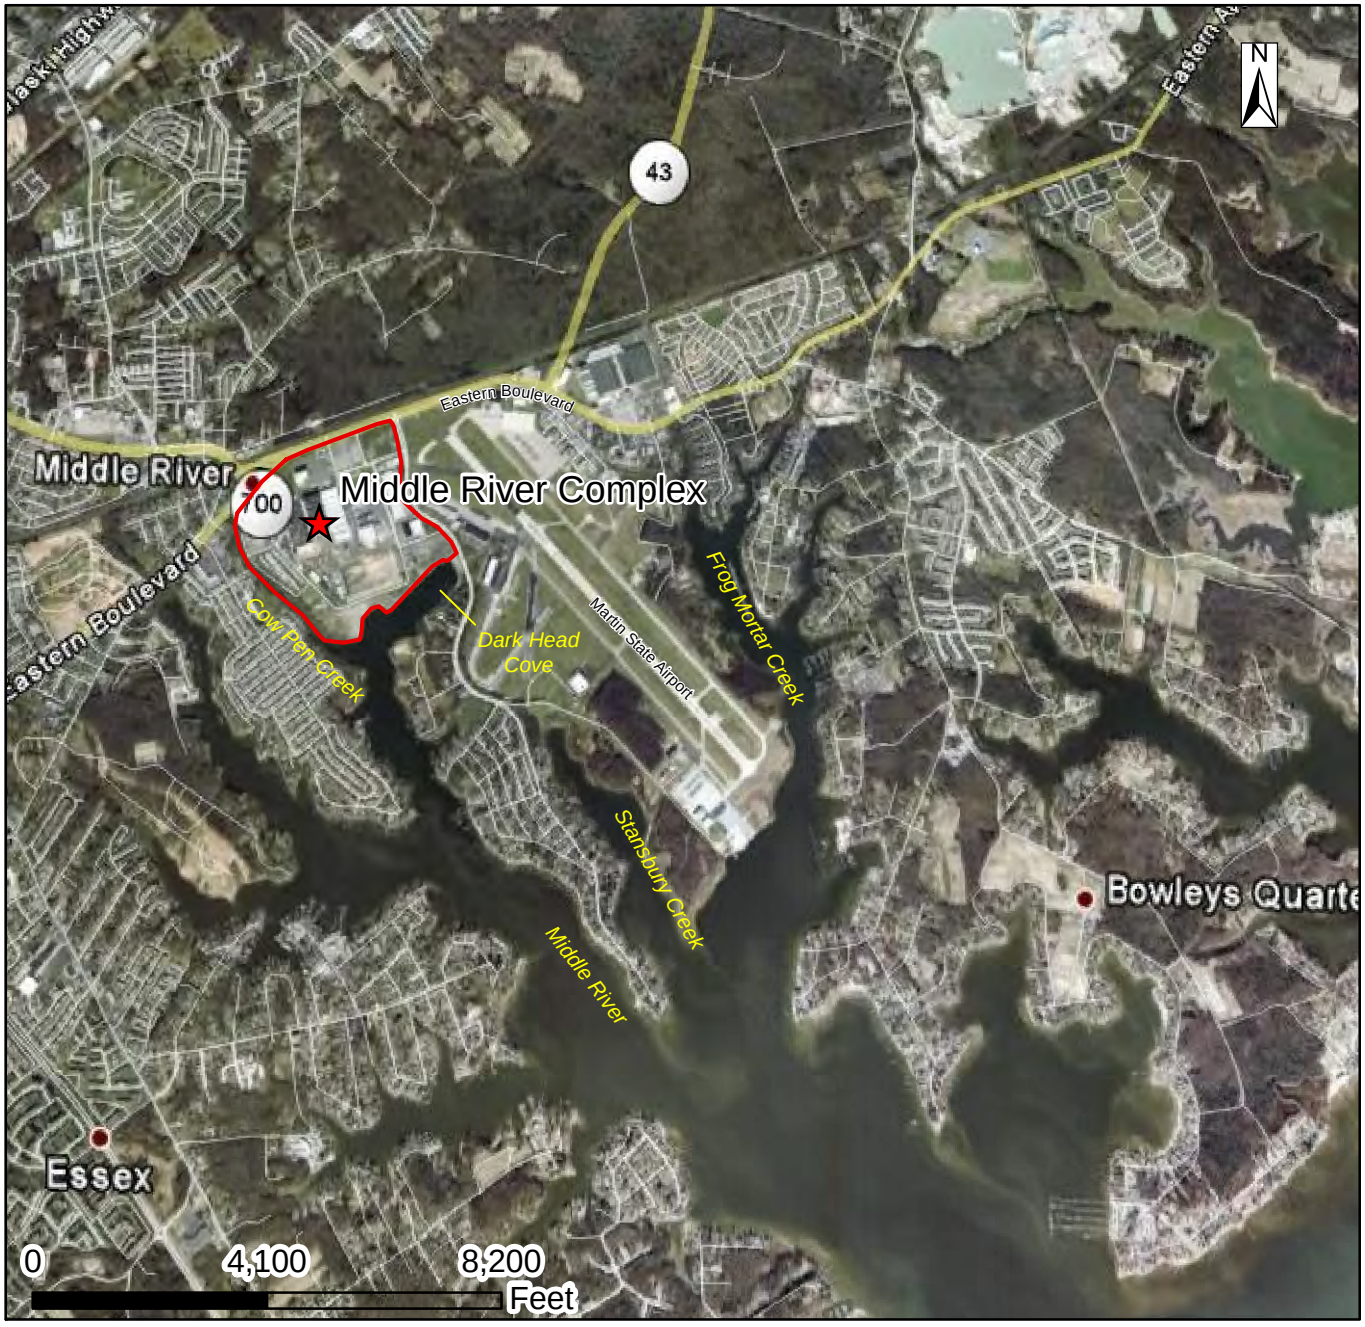
Section 1
Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech Inc. (Tetra Tech) has prepared the following report that describes the monitoring well repairs conducted in 2013 at the Middle River Complex (MRC), located at 2323 Eastern Boulevard, Middle River, Maryland (see Figure 1-1). The Middle River Complex is approximately 11.5 miles northeast of downtown Baltimore and is comprised of approximately 161 acres, including 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a concrete-covered vacant lot, a trailer and parts storage lot, and numerous grassy green spaces along its perimeter. The Middle River Complex is bounded by Eastern Boulevard (Route 150) to the north, Dark Head Cove to the south, Cow Pen Creek to the west, and Martin State Airport (MSA) to the east.

Site investigations at the Middle River Complex have identified soil and groundwater contamination associated with historical plant activities. Past sampling programs detected elevated levels of volatile organic compounds (VOCs) and metals in groundwater. The work described herein summarizes the repair and maintenance activities conducted for existing monitoring wells at Middle River Complex, and supports long-term groundwater monitoring at the Middle River Complex. Numerous monitoring wells have been installed to characterize groundwater at Middle River Complex. Over time, the condition of some of these monitoring wells has deteriorated, and maintenance is required. Well inspections conducted during the fiscal year 2013 (FY2013) annual groundwater monitoring program included a groundwater well survey that logged field observations of existing well conditions. A well repair schedule was provided and proposed for completion before the next groundwater sampling event. Specific site monitoring wells were repaired to maintain their integrity and security.

Well repairs included replacing bolts, replacing a protective well cover with a full well pad, and modifying the polyvinyl chloride pipe (PVC) elevation of one well so that the protective well cover could be properly secured. The well requiring pipe alteration was resurveyed following

repair by a professional surveyor. Figure 1-2 shows the locations of the monitoring wells that were repaired in 2013 at the Middle River Complex.



This report is organized as follows:

Section 1—Introduction: This section provides site information and presents an overview of well repairs conducted.

Section 2—Well Repair Approach and Methodology: Presents the technical approach used to repair site monitoring wells, and describes the field methodology employed.

Section 3—Summary: Summarizes the well repair activities.

Section 2
Well Repair Approach and Methodology

Before conducting the monitoring well repair activities, appropriate Tetra Tech Inc. (Tetra Tech) personnel became familiar with the site-specific health and safety plan (HASP) and the respective safe work permit and emergency response plan included in the HASP, as well as the waste handling, transportation, and disposal plan. Tetra Tech conducted a daily mandatory health and safety tailgate meeting before all field activities. Safety requirements were followed as detailed in the site-specific Tetra Tech HASP, which was included as Appendix A of the work plan.

2.1 UTILITY CLEARANCE AND PERMITTING

The type and location of the monitoring well repair work required no access agreements or special permits. In addition, all well repairs were conducted within the existing limits of the current well pads; therefore, no further utility clearance was required.

2.2 REPLACING BOLTS

The bolts on thirty-one wells (Table 2-1; Figure 1-2) needed replacement, so new ($^{9}/_{16}$-inch) stainless-steel bolts were installed in the existing flush-mounted well covers of these wells.

2.3 WELL PAD AND EMBEDDED CAP REPLACEMENT

The concrete pads and flush-mounted covers surrounding six (6) existing monitoring wells (MRC-MW08A, MRC-MW12A, MRC-MW26A, MRC-MW27A, MRC-MW27C, and MRC-MW30A) had cracked/deteriorated over time and needed to be replaced (Table 2-1). Attempts to salvage two wells (MRC-MW12A and MRC-MW30A) were successful; field personnel were able to re-tap the dog ears of these wells and longer bolts were used to restore the functionality of the protective casings at these locations. The existing 2-foot by 2-foot concrete pads of the other wells were broken up with a jackhammer, and concrete and gravel rubble was

cleared to approximately 6-inches below ground surface (bgs) using a shovel. All concrete debris was disposed of according to the waste handling, transportation, and disposal plan. Broken pieces of concrete were placed in 55-gallon steel drums that were subsequently removed from the site by a Lockheed Martin Corporation (Lockheed Martin)-approved waste vendor. Steel flush–mounted well covers were disposed of as standard metal debris in an approved, on-site, recyclable metal roll-off dumpster.

New flush-mount covers were installed around the polyvinyl chloride (PVC) well prior to pouring the concrete. Each flush-mounted well cover was an appropriately–sized (approximately 8 to 10-inch diameter) watertight gasket with a bolt-secured well lid and a skirt constructed of stainless steel. High strength concrete (Pro Finish Quikrete 5000®) consisting of Portland cement and water was mixed in a wheelbarrow. Steel reinforcing bars were placed into the form in 12-inch lengths to strengthen the new concrete pads. The fresh concrete pads were installed flush with the ground surface to prevent damage from vehicles, equipment, and snowplows.

Three nested off-site monitoring wells located west of the Middle River Complex (MRC) and across Cow Pen Creek also needed repair. These wells are enclosed in 4-inch diameter PVC pipe equipped with a locking well cap (i.e., a 4-inch "Grip-N-Lock") to prevent tampering. The clamp on this cap was broken so a new security cap was installed.

2.4 PVC ALTERATION

The PVC pipes on nested monitoring wells MRC-MW101A-B were cut down so that the metal lid could fit securely on the flush-mounted well cover (Table 2-1). The pipes were cut with a specialized PVC saw that left the edges level and smooth. These wells were resurveyed by a professional surveyor following repairs because their elevation changed.

2.5 DOCUMENTATION

A master site logbook was maintained as an overall record of field activities. No photos of the wells at Middle River Complex were taken because photographs are restricted in the secured area of the site.

2.6 WASTE MANAGEMENT

All waste and debris were disposed of according to the waste management plan. Concrete waste was placed in 55-gallon steel drums, and metal casings were placed in a designated (Lockheed Martin-approved) dumpster for recycling in support of the Lockheed Martin "Go Green" program. Drummed concrete was characterized and profiled as nonhazardous construction debris, and removed from the site by a Lockheed Martin-approved nonhazardous-waste vendor. Waste management forms and the bills of lading are presented in Appendix A.

2.7 SITE RESTORATION

Site restoration was completed as necessary and as required by Lockheed Martin. Each location was returned to its original condition once the repairs described in this report were completed. Well covers and well pads were installed flush with the ground surface to prevent damage from vehicle traffic and snow plowing, and investigative-derived waste was disposed of as described in the previous section. No damage was done to the surrounding asphalt or grass areas of the site.

2.8 RESURVEY OF WELL CASINGS

The four monitoring wells requiring new pads (MRC-MW08A, MRC-MW26A, MRC-MW27A, and MRC-MW27C and the nested monitoring wells MRC-MW101A-B that were cut down were professionally surveyed by a qualified, Maryland-licensed land surveying firm. These wells were resurveyed because of elevation changes resulting from the well repairs described above. Horizontal and vertical coordinates were provided for each repaired well: vertical elevations were accurate to the nearest 0.01 foot in the North American Vertical Datum 1988, and horizontal well locations were accurate to the nearest 0.1 foot in the North American Datum 1983. The well re-survey data is in Appendix B.

Section 3
Summary

This report summarizes and describes groundwater monitoring well repairs conducted at the Middle River Complex (MRC) in 2013. Field procedures, a table presenting the specific repairs completed, documentation of waste handling and disposal, and new survey data are presented herein. New and updated monitoring well elevation data were added to the Middle River Complex environmental geographical information system (EGIS), as appropriate. Tetra Tech Inc. (Tetra Tech) personnel will continue to regularly inspect the integrity and condition of the Middle River Complex monitoring wells during future groundwater monitoring and sampling events. Additional attention will be paid to the condition of wells in high traffic areas that may pose health and safety or well integrity concerns. Tetra Tech, Inc. has also asked the Middle River Complex tenants to notify Tetra Tech, Inc. if they notice a well that requires repair or replacement. Tetra Tech, Inc. will notify Lockheed Martin Corporation (Lockheed Martin) and Remediation Technical Operations, and will obtain approval and funding before starting any future well repairs.

SUBJECT: **ORGANIC AND INORGANIC DATA VALIDATION- VOC AND SELECT METALS**
LOCKHEED-MIDDLE RIVER COMPLEX
SDG 240-22082-1

SAMPLES: 9/Aqueous/

MRC-MW30A-031513	MRC-MW31A-031513
MRC-MW32A-031513	MRC-MW33A-031513
MRC-MW34A-031513	MRC-MW86A-031513
MRC-MW86B-031513	MRC-MW87B-031513
TB-031513	

Overview

The sample set for Lockheed MRC, SDG 240-22082-1, consists of eight (8) aqueous environmental samples and one trip blank. This SDG contained no field duplicate pairs.

All samples were analyzed for volatile organic compounds (VOCs) and select metals (except TB-031513). The samples were collected by Tetra Tech on March 15th, 2013 and analyzed by TestAmerica. VOC analyses were conducted using method 8260B. Metals analyses were conducted using methods 6020. Mercury analyses were conducted using method 7470A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, GC/MS tuning, MS tuning, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, ICP internal standard recoveries, surrogate standard recoveries, laboratory control sample recoveries, matrix spike recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems-

- The initial calibration analyzed on 2/7/13 on instrument A3UX16 had a relative response factor (RRF) <0.05 for tertiary butyl alcohol. All samples were affected. The non-detected results were qualified as rejected (UR).

- The continuing calibration analyzed on 3/25/13 at 17:48 on instrument A3UX16 had a relative response factor (RRF) <0.05 for tertiary butyl alcohol. All samples were affected. The non-detected results were qualified as rejected (UR).

Minor Problems-

- The following contaminants were detected in method and calibration blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Hexachlorobutadiene [1]	0.31 ug/L	1.5 ug/L
Acetone [2]	11 ug/L	110.0 ug/L
Copper [3]	0.94 ug/L	4.7 ug/L

[1] Maximum concentration found in a preparation blank affecting all samples except the trip blank.
[2] Maximum concentration found in the associated trip blank affecting all samples.
[3] Maximum concentration found in a preparation blank affecting all samples.

An action level of 5X and 10X (methylene chloride only) the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) for blank contamination.

- The continuing calibration analyzed on 3/25/13 at 17:48 on instrument A3UX16 had a percent difference > 20% but < 50% for chloromethane, chloroethane, 1,1,2-trichlorotrifluoroethane, 1,2,4-trichlorobenzne, naphthanlene, and 1,2,3-trichlorobenzene and percent recoveries > 50% for dichlorodifluoromethane, trichlorofluoromethane, and hexachlorobutadiene. Non-detected dichlorodifluoromethane, trichlorofluoromethane, and hexachlorobutadiene results were qualified as estimated (UJ). No validation action was warranted for chloromethane, chloroethane, 1,1,2-trichlorotrifluoroethane, 1,2,4-trichlorobenzne, naphthanlene, and 1,2,3-trichlorobenzene as sample results were non-detected.

Notes

Positive results greater than MDL but less than the RL were qualified as estimated (J).

Sample MRC-MW87B-031513 was analyzed at a 2.5X dilution for VOC.

Form 1s had non-detected results reported to the reporting limit (RL). The validator changed the non-detected results to be reported at the method detection limit (MDL).

The laboratory spike had a percent recovery greater than the upper control limit for dichlorodifluoromethane, trichlorofluoromethane, and 1,1,2-trichlorotrifluoroethane. All samples were affected. No validation action was warranted as sample results were non-detected.

Executive Summary

Laboratory Performance: Preparation and calibration blank contamination resulted on the qualification of sample results. Initial and continuing calibration non-compliances resulted in the qualification of sample results.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the Region III modifications to the National Functional Guidelines for Inorganic Data Validation (April 1993) and U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994).

Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient $r < 0.995$
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW Sampling

Report Number: 240-22082-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Total Recoverable Metals and the 7470A Total Mercury analyses were performed at the TestAmerica Irvine laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available Any exceptions to NELAP requirements are noted in this report Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 03/16/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.9 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MRC-MW32A-031513 (240-22082-3), MRC-MW33A-031513 (240-22082-4), TB-031513 (240-22082-5), MRC-MW34A-031513 (240-22082-6), MRC-MW86A-031513 (240-22082-7), MRC-MW86B-031513 (240-22082-8) and MRC-MW87B-031513 (240-22082-9) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/25/2013.

Acetone and Hexachlorobutadiene were detected in method blank MB 240-79378/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Sample MRC-MW87B-031513 (240-22082-9)[2.5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 79378 exceeded control limits for the following analyte(s): Dichlorodifluoromethane, Trichlorofluoromethane and 1,1,2-Trichloro-1,2,2-trifluoroethane--has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

There was an MS/MSD analyzed in batch 79378 but could not be reported because the associated sample needed reanalyzed in a different batch.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MRC-MW30A-031513 (240-22082-1), MRC-MW31A-031513 (240-22082-2), MRC-MW33A-031513 (240-22082-4), MRC-MW86A-031513 (240-22082-7), MRC-MW86B-031513 (240-22082-8) and MRC-MW87B-031513 (240-22082-9) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared and analyzed on 04/01/2013.

Copper was detected in method blank MB 440-95355/1-A at a level that was above the method detection limit but below the reporting

limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MRC-MW30A-031513 (240-22082-1), MRC-MW31A-031513 (240-22082-2), MRC-MW33A-031513 (240-22082-4), MRC-MW86A-031513 (240-22082-7), MRC-MW86B-031513 (240-22082-8) and MRC-MW87B-031513 (240-22082-9) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/29/2013.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

7. Could all bottle labels be reconciled with the COC?	(Yes)	No
8. Were correct bottle(s) used for the test(s) indicated?	(Yes)	No
9. Sufficient quantity received to perform indicated analyses?	(Yes)	No
10. Were sample(s) at the correct pH upon receipt?	(Yes)	No NA
11. Were VOAs on the COC?	(Yes)	No
12. Were air bubbles >6 mm in any VOA vials?	Yes	(No) NA
13. Was a trip blank present in the cooler(s)?	(Yes)	No

Contacted PM _____ Date _____ by _____ via Verbal Voice Mail Other

Concerning _____

14. CHAIN OF CUSTODY & SAMPLE DISCREPANCIES

COC = 1x250 (HNO3) for 868@1227, Rec'd 2x250 will log

15. SAMPLE CONDITION

Sample(s) _____ were received after the recommended holding time had expired.

Sample(s) _____ were received in a broken container.

Sample(s) _____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in Sample Receiving to meet recommended pH level(s). Nitric Acid Lot# 031512-HNO3; Sulfuric Acid Lot# 051012-H2SO4; Sodium Hydroxide Lot# 121809 -NaOH; Hydrochloric Acid Lot# 041911-HCl; Sodium Hydroxide and Zinc Acetate Lot# 100108-(CH3COO)2ZN/NaOH. What time was preservative added to sample(s)? _____

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Not listed on COC.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

MRC-MW62C-031813		

1 / Aqueous / 1,4-Dioxane

MRC-MW44A-031813

Overview

The sample set for Lockheed - MSA, SDG 240-22125-1, consisted of nine (9) aqueous samples including one (1) aqueous trip blank sample. Five (5) of the samples were analyzed for volatile organic compounds (VOC) as listed above. Four (4) aqueous samples were analyzed for polychlorinated biphenyls (PCB) as listed above. One (1) of the samples was also analyzed for the semi-volatile organic compound (SVOC) 1,4-dioxane as listed above. No field duplicate sample pairs were included in the sample delivery group (SDG).

The samples were collected by Tetra Tech on March 18, 2013 and analyzed by TestAmerica Laboratories, Inc., Canton for all analyses. All analyses were conducted in accordance with EPA SW-846 Methods 8260B for VOCs, 8270D for SVOCs, and 8082 for PCBs, analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, internal standard recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major Problems

- The VOC initial calibration average relative response factors (RRF) were less than the 0.05 criteria for tert-butyl alcohol on instrument A3UX16 on 02/07/13. The continuing calibration verification (CCV) RRF for tert-butyl alcohol was also less than the 0.05 criteria for instrument A3UX16 on 03/26/13 @ 13:27.
  Affected Samples: All samples
  Action: The sample non-detected results for tert-butyl alcohol were qualified rejected, (UR). The sample positive tert-butyl alcohol result was qualified estimated, (J).

Minor Problems

- The VOC continuing calibration verification (CCV) percent differences (%Ds) were greater than the 20% and greater than the 50% quality control limit for dichlorodifluoromethane, trichlorofluoromethane, 1,1,2-trichlorotrifluoroethane, and hexachlorobutadiene for instrument A3UX16 on 03/26/13 @ 13:27.
  Affected Samples: All samples
  Action: The sample non-detected results for the aforementioned analytes were qualified estimated, (UJ).

- The following laboratory VOC contaminants were detected in the method blank at the following maximum concentrations affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Hexachlorobutadiene [1]	0.327	1.635
Methylene chloride [1]	1.46	14.6
Acetone [2]	1.5	15.0
Toluene [2]	0.13	0.65

  [1] Method blank MB 240-79501 affecting all samples.
  [2] Trip blank sample TB-031813 affecting all samples.

  An action level of ten times the maximum level for methylene chloride and five times the maximum level for hexachlorobutadiene has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Sample MRC-MW78B-031813 and MRC-MW87A-031813 acetone results were qualified (B) for blank contamination.

- Sample MRC-MW76A-031813 had a positive VOC result for cyclohexane reported as a TIC. The sample positive VOC TIC result was qualified as estimated, (NJ), presumptively present, as a TIC analyte.

- Samples MRC-MW76B-031813 and MRC-MW78B-031813 had positive VOC results for the analyte trimethyl silanol reported as a TIC. The analyte is considered present due to column bleed. The sample positive VOC TIC results were qualified as presumptively present, (NJ), due to column bleed.

- Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

Notes

The VOC CCV %Ds were greater than the 20% and less than the 50% quality control limit for 1,2,4-trichlorobenzene, naphthalene, 1,2,3-trichlorobenzene, and tert-amyl-methyl ether for instrument A3UX16 on 03/26/13 @ 13:27.
Affected Samples: All samples
Action: The sample results for the aforementioned analytes were non-detected and were not qualified.

The VOC laboratory control sample (LCS) percent recovery (%R) was greater than the quality control limit for dichlorodifluoromethane and trichlorofluoromethane for LCS 240-79501.

Affected Samples: All samples

Action: The sample results for the aforementioned analytes were non-detected and were not qualified.

The surrogate tetrachloro-m-xylene (TCX) %R was greater than the quality control limit for the Aroclor analysis for sample MRC-MW43A-031813.

Affected Sample: MRC-MW43A-031813

Action: No validation action was taken as the sample had non-detected Aroclor results.

The laboratory reported non-detected sample results to the Method Detection Limit (MDL).

EXECUTIVE SUMMARY

Laboratory Performance Issues: VOC non-detected tert-butyl alcohol sample results for all samples were rejected due to calibration and CCV RRF criteria non-compliances. VOC sample results were qualified for method blank contamination and CCV %D non-compliances.

Other Factors Affecting Data Quality: Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

The data for these analyses were reviewed with reference to EPA SW-846 Methods 8260B, 8270D, 8082, and 8015C, and the Region III EPA Functional Guidelines for Organic Data Validation (9/94).

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

DATA QUALIFICATION CODE (QUAL CODE)

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's r < 0.995
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient r < 0.995
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Not listed on COC.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW Sampling

Report Number: 240-22125-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Total Recoverable Metals and the 7470A Total Mercury analyses were performed at the TestAmerica Irvine laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 03/19/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.8 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MRC-MW76A-031813 (240-22125-5), MRC-MW76B-031813 (240-22125-6), MRC-MW78B-031813 (240-22125-7), MRC-MW87A-031813 (240-22125-8) and TB-031813 (240-22125-9) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/26/2013.

Methylene Chloride was detected in method blank MB 240-79501/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Hexachlorobutadiene was detected in method blank MB 240-79501/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample(LCS) for batch 79501 exceeded control limits for the following analyte(s): Dichlorodifluoromethane and Trichlorofluoromethane--has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Sample MRC-MW44A-031813 (240-22125-4) was analyzed for semivolatile organic compounds (GC-MS)in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/21/2013 and analyzed on 03/26/2013.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the SVOCs analysis. All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2), MRC-MW43A-031813 (240-22125-3) and

MRC-MW44A-031813 (240-22125-4) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 03/22/2013 and analyzed on 03/27/2013.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Tetrachloro-m-xylene failed the surrogate recovery criteria high for MRC-MW43A-031813 (240-22125-3).

The closing continuing calibration verification (CCV) associated with these samples passed average. Since the samples were ND, no corrective action is required. MRC-MW43A-031813 (240-22125-3), MRC-MW44A-031813 (240-22125-4), MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2)

Two surrogates are used for this analysis. The laboratory's SOP allows 1 of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: MRC-MW43A-031813 (240-22125-3). These results have been reported and qualified.

The following sample required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences: (CCV 240-79626/3).

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 79140.

No other difficulties were encountered during the PCBs analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2), MRC-MW76A-031813 (240-22125-5), MRC-MW76B-031813 (240-22125-6) and MRC-MW78B-031813 (240-22125-7) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/01/2013 and analyzed on 04/02/2013.

Copper and Molybdenum were detected in method blank MB 440-95414/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2), MRC-MW76A-031813 (240-22125-5), MRC-MW76B-031813 (240-22125-6) and MRC-MW78B-031813 (240-22125-7) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/29/2013.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

Definitions/Glossary

Client: Tetra Tech, Inc
Project/Site: MRC GW Sampling

TestAmerica Job ID: 240-22125-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
J	Indicates an Estimated Value for TICs
N	This flag indicates the presumptive evidence of a compound.
T	Result is a tentatively identified compound (TIC) and an estimated value.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Overview

The sample set for Lockheed MRC, SDG 240-22125-1, consists of five (5) aqueous environmental samples. This SDG contained no field duplicate pairs.

All samples were analyzed for select metals. The samples were collected by Tetra Tech on March 18th, 2013 and analyzed by TestAmerica. Metals analyses were conducted using methods 6020. Mercury analyses were conducted using method 7470A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, MS tuning, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, ICP internal standard recoveries, laboratory control sample recoveries, matrix spike recoveries, analyte quantitation, and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems-

- None.

Minor Problems-

- The following contaminants were detected in method and calibration blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Copper [1]	0.52 ug/L	2.6 ug/L
Molybdenum [1]	0.26 ug/L	1.3 ug/L
Antimony [2]	0.34 ug/L	1.7 ug/L

[1] Maximum concentration found in a preparation blank affecting all samples.
[2] Maximum concentration found in a calibration blank affecting all samples.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for

blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) for blank contamination.

Notes

Positive results greater than MDL but less than the RL were qualified as estimated (J).

Form 1s had non-detected results reported to the reporting limit (RL). The validator changed the non-detected results to be reported at the method detection limit (MDL).

The CRDL standard analyzed on 4/2/13 had percent recoveries > 110% for antimony, copper, cobalt, silver, nickel and a percent recovery < 80% for zinc. All samples were affected. No other validation action was warranted as sample results were either qualified for blank contamination or were greater than 2X CRDL.

No batch QC was provided for this SDG.

Executive Summary

Laboratory Performance: Preparation and calibration blank contamination resulted on the qualification of sample results.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the Region III modifications to the National Functional Guidelines for Inorganic Data Validation (April 1993).

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's r < 0.995
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient r < 0.995
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW Sampling

Report Number: 240-22125-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Total Recoverable Metals and the 7470A Total Mercury analyses were performed at the TestAmerica Irvine laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available Any exceptions to NELAP requirements are noted in this report Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT
The samples were received on 03/19/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.8 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples MRC-MW76A-031813 (240-22125-5), MRC-MW76B-031813 (240-22125-6), MRC-MW78B-031813 (240-22125-7), MRC-MW87A-031813 (240-22125-8) and TB-031813 (240-22125-9) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/26/2013.

Methylene Chloride was detected in method blank MB 240-79501/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Hexachlorobutadiene was detected in method blank MB 240-79501/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The laboratory control sample(LCS) for batch 79501 exceeded control limits for the following analyte(s): Dichlorodifluoromethane and Trichlorofluoromethane--has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)
Sample MRC-MW44A-031813 (240-22125-4) was analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/21/2013 and analyzed on 03/26/2013.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the SVOCs analysis. All quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)
Samples MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2), MRC-MW43A-031813 (240-22125-3) and

MRC-MW44A-031813 (240-22125-4) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 03/22/2013 and analyzed on 03/27/2013.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Tetrachloro-m-xylene failed the surrogate recovery criteria high for MRC-MW43A-031813 (240-22125-3).

The closing continuing calibration verification (CCV) associated with these samples passed average. Since the samples were ND, no corrective action is required. MRC-MW43A-031813 (240-22125-3), MRC-MW44A-031813 (240-22125-4), MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2)

Two surrogates are used for this analysis. The laboratory's SOP allows 1 of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: MRC-MW43A-031813 (240-22125-3). These results have been reported and qualified.

The following sample required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences: (CCV 240-79626/3).

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 79140.

No other difficulties were encountered during the PCBs analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2), MRC-MW76A-031813 (240-22125-5), MRC-MW76B-031813 (240-22125-6) and MRC-MW78B-031813 (240-22125-7) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/01/2013 and analyzed on 04/02/2013.

Copper and Molybdenum were detected in method blank MB 440-95414/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MRC-MW62A-031813 (240-22125-1), MRC-MW62C-031813 (240-22125-2), MRC-MW76A-031813 (240-22125-5), MRC-MW76B-031813 (240-22125-6) and MRC-MW78B-031813 (240-22125-7) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 03/29/2013.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Not listed on COC.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

Overview

The sample set for Middle River Center - Groundwater, SDG 240-22161-1, consists of one (1) aqueous environmental sample. No field duplicate pairs were included within this SDG.

The sample was analyzed for select metals including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc. Metals analyses were conducted using SW-846 method 6020. Mercury analyses were conducted using SW-846 method 7470A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike/matrix spike duplicate recoveries, ICP serial dilution results, internal standard recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems

None.

Minor Problems

- The contract required detection limit (CRDL) percent recovery for mercury on 04/08/2013 at 14:52 was < 80% quality control limit. The nondetected result reported for mercury was qualified as biased low, "UL"

- The CRDL percent recovery for silver on 04/02/2013 at 09:18 was > 110% quality control limit. The positive result reported for silver was qualified as estimated, "J", as a result of conflicting noncompliances.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated, "J".

Notes

Nondetected results are reported to the method detection limits.

The CRDL percent recovery for nickel on 04/02/2013 at 09:18 was > 110% quality control limit. No validation actions were required as the sample result was > 2X CRDL.

The CRDL percent recovery for mercury on 04/18/2013 at 17:29 was > 120% quality control limit. No validation action was required as the sample result was nondetected.

The following contaminants were detected in the laboratory preparation blank at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Copper	0.526 ug/L	2.63 ug/L
Molybdenum	0.267 ug/L	1.335 ug/L

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. No validation actions were warranted as all sample results were either greater than the action level or were nondetected.

Executive Summary

Laboratory Performance:. The CRDL percent recovery for mercury on 04/08/2013 at 14:52 was < 80% quality control limit. The CRDL percent recovery for silver on 04/02/2013 at 09:18 was > 110% quality control limit.

Other Factors Affecting Data Quality: Positive results reported below the RL but above the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed

SUPPORT DOCUMENTATION

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW Sampling

Report Number: 240-22161-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Metals and 7470A Mercury analysis were performed at the TestAmerica Irvine Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 03/20/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 0.6 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MRC-MW95B-031913 (240-22161-1), MRC-MW88B-031913 (240-22161-2), MRC-MW77A-031913 (240-22161-3), MRC-MW74C-031913 (240-22161-4), MRC-MW73B-031913 (240-22161-5) and TB-031913 (240-22161-6) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/26/2013, 03/27/2013, 03/28/2013 and 03/29/2013.

1,2,3-Trichlorobenzene and Naphthalene were detected in method blank MB 240-79480/5 at levels exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

1,2,4-Trichlorobenzene, Hexachlorobutadiene and Methylene Chloride were detected in method blank MB 240-79480/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

1,2,3-Trichlorobenzene and Naphthalene were detected in method blank MB 240-79643/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Several analytes were detected in method blank MB 240-79817/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

1,2,3-Trichlorobenzene, Hexachlorobutadiene and Naphthalene were detected in method blank MB 240-79934/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

tert-Butyl alcohol failed the recovery criteria low for LCS 240-79934/4.

2-Chloroethyl vinyl ether failed the recovery criteria low for the MS/MSD of sample MRC-MW95B-031913MS/MSD (240-22161-1) in batch 240-79480.

Samples MRC-MW77A-031913 (240-22161-3)[2X], MRC-MW74C-031913 (240-22161-4)[2X] and MRC-MW73B-031913 (240-22161-5) [6.67X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The method blank for batch 79480 contained Napthalene and 1,2,3-Trichlorobenzene above the reporting limit (RL). None of the samples associated with this method blank contained the target compounds; therefore, re-extraction and/or re-analysis of samples were not performed.

Method 8260 stipulates a 12 hour sequence for the analysis of samples. Due to a system software issue, the MSD for sample 22349-2 exceeded the 12 hour time limit by 19 minutes. The MS/MSD was reported for batch QC.

The laboratory control sample (LCS) for batch 79934 exceeded control limits for the following analyte(s): 2-Methyl-2-propanol–has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Sample MRC-MW77A-031913 (240-22161-3) was analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/01/2013 and analyzed on 04/02/2013.

Copper and Molybdenum were detected in method blank MB 440-95414/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analysis. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Sample MRC-MW77A-031913 (240-22161-3) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 04/08/2013.

No difficulties were encountered during the mercury analysis. All quality control parameters were within the acceptance limits.

SUBJECT: **INORGANIC DATA VALIDATION – SELECT METALS**
MIDDLE RIVER CENTER - GROUNDWATER
SAMPLE DELIVERY GROUP (SDG) – 240-22242-1

SAMPLES: 3/Aqueous/

MRC-MW-105A-032013 MRC-MW102B-032013
MRC-MW79B-032013

Overview

The sample set for Middle River Center - Groundwater, SDG 240-22242-1, consists of three (3) aqueous environmental samples. No field duplicate pairs were included within this SDG.

All samples were analyzed for select metals including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc. Metals analyses were conducted using SW-846 method 6020. Mercury analyses were conducted using SW-846 method 7470A.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike/matrix spike duplicate recoveries, ICP serial dilution results, internal standard recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems

None.

Minor Problems

- The contract required detection limit (CRDL) percent recovery for mercury on 04/08/2013 at 14:52 was < 80% quality control limit affecting all samples. The nondetected results reported for mercury were qualified as biased low, "UL"

- The following contaminants were detected in the laboratory preparation blank at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Copper	0.526 ug/L	2.63 ug/L
Molybdenum	0.267 ug/L	1.335 ug/L

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive result less than the blank action level reported for molybdenum was qualified "B" as a result of laboratory blank contamination.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated, "J".

Notes

Nondetected results are reported to the method detection limits.

The CRDL percent recoveries for nickel and silver were > 110% quality control limit affecting all samples. No validation actions were required as all sample results were > 2X CRDL or were nondetects.

The CRDL percent recovery for mercury on 04/18/2013 at 17:29 was > 120% quality control limit affecting all samples. No validation actions were required as all sample results were nondetects.

Executive Summary

Laboratory Performance: Several contaminants were present in the laboratory method / preparation blanks. The CRDL percent recovery for mercury on 04/08/2013 at 14:52 was < 80% quality control limit affecting all samples.

Other Factors Affecting Data Quality: Positive results reported below the RL but above the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed

APPENDIX C
SUPPORT DOCUMENTATION

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: Middle River Complex, MD

Report Number: 240-22242-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Metals and 7470A Mercury analysis were performed at the TestAmerica Irvine Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available Any exceptions to NELAP requirements are noted in this report Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT
The samples were received on 03/21/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 1.7 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)
Samples TB-032013 (240-22242-1), MRC-MW101A-032013 (240-22242-2), MRC-MW101B-032013 (240-22242-3), MRC-MW102A-032013 (240-22242-4), MRC-MW102B-032013 (240-22242-5), MRC-MW79B-032013 (240-22242-6), MRC-MW-38A-032013 (240-22242-8), MRC-MW-38B-032013 (240-22242-9) and MRC-MW-94B-032013 (240-22242-10) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/27/2013.

Several analytes were detected in method blank MB 240-79631/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Samples MRC-MW101A-032013 (240-22242-2)[1.43X], MRC-MW102B-032013 (240-22242-5)[9.09X] and MRC-MW79B-032013 (240-22242-6)[9.52X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 79631 exceeded control limits for the following analyte(s): Dichlorodifluoromethane and Trichlorofluoromethane--has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)
Samples MRC-MW102B-032013 (240-22242-5), MRC-MW79B-032013 (240-22242-6) and MRC-MW-105A-032013 (240-22242-7) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/01/2013 and analyzed on 04/02/2013.

Copper and Molybdenum were detected in method blank MB 440-95414/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MRC-MW102B-032013 (240-22242-5), MRC-MW79B-032013 (240-22242-6) and MRC-MW-105A-032013 (240-22242-7) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 04/08/2013.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

240-22242 Chain of Custody

Page 525 of 528

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal
☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months
(A fee may be assessed if samples are retained longer than 1 month)

Turn Around Time Required
☐ 24 Hours ☐ 48 Hours ☐ 7 Days ☐ 14 Days ☐ 21 Days ☐ Other _____

QC Requirements (Specify)

	Date	Time		Date	Time
1. Relinquished By	3-20-13	1600	1. Received By	3/20/13	1600
2. Relinquished By	3/20/13	1700	2. Received By	3-21-13	1000
3. Relinquished By			3. Received By		

Comments

DISTRIBUTION: WHITE - Returned to Client with Report; CANARY - Stays with the Sample; PINK - Field Copy

Overview

The sample set for Lockheed MRC, SDG 240-22303-1, consists of nine (9) aqueous environmental samples and one trip blank. This SDG contained no field duplicate pairs.

All samples were analyzed for volatile organic compounds (VOCs). Samples MRC-MW34B-032113 and MRC-MW37B-032113 were analyzed for organic volatile gases (OVG), alkalinity, ammonia-N, chloride, dissolved organic carbon (DOC), nitrate-N, nitrite-N, orthophosphate-P, silicon dioxide, sulfate, and total dissolved solids (TDS). Samples MRC-MW104B-032113, MRC-MW34B-032113, MRC-MW37B-032113, and MRC-MW93A-032113 were analyzed for select metals. Samples MRC-MW74A-032113 and MRC-MW74B-032113 were analyzed for perchlorate. The samples were collected by Tetra Tech March 21st, 2013 and analyzed by TestAmerica. VOC analyses were conducted using method 8260B. OVG analyses were conducted using method RSK-175. Metals analyses were conducted using methods 6010B and 6020A. Mercury analyses were conducted using method 7471B. Perchlorate analyses were conducted using method 6850. Alkalinity analyses were conducted using method 310.1. Ammonia-n analyses were conducted using method 350.3. Chloride, nitrate-N, nitrite-N, orthophosphate-P, and sulfate analyses were conducted using method 300.0. DOC analyses were conducted using method 9060. Silicon dioxide analyses were conducted using method 6010C. TDS analyses were conducted using method 160.1.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, GC/MS tuning, MS tuning, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, ICP internal standard recoveries, surrogate standard recoveries, laboratory control sample recoveries, matrix spike recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits.

Areas of concern with respect to data quality are listed below.

Major Problems-

- The initial calibration analyzed on 2/11/13 on instrument A3UX10 had a relative response factor (RRF) <0.05 for tertiary butyl alcohol and vinyl acetate. Samples MRC-MW104A-032113, MRC-

MW104B-032113, MRC-MW37B-032113, MRC-MW37C-032113, MRC-MW74A-032113, MRC-MW74B-032113, and MRC-MW93A-032113 were affected. The non-detected results were qualified as rejected (UR).

- The continuing calibration analyzed on 4/1/13 at 12:15 on instrument A3UX10 had a relative response factor (RRF) <0.05 for tertiary butyl alcohol and vinyl acetate. Samples MRC-MW104A-032113, MRC-MW104B-032113, MRC-MW37B-032113, MRC-MW37C-032113, MRC-MW74A-032113, MRC-MW74B-032113, and MRC-MW93A-032113 were affected. The non-detected results were qualified as rejected (UR).

- The initial calibration analyzed on 2/10/13 on instrument A3UX15 had a relative response factor (RRF) <0.05 for tertiary butyl alcohol and vinyl acetate. Samples MRC-MW34B-032113, MRC-MW34C-032113, and TB-032113 were affected. The non-detected results were qualified as rejected (UR).

- The continuing calibration analyzed on 3/30/13 at 9:00 on instrument A3UX15 had a relative response factor (RRF) <0.05 for tertiary butyl alcohol and vinyl acetate. Samples MRC-MW34B-032113, MRC-MW34C-032113, and TB-032113 were affected. The non-detected results were qualified as rejected (UR).

Minor Problems-

- The following contaminants were detected in method and calibration blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Acetone [1]	2.6 ug/L	26 ug/L
Acetone [2]	2.82 ug/L	28.2 ug/L
Hexachlorobutadiene [2]	0.54 ug/L	2.7 ug/L
Naphthalene [3]	0.54 ug/L	2.7 ug/L
1,2,3-Trichlorobenzne [3]	0.18 ug/L	0.9 ug/L
Calcium [4]	139 ug/L	695 ug/L
Magnesium [4]	39.8 ug/L	199 ug/L
Manganese [4]	2.06 ug/L	10.3 ug/L
Molybdenum [5]	1.0 ug/L	5.0 ug/L
Silica Dioxide [6]	19.6 ug/L	98 ug/L
Silver [7]	0.24 ug/L	1.2 ug/L
Chloride [8]	0.15 mg/L	0.75 mg/L
Ammonia [9]	0.043 mg/L	0.21 mg/L

[1] Maximum concentration found in a trip blank.
[2] Maximum concentration found in a preparation blank affecting samples in 240-79987.
[3] Maximum concentration found in a preparation blank affecting samples in 240-80086.
[4] Maximum concentration found in a preparation blank affecting samples in 240-79873.
[5] Maximum concentration found in a preparation blank affecting samples in 240-96231.
[6] Maximum concentration found in a calibration blank affecting samples analyzed on 4/4/13.
[7] Maximum concentration found in a calibration blank affecting samples analyzed on 4/5/13.
[8] Maximum concentration found in a preparation blank affecting samples in 240-79203.
[9] Maximum concentration found in a calibration blank affecting samples analyzed on 4/1/13.

An action level of 5X and 10X (Acetone only) the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) for blank contamination.

- The continuing calibration standard analyzed on 4/1/13 on instrument A3UX10 had a percent difference > 20% for trichlorofluoromethane, tert-butyl alcohol, 2-butanone, 2-chloroethyl vinyl ether, 4-methyl-2-pentanone, 2-hexanone, 1,2,4-trichlorobenzene, naphthalene, and 1,2,3-trichlorobenzene. Samples MRC-MW104A-032113, MRC-MW104B-032113, MRC-MW37B-032113, MRC-MW37C-032113, MRC-MW74A-032113, MRC-MW74B-032113, and MRC-MW93A-032113 were affected. Non-detected results were qualified as estimated (J).

- The continuing calibration standard analyzed on 3/30/13 on instrument A3UX15 had a percent difference > 20% for tert-butyl alcohol, bromomethane, acetone, 2,2-dichloropropane, and 2-hexanone. Samples MRC-MW34B-032113, MRC-MW34C-032113, and TB-032113 were affected. Positive results were qualified as estimated (J). Non-detected results were qualified as estimated (J).

- The laboratory control spike for preparation batch 240-80086 had a percent recovery less than the lower control limit for tert-butyl alcohol and 1,2,3-trichlorobenzene. Sample MRC-MW104A-032113, MRC-MW104B-032113, MRC-MW37B-032113, MRC-MW37C-032113, MRC-MW74A-032113, MRC-MW74B-032113, and MRC-MW93A-032113 were affected. No validation action was taken for tert-butyl alcohol as sample results were rejected for calibration non-compliances. Non-detected 1,2,3-trichlorobenzene results were qualified as estimated (J) due to conflicting directional bias.

- The CRDL standard analyzed on 4/8/13 had a percent recovery < 90% for mercury. Samples MRC-MW104B-032113, MRC-MW34B-032113, and MRC-MW93A-032113 were affected. Non-detected results were qualified as biased low (UL).

- The CRDL standard analyzed on 4/5/13 had a percent recovery >110% for copper, nickel, selenium, and silver. Samples MRC-MW104B-032113, MRC-MW34B-032113, and MRC-MW93A-032113 were affected. Positive selenium results were qualified as biased high (K) and estimated (J) due to conflicting directional bias. Silver results were qualified as sample results were previously qualified for blank contamination or were non-detected.

- Interference standard analyzed on 4/5/13 had a percent recovery >120% for zinc. Samples MRC-MW104B-032113, MRC-MW34B-032113, and MRC-MW93A-032113 were affected. Positive results were qualified as biased high (K).

Notes

Samples MRC-MW74A-032113 (40X) and MRC-MW74B-032113 (1250X) were analyzed at dilutions for VOC analyses due to high trichloroethene results.

The laboratory control spike for preparation batch 240-79987 had a percent recovery greater than the upper control limit for tert-butyl alcohol. Sample MRC-MW34B-032113, MRC-MW34C-032113, and TB-032113 were affected. No validation action was taken as sample results were rejected for calibration non-compliances. Positive results greater than MDL but less than the RL were qualified as estimated (J).
The continuing calibration 3/22/13 had a percent recovery > 110% for nitrite-N and orthophosphate-P. Samples MRC-MW34B-032113 and MRC-MW37B-032113 were affected. No validation action was

warranted as sample results were non-detected.

The continuing calibration analyzed on 3/22/13 had a percent recovery > 110% for nitrite-N and orthophosphate-P. Samples MRC-MW34B-032113 and MRC-MW37B-032113 were affected. No validation action was warranted as sample results were non-detected.

Non-detected results were reported at the MDL.

TICs were also analyzed for VOC analyses.

Executive Summary

Laboratory Performance: Calibration and preparation blank contamination resulted in the qualification of sample results. VOC initial and continuing calibration non-compliances resulted in the qualification of sample results. VOC laboratory spike percent recovery non-compliances resulted in the qualification of sample results. CRDL standard non-compliances for selenium resulted in the qualification of sample results.

Other Factors Affecting Data Quality: Interference standard non-compliances for zinc resulted in the qualification of sample results.

The data for these analyses were reviewed with reference to the Region III modifications to the National Functional Guidelines for Inorganic Data Validation (April 1993) and U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994).

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's r < 0.995
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient r < 0.995
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW Sampling MD

Report Number: 240-22303-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Metals and 7470A Mercury analysis were performed at the TestAmerica Irvine Laboratory. The 6850 Perchlorate analysis was performed at the TestAmerica Sacramento Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available Any exceptions to NELAP requirements are noted in this report Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 03/22/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 0.4 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples TB-032113 (240-22303-1), MRC-MW34B-032113 (240-22303-2), MRC-MW34C-032113 (240-22303-3), MRC-MW74A-032113 (240-22303-4), MRC-MW74B-032113 (240-22303-5), MRC-MW104A-032113 (240-22303-6), MRC-MW104B-032113 (240-22303-7), MRC-MW37B-032113 (240-22303-8), MRC-MW37C-032113 (240-22303-9) and MRC-MW93A-032113 (240-22303-10) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 03/30/2013 and 04/01/2013.

Acetone and Hexachlorobutadiene were detected in method blank MB 240-79987/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Acetone and Methylene Chloride were detected in method blank MB 240-79987/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

1,2,3-Trichlorobenzene, Acetone and Naphthalene were detected in method blank MB 240-80086/6 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

tert-Butyl alcohol failed the recovery criteria high for LCS 240-79987/4. 1,2,3-Trichlorobenzene and tert-Butyl alcohol failed the recovery criteria low for LCS 240-80086/4.

Samples MRC-MW74A-032113 (240-22303-4)[40X] and MRC-MW74B-032113 (240-22303-5)[1250X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 80086 exceeded control limits for the following analyte(s): 2-Methyl-2-propanol, 1,2,3-Trichlorobenzene. These have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED GASES
Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for dissolved gases in accordance with RSK_175. The samples were analyzed on 03/26/2013.

No difficulties were encountered during the dissolved gases analyses. All quality control parameters were within the acceptance limits.

PERCHLORATE
Samples MRC-MW74A-032113 (240-22303-4) and MRC-MW74B-032113 (240-22303-5) were analyzed for Perchlorate in accordance with EPA SW846 Method 6850. The samples were prepared on 04/02/2013 and analyzed on 04/03/2013.

No difficulties were encountered during the perchlorate analyses. All quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)
Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 03/29/2013 and analyzed on 04/01/2013 and 04/04/2013.

Calcium, Magnesium and Manganese were detected in method blank MB 240-79873/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

SiO2, Silica failed the recovery criteria low for the MS/MSD of sample MRC-MW37B-032113MS/MSD (240-22303-8) in batch 240-80661.

Sample MRC-MW37B-032113 (240-22303-8)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)
Samples MRC-MW34B-032113 (240-22303-2), MRC-MW104B-032113 (240-22303-7) and MRC-MW93A-032113 (240-22303-10) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/04/2013 and analyzed on 04/05/2013.

Molybdenum was detected in method blank MB 440-96231/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY
Samples MRC-MW34B-032113 (240-22303-2), MRC-MW104B-032113 (240-22303-7) and MRC-MW93A-032113 (240-22303-10) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 04/08/2013.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL DISSOLVED SOLIDS
Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for total dissolved solids in accordance with EPA Method 160.1. The samples were analyzed on 03/27/2013.

No difficulties were encountered during the TDS analyses. All quality control parameters were within the acceptance limits.

ANIONS
Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for anions in accordance with EPA Method 300.0. The samples were analyzed on 03/22/2013.

The laboratory control sample (LCS) for batch 79204 exceeded control limits for the following analytes: nitrite and orthophosphate. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No other difficulties were encountered during the anions analyses. All quality control parameters were within the acceptance limits.

ANIONS
Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for anions in accordance with EPA Method 300.0. The samples were analyzed on 03/22/2013.

Chloride was detected in method blank MB 240-79203/3 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the anions analyses. All other quality control parameters were within the acceptance limits.

ALKALINITY

Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for alkalinity in accordance with EPA Method 310.1. The samples were analyzed on 04/01/2013.

No difficulties were encountered during the alkalinity analyses. All quality control parameters were within the acceptance limits.

AMMONIA

Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for ammonia in accordance with EPA Method 350.3. The samples were analyzed on 04/01/2013.

Ammonia (as N) was detected in method blank MB 240-80119/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the ammonia analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED ORGANIC CARBON

Samples MRC-MW34B-032113 (240-22303-2) and MRC-MW37B-032113 (240-22303-8) were analyzed for dissolved organic carbon in accordance with EPA SW-846 Method 9060. The samples were analyzed on 04/06/2013.

No difficulties were encountered during the TOC analyses. All quality control parameters were within the acceptance limits.

Overview

The sample set for Lockheed MRC, SDG 240-22475-1, consisted of nine (9) aqueous samples including one (1) aqueous trip blank sample. Eight (8) aqueous samples were analyzed for volatile organic compounds (VOC) as listed above. Four (4) aqueous samples were analyzed for the semi-volatile organic compound (SVOC) 1,4-dioxane and the analyte perchlorate, as listed above. Two (2) aqueous samples were analyzed for organic volatile gases (OVG) and the miscellaneous inorganic analytes of chloride, sulfate, nitrate as Nitrogen (N), nitrite as N, ammonia as N, orthophosphate, alkalinity, total dissolved solids (TDS), and dissolved organic carbon, as listed above. Six (6) aqueous samples were analyzed for total metals as listed above. One (1) aqueous sample was analyzed for select metals and silicon dioxide as listed above. One (1) aqueous sample was analyzed for total and select metals and silicon dioxide, as listed above. No field duplicate sample pairs were included in the sample delivery group (SDG).

The samples were collected by Tetra Tech on March 26, 2013 and analyzed by TestAmerica Laboratories, Inc., North Canton, Irvine, and Sacramento for the analyses. All analyses were conducted in accordance with EPA SW-846 Methods 8260B for VOCs, 8270D for SVOCs, 6010C for metals, 6020 for metals, 7470A for mercury, 9060 for dissolved organic carbon, and EPA Method 6850 for perchlorate, method RSK-175 for OVGs, Method 300.0 for anions, Method 310.1 for alkalinity, Method 350.3 for ammonia as nitrogen, and Method 160.1 for total dissolved solids, analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank/preparation results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate results, internal standard recoveries, chromatographic resolution, ICP serial dilution results, ICP interference results, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major Problems

- The VOC initial calibration average relative response factors (RRF) were less than the 0.05 criteria for vinyl acetate and tert-butyl alcohol on instrument A3UX17 on 02/26/13. The continuing calibration verification (CCV) RRFs for tert-butyl alcohol and vinyl acetate were also less than the 0.05 criteria for instrument A3UX17 on 04/03/13 @ 12:40 and on 04/04/13 @ 11:32.

  Affected Sample: All samples

  Action: All sample non-detected results for tert-butyl alcohol and vinyl acetate were qualified rejected, (UR). The sample MRC-MW29A-032613 positive tert-butyl alcohol result was qualified estimated, (J).

Minor Problems

- Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

- The following laboratory VOC contaminants were detected in the method blank and trip blank sample at the following maximum concentrations affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Acetone [1]	1.1	11.0
Methylene chloride [2]	0.396	3.960

[1] Trip blank sample TB-032613 affecting all samples.
[2] Method blank MB 240-80568 affecting sample MRC-MW72B-032613.

An action level of ten times the maximum level for methylene chloride and acetone has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Sample analyte results less than the analyte action level were qualified (B) for blank contamination.

- The VOC continuing calibration verification (CCV) percent differences (%Ds) were greater than the 20% and less than the 50% quality control limit for chloroethane, methylene chloride, tert-butyl alcohol, methyl tert-butyl ether, vinyl acetate, 2,2-dichloropropane, 1,1,1-trichloroethane, carbon tetrachloride, and tert-amyl-methyl ether for instrument A3UX17 on 04/03/13 @ 12:40 and @ 13:02.

  Affected Samples:

MRC-MW-110A-032613	MRC-MW-110B-032613	MRC-MW-53A-032613
MRC-MW-53B-032613	MRC-MW29A-032613	MRC-MW37A-032613
TB-032613		

  Action: The sample positive tert-butyl alcohol and methyl tert-butyl ether results were qualified estimated, (J). The sample vinyl acetate and tert-butyl alcohol non-detected results were rejected for RRF criteria non-compliances and no further action was necessary. The remaining non-detected analyte sample results were not qualified.

- The VOC CCV %D was greater than the 20% and greater than the 50% quality control limit for dichlorodifluoromethane for instrument A3UX17 on 04/03/13 @ 12:40.

  Affected Samples:

MRC-MW-110A-032613	MRC-MW-110B-032613	MRC-MW-53A-032613
MRC-MW-53B-032613	MRC-MW29A-032613	MRC-MW37A-032613
TB-032613		

  Action: The non-detected dichlorodifluoromethane sample results were qualified estimated, (UJ).

- The VOC CCV %D was greater than the 20% and greater than the 50% quality control limit for dichlorodifluoromethane for instrument A3UX17 on 04/04/13 @ 11:32.

  Affected Sample: MRC-MW72B-032613

  Action: The non-detected dichlorodifluoromethane sample result was qualified estimated, (UJ).

- Samples had positive VOC tentatively identified compound (TICs) results as listed below.

Sample	TIC Analyte(s)
MRC-MW-110A-032613	tetrahydrofuran
MRC-MW-110B-032613	2-methyl butane,
MRC-MW-53A-032613	dimethyl ether
MRC-MW29A-032613	2-methyl butane, dimethyl ether
MRC-MW37A-032613	dimethyl ether

  Actions: The sample positive VOC TIC results were qualified as estimated, (NJ), presumptively present, as TIC analytes.

- The following laboratory OVG contaminant was detected in the method blank at the following maximum concentration affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Methane [1]	0.159	0.795

  [1] Method blank MB 240-79766 affecting samples MRC-MW37A-032613 and MRC-MW72B-032613.

  An action level of five times the maximum level for methane has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified (B) for blank contamination. Sample MRC-MW37A-032613 and MRC-MW72B-032613 positive results were qualified for blank

contamination.

- The contract required detection limit (CRDL) %Rs were less than the 90% (and >50%) quality control limit for copper, nickel, selenium, and silver for CRI 440-96433/9.

  Affected Samples:

MRC-MW-110A-032613	MRC-MW-110B-032613	MRC-MW-53A-032613
MRC-MW-53B-032613	MRC-MW26A-032613	MRC-MW29A-032613
MRC-MW37A-03261		

  Actions: The non-detected copper, selenium, and silver analyte sample results were qualified biased non-detected low, (UL). The positive copper, nickel, and selenium sample analyte results <2X the CRDL arsenic and molybdenum were qualified biased detected low, (L), except for positive results qualified (J) due to a conflicting qualifier(s).

- The following metal contaminants were detected in the blank samples at the following maximum concentration:

Analyte	Maximum Conc. µg/L	Action Level µg/L
Calcium [1]	139	695
Magnesium [1]	39.8	199.0
Manganese [1]	2.06	10.30
Molybdenum [2]	1.00	5.00

  [1] Maximum concentration found in preparation blank MB 240-22475/1-A affecting samples MRC-MW37A-032613 and MRC-MW72B-032613.
  [2] Maximum concentration found in a method blank sample MB 440-96231/1-A affecting samples MRC-MW-110A-032613, MRC-MW-110B-032613, MRC-MW-53A-032613, MRC-MW-53B-032613, MRC-MW26A-032613, MRC-MW29A-032613, and MRC-MW37A-032613.

  An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors were taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified (B) for blank contamination. Samples MRC-MW-53A-032613, MRC-MW-53B-032613, MRC-MW26A-032613, and MRC-MW29A-032613 positive molybdenum results were qualified for blank contamination.

- The following laboratory anion contaminant was detected in the CCB and the method blank at the following maximum concentration affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Chloride [1]	0.163	0.815
Ammonia as N [2]	0.0752	0.3760
Ammonia as N [3]	0.0544	0.2720

  [1] CCB 240-81024/15 affecting samples MRC-MW37A-032613 and MRC-MW72B-032613.
  [2] Method blank MB 240-80480/7 affecting samples MRC-MW37A-032613 and MRC-MW72B-032613.
  [3] CCB 240-80480/30 affecting samples MRC-MW37A-032613 and MRC-MW72B-032613. Maximum ammonia contamination detection of applicable CCBs and ICB.

An action level of five times the maximum level for the contaminants has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were

taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified (B) for blank contamination. Both sample ammonia results were qualified for method blank contamination.

- The general chemistry chloride matrix spike (MS) %R was greater than the quality control limit for spiked sample MRC-MW72B-032613.
  Affected Samples: MRC- MW37A-032613 and MRC-MW72B-032613
  Action: Sample MRC-MW37A-032613 and MRC-MW72B-032613 positive chloride results were qualified biased high, (K).

Notes

Samples were analyzed diluted for VOCs as listed below resulting in elevated concentrations for non-detected VOC analytes.

Sample	Dilution
MRC-MW37A-032613	2.5X
MRC-MW-53B-032613	5.714X

The VOC continuing calibration verification (CCV) percent differences (%Ds) were greater than the 20% and less than the 50% quality control limit for bromomethane, chloroethane, 2,2-dichloropropane, naphthalene, 1,2,3-trichlorobenzene, and tert-amyl-methyl ether for instrument A3UX17 on 04/04/13 @ 11:32 and @ 11:54.
Affected Sample: MRC-MW72B-032613
Action: The analyte sample results were all non-detected and were not qualified.

The VOC matrix spike (MS) and MS duplicate (MSD) %Rs were non-compliant for VOC analytes for a spiked sample from another SDG (240-22543-A-1). No validation action was necessary as the spiked sample was not from this SDG.

The general chemistry orthophosphate as P matrix spike (MS) %R was greater than the quality control limit for spiked sample MRC-MW37A-032613.
Affected Samples: MRC- MW37A-032613 and MRC-MW72B-032613
Action: The samples had non-detected orthophosphate as P results and were not qualified.

The mercury analysis MS and MSD %Rs were non-compliant for a spiked sample from another SDG (240-22439-A-6-E). No validation action was necessary as the spiked sample was not from this SDG.

The laboratory reported non-detected sample results to the Method Detection Limit (MDL).

EXECUTIVE SUMMARY

Laboratory Performance Issues: VOC non-detected tert-butyl alcohol and vinyl acetate sample results were rejected due to calibration and CCV RRF criteria non-compliances. Sample VOC, methane, ammonia, and molybdenum results were qualified blank contamination. Sample VOC results were qualified for CCV %D non-compliances. Sample metal analyte results were qualified for CRDL %R non-compliances.

Other Factors Affecting Data Quality: Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J). Sample positive VOC TIC results were qualified as presumptively present. Sample chloride results were qualified for MS and MSD %R non-compliances.

The data for these analyses were reviewed with reference to EPA SW-846 Methods 8260B, 8270D, 6010C, 6020, 7470A, 9060, EPA Method 6850, RSK-175, Method 300.0, Method 310.1, Method 350.3, and Method 160.1, the Region III EPA Functional Guidelines for Organic Data Validation (9/94), and the Region III EPA Modifications to the Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses (April 1993).

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

DATA QUALIFICATION CODE (QUAL CODE)

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's r < 0.995
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient r < 0.995
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW SAMPLING MD

Report Number: 240-22475-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Metals and 7470A Mercury (Samples 4 - 9 only for Mercury) analysis was performed at the TestAmerica Irvine Laboratory. The 6850 Perchlorate analysis was performed at the TestAmerica Sacramento Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available Any exceptions to NELAP requirements are noted in this report Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 03/27/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 1.0 and 1.2 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples TB-032613 (240-22475-1), MRC-MW72B-032613 (240-22475-2), MRC-MW37A-032613 (240-22475-3), MRC-MW29A-032613 (240-22475-4), MRC-MW-53A-032613 (240-22475-6), MRC-MW-53B-032613 (240-22475-7), MRC-MW-110A-032613 (240-22475-8) and MRC-MW-110B-032613 (240-22475-9) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/03/2013 and 04/04/2013.

Methylene Chloride was detected in method blank MB 240-80568/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Samples MRC-MW37A-032613 (240-22475-3)[2.5X] and MRC-MW-53B-032613 (240-22475-7)[5.71X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No MS/MSD for batch 80415 due to instrument failure.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MRC-MW-53A-032613 (240-22475-6), MRC-MW-53B-032613 (240-22475-7), MRC-MW-110A-032613 (240-22475-8) and MRC-MW-110B-032613 (240-22475-9) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 03/29/2013 and analyzed on 04/03/2013.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

DISSOLVED GASES

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for dissolved gases in accordance with RSK_175. The samples were analyzed on 03/28/2013.

Methane was detected in method blank MB 240-79766/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the dissolved gases analyses. All other quality control parameters were within the acceptance limits.

PERCHLORATE

Samples MRC-MW-53A-032613 (240-22475-6), MRC-MW-53B-032613 (240-22475-7), MRC-MW-110A-032613 (240-22475-8) and MRC-MW-110B-032613 (240-22475-9) were analyzed for Perchlorate in accordance with EPA SW846 Method 6850. The samples were prepared on 04/02/2013 and analyzed on 04/03/2013.

No difficulties were encountered during the perchlorate analyses. All quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 03/29/2013 and analyzed on 04/01/2013.

Calcium, Magnesium and Manganese were detected in method blank MB 240-79873/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MRC-MW37A-032613 (240-22475-3), MRC-MW29A-032613 (240-22475-4), MRC-MW26A-032613 (240-22475-5), MRC-MW-53A-032613 (240-22475-6), MRC-MW-53B-032613 (240-22475-7), MRC-MW-110A-032613 (240-22475-8) and MRC-MW-110B-032613 (240-22475-9) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/04/2013 and analyzed on 04/05/2013.

Molybdenum was detected in method blank MB 440-96231/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MRC-MW72B-032613 (240-22475-2), MRC-MW37A-032613 (240-22475-3), MRC-MW29A-032613 (240-22475-4), MRC-MW26A-032613 (240-22475-5), MRC-MW-53A-032613 (240-22475-6), MRC-MW-53B-032613 (240-22475-7), MRC-MW-110A-032613 (240-22475-8) and MRC-MW-110B-032613 (240-22475-9) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 04/03/2013 and 04/16/2013 and analyzed on 04/04/2013 and 04/16/2013.

No other difficulties were encountered during the mercury analyses. All other quality control parameters were within the acceptance limits.

TOTAL DISSOLVED SOLIDS

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for total dissolved solids in accordance with EPA Method 160.1. The samples were analyzed on 03/29/2013.

No difficulties were encountered during the TDS analyses. All quality control parameters were within the acceptance limits.

ANIONS

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for anions in accordance with EPA Method 300.0. The samples were analyzed on 03/28/2013.

Orthophosphate as P failed the recovery criteria high for the MS of sample MRC-MW37A-032613MS (240-22475-3) in batch 240-79687.

The orthophosphate matrix spike / matrix spike duplicate (MS/MSD) recoveries for IC batch 79687 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other difficulties were encountered during the anions analyses. All other quality control parameters were within the acceptance limits.

ANIONS

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for anions in accordance with EPA Method 300.0. The samples were analyzed on 04/06/2013 and 04/08/2013.

Chloride was detected in method blank MB 240-80760/29 at a level that was above the method detection limit but below the reporting

limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Chloride failed the recovery criteria high for the MS of sample MRC-MW72B-032613MS (240-22475-2) in batch 240-81024.

No other difficulties were encountered during the anions analyses. All other quality control parameters were within the acceptance limits.

ALKALINITY

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for alkalinity in accordance with EPA Method 310.1. The samples were analyzed on 04/03/2013.

No difficulties were encountered during the alkalinity analyses. All quality control parameters were within the acceptance limits.

AMMONIA

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for ammonia in accordance with EPA Method 350.3. The samples were analyzed on 04/03/2013.

Ammonia (as N) was detected in method blank MB 240-80480/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the ammonia analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED ORGANIC CARBON

Samples MRC-MW72B-032613 (240-22475-2) and MRC-MW37A-032613 (240-22475-3) were analyzed for dissolved organic carbon in accordance with EPA SW-846 Method 9060. The samples were analyzed on 04/06/2013.

No difficulties were encountered during the TOC analyses. All quality control parameters were within the acceptance limits.

Detection Limit Exceptions Summary

Client: Tetra Tech, Inc
Project/Site: MRC GW SAMPLING MD

TestAmerica Job ID: 240-22475-1

The requested project specific reporting limits listed below were less than laboratory standard quantitation limits (PQL) but greater than or equal to the laboratory method detection limits (MDL). It must be noted that results reported below lab standard quantitation limits may result in false positive/false negative values and less accurate quantitation. Routine laboratory procedures do not indicate corrective action for detections below the laboratory's PQL.

Method	Matrix	Analyte	Units	Client RL	Lab PQL
8260B	WQ	2-Butanone	ug/L	5.0	10
8260B	WQ	2-Hexanone	ug/L	5.0	10
8260B	WQ	4-Methyl-2-pentanone	ug/L	5.0	10
8260B	WQ	Acetone	ug/L	5.0	10
8260B	WQ	Diisopropyl ether	ug/L	5.0	10
8260B	WQ	tert-Butyl alcohol	ug/L	20	50

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
B	Compound was found in the blank and sample.
F	MS or MSD exceeds the control limits

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	This flag indicates the presumptive evidence of a compound.
T	Result is a tentatively identified compound (TIC) and an estimated value.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

GC VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

LCMS

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
U	Indicates the analyte was analyzed for but not detected.
F	MS or MSD exceeds the control limits
B	Compound was found in the blank and sample.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
F	MS or MSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Method 8260B

Volatile Organic Compounds (GC/MS) by Method 8260B

Overview

The sample set for Lockheed MRC, SDG 240-22510-1, consisted of nine (9) aqueous samples including one (1) aqueous trip blank sample. Six (6) of the samples were analyzed for volatile organic compounds (VOC) as listed above. Two (2) aqueous samples were analyzed for the semi-volatile organic compound (SVOC) 1,4-dioxane and the analyte perchlorate, as listed above. Three (3) samples were analyzed for organic volatile gases (OVG), total & select metals & silicon dioxide, and the miscellaneous inorganic analytes of chloride, sulfate, nitrate as Nitrogen (N), nitrite as N, ammonia as N, orthophosphate, alkalinity, total dissolved solids (TDS), and dissolved organic carbon, as listed above. Two (2) samples were analyzed for total metals as listed above. Two (2) samples were analyzed for polychlorinated biphenyls (PCBs), as listed above. No field duplicate sample pairs were included in the sample delivery group (SDG).

The samples were collected by Tetra Tech on March 27, 2013 and analyzed by TestAmerica Laboratories, Inc., North Canton, Irvine, and Sacramento for the analyses. All analyses were conducted in accordance with EPA SW-846 Methods 8260B for VOCs, 8270D for SVOCs, 8082 for PCBs, 6010C for metals, 6020 for metals, 7470A for mercury, 9060 for dissolved organic carbon, and EPA Method 6850 for perchlorate, method RSK-175 for OVGs, Method 300.0 for anions, Method 310.1 for alkalinity, Method 350.3 for ammonia as nitrogen, and Method 160.1 for total dissolved solids, analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank/preparation results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate results, internal standard recoveries, chromatographic resolution, ICP serial dilution results, ICP interference results, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major Problems

- The VOC initial calibration average relative response factors (RRF) were less than the 0.05 criteria for tert-butyl alcohol on instrument A3UX16 on 02/07/13. The continuing calibration verification (CCV) RRF for tert-butyl alcohol was also less than the 0.05 criteria for instrument A3UX16 on 04/04/13 @ 11:39.

  Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW27A-032713
MRC-MW27B-032713	MRC-MW27C-032713	TB-032713

  Action: All affected samples had non-detected results for tert-butyl alcohol which were qualified rejected, (UR).

Minor Problems

- Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

- The following laboratory VOC contaminants were detected in the method blank and trip blank sample at the following maximum concentrations affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Acetone [1]	1.3	13.0
Benzene [2]	0.138	0.690
Hexachlorobutadiene [2]	0.831	4.155
Methylene chloride [2]	1.18	11.8
1,2,3-Trichlorobenzene [2]	0.440	2.200
1,2,4-Trichlorobenzene [2]	0.288	1.440

  [1] Trip blank sample TB-032713 affecting samples MRC-MW-96A-032713, MRC-MW-96B-032713, MRC-MW27A-032713, MRC-MW27B-032713, MRC-MW27C-032713, and TB-032713.

  [2] Method blank MB 240-80572 affecting samples MRC-MW-96A-032713, MRC-MW-96B-032713, MRC-MW27A-032713, MRC-MW27B-032713, MRC-MW27C-032713, and TB-032713.

  An action level of ten times the maximum level for methylene chloride and acetone, and five times the maximum level for the other contaminants, has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Sample analyte results less than the analyte action level were qualified (B) for blank contamination. The trip blank sample results were not qualified for blank contamination. Positive sample results for acetone and methylene chloride were qualified for blank contamination.

- The VOC continuing calibration verification (CCV) percent difference (%D) was greater than the 20% and less than the 50% quality control limit for 1,2,3-trimethylbenzene for instrument A3UX16 on 04/04/13 @ 12:01.

  Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW27A-032713
MRC-MW27B-032713	MRC-MW27C-032713	TB-032713

  Action: The sample MRC-MW-96B-032713 positive 1,2,3-trimethylbenzene result was qualified estimated, (J). The remaining samples had non-detected 1,2,3-trimethylbenzene results which were not qualified.

- The VOC CCV %D was greater than the 20% and greater than the 50% quality control limit for dichlorodifluoromethane and trichlorofluoromethane for instrument A3UX16 on 04/04/13 @ 11:39.

  Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW27A-032713
MRC-MW27B-032713	MRC-MW27C-032713	TB-032713

  Action: The non-detected dichlorodifluoromethane and trichlorofluoromethane sample results were qualified estimated, (UJ).

- Samples had positive VOC tentatively identified compound (TICs) results and other VOCs (VOCs which had not been requested to be analyzed for in the samples but were calibrated for by the laboratory) as listed below.

Sample	TIC Analyte(s) and other non-requested VOCs
MRC-MW-96B-032713	1-ethyl-2-methyl benzene, butane, 2,2-dimethyl butane, 2-methyl butane, pentane, 3-methyl pentane
MRC-MW27A-032713	1-pentene, 2-methyl butane, cyclohexane
MRC-MW27C-032713	dimethyl ether

  Actions: The sample positive VOC TIC results were qualified as estimated, (NJ), presumptively present, as TIC analytes. The VOC analytes which the laboratory had included in the instrument calibration but which were not included in the list of VOCs to be analyzed, were also qualified as estimated, (NJ), presumptively present.

- The contract required detection limit (CRDL) %Rs were less than the 90% (and >50%) quality control limit for copper, nickel, selenium, and silver for CRI 440-96433/9.

  Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW24A-032713
MRC-MW27A-032713	MRC-MW27B-032713	

  Actions: The non-detected selenium and silver analyte sample results were qualified biased non-detected low, (UL), with the exception of a sample result qualified non-detected for blank contamination. The positive copper analyte result for sample MRC-MW27A-032713 was <2X the CRQL and was therefore qualified biased detected low, (L). The remaining sample copper results were >2X the CRQL and were not qualified. The positive selenium sample results were qualified (J) due to a conflicting qualifier(s) and were therefore not qualified for the CRDL non-compliance.

- The interference AB check standard %R was greater than the 120% quality control limit for zinc for ICSAB 440-96433/15.

  Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW24A-032713
MRC-MW27A-032713	MRC-MW27B-032713	

  Actions: The positive zinc analyte sample results were qualified biased high, (K).

- The following metal contaminants were detected in the blank samples at the following maximum concentration:

Analyte	Maximum Conc. µg/L	Action Level µg/L
Calcium [1]	139	695
Magnesium [1]	39.8	199.0
Manganese [1]	2.06	10.30
Molybdenum [2]	0.255	1.275
Silver [2]	0.244	1.220
Molybdenum [3]	1.00	5.00

[1] Maximum concentration found in preparation blank MB 240-79873/1-A affecting samples MRC-MW24A-032713, MRC-MW27A-032713, and MRC-MW27B-032713.
[2] Maximum concentration found in CCB 440-96433/47 affecting samples MRC-MW-96A-032713, MRC-MW-96B-032713, and MRC-MW24A-032713.
[3] Maximum concentration found in a preparation blank sample MB 440-96231/1-A affecting samples MRC-MW-96A-032713, MRC-MW-96B-032713, MRC-MW24A-032713, MRC-MW27A-032713, and MRC-MW27B-032713.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors were taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified (B) for blank contamination. Affected sample positive molybdenum and silver results were qualified for blank contamination.

- The following laboratory anion contaminant was detected in the continuing calibration blank (CCB) and the method blank at the following maximum concentration affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Chloride [1]	0.113	0.565
Ammonia as N [2]	0.0752	0.3760
Ammonia as N [3]	0.0544	0.2720

[1] CCB 240-81184/14 affecting samples MRC-MW24A-032713, MRC-MW27A-032713, and MRC-MW27B-032713.
[2] Method blank MB 240-80480/7 affecting samples MRC-MW24A-032713, MRC-MW27A-032713, and MRC-MW27B-032713.
[3] CCB 240-80480/30 affecting samples MRC-MW24A-032713, MRC-MW27A-032713, and MRC-MW27B-032713. Maximum ammonia contamination detection of applicable CCBs and initial calibration blank (ICB).

An action level of five times the maximum level for the contaminants has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified (B) for blank contamination. Sample MRC-MW24A-032713 and MRC-MW27B-032713 ammonia results were qualified for method blank contamination.

Notes

Samples were analyzed diluted for VOCs as listed below resulting in elevated concentrations for non-detected VOC analytes.

Sample	Dilution
MRC-MW-96A-032713	833.3X
MRC-MW-96B-032713	25X
MRC-MW27A-032713	5X
MRC-MW27B-032713	33.3X

The VOC CCV %Ds were greater than the 20% and less than the 50% quality control limit for dichlorodifluoromethane, chloromethane, bromomethane, chloroethane, 1,1,2-trichlorotrifluoroethane, 1,2,4-trichlorobenzene, hexachlorobutadiene, 1,2,3-trichlorobenzene, and tert-amyl-methyl ether for instrument A3UX16 on 04/04/13 @ 11:39 and @ 12:01.

Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW27A-032713
MRC-MW27B-032713	MRC-MW27C-032713	TB-032713

Action: The sample aforementioned analyte results were all non-detected and were not qualified.

The VOC laboratory control sample (LCS) percent recovery (%R) was greater than the quality control limit for trichlorofluoromethane for LCS 240-80572.

Affected Samples:

MRC-MW-96A-032713	MRC-MW-96B-032713	MRC-MW27A-032713
MRC-MW27B-032713	MRC-MW27C-032713	TB-032713

Action: The trichlorofluoromethane sample results were all non-detected and were not qualified.

The VOC matrix spike (MS) and MS duplicate (MSD) %Rs were non-compliant for VOC analytes for a spiked sample from another SDG (240-22494-F-45). No validation action was necessary as the spiked sample was not from this SDG.

Sample MRC-MW27A-032713 was analyzed diluted 10X for methane.

The following laboratory OVG contaminant was detected in the method blanks at the following maximum concentrations affecting samples as listed.

Analytes	Maximum Conc. µg/L	Action Level µg/L
Methane [1]	0.232	1.160
Methane [2]	0.167	0.835

[1] Method blank MB 240-79864 affecting sample MRC-MW24A-032713.
[2] Method blank MB 240-79766 affecting sample MRC-MW27A-032713 and MRC-MW27B-032713.

An action level of five times the maximum level for methane has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Sample analyte results less than the action level were qualified (B) for blank contamination. No sample methane results were qualified for blank contamination.

Sample MRC-MW24A-032713 and MRC-MW27A-032713 were analyzed diluted 5X for chloride.

The general chemistry chloride matrix spike (MS) %R was greater than the quality control limit for a spiked sample from another SDG (240-22482-B-1). No validation action was necessary as the spiked sample was not from this SDG.

The general chemistry orthophosphate as P matrix spike (MS) %R was greater than the quality control limit for a spiked sample from another SDG (240-22507-K-4). No validation action was necessary as the spiked sample was not from this SDG.

Samples were analyzed diluted for metals as listed below.

Sample	Analyte	Dilution
MRC-MW24A-032713	Manganese	2X
MRC-MW27A-032713	Manganese	5X

The laboratory reported non-detected sample results to the Method Detection Limit (MDL).

EXECUTIVE SUMMARY

Laboratory Performance Issues: VOC non-detected tert-butyl alcohol sample results were rejected due to calibration and CCV RRF criteria non-compliances. Sample VOC, ammonia, and metal results were qualified blank contamination. Sample VOC results were qualified for CCV %D non-compliances. Sample metal analyte results were qualified for CRDL %R and interference AB check standard %R non-compliances.

Other Factors Affecting Data Quality: Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J). Sample positive VOC TIC results were qualified as presumptively present.

The data for these analyses were reviewed with reference to EPA SW-846 Methods 8260B, 8270D, 8082, 6010C, 6020, 7470A, 9060, EPA Method 6850, RSK-175, Method 300.0, Method 310.1, Method 350.3, and Method 160.1, the Region III EPA Functional Guidelines for Organic Data Validation (9/94), and the Region III EPA Modifications to the Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analyses (April 1993).

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

DATA QUALIFICATION CODE (QUAL CODE)

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01	=	GC/MS Tuning Noncompliance
D	=	MS/MSD Recovery Noncompliance
E	=	LCS/LCSD Recovery Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K	=	ICP Interference - includes ICS % R Noncompliance
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation Noncompliance
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Recovery Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	RPD between columns/detectors >40% for positive results determined via GC/HPLC
V	=	Non-linear calibrations; correlation coefficient $r < 0.995$
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity
Z1	=	Tentatively Identified Compound considered presumptively present
Z2	=	Tentatively Identified Compound column bleed

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: MRC GW SAMPLING MD

Report Number: 240-22510-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Metals and the 7470A Mercury analyses were performed at the TestAmerica Irvine laboratory. The 6850 Perchlorate analysis was performed at the TestAmerica Sacramento laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 03/28/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt were 1.6 and 2.2 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples TB-032713 (240-22510-1), MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3), MRC-MW27C-032713 (240-22510-4), MRC-MW-96A-032713 (240-22510-8) and MRC-MW-96B-032713 (240-22510-9) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 04/04/2013.

Methylene Chloride was detected in method blank MB 240-80572/5 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Several analytes were detected in method blank MB 240-80572/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Samples MRC-MW27A-032713 (240-22510-2)[5X], MRC-MW27B-032713 (240-22510-3)[33.33X], MRC-MW-96A-032713 (240-22510-8) [833.33X] and MRC-MW-96B-032713 (240-22510-9)[25X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 80572 exceeded control limits for the following analyte(s): Trichlorofluoromthane--has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

No other difficulties were encountered during the VOCs analyses. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MRC-MW-96A-032713 (240-22510-8) and MRC-MW-96B-032713 (240-22510-9) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 04/02/2013 and analyzed on 04/04/2013.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the SVOCs analyses. All quality control parameters were within the acceptance limits.

DISSOLVED GASES
Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for dissolved gases in accordance with RSK_175. The samples were analyzed on 03/29/2013 and 04/01/2013.

Methane was detected in method blank MB 240-79864/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Methane was detected in method blank MB 240-80082/25 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Sample MRC-MW27A-032713 (240-22510-2)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the dissolved gases analyses. All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)
Samples MRC-MW103A-032713 (240-22510-6) and MRC-MW103B-032713 (240-22510-7) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082. The samples were prepared on 04/02/2013 and analyzed on 04/03/2013.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

No difficulties were encountered during the PCBs analyses. All quality control parameters were within the acceptance limits.

PERCHLORATE
Samples MRC-MW-96A-032713 (240-22510-8) and MRC-MW-96B-032713 (240-22510-9) were analyzed for Perchlorate in accordance with EPA SW846 Method 6850. The samples were prepared on 04/02/2013 and analyzed on 04/03/2013.

No difficulties were encountered during the perchlorate analyses. All quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)
Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 03/29/2013 and analyzed on 04/01/2013.

Calcium, Magnesium and Manganese were detected in method blank MB 240-79873/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Samples MRC-MW27A-032713 (240-22510-2)[5X] and MRC-MW24A-032713 (240-22510-5)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICPMS)
Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3), MRC-MW24A-032713 (240-22510-5), MRC-MW-96A-032713 (240-22510-8) and MRC-MW-96B-032713 (240-22510-9) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 04/04/2013 and analyzed on 04/05/2013.

Molybdenum was detected in method blank MB 440-96231/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the metals analyses. All other quality control parameters were within the acceptance limits.

TOTAL MERCURY
Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3), MRC-MW24A-032713 (240-22510-5), MRC-MW-96A-032713 (240-22510-8) and MRC-MW-96B-032713 (240-22510-9) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 03/29/2013 and 04/16/2013 and analyzed on 04/01/2013 and 04/16/2013.

No difficulties were encountered during the mercury analyses. All quality control parameters were within the acceptance limits.

TOTAL DISSOLVED SOLIDS
Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were

analyzed for total dissolved solids in accordance with EPA Method 160.1. The samples were analyzed on 03/29/2013.

No difficulties were encountered during the TDS analyses. All quality control parameters were within the acceptance limits.

ANIONS

Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for anions in accordance with EPA Method 300.0. The samples were analyzed on 03/29/2013.

No other difficulties were encountered during the anions analyses. All other quality control parameters were within the acceptance limits.

ANIONS

Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for anions in accordance with EPA Method 300.0. The samples were analyzed on 04/06/2013, 04/09/2013 and 04/10/2013.

Chloride was detected in method blank MB 240-81324/10 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Samples MRC-MW27A-032713 (240-22510-2)[5X] and MRC-MW24A-032713 (240-22510-5)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the anions analyses. All other quality control parameters were within the acceptance limits.

ALKALINITY

Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for alkalinity in accordance with EPA Method 310.1. The samples were analyzed on 04/04/2013.

No difficulties were encountered during the alkalinity analyses. All quality control parameters were within the acceptance limits.

AMMONIA

Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for ammonia in accordance with EPA Method 350.3. The samples were analyzed on 04/03/2013.

Ammonia (as N) was detected in method blank MB 240-80480/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

No other difficulties were encountered during the ammonia analyses. All other quality control parameters were within the acceptance limits.

DISSOLVED ORGANIC CARBON

Samples MRC-MW27A-032713 (240-22510-2), MRC-MW27B-032713 (240-22510-3) and MRC-MW24A-032713 (240-22510-5) were analyzed for dissolved organic carbon in accordance with EPA SW-846 Method 9060. The samples were analyzed on 04/09/2013.

No difficulties were encountered during the TOC analyses. All quality control parameters were within the acceptance limits.

Detection Limit Exceptions Summary

Client: Tetra Tech, Inc
Project/Site: MRC GW SAMPLING MD

TestAmerica Job ID: 240-22510-1

The requested project specific reporting limits listed below were less than laboratory standard quantitation limits (PQL) but greater than or equal to the laboratory method detection limits (MDL). It must be noted that results reported below lab standard quantitation limits may result in false positive/false negative values and less accurate quantitation. Routine laboratory procedures do not indicate corrective action for detections below the laboratory's PQL.

Method	Matrix	Analyte	Units	Client RL	Lab PQL
8260B	WQ	2-Butanone	ug/L	5.0	10
8260B	WQ	2-Hexanone	ug/L	5.0	10
8260B	WQ	4-Methyl-2-pentanone	ug/L	5.0	10
8260B	WQ	Acetone	ug/L	5.0	10
8260B	WQ	Diisopropyl ether	ug/L	5.0	10
8260B	WQ	tert-Butyl alcohol	ug/L	20	50

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
*	LCS or LCSD exceeds the control limits
B	Compound was found in the blank and sample.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	This flag indicates the presumptive evidence of a compound.
T	Result is a tentatively identified compound (TIC) and an estimated value.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

GC VOA

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

LCMS

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.

General Chemistry

Qualifier	Qualifier Description
F	MS or MSD exceeds the control limits
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
