Executive Summary

On behalf of Lockheed Martin Corporation (LMC), Tetra Tech, Inc. has prepared a Surface Water and Sediment Sampling Report documenting the investigation of the waterways adjacent to the LMC Middle River Complex (MRC), located at 2323 Eastern Boulevard in Middle River, Maryland. Eight individual tax blocks at the MRC have been submitted into the Maryland Department of the Environment's (MDE) Voluntary Cleanup Program (VCP). The surface water bodies surrounding the MRC (e.g. Cow Pen Creek and Dark Head Cove) are considered waters of the State of Maryland and as such are not considered to be part of the VCP process. However, in order to evaluate the environmental condition of the surface water and sediment bodies adjacent to MRC, LMC has conducted this baseline characterization. The objectives of the surface water and sediment sampling program were as follows:

- To obtain analytical data to quantify the presence or absence of chemicals in the surface water bodies surrounding the waterfront area of the LMC MRC based on two characterization studies conducted in March and October 2005.

- To conduct human health and ecological risk assessments to determine if any detected chemicals are present at concentrations of potential concern to site receptors.

The MRC is an industrial facility within the broader Chesapeake Industrial Park and the area surrounding the property primarily consists of commercial, industrial, and residential establishments. Six other facilities, comprising the remaining portion of the Chesapeake Industrial Park, lie adjacent to the LMC MRC. These facilities include Tilley Chemical Company, Inc., a food and pharmaceutical chemical distributor for personal care and industries; North American Rigging, L.L.C., a broker firm specializing in the moving and installation of machinery and heavy equipment; Johnson and Towers, a heavy duty automotive/boat repair and maintenance company; Poly-Seal Corp., a company that produces flexible packaging for miscellaneous items; Exxon, a gasoline fill station and convenience store, and the Middle River Post Office. Residential developments are located on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek, as well as north of Eastern Boulevard (Route 150).

To determine the environmental condition of the surface water bodies adjacent to the Chesapeake Industrial Park, surface water and sediment sampling was conducted in two separate phases (March 2005 and October 2005). During the March 2005 investigation, 7 surface water and 12 sediment samples (surface sediments) were collected in Cow Pen Creek and Dark Head Cove. Locations were generally selected to coincide with storm water outfalls along the bulkhead bordering MRC as well as to generate area wide background data. The investigation was expanded in October 2005 with the collection of 10 additional surface water and 50 additional sediment samples in the area. The October sampling event included both areas previously sampled for confirmation and vertical distribution of detected chemicals as well as additional lateral sampling of Dark Head Cove. Surface water and sediment samples were analyzed for a wide range of chemicals, consistent with the project objectives to provide a baseline characterization of the study area.

The data generated during the investigation was used to conduct human health and ecological risk assessments. The purpose of the risk assessments was to evaluate the likelihood that individuals or ecological receptors potentially exposed to the chemical concentrations in the sediments and surface water adjacent to Chesapeake Industrial Park could experience adverse health effects. The objective of the risk assessments was to provide sufficient information to allow for identification of areas with the potential for unacceptable risks to potentially exposed receptors and as a tool to support further actions.

The human health risk assessment (HHRA) determined that non-cancer risks are acceptable for both surface water and sediment because the calculated Hazard Index is less than 1.0. Potential carcinogenic risks for surface water are less than the MDE's upper end threshold level of 1×10^{-5}. Potential carcinogenic risks for sediment are within the EPA's acceptable risk range of 1×10^{-4} to 1×10^{-6}, but exceed the MDE's upper end threshold level of 1×10^{-5}. Therefore, additional consideration of the contributing carcinogenic COPCs in sediment may be necessary. The primary contributors in sediment include arsenic, polynuclear aromatic hydrocarbons (PAHs), and polychlorinated biphenyl's (PCBs). It is important to note that there is considerable uncertainty associated with the exposures assumed in the HHRA. The sediments at the site are for the most part underwater, in many cases the water is 8 feet or more in depth, which will reduce or even eliminate the levels of exposure to a recreational user via dermal contact and ingestion. The risk

estimates are believed to be conservative in that they tend to overestimate any actual risks, in this case perhaps by a large margin. In addition, arsenic is a naturally occurring metal which is present in soils and sediments in Maryland. The concentrations of arsenic in sediment may be reflective of naturally occurring background and the contribution of arsenic to risk may be overstated.

The ecological risk assessment (ERA) determined that the receptors potentially at risk are: lower trophic level organisms consisting of water-column communities as well as the benthic invertebrates; and upper trophic level organisms represented by the great blue heron through the food-web exposure model. One surface water COPC (cadmium) and five sediment COPCs (barium, silver, benzo(a)pyrene, benzo(g,h,I,)perylene, and indeno(1,2,3-cd)pyrene) are considered the primary contributors to potential ecological exposure. Mercury in the diet of the great blue heron was also identified as an ecological concern through food chain modeling based on sediment concentrations of mercury.

Section 1
Introduction

On behalf of Lockheed Martin Corporation (LMC), Tetra Tech, Inc. has prepared the following Surface Water and Sediment Sampling Report documenting the investigation of the waterways adjacent to the LMC Middle River Complex (MRC), located at 2323 Eastern Boulevard in Middle River, Maryland. The objectives of the surface water and sediment sampling events were as follows:

- To obtain analytical data to quantify the presence or absence of chemicals in the surface water bodies surrounding the waterfront area of the LMC MRC based on two characterization studies conducted in March and October 2005.
- To conduct human health and ecological risk assessments to determine if any detected chemicals are present at concentrations of potential concern to site receptors.

The remainder of this report is organized as follows:

- Section 2 – Site Background – Presents a brief description of the site, site conditions, and previous investigations.
- Section 3 – Investigation Approach and Field Methodology – Presents a description of the field methodologies employed.
- Section 4 – Human Health Risk – Evaluates the potential for adverse effects on human receptors.
- Section 5 – Ecological Risk – Evaluates the potential for adverse effects on floral and faunal receptors.
- Section 6 – Summary and Conclusions – the overall summary and conclusions of the investigation.
- Section 7 – References - Cites references used to compile this report.

Field sample data sheets including chain-of-custody forms and Sample Log Sheets are included in Appendix A. Analytical data summary tables are included as Appendix B. Appendix C contains complete Data Validation Memorandum.

Section 2
Site Background

2.1 SITE DESCRIPTION

The LMC MRC is located at 2323 Eastern Boulevard in Middle River, Maryland. A facility location map is provided as Figure 2-1. The site consists of approximately 180 acres of land and 12 main buildings. The property includes an active industrial area and yard, perimeter parking lots, an athletic field, a concrete-covered vacant lot, a trailer and parts storage lot, and numerous grassy areas along the facility's perimeter. Locked chain-link fences surround all exterior lots and the main industrial area. The site is bounded by Eastern Boulevard (Route 150) to the north, Dark Head Cove to the south, Cow Pen Creek to the west, and Martin State Airport to the east. A facility layout map is provided as Figure 2-2.

Currently, LMC activities at the site are limited to facility and building management and maintenance. There are two main tenants at the site, Middle River Aircraft Systems (MRAS) and Maritime Systems & Sensors (MS2) – Marine Systems. MRAS conducts design, manufacturing, fabrication, testing, overhaul, and repair and maintenance of aeronautical structures, parts, and components for military and commercial applications. MS2 – Marine Systems conducts fabrication, assembly, testing, and support of vertical launch systems. Historically, the property has been used for aircraft and missile launching systems design, development, and sales.

2.1.1 Physical Setting

2.1.1.1 Land Use

The MRC is an industrial facility within the broader Chesapeake Industrial Park and the area surrounding the property primarily consists of commercial, industrial, and residential establishments. Six other facilities, comprising the remaining portion of the Chesapeake Industrial Park, lie adjacent to the LMC MRC. These facilities include Tilley Chemical Company, Inc., a food and pharmaceutical chemical distributor for personal care and industries; North American Electric, L.L.C., a broker firm specializing in the moving and installation of machinery and heavy equipment; Johnson and Towers, a heavy duty automotive/boat repair and maintenance company; Poly-Seal Corp., a company that produces flexible packaging for miscellaneous items; Exxon, a gasoline fill station and convenience store, and the Middle River Post Office. Residential developments are located on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek, as well as north of Eastern Boulevard (Route 150).

2.1.1.2 Physiography

The site is located within the Western Shore of the Coastal Plain Physiographic Province. The Coastal Plain topography is generally characterized by low relief. The topography of the MRC is gently sloping, ranging from sea level to approximately 32 feet above mean sea level (Cassell, July 1977). The topography slopes from Eastern Boulevard to the southwest and south towards Cow Pen Creek and Dark Head Cove.

2.1.1.3 Hydrology

The LMC MRC lies at the junction of Cow Pen Creek and Dark Head Cove. Both are tidal surface water bodies that feed into Dark Head Creek, a tributary to Middle River, which is a tributary to Chesapeake Bay. The facility lies approximately 3.2 miles upstream of Chesapeake Bay.

No surface water bodies lie within or cross the LMC MRC. Excluding areas immediately adjacent to Cow Pen Creek and Dark Head Creek, surface water runoff discharges from the facility via storm drains, soil infiltration, and evaporation. A total of 12 stormwater drain systems discharging to Cow Pen Creek and Dark Head Cove have been mapped at the facility (Cassell, July 1977) and are shown on Figure 2-2. Stormwater runoff from the Chesapeake Industrial Park and a portion of the Martin State Airport located across Wilson Point Road is collected through a stormwater conveyance system and discharged to Cow Pen Creek and Dark Head Cove.

LMC MRC maintains a State of Maryland National Pollution Discharge Elimination System (NPDES) Permit (State Discharge Permit No.: 00-DP-0298, NPDES No.: MD0002852) issued by Maryland Department of the Environment (MDE) Industrial Discharge Permits Division, Water Management Administration (Earth Tech, February 2003). MRAS generates sanitary wastewater and process wastewater and is categorized as an Industrial User. The facility pretreats and discharges its wastewater under the Industrial User Discharge Permit (Permit No.: WWDP#1390), issued to MRAS by the Baltimore County Department of Public Works Bureau of Utilities (Earth Tech, February 2003). According to the permit, the facility is authorized to discharge its processed and sanitary wastewater from seven permitted discharge points (i.e., outfalls).

2.1.2 Subsurface Conditions

2.1.2.1 Soils

Soils underlying the LMC MRC have been mapped as Mattapex-Urban Land Complex and Sassafras-Urban Land Complex by the United States Department of Agriculture (USDA) Soil Conservation Service. Mattapex-Urban Land soils consist of deep, well-drained silty soils whose original texture has been disturbed, graded over, or otherwise altered prior to construction. Sassafras-Urban Land soils consist of deep, well-drained sandy soils whose original texture has been disturbed, graded over, or otherwise altered prior to construction (USDA, September 1993). Site assessment activities conducted at MRC, however, indicate a high percentage of the soils containing a very high clay and silt content and surface drainage is poor.

2.1.2.2 Geology

Based on geologic mapping of Baltimore County, the LMC MRC is underlain by the Potomac Group, a Cretaceous age interbedded gravel, sand, silt, and clay unit ranging in thickness from 0 to 800 feet. The Potomac Group is composed of three units: the Raritan and Patapsco Formations, the Arundel Clay, and the Patuxent Formation. The Raritan and Patapsco Formations range up to 400 feet thick and are composed of a gray, brown, and red variegated silt and clay unit with lenticular lenses of sand and few gravels. The Arundel Clay is composed of dark gray and maroon lignitic clays and ranges in thickness from 25 to 200 feet. The Patuxent Formation is described as a white or light gray to orange brown, moderately sorted sand unit with quartz gravels, silts, and clays and ranges up to 250 feet in thickness (Reinhardt, 1977).

The Geologic Map of the Middle River Quadrangle (Reinhardt, 1977) Maps the entire survey area as either the clay or sand facies of the Patapsco Formation. The sands are more concentrated on the peninsulas east of Martin State Airport and areas north of Eastern Boulevard; whereas, all of the peninsulas (with the exception of the Wilson Point Road area) to the west of the airport are mapped as belonging to the clay facies. The Arundel Clay has been mapped as outcropping northwest of the MRC facility (Reinhardt, 1977).

Lithologic logging of the soils beneath the MRC conducted during extensive site characterization activities identified a very heterogeneous substrate. The underlying soils are composed primarily of silty sands, fine-grained to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primarily lithology being clay to silty clay. Sand lenses of various concentrations were encountered but do not appear to be continuous beneath the facility. Shallow groundwater tends to flow in the more sandy lenses towards the surface water bodies and the water table is generally a subdued representation of the surface topography.

2.2 PREVIOUS INVESTIGATIONS

Numerous environmental investigations have been conducted at the LMC MRC. Investigations include underground storage tank closures and abandonments, soil excavations, Phase I Environmental Site Assessments (ESAs), and Phase II ESAs. In 2003, a facility-wide Phase I

ESA was conducted at the LMC MRC. The Phase I identified 13 recognized environmental concerns (RECs) at the facility associated primarily with current site conditions (Earth Tech, February 2003). Subsequent review of historic site activities identified another 18 RECs at the facility (Tetra Tech, August 2004). Many of the identified RECs are located in the southern portion of the facility along the waterfront. Soil and groundwater sampling at the RECs identified sporadic soil and groundwater impacts in the media underlying the facility. The MRC has been entered into the MDE Voluntary Cleanup Program (VCP).

On March 17 and 18, 2005, surface water and sediment sampling was conducted in the surface water bodies (i.e., Cow Pen Creek, Dark Head Cove, and Dark Head Creek) adjacent to the facility's southern and western property boundaries. Ten additional surface water and 50 additional sediment samples were collected in October 2005 to further characterize and delineate chemicals identified during the March sampling event. This event included much more extensive investigation in Dark Head Cove as well as vertical profiling of chemical concentrations in sediments. Both events are discussed in more detail in Section 3.0.

Site Background

2.1 SITE DESCRIPTION

The LMC MRC is located at 2323 Eastern Boulevard in Middle River, Maryland. A facility location map is provided as Figure 2-1. The site consists of approximately 180 acres of land and 12 main buildings. The property includes an active industrial area and yard, perimeter parking lots, an athletic field, a concrete-covered vacant lot, a trailer and parts storage lot, and numerous grassy areas along the facility's perimeter. Locked chain-link fences surround all exterior lots and the main industrial area. The site is bounded by Eastern Boulevard (Route 150) to the north, Dark Head Cove to the south, Cow Pen Creek to the west, and Martin State Airport to the east. A facility layout map is provided as Figure 2-2.

Currently, LMC activities at the site are limited to facility and building management and maintenance. There are two main tenants at the site, Middle River Aircraft Systems (MRAS) and Maritime Systems & Sensors (MS2) – Marine Systems. MRAS conducts design, manufacturing, fabrication, testing, overhaul, and repair and maintenance of aeronautical structures, parts, and components for military and commercial applications. MS2 – Marine Systems conducts fabrication, assembly, testing, and support of vertical launch systems. Historically, the property has been used for aircraft and missile launching systems design, development, and sales.

2.1.1 Physical Setting

2.1.1.1 Land Use

The MRC is an industrial facility within the broader Chesapeake Industrial Park and the area surrounding the property primarily consists of commercial, industrial, and residential establishments. Six other facilities, comprising the remaining portion of the Chesapeake Industrial Park, lie adjacent to the LMC MRC. These facilities include Tilley Chemical Company, Inc., a food and pharmaceutical chemical distributor for personal care and industries; North American Electric, L.L.C., a broker firm specializing in the moving and installation of machinery and heavy equipment; Johnson and Towers, a heavy duty automotive/boat repair and maintenance company; Poly-Seal Corp., a company that produces flexible packaging for miscellaneous items; Exxon, a gasoline fill station and convenience store, and the Middle River Post Office. Residential developments are located on the opposite shores of Cow Pen Creek, Dark Head Cove, and Dark Head Creek, as well as north of Eastern Boulevard (Route 150).

2.1.1.2 Physiography

The site is located within the Western Shore of the Coastal Plain Physiographic Province. The Coastal Plain topography is generally characterized by low relief. The topography of the MRC is gently sloping, ranging from sea level to approximately 32 feet above mean sea level (Cassell, July 1977). The topography slopes from Eastern Boulevard to the southwest and south towards Cow Pen Creek and Dark Head Cove.

2.1.1.3 Hydrology

The LMC MRC lies at the junction of Cow Pen Creek and Dark Head Cove. Both are tidal surface water bodies that feed into Dark Head Creek, a tributary to Middle River, which is a tributary to Chesapeake Bay. The facility lies approximately 3.2 miles upstream of Chesapeake Bay.

No surface water bodies lie within or cross the LMC MRC. Excluding areas immediately adjacent to Cow Pen Creek and Dark Head Creek, surface water runoff discharges from the facility via storm drains, soil infiltration, and evaporation. A total of 12 stormwater drain systems discharging to Cow Pen Creek and Dark Head Cove have been mapped at the facility (Cassell, July 1977) and are shown on Figure 2-2. Stormwater runoff from the Chesapeake Industrial Park and a portion of the Martin State Airport located across Wilson Point Road is collected through a stormwater conveyance system and discharged to Cow Pen Creek and Dark Head Cove.

LMC MRC maintains a State of Maryland National Pollution Discharge Elimination System (NPDES) Permit (State Discharge Permit No.: 00-DP-0298, NPDES No.: MD0002852) issued by Maryland Department of the Environment (MDE) Industrial Discharge Permits Division, Water Management Administration (Earth Tech, February 2003). MRAS generates sanitary wastewater and process wastewater and is categorized as an Industrial User. The facility pretreats and discharges its wastewater under the Industrial User Discharge Permit (Permit No.: WWDP#1390), issued to MRAS by the Baltimore County Department of Public Works Bureau of Utilities (Earth Tech, February 2003). According to the permit, the facility is authorized to discharge its processed and sanitary wastewater from seven permitted discharge points (i.e., outfalls).

2.1.2 Subsurface Conditions

2.1.2.1 Soils

Soils underlying the LMC MRC have been mapped as Mattapex-Urban Land Complex and Sassafras-Urban Land Complex by the United States Department of Agriculture (USDA) Soil Conservation Service. Mattapex-Urban Land soils consist of deep, well-drained silty soils whose original texture has been disturbed, graded over, or otherwise altered prior to construction. Sassafras-Urban Land soils consist of deep, well-drained sandy soils whose original texture has been disturbed, graded over, or otherwise altered prior to construction (USDA, September 1993). Site assessment activities conducted at MRC, however, indicate a high percentage of the soils containing a very high clay and silt content and surface drainage is poor.

2.1.2.2 Geology

Based on geologic mapping of Baltimore County, the LMC MRC is underlain by the Potomac Group, a Cretaceous age interbedded gravel, sand, silt, and clay unit ranging in thickness from 0 to 800 feet. The Potomac Group is composed of three units: the Raritan and Patapsco Formations, the Arundel Clay, and the Patuxent Formation. The Raritan and Patapsco Formations range up to 400 feet thick and are composed of a gray, brown, and red variegated silt and clay unit with lenticular lenses of sand and few gravels. The Arundel Clay is composed of dark gray and maroon lignitic clays and ranges in thickness from 25 to 200 feet. The Patuxent Formation is described as a white or light gray to orange brown, moderately sorted sand unit with quartz gravels, silts, and clays and ranges up to 250 feet in thickness (Reinhardt, 1977).

The Geologic Map of the Middle River Quadrangle (Reinhardt, 1977) Maps the entire survey area as either the clay or sand facies of the Patapsco Formation. The sands are more concentrated on the peninsulas east of Martin State Airport and areas north of Eastern Boulevard; whereas, all of the peninsulas (with the exception of the Wilson Point Road area) to the west of the airport are mapped as belonging to the clay facies. The Arundel Clay has been mapped as outcropping northwest of the MRC facility (Reinhardt, 1977).

Lithologic logging of the soils beneath the MRC conducted during extensive site characterization activities identified a very heterogeneous substrate. The underlying soils are composed primarily of silty sands, fine-grained to medium-grained sands, silty clays, clayey silts, and plastic clay, with the primarily lithology being clay to silty clay. Sand lenses of various concentrations were encountered but do not appear to be continuous beneath the facility. Shallow groundwater tends to flow in the more sandy lenses towards the surface water bodies and the water table is generally a subdued representation of the surface topography.

2.2 PREVIOUS INVESTIGATIONS

Numerous environmental investigations have been conducted at the LMC MRC. Investigations include underground storage tank closures and abandonments, soil excavations, Phase I Environmental Site Assessments (ESAs), and Phase II ESAs. In 2003, a facility-wide Phase I

ESA was conducted at the LMC MRC. The Phase I identified 13 recognized environmental concerns (RECs) at the facility associated primarily with current site conditions (Earth Tech, February 2003). Subsequent review of historic site activities identified another 18 RECs at the facility (Tetra Tech, August 2004). Many of the identified RECs are located in the southern portion of the facility along the waterfront. Soil and groundwater sampling at the RECs identified sporadic soil and groundwater impacts in the media underlying the facility. The MRC has been entered into the MDE Voluntary Cleanup Program (VCP).

On March 17 and 18, 2005, surface water and sediment sampling was conducted in the surface water bodies (i.e., Cow Pen Creek, Dark Head Cove, and Dark Head Creek) adjacent to the facility's southern and western property boundaries. Ten additional surface water and 50 additional sediment samples were collected in October 2005 to further characterize and delineate chemicals identified during the March sampling event. This event included much more extensive investigation in Dark Head Cove as well as vertical profiling of chemical concentrations in sediments. Both events are discussed in more detail in Section 3.0.

Section 3
Investigation Approach and Field Methodology

Surface water and sediment sampling was conducted in two separate phases (March 2005 and October 2005). During the March 2005 investigation, surface water and sediment sampling was conducted in the surface water bodies adjacent to the facility's southern and western property boundaries (Cow Pen Creek and Dark Head Cove). Sampling activities were conducted on March 17 and 18, 2005 in accordance with the Surface Water and Sediment Sampling Work plan (Tetra Tech, March 2005).

During the October 2005 investigation, additional surface water and sediment sampling was conducted at Dark Head Cove and Cow Pen Creek. The sampling included both areas previously sampled for confirmation and vertical distribution of detected chemicals as well as additional lateral sampling of Dark Head Cove. Sampling activities were conducted on October 20 and 21, 2005 in accordance with the Surface Water and Sediment Sampling Work plan (Tetra Tech, October 2005).

3.1 SURFACE WATER SAMPLING

3.1.1 Surface Water Sampling March 2005

A total of seven surface water samples, designated SW-1 through SW-7, were collected from Cow Pen Creek and Dark Head Cove (Figure 3-1). Two (SW-1 and SW-2) of the seven surface water samples were collected as background reference samples, one (SW-1) hydraulically upgradient of the facility's first outfall along Cow Pen Creek and one (SW-2) from a cove within Dark Head Creek. The remaining five sample locations (SW-3 through SW-7) were along the facility's waterfront approximately 10 feet from the shoreline. The surface water sample locations were

positioned adjacent to areas of known groundwater impacts and typically coincided with every second (i.e., alternate) sediment sample location. At least one of the surface water sample locations (SW-7) was located within an area recently impacted from a fuel oil spill that originated from the adjacent Martin State Airport facility.

3.1.2 Surface Water Sampling October 2005

A total of 10 surface water samples, designated SW-8 through SW-17, were collected from Cow Pen Creek and Dark Head Cove (Figure 3-2) in October 2005. The sample locations were distributed to provide a broad evaluation of surface water quality in Dark Head Cove.

3.1.3 Surface Water Sampling Protocols

Surface water samples were collected as grab samples using direct fill sampling techniques. A pre-cleaned, unpreserved bottle was submerged approximately 1 foot below the water surface and allowed to fill. The collected sample volume was then decanted into the appropriate sample containers, taking care to minimize agitation of the collected water. Each sample was submitted for the following analyses: volatile organic compounds (VOCs) using Method 8260B; semi-volatile organic compounds (SVOCs) using Method 8270C; Total Priority Pollutant Metals using Method 6020; polychlorinated biphenyls (PCBs) using Method 8082; and hexavalent chromium using Method 7196A. In addition, a peristaltic pump fitted with a 0.45 micron inline filter was used to collect a filtered surface water sample from each location. The filtered water sample was submitted for Dissolved Priority Pollutant Metals analysis by Method 6020 only. Five surface water samples were analyzed for Alkyltins during the October 2005 investigation primarily to determine if dibutyltin tin was present due to its possible historical use as an algal growth inhibitor in paint. All surface water samples were collected using dedicated and disposable sampling equipment.

Surface water quality parameters, including temperature, pH, specific conductance, turbidity, dissolved oxygen, and oxidation-reduction potential, were collected from each surface water sample location. The surface water quality measurements are presented on the field sample data sheets included in Appendix A.

3.2 SEDIMENT SAMPLING

3.2.1 Sediment Sampling March 2005

Twelve sediment samples, designated SD-1 through SD-12, were collected from Cow Pen Creek, Dark Head Cove, and Dark Head Creek. Two (SD-1 and SD-2) of the 12 sediment samples were collected as background reference samples, one (SD-1) hydraulically upgradient of the facility's first outfall along Cow Pen Creek and one (SD-2) from a cove within Dark Head Creek. The remaining 10 sample locations (SD-3 through SD-12) are collected approximately 10 feet from the facility's shoreline near one or more of the facility's outfalls.

The 12 sediment sample locations are shown on Figure 3-1. At least one of the sediment sample locations (SD-12) was located within an area recently impacted from a fuel oil spill originating on the adjacent Martin State Airport facility.

3.2.2 Sediment Sampling Protocols March 2005

Sediment samples were collected as grab samples using dedicated polyethylene trowels for shallow (less than 0.5 foot of water) sediment samples (SD-1, SD-3, and SD-4) and a decontaminated stainless steel ponar dredge for sediment sample locations collected in deeper water (SD-2 and SD-5 through SD-12). The stainless steel ponar dredge was decontaminated between sample locations, as described in Section 3.4. Upon sample retrieval, the initial sample volume was placed within the VOC sample container until no headspace remained. The remaining sample volume was then homogenized and placed within the other pre-cleaned sample containers supplied by the analytical laboratory. The collected samples were submitted for analysis for VOCs using Method 8260B; SVOCs using Method 8270C; Total Priority Pollutant Metals using Method 6020; PCBs using Method 8082; and hexavalent chromium using Method 7196A.

During sampling, the collected sediment samples were lithologically and visually characterized for color, sorting, grain size, and other pertinent characteristics. Sorting was determined by observing the grain-size distribution. Grain size was determined by comparing grains of soil to a grain-size

chart. In addition, the depth to the bottom of the surface water body was measured using a weighted tape. All sediment sampling information was documented on the sediment sample sheets included in Appendix A.

3.2.3 Sediment Sampling October 2005

A total of 50 sediment samples were collected during this investigation. A total of 30 sediment sample locations, designated SD-13 through SD-42, were sampled from Cow Pen Creek and Dark Head Cove to provide data sufficient to evaluate the horizontal distribution of chemicals of concern detected in March 2005. At all 30 locations, surficial sediments (i.e., the top approximately 6 inches of unconsolidated material) were collected. At 9 of the 30 locations (SD-13, 14, 16, 19, 27, 28, 29, 40, and 42), samples were also collected at depths of approximately 1 and 2 feet below the sediment/surface water interface. Sample locations selected for coring were in relatively close proximity to the shoreline of the LMC MRC and were intended to confirm previous sample results and to evaluate the vertical distribution of chemicals.

3.2.4 Sediment Sampling Protocols October 2005

Sediment samples were collected as grab samples from Cow Pen Creek and Dark Head Cove using a stainless steel dredge or coring device from locations at depth. All reusable equipment was decontaminated between sample locations, as described in Section 3.4. Upon sample retrieval, the initial sample volume was placed within the VOC sample container until no headspace remained. The remaining sample volume was homogenized and placed within the remaining sample containers supplied by the analytical laboratory. Samples collected from depths of 1 and 2 feet beneath the surface water interface were collected by utilizing a barge-mounted vibracore system to collect an approximately 3-inch-diameter core. Each core sample was retrieved in a dedicated disposable polyethylene bag. All samples were submitted for analysis for VOCs using Method 8260B; SVOCs using Method 8270C; Total Priority Pollutant Metals using Method 6020; PCBs using Method 8082; and hexavalent chromium using Method 7196A. In addition, 14 samples (nine surface sediments and six from 2- and 3-foot depths) were also analyzed for total organic carbon (TOC) following the Lloyd Kahn method. Twelve sediment

samples were analyzed for Alkyltins during the October 2005 investigation primarily to determine if dibutyltin was present due to its possible historical use as an algal growth inhibitor in paint.

During sampling, the sediment was logged to describe the color, sorting, grain size, and any other pertinent soil characteristics. Textural properties of the soil were determined by using tables specified in the ASTM D2488-00 method. Sorting was determined by observing the grain-size distribution. Grain size was determined by comparing grains of soil to a grain-size chart. In addition, the depth to the bottom of the surface water body was measured using a weighted tape. All information was documented on sediment sample forms (see appendix A).

3.3 SAMPLE NOMENCLATURE AND HANDLING

Laboratory-submitted samples were identified using a "SW" or "SD" prefix, identifying the sample medium, followed by a sequential numeric number identifying the sample location, followed by the sample date. An example would be SD-2-031805 for a sediment sample collected from location 2 on March 18, 2005.

Proper custody procedures were followed throughout all phases of sample collection and handling. Chain-of-custody protocols were used throughout sample handling to establish evidentiary integrity of sample containers. After collection, the samples remained in the custody of the samplers until they were picked up by a representative of the analytical laboratory.

3.4 EQUIPMENT DECONTAMINATION

All non-disposable sampling equipment was properly decontaminated between sample locations. Disposable items such as polyethylene hand trowels and disposable polyethylene core sample bags were properly discarded after each sample location.

The stainless steel ponar dredge and vibracore steel sample tube were decontaminated according to the following procedure:

- Loose sediment was brushed off with a steel-bristle brush.

- Equipment was then washed in a non-phosphate detergent solution using plastic scrub brushes.
- The equipment was then rinsed with distilled water and isopropanol and allowed to air dry.

3.5 DATA VALIDATION

All chemical data was validated in accordance with the United States Environmental Protection Agency (EPA) Region III procedures for validation established in the National Functional Guidelines. Data validation fulfills three basic functions: (1) it serves as an independent Quality Assurance check of the veracity of laboratory results; (2) it is a means of evaluating laboratory performance and determining the impact of noncompliance on the data; and (3) lends interpretive guidance for the proper usage and limitations of the data through the use of data qualifiers.

Data validation memoranda are generated to explain the findings of the data evaluation process and interpret actions taken on the data and limits of the data usability. They present the qualified analytical results and include support documents as necessary discussing problems areas and noncompliance and supporting the validation actions taken. The full data validation memoranda are included in Appendix C.

Section 4
HUMAN HEALTH RISK ASSESSMENT

4.1 INTRODUCTION

4.1.1 Purpose and Objectives

The purpose of this human health risk assessment (HHRA) is to evaluate the likelihood that individuals exposed to the chemical concentrations in the sediments and surface water adjacent to the MRC could experience adverse health effects. The objective is to provide sufficient information to allow for identification of areas with the potential for unacceptable risks to potentially exposed individuals and as a tool to support further actions or the need for remedial actions.

4.1.2 Scope of the Human Health Risk Assessment

The HHRA was designed and conducted to conform to State and federal risk assessment policies and guidelines. Primary sources of guidance include the MDE's *Cleanup Standards for Soil and Ground Water* (August, 2001) and the MDE's *Voluntary Cleanup Program Guidance Document* (September, 2005). The HHRA also makes use of EPA Region 3 risk assessment guidance and EPA's *Risk Assessment Guidance for Superfund* as appropriate.

The risks, expressed both for cancer and effects other than cancer (noncancer hazards), were conservatively derived for specific exposure scenarios assuming reasonable maximum exposure (RME) conditions. The RME risk estimates are derived using methodology and assumptions that have been for the most part standardized for use by risk managers and regulators. This approach provides a means by which to prioritize sites, to make remedial decisions, and also to determine

acceptable cleanup levels. The risk estimates in the HHRA are upper bound estimates; the true risks are more likely to be lower.

This HHRA provides RME risk estimates for hypothetical recreational use of the portions of Cow Pen Creek and Dark Head Cove that are adjacent to the MRC. RME estimates of cancer and noncancer risks were derived for an individual's contact with sediment and surface water during recreational activities such as wading and swimming. Using sampling data, activity factors, and other exposure assumptions, the model assumes that the RME individual receives intakes of chemical substances present in sediment and surface water from (1) incidental ingestion and (2) absorption through the skin. The following receptors and routes of exposure are assessed in this HHRA:

- Media: Sediment and surface water
- Receptors: Recreational visitors or residents - adult, youth, and child
- Exposure Pathways: Incidental ingestion and dermal contact

The HHRA is similar to a Superfund Baseline Risk Assessment in that it does not *a priori* assume any physical or engineering controls or remediation that would serve to limit or reduce the levels of exposure. For decision making, RME risk estimates are typically compared to policy-based values for presumptively acceptable risk. The MDE has set an upper end threshold at risk levels of 1 in 100,000 (i.e., $1x10^{-5}$) for carcinogens (cancer risk) and a hazard quotient (HQ) of 1 for noncarcinogens.

The HHRA was based on data from sediment and surface water sampling conducted in March and October 2005. Further information on the site history and characterization activities can be found in Sections 2.0 and 3.0 of this report. The HHRA consists of the following:

- Data evaluation and selection of chemicals of potential concern (COPCs).
- Identification of potential current and future human activities in Cow Pen Creek and Dark Head Cove and potential routes of exposure to chemicals in environmental media.
- Assumptions related to the level of exposure by pathway and receptor type and the associated numerical estimates known as exposure factors.

- Evaluation of the toxicity of COPCs.
- Characterization of the risk posed by environmental conditions in the media assessed to potential receptors engaged in activities that result in exposure.
- Discussion of the uncertainty in the underlying assumptions, parameters, and numerical risk estimates.

Section 4.2 describes the data evaluation and screening procedure used to identify COPCs, and Section 4.3 describes the exposure assessment. Section 4.4 presents the toxicity values for COPCs. Section 4.5 presents the risk characterization and results of the risk assessment. Section 4.6 discusses some of the uncertainties associated with the risk estimates. Section 4.7 presents the conclusions of the risk assessment.

4.2 IDENTIFICATION OF CHEMICALS OF POTENTIAL CONCERN

4.2.1 Data Evaluation

This HHRA was based on data from sediment and surface water investigations conducted in 2005. Figure 4-1 collectively shows the sampling locations utilized during these investigations. The sediment samples were collected from three depths: surface (0 to 6 inches), 1 foot below the water surface and 2 feet below the water surface.

The data from previous investigations were reviewed to ensure that the quantity and quality of the analytical data were suitable for risk assessment purposes. The data validation reports for the samples used in this HHRA can be found in Appendix C.

Validated sampling data were processed as follows:

- All samples with data qualifiers UR and B were removed from the dataset because they represent unreliable/unusable results or possible laboratory contamination.
- All units for sample results were converted to mg/kg. Non-detects (validation qualifiers of U, UL, or UJ) were converted to values representing one-half the sample quantitation

limit (SQL)[1]. Accordingly, throughout the HHRA, COPCs (defined separately for each medium) were assumed to be present in all samples at levels of not less than ½ the SQL.

- Three sediment sampling data sets were constructed: (1) surface sediment samples collected at depths of approximately 6 inches below the sediment surface, (2) subsurface sediment collected at about 1-foot depth, and (3) subsurface sediment samples collected at about 2-foot depth.

- Surface water data were assessed as a single dataset.

4.2.2 Identification of Chemicals of Potential Concern

This section describes the methodology of the screening evaluation used to generate the list of chemicals that was evaluated quantitatively in the risk assessment. The approach is consistent with the recommended methodology in the *Risk Assessment: Technical Guidance Manual* (EPA Region 3, 2003).

4.2.1.1 Sediment COPCs

Table 4-1 shows the list of analytes detected in sediment. Table 4-1 forms the basis for risk-based screening of all analytes: it shows the numbers of samples collected, the numbers of samples with detectable concentrations, the ranges of detected concentrations, the maximum reported concentrations, and the residential risk-based concentrations (RBC) for soil published by MDE or EPA Region 3. During the screening process, analytes were compared to MDE/EPA Region 3 RBCs for residential soils (in the absence of any published RBCs for recreational use involving contact with sediment), adjusted as necessary to reflect the following screening-level target risk levels:

- The lower end of EPA's presumptively acceptable cancer risk range, a 1 in one million ($1x10^{-6}$) probability of cancer.
- An HQ of 0.1.

The lowest RBC for the above target risk values were adopted as the screening values.

1 The sample quantitation limit is the quantity reported by the laboratory for results that have been flagged with a non-detect qualifier.

COPCs were selected according to the following protocol:

- Analytes with maximum detected concentrations in sediment that exceeded the residential soil RBCs were retained for quantitative risk evaluation and considered COPCs for the risk analysis.

- Analytes detected at least once but whose highest concentration was less than the RBC were eliminated from further consideration.

- Analytes never detected at concentrations greater than the SQL, signifying that the chemical cannot be confirmed to be present in the sample but may exist at a concentration less than this SQL, were not carried through the quantitative risk evaluation but are evaluated separately in the discussion of uncertainties.

- Analytes with no RBCs are discussed in the discussion of uncertainties.

Analytes that were either never detected, whose concentrations are less than the RBC, or for which an RBC is not available were excluded from quantitative evaluation in the HHRA. The results for analytes that were never detected (i.e., all laboratory results indicated concentrations less than the laboratory's quantitation limit) were additionally evaluated by comparing their sample SQLs to their RBCs; those with SQLs that exceed the RBCs are identified on Table 4-2. These analytes were not carried forward in the HHRA because there is no evidence that they were actually present in the sediments and the range of SQLs for these is compared to the RBC values. The implications for risk associated with these analytes are discussed separately in the HHRA's discussion of uncertainties.

Based on the results of this sediment screening process, the COPCs in sediment, as shown in Table 4-1, are as follows:

- Seven metals: antimony, arsenic, cadmium, chromium, mercury, thallium, and vanadium.

- Five members of the family of organic compounds know as polycyclic aromatic hydrocarbons (PAHs), benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene.

- One PCB isomer: Aroclor-1260.

4.2.1.1 Surface Water COPCs

The surface water samples from Cow Pen Creek and Dark Head Cove were analyzed for inorganic constituents, VOCs, SVOCs, and PAHs. Because no relevant published RBCs for recreational use of surface water could be found, any analyte detected at least once in surface water was considered a COPC. Table 4-3 lists the surface water COPCs and their concentration ranges, numbers of analyses, and numbers of detections.

Based on the results of the surface water screening process, the COPCs in surface water are as follows:

- Fourteen metals: antimony, arsenic, barium, beryllium, cadmium, chromium, copper, lead, mercury, molybdenum, nickel, selenium, silver, and zinc.
- Two SVOCs: bis(2)ethylhexyl phthalate and di-n-buty phthalate.
- Five VOCs: acetone, carbon disulfide, chloroform, methyl tert-butyl ether (MTBE), and trichloroethene.

4.3 EXPOSURE ASSESSMENT

The exposure assessment identifies and describes potentially exposed human receptors, develops exposure pathways, and estimates chemical concentrations at the point where a human receptor could come into contact with surface water and sediments in these surface water bodies [i.e., exposure point concentrations (EPCs)].

4.3.1 Conceptual Site Model

The HHRA postulates a hypothetical recreational use of Cow Pen Creek and Dark Head Cove. The conceptual site model includes an individual who either lives at or visits the area and engages in wading and swimming activities that result in contact with sediment and surface water.

4.3.2 Potential Exposure Pathways

An exposure pathway is the mechanism by which a human receptor is exposed to chemicals from a source. The four elements of a complete exposure pathway are as follows:

- A source of chemical release.
- A mechanism of release through a transport medium.
- A point of contact between the potential receptor and the transport medium, e.g., ingestion of sediment.
- A potential receptor, i.e., the individual.

If any one of the four elements is missing, the exposure pathway is considered incomplete. Only complete exposure pathways would result in exposures. The pathways assessed in the HHRA are assumed to be complete for both future users and any current users of the water bodies. The first two criteria are assumed to be satisfied, i.e., a source is/was present and the release has occurred. The receptor and point of contact are also assumed to be present. The exposure pathways for an individual using the water bodies recreationally evaluated in this HHRA are as follows:

- Incidental ingestion of surface water and sediments
- Dermal contact with surface water and sediments

Inhalation of volatile substances in surface water while swimming, although a potentially complete pathway, is considered to be negligible compared with potential exposures from the above pathways.

Inhalation of sediment particles is also deemed negligible and has not been evaluated in this HHRA as the sediments present are saturated, in most cases under 10 or more feet of water.

4.3.3 Current and Future Receptors

There are no site-specific data to characterize any current recreational users of the water bodies. Therefore, a single individual receptor is evaluated in this HHRA: an individual who recreates as a child, as a youth, and then as an adult over the duration of exposure. (The assumption that the

receptor is exposed over this age range results in higher cancer risks than if the receptor was exposed as a youth then adult or as an adult only).

4.3.4 Quantification of Exposure

This section describes the quantification of the chemical intake or exposure doses. These exposure doses provided the basis for subsequent risk calculations using dose-response relationships. The RME approach was used to provide an estimate of the maximum exposure that might occur (EPA, 1989). Under the RME scenario, the intent is to conservatively quantify an exposure that is still within the range of possible exposures.

4.3.4.1 Estimation of Concentration at the Point of Exposure

For each COPC, an upper confidence limit (UCL) of the mean concentration was used to estimate the concentration at the point of exposure (i.e., EPC). The UCL, typically the 95 percent UCL, provides reasonable confidence that the true site average will not be underestimated (EPA, 1992). The ProUCL software from the EPA National Exposure Research Laboratory, Environmental Sciences, was used to calculate the UCL values. The ProUCL software performs the necessary statistical tests and recommends an appropriate UCL value. (It generates a recommended value for the UCL depending on the distribution of the data that can be one of several statistical quantities including, the 95 percent UCL, the 97.5 percent and 99 percent UCLs or the maximum value detected or higher.) As a matter of protocol, Tetra Tech has taken the EPC to be the lower of either the UCL value recommended by ProUCL or the maximum detected concentration.

UCLs were generated for all COPCs in surface water using all available data. UCLs for sediment were computed for each of the three depth zones evaluated (surface, 1 foot, and 2 feet). The UCLs were based on the transformed data sets including surrogate values of ½ the laboratory reported SQLs for COPCs in samples for which the laboratory reported a non-detect result.

Tables 4-4, 4-5, and 4-6 provide the COPC and sampling location-specific concentrations (including surrogate values for non-detects) for surface, 1-foot and 2-foot sediments respectively.

Similarly, Table 4-7 provides the surface water COPC concentrations. These tables also show the UCL values derived from the location-specific concentrations as explained above.

4.3.4.2 Exposure Parameters

The recreational activities at Cow Pen Creek/Dark Head Cove are postulated to be wading and swimming with associated contact with sediments and surface water. The exposure assessment requires derivation of lifetime and average daily doses (the product of the concentration and the intake). Estimation of the magnitude of the doses requires knowledge of or assumptions regarding an individual's contact rate with the chemical in the media and the exposure pathways considered. These exposure factors consist of activity patterns and other receptor-specific parameters. Examples of exposure factors include exposure frequency (days exposed per year), exposure duration (years exposed), ingestion rates for soil, skin area exposed for dermal absorption, and body weights.

The RME case is assumed to involve repetitive use of the water bodies over a period of 30 years (a standard residential scenario exposure duration representing an upper bound on nationwide residential occupancy periods). The receptor is modeled as a 15 kg child for 6 years, a 40 kg youth for 12 years, and as a 70 kg adult for the remaining 12 years. The RME individual is assumed to recreate and swim for 4 days per week for the four summer months (June through September). This exposure frequency of 70 days per year is assumed to apply to each year of the 30-year duration, i.e., a total of 2,100 days of exposure. The exposure assessment algorithms and parameter values are presented in the Tables 4-8 through 4-13.

The equations for ingestion and dermal contact with sediment are shown on Table 4-8. The algorithms and receptor-specific values such as sediment ingestion rates, sediment to skin adherence factors, and skin-sediment contact areas are the same as the EPA/MDE default RME values for exposures to soil. EPA's recent dermal assessment guidance (EPA, 2004) recommends this approach with certain caveats. These limitations and sources of uncertainty are discussed in the section of this report on uncertainties. Table 4-10 provides the receptor-specific exposure factors for sediment exposure, and Table 4-12 provides the COPC-specific factors for sediment exposure assessment.

For surface water, the algorithms for ingestion and dermal contact follow the approach outlined in MDE's *Cleanup Standards for Soil and Ground Water* (2001). The equations used and receptor-specific exposure factors are shown in Tables 4-9 and 4-11, respectively. Table 4-13 provides the COPC-specific factors for surface water exposure assessment.

4.4 TOXICITY ASSESSMENT

Toxicity assessment addresses the ability of a compound, at an administered dose, to elicit an adverse human health response. For risk assessment purposes, toxic chemical effects were separated into two categories of toxicity: carcinogenic effects and noncarcinogenic effects. This division relates to the currently held scientific opinion that the mechanisms of action for these endpoints differ. For carcinogens, it is assumed, likely conservatively, that any level of exposure has a finite possibility of causing cancer and that a single exposure to a carcinogenic chemical will result in an increased probability of developing cancer. Therefore, according to this theory, there is no threshold dose for carcinogenic effects. For a chemical exhibiting noncarcinogenic effects, there is an assumed threshold dose for these effects. This threshold concept view of noncarcinogenic effects holds that a range of exposures up to some defined threshold can be tolerated by humans without appreciable risk of harm.

For quantitative risk assessment, the cancer potency of an agent considered carcinogenic is defined by a cancer slope factor (CSF). The CSF is an estimate of the slope of the tumor dose-response curve. To ensure an adequate margin of safety, the CSF is the 95^{th} percentile upper-bound confidence level of the slope of the tumor dose-response curve. Thus, the actual slope factors estimating carcinogenic potency could be lower, but are not likely to be higher.

The noncarcinogenic, or threshold, health effects of a chemical are evaluated using a reference dose (RfD) approach. A RfD is a conservative estimate of the daily intake of a chemical (milligram of chemical per kilogram body weight per day) that is without appreciable risk of any threshold health effects in humans, including sensitive subpopulations (women of child-bearing age and children).

The numerical estimates of cancer and noncancer potency via oral administration for COPCs (toxicity factors), namely the oral CSFs and oral noncancer RfDs, respectively, used in this HHRA were obtained from the most recent version of EPA Region 3's RBC Table, which was updated in October 2005. Oral toxicity factors were adjusted for the dermal exposure pathway in accordance with the recommended approach of EPA Region 3's *Updated Dermal Exposure Assessment Guidance* (2003), which incorporates by reference EPA's *Risk Assessment Guidance for Superfund* (Part E) (2004).

Tables 4-13 and 4-14 provide the toxicity factors for ingestion (oral) and dermal exposure for COPCs in sediment and surface water, respectively[2,3].

4.5 RISK CHARACTERIZATION

This section describes how calculated exposure doses were integrated with the toxicity criteria to yield estimates of potential health risks. Risk characterization involves the integration of health effects information, developed as part of the dose-response assessment, with exposure estimates developed as part of the exposure assessment. The result is a quantitative estimate of non-threshold carcinogenic risks, as well as a quantitative estimate of chronic and noncarcinogenic hazards based on the presumption that a threshold dose is required to elicit a response.

The EPA considers a risk range of 1 in 10,000 to 1 in 1,000,000 (1×10^{-4} to 1×10^{-6}) as a target range within which to manage human health risk [40 Code of Federal Regulations (CFR), Section 300.430(e)(2)(i)(A)] (EPA, 1991). It is generally accepted that risks greater than this range require attention. The one-in-a-million level of risk is often referred to as the "de minimis"

2 The toxicity factor for chromium measured as total chromium in sediments and surface water was adjusted to that of a mixture of six parts trivalent chromium (Cr III) to one part of the more toxic form hexavalent chromium (Cr VI) -- this is the ratio assumed by EPA Region 9 for total chromium in its Preliminary Remediation Goal (PRG) table. Cr VI was detected in 6 of 62 sediment samples, and the ratios of CR III to Cr VI in these samples varied from 7:1 to about 700:1. The assumption that a 6:1 ratio exists in all samples is conservative when compared to actual site conditions; however, even with this assumption, chromium does not have a large influence on the results of the HHRA.

3 For mercury, the toxicity factors combine both elemental mercury, which has an RfD for inhalation only, and methyl mercury, which has an oral RfD only. Both RfDs are assumed to apply, meaning that the form of mercury in the environment could be either elemental or methyl (or mercuric chloride because the RfD for methyl mercury is lower than the RfD for mercuric chloride).

level of risk; human health risks below this range would not require attention. The MDE's upper end threshold is 1 in 100,000 (i.e., 1 x 10^{-5}) for carcinogens (cancer risk), or a hazard index (HI) of 1.0 for noncarcinogens.

4.5.1 Carcinogenic Risk Estimates

The theoretical excess lifetime cancer risk is an estimate of the increased risk of an individual developing cancer as a result of exposure to the COPCs at specified daily dosages averaged over a lifetime of 70 years. Lifetime daily intakes, using an averaging time of 70 years, effectively prorate the total cumulative dose over a lifetime. This approach is based on the assumption that a high dose of carcinogens received over a short period of time, at any age, is equivalent to a correspondingly low dose received over a lifetime. The excess lifetime cancer risk was estimated for each assumed carcinogen using the following equation:

$$\textit{Excess Cancer Risk} = \textit{Exposure Dose} \times \textit{CSF}$$

The equations on Tables 4-9 and 4-10 present this equation with the exposure dose shown in terms of individual parameters.

4.5.2 Noncarcinogenic Effects

The HQ is the ratio of the estimated exposure dose to the RfD and is used to evaluate noncarcinogenic health effects due to exposure to a constituent. An HQ greater than 1 indicates that the estimated exposure dose for that constituent exceeds the RfD. Although an HQ of less than 1 suggests that noncarcinogenic health effects would not occur, an HQ of greater than 1 is not necessarily an indication that adverse effects will occur. The noncancer risk was estimated for each agent with potential noncarcinogenic adverse health effects using the following equation:

$$\textit{Noncancer HQ} = \textit{Exposure Dose} \;/\; \textit{RfD}$$

The equations on Tables 4-9 and 4-10 present this equation with the exposure dose shown in terms of individual parameters.

The sum of the HQs is termed the HI. Summing HQs across all chemicals and across all pathways assumes that all human health effects are additive. Because this assumption is not necessarily accurate, when an HI exceeds 1.0, it is acceptable to re-examine the health effects and to segregate the individual HQs on the basis of target organ or mechanism of action.

4.5.3 Results of the Risk Characterization

4.5.3.1 Risks Associated with Exposures of a Recreational User to Sediment

Risk estimates for cancer and noncancer endpoints were computed for recreational exposure to surface and all sediments (surface, 1-foot and 2-foot depths). The aggregate risks, which are the sums of ingestion and dermal risks across all COPCs, for the age-integrated (child-youth-adult) receptor are shown in the table below.

	RME Cancer Risks			RME Noncancer HIs		
Recreational	**Ingestion**	**Dermal**	**Total**	**Ingestion**	**Dermal**	**Total**
Sediment (surface)	1.2×10^{-5}	3.2×10^{-6}	1.5×10^{-5}	0.43	0.24	0.68
Sediment (all depths)	1.4×10^{-5}	4.3×10^{-6}	1.8×10^{-5}	0.49	0.28	0.78

These values were developed using UCL-based exposure concentrations and RME exposure assumptions. The pathway- and COPC-specific risks that make up these aggregate values are provided in Tables 4-16 (surface sediment) and 4-17 (all depths). The difference between surface and all (surface and subsurface) sediment exposure risks is small due in part to a greater number of surface samples than subsurface samples; the combined risks are slightly higher than for the surface alone because higher concentrations of chemicals in subsurface samples result in an increase in EPCs. The following discussion is limited to surface sediments because these are deemed more likely to represent exposures to recreational users; however, the general conclusions are not altered by this decision.

From the surface sediment values on Table 4-16, it can be seen that the primary contributors to the estimated cancer risks are as follows:

- Arsenic via ingestion, with a risk of 4.5×10^{-6}, 31 percent of the total cancer risk.
- PAHs via ingestion, which, treated as a group, contribute a risk of 4.3×10^{-6}, 29 percent of the total cancer risk.
- Aroclor-1260 via ingestion and dermal contact, with risks of 2.6×10^{-6} and 1.1×10^{-6}, 18 percent and 8 percent of the total cancer risk, respectively.

The same contributing COPCs are found in the cancer risk estimates for surface and subsurface sediment combined (Table 4-17).

The primary contributors to the estimated noncancer HI in surface sediment are as follows:

- Vanadium via ingestion and dermal contact, with HQs of 0.15 and 0.16, which, respectively, make up, 21 percent and 23 percent of the total noncancer HI.
- Cadmium via ingestion, with an HQ of 0.12, 17 percent of the total noncancer HI.
- Other metals, including chromium via dermal contact (10 percent) and arsenic via ingestion (10 percent), make up the remainder.

The same contributing COPCs are found in the noncancer risk estimates for surface and subsurface sediment combined (Table 4-17).

Tables 4-18 through 4-23 provide risk values for COPCs in surface sediment at each sampling location. Tables 4-18 and 4-19 show the values for cancer and noncancer risk based on combined ingestion and dermal contact. Tables 4-20 through 4-23 divide the risks by route of exposure, for example, Table 4-20 provides the risk values for cancer via ingestion. Figures 4-2 though 4-4 show the sampling locations with symbols color coded according to the levels of "risk" associated with each sampling point. Figures 4-5 and 4-6 show the relative contributions of risk-driving chemicals at each point for cancer and noncancer endpoints, respectively. Figures 4-7 and 4-8 provide the total risk estimates for each sampling point in the 1-foot depth and 2-foot depth subsurface sediments.

It should be noted that these risk estimates calculated for individual sampling points should not be construed as risk estimates for the receptor because it is not reasonable to assume that the receptor receives his or her entire exposure, over a number of years, at a single point. The location-specific tables and associated figures are intended as a tool for a remedial manager to identify relative risk contributions at each point across the horizontal and vertical extents of the sampling and to aid in decisions concerning any remedial actions. The UCL-based risk estimates given in Tables 4-16 and 4-24 more accurately represent the various concentrations to which a receptor would be exposed over time and should therefore be considered the risk assessment results for sediment exposure.

4.5.3.2 Risks Associated with Exposures of a Recreational User to Surface Water

Risk estimates for cancer and noncancer endpoints were computed for recreational exposure to surface water. The aggregate risks, which are the sums of ingestion and dermal risks across all COPCs for the age-integrated (child-youth-adult) receptor, are shown in the table below.

	RME Cancer Risks			RME Noncancer HIs		
Recreational	Ingestion	Dermal	Total	Ingestion	Dermal	Total
Surface Water	1.0×10^{-6}	8.0×10^{-6}	9.0×10^{-6}	0.036	0.12	0.15

These values were developed using UCL-based exposure concentrations and RME exposure assumptions. The pathway- and COPC-specific risks that make up these aggregate values are provided in Table 4-24.

Table 4-24 shows that the primary contributor to the estimated cancer risks from exposure to surface water is bis(2-ethylhexyl) phthalate via dermal contact, with a risk of 7.2×10^{-6}, which makes up 80 percent of the total cancer risk.

The primary contributors to the estimated noncancer HI in surface sediment are as follows:

- bis(2-Ethylhexyl) phthalate via dermal contact, with a hazard quotient of 0.08, is responsible for 53 percent of the total noncancer HI.
- Antimony and arsenic via dermal contact and ingestion make up 15 percent and 7 percent of the total HI, respectively.

Similarly to sediments, Tables 4-25 through 4-30 and the associated Figures 4-9 through 4-13 provide "risk" values for COPCs in surface water at each sampling location. Again, it should be noted that these risk estimates calculated for individual sampling points should not be construed as risk estimates for the receptor because it is not reasonable to assume that the receptor receives all of his or her exposure at a single point. The UCL-based risk estimates more accurately represent the potential exposures and should be considered the risk assessment results for surface water exposure.

4.5.4 Discussion of Results

The findings of the HHRA suggest that the potential exposures of a recreational user to Cow Pen Creek and Dark Head Cove in this area result in a cancer risk that is within the acceptable risk range of 1×10^{-6} to 1×10^{-4} but that exceeds the MDE threshold level of 1×10^{-5}. The combined cancer risk to an individual exposed to both sediment and surface water as a child, youth, and adult over a period of 30 years as was assumed in this HHRA is estimated at approximately 2.4×10^{-5}. The sum of the HIs for sediment and surface water is estimated at 0.85.

4.5.4.1 Primary COPCs in Sediment

As described in Section 4.6.1, the primary cancer contributing chemicals in sediment are arsenic, PAHs, and the PCB Aroclor-1260. The magnitude and relative contribution to the total cancer risks from these chemicals can be seen in Figure 4-5. The following observations are made:

- Arsenic contributes significantly to the aggregate risk estimates, typically accounting for about 30 percent of the cancer risk, or levels in the region of 5×10^{-6}. As can be seen in Figure 4-5, the contribution of arsenic to risks at most sampling locations is about 50

percent, with PAHs accounting for the remainder. Arsenic is a naturally occurring metal and is therefore expected to be present in sediments independent of anthropogenic sources. The UCL concentration was calculated to be 8.6 mg/kg in surface sediments. The UCL in sediments at the 1-foot depth is 7.5 mg/kg and at the 2-foot depth is 5.7 mg/kg. To further aid in this analysis, the concentrations of arsenic in surface sediments are presented on Figure 4-14.

- Aroclor-1260 is significant contributor locally, especially in the vicinity of sampling location SD-9, where in itself it represents a "risk" of approximately 5×10^{-5}. The level of impact in this area, near the shore and in what is perhaps a logical place for recreational activity, can be seen to be much higher than other areas of the water body. The concentrations of Aroclor-1260 in surface sediments are presented on Figure 4-15.

- The concentrations and absolute and relative risk contributions of PAHs can also be seen in Figure 4-5 to be elevated nearer the shore in the vicinity of SD-9 compared to other areas, but the difference is not as marked as for Aroclor-1260. Concentrations of the most toxic of the PAHs, benzo(a)pyrene, are presented on Figure 4-16.

Lead is also present in sediments. Although the concentrations of lead did not exceed MDE's soil cleanup standard for residential exposure (400 mg/kg), examination of the concentration map shown in Figure 4-17 shows that lead was detected in sediments at levels that generally exceed those found in soils during site characterization of the MRC.

With respect to noncancer risks, as described in Section 4.6.1, the metals vanadium, cadmium, chromium, and arsenic are the primary contributors. All of these can be expected to be present in background samples and therefore, to the extent that any remedial actions are influenced by the noncancer risk estimates, the range of background concentrations for these metals should be carefully considered.

4.5.4.2 Primary COPCs in Surface Water

As described in Section 4.6.2, the primary cancer contributing chemical in surface water is bis(2-ethylhexyl) phthalate. This compound is a common laboratory contaminant and its presence in surface water is suspect. Nonetheless, the magnitude and relative contribution to the total cancer risks from this chemical and the other carcinogens evaluated in this medium (arsenic, MTBE and trichloroethene) can be seen in Figure 4-12. The SVOC bis(2-ethylhexyl) phthalate is the primary concern at all sampling locations. The contribution to the aggregate UCL cancer risk

estimate (9.0×10^{-6}) from the other carcinogens detected is less than 2×10^{-6}. The aggregate cancer risk falls within the MDE's acceptable risk range, suggesting that no action is required.

With respect to noncancer risks, as described in Section 4.6.2 and as can be seen in Figure 4-13, metals, specifically antimony and arsenic, are the main contributors. However, because of the low overall HI for surface water (0.15), noncancer endpoints are unlikely to drive any remedial actions in surface water, and no further discussion of these risks is warranted.

Although lead was not quantitatively evaluated, the maximum lead concentration in surface water of 5 µg/L (see Table 4-3) is less than the lead action level for drinking water of 15 µg/L.

To the extent that COPCs identified in surface water have also been detected in shallow groundwater nearby, the potential for groundwater to influence the concentrations in surface water currently and in the future and the implications for risk should be evaluated. This issue is identified as a source of uncertainty in the risk estimates.

4.6 UNCERTAINTY

4.6.1 Uncertainties in the Risk Assessment

This section discusses the major sources of uncertainties involved in the process of quantifying risk for the human receptors evaluated in this HHRA. Because risk estimates are based on a combination of measurements and assumptions, it is important to provide information on sources of uncertainty in risk characterization. The following subsections describe the main sources of uncertainty associated with the risk estimates of the HHRA.

4.6.2 Uncertainties in the Exposure Assessment

A prevailing uncertainty in the exposure assessment lies in the estimation of chemical intake or dose. Possible variability in the concentration at the point of exposure is a significant factor in the uncertainty of the risk estimates. In most cases, the EPC (UCL value) is at an upper percentile of the distribution of measured concentrations values, if not the maximum detected value. Therefore,

to the extent that the UCL value over predicts the average of the underlying distribution of concentrations, the calculated risks and HIs are likely to be overestimated.

The HHRA's approach to COPC identification screens out from further consideration of analytes that were never detected in a particular medium. This could serve to underestimate risk if the analytical SQLs for theses analytes exceed the risk-based screening levels. If this was the case, the analyte could be present in the medium at levels that would present a risk or contribute to the total risk estimate. Table 4-2 presents the list of analytes that were never detected in sediment and the range of laboratory SQLs for each analyte. It can be seen in Table 4-2 that the low ends of the ranges for all analytes do not exceed the RBCs; the high ends of the ranges in some cases exceed the RBCs. Typically however, the majority of the analyses for any one analyte achieved a SQL lower than the RBC, and it is therefore believed that the exclusion of these analytes is appropriate. Inclusion of analytes on the basis of instances of higher than normal SQLs would likely bias the risks high and lead to misleading results.

The HHRA modeled exposure to sediments in the same manner as the risk assessment guidance recommends for contact with soils. EPA's dermal risk assessment guidance (2004) suggests this approach but points out the following considerations:

- Sediment samples used for risk assessment should be located in the same areas as the receptor is likely to contact. Sediments evaluated should include those that are exposed for some time. This HHRA considered all areas of sediment in determining the EPCs. Based on knowledge of the water bodies, it is believed unlikely that any significant area of sediment is subject to being uncovered with the possible exception of the northern reaches of Cow Pen Creek within the study area. In general, the primary COPCs are concentrated in samples collected from Dark Head Cove in which water depths are typically 8 to 12 feet.

- EPA points out that sediments covered by considerable amounts of water are subject to being washed off of the receptor. To the extent that sediments are washed off, the dermal absorption model applied in this HHRA may overestimate risks.

- Conversely, to the extent that the derivation of the EPC does not reflect actual exposures to near-shore sediments and to the extent that these zones have higher concentrations relative to other areas, the UCL-based risks may be underestimated. Based on the location-specific risk maps (e.g., Figure 4-2), the sediments near the shore in Dark Head Cove (from the southernmost point to the east) are on balance more impacted than other areas, but the reverse is seen in Cow Pen Creek to the west. In addition, it should be noted that the shoreline separating Dark Head Cove and the land is mostly a bulkhead, and sediments are

not uncovered in these areas of the Cove. The mapping of location-specific "risk" estimates is intended to allow the remedial manger to assess the differences in the conditions in discrete areas of sediment including those nearer the shoreline.

- The effect of the moisture content of sediments, which is typically greater than that of soils, will influence the adherence of sediment to the skin. However, the effect on the internal dose of increased adherence will likely be counterbalanced by the degree to which sediments are washed off during and after contact. There is insufficient information to predict the level of possible over- or under-estimation of risk associated with this source of uncertainty.

- The amount of chemical in adhered sediment that absorbs has been assumed to equal that absorbed after soil exposure. This assumption, recommended by EPA dermal guidance as a default approach, is a source of uncertainty because the potential for absorption may be different depending on whether the matrix is soil or sediment. The magnitude of this uncertainty is likely chemical specific and not readily quantifiable.

With respect to dermal contact with PAHs in sediment, the quantitative assessment does not include the effect these compounds might have on the skin. PAHs can result in skin damage including formation of warts and blisters. The potential for this effect is not addressed in this HHRA and is an acknowledged uncertainty.

A large source of uncertainty in the risk assessment is the use of generic exposure factors related to the frequency and durations of recreational activities. In the absence of any site-specific data, it was assumed that the recreational users spend 70 days recreating in this area, during which 2 hours will be spent swimming. This frequency of exposure was assumed to be repeated every year for 30 years. While the extent of any current or future recreational activities is unknown, it is believed that the assumed frequency of contact, 2,100 days in a lifetime, is sufficiently high as to not underestimate the highest reasonably anticipated exposures.

4.6.3 Uncertainties in the Toxicity Assessment

This HHRA used standard toxicity factors in the calculation of risks. The toxicity factors are designed to provide a margin of safety and therefore their use can be expected to result in overestimates of any true risks.

4.6.4 Uncertainties in the Risk Estimates

The estimated carcinogenic and noncarcinogenic risks are based on the assumption that effects are additive. It is recognized in the scientific community that chemical mixtures could have antagonistic or synergistic effects. If there are synergistic rather than additive effects, the aggregate risks could be underestimated.

This HHRA does not determine the potential source of COPCs. Background conditions have not been specifically considered in the HHRA. Several of the COPCs are metals that can be expected to be present naturally in soils and sediments. Other COPCs including PAHs, which in this case although likely not naturally occurring, are recognized to be ubiquitously present at some level in the environment particularly in urban settings. The exposure concentrations of COPCs represent the "total" exposure potential of the media evaluated.

The HHRA is based on data that are potentially subject to change in the future. It assumes long-term exposure whereas the data necessarily reflect a snapshot of conditions. The results of the HHRA would change depending on future trends of concentrations of COPCs in the sediment and surface water. Because the area including MRC is known to contain plumes of contaminants, including chlorinated organic compounds, in shallow groundwater, the extent to which the groundwater conditions might influence sediments and surface water in the future should be considered and is a source of uncertainty in the estimation of long-term exposure future risks.

There are many factors that have to be enumerated to perform a quantitative risk assessment, each having an associated level of level of uncertainty that will contribute to the overall uncertainty in the risk estimates. This report cannot address every possible source of uncertainty, but it has been designed to produce risk estimates that have levels of uncertainty similar to typical risk assessments conducted using default parameter values recommended by current guidance. As such, the level of uncertainty in the estimates provided in this report should be comparable to that produced by risk assessments conducted for other sites.

4.7 CONCLUSIONS

The risk characterization for potential exposures to the sediments in the vicinity of MRC resulted in theoretical cancer risk estimates for the RME case that exceed the MDE's threshold level of 1×10^{-5} but are within EPA's presumptively acceptable risk range of 1×10^{-6} to 1×10^{-4}. The cancer risk estimates for potential exposure to surface water fall below the MDE cancer risk range.

Non cancer effects in recreational users are deemed unlikely since the hazard index for sediment and surface water exposure (for all compounds and exposure routes combined) at 0.85 is below a value of 1, the point of departure for potential adverse health effects.

The risk estimates for exposure to sediments indicates the following primary contributors: arsenic, PAHs and, locally, PCB mixture Aroclor 1260. Each of these are discussed below.

- Arsenic. Arsenic is a naturally occurring metal which is expected to be present in soils and sediments in Maryland. Figure 4-14 depicts the results for arsenic. The levels range up to 12.5 mg/kg. The concentrations may be reflective of naturally occurring background but are slightly higher than the range for soils at MRC. The figure shows low concentration in Cow Pen Creek and the higher levels in Dark Head Cove. The concentrations in Dark Head Cove may be reflective of a higher background concentration in sediments compared to soils. This may be due to the presence of greater amounts of organic matter in sediments.

- Polycyclic aromatic Hydrocarbons (PAHs). PAHs are a group of approximately 10,000 carbon-based chemical compounds that either occur naturally in coal, crude oil, and gasoline or are man-made. Examples of the most common PAHs are anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and fluoranthene. They are found in many materials including asphalt, coal tar, crude oil, creosote, roofing tar, gasoline, motor oil, and a number of other products. Most direct releases of PAHs to the environment are to the atmosphere from both natural and anthropogenic (man-made) sources. Such releases occur primarily through the incomplete burning of carbon-based materials such as coal, oil, gas, wood, charcoal, tobacco, or garbage. Sources of PAHs in soil and water include atmospheric deposition, improper disposal of used motor oil, outdoor burning activities (e.g. charcoal barbeques), municipal wastewater, and discharges of industrial effluents. Atmospheric deposition after local and long-range transport is believed to be the main source of PAHs in most soils. However, the primary sources of PAHs in soils along roads are vehicular exhausts and emissions from the wearing of tires and asphalt. Other potential sources include sewage sludge disposal, gasoline, motor oil, soil compost, and fertilizers.

Figure 4-16 shows concentration of the most toxic PAH, benzo(a)pyrene. The data highlights some areas near the shore and at the far northeastern end of Dark Head Cove with the highest benzo(a)pyrene concentrations which suggest a localized impact from adjacent land or more likely from storm water outfalls in these locations.

- Polychlorinated Biphenyls (PCBs). PCBs are not naturally occurring but their widespread historical use in the United States and their persistence in environment means that they are widespread and often found in sediments. As shown on Figure 4-15, there is an area of PCB impact in Dark Head Cove in the vicinity of sample locations SD-9 and SD-27; PCBs are also detected but at lower levels in the sediments along the bulkhead extending from SD-22 to SD-13 and in some samples from the middle portion of Dark head Cove.

It should be stressed that there is considerable uncertainty associated with the exposures assumed in this HHRA. The sediments at the site are for the most part underwater. That this will serve to reduce or even eliminate the levels of exposures assumed to occur via dermal contact and ingestion. The risk estimates are believed to be conservative in that they tend to overestimate any actual risks, in this case perhaps by a large margin. This uncertainty should be borne in mind if the HHRA risk assessment results are to be used as a basis for remedial decision making for these water bodies.

Notes:
The analytes listed on this table do not include analytes tested for but never detected above laboratory detection limits

(1) M = metal; OS = semi-volatile organic; OV = volatile organic; PEST/PCB = Pesticide or PCB; PET = gasoline/diesel range hydrocarbons

(2) Minimum and maximum detected values from database fields "VAL_RES"

(3) Residential soil RBCs from the EPA R3 RBC Table April 2005, except as noted in comments

(4) SL = Screening Level: an RBC based on the lower of residential RBCs for a target cancer risk of 1x10-6 or a target non-cancer hazard of 0.1

ND = never detected

If the target cancer risk on which the RBC is based exceeds the target hazard of 0.1; SL taken from EPA R3 "alternate RBC table"

"ND / SQL > SL" = chemical never detected but the SQL exceeds the SL in at least one sample; see report uncertainty section

Notes:
The analytes listed on this table do include analytes tested for but never detected above laboratory detection limits

(1) M = metal; OS = semi-volatile organic; OV = volatile organic; PEST/PCB = Pesticide or PCB; PET = gasoline/diesel range hydrocarbons

(2) Minimum and maximum detected values from database fields "VAL_RES"

(3) Residential soil RBCs from the EPA R3 RBC Table April 2005, except as noted in comments

(4) SL = Screening Level: an RBC based on the lower of residential RBCs for a target cancer risk of 1x10-6 or a target non-cancer hazard of 0.1

ND = never detected

If the target cancer risk on which the RBC is based exceeds the target hazard of 0.1; SL taken from EPA R3 "alternate RBC table"

"ND / SQL > SL" = chemical never detected but the SQL exceeds the SL in at least one sample; see report uncertainty section

Section 5
ECOLOGICAL RISK ASSESSMENT

This section presents the purpose, methods, and results of Step 1, Step 2, and an initial Step 3 aquatic Ecological Risk Assessment (ERA) for the surface water and sediments in Cow Pen Creek and Dark Head Cove, adjacent to the Chesapeake Industrial Park. Steps 1 and 2 of an ERA are initial screening processes designed to estimate the likelihood of ecological risk and to provide a basis for determining the necessity of the more thorough Step 3 ERA. The Step 3 ERA process involves a more refined food web exposure analysis to more realistically characterize risk to ecological receptors. The decision to proceed to any additional ERA steps is made as a part of the risk management decisions, specifically using Scientific Management Decision Points (SMDPs) built into the EPA ERA Process (EPA, 1997).

5.1 OBJECTIVES

This ERA incorporates the latest available guidance and concepts on ERA, including the following:

- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments* (EPA, 1997)
- *Guidelines for Ecological Risk Assessment* (EPA, 1998)
- *Issuance of Final Guidance: Ecological Risk Assessment and Risk Management Principles for Superfund Sites* (EPA, 1999a)

The overall objectives of the ecological risk screening approach are to characterize the ecological habitat, to identify the ecological receptors of concern (ROCs) and COPCs in each applicable medium (i.e., surface water and sediment), and to assess potential risks to the environment. The results of this approach will allow stakeholders to make informed decisions regarding environmental protection and regulatory compliance.

The screening level assessment comprises the first two steps of an eight-step process of ERA at Superfund sites. This methodology has been adapted for use in evaluating ecological risk in surface water and sediments around Chesapeake Industrial Park. The screening level process, as applied to the study area, consists of following three steps:

1. Problem Formulation and Ecological Effects Evaluation
2. Exposure Estimate and Risk Calculation
3. SMDPs to determine whether data are sufficient to make a risk decision or to go to Step 3

The screening level assessment approach corresponds to Steps 1 and 2 in Figure 5-1. Additionally, this risk assessment documents a more refined food web assessment for aquatic receptors at the study site as the initial steps for Step 3 as shown in Figure 5-1.

5.2 PROBLEM FORMULATION AND ECOLOGICAL EFFECTS EVALUATION

The problem formulation represents the scoping stage of an ERA. In this step, existing information is examined, the site visited, ROCs identified, a conceptual model for the site is developed to identify potential exposure pathways, and preliminary assessment and measurement endpoints are identified. Ultimately, the problem formulation generates one or more questions, speculations, or hypotheses regarding current or future human-induced changes to the environment. These questions are answered or hypotheses tested by collecting information during the analysis phase. The ecological significance of the results is evaluated during risk characterization step.

5.2.1 Environmental Setting

A site visit by Tetra Tech ecologists on April 12, 2005 was used to gather pertinent information for the ERA. Plant species at the MRC can be divided into two distinct habitats, field habitat and riparian forest. Most of the undeveloped land surrounding Cow Pen Creek and Dark Head Cove is field habitat (approximately 95 percent) and consists of open areas with no woody plants. Riparian forest habitat (approximately 5 percent) borders Cow Pen Creek in the vicinity of North American Electric and is very limited in size. Across from Chesapeake Industrial Park land use is primarily residential and is characterized as open area.

Dark Head Cove is a freshwater tidal water bodies that are one of the many upper inlets associated with Chesapeake Bay. The area is surrounded by urban and commercial land uses. Cow Pen Creek flows into Dark Head Cove. Cow Pen Creek is a small tributary surrounded by a narrow

riparian corridor. The area is influenced by runoff from Chesapeake Industrial Park, Martin State Airport, and surrounding roadways including Eastern Boulevard. In addition discharge of impacted shallow groundwater may also impact the area.

Although the variety of habitat is limited around the study site (dominated by field habitat), many species could still occur. Based on the observed condition of the habitats, the most prevalent wildlife in the area is expected to consist of aquatic and migratory bird species including geese, ducks, herons, finches, sparrows, robins, hawks, gulls, osprey, and kingfishers (Table 5-1). Small mammals such as foxes, moles, shrews, rabbits, woodchucks, squirrels, muskrats, and raccoons could also occur (Table 5-1). Large mammals other than white-tailed deer are unlikely to be present due to urbanization and lack of forest habitat in the region. It is likely that frogs and other amphibians are present as well based on the proximity to water bodies such as Dark Head Creek. Reptiles likely to occur at this site include snakes and lizards (Table 5-1).

5.2.2 Receptors of Concern

Ecological ROCs are species or guilds of species that are important to the ecology of the site and that may be susceptible to chemical constituents released into the environment. The following five criteria were used to evaluate potential ecological ROCs for this ERA:

- Presence – known or expected to occur on site
- Susceptibility – exposure pathway is likely complete and of sufficient duration/magnitude
- Representative – of the food web and/or guild
- Data Availability – sufficient and appropriate type of toxicity and exposure information
- Societal Importance – species merits public attention

The following sections summarize the ROCs selected for this ERA and the rationale for selecting them.

5.2.2.1 Threatened or Endangered Species

Current information suggests that State or federal threatened or endangered species do not occur at this site and so are not applicable to this ERA (MDNR, 2004).

5.2.2.2 Other Species

Aquatic habitats are present along Dark Head Cove. ROCs identified as representative of this type of environment include the raccoon (representative of omnivorous mammals), mallard duck (representative of omnivorous birds), and the belted kingfisher and great blue heron (representative of piscivores). In addition, aquatic invertebrates including small benthic invertebrates inhabiting the sediment as well as more mobile aquatic invertebrates such as blue crabs and fish that live in both the water column and sediment have been designated as aquatic ROCs.

5.2.3 Ecological Risk Conceptual Site Model

The conceptual site model is an end product of the problem formulation step. It contains a description of the physical and ecological characteristics of the site, potential exposure scenarios, ROCs, and assessment and measurement endpoints. Figure 5-2 presents the ecological conceptual site model for the LMC MRC.

5.2.4 Assessment and Measurement Endpoints

EPA guidance (1998) stresses the importance of ecologically significant endpoints. The selection of assessment endpoints is based on fundamental knowledge of the local ecology. Based on the ROCs observed during the site visit, existing habitat, and the above observations, the following ecological assessment endpoints are defined:

1. Protection of aquatic organisms that live in the water column in the creeks in the study area by determining that COPCs in surface water do not have adverse direct toxicity effects.

2. Protection of benthic organisms that live in the sediment in the creeks by determining that COPCs in sediment do not have adverse direct toxicity effects.

3. Protection of birds, represented by the omnivorous aquatic mallard duck and the piscivorous belted kingfisher and the great blue heron, by determining that ingestion of COPCs in food items, sediment, and surface water does not have unacceptable adverse impacts on survival, growth, and reproduction of higher trophic levels.

4. Protection of mammals, represented by the omnivorous raccoon, by determining that ingestion of COPCs in food items, sediment, and surface water does not have unacceptable adverse impacts on survival, growth, and reproduction of higher trophic levels.

Measurement endpoints are measurable ecological characteristics that are related to the assessment endpoints (EPA, 1998). Because it is difficult to "measure" assessment endpoints, measurement

endpoints were chosen that permit inference regarding the above-described assessment endpoints. Measurement endpoints selected for this risk assessment include the following (see Table 5-2):

- Media Chemistry for Surface Water – The measurement of chemical constituent concentrations in surface water provides the means, when compared to water quality criteria, for drawing inferences regarding the protection of aquatic organisms that live in the water column. Surface water samples collected at the study site are discussed in Section 3.1.

- Media Chemistry for Sediment – The measurement of chemical constituent concentrations in sediment provides the means, when compared to appropriate sediment screening values, to assess the protection of benthic organisms that live in the sediment. Sediment samples collected at the study site are discussed in Section 3.2.

Media chemistry data were compared to toxicological data in the scientific literature to develop measurement endpoints related to direct contact and ingestion pathways affecting the assessment endpoints

5.3 COPC SCREEN

Validated surface water and sediment data for the March and October 2005 sampling events were utilized in this ERA. In accordance with EPA ERA guidance, and for statistical purposes, one-half the SQL was used as the value of samples determined to contain concentrations less than detectable levels.

The screening process that identifies COPCs is environmentally conservative so as not to eliminate analytes that could pose potential ecological risk. Using conservative assumptions and appropriate screening values during the COPC screening process minimizes this potential. Analytes remaining after the screening process are COPCs.

5.3.1 Surface Water COPC Identification

Cow Pen Creek and Dark Head Cove are freshwater. Sources of surface water screening toxicity values (STVs) and toxicity reference values (TRVs) for freshwater include the following:

- National Ambient Water Quality Criteria (EPA, 1999b and 2002).
- USEPA Ecotox Thresholds (EPA, 1996).

- USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels (EPA, 1995a).
- USEPA Region 5 RCRA Ecological Screening Levels (EPA, 2003).
- USEPA Region 4 screening values (EPA, 1999c).
- Scientific literature, such as the Aquatic Information Retrieval (AQUIRE) database and Suter and Tsao (1996), and literature compilations such as Buchman (1999).

For metals, both unfiltered (total) and filtered (dissolved) concentrations were included in the STV comparisons. For chemicals known to bioaccumulate in aquatic food webs, STVs were based on the final chronic value (rather than the final residue value) as per EPA (1996) and Suter and Tsao (1996). The use of final chronic values is intended to protect ecological receptors from direct exposure to chemicals in surface water, rather than from exposure via food webs. Potential risks to upper trophic-level receptors from food web exposures (tissue residues) were evaluated separately (see Section 5.4). Surface water STVs used in this study are summarized in Table 5-3.

Maximum concentrations of seven metals, one SVOC and one VOC, exceeded screening values for surface water (Table 5-4). Fifteen additional SVOCs and five PCBs were identified as COPCs because one-half the maximum reporting limit was greater than the TRV (Table 5-4). An additional metal, 15 SVOCs, and 25 VOCs, were identified as COPCs because they lack STVs (Table 5-4).

5.3.2 Sediment COPC Identification

Sources of sediment STVs and TRVs included the following:

- EPA Region 3 BTAG screening levels (1995a). However, these values are primarily Effects Range-Low (ER-L) values (Long and Morgan, 1990; Long et al., 1995) and Apparent Effects Thresholds (AETs) from various literature sources. ER-L values were derived for marine and estuarine systems, but surface waters near the study area are freshwater. These values have often been used to assess freshwater systems, but only in the absence of appropriate freshwater screening levels. Certain AET values may have been derived from freshwater studies, but because the AET represents the sediment contaminant concentration above which statistically significant biological effects are expected to occur, they may be overprotective.

- EPA Region 4 screening values (1999c).

- EPA Region 5 Resource Conservation and Recovery Act (RCRA) Ecological Screening Levels (2003).

- Ontario freshwater sediment screening guidelines (Persaud et al., 1993).

- EPA Ecotox Thresholds (1996).
- Sediment values developed as part of ongoing Great Lakes sediment research (e.g., Smith et al., 1996; Ingersoll et al., 1996).
- Scientific literature and literature compilations (e.g., Buchman, 1999).

These TRVs are typically based on studies that correlate chemical concentrations in sediment with some measure of benthic community impairment; this approach is known as the Screening Level Concentration approach. Because these TRVs do not consider site-specific bioavailability, and because they correlate effects to each individual chemical without accounting for the possible effects of other chemicals in the sediment, their use tends to result in a conservative estimate of risk. Sediment STVs used in this study are summarized in Table 5-5.

Thirteen metals, 19 SVOCs, two VOC, and one PCB were identified as COPCs in sediment due to concentrations exceeding the respective screening value (Table 5-6). In addition, three metals, 20 SVOCs, and 43 VOCs were retained as COPCs based on the absence of STVs (Table 5-6). Twenty-seven SVOCs, two VOCs, and six PCBs were identified as COPCs because one-half the maximum reporting limit was in excess of the screening value (Table 5-6).

5.3.3 Summary of Ecological COPCs

A summary of ecological COPCs for all matrices identified at the end of Step 1 of the aquatic ERA is shown in Table 5-7.

5.4 STEP 2 ECOLOGICAL RISK ASSESSMENT

A Step 2 ERA intentionally uses conservative exposure assumptions designed to retain and properly evaluate all contaminants that might pose a risk to ROCs. Exposure assessment is a key component of risk quantization evaluated in Step 2, linking contaminants to receptors through complete pathways. Exposure refers to the degree of contact between ecological receptors at a site and the COPC. COPCs that are bioaccumulative are examined in upper trophic-level receptor food webs where indirect contact (dietary exposure) is the most relevant exposure pathway. All COPCs are evaluated for direct contact by receptors such as aquatic water column communities and benthic invertebrates.

5.4.1 Direct Exposure of Benthic and Aquatic Communities to Sediment and Surface Water

The relevant pathway for exposure of COPCs in sediments and surface water to benthic and aquatic communities is chronic exposure to sediment and surface water contaminants that may exhibit a detrimental effect on survival, growth, and reproduction. Maximum sediment and surface water concentrations were compared to sediment and surface water TRVs. It was assumed that the COPCs are 100 percent bioavailable to the organisms for uptake and that they are always present at the maximum concentration observed. An HQ was calculated for aquatic plants and invertebrates assuming that COPCs are 100 percent bioavailable for uptake by the plants and invertebrates. An HQ greater than or equal to 1.0 indicates that ecological risk is possible, and a HQ less than 1.0 indicates that ecological risk is unlikely. HQs were calculated as follows:

$$HQ = \frac{\text{Maximum Surface Water or Sediment Concentration}}{\text{Sediment or Surface Water TRV}}$$

5.4.2 Indirect Exposure of Higher Trophic Levels to COPCs (Food Web Analyses)

5.4.2.1 Aquatic Food Web

Bioaccumulation factors (BAFs) for aquatic invertebrates, plants, and fish used for the determination of exposure by the raccoon, mallard duck, belted kingfisher, and great blue heron are shown in Table 5-8. In the absence of published aquatic invertebrate BAFs, a BAF = 1.0 was used.

Fish BAFs were used to estimate the concentrations of COPCs in sediment that are transferred to fish living in that system. The equation used to make this estimate is as follows:

$$[X]_{fish} = [x]_{sediment} \times BAF_{sediment}$$

where:

$[X]_{fish}$ = the concentration of chemical X in fish

$[x]_{sediment}$ = the concentration of chemical X in the sediment

BAF = the bioaccumulation factor

The bioconcentration factor (BCF) is used to approximate the chemical concentrations found in prey items (fish) living in water at certain chemical concentration. The equation used to estimate this concentration is as follows:

$$[X]_{fish} = [x]_{surface\ water} \times BCF_{surface\ water}$$

where:

$[X]_{fish}$ = the concentration of chemical X in fish (wet weight)

BCF = the bioconcentration factor

$[X]_{surface\ water}$ = the concentration of chemical X in the surface water

Most BAFs are less than 1.0, indicating that expected concentrations in organisms are less than than those found in sediment. Most fish BCFs are much higher than 1.0 due to the ease with which many contaminants from surface water can move across the gill membranes. Higher trophic-level organisms that subsist on fish, such as the belted kingfisher, are exposed indirectly to contaminants in sediment and surface water via the food source. Fish, as a food source, can be exposed to surface water contaminants directly and sediment contaminants indirectly (via dietary uptake of benthic macroinvertebrates). However, many bioaccumulative contaminants (especially organic compounds) are fairly hydrophobic (insoluble in water) and are only present in low concentrations in water. For many of these contaminants, the food chain pathway (sediments - plants and macroinvertebrates – fish – birds and mammals) is the major route by which they occur in receptors.

5.4.2.2 Aquatic Upper Trophic-Level Dosage

The total dose to upper trophic-level organisms is calculated as follows:

$$Dose_{total} = Dose_{food} + Dose_{sediment} + Dose_{surfacewater}$$

where:

$Dose_{total}$ = Total daily dose of COPC received by receptor; mg COPC/kg-body wt./day

$Dose_{food}$ = Daily dose of COPC received by receptor from most contaminated food item; mg COPC/kg-body wt./day

$Dose_{soil/sediment}$ = Daily dose of COPC received by receptor from incidentally ingested sediment; mg COPC/kg-body wt./day

$Dose_{water}$ = Daily dose of COPC received by receptor from ingestion of surface water; mg COPC/L/day

The total dose from food is given by the following equation:

$$Dose_{food} = F_f \times U \times C_f$$

where:

F_f = Total daily feeding rate in kg food (wet basis)/kg-body weight of ROC/day (wet basis)

U = Habitat usage factor (fraction of habitat range represented by site) for receptor; assumed to be 1.0 for the Step 2 food web

C_f = Concentration of COPC in food; calculated using the maximum dose as determined in each contaminated food item [mg COPC/kg food(wet basis)]

The total dose from incidental ingestion of sediment is given by the following equation:

$$Dose_{sediment} = F_s \times U \times C_s$$

where:

F_s = Total daily incidental sediment ingestion rate in kg sediment (dry basis)/ kg-body weight of ROC/day (wet basis)

U = Habitat usage factor (fraction of habitat range represented by site) for receptor; assumed to be 1.0 for the Step 2 food web

C_s = Concentration of COPC in sediment; mg COPC/kg sediment (dry basis)

The total daily sediment feeding rate is given by the following equation:

$$F_s = F_f \times F_{sediment}$$

where:

F_s = Total daily incidental sediment ingestion rate in kg soil/day (wet basis)

F_f = Total daily feeding rate in kg food/day (wet basis)

$F_{soil/sediment}$ = Fraction incidental sediment ingestion as a proportion of food ingestion rate

Lastly, the total dose from surface water is given by the following equation:

$$Dose_{surfacewater} = F_w \times U \times C_w$$

when:

F_w	=	Total daily surface water ingestion rate in surface water/kg body weight of ROC/day
U	=	Habitat usage factor (fraction of habitat range represented by site) for receptor; assumed to be 1.0 for the Step 2 food web
F_w	=	Concentration of COPC in surface water; mg COPC/L water

Information necessary for this calculation includes organism body weight (BW), food ingestion rate (F_f), fraction incidental sediment ingestion as a proportion of food ingestion rate ($F_{sediment}$), and analyte concentrations of ingested materials. Ingested media include both abiotic (sediment) and biotic (food item) materials. Information specifically relevant to the ecology of the ROC (e.g., BWs and F_f values) was obtained from published sources (Table 5-9).

Upper trophic-level terrestrial receptors that utilize aquatic habitat, like the raccoon or kingfisher, are exposed by direct contact or through ingestion of food exposed to the sediment. The starting point for the evaluation of aquatic receptors is the concentration of each COPC in the solid matrix, in this case sediment.

5.4.2.3 Indirect Exposure of Mammals and Birds to Sediment and Surface Water

The relevant pathway through which mammalian and avian ROCs dependent on aquatic-derived food are exposed to sediment and surface water COPCs is through chronic exposure to sediment and surface water contaminants via dietary uptake. The ROCs occupy different feeding guilds but have diets that contain potential vectors for site-related sediment and surface water contaminants. The Step 2 aquatic risk assessment assumed that all ROCs consumed only the most contaminated food item. Incidental sediment and surface water ingestion also was included in this assessment.

In Step 2, bioaccumulative COPC concentrations in food organisms were calculated as the maximum sediment or surface water concentration multiplied by the maximum BAF/BCF for sediment and surface water. All dietary concentrations are presented on a dry-weight basis, but dietary contaminants are assumed to be consumed at a much higher wet-weight basis.

Dietary exposures for ROCs were estimated as body-weight-normalized daily doses for comparison to a body-weight-normalized daily dose TRV. The daily dose for a given receptor to a given COPC is calculated by multiplying the total feeding rate by the concentration in the most contaminated food item. The habitat usage factor is assumed to be equal to 1.0 (100 percent usage at the study site) for this food web. Separate doses are presented for sediment, surface water, and food contributions and then summed to produce the total dose for each ROC.

Information specifically relevant to the ecology of the aquatic ROCs (i.e., BWs and $F_{f\ values}$) is presented in Table 5-9. The primary source used for these exposure parameters was EPA (1993).

5.4.3 Toxicity Assessment

Lower trophic-level receptor species (e.g., fish and macroinvertebrates) were evaluated based on those taxonomic groupings for which medium-specific TRVs have been developed. As such, specific species of lower trophic-level biota were not chosen as receptor species because of the limited information available for specific species and because aquatic biota are dealt with on a community level via a comparison to surface water and sediment TRVs.

Upper trophic-level receptor exposures (via food webs) to chemicals present in surface water and sediment were determined by estimating the chemical concentrations in the most contaminated dietary component for each receptor as described in the previous section. Incidental ingestion of sediment and surface water was included when calculating the total exposure. Dietary intakes for each upper trophic-level receptor were calculated as per Section 5.4.2.2.

5.4.4 Risk Characterization for Step 2

The risk characterization portion of the ERA used the information generated during the two previous parts of the ERA (problem formulation and analysis) to estimate potential risks to

ecological receptors at the level of conservatism applied (screening or baseline). Also included is an evaluation of the uncertainties associated with the models, assumptions, and methods used in the ERA, and the potential effects of these uncertainties on the conclusions of the assessment.

The main objective of risk characterization at the screening level (termed risk calculation) is to derive a list of COPCs. As part of this risk calculation, the exposure concentrations (abiotic media) or exposure doses (upper trophic-level receptor species) are compared to the corresponding TRVs to derive risk estimates using the HQ method (Tables 5-10 and 5-11). HQs were calculated by dividing the chemical concentration in the medium being evaluated by the corresponding medium-specific TRV or by dividing the exposure dose by the corresponding ingestion-based TRV. HQs equaling or exceeding 1.0 indicate the potential for unacceptable risk because the chemical concentration or dose (exposure) equals or exceeds the TRV (effect). However, TRVs and exposure estimates are derived using intentionally conservative assumptions at the screening level such that HQs greater than or equal to 1.0 do not necessarily indicate that risks are present or impacts are occurring. Rather, HQs greater than 1.0 identify chemical-pathway-receptor combinations requiring further evaluation using more realistic exposure scenarios and assumptions. Following the same reasoning, HQs less than 1.0 indicate that risks are unlikely, enabling a conclusion of negligible risk to be reached with high confidence.

EPA guidance (1997) specifies that a screening ecotoxicity value should be "equivalent to a documented or best conservatively estimated chronic No Observed Adverse Effect Level (NOAEL)." Because there is wide variation in the literature on NOAELs, risks were also calculated for conservatively estimated Lowest Observed Adverse Effect Levels (LOAELs) to provide some frame of reference for the results.

Sample et al. (1996) was used as the primary source for NOAEL and LOAEL TRVs for mammals and birds. When analyte/receptor combinations were not located in Sample et al. (1996), other scientific literature (i.e., ATSDR, 1990, 1994a, 1994b, 1995, 1996, 1997, 1999a and 1999b; Coulston and Kolbye, 1994; EPA, 1999a, 1997, and 1995; Eisler, 1996; and TERRETOX, 2002) was used to select alternative toxicity values.

COPCs for which HQs are not available do not have defined TRVs. These COPCs cannot be eliminated as a concern, although the risk they pose cannot be quantified. Such COPCs were considered an uncertainty in Step 2 and carried forward to Step 3 of the ERA process.

For Step 2, the potential hazards were characterized through comparisons of exposure (i.e., dosage) concentrations (using the maximum soil concentration of each bioaccumulative COPC at

the study site multiplied by its 90th percentile BAF for the most contaminated food item) to the NOAEL TRVs, listed in Table 5-10.

5.4.5 Step 2 Aquatic Receptor Risk Characterization Results

Summaries of the direct exposure risks to benthic invertebrates and aquatic communities are reported in Tables 5-12 and 5-13, respectively. Thirteen metals, 45 SVOCs, eight VOCs, and seven PCBs were determined to have high enough concentrations in sediment to have maximum HQ values in excess of 1.0. In addition, maximum HQ values could not be calculated for three metals, 20 SVOC, and 44 VOCs because TRVs were unavailable.

Seven metals, 16 SVOCs, one VOC, and five PCBs were present in the water column in sufficient concentrations to have maximum HQ values greater than 1.0. There was one metal, 15 SVOCs, and 28 VOCs for which no TRV values were available.

Details of the Step 2 aquatic food web are summarized in Table 5-14.

5.4.5.1 Avian Aquatic Species

Mallard

Eight metals and seven PCB COPCs pose a potential risk to the mallard due to HQs in excess of 1.0. 4-Bromophenyl-phenylether, 4-chlorophenyl-phenylether, hexachlorocyclopentadiene, hexachloroethane, and 1,1,1,2-tetrachloroethane were also carried forward to Step 3 due to the lack of NOAELs for the mallard.

Belted Kingfisher

Seven metals, 15 SVOCs, and seven PCBs were calculated as having a potential risk to the belted kingfisher as evidenced by NOAEL HQs greater than 1.0. Four SVOCs (4-bromophenyl-phenylether, 4-chlorophenyl-phenylether, hexachlorocyclopentadiene, and hexachloroethane) and one VOC (1,1,1,2-tetrachloroethane) were carried forward to Step 3 due to the lack of NOAELs for the belted kingfisher.

Great Blue Heron

Five metals, 15 SVOCs, and seven PCBs were determined to pose a risk to great blue heron. Additionally, because of the lack of NOAEL values for hexachlorocyclopentadiene,

hexachloroethane, 4-bromophenyl-phenylether, 4-chlorphenyl-phenylether, and 1,1,1,2-tetrachloroethane, these COPCs were carried forward to Step 3.

5.4.5.2 Mammalian Aquatic Species

Raccoon

Four metals, nine SVOCs, and seven PCBs posed a risk to the raccoon as evidenced by NOAEL HQs greater than 1.0. 4-Bromophenyl-phenylether and 4-chlorophenyl-phenylether were lacking any toxicity information and were thus carried forward to Step 3 and labeled as uncertainties.

5.4.6 Summary of Step 2 Ecological Risk Screening

Table 5-15 summarizes the ecological COPCs that remain after the Step 2 ecological risk screening with respect to each aquatic receptor. 4-Bromophenyl-phenylether, 4-chlorophenyl-phenylether, hexachlorocyclopentadiene, hexachloroethane, and 1,1,1,2-tetrachloroethane remain as COPCs for one or more aquatic receptors because they exceeded Step 1 screening values and no toxicity threshold values are available for these chemicals. Consequently, it is not possible to determine if the presence of these five chemicals in various media pose unacceptable risks. Other COPC/receptor combinations for which no toxicity values were available are noted as such in Table 5-15 and represent uncertainties in the Step 2 ERA.

5.4.7 Scientific Management Decision Point I

Results summarized in Table 5-15 indicate that several COPCs are present at the study site and that some of these pose potential risks to aquatic ROCs based on conservative exposure assumptions. A review of the site data used as the basis for calculating Step 2 risks suggests that there are sufficient contaminant data, and that data were of sufficient quality, to evaluate Step 2 risks to ROCs in the media present at the site (surface water and sediment). Thus, there do not appear to be any important data gaps present at this stage of the ERA. Based on the potential risks calculated in the Step 2 ERA, it appears appropriate and necessary to proceed to Step 3 of the

ERA framework and further evaluate the potential for ecological risks of remaining COPCs at the study site.

5.5 STEP 3 REFINEMENT

5.5.1 COPCs and ROCs in the Step 3 Ecological Risk Assessment

The Step 2 exposure assessment consisted of a conservative food web model and exposure assessment analysis. COPCs that had HQs less than 1.0 for all ROCs are considered to present acceptable risk to ecological resources and were not evaluated further in this section. COPCs for which no approved toxicity thresholds were available could, however, present potential risks and therefore cannot be eliminated. Instead, risks in these cases are evaluated by examining in greater detail the spatial pattern and distribution of concentration values in a given medium and then comparing these data to available effects data in the literature. Remaining COPCs that have TRVs were subjected to Step 3 Problem Formulation (EPA, 1997). This refinement of the exposure assessment is summarized below. The risk calculations in the food web models were revisited using refinements of exposure assumptions used in the Step 2 ERA, including more realistic ROC exposure assumptions and appropriate exposure concentrations.

The list of medium/COPC/ROC combinations that were quantified in the following sections are summarized in Table 5-15.

5.5.2 Step 3 Exposure Assessments

The purpose of the Step 2 exposure assessment is to conservatively quantify the degree of contact between ecological ROCs and COPCs identified at the site. The Step 3 exposure assessment allows for more realistic exposure assumptions than those found in the conservative Step 2 exposure assessment. The factors that make risk quantification in a Step 3 refined exposure assessment more realistic are discussed below.

5.5.2.1 Use of Appropriate Exposure Concentrations

The Step 2 exposure assessment includes the assumption that ROCs are exposed to the maximum detected concentration found across the site. In Step 3, all exposures were estimated based on the arithmetic mean concentration in a given medium at the study site (Table 5-16), consistent with EPA guidance (1997).

5.5.2.2 Use of More Realistic ROC Exposure Assumptions

The Step 2 food web maximized exposure by using the smallest BW and the highest F_f data found in the literature and using the dry-weight concentration of prey items. The Step 3 exposure assessment utilized mean or median BWs, food consumption rates, and BAFs/BCFs shown in Tables 5-17 and 5-18 for aquatic receptors. The wet-weight concentrations of prey items were also used in the food web analysis.

5.5.2.3 Use of Appropriate Home Ranges

In the Step 2 ERA, the home range of the individual receptors was assumed to be only as large as the study site. In Step 3, the appropriate Area Use Factor (AUF) was used in calculating the dosage to each receptor. This more realistic method is particularly relevant to higher trophic levels of birds (e.g., heron and kingfisher) and mammals, which often require fairly large home ranges and are not expected to inhabit the Dark Head Cove area for 100 percent of their life span. The study site is estimated to encompass about 60 acres. The home ranges of the ROCs are noted in Table 5-17.

5.5.3 Toxicity Assessment

Toxicity values presented in Section 5.4 are used for both the Step 2 and 3 exposure assessments. However, while LOAEL toxicity values were presented in Section 5.4, they were not used to evaluate risk, consistent with the Step 2 screening risk assessment procedures. Step 3 evaluated risks based on both NOAEL and LOAEL values to enable a more realistic assessment. The comparison of site mean concentrations in Step 3 to NOAELs and LOAELs is important due to the fact that NOAELs and LOAELs are scientifically derived values that could be an order of magnitude different. Many times, the effects are observed at a certain concentration (LOAEL), and the NOAELs are extrapolated by decreasing the concentration by an order of magnitude. Therefore, actual risk is better characterized by using the LOAEL along with the NOAEL. Risks based on LOAELs can be placed into the context of risk management to determine if it is necessary to either remediate the site, obtain additional data, or if risks are acceptable to populations and communities of ecological receptors and no further action is necessary.

5.5.4 Step 3 Risk Characterization Results

5.5.4.1 Step 3 Risk From COPCs in Sediment and Surface Water

Benthic Invertebrates

The relevant pathway for benthic communities is chronic exposure to sediment contaminants that may exhibit a detrimental effect on survival and growth. Risk to benthic organisms for the Step 3 ERA was based on calculation of an HQ using the following equation:

HQ = Mean Sediment Concentration / Sediment TRV

Consistent with the EPA, 1997, mean sediment concentrations were used in Step 3 exposure assessment.

Table 5-19 shows mean HQs for benthic invertebrates at the study site. Ten of the 13 metals identified in Step 2 as presenting a potential risk to benthic invertebrates had mean HQs greater than 1.0 in Step 3. Therefore these 10 metals all pose a risk to benthic invertebrates. Certain organic chemicals including 41 SVOCs and three VOCs also had mean HQs in excess of 1.0, indicating possible risk to benthic invertebrates.

The risk from three metals, 20 SVOCs, and 44 VOCs were unable to be determined because toxicological information pertaining to their effects on benthic invertebrates is unavailable.

Aquatic Communities

The relevant pathway for aquatic communities is chronic exposure to surface water contaminants that may exhibit a detrimental effect on survival and growth. As with the benthic invertebrates, risk to aquatic organisms for the Step 3 ERA was based on calculation of an HQ using the following equation:

HQ = Mean Surface Water Concentration / Surface Water TRV

As with sediment, the use of mean surface water concentrations is appropriate in a Step 3 exposure assessment because the toxicity endpoints to which concentrations are being compared are those that result from exposure to the aquatic organisms over a long period of time (weeks to months). Table 5-20 shows mean HQs for aquatic communities at the study site. Six metals identified in Step 2 also had mean HQs greater than 1.0, indicating possible risk to aquatic communities.

Fifteen SVOCs, one VOC, and five PCBs were also identified as posing a possible risk (mean HQs greater than 1.0) to aquatic communities. The risks from one metal, 15 SVOCs, and 28 VOCs were unable to be determined because toxicological information on their effects on aquatic communities is unavailable.

Aquatic Mammals and Birds

The risks for aquatic ROCs are summarized in Table 5-21. No risks were associated with any COPC for the raccoon, mallard, or belted kingfisher (although the NOAEL HQ for total mercury was greater than 1.0, the LOAEL HQ was lower). NOAEL HQs associated with fluorene, hexachlorobenzene and Aroclors-1248, -1254, and -1260 to the great blue heron were greater than 1.0. However, the LOAEL HQ was greater than 1.0 only for total mercury. Risks from 4-bromophenyl-phenylether, 4-chlorophenyl-phenylether, hexachlorocyclopentadiene, hexachloroethane, and 1,1,1,2-tetrachloroethane were unable to be characterized due to the lack of toxicological information.

5.5.5 Step 3 Risk Characterization Summary

Table 5-22 summarizes the aquatic COPCs that remain after Step 3 ecological risk screening. 4-Bromophenyl-phenylether, 4-chlorophenyl-phenylether, hexachloroethane, and 1,1,1,2-tetrachloroethane remain as COPCs for aquatic receptors because they exceeded Step 1 STVs and because toxicity threshold values are unavailable for these chemicals. Consequently, it is not possible to determine if the presence of these five chemicals in surface water and sediment pose unacceptable risks. Other COPC/receptor combinations that were identified due to the lack of STVs or when the COPC were undetected and one-half the reporting limit was in excess of the STV are identified in Table 5-22 with "x." COPCs with concentrations in excess of STVs are identified with a "X." All marked COPCs (x or X) represent potential risk to that receptor; either defined (X) or undefined (x) due to the lack of toxicological information or detectable concentrations.

5.6 UNCERTAINTY ASSOCIATED WITH THE STEP 3 REFINEMENT

Uncertainties are present in all risk assessments because of the limitations of the available data and the need to make certain assumptions and extrapolations based upon incomplete information. The uncertainty in this ERA is mainly attributable to the following factors.

5.6.1 Reporting Limits

One-half the maximum reporting limits for some analytes exceeded applicable TRVs in some media; these chemicals were identified as COPCs.

Nineteen chemicals are identified in Step 1 as exceeding the TRVs for surface water because for each, one-half the reporting limit was greater than the TRV. Of these 19, only 12 were deemed bioaccumulative and evaluated in the Steps 2 and 3 food web analyses of the ERA. Of these 12, none resulted in Step 3 NOAEL or LOAEL HQs greater than 1.0 indicating possible risk.

Thirty-seven chemicals were identified in Step 1 because for each, one-half the reporting limit exceeded the TRV for sediment. Ten were deemed bioaccumulative and evaluated in the Steps 2 and 3 food web analyses of the ERA. Of these 10, none resulted in LOAEL HQs greater than 1.0 indicating possible risk to upper trophic-level receptors.

5.6.2 Selection of COPCs

Chemicals without available TRVs for a medium were retained as COPCs in the Step 3 portion of the assessment.

Forty-four chemicals in surface water were carried forward to Step 2 due to the lack of surface water TRVs. Of these 44, only four were potentially bioaccumulative and thus examined in Steps 2 and 3. No surface water chemical lacking a TRV exceeded a LOAEL HQ of 1 in Step 3, although 4-chlorphenyl ether was carried forward to Step 3 due to the lack of NOAELs and LOAELs. Uncertainty exists regarding 4-chloropheny ether because it was unable to be analyzed in Step 2 and 3 due to the lack of toxicological data.

Sixty-eight chemicals examined lacked a screening TRV for sediment in Step 1. Two of these 68 were potentially bioaccumulative and analyzed in the Step 2 and 3 food web analyses. 4-Chlorphenyl phenyl ether and 1,1,1,2-tetrachloroethane lacked NOAELs and LOAELs, and uncertainty exists regarding those chemicals that were unable to be analyzed in Step 2 and 3 due to the lack of toxicological data.

5.6.3 Sediment TRVs

Most of the sediment TRVs used in the ERA do not consider site-specific bioavailability to ecological receptors and are typically based on correlational studies (termed the Screening Level

Concentration approach). These factors tend to make the resulting TRVs conservative and may overestimate potential risk.

5.6.4 Ingestion TRVs

Data on the toxicity of many chemicals to the receptor species were sparse or lacking, requiring the extrapolation of data from other wildlife species or from laboratory studies with non-wildlife species. This is a typical extrapolation for ERAs because so few wildlife species have been tested directly for most chemicals. The uncertainties associated with toxicity extrapolation were minimized through the selection of the most appropriate test species for which suitable toxicity data were available. The factors considered in selecting a test species to represent a receptor species included taxonomic relatedness, trophic level, foraging method, and similarity of diet.

5.6.5 Chemical Mixtures

Information on the ecotoxicological effects of chemical interactions is generally lacking, which required (as is standard for ERAs) that the chemicals be evaluated on a chemical-by-chemical basis in comparisons to TRVs. This could result in an underestimation of risk (if there are additive or synergistic effects among chemicals) or an overestimation of risks (if there are antagonistic effects among chemicals).

5.6.6 Food Web Exposure Modeling

Chemical concentrations in aquatic food items (plants, benthic invertebrates, and fish) were modeled from measured media concentrations and were not directly measured. The use of generic, literature-derived exposure models and BAFs introduces some uncertainty into the resulting estimates. The values selected and methodology employed were intended to provide a conservative (Step 2) or more realistic (Step 3) estimate of potential food web exposure concentrations.

Another source of uncertainty is the use of default assumptions for exposure parameters such as BCFs and BAFs. Although BCFs or BAFs for many bioaccumulative chemicals were readily available from the literature and were used in the ERA, the use of a default factor of 1.0 to estimate the concentration of some chemicals in receptor prey items is a source of uncertainty.

5.6.7 Mean versus Maximum Media Concentrations

As is typical in an ERA, a finite number of samples of environmental media are used to develop the exposure estimates. The maximum measured concentration provides a conservative estimate for immobile biota or those with a limited home range. The most realistic exposure estimates for mobile species with relatively large home ranges and for species populations (even those that are immobile or have limited home ranges) are those based upon the mean chemical concentrations in each medium to which these receptors are exposed. This is reflected in the wildlife dietary exposure models contained in the Wildlife Exposure Factors Handbook (EPA, 1993), which specifies the use of average media concentrations. Based on the mobility of the upper trophic-level receptor species used in the ERA, the use of maximum chemical concentrations (rather than mean concentrations) to estimate the exposure via food webs is probably conservative in Steps 1 and 2 of the screening level ERA. This conservatism was reduced to more realistic levels in the Step 3 evaluation through the use of mean concentration values.

5.6.8 Extrapolation of NOAELs from Calculated LOAELs

In cases where a NOAEL for a specific chemical was not available, but a LOAEL had been determined experimentally or where the NOAEL was from a subchronic study, the chronic NOAEL was estimated. EPA (1993) suggests the use of uncertainty factors of 1 to 10 for subchronic to chronic NOAEL and LOAEL estimation.

5.6.9 Background Concentrations

Three surface water (SW-1, SW-2, and SW-16) and three sediment (SD-1, SD-2, and SD-39) samples were collected to provide some indication of anthropogenic impacts which may not be related to activities at Chesapeake Industrial Park. SW-1 and SD-1 were located in the headwaters of Cow Pen Creek, and SW-2, SW-16, SD-2, and SD-39 were located in two coves on Dark Head Creek downstream of the study site. Comparisons of reference sediment and surface water concentrations to those measured closer to MRC indicate that for most contaminants identified in Step 1 as COPCs, reference site concentrations were less than those measured in study area locations. However, the mean sediment concentrations measured at the three reference locations resulted in mean HQs greater than 1.0 for direct toxicity to benthic invertebrates for the same COPCs as the samples collected within more impacted areas of the study site with the exception of barium, silver, benzo(a)pyrene, benzo(g,h,i)perylene, benzoic acid, indeno(1,2,3-cd)pyrene, isophrone, and phenol (Table 5-23). Mean background surface water concentrations resulted in mean HQs greater than 1.0 for all COPCs with the exception of total and dissolved cadmium (Table 5-24). Therefore, the potential risks to benthic invertebrates and aquatic communities

calculated in this ERA for the areas around Chesapeake Industrial Park may not be related to exposure to COPCs from the study area and may be an artifact of conservative TRVs.

5.7 ECOLOGICAL RISK SUMMARY

An ERA was performed for sediment and surface water adjacent to the study site. The results of the Steps 1 and 2 ERA identified many potential COPCs to ecological receptors in the study area, which supported the decision to conduct a more realistic exposure and risk characterization for the site, consistent with EPA guidance (1997). Refinements included in the Step 3 evaluation included the use of more realistic ROC exposure assumptions and more realistic feeding rates and BWs of receptors.

The Step 2 ERA identified a number of medium/COPC/ROC combinations for which acceptable risks were found at the study site. The Step 3 refinement focused on those medium/COPC/ROC combinations for which potential risk was identified as a result of the Step 2 ERA and for which appropriate toxicity values were available in the toxicological literature (Tables 5-10 and 5-11). The absence of appropriate toxicity values for some medium/COPC/ROC combinations means that it is not possible to dismiss potential risk for those particular combinations.

Standard ERA practice (EPA, 1997) places ecological risk into the context of assessment and measurement endpoints, where assessment endpoints are those characteristics of an environment that need to be protected and measurement endpoints provide distinct measures of this degree of protection. The results of the Step 3 refinement are shown in Table 5-25 in the context of the defined assessment and measurement endpoints. These results suggest the possibility of risk for some COPCs in certain media and for certain types of receptors. The results of the ERA are discussed below for surface water and sediment from Dark Head Cove and Cow Pen Creek, adjacent to the Chesapeake Industrial Park.

5.7.1 Surface Water

Ecological receptors identified that may be exposed to COPCs in surface water include aquatic communities, mallard ducks, belted kingfishers, great blue heron, raccoons, and muskrats.

The risks to aquatic communities were defined relative to concentrations of COPCs in surface water based on medium-specific TRVs. As shown in Table 5-20, there were many surface water COPCs with potential risks to aquatic communities [mean ecological quotients (EQs) greater than 1.0] at the study site based on the results of the Step 3 refinement. The lack of rare or endangered animal species at the site, however, may decrease the significance of the calculated risks to aquatic

communities from exposure to COPCs in surface water in this area. In addition, the similarity in concentrations of COPCs between study site surface water and surface water at reference sites (Table 5-24) decreases the significance of potential risks to aquatic communities in the vicinity of Chesapeake Industrial Park.

Risks from all Step 1 surface water COPCs were non existent to upper trophic-level organisms in Step 3, with the exception of 4-bromophenyl-phenylether, 4-chlorophenyl-phenylether, and hexachlorocyclopentadiene for which risks could not be defined due to the lack of toxicological information.

5.7.2 Sediment

Ecological receptors identified that may be exposed to COPCs in sediment included benthic invertebrates, mallard ducks, great blue herons, belted kingfishers, raccoons, and muskrats.

The risks to benthic invertebrates were defined relative to concentrations of COPCs in sediment based on medium-specific TRVs. Table 5-19 summarizes sediment COPCs with potential risk to benthic invertebrates (mean EQs greater than 1.0) study site. Although many sediment COPCs resulted in Step 3 mean EQs_s greater than 1.0 for direct toxicity to benthic invertebrates, the similarity of study site concentrations to reference location sediment concentrations (Table 5-23) demonstrate that the risk is comparable near Chesapeake Industrial Park to elsewhere in the area. Therefore, there is no significant increase in potential risk to benthic invertebrates in the vicinity of MRC and the study site.

Acceptable food web risk was found for the raccoon, mallard, and belted kingfisher as all NOAEL HQs were less than 1.0 for these receptors (Table 5-21), with the exception of total mercury and Aroclor-1260 for the belted kingfisher (NOAEL HQ_s of 1.48 and 1.26, respectively, but both LOAEL HQs were less than 1.0).

The NOAEL HQ_S for the great blue heron for all COPCs were less than 1.0 except total mercury (NOAEL HQ of 5.34), hexachlorobenzene (NOAEL HQ of 2.26), Aroclor-1248 (NOEAL HQ of 1.35), Aroclor-1254 (NOAEL HQ of 2.29) and Aroclor-1260 (NOAEL HQ of 4.63). The LOAEL HQs for hexachlorobenzene (0.44), Aroclor-1248 (0.27), Aroclor-1254 (0.46), and Aroclor-1260 (0.93) were less than 1.0, thus no detrimental effects to the great blue heron are expected. There is potential risk from total mercury, which does not have a LOAEL HQ less than 1.0 (1.78).

5.8 CONCLUSIONS

An ERA was performed to investigate possible risks to ecological receptors from chemical constituents in sediment and surface water adjacent to the Chesapeake Industrial Park. Assessment endpoints considered in the ERA included effects on the aquatic water column community, the benthic (bottom-dwelling) community, omnivorous birds that feed on shorelines (represented by the mallard duck), piscivorous birds (represented by the belted kingfisher and great blue heron), and omnivorous mammals that feed on shorelines (represented by the raccoon). Steps 1 and 2 of the ERA identified COPCs by comparing conservatively estimated exposures of ecological receptors against corresponding toxicological benchmarks in the scientific literature. Step 3 of the ERA refined the list of COPCS using less conservative, more realistic exposure assumptions.

Section 5.8.1 summarizes the chemical constituents retained as COPCs following Step 3 of the ERA. Section 5.8.2 discusses risk management considerations when identifying potential ecological COPCs requiring further consideration.

5.8.1 COPC Summary

COPCs retained following Step 3 of the ERA on the basis of exceedance of toxicological benchmark data from the scientific literature (expressed as media concentrations or as ingested doses) are summarized below for ecological receptors in the water column community, ecological receptors in the benthic community, and upper trophic-level ecological receptors.

Water Column Community: The following metals were retained as COPCs following Step 3 of the ERA because their concentrations in surface water exceeded corresponding TRVs from the scientific literature:

- Total Cadmium
- Dissolved Cadmium
- Total Copper
- Total Lead
- Total Silver
- Dissolved Silver

Additionally, the following organic constituents were retained as COPCs following Step 3 of the ERA because their concentrations in surface water exceeded corresponding TRVs from the scientific literature:

- Di-n-butyl phthalate
- Carbon Disulfide

Benthic Community: The following metals were retained as COPCs following Step 3 of the ERA because their concentrations in sediment exceeded corresponding TRVs from the scientific literature:

- Barium
- Cadmium
- Chromium
- Cobalt
- Cobalt
- Copper
- Lead
- Total Mercury
- Nickel
- Silver
- Zinc

The following SVOCs were retained as COPCs following Step 3 of the ERA because their concentrations in sediment exceeded corresponding TRVs from the scientific literature:

- 2-Methylnaphthalene
- Acenaphthene
- Acenaphthylene
- Anthracene
- Benzo(a)anthracene
- Benzo(a)pyrene
- Benzo(g,h,i)pyrene
- Benzo(k)fluoranthene
- Bis(2-ethylhexyl)phthalate
- Benzy lbutyl phthalate
- Chrysene
- Dibenzo(a,h)anthracene
- Fluoranthene
- Fluorene
- Indeno(1,2,3-cd)pyrene
- Naphthalene
- Phenanthracene
- Pyrene

The following additional chemical constituents were retained as COPCs following Step 3 of the ERA because their concentrations in sediment exceeded corresponding TRVs from the scientific literature:

- Acetone
- Aroclor 1260

Upper Trophic Level Receptors: No chemical constituents were retained as COPCs following Step 3 of the ERA for the raccoon or mallard duck based on NOAEL-based HQs that exceeded 1.0. The NOAEL-based HQs for the belted kingfisher did exceed 1.0 for the following constituents:

- Total Mercury
- Aroclor 1260

The NOAEL-based HQs for the great blue heron exceeded 1.0 for the following constituents:

- Total Mercury
- Hexachlorobenzene
- Aroclor 1248
- Aroclor 1254
- Aroclor 1260

Additional chemical constituents were retained as COPCs following Step 3 of the ERA because suitable toxicological benchmarks were not available in the scientific literature, or because the reporting limits for non-detected constituents exceeded corresponding toxicological benchmarks. It is not possible for an ERA to demonstrate that such COPCs do not have the potential to pose significant risk to ecological receptors.

5.8.2 Risk Management Considerations

Identification of the Primary COPCs contributing to Risk:
It is recommended that the following COPCs be identified as the primary contributors to potential ecological risk –

For ecological receptors in the surface water community:

- Total Cadmium
- Dissolved Cadmium

For ecological receptors in the benthic community:

- Barium
- Silver
- Benzo(a)pyrene
- Benzo(g,h,i)perylene
- Indeno(1,2,3-cd)pyrene

For higher trophic level ecological receptors:

- Total Mercury (only for piscivorous birds represented by the great blue heron)

Not every COPC retained following the Step 3 ERA is recommended for identification as a significant potential contributor to ecological risk. Certain COPCs are excluded because their concentrations were below corresponding site background concentrations. Certain COPCs

identified for higher trophic level receptors are excluded because their corresponding LOAEL-based HQs are less than 1.0, even though their NOAEL-based HQs exceeded 1.0. Finally, those COPCs identified following the Step 3 ERA solely on the basis of lacking suitable toxicological data in the scientific literature, or on the basis of reporting limits exceeding toxicological benchmarks, are excluded.

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Recurvirostra americana	Avocet, American
Botaurus lentiginosus	Bittern, American
Ixobrychus exilis	Bittern, least
Agelaius phoeniceus	Blackbird, red-winged
Euphagus carolinus	Blackbird, rusty
Sialia sialis	Bluebird, eastern
Dolichonyx oryzivorus	Bobolink
Colinus virginianus	Bobwhite, northern
Bucephala albeola	Bufflehead
Passerina cyanea	Bunting, indigo
Plectrophenax nivalis	Bunting, snow
Aythya valisineria	Canvasback
Cardinalis cardinalis	Cardinal, northern
Dumetella carolinensis	Catbird, gray
Icteria virens	Chat, yellow-breasted
Poecile atricapilla	Chickadee, black-capped
Parus carolinensis	Chickadee, Carolina
Fulica americana	Coot, American
Phalacrocorax auritus	Cormorant, double-crested
Phalacrocorax carbo	Cormorant, great
Molothrus ater	Cowbird, brown-headed
Certhia americana	Creeper, brown
Corvus brachyrhynchos	Crow, American
Corvus ossifragus	Crow, fish
Coccyzus erythropthalmus	Cuckoo, black-billed
Coccyzus americanus	Cuckoo, yellow-billed
Zenaida macroura	Dove, mourning
Columba livia	Dove, rock
Limnodromus scolopaceus	Dowitcher, long-billed
Limnodromus griseus	Dowitcher, short-billed
Anas rubripes	Duck, American black
Aythya collaris	Duck, ring-necked
Oxyura jamaicensis	Duck, ruddy

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Aix sponea	Duck, wood
Calidris alpina	Dunlin
Haliaeetus leucocephalus	Eagle, bald
Aquila chrysaetos	Eagle, golden
Bubulcus ibis	Egret, cattle
Ardea alba	Egret, great
Egretta thula	Egret, snowy
Falco peregrinus	Falcon, peregrine
Carpodacus mexicanus	Finch, house
Carpodacus purpureus	Finch, purple
Colaptes auratus	Flicker, Northern
Empidonax virescens	Flycatcher, Acadian
Empidonax alnorum	Flycatcher, Alder
Myiarchus crinitus	Flycatcher, great crested
Empidonax minimus	Flycatcher, least
Empidonax traillii	Flycatcher, willow
Empidonax flaviventris	Flycatcher, yellow-bellied
Anas strepera	Gadwall
Polioptila caerulea	Gnatcatcher, blue-gray
Carduelis tristis	Goldfinch, American
Limosa haemastica	Godwit, Hudsonian
Limosa fedoa	Godwit, marbled
Bucephala clangula	Goldeneye, common
Branta canadensis	Goose, Canada
Chen caerulescen	Goose, snow
Quiscalus quiscula	Grackle, common
Podiceps auritus	Grebe, horned
Podilymbus podiceps	Grebe, pied-billed
Podiceps grisegena	Grebe, red-necked
Guiraca caerulea	Grosbeak, blue
Coccothraustes vespertinus	Grosbeak, evening
Pheucticus ludovicianus	Grosbeak, rose-breasted
Larus ridibundus	Gull, black-headed

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Larus Philadelphia	Gull, Bonaparte's
Larus hyperboreus	Gull, glaucous
Larus marinus	Gull, great black-backed
Larus argentatus	Gull, herring
Larus glaucoides	Gull, Iceland
Larus atricilla	Gull, laughing
Larus fuscus	Gull, lesser black-backed
Larus minutus	Gull, little
Larus delawarensis	Gull, ring-billed
Circus cyaneus	Harrier, northern
Buteo platypterus	Hawk, broad-winged
Accipiter cooperii	Hawk, Cooper's
Buteo lineatus	Hawk, red-shouldered
Buteo jamaicensis	Hawk, red-tailed
Buteo lagopus	Hawk, rough-legged
Accipiter striatus	Hawk, sharp-shinned
Egretta caerulea	Heron, little blue
Nycticorax nycticorax	Heron, black-crowned night
Ardea herodias	Heron, great blue
Butorides virescens	Heron, green
Egretta tricolor	Heron, tri-colored
Nyctanassa violacea	Heron, yellow-crowned night
Archilochus colubris	Hummingbird, ruby-throated
Plegadis falcinellus	Ibis, glossy
Cyanocitta cristata	Jay, blue
Junco hyemalis	Junco, dark-eyed
Falco sparverius	Kestrel, American
Charadrius vociferus	Killdeer
Tyrannus tyrannus	Kingbird, eastern
Ceryle alcyon	Kingfisher, belted
Regulus satrapa	Kinglet, golden-crowned
Regulus calendula	Kinglet, ruby-crowned
Calidris canutus	Knot, red

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Eremophila alpestris	Lark, horned
Calcarius lapponicus	Longspur, lapland
Gavia immer	Loon, common
Gavia stellata	Loon, red-throated
Anas platyrhynchos	Mallard
Progne subis	Martin, purple
Sturnella magna	Meadowlark, eastern
Mergus merganser	Merganser, common
Lophodytes cucullatus	Merganser, hooded
Mergus serrator	Merganser, red-breasted
Falco columbarius	Merlin
Mimus polyglottos	Mockingbird, northern
Gallinula chloropus	Moorhen, common
Chordeiles minor	Nighthawk, common
Sitta canadensis	Nuthatch, red-breasted
Sitta carolinensis	Nuthatch, white-breasted
Clangula hyemalis	Oldsquaw
Icterus galbula	Oriole, Baltimore
Icterus spurius	Oriole, orchard
Pandion haliaetus	Osprey
Seiurus aurocapillus	Ovenbird
Tyto alba	Owl, common barn
Strix varia	Owl, barred
Otus asio	Owl, Eastern screech
Bubo virginianus	Owl, great horned
Aegolius acadicus	Owl, northern saw-whet
Asio flammeus	Owl, short-eared
Contopus virens	Pewee, eastern wood
Phalaropus tricolor	Phalarope, Wilson's
Phasianus colchicus	Pheasant, ring-necked
Sayornis phoebe	Phoebe, eastern
Anas acuta	Pintail, northern
Anthus rubescens	Pipit, American

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland
Page 5 of 12

Species Name	Common Name
Avian Species	
Pluvialis squatarola	Plover, black-bellied
Pluvialis dominica	Plover, American golden
Charadrius semipalmatus	Plover, semipalmated
Laterallus jamaicensis	Rail, black
Rallus limicola	Rail, Virginia
Rallus elegans	Rail, king
Aythya americana	Redhead
Setophaga ruticilla	Redstart, American
Turdus migratorius	Robin, American
Calidris alba	Sanderling
Calidris bairdii	Sandpiper, Baird's
Tryngites subruficollis	Sandpiper, buff-breasted
Calidris minutilla	Sandpiper, least
Calidris melantos	Sandpiper, pectoral
Calidris pusilla	Sandpiper, semipalmated
Tringa solitaria	Sandpiper, solitary
Actitis macularia	Sandpiper, spotted
Calidris himantipus	Sandpiper, stilt
Bartramia longicauda	Sandpiper, upland
Calidris mauri	Sandpiper, western
Calidris fuscicollis	Sandpiper, white-rumped
Sphyrapicus varius	Sapsucker, yellow-bellied
Aythya marila	Scaup, greater
Aythya affinis	Scaup, lesser
Melanitta fusca	Scoter, white-winged
Anas clypeata	Shoveler, northern
Carduelis pinus	Siskin, pine
Gallinago gallinago	Snipe, common
Porzana carolina	Sora
Spizella arborea	Sparrow, American tree
Spizella passerina	Sparrow, chipping
Spizella pusilla	Sparrow, field
Passerella iliaca	Sparrow, fox

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Ammodramus savannarum	Sparrow, grasshopper
Passer domesticus	Sparrow, house
Melospiza lincolnii	Sparrow, Lincoln's
Ammodramus nelsoni	Sparrow, Nelson's Sharp-tailed
Ammodramus cauductus	Sparrow, Saltmarsh Sharp-tailed
Passerculus sandwichensis	Sparrow, Savannah
Ammodramus maritimus	Sparrow, seaside
Melospiza melodia	Sparrow, song
Melospiza georgiana	Sparrow, swamp
Pooecetes gramineus	Sparrow, vesper
Zonotrichia leucophrys	Sparrow, white-crowned
Zonotrichia albicollis	Sparrow, white-throated
Sturnus vulgaris	Starling, European
Riparia riparia	Swallow, bank
Hirundo rustica	Swallow, barn
Petrochelidon pyrrhonota	Swallow, cliff
Stelgidopteryx serripennis	Swallow, Northern rough-winged
Tachycineta bicolor	Swallow, tree
Cygnus olor	Swan, mute
Cygnus columbianus	Swan, tundra
Chaetura pelagica	Swift, chimney
Piranga olivacea	Tanager, scarlet
Piranga rubra	Tanager, summer
Anas discors	Teal, blue-winged
Anas crecca	Teal, green-winged
Chilidonias niger	Tern, black
Sterna caspia	Tern, Caspian
Sterna hirundo	Tern, common
Sterna forsteri	Tern, Forster's
Sterna antillarum	Tern, least
Toxostoma rufum	Thrasher, brown
Catharus bicknelli	Thrush, Bicknell's

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Catharus minimus	Thrush, gray-cheeked
Catharus guttatus	Thrush, hermit
Catharus ustulatus	Thrush, Swainson's
Hylocichla mustelina	Thrush, wood
Parus bicolor	Titmouse, tufted
Pipilo erythrophthalmus	Towhee, Eastern
Meleagris gallopavo	Turkey, wild
Arenaria interpres	Turnstone, ruddy
Catharus fuscescens	Veery
Vireo solitarius	Vireo, blue-headed
Vireo philadelphicus	Vireo, Philadelphia
Vireo olivaceus	Vireo, red-eyed
Vireo gilvus	Vireo, warbling
Vireo griseus	Vireo, white-eyed
Vireo flavifrons	Vireo, yellow-throated
Coragyps atratus	Vulture, black
Cathartes aura	Vulture, turkey
Dendroica castnea	Warbler, bay-breasted
Mniotilta varia	Warbler, black-and-white
Dendroica virens	Warbler, black-throated green
Dendroica fusca	Warbler, blackburnian
Vermivora pinus	Warbler, blue-winged
Wilsonia Canadensis	Warbler, Canada
Dendroica tigrina	Warbler, Cape May
Dendroica cerulean	Warbler, cerulean
Dendroica pensylvanica	Warbler, chestnut-sided
Oporornis agilis	Warbler, Connecticut
Vermivora chrysoptera	Warbler, golden-winged
Wilsonia citrina	Warbler, hooded
Oporornis formosus	Warbler, Kentucky
Dendroica coronata	Warbler, yellow-rumped
Dendroica magnolia	Warbler, magnolia
Oporornis Philadelphia	Warbler, mourning

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Vermivora ruficapilla	Warbler, Nashville
Parula americana	Warbler, northern parula
Vermivora celata	Warbler, orange-crowned
Dendroica palmarum	Warbler, palm
Dendroica pinus	Warbler, pine
Dendroica discolor	Warbler, prairie
Protonotaria citrea	Warbler, prothonotary
Vermivora peregrine	Warbler, Tennessee
Wilsonia pusilla	Warbler, Wilson's
Helmitheros vermivorus	Warbler, worm-eating
Dendroica petechia	Warbler, yellow
Dendroica dominica	Warbler, yellow-throated
Seiurus motacilla	Waterthrush, Louisiana
Seiurus noveboracensis	Waterthrush, Northern
Bombycilla cedrorum	Waxwing, cedar
Numenius phaeopus	Whimbrel
Caprimulgus vociferus	Whip-poor-will
Caprimulgus carolinensis	Chuck-will's-widow
Anas americana	Wigeon, American
Catoptrophorus semipalmatus	Willet
Scolopax minor	Woodcock, American
Picoides pubescans	Woodpecker, downy
Picoides villosus	Woodpecker, hairy
Dryocopus pileatus	Woodpecker, pileated
Melanerpes carolinus	Woodpecker, red-bellied
Melanerpes erythrocephalus	Woodpecker, red-headed
Thryothorus ludovicianus	Wren, Carolina
Troglodytes aedon	Wren, house
Cistothorus palustris	Wren, marsh
Troglodytes troglodytes	Wren, winter
Tringa melanoleuca	Yellowlegs, greater
Tringa flavipes	Yellowlegs, lesser

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Avian Species	
Geothlypis trichas	Yellowthroat, common
Mammalian Species	
Eptesicus fuscus	Bat, big brown
Lasiurus borealis	Bat, eastern red
Nyciticeius humeralis	Bat, evening
Lasiurus cinereus	Bat, hoary
Myotis sodalist	Bat, Indiana
Lasiurus borealis	Bat, red
Lasionycteris noctivagans	Bat, silver-haired
Castor canadensis	Beaver
Tamias striatus	Chipmunk, eastern
Sylvilagus floridanus	Cottontail, eastern
Canis latrans	Coyote
Martes pennanti	Fisher
Urocyon cineroeargenteus	Fox, gray
Vulpes vulpes	Fox, red
Synaptomys cooperi	Lemming, southern bog
Mustela vison	Mink
Scalopus aquaticus	Mole, eastern
Condylura cristata	Mole, star-nosed
Peromyscus maniculatus	Mouse, deer
Reithrodontomys humulus	Mouse, eastern harvest
Zapus hudsonius	Mouse, meadow jumping
Peromyscus leucopus	Mouse, white-footed
Mus musculus	Mouse, house
Ondatra zibethica	Muskrat
Myotis leibii	Myotis, eastern small-footed
Myotis lucifugus	Myotis, little brown
Myotis septentrionalis	Myotis, northern
Didelphis virginianus	Opossum
Lutra canadensis	Otter, northern river
Pipistrellus subflavus	Pipistrelle, eastern
Procyon lotor	Raccoon

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Mammalian Species	
Neotoma magister	Rat, Allegheny wood
Rattus rattus	Rat, black
Rattus norvegicus	Rat, Norway
Oryzomys palustris	Rat, marsh rice
Cryptotis parva	Shrew, least
Sorex cinereus	Shrew, masked
Blarina carolinensis	Shrew, short-tailed
Sorex longirostris	Shrew, southeastern
Sorex palustris	Shrew, water
Mephitis mephitis	Skunk, striped
Scurius niger	Squirrel, eastern fox
Scurius carolinensis	Squirrel, eastern gray
Tamiasciurus hudsonicus	Squirrel, eastern red
Glaucomys volans	Squirrel, southern flying
Microtus chrotorrhinus	Vole, rock
Clethrionoms gapperi	Vole, southern red-backed
Microtus pinetorum	Vole, woodland
Microtus pennsylvanicus	Vole, meadow
Mustela frenata	Weasel, long-tailed
Marmota monax	Woodchuck
Reptile Species	
Agkistrodon contortrix mokason	Copperhead, northern
Sceloporus undulatus hyacinthinus	Lizard, northern fence
Coluber constrictor constrictor	Racer, northern black
Cnemidophorous sexlineatus	Racerunner, six-lined
Eumeces fasciatus	Skink, five-lined
Scincella lateralis	Skink, ground
Elaphe obsoleta obsoleta	Snake, black rat
Elaphe guttata guttata	Snake, corn
Virginia valeriae	Snake, eastern earth
Thamnophis sirtalis sirtalis	Snake, eastern garter

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Reptile Species	
Thamnophis sauritus sauritus	Snake, eastern ribbon
Carphophis amoenus amoenus	Snake, eastern worm
Pseudaspis cana	Snake, mole
Nerodia sipedon sipedon	Snake, northern water
Sternotherus odoratus	Stinkpot
Chelydra serpentina serpentina	Turtle, common snapping
Terrapene carolina carolina	Turtle, eastern box
Kinosternon subrubrum subrubrum	Turtle, eastern mud
Chrysemys picta picta	Turtle, eastern painted
Pseudemys rubriventris	Turtle, red-bellied
Clemmys guttata	Turtle, spotted
Amphibian Species	
Rana catesbeiana	Bullfrog
Hyla chrysoscelis	Frog, Copes gray tree
Rana sylvatica	Frog, wood
Acris crepitans crepitans	Frog, eastern cricket
Rana palustris	Frog, pickeral
Rana sphenocephala utricularia	Frog, southern leopard
Pseudacris feriarum feriarum	Frog, upland chorus
Pseudacris brachyphona	Frog, mountain chorus
Rana clamitans melanota	Frog, northern green
Necturus maculosus maculosus	Mudpuppy, common
Notophthalmus viridescens viridescens	Newt, red-spotted
Pseudacris crucifer crucifer	Peeper, northern spring
Pseudotriton montanus montanus	Salamander, eastern mud
Eurycea longicauda longicauda	Salamander, long tailed
Ambystoma opacum	Salamander, marbled
Desmognathus fuscus fuscus	Salamander, northern dusky
Pseudotriton ruber ruber	Salamander, northern red

Table 5-1

Ecological Inventory of Possible Animal Species
LMC Middle River Complex, Middle River, Maryland

Species Name	Common Name
Amphibian Species	
Plethodon glutinosus	Salamander, northern slimy
Eurycea bislineata	Salamander, northern two-lined
Ambystoma maculatum	Salamander, spotted
Plethodon wehrlei	Salamander, Wehrle's
Scaphiopus holbrooki holbrooki	Spadefoot, eastern
Bufo americanus	Toad, american
Bufo woodhousii fowleri	Toad, Fowler's
Hyla versicolor	Treefrog, gray
Hyla cinerea	Treefrog, green

Table 5-2

Ecological Risk Screen Assessment Endpoints
LMC Middle River Complex, Middle River, Maryland

Assessment Endpoint	Null Hypothesis	Measurement Endpoint	Specifics of Assessment
Ecological health of aquatic water column communities	Surface water does not exhibit a detrimental effect on aquatic plant and organism survival and growth	Evaluation of surface water chemistry with respect to water quality criteria	• Comparison of surface water concentrations to surface water screening values.
Ecological health of benthic invertebrate communities	Sediment does not exhibit a detrimental effect on invertebrate survival and growth	Evaluation of sediment chemistry with respect to sediment screening values	• Comparison of sediment concentrations to sediment screening values.
Long term health and reproductive capacity of omnivorous aquatic avian species (mallard duck)	Ingestion of COPC in prey does not have a negative impact on growth, survival, and reproductive success of the species	Evaluation of dose in prey based on sediment data and dietary exposure models	• Vegetation and invertebrate dose approximated by multiplying maximum sediment concentration by BCF or BAF for COPC. • The risk associated with the calculated dose will be evaluated by comparison to Toxicity Reference Values (TRVs).
Long term health and reproductive capacity of piscivorous wading birds (blue heron)	Ingestion of COPC in prey does not have a negative impact on growth, survival, and reproductive success of the species	Evaluation of dose in prey based on sediment data and dietary exposure models	• Food dose approximated by multiplying maximum sediment concentration by BCF or BAF for COPC. • The risk associated with the calculated dose will be evaluated by comparison to Toxicity Reference Values (TRVs).
Long term health and reproductive capacity of piscivorous aquatic avian species (belted kingfisher)	Ingestion of COPC in prey does not have a negative impact on growth, survival, and reproductive success of the species	Evaluation of dose in prey based on sediment data and dietary exposure models	• Food dose approximated by multiplying maximum sediment concentration by BCF or BAF for COPC. • The risk associated with the calculated dose will be evaluated by comparison to Toxicity Reference Values (TRVs).
Long term health and reproductive capacity of omnivorous aquatic mammalian species (raccoon)	Ingestion of COPC in prey does not have a negative impact on growth, survival, and reproductive success of the species	Evaluation of dose in prey based sediment data and dietary exposure models	• Dose from food approximated by multiplying maximum sediment concentration by BAF or BCF for COPC. • The risk associated with the calculated dose will be evaluated by comparison to Toxicity Reference Values (TRVs).

Table 5-4

Surface Water COPC
LMC Middle River Complex, Middle River, Maryland

CAS Number	Chemical	Minimum Concentration	Minimum Qualifier	Maximum Concentration	Maximum Qualifier	Units	Location of Maximum Detected Concentration	Detection Frequency	Frequency of Sites with Concentrations Above Screening Value	Screening Toxicity Value	SVR	COPC Flag	Additional Considerations

[1] - indicates chemicals that are bioaccumulative (Table 4-2., USEPA 2000).
N/A = Not Available
COPC = Chemical of Potential Concern
SVR = Screening Value Ratio (maximum detected concentration/screening toxicity value)
J = Indicates an estimated value
K = Estimated high value

Table 5-5

Summary of Ecological Risk Sediment Screening Toxicity Values
LMC Middle River Complex, Maryland

[1] - indicates chemicals that are bioaccumulative (Table 4-2., USEPA 2000).
N/A = Not Available
COPC = Chemical of Potential Concern
SVR = Screening Value Ratio (maximum detected concentration/screening toxicity value)
J = Indicates an estimated value
K = Estimated high value

Ecological Risk Assessment Summary
LMC Middle River Complex, Middle River, Maryland

Assessment Endpoint	Measurement Endpoint	Result
Ecological health of aquatic water column communities	Evaluation of surface water chemistry with respect to water quality criteria	• Mean EQs for 6 metals (4 total and 2 dissolved), 15 semi-volatile organic compounds, and 5 PCB Aroclors were > 1, indicating potential risk to aquatic water column communities. • Risks from 1 metal, 15 semi-volatile organic compounds, and 28 volatile organic compounds could not be determined due to the lack of toxicological information.
Ecological health of benthic invertebrate communities	Evaluation of sediment chemistry with respect to sediment screening values	• Mean EQs for 10 metals, 41 semi-volatile organic compounds, 3 volatile organic compounds, and 7 PCB Aroclors were > 1, indicating potential risk to benthic invertebrate communities. • Risks from 3 metals, 20 semi-volatile organic compounds, and 44 volatile organic compounds could not be determined due to the lack of toxicological information.
Long-term health and reproductive capacity of omnivorous aquatic avian species (Mallard duck)	Evaluation of dose in prey based on surface water and sediment data and dietary exposure models	• The NOAEL HQ for all COPCs was below 1.0 indicating acceptable risk. • Risks from four semi-volatile organic compounds and one volatile organic compound could not be determined due to the lack of toxicological information.
Long-term health and reproductive capacity of picivorous aquatic avian species (Belted kingfisher)	Evaluation of dose in prey based on surface water and sediment data and dietary exposure models	• The NOAEL HQ for all COPCs, except mercury and Aroclor 1260, was below 1.0 indicating acceptable risk. • LOAEL HQs for mercury and Aroclor 1260 were less than 1.0 indicating acceptable risk as no adverse effects are expected. • Risks from four semi-volatile organic compounds and one volatile organic compound could not be determined due to the lack of toxicological information.
Long-term health and reproductive capacity of picivorous aquatic avian species (Great blue heron)	Evaluation of dose in prey based on surface water and sediment data and dietary exposure models	• The NOAEL HQs for all COPCs except, mercury, hexachlorobenzene, and Aroclor 1260, were less than 1.0 indicating acceptable risk. • LOAEL HQs for hexachlorobenzene and Aroclors 1260 were less than 1.0 indicating acceptable risk as no adverse effects are expected. • LOAEL HQ for mercury were greater than 1.0 indicating possible risk to the great blue heron. • Risks from four semi-volatile organic compounds and one volatile organic compound could not be determined due to the lack of toxicological information.
Long-term health and reproductive capacity of omnivorous aquatic mammalian species (Raccoon)	Evaluation of dose in prey based on surface water and sediment data and dietary exposure models	• The NOAEL HQs for all COPCs, were below 1.0 indicating acceptable risk. • Risks from two semi-volatile organic compounds could not be determined due to the lack of toxicological information.

Section 6
Summary and Conclusions

6.1 Summary

Surface water and sediment sampling was performed on waterways adjacent to the Chesapeake Industrial Park. The objectives of the sampling events were as follows:

- To obtain analytical data to quantify the presence or absence of chemicals in the surface water bodies surrounding the waterfront area of the MRC.

- To quantify potential risks to human and ecological receptors in this area.

Chemical data for surface water and sediments was collected during two field events conducted in 2005. That data provides the basis for the HHRA and ERA for the area.

The HHRA determined that non-cancer risks are acceptable for both surface water and sediment because the calculated Hazard Index is less than 1.0. Potential carcinogenic risks for surface water are less than the MDE's threshold level of 1 X 10^{-5}. Potential carcinogenic risks for sediment are within the EPA's acceptable risk range of 1 x 10^{-4} to 1 x 10^{-6}, but exceed the MDE's threshold level of 1 X 10^{-5}. Therefore, additional consideration of contributing carcinogenic COPCs in sediment may be necessary. The primary contributors to carcinogenic risk in sediment include: arsenic, PAHs, and PCBs.

The ERA determined that the receptors potentially at risk are: lower trophic level organisms consisting of water-column communities as well as the benthic invertebrates; and upper trophic level organisms represented by the great blue heron through the food-web exposure model. One surface water COPC (cadmium) and five sediment COPCs (barium, silver, benzo(a)pyrene, benzo(g,h,I,)perylene, and indeno(1,2,3-cd)pyrene) are the primary contributing COPCs. Mercury

in the diet of the great blue heron was also identified as an ecological concern through food chain modeling.

6.2 Conclusions

Based on the human health and ecological risk assessments, additional consideration of the primary contributing COPCs maybe warranted. These include the following:

- Arsenic is identified as a potential human health risk concern in sediment. Arsenic is a naturally occurring metal and is typically found in soils and sediments in Maryland. To determine if additional action is warranted, the contribution of arsenic from background should be addressed. Typical sediment background concentrations may produce a potential carcinogenic risk of 1×10^{-5}.

- PAHs in sediment are identified as contributors to potential human health and ecological receptors. The most toxic PAH, benzo(a)pyrene, is associated with higher concentrations of PAHs located near the shore and at the far northeastern end of Dark Head Cove. It appears the adjacent land or more likely storm water outfalls in these locations are contributing the PAHs in sediment.

- PCBs are identified as potential human health risk concern in sediment. Elevated concentrations of PCBs are localized in Dark Head Cove in the vicinity of sample locations SD-9 and SD-27. Somewhat lower concentrations were detected in the sediments along the bulkhead extending from SD-22 to SD-13 and in some samples from the middle portion of Dark Head Cove.

- Cadmium was identified as a potential concern to ecological receptors in surface water. Barium, silver, benzo(a)pyrene, benzo(g,h,I,)perylene, and indeno(1,2,3-cd)pyrene were identified as contributing COPCs to ecological risk in sediment. Mercury in the diet of the great blue heron was also identified as an ecological concern.

~~total~~ Priority Pollutant Metals			
~~Diss~~ Priority Pollutant Metals			
PCBs (8082)	1 8oz soil	✓	
Hex. Chromium			

OBSERVATIONS / NOTES:

Sample collected ~ 5 ft SW of outfall - only deposit. area in ~ 500 ft
~~Background~~ Area - shallow (<2"), red oxid precip? No veg.
Cow Pen Creek = 3 to 4 ft. wide, good flow ~ 0.5' deep

SURFACE WATER SAMPLE LOG SHEET

Project Site Name: Lockheed Martin Corp. Middle River Complex, Md
Project No.: 112I00107

Sample ID No.: SW-08-102005
Sample Location: SW-08
Sampled By: FJK/W.P.
C.O.C. No.:

[] Stream
[] Spring
[] Pond
[] Lake
[X] Other: Tidal creek (estuarine)
[] QA Sample Type:

Type of Sample:
[X] Low Concentration
[] High Concentration

SAMPLING DATA:

Date: 10/20/05	Color (Visual)	pH (S.U.)	S.C. (mS/cm)	Temp. (°C)	Turbidity (NTU)	DO (mg/l)	Salinity (%)	Other ORP
Time: 11:10								
Depth: 10.1'	LT Brown	7.18	11.89	17.96	10.3	7.33	6.82	214.6
Method: Dip (Bailer)								

SAMPLE COLLECTION INFORMATION:

Analysis	Preservative	Container Requirements	Collected
VOCs	HCL	3 40 mL Vials	✓
SVOCs	—	2 1 L. Amber Glass	✓
PCBs	—	2 1 L. amber Glass	✓
Total P.P. metals	HNO_3	1 1 L. plastic	✓
Diss. P.P. metals	HNO_3	1 1 L. plastic	✓
Crtle (Total)	—	1 125 mL plastic	✓

Overview

The sample set for Lockheed Middle River, SDG 503077 consists of three (3) environmental sediment samples, seven (7) environmental aqueous samples, and one (1) trip blank. All samples except the trip blank (TB031705) were analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC), and polychlorinated biphenyls (PCB). The trip blank was analyzed for VOC only.

The samples were collected by Tetra Tech NUS on March 17, 2005 and analyzed by Phase Separation Science, Inc. All analyses were conducted in accordance with Quality Assurance/Quality Control (QA/QC) criteria using SW-846 8260B, 8270C, and 8082 analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, internal standard recoveries, and detection limits. Areas of concern are listed below.

Major

- The VOC initial calibration performed on March 8, 2005 and all continuing calibrations were below the 0.05 relative response factor (RRF) quality control criterion for 1,4-dioxane. Non-detected results for 1,4-dioxane were rejected (UR) in all aqueous samples.

Minor

- The VOC initial calibration performed on March 8, 2005 exceeded the 30% relative standard deviation (RSD) quality control criterion for acetone. Positive results for acetone were qualified as estimated (J) in all samples.

- The SVOC continuing calibration performed on March 25 at 10:35 exceeded the 25% (but was <50%) difference quality control criterion for bis(2-ethylhexyl)phthalate, benzo(g,h,i)perylene, and dibenz(a,h)anthracene. The positive results for bis(2-ethylhexyl)phthalate were qualified as

estimated (J) in the aqueous samples SW-1-031705, SW-2-031705, SW-3-031705, SW-6-031705, and SW-7-031705. No action was taken for benzo(g,h,i)perylene and dibenz(a,h)anthracene.

- The SVOC continuing calibration performed on March 28 at 10:38 exceeded the 25% difference (but was <50%) quality control criterion for bis(2-ethylhexyl)phthalate. The positive results for bis(2-ethylhexyl)phthalate were qualified as estimated (J) in samples SW-4-031705 and SW-5-031705.

- The SVOC continuing calibration performed on March 29 at 10:32 exceeded the 25% difference (but was <50%) quality control criterion for 2,4-dinitrophenol and bis(2-ethylhexyl)phthalate. The positive results for bis(2-ethylhexyl)phthalate were qualified as estimated (J) in all sediment samples.

- Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

- Acetone is a suspected laboratory contaminant. Positive results for acetone were qualified as estimated (J) in all sediment and aqueous samples.

- The percent recovery of the VOC surrogate toluene-d8 was below the quality control criterion in sample SW-7-031705, SW-7-031705RE, and SW-3-031705RE. Positive and non-detected results were qualified as estimated (J) and (UJ) in samples SW-3-031705 and SW-7-031705.

Notes

The laboratory did not report the same compound list as provided in the SOW for the VOC and SVOC fractions. According to the laboratory the SOW was received with all compound lists crossed out. The laboratory faxed a copy of the compound list pages of the SOW showing the cross outs. The faxed sheets are included in the support documentation. No action was taken on this basis because a definite compound list could not be determined.

The VOC continuing calibration performed on March 23 at 13:47 exceeded the 25% (but was <50%) difference quality control criterion for bromomethane and carbon disulfide. No action was taken on this basis.

The VOC continuing calibration performed on March 28 at 08:07 exceeded the 25% (but was <50%) difference quality control criterion for bromomethane and MTBE. No action was taken on this basis.

The VOC continuing calibration performed on March 29 at 10:05 exceeded the 25% (but was <50%) difference quality control criterion for MTBE. No action was taken on this basis.

The percent recovery of the VOC surrogate 4-bromofluorobenzene exceeded the quality control criterion in the MSD of sample SD-04-031705. No action was taken on this basis because the surrogate was compliant in the MS and un-spiked samples.

The percent recovery of chlorobenzene was below the quality control criterion in the MSD of sample SW-3-031705. No action was taken on this basis.

Several minor percent recovery and relative percent difference (RPD) non-compliances were noted in the MS/MSD performed on the VOC fraction of sample SD-04-031705. No action was taken on this basis because all LCS percent recoveries were compliant.

The VOC internal standards chlorobenzene-d5 and fluorobenzene were below the percent recovery quality control criterion in sample SW-3-031705. Chlorobenzene-d5 was also below criterion in sample SW-7-031705. Both samples were re-analyzed within holding time with acceptable results.

The percent recovery of Aroclor 1016 exceeded the quality control criterion in the PCB MS/MSD and the recovery of Aroclor 1260 was below criterion in the MS. No action was taken on this basis because the un-spiked sample was not associated with this SDG.

Calculations could not be reproduced because no raw data was provided for the environmental samples. No action was taken on this basis.

Executive Summary

Laboratory Performance: Qualifications were made based on calibration non-compliances.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Data Validation (9/94). The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:
Appendix A – Qualified Analytical Results
Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

The Case Narrative, Chain of Custody, Sample Receipt Checklist, and the cover page of the Sample Analysis Report, are integral parts of GPL Laboratories' report package. If you did not receive all of these documents, please contact GPL immediately.

Sample Receipt

Fifteen water and Three soil samples were received on 03/17/2005. The samples were delivered by GPL courier. Sample receipt conditions and temperatures are documented on the Sample Receipt checklist.

Sample Analysis

Samples were prepared and analyzed by GPL using the analytical methodologies indicated on the Sample Analysis Summary Report. In some chromatographic analyses, manual integration is used instead of automated integration because it produces more accurate results. All manual integrations are denoted on the sample quantitation report. Analysis results and limits for soil are reported on a dry weight basis unless otherwise specified on the report.

Volatiles

Eight water and three soil samples were analyzed for volatile organic compounds using SW846 method 8260B. Analyses of the samples were performed within holding time.

Samples SW-3-031705 and SW-7-031705 had internal standard recoveries below the QC limits. Sample SW-7-031705 had one surrogate recovery below QC limits as well. Both samples were rerun within holding time and data reports for all analyses were submitted with this package. Data is reported from reanalyses.

Matrix spike and matrix spike duplicate analyses were performed on samples SW-3-031705 and SD-4-031705. Sample SW-3-031705MS/MSD had recovery of chlorobenzene below QC limits. Sample SD-4-031705MS/MSD had low spike recoveries.

Three laboratory control spikes (LCS) were analyzed along with the sample batch. All recoveries were within QC limits.

Manual integration was performed on some peaks that were improperly integrated by the software. The manually integrated compounds are designated by an "m" next to the area of the quantitation report, and chromatograms for these compounds were submitted.

Semivolatiles

Seven water and three soil samples were extracted using methods 3520C and 3550B, respectively. The samples were analyzed for semi-volatile organic compounds using method 8270C.

All surrogate recoveries were within QC limits.

For the waters, matrix spike and duplicate analysis was performed on sample SW-3-031705. All matrix spike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

For the soils, QC was shared with work order 503094. Matrix spike and duplicate analysis was performed on sample SD-6-031805. All matrix spiike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

Extraction and analysis holding times were met.

PCBs

Three soil and seven water samples were extracted and analyzed for PCB compounds using method 8082A.

Matrix spike and matrix spike duplicate analyses for soils were shared with work order 503094. PCB -1016 on both and PCB-1260 on MS were outside QC limits due to matrix effect. RPD for both was outside QC limits. Matrix spike and duplicate analyses for waters were performed on SW-3-031705. All recoveries were within QC limits.

A laboratory control sample was extracted and analyzed along with the soil and water samples. Recoveries were within control limits.

All samples were extracted and analyzed within holding times.

All other analyses met QC criteria.

Metals

Fourteen water samples and three soil samples were analyzed for PP metals by EPA SW846 methods. The water samples were analyzed by ICPMS in order to meet the required reporting limits

A matrix spike and duplicate were performed on samples SW-3-031705 and SW-3-031705FIL for all analytes. Serial dilutions were also performed for ICPMS analytes. A duplicate RPD on sample SW-3-031705 was outside of the control limit for copper; all associates data were flagged with an "*". The serial dilution on sample SW-3-031705 was outside of the control limits for copper, nickel, and zinc; all associated data were flagged with an "E".

A matrix spike, duplicate, and serial dilution were performed on the batch sample 503117-001 for all required ICP analytes. The matrix spike was outside of the control limits for antimony, beryllium, and chromium; all associated data were flagged with an "N". A post digestion analytical spike was performed with a recovery 118.1% for beryllium. No control limit applied to the matrix spike for arsenic due to an insignificant spike addition. A duplicate was outside of the control limits for arsenic, beryllium, and chromium; all associated data were flagged with an "*".

A matrix spike and duplicate were performed on the batch sample 503094-005 for mercury. . A duplicate was outside of the control limits for mercury; all associated data were flagged with an "*".

Calibration standards are verified against independent check standards purchased from a commercial vendor of environmental standards.

All GPL QA/QC criteria were met with the exceptions of those mentioned above.

General Chemistry

Seven water samples were analyzed for Hexavalent Chromium by SW846 method 7196A. Three soil samples were digested by method 3060A and were also analyzed for Hexavalent Chromium by method 7196A.

Duplicate and matrix spike analyses for water were performed on sample SW-3-031705. Duplicate and matrix spike analyses for soil were shared with GPL work order 503094.

A laboratory control sample was digested and analyzed along with the soil batch.

All QC criteria were met.

The Case Narrative, Chain of Custody, Sample Receipt Checklist, and the cover page of the Sample Analysis Report, are integral parts of GPL Laboratories' report package. If you did not receive all of these documents, please contact GPL immediately.

Sample Receipt

Fifteen water and Three soil samples were received on 03/17/2005. The samples were delivered by GPL courier. Sample receipt conditions and temperatures are documented on the Sample Receipt checklist.

Sample Analysis

Samples were prepared and analyzed by GPL using the analytical methodologies indicated on the Sample Analysis Summary Report. In some chromatographic analyses, manual integration is used instead of automated integration because it produces more accurate results. All manual integrations are denoted on the sample quantitation report. Analysis results and limits for soil are reported on a dry weight basis unless otherwise specified on the report.

Volatiles

Eight water and three soil samples were analyzed for volatile organic compounds using SW846 method 8260B. Analyses of the samples were performed within holding time.

Samples SW-3-031705 and SW-7-031705 had internal standard recoveries below the QC limits. Sample SW-7-031705 had one surrogate recovery below QC limits as well. Both samples were rerun within holding time and data reports for all analyses were submitted with this package. Data is reported from reanalyses.

Matrix spike and matrix spike duplicate analyses were performed on samples SW-3-031705 and SD-4-031705. Sample SW-3-031705MS/MSD had recovery of chlorobenzene below QC limits. Sample SD-4-031705MS/MSD had low spike recoveries.

Three laboratory control spikes (LCS) were analyzed along with the sample batch. All recoveries were within QC limits.

Manual integration was performed on some peaks that were improperly integrated by the software. The manually integrated compounds are designated by an "m" next to the area of the quantitation report, and chromatograms for these compounds were submitted.

Semivolatiles

Seven water and three soil samples were extracted using methods 3520C and 3550B, respectively. The samples were analyzed for semi-volatile organic compounds using method 8270C.

All surrogate recoveries were within QC limits.

For the waters, matrix spike and duplicate analysis was performed on sample SW-3-031705. All matrix spike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

For the soils, QC was shared with work order 503094. Matrix spike and duplicate analysis was performed on sample SD-6-031805. All matrix spiike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

Extraction and analysis holding times were met.

PCBs

Three soil and seven water samples were extracted and analyzed for PCB compounds using method 8082A.

Matrix spike and matrix spike duplicate analyses for soils were shared with work order 503094. PCB -1016 on both and PCB-1260 on MS were outside QC limits due to matrix effect. RPD for both was outside QC limits. Matrix spike and duplicate analyses for waters were performed on SW-3-031705. All recoveries were within QC limits.

A laboratory control sample was extracted and analyzed along with the soil and water samples. Recoveries were within control limits.

All samples were extracted and analyzed within holding times.

All other analyses met QC criteria.

Metals

Fourteen water samples and three soil samples were analyzed for PP metals by EPA SW846 methods. The water samples were analyzed by ICPMS in order to meet the required reporting limits

A matrix spike and duplicate were performed on samples SW-3-031705 and SW-3-031705FIL for all analytes. Serial dilutions were also performed for ICPMS analytes. A duplicate RPD on sample SW-3-031705 was outside of the control limit for copper; all associates data were flagged with an "*". The serial dilution on sample SW-3-031705 was outside of the control limits for copper, nickel, and zinc; all associated data were flagged with an "E".

A matrix spike, duplicate, and serial dilution were performed on the batch sample 503117-001 for all required ICP analytes. The matrix spike was outside of the control limits for antimony, beryllium, and chromium; all associated data were flagged with an "N". A post digestion analytical spike was performed with a recovery 118.1% for beryllium. No control limit applied to the matrix spike for arsenic due to an insignificant spike addition. A duplicate was outside of the control limits for arsenic, beryllium, and chromium; all associated data were flagged with an "*".

A matrix spike and duplicate were performed on the batch sample 503094-005 for mercury. . A duplicate was outside of the control limits for mercury; all associated data were flagged with an "*".

Calibration standards are verified against independent check standards purchased from a commercial vendor of environmental standards.

All GPL QA/QC criteria were met with the exceptions of those mentioned above.

General Chemistry

Seven water samples were analyzed for Hexavalent Chromium by SW846 method 7196A. Three soil samples were digested by method 3060A and were also analyzed for Hexavalent Chromium by method 7196A.

Duplicate and matrix spike analyses for water were performed on sample SW-3-031705. Duplicate and matrix spike analyses for soil were shared with GPL work order 503094.

A laboratory control sample was digested and analyzed along with the soil batch.

All QC criteria were met.

Surrogate Recovery Summary

Matrix : SOIL **Analytical Method : SW8082** **SDG No : 503077**

Surrogate	CL10BZ2	XYL2456CLM
Lower QC Limits	47	54
Upper QC Limits	161	168
Sample ID		
BKS74568	65	75
	65	76
BLK74568	73	89
	72	90
SD-04-031705	117	127
	81	128
SD-1-031705	68	89
	88	99
SD-3-031705	98	93
	69	92

* Value outside of QC Limts

CL10BZ2 = Decachlorobiphenyl XYL2456CLM = Tetrachloro-m-xylene

GPL Laboratories

LCS SUMMARY

SAMPLE NO
BKS74568

Lab Name : GPL Laboratories
Contract. : Middle River
Lab Code : GPL
SDG NO : 503077
Matrix : SOIL
Lab Sample ID : BKS74568
Method : SW8082
Analysis Date : 03/29/2005

SUBJECT: **INORGANIC DATA VALIDATION – METALS AND HEXAVALENT CHROMIUM**
LOCKHEED MIDDLE RIVER
SAMPLE DELIVERY GROUP (SDG) – 503077

SAMPLES: 3/SEDIMENT/

SD-04-031705	SD-1-031705	SD-3-031705

7/AQUEOUS/

SW-1-031705	SW-2-031705	SW-3-031705
SW-4-031705	SW-5-031705	SW-6-031705
SW-7-031705		

Overview

The sample set for SDG 503077, Lockheed Middle River, consists of three (3) sediment and seven (7) aqueous environmental samples.

The sediment samples were analyzed for select metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, zinc) and hexavalent chromium. The aqueous samples were analyzed for total and dissolved select metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, zinc) and hexavalent chromium. The samples were collected by Tetra Tech NUS on March 17, 2005 and analyzed by GPL Laboratories, LLLP. Sediment metals analyses except mercury were conducted using SW-846 method 6010B. Aqueous metals analyses except mercury were conducted using SW-846 method 6020. Sediment mercury analyses were conducted using SW-846 method 7471A. Aqueous mercury analyses were conducted using SW-846 method 7470A. Hexavalent chromium analyses were conducted using SW-846 method 7196A.

Summary

All analytes were successfully analyzed. The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, calibration data, laboratory method/preparation blanks, matrix spike results, post digestion spike (PDS) results, laboratory duplicate results, laboratory control sample (LCS) results, ICP serial dilution results, detection limits and analyte quantitation.

Sediment metals analyses except mercury were conducted using Inductively Couple Plasma (ICP) methodology. Aqueous metals analyses except mercury were conducted using Inductively Coupled Plasma Mass Spectrometry (ICP-MS) methodology. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

Areas of concern with respect to data quality are listed below.

Minor Problems

- The reporting limit (RL) standard run on 3/23/05 at 6:27 PM had percent a recovery %R >110% for selenium. The positive result reported for selenium <2X the RL was qualified as biased high (K) in sample SD-3-031705.

- The RL standard run on 3/24/05 at 2:48 PM had a %R <90% for thallium. The nondetected result reported for thallium was qualified as biased low (UL) in sample SD-04-031705.

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Aqueous Action Level	Solid Action Level
Antimony[1]	4.0 ug/L	NA	2.0 mg/kg
Beryllium[1]	0.2 ug/L	NA	0.1 mg/kg
Cadmium[1]	0.5 ug/L	NA	0.25 mg/kg
Chromium[2]	0.057 mg/kg	NA	0.285 mg/kg
Chromium[3]	0.18 ug/L	0.9 ug/L	NA
Copper[1]	1.3 ug/L	NA	0.65 mg/kg
Copper[4]	1.9 ug/L	9.5 ug/L	NA
Lead[2]	0.28 mg/kg	NA	1.4 mg/kg
Lead[4]	0.74 ug/L	3.7 ug/L	NA
Nickel[1]	1.5 ug/L	NA	0.75 mg/kg
Nickel[3]	0.091 ug/L	0.455 ug/L	NA
Silver[3]	0.035 ug/L	0.175 ug/L	NA
Thallium[3]	0.7 ug/L	3.5 ug/L	NA
Zinc[4]	1.8 ug/L	9.0 ug/L	NA

[1] Maximum concentration present in sediment calibration blank.
[2] Maximum concentration present in sediment preparation blank from batch 74546.
[3] Maximum concentration present in aqueous calibration blank.
[4] Maximum concentration present in aqueous preparation blank from batch 74543.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. For the sediment samples, positive results below the action level for antimony were qualified (B) as a result of blank contamination. For the aqueous samples, positive results below the action level for copper, lead, silver, thallium, and zinc were qualified (B) as a result of blank contamination. The remaining analytes were not qualified for blank contamination because the results were either above the action level or they were nondetects.

- The total metals aqueous laboratory duplicate performed on sample SW-3-031705 had imprecision (Difference >RL) for copper. Positive results reported for copper were qualified as estimated (J) for total metals aqueous samples only.

- The total metals aqueous ICP serial dilution performed on sample SW-3-031705 had percent differences (%Ds) >10% and initial sample concentrations >50X the instrument detection limit (IDL) for copper, nickel, and zinc. Positive results reported for copper, nickel, and zinc were qualified as estimated (J) in the total metals aqueous samples only.

Notes

The original data package submittal from the laboratory was missing calibration data, blank data, preparation data, the instrument run log, and raw data. The data reviewer contacted the laboratory and the missing data were submitted.

The RL standard run on 3/23/05 at 6:27 PM had %Rs <90% for chromium and >110% for lead. No qualification action was required for chromium and lead because the results were >2X the RL.

The PQL standard run on 4/4/05 at 2:39 PM had %Rs <90% for chromium and copper. No qualification action was required on this basis.

Dilutions were performed for chromium, lead, selenium, silver, and thallium in sample SD-04-031705.

The soil matrix spike (MS) performed on sample 203-SS-804-EW-2 had %Rs <75% for antimony, beryllium, and chromium. No qualification action was required because this sample was not included in this SDG.

The soil laboratory duplicate performed on sample 203-SS-805-EW-2 had imprecision (RPD >35%) for beryllium. No qualification action was required because this sample was not included in this SDG.

The filtered silver result in sample SW-1-031705 is approximately 10X greater than in the total fraction. No action was taken. This item is noted for completeness.

Executive Summary

Laboratory Performance: Several analytes were qualified due to calibration noncompliance. Several analytes were present in the laboratory method/preparation blanks. Copper was qualified due to laboratory duplicate imprecision.

Other Factors Affecting Data Quality: Several analytes were qualified due to ICP serial dilution noncompliance.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Validation", April 1993 as amended for use within USEPA Region III.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

U	-	Value is a nondetect as reported by the laboratory.
UL	-	Nondetected result is considered biased low as a result of technical noncompliance.
B	-	Positive result is considered to be an artifact of blank contamination and should not be considered present.
J	-	Positive result is considered estimated as a result of technical noncompliance.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Analytical Report For 503077

for

Tetra Tech NUS

Project Manager: Michael Martin

Project Name: Middle River

GPL

Laboratories

GPL Laboratories, LLLP certifies that the test results meet all requirements of the NELAC Standards unless otherwise noted

Reviewed By,
Project Manager

Approved By,
Laboratory Director

The Case Narrative, Chain of Custody, Sample Receipt Checklist, and the cover page of the Sample Analysis Report, are integral parts of GPL Laboratories' report package. If you did not receive all of these documents, please contact GPL immediately.

Sample Receipt

Fifteen water and Three soil samples were received on 03/17/2005. The samples were delivered by GPL courier. Sample receipt conditions and temperatures are documented on the Sample Receipt checklist.

Sample Analysis

Samples were prepared and analyzed by GPL using the analytical methodologies indicated on the Sample Analysis Summary Report. In some chromatographic analyses, manual integration is used instead of automated integration because it produces more accurate results. All manual integrations are denoted on the sample quantitation report. Analysis results and limits for soil are reported on a dry weight basis unless otherwise specified on the report.

Volatiles

Eight water and three soil samples were analyzed for volatile organic compounds using SW846 method 8260B. Analyses of the samples were performed within holding time.

Samples SW-3-031705 and SW-7-031705 had internal standard recoveries below the QC limits. Sample SW-7-031705 had one surrogate recovery below QC limits as well. Both samples were rerun within holding time and data reports for all analyses were submitted with this package. Data is reported from reanalyses.

Matrix spike and matrix spike duplicate analyses were performed on samples SW-3-031705 and SD-4-031705. Sample SW-3-031705MS/MSD had recovery of chlorobenzene below QC limits. Sample SD-4-031705MS/MSD had low spike recoveries.

Three laboratory control spikes (LCS) were analyzed along with the sample batch. All recoveries were within QC limits.

Manual integration was performed on some peaks that were improperly integrated by the software. The manually integrated compounds are designated by an "m" next to the area of the quantitation report, and chromatograms for these compounds were submitted.

Semivolatiles

Seven water and three soil samples were extracted using methods 3520C and 3550B, respectively. The samples were analyzed for semi-volatile organic compounds using method 8270C.

All surrogate recoveries were within QC limits.

For the waters, matrix spike and duplicate analysis was performed on sample SW-3-031705. All matrix spike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

For the soils, QC was shared with work order 503094. Matrix spike and duplicate analysis was performed on sample SD-6-031805. All matrix spiike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

Extraction and analysis holding times were met.

PCBs

Three soil and seven water samples were extracted and analyzed for PCB compounds using method 8082A.

Matrix spike and matrix spike duplicate analyses for soils were shared with work order 503094. PCB -1016 on both and PCB-1260 on MS were outside QC limits due to matrix effect. RPD for both was outside QC limits. Matrix spike and duplicate analyses for waters were performed on SW-3-031705. All recoveries were within QC limits.

A laboratory control sample was extracted and analyzed along with the soil and water samples. Recoveries were within control limits.

All samples were extracted and analyzed within holding times.

All other analyses met QC criteria.

Metals

Fourteen water samples and three soil samples were analyzed for PP metals by EPA SW846 methods. The water samples were analyzed by ICPMS in order to meet the required reporting limits

A matrix spike and duplicate were performed on samples SW-3-031705 and SW-3-031705FIL for all analytes. Serial dilutions were also performed for ICPMS analytes. A duplicate RPD on sample SW-3-031705 was outside of the control limit for copper; all associates data were flagged with an "*". The serial dilution on sample SW-3-031705 was outside of the control limits for copper, nickel, and zinc; all associated data were flagged with an "E".

A matrix spike, duplicate, and serial dilution were performed on the batch sample 503117-001 for all required ICP analytes. The matrix spike was outside of the control limits for antimony, beryllium, and chromium; all associated data were flagged with an "N". A post digestion analytical spike was performed with a recovery 118.1% for beryllium. No control limit applied to the matrix spike for arsenic due to an insignificant spike addition. A duplicate was outside of the control limits for arsenic, beryllium, and chromium; all associated data were flagged with an "*".

A matrix spike and duplicate were performed on the batch sample 503094-005 for mercury. . A duplicate was outside of the control limits for mercury; all associated data were flagged with an "*".

Calibration standards are verified against independent check standards purchased from a commercial vendor of environmental standards.

All GPL QA/QC criteria were met with the exceptions of those mentioned above.

General Chemistry

Seven water samples were analyzed for Hexavalent Chromium by SW846 method 7196A. Three soil samples were digested by method 3060A and were also analyzed for Hexavalent Chromium by method 7196A.

Duplicate and matrix spike analyses for water were performed on sample SW-3-031705. Duplicate and matrix spike analyses for soil were shared with GPL work order 503094.

A laboratory control sample was digested and analyzed along with the soil batch.

All QC criteria were met.

TB-031805

Overview

The sample set for Lockheed Middle River, SDG 503094 consists of nine (9) environmental sediment samples and one (1) trip blank sample. All samples were analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC), and polychlorinated biphenyls (PCB).

The samples were collected by Tetra Tech NUS on March 18, 2005 and analyzed by GPL Laboratories. All analyses were conducted in accordance with SW-846 8260B, 8270C, and 8082 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate results, internal standard recoveries, and detection limits. Areas of concern are listed below.

Minor

- The soil initial calibration performed on 3/08/05 exceeded the 30% difference (but was <50%) quality control criterion for acetone. The positive result for acetone has been qualified as estimated (J) in the trip blank.

- The surrogate decachlorobiphenyl had a recovery greater than the quality control limit for sample SD-5-031805. The positive Aroclor-1260 result for sample SD-5-031805 has been qualified as estimated (J).

- The matrix spike / matrix spike duplicate (MS/MSD) performed on sample SD-6-031805 had recoveries greater than the quality control limit for Aroclor-1016 in the MS/MSD and a recovery less than the quality control limit for Aroclor-1260 in the MS. In addition the relative percent difference (%RPD) exceeded the quality control limit for Aroclor-1016 and Aroclor-1260. The positive result for Aroclor-1260 in sample SD-6-031805 was qualified as estimated (J). No action was taken on the

Aroclor-1016 result because the Aroclor was not detected.

- The SVOA continuing calibration performed on 3/30/05 @ 11:58 exceeded the 25% difference (but were <50%) quality control criterion for bis(2-ethylhexyl)phthalate. The positive results for bis(2-ethylhexyl)phthalate were qualified as estimated (J), in the affected samples.

- The SVOA continuing calibration performed on 3/29/05 @ 10:32 exceeded the 25% difference (but were <50%) quality control criterion for bis(2-ethylhexyl)phthalate. The positive results for bis(2-ethylhexyl)phthalate were qualified as estimated (J), in the affected samples.

- The following compound was detected in the trip blank at the maximum concentration indicated below:

Compound	Concentration (µg/L)	Action Level (µg/kg)
Acetone	14	140

Blank Actions

- Value < Reporting Limit (RL); report value followed by a B.
- Value > RL and < Action Level; report value followed by a B.
- Value > RL and > Action Level; report value unqualified.

An action level of 10X the maximum contaminant concentration was established for acetone to evaluate laboratory contamination. Dilution factors, percent solids, and sample aliquots were taken into consideration during the application of all action levels. The affected positive results were qualified (B) as a result of blank contamination for acetone.

Notes

The VOA matrix spike / matrix spike duplicate performed on sample SD-6-031805 had a percent recoveries less than the quality control limit for the following compounds: 1,1,1-trichloroethane, 1,2-dichloroethane, 4-methyl-2-pentanone, benzene, bromodichloromethane, bromoform, carbon tetrachloride, chlorobenzene, chloroform, dibromochloromethane, toluene, and trichloroethene. No action was taken on this basis because none of the aforementioned compounds were detected in the unspiked sample.

The VOA continuing calibration performed on 3/25/05 @ 08:24 exceeded the 25% difference (but was <50%) quality control criterion for methyl tert-butyl ether and 2-butanone. No action was taken on this basis because the aforementioned compounds were not detected in any samples.

The VOA continuing calibration performed on 3/29/05 @ 10:05 exceeded the 25% difference (but was <50%) quality control criterion for methyl tert-butyl ether. No action was taken on this basis because methyl tert-butyl ether was not detected in any samples.

The SVOA continuing calibration performed on 3/29/05 @ 10:32 exceeded the 25% difference (but was <50%) quality control criterion for 2,4-dinitrophenol. No action was taken on this basis because 2,4-dinitrophenol was not detected in any samples.

The SVOA continuing calibration performed on 3/30/05 @ 11:58 exceeded the 25% difference (but were <50%) quality control criterion for 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, di-n-octylphthalate, and pyridine. No action was taken on this basis because the aforementioned compounds were not detected in any samples.

Samples SD-10-031805, SD-11-031805, SD-12-031805, and SD-9-031805 were diluted because of concentrations of Aroclor-1260 greater than the calibration range of the instrument. This accounts for the elevated detection limits for the non-detected Aroclors in the aforementioned samples.

Executive Summary

Laboratory Performance: VOA and SVOA continuing calibrations failed to meet linearity criteria resulting in qualification of the data. Acetone was qualified in all sediment samples due to trip blank contamination. Qualifications were made due to PCB surrogate non-compliances.

Other Factors Affecting Data Quality: Qualifications were made due to matrix spike non-compliances.

The data for these analyses were reviewed with reference to SW-846 method-specific requirements and U.S. EPA National Functional Guidelines for Data Validation as modified by EPA Region III (9/94) to the extent practicable. The text of this report has been formulated to address only those problem areas affecting data quality.

Analytical Report For 503094

for

Tetra Tech NUS

Project Manager: Michael Martin

Project Name: Middle River

GPL

Laboratories

GPL Laboratories, LLLP certifies that the test results meet all requirements of the NELAC Standards unless otherwise noted

Reviewed By,
Project Manager

Approved By,
Laboratory Director

The Case Narrative, Chain of Custody, Sample Receipt Checklist, and the cover page of the Sample Analysis Report, are integral parts of GPL Laboratories' report package. If you did not receive all of these documents, please contact GPL immediately.

Sample Receipt

Nine soil and one water samples were received on 03/18/2005. The samples were delivered by GPL courier. Sample receipt conditions and temperatures are documented on the Sample Receipt checklist.

Sample Analysis

Samples were prepared and analyzed by GPL using the analytical methodologies indicated on the Sample Analysis Summary Report. In some chromatographic analyses, manual integration is used instead of automated integration because it produces more accurate results. All manual integrations are denoted on the sample quantitation report. Analysis results and limits for soil are reported on a dry weight basis unless otherwise specified on the report.

Volatiles

One water and nine soil samples were analyzed for volatile organic compounds using SW846 method 8260B. Analyses of the samples were performed within holding time.

All surrogate recoveries were within QC limits.

Matrix spike and matrix spike duplicate analyses were performed on sample SD-5-031805. Several recoveries were below QC limits.

Two laboratory control spikes (LCS) were analyzed along with the sample batch. All recoveries were within QC limits.

Manual integration was performed on some peaks that were improperly integrated by the software. The manually integrated compounds are designated by an "m" next to the area of the quantitation report, and chromatograms for these compounds were submitted.

Semivolatiles

Nine soil samples were extracted using method 3550B. The samples were analyzed for semi-volatile organic compounds using method 8270C.

All surrogate recoveries were within QC limits.

Matrix spike and duplicate analysis was performed on sample SD-6-031805. All matrix spike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

The continuing calibration analyzed on 3/30/05 showed a %D for n-nitrosodiphenylamine at -22.3, Pentachlorophenol at -22.5, and Di-n-octylphthalate at -44.0. No reanalysis was necessary as the responses for these compounds were above that of the initial calibration and since none were detected in any of the samples analyzed that day.

Extraction and analysis holding times were met.

PCBs

Nine soil samples were extracted and analyzed for PCB compounds using method 8082A.

Matrix spike and matrix spike duplicate analyses for soil were performed on sample SD-6-031805. PCB -1016 on both and PCB-1260 on MS were outside QC limits due to matrix effect. RPD for both was outside QC limits.

A laboratory control sample was extracted and analyzed along with the soil samples. Recoveries were within control limits.

Samples SD-10-031805, SD-11-031805, SD-12-031805 and SD-9-031805 were diluted at different levels to meet QC limits.

DCB surrogates recoveries for diluted samples was outside QC limits.

All other analyses met QC criteria.

Metals

Nine soil samples were analyzed for PP metals by EPA SW846 methods.

A matrix spike and duplicate were performed on sample SD-6-031805 for all required analytes. A serial dilution was also performed for ICP analytes. The matrix spike was outside of the control limits for antimony and cadmium. A post digestion analytical spike was performed with a recovery 91.0% for cadmium. The duplicate was outside of the control limits for mercury. The serial dilution was outside of the control limit for beryllium.

Calibration standards are verified against independent check standards purchased from a commercial vendor of environmental standards.

All GPL QA/QC criteria were met with the exceptions of those mentioned above.

General Chemistry

Nine soil samples were digested by SW846 method 3060A and were analyzed for Hexavalent Chromium by method 7196A.

Duplicate and matrix spike analyses were performed on sample SD-6-031805.

A laboratory control sample was digested and analyzed along with the batch.

All QC criteria were met.

Overview

The sample set for SDG 503094, Lockheed Middle River, consists of nine (9) sediment environmental samples.

All samples were analyzed for select metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, zinc) and hexavalent chromium. The samples were collected by Tetra Tech NUS on March 18, 2005 and analyzed by GPL Laboratories, LLLP. Metals analyses except mercury were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7471A. Hexavalent chromium analyses were conducted using SW-846 method 7196A.

Summary

All analytes were successfully analyzed. The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, calibration data, laboratory method/preparation blanks, matrix spike results, post digestion spike (PDS) results, laboratory duplicate results, laboratory control sample (LCS) results, ICP serial dilution results, detection limits and analyte quantitation.

Metals analyses except mercury were conducted using Inductively Couple Plasma (ICP) methodology. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) methodology.

Areas of concern with respect to data quality are listed below.

Minor Problems

- The CRDL standard run on 3/28/05 at 17:41 had a percent recovery (%R) >110% for arsenic. Positive results reported for arsenic <2X the CRDL were qualified as biased high (K).

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Antimony[(1)]	0.58 mg/kg	2.9 mg/kg
Beryllium	0.2 ug/L	0.1 mg/kg
Cadmium	0.5 ug/L	0.25 mg/kg
Chromium	0.9 ug/L	0.45 mg/kg
Nickel	0.7 ug/L	0.35 mg/kg
Thallium	7.1 ug/L	3.55 mg/kg

[(1)] Maximum concentration present in sediment preparation blank.

An action level of 5X the maximum concentration was used to evaluate the sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results below the action level for antimony and thallium were qualified (B) as a result of blank contamination. The remaining analytes were not qualified for blank contamination because the results were either above the action level or they were nondetects.

- The matrix spike (MS) had a %R >125% for cadmium. Positive results reported for cadmium were qualified as biased high (K).

- The ICP serial dilution had a percent difference (%D) >10% and initial sample concentration >50X the instrument detection limit (IDL) for beryllium. Positive results reported for beryllium were qualified as estimated (J).

Notes

The original data package submittal from the laboratory was missing calibration data, preparation data, the instrument run log, and raw data. The data reviewer contacted the laboratory and the missing data were submitted.

The CRDL standard run on 3/28/05 at 17:41 had %Rs >110% for antimony and lead and <90% for beryllium. No qualification action was required for antimony, beryllium, or lead because the results were either previously qualified for laboratory blank contamination or the concentrations were >2X the CRDL.

The MS had a %R <75% for antimony. No qualification action was required because all results were previously qualified for laboratory blank contamination.

Executive Summary

Laboratory Performance: Arsenic was qualified due to calibration noncompliance. Several analytes were present in the laboratory method/preparation blanks.

Other Factors Affecting Data Quality: Cadmium was qualified due to matrix spike noncompliance. Beryllium was qualified due to ICP serial dilution noncompliance.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Validation", April 1993 as amended for use within USEPA Region III.

The text of this report has been formulated to address only those problem areas affecting data quality.

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

U	-	Value is a nondetect as reported by the laboratory.
B	-	Positive result is considered to be an artifact of blank contamination and should not be considered present.
J	-	Positive result is considered estimated as a result of technical noncompliance.
K	-	Positive result is considered biased high as a result of technical noncompliance.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Analytical Report For 503094

for

Tetra Tech NUS

Project Manager: Michael Martin

Project Name: Middle River

GPL

Laboratories

GPL Laboratories, LLLP certifies that the test results meet all requirements of the NELAC Standards unless otherwise noted

Reviewed By,
Project Manager

Approved By,
Laboratory Director

The Case Narrative, Chain of Custody, Sample Receipt Checklist, and the cover page of the Sample Analysis Report, are integral parts of GPL Laboratories' report package. If you did not receive all of these documents, please contact GPL immediately.

Sample Receipt

Nine soil and one water samples were received on 03/18/2005. The samples were delivered by GPL courier. Sample receipt conditions and temperatures are documented on the Sample Receipt checklist.

Sample Analysis

Samples were prepared and analyzed by GPL using the analytical methodologies indicated on the Sample Analysis Summary Report. In some chromatographic analyses, manual integration is used instead of automated integration because it produces more accurate results. All manual integrations are denoted on the sample quantitation report. Analysis results and limits for soil are reported on a dry weight basis unless otherwise specified on the report.

Volatiles

One water and nine soil samples were analyzed for volatile organic compounds using SW846 method 8260B. Analyses of the samples were performed within holding time.

All surrogate recoveries were within QC limits.

Matrix spike and matrix spike duplicate analyses were performed on sample SD-5-031805. Several recoveries were below QC limits.

Two laboratory control spikes (LCS) were analyzed along with the sample batch. All recoveries were within QC limits.

Manual integration was performed on some peaks that were improperly integrated by the software. The manually integrated compounds are designated by an "m" next to the area of the quantitation report, and chromatograms for these compounds were submitted.

Semivolatiles

Nine soil samples were extracted using method 3550B. The samples were analyzed for semi-volatile organic compounds using method 8270C.

All surrogate recoveries were within QC limits.

Matrix spike and duplicate analysis was performed on sample SD-6-031805. All matrix spike recoveries were within QC limits. A laboratory control sample was also extracted and analyzed with this batch. All spike recoveries were within QC limits.

The continuing calibration analyzed on 3/30/05 showed a %D for n-nitrosodiphenylamine at -22.3, Pentachlorophenol at -22.5, and Di-n-octylphthalate at -44.0. No reanalysis was necessary as the responses for these compounds were above that of the initial calibration and since none were detected in any of the samples analyzed that day.

Extraction and analysis holding times were met.

PCBs

Nine soil samples were extracted and analyzed for PCB compounds using method 8082A.

Matrix spike and matrix spike duplicate analyses for soil were performed on sample SD-6-031805. PCB -1016 on both and PCB-1260 on MS were outside QC limits due to matrix effect. RPD for both was outside QC limits.

A laboratory control sample was extracted and analyzed along with the soil samples. Recoveries were within control limits.

Samples SD-10-031805, SD-11-031805, SD-12-031805 and SD-9-031805 were diluted at different levels to meet QC limits.

DCB surrogates recoveries for diluted samples was outside QC limits.

All other analyses met QC criteria.

Metals

Nine soil samples were analyzed for PP metals by EPA SW846 methods.

A matrix spike and duplicate were performed on sample SD-6-031805 for all required analytes. A serial dilution was also performed for ICP analytes. The matrix spike was outside of the control limits for antimony and cadmium. A post digestion analytical spike was performed with a recovery 91.0% for cadmium. The duplicate was outside of the control limits for mercury. The serial dilution was outside of the control limit for beryllium.

Calibration standards are verified against independent check standards purchased from a commercial vendor of environmental standards.

All GPL QA/QC criteria were met with the exceptions of those mentioned above.

General Chemistry

Nine soil samples were digested by SW846 method 3060A and were analyzed for Hexavalent Chromium by method 7196A.

Duplicate and matrix spike analyses were performed on sample SD-6-031805.

A laboratory control sample was digested and analyzed along with the batch.

All QC criteria were met.

Overview

This sample set for the Lockheed Middle River Facility consists of 5 surface water and 12 sediment samples. The samples were analyzed for alkyltins (i.e., monobutyltin, dibutyltin, tributyltin, and tetrabutyltin). No field duplicates were included in this data set.

The samples were collected by Tetra Tech NUS, Inc. on October 20 and 21, 2005 and analyzed by Severn Trent Laboratories, Burlington VT. The samples were analyzed by gas chromatography methodology using compound derivatives and an internal standard and peak areas for calibration and quantitation.

Summary

The findings in this report are based upon a general review of all available data including: data completeness, system performance, holding times, initial / continuing calibrations, laboratory method blank contamination, surrogate spikes, MS/MSD results, LCS results, compound identification, compound quantitation, and detection limits. Areas of concern are listed below; documentation supporting these findings is presented in Appendix C. Qualified analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B.

Major Problems

MS/MSD recoveries for monobutyltin were 0 percent. Therefore, the nondetected result for this analyte is qualified as rejected, "UR", in the spiked sample only (SD-40-02).

Minor Problems

The percent solids for sediment samples SD-22-SS, SD-28-SS, SD-37-SS, and SD-40-SS were less than 30%, resulting in elevated detection limits for these samples. Positive and nondetected results reported for all target analytes in these samples were qualified as estimated (J) and (UJ), respectively, due to low percent solids content. The direction of bias cannot be determined.

Notes

As indicated in the laboratory narrative, no formal chain of custody was included with the samples. The samples were received at the laboratory 27 to 28 days after sample collection and extracted 1 to 2 days later (28 to 30 days after collection). EPA guidance states that samples should be extracted within 7 days of collection for analytes such as SVOCs and pesticides/PCBS. However, since holding time requirements have not been established for alkyltins, no data validation actions were performed on the basis of holding times.

The aqueous LCS recovery for monobutyltin (analyzed on 11/22/2005 at 11:11) was very low (16%). No data validation actions were performed on the basis of the LCS recovery because this recovery was within the QC limits determined by the laboratory (10 – 45 %) and because an acceptable LCS recovery range has not been determined for alkyltins by the EPA. Note also that monobutyltin is considered to be a "poor performer", as discussed in the laboratory narrative.

Executive Summary

Laboratory Performance: None.

Other Factors Affecting Data Quality: Matrix spike/matrix spike duplicates sample recoveries for monobutyltin were outside of quality control limits. Possible holding time exceedances.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Organic Data Validation" (9/94) as amended for use within USEPA Region III. The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the validation criteria as specified in the Region III Data Validation Guidance."

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation.

Data Qualifier Key:

J - Positive result is considered estimated, "J", as a result of technical noncompliance.

U - Value is a nondetect as reported by the laboratory.

UJ - Quantitation limit is considered estimated, "UJ", as a result of technical noncompliance.

UR - Nondetected result is considered rejected, "UR", as a result of severe technical noncompliance.

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A	=	Lab Blank Contamination
B	=	Field Blank Contamination
C	=	Calibration (i.e., % RSDs, %Ds, ICVs, CCVs, RPDs, RRFs, etc.) Noncompliance
D	=	MS/MSD Noncompliance
E	=	LCS/LCSD Noncompliance
F	=	Lab Duplicate Imprecision
G	=	Field Duplicate Imprecision
H	=	Holding Time Exceedance
I	=	ICP Serial Dilution Noncompliance
J	=	GFAA PDS - GFAA MSA's r < 0.995
K	=	ICP Interference - include ICSAB % R's
L	=	Instrument Calibration Range Exceedance
M	=	Sample Preservation
N	=	Internal Standard Noncompliance
N01	=	Internal Standard Noncompliance Dioxins
N02	=	Recovery Standard Noncompliance Dioxins
N03	=	Clean-up Standard Noncompliance Dioxins
O	=	Poor Instrument Performance (i.e., base-time drifting)
P	=	Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q	=	Other problems (can encompass a number of issues)
R	=	Surrogates Recovery Noncompliance
S	=	Pesticide/PCB Resolution
T	=	% Breakdown Noncompliance for DDT and Endrin
U	=	Pest/PCD% between columns for positive results
V	=	Non-linear calibrations, tuning r < 0.995 (correlation coefficient)
W	=	EMPC result
X	=	Signal to noise response drop
Y	=	Percent solids <30%
Z	=	Uncertainty at 2 sigma deviation is less than sample activity

Re: Laboratory Project No. 25000
Case: 25000; SDG: 111177

Dear Ms. Thomson:

Enclosed are the analytical results for samples received by STL Burlington on November 17, 2005. This report is sequentially numbered starting with page 0001 and ending with page 0270. Laboratory identification numbers were assigned, and designated as follows:

Lab ID	Client Sample ID	Sample Date	Sample Matrix
	Received: 11/17/05 ETR No: 111177		
648311	SD-22-SS	10/21/05	Soil
648312	SD-28-SS	10/21/05	Soil
648313	SD-28-01	10/21/05	Soil
648314	SD-28-02	10/21/05	Soil
648315	SD-31-SS	10/21/05	Soil
648316	SD-31-01	10/21/05	Soil
648317	SD-31-02	10/21/05	Soil
648318	SD-29-SS	10/21/05	Soil
648319	SD-37-SS	10/21/05	Soil
648320	SD-40-SS	10/21/05	Soil
648321	SD-40-01	10/21/05	Soil
648322	SD-40-02	10/21/05	Soil
648323	SW-11	10/20/05	Water
648324	SW-13	10/20/05	Water
648325	SW-14	10/20/05	Water
648326	SW-15	10/20/05	Water
648327	SW-17	10/20/05	Water

Documentation of the condition of the samples at the time of their receipt and any exception to the laboratory's Sample Acceptance Policy is documented in the Sample Handling section of this submittal. It should be noted that the samples were received outside of the prescribed holding time for the analyses requested, and there was no formal chain of custody included with the shipment of the samples.

The samples were analyzed for alkyltins using an internal standard form of analysis, with tetra-n-propyltin as the internal standard. Peak area was used as the measure of instrument response in performing calibration and quantification. The analytical report forms list the alkyltin analytes as

unsubstituted alkyltin compounds, and these are correctly stated. The analysis of three of the compounds employed the use of alkyltin chlorides. These are tributyltin chloride, dibutyltin dichloride, and monobutyltin trichloride. The derived results for these compounds were converted to reflect the concentration of the unsubstituted form. The following conversion factors were used:

Analyte	Factor	Converts to
tetrabutyltin	1.0	tetrabutyltin
tributyltin chloride	0.89	tributyltin
dibutyltin dichloride	0.77	dibutyltin
monobutyltin trichloride	0.62	monobutyltin
tripentyltin chloride (SS)	0.90	tripentyltin
tetrapropyltin (IS)	1.0	tetrapropyltin

Each of the analyses for alkyltins exhibited good surrogate recovery. The recovery of monobutyltin in the analysis of the matrix spike and matrix spike duplicate was zero percent. Laboratory control samples were prepared and analyzed in association with the samples. There were acceptable recoveries of the spiked analytes in each of the analyses. The recovery of monobutyltin in the laboratory control sample A111905LCS, which was associated with the water samples, was sixteen percent. In general, monobutyltin is not recovered well in this method of analysis, and the low recovery efficiency of monobutyltin is consistent with the laboratory's experience in performing this work. The monobutyltin was better recovered in the solid laboratory control sample approximating seventy percent. The method blank associated with this analytical work was free of contamination.

The analytical results associated with the samples presented in this test report were generated under a quality system that adheres to requirements specified in the NELAC standard. Release of the data in this test report and any associated electronic deliverables is authorized by the Laboratory Director's designee as verified by the following signature.

If there are any questions regarding this submittal, please contact me at 802 655-1203.

Sincerely,

Richard H. Karam
Project Manager

CALCULATION WORKSHEET

CLIENT: LOCKHEED MIDDLE RIVER	**SDG No.** 111177
SUBJECT: EXAMPLE CALCULATION - DIBUTYLTIN IN SOIL/SEDIMENT	
BY: T. JACKMAN	**DATE:** 01/09/06

Sample ID = SD-31-02
Concentration = 5.5 ug/kg

EQUATION:

$$C_w = \frac{A_x \times Is \times V_t \times Df}{A_{is} \times RRF \times V_i \times W_s \times D}$$

Where:

C_s	=	analyte concentration in soil		ug/l
A_x	=	analyte response	= 20630	
Is	=	amount of internal standard	= 0.75	ng
V_t	=	volume of final extract	= 1	mL
Df	=	dilution factor	= 1	
A_{is}	=	response of internal standard	= 159357	
RRF	=	response factor of analyte	= 1.26	
V_i	=	volume injected	= 1.5	uL
Ws	=	sample weight	= 0.03	kg
D	=	percent solids	= 0.31	

Therefore: 1,4-dioxane concentration in water =

$$\frac{20630 \times 0.75ng \times 1mL \times 1}{159357 \times 1.255 \times 1.5uL \times 0.03kg \times 0.31}$$

C_s = 5.55 ug/kg

Target Compounds

Peak RT	Expected RT	Target Compound
3.715	3.697	Tetra-n-propyl tin
	5.934	Tetrabutyltin
	6.978	Tributyltin
7.922	7.902	Dibutyltin
8.299	8.275	Tripentyltin
	8.731	Monobutyltin

CALCULATION WORKSHEET

CLIENT: LOCKHEED MIDDLE RIVER	**SDG No.** MID-15
SUBJECT: EXAMPLE CALCULATION - DIBUTYLTIN (AQUEOUS)	
BY: T. JACKMAN	**DATE:** 01/12/06

Sample ID = A111905LCS
Concentration = 0.38 ug/L

EQUATION:

$$C_w = \frac{A_x \times Is \times V_t \times Df}{A_{is} \times RRF \times V_o \times V_i}$$

Where:

C_w	=	analyte concentration in water		ug/l
A_x	=	analyte response	=	133634
Is	=	amount of internal standard	=	0.75 ng
V_t	=	volume of final extract	=	1 mL
Df	=	dilution factor	=	1
A_{is}	=	response of internal standard	=	141144
RRF	=	response factor of analyte	=	1.26
V_o	=	sample volume	=	1 L
V_i	=	volume injected	=	1.5 uL

Therefore: dibutylin concentration in water =

$$\frac{133634 \times 0.75ng \times 1mL \times 1}{141144 \times 1.255 \times 1L \times 1.5uL}$$

C_w = 0.3772 ng/ul

C_w = **0.38** **ug/L**

SD-23-SS		

Overview

The sample set for Lockheed Middle River, SDG MID-5, consists of nineteen (19) sediment environmental samples.

All samples were analyzed for antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, zinc and hexavalent chromium. In addition, samples SD-17-SS, SD-19-01, SD-19-02, SD-19-SS and SD-23-SS were also analyzed for total organic carbon (TOC). The samples were collected on October 20 and 21, 2005 and analyzed by Katahdin Analytical Services. Metals analyses, with the exception of mercury, were conducted using SW-846 method 6010B. Mercury analyses were conducted using SW-846 method 7471A. Analyses for hexavalent chromium were conducted using SW-846 method 7196A. TOC analyses were conducted using the Lloyd Kahn method.

Summary

All analytes were successfully analyzed. The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, calibration data, laboratory method/preparation blanks, interference check sample (ICS) results, matrix spike (MS) results, laboratory duplicate results, laboratory control sample (LCS) results, detection limits and analyte quantitation.

All metals analyses, with the exception of mercury, were conducted using Inductively Coupled Plasma (ICP) instrumentation. Mercury analyses were conducted using Cold Vapor Atomic Absorption (CVAA) instrumentation.

Areas of concern with respect to data quality are listed below.

Minor Problems

- The Contract Required Detection Limit (CRDL) percent recoveries for copper, selenium and silver on 11/2/05 were < 90% quality control limit, affecting all samples. The positive results, less than two times the CRDL, reported for selenium and silver were qualified as biased low, "L", or estimated, "J", due to conflicting noncompliances. The nondetected results reported for selenium were qualified as biased low, "UL", or estimated, "UJ", due to conflicting noncompliances. No validation action was necessary for copper because all results were greater than two times the CRDL.

- The matrix spike (MS) percent recovery for mercury was < 75% quality control limit. Positive results reported for mercury were qualified as biased low, "L", or estimated, "J", due to conflicting noncompliances.

- The MS percent recovery for hexavalent chromium was < 75% quality control limit. Nondetected results reported for hexavalent chromium were qualified as biased low, "UL", or estimated, "UJ", due to conflicting noncompliances. Positive results reported for hexavalent chromium were qualified as estimated, "J", due to conflicting noncompliances.

- Positive and nondetected results reported for all analytes in samples SD-13-SS, SD-15-SS, SD-16-SS, SD-17-SS, SD-18-SS, SD-19-SS, SD-20-SS, SD-21-SS, SD-22-SS and SD-23-SS were qualified as estimated, "J" and "UJ", respectively, due to low (< 30%) percent solids.

- The positive result reported for hexavalent chromium in sample SD-14-SS was qualified as estimated, "J", due to uncertainty near the detection limit.

Notes

The following contaminant was detected in the laboratory preparation blank at the following maximum concentration:

Analyte	Maximum Concentration	Action Level
Zinc[1]	0.49 mg/kg	2.45 mg/kg

[1] Maximum concentration present in a laboratory preparation blank.

An action level of five times the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot, percent solids and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. No validation action was necessary because all results were greater than the action level.

The laboratory preformed MS analyses for mercury and hexavalent chromium. The laboratory did not perform MS, laboratory duplicate or ICP serial dilution analyses for any other metals on any of the samples within this SDG.

The Practical Quantitation Limit (PQL) percent recoveries for antimony, lead, molybdenum, silver and thallium on 11/2/05 were < 90% quality control limit. No validation action was taken based on the PQL percent recoveries.

The PQL percent recovery for mercury on 10/28/05 was > 120% quality control limit. No validation action was taken based on the PQL percent recoveries.

Mercury was analyzed at a 2X dilution in sample SD-16-02.

Executive Summary

Laboratory Performance: Selenium and silver were qualified due to calibration noncompliance. Zinc was present in the laboratory preparation blank.

Other Factors Affecting Data Quality: Hexavalent chromium and mercury were qualified due to MS noncompliance. Hexavalent chromium was qualified due to uncertainty near the detection limit in sample SD-14-SS. Several analytes were qualified due to low percent solids in several samples.

The data for these analyses were reviewed with reference to the "National Functional Guidelines for Inorganic Data Validation", April 1993 as amended for use within USEPA Region III.

The text of this report has been formulated to address only those problem areas affecting data quality.

Quality Assurance Officer

Attachments:

1. Appendix A - Qualified Analytical Results
2. Appendix B - Results as reported by the Laboratory
3. Appendix C - Support Documentation

Data Qualifier Key:

J - Positive result is considered estimated, "J", as a result of technical noncompliances.

L - Positive result is considered biased low, "L", as a result of technical noncompliances.

U - Value is a nondetect as reported by the laboratory.

UJ - Nondetected result is considered estimated, "UJ", as a result of technical noncompliances.

UL - Nondetected result is considered biased low, "UL", as a result of technical noncompliances.

APPENDIX A
QUALIFIED ANALYTICAL RESULTS

Data Validation Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (e.g. base-line drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is greater than sample activity

Data Qualifier Key:

J - Positive result is considered estimated, "J", as a result of technical noncompliances.

L - Positive result is considered biased low, "L", as a result of technical noncompliances.

U - Value is a nondetect as reported by the laboratory.

UJ - Nondetected result is considered estimated, "UJ", as a result of technical noncompliances.

UL - Nondetected result is considered biased low, "UL", as a result of technical noncompliances.

Sample Receipt

The following samples were received on October 21 and 22, 2005 and were logged in under Katahdin Analytical Services work order numbers WV5583 and WV5604 for a hardcopy due date of October 28, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5583-1	SD-13-SS
WV5583-2	SD-13-01
WV5583-3	SD-13-02
WV5583-4	SD-14-SS
WV5583-5	SD-14-01
WV5583-6	SD-14-02
WV5583-7	SD-16-SS
WV5583-8	SD-16-01
WV5583-9	SD-16-02
WV5583-10	TB102005A
WV5604-1	SD-15-SS
WV5604-2	SD-17-SS
WV5604-3	SD-18-SS
WV5604-4	SD-19-SS
WV5604-5	SD-19-01
WV5604-6	SD-19-02
WV5604-7	SD-20-SS
WV5604-8	SD-21-SS
WV5604-9	SD-22-SS
WV5604-10	SD-23-SS

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

the method acceptance criteria of 0.990. These compounds were calibrated using the average model.

The initial calibration standard (file X9008) had a response for the internal standards perylene-d12, which was low and outside the method acceptance limits of -50% to +100% of the responses of the internal standard of the mid-point level calibration standard from the initial calibration performed on 10/29/05.

The calibration verification standard (CV) (file X9053) had a high response for the calibration check compound (CCC) di-n-octylphthalate which resulted in a %D that was outside the method acceptance limit of 20%. The internal standard perylene-D12 had a response that was low and outside of the method acceptance limit of -50 to 100% of the response of the mid level standard from the initial calibration.

Samples WV5583-1, 3, 3DL, 4, 7, 8 and WV5604-5, 7 and 8 had high or low recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. Samples WV5583-1, 2, 2DL, 3, 3DL, 8 and 9RA and WV5604-1 through 10 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The laboratory method blanks WG21993-1 and WG22096-1 and the LCSD WG21993-3 had low recoveries for one surrogate. The client was contacted and notified the laboratory to accept the data as long as the surrogate recoveries were greater than 15%, and the internal standard responses were at least 15% of the internal standard of the daily calibration verification standard. Since the surrogate recoveries and internal standard responses met these criteria, these samples were not reextracted. Sample WV5583-8 was reanalyzed at a dilution of 1:2, per client request in order to confirm internal standard response deviations.

Sample WV5583-9 was initially analyzed outside of the 12-hour analytical shift. The sample was reanalyzed and is labeled with the suffix "RA".

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG MID-5 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectrometric Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5583-(1-9) and WV5604-(1-10) were digested for ICP analysis on 10/26/05 (QC Batch VJ26ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this batch.

ICP analyses of SDG MID-5 sample digestates were performed using a Thermo Jarrell Ash Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WV5583-(1-9) were digested for mercury analysis on 10/24/05 (QC Batch VJ24HGS0) in accordance with USEPA Method 7471A. Duplicate laboratory control samples were prepared in this batch.

Solid-matrix Katahdin Sample Nos. WV5604-(1-10) were digested for mercury analysis on 10/27/05 (QC Batch VJ27HGS0) in accordance with USEPA Method 7471A. Katahdin Sample No. WV5604-10 was prepared with duplicate matrix-spiked aliquots. Duplicate laboratory control samples were prepared in this batch.

Mercury analyses of Katahdin SDG MID-5 sample digestates were performed using a Cetac M6100 automated mercury analyzer in accordance with USEPA Method 7471A. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

One of the matrix spiked aliquots of Katahdin Sample No. WV5604-10 is outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for mercury.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5604-10 is within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for mercury.

Wet Chemistry Analysis

The samples of SDG MID-5 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses for Total organic Carbon (TOC) were performed according to "Determination of Total Organic Carbon in Sediment", Lloyd Kahn, USEPA Region II, 7/88.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding time. All quality control criteria were met, with the following exceptions:

The recovery of hexavalent chromium from the matrix spike (33%) aliquot of Katahdin Sample No. WV5583-9 is outside the laboratory's acceptance limits of 75% - 125%. Low matrix spike recoveries for hexavalent chromium may indicate the presence of reducing conditions in the sample.

No other deviations were noted by the Wet Chemistry group.

SD-23-SS		

Overview

The sample set for Lockheed Middle River, SDG MID-5 consists of nineteen (19) environmental sediment samples and one (1) trip blank. All sediment samples were analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC) and polychlorinated biphenyls (PCB). The trip blank was analyzed for VOC only.

The samples were collected by Tetra Tech NUS on October 13, 20, and 21, 2005 and analyzed by Katahdin Analytical Services. All analyses were conducted in accordance with Quality Assurance/Quality Control (QA/QC) criteria using SW-846 8260B, 8270C, and 8082 analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, internal standard recoveries, and detection limits. Areas of concern are listed below.

Major

- The VOC initial calibration performed on October 25, 2005 on the GCMS-Z instrument and all associated continuing calibrations were below the 0.05 RRF quality control criterion for tert-butyl alcohol, acetone, and 2-butanone. Positive and non-detected results for the aforementioned compounds not qualified for blank contamination were qualified as estimated (J) and rejected (UR) respectively, in all samples except SD-20-SS, SD-21-SS, SD-22-SS, and SD-23-SS.

- The VOC continuing calibration performed on October 20, 2005 on the GCMS-S instrument was below the 0.05 RRF quality control criterion for acetone and 2-butanone. Non-detected results for acetone and 2-butanone were rejected (UR) in the trip blank (TB102005A).

- The VOC continuing calibration performed on October 28 at 13:13 on the GCMS-S instrument was below the 0.05 RRF quality control criterion for acetone, tert-butyl alchohol, 2-chloroethylvinyl ether, and 2-butanone. Non-detected results for the aforementioned compounds were rejected (UR) in the trip blank (TB102005A).

- The VOC continuing calibration performed on October 26 at 15:59 on the GCMS-M instrument was below the 0.05 RRF quality control criterion for tert-butyl alcohol, 2-butanone, and acetone. Positive and non-detected results for the aforementioned compounds not qualified for blank contamination were qualified as estimated (J) and rejected (UR) respectively, in samples SD-20-SS, SD-21-SS, SD-22-SS, and SD-23-SS.

Minor

- The following compounds were detected in the solid method blanks:

Compound	Maximum Concentration	Blank Action Level
Acetone	6 µg/kg	60 µg/kg
Methylene chloride	5 µg/kg	50 µg/kg
Styrene	0.4 µg/kg	2.0 µg/kg
Trichloroethene	3 µg/kg	15 µg/kg
1,2,4-Trichlorobenzene	3.0 µg/kg	15 µg/kg

Sample aliquot and dilution factors were taken into consideration when applying the blank action levels. Positive results for the aforementioned compounds below the action level were qualified as non-detected (B). The trip blanks were not qualified for method blank contamination.

- The VOC surrogate p-bromofluorobenzene exceeded the percent recovery quality control criterion in sample SD-13-01. In addition, the internal standard 1,4-dichlorobenzene-d4 was below the percent recovery quality control criterion and was <25% recovery. The sample was re-analyzed with the surrogates dibromofluoromethane, 1,2-dichloroethane-d4, and toluene-d8 below the recovery criteria and all internal standards compliant. Furthermore, the sample was analyzed as a medium-level soil with all surrogates and internal standards compliant. However, the target compound detected in the low-level analyses was not detected in the medium-level analysis. The re-analysis at low-level was used for validation. Positive and non-detected results not previously rejected or qualified for blank contamination were qualified as biased low (L) and (UL) respectively, in sample SD-13-01.

- The VOC surrogates toluene-d8 and p-bromofluorobenzene exceeded the percent recovery quality control criteria in sample SD-13-02. The sample was re-analyzed with the surrogates dibromofluoromethane, 1,2-dichloroethane-d4, and toluene-d8 below the recovery criteria. In addition, the sample was analyzed as a medium-level soil. However, the target compounds detected in the low-level analyses was not detected in the medium-level analysis. The initial analysis was used for validation. Positive results were qualified as biased high (K) in sample SD-13-02.

- All VOC surrogates were below the percent recovery quality control criterion in sample SD-14-02. The sample was re-analyzed with similar results. The initial analysis was used for validation. Non-detected results not previously rejected or qualified for blank contamination were qualified as biased low (UL) in sample SD-14-02.

- The VOC surrogate dibromofluorobenzene was below the percent recovery quality control criterion in sample SD-18-SS. The sample was re-analyzed with similar results. The re-analysis was used for validation because the initial analysis was performed outside the 12-hour analytical shift. Positive and non-detected results not previously rejected or qualified for blank contamination were qualified as estimated (J) and (UJ) in sample SD-18-SS.

- The VOC internal standard 1,4-dichlorobenzene-d4 was below the percent recovery quality control criterion in sample SD-13-SS. The sample was re-analyzed with similar results. The initial analysis was used for validation. Positive and non-detected results for isopropylbenzene, bromobenzene, n-propylbenzene, 1,1,2,2-tetrachloroethane, 2-chlorotoluene, 1,2,3-trichloropropane, 4-chlorotoluene, tert-butylbenzene, 1,2,4-trimethylbenzene, 4-isopropyltoluene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, n-butylbenzene, sec-butylbenzene, 1,2-dichlorobenzene, 1,2-dibromo-3-chloropropane, hexachlorobutadiene, 1,2,4-trichlorobenzene, 1,2,3-trimethylbenzene, naphthalene, and 1,2,3-trichlorobenzene were qualified as estimated (UJ) in sample SD-13-SS.

- The SVOC continuing calibration performed on October 28 at 13:26 on the GCMS-X instrument exceeded the 25% (and was >50%) difference quality control criterion for benzyl alcohol. Non-detected results for benzyl alcohol were qualified as estimated (UJ) in samples SD-13-SS, SD-13-01, SD-13-02, SD-14-SS, SD-14-01, SD-14-02, SD-16-SS, and SD-16-01.

- The SVOC internal standards phenanthrene-d10, chrysene-d12, and perylene-d12 were below the percent recovery quality control criterion in samples SD-13-01, SD-13-02, and SD-16-01. The samples were re-analyzed at 2X, 3X, and 2X dilutions respectively. The internal standards chrysene-d12 and perylene-d12 were below the percent recovery quality control criterion in the diluted analyses of SD-13-01 and SD-13-02. All internal standards were compliant in the diluted analysis of sample SD-16-01. The original analyses were used for validation with the exception of pyrene in SD-13-01 and SD-13-02 because the results exceeded the linear calibration range of the instrument in the un-diluted analyses. Positive and non-detected results for 4,6-dinitro-2-methylphenol, N-nitrosodiphenylamine, 4-bromophenylphenyl ether, hexachlorobenzene, pentachlorophenol, phenanthrene, anthracene, carbazole, di-n-butylphthalate, fluoranthene, benzidine, pyrene, butylbenzylphthalate, benzo(a)anthracene, 3,3'-dichlorobenzidine, chrysene, bis(2-ethylhexyl)phthalate, di-n-octylphthalate, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene were qualified as estimated (J) and (UJ) respectively, in the aforementioned samples.

- The SVOC internal standards chrysene-d12 and perylene-d12 were below the percent recovery quality control criterion in samples SD-13-SS, SD-15-SS, SD-16-02, SD-19-02, SD-22-SS, SD-23-SS, SD-17-SS, SD-18-SS, and SD-19-SS. The samples were not re-analyzed. Positive and non-detected results for benzidine, pyrene, butylbenzylphthalate, benzo(a)anthracene, chrysene, 3,3'-dichlorobenzidine, bis(2-ethylhexyl)phthalate, di-n-octylphthalate, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene were qualified as estimated (J) and (UJ) respectively, in the aforementioned samples.

- The SVOC internal standard perylene-d12 was below the percent recovery quality control criterion in samples SD-20-SS, SD-21-SS, and SD-19-01. Positive and non-detected results for di-n-octylphthalate, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene were qualified as estimated (J) and (UJ) respectively, in the aforementioned samples.

- The PCB continuing calibration performed on October 31 at 02:29 exceeded the 15% (but was <30%) difference quality control criterion for Aroclor 1016 and Aroclor 1260 on both columns. No action was taken for Aroclor 1016 on this basis because all results were non-detected. Positive results for Aroclor 1260 were qualified as estimated (J) in samples SD-17-SS, SD-18-SS, SD-19-SS, SD-19-01, SD-19-02, SD-20-SS, SD-21-SS, SD-22-SS, and SD-23-SS.

- Positive and non-detected results were qualified as estimated (J) and (UJ) in samples with percent solids <30%.

- Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

Notes

The VOC initial calibration performed on October 31, 2005 on the GCMS-F instrument and the associated continuing calibration were below the 0.05 RRF quality control criterion for acetone. No action was taken on this basis because no samples associated with this calibration were used for validation.

The VOC continuing calibration performed on November 2 at 22:14 on the GCMS-F instrument was below the 0.05 RRF quality control criterion for tert-butyl alcohol, acetone, and 2-butanone. No action was taken on this basis because no samples associated with this calibration were used for validation.

The VOC continuing calibrations performed on October 25 at 12:44 and October 26 at 06:47 on the GCMS-Z instrument exceeded the 25% (but was <50%) difference quality control criterion for 1,2,3-trichloropropane. No action was taken on this basis because all associated results for 1,2,3-trichloropropane were non-detected.

The VOC continuing calibration performed on October 27 at 06:26 on the GCMS-Z instrument exceeded the 25% (but was <50%) difference quality control criterion for naphthalene and 1,2,3-trichloropropane. No action was taken on this basis because all associated results for naphthalene and 1,2,3-trichloropropane were non-detected.

The VOC continuing calibration performed on October 28 at 13:13 on the GCMS-S instrument exceeded the 25% (but was <50%) difference quality control criterion for naphthalene and 1,2,3-trichlorobenzene. No action was taken on this basis because all associated results for the aforementioned compounds were non-detected.

The VOC continuing calibration performed on October 26 at 15:59 on the GCMS-M instrument exceeded the 25% (but was <50%) difference quality control criterion for ethyl tert-butyl ether, acetone, 2-butanone, tert-butylbenzene, sec-butylbenznene, and tert-butyl alcohol. No action was taken on this basis because the associated results for the aforementioned compounds were non-detected or rejected for RRF non-compliance.

The VOC continuing calibration performed on November 2 at 22:14 exceeded the 25% (but was <50%) difference quality control criterion for tert-butyl alcohol, trichloroethene, 4-methyl-2-pentanone, 1,1,2,2-tetrachloroethane, 1,2,3-trichloropropane, and 1,2-dibromo-3-chloropropane. No action was taken on this basis because all associated results for the aforementioned compounds were non-detected.

Minor blank spike recovery non-compliances were noted in the VOC fraction. No action was taken on this basis because the non-compliances varied in the different LCS samples.

An MS/MSD was not performed with the VOC fraction of this SDG. No action was taken on this basis. This item is noted as a completeness issue.

According to the laboratory narrative, volatile sample SD-14-01 was analyzed three times. The first two analyses used 5 grams of sample and "resulted in non-useable data" and the third analysis used 1 gram of sample. The validator could only verify the third analysis because the first two analyses were not reported. This accounts for the elevated reporting limits for all non-detected compounds in sample SD-14-01. No action was taken on this basis.

The SVOC continuing calibration performed on October 28 at 13:26 on the GCMS-X instrument exceeded the 25% (but was <50%) difference quality control criterion for benzoic acid and benzidine. No action was taken on this basis because all associated results for the aforementioned compounds were non-detected.

The SVOC continuing calibration performed on October 30 at 18:27 on the GCMS-X instrument exceeded the 25% (but was <50%) difference quality control criterion for benzoic acid. No action was taken on this basis because all associated results for benzoic acid were non-detected.

The SVOC continuing calibration performed on November 1 at 15:05 on the GCMS-X instrument was not summarized because no results associated with this calibration were used for validation.

The SVOC surrogate terphenyl-d14 was outside the percent recovery quality control criterion in samples SD-14-SS, SD-16-SS, SD-13-SS, SD-16-01, SD-20-SS, SD-21-SS, SD-19-01, the diluted analysis of sample SD-13-02, both method blanks, and the LCSD (WG21993-LCSD). No action was taken on this basis because only one surrogate was non-compliant.

The SVOC surrogate phenol-d6 exceeded the percent recovery quality control criterion in sample SD-13-02. No action was taken on this basis because only one surrogate was non-compliant.

Several minor LCS percent recovery non-compliances were noted in the SVOC fraction. No action was taken on this basis because the non-compliances varied in the different LCS samples.

The PCB continuing calibration performed on October 28 at 03:59 exceeded the 15% (but was <30%) difference quality control criterion for Aroclor 1016 on both columns and for Aroclor 1260 on the RTX-35 column. No action was taken on this basis because all results for Aroclor 1016 were non-detected and the RTX-5 column was compliant for Aroclor 1260.

The PCB surrogate tetrachloro-m-xylene exceeded the percent recovery quality control criterion on the RTX-5 column in all LCS/LCSD samples and the method blank (WG22175-BLANK). In addition, tetrachloro-m-xylene exceeded the recovery criterion on the RTX-35 column in the LCS (WG1992-LCS). No action was taken on this basis.

The PCB surrogate decachlorobiphenyl exceeded the percent recovery quality control criterion on the RTX-35 column in samples SD-13-01 and SD-13-02. No action was taken on this basis because the three remaining surrogate recoveries were compliant.

The percent recovery of Aroclor 1260 exceeded the quality control criterion in the LCSD (WG22175-LCS). No action was taken on this basis because the LCS was compliant.

Executive Summary

Laboratory Performance: Qualifications were made based on calibration non-compliances, method blank contamination, surrogate recovery non-compliances, and internal standard non-compliances.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Data Validation (9/94). The text of this report has been formulated to address only those problem areas affecting data quality.

SDG NARRATIVE
KATAHDIN ANALYTICAL SERVICES
TETRA TECH NUS
CASE MIDDLE RIVER
SDG: MID-5

Sample Receipt

The following samples were received on October 21 and 22, 2005 and were logged in under Katahdin Analytical Services work order numbers WV5583 and WV5604 for a hardcopy due date of October 28, 2005.

KATAHDIN Sample No.	TTNUS Sample Identification
WV5583-1	SD-13-SS
WV5583-2	SD-13-01
WV5583-3	SD-13-02
WV5583-4	SD-14-SS
WV5583-5	SD-14-01
WV5583-6	SD-14-02
WV5583-7	SD-16-SS
WV5583-8	SD-16-01
WV5583-9	SD-16-02
WV5583-10	TB102005A
WV5604-1	SD-15-SS
WV5604-2	SD-17-SS
WV5604-3	SD-18-SS
WV5604-4	SD-19-SS
WV5604-5	SD-19-01
WV5604-6	SD-19-02
WV5604-7	SD-20-SS
WV5604-8	SD-21-SS
WV5604-9	SD-22-SS
WV5604-10	SD-23-SS

The samples were logged in for the analyses specified on the chain of custody form. All problems encountered and resolved during sample receipt have been documented on the applicable chain of custody forms.

We certify that the test results provided in this report meet all the requirements of the NELAC standards unless otherwise noted in this narrative or in the Report of Analysis.

Sample analyses have been performed by the methods as noted herein.

Should you have any questions or comments concerning this Report of Analysis, please do not hesitate to contact your Katahdin Analytical Services Project Manager, **Andrea J. Colby**. This narrative is an integral part of the Report of Analysis.

Organics Analysis

The samples of SDG MID-5 were analyzed in accordance with "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA, for the specific methods listed below or on the Report of Analysis. Some manual integrations may have been performed due to split peaks and/or corrected baselines. All have been flagged with a "M" (software-generated) on the pertinent quantitation reports.

8260B Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory contaminants acetone and methylene chloride) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

One or more target analytes may have been detected above the MDL in some method blanks. Any of these analytes that were also detected in any of the associated samples were flagged with a "B" qualifier indicating that the analyte was detected in the method blank analyzed and/or extracted concurrently with the sample.

The method blank WG22364-2 had a high recovery for one surrogate, which was outside of the laboratory established acceptance limits. Since a high recovery would indicate a high bias and there were no target analytes detected above the PQL in the sample that are quantitated against the same internal standard that is associated with this surrogate, the method blank was not reanalyzed.

The initial analysis of sample WV5583-1 had a low response for one internal standard, which was outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The sample was reanalyzed and also had a low response for one internal standard, which indicates a matrix effect. The results from both analyses are included in the report.

The initial analysis of sample WV5583-2 had a low response for one internal standard, which was outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The sample also had a low recovery for one surrogate, which was outside of the laboratory established acceptance limits. The sample was reanalyzed and had low recoveries for three surrogates, indicating a matrix effect. Also, the original analysis detected sec-butylbenzene outside of the calibration range. The reanalysis detected this analyte at a much lower concentration. The sample also contained several non target analytes at high concentrations. Per the client request, the sample was reanalyzed as a high concentration soil sample. The results from all three analyses are included in the report.

The initial analysis of sample WV5583-3 had high recoveries for two surrogates, which were outside of the laboratory established acceptance limits. The sample was reanalyzed and had low recoveries for three surrogates, indicating a matrix effect. The sample also contained several non target analytes at high concentrations. Per the client request, the sample was reanalyzed as a high concentration soil sample. The results from all three analyses are included in the report.

The first two analyses of sample WV5583-5 resulted in non-useable data, likely due to the sample matrix, which resulted in incomplete purges. The first two analyses used 5 grams of sample, while the third used only 1 gram of sample. The results from the third analysis are reported.

The initial analysis of sample WV5583-6 had low recoveries for all four surrogates, which were outside of the laboratory established acceptance limits. The sample was reanalyzed and also low recoveries for all four surrogates, which indicates a matrix effect. The results from both analyses are included in the report.

The initial analyses of samples WV5583-7, 8 and WV5604-1 had surrogate failures. The samples were reanalyzed and had acceptable surrogate recoveries. Therefore, only the reanalyses for each sample are reported.

The initial analyses of samples WV5604-2, 4, 5 and 6 were analyzed outside of the 12-hour analytical shift. The samples were reanalyzed and had acceptable QC. Therefore, only the reanalyses for each sample are reported.

The initial analysis of sample WV5604-3 had a low recovery for one surrogate and was analyzed 44 minutes outside of the 12-hour analytical shift. The reanalysis also had a surrogate failure, indicating matrix interference. The results from both analyses are reported.

8082 Analysis

The method blank, WG22175-1, and the laboratory control samples, WG21992-2RA and 3RA and WG22175-2 and 3, had high recoveries for the extraction surrogate TCX on one or both channels, which were outside of the laboratory established acceptance limits. Since the recoveries for DCB were acceptable on both channels, the associated samples were not reextracted.

Samples, WV5583-2RA and 3, had high recoveries for the extraction surrogate DCB on channel B, which were outside of the laboratory established acceptance limits. Since the recoveries for TCX on both channels and DCB on channel A were acceptable, the samples were not reextracted.

The LCSD WG22175-3 had a high recovery for Aroclor 1260, which was outside of the laboratory established acceptance limits. Since the LCS had an acceptable recovery, the associated samples were not reextracted.

The CV standard (file 6VJ8002) had a high response for DCB on channel B, which resulted in a %D that was outside of the method acceptance limits of 15%. Since the response was acceptable on channel A, the associated samples were not reanalyzed.

The CV standards (files 6VJ7034 and 6VJ8034) had high responses for Aroclor 1016 on both channels and Aroclor 1260 on channel B, which resulted in %D's that were outside of the method acceptance limits of 15%. Since a high response would indicate a high bias and Aroclor 1016 was not detected in the associated sample above the PQL and the response for Aroclor 1260 was acceptable on channel A, the associated samples were not reanalyzed.

The closing CV standards (files 6VJ7098 and 6VJ8098) had high responses for Aroclor 1016, Aroclor 1260 and DCB on both channels and TCX on channel A, which resulted in %D's that were outside of the method acceptance limits of 15%. Since the opening CV's had acceptable responses, the associated samples were not reanalyzed.

The Form 7 for the CV's (files 6VJ7034, 6VJ8034, 6VJ7098, and 6VJ8098) are flagged for the surrogates TCX and/or DCB indicating that the %D is greater than the method acceptance limit of 15%. With the exception of TCX on channel A and DCB on both channels for files 6VJ7098 and 6VJ8098, which were high, the %D's are actually within the method acceptance limits and should not be flagged, but due to software limitations the flagging could not be removed.

8270C Analysis

The reported percent recovery acceptance limits for the Laboratory Control Samples (LCSs) are statistically derived for the full list of spiked compounds. The recoveries of the spiked analytes in the LCS, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are compared to these acceptance limits. Katahdin standard operating procedure is not to take corrective action until greater than ten percent of the spiked analytes (with the exception of the common laboratory phthalate ester contaminants) in the LCS are outside of the QC limits. If the associated MS/MSD have greater than ten percent of the spiked analytes outside of the QC limits, no corrective action is taken, as long the LCS is acceptable.

The LCSD WG21993-3 had greater than ten percent of the spiked analytes with recoveries that were high and outside of the laboratory established acceptance limits. The RPD's for the LCS and LCSD were high for several analytes. Since the LCS WG21993-2 had acceptable recoveries, the associated samples were not reextracted.

The initial calibration analyzed on 10/22/05 on the X instrument had %RSD values for several analytes that exceeded the method acceptance limit of 15%. For these analytes, either a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes benzoic acid, 2-chloronaphthalene, 4-nitrophenol, and 2,4-dinitrophenol failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than the method acceptance criteria of 0.990. These compounds were calibrated using the average model. Since none of the associated samples detected any of the aforementioned target analytes above the PQL, the samples were not reanalyzed.

The initial calibration analyzed on 10/29/05 on the X instrument had %RSD values for eight analytes that exceeded the method acceptance limit of 15%. For these analytes, a linear or quadratic model was used for quantitation instead of an average response factor. The target analytes N-nitroso-di-n-propylamine, hexachlorocyclopentadiene, 2-chloronaphthalene, anthracene, benzidine, pyrene, and the surrogate terphenyl-d14 failed for both the linear and quadratic models in the initial calibration curve due to the correlation coefficient being less than

the method acceptance criteria of 0.990. These compounds were calibrated using the average model.

The initial calibration standard (file X9008) had a response for the internal standards perylene-d12, which was low and outside the method acceptance limits of -50% to +100% of the responses of the internal standard of the mid-point level calibration standard from the initial calibration performed on 10/29/05.

The calibration verification standard (CV) (file X9053) had a high response for the calibration check compound (CCC) di-n-octylphthalate which resulted in a %D that was outside the method acceptance limit of 20%. The internal standard perylene-D12 had a response that was low and outside of the method acceptance limit of -50 to 100% of the response of the mid level standard from the initial calibration.

Samples WV5583-1, 3, 3DL, 4, 7, 8 and WV5604-5, 7 and 8 had high or low recoveries for one or more surrogates, which were outside the laboratory established acceptance limits. Samples WV5583-1, 2, 2DL, 3, 3DL, 8 and 9RA and WV5604-1 through 10 had low responses for one or more internal standards, which were outside the laboratory acceptance limit of -50% to 100% of the response of the internal standard of the daily calibration verification standard. The laboratory method blanks WG21993-1 and WG22096-1 and the LCSD WG21993-3 had low recoveries for one surrogate. The client was contacted and notified the laboratory to accept the data as long as the surrogate recoveries were greater than 15%, and the internal standard responses were at least 15% of the internal standard of the daily calibration verification standard. Since the surrogate recoveries and internal standard responses met these criteria, these samples were not reextracted. Sample WV5583-8 was reanalyzed at a dilution of 1:2, per client request in order to confirm internal standard response deviations.

Sample WV5583-9 was initially analyzed outside of the 12-hour analytical shift. The sample was reanalyzed and is labeled with the suffix "RA".

There were no other protocol deviations or observations noted by the organics laboratory staff.

Metals Analysis

The samples of Katahdin SDG MID-5 were prepared and analyzed for metals in accordance with the "Test Methods for Evaluating Aqueous Waste", SW-846, November 1986, Third Edition.

Inductively-Coupled Plasma Atomic Emission Spectrometric Analysis (ICP)

Solid-matrix Katahdin Sample Nos. WV5583-(1-9) and WV5604-(1-10) were digested for ICP analysis on 10/26/05 (QC Batch VJ26ICS0) in accordance with USEPA Method 3050B. Duplicate laboratory control samples were prepared in this batch.

ICP analyses of SDG MID-5 sample digestates were performed using a Thermo Jarrell Ash Trace ICP spectrometer in accordance with USEPA Method 6010B. All samples were analyzed within holding times and all analytical run QC criteria were met.

Analysis of Mercury by Cold Vapor Atomic Absorption (CVAA)

Solid-matrix Katahdin Sample Nos. WV5583-(1-9) were digested for mercury analysis on 10/24/05 (QC Batch VJ24HGS0) in accordance with USEPA Method 7471A. Duplicate laboratory control samples were prepared in this batch.

Solid-matrix Katahdin Sample Nos. WV5604-(1-10) were digested for mercury analysis on 10/27/05 (QC Batch VJ27HGS0) in accordance with USEPA Method 7471A. Katahdin Sample No. WV5604-10 was prepared with duplicate matrix-spiked aliquots. Duplicate laboratory control samples were prepared in this batch.

Mercury analyses of Katahdin SDG MID-5 sample digestates were performed using a Cetac M6100 automated mercury analyzer in accordance with USEPA Method 7471A. All samples were analyzed within holding times and all analytical run QC criteria were met.

Matrix QC Summary

One of the matrix spiked aliquots of Katahdin Sample No. WV5604-10 is outside the laboratory's acceptance criteria (75% - 125% recovery of the added element, if the native concentration is less than four times the amount added) for mercury.

The matrix-spike duplicate analysis of Katahdin Sample No. WV5604-10 is within the laboratory's acceptance limit (<20% relative difference between duplicate matrix-spiked aliquots) for mercury.

Wet Chemistry Analysis

The samples of SDG MID-5 were analyzed in accordance with the specific methods listed on the Report of Analysis.

Analyses for hexavalent chromium were performed according to "Test Methods for Evaluating Solid Wastes: Physical/Chemical Methods." SW-846. 2nd edition, 1982 (revised 1984), 3rd edition, 1986, and Updates I, II, IIA, and III 1996, Office of Solid Waste and Emergency Response, U.S. EPA.

Analyses for Total organic Carbon (TOC) were performed according to "Determination of Total Organic Carbon in Sediment", Lloyd Kahn, USEPA Region II, 7/88.

Analyses for total solids were performed according to "U.S. EPA Contract Laboratory Program Statement of Work for Inorganic Analysis", SOW 7/88.

All Wet Chemistry results were evaluated to Katahdin Analytical Services' Method Detection Limits (MDL). Measured concentrations that fall between the MDL and Katahdin's Practical Quantitation Limit (PQL) are flagged "J". Measured concentrations that are below the MDL are flagged "U" and reported as "U PQL", where "PQL" is the numerical value of the Practical Quantitation Limit.

All analyses were performed within analytical holding time. All quality control criteria were met, with the following exceptions:

The recovery of hexavalent chromium from the matrix spike (33%) aliquot of Katahdin Sample No. WV5583-9 is outside the laboratory's acceptance limits of 75% - 125%. Low matrix spike recoveries for hexavalent chromium may indicate the presence of reducing conditions in the sample.

No other deviations were noted by the Wet Chemistry group.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Operations Manager or the Quality Assurance Officer as verified by the following signature.
