QC Flag Legend

a - Target compound detected but, quantitated amount
Below Limit Of Quantitation(BLOQ).
M - Compound response manually integrated.

QC Flag Legend

a - Target compound detected but, quantitated amount Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount exceeded maximum amount.
R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.

QC Flag Legend

T - Target compound detected outside RT window.
a - Target compound detected but, quantitated amount Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount exceeded maximum amount.
Q - Qualifier signal failed the ratio test.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

Overview

The sample set for Lockheed Middle River, SDG MID-6, consists of twenty (20) sediment environmental samples.

All samples were analyzed for select metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc) and hexavalent chromium. Samples SD-25-SS, SD-27-SS, SD-31-02, SD-33-SS, and SD-35-SS were also analyzed for total organic carbon (TOC). The samples were collected by Tetra Tech NUS on October 21, 2005 and analyzed by Katahdin Analytical Services. Metals analyses except mercury were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7471A. Hexavalent chromium analyses were conducted using SW-846 method 7196A. TOC analyses were conducted using the Lloyd Kahn method.

Summary

All analytes were successfully analyzed. The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, calibration data, laboratory method/preparation blanks, interference check sample (ICS) results, matrix spike results, laboratory duplicate results, laboratory control sample (LCS) results, ICP serial dilution results, detection limits, and analyte quantitation.

All metals analyses, with the exception of mercury, were conducted using Inductively Coupled Plasma (ICP) methodology. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

Minor Problems

- Percent solids were <30% in samples SD-26-SS, SD-28-SS, SD-30-SS, SD-32-SS, SD-33-SS, and SD-35-SS. Positive and nondetected results were qualified as estimated, (J) and (UJ), respectively for all analytes in these samples.

- The contract required detection limit (CRDL) standards run on 11/2/05 at 12:32 and 16:59 and on 11/3/05 at 01:36 had percent recoveries (%Rs) <90% for silver. Positive results <2X the CRDL and nondetects reported for silver were qualified as biased low, (L) and (UL), respectively. Positive results <2X the CRDL reported for silver in samples with %solids <30% were qualified as estimated (J) due to conflicting directional bias.

- The CRDL standard run on 11/3/05 at 01:36 had a %R <90% for thallium. Nondetected results reported for thallium in the associated samples were qualified as biased low (UL). Nondetected results reported for thallium in the associated samples with %solids <30% were qualified as estimated (UJ) due to conflicting directional bias.

- The CRDL standards run on 11/4/05 at 14:32 and 16:34 had %Rs <90% for selenium. Nondetected results reported for selenium in the associated samples were qualified as biased low (UL). Nondetected results reported for selenium in the associated samples with %solids <30% were qualified as estimated (UJ) due to conflicting directional bias.

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Mercury[(1)]	0.014 mg/kg	0.07 mg/kg
Selenium	4.63 ug/L	2.32 mg/kg
Thallium	6.26 ug/L	3.13 mg/kg
Vanadium[(2)]	0.158 mg/kg	0.79 mg/kg
Zinc	57.81 ug/L	28.91 mg/kg

(1) Maximum concentration was present in preparation blank from batch SVJ26HGS0.
(2) Maximum concentration was present in preparation blank from batch SVJ27ICS0.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the action level for mercury, selenium, and thallium were qualified (B) as a result of laboratory blank contamination. The remaining analytes were not qualified because the results were either greater than the action level or they were nondetects.

- The matrix spike (MS) and matrix spike duplicate (MSD) performed on sample SD-25-SS had %Rs <75% for antimony. Positive and nondetected results reported for antimony were qualified as biased low, (L) and (UL), respectively. Positive and nondetected results reported for antimony in samples with %solids <30% were qualified as estimated, (J) and (UJ), respectively, due to conflicting directional bias.

- The MS performed on sample SD-27-SS had %Rs <75% for antimony and >125% for mercury. The MSD performed on sample SD-27-SS had %Rs <30% for antimony and >125% for mercury. Positive and nondetected results reported for antimony were qualified as biased low, (L) and (UL), respectively. Positive and nondetected results reported for antimony in samples with %solids <30% were qualified as estimated, (J) and (UJ), respectively, due to conflicting directional bias. Positive results reported for mercury were qualified as estimated (J) due to conflicting directional bias.

- The MS and MSD performed on sample SD-31-02 had %Rs <75% for antimony and mercury and >125% for chromium. The MSD performed on sample SD-31-02 had a %R >125% for copper and the MS was compliant. Positive and nondetected results reported for antimony were qualified as biased low, (L) and (UL), respectively. Positive and nondetected results reported for antimony in samples with %solids <30% were qualified as estimated, (J) and (UJ), respectively, due to conflicting directional bias. Positive results reported for copper and mercury were qualified as estimated (J) due to conflicting directional bias. Positive results reported for chromium were qualified as biased high (K). Positive results reported for chromium in samples with %solids <30% were qualified as estimated (J).

- The MSs performed on samples SD-25-SS, SD-27-SS, and SD-31-02 had %Rs <75% for hexavalent chromium. Nondetected results reported for hexavalent chromium were qualified as biased low (UL). Nondetected results reported for hexavalent chromium in samples with %solids <30% were qualified as estimated (UJ) due to conflicting directional bias.

- The MS and MSD performed on sample SD-25-SS and the MS performed on sample SD-27-SS had %Rs >125% for TOC. Positive results reported for TOC were qualified as biased high (K). Positive results reported for TOC in samples with %solids <30% were qualified as estimated (J) due to conflicting directional bias.

- The ICP serial dilution performed on sample SD-31-02 had a percent difference (%D) >10% and an initial sample concentration >50X the IDL for copper. Positive results reported for copper were qualified as estimated (J).

Notes

The continuing calibration verification (CCV) standards run on 11/2/05 at 20:12 and 21:38 had %Rs <90% for vanadium. No qualification action was required because no samples that were associated with these standards were analyzed for vanadium.

The CCV standard run on 11/4/05 at 01:09 had %Rs >110% for calcium, magnesium, and selenium. No qualification action was required because no samples that were associated with this standard were analyzed for calcium, magnesium, and selenium.

The CRDL standards run on 11/2/05 at 16:59 and 21:17 had %Rs <90% for copper. No qualification action was required because all copper results were >2X the CRDL.

The CRDL standards run on 11/2/05 at 16:59 and on 11/3/05 at 01:36 had %Rs <90% for selenium. No qualification action was required because no samples that were associated with these standards were analyzed for selenium.

The CRDL standards run on 11/2/05 at 21:17 and on 11/3/05 at 01:36 had %Rs <90% for lead. No qualification action was required because all lead results were >2X the CRDL.

The CRDL standard run on 11/2/05 at 21:17 had a %R <90% for vanadium. No qualification action was required because all vanadium results in the associated samples were >2X the CRDL.

The CRDL standards run on 11/3/05 at 19:04 and 23:22 and on 11/4/05 at 03:40 had %Rs >110% for selenium. No qualification action was required because all selenium results were either previously qualified for laboratory blank contamination or they were nondetects.

The CRDL standard run on 10/27/05 at 11:37 had a %R >120% for mercury. No qualification action was required because all mercury results were either >2X the CRDL or they were previously qualified for laboratory blank contamination.

The interference check sample (ICS) AB solution run on 11/2/05 at 21:31 had a %R <80% for selenium. No qualification action was required because no interfering analytes were present in any samples.

Dilutions were performed for selenium and vanadium in sample SD-29-02 due to matrix interference.

Dilutions were performed for all metals except mercury in sample SD-31-01 due to matrix interference.

Executive Summary

Laboratory Performance: Several analytes were qualified due to calibration noncompliance. Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: All analytes in several samples were qualified due to %solids <30%. Several analytes were qualified due to matrix spike noncompliance. Copper was qualified due to ICP serial dilution noncompliance.

The data for these analyses were reviewed with reference to the USEPA Region III modifications to "National Functional Guidelines for Inorganic Review", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

U - Value is a nondetect as reported by the laboratory.

UJ - Nondetected result is considered estimated as a result of technical noncompliance.

UL - Nondetected result is considered biased low as a result of technical noncompliance.

B - Positive result is considered to be an artifact of blank contamination and should not be considered present.

J - Positive result is considered estimated as a result of technical noncompliance.

K - Positive result is considered biased high as a result of technical noncompliance.

L - Positive result is considered biased low as a result of technical noncompliance.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on October 22, 2005 and were logged in under Katahdin Analytical Services work order number WV5605 for a hardcopy due date of October 28, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5605-1	SD-24-SS
WV5605-2	SD-25-SS
WV5605-3	SD-26-SS
WV5605-4	SD-27-SS
WV5605-5	SD-27-01
WV5605-6	SD-27-02
WV5605-7	SD-28-SS
WV5605-8	SD-28-01
WV5605-9	SD-28-02
WV5605-10	SD-29-SS
WV5605-11	SD-29-01
WV5605-12	SD-29-02
WV5605-13	SD-30-SS
WV5605-14	SD-31-SS
WV5605-15	SD-31-01
WV5605-16	SD-31-02
WV5605-17	SD-32-SS
WV5605-18	SD-33-SS
WV5605-19	SD-34-SS
WV5605-20	SD-35-SS

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SDG MID-6 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Samples WV5605-3, 4, and 16 were used for the matrix spike (MS) and matrix spike duplicate (MSD), per the client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The LCS WG22183-1 had greater than ten percent of the spiked analytes with recoveries that were high and outside of the laboratory established acceptance limits. Since the LCS is associated only with the MS/MSD, the MS/MSD were not reanalyzed.

The analysis of samples labeled WV5605-10RA and 15 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The initial analysis of WV5605-10 had a low recovery for one surrogate, while the reanalysis of sample WV5605-15 had both low responses for internal standards and low recoveries for surrogates. The results for both analyses are reported.

The analysis of samples WV5605-5, 7, 10, 11, 11RA, 17, 17RA, 18, and 19 had low recoveries for one or more surrogates, which were outside of the laboratory established acceptance limits. The second analysis of these samples also low surrogate recoveries. The results for both analyses are reported.

The analysis of samples WV5605-5RA, 7RA, 15RA, 19RA and 20 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. These analyses also had low surrogate recoveries. The second analyses of these samples also had both low

internal standard responses and low surrogate recoveries. The results for both analyses are reported.

The first analysis of sample WV5605-20 low responses for all four internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The second analysis of this sample had a low recovery for one surrogate. The third analysis of this sample, WV5605-20RA2, also had a low recovery for one surrogate. The result for WV5605-20RA2 is included in the report.

8082 Analysis

Sample WV5605-1, the method blank, WG22135-1, and the laboratory control samples, WG21992-2RA and 3RA, had high recoveries for the extraction surrogate TCX on one or both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for DCB were acceptable on both channels, the associated samples were not reextracted.

Samples WV5605-7, 8 and 11, had high recoveries for the extraction surrogate DCB on channel B, which was outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the samples were not reextracted.

The MS/MSD, WG22135-3 and 4, had high recoveries for Aroclor 1016 and low recoveries for Aroclor 1260, which were outside of the laboratory established acceptance limits. Based on the sample chromatograms, the discrepancies are likely due to the matrix of the sample. Since the associated LCS was acceptable, no corrective action was taken.

The MS/MSD, WG22135-5 and 6, had high recoveries for Aroclor 1260 and Aroclor 1016, which were outside of the laboratory established acceptance limits. The concentrations in the MS and MSD were high and outside of the calibration range. The discrepancies are likely due the high concentration of Aroclor 1260 in the native sample, WV5605-4 and also due to the matrix of the sample. The laboratory policy is not to reanalyze MS and MSD's for dilutions. These samples also had high recoveries for TCX and/or DCB on one channel, which were outside of the laboratory established acceptance limits.

The MS/MSD, WG22135-7 and 8, had high recoveries for Aroclor 1016, which were outside of the laboratory established acceptance limits. Based on the sample chromatograms, the discrepancies are likely due to the matrix of the sample. These samples also had high recoveries for TCX and/or DCB on one channel, which were outside of the laboratory established acceptance limits. Since the associated LCS was acceptable, no corrective action was taken.

The CV standards (files 6VJ8002, 6VK2040 and 6VK2048) had high responses for DCB on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable on channel A, the associated samples were not reanalyzed.

The CV standards (files 6VJ7115, 6VK1002, 6VK1040 and 6VK1048) had high responses for TCX on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable on channel B, the associated samples were not reanalyzed.

The CV standards (files 6VJ7034 and 6VJ8034) had high responses for Aroclor 1016 on both channels and Aroclor 1260 on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since a high response would indicate a high bias and Aroclor 1016 was not detected in the associated sample above the PQL and the response for Aroclor 1260 was acceptable on channel A, the associated samples were not reanalyzed.

The closing CV standards (files 6VJ7098 and 6VJ8098) had high responses for Aroclor 1016, Aroclor 1260 and DCB on both channels and TCX on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the opening CV's had acceptable responses, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VJ7034, 6VJ8034, 6VJ8098, 6VK1026 and 6VK2026) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of DCB on channel B for file 6VJ8098, which was high, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 10/07/05 on the K instrument had %RSD values for several analyte that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes hexachlorocyclopentadiene, 2-chloronaphthalene 4-nitrophenol and benzidine failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected any of the aforementioned target analytes above the PQL, the samples were not reanalyzed.

The initial calibration analyzed on 10/22/05 on the X instrument had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes benzoic acid, 2-chloronaphthalene, 4-nitrophenol, and 2,4-dinitrophenol failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected any of the aforementioned target analytes above the PQL, the samples were not reanalyzed.

The initial calibration analyzed on 10/29/05 on the X instrument had %RSD values for eight analytes that exceeded the method acceptance limit of 15%. For these analytes, a linear or

quadratic model was used for quantitation instead of an average response factor. The target analytes N-nitroso-di-n-propylamine, hexachlorocyclopentadiene, 2-chloronaphthalene, anthracene, benzidine, pyrene, and the surrogate terphenyl-d14 failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model.

The initial calibration standard (file X9008) had a response for the internal standards perylene-d12, which was low and outside the method acceptance limits of -50% to +100% of the responses of the internal standard of the mid-point level calibration standard from the initial calibration performed on 10/29/05.

Samples WV5605-1, 3, 5, 6, 8, 9, 10, 12, 14, 15, 17 and 18 had high and/or low recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. Samples WV5605-1, 2, 4, 7, 10, 11, 13, and 19 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The laboratory method blanks WG21977-1 and WG22096-1 and MSD WG22096-4 had low or high recoveries for one surrogate. The MS WG21977-4, WG22096-3 and WG22096-5 and the MSD WG22096-4 and 6 had low responses for one or more internal standards. The client was contacted and notified the laboratory to accept the data as long as the surrogate recoveries were greater than 15%, and the internal standard responses were at least 15% of the internal standard of the daily calibration verification standard. Since the surrogate recoveries and internal standard responses met these criteria, these samples were not reextracted.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG MID-6 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectrometric Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5605-(1-20) were digested for ICP analysis on 10/27/05 (QC Batch VJ27ICS0) in accordance with USEPA Method 3050B. Katahdin Sample Nos. WV5605-(2, 4, and 16) were prepared with duplicate matrix-spiked aliquots.

ICP analyses of SDG MID-6 sample digestates were performed using a Thermo Jarrell Ash Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WV5605-(1-20) were digested for mercury analysis on 10/26/05 (QC Batch VJ26HGS0) in accordance with USEPA Method 7471A. Katahdin Sample Nos. WV5605-(2, 4, and 16) were prepared with duplicate matrix-spiked aliquots.

Mercury analyses of Katahdin SDG MID-6 sample digestates were performed using a Cetac M6100 automated mercury analyzer in accordance with USEPA Method 7471A. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

Both of the matrix-spiked aliquots of Katahdin Sample No. WV5605-2 are outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for antimony.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5605-2 is within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all analytes.

Both of the matrix-spiked aliquots of Katahdin Sample No. WV5605-4 are outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for antimony and mercury.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5605-4 is outside the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for antimony.

One or both of the matrix-spiked aliquots of Katahdin Sample No. WV5605-16 are outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for antimony, chromium, copper, and mercury.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5605-16 is outside the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for copper.

Low matrix spike recoveries for antimony in soil samples are common, and are attributed to loss of insoluble antimony compounds during filtration of the digestates. Sample inhomogeneity may also be a factor in these matrix spike failures.

The serial dilution analyses of Katahdin Sample Nos. WV5605-(2 and 4) are within the laboratory's ICP serial dilution acceptance limit (<10% difference between the original sample result and the result for a 5-fold dilution of the sample, if the result for the dilution is at least ten times the instrument detection limit) for all analytes.

The serial dilution analysis of Katahdin Sample No. WV5605-16 is outside the laboratory's ICP serial dilution acceptance limit (<10% difference between the original sample result and the result

for a 5-fold dilution of the sample, if the result for the dilution is at least ten times the instrument detection limit) for copper.

Wet Chemistry Analysis

The samples of SDG MID-6 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses for Total organic Carbon (TOC) were performed according to "Determination of Total Organic Carbon in Sediment", Lloyd Kahn, USEPA Region II, 7/88.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding time. All quality control criteria were met, with the following exceptions:

The recoveries of hexavalent chromium from the matrix spike aliquots of Katahdin Sample Nos. WV5605-2 (46%), WV5605-4 (46%) and WV5605-16 (45%) are outside the laboratory's acceptance limits of 75% - 125%. Low matrix spike recoveries for hexavalent chromium may indicate the presence of reducing conditions in the sample.

The recoveries of TOC from the matrix spike (166%) and matrix spike duplicate (126%) aliquots of Katahdin Sample No. WV5605-2 are outside the laboratory's acceptance limits of 75% - 125%. The recovery of TOC from the matrix spike (129%) aliquot of Katahdin Sample No. WV5605-4 is outside the laboratory's acceptance limits of 75% - 125%.

No other deviations were noted by the Wet Chemistry group.

Overview

The sample set for Lockheed Middle River, SDG MID-6 consists of twenty (20) environmental sediment samples. All samples were analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC) and polychlorinated biphenyls (PCB).

The samples were collected by Tetra Tech NUS on October 21, 2005 and analyzed by Katahdin Analytical Services. All analyses were conducted in accordance with Quality Assurance/Quality Control (QA/QC) criteria using SW-846 8260B, 8270C, and 8082 analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike recoveries, internal standard recoveries, and detection limits. Areas of concern are listed below.

Major

- The VOC initial calibration performed on October 25, 2005 on the GCMS-Z instrument and all associated continuing calibrations were below the 0.05 RRF quality control criterion for tert-butyl alcohol, acetone, and 2-butanone. No action was taken for acetone on this basis because all results were qualified for method blank contamination. Positive and non-detected results for the remaining aforementioned compounds were qualified as estimated (J) and rejected (UR) respectively, in samples SD-24-SS, SD-25-SS, SD-26-SS, SD-27-01, SD-27-02, SD-27-SS, SD-28-01, SD-28-02, SD-28-SS, SD-29-SS, SD-33-SS, and SD-35-SS.

- The VOC continuing calibration performed on October 27 at 07:19 on the GCMS-M instrument was below the 0.05 RRF quality control criterion for tert-butyl alcohol and acetone. No action was taken for acetone on this basis because all results were qualified for method blank contamination. Non-detected results for tert-butyl alcohol were rejected (UR) in samples SD-29-01, SD-29-02, SD-30-SS, SD-31-01, SD-31-02, SD-31-SS, SD-32-SS, and SD-34-SS.

- The percent recovery of carbon disulfide and trichloroethene were <10% in the MS/MSD performed on the VOC fraction of sample SD-25-SS. Non-detected results for carbon disulfide and trichloroethene were rejected (UR) in sample SD-25-SS.

- The percent recovery of hexachloroethane and hexachlorocyclopentadiene were <10% in the MS/MSD performed on sample SD-31-02. Non-detected results for hexachloroethane and hexachlorocyclopentadiene were rejected (UR) in the un-spiked sample SD-31-02.

- The percent recovery of hexachlorocyclopentadiene was <10% in the MS/MSD performed on the SVOC fraction of sample SD-25-SS. Several other minor recovery non-compliances were noted in this MS/MSD. The non-detected result for hexachlorocyclopentadiene was rejected (UR) in sample SD-25-SS. No further qualifications were made on this basis.

- The percent recovery of hexachlorocyclopentadiene was <10% in the MS/MSD performed on the SVOC fraction of sample SD-27-SS. Several other minor recovery non-compliances were noted in this MS/MSD. The non-detected result for hexachlorocyclopentadiene was rejected (UR) in sample SD-27-SS. No further qualifications were made on this basis.

Minor

- The following compounds were detected in the method blanks:

Compound	Maximum Concentration	Blank Action Level
Acetone	6 µg/kg	60 µg/kg
Methylene chloride	5 µg/kg	50 µg/kg
Styrene	0.4 µg/kg	2.0 µg/kg
1,2-Dichlorobenzene	0.4 µg/kg	2.0 µg/kg
Naphthalene	4 µg/kg	20 µg/kg
1,3-Dichlorobenzene	0.4 µg/kg	2.0 µg/kg
1,2,4-Trichlorobenzene	3.0 µg/kg	15 µg/kg
1,4-Dichlorobenzene	32 µg/kg	160 µg/kg
Acenaphthene	68 µg/kg	340 µg/kg

Sample aliquot and dilution factors were taken into consideration when applying the blank action levels. Positive results for the aforementioned compounds below the action level were qualified as non-detected (B). The trip blanks were not qualified for method blank contamination.

- Samples SD-27-01, SD-28-SS, SD-29-01, SD-29-SS, SD-32-SS, SD-33-SS, and SD-34-SS had low surrogate recoveries in the VOC fraction. Samples SD-27-01, SD-28-SS, SD-29-01, SD-32-SS, and SD-34-SS were re-analyzed with similar results. The initial analyses of samples SD-27-01, SD-28-SS, SD-29-01, SD-32-SS, and SD-34-SS were used for validation. Positive and non-detected results not previously rejected or qualified for blank contamination were qualified as estimated (J) and (UJ) respectively, in samples SD-29-01, SD-32-SS, and SD-34-SS because one surrogate was non-compliant. Positive and non-detected results were qualified as biased low (L) and (UL) respectively, in samples SD-27-01 and SD-28-SS because two or more surrogates were non-compliant and below criteria. Samples SD-29-SS and SD-33-SS were re-analyzed with compliant surrogate recoveries. The re-analyses of samples SD-29-SS and SD-33-SS were used for validation. No qualifications were made to samples SD-29-SS and SD-33-SS on this basis.

- According to the laboratory narrative, volatile sample SD-35-SS was analyzed three times. The first analysis had all internal standards below the recovery criterion, the second analysis had one surrogate below recovery criterion, and the third analysis had one surrogate below criterion. The validator could only verify the third analysis because the first two analyses were not reported. Positive and non-detected results not previously rejected or qualified for blank contamination were qualified as estimated (J) and (UJ) respectively, in sample SD-35-SS.

- The percent recovery and/or RPD of the majority of spiked compounds were outside the quality control criteria in the MS/MSD performed on the VOC fraction of samples SD-25-SS and SD-27-SS. Positive and non-detected results for all compounds not previously rejected or qualified for blank contamination were qualified as estimated (J) and (UJ) respectively, in samples SD-25-SS and SD-27-SS.

- All internal standards were below the percent recovery quality control criterion in sample SD-31-01. The sample was re-analyzed with all internal standards recovered <25%. The initial analysis was used for validation. Positive and non-detected results not previously rejected or qualified for blank contamination were qualified as estimated low (J) and (UJ) respectively, in sample SD-31-01.

- The VOC internal standard 1,4-dichlorobenzene-d4 was below the percent recovery quality control criterion in the re-analysis of sample SD-29-SS. Because the re-analysis was used for validation, positive and non-detected results for isopropylbenzene, bromobenzene, n-propylbenzene, 1,1,2,2-tetrachloroethane, 2-chlorotoluene, 1,2,3-trichloropropane, 4-chlorotoluene, 1,2,4-trimethylbenzene, 4-isopropyltoluene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, n-butylbenzene, sec-butylbenzene, 1,2-dichlorobenzene, 1,2-dibromo-3-chloropropane, hexachlorobutadiene, 1,2,4-trichlorobeznene, 1,2,3-trimethylbenzene, naphthalene, and 1,2,3-trichlorobenzene were qualified as biased low (L) and (UL) respectively, in sample SD-29-SS. No action was taken for tert-butylbenzene on this basis because the result was rejected for RRF non-compliance.

- The SVOC continuing calibration performed on October 29 at 11:35 on the GCMS-K instrument exceeded the 25% (and was >50%) difference quality control criterion for benzyl alcohol. Non-detected results for benzyl alcohol were qualified as estimated (UJ) in samples SD-30-SS, SD-31-01, SD-31-02, SD-31-SS, SD-32-SS, SD-33-SS, SD-34-SS, and SD-35-SS.

- The SVOC continuing calibration performed on October 30 at 20:24 on the GCMS-K instrument exceeded the 25% (and was >50%) difference quality control criterion for benzyl alcohol. Non-detected results for benzyl alcohol were qualified as estimated (UJ) in samples SD-25-SS and SD-27-SS.

- The SVOC surrogates 2-fluorophenol, nitrobenzene-d5, and terphenyl-d4 were below the percent recovery quality control criterion in sample SD-33-SS. Positive and non-detected results were qualified as estimated (J) and (UJ) in the base/neutral fraction of sample SD-33-SS. No action was taken for the acid fraction because only one acid fraction surrogate was non-compliant.

- The percent recovery and/or RPD of the majority of spiked compounds were outside the quality control criteria in the MS/MSD performed on the SVOC fraction of sample SD-31-02. Positive and non-detected results for all compounds except hexachloroethane and hexachlorocyclopentadiene were qualified as estimated (J) and (UJ) respectively, in sample SD-31-02. Hexachloroethane and hexachlorocyclopentadiene were previously rejected because the recoveries were <10%.

- The SVOC internal standard perylene-d12 was below the percent recovery quality control criterion in samples SD-25-SS, SD-27-SS, SD-29-01, SD-30-SS, and SD-34-SS. Positive and non-detected results for di-n-octylphthalate, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene were qualified as estimated (J) and (UJ) respectively, in the aforementioned samples.

- The SVOC internal standards chrysene-d12 and perylene-d12 were below the percent recovery quality control criterion in samples SD-28-SS, SD-29-SS, and SD-24-SS. Positive and non-detected results for benzidine, pyrene, butylbenzylphthalate, benzo(a)anthracene, chrysene, 3,3'-dichlorobenzidine, bis(2-ethylhexyl)phthalate, di-n-octylphthalate, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene were qualified as estimated (J) and (UJ) respectively, in the aforementioned samples.

- The PCB continuing calibration performed on October 28 at 03:59 exceeded the 15% (but was <30%) difference quality control criterion for Aroclor 1260 on the RTX-35 column. The result for Aroclor 1260 was qualified as estimated (UJ) in sample SD-24-SS because the result was reported from the RTX-35 column.

- The PCB continuing calibration performed on October 31 at 02:29 exceeded the 15% (but was <30%) difference quality control criterion for Aroclor 1016 and Aroclor 1260 on both columns. No action was taken for Aroclor 1016 on this basis because all results were non-detected. Positive results for Aroclor 1260 were qualified as estimated (J) in samples SD-25-SS, SD-26-SS, SD-27-01, and SD-27-02.

- The percent recovery of Aroclor 1016 and Aroclor 1260 grossly exceeded the quality control criterion in the MS/MSD performed on sample SD-27-SS. In addition, the recoveries of Aroclor 1260 exceeded the relative percent difference quality control criterion. Positive and non-detected results were qualified as estimated (J) and (UJ) in sample SD-27-SS because there was a high concentration of un-identified contamination in addition to the high concentration of Aroclor 1260.

- The results for Aroclor 1260 exceeded the 25% difference between analytical columns quality control criterion in sample SD-28-01. The result for Aroclor 1260 was qualified as estimated (UJ) in sample SD-28-01.

- Positive and non-detected results were qualified as estimated (J) and (UJ) in samples with percent solids <30%.

- Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

Notes

The VOC continuing calibrations performed on October 27 at 06:26 and 16:51 and October 28 at 07:27 on the GCMS-Z instrument exceeded the 25% (but was <50%) difference quality control criterion for 1,2,3-trichloropropane. No action was taken on this basis because all associated results for 1,2,3-trichloropropane were non-detected.

The VOC continuing calibration performed on October 27 at 16:51 on the GCMS-Z instrument exceeded the 25% (but was <50%) difference quality control criterion for naphthalene. No action was taken on this basis because all associated results for the aforementioned compounds were non-detected.

The VOC continuing calibration performed on October 27 at 07:19 on the GCMS-M instrument exceeded the 25% (but was <50%) difference quality control criterion for 2-butanone and tert-butyl alcohol. No action was taken on this basis because the associated results for the aforementioned compounds were non-detected or rejected for RRF non-compliance.

The VOC continuing calibrations performed on October 27 at 18:24 on the GCMS-M instrument and on October 29 at 10:15 on the GCMS-Z instrument were not evaluated because only QC samples were associated with these calibrations.

Minor blank spike recovery non-compliances were noted in the VOC fraction. No action was taken on this basis because the non-compliances varied in the different LCS samples.

All internal standards were below the percent recovery quality control criterion in the re-analysis of sample SD-28-SS. No action was taken on this basis because the initial analysis was used for validation.

The internal standard 1,4-dichlorobenzene-d4 was also below the percent recovery quality control criterion in the re-analyses of samples SD-27-01 and SD-34-01. No action was taken on this basis because the initial analyses of the aforementioned samples were used for validation.

The SVOC continuing calibration performed on October 29 at 11:35 on the GCMS-K instrument exceeded the 25% (but was <50%) difference quality control criterion for benzoic acid, 2-methylnaphthalene, benzidine, and 4-nitrophenol. No action was taken on this basis because all associated results for the aforementioned compounds were non-detected.

The SVOC continuing calibration performed on October 30 at 20:24 on the GCMS-K instrument exceeded the 25% (but was <50%) difference quality control criterion for benzoic acid. No action was taken on this basis because all associated results for benzoic acid were non-detected.

The SVOC continuing calibration performed on October 30 at 18:27 on the GCMS-X instrument exceeded the 25% (but was <50%) difference quality control criterion for benzoic acid. No action was taken on this basis because all associated results for benzoic acid were non-detected.

The SVOC surrogate terphenyl-d14 was outside the percent recovery quality control criterion in samples SD-24-SS, SD-26-SS, SD-27-01, SD-27-02, SD-28-01, SD-28-02, SD-29-02, SD-29-SS, SD-31-01, SD-31-SS, and SD-32-SS. No action was taken on this basis because only one surrogate was non-compliant.

Minor LCS percent recovery non-compliances were noted in the SVOC fraction. No action was taken on this basis because the non-compliances varied in the different LCS samples.

The PCB continuing calibration performed on October 28 at 03:59 exceeded the 15% (but was <30%) difference quality control criterion for Aroclor 1016 on both columns and for Aroclor 1260 on the RTX-35 column. No action was taken on this basis because all results for Aroclor 1016 were non-detected and the RTX-5 column was compliant for Aroclor 1260.

The PCB surrogate tetrachloro-m-xylene exceeded the percent recovery quality control criterion on the RTX-5 column in sample SD-24-SS. No action was taken on this basis because the three remaining surrogate recoveries were compliant.

All surrogates were not recovered in the PCB fraction sample SD-27-SS. No action was taken on this basis because the sample was analyzed at a 50X dilution.

The PCB surrogate decachlorobiphenyl exceeded the percent recovery quality control criterion on the RTX-35 column in samples SD-28-SS, SD-28-01, and SD-29-01. No action was taken on this basis because the three remaining surrogate recoveries were compliant.

The percent recovery of Aroclor 1016 exceeded the quality control criterion and Aroclor 1260 was below the recovery criterion in the MS/MSD performed on sample SD-25-SS. No action was taken on this basis because Aroclor 1016 was not detected in the un-spiked sample and the concentration of Aroclor 1260 in the un-spiked sample was >3X the spiked concentration.

The percent recovery of Aroclor 1016 exceeded the quality control criterion in the MS/MSD performed on sample SD-31-02. No action was taken on this basis because Aroclor 1016 was non-detected in the un-spiked sample.

Executive Summary

Laboratory Performance: Qualifications were made based on calibration non-compliances, method blank contamination, surrogate recovery non-compliances, and internal standard non-compliances.

Other Factors Affecting Data Quality: Qualifications were made based on MS/MSD non-compliances.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Data Validation (9/94). The text of this report has been formulated to address only those problem areas affecting data quality.

Appendix A

Qualified Analytical Results

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

SDG NARRATIVE
KATAHDIN ANALYTICAL SERVICES
TETRA TECH NUS
CASE MIDDLE RIVER
SDG: MID-6

Sample Receipt

The following samples were received on October 22, 2005 and were logged in under Katahdin Analytical Services work order number WV5605 for a hardcopy due date of October 28, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5605-1	SD-24-SS
WV5605-2	SD-25-SS
WV5605-3	SD-26-SS
WV5605-4	SD-27-SS
WV5605-5	SD-27-01
WV5605-6	SD-27-02
WV5605-7	SD-28-SS
WV5605-8	SD-28-01
WV5605-9	SD-28-02
WV5605-10	SD-29-SS
WV5605-11	SD-29-01
WV5605-12	SD-29-02
WV5605-13	SD-30-SS
WV5605-14	SD-31-SS
WV5605-15	SD-31-01
WV5605-16	SD-31-02
WV5605-17	SD-32-SS
WV5605-18	SD-33-SS
WV5605-19	SD-34-SS
WV5605-20	SD-35-SS

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SDG MID-6 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Samples WV5605-3, 4, and 16 were used for the matrix spike (MS) and matrix spike duplicate (MSD), per the client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The LCS WG22183-1 had greater than ten percent of the spiked analytes with recoveries that were high and outside of the laboratory established acceptance limits. Since the LCS is associated only with the MS/MSD, the MS/MSD were not reanalyzed.

The analysis of samples labeled WV5605-10RA and 15 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The initial analysis of WV5605-10 had a low recovery for one surrogate, while the reanalysis of sample WV5605-15 had both low responses for internal standards and low recoveries for surrogates. The results for both analyses are reported.

The analysis of samples WV5605-5, 7, 10, 11, 11RA, 17, 17RA, 18, and 19 had low recoveries for one or more surrogates, which were outside of the laboratory established acceptance limits. The second analysis of these samples also low surrogate recoveries. The results for both analyses are reported.

The analysis of samples WV5605-5RA, 7RA, 15RA, 19RA and 20 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. These analyses also had low surrogate recoveries. The second analyses of these samples also had both low

internal standard responses and low surrogate recoveries. The results for both analyses are reported.

The first analysis of sample WV5605-20 low responses for all four internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The second analysis of this sample had a low recovery for one surrogate. The third analysis of this sample, WV5605-20RA2, also had a low recovery for one surrogate. The result for WV5605-20RA2 is included in the report.

8082 Analysis

Sample WV5605-1, the method blank, WG22135-1, and the laboratory control samples, WG21992-2RA and 3RA, had high recoveries for the extraction surrogate TCX on one or both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for DCB were acceptable on both channels, the associated samples were not reextracted.

Samples WV5605-7, 8 and 11, had high recoveries for the extraction surrogate DCB on channel B, which was outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the samples were not reextracted.

The MS/MSD, WG22135-3 and 4, had high recoveries for Aroclor 1016 and low recoveries for Aroclor 1260, which were outside of the laboratory established acceptance limits. Based on the sample chromatograms, the discrepancies are likely due to the matrix of the sample. Since the associated LCS was acceptable, no corrective action was taken.

The MS/MSD, WG22135-5 and 6, had high recoveries for Aroclor 1260 and Aroclor 1016, which were outside of the laboratory established acceptance limits. The concentrations in the MS and MSD were high and outside of the calibration range. The discrepancies are likely due the high concentration of Aroclor 1260 in the native sample, WV5605-4 and also due to the matrix of the sample. The laboratory policy is not to reanalyze MS and MSD's for dilutions. These samples also had high recoveries for TCX and/or DCB on one channel, which were outside of the laboratory established acceptance limits.

The MS/MSD, WG22135-7 and 8, had high recoveries for Aroclor 1016, which were outside of the laboratory established acceptance limits. Based on the sample chromatograms, the discrepancies are likely due to the matrix of the sample. These samples also had high recoveries for TCX and/or DCB on one channel, which were outside of the laboratory established acceptance limits. Since the associated LCS was acceptable, no corrective action was taken.

The CV standards (files 6VJ8002, 6VK2040 and 6VK2048) had high responses for DCB on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable on channel A, the associated samples were not reanalyzed.

The CV standards (files 6VJ7115, 6VK1002, 6VK1040 and 6VK1048) had high responses for TCX on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the responses were acceptable on channel B, the associated samples were not reanalyzed.

The CV standards (files 6VJ7034 and 6VJ8034) had high responses for Aroclor 1016 on both channels and Aroclor 1260 on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since a high response would indicate a high bias and Aroclor 1016 was not detected in the associated sample above the PQL and the response for Aroclor 1260 was acceptable on channel A, the associated samples were not reanalyzed.

The closing CV standards (files 6VJ7098 and 6VJ8098) had high responses for Aroclor 1016, Aroclor 1260 and DCB on both channels and TCX on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the opening CV's had acceptable responses, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VJ7034, 6VJ8034, 6VJ8098, 6VK1026 and 6VK2026) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of DCB on channel B for file 6VJ8098, which was high, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 10/07/05 on the K instrument had %RSD values for several analyte that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes hexachlorocyclopentadiene, 2-chloronaphthalene 4-nitrophenol and benzidine failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected any of the aforementioned target analytes above the PQL, the samples were not reanalyzed.

The initial calibration analyzed on 10/22/05 on the X instrument had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes benzoic acid, 2-chloronaphthalene, 4-nitrophenol, and 2,4-dinitrophenol failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected any of the aforementioned target analytes above the PQL, the samples were not reanalyzed.

The initial calibration analyzed on 10/29/05 on the X instrument had %RSD values for eight analytes that exceeded the method acceptance limit of 15%. For these analytes, a linear or

quadratic model was used for quantitation instead of an average response factor. The target analytes N-nitroso-di-n-propylamine, hexachlorocyclopentadiene, 2-chloronaphthalene, anthracene, benzidine, pyrene, and the surrogate terphenyl-d14 failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model.

The initial calibration standard (file X9008) had a response for the internal standards perylene-d12, which was low and outside the method acceptance limits of -50% to +100% of the responses of the internal standard of the mid-point level calibration standard from the initial calibration performed on 10/29/05.

Samples WV5605-1, 3, 5, 6, 8, 9, 10, 12, 14, 15, 17 and 18 had high and/or low recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. Samples WV5605-1, 2, 4, 7, 10, 11, 13, and 19 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The laboratory method blanks WG21977-1 and WG22096-1 and MSD WG22096-4 had low or high recoveries for one surrogate. The MS WG21977-4, WG22096-3 and WG22096-5 and the MSD WG22096-4 and 6 had low responses for one or more internal standards. The client was contacted and notified the laboratory to accept the data as long as the surrogate recoveries were greater than 15%, and the internal standard responses were at least 15% of the internal standard of the daily calibration verification standard. Since the surrogate recoveries and internal standard responses met these criteria, these samples were not reextracted.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG MID-6 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectrometric Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5605-(1-20) were digested for ICP analysis on 10/27/05 (QC Batch VJ27ICS0) in accordance with USEPA Method 3050B. Katahdin Sample Nos. WV5605-(2, 4, and 16) were prepared with duplicate matrix-spiked aliquots.

ICP analyses of SDG MID-6 sample digestates were performed using a Thermo Jarrell Ash Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WV5605-(1-20) were digested for mercury analysis on 10/26/05 (QC Batch VJ26HGS0) in accordance with USEPA Method 7471A. Katahdin Sample Nos. WV5605-(2, 4, and 16) were prepared with duplicate matrix-spiked aliquots.

Mercury analyses of Katahdin SDG MID-6 sample digestates were performed using a Cetac M6100 automated mercury analyzer in accordance with USEPA Method 7471A. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

Both of the matrix-spiked aliquots of Katahdin Sample No. WV5605-2 are outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for antimony.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5605-2 is within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all analytes.

Both of the matrix-spiked aliquots of Katahdin Sample No. WV5605-4 are outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for antimony and mercury.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5605-4 is outside the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for antimony.

One or both of the matrix-spiked aliquots of Katahdin Sample No. WV5605-16 are outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for antimony, chromium, copper, and mercury.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5605-16 is outside the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for copper.

Low matrix spike recoveries for antimony in soil samples are common, and are attributed to loss of insoluble antimony compounds during filtration of the digestates. Sample inhomogeneity may also be a factor in these matrix spike failures.

The serial dilution analyses of Katahdin Sample Nos. WV5605-(2 and 4) are within the laboratory's ICP serial dilution acceptance limit (<10% difference between the original sample result and the result for a 5-fold dilution of the sample, if the result for the dilution is at least ten times the instrument detection limit) for all analytes.

The serial dilution analysis of Katahdin Sample No. WV5605-16 is outside the laboratory's ICP serial dilution acceptance limit (<10% difference between the original sample result and the result

for a 5-fold dilution of the sample, if the result for the dilution is at least ten times the instrument detection limit) for copper.

Wet Chemistry Analysis

The samples of SDG MID-6 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses for Total organic Carbon (TOC) were performed according to "Determination of Total Organic Carbon in Sediment", Lloyd Kahn, USEPA Region II, 7/88.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding time. All quality control criteria were met, with the following exceptions:

The recoveries of hexavalent chromium from the matrix spike aliquots of Katahdin Sample Nos. WV5605-2 (46%), WV5605-4 (46%) and WV5605-16 (45%) are outside the laboratory's acceptance limits of 75% - 125%. Low matrix spike recoveries for hexavalent chromium may indicate the presence of reducing conditions in the sample.

The recoveries of TOC from the matrix spike (166%) and matrix spike duplicate (126%) aliquots of Katahdin Sample No. WV5605-2 are outside the laboratory's acceptance limits of 75% - 125%. The recovery of TOC from the matrix spike (129%) aliquot of Katahdin Sample No. WV5605-4 is outside the laboratory's acceptance limits of 75% - 125%.

No other deviations were noted by the Wet Chemistry group.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

QC Flag Legend

T - Target compound detected outside RT window.
a - Target compound detected but, quantitated amount Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount exceeded maximum amount.
M - Compound response manually integrated.

SEMIVOLATILE ORGANIC INSTRUMENT PERFORMANCE CHECK
DECAFLUOROTRIPHENYLPHOSPHINE (DFTPP)

Lab Name: KATAHDIN ANALYTICAL SERVICES Lab Code: KAS

Project: MIDDLE RIVER SDG No.: MID-6

Lab File ID: KD646 DFTPP Injection Date: 10/07/05

Instrument ID: GCMS-K DFTPP Injection Time: 1228

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
51	30.0 - 60.0% of mass 198	52.5
68	Less than 2.0% of mass 69	0.0 (0.0)1
69	Less than 100.0% of mass 198	57.7
70	Less than 2.0% of mass 69	0.2 (0.3)1
127	40.0 - 60.0% of mass 198	46.2
197	Less than 1.0% of mass 198	0.0
198	Base Peak, 100% relative abundance	100.0
199	5.0 to 9.0% of mass 198	7.5
275	10.0 - 30.0% of mass 198	20.4
365	1.0 - 100.0% of mass 198	2.0
441	0.0 - 100.0% of mass 443	7.6 (83.8)2
442	40.0 - 100.0% of mass 198	45.9
443	17.0 - 23.0% of mass 442	9.1 (19.8)3

1-Value is % mass 69 2-Value is % mass 443
3-Value is % mass 442

Sample Data Summary A0000254

KATAHDIN ANALYTICAL SERVICES
MATRIX SPIKE/MATRIX SPIKE DUPLICATE RECOVERY

Client: Tetra Tech NUS, Inc
Project: MIDDLE RIVER
PO No:
Sample Date: 10/21/05
Received Date: 10/22/05
Extraction Date: 10/27/05
Analysis Date: 10/31/05
Report Date: 11/01/2005
Matrix: SOIL

Lab ID: WG22096-5 & WG22096-6
Client ID: SD-27-SSMS & SD-27-SSMSD
SDG: MID-6
Extracted by: KF
Extraction Method: SW846 3540
Analyst: JCG
Analysis Method: SW846 8270C
Lab Prep Batch: WG22096
Units: ug/Kg

QC Flag Legend

a - Target compound detected but, quantitated amount Below Limit Of Quantitation(BLOQ).
A - Target compound detected but, quantitated amount exceeded maximum amount.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

LOCKHEED MIDDLE RIVER
SAMPLE DELIVERY GROUP (SDG) – MID-7

SAMPLES: 11/Sediment/

SD-36-SS	SD-37-SS	SD-38-SS
SD-39-SS	SD-40-01	SD-40-02
SD-40-SS	SD-41-SS	SD-42-01
SD-42-02	SD-42-SS	

Overview

The sample set for Lockheed Middle River, SDG MID-7, consists of eleven (11) sediment environmental samples.

All samples were analyzed for antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc and hexavalent chromium. In addition, samples SD-39-SS, SD-40-SS, SD-40-01 and SD-40-02 were also analyzed for total organic carbon (TOC). The samples were collected on October 21, 2005 and analyzed by Katahdin Analytical Services. Metals analyses, with the exception of mercury, were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7471A. Analyses for hexavalent chromium were conducted using SW-846 method 7196A. TOC analyses were conducted using the Lloyd Kahn method.

Summary

All analytes were successfully analyzed. The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, calibration data, laboratory method/preparation blanks, interference check sample (ICS) results, laboratory control sample (LCS) results, detection limits and analyte quantitation.

All metals analyses, with the exception of mercury, were conducted using Inductively Coupled Plasma (ICP) instrumentation. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) instrumentation.

Areas of concern with respect to data quality are listed below.

Minor Problems

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Barium	0.36 µg/L	0.18 mg/kg
Cadmium	0.54 µg/L	0.27 mg/kg
Chromium[(1)]	0.102 mg/kg	0.51 mg/kg
Cobalt	1.72 µg/L	0.86 mg/kg
Silver	2.51 µg/L	1.255 mg/kg
Thallium	7.47 µg/L	3.735 mg/kg
Zinc[(1)]	0.287 mg/kg	1.435 mg/kg

[(1)] Maximum concentration present in a laboratory preparation blank.

An action level of five times the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot, percent solids and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level reported for silver and thallium were qualified "B" as a result of laboratory blank contamination.

- Positive and nondetected results reported for all analytes in samples SD-36-SS, SD-37-SS, SD-38-SS, SD-39-SS, SD-40-SS and SD-41-SS were qualified as estimated, "J" and "UJ", respectively, due to low (< 30%) percent solids.

Notes

The laboratory did not perform matrix spike (MS), laboratory duplicate or ICP serial dilution analyses for metals or hexavalent chromium on any of the samples within this SDG.

The Contract Required Detection Limit (CRDL) percent recoveries for antimony, chromium and zinc on 10/31/05 at 18:03 were > 110% quality control limit, affecting all samples. No validation action was necessary because all results for antimony, chromium and zinc were either reported by the laboratory as nondetected or were greater than two times the CRDL.

The CRDL percent recoveries for copper and lead on 10/31/05 at 18:03 were < 90% quality control limit, affecting all samples. No validation action was necessary because all results for copper and lead were greater than two times the CRDL.

The CRDL percent recoveries for thallium on 11/1/05 at 18:48 and 21:33 were > 110% quality control limit, affecting all samples. No validation action was necessary because all results for thallium were either reported by the laboratory as nondetected or were qualified "B" as a result of laboratory blank contamination.

The CRDL percent recovery for vanadium on 11/2/05 at 01:51 was < 90% quality control limit, affecting all samples. No validation action was necessary because all results for vanadium were greater than two times the CRDL.

The Practical Quantitation Limit (PQL) percent recoveries for cadmium, cobalt, molybdenum, selenium and zinc on 10/31/05 were > 110% quality control limit. No validation action was taken based on the PQL percent recoveries.

The PQL percent recoveries for arsenic and thallium on 11/1/05 were > 110% quality control limit. No validation action was taken based on the PQL percent recoveries.

Arsenic was analyzed at a 3X dilution in sample SD-42-01.

Executive Summary

Laboratory Performance: Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: Several analytes were qualified due to low percent solids in several samples.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Validation", April 1993 as amended for use within USEPA Region III.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

U - Value is a nondetect as reported by the laboratory.

B - Positive result is considered to be an artifact of blank contamination and should not be considered present.

UJ - Nondetected result is considered estimated, "UJ", as a result of technical noncompliances.

J - Positive result is considered estimated, "J", as a result of technical noncompliances.

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Sample Receipt

The following samples were received on October 22, 2005 and were logged in under Katahdin Analytical Services work order number WV5606 for a hardcopy due date of October 28, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5606-1	SD-36-SS
WV5606-2	SD-37-SS
WV5606-3	SD-38-SS
WV5606-4	SD-39-SS
WV5606-5	SD-40-SS
WV5606-6	SD-40-01
WV5606-7	SD-40-02
WV5606-8	SD-41-SS
WV5606-9	SD-42-SS
WV5606-10	SD-42-01
WV5606-11	SD-42-02

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SDG MID-7 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

Metals Analysis

The samples of SDG MID-7 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5606-(1-11) were digested for ICP analysis on 10/25/05 (QC Batch VJ25ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this digestion batch.

ICP analyses of SDG MID-7 sample digestates were performed using a Thermo Jarrell Ash Trace ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WV5606-(1-11) were digested for mercury analysis on 10/28/05 (QC Batch VJ28HGS0) in accordance with USEPA Method 7471A. Duplicate laboratory control samples were prepared in this digestion batch.

Mercury analyses of Katahdin SDG MID-7 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Wet Chemistry Analysis

The samples of SDG MID-7 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses for Total organic Carbon (TOC) were performed according to "Determination of Total Organic Carbon in Sediment", Lloyd Kahn, USEPA Region II, 7/88.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding time. All quality control criteria were met.

No other deviations were noted by the Wet Chemistry group.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

Were ICP interelement corrections applied ?	Yes
Were ICP background corrections applied ?	Yes
If yes - were raw data generated before application of background corrections ?	No

Comments:

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on floppy diskette has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

Signature: Edward A. Morgan Name: Edward A. Morgan

Date: November 2, 2005 Title: Senior Chemist

Overview

The sample set for Lockheed Middle River, SDG MID-7 consists of eleven (11) sediment environmental samples. All samples were analyzed for volatile organic compounds (VOCs). Samples denoted with an asterisk were also analyzed for semivolatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs).

The samples were collected by Tetra Tech NUS on October 21, 2005 and analyzed by Katahdin Analytical Services, Inc. All analyses were conducted in accordance with SW-846 8260B, 8270C, and 8082 analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate results, internal standard recoveries, and detection limits. Areas of concern are listed below.

Major

- The VOA initial calibration relative response factors (RRFs) were less than the 0.05 quality control limit for acetone and tertiary-butyl alcohol on instrument GCMS-M. The non-detected results reported for acetone and tertiary-butyl alcohol have been rejected (UR) for all samples. Positive results for acetone were qualified as estimated (J) in the affected samples.

- The VOA continuing calibrations RRFs were less than the 0.05 quality control limit for acetone, tertiary-butyl alcohol, and 2-butanone on instrument GCMS-M. The non-detected results reported for acetone, tertiary-butyl alcohol, and 2-butanone have been rejected (UR) for all samples. Positive results for acetone were qualified as estimated (J), in the affected samples.

Minor

- The surrogates dibromofluoromethane, 1,2-dichloroethane-d4, toluene-d8, and p-bromofluorobenzene had recoveries less than the quality control limit for samples SD-37-SS and SD-42-02. The samples were re-analyzed with similar results. The original sample results were used for validation. All positive and non-detected results for samples SD-37-SS and SD-42-02

have been qualified as estimated (J).

- The surrogates dibromofluoromethane and toluene-d8 had recoveries less than the quality control limit for sample SD-41-SS. The sample was re-analyzed with similar results. The original sample results were used for validation. All positive and non-detected results for sample SD-41-SS have been qualified as estimated (J).

- The surrogate dibromofluoromethane had recoveries less than the quality control limit for samples SD-38-SS and SD-39-SS. The samples were re-analyzed with similar results. The original sample results were used for validation. All positive and non-detected results for samples SD-38-SS and SD-39-SS have been qualified as estimated (J).

- The internal standard 1,4-dichlorobenzene-d4 had low area counts less than 50% the quality control limit for samples SD-40-02, SD-42-SS, and SD-42-01. The samples were re-analyzed with acceptable internal standard area counts for samples SD-40-02 and SD-42-SS, however, because of surrogate recovery problems, the original sample results were used for validation. The non-detected results quantitated using the unacceptable internal standards were qualified as estimated (UJ). Sample SD-42-01 had similar internal standard area counts in the re-analysis. The original analysis was used for validation and the non-detected results quantitated using the unacceptable internal standards were qualified as estimated (UJ).

- The SVOC continuing calibrations performed on 10/29/05 at 11:35 and 10/30/05 at 20:24 on instrument GCMS-K exceeded the 25% (and was >50%) difference quality control limit for benzyl alcohol. The non-detected benzyl alcohol results for all samples have been qualified as estimated (UJ).

- The following compounds were detected in the VOC and SVOC method blanks at the maximum concentrations listed below:

Compound	Maximum Concentration	Blank Action Level
1,24-Trichlorobenzene	3 ug/kg	15 ug/kg
Methylene chloride	2 µg/kg	20 µg/kg
1,4-Dichlorobenzene[(1)]	32 µg/kg	160 µg/kg
Acenaphthene[(1)]	68 µg/kg	340 µg/kg

1 – Detected in the SVOA method blanks.

Blank Actions

- Value < Reporting Limit (RL); report value followed by a B.
- Value > RL and < Action Level; report value followed by a B.
- Value > RL and > Action Level; report value unqualified.

An action level of 10X the maximum contaminant concentration was established to evaluate laboratory contamination for methylene chloride; and 5X for 1,4-dichlorobenzene and acenaphthalene. Sample aliquots, percent solids, and dilution factors were taken into consideration during the application of the action level. All positive 1,4-dichlorobenzene and acenaphthalene were qualified (B) as a result of blank contamination.

- Positive and non-detected results reported for all compounds in samples SD-36-SS, SD-37-SS, SD-38-SS, SD-39-SS, SD-40-SS and SD-41-SS were qualified as estimated, "J" and "UJ", respectively, due to low (< 30%) percent solids.

Notes

The Laboratory control sample (LCS) associated with batch WG22077 had recoveries greater than the quality control limit for o-xylene, styrene, and 4-chlorotoluene and less than the quality control limit for sec-butylbenzene. No action was taken on this basis because these compounds were not detected in any associated samples.

The LCS associated with batch WG22133 had recoveries greater than the quality control limit for 1,1-dichloropropene, bromodichloromethane, tetrachloroethene, ethylbenzene, and total xylenes and less than the quality control limit for sec-butylbenzene and tertiary-butyl alcohol. No action was taken on this basis because these compounds were not detected in any associated samples. Tertiary-butyl alcohol was previously rejected due to low RRF.

The VOC continuing calibration performed on 10/26/05 at 15:59 on instrument GCMS-M exceeded the 25% (but was <50%) difference quality control limit for ethyl tertiary-butyl ether, tert-butylbenzene, and sec-butylbenzene. No action was taken on the non-detected results reported for the aforementioned compounds. Acetone exceeded the 50% difference quality control limit but was previously rejected due to low RRF.

The VOC continuing calibration performed on 10/27/05 at 18:24 on instrument GCMS-M exceeded the 25% (but was <50%) difference quality control limit for acetone, tert-butylbenzene, sec-butylbenzene, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene. No action was taken on the non-detected results reported for the aforementioned compounds.

The LCS associated with batch WG21977 had recoveries greater than the quality control limit for hexachlorocyclopentadiene, and less than the quality control limit for benzyl alcohol, 3-nitroaniline, 4-nitroaniline, N-nitrosodiphenylamine, and carbazole. No action was taken on this basis because these compounds were not detected in any associated samples.

The SVOC continuing calibration performed on 10/29/05 at 11:35 on instrument GCMS-K exceeded the 25% (but was <50%) difference quality control limit for benzoic acid, 2-methylnaphthalene, and 4-nitrophenol. No action was taken on the non-detected results reported for the aforementioned compounds.

The SVOC continuing calibration performed on 10/30/05 at 20:24 on instrument GCMS-K exceeded the 25% (but was <50%) difference quality control limit for benzoic acid. No action was taken on the non-detected results reported for benzoic acid.

The surrogate tetrachloro-m-xylene had recoveries greater than the quality control limit for WG22175-BLANK, WG22175-LCS, WG22175-LCSD, and WG22135-BLANK. No action was taken on this basis because only QC samples were affected.

The LCS / LCSD associated with QC batch WG22175 had an LCSD recovery (119%, > 118% limit) greater than the quality control limit for Aroclor-1260. No action was taken on this basis because the LCS recovery was acceptable and the recovery is only marginally outside of control limit.

Average calibration verification %D exceeded the 15% (but was <30%) quality control limit for Aroclor-1016 on column RTX-5 and RTX-35 on instrument GC06, on 10/31/05 @02:29. No action was taken on the non-detected results for Aroclor-1016.

The surrogate terphenyl-d14 had a recovery less than the quality control limit in the method blank, SD-40-SS, SD-39-SS, and SD-40-01. No action was taken on this basis because only one surrogate per fraction was out side recovery limits.

Executive Summary

Laboratory Performance: Qualifications were made on initial and continuing calibration of several VOA, SVOA, and PCB compounds that failed to comply with %D or RRF quality control criteria. Qualifications were made based on blank contamination for the SVOA fraction.

Other Factors Affecting Data Quality: Several VOC compounds were qualified due to surrogate and internal standard non-compliances.

The data for these analyses were reviewed with reference to SW-846 method-specific requirements and U.S. EPA National Functional Guidelines for Data Validation as modified by EPA Region III (9/94) to the extent practicable. The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:
Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance.
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

SDG NARRATIVE
KATAHDIN ANALYTICAL SERVICES
TETRA TECH NUS
CASE MIDDLE RIVER
SDG: MID-7

Sample Receipt

The following samples were received on October 22, 2005 and were logged in under Katahdin Analytical Services work order number WV5606 for a hardcopy due date of October 28, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5606-1	SD-36-SS
WV5606-2	SD-37-SS
WV5606-3	SD-38-SS
WV5606-4	SD-39-SS
WV5606-5	SD-40-SS
WV5606-6	SD-40-01
WV5606-7	SD-40-02
WV5606-8	SD-41-SS
WV5606-9	SD-42-SS
WV5606-10	SD-42-01
WV5606-11	SD-42-02

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SDG MID-7 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits.

The LCS WG22133-1 had greater than ten percent of the spiked analytes with recoveries that were high or low and outside of the laboratory established acceptance limits. Since all of the samples (with the exception of WV5606-1) were reanalyses, and there were no target analytes detected above the PQL, the samples were not reanalyzed a third time.

Samples WV5606-10 and 11 were initially analyzed outside of the 12-hour analytical shift. The samples were reanalyzed within hold time to confirm either low surrogate recoveries or internal standard failures. The results from both analyses are reported.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

Samples WV5606-2, 3, 4, 8, 9RA, 10RA and 11 had recoveries for one or more surrogates that were low and outside of laboratory established acceptance limits. Since the reanalysis results correlated with those from the initial analyses, the samples were not analyzed a third time. The results from both analyses are reported.

Samples WV5606- 7, 9, and 10 had low responses for one or more internal standards that resulted in %D's which were outside the laboratory acceptance limit of -50% to +100% of the response of the internal standard of the daily calibration verification standard. The samples were reanalyzed with similar responses for the internal standards indicating a matrix effect. The results from both analyses are included in the report.

8082 Analysis

The method blanks, WG22135-1 and WG22175-1, and the laboratory control samples, WG22175-2 and 3, had high recoveries for the extraction surrogate TCX on channel A, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX on channel B and DCB on both channels were acceptable, the associated samples were not reextracted.

The LCSD WG22175-3 had a high recovery for Aroclor 1260, which was outside of the laboratory established acceptance limits. Since the LCS had an acceptable recovery, the associated samples were not reextracted.

The closing CV standards (files 6VJ7098 and 6VJ8098) had high responses for Aroclor 1016, Aroclor 1260 and DCB on both channels and TCX on channel A, which resulted in %D's that

were outside of the method acceptance limits of 15%. Since the opening CV's had acceptable responses, the associated samples were not reanalyzed.

The CV standard (file 6VK1002) had a high response for TCX on channel A, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on channel B, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VJ8098, 6VK1026 and 6VK2026) are flagged for the surrogates TCX and/or DCB indicating that the %D's are greater than the method acceptance limit of 15%. With the exception of DCB on channel B for file 6VJ8098, which was high, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

For some samples that were reported for Aroclor 1260, the peaks in the sample chromatograms that are specific to Aroclor 1260 are not all proportional to those peaks in the Aroclor 1260 standard. Since most of the peaks were present in the samples for this aroclor, these samples were identified for this aroclor. Samples WV5606-6 and 7 also contained some peaks that were similar to those of Aroclor 1242. Since either some peaks specifically for Aroclor 1242 were not present, or the proportionality of the peaks did not match, these samples were not identified for this aroclor.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The acceptance limits for the MS/MSD are for a short list of the spiked compounds. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits.

The initial calibration analyzed on 10/07/05 on the K instrument had %RSD values for several analyte that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes hexachlorocyclopentadiene, 2-chloronaphthalene 4-nitrophenol and benzidine failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected any of the aforementioned target analytes above the PQL, the samples were not reanalyzed.

Samples WV5606-4, 5 and 6 had low recoveries for one surrogate, which were outside the method established limits. The laboratory method blank WG21977-1 had a low recovery for one surrogate, which was outside the laboratory established acceptance limits. The client was contacted and notified the laboratory to accept the data as long as the surrogate recoveries were greater than 15%. Since the recoveries met these criteria, these samples were not reextracted.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of SDG MID-7 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5606-(1-11) were digested for ICP analysis on 10/25/05 (QC Batch VJ25ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this digestion batch.

ICP analyses of SDG MID-7 sample digestates were performed using a Thermo Jarrell Ash Trace ICP spectrometer. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WV5606-(1-11) were digested for mercury analysis on 10/28/05 (QC Batch VJ28HGS0) in accordance with USEPA Method 7471A. Duplicate laboratory control samples were prepared in this digestion batch.

Mercury analyses of Katahdin SDG MID-7 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Wet Chemistry Analysis

The samples of SDG MID-7 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses for Total organic Carbon (TOC) were performed according to "Determination of Total Organic Carbon in Sediment", Lloyd Kahn, USEPA Region II, 7/88.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding time. All quality control criteria were met.

No other deviations were noted by the Wet Chemistry group.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.

SW-08-102005	SW-09-102005	SW-10-102005
SW-11-102005	SW-12-102005	SW-13-102005
SW-14-102005	SW-15-102005	SW-16-102005
SW-17-102005	TB102005	

Overview

The sample set for SDG WV5584 consists of ten (10) environmental surface water samples and one (1) trip blanks. Samples were analyzed for analytical fractions as indicated above, except the trip blanks which was analyzed for VOCs only.

The samples were collected by Tetra Tech Inc. on October 20, 2005 and analyzed by Katahdin Analytical Services, Inc. All analyses were conducted in accordance with SW-846 8260B, 8270C, and 8082 analytical methodology.

The findings in this report are based upon a general review of all available data including: data completeness, system performance, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike/internal standard recoveries, blank spike results, matrix spike results, field duplicate precision, compound identification, compound quantitation, and detection limits.

Areas of concern are listed below; documentation supporting these findings is presented in Appendix C. Qualified analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B.

Major

- The initial calibration run on October 24, 2005 at 10:22 on instrument GCMS-F yielded an Relative Response Factor (RRF) less than 0.050 for acetone. The RRFs in the associated continuing calibration were also less than 0.050. The nondetected results report for this compound were rejected (UR). The positive result reported for acetone in the trip blank is estimated qualified (J). All samples in the SDG were affected.

- The volatile and semivolatile Matrix Spike/Matrix Spike Duplicate (MS/MSD) Percent Recoveries (%Rs) for 2-chloroethylvinyl ether, benzoic acid, and benzidine were less than 10%. The nondetected results reported for these compounds in the unspiked sample (SW-17-102005) were considered unusable and were rejected (UR).

Minor

- The following compound was detected in the trip blank:

Analyte	Maximum Detection	Action Level
Acetone	4 ug/L	40 ug/L

  Sample aliquot size, and dilution factors were taken into consideration during the application of action limits. Positive results for this compound reported at concentrations below the action level were qualified, (B), as a result of blank contamination.

- The initial calibration Percent Relative Standard Deviation (%RSD) for acetone run on October 24, 2005 at 10:22 on instrument GCMS-F was greater 30% but less than 50%. Only positive results are affected. The positive result in the trip blank was qualified as estimated, (J). No biased could be determined.

- The continuing calibration Percent Differences (%D) for xylenes run on October 26, 2005 at 11:41 on instrument GCMS-F was greater 50%. Only nondetects were reported for xylenes in the affected samples and these results were qualified as estimated (UJ). All samples in the SDG are affected.

- The continuing calibration %D for benzyl alcohol run on October 27, 2005 at 16:10 on instrument GCMS-X was greater 50%. Only nondetects were reported for benzyl alcohol in the affected samples and these results were qualified as estimated (UJ). All samples in the SDG, except SW-17-102005, and SW-09-102005, were affected.

- The continuing calibration %D for benzyl alcohol run on October 28, 2005 at 13:26 on instrument GCMS-X was greater 50%. Only nondetects were reported for benzyl alcohol in the affected samples and these results were qualified as estimated (UJ). Samples SW-09-102005 and SW-17-102005 were affected.

- The MS/MSD %Rs for approximately 75% of the semivolatile fraction compounds were low. Additionally most Relative Percent Differences (RPDs) were high. Only nondetected results were reported for the all the semivolatile fraction compounds in the unspiked sample (SW-17-102005), all the results in the unspiked samples were qualified as estimated (UJ). It is the validators professional opinion that all compound results could be affected by the poor recoveries.

- The volatile fraction surrogate 1,2-dichloroethane-d4 yielded high Percent Recoveries (%Rs) in all environmental samples. Positive and nondetected results were qualified as estimated (J and UJ, respectively) as a result of this noncompliance.

- The semivolatile fraction surrogate recoveries for 2-fluorophenol, nitrobenzene-d5, and 2-fluorobiphenyl were low in sample SW-09-102005. The base/neutral fraction compounds were qualified as biased low in this sample. Only nondetects were reported and they were qualified (UL).

- The surrogate decachlorobiphenyl %Rs were low on both columns in the LCS, the method blank, and samples SW-08-102005, SW-12-102005, and SW-12-102005. Only nondetected were reported in these samples and the nondetected results were qualified as estimated (UJ). No actions were taken in the LCS or method blank.

- All positive results below the reporting limit but above the MDL were qualified as estimated (J) due to uncertainty near the detection limit.

Notes

The continuing calibration %Ds for acetone, diisopropylether, 1,1-dichloroethene, 1,1,1-trichloroethane, bromodichloromethane, tetrachloroethene, naphthalene, and 1,2,3-trichlorobenzene run on October 26, 2005 at 11:41 on instrument GCMS-F were greater 25% but less than 50%. Only positive results are affected by this noncompliance and no positives were reported for these compounds in the affected samples.

The continuing calibration run on October 27, 2005 at 16:10 on instrument GCMS-X yielded %Ds for hexachlorocyclopentadiene, 4-nitroaniline, benzidine, butylbenzylphthalate, di-n-octylphthalate, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene that were greater than 25% but less than 50%. No actions were warranted as only positive results are affected by this noncompliance and only nondetects were reported for these compounds in the affected samples. All samples in the SDG, except SW-17-102005, and SW-09-102005, were affected.

The continuing calibration run on October 28, 2005 at 13:26 on instrument GCMS-X yielded %Ds for benzoic acid and benzidine that were greater than 25% but less than 50%. No actions were warranted as only positive results are affected by this noncompliance and only nondetects were reported for these compounds in the affected samples. Samples SW-17-102005, and SW-09-102005 were affected.

The continuing calibration %Ds for Aroclor-1016 and Aroclor-1260 were greater than 15% but less than 30% in calibration run on October 28, 2005 at 3:59 (on both columns). No actions were warranted as only positive results are affected by this noncompliance and only nondetects were reported for these compounds in the affected samples.

The surrogate %Rs for nitrobenzene-d5 were low in samples SW-17-102005, SW-17-102005MS, SW-08-102005, SW-11-102005, and SW-12-102005. No actions were taken as only one fraction surrogate was noncompliant.

The Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD) sample WG22067 analysis yielded a marginally low %R for tertiary butyl alcohol and a high %R for isopropylbenzene. No actions were warranted as the recoveries were only marginally noncompliant and are not indicative of data quality issues.

The LCS/LCSD analysis of sample WG22052 yielded low %Rs for 1,2,4-trichlorobenzene, hexachlorobutadiene, 2-nitroaniline, 2,4-dinitrophenol, and 3,3'-dichlorobenzidine. No actions were warranted as the recoveries were only marginally noncompliant and are not indicative of data quality issues.

The volatile fraction MS/MSD analysis of sample SW-17-102005 yielded high %Rs for chloroform, carbon tetrachloride, 1,1,1-trichloroethane, 1,1-dichloropropene, 1,2-dichloroethane, trichloroethene, dibromomethane, bromodichloromethane, trans-1,3-dichloropropene, isopropylbenzene, and 1,1,2,2-tetrachloroethane. 2-Butanone had one high and one low recovery and the RPDs for chloromethane, tert-butyl alcohol, and vinyl chloride were high. No actions were taken in the unspiked sample as none of the noncompliances were gross exceedences.

Surrogate decachlorobiphenyl %R was low on one column in sample SW-17-102005MSD. No action was taken.

Executive Summary

Laboratory Performance: The initial calibration RRF for acetone was less than 0.05. Continuing calibration RRF for acetone was less than 0.05. There were several volatile and semivolatile fraction noncompliant continuing calibration %Ds. There were several LCS/LCSD sample noncompliances.

Other Factors Affecting Data Quality: Many volatile and semivolatile fraction MS/MSD noncompliances were noted. Acetone was detected in the trip blank. There were several volatile, semivolatile, and PCB fraction surrogate noncompliances.

The data for these analyses were reviewed with reference to SW-846 method-specific requirements and U.S. EPA National Functional Guidelines for Data Validation as modified by EPA Region III (9/94) to the extent practicable. The text of this report has been formulated to address only those problem areas affecting data quality.

WV5584-20	SW-17-102005
WV5584-21	SW-17-102005

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of work order WV5584 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Sample WV5584-20 was used for a matrix spike (MS) and matrix spike duplicate (MSD), as per client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "V" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

Samples WV5584-2, 4, 6, 8, 10, 12, 14, 16, 18, and 20 had high recoveries for one or more surrogates, which were outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and there were no target analytes detected above the PQL in the aforementioned samples, the samples were not reanalyzed.

The initial calibration analyzed on the F instrument on 10/12/05 had a %RSD value for acetone that exceeded the method acceptance limit of 15%. Even though the %RSD is greater than 15%, acetone was calibrated with the average model since this calibration model is more accurate for this analyte at concentrations near the PQL than either the linear or quadratic calibration models.

8082 Analysis

Samples WV5584-2, 10, 12, the method blank, WG22030-1, the laboratory control sample, WG22030-2 and the matrix spike duplicate, WG22030-4, had low recoveries for the extraction surrogate DCB on one or both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were acceptable on both channels for all samples and QC, the samples were not reextracted.

The calibration verification standards (CV) (files 6VJ7034 and 6VJ8034) had high responses for Aroclor 1016 on both channels and Aroclor 1260 on channel B, which resulted in %D's that were

outside of the method acceptance limits of 15%. Since high recoveries would indicate a high bias and no target analytes were detected in the samples, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VJ7034 and 6VJ8034) are flagged for the surrogates TCX and DCB indicating that the %D is greater than the method acceptance limit of 15%. The %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 10/22/05 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes benzoic acid, 2-chloronapthalene, 2,4-dinitrophenol and 4-nitrophenol, failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since there were none of the aforementioned analytes detected above the PQL in the associated samples, the samples were not reanalyzed.

The calibration verification standard (CV) (file X8964) had a high response for the (CCC) calibration check compound di-n-octylphthalate, which resulted in a %D that was outside the method acceptance limit of 20%. Since a high response would indicate a high bias and this target analyte was not detected in the associated sample above the PQL, the sample was not reanalyzed.

Samples WV5584-2, 4RA, 8, 10 and 20RA and the matrix spike sample (MS) WG22052-3 had low recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. The client was contacted and notified the laboratory to proceed with narration.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin Work Order WV5584 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

SW-17-102005		

Overview

The sample set for Lockheed Middle River, SDG WV5584, consists of ten (10) aqueous environmental samples.

All samples were analyzed for total and dissolved select metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc) and hexavalent chromium. The samples were collected by Tetra Tech NUS on October 20, 2005 and analyzed by Katahdin Analytical Services. Metals analyses except mercury were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7470A. Hexavalent chromium analyses were conducted using SW-846 method 7196A.

Summary

All analytes were successfully analyzed. The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, calibration data, laboratory method/preparation blanks, interference check sample (ICS) results, matrix spike results, laboratory duplicate results, laboratory control sample (LCS) results, ICP serial dilution results, detection limits, and analyte quantitation.

All metals analyses, with the exception of mercury, were conducted using Inductively Coupled Plasma (ICP) methodology. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

Minor Problems

- The contract required detection limit (CRDL) standard run on 10/31/05 at 18:03 had percent recoveries (%Rs) >110% for chromium and zinc and <90% for copper and lead. Positive results reported for chromium and zinc <2X the CRDL were qualified as biased high (K) and nondetects reported for copper and lead were qualified as biased low (UL) in dissolved sample SW-17-102005.

- The CRDL standards run on 11/1/05 at 12:24 and 16:51 had %Rs <90% for copper and lead. Positive results reported for copper and lead <2X the CRDL were qualified as biased low (L) and nondetected results reported for copper and lead were qualified as biased low (UL) in the associated samples.

- The CRDL standard run on 11/1/05 at 16:51 had %Rs >110% for antimony, chromium, selenium, and zinc and <90% for beryllium, silver, and vanadium. Positive results reported for antimony, chromium, selenium, and zinc <2X the CRDL were qualified as biased high (K) and nondetects reported for beryllium, silver, and vanadium were qualified as biased low (UL) in the associated samples.

- The CRDL standard run on 11/2/05 at 16:59 had a %R <90% for selenium. The nondetected result reported for selenium was qualified as biased low (UL) in total metals sample SW-17-102005.

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Barium	0.36 ug/L	1.8 ug/L
Cadmium	0.54 ug/L	2.7 ug/L
Cobalt	1.72 ug/L	8.60 ug/L
Silver	2.51 ug/L	12.6 ug/L
Thallium	7.47 ug/L	37.4 ug/L
Zinc	1.55 ug/L	7.75 ug/L

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the action level for cadmium and cobalt were qualified (B) as a result of blank contamination. The remaining analytes were not qualified because the results were either greater than the action level or they were nondetects.

Notes

The continuing calibration verification (CCV) standard run on 10/31/05 at 18:25 had %Rs >110% for antimony, barium, chromium, molybdenum, nickel, selenium, and zinc. No qualification action was required because no samples were associated with this standard.

The CCV standard run on 11/1/05 at 17:12 had %Rs >110% for antimony, barium, chromium, cobalt, molybdenum, nickel, selenium, and zinc. No qualification action was required because no samples associated with this standard were analyzed for these analytes.

The CRDL standard run on 10/31/05 at 18:03 had a %R >110% for antimony. No qualification action was required because all antimony results were nondetects.

The CRDL standard run on 11/1/05 at 16:51 had %Rs >110% for cobalt and thallium. No qualification action was required because all results for cobalt and thallium were either nondetects or they were previously qualified for laboratory blank contamination.

The CRDL standards run on 11/1/05 at 18:48 and 21:33 had %Rs >110% for thallium. The CRDL standard run on 11/2/05 at 01:51 had a %R <90% for vanadium. No qualification action was required because no samples were associated with these standards.

Interfering analytes were not present in these samples so interference analyses could not be performed.

Executive Summary

Laboratory Performance: Several analytes were qualified due to calibration noncompliance. Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the USEPA Region III modifications to "National Functional Guidelines for Inorganic Review", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

U	-	Value is a nondetect as reported by the laboratory.
UL	-	Nondetected result is considered biased low as a result of technical noncompliance.
B	-	Positive result is considered to be an artifact of blank contamination and should not be considered present.
K	-	Positive result is considered biased high as a result of technical noncompliance.
L	-	Positive result is considered biased low as a result of technical noncompliance.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of work order WV5584 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Sample WV5584-20 was used for a matrix spike (MS) and matrix spike duplicate (MSD), as per client's request. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "V" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

Samples WV5584-2, 4, 6, 8, 10, 12, 14, 16, 18, and 20 had high recoveries for one or more surrogates, which were outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and there were no target analytes detected above the PQL in the aforementioned samples, the samples were not reanalyzed.

The initial calibration analyzed on the F instrument on 10/12/05 had a %RSD value for acetone that exceeded the method acceptance limit of 15%. Even though the %RSD is greater than 15%, acetone was calibrated with the average model since this calibration model is more accurate for this analyte at concentrations near the PQL than either the linear or quadratic calibration models.

8082 Analysis

Samples WV5584-2, 10, 12, the method blank, WG22030-1, the laboratory control sample, WG22030-2 and the matrix spike duplicate, WG22030-4, had low recoveries for the extraction surrogate DCB on one or both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX were acceptable on both channels for all samples and QC, the samples were not reextracted.

The calibration verification standards (CV) (files 6VJ7034 and 6VJ8034) had high responses for Aroclor 1016 on both channels and Aroclor 1260 on channel B, which resulted in %D's that were

outside of the method acceptance limits of 15%. Since high recoveries would indicate a high bias and no target analytes were detected in the samples, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VJ7034 and 6VJ8034) are flagged for the surrogates TCX and DCB indicating that the %D is greater than the method acceptance limit of 15%. The %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The initial calibration analyzed on 10/22/05 had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes benzoic acid, 2-chloronapthalene, 2,4-dinitrophenol and 4-nitrophenol, failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since there were none of the aforementioned analytes detected above the PQL in the associated samples, the samples were not reanalyzed.

The calibration verification standard (CV) (file X8964) had a high response for the (CCC) calibration check compound di-n-octylphthalate, which resulted in a %D that was outside the method acceptance limit of 20%. Since a high response would indicate a high bias and this target analyte was not detected in the associated sample above the PQL, the sample was not reanalyzed.

Samples WV5584-2, 4RA, 8, 10 and 20RA and the matrix spike sample (MS) WG22052-3 had low recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. The client was contacted and notified the laboratory to proceed with narration.

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin Work Order WV5584 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectroscopic Analysis (ICP)

Aqueous-matrix Katahdin Sample Nos. WV5584-(2-20) were digested for ICP analysis on 10/25/05 (QC Batch VJ25ICW2) in accordance with USEPA Method 3010A. Katahdin Sample No. WV5584-20 was prepared with duplicate matrix-spiked aliquots.

Aqueous-matrix Katahdin Sample No. WV5584-21 was originally digested for ICP analysis on 10/25/05 (QC Batch VJ25ICW2) in accordance with USEPA Method 3010A. The sample was redigested on 10/28/05 (QC Batch VJ28ICW0). For convenience, all results were taken from the redigestion batch. This sample was prepared with duplicate matrix-spiked aliquots.

Redigestates are identified throughout the raw data and in sample preparation and analysis run logs by the suffix "R" appended to the Katahdin sample number, e.g. "WV5584-021R".

ICP analyses of Katahdin Work Order WV5584 sample digestates were performed using a Thermo Jarrell Ash (TJA) Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met, with the following comments or exceptions:

Some of the results for analytical run QC samples (ICV, ICB, CCV, CCB, ICSA, and ICSAB) included in the accompanying data package may have exceeded acceptance limits for some elements. Please note that all client samples and batch QC samples associated with out-of-control results for run QC samples were subsequently reanalyzed for the analytes in question.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Aqueous-matrix Katahdin Sample Nos. WV5584-(2-21) were digested for mercury analysis on 10/24/05 (QC Batch VJ24HGW0) in accordance with USEPA Method 7470A. Katahdin Sample Nos. WV5584-(20 and 21) were prepared with duplicate matrix-spiked aliquots

Mercury analyses of Katahdin Work Order WV5584 sample digestates were performed using a Cetac M6100 automated mercury analyzer. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

The recoveries of all of the matrix-spiked aliquots of Katahdin Sample Nos. WV5584-(20 and 21) are within the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for all analytes.

The matrix-spike duplicate analyses of Katahdin Sample Nos. WV5584-(20 and 21) are within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for all analytes.

The serial dilution analyses of Katahdin Sample Nos. WV5584-(20 and 21) are within the laboratory's acceptance limit (<10% relative percent difference, if the concentration in the original sample is greater than 50 times the IDL) for all analytes.

Wet Chemistry Analysis

The samples of work order WV5584 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding times. All quality control criteria were met.
