Subject: Transmittal of the UST 2 TCE-Source Remedial Action Summary of MPE System Operation
Lockheed Martin Corporation; Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Carroll:

Please find enclosed two hard copies with a CD of the above-referenced document. This document presents the results of the multi-phase extraction (MPE) system operated in 2014 and 2015 to recover and treat groundwater with high concentrations of trichloroethene (TCE) in the vicinity of underground storage tank (UST) 2 in Block E at the Middle River Complex. Operation of the MPE system was completed in December 2015. We respectfully request to receive Maryland Department of the Environment's comments by June 2, 2016.

Please let me know if you have any questions. My office phone is (301) 548-2227.

Sincerely,

Lynnette Drake
Remediation Analyst, Environmental Remediation

Section 1
Introduction

Tetra Tech, Inc. (Tetra Tech), on behalf of Lockheed Martin Corporation (Lockheed Martin), installed a multi-phase extraction (MPE) system at the Middle River Complex (MRC) in Middle River, Maryland in August 2014, and operated the system in 2014 and 2015. The system was designed to remove trichloroethene (TCE) mass from the subsurface near the former location of underground storage tank (UST) 2 in Block E of the Middle River Complex. The tank, identified during installation of the *in situ* bioremediation system in Block E, contained high concentrations of trichloroethene. The tank was removed, but subsequent investigations in July and October 2013 indicated that the mass and concentration of trichloroethene in soil and groundwater near the tank would not be efficiently addressed by using *in situ* bioremediation only. Therefore, temporary operation of the multi-phase extraction system was recommended and approved by the Maryland Department of the Environment. This document details the operation of the multi-phase extraction system in 2014 and 2015.

Operation of the MPE system is complete and Lockheed Martin Corporation is planning a groundwater sampling event to identify modifications necessary to the remedial program based on the current TCE plume extents, which may have changed since the *Groundwater Response Action Plan* (Tetra Tech, 2012) was approved. During the groundwater sampling event, samples for analysis of volatile organic compounds (VOC) will be collected from 28 injection wells and 13 monitoring wells. In addition, soil samples for analysis of volatile organic compounds are being collected as part of the Block E Soil Remedial Investigation (Tetra Tech, 2016). These data will provide a sound basis for determining details for effective *in situ* bioremediation. The data obtained from this sampling will also be entered into the groundwater model to determine the mass of trichloroethene in the treatment area of Block E using the same procedures used in the *Response Action Plan*. This trichloroethene mass will be the baseline condition for groundwater remediation in Block E. Based on Section 7.1 of the *Response Action Plan,* the goal for the MRC response action will be to reduce trichloroethene mass in the active remediation areas by 70%, which will be the primary mechanism for determining when the remedial action is complete.

1.1 OVERVIEW OF SYSTEM DESIGN

The multi-phase extraction system at Block E was installed in August 2014. A detailed description of the system layout, process equipment, control system, and interlocks is in the *UST 2 TCE-Source Remedial Action Design-Basis Report* (Tetra Tech, Inc. [Tetra Tech], 2014). The layout of the multi-phase extraction system is shown on Figure 1-1, and the process and instrumentation diagram (P&ID) is shown on Figure 1-2. The extraction system and its key components are described below:

- Four multi-phase extraction wells and one soil-vapor extraction (SVE) well were connected to the equipment compound via temporary aboveground lines. The multi-phase extraction wells were designed to recover both liquid and vapor. The soil-vapor extraction well was designed to recover vapor only.

- Submersible pumps were installed in each extraction well to extract groundwater; each pump was controlled using a submersible pressure-transducer and a variable-frequency drive (VFD).

- Effluent from all well pumps was directed to a shallow-tray air-stripper skid that served as a primary treatment unit to remove volatile organic compounds (VOC).

- Liquid-phase granular-activated-carbon (LGAC) vessels (two 500-pound vessels, in series) were used to treat ("polish") the aqueous effluent from the air stripper.

- Treated groundwater accumulated in two frac tanks and was transported via tanker-trailers to the discharge location on the Lockheed Martin Corporation (Lockheed Martin) property as needed (usually weekly). Treated groundwater was discharged to the sewer manhole on the Lockheed Martin property under a Baltimore County sewer-discharge permit.

- A vacuum pump was applied to the extraction wells to enhance trichloroethene-mass removal.

- Vapor effluent from the air stripper and the vacuum pump was treated in two vapor-phase granular-activated carbon (VGAC) vessels (1,500-pounds each) in series.

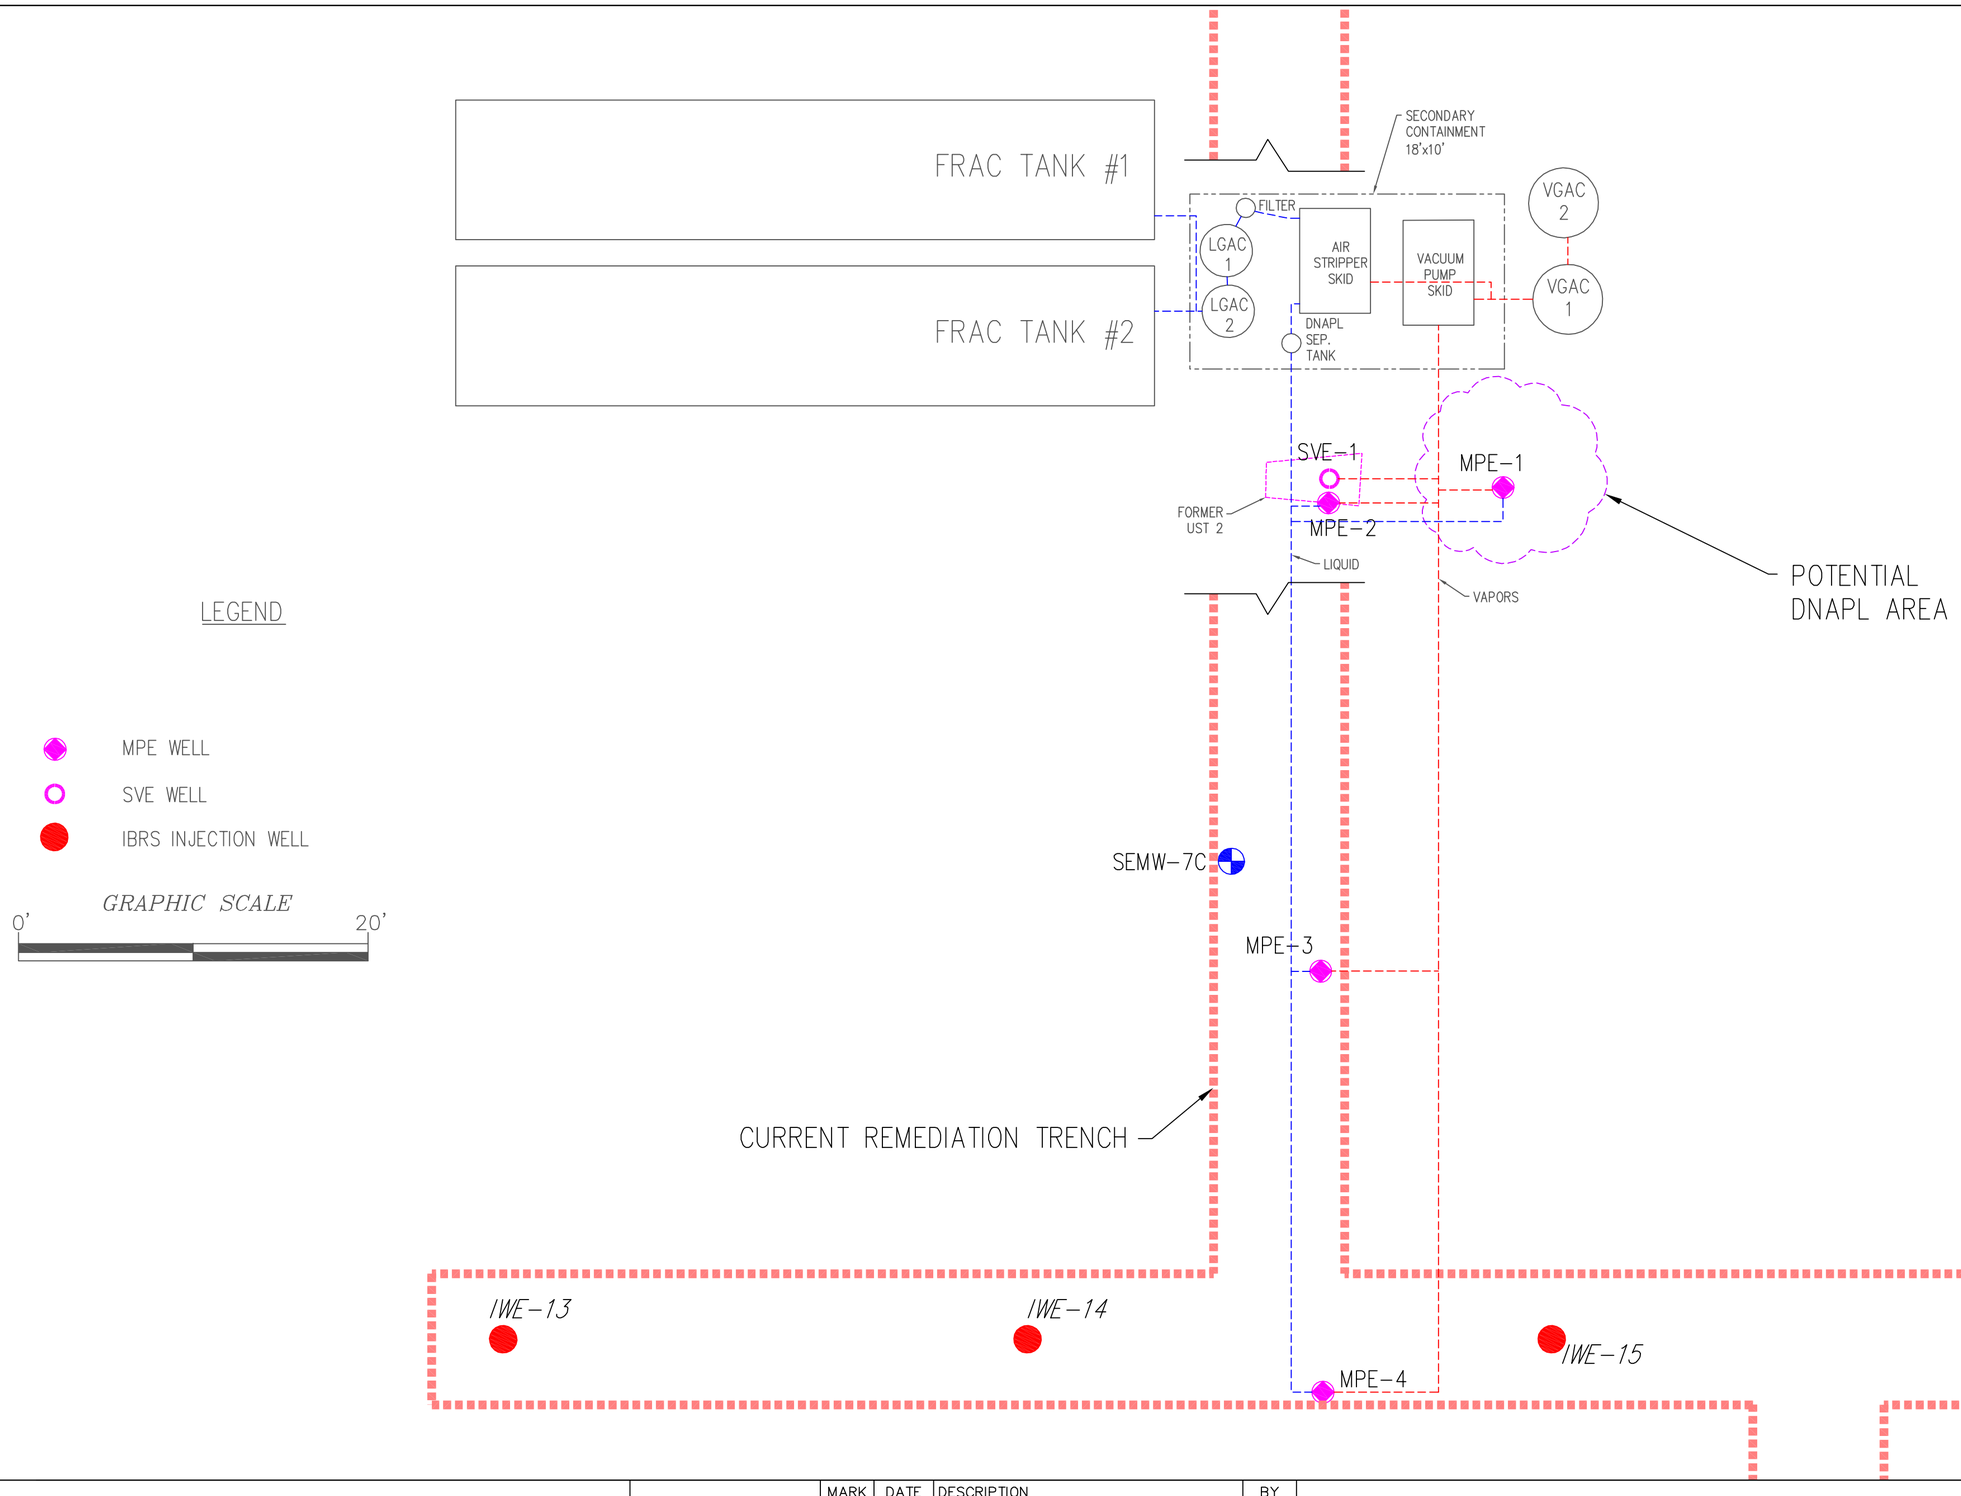
- The equipment for the multi-phase extraction system was mounted within a secondary containment area. The control system allowed unattended automatic operation. A remote system-status notification notified the operator of system shutdowns.

1.2 SUMMARY OF OPERATION

The multi-phase extraction system began operation on September 11, 2014. The multi-phase extraction system was shut down for the winter on December 15, 2014, and restarted on March 25, 2015 with final system shut down on November 30, 2015. The total duration of operation was 345 days (95 days in 2014 and 250 days in 2015). The multi-phase extraction system was down

for 56 days due to equipment malfunctions, power interruptions, and other events; overall, system up-time was 84%.

During its operation, the multi-phase extraction system removed 547 pounds of trichloroethene (255 pounds in 2014, and 292 pounds in 2015; see Figure 1-3). Contaminant removal rates increased dramatically when vacuum was added (September 29, 2014), and remained relatively high until early July 2015 (Figure 1-3). The average trichloroethene removal rate was approximately 3.3 pounds per day through July 2015. Trichloroethene removal rates slowly decreased from early July 2015 to the end of system operation (Figure 1-3). The average removal rate during this period (July 2015 to November 2015) was approximately 0.92 pounds per day. Trichloroethene removal rates were approaching 0.5 pounds per day during the last two months of system operation. Overall, trichloroethene removal trends suggest that most of the residual mass near the former tank location was removed, and that most of the remaining trichloroethene mass is in the dissolved phase and/or adsorbed to the soil matrix.



Approximately 1.2 million gallons of groundwater were extracted, treated, and discharged (267,075 gallons in 2014, and 919,057 gallons in 2015, see Figure 1-4). Total groundwater pumping rates were between two and four gallons per minute (gpm), with an average rate of three gallons per minute. Pumping rates for individual wells generally increased as operation of the vacuum continued. Note that only two or three multi-phase extraction wells could be operated simultaneously, to prevent exceeding the sewer discharge limit (maximum 6,000 gallons per day, or 4.16 gallons per minute. Operation therefore alternated between different extraction wells, with the goal of maintaining the maximum trichloroethene recovery while not exceeding the maximum daily-flow limit. Note that, for clarity, the time scale on Figures 1-3 and 1-4 is in operational days, and does not represent calendar time. Therefore, the spring 2015 restart is shown immediately after the system shutdown in fall 2014.

1.3 TREATMENT-TRAIN EFFICIENCY

Treatment and removal of organic vapors from the vapor stream before discharge to the atmosphere by the vapor-phase granular activated-carbon vessels was effective. Organic vapors were not detected at the vapor-phase-effluent stack. Approximately 10,500 pounds (4,500 pounds in 2014, and 6,000 pounds in 2015) of vapor-phase granular activated-carbon were used during system operation, and approximately 547 pounds of volatile organic compounds (calculated as trichloroethene) were treated by the vapor-phase granular-activated-carbon system. This

corresponds to an organic-vapor loading capacity of approximately five percent by weight. Spent vapor-phase granular activated-carbon was removed from the vessels, placed in 55-gallon drums, and disposed of as hazardous waste at the Lockheed Martin-designated facility.

The liquid-phase treatment system also proved effective at treating the contaminants of concern and reliably meeting sewer discharge-permit requirements. In fact, the main contaminants of concern (volatile organics) were never detected in treated groundwater during operation of the multi-phase extraction system. =Due to the positive liquid-phase treatment system results in 2014. Baltimore County simplified the analytical sampling requirements for discharge in 2015, and requested only analysis for volatile organics and pH (i.e., analyses for nonvolatile organics and metals were not required in 2015). The main unit in the liquid-phase treatment is the air stripper. It removed most volatile organic compounds, so that the liquid-phase granular-activated-carbon polishing units received only a negligible load of volatiles. Typically, the influent concentration of volatile organic compounds at the liquid-phase granular activated-carbon ranged from below detection limit to several parts per billion. When operation of the multi-phase extraction system was complete, the liquid-phase granular activated-carbon was removed from the vessels, placed in 55-gallon drums, and disposed of as nonhazardous waste at the Lockheed Martin-designated facility.

Section 2
Year 2014 Operation

This section summarizes the operation of the multi-phase extraction (MPE) system from startup on September 11, 2014 until December 15, 2014, when the system was shut down for winter. All system equipment remained on site in anticipation of system restart in March 2015. The MPE system operated for 65 days in 2014. It was automatically shut down four times when the liquid-level sensor was activated after rainwater had collected in the secondary containment area. A remote notification was sent to the system operator during each shutdown. At each event, rainwater was pumped from the secondary containment area and treated, and the system was restarted. Rain-related down time for the MPE system was approximately 7.5 days.

The MPE system was shut down between November 16 and December 5 (2014)[1] due to cold temperatures. These weather conditions were anticipated, and a planned shutdown was conducted, including draining the equipment to limit freeze damage. Up time for the 2014 operational period was approximately 71%. If the cold-weather shutdown (19 days) in November/December 2014 is excluded, MPE-system up time was approximately 90%.

2.1 INITIAL OPERATION WITHOUT VACUUM

The MPE system was started on Thursday, September 11, 2014 and shut down for the weekend on Friday, September 12. Continuous system operation began on Monday, September 15 using the four MPE wells (MPE-1 through -4). To achieve steady-state pumping and contaminant-removal conditions, and to prevent sharp spikes in contaminant-inlet concentrations, the MPE system was initially operated without vacuum. During this two-week period, the MPE system operated continuously except for one day (September 25), when rain collected in the secondary containment area, resulting in a high liquid-level alarm that triggered a shutdown.

The speeds of the well pumps were adjusted to maintain a nearly constant liquid level in each well. MPE-1, MPE-3, and MPE-4 were relatively low-yield wells, and the liquid level in each well was

[1]Note that, for clarity, the time scale used on Figures 1-3 and 1-4 is in operational days, and does not represent calendar time. Therefore, the restart is shown immediately after the system shutdown, because it is the first operational day after shutdown.

maintained at approximately three to five feet above the pump's intake. Extraction well MPE-2 returned a considerably higher yield as compared to other wells, so the speed of its pump was adjusted to maintain a liquid level of approximately 15 feet above the pump's intake. Placing the pump at that location resulted in a typical pumping rate of approximately 0.75 gallons per minute (gpm) from MPE-2. One possible reason for the high yield in MPE-2 is that it is hydraulically connected to a nearby gravel-filled trench that collects stormwater runoff.

As shown in Table 2-1, pumping rates for the total system (without vacuum) ranged between 1.85–2.5 gpm, with an estimated contaminant-removal rate generally between 1.3–2 pounds per day (lbs/day). Average individual pumping rates for each of the extraction wells are summarized in Table 2-2 and below:

- MPE-1—0.52 gpm (suspected residual dense-non-aqueous-phase-liquid [DNAPL] area)
- MPE-2—0.81 gpm (former underground storage tank [UST] 2 location)
- MPE-3—0.54 gpm
- MPE-4—0.3 gpm

2.2 CONTINUED OPERATION WITH VACUUM

Vacuum operation began when near steady-state conditions were achieved and contaminant removal rates decreased as compared to the initial values following startup. Operation with vacuum applied to the wells MPE-1, MPE-3, and MPE-4, and to soil-vapor extraction well SVE-1, began on September 29 and ended on December 15, 2014. Approximately 9–10 inches of mercury (in. Hg) vacuum was applied to the MPE wells, and approximately 3 in. Hg of vacuum was applied to SVE-1. High-yield well MPE-2 was not operated under vacuum, as its operation under vacuum would result in a total pumping rate above the sewer discharge limit of 6000 gallons per day (gpd), or 4.17 gpm.

Using the vacuum resulted in a four-fold increase in contaminant removal on September 29 2014, when the vacuum was turned on. Most of this increase can be attributed to the aqueous-phase (air-stripper effluent), with a very low contribution from the actual vapor flow (see Table 2-1).

The actual soil-vapor flow through the formation (shown as vacuum-pump flow in Table 2-1) was very low. Vacuum-pump flow for the entire system ranged between 16–21 standard cubic feet per

minute (SCFM). One possible explanation for this low soil-vapor flow is the low permeability lenses in the upper formation that limits the influx of atmospheric air into the lower formation.

Application of vacuum also increased individual extraction-well yields. As shown in Table 2-2, the average total pumping rate of the three MPE wells under vacuum increased from 1.36 gpm (without vacuum) to 3.3 gpm (under vacuum). The liquid-ring vacuum pump shut down several times due to water in the knockout tank and high-seal water levels. As a result, the contaminant removal rate decreased each time the vacuum pump turned off.

Unusually cold weather in November with below freezing temperatures required the addition of standard automotive antifreeze liquid to the seal-liquid tank in the liquid-ring vacuum pump. An approximately 50/50 blend of antifreeze liquid and water was used. Operation of the liquid-ring vacuum pump with antifreeze proved difficult. The vacuum pump shut down several times due to either high or low liquid-level at the seal. Overall, with antifreeze added, the vacuum pump was operational approximately 50% of the time.

As the vacuum operation continued, the resultant contaminant removal rate (Table 2-1). The contaminant removal rate decreased from 17 lbs/day to 4.4 lbs/day on October 3, 2014, when extraction well MPE-1 was shut down due to equipment malfunction. The removal rate again increased, from 1.8 lbs/day to 11.8 lbs/day, on October 13, 2014, when MPE-1 was restarted. Therefore, most of the mass was probably removed from well MPE-1, and what was being recovered might have been residual DNAPL from the trichloroethene (TCE) at the former tank location. DNAPL droplets were observed on the transparent section of the tubing at well MPE-1.

Contaminant removal rates generally decreased as the MPE system continued to operate. Daily volatile organic compound (VOC) removal rates typically ranged from 4–5.5 lbs/day under vacuum operation, and from approximately 2–4 lbs/day when operating without vacuum (Figure 2-1). Contaminant removal rates generally decreased from peak levels at startup, but fluctuated after events such as the system restart and changes in pumping-well configuration.

Note that the contaminant removal rates in this report have been calculated using vapor concentrations measured in MPE-system effluent using a photoionization detector (PID), while simultaneously collecting MPE system air-flow-rate measurements. These PID-based calculations were validated by comparing them to calculations based on the analytical laboratory data for air-

stripper influent (see discussion in Section 2-5). The following equation was used to calculate the daily contaminant-removal rate:

(Equation 2-1) $$M = \frac{p \times C_v \times 10^{-6} \times Q \times 1440 \left[{}^{min}/_{day} \right] \times MW}{MV}$$

where

- *M* daily contaminant-removal as TCE (lbm/day)
- *p* photo-ionization detector response factor for TCE (0.7)
- C_v effluent-vapor concentration
- *Q* effluent air-flow at standard conditions[2] (ft^3/min)
- *MW* TCE molecular weight (131.4 lbm/lbmol)
- *MV* molar volume at standard conditions[2] (379.48 ft^3/lbmol)

The system was shut down on November 16, 2014 during an unexpected cold-weather period. Liquids were drained from process lines and from the liquid-phase granular-activated-carbon (LGAC) vessels. The system was restarted on December 5, 2014 and was operated until winter shutdown on December 15, 2014.

2.3 PERFORMANCE OF INDIVIDUAL WELLS

During the MPE system start-up, the speed of the well pumps was adjusted to maintain a nearly constant liquid level in the wells. Before the vacuum was applied, wells MPE-1, MPE-3, and MPE-4 were relatively low yield, and the liquid level in each well was maintained at approximately three to five feet above the pump's intake. Extraction well MPE-2 returned a considerably higher yield as compared to other wells, so its pump was adjusted to maintain the liquid level at approximately 15 feet above the pump's intake. This setting resulted in a typical pumping rate of approximately 0.75 gpm for MPE-2. Average individual pumping rates for the initial period of operation without vacuum (September 11–29, 2014) are shown in Table 2-2 and summarized below:

- MPE-1: 0.52 gpm
- MPE-2: 0.81 gpm
- MPE-3: 0.54 gpm

[2]Standard conditions—60°F and 14.696 psi—are assumed.

- MPE-4: 0.3 gpm

Pumping rates for the wells under vacuum increased significantly once the vacuum was applied. Accordingly, the pumping rate at MPE-2 (high-yield well with no vacuum) was reduced to keep the total flow within the facility's discharge-permit level (i.e., 6,000 gpd). Changes in the pumping rates for wells operating with and without vacuum are summarized below:

Well	Yield without vacuum (gpm)	Yield with vacuum (gpm)
MPE-1	0.5	1.0
MPE-2	0.82	0.5 gpm (no vacuum; reduced flow)
MPE-3	0.56	1.25
MPE-4	0.3	0.8

On average, well pumping rates increased approximately 2.3 times when vacuum was applied. This increase in pumping rates was sustained during the entire operating period of the MPE system in 2014. Pumping rates for individual wells and operational details such as which wells were operational at any particular time are listed in Table 2-2.

MPE-system pumping rates and total groundwater recovery for the 2014 operation are shown on Figure 2-2. The pumping rates were between 2–4 gpm, and generally between 3–3.5 gpm. The average MPE-system pumping rate for the entire 2014 operating period (65 days) was 2.85 gpm. Approximately 267,000 gallons of groundwater were extracted, treated, and discharged to the sanitary sewer during operation of the MPE system in 2014 (Figure 2-2 and Table 2-1).

2.4 SAMPLING RESULTS

Analytical samples were collected seven times in 2014, including for sanitary-sewer discharge-permit compliance (three sampling events), and evaluation of the MPE system's performance (four sampling events). Results of these analyses are in Appendix A. A brief summary of these results follows.

2.4.1 Aqueous Influent and Effluent Parameters

Samples of effluent from the liquid-phase treatment system were collected on September 16, September 17, September 26, September 29, October 1, and October 9, 2014. All liquid-phase effluent samples were analyzed for VOCs, but none were detected. Aqueous samples were also

collected from air-stripper influent and effluent on four occasions (September 19, September 26, October 1, and October 9, 2014) in 2014 and analyzed for VOCs. TCE was detected in influent samples during each sampling event: on September 19 (48 milligrams per liter [mg/L]), September 26 (110 mg/L), October 1 (280 mg/L), and October 9 (48 mg/L). However, only trace concentrations of TCE were detected in air-stripper effluent: on September 26 (0.00025 mg/L) and October 1 (0.0045 mg/L). Acetone was detected three times in air-stripper effluent: on September 19 (0.0045 mg/L), September 26 (0.006 mg/L), and October 1 (0.044 mg/L). 2-Butanone was detected once in air-stripper effluent on October 4, 2014 (0.0067 mg/L). Both acetone and 2-butanone might be in the polyvinyl chloride (PVC) cement used during construction of the system.

Samples were collected and analyzed for metals (silver, cadmium, chromium, copper, nickel, lead, zinc, and mercury) from air-stripper influent, air-stripper effluent, and MPE-system effluent on September 19, September 26, and October 9, 2014. All metals were below permitted levels; zinc was the only metal reported above laboratory reporting-limits. The highest zinc concentrations were detected in air-stripper effluent on September 19 (2.4 mg/L) and system effluent on September 26 (4.2 mg/L). All zinc results were well below its sewer-discharge permit level (17.85 mg/L). Detailed results for metals and VOCs are in Appendix A.

2.4.2 Sewer Discharge Sampling

The first sewer-discharge sampling event was on September 29, 2014. In accordance with the sewer-discharge permit-requirements, grab samples were collected from the discharge sampling port at the discharge manhole and analyzed for cyanide, volatile toxic organics, total petroleum hydrocarbons (TPH), and pH. Composite samples (several samples collected over a period of time) were collected for metals and nonvolatile toxic organics.

Sampling results indicated that the sewer discharge limits for all compounds were met within a high margin of safety. Refer to Table 2-3 for a summary of sewer-discharge sampling results. During the first sewer-discharge sampling event, samples were also collected for the parameters that have no discharge limits but do have certain surchargeable limits: total Kjeldahl nitrogen (TKN), phosphorous, biochemical oxygen demand (BOD), chemical oxygen demand (COD), and total suspended solids (TSS). These analytical results indicated that these compounds were well below the surchargeable limits (Table 2-3).

The second sewer-discharge sampling event was on October 30, 2014. In accordance with the sewer-discharge permit-requirements, grab samples (collected from the discharge sampling port) were collected only for volatile toxic organics and pH. No volatile toxic organics were detected and pH level was within the permit level (Table 2-3). Sewer-discharge limits were met.

The third and final sewer-discharge sampling event was on December 3, 2014. In accordance with the sewer-discharge permit-requirements, grab samples (collected from the discharge sampling port) were collected for cyanide, volatile toxic organics, TPH, and pH. Composite samples (several samples collected over a period of time) were collected for metals and nonvolatile toxic organics. The analytical sampling results indicated that the sewer-discharge limits for all compounds were met with a very high margin of safety. Refer to Table 2-3 for a summary of sewer-discharge sampling results.

During the third sewer-discharge sampling event, samples were also collected for the parameters that have no discharge limits but do have certain surchargeable limits (i.e., TKN, phosphorous, BOD, COD, and TSS). The analytical results indicated that these compounds were well below the surchargeable limits (Table 2-3). The results of the sewer-discharge compliance sampling were reported to the Baltimore County Department of Public Works, as required by the permit (Appendix B**).**

2.4.3 Vapor-Stream VOCs

Analytical samples for VOCs were collected on September 19, 2014 from the vapor-stream carbon-system at the VGAC-1 influent, at the VGAC-1 effluent (midstream), and at the VGAC-2 effluent (discharge). The only compound detected above the laboratory reporting-limit was TCE, in VGAC-1 influent (8.1 parts per million by volume [ppm_v]). Vinyl chloride was also detected at estimated (lab qualifier) levels below its laboratory reporting limit (1 ppm_v) in VGAC-1 influent (0.22 ppm_v), midstream (0.16 ppm_v), and effluent (0.14 ppm_v) samples.

2.5 AIR-STRIPPER PERFORMANCE ANALYSES

The concentration of aqueous-phase TCE at the air-stripper inlet was calculated (Table 2-1) to estimate influent concentrations and potential DNAPL-influx into the MPE system using the air-stripper influent-air-stream vapor concentrations measured during regular site visits. This calculation assumes that the entire vapor stream consists of TCE, and that all dissolved TCE is

transferred into the vapor phase by air stripping. The following equation was used to calculate aqueous-phase TCE concentrations at the air-stripper inlet (results are in Table 2-1).

(Equation 2-2) $$C_a = \frac{10^6 \times M}{q \times 1440 \left[{}^{min}/_{day}\right] \times \rho_w}$$

where

- C_a aqueous-phase TCE at the air-stripper inlet (mg/L)
- M daily contaminant-removal as TCE (lb/day), as calculated from Equation 2-1
- q MPE-system pumping rate (gpm)
- ρ_w water density (8.327 lb/gallon)

The calculated concentration of aqueous-phase contaminant (i.e., TCE) in air-stripper influent remained high throughout MPE system operation in 2014. Without the vacuum applied to the extraction wells, the calculated TCE concentrations in air-stripper influent ranged from 48-102 mg/L (Table 2-1). Under vacuum operation and with extraction well MPE-1 running, the calculated TCE concentration in air-stripper influent ranged from 231–410 mg/L (Table 2-1). These high TCE levels in 2014 are likely associated with the residual DNAPL in the area.

Calculation of the air-stripper-influent contaminant-concentration is based on several assumptions and therefore subject to error. To validate this calculation and its assumptions, the calculated contaminant concentrations were compared to the actual analytical results of air-stripper-influent samples. This comparison, summarized in Table 2-4, shows that the calculated values are relatively close to actual analytical results, with an average deviation of 11%. The observed randomness in the direction of the deviation is further indication that the estimate generated by the calculation is scientifically acceptable and unbiased. Thus, this calculation was used for the MPE-system operation analyses. A comparison of the analytical results for air-stripper influent and effluent samples also suggests that the MPE system is highly efficient (at least 99.999%) in removing TCE from the aqueous stream (Table 2-4). Thus, VOC loading on the system's LGAC vessels was negligible.

Table 2-1

LMC MRC Block E MPE System Operation

Section 3
Year 2015 Operation

This section summarizes multi-phase-extraction (MPE) system operation in 2015, from its (re)startup on March 25, 2015 until shutdown on November 30, 2015. The system had been shut down for winter on December 15, 2014, and all system equipment had remained on site until the system was restarted in March 2015. The MPE system layout, with the locations of the extraction wells and the MPE system equipment, is shown on Figure 1-1. Refer to the *UST 2 TCE-Source Remedial Action Design-Basis Report* (Tetra Tech, Inc. [Tetra Tech], 2014) for details of the MPE system (e.g., equipment specifications, calculations, and design drawings).

3.1 GENERAL SEQUENCE OF OPERATIONS

Continuous system operation began again on March 25, 2015, with all five wells operating (MPE-1 through -4 and SVE-1). To achieve steady-state conditions and prevent sharp spikes in inlet contaminant-concentrations, the MPE system was initially operated without vacuum for approximately four weeks. The pumping rate of the MPE system ranged between 1.56-3.5 gallons per minute (gpm), and the estimated contaminant-removal rate was approximately 1–2 pounds per day (lbs/day). Operation during this initial period was continuous except for two shutdowns in response to high liquid levels in the secondary containment area due to rain on April 8 and 15 (2015). See Table 3-1 and Figure 3-1 for details.

Vacuum operation began when near-steady-state pumping and contaminant-removal rates were achieved and contaminant-removal rates had decreased compared to the initial values following startup. Vacuum was applied to the wells on April 27, 2015, and continued until system shutdown. Vacuum was applied to extraction wells MPE-1, MPE-3, and MPE-4[3], and to soil-vapor extraction well SVE-1. The wellhead vacuum ranged from 10–15 inches of mercury (in. Hg) for the MPE wells, and approximately 3 in. Hg for soil-vapor extraction well SVE-1. Application of vacuum resulted in an approximately 50% increase in contaminant removal. Approximately 919,000 gallons

[3]High yield well MPE-2 was not operated under vacuum because it would increase the pumping rate of the MPE system to a level well above the sewer discharge limit (6000 gallons per day, or 4.17 gpm).

of groundwater were recovered during MPE-system operation in 2015. The average pumping rate for the MPE system was 2.9 gpm (both with and without the vacuum applied).

As shown in Table 3-1, soil-vapor flow (shown in the table as vacuum-pump flow) through the formation continued to be very low. Vacuum-pump flow ranged between 10–14 standard cubic feet per minute (SCFM). The liquid-ring vacuum pump ran consistently, but was shut down twice for short periods (one day) due to a high liquid level in the seal water-tank.

The MPE system was operational for 223 days (approximately 89% up-time) in 2015. The system was automatically shut down six times due to heavy rain (Figure 3-1); rainwater collected in the secondary containment area and high water activated the liquid-level sensor. Rainwater was pumped out, treated, and the system was restarted. The system was also shut down for 10 days May 2-12, 2015) when the air-stripper blower failed and had to be replaced. The system was also shut down once due to a power outage. A remote notification was sent to alert the system operator during each shutdown. MPE-system operation was discontinued on November 30, 2015, when the contaminant-recovery rate approached asymptotic [4] behavior, ranging mostly between 0.5-0.7 lb/day. These decreased recovery rates occurred during the last 45 days of system operation, averaging approximately 0.66 lbs/day during that period.

3.2 PERFORMANCE OF INDIVIDUAL WELLS

The speed of the well pumps was adjusted to maintain a nearly constant liquid level in the wells. The liquid level in wells MPE-1, MPE-3, and MPE-4 was maintained at approximately 3–5 feet above the pump's intake, similar to adjustments made in 2014. Likewise, extraction well MPE-2 returned a considerably higher yield compared to other wells, and was therefore not operated at maximum capacity, to avoid exceeding the total maximum daily-discharge permit-limit (6000 gallons per day or 4.16 gpm). The high yield at MPE-2 might be due to its hydraulic connection to a nearby gravel-filled trench that collects stormwater runoff. Representative pumping rates for individual wells (without vacuum) were as follows:

- MPE-1—0.5 gpm (suspected residual dense-non-aqueous-phase-liquid [DNAPL] area)
- MPE-2—1 gpm (former underground storage tank [UST] 2 location)
- MPE-3—1 gpm
- MPE-4—0.75 gpm

[4] A line on a graph that draws increasingly nearer to a curve without ever meeting it.

These pumping rates were considerably higher as compared to the rates observed at the beginning of MPE-system operation in 2014 (Tetra Tech, 2015). Pumping rates gradually increased as the 2015 operation progressed. A likely reason for this is the gradual development of the pumping wells and removal of fine particles, especially under vacuum conditions. Representative pumping rates for the individual wells during the last three months of system operation are shown in Table 3-2 and summarized below:

- MPE-1—1.25 gpm (with ~14in. Hg vacuum)
- MPE-2—2.5 gpm (no vacuum, full flow)
- MPE-3—1.4 gpm (with ~14in. Hg vacuum)
- MPE-4—1.7 gpm (with ~14in. Hg vacuum)

3.3 CONTAMINANT REMOVAL TRENDS

In general, applying vacuum to the MPE system increased contaminant removal approximately 1.5 times, but, in comparison to operations in 2014, the increase in contaminant removal was not nearly as pronounced in 2015 (Tetra Tech, 2015). We suspect that most of the residual DNAPL mass was reduced by MPE-system operation in 2014. Therefore, applying the vacuum in 2015 did not cause the same jump in the contaminant removal rate as it did in 2014. As in 2014, almost all of the contaminant mass came from the aqueous-phase (via air-stripper vapor effluent), with a very low contribution from the actual vapor flow (see Table 3-1).

Contaminant removal rates in 2015 decreased as compared to 2014 rates (Table 3-1). Applying vacuum moderately increased contaminant-removal rates, as compared to 2014. The highest trichloroethene (TCE) removal rate (10 lbs/day) occurred on May 12, 2015, when the system was restarted after a 10-day shutdown (due to a failed air-stripper blower and the time to replace it). This high removal rate was probably due to a string of DNAPL being pulled into the system. However, after only three days of operation (May 12-15, 2015), the TCE-removal rate declined to approximately 3 lbs/day.

The extraction wells' yields gradually increased in 2015. The maximum daily flow under the sewer discharge permit was 6,000 gallons per day. This limitation prevented all extraction wells from being operated simultaneously under vacuum. Their operation therefore alternated between different extraction wells, with the goal of maintaining the maximum TCE recovery while not exceeding the maximum daily-flow limit. To maximize recovery, the contributions of individual MPE wells to TCE recovery were tested on June 17 (by analytical sampling), July 24, and September 22. The

results of these tests are summarized in Table 3-3. These test results led to focusing the MPE system on those wells with the highest TCE-recovery potential. The operation was switched from one group of extraction wells to another when the TCE removal rates declined or leveled off. The following different modes of operation were used in 2015:

- 3/25 to 4/27: MPE-1, MPE-2, MPE-3, and MPE-4 operated without vacuum
- 4/27 to 5/12: MPE-1 and SVE-1 under vacuum, MPE-2 and MPE-3 without vacuum, MPE-4 off
- 5/12 to 5/29: MPE-1 and SVE-1 under vacuum, MPE-2 without vacuum, MPE-3 and MPE-4 off
- 5/29 to 6/26: MPE-1, MPE-2, MPE-3, and SVE-1 under vacuum, MPE-2 off
- 6/26 to 7/24: MPE-1, MPE-4, and SVE-1 under vacuum, MPE-3 without vacuum, MPE-2 off
- 7/24 to 10/12: MPE-1, MPE-3, and SVE-1 under vacuum, MPE-2 and MPE-4 off
- 10/12 to 11/30:MPE-1, MPE-4, and SVE-1 under vacuum, MPE-2 and MPE-3 off

Overall, TCE removal rates are comparable for all modes of operation, generally remaining between 0.6–2.5 lbs of TCE per day. The final period of operation between July 13 and November 30 resulted in a smooth decline of the mass-removal rate from 1.6 to approximately 0.55 lbs/day, as shown on Figure 3-3.

The air-stripper-influent aqueous-phase contaminant-concentration (Table 3-1) was calculated (Equation 2-2 in Section 2-5) to estimate the system-influent contaminant concentrations. The calculated air-stripper-influent aqueous-phase contaminant (TCE) concentration remained moderately high over the course of system operation. The calculated air-stripper-influent TCE concentration ranged from 14–264 mg/L (Table 3-1), with an average of 45.4 mg/L and median value at 36.6 mg/L. The highest value (264 mg/L) was calculated for May 12, 2015, when the system was restarted after a 10-day pause (the air-stripper blower had to be replaced). This high concentration event was short lived and probably caused by a string of DNAPL passing through the system. Towards the end of MPE-system operation (mid-July to November), the calculated air-stripper-influent TCE-values were decreasing. For this period, the calculated air-stripper-influent TCE-concentration ranged from 13–53 mg/L (Table 3-1), with a median value of 23 mg/L. During the last 4.5 months of 2015 MPE-system operation (mid-July to November), the

contaminant-removal rate generally followed a declining trend, as shown on Figure 3-3. The contaminant-removal rate during this period was typically at or below 1 lb/day.

MPE-system operation was discontinued on November 30, 2015 when the contaminant-recovery rate approached asymptotic behavior (Figures 3-1 and 3-3), and removal rates had decreased to 0.5-0.7 lb/day for 45 consecutive days. The average removal rate during the last days of operation was 0.66 lbs/day. Direct observations of DNAPL (such as droplets and stringers in the transparent inlet-piping) were not found during the 2015 operation. Overall, contaminant-removal trends suggest that by the end of MPE-system operation, most residual DNAPL had been removed by the MPE system, and the remaining TCE is mainly associated with adsorbed and dissolved phases.

3.4 SEWER DISCHARGE SAMPLING AND REPORTING

Samples were collected monthly at the point of discharge in accordance with sewer-discharge permit requirements. Nine sampling events were conducted in 2015 (April 2, May 7, June 10, July 15, August 14, September 14, October 15, November 17, and December 3). As required, grab samples collected from the discharge sampling port were analyzed for toxic volatile organic compounds and for pH. Analytical sampling results indicate that all sewer-discharge limits were met with a high margin of safety. Toxic volatile organics were not detected in any sample. Appendix C contains the analytical laboratory reports. Sewer-discharge compliance-sampling results and flow-volume records were submitted to the Baltimore County Department of Public Works, as required by the permit. (Three “Industrial-User Monitoring Reports” were submitted in 2015; see Appendix B).

Notes

gpm	gallons per minute
A/S	air stripper
PID	photo-ionozation detector
PPMv	parts per million by volume
SCFM	standard cubic feet per minute
VGAC	vapor-phase granular activated carbon
mg/L	milligrams per liter

TestAmerica Job ID: 240-41962-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Preliminary Data

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: MRC BLOCK E MPE SYSTEM O&M

TestAmerica Job ID: 240-41962-1

Client Sample ID: TB-091614 — **Lab Sample ID: 240-41962-1**

No Detections.

Client Sample ID: WSP-4-091614 — **Lab Sample ID: 240-41962-2**

No Detections.

Client Sample ID: FRT-1-091614 — **Lab Sample ID: 240-41962-3**

No Detections.

Preliminary Data

This Detection Summary does not include radiochemical test results.

Client: Tetra Tech, Inc.
Project/Site: MRC BLOCK E MPE SYSTEM O&M

TestAmerica Job ID: 240-41962-1

Client Sample ID: TB-091614
Date Collected: 09/16/14 00:00
Date Received: 09/17/14 07:50

Lab Sample ID: 240-41962-1
Matrix: Water

Method: 8260C - Volatile Organic Compounds by GC/MS

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42033-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Preliminary Data

Client: Tetra Tech, Inc. Job Number: 240-42033-1

GC/MS VOA INSTRUMENT PERFORMANCE CHECK
BROMOFLUOROBENZENE (BFB)

Lab Name: TestAmerica Canton Job No.: 240-42033-1

SDG No.:

Lab File ID: BFB918C.D BFB Injection Date: 09/18/2014

Instrument ID: A3UX11 BFB Injection Time: 10:13

Analysis Batch No.: 147557

M/E	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE	
50	15.0 - 40.0 % of mass 95	15.1	
75	30.0 - 60.0 % of mass 95	43.8	
95	Base Peak, 100% relative abundance	100.0	
96	5.0 - 9.0 % of mass 95	6.7	
173	Less than 2.0 % of mass 174	0.0	(0.0)1
174	50.0 - 120.00 % of mass 95	90.4	
175	5.0 - 9.0 % of mass 174	6.4	(7.0)1
176	95.0 - 101.0 % of mass 174	88.5	(97.9)1
177	5.0 - 9.0 % of mass 176	5.8	(6.6)2

1-Value is % mass 174 2-Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS AND STANDARDS:

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: LM MRC Block E MPE System O&M

Report Number: 240-42186-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 9/20/2014 9:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.0º C.

Sample TB-091914 is listed on the Chain of Custody, however it was not received.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples WSP-1-091914 (240-42186-1), WSP-2-091914 (240-42186-2), WSP-3-091914 (240-42186-3), WSP-101-091914 (240-42186-4), WSP-201-091914 (240-42186-5), WSP-301-091914 (240-42186-6) and WSP-401-091914 (240-42186-7) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 09/24/2014.

Samples WSP-1-091914 (240-42186-1)[3333.33X], WSP-101-091914 (240-42186-4)[3333.33X], WSP-201-091914 (240-42186-5) [3333.33X], WSP-301-091914 (240-42186-6)[3333.33X] and WSP-401-091914 (240-42186-7)[3333.33X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 148401 recovered outside control limits for the following analyte(s): 2-Methyl-2-propanol, Trichlorofluoromethane. These analytes have been identified as poor performing analytes when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

The continuing calibration verification (CCV) for analytical batch 148401 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICP)

Samples WSP-1-091914 (240-42186-1), WSP-2-091914 (240-42186-2) and WSP-4-091914 (240-42186-8) were analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 09/22/2014 and analyzed on 09/23/2014.

Manganese and Zinc were detected in method blank MB 240-147984/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples WSP-1-091914 (240-42186-1), WSP-2-091914 (240-42186-2) and WSP-4-091914 (240-42186-8) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 09/22/2014 and analyzed on 09/23/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42186-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	F1	MS and/or MSD Recovery exceeds the control limits
	F2	MS/MSD RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Comments
The VOC Vapor analysis was performed at Pace Analytical Services, Inc.

Receipt
The samples were received on 9/22/2014 9:40 AM; the samples arrived in good condition and on ice. The temperature of the cooler at receipt was 1.6º C.

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

RE: **240-42212-1 / LM MRC Block**
Microseeps Workorder: 13434

Dear John McFadden:

Enclosed are the analytical results for sample(s) received by the laboratory on Tuesday, September 23, 2014. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbin Robl 10/07/2014

ANALYTICAL RESULTS QUALIFIERS

Workorder: 13434 240-42212-1 / LM MRC Block

DEFINITIONS/QUALIFIERS

Disclaimer : The Pennsylvania Department of Environmental Protection (PADEP) has decided to no longer recognize analyses that do not produce data for primary compliance, for NELAP accreditation. The methods affected by this decision are AM20GAx, AM21G, SW846 7199 and AM4.02. The laboratory shall continue to administer the NELAP/TNI standard requirements in the performance of these methods.

MDL	Method Detection Limit. Can be used synonymously with LOD; Limit Of Detection.
PQL	Practical Quanitation Limit. Can be used synonymously with LOQ; Limit Of Quantitation.
ND	Not detected at or above reporting limit.
DF	Dilution Factor.
S	Surrogate.
RPD	Relative Percent Difference.
% Rec	Percent Recovery.
U	Indicates the compound was analyzed for, but not detected at or above the noted concentration.
J	Estimated concentration greater than the set method detection limit (MDL) and less than the set reporting limit (PQL).

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: LM MRC Block E MPE System O&M

Report Number: 240-42183-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The sample was received on 9/20/2014 9:40 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.0º C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Sample WSP-4-091914 (240-42183-1) was analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 09/23/2014.

The continuing calibration verification (CCV) for analytical batch 148222 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42183-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Tetra Tech, Inc. Job Number: 240-42183-1

Project: LM MRC Block E

Report Number: 240-42438-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 9/27/2014 9:50 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.2° C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples WSP-1-092614 (240-42438-1), WSP-2-092614 (240-42438-2), WSP-3-092614 (240-42438-3), WSP-4-092614 (240-42438-4) and TB-092614 (240-42438-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 10/02/2014 and 10/03/2014.

Naphthalene was detected in method blank MB 240-149718/18 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Sample WSP-1-092614 (240-42438-1)[5000X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No MS/MSD in batch 149718 due to an incorrect sample dilution. The following samples were in the affected batch:TB-092614 (240-42438-5), WSP-2-092614 (240-42438-2), WSP-3-092614 (240-42438-3), WSP-4-092614 (240-42438-4)

The continuing calibration verification (CCV) for analytical batch 149984 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICP)

Samples WSP-1-092614 (240-42438-1), WSP-2-092614 (240-42438-2) and WSP-4-092614 (240-42438-4) were analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 09/30/2014 and analyzed on 10/01/2014.

Lead was detected in method blank MB 240-149343/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples WSP-1-092614 (240-42438-1), WSP-2-092614 (240-42438-2) and WSP-4-092614 (240-42438-4) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 09/30/2014 and analyzed on 10/01/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42438-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	F1	MS and/or MSD Recovery exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Certification Summary

Client: Tetra Tech, Inc.
Project/Site: LM MRC Block E

TestAmerica Job ID: 240-42438-1

Laboratory	Authority	Program	EPA Region	Certification ID
TestAmerica Canton	California	State Program	9	2927
TestAmerica Canton	Connecticut	State Program	1	PH-0590
TestAmerica Canton	Florida	NELAP	4	E87225
TestAmerica Canton	Georgia	State Program	4	N/A
TestAmerica Canton	Illinois	NELAP	5	200004
TestAmerica Canton	Kansas	NELAP	7	E-10336
TestAmerica Canton	Kentucky (UST)	State Program	4	58
TestAmerica Canton	L-A-B	DoD ELAP		L2315
TestAmerica Canton	Minnesota	NELAP	5	039-999-348
TestAmerica Canton	Nevada	State Program	9	OH-000482008A
TestAmerica Canton	New Jersey	NELAP	2	OH001
TestAmerica Canton	New York	NELAP	2	10975
TestAmerica Canton	Ohio VAP	State Program	5	CL0024
TestAmerica Canton	Pennsylvania	NELAP	3	68-00340
TestAmerica Canton	Texas	NELAP	6	
TestAmerica Canton	USDA	Federal		P330-13-00319
TestAmerica Canton	Virginia	NELAP	3	460175
TestAmerica Canton	Washington	State Program	10	C971
TestAmerica Canton	West Virginia DEP	State Program	3	210
TestAmerica Canton	Wisconsin	State Program	5	999518190

Accreditation may not be offered or required for all methods and analytes reported in this package. Please contact your project manager for the laboratory's current list of certified methods and analytes.

Method 8260C

Volatile Organic Compounds (GC/MS) by Method 8260C

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: LM MRC Block E MPE System O&M

Report Number: 240-42475-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 9/30/2014 7:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.8° C.

VOLATILE ORGANIC COMPOUNDS (GC/MS)

Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for Volatile organic compounds (GC/MS) in accordance with EPA Method 624. The samples were analyzed on 10/01/2014.

Methylene Chloride was detected in method blank MB 240-149656/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The continuing calibration verification (CCV) associated with batch 149656 recovered above the upper control limit for multiple analytes. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: DSP-1-092914 GRAB (240-42475-1).

The following sample submitted for volatiles analysis was received with insufficient preservation (pH >2): DSP-1-092914 GRAB (240-42475-1)(pH of 5).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Sample DSP-1-092914 COMP (240-42475-2) was analyzed for semivolatile organic compounds (GCMS) in accordance with EPA Method 625. The samples were prepared on 10/04/2014 and 10/10/2014 and analyzed on 10/08/2014 and 10/12/2014.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Bis(2-ethylhexyl) phthalate was detected in method blank MB 240-150974/9-A at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The laboratory control sample (LCS) for prep batch 151224, associated with samples DSP-1-092914 COMP (240-42475-2), recovered outside control limits for benzidine. The associated samples were re-prepared and re-analyzed outside holding time with all QC meeting acceptance criteria. The initial results have been reported as has benzidine from the reextracted results.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with batch 150089, 625.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with batch 150974, 625.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DIOXIN SCREEN

Sample DSP-1-092914 COMP (240-42475-2) was analyzed for Dioxin Screen in accordance with EPA Method 625 Dioxin Screen. The samples were prepared on 10/04/2014 and analyzed on 10/11/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POLYCHLORINATED BIPHENYLS (PCBS)

Sample DSP-1-092914 COMP (240-42475-2) was analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA Method 608. The samples were prepared on 10/02/2014 and analyzed on 10/03/2014.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required. All of the samples in this data set analyzed for PCBs were subjected to the sulfuric acid cleanup procedure before instrumental analysis, per EPA Method 3665A.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with batch 149713, 608 PCB.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CHLORINATED PESTICIDES

Sample DSP-1-092914 COMP (240-42475-2) was analyzed for chlorinated pesticides in accordance with EPA Method 608. The samples were prepared on 10/01/2014 and analyzed on 10/06/2014.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

The continuing calibration verification (CCV) associated with batch 150213 recovered above the upper control limit for Multiple Analytes. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: DSP-1-092914 COMP (240-42475-2).

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with batch 149492, 608 Pest.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICP)

Sample DSP-1-092914 COMP (240-42475-2) was analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 10/01/2014 and analyzed on 10/02/2014.

Antimony and Manganese were detected in method blank MB 240-149504/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Sample DSP-1-092914 COMP (240-42475-2) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 10/01/2014 and analyzed on 10/03/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

N-HEXANE EXTRACTABLE MATERIAL

Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for n-hexane extractable material in accordance with EPA Method 1664A. The samples were prepared and analyzed on 10/03/2014.

Analysis for Hexane Extractable Material (HEM) was performed for the following samples: DSP-1-092914 GRAB (240-42475-1). Since the HEM results were below the reporting limit (RL), the results for Silica Gel Treated - Hexane Extractable Material (SGT-HEM) were reported as a non-detect. All HEM quality control criteria were met.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL SUSPENDED SOLIDS
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for total suspended solids in accordance with SM 2540D. The samples were analyzed on 10/02/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL CYANIDE
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for total cyanide in accordance with SM 4500_CN-E. The samples were prepared and analyzed on 10/07/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL PHOSPHORUS
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for total phosphorus in accordance with SM 4500 P E. The samples were prepared and analyzed on 10/03/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

BIOCHEMICAL OXYGEN DEMAND
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for Biochemical oxygen demand in accordance with SM 5210B. The samples were analyzed on 10/01/2014.

The glucose-glutamic acid standard recovered outside the recovery limits specified in the method in batch 149475 .

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CHEMICAL OXYGEN DEMAND
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for chemical oxygen demand in accordance with SM 5220D. The samples were analyzed on 10/01/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PH
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for pH in accordance with SM 4500 H+ B. The samples were analyzed on 09/30/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL KJELDAHL NITROGEN
Sample DSP-1-092914 GRAB (240-42475-1) was analyzed for total kjeldahl nitrogen in accordance with SM 4500 NH3 E. The samples were prepared on 10/02/2014 and analyzed on 10/03/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42475-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC/MS Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time
GC Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate is outside control limits
	p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
Metals		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	s	Seeded Control Blank (SCB) Recovery High

GC SEMI VOA BATCH WORKSHEET

Lab Name: TestAmerica Canton Job No.: 240-42475-1

SDG No.:

Batch Number: 149492 Batch Start Date: 10/01/14 08:00 Batch Analyst: Earle, Steve

Batch Method: 608 Batch End Date: 10/02/14 08:00

Lab Sample ID	Client Sample ID	Method Chain	Basis	ReceivedpH	InitialAmount	FinalAmount	EX2/.2SURRW 00042		
240-42475-G-2	DSP-1-092914 COMP	608, 608	T	6 SU	1030 mL	5 mL	1 mL		

Batch Notes	
Exchange Solvent Lot #	1573723
Na2SO4 Lot Number	1555593
Prep Solvent Lot #	1691135

Basis	Basis Description
T	Total/NA

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

Method 608 PCBs

Polychlorinated Biphenyls (PCBs) (GC) by Method 608

Batch Notes	
Exchange Solvent Lot #	1573731
Filter Paper Lot Number	1668476 acid cleanup
Na2SO4 Lot Number	1555584
Prep Solvent Lot #	1691136

Basis	Basis Description
T	Total/NA

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: LM MRC Block E MPE System O&M

Report Number: 240-42580-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 10/2/2014 9:25 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.2° C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples TB-100114 (240-42580-1), FRT-1-100114 (240-42580-2), WSP-2-100114 (240-42580-3) and WSP-1-100114 (240-42580-4) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 10/02/2014.

Sample WSP-1-100114 (240-42580-4)[10000X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) associated with batch 149741 recovered above the upper control limit for multiple analytes. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: FRT-1-100114 (240-42580-2), TB-100114 (240-42580-1), WSP-1-100114 (240-42580-4), WSP-2-100114 (240-42580-3).

The continuing calibration verification (CCV) for analytical batch149741 recovered outside control limits (low) for 2-methyl-2-propanol, naphthalene, and 1,2-dibromo-3-chloropropane. An acceptable method reporting limit (MRL) standard was analyzed to verify these compounds were detected at the reporting limit. The batch has been qualified and accepted. The affected samples are: FRT-1-100114 (240-42580-2), TB-100114 (240-42580-1), WSP-1-100114 (240-42580-4), WSP-2-100114 (240-42580-3).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42580-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Tetra Tech, Inc. Job Number: 240-42580-1

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: MRC Block E MPE System O&M

Report Number: 240-42919-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 10/10/2014 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.6° C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples WSP-4-100914 (240-42919-1), WSP-3-100914 (240-42919-2), WSP-2-100914 (240-42919-3), WSP-1-100914 (240-42919-4) and TB-100914 (240-42919-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 10/15/2014.

Sample WSP-1-100914 (240-42919-4)[2000X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 151736 recovered outside control limits for the following analyte(s): 2-Chloroethyl vinyl ether. This analyte has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

The continuing calibration verification (CCV) for analytical batch 151736 exceeded control criteria for multiple compounds. The samples associated with this CCV were non-detects for the affected analytes. In accordance with the laboratory SOP, a low level CCV at the reporting limit (labeled as an MRL) was analyzed and the affected compounds were detected; therefore the data has been reported. No further corrective action was required.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL RECOVERABLE METALS (ICP)

Samples WSP-4-100914 (240-42919-1), WSP-2-100914 (240-42919-3) and WSP-1-100914 (240-42919-4) were analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 10/13/2014 and analyzed on 10/14/2014.

Zinc was detected in method blank MB 240-151291/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL MERCURY

Samples WSP-4-100914 (240-42919-1), WSP-2-100914 (240-42919-3) and WSP-1-100914 (240-42919-4) were analyzed for total

mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 10/13/2014 and analyzed on 10/14/2014.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-42919-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Tetra Tech, Inc. Job Number: 240-42919-1
