Subject: Transmittal of the Groundwater Monitoring Report March–April 2017
Lockheed Martin Corporation; Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Carroll:

For your review please find enclosed two hard copies with a CD of the above-referenced document. This groundwater monitoring report summarizes the March-April 2017 groundwater sampling round at Lockheed Martin's Middle River Complex in Middle River, Maryland. If possible, we respectfully request to receive MDE's comments by December 20, 2017.

Please let me know if you have any questions. My office phone is (301) 548-2227.

Sincerely,

Lynnette Drake
Remediation Analyst, Environmental Remediation

Section 1
Introduction

This groundwater monitoring report summarizes the March/April 2017 round of groundwater sampling at the Lockheed Martin Middle River Complex (MRC) in Middle River, Maryland. Figure 1-1 shows the location of the Middle River Complex. This report contains a current round of groundwater levels and chemical data for selected wells as part of ongoing environmental investigations at the facility. These data will be used to define the nature and extent of chemical contamination in groundwater, evaluate the trends of chemical plumes in on-site groundwater, and evaluate the natural attenuation of groundwater chemicals of concern at the Middle River Complex.

Groundwater samples were analyzed for volatile organic compounds (VOCs), 1,4-dioxane (a semivolatile organic compound [SVOC]), polychlorinated biphenyls (PCBs), metals, and natural-attenuation-assessment (NAA) parameters. All wells were inspected to assess their integrity and any need for repairs during sampling. Five wells were repaired (complete well pad replacement) in August 2017. Two monitoring wells (MW11A and MW16A) will be repaired at a later date due to the ongoing sediment removal action now underway in the area of the wells. This report is organized as follows:

Section 2—Site Background: Briefly summarizes the site and references recent reports containing detailed background information related to groundwater.

Section 3—Investigation Approach: Presents the technical approach to the investigation and describes the field methodologies used.

Section 4—Investigation Results: Presents the investigation results.

Section 5—Summary: Summarizes the investigation findings.

Section 6—References: Cites references used to compile this report.

Section 2
Site Background

2.1 MIDDLE RIVER COMPLEX HISTORY AND SITE CHARACTERISTICS

The Middle River Complex (MRC), part of the Chesapeake Industrial Park at 2323 Eastern Boulevard in Middle River, Maryland, is approximately 11.5 miles northeast of downtown Baltimore. It comprises approximately 161 acres, including 12 main buildings, an active industrial area and yard, perimeter parking lots, an athletic field, a vacant concrete lot, trailer and parts storage areas, and numerous grassy spaces along its perimeter. It is bounded by Eastern Boulevard (Route 150) to the north, Martin State Airport (MSA) to the east, Dark Head Cove to the south, and Cow Pen Creek to the west. Figure 2-1 is a map showing the MRC layout.

MRC is owned by LMC Properties, Inc. (LMCPI), a subsidiary of Lockheed Martin Corporation (Lockheed Martin). Currently, LMCPI's primary activities at the MRC are facility and building management and maintenance. The main site tenant (MRA Systems, Inc., [MRAS] [a subsidiary of General Electric Company]) designs, manufactures, fabricates, tests, overhauls, repairs, and maintains aeronautical structures, parts, and components for military and commercial applications. Lockheed Martin Rotary and Mission Systems (formerly Mission Systems & Training, a Lockheed Martin business segment) engineers, fabricates, assembles, tests, and otherwise supports vertical-launch systems. Applied NanoStructured Solutions LLC (a Lockheed Martin subsidiary) also occupies a portion of the MRC and is engaged in research and design of nanotechnology applications.

In 1929, the Glenn L. Martin Company (GLM) (a predecessor entity of Lockheed Martin) acquired large parcels of undeveloped land in Middle River, Maryland on which to manufacture aircraft for United States government and commercial clients. In the early 1960s, GLM merged with American-Marietta Company to form Martin Marietta Corporation. Around 1975, the adjacent eastern airport area (currently MSA), comprised of approximately 750 acres, was transferred to

the State of Maryland. In 1995, Martin Marietta Corporation merged with Lockheed Corporation to form Lockheed Martin Corporation. Shortly after the merger, General Electric Company acquired most of Lockheed Martin's aeronautical business in Middle River, and MRAS began operations at the site.

The MRC is an industrial facility surrounded primarily by commercial, industrial, and residential establishments. Six facilities adjacent to the MRC constitute the remaining portion of the Chesapeake Industrial Park. These include Tilley Chemical Company, Inc. (a food- and pharmaceutical-chemical distributor), Total Industrial Group (a welding contractor; formerly North American Electric, Inc.), Johnson and Towers (a heavy-duty automotive and boat repair and maintenance company), an Ashley Furniture distribution center, Exxon Tiger Mart (a gasoline filling station and convenience store), and the Middle River Post Office. Residential developments are on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek, and north of Eastern Boulevard (Route 150).

2.2 GROUNDWATER AT MIDDLE RIVER COMPLEX

Hydrogeology—Investigations of MRC groundwater began in 1988 and are ongoing. Groundwater at MRC is encountered at depths ranging from less than one foot to nearly 18 feet below grade. In general, the shallowest depths to groundwater are typically found along the shorelines of Dark Head Cove and Cow Pen Creek, and the deepest depths to groundwater are in the upgradient area south of Buildings A, B, and C. In this report, all groundwater discussed is surficial groundwater. Wells sampled during the March/April 2017 sampling typically contain the designations "A," "B," or "C" in their location identifiers, which indicate whether the well is in the upper surficial-aquifer ("A"), intermediate surficial- ("B"), or lower surficial- ("C") aquifer. Shallow groundwater follows site topography and flows radially from the hydraulically upgradient northern portion of the MRC (at Eastern Boulevard and south of Buildings A, B, and C) to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Deeper groundwater is typically under hydraulically confined conditions at the MRC.

Lithologic logging of the soils beneath the MRC has identified a very heterogeneous stratigraphy. Underlying soils are composed primarily of silty sands, fine- to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primary lithology being clay to silty clay. Areas along the waterfront have been filled to their present elevation over past decades.

Groundwater chemicals of concern—A risk assessment (Tetra Tech, Inc., [Tetra Tech], 2006) identified trichloroethene (TCE), tetrachloroethene (PCE), vinyl chloride (VC), benzene, and certain metals as the most significant contaminants in groundwater at the MRC. The two largest groups of organic chemicals of concern are chlorinated volatile organic compounds (cVOCs) and petroleum-related hydrocarbons. CVOCs include the commonly used solvents PCE and TCE, which degrade into a variety of other cVOCs and volatile organic compounds (VOCs). CVOCs are in groundwater in several areas of the facility; three areas of elevated cVOCs (Figure 2-2) in groundwater are targeted by the current groundwater remedy program (Tetra Tech, 2012a).

Petroleum-based fuels such as gasoline and fuel oil have numerous chemical constituents. Several VOCs associated with fuels are fairly soluble in groundwater and are therefore mobile in the subsurface. The most commonly detected petroleum-VOCs in groundwater at MRC are benzene, toluene, ethylbenzene, and xylenes (BTEX), and methyl *tert*-butyl ether (MTBE).

1,4-Dioxane is also a groundwater chemical of concern, because it has been detected at concentrations above its selected screening-concentration for MRC groundwater, and also because it is a contaminant of emerging concern nationwide. The screening level used for 1,4-dioxane is the California Department of Health Services advisory level of 3 µg/L (see Section 4.2); Maryland has no drinking water or groundwater standard or advisory for 1,4-dioxane. Metals (primarily nickel, cobalt, beryllium, and zinc) have been detected in groundwater at concentrations above Maryland Department of the Environment (MDE) groundwater standards (MDE, 2008). Polychlorinated biphenyls (PCBs) have also been detected in Block E groundwater at concentrations exceeding MDE groundwater standards. The sub-sections that follow highlight areas of the site with known cVOC impact in groundwater.

Block I—Building A western plume—Previous groundwater sampling in both the "A" and "B" zones of the surficial aquifer has demonstrated cVOC impact west of Building I; most contamination is within the "A" zone of the surficial aquifer. The maximum TCE concentration is in MW96A near Building A. Available data show that TCE concentrations decrease rapidly to the north, south, and west of this well. This area is undergoing additional investigation to fully delineate TCE concentrations in this area.

Groundwater response-action—MDE approved the MRC *Groundwater Response Action Plan* (Tetra Tech, 2012a) in 2012. Construction of the groundwater-treatment remedy for cVOCs in Tax

Blocks E, G, and I began in early summer 2013. The MRC groundwater response-action now underway is in accordance with the groundwater response action plan (RAP) and a consent order with MDE. The groundwater response-action uses enhanced anaerobic-bioremediation to treat three areas of the MRC that have high groundwater concentrations of TCE. The response action addresses the southeastern TCE area (Block E area), the southwestern TCE area (Block G area), and the northern TCE area (Block I area). These three areas are shown on Figure 2-2.

Semi-permanent injection wells were installed to inject biological amendments into the subsurface. These wells are arranged in rows and connected via underground conveyance piping to injection equipment in each of three TCE areas. The injection equipment and controls are housed in two modified shipping containers (i.e., the equipment modules). This system allows flexibility in selecting and setting system parameters, such as the number of operational injection wells, substrate type and dosage, and injection rates, volumes, and durations. A tracer study was performed for Blocks G and I (May–July 2014) before the full-scale injection to evaluate injection effects and to determine the main injection and operational parameters for the full-scale injection (see Appendix A of the *Operation and Maintenance Plan for Groundwater Remediation System,* [Tetra Tech, 2014a]).

The following subsections discuss the status of the remedial action in each of these areas:

Block G, southwestern TCE plume—The first injection in Block G was completed in June 2015. The second injection, in February 2016, included bioaugmentation. TCE reductions of greater than 99% and VOC reductions of greater than 93% were accomplished in Block G; therefore, only two injection events were needed. Post-injection groundwater monitoring for rebound in Block G was completed in April 2017. The area will be sampled again in 2018, followed by a possible "no further action" request.

Block I, northern TCE plume—The first injection in Block I was completed in June 2015, and the second injection was completed in February 2016. TCE reductions greater than 50% were observed, but distribution of the injected substrate was not adequate to treat the entire remediation area, and additional injections in Block I are currently being implemented. The system in Block I was augmented with a pumping system to lower the groundwater table and aid in substrate distribution. Details of the operation of the groundwater extraction and injection at Block I are in

the *Final Groundwater Response Action Plan, Addendum 3: Remedy Modifications for Block I* (Tetra Tech, 2017).

Block E, southeastern TCE plume—During installation of the groundwater remedy in Block E, two underground storage tanks (USTs) were discovered between the foundation where Building D formerly stood and the concrete road a few feet to the south. UST 2, which contained high concentrations of TCE, was identified and removed during installation of the *in situ* bioremediation system. UST 1, which was nearly empty when discovered, was also removed. UST 1 had underlying soil contaminated with low concentrations of petroleum constituents.

Subsequent investigations indicate that the mass and concentrations of TCE in the immediate former vicinity of UST 2 would not be readily addressed solely via *in situ* bioremediation. With MDE approval, Tetra Tech installed a multi-phase extraction (MPE) system in Block E in 2014. The system operated from September to December 2014 and from March to November 2015 (the system was not designed for winter operation). The MPE system was designed to remove TCE mass (existing as traces of product), groundwater contamination, and soil and vapor contamination from the subsurface near former UST 2.

Block E injections were delayed by the need to address the TCE source associated with UST 2. Additional groundwater sampling in this area followed MPE operation. Additional downgradient TCE impact extending from UST 2 to Dark Head Cove is currently under investigation. Proposed modifications to the Block E remedy will be included in an amendment to the groundwater RAP. Remediation of Block E groundwater is scheduled to begin in 2019.

The general operational procedures and operation details for the unmodified groundwater remediation system are described in the *Operation and Maintenance Plan for Groundwater Remediation System* (Tetra Tech, 2014a) and in Appendix A1 of the *Block E Tracer-Testing Work Plan*, an addendum to that document (Tetra Tech, 2016a). Additional details regarding MRC background and history, including details of previous environmental investigations and discussions of contaminant source areas, are in the RAP and subsequent groundwater monitoring reports (Tetra Tech, 2009, 2012a–d; 2013; 2014b, 2015a, 2016b).

Section 3
Investigation Approach

The 2017 groundwater-sampling program for the Middle River Complex (MRC) included synoptic groundwater-level measurements and the collection of groundwater samples for laboratory chemical analyses. This sampling round augments groundwater data and level measurements obtained from 2003–2016. The results also supplement the performance-monitoring samples collected at the remediation areas in Blocks G and I.

3.1 SYNOPTIC GROUNDWATER-LEVEL MEASUREMENTS

A synoptic round of groundwater-level measurements was conducted on March 6–7, 2017. The air- and water-tight sanitary seals on flush-mounted well casings were opened on March 5, 2017, the day before water levels were measured, to allow air pressure and groundwater in the casings to reach equilibrium. Static water levels were measured using a graduated electronic-sounding water-level meter; note that static water levels in SEMW7I and SEMW8S were inadvertently not recorded.

The static water level was determined by lowering the meter's probe into the well until the liquid level-indicator emitted an audible tone, indicating the air/water interface. The water level was read from the probe cable at the reference elevation (top of the plastic well casing) and recorded to the nearest 0.01 foot. Water levels and the time of measurement were recorded on a field form, and were used to develop groundwater-elevation contour maps for the surficial aquifer. The groundwater-level field form is in Appendix A. The water level summary is in Section 4.

Two wells (MRC-MW16A and MRC-MW72A) could not be located during the water-level round; therefore, groundwater levels at those wells could not be measured. MW16A is in the eastern portion of Block G/Lot 3 and is assumed to have been covered with gravel during the installation of a haul road for the 2016 sediment-removal action. MW72A is in the southeastern portion of Block E/Lot D and might have been affected during groundwater remedy construction. Attempts to locate the wells by field survey and geophysics were successful for MW16A and unsuccessful

for MW72A. MW16A was sampled on June 7, 2017, and the water level at this well was measured at that time. Tetra Tech is currently working with a licensed driller to complete the abandonment forms for MW72A.

3.2 GROUNDWATER SAMPLING

Groundwater samples were collected from 118 on-site wells from March 8–April 21, 2017 and June 7, 2017. Chemical analyses of groundwater samples vary by well, as detailed in the work plan, depending on the data needed for that particular area. Wells sampled for this round are shown on Figure 3-1; the chemical analyses performed for each sample are listed in Table 3-1.

The following variations from the 2016–2017 work plan occurred during the 2017 sampling round:

- monitoring well MW72A was scheduled to be sampled for 1,4-dioxane/total metals, but could not be found due to previous earth moving near the well
- monitoring well MW16A initially could not be located, but was later found and subsequently sampled on June 7, 2017
- monitoring well MW16A was sampled for total metals in addition to the other analyses listed in the work plan
- monitoring well MW112A was scheduled to be sampled for VOCs, 1,4-dioxane, and polychlorinated biphenyl (PCB) homologs, but this well was abandoned this year before sampling to allow activities associated with the stormwater infrastructure investigation

Monitoring wells MW104A and MW104B were also sampled for PCB homologs based on an agreement after the work plan was finalized.

Wells were purged and sampled using the following procedures:

- ***Well purging—***Monitoring wells were purged before sample collection using low-flow-purging techniques via a peristaltic pump (fitted with dedicated, disposable, Teflon®-lined tubing) positioned in the center of the well's saturated-screen length. The pumping rate during purging ranged between 100–300 milliliters per minute (ml/min); and the rate was constantly measured using a graduated cylinder. The purge rate was adjusted, but was not allowed to fall below 100 ml/min, to minimize drawing the water level below its static-water level.

  Water-level-drawdown measurements and groundwater parameters were collected every five to 10 minutes until purging was complete. Groundwater parameters (including pH [a measure of acidity and alkalinity], temperature, specific conductance, dissolved oxygen [DO], oxidation-reduction potential [ORP], and turbidity) were also measured during

purging. These data were recorded on low-flow-purge data sheets. Water-quality parameters were measured with an inline water-quality meter. Turbidity readings were collected using a separate turbidity meter. Groundwater purging and sample-record sheets are in Appendix B.

Purging was considered complete when: (a) the monitored water-quality parameters stabilized, (b) three saturated well-casing volumes had been removed, or (c) the well had been purged dry. Stabilization was considered achieved when three consecutive readings taken at five-minute intervals were within ±0.1 standard units for pH, ±3% for specific conductance and temperature, ±10% for DO and ORP, and less than 10 nephelometric turbidity units for turbidity. If the monitoring well was purged dry, the water level was allowed to recover at least 80% of its initial static-water level before sampling it for groundwater. All purged water was collected in United States Department of Transportation (USDOT)-approved 55-gallon steel drums that had been staged in the central portion of the MRC D-lot.

- ***Sample collection—***Each monitoring well was sampled after purging; sampling was completed without stopping flow, using the same dedicated tubing or submersible pump as had been used during purging. Groundwater was pumped directly into certified-clean sample containers supplied by the analytical laboratory. Sample containers for VOC analyses were filled directly, to minimize VOC losses. Groundwater samples for VOCs were collected first, followed by samples to be analyzed for 1,4-dioxane, polychlorinated biphenyls (PCBs), metals, and natural-attenuation-assessment (NAA) parameters. Duplicates were collected at a rate of 5% (1:20 basis) to evaluate laboratory analytical precision. Trip blank (TB) samples, provided by the laboratory and carried throughout the sampling event, were analyzed to ensure VOC quality assurance (QA) and quality control (QC). Trip blanks were submitted at a rate of one per cooler of VOCs per day. Matrix-spike and matrix-spike-duplicate samples were also collected and analyzed on a 1:20 basis.

3.3 WELL REPAIR

The condition of accessible MRC wells was documented during collection of the synoptic groundwater-levels on March 6–7, 2017. The well-condition information is in the right column of the groundwater-level measurement sheets in Appendix A. This inspection led to the repair of five MRC monitoring wells following the 2017 groundwater sampling program (Tetra Tech, 2016c). Additionally, one monitoring well (MW16A) will be repaired at a later date because activities associated with the sediment-removal action are ongoing in this area. Repairs completed after sampling include replacing the concrete pads and flush-mounted covers of five wells (MW11A, MW25A, MW37C, MW53A, and MW109A/B). The condition of the six wells requiring repair did not affect sampling or groundwater quality.

3.4 LABORATORY ANALYSES

Samples from the subject wells were analyzed for the following chemicals (Table 3-1):

- VOCs, by United States Environmental Protection Agency (USEPA) Method 8260C
- 1,4-dioxane, by USEPA Method 522
- PCBs, by USEPA Method 680 (PCB homologs)
- total metals, as listed in Table 3-1, by USEPA Methods 6020A, 6010C, and 7470A (mercury)
- hexavalent chromium, by USEPA Method 218.6
- NAA parameters, by USEPA SW-846 protocols (for nitrate/nitrite, ammonia nitrogen, orthophosphate, potassium, sulfate, chloride, total alkalinity, total iron, total manganese, silicon dioxide, total dissolved solids, and dissolved organic carbon)
- methane, ethane, and ethene (MEE) by USEPA Method RSK-175

Two fixed-base laboratories were used for sample analysis. ALS Environmental of Middletown, Pennsylvania performed the hexavalent chromium analyses, and TestAmerica, Inc. of North Canton, Ohio performed all other analyses.

3.5 DOCUMENTATION

A master site logbook was maintained to document field activities. Sample documentation consists of completed chain-of-custody (COC) reports and matrix-specific sample log-sheets. The COC report is a standardized form summarizing and documenting pertinent sample information such as sample identification and type, the sampled matrix, date and time of collection, preservation, and requested analysis. Sample custody procedures document sample acquisition and integrity. COC reports are in Appendix C with the data-validation reports.

3.6 EQUIPMENT DECONTAMINATION

Reusable equipment (e.g., water-level meter, submersible pump) was decontaminated before and after each use. Decontamination of reusable small equipment involved the following:

- Liquinox® (a laboratory-grade, phosphate-free, ionic/anionic surfactant) and potable-water wash

- potable-water rinse
- distilled-water rinse
- air drying

Decontamination-rinsate water was transferred into 55-gallon drums staged in the central portion of the MRC D-lot for subsequent disposal. Dedicated and/or disposable equipment that did not require decontamination was used for groundwater purging/sampling.

3.7 WASTE MANAGEMENT

Well purge-water was collected as investigation-derived waste (IDW) in five USDOT-approved 55-gallon steel drums. The drums were stored at an approved central staging area on the facility's D-lot, pending waste-profile-sampling results. Four of the drums were deemed nonhazardous based on waste characterization sampling. One drum was conservatively classified as hazardous without having collected a waste characterization sample, because it contained waste from wells in an area of Block E known to contain elevated trichloroethene (TCE) concentrations (i.e., the area adjacent to UST 2). Although no history of TCE use is documented for UST 2, it was conservatively assumed to contain spent solvent (a listed waste).

The results were provided to Clean Harbors, Inc. (a Maryland-licensed waste transporter). Upon receipt of the IDW analytical data, Clean Harbors, Inc. removed the IDW from the MRC and properly disposed of the nonhazardous waste at the Clean Harbors, Inc. Cleveland, Ohio facility and the hazardous drum at the Clean Harbors, Inc. facility in El Dorado, Arkansas (both are Lockheed Martin Corporation- [Lockheed Martin-] approved waste treatment facilities) in accordance with federal, state, and local regulations. IDW forms are in Appendix D.

3.8 GENERAL SAMPLING PROCEDURES, NOMENCLATURE, AND HANDLING

A master site logbook was maintained for the sampling program to document field activities. Each sample collected was given a unique sample identification consisting of the site, well name, and sampling date (e.g., MRC-MW13A-041217). Trip blanks were labeled with a "TB" prefix followed by a six-digit submittal date (e.g., TB-042117). Sample handling includes field-related considerations concerning selection of sample containers, preservatives, allowable holding times, and analyses requested.

Proper custody procedures were followed throughout all phases of sample collection and handling. COC protocols were used throughout sample handling to document the integrity of sample containers. These protocols document that samples were handled and transferred in a manner that eliminates (or detects) possible tampering. Sample containers were released under signature from the laboratory and were accepted under signature by a responsible individual who maintained custody until the sample containers had been transferred to the sampling team. Groundwater samples were released under signature from the sampling team and were accepted under signature by the laboratory.

Transport containers returning to the laboratory were sealed with strapping tape and a tamper-resistant custody seal. The custody seal shows the signature of the individual releasing the transport container, along with the date and time. Signed COC are in Appendix C. They are also in each laboratory report and data-validation report as internal supporting documentation.

3.9 DATA VALIDATION

Data validation involves having a party independent of the analytical laboratory review the laboratory data to ensure that specific criteria established in the sampling and analysis work plan and in the analytical method have been met. These criteria are concerned with specifications that are not sample-dependent; they specify performance requirements that should be fully under a laboratory's control. For organic-data analyses, specific validation areas include blanks, performance-evaluation-standard materials, and instrument-performance checks. For inorganic-data analyses, specific validation areas include blanks, calibration standards, calibration-verification standards, laboratory-control standards, and interference-check standards.

Once the investigation was complete, chemical data were validated by Tetra Tech in accordance with established USEPA protocols to assess the reliability and accuracy of the data. This review was based on the USEPA *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2017a) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA, 2017b) and the specifics of the analytical method used. Data-validation reports are in Appendix C (on compact disc). Appendix E summarizes all analytical results for the 2017 MRC groundwater-sampling program, including nondetects.

Validation of these data concluded that they are acceptable for their intended uses (i.e., risk screening and risk assessment). The data qualifiers (i.e., flags) applied to the chemical results during data validation are listed below:

J The analyte is considered present in the sample, but the value is estimated and may not meet highest accuracy or precision standards. In this program, samples were qualified with "*J*" because quantitation was above the method detection-limit but below the practical quantitation-limit. A "*J*" qualifier can also be applied if one or more quality control specifications were not met. In these cases, if non-conformance did not affect correct identification of the analyte, but could have resulted in quantitation that did not meet highest accuracy or precision standards, a "*J*" qualifier would be applied.

U Not detected; the analyte is considered not detected at the reported value.

UJ The analyte was not detected. However, the quantitation or detection limit may be inaccurate or imprecise.

These flags (i.e., *J, U,* and UJ) appear in the chemical-results tables in Section 4 and in Appendices C and E.

3.10 DATA MANAGEMENT

Laboratory data-handling procedures met the requirements set forth in the laboratory subcontract. All analytical and field data are maintained in the project files. The project files contain copies of the COC, sampling log forms, sampling location maps, and data quality-assurance documentation.

3.10.1 Data Tracking and Control

A "cradle to grave" sample-tracking system was used from the beginning to the end of sampling. The field operations leader coordinated sample tracking before field mobilization. Sample jar labels were handwritten in the field. Labels were reviewed to ensure their accuracy and adherence to work plan requirements. The project manager's (PM) assistant coordinated with the analytical laboratory to ensure that they were aware of the number and type of samples and analyses to expect.

When field sampling was underway, the field operations leader forwarded the COC to the PM's assistant and to the laboratory for each day that samples were collected. The PM's assistant confirmed that the COC provided the information required by the work plan. This allowed early detection of errors made in the field so that adjustments could be made while the field team was mobilized. The laboratory submitted an electronic deliverable for the sample delivery groups.

When all electronic deliverables had been received from the laboratory, the PM's assistant confirmed that the laboratory performed all analyses requested.

3.10.2 Sampling Information

Data from field measurements were recorded using the appropriate log sheets, as per Tetra Tech's standard operating procedure SA-6.3. Reduction of field data entailed summarizing and presenting these data in tabular form. Reduction of laboratory data entailed manipulating raw data-instrument output into reportable results. Laboratory data were verified by the group supervisor and then by the laboratory's QC/documentation department.

3.10.3 Project-Data Compilation

The analytical laboratory generated an Adobe *Acrobat*® portable document format (PDF) file of the analytical data packages, as well as an electronic database deliverable. The electronic database was checked against the PDF file provided by the laboratory and updated as required, based on data-qualifier flags applied during data validation. Data generated during implementation of the sampling and analysis plan were incorporated into the MRC environmental geographic information system (GIS) database. All data (such as units of measure and chemical nomenclature) were checked to maintain consistency with the project database.

3.10.4 Geographical Information System

The data management system for this effort consists of a relational database and GIS to manage environmental information pertaining to MRC. The relational database stores chemical, geological, hydrogeologic, and other environmental data collected for the MRC environmental investigations. The GIS is built from the relational database and contains subsets of the larger data pool. Using the GIS, environmental data were posted onto base maps to represent the information graphically for this report.

1 Metals are Ag (silver), As (arsenic), Ba (barium), Be (beryllium), Cd (cadmium), Co (cobalt), Cr (chromium), Cu (copper), Hg (mercury), Ni (nickel), Mo (molybdenum), Pb (lead), Sb (antimony), Se (seleniu Tl (thallium), V (vanadium), Zn (zinc).

2 These are three newly-installed wells near the southeastern TCE plume southeast of the 500,000-gallon aboveground water tank.

A - upper surficial aquifer well

B - intermediate surficial aquifer well

C - lower surficial aquifer well

D - deep confined aquifer for MW93D through MW96D

EXT - existing (for wells prior to the voluntary cleanup program in 2002)

MEE- methane, ethane, and ethene via AM 20GAX or equivalent

MRC - Middle River Complex

NAA - natural attenuation assesment

OF - off facility

OW - observation wells used for treatability testing (not typically sampled)

PCB - polychlorinated biphenyl

PZ - well used for aquifer hydraulics tested

TCE - trichloroethene

USEPA - United States Environmental Protection Agency

VOCs - volatile organic compounds

Section 4
Investigation Results

This section presents the results of the 2017 groundwater-elevation data and groundwater sampling and chemical analyses program for the Middle River Complex (MRC). Most well designations begin with the prefix "MRC-," so that prefix is dropped in the discussions below, to improve readability.

4.1 GROUNDWATER-LEVEL DATA

Table 4-1 lists the 2017 groundwater-level measurements and computed groundwater elevations for wells at the MRC. Figures 4-1 and 4-2 show the groundwater-elevation contour maps for the upper/intermediate and lower surficial-aquifer zones, respectively. As presented in Table 4-1, static groundwater levels in the wells were recorded as groundwater depths measured from the top of the well casings. Groundwater depth measurements at or near 0.00 feet indicate groundwater levels at or near the top of the well casing, which is near the ground surface for most wells. A negative value, such as that for MW08B (−3.00), indicates a static water level above the casing, as measured using a temporary well-casing extension. Groundwater levels were converted to elevations based on the well top of casing elevation using North American Vertical Datum of 1988 (NAVD88), and groundwater elevations are discussed using different notation than groundwater depths (i.e., discussed as feet above/below NAVD88).

Groundwater elevations for the surficial aquifer ranged from 1.06 feet above NAVD88 at well MW37B (in the southeastern portion of MRC in Block E) to 30.31 feet above NAVD88 at well MW58A (southeast of Building A). Accounting for well-casing stick-down for flush-mounted well designs, groundwater depths ranged from 3.00 feet above the top of casing (i.e., using a temporary casing-extension and measuring the static-groundwater level) at well MW08B to approximately 21.10 feet below the top of the casing at well MW91B in the surficial aquifer. Shallow groundwater was encountered near the ground surface along the shorelines of Cow Pen Creek and Dark Head

Cove (including wells MW08A, MW08B, MW12C, MW15A, MW39A, MW40A, MW45A, and MW107B/C) and in Block E (including well MW30A).

Figures 4-1 and 4-2 show the groundwater-elevation contour maps for the upper ("A" and "B") and lower ("C") surficial-aquifer wells, respectively. The March 6–7, 2017 groundwater flow for the surficial aquifer is similar to that depicted in previous investigations. However, the 2017 surficial-aquifer groundwater elevations are generally lower than those measured in 2016.

As shown in Figure 4-1, shallow groundwater follows the site topography and flows radially from the hydraulically upgradient northern portion of the MRC (at Eastern Boulevard and immediately south of Buildings A, B, and C) to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Subsurface sandy zones act as preferential pathways for contaminant transport in groundwater, possibly originating from an upgradient source in the clay-rich materials. Groundwater in the lower surficial-aquifer (Figure 4-2) flows southeast from the area south of Buildings A–C toward Dark Head Cove.

4.2 GROUNDWATER CHEMICAL RESULTS

Validated groundwater-chemical data were used to generate a statistical summary table (Table 4-2) and a "hits" table (Table 4-3) summarizing positive detections of chemical analytes in the 2017 groundwater samples. Appendix E presents all analytical data for 2017, including nondetected chemicals. Groundwater results (excluding nondetected chemicals) for volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and metals (Table 4-3) are compared against current Maryland Department of the Environment (MDE) groundwater standards (MDE, 2008).

At present, MDE has not established an advisory level or standard for 1,4-dioxane in drinking water or groundwater. Several states (e.g., California, Colorado, Connecticut, Florida, Maine, Massachusetts, Michigan, and North Carolina) have established drinking water standards or action levels for 1,4-dioxane, ranging from California's action level of three micrograms per liter (µg/L) to Michigan's drinking water standard of 85 µg/L (United States Environmental Protection Agency [USEPA], 2006 and 2009, respectively). USEPA has also published a preliminary remedial goal of 6.1 µg/L for 1,4-dioxane in tap water (USEPA, 2006) and a risk-based regional screening-level of 0.46 µg/L for tap water (USEPA, 2017c).

Regional tap-water screening levels are not typically adopted as enforceable standards; therefore, the current advisory level or the standard most protective of human health is used in this report as a comparison criterion to evaluate groundwater concentrations of 1,4-dioxane. The California Department of Health Services advisory level (3 µg/L) is used herein as the groundwater screening level. Gray shading in Table 4-3 indicates results exceeding Maryland groundwater standards (or for 1,4-dioxane, the California action level, because Maryland has no standard). Chemical results for the 2017 groundwater sampling are discussed below according to analyte group (i.e., VOCs, 1,4-dioxane [a semivolatile organic compound (SVOC)], PCBs, etc.).

4.2.1 Volatile Organic Compounds

The 2017 sampling results confirm that the trichloroethene (TCE) and benzene groundwater plumes previously identified in the central and downgradient portions of the MRC are consistent with earlier results showing TCE and benzene in groundwater at concentrations exceeding the Maryland groundwater standard (i.e., 5 µg/L for each constituent). TCE detected west of Building A (centered at MW96A) has been identified as an area where additional investigation is required; this investigation is currently underway. Tetrachloroethene (PCE), chlorobenzene, and several chlorobenzene compounds also exceed MDE standards, and have formed a small plume in the southwestern portion of Lot D (i.e., Block E). TCE and benzene results are discussed herein because they are primary indicators of solvent and petroleum VOC contamination, and most frequently exceed groundwater standards at MRC. Chlorinated VOC-degradation daughter products (e.g., dichloroethenes, vinyl chloride [VC], etc.) or other petroleum-related VOCs (e.g., methyl *tert*-butyl ether [MTBE], benzene isomers, naphthalene, etc.) are typically co-located with these primary VOCs.

Chlorinated volatile organic compounds (cVOCs)—The cVOC results for the 2017 sampling are discussed below; following a general discussion of the overall results, each major area of cVOC contamination will be discussed individually. TCE results are in Table 4-3 and on Figure 4-3. TCE was detected in shallow groundwater at several areas at concentrations ranging from 0.33*J* µg/L at well MW106B/C (in the east/southeast portion of Block G) to 61,000 µg/L at well SEMW-8S (one of the newly installed wells near the southeastern TCE plume, southeast of the 500,000-gallon aboveground water tank). PCE, another chlorinated solvent and degreaser, was detected less frequently (in 8% of samples), at concentrations ranging from 0.31*J* µg/L at well MW22B (southwestern portion of Block I) to 52 µg/L at well MW113A (in the southwestern corner of

Lot D), with an average detected concentration of 9.3 µg/L. In addition to MW113A, PCE also exceeds its groundwater standard (5 µg/L) at well MW21B (8.5*J* µg/L) in the southwestern portion of Block I and at well MW16A (in Block G). TCE is co-located with all PCE detections.

- ***Eastern TCE plumes:*** The largest contiguous area containing samples with the highest concentrations of TCE in groundwater extends southeast from MW60A (1,300 µg/L), MW60B (7,100 µg/L), MW48A (880 µg/L) (south of Building C), MW27B (300 µg/L) (at the southern end of the vertical-launch building), to MW74A–B (near the southeastern portion of Block E), with additional TCE exceedances in new wells SEMW-7I (26,000 µg/L), SEMW-8S (61,000 µg/L), and SEMW-8I (3,600 µg/L) (near Dark Head Cove). Due to the elevated TCE concentrations detected in proximity to Dark Head Cove, the sampling program was expanded in 2017 to include additional groundwater and nearby surface water locations. Maximum detected TCE concentrations of 3,000 µg/L, 38,000 µg/L, and 1,600 µg/L are reported for wells MW72B, MW74B, and MW79B, respectively, which are also within the plume. MW74B and MW72B are in the southeastern portion of the plume, west of the aboveground water tank, whereas well MW79B is in the northern portion of Block E.

    - Elevated TCE concentrations are at the northern (i.e., MW60A and MW60B) and southern (e.g., SEMW-8S, SEMW8I, SEMW-7I, and MW74B) ends of the southeastern plume, but with limited high concentration locations between them, suggesting at least two distinct TCE-source areas. A third area of elevated TCE concentrations is at well MW79B (1,600 µg/L), but this area is considered an extension of the northern end plume, because it is hydraulically downgradient of well MW60B.

    - Two of the higher concentrations of TCE detected in the intermediate depth of the surficial aquifer were from wells MW60B and MW79B, screened 30 feet below grade. This plume might originate from the southern end of the Building C basement (MW60B), or possibly from spills of material handled near MW60B.

    - VOCs in groundwater at wells MW72B and MW74B (near the southern end of the southeastern TCE plume) are considered to originate, at least in part, from a TCE-containing underground storage tank (UST 2). The leaking tank was discovered in 2013 when soil was remediated for the Block E groundwater treatment area. The tank contained full-strength TCE, and was removed from its location near the former Building D foundation. Soil under the tank had been impacted by the TCE in the tank.

    - The highest TCE concentrations detected during the 2017 sampling round were in the southern portions of the plume, including well MW74B (38,000 µg/L) and new wells SEMW-8S (61,000 µg/L) and SEMW-7I (26,000 µg/L). MW74B is in the southeastern portion of Block E. The new wells are near Dark Head Cove.

    - High TCE concentrations at MW74B over time (shown below) suggest that the well is located near a source of nonaqueous material. Concentrations in the well decreased significantly in 2014, rebounded somewhat in 2015, and increased again in 2016 and 2017 (as shown in the chart below). This area will be addressed in upcoming remedial actions in Block E.

Date	TCE concentration
2007	70,000
2008	12,000
2009	17,000
2010	19,000
2011	23,000
2012	30,000
2013	40,000
2014	1,900
2015	21,800
2016	37,000
2017	38,000

- Residual TCE might be trapped in silt and sand lenses in the clay-rich zones in the southeastern TCE plume source-areas, and/or might be adsorbed to organic material and clays. Dissolved TCE has presumably been released from these source areas to groundwater, and now moves preferentially to the southeast along the more permeable sandy and silty material that extends from well MW48 southeastward to well MW37.

- ***Southwestern TCE plume:*** The second largest contiguous area of TCE in groundwater extends from well MW21B (south of Building A, near recognized environmental condition #9, a former 2,000 gallon waste-oil UST) to MW71B (in Block G). Additional concentrations greater than the screening level were detected near MW12B (near Cow Pen Creek). The current maximum reported concentrations of TCE in this area are in wells MW21B (570 µg/L) and MW12B (270 µg/L) in the northern and southernmost portions of the plume, respectively, and in wells MW98B (350 µg/L) and MW111B (410 µg/L) in the northern portion of the plume. The groundwater remedy (*in situ* enhanced reductive-dechlorination) was completed in this area in 2015 and 2016; the success of this action is indicated by significant reductions in TCE concentrations in MW1B, MW12AA, and MW70B; the table below shows TCE concentrations for main source area wells from 2012–2017.

Trichloroethene[(1)] Concentrations (µg/L) for Wells near Southwestern TCE-Plume Area 2012–2017

Year	MW21B	MW98B	MW111B	MW14B[(2)]	MW12A[(2)]	MW12B	MW70A[(2)]	MW70B[(2)]
2012	400	620	390	3500	1800	320	1.3	40
2013	660	530	460	2300	1500	240	1.8	75
2014	780	470	530	1000	1300	320	1.2	180
2015	708	554	1270	2	838	777	—	1170
2016	790	490	470	0.35*J*	66	510	—	0.33
2017	570	350	410	0.78*J*	—	270	—	3.9

— = not detected
µg/L = microgram(s) per liter
[(1)]The MDE groundwater standard for TCE is 5 µg/L.
[(2)]These wells are within the groundwater remediation area.

- Data generally indicate relatively stable TCE concentrations in the northern portion of the southwestern TCE plume at wells MW21B, MW98B, and MW111B. No TCE-daughter products were detected in these wells, indicating that significant biological degradation of TCE is not occurring. However, 1,1-dichloroethene (1,1-DCE), a known breakdown product of trichloroethanes, was detected in MW98B and MW111B at 170 µg/L. Monitoring will continue in this area; no additional investigation is planned.

- Results for the southwestern portion of the plume show varying trends from 2012–2014 (TCE is decreasing at MW12A, stable at MW12B and MW70A, and increasing at MW70B). However, TCE concentrations decreased rapidly in wells MW14B, MW-12A, and MW70B in response to the remedial action. The 2017 results confirm that TCE has decreased in these wells, and also indicate a decrease in well MW12B. TCE concentrations in 2017 for MW14B (a source-area well with historical maximum VOCs for Block G) and MW70B are below its MDE groundwater standard (5 µg/L).

- These results confirm those found in the remedial action performance monitoring in 2015 and 2016. Data from the second injection completed in 2016 indicate a 99% reduction of VOCs from baseline conditions. In addition to the TCE reductions, total VOC reductions of 96% were observed in the remedial area. These results are in the Block G second-injection-event report (Tetra Tech, 2016d).

- ***Block E southwest:*** A TCE exceedance of the groundwater standard (5 µg/L) was detected at the southwestern portion of Lot D (Block E) at wells MW113A (25 µg/L) and MW114A (6.1 µg/L). As mentioned previously, the maximum detection of PCE (52 µg/L) was also detected at well 113A in 2017 (and also in 2016). These wells have no *cis*-1,2-DCE or vinyl chloride (both are TCE degradation products). This contamination is isolated and does not appear to be associated with a larger plume. Monitoring will continue in this area; no additional investigation is planned.

- ***Other TCE areas****:* TCE exceedances of the groundwater standard (5 µg/L) were also detected at the western portion of the facility and west of Building A in wells MW96A-B (3,300 µg/L and 12*J* µg/L, respectively), MW90B (28 µg/L), MW53A (41 µg/L), MW53B (12 µg/L), MW109B (25 µg/L), MW110A-B (34 µg/L and 39 µg/L), MW50A (7.6 µg/L), and MW17A (7.5 µg/L), and at well MW16A (22 µg/L), which is southwest of Building A in Block G. The maximum TCE concentration (3,300 µg/L at well MW96A) is west of Building A. An ongoing investigation is assessing the possible intrusion into the Building A basement of soil vapor associated with these groundwater concentrations. The investigation is focused on determining if these TCE concentrations west of Building A are related to the groundwater and soil-vapor concentrations under Building A. Additional groundwater investigation is in progress in this area to fully delineate the groundwater plume and eliminate data gaps between MW102A and MW114A.

Benzene and chlorobenzenes—Figure 4-4 presents benzene results for MRC wells. The highest concentrations of benzene would likely be encountered in shallowest groundwater near source areas, because fuels in product form are less dense than water and, when present above the solubility limit, will float on top of the groundwater. Recharge (i.e., infiltrating precipitation) and downward hydraulic gradients might drive dissolved benzene and other petroleum-related contaminants downward in the aquifer as the contaminant travels farther from the source area(s). Benzene biodegrades, so concentrations will diminish over time in the absence of a continuing source. Benzene concentrations at the site are low and sporadic as compared to TCE; the areal extents of benzene plumes are also limited and much smaller. Benzene concentrations have been generally stable over time. Direct sources of this contamination are not definitively known, but are believed to be related to operations in the area of the highest concentrations. The following chart shows benzene concentrations over time (2012–2017) for the main source-area wells.

Benzene Concentrations[(1)] (µg/L) for Source-Area Wells 2012–2017

	West of Building A					Southwestern TCE plume area			VLS building
Year	MW109B	MW17A	MW96B	MW110B	MW53B	MW21B	MW111B	MW14B	MW77A
2012	230	68	520	10	96	19	2.2*J*	50*J*	16
2013	37	110	560	3.3	0.84	23	2.5*J*	36	18
2014	10	160	470	18	13	26	3.2	18	11
2015	123	163	646	47.4	1.2	29.5	7.9	25.4	14
2016	98	42	670	49	130	26	—	5.8	11
2017	34	110	720	42	17	21	—	15	11

— = not detected
µg/L = microgram(s) per liter
[(1)]The MDE groundwater standard for benzene is 5 µg/L.

- The highest exceedances of the benzene groundwater standard (5 µg/L) are west of Building A, at wells MW96B (720 µg/L) and MW109B (34 µg/L). These wells are near underground wastewater lines; other areas with benzene concentrations above the groundwater standard include:
    - well MW17A (110 µg/L), near Building A south of well MW109A/B
    - wells MW53B (17 µg/L) and MW110B (42 µg/L) in parking Lot 2, west of Building A (hydraulically downgradient of wells MW96B/MW17)
    - well MW21B (21 µg/L), southwest of Building A near a former UST and co-located with the southwestern TCE plume
    - well MW14B (15 µg/L), co-located with the southwestern TCE plume
    - well MW77A (11 µg/L), on the east side of the vertical-launch systems (VLS) building in the area of an abandoned-in-place 25,000-gallon fuel oil UST
    - wells SWMW-2I (9.2 µg/L) and SWMW-3I (7 µg/L) near the southeastern portion of Block G

Benzene exceedances have increased from 2016–2017 in two wells west of Building A: MW17A (from 42 µg/L in 2016 to 110 µg/L in 2017) and MW96B (from 670 µg/L in 2016 to 720 µg/L in 2017). However, benzene concentrations decreased in several wells: MW109B (98 µg/L to 34 µg/L), MW110B (49 µg/L to 42 µg/L), and MW53B (130 µg/L to 17 µg/L). Benzene was not detected in MW113A and MW114A in 2017, but had been previously since their installation in 2014. The explanation for nondetect benzene in 2017 is unknown; monitoring of these wells will continue. Benzene concentrations in the southwestern TCE plume also decreased in well MW21B (from 26 µg/L to 21 µg/L), but the concentration in MW14B increased (from 5.8 µg/L in 2016 to 15 µg/L in 2017). In 2017 (and also 2016), the result for MW111B was not detected.

Overall, since 2012, benzene concentrations in the northern area of the southwestern TCE plume have increased slightly near the source area at MW21B, but have stabilized somewhat from 2014–2017. Benzene increased nearly four-fold (from 2.2 µg/L to 7.9 µg/L) in well MW111B from 2012–2015, possibly indicating an expansion of the southeastern plume boundary during this period. However, the 2016 and 2017 results indicate sharp reductions of these boundaries. Benzene was not detected at well MW111B in 2016 or 2017; benzene at MW14B (15 µg/L, above the MDE groundwater standard of 5 µg/L) decreased from 2012, but increased from 2016 to 2017. The source of this benzene might be the wastewater treatment plant that previously operated in this area. Benzene in groundwater at well MW77A (the well with the historically highest benzene

concentration in the VLS area) has steadily decreased from 2013 (18 µg/L) to 2017 (11 µg/L). Benzene at downgradient wells MW27A and MW79B (not shown in the table) have remained stable, with concentrations varying from 1–2.7 µg/L from 2012–2017.

Chlorobenzenes detected in Block E are believed to be associated with transformers formerly in the area, and are generally associated with PCB impacts. As shown in Table 4-3, groundwater concentrations of chlorobenzene isomers exceed groundwater standards at wells MW43A, MW113A, and MW114A in the southwestern portion of Lot D (Block E) (groundwater standards for the chlorobenzene and chlorobenzene compounds range from 1.8–600 µg/L). Chlorobenzene compounds exceeding groundwater standards in one or more wells in the southwestern portion of Lot D include chlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene. These compounds are typically associated with transformer oil, and are detected in wells downgradient of a saturated-soil zone in the southwestern portion of Block E where PCBs have been found. Several cVOCs (PCE, TCE, and 1,2-dichloroethane) also exceed groundwater standards in these wells. Chlorobenzenes are co-located with the PCBs, especially in their Block E source areas, so planning for additional chlorobenzene investigation will be part of PCB remediation at the site. Details are in the *Block E Soil Remedial Investigation Work Plan Addendum 3: Fall 2017 Soil and Groundwater Sampling* (Tetra Tech, 2017).

Natural-attenuation parameters—In addition to the standard analyses for VOCs, the laboratory-analyzed groundwater samples from 14 wells for several natural-attenuation assessment (NAA) parameters include three wells within the Block G southwestern remediation area, three wells within the Block I northern remediation area, one well in the Block E southeastern remediation area, and seven other wells that contain various concentrations of TCE. The NAA analyses include alkalinity, ammonia nitrogen, chloride, nitrate, nitrite, orthophosphate, sulfate, total dissolved solids, total iron, dissolved organic carbon, manganese, and the dissolved gasses ethane, ethene, and methane. NAA parameters were also measured in the field. Field measurements include groundwater pH (a measure of acidity or alkalinity), oxidation-reduction potential (ORP), dissolved oxygen (DO), and temperature.

Pre-remediation evaluations of NAA parameters are in several MRC groundwater monitoring reports (Tetra Tech, 2012b, 2012c, 2012d, and 2013). These results, in general, indicate that some natural conditions support reductive chlorination of VOCs in Block I; these natural conditions have

been supplemented by recent substrate injections. TCE-daughter products were detected in Block I before the substrate injections began, and the low concentrations of daughter products were found throughout the site. In areas of Block G where natural conditions are less conducive for natural attenuation, injections have also allowed significant reductive dechlorination. Areas within Block E are the least conducive for natural attenuation, primarily due to the low pH and high ORP in that area. More detail on the analysis of NAA parameters in the Block I and G remediation areas is in the *Second Injection Completion Report, Blocks G and I* (Tetra Tech, 2016d).

4.2.2 1,4-Dioxane

1,4-Dioxane is a synthetic industrial chemical used primarily as a solvent in paints, varnishes, lacquers, cosmetics, deodorants, semiconductors, electronic components, and detergent preparations. 1,4-Dioxane often has been used with chlorinated solvents as a stabilizer and corrosion inhibitor. 1,4-Dioxane is highly miscible in water, and can be found in groundwater plumes far in advance of any solvents with which it might have entered the subsurface originally. It migrates rapidly in soil and groundwater, but biodegrades slowly.

Recent 1,4-dioxane sampling at the site has focused on the western portion of the site. Historically, 1,4-dioxane has not been detected extensively in the eastern part of the MRC. Sampling in the east was suspended following the 2008 sampling when no samples exceeded the then-action level of 10 µg/L; note that some wells in this area were sampled for 1,4-dioxane after 2008 (when they were newly installed). Samples from some wells were analyzed for 1,4-dioxane in 2015, but because the detection limit was high (10 µg/L), no 1,4-dioxane was detected.

In 2017, several wells in the eastern portion of the site were sampled for 1,4-dioxane using a new screening level (3 µg/L). As shown in Table 4-2 and Figure 4-5, the SVOC 1,4-dioxane was detected in 69 of 79 (87%) of groundwater samples in which it was analyzed for in 2017. These samples were collected from areas of known or suspected 1,4-dioxane contamination, at concentrations ranging from 0.095*J* µg/L (at MW92C) to 180 µg/L (at MW14B).

Concentrations exceeding the screening level of 3 µg/L are shown within contours on Figure 4-5. The contours indicate a continuous plume of 1,4-dioxane running generally east-west from MW16A to MW79B; no wells inside this contour have 1,4-dioxane concentrations less than 3 µg/L, but whether all areas within the contour contain 1,4-dioxane exceedances is unknown. The exceedances

in the center of the site (MW25A, MW101A, and MW101B) appear to be co-located with low levels of chlorinated solvents; a direct source in this area is not known. Additional investigation in these areas is not warranted, because 1,4-dioxane concentrations are low.

The average of all 1,4-dioxane detections is 14.3 µg/L (Table 4-2). The highest concentrations occurred primarily in the upper and intermediate surficial-aquifer wells, with the highest reported concentrations (100–180 µg/L) at wells MW12A, MW12B, MW14B, MW111B, and MW98B, which are within or near areas of the southwestern TCE exceedances in the southwestern portion of the MRC. 1,4-Dioxane concentrations over time have been steady to slightly decreasing in the southwestern TCE plume area and at wells outside of the groundwater remedy areas.

1,4-Dioxane was detected in several wells in the southwestern TCE plume area with 1,4-dioxane extending from well MW19A (to the south of Building A) to wells MW12A-B (adjacent to Cow Pen Creek). These detections might be the result of the waste oil tank formerly located near MW21B and/or the wastewater treatment plant located upgradient of MW12A and MW12B. The highest concentrations stretch in a line from just north of the Tilley Chemical building (140 µg/L and 170 µg/L at wells MW98B and MW111B, respectively) to Cow Pen Creek (150 µg/L and 100 µg/L at wells 12A-B, respectively). The maximum detected 1,4-dioxane concentration was within this area at MW14B (180 µg/L).

Sampling of these wells and the nearby surface water will continue; no additional investigations are required. 1,4-Dioxane was also detected at concentrations exceeding its screening level west of Building A in samples from wells MW69A (6.3 µg/L), MW96A (4 µg/L), MW110A (5.8 µg/L), and MW110B (5.8 µg/L). Likewise, no additional investigations are warranted, due to the low concentrations and the presence of downgradient wells where 1,4-dioxane was less than 3 µg/L near Cow Pen Creek (MW08A and MW08B).

As stated above, several wells in the eastern portion of the site were sampled in 2017 for 1,4-dioxane using the lower detection limit. 1,4-Dioxane was detected at concentrations greater than its screening level (3 µg/L) in the following Block E wells: MW113A (6.9 µg/L), MW79B (14 µg/L), and MW44A (4.7 µg/L). No wells in the southeastern TCE remediation area had 1,2-dioxane exceedances, and only MW89B in Block I had an exceedance (3.9 µg/L). No additional investigation is planned for this area, because detected concentrations of 1,4-dioxane

are low, and 1,4-dioxane was not detected near Dark Head Cove. However, groundwater monitoring in these wells will continue.

4.2.3 Polychlorinated Biphenyls

Groundwater samples for PCB analyses were collected in areas of Block E where elevated PCBs had previously been detected in soil (Figure 4-6). PCBs have been found to be widely distributed in soil along the southern third of Block E, with Aroclor-1260 PCBs detected in the soil in the southwestern and south-central areas of Block E. The source of the Aroclor-1260 contamination in this area appears to be four transformer rooms identified in former Building D. Aroclor-1254 was detected in the soil in the southeastern portion of Block E, around the aboveground water tank. The source of this contamination is unknown, but may be from operations or disposal activities in this area.

Groundwater samples from 19 Block E and Block F wells hydraulically upgradient, cross-gradient, and downgradient of elevated PCBs in soil were analyzed for PCB homologs (Tables 4-2 and 4-3). This sampling sought to detect whether PCBs are being dissolved and transported in groundwater. PCBs are generally immobile, so in some cases the monitoring wells were very close to high-concentration-PCB soil, especially deeper contaminated soils.

Homologs are groups of chlorobiphenyls based on the number and location of chlorine atoms in the PCB molecule. Monochlorobipenyls and dichlorobiphenyls, for example, are lower-chain chlorobiphenyls that contain only one and two chlorine atoms (respectively) in their structures. Lower-chain chlorobiphenyls are lighter, generally more soluble in water (i.e., less stable in the environment), and are considered less toxic than the intermediate- and higher-chain chlorobiphenyls.

Aroclor was the trade name of the commercial PCB mixtures manufactured and sold in the United States. (PCBs were banned in the United States in 1979.) An Aroclor PCB mixture might consist of more than 100 different individual PCB-congeners, although 10–20 might make up more than 50% of the mixture. PCBs were commonly used in electrical transformer and capacitor oils, fluorescent-light ballasts, hydraulic fluids, plasticizers, paints, and might be the byproduct of some manufacturing processes.

PCB detections in groundwater are shown on Figure 4-6 and Tables 4-2 and 4-3. PCB homologs were not detected in upgradient wells MW62A and MW62C. Monochlorobiphenyls were detected in source-area well MW43A (0.26 µg/L) and in downgradient well MW114A (0.01*J* µg/L). Higher-chain dichlorobiphenyls (0.061*J* µg/L), hexachlorobiphenyls (0.023*J* µg/L), tetrachlorobiphenyls (0.05*J* µg/L), pentachlorobiphenyls (0.2 µg/L), and trichlorobiphenyls (0.007*J* µg/L) were also detected in well MW43A in the southwestern portion of Block E, where elevated PCBs have been detected in soil. Total PCB homolog concentrations at MW114A (0.01 µg/L) are less than the PCB groundwater standard, but total PCB homologs at MW43A (0.601 µg/L) exceed the PCB groundwater standard (0.5 µg/L). Results indicate that chlorobiphenyl concentrations below the groundwater standard are migrating in groundwater from well MW43A.

The only other PCB detection was observed in well MW74B, which is in the area of Aroclor-1254 soil exceedances; this well had a detected concentration of 0.014*J* µg/L for pentachlorobiphneyls. The total PCB homolog concentration at MW74B (0.014 µg/L) is less than the PCB groundwater-standard (0.5 µg/L). In support of the PCB soil remedy, planning for additional groundwater PCB investigation in these source areas is currently underway. Details are in the *Block E Soil Remedial Investigation Work Plan Addendum 3: Fall 2017 Soil and Groundwater Sampling* (Tetra Tech, 2017).

4.2.4 Metals

Total metals (from unfiltered samples) concentrations above MDE standards were found throughout the MRC (previous site-wide plots of beryllium, cobalt, and nickel are in Tetra Tech [2009]). Table 4-3 summarizes detections of metals in the groundwater samples. Table 4-4 includes a statistical summary of metals in site groundwater that exceed Maryland groundwater standards.

Concentrations of nine metals exceed Maryland groundwater standards (for drinking water) in one or more samples. Iron (79%), manganese (79%), vanadium (38%), beryllium (33%), and antimony (29%) exceed their standards most frequently, with maximum manganese and iron concentrations more than two orders of magnitude (greater than 100 times) above their respective groundwater standards (Table 4-4). Concentrations of nickel, lead, arsenic, and zinc exceed their standards in 19%, 15%, 8%, and 4% of samples, respectively, and their maximum concentrations (390, 50, 12,

and 16,000 µg/L, respectively) exceed groundwater standards by less than two-times for arsenic, by approximately three times for lead and zinc, and by approximately five times for nickel. Concentrations of the remaining metals did not exceed the standards. Metals do not contribute to site risk, and additional investigation and/or remediation for metals is not planned; monitoring will continue to determine if significant changes in metals concentrations occur at the site.

Notes:

Shaded cells indicate detected concentration exceeds groundwater screening level

1 Screening levels for all analytes except 1,4-dioxane are Maryland Department of the Environment (MDE) groundwater standards (MDE, 2008).

2 The screening level for 1.4-dioxane is State of California drinking water action level (MDE standard not available).

µg/L - micrograms per liter

-AVG (in sample ID) - average concentration for the sample and its duplicate (i.e., "-D")

-D (in Sample ID) - duplicate sample

J - estimated value

MDE - Maryland Department of the Environment

mg/L - milligrams per liter

NA - not analyzed

NC - no criterion

U - not detected at the concentration left of the letter

UJ - analyte not detected, detection limit may be inacurate or imprecise

Section 5
Summary

The findings of the March/April 2017 groundwater sampling and analyses and the groundwater level measurements for the Lockheed Martin Corporation (Lockheed Martin) Middle River Complex (MRC) are summarized below:

- All accessible wells were inspected during the 2017 sampling program to assess their need for repairs; five wells were repaired and two (MW11A and MW16A) will be repaired at a later date following completion of the sediment removal activities.
- Each well was inspected and a round of synoptic groundwater measurements was collected on March 6–7, 2017.
- Groundwater samples were collected from monitoring wells in March–April 2017 and June 7, 2017 (MW16A). Samples were analyzed for one or more of the following: volatile organic compounds (VOCs), 1,4-dioxane, total metals, polychlorinated biphenyls (PCBs), natural-attenuation assessment (NAA) parameters, and field water-quality parameters.
- Two wells (MW16A and MW72A) could not be located during the planned water-level round; therefore, groundwater levels at those wells could not be measured. However, MW16A was later located and sampled, and the water level at this well was measured at that time. MW16A was damaged (but not compromised) and will be repaired at a later date, because the sediment removal action is currently underway in this area. Repairs completed after sampling include replacing the concrete pads and flush-mounted covers of five wells (MW11A, MW25A, MW37C, MW53A, and MW109A/B). The condition of six wells that required repair did not affect sampling or groundwater quality.
- Groundwater flow in March 2017 is similar to that depicted by previous groundwater investigations. Shallow groundwater follows site topography and flows radially from the hydraulically upgradient northern portion of the Middle River Complex (at Eastern Boulevard and immediately south of Buildings A, B, and C) to the southeast, south, and southwest toward Dark Head Cove and Cow Pen Creek. Groundwater in the deep surficial-aquifer flows southeasterly from Eastern Boulevard toward Dark Head Cove. The March 2017 surficial-aquifer groundwater elevations are generally lower than those measured in 2016.

- Concentrations of chlorinated volatile organic compounds exceed Maryland groundwater standards at three main areas of the facility and at multiple depths. Trichloroethene (TCE), a common industrial solvent and metal degreaser, is the primary volatile organic compound exceeding its Maryland groundwater standard. Trichloroethene-degradation products, such as dichloroethenes and vinyl chloride (VC), also exceed Maryland groundwater standards at the facility, as do tetrachloroethene (PCE), chlorobenzene compounds, and the fuel-related volatile organic compound benzene. These data confirm four significant trichloroethene and trichloroethene-degradation-product plumes.

    - The northern trichloroethene plume, directly south of Building C, is possibly related to past handling and storage practices in and near that building. A remedial action to address this contamination is ongoing in this area. High concentrations of trichloroethene within this plume are in the intermediate depth of the surficial aquifer in wells MW60B, MW79B, and MW27B (downgradient of the remediation area), screened 30 feet below grade; concentrations in these wells are 7,100 µg/L, 1,600 µg/L, and 300 µg/L, respectively.

    - The southeastern trichloroethene plume is near the former location of an underground storage tank (documentation references the tank as "UST 2") that was located (and removed) near the former Building D foundation; this tank contained trichloroethene product and is believed to be the source of trichloroethene contamination in that area. An interim remedial action (multi-phase extraction) was implemented to address high concentrations of trichloroethene in the immediate area of the underground storage tank. Additional investigation of recently observed contamination to the south of this area toward Dark Head Cove has delayed implementation of planned groundwater remediation in this area.

        - The maximum concentration of trichloroethene at the site (61,000 micrograms per liter [µg/L]) was detected in groundwater near the southern end of the southeastern trichloroethene plume at new well SEMW-8S, and is assumed to be associated (in part) with the underground storage tank. This well is south of Block E and well MW74B, where the maximum trichloroethene concentration was detected in 2016 and the second highest TCE concentration was detected in 2017. The third highest TCE concentration in 2017 was detected nearby at newly installed well SEMW-7I, located north of SEMW-8S and south of MW74B. Due to the elevated TCE concentrations detected in proximity to Dark Head Cove, the sampling program was expanded in 2017 to include additional groundwater and nearby surface water locations.

        - Trichloroethene in well MW74B (in the southeastern portion of Block E near the shallow polychlorinated biphenyl source and an aboveground storage tank) had reduced in previous years by a factor of 21 (from 40,000 µg/L in 2013 to 1,900 µg/L in 2014), but rebounded in 2015 (to 21,800 µg/L) and again in 2016 (to 37,000 µg/L) and 2017 (to 38,000 µg/L).

    - The southwestern trichloroethene plume originates from a known solvent spill from a waste-oil tank north of Tilley Chemical and a possible secondary trichloroethene source at the former wastewater treatment plant south of Tilley Chemical and Chesapeake Park Plaza in Block G. A remedial action implemented in this area in 2015 and 2016

successfully reduced trichloroethene and daughter-product concentrations in this area. Post-remediation monitoring is underway.

  - A smaller trichloroethene plume is also west of Building A. An investigation is in progress to more fully define this plume, its source, and its relationship to possible contamination under the Building A basement and the adjacent Maintenance Building. Historical data indicate that concentrations are not changing—the plume appears to be static. Trichloroethene has also been detected at several isolated locations in the western portion of the facility and in the southwestern portion of Lot D (Block E).

- Benzene concentrations at areas west of Building A, in the southwestern trichloroethene plume, and near the vertical-assembly building, exceed the state groundwater standard of five micrograms per liter. However, these concentrations decline rapidly to levels below the standard at nearby downgradient wells. Most wells that had benzene exceedances in 2016 exhibited lower concentrations in 2017. At this time, no additional investigations for benzene are planned; monitoring will continue.

  - Chlorobenzene and chlorobenzene compounds (1,2,4-trichlorobenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene) exceed groundwater standards in several shallow wells (MW43A, MW113A, and MW114A) in the southwestern portion of Lot D (Tax Block E). Several chlorinated volatile organic compounds (including tetrachloroethene, trichloroethene, and 1,2-dichloroethane) also exceed their groundwater standards at these wells. Planning for additional chlorobenzene investigation is part of the site remediation for polychlorinated biphenyls, because chlorobenzenes are co-located with the polychlorinated biphenyls, especially in the Block E source areas.

- 1,4-Dioxane was detected in many wells in the southwestern trichloroethene plume area. The highest concentrations occur primarily in upper- and intermediate-surficial-aquifer wells. The highest 1,4-dioxane concentrations (including the maximum concentration of 180 µg/L in MW14B) occur along a southwesterly line originating just north of the Tilley Chemical building extending to Cow Pen Creek. 1,4-Dioxane screening-criterion exceedances were detected in 21 wells west, southwest, and south of Building A. 1,4-Dioxane concentrations over time have been constant to slightly decreasing in the southwestern trichloroethene plume area, and at wells outside of the groundwater remedy areas. 1,4-Dioxane screening-criterion exceedances were also in several wells in/nearby the northwest corner of Tax Block E and south of Building C. Historically, 1,4-dioxane has not exceeded its screening level in eastern-area wells; however, additional (as compared to 2016) eastern-area wells were sampled for 1,4-dioxane in 2017, to confirm the low concentrations and in response to recent reduced (i.e., more stringent) regulatory standards in other states. Concentrations of 1,4-dioxane exceeded its screening level in several wells in the eastern portion of the MRC.

  - Recent 1,4-dioxane sampling at the site has focused on the western portion of the site. Historically, 1,4-dioxane has not been detected extensively in the eastern part of the MRC. Sampling in the east was suspended following the 2008 sampling, when no samples exceeded the then-action level of 10 µg/L. In 2017, a significant number of wells in the eastern portion of the site were sampled using the new screening level (3 µg/L).

- 1,4-Dioxane was detected in several wells in the southwestern trichloroethene plume area, extending from well MW19A (to the south of Building A) to wells MW12A-B (adjacent to Cow Pen Creek). The highest concentrations occur in a line extending from just north of the Tilley Chemical building (140 µg/L and 170 µg/L at wells MW98B and MW111B, respectively) to Cow Pen Creek (150 µg/L and 100 µg/L at wells 12A–B, respectively). Sampling of these wells and the nearby surface water will continue; no additional investigations are required.

- 1,4-Dioxane was also detected at concentrations exceeding its screening level west of Building A in samples from wells MW69A (6.3 µg/L), MW96A (4 µg/L), MW110A (5.8 µg/L), and MW110B (5.8 µg/L). No additional investigations are warranted, because these concentrations are relatively low and downgradient wells near Cow Pen Creek (MW08A and MW08B) have 1,4-dioxane concentrations less than 3 µg/L.

- 1,4-Dioxane was detected at concentrations greater than its screening level (3 µg/L) in the following Block E wells: MW113A (6.9 µg/L), MW79B (14 µg/L), and MW44A (4.7 µg/L). No wells in the southeastern TCE remediation area had exceedances. In Block I, MW89B is the only well with an exceedance, with a concentration of 3.9 µg/L. No additional investigation is planned in this area; however, groundwater monitoring in these wells will continue, due to the low concentrations and lack of detections near Dark Head Cove.

- Polychlorinated biphenyl homologs were analyzed in groundwater samples collected from 19 wells in Tax Blocks E and F. Homologs were detected in two samples at concentrations below the groundwater standard and in one sample at a concentration slightly greater than the standard, when considering the total-homologs result. Total homologs exceeding the groundwater standard were detected at MW43A in the southwestern portion of Block E, which is the well where elevated polychlorinated biphenyls were detected in soil. Results indicate that only concentrations of chlorobiphenyls below the groundwater standard are migrating in groundwater from well MW43A. In support of the soil remedy, planning for additional groundwater investigation in these source areas is currently underway.

- Concentrations of nine metals exceeded Maryland groundwater standards in one or more groundwater samples this round. Concentrations of manganese, iron, vanadium, beryllium, and manganese exceed their respective standards most frequently, with maxima for manganese and iron exceeding standards by more than two orders of magnitude (greater than 100 times). Nickel, lead, zinc, and arsenic exceeded their respective standards less frequently, with the maxima of these metals approximately less than two to five times above their respective groundwater standards. Metals do not contribute to site risk, and additional investigations and/or remediation for metals is not planned; monitoring will continue to determine if significant changes in metals concentrations occur at the site.

- Two areas of data gaps identified in the report require additional investigation:

  - A smaller trichloroethene plume west of Building A is currently under investigation so that its source can be fully defined and its relationship to possible contamination under the Building A basement and the adjacent Maintenance Building can be determined.

- Polychlorinated biphenyls in soil near four transformer rooms in former Building D (Block E), and chlorobenzenes and polychlorinated biphenyls appear to be co-located in groundwater. In support of the soil remedy, planning for additional groundwater investigation in these source areas is currently underway. Details are in the *Block E Soil Remedial Investigation Work Plan Addendum 3: Fall 2017 Soil and Groundwater Sampling* (Tetra Tech, 2017).

Lockheed Martin Corporation is, in coordination with the Maryland Department of the Environment, continuously optimizing the groundwater monitoring program at the Middle River Complex. For example, to meet current and potential future lower screening levels for 1,4-dioxane, Method SW846 8270D will be used for future analyses. Additionally, a third party, EarthCon Consultants, Inc., is working to develop an independent assessment of possible sources, plume stability, and monitoring recommendations. The results of this analysis will be used in conjunction with previously prepared decision rules to optimize the monitoring protocol for 2018 and beyond.

APPENDIX C—DATA-VALIDATION REPORTS WITH CHAIN OF CUSTODY FORMS

TETRA TECH

INTERNAL CORRESPONDENCE

TO: **M. MARTIN** **DATE:** **APRIL12, 2017**

FROM: **TERRI L. SOLOMON** **COPIES:** **DV FILE**

SUBJECT: **ORGANIC DATA VALIDATION – VOCs, 1,4-DIOXANE, PCBs**
LOCKHEED MARTIN CORPORATION (LMC) – MIDDLE RIVER COMPLEX (MRC) GROUNDWATER
SDG 240-76517-1

SAMPLES: 3/Aqueous
VOCs

MRC-MW44A-030817 MRC-MW76A-030817 MRC-MW76B-030817

1/Aqueous
1,4-Dioxane/PCBs

MRC-MW44A-030817

1/Trip Blank

TB-030817

Overview

The sample set for LMC-MRC Groundwater, SDG 240-76517-1 consisted of three (3) aqueous environmental samples and one (1) trip blank. Samples MRC-MW76A-030817, MRC-MW76B-030817 and TB-030817 were analyzed for volatile organic carbons (VOCs). Sample MRC-MW44A-030817 was analyzed for select VOCs, 1,4-Dioxane and polychlorinated biphenyls (PCBs). No field duplicate sample pairs were included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 8, 2017 and analyzed by TestAmerica – Canton, TestAmerica-Burlington and TestAmerica-Savannah. All analyses were conducted in accordance with SW-846 Method 8260C and EPA methods 522 and 680 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample / laboratory control sample duplicate results, matrix spike / matrix spike duplicate recoveries, internal standard areas, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The VOC continuing calibration performed on instrument A3UX17 on 03/14/17 @ 10:59 had percent differences (%Ds) for dichlorodifluoromethane, bromomethane, chloroethane and 2-butanone which exceeded the quality control limits. Samples MRC-MW76A-030817, MRC-MW76B-030817 and TB-030817 were affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- Detected results reported below the RL but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

Sample MRC-MW43A-030817 was listed on the chain of custody but was not included within this SDG.

The laboratory control standard (LCS) percent recovery for 2-butanone was above the quality control limit. Samples MRC-MW76A-030817, MRC-MW76B-030817 and TB-030817 were affected. No validation actions were warranted as all sample results were nondetects.

The matrix spike (MS) and/or matrix spike duplicate (MSD) percent recoveries for all PCBs except nonachlorobiphenyls for sample MRC-MW44A-030817 were below the quality control limit. No validation action was warranted based on MS/MSD recoveries alone.

The MS/MSD relative percent differences (RPDs) for dichlorobiphenyls, tetrachlorobiphenyls and trichlorobiphenyls for sample MRC-MW44A-030817 were outside the quality control limit. No validation action was warranted based on the MS/MSD RPD recoveries alone.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: One CCV %D was noncompliant for the VOC fraction.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Sample(s) ____ were received after the recommended holding time had expired.
Sample(s) ____ were received in a broken container.
Sample(s) ____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) ____ were further preserved in the laboratory.
Time preserved: ____ Preservative(s) added/Lot number(s): ____

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-76517-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 522 1.4 Dioxane analysis was performed at TestAmerica Burlington Laboratory. The 680 PCB analysis was perfromed at TestAmerica Savannah Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/9/2017 9:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

1,4-DIOXANE
Sample MRC-MW44A-030817 (240-76517-2) was analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/13/2017 and analyzed on 03/15/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples TB-030817 (240-76517-1), MRC-MW44A-030817 (240-76517-2), MRC-MW76A-030817 (240-76517-4) and MRC-MW76B-030817 (240-76517-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/14/2017.

The continuing calibration verification (CCV) for analytical batch 270478 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required. TB-030817 (240-76517-1), MRC-MW44A-030817 (240-76517-2), MRC-MW76A-030817 (240-76517-4) and MRC-MW76B-030817 (240-76517-5)

The laboratory control sample (LCS) for analytical batch 240-270478 recovered outside control limits for the following analyte. 2-Butanone. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported. TB-030817 (240-76517-1), MRC-MW44A-030817 (240-76517-2), MRC-MW76A-030817 (240-76517-4), MRC-MW76B-030817 (240-76517-5) and (LCS 240-270478/4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)
Sample MRC-MW44A-030817 (240-76517-2) was analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA Method 680. The samples were prepared on 03/13/2017 and analyzed on 03/16/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Overview

The sample set for LMC-MRC Groundwater, SDG 240-76566-1 consisted of five (5) aqueous environmental samples and one (1) trip blank. Samples MRC-MW58A-030907, MRC-MW94B-030917 and TB-030917 were analyzed for volatile organic carbons (VOCs). Samples MRC-DUP01-030907, MRC-MW103A-030907 and MRC-MW103B-030907 were analyzed for select VOCs, and polychlorinated biphenyls (PCBs). Sample MRC-MW58A-030917 was also analyzed for 1,4-Dioxane. One (1) field duplicate sample pair (MRC-MW103A-030907 / MRC-DUP01-030907) was included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 9, 2017 and analyzed by TestAmerica – Canton, TestAmerica-Burlington and TestAmerica-Savannah. All analyses were conducted in accordance with SW-846 Method 8260C and EPA methods 522 and 680 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample / laboratory control sample duplicate results, matrix spike / matrix spike duplicate recoveries, internal standard areas, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The VOC continuing calibration performed on instrument A3UX11 on 03/16/17 @ 9:29 had percent differences (%Ds) for bromomethane and bromoform which exceeded the quality control limits. Samples MRC-MW58A-030907, MRC-MW94B-030917 and TB-030917 were affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

Notes

The following compound was detected in the method blank at the maximum concentration indicated below:

Compound	Concentration	Action Level
Methylene chloride	0.914 ug/L	9.14 ug/L

An action level of 10X the maximum concentration was established to evaluate for blank contamination. Dilution factors, if necessary, were taken into consideration during the application of the action level. No validation actions were warranted as all sample results were nondetects.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: One CCV %D was noncompliant for the VOC fraction.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Samples processed by:

15. SAMPLE CONDITION

Sample(s) ____ were received after the recommended holding time had expired.

Sample(s) ____ were received in a broken container.

Sample(s) ____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) ____ were further preserved in the laboratory.

Time preserved: ____ Preservative(s) added/Lot number(s): ____

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-76566-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 680_PCB analysis was performed at TestAmerica Savannah Laboratory. The 522 1,4-Dioxane analysis was performed at TestAmerica Burlington Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 3/10/2017 11:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.1º C.

1,4-DIOXANE

Sample MRC-MW58A-030907 (240-76566-4) was analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/13/2017 and analyzed on 03/15/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples TB-030917 (240-76566-1), MRC-MW103A-030907 (240-76566-2), MRC-MW103B-030907 (240-76566-3), MRC-MW58A-030907 (240-76566-4), MRC-MW94B-030907 (240-76566-5) and MRC-DUP01-030907 (240-76566-6) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/16/2017.

Methylene Chloride was detected in method blank MB 240-270891/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The continuing calibration verification (CCV) for analytical batch 270891 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required. TB-030917 (240-76566-1), MRC-MW103A-030907 (240-76566-2), MRC-MW103B-030907 (240-76566-3), MRC-MW58A-030907 (240-76566-4), MRC-MW94B-030907 (240-76566-5) and MRC-DUP01-030907 (240-76566-6)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples MRC-MW103A-030907 (240-76566-2), MRC-MW103B-030907 (240-76566-3) and MRC-DUP01-030907 (240-76566-6) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA Method 680. The samples were prepared on 03/13/2017 and analyzed on 03/16/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

PCBS BATCH WORKSHEET

Lab Name: TestAmerica Savannah Job No.: 240-76566-1

SDG No.:

Batch Number: 472187 Batch Start Date: 03/13/17 15:39 Batch Analyst: Simmons, Richard B

Batch Method: 680 Batch End Date: 03/14/17 09:43

Batch Notes	
Balance ID	23
Batch Comment	680 box M680-99
Concentration End Time	1251
Concentration Start Time	1211
Analyst ID - Concentration	RKL
Exchange Solvent ID	4969398
Exchange Solvent Name	Hexanes
Exchange Solvent Volume Used	1 mL
Extraction 1 End Time	0943
Extraction 1 Start Time	1539
pH Paper ID	4785212 4961266 4923424
Pipette ID	AA02G
Prep Solvent ID	4975501
Prep Solvent Name	MeCL2
Prep Solvent Volume Used	70 mL
Person's name who did the prep	RBS
Analyst ID - Reagent Drop Witness	CEW/RBS
Residual Chlorine Indicator ID	4852916
Analyst ID - Spike Analyst	RBS
Analyst ID - Spike Witness Analyst	CEW
Sufficient volume for MS/MSD?	Yes
Vial ID	84000

Basis	Basis Description
T	Total/NA

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

Overview

The sample set for LMC-MRC Groundwater, SDG 240-76607-1 consisted of five (5) aqueous environmental samples and one (1) trip blank. All samples were analyzed for volatile organic carbons (VOCs). Samples MRC-DUP02-031017, MRC-MW33A-031017 and MRC-MW34A-031017 were analyzed for 1,4-Dioxane. One (1) field duplicate sample pair (MRC-MW34A-031017 / MRC-DUP02-031017) was included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 10, 2017 and analyzed by TestAmerica – Canton and TestAmerica-Burlington. All analyses were conducted in accordance with SW-846 Method 8260C and EPA method 522 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample / laboratory control sample duplicate results, matrix spike / matrix spike duplicate recoveries, internal standard areas, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The VOC continuing calibration performed on instrument A3UX17 on 03/14/17 @ 10:59 had percent differences (%Ds) for dichlorodifluoromethane, bromomethane, chloroethane and 2-butanone which exceeded the quality control limits. All samples were affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- Detected results reported below the RL but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

The laboratory control standard (LCS) percent recovery for 2-butanone was above the quality control limit. All samples were affected. No validation actions were warranted as all sample results were nondetects.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: One CCV %D was noncompliant for the VOC fraction.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Appendix C – Support Documentation

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Cooler unpacked by: POP

Cooler Received on 3-11-17 Opened on 3-11-17

FedEx: 1st Grd ~~Exp~~ UPS FAS Stetson Client Drop Off TestAmerica Courier Other

Receipt After-hours: Drop-off Date/Time Storage Location

TestAmerica Cooler # ~~Foam Box~~ Client Cooler Box Other

Packing material used: ~~Bubble Wrap~~ Foam ~~Plastic Bag~~ None Other

COOLANT: Wet Ice Blue Ice Dry Ice Water None

1. Cooler temperature upon receipt ☐ See Multiple Cooler Form
   IR GUN# IR-8 (CF **-0.3** °C) Observed Cooler Temp. 1.6 °C Corrected Cooler Temp. 1.3 °C
   IR GUN #36 (CF **+0.3**°C) Observed Cooler Temp. ____ °C Corrected Cooler Temp. ____ °C
2. Were custody seals on the outside of the cooler(s)? If Yes Quantity 1 ~~Yes~~ No
   -Were custody seals on the outside of the cooler(s) signed & dated? ~~Yes~~ No NA
   -Were custody seals on the bottle(s) or bottle kits (LLHg/MeHg)? Yes ~~No~~
3. Shippers' packing slip attached to the cooler(s)? ~~Yes~~ No
4. Did custody papers accompany the sample(s)? ~~Yes~~ No
5. Were the custody papers relinquished & signed in the appropriate place? ~~Yes~~ No
6. Was/were the person(s) who collected the samples clearly identified on the COC? ~~Yes~~ No
7. Did all bottles arrive in good condition (Unbroken)? ~~Yes~~ No
8. Could all bottle labels be reconciled with the COC? ~~Yes~~ No
9. Were correct bottle(s) used for the test(s) indicated? ~~Yes~~ No
10. Sufficient quantity received to perform indicated analyses? ~~Yes~~ No
11. Are these work share samples? Yes ~~No~~
    If yes, Questions 11-15 have been checked at the originating laboratory.
11. Were sample(s) at the correct pH upon receipt? Yes No ~~NA~~ pH Strip Lot# **HC682547**
12. Were VOAs on the COC? ~~Yes~~ No
13. Were air bubbles >6 mm in any VOA vials? Yes ~~No~~ NA
14. Was a VOA trip blank present in the cooler(s)? Trip Blank Lot # 163030103 ~~Yes~~ No
15. Was a LL Hg or Me Hg trip blank present? Yes ~~No~~

15. SAMPLE CONDITION

Sample(s) ____ were received after the recommended holding time had expired.
Sample(s) ____ were received in a broken container.
Sample(s) ____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) ____ were further preserved in the laboratory.
Time preserved: ____ Preservative(s) added/Lot number(s): ____

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-76607-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 522 1,4-Dioxane analysis was performed at the TestAmerica Burlington Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/11/2017 10:51 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.3º C.

1,4-DIOXANE
Samples MRC-MW34A-031017 (240-76607-3), MRC-MW33A-031017 (240-76607-4) and MRC-DUP02-031017 (240-76607-6) were analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/15/2017 and analyzed on 03/16/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples TB-031017 (240-76607-1), MRC-MW32A-031017 (240-76607-2), MRC-MW34A-031017 (240-76607-3), MRC-MW33A-031017 (240-76607-4), MRC-MW88B-031017 (240-76607-5) and MRC-DUP02-031017 (240-76607-6) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/14/2017.

The continuing calibration verification (CCV) for analytical batch 270478 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required. TB-031017 (240-76607-1), MRC-MW32A-031017 (240-76607-2), MRC-MW34A-031017 (240-76607-3), MRC-MW33A-031017 (240-76607-4), MRC-MW88B-031017 (240-76607-5) and MRC-DUP02-031017 (240-76607-6)

The laboratory control sample (LCS) for analytical batch 240-270478 recovered outside control limits for the following analyte.
2-Butanone. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported. TB-031017 (240-76607-1), MRC-MW32A-031017 (240-76607-2), MRC-MW34A-031017 (240-76607-3), MRC-MW33A-031017 (240-76607-4), MRC-MW88B-031017 (240-76607-5), MRC-DUP02-031017 (240-76607-6) and (LCS 240-270478/4)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SUBJECT: **DATA VALIDATION – VOC, 1,4-DIOXANE, OVG, METALS, MISCELLANEOUS LOCKHEED MARTIN CORPORATION (LMC) – MIDDLE RIVER COMPLEX (MRC) SAMPLE DELIVERY GROUP (SDG) 240-76678-1**

SAMPLES: 5/Aqueous/

MRC-MW60A-031317	MRC-MW60B-031317	MRC-MW78B-031317
MRC-MW81A-031317	TB-031317	

Overview

The sample set for LMC-MRC, SDG 240-76678-1 consisted of four (4) aqueous environmental samples and one (1) trip blank. The samples were analyzed for volatile organic compounds (VOC), 1,4-dioxane, organic volatile gases (OVG), metals, and/or miscellaneous parameters including alkalinity, ammonia, chloride, dissolved organic carbon (DOC), nitrate, nitrite, orthophosphate, phosphate, sulfate, and total dissolved solids (TDS). The trip blank was only analyzed for VOC. No field duplicate sample pairs were included in this SDG.

The samples were collected by Tetra Tech on March 13, 2017 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with SW-846 Methods 8260C for VOC, 6010C/6020A/7470A for metals, and 9060 for DOC, RSK-175 for OVG, EPA methods 522 for 1,4-dioxane, 300 for anions, and 350 for ammonia, and standard methods 2320B for alkalinity, 2540C for TDS, and 4500 for orthosphosphate/phosphate analytical and reporting protocols.

The data contained in this SDG were validated with regard the following parameters: data completeness, holding times, GC/MS tuning, ICP/MS tuning, initial/continuing calibrations, laboratory method/preparation blanks, Interference Check Sample (ICS), surrogate spike recoveries, laboratory control sample/laboratory control sample duplicate results, internal standard areas and recoveries, ICP serial dilution results, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were noted.

Minor

- VOC continuing calibration percent difference (%D) was greater than quality control (QC) limits (20%) on 3/23/2017 at 8:56 for methylcyclohexane and 2-hexanone affecting all samples. All results for these parameters were nondetect and were qualified as estimated (UJ).

- Methylene chloride was detected in the laboratory blank at the following maximum concentration:

Parameter	Maximum Concentration (ug/L)	Action Level (ug/L)
Methylene chloride	1.58	15.8

Dilution factor, if applicable, was taken into consideration when evaluating for blank contamination. Detected results reported below the action level were qualified as non-detected, (U), due to blank contamination. The trip blank was not qualified for laboratory blank contamination.

- Laboratory Control Sample (LCS) percent recovery (%) was less than QC limits for methylcyclohexane. Nondetected results for methylcyclohexane were qualified as estimated (UJ).

- The following analytes were detected in the laboratory preparation and calibration blanks at the following maximum concentrations:

Analyte	Maximum Concentration (ug/L)	Reporting Limit (RL) (> or <)
Barium(1)	0.776	<RL
Copper(1)	0.388	<RL
Nickel(1)	0.438	<RL
Potassium(2)	1810	<RL
Sodium(2)	1020	<RL
Antimony(3)	1.15	<RL
Cobalt(3)	0.054	<RL
Lead(3)	0.155	<RL
Molybdenum(3)	0.746	<RL
Selenium(3)	0.312	<RL

1. Concentration in method blank affecting all samples.
2. Maximum concentration in continuing calibration blanks on 3/16/2017 at 15:36 affecting all samples.
3. Maximum concentration in continuing calibration blank on 3/16/2017 at 15:10, 16:00, and 16:50 affecting all samples.

Dilution factor, if applicable, was taken into consideration when evaluating for blank contamination. Detected results reported below the RL were qualified as non-detected, (U), due to blank contamination.

- Metal internal standard %R was less than 60%QC limit for Rhodium (Rh), Indium (In), and Bismuth (Bi) in sample MRC-MW78B-031317. Results for associated analytes were qualified as estimated (J) and (UJ) for detected and nondetected results.

- Detected results reported below the RL limit but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

Non-detected results were reported to the MDL.

The following samples were analyzed at dilution resulting in elevated detection limits for nondetected results:

Sample	Parameter	Dilution
MRC-MW60A-031317	VOC	50X
MRC-MW60B-031317	VOC	200X

Sulfate was present in the calibration blank at 0.137 mg/L, which is less than the RL. No action was taken as the detected result for sulfate was greater than the RL.

Executive Summary

Laboratory Performance: Calibration noncompliance was noted for VOCs. Methylene chloride, metals, and sulfate were present in laboratory preparation and method blanks. LCS noncompliance was noted for one VOC. Internal standard noncompliance was noted for several metals.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Review" (January 2017) and the "National Functional Guidelines for Inorganic Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

*Sample was analyzed for chlorinated benzenes only.

OVERVIEW

The sample set for MRC GW, SDG 240-76810-1, consists of five (5) groundwater environmental samples and one (1) trip blank. Samples were analyzed for volatile organic compounds (VOC), 1,4-dioxane, dissolved gases, polychlorinated biphenyl (PCB) homologs, select metals, and miscellaneous parameters. No field duplicate pairs are included in this SDG.

The samples were collected by Tetra Tech on March 15, 2017 and analyzed by Test America. Analyses were conducted in accordance with SW-846 Methods 8260C (for VOC), 6010C (for metals), and 9060 (for dissolved organic carbon) as well as EPA Method 522 (for 1,4-dioxane), Method RSK-175 (for dissolved gases), EPA Method 680 (for PCB homologs), Standard Methods 2320B-1997 (for alkalinity), 4500 PE (for orthophosphate), and 2540C (for total dissolved solids), and MCAWW Methods 300.0 (for anions) and 350.2 (for nitrogen, ammonia) analysis and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blanks, surrogate spike recoveries, laboratory control sample results, matrix spike/matrix spike duplicate results, internal standard areas and recoveries, analyte identification, analyte quantitation, and detection limits. Areas of concern with respect to data quality are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- Detected results below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Non-detected results were reported to the MDL.

The laboratory case narrative report indicates that a VOC matrix spike (MS)/matrix spike duplicate (MSD) sample was not analyzed in batch 271291 due to an instrument malfunction. No validation action was necessary.

VOCs in sample MRC-MW43A-031517 were analyzed at a dilution factor of 250.

Chloride was analyzed at a dilution factor of 5 in sample MRC-MW34B-031517.

The following analyte was detected in the VOC method/trip blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Methylene chloride	1.17 ug/L(1)	11.7 ug/L
Methylene chloride	0.83 ug/L(2)	8.3 ug/L

1 – Maximum concentration detected in method blank associated with preparation batch 271291 affecting samples MRC-MW34B-031517, MRC-MW34C-031517, and TB-031517.
2 – Maximum concentration detected in trip blank TB-031517 affecting all VOC samples.

Action levels of 10x the maximum concentrations of the common laboratory contaminant methylene chloride were used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were considered in evaluating for blank contamination. No action was necessary, as results for methylene chloride were non-detected in the affected environmental samples and trip blank results are not qualified for blank contamination.

The laboratory case narrative report for the dissolved gases fraction indicates that a MS/MSD for batch 240-271163 was not analyzed due to insufficient sample volume. No validation action was necessary.

For the metals sample, the calibration percent recoveries (%Rs) were less than the than the 90-110% quality control range for silicon dioxide in the initial and continuing calibrations analyzed on 03/21/17 at 09:22 and 12:05, respectively. No action was necessary because the environmental sample from this SDG was not associated with these calibrations.

In the miscellaneous parameters fraction, sulfate was detected in the initial calibration blank analyzed on 11/24/16 at 12:33. No action was necessary because the environmental sample in this SDG was not affected by this calibration blank.

The following analyte was detected in the metals calibration blank at the following maximum concentration:

Analyte	Maximum Concentration	RL (< or >)
Potassium	416 ug/L(1)	< RL

1 – Maximum concentration detected in calibration blanks analyzed on 03/21/17 at 10:17 and 11:44 affecting sample MRC-MW34B-031517.

No action was necessary, as the detected result for potassium in sample MRC-MW34B-031517 was greater than the action level.

For the metals fraction, the MS performed on sample 190-13000-A-1-B (laboratory identification) and the MSD performed on sample 190-13000-A-1-C (laboratory identification) had %Rs that were greater than the laboratory quality control limits for silicon dioxide. Additionally, the post digestion spike (PDS) associated with this MS/MSD had a %R for silicon dioxide that was greater than the quality control limits. No action was necessary because the MS/MSD and PDS were not performed on samples from this SDG.

EXECUTIVE SUMMARY

Laboratory Performance Issues: None.

Other Factors Affecting Data Quality: Detected results below RL but above the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Superfund Organic Methods Data Review" (January 2017) and "National Functional Guidelines for Inorganic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those problem areas affecting data quality.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

APPENDIX C

SUPPORT DOCUMENTATION

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-76810-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 522 1,4-Dioxane analysis was performed at the TestAmerica Burlington Laboratory. The 680 Polychlorinated Biphenyls analysis was performed at the TestAmerica Savannah Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/16/2017 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.3º C and 2.5º C.

1,4-DIOXANE
Samples MRC-MW34B-031517 (240-76810-2) and MRC-MW34C-031517 (240-76810-3) were analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/20/2017 and analyzed on 03/22/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples TB-031517 (240-76810-1), MRC-MW34B-031517 (240-76810-2), MRC-MW34C-031517 (240-76810-3), MRC-MW62A-031517 (240-76810-4), MRC-MW43A-031517 (240-76810-5) and MRC-MW62C-031517 (240-76810-6) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/21/2017.

Sample MRC-MW43A-031517 (240-76810-5)[250X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The MS/MSD for batch 271291 was not analyzed due to an instrument malfunction. Batch included: TB-031517 (240-76810-1), MRC-MW34B-031517 (240-76810-2), MRC-MW34C-031517 (240-76810-3), MRC-MW62A-031517 (240-76810-4), MRC-MW43A-031517 (240-76810-5) and MRC-MW62C-031517 (240-76810-6)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED GASES
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for dissolved gases in accordance with RSK_175. The sample was analyzed on 03/20/2017.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 240-271163.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)
Samples MRC-MW62A-031517 (240-76810-4), MRC-MW43A-031517 (240-76810-5) and MRC-MW62C-031517 (240-76810-6) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA Method 680. The samples were prepared on 03/21/2017 and analyzed on 03/27/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICP)
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 03/20/2017 and analyzed on 03/21/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ALKALINITY
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for alkalinity in accordance with SM 2320B. The sample was analyzed on 03/23/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL DISSOLVED SOLIDS
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for total dissolved solids in accordance with SM 2540C. The sample was analyzed on 03/22/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ANIONS
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for anions in accordance with EPA Method 300.0. The sample was analyzed on 03/16/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ANIONS
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for anions in accordance with EPA Method 300.0. The sample was analyzed on 03/16/2017 and 03/17/2017.

Sample MRC-MW34B-031517 (240-76810-2)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

AMMONIA
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for ammonia in accordance with EPA Method 350.2. The sample was prepared and analyzed on 03/22/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

ORTHOPHOSPHATE AS P
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for orthophosphate as P in accordance with SM 4500 P E. The sample was analyzed on 03/16/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISSOLVED ORGANIC CARBON
Sample MRC-MW34B-031517 (240-76810-2) was analyzed for dissolved organic carbon in accordance with EPA SW-846 Method 9060. The sample was analyzed on 03/21/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TB-031617

Overview

The sample set for LMC-MRC Groundwater, SDG 240-76905-1 consisted of five (5) aqueous environmental samples and one (1) trip blank. All samples were analyzed for volatile organic carbons (VOCs). Samples MRC-MW110A-031617, MRC-MW110B-031617, MRC-MW53A-031617 and MRC-MW53B-031617 were also analyzed for 1,4-Dioxane. One (1) field duplicate sample pair (MRC-MW53B-031617 / MRC-DUP03-031617) was included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 16, 2017 and analyzed by TestAmerica – Canton and TestAmerica-Burlington. All analyses were conducted in accordance with SW-846 Method 8260C and EPA method 522 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample / laboratory control sample duplicate results, internal standard areas, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The VOC continuing calibration performed on instrument A3UX15 on 03/27/17 @ 9:21 had percent differences (%Ds) for dichlorodifluoromethane, chloroethane, trichlorofluoromethane, 1,1,1-trichloroethane, carbon tetrachloride, cis-1,3-dichloropropene, bromoform and 1,1,2,2-tetrachloroethane which exceeded the quality control limits. Samples TB-031617, MRC-MW53B-031617, MRC-MW110A-031617 and MRC-DUP03-031617 were affected. The non-detected results

reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- The VOC continuing calibration performed on instrument A3UX15 on 03/28/17 @ 8:34 had percent differences (%Ds) for bromomethane, chloroethane, trichlorofluoromethane, 1,1,1-trichloroethane, carbon tetrachloride, bromoform and isopropyl benzene which exceeded the quality control limits. Samples MRC-MW53A-031617 and MRC-MW11OB-031617 were affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- The following compound was detected in the method blank at the maximum concentration indicated below:

Compound	Concentration	Action Level
Methylene chloride(1)	0.925 ug/L	9.25 ug/L
Methylene chloride(2)	0.727 ug/L	7.27 ug/L

(1) Maximum concentration present in a method blank affecting samples TB-031617, MRC-MW53B-031617, MRC-MW110A-031617 and MRC-DUP03-031617.
(2) Maximum concentration present in a method blank affecting samples MRC-MW53A-031617 and MRC-MW11OB-031617.

An action level of 10X the maximum concentration was established to evaluate for blank contamination. Dilution factors, if necessary, were taken into consideration during the application of the action level. The detected result reported for methylene chloride in sample MRC-MW110B-031617 was qualified as nondetected, (U). Field blanks are not qualified for method blank contamination.

- The VOC laboratory control samples (LCSs) had percent recoveries for chloroethane which exceeded the quality control limits. All samples were affected. The non-detected results reported for chloroethane in the affected samples were qualified as estimated, (UJ).

- Detected results reported below the RL but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

Samples MRC-MW53A-031617 and MRC-MW110B-031617 were analyzed at a dilution for the VOC analyses. The detection limits of the non-detected results were elevated.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: Several CCV %Ds were noncompliant for the VOC fraction. Contaminants were detected in the laboratory method blanks. LCS percent recoveries were noncompliant in the VOC fraction.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-76905-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 522 1,4-Dioxane analysis was performed at the TestAmerica Burlington Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/17/2017 9:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.3º C.

1,4-DIOXANE
Samples MRC-MW53A-031617 (240-76905-2), MRC-MW53B-031617 (240-76905-3), MRC-MW110A-031617 (240-76905-4) and MRC-MW110B-031617 (240-76905-5) were analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/20/2017 and analyzed on 03/22/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples TB-031617 (240-76905-1), MRC-MW53A-031617 (240-76905-2), MRC-MW53B-031617 (240-76905-3), MRC-MW110A-031617 (240-76905-4), MRC-MW110B-031617 (240-76905-5) and MRC-DUP03-031617 (240-76905-6) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/27/2017 and 03/28/2017.

Methylene Chloride was detected in method blank MB 240-272071/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Methylene Chloride was detected in method blank MB 240-272197/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Methylene Chloride failed the recovery criteria high for MRL 240-272071/5.

Samples MRC-MW53A-031617 (240-76905-2)[2X] and MRC-MW110B-031617 (240-76905-5)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for analytical batch 272071 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required. TB-031617 (240-76905-1), MRC-MW53B-031617 (240-76905-3), MRC-MW110A-031617

(240-76905-4), MRC-DUP03-031617 (240-76905-6) and (240-76904-B-1)

The continuing calibration verification (CCV) for analytical batch 272197 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required. MRC-MW53A-031617 (240-76905-2) and MRC-MW110B-031617 (240-76905-5).

The laboratory control sample (LCS) for 272017 recovered outside control limits for the following analyte: Chloroethane. This analyte has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. TB-031617 (240-76905-1), MRC-MW53B-031617 (240-76905-3), MRC-MW110A-031617 (240-76905-4), MRC-DUP03-031617 (240-76905-6) and (LCS 240-272071/4)

The laboratory control sample (LCS) for 272197 recovered outside control limits for the following analyte: Chloroethane. These analytes have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed. MRC-MW53A-031617 (240-76905-2), MRC-MW110B-031617 (240-76905-5) and (LCS 240-272197/4)

No MS/MSD in batch 272197 due to analyst error (forgot to spike). Batch included: MRC-MW53A-031617 (240-76905-2) and MRC-MW110B-031617 (240-76905-5)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

MRC-MW115A-031717	MRC-MW116A-031717	MRC-MW57A-031717
MRC-MW95B-031717	TB-031717	

OVERVIEW

The sample set for MRC GW, SDG 240-76938-1, consists of four (4) groundwater environmental samples and one (1) trip blank. Samples were analyzed for volatile organic compounds (VOC). No field duplicate pairs are included in this SDG.

The samples were collected by Tetra Tech on March 17, 2017 and analyzed by Test America. Analyses were conducted in accordance with SW-846 Method 8260C analysis and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blanks, surrogate spike recoveries, laboratory control sample results, matrix spike/matrix spike duplicate results, internal standard areas and recoveries, analyte identification, analyte quantitation, and detection limits. Areas of concern with respect to data quality are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The VOC continuing calibration performed on 03/23/17 at 08:56 on instrument A3UX12 had percent differences (%Ds) for methyl cyclohexane, 2-hexanone, and 1,2,4-trichlorobenzene that were greater than the 20% quality control limit. Samples MRC-MW95B-031717 and MRC-MW115A-031717 were affected. Non-detected results for the aforementioned analytes were qualified as estimated (UJ) in the affected samples.

- The laboratory control sample (LCS) 240-271642/4 associated with preparation batch 271642 had a percent recovery (%R) for methyl cyclohexane that was less than the quality control range. Samples MRC-MW95B-031717 and MRC-MW115A-031717 were associated with this LCS. Non-detected results for methyl cyclohexane were qualified as estimated (UJ) in the associated samples.

- The detected results below the reporting limit (RL) but above the method detection limit (MDL) was qualified as estimated (J).

NOTES

Non-detected results were reported to the MDL.

According to the laboratory case narrative report, the matrix spike (MS)/matrix spike duplicate (MSD) for batch 271291 was not analyzed due to an instrument malfunction, affecting samples TB-031717, MRC-MW116A-031717, and MRC-MW57A-031717. No validation action was taken.

The following analyte was detected in the VOC method blanks at the following maximum concentration:

Analyte	Maximum Concentration	Action Level
Methylene chloride	1.17 ug/L(1)	11.7 ug/L

1 – Maximum concentration detected in method blank associated with preparation batch 271291 affecting samples TB-031717, MRC-MW116A-031717, and MRC-MW57A-031717.
2 – Maximum concentration detected in method blank associated with preparation batch 271642 affecting samples MRC-MW95B-031717 and MRC-MW115A-031717.

Action levels of 10x the maximum concentrations of the common laboratory contaminant methylene chloride were used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were considered in evaluating for blank contamination. No action was necessary, as results for methylene chloride were non-detected in the affected samples.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Several non-detected VOC results were qualified as estimated due to calibration noncompliance. Some non-detected VOC results were qualified as estimated due to LCS %R noncompliance.

Other Factors Affecting Data Quality: One detected result above the RL but less than the MDL was qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those problem areas affecting data quality.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

APPENDIX C

SUPPORT DOCUMENTATION

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-76938-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 3/18/2017 11:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples TB-031717 (240-76938-1), MRC-MW116A-031717 (240-76938-2), MRC-MW57A-031717 (240-76938-3), MRC-MW95B-031717 (240-76938-4) and MRC-MW115A-031717 (240-76938-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/21/2017 and 03/23/2017.

Methylene Chloride was detected in method blanks MB 240-271291/7 and MB 240-271642/7 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The MS/MSD for batch 271291 was not analyzed due to an instrument malfunction: Batch included: TB-031717 (240-76938-1), MRC-MW116A-031717 (240-76938-2) and MRC-MW57A-031717 (240-76938-3).

The laboratory control sample (LCS) for analytical batch 240-271642 recovered outside control limits for the following analyte: Methylcyclohexane. Methylcyclohexane has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified: MRC-MW95B-031717 (240-76938-4), MRC-MW115A-031717 (240-76938-5) and (LCS 240-271642/4).

The continuing calibration verification (CCV) analyzed in batch 240-271642 was outside the method criteria for the following analytes: 2-Hexanone and Methylcyclohexane. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analytes is considered estimated: MRC-MW95B-031717 (240-76938-4), MRC-MW115A-031717 (240-76938-5) and (CCVIS 240-271642/3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Client Tetra Tech Site Name _____ Cooler unpacked by: DSO

Cooler Received on 03/18/17 Opened on 03/18/17

FedEx: 1st Grd Exp UPS FAS Stetson Client Drop Off TestAmerica Courier Other _____

Receipt After-hours: Drop-off Date/Time _____ Storage Location _____

TestAmerica Cooler # _____ Foam Box Client Cooler Box Other _____

Packing material used: Bubble Wrap Foam Plastic Bag None Other _____

COOLANT: Wet Ice Blue Ice Dry Ice Water None

1. Cooler temperature upon receipt ☐ See Multiple Cooler Form

IR GUN# IR-8 (CF **-0.3** °C) Observed Cooler Temp. 3.6 °C Corrected Cooler Temp. 3.3 °C

IR GUN #36 (CF **+0.3**°C) Observed Cooler Temp. _____ °C Corrected Cooler Temp. _____ °C

2. Were custody seals on the outside of the cooler(s)? If Yes Quantity 1	Yes	No
-Were custody seals on the outside of the cooler(s) signed & dated?	Yes	No NA
-Were custody seals on the bottle(s) or bottle kits (LLHg/MeHg)?	Yes	No
3. Shippers' packing slip attached to the cooler(s)?	Yes	No
4. Did custody papers accompany the sample(s)?	Yes	No
5. Were the custody papers relinquished & signed in the appropriate place?	Yes	No
6. Was/were the person(s) who collected the samples clearly identified on the COC?	Yes	No
7. Did all bottles arrive in good condition (Unbroken)?	Yes	No
8. Could all bottle labels be reconciled with the COC?	Yes	No
9. Were correct bottle(s) used for the test(s) indicated?	Yes	No
10. Sufficient quantity received to perform indicated analyses?	Yes	No
11. Are these work share samples?	Yes	No
If yes, Questions 11-15 have been checked at the originating laboratory.		
11. Were sample(s) at the correct pH upon receipt?	Yes	No NA pH Strip Lot# **HC682547**
12. Were VOAs on the COC?	Yes	No
13. Were air bubbles >6 mm in any VOA vials?	Yes	No NA
14. Was a VOA trip blank present in the cooler(s)? Trip Blank Lot # B630301VB	Yes	No
15. Was a LL Hg or Me Hg trip blank present? _____	Yes	No

Contacted PM _____ Date _____ by _____ via Verbal Voice Mail Other

Concerning _____

14. CHAIN OF CUSTODY & SAMPLE DISCREPANCIES Samples processed by:

15. SAMPLE CONDITION

Sample(s) _____ were received after the recommended holding time had expired.

Sample(s) _____ were received in a broken container.

Sample(s) _____ were received with bubble >6 mm in diameter. (Notify PM)

16. SAMPLE PRESERVATION

Sample(s) _____ were further preserved in the laboratory.

Time preserved: _____ Preservative(s) added/Lot number(s): _____

Method 8260C

Volatile Organic Compounds (GC/MS) by Method 8260C

*Sample was analyzed for chlorinated benzenes only.

OVERVIEW

The sample set for MRC GW, SDG 240-77152-1, consists of three (3) groundwater environmental samples and one (1) trip blank. Samples were analyzed for volatile organic compounds (VOC), 1,4-dioxane, polychlorinated biphenyl (PCB) homologs, and select metals. No field duplicate pairs are included in this SDG.

The samples were collected by Tetra Tech on March 22, 2017 and analyzed by Test America. Analyses were conducted in accordance with SW-846 Methods 8260C (for VOC), 6020A (for metals), as well as EPA Method 522 (for 1,4-dioxane), and EPA Method 680 (for PCB homologs), analysis and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blanks, surrogate spike recoveries, laboratory control sample results, matrix spike/matrix spike duplicate results, internal standard areas and recoveries, analyte identification, analyte quantitation, and detection limits. Areas of concern with respect to data quality are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- Detected results below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

- The following analyte was detected in the VOC method blank at the following maximum concentration:

Maximum

Analyte	Concentration	Action Level
Methylene chloride	1.92 ug/L(1)	19.2 ug/L

[1] – Maximum concentration detected in method blank associated with preparation batch 272601 affecting all samples.

- Action levels of 10x the maximum concentrations of the common laboratory contaminant methylene chloride were used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were considered in evaluating for blank contamination. Results for methylene chloride were qualified as non-detected (U) in the affected environmental samples.
- The following analytes were detected in the metals calibration blanks at the following maximum concentration:

Analyte	Maximum Concentration	RL (< or >)
Antimony	0.826 ug/L	<RL
Beryllium	0.097 ug/L	<RL
Cobalt	0.062 ug/L	<RL
Iron	20.7 ug/L	<RL
Lead	0.165 ug/L	<RL
Molybdenum	0.841 ug/L	<RL
Silver	0.024 ug/L	<RL
Barium	1.30 ug/L	<RL
Copper	0.653 ug/L	<RL
Zinc	6.55 ug/L	<RL

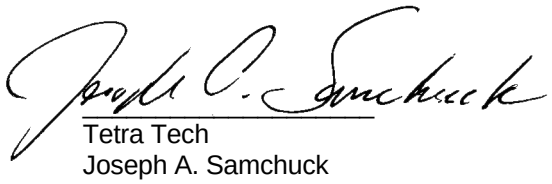
Detections less than the blank action level were qualified as nondetected (U). Dilution factors and sample aliquot were taken into consideration during the application of the blank action level.

NOTES

Non-detected results were reported to the MDL.

The laboratory case narrative report indicates that a VOC matrix spike (MS)/matrix spike duplicate (MSD) sample was not analyzed in batch 271291 due to an instrument malfunction. No validation action was necessary.

VOCs in sample MRC-MW43A-031517 were analyzed at a dilution factor of 250.



EXECUTIVE SUMMARY

Laboratory Performance Issues: None.

Other Factors Affecting Data Quality: Detected results below RL but above the MDL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA “National Functional Guidelines for Superfund Organic Methods Data Review” (January 2017) and “National Functional Guidelines for Inorganic Superfund Methods Data Review” (January 2017). The text of this report has been formulated to

address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-77152-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 522 1.4 Dioxane analysis was performed at TestAmerica Burlington Laboratory. The 680 PCB analysis was performed at TestAmerica Savannah Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/23/2017 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1º C.

1,4-DIOXANE
Samples MRC-MW74A-032217 (240-77152-2) and MRC-MW74B-032217 (240-77152-3) were analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/28/2017 and analyzed on 03/29/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples TB-032217 (240-77152-1), MRC-MW74A-032217 (240-77152-2) and MRC-MW74B-032217 (240-77152-3) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/30/2017.

Methylene Chloride was detected in method blank MB 240-272601/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Samples MRC-MW74A-032217 (240-77152-2)[3.33X] and MRC-MW74B-032217 (240-77152-3)[2500X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)
Samples MRC-MW74A-032217 (240-77152-2), MRC-MW74B-032217 (240-77152-3) and MRC-MW74C-032217 (240-77152-4) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA Method 680. The samples were prepared on 03/27/2017 and analyzed on 03/31/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICPMS)
Samples MRC-MW74A-032217 (240-77152-2) and MRC-MW74B-032217 (240-77152-3) were analyzed for total recoverable metals

(ICPMS) in accordance with EPA SW-846 Method 6020A. The samples were prepared on 03/24/2017 and analyzed on 03/27/2017.

Barium, Copper, Iron, Manganese and Zinc were detected in method blank MB 240-271839/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples MRC-MW74A-032217 (240-77152-2) and MRC-MW74B-032217 (240-77152-3) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 03/24/2017 and analyzed on 03/25/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Overview

The sample set for LMC-MRC Groundwater, SDG 240-77205-1 consisted of four (4) aqueous environmental samples and one (1) trip blank. Samples MRC-MW104A-032317, MRC-MW104B-032317, MRC-MW73B-032317 and TB-032317 were analyzed for volatile organic carbons (VOCs). Samples MRC-MW73A-032317 and MRC-MW73B-032317 were analyzed for 1,4-Dioxane and select metals. Samples MRC-MW104A-032317 and MRC-MW104B-032317 were analyzed for polychlorinated biphenyls (PCBs). No field duplicate sample pairs were included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 23, 2017 and analyzed by TestAmerica-Canton, TestAmerica-Burlington and TestAmerica-Savannah. All analyses were conducted in accordance with SW-846 Methods 8260C, 6020A and 7470A and EPA methods 522 and 680 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, ICP/MS tuning, initial/continuing calibrations, laboratory method/preparation/trip blank results, Interference Check Sample (ICS) recoveries, surrogate spike recoveries, laboratory control sample / laboratory control sample duplicate results, matrix spike / matrix spike duplicate recoveries, ICP serial dilution results, internal standard areas and recoveries, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The VOC initial calibration verification performed on instrument A3UX11 on 03/29/17 @ 15:09 had a percent difference (%D) for acetone which exceeded the quality control limit. All samples were affected. The non-detected results reported for acetone in the affected samples were qualified as

estimated, (UJ).

- The VOC continuing calibration performed on instrument A3UX11 on 03/31/17 @ 10:13 had percent differences (%Ds) for bromomethane, 2-butanone, 2-hexanone and bromoform which exceeded the quality control limits. Samples MRC-MW104A-032317, MRC-MW104B-032317 and MRC-MW73B-032317 were affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- The following analytes were detected in the laboratory instrument/method blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Reporting Limit (RL) > or <
Antimony(1)	1.21 ug/L	< RL
Cadmium(1)	0.064 ug/L	< RL
Cobalt(1)	0.035 ug/L	< RL
Molybdenum(1)	0.849 ug/L	< RL
Beryllium(1)	0.064 ug/L	< RL
Barium(2)	0.700 ug/L	< RL
Copper(2)	0.372 ug/L	< RL

(1) Maximum concentration present in an instrument blank.
(2) Maximum concentration present in a method blank.

The detected results reported below the RL for antimony and molybdenum were qualified as non-detected, (U).

- The internal standard recoveries for Lithium-6, Scandium-45, Rhodium-103 and Indium-115 were below the quality control limit for sample MRC-MW73A-032317. The detected and non-detected results reported for arsenic, barium, cadmium, chromium, cobalt, copper, nickel, selenium, silver, vanadium and zinc were qualified as estimated (J) and (UJ) respectively.

- The internal standard recoveries for Lithium-6, Scandium-45, Rhodium-103, Indium-115, Terbium-159, Holmium-165 and Bismuth-209 were below the quality control limit for sample MRC-MW73B-032317. The detected and non-detected results reported for arsenic, barium, cadmium, chromium, cobalt, copper, lead, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc were qualified as estimated (J) and (UJ) respectively.

- Detected results reported below the RL but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

Methylene chloride was detected in the method blank at a concentration of 1.92 ug/L. Sample TB-032317 was affected. Trip blanks are not qualified for laboratory blank contamination.

The continuing calibration verification internal standard area was greater than the quality control limit for Chrysene-d12 for sample MRC-MW104A-032317. No validation actions were warranted as all sample results were nondetects.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: Several CCV %Ds were noncompliant for the VOC fraction. Contaminants were detected in the laboratory preparation/method/field blanks. Several internal standard recoveries were noncompliant in the metals fraction.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and the "National Functional Guidelines for Inorganic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC 2017 GW

Report Number: 240-77205-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 522 1,4-Dioxane analysis was performed at the TestAmerica Burlington Laboratory. The 680 Polychlorinated Biphenyls analysis was performed at the TestAmerica Savannah Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT
The samples were received on 3/24/2017 9:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.5º C.

1,4-DIOXANE
Samples MRC-MW73A-032317 (240-77205-3) and MRC-MW73B-032317 (240-77205-4) were analyzed for 1,4-Dioxane in accordance with EPA Method 522. The samples were prepared on 03/28/2017 and analyzed on 03/29/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOLATILE ORGANIC COMPOUNDS (GCMS)
Samples MRC-MW104A-032317 (240-77205-1), MRC-MW104B-032317 (240-77205-2), MRC-MW73B-032317 (240-77205-4) and TB-032317 (240-77205-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 03/30/2017 and 03/31/2017.

Methylene Chloride was detected in method blank MB 240-272601/6 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The continuing calibration verification (CCV) for analytical batch 272768 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required: MRC-MW104A-032317 (240-77205-1), MRC-MW104B-032317 (240-77205-2) and MRC-MW73B-032317 (240-77205-4).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)
Samples MRC-MW104A-032317 (240-77205-1) and MRC-MW104B-032317 (240-77205-2) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA Method 680. The samples were prepared on 03/27/2017 and analyzed on 03/31/2017.

The internal standard response for the following sample was outside of acceptance limits when compared to the area of the CCVIS (continuing calibration verification internal standard). The 680 method allows that the sample also be compared to the average internal

standard area of the calibration (ICISAV). Due to limitations in the software, when the areas of the sample are out of control for either the CCVIS or the ICISAV both are flagged. Although a * flag appears on the data, the sample is within the area range for the average internal standard area of the calibration (ICISAV): MRC-MW104A-032317 (240-77205-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICPMS)

Samples MRC-MW73A-032317 (240-77205-3) and MRC-MW73B-032317 (240-77205-4) were analyzed for total recoverable metals (ICPMS) in accordance with EPA SW-846 Method 6020A. The samples were prepared on 03/28/2017 and analyzed on 03/29/2017 and 03/30/2017.

Barium, Copper and Iron were detected in method blank MB 240-272184/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples MRC-MW73A-032317 (240-77205-3) and MRC-MW73B-032317 (240-77205-4) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 03/28/2017 and analyzed on 03/29/2017.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TB-032717

Overview

The sample set for LMC-MRC Groundwater, SDG 240-77337-1 consisted of four (4) aqueous environmental samples and one (1) trip blank. All samples were analyzed for volatile organic carbons (VOCs). Samples MRC-MW37C-032717, MRC-SEMW-7I-032717, MRC-SEMW-8I-032717 and MRC-SEMW-8S-032717 were also analyzed for 1,4-Dioxane and polychlorinated biphenyls (PCBs). Samples MRC-SEMW-7I-032717, MRC-SEMW-8I-032717 and MRC-SEMW-8S-032717 were also analyzed for select metals. No field duplicate sample pairs were included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 27, 2017 and analyzed by TestAmerica-Canton, TestAmerica-Burlington and TestAmerica-Savannah. All analyses were conducted in accordance with SW-846 Methods 8260C, 6020A and 7470A and EPA methods 522 and 680 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, ICP/MS tuning, initial/continuing calibrations, laboratory method/preparation/trip blank results, Interference Check Sample (ICS) recoveries, surrogate spike recoveries, laboratory control sample / laboratory control sample duplicate results, matrix spike / matrix spike duplicate recoveries, ICP serial dilution results, internal standard areas and recoveries, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

No major issues were identified.

Minor

- The VOC initial calibration verification performed on instrument A3UX11 on 03/29/17 @ 15:09 had a percent difference (%D) for acetone which exceeded the quality control limit. Sample TB-032717 was affected. The non-detected result reported for acetone in the affected sample was qualified as estimated, (UJ).

- The VOC continuing calibration performed on instrument A3UX11 on 03/31/17 @ 10:13 had percent

differences (%Ds) for bromomethane, 2-butanone, 2-hexanone and bromoform which exceeded the quality control limits. Sample TB-032717 was affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- The VOC continuing calibration performed on instrument A3UX9 on 04/04/17 @ 21:45 had %Ds for dichlorodifluoromethane and 2-butanone which exceeded the quality control limits. Samples MRC-MW37C-032717, MRC-SEMW-7I-032717, MRC-SEMW-8I-032717 and MRC-SEMW-8S-032717 were affected. The non-detected results reported for the aforementioned compounds in the affected samples were qualified as estimated, (UJ).

- The following analytes were detected in the laboratory instrument/method blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Reporting Limit (RL) > or <
Antimony(1)	0.834 ug/L	< RL
Beryllium(1)	0.0570 ug/L	< RL
Cobalt(1)	0.0560 ug/L	< RL
Molybdenium(1)	0.696 ug/L	< RL
Selenium(1)	0.314 ug/L	< RL
Thallium(1)	0.0840 ug/L	< RL
Copper(2)	0.639 ug/L	< RL
Lead(2)	0.169 ug/L	< RL

(1) Maximum concentration present in an instrument blank.
(2) Maximum concentration present in a method blank.

The detected results reported below the reporting limit (RL) for molybdenum, selenium, copper and lead were qualified as non-detected, (U).

- The internal standard recoveries for Lithium-6, Scandium-45, Indium-115 were below the quality control limit for samples MRC-SEMW-7I-032717 and MRC-SEMW-8I-032717. The detected and non-detected results reported for arsenic, barium, beryllium, cadmium, chromium, cobalt, nickel, selenium and vanadium were qualified as estimated (J) and (UJ) respectively.

- The internal standard recoveries for Lithium-6, Scandium-45, Rhodium-103 and Indium-115 were below the quality control limit for sample MRC-SEMW-8S-032717. The detected and non-detected results reported for arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, molybdenum, nickel, selenium, silver, vanadium and zinc were qualified as estimated (J) and (UJ) respectively.

- Detected results reported below the RL but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

Samples MRC-SEMW-7I-032717, MRC-SEMW-8S-032717 and MRC-SEMW-8I-032717 were analyzed at a dilution for the VOC analyses. The detection limits of the non-detected results were elevated.

The PCB surrogate decachlorobiphenyl-13C12 was above the quality control limit for sample MRC-MW37C-032717. No validation actions were warranted as all sample results were nondetects.

The matrix spike (MS) and/or matrix spike duplicate (MSD) percent recoveries for all PCBs except monochlorobiphenyls for sample MRC-MW37C-032717 were above the quality control limit. No validation actions were warranted based on MS/MSD recoveries alone.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: Several CCV %Ds were noncompliant for the VOC fraction. Contaminants were detected in the laboratory preparation/method/field blanks. Several internal standard recoveries were noncompliant in the metals fraction.

Other Factors Affecting Data Quality: Results below the RL were estimated.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and the "National Functional Guidelines for Inorganic Superfund Methods Data Review" (January 2017). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's r < 0.995
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient r < 0.995
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

CAS NO.	COMPOUND NAME	RESULT	Q	RL	MDL
71-55-6	1,1,1-Trichloroethane	460	U	2000	460
79-34-5	1,1,2,2-Tetrachloroethane	640	U	2000	640
76-13-1	1,1,2-Trichloro-1,2,2-trifluoroethane	820	U	2000	820
79-00-5	1,1,2-Trichloroethane	680	U	2000	680
75-34-3	1,1-Dichloroethane	500	U	2000	500
75-35-4	1,1-Dichloroethene	540	U	2000	540
120-82-1	1,2,4-Trichlorobenzene	540	U	2000	540
96-12-8	1,2-Dibromo-3-Chloropropane	940	U	4000	940
106-93-4	Ethylene Dibromide	460	U	2000	460
95-50-1	1,2-Dichlorobenzene	520	U	2000	520
107-06-2	1,2-Dichloroethane	600	U	2000	600
78-87-5	1,2-Dichloropropane	600	U	2000	600
541-73-1	1,3-Dichlorobenzene	640	U	2000	640
106-46-7	1,4-Dichlorobenzene	460	U	2000	460
78-93-3	2-Butanone (MEK)	2000	U	20000	2000
591-78-6	2-Hexanone	2500	U	20000	2500
108-10-1	4-Methyl-2-pentanone (MIBK)	1400	U	20000	1400
67-64-1	Acetone	3500	U	20000	3500
71-43-2	Benzene	560	U	2000	560
75-27-4	Dichlorobromomethane	600	U	2000	600
75-25-2	Bromoform	860	U	2000	860
74-83-9	Bromomethane	840	U	2000	840
75-15-0	Carbon disulfide	680	U	2000	680
56-23-5	Carbon tetrachloride	700	U	2000	700
108-90-7	Chlorobenzene	640	U	2000	640
75-00-3	Chloroethane	820	U	2000	820
67-66-3	Chloroform	620	U	2000	620
74-87-3	Chloromethane	860	U	2000	860
