Subject: Transmittal of the Vapor Intrusion Investigation and Sub-Slab-Depressurization-System Operation, August 2016 Monitoring Report
Lockheed Martin Corporation; Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Carroll:

For your review please find enclosed two hard copies with a CD of the above-referenced document. This document presents the data for the second round of indoor-air-quality and sub-slab-vapor monitoring for calendar year 2016 at Lockheed Martin's Middle River Complex in Middle River, Maryland. If possible, we respectfully request to receive MDE's comments by May 11, 2017.

Please let me know if you have any questions. My office phone is (301) 548-2227.

Sincerely,

Lynnette Drake
Remediation Analyst, Environmental Remediation

Section 1
Introduction

Tetra Tech, Inc. (Tetra Tech) has prepared this report on behalf of Lockheed Martin Corporation (Lockheed Martin) to document the second round of indoor-air-quality (IAQ) and sub-slab-vapor (SV) monitoring for calendar year 2016 at Lockheed Martin's Middle River Complex (MRC) in Middle River, Maryland. This report contains the Round 21 (August 2016) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems originally installed at the Middle River Complex in 2008: one beneath the Building A plating shop, and the other beneath the southern portion of the Building C basement. This monitoring is part of an ongoing investigation to evaluate whether volatile organic compounds (VOCs) in sub-slab vapors (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air at Middle River Complex facilities. The second monitoring round for calendar year 2016 continues investigations previously described in the following reports:

- *Indoor-Air-Quality Investigation of Buildings A, B, C, and the (Vertical-Launch System) VLS (Facility), Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2007)
- *Indoor-Air-Quality Investigation Round 3, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2008a)

- *Vapor Intrusion Investigation and Sub-Slab-Depressurization-System Operation September 2014 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2015a)

- *Vapor Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2015 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2015b)

- *Vapor Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2015 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2015c)

- *Vapor Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2016 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2016)

This report is organized as follows:

Section 2—Round 21 Indoor-Air-Quality and Vapor Intrusion Investigation: Briefly describes the sampling methodology used for the current investigation round.

Section 3—Round 21 Results: Discusses the Round 21 results, including results exceeding screening levels, relevant data trends, and comparison of sampling results to background concentrations.

Section 4—Sub-Slab-Depressurization-System Data Analysis: Analyzes relevant data and evaluates sub-slab-depressurization-system performance.

Section 5—Conclusions and Recommendations: Presents conclusions based on the Round 21 sampling results and recommends future work at the site related to vapor intrusion.

Section 6—References: Lists the references used in this report.

This page intentionally left blank.

Section 2
Round 21 Indoor-Air-Quality and Vapor Intrusion Investigation

2.1 INVESTIGATION APPROACH AND GUIDANCE

The indoor-air-quality (IAQ) and sub-slab-vapor (SV) investigation described herein is designed to evaluate whether volatile organic compounds (VOCs) associated with soil and groundwater contamination at the site might be moving into indoor air (IA) at Middle River Complex (MRC) facilities. Initial sampling locations for Buildings A, B, and C were chosen during a 2006 site reconnaissance by Tetra Tech industrial hygienists. Additional sampling locations have been selected periodically, based on subsequent monitoring results.

Two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems (one beneath the Building A plating shop, and the other beneath the southern portion of the Building C basement) were originally installed at the Middle River Complex in 2008. However, occasional detections of trichloroethene (TCE) in IA that exceeded the screening level have been observed over time in the Building A basement (which is not continuously occupied). Three air-purifying filters were installed in the Building A basement in January 2015 to address these TCE exceedances. Investigations into SV, IA, and groundwater contamination in the Building A basement are ongoing.

The sampling plan for Round 21 is based on historical detections and information obtained during site reconnaissance and review of historical information and reports. IA and SV samples were collected from Buildings A, B, and C during Round 21 sampling. Relevant guidance from the United States Environmental Protection Agency [USEPA] (USEPA, 1996, 2004, 2012 and 2015) and the Maryland Department of the Environment [MDE] (MDE, 2006) were used to develop the investigation methodology.

2.2 INVESTIGATION PROCEDURES

IAQ and SV sampling within Buildings A, B, and C was conducted in accordance with the work plan (Tetra Tech, 2015d). Background outdoor air samples were collected from the same sampling locations as had been used for Round 20 (Figure 2-1). Not all existing monitoring points inside the subject buildings were sampled during Round 21. As in previous rounds, samples were collected selectively, in or adjacent to areas where contaminants had been detected previously, or in areas where contaminants are currently suspected of being present.

TCE has been targeted as a primary chemical of concern (COC); it has a history of use at the site, has been detected in groundwater and soil gas, and can be toxic and mobile in the environment. Historical sampling locations and the sub-slab-vapor monitoring points (VMPs) sampled in Buildings A, B, and C during this round are shown in Figures 2-2, 2-3, and 2-4, respectively. IAQ sampling locations were co-located with most monitored SV sampling locations to evaluate indoor air and possible relationships between SV and IAQ.

Round 21 sampling was performed on August 16–17, 2016. Seventy-four samples (and eight duplicates) were collected and submitted for analysis:

- four background ambient air samples (collected at the same locations used in the previous round)
- 41 IAQ samples (and four duplicates) from Buildings A, B, and C:
  - 16 IAQ samples (and two duplicates) from Building A
  - Three IAQ samples from Building B
  - 22 IAQ samples (and two duplicates) from Building C
- 29 SV samples (and four duplicates) from Buildings A, B, and C:
  - 13 SV samples (and two duplicates) from Building A
  - Two SV samples from Building B
  - 14 SV samples (and two duplicates) from Building C

The “-A”, “-B”, and “-C” suffixes in the sampling location designations correspond with Buildings A, B, and C, respectively.

One IAQ sample (from location 060-C) was collected but not analyzed because an insufficient volume was collected in the canister; therefore, only results for 40 IAQ samples were analyzed.

One SV sample (from location 131-C) and its duplicate were collected, but not analyzed, due to insufficient volume; therefore, only results for 28 SV samples were analyzed. Five IAQ samples from Building C (144-C through 146-C, 150-C, and 152-C) were collected in the machine shop in the Lockheed Martin Rotary and Mission Systems (RMS), formerly Lockheed Martin Mission Systems & Training (MST), mechanical prototype laboratory (MPL). Monitoring continues in this area because TCE was detected in IA at a concentration greater than its screening level during Round 15 (August 2013). The five sampling locations that provide data for possible worker exposure areas within the MPL are:

- 144-C: machine shop area
- 145-C: cubicle area
- 146-C: kitchen area
- 150-C: kitchen area
- 152-C: machine shop area

The sub-slab-depressurization systems (SSDSs) in the Building C basement area and the Building A plating shop were shut down approximately 24 hours before sampling began. The SSDSs were restarted within one hour after sampling had been completed in Buildings A and C; this is consistent with previous monitoring episodes. The following observations were recorded during the August 2016 sampling:

- Mean outdoor ambient temperature during the sampling period was 84 degrees Fahrenheit (°F) on August 16 and 17, 2016. Barometric pressure decreased during the sampling period, from 30.20 inches of mercury (in. Hg) to 30.05 in. Hg. Wind direction on August 16 was from the south–southeast, and average wind speed ranged from calm to 16 miles per hour (mph). Wind direction on August 17 was from the west–southwest, with wind speeds ranging from six to 16 mph and gusts up to 22 mph. Skies were mostly cloudy on August 16 and August 17.

- No precipitation was recorded on August 16; 0.96 inches of rain was recorded on August 17.

- Water was in the flush-mounted vault at sampling location SV-018A, so a sample could not be collected. An alternate sample was collected at nearby location SV-116A.

- IA and SV samples from 118-A were collected in the bond layup room, where a positive-pressure air-conditioning system was operating.

- Sampling location 015-A is in the former plating shop area. Subsequent to the August 2015 sampling round, this area has undergone construction and redevelopment. A new floor was installed and the area is now an extension of the bond layup room. IA and SV samples from

015-A were collected in this newly expanded bond layup room (the former plating shop), where a positive-pressure air-conditioning system was operating.

- Sampling location 076-A was approximately 20 feet away from a flammable materials storage cabinet and hazardous waste drum containing rags.

- The air-purifying units in the Building A basement were operating when IA/SV-093-A and IA/SV-138-A were sampled.

- Building A is a one-story building, except for a basement corridor under an open-air loading dock on its western side. Roof vents approximately 50 feet above the work floor were open in Building A during Round 21 sampling. The large doors at the loading docks on the western side of the building were also open to permit movement of carts, forklifts, personnel, and equipment. Increased ventilation associated with the open doors and roof vents might have affected sample concentrations on the first floor of Building A. No personnel or other activities were observed in the Building A basement.

- The bay doors across the southern end of Building B were open during sampling. The automatic bay door at the southeastern corner of Building B was opened and closed quickly to allow carts and equipment to pass. These open doors might have affected the concentrations collected from the southernmost sampling locations (IA-100-B and IA-101-B). Open roof vents were also observed in Building B during sampling.

- Sampling location IA-130C/SV-130C (in the museum storage area) was covered by a large airplane engine and therefore could not be sampled; an alternate sample was collected at nearby location IA-131C/SV-131C, farther south within the museum's caged area.

- IA and SV samples at 001-C and 004-C were collected approximately 70 feet from a bay door that was opened to the outside intermittently.

- IA-005-C was collected approximately 80 feet from a bay door that opened to the outside intermittently.

- Samples IA-144-C through IA-146-C and IA-150-C and IA-152-C were collected in a positive-pressure, air-conditioned room (RMS MPL machine shop).

- Insufficient volume was collected in the Summa® canister for sample IA-060-C due to a faulty regulator. This sample was not analyzed by the laboratory due to insufficient sample volume/integrity.

- The Building C basement is generally accessed via two doors on the eastern side and one on the southern side. These are automatic rolling doors that open and close quickly to allow carts and forklifts to pass. The automatic rolling door approximately 40 feet east of sampling location 141-C was opened and closed intermittently during the day. The bay doors at the southern and southeastern sides of the Building C basement were open during the sampling period. This might have influenced indoor air concentrations in the samples collected from location 001-C, 004-C, and 005-C.

- The southern end of the Building C basement is now vacant and has been cleared of stored materials, workstations, and equipment. These items have been relocated to the drop-hammer building at MRC.

- Samples IA-060-C and SV-131-C/SV-DUP01-C, which were not analyzed by the laboratory, were not deemed critical and therefore were not resampled. No additional resampling was required, as no TCE concentrations were detected above its industrial screening level of 8.8 micrograms per cubic meter ($\mu g/m^3$) in August 2016.

- The highest number of personnel and the most activity observed at the MRC were in Building B, in locations from the thrust-reverser assembly area in the southern portion of the building to the machining area in the central portion. Less activity was observed in Building A; activity there was generally focused in the expanded bond-layup room (former plating shop area) and autoclave areas, and in the parts and assembly areas. No activity was observed in the southern portion of Building C. Light activity (three people) was observed in the machine shop area in Building C basement.

- The pressure gauges on most Summa® canisters responded instantaneously upon opening the valve by dropping to between ~28 and ~30 in. Hg. The pressure gauges for samples SV-131-C/SV-DUP01-C (constricted by water) did not drop in the field and stayed at −30 in. Hg. Of the remaining Summa® canisters, all but three pressure gauges had a remaining pressure between zero and ~5 in. Hg: sample IA-076-A had a remaining pressure of ~15 in. Hg; sample IA-065-C had a remaining pressure of −6 in. Hg; and sample SV-100-B had a remaining pressure of −6 in. Hg. These three canisters, despite the elevated remaining pressure, did have adequate volume and were analyzed by the laboratory. The laboratory reported inadequate sample volumes had been collected to analyze samples SV-131-C/SV-DUP01-C, as described above, so they were not analyzed. Pressure readings for the Summa® canisters are recorded on the chain of custody forms (Appendix A).

Samples were analyzed for the current target-compound list, last amended on February 12, 2012:

- benzene
- carbon tetrachloride
- chlorodifluoromethane (Freon 22)
- chloroform
- dichlorodifluoromethane
- 1,1-dichloroethane (1,1-DCA)
- 1,2-dichloroethane (1,2-DCA)
- 1,1-dichloroethene (1,1-DCE)
- *cis*-1,2-dichloroethene (*cis*-1,2-DCE)
- *trans*-1,2-dichloroethene (*trans*-1,2-DCE)
- ethylbenzene
- naphthalene
- tetrachloroethene (PCE)
- toluene
- 1,2,4-trichlorobenzene
- 1,1,1-trichloroethane (1,1,1-TCA)
- 1,2,3-trimethylbenzene (1,2,3-TMB)
- 1,2,4-trimethylbenzene (1,2,4-TMB)
- 1,3,5-trimethylbenzene (1,3,5-TMB)
- trichloroethene (TCE)
- 1,1,2-trichloroethane (1,1,2-TCA)
- vinyl chloride (VC)

- methyl-tertiary-butyl ether (MTBE)
- methylene chloride
- xylenes (total)

All samples collected during Round 21 were submitted to TestAmerica in Knoxville, Tennessee for analysis via gas chromatograph/mass spectrometer (GC/MS) using cryogenic concentration (as described in Sections 9 and 10 of USEPA Method [Toxic Organic-15] TO-15 [USEPA, 1999]). This method was used because of its low detection limit (in the parts-per-billion by volume range), and because it can quantify all VOCs of concern. TestAmerica is certified in USEPA Method TO-15 analysis and meets all quality assurance/quality control requirements specified in the TO-15 methodology.

All samples were stored at ambient temperatures and shipped to the laboratory via overnight carrier. All samples were submitted and analyzed within the method's specified 30-day holding time. All appropriate chain of custody documentation was completed for each sample (see Appendix A). A table listing TestAmerica's method detection-limits is in Appendix B; Appendix C contains the laboratory analytical reports. Data-validation reports and supporting documentation are in Appendix D.

Analytical data were qualified in accordance with USEPA *National Functional Guidelines for Superfund Organic Methods Data Review* (USEPA, 2014). Attaching data qualifiers to analytical results signifies a quality-control noncompliance. During Round 21, the following data qualifiers were applied to nonconforming data (i.e., data affected by technical limitations during laboratory analysis) after validation:

- *J*—indicates an estimated result below the reporting limit or an estimated result greater than the reporting limit with a quality control nonconformance.
- *U*—indicates the chemical was not detected at the numerical detection limit (i.e., the sample-specific quantitation limit).
- UJ—indicates the chemical was not detected at the (estimated) numerical detection limit (i.e., the sample-specific quantitation limit).

No results were rejected during data validation.

Section 3
Round 21 Results

All analytical results for indoor-air-quality (IAQ) and background (ambient air) samples were compared to screening levels for industrial air; these levels are based on United States Environmental Protection Agency (USEPA) *Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites* (USEPA, 2016). Screening the chemicals of concern (COC) uses the lower of the carcinogenic (*c*) or noncarcinogenic (*nc*) values. Carcinogenic values are based on a 1×10^{-5} (i.e., a one-in-100,000 probability) excess cancer-risk, whereas the noncarcinogenic values are based on a hazard quotient of 1 (i.e., the "no adverse effect" level).

These risk benchmarks were selected in accordance with Maryland Department of the Environment (MDE) requirements. The screening level for 1,2,3-trimethylbenzene was used as a surrogate for 1,3,5-trimethylbenzene, because USEPA has not published an industrial-air RSL for this chemical. Analytical results were also compared to (federal) Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits.

Sub-slab-vapor (SV) sampling results were compared to SV screening values derived in accordance with the methods discussed in Appendix D of USEPA guidance for evaluating vapor intrusion (USEPA, 2002) and were calculated by dividing indoor air (IA) screening levels by a conservative attenuation factor (AF) of 0.03. The attenuation factor represents the adjustment applied to IA screening levels to account for concentration reductions due to diffusive, advective, and/or other attenuating mechanisms as vapor migrates from the sub-slab to indoor air. Simply stated, SV is expected to dilute upon movement into IA; the AF is the ratio of the IA concentration to its SV concentration, under a conservative vapor intrusion (VI) scenario. The most recent USEPA guidance (USEPA, 2015) confirms that an AF of 0.03 is appropriate; this value results in higher SV screening values, as compared to those used for sampling rounds before August 2012,

when an earlier USEPA AF of 0.1 was used. USEPA further acknowledges that applying the AF of 0.03 to industrial buildings is conservative, since the value was developed based on residential vapor intrusion studies, and does not account for industrial buildings that generally have thicker building slabs and stronger heating/ventilation/air-conditioning (HVAC) systems than residential homes.

3.1 ROUND 21 DATA ANALYSIS

The sampling-round designation (R21) is not included when identifying samples or sampling locations in the following text or tables, because all data discussed in this section are from Round 21. For example, an IA sample collected from VMP 076 (e.g., sample IA-076-A-R21) is referred to as "076-A." If comparisons are made to specific samples from previous sampling rounds, they will be identified as such in the text or by using the round-designation suffix (e.g., R06 for Round 6).

Descriptive statistics for Round 21 IAQ and SV samples are shown in Tables 3-1 and 3-2, respectively. Summary statistics for trichloroethene (TCE and naphthalene in IA over time are shown in Tables 3-3 and 3-4, respectively. Figures 3-1, 3-2, and 3-3 show Round 21 exceedances in Buildings A, B, and C, respectively. The following chemicals were detected in Round 21 IAQ and/or SV samples at concentrations exceeding their respective MDE industrial risk-management benchmarks:

- ***IA—***naphthalene
- ***SV—***TCE and vinyl chloride (VC)

Building A—Tables 3-5 and 3-6 present Building A IAQ and SV results, respectively. Locations with exceedances are shown in Figure 3-1. Naphthalene in IA exceeded its screening level (3.6 µg/m^3) at location 018-A in both the original and duplicate sample (12 and 15 µg/m^3, respectively). No other IA concentrations exceeded screening levels during Round 21.

TCE has periodically been detected in IA in the Building A basement, beginning with Round 15, at concentrations greater than the IA screening level of 8.8 µg/m^3. TCE was detected in each of the Round 21 Building A sampling locations 093-A (6.0 µg/m^3) and 138-A (2.7 µg/m^3), but at concentrations less than its screening level.

TCE SV exceeded its screening level (293 µg/m^3) at two locations, 118-A (890 µg/m^3) and 136-A (850 µg/m^3), in the central portion of Building A. TCE SV exceedances were also observed at these two locations during Rounds 18 through 20. TCE concentrations detected during Round 21 are less than those detected during Round 20, at some locations by an order of magnitude (i.e., a power of 10) or more.

Building B—Tables 3-7 and 3-8 present Building B IAQ and SV results, respectively. No IA or SV exceedances were noted in Building B during Round 21.

Building C—Tables 3-9 and 3-10 present Building C IAQ and SV results, respectively. No IA exceedances were detected in Round 21 samples. TCE exceedances in SV were noted for three locations: 001-C (900 µg/m^3); 113-C (320 µg/m^3); and 126-C (890 µg/m^3). A VC exceedance (5,000 µg/m^3), as compared to its screening level (933 µg/m^3), also occurred at 126-C. TCE at location 001-C also exceeded its screening level during Round 20, and the concentration detected at this location during Round 21 exceeds that detected during Round 20 (350 µg/m^3). VC exceedances were also noted in SV at location 126-C during Rounds 18 through 20: Round 18 at 1,310 µg/m^3, Round 19 at 16,000 µg/m^3, and Round 20 at 3,100 µg/m^3. TCE SV exceedances in Building C during Round 21 are sporadic, and do not follow an observable pattern. However, VC exceedances in SV have consistently been observed at location 126-C during recent sampling rounds (i.e., in Rounds 12–21).

3.2 BACKGROUND AMBIENT-AIR SAMPLES

Outdoor-air-quality (i.e., background) samples provide baseline concentrations for COC that can be compared to interior concentrations. Comparison to background indicates whether chemicals detected in IA are more likely associated with an exterior (i.e., background) or interior source (e.g., chemicals used in the workplace, past spills of chemicals absorbed to above-slab building materials, or sub-slab sources). Analytical results for Round 21 ambient (background) air samples are shown in Table 3-11. Figure 2-1 shows the background sampling locations used for Round 21; these locations are sufficiently far from site operations to avoid any possible site influence.

Table 3-12 lists chemicals detected in background samples and compares IA concentrations to the maximum detected background concentration. All chemicals detected in background samples were also detected in IA samples. All background concentrations were below their respective screening

criteria. Table 3-12 evaluates whether or not chemical concentrations detected in IA are possibly due to interior sources, or if they simply reflect background conditions, using the following logic:

- When IA concentrations are equal to or less than background concentrations, IA concentrations likely reflect background conditions.
- When IA concentrations are greater than background concentrations and/or sub-slab concentrations, other interior sources are possibly contributing to IA concentrations.
- The presence of chlorinated degradation-products in IA samples (at concentrations less than those detected in SV samples), but not in the background samples, suggests that sub-slab sources may contribute to these IA concentrations.

In Round 21, only two IA concentrations of naphthalene (a sample and duplicate at one location) exceeded the MDE risk-management benchmark. Naphthalene was not detected in background samples and its SV concentrations were less than the VI screening level. Therefore, naphthalene in IA is more likely to be due to indoor air sources. SV concentrations of TCE and VC exceed risk-management benchmarks. VC was not detected in IA during Round 21, and concentrations of TCE detected in IA do not exceed benchmarks. TCE and VC were not detected in background samples, indicating that any concentrations of these chemicals detected in indoor air are not likely attributable to background.

Although concentrations of TCE in IA in the Building A basement are less than screening levels, this VOC in IA may be due to vapor intrusion or indoor air sources. The SV concentrations for all remaining IA contaminants are less than screening levels; their IA concentrations span a range above and below background concentrations. As presented in Table 3-12, chemicals with the majority of detections below background (chlorodifluoromethane, dichlorodifluoromethane, methylene chloride, and toluene) are likely influenced by ambient background sources. The remaining IA contaminants might be due to indoor air sources and/or ambient background conditions, but in any case, were below screening levels during Round 21.

A shaded maximum background value indicates that the maximum detected value from the site data exceeds the maximum background value.

A bolded chemical name indicates that the chemical exceeds background and the industrial air RSL based on an HQ of 0.1 or an ILCR of 1×10^{-6}.

A bolded/shaded chemical name indicates the chemical exceeds background and the industrial air RSL based on an HQ of 1 or an ILCR of 1×10^{-5}

Footnotes:

1 - Sample and duplicate are considered two separate samples when determining the minimum and maximum concentrations but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding screening criteria.

2 - Values presented are sample-specific quantitation limits.

3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.

4 - Exceedance counts are based on detected results only.

5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, May 2016. RSLs for carcinogens were adjusted to be based on a lifetime cancer risk of 1E-05. RSLs for noncarcinogens were not adjusted and represent a hazard quotient (HQ) of 1.

6 - Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit (PEL).

7 - The value for 1,2,3-trimethylbenzene is presented for 1,3,5-trimethylbenzene.

Definitions:

ca = screening value based on 1×10^{-5} carcinogenic risk
HQ - hazard quotient
ILCR - incremental lifetime cancer risk
J - estimated value
µg/m^3 - micrograms per cubic meter
N = National Institute for Occupational Safety and Health Recommer
NA - not applicable/not available
nc = noncarcinogenic screening values based on noncarcinogenic haz
ND - not detected
OSHA - Occupational Safety and Health Administration
PEL - permissable exposure limit
RSL - regional screening level
USEPA - United States Environmental Protection Agency

A bolded chemical name indicates that the chemical exceeds the industrial air RSL divided by 0.03 (based on an HQ of 0.1 or an ILCR of 1×10^{-6}).

A bolded/shaded chemical name indicates that the chemical exceeds the industrial air RSL divided by 0.03 (based on an HQ of 1 or an ILCR of 1×10^{-5}).

Footnotes:

1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations, but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding criteria.

2 - Values presented are sample-specific quantitation limits.

3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.

4 - Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor 0.03, and correspond to a target cancer risk level of 1.0E-05 or a hazard quotient (HQ) of 1.

5 - Exceedance counts are based on detected results only.

6 - The value for 1,2,3-trimethylbenzene is presented for 1,3,5-trimethylbenzene.

Definitions:

-- = no criterion available

ca = screening value based on carcinogenic effects

HQ = hazard quotient

ILCR = incremental lifetime cancer risk

J = estimated value

NA = not available

nc = screening value based on noncarcinogenic effects

RSL = regional screening level

All results are in µg/m^3.

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the non-carcinogenic industrial air regional screening level corresponding to HI = 1 (USEPA, May 2016).

(6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.

(7) The maximum detected concentration of 36 µg/m^3 was detected in a duplicate sample, and the corresponding original sample concentration of 0.75 µg/m^3 is considerably less than the maximum concentration. Resampling at the same location found concentrations that were closer to the original sample concentration.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are less than three detections; therefore, a UCL is not presented.

Definitions:

HI - hazard index
ILCR - incremental lifetime cancer risk
J - estimated value
µg/m^3 - micrograms per cubic meter
NA - not applicable/not available
UCL - upper confidence limit
USEPA - United States Environmental Protection Agency

A benchmark of 8.8 µg/m^3 corresponds to HI = 1.

All results are in µg/m^3.

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the carcinogenic industrial air regional screening level corresponding to 1×10^{-5} risk level (USEPA, May 2016).

(6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.

(7) There are less than three detections; therefore, a UCL is not presented.

(8) There are less than five samples; therefore, a UCL is not presented.

Definitions:

HI - hazard index

ILCR - incremental lifetime cancer risk

J - estimated value

µg/m^3 - micrograms per cubic meter

UCL - upper confidence limit

USEPA - United States Environmental Protection Agency

U = nondetect
UJ = non-detected value is estimated
ca = screening value based on carcinogenic effects
nc = screening value based on noncarcinogenic effects
(1) Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor of 0.03, and correspond to a target cancer risk level of 1×10^{-5}.
(2) Value is for 1,2,3-trimethylbenzene.

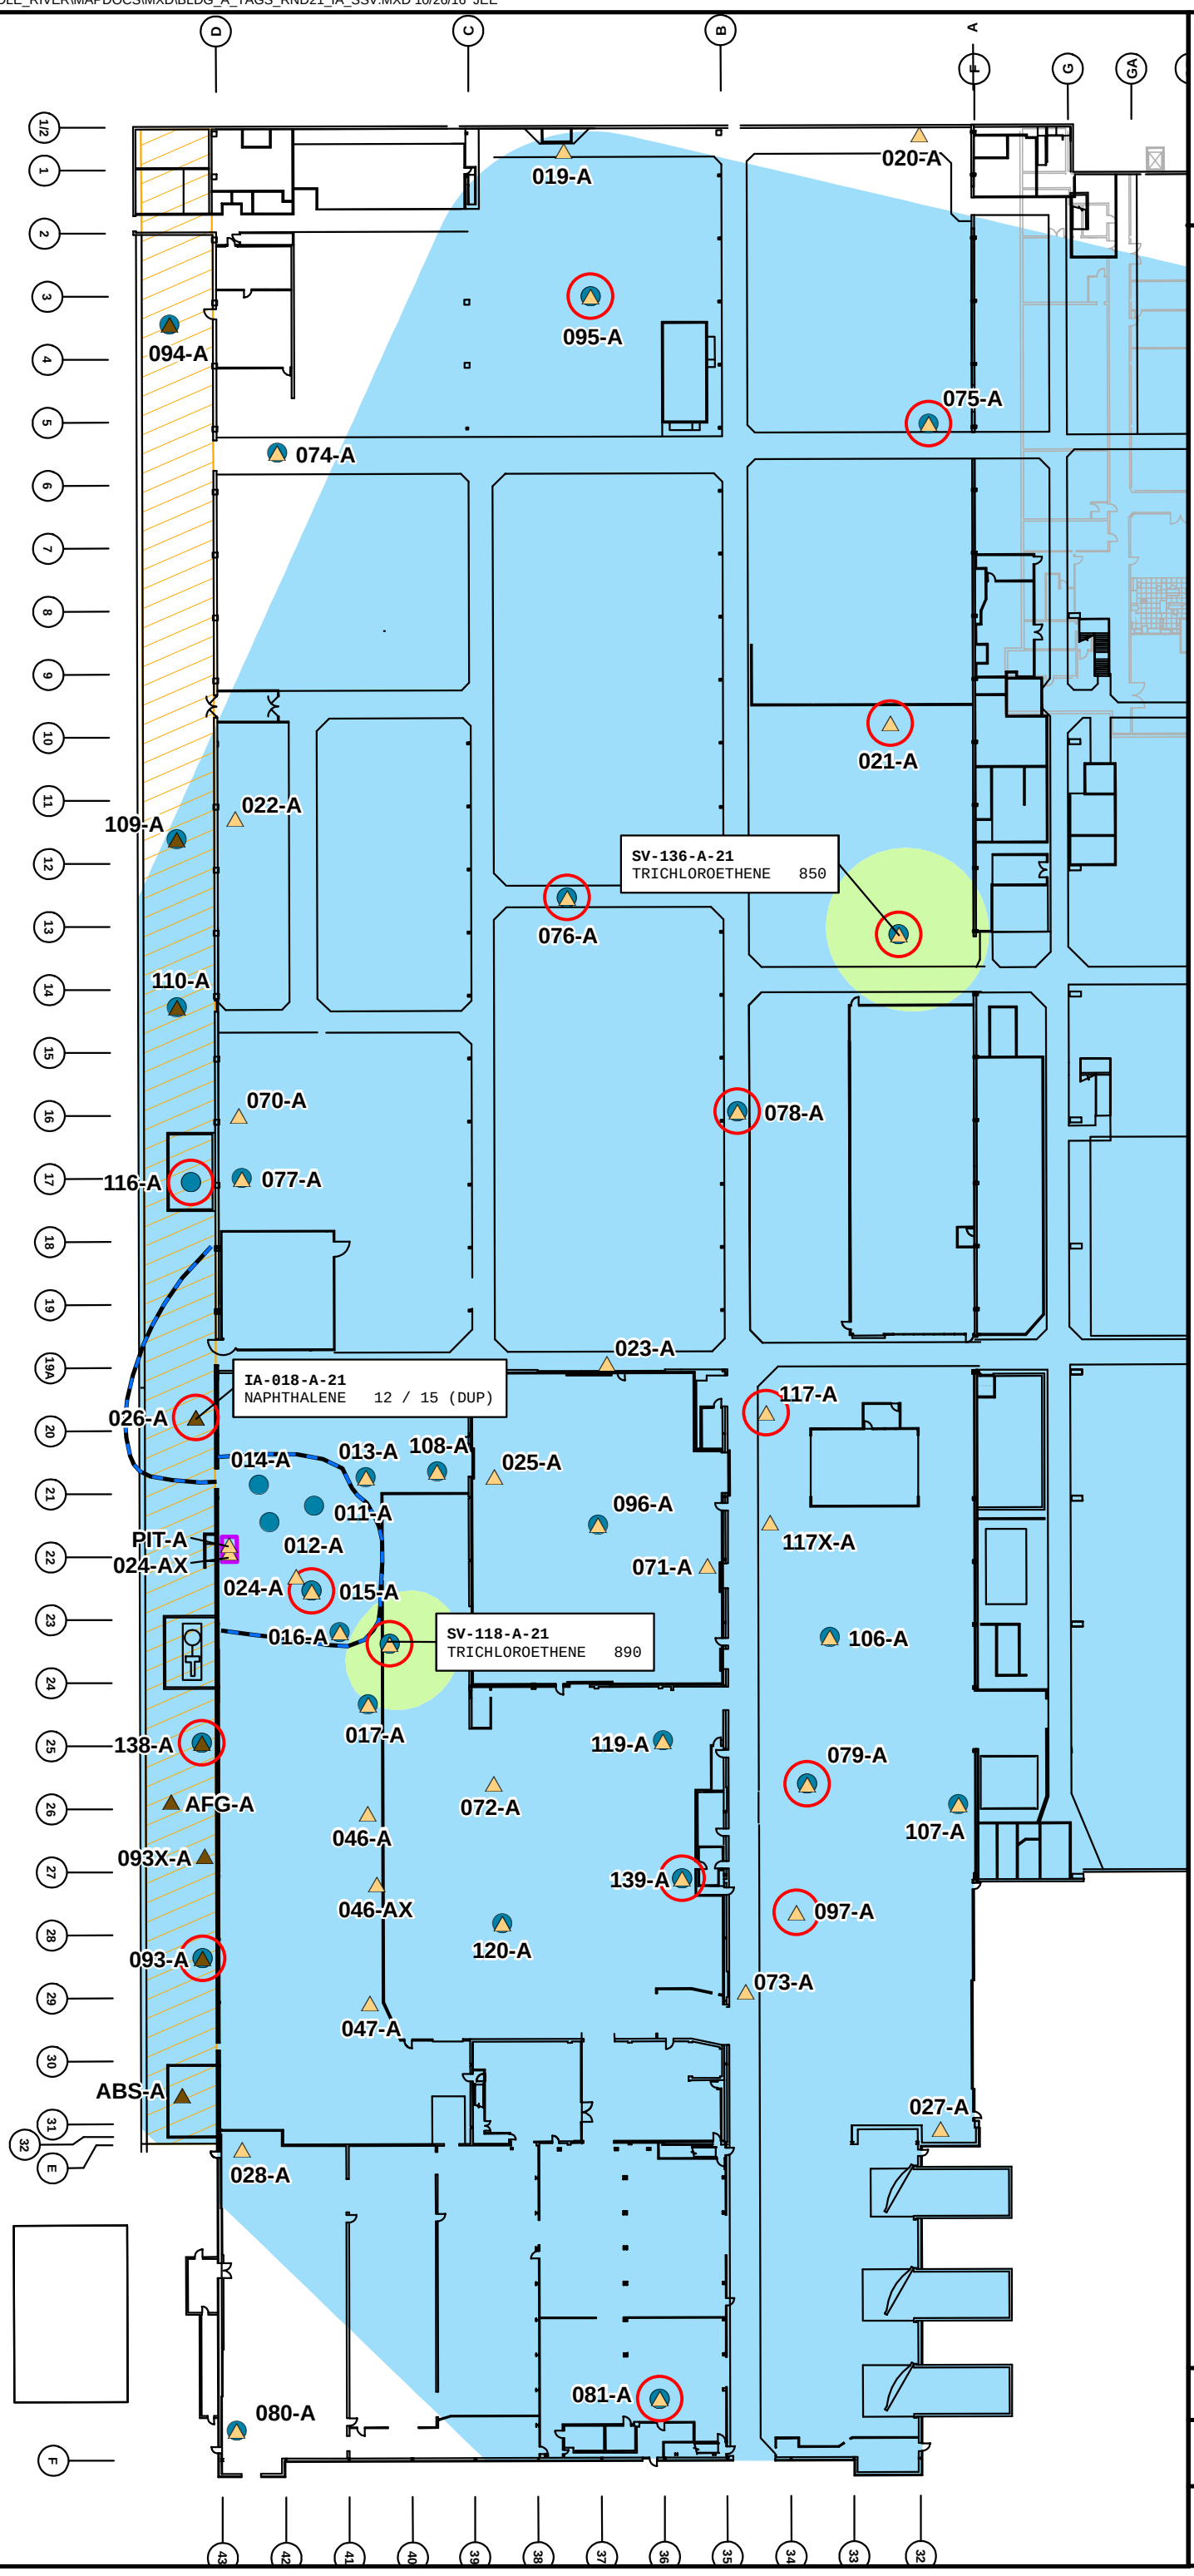
TOTAL XYLENES	3.8	36	37	28	0	9

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration, but are considered one sample when determining the number of samples with detects and the number of samples less than, equal to, or greater than background.



(2) If one sample in a duplicate pair was greater/equal to background and the other sample in the duplicate pair was less than background, the maximum detected concentration in the field duplicate pair was used to represent the field duplicate pair.

There are a total of four background samples and 40 indoor air samples for Round 21.

Section 4
Sub-Slab-Depressurization-System Data Analysis

This section summarizes the operation and monitoring activities for the sub-slab-depressurization (SSD) systems in Buildings A and C for the reporting period from April 1 to September 30, 2016. A detailed account of these activities is in the October 14, 2016 remedial action progress report (Appendix E). The location and layout of the SSD systems, and associated sub-slab-vapor (SV) extraction points and vapor monitoring points (VMPs), are shown in Figures 1, 2, and 4 of Appendix E. This section discusses SV sampling results, extraction points, system influent, vacuum influence, and performance of the SSD systems.

4.1 SUB-SLAB-VAPOR MONITORING POINTS

Tables 4-1 and 4-2 summarize the concentrations of target volatile organic compounds (VOCs) detected at SV monitoring points to date in the Building A lay-up room (the former plating shop on the main floor), basement, and eastern area (on the main floor), and in the Building C basement, respectively. VMPs 079-A and 136-A, both in the eastern area of Building A, recently were added to Table 4-1, as they are in the area of the Building A SSD-system second-phase expansion that was completed in April 2016.

4.1.1 Building A

SV samples collected to date near the Building A SSD-system are listed in Table 4-3. SV VMP 015-A (on the main floor of Building A) and 018-A (in the basement) have been sampled regularly as part of the facility-wide semiannual sub-slab and indoor-air monitoring program (see Figure 2 in Appendix E), but VMP 018-A has not been sampled since February 2014 because water had collected in the flush-mounted vault. Both 015-A and 018-A are within the measured SSD-system radius of influence.

The highest trichloroethene (TCE) concentrations detected at SV VMPs 015-A and 018-A, 079-A, and 136-A before and after the SSD-systems began operation are shown in Table 4-4. The concentrations detected in August 2016 at these VMPs are one to three orders of magnitude (i.e., 10–1,000 times) lower than the concentrations detected before the systems began operation.

While a significant decline has been observed at 015-A overall, TCE concentrations continue to fluctuate over time. For example, TCE was detected at an estimated 112 micrograms per cubic meter air ($\mu g/m^3$) in February 2015, but at 1,300 $\mu g/m^3$ in August 2015 (Figure 4-1). VOC-impacted groundwater likely provides a continuing VOC source in soil vapor at 015-A. Similar fluctuations have also occurred at 018-A, where SV TCE was detected at the following concentrations between August 2011 and February 2014 (Figure 4-2):

- 7.2 $\mu g/m^3$ in August 2011
- 800,000 $\mu g/m^3$ in October 2011
- 95,000 $\mu g/m^3$ in February 2013
- 28,000*J* $\mu g/m^3$ (estimated) in August 2013
- 174 $\mu g/m^3$ in February 2014

Concentrations observed after SSD startup are generally lower than concentrations detected before the system began operation. VOC reductions at 018-A (in the basement) might be more limited than those observed at the main floor VMPs, because the shallow groundwater table (frequently less than one foot below the basement slab) possibly impedes vapor flow. VMPs near new system-extraction points were sampled in August 2016 for the first time since system expansion; each showed significant VOC-concentration decreases since the May 2016 startup in comparison to February 2016 (pre-startup) results. The results of future sampling rounds will be used to determine if this decrease is due to SSD-system operation.

4.1.2 Building C

SV samples collected to date near the Building C SSD-system are listed in Table 4-5. These points are within 100 feet of the Building C SSD-system extraction points in the basement; most of the following sampling locations:

- 001-C
- 113-C
- SSD-4-C
- 127-C
- 060-C
- 133-C

- 135-C
- 149-C
- 152-C
- 153-C
- 155-C
- 156-C

are within the vacuum influence of SSD-system operations. SV VMPs 001-C and SSD-4-C (in the southern basement area) and the following locations were sampled in August 2016 (see Figure 4 in Appendix E):

- 060-C
- 088-C
- 152-C
- 126-C
- 149-C
- 155-C (in the mid-basement area)
- 153-C
- 113-C

The highest TCE concentrations were observed at VMPs near the SSD system before it began operation. The most recent concentrations (sampled during SSD-system operation) are summarized in Table 4-6. The August 2016 TCE concentrations are lower than the concentrations measured before SSD-system startup. Compared to the concentrations measured in the previous semiannual event (February 2016), VMP 060-C has a lower TCE concentration, and the following VMPs have higher TCE concentrations (see Table 4-2):

- 001-C
- SSD-4-C
- 088-C
- 113-C
- 126-C
- 149-C
- 152-C
- 153-C
- 155-C

Concentrations of vinyl chloride (VC) observed at 126-C have also decreased since the SSD-system expansion (see Figure 4-3). VC concentrations in sub-slab vapor at 126-C have varied over time, as shown on Figure 4-3. The reason for these fluctuations is difficult to determine. VC has not been detected in SSD-system-influent samples or in groundwater samples collected from a nearby well pair (MW-88A/B).

4.2 SUB-SLAB-VAPOR EXTRACTION POINTS

The Building A and Building C sub-slab-vapor extraction points are not sampled as part of the semiannual monitoring program, as the combined influent for the Building A system is sampled monthly and every two months for the Building C system. Figure 2 in Appendix E shows the locations of the Building A extraction points: North, South, Basement North, and Basement South horizontal-extraction laterals, and vertical extraction points SSD-34-A, SSD-35-A, SSD-36-A,

SSD-37-A, and SSD-38-A. Figure 4 in Appendix E shows the Building C extraction points, all vertical: SSD-21-C, SSD-23-C, SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C.

During this reporting period, the new extraction points in Building A (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, and SSD-38-A) were sampled in April 2016 as part of the second-phase expansion start-up. TCE concentrations at these extraction points were as follows:

- SSD-34-A = 8,900 $\mu g/m^3$
- SSD-35-A = 13,320 $\mu g/m^3$
- SSD-36-A = 36 $\mu g/m^3$
- SSD-37-A = 85 $\mu g/m^3$
- SSD-38-A = 55 $\mu g/m^3$

4.3 VACUUM INFLUENCE

Induced vacuum levels over time for sub-slab VMPs in the targeted areas are shown on the following figures in Appendix E:

- Figure 6
  (Building A lay-up room and basement)
- Figure 7
  (Building A eastern area)
- Figure 8
  (Building C southern basement area)
- Figure 9
  (Building C mid-basement area)

Representative vacuum measurements from the September 7, 2016 monitoring episode are indicated on plan views on Figures 10, 11, 12, and 13 of Appendix E. Vacuum influence associated with SSD-system VMPs is checked biweekly. The target vacuum is 0.01 inches of water column or greater. As indicated in the October 2016 progress report (Appendix E), extraction trenches near the Building A lay-up room induce a vacuum equal to or greater than 0.01-inches water column over an approximately 3,800-square-foot area; this area encompasses all SV monitoring points that had high levels of VOCs before system startup. The trenches in the Building A basement induce a vacuum over an approximately 2,000-square-foot area that encompasses two of four VMPs used to measure the SSD-system-induced vacuum in the basement. Induced vacuum has not been consistent at the other basement points, possibly because of high groundwater levels (typically one foot or less below the slab). The extraction wells in the eastern area of Building A induce a vacuum over an approximately 6,100-square-foot-area, and encompass nine of 14 VMPS used to measure the SSD-system-induced vacuum in that area.

The Building C basement wells induce vacuum influence over an approximately 4,000-square-foot area in the southern end of the basement, whereas the extraction wells in the mid-basement area induce vacuum influence over an approximately 32,000-square-foot area. In the mid-basement, 14 of 21 monitoring points are within the target area shown to have vacuum influence. Vacuum influence has not been observed at the northern end of the mid-basement area; possible reasons include high groundwater levels, subsurface preferential pathways, short-circuiting, and/or blockages. However, VOC concentrations at VMP 126-C (outside the area of demonstrated vacuum influence) have decreased by more than 85% since the system was expanded in May 2013.

4.4 INFLUENT-VAPOR SAMPLES

Influent-vapor samples are collected monthly to monitor the Building A SSD-system operation, and bimonthly to monitor the Building C system. VOC concentrations at the granular activated-carbon (GAC) influent, midpoint (after the lead drum), and effluent (after the second drum) points are monitored to determine when the midpoint concentration reaches 50% of the influent; when the 50% breakthrough is reached, or at Tetra Tech's discretion with concurrence from Lockheed Martin, the lead GAC drum is changed out. These samples also allow monitoring of influent-concentration trends over time. Samples were collected directly from all three sampling ports of both SSD-systems by connecting a clean one-liter Summa® canister (batch certified) to the Teflon® tubing of each sampling port and opening the valve for approximately one minute. Samples were submitted to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee for VOC analysis using United States Environmental Protection Agency (USEPA) Toxic Organic Method (TO-15).

Tables 4-7A and 4-7B summarize the influent-vapor concentrations of target VOCs in samples over time (from system startup in March 2008 through September 2016). These results are displayed graphically on Figures 14 and 15 in Appendix E. Tables 4-3A and 4-3B provide average influent-concentrations for the current (April to September 2016) and previous (October 2015 to March 2016) reporting periods. The six-month average-influent VOC concentrations in Buildings A and C during the current reporting period (1,913 µg/m^3 and 146 µg/m^3, respectively) are similar to those observed during the previous semiannual reporting period (1,679 µg/m^3 and 89 µg/m^3, respectively). Overall, influent VOC concentrations for both SSD systems have been relatively stable or slowly decreasing since 2009 (see Figures 14 and 15 in Appendix E).

The key goal of the SSD systems is to maintain a negative pressure below the slab (relative to the room space), thus minimizing the migration of VOCs from the sub-slab soil into indoor air. VOC-mass removal occurs while vapor is drawn out to maintain the vacuum. VOC removal rates for SSD-system influent-mass in Building A ranged from 0.032 to 0.081 pounds per day (lbs/day); these rates are higher than the removal rates (0.013 to 0.027 lbs/day) observed in the previous semiannual reporting period, most likely due to the second-phase system expansion. The Building A system has removed 8.3 pounds (lbs) of VOCs during this reporting period, 3.7 lbs in the previous reporting period, and 141 lbs since system startup in March 2008.

VOC removal rates in Building C during the current reporting period ranged between 0.060 lbs/month and 0.096 lbs/month; these rates are higher than the removal rates (0.026 to 0.088 lbs/month) observed during the previous semiannual reporting period. The Building C SSD-system has removed 0.45 lbs of VOCs this reporting period, 0.25 lbs in the previous reporting period, and 11 lbs since system startup in March 2008.

4.5 SYSTEM PERFORMANCE

In general, flow rates and induced vacuums for the SSD-systems are performing as designed, except for a lack of induced vacuum near SSD-136-A in the eastern area of Building A, and near SSD-29-C and SSD-34-C in the northern portion of the mid-basement area of Building C. We will continue to monitor system induced-vacuum performance; however, due to heterogeneous structure and water accumulation expected in the subsurface of old structures, it is not unusual that some localized areas are not amenable to induced vacuum. The induced-vacuum influence of the Building A system is at least 0.05-inches water column over 3,800-square-feet on the main floor (encompassing the lay-up room), 2,000-square-feet in the basement, and 6,100-square-feet in the eastern area. The induced-vacuum influence of at least 0.05-inches water column of the Building C SSD-system extends over an approximately 4,000-square-foot area in the southern basement, and over approximately 32,000-square-feet in the mid-basement area.

Notes:

Data presented in this table is from sub-slab vapor samples.
VOC = volatile organic compound
SSDS = sub-slab depressurization system
µg/m^3 = micrograms per cubic meter
- = not detected (below detection limit)
NA = compound not reported
J = estimated value
J+ = estimated value, may be biased high
K = value is biased high
NS = not sampled
N/A = sampling data for this location not previously included in this table

Notes:

Data presented in this table is from sub-slab vapor samples.

VOC = volatile organic compound
SSDS = sub-slab depressurization system
µg/m^3 = micrograms per cubic meter
- = not detected (below detection limit)
DL = diluted analysis
NS = not sampled

J = estimated value
J+ = estimated value, may be biased high
K = value is biased high
L = value is biased low
NA = compound not reported
NA = compound not reported

Notes:
- —point(s) not sampled.
N/A—point may have been sampled but the results were not applicable to the SSD-system
Points with an “SSD” designation were installed and are monitored for the SSD-system
Points without the SSD designation are used for the vapor-intrusion monitoring program.

TABLE 4-4

TRICHLOROETHENE CONCENTRATIONS BEFORE AND DURING SSDS OPERATION, BUILDING A LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND

Vapor Monitoring Point	*Before SSD-system operation**		*During SSD-system operation (most recent concentration)*	
	Date	*Sub-Slab Vapor Concentration ($\mu g/m^3$)*	*Date*	*Sub-Slab Vapor Concentration ($\mu g/m^3$)*
015-A	April 2007	326,000	August 2016	35 *J*
018-A	August 2010	64,000	February 2014	174
079-A	February 2016	3,500	August 2016	120
136-A	February 2016	35,300	August 2016	850

Notes:

*SSD-system startup for the main floor of Building A (015-A) was in March 2008, for the Building A basement (018-A) in October 2010, and April 2016 for the Building A eastern area (079-A and 136-A).

$\mu g/m^3$—microgram(s) per cubic meter air

J—estimated value

SSD—sub-slab depressurization

Notes:
- —point(s) not sampled
N/A—point may have been sampled but the results were not applicable to the SSD-syste
Points with an “SSD” designation were installed and are monitored for the SSD-syste
Points without the SSD designation are used for the vapor-intrusion monitoring progra

155-C	Not Sampled		August 2016	1.4

Notes:

*SSD-system startup in the south end of the Building C basement was in March 2008.

**SSD-system startup in the mid-basement area of Building C was in May 2013.

$\mu g/m^3$—microgram(s) per cubic meter air

J—estimated value

SSD—sub-slab depressurization

Conclusions and Recommendations

5.1 CONCLUSIONS

Tetra Tech, Inc. (Tetra Tech) has completed Round 21 of vapor intrusion monitoring (the second of two scheduled for 2016) in Buildings A, B, and C at the Middle River Complex (MRC) (owned by LMC Properties, Inc.) in Middle River, Maryland. This ongoing investigation seeks to evaluate whether volatile organic compounds (VOCs) in sub-slab-vapor (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air (IA) at the Middle River Complex facilities. The data set is comprised of indoor air and sub-slab-vapor (SV) samples collected in August 2016. Ambient air samples were also collected at four outdoor background locations around the perimeter of the Middle River Complex. All data were validated to ensure compliance with analytical method requirements.

Indoor air quality (IAQ) data were compared to risk-based screening levels for industrial air set at the 1×10^{-5} (i.e., one-in-100,000 probability) risk level for carcinogens, at a hazard quotient of 1 for noncarcinogens (as published in the United States Environmental Protection Agency [USEPA] *Regional Screening Levels for Chemical Contaminants at Superfund Sites* [USEPA, 2016]), and at (federal) Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits. SV data were compared to screening values derived using methods described in *Draft Guidance for Evaluating the Vapor Intrusion to Indoor-Air Pathway from Groundwater and Soils* (USEPA, 2002) by applying an attenuation factor of 0.03 to the indoor-air screening-values.

Historically, trichloroethene (TCE) and naphthalene have been the prevalent contaminants of concern in indoor air at this site; however, only two naphthalene exceedances (in an original and

its duplicate sample) at one location (Building A) were detected in indoor air samples during Round 21. Trichloroethene was detected below its screening level in indoor air in Buildings A and C, and was not detected in Building B (see plan view in Figure 5-1). Trichloroethene was detected in seven of 40 indoor air samples in Round 21; detections were observed in Buildings A and C. Naphthalene was detected in IA above its screening level in Building A, but at levels less than its screening level in Building C. Naphthalene was not detected in indoor air in Building B. Naphthalene was detected in six of 40 indoor air samples in Round 21; these detections were observed in Buildings A and C.

5.1.1 BUILDING A

Historically, trichloroethene in indoor air has exceeded its screening level at location 093-A in the Building A basement. The maximum detected TCE concentration (six micrograms per cubic meter [$\mu g/m^3$]) during Round 21 was at this location. Indoor air exceedances of trichloroethene at location 093-A occurred between August 2013 and September 2014. During Round 16 (February 2014), a trichloroethene concentration of 87 $\mu g/m^3$ was measured above a nearby floor grate using the hand-held hazardous air *p*ollutants on-*site* (HAPSITE) field instrument. (For comparison, trichloroethene laboratory-analyzed concentrations of 5.9 $\mu g/m^3$ and 8.4 $\mu g/m^3$ were observed at locations 093-A and 093X-A, respectively, during conventional sampling in Round 16). Trichloroethene exceedances were observed in all samples collected from location 093-A during Round 17 (in August supplemental sampling, September sampling, and October 2014 resampling), with little variability. These results indicate that the floor grate might serve as a preferential vapor-intrusion pathway to this part of Building A.

Additional information about the underground network in the Building A basement was obtained during a recent interview with EMCOR, the on-site maintenance contractor. Many of the floor sumps and drains were historically used to manage groundwater infiltration. Sumps collected infiltrated groundwater and pumped it out of the basement. Several large sumps were used to prevent water intrusion into large air handlers that once sat directly on top of the sumps. These air handlers pumped air through large diameter heat tunnels and corridors in the Building A basement's eastern wall; these tunnels extend back under the main floor of Building A. These sumps may also connect to pipes that carry the air to other parts of the building. This network provides a preferential pathway to transfer contaminants in indoor air. Groundwater in the basement sumps is pumped back to Lift Station #5 (located farther north in the Building A

basement) and is then discharged to the sanitary system. Several floor drains in this area also drain groundwater from the basement floor; they are connected to the storm-drain system that provides a direct pathway to Cow Pen Creek.

The consistent presence of trichloroethene at concentrations that fluctuate above and below its indoor-air screening level in the Building A basement led to the installation of three indoor-air filter-units in January 2015. Each unit filters 300 cubic feet of indoor air per minute. Trichloroethene concentrations in this area during the last four sampling rounds have been less than the indoor air screening level, but have generally been increasing. Indoor air concentrations of trichloroethene detected at 093-A during additional sampling in January 2015 (before the filters were installed) were 3.6–8.3 $\mu g/m^3$; the highest concentration in that range is just below the screening level (8.8 $\mu g/m^3$). After filter installation, the trichloroethene concentrations at 093-A during Round 18 in February 2015 (1.5 $\mu g/m^3$), during Round 19 in August 2015 (3.3 $\mu g/m^3$), during Round 20 in February 2016 (6.4 $\mu g/m^3$), and during Round 21 in August 2016 (6 $\mu g/m^3$), did not exceed the screening level.

A trichloroethene exceedance at nearby basement location 138-A was noted in Building A indoor air samples during Round 20. However, when the same location was resampled one month later, the trichloroethene concentration was less than its screening level. Note that, historically, trichloroethene has not exceeded its screening level in indoor air at location 138-A (Figure 5-3). However, the initial exceedance at this location during Round 20 indicates that a source continues to contribute trichloroethene to indoor air, despite the air filtration units in the basement. During Round 21, trichloroethene was detected (2.7 $\mu g/m^3$) at location 138-A, but its concentration did not exceed its screening level.

Figure 5-2 shows trichloroethene concentrations at location 093-A for regular sampling rounds (i.e., excluding additional January 2015 samples) over time, beginning when it was first sampled in August 2010. This graph suggests that trichloroethene concentrations in this area were increasing over time. However, the reduction in trichloroethene concentrations to below their indoor-air screening level during Rounds 18 through 21 might be due to the use of indoor-air filtration units that were in operation during sampling. The ongoing study of groundwater, sub-slab vapor, indoor air, and the network of sumps and pipes may improve our understanding of how trichloroethene migrates into the building.

The sub-slab-depressurization system in Building A appears to be operating as designed, and appears to be effectively mitigating sub-slab-vapor intrusion from known source areas of sub-slab-vapor contamination, in concert with the indoor-air filtration units. Contaminants are constantly removed from soil vapor during system operation, and indoor air concentrations in the main part of Building A excluding the basement rarely exceed screening values. The operation and maintenance manual for the Building A SSDS has been updated to include biweekly inspections of the air-filter units. Filter cartridges are changed out quarterly; no other maintenance is required. Although basement occupancy is intermittent, this area will continue to be monitored as the sub-slab-depressurization system continues to operate.

Although below the screening level in indoor air, trichloroethene was detected in Building A sub-slab vapor at concentrations exceeding the sub-slab-vapor screening level during Round 21. Trichloroethene exceeded its screening level at locations 118-A and 136-A. Sub-slab-vapor concentrations of trichloroethene in samples collected from location 136-A have been consistently greater than its screening level.

The Round 21 trichloroethene sub-slab-vapor concentration detected at 136-A (850 $\mu g/m^3$) is almost three times greater than the screening level (293 $\mu g/m^3$), but is two orders of magnitude less than the concentrations detected at that location during the previous round (37,000 $\mu g/m^3$ in the original sample, and 33,000 $\mu g/m^3$ in the duplicate sample). Historical sub-slab-vapor exceedances of trichloroethene have been consistently detected at location 079-A, but the concentration at 079-A during Round 21 (120 $\mu g/m^3$) did not exceed the screening level. Locations 079-A and 136-A are in the eastern portion of Building A in the central and southern areas of the building, respectively. These locations have been within the zone of influence from the new second-phase expansion of the Building A SSDS since installation in February 2016. Historical trichloroethene concentrations in sub-slab vapor have also exceeded screening levels at location 118-A, which is in the southwestern portion of Building A, and some historical exceedances have also been detected at nearby location 015-A. These two locations are within the zone of influence from the original SSDS that was installed in 2008.

During Round 21, a trichloroethene sub-slab-vapor exceedance was detected at location 118-A (890 $\mu g/m^3$), but the concentration detected at location 015-A (35 $\mu g/m^3$) did not exceed the screening level (293 $\mu g/m^3$). Elevated trichloroethene concentrations in sub-slab vapor suggest

that vapor intrusion into indoor air is possible; however, indoor air concentrations of trichloroethene did not exceed the screening level during Round 21. These results indicate that the sub-slab-depressurization system is effective in preventing vapor intrusion in Building A. Figures 5-4A, 5-4B and 5-4C display the Round 21 sub-slab-vapor and indoor-air concentrations from the basement and first floor in Building A for chemicals that exceed their screening levels.

Chloroform (at location 136-A) was detected in sub-slab vapor at concentrations greater than its screening level during Round 20, but concentrations of chloroform detected in indoor air and sub-slab vapor during Round 21 did not exceed screening levels. Naphthalene (at location 075-A) exceeded its sub-slab-vapor screening level during Round 19, but the concentration at the same location during Rounds 20 (100 µg/m^3) and 21 (110*J* µg/m^3) did not exceed the screening level. However, indoor air naphthalene concentrations (12 µg/m^3 for the original sample, and 15 µg/m^3 for the duplicate) at location 018-A did exceed the screening level (3.6 µg/m^3) during Round 21.

In summary, trichloroethene in indoor air has historically exceeded its screening level at location 093-A in the Building A basement, and previous investigation results indicate that the nearby floor grate might serve as a preferential vapor intrusion pathway. The consistent presence of trichloroethene at concentrations that fluctuate above and below its indoor-air screening level in the Building A basement led to the installation of three indoor-air filter units in January 2015. After filter installation, indoor air trichloroethene concentrations at 093-A during the following four sampling rounds did not exceed the screening level, possibly due to the use of indoor-air filtration units that were in operation during sampling. However, an exceedance of the trichloroethene indoor air screening level at a nearby location during Round 20 indicates that a source continues to contribute trichloroethene to indoor air, despite the operation of the air filtration units in the basement.

Trichloroethene was detected in Building A sub-slab vapor at concentrations exceeding the screening level during Round 21 at two locations. The sub-slab-depressurization system in Building A appears to be operating as designed, and appears to be effectively mitigating sub-slab-vapor intrusion from known source areas of sub-slab-vapor contamination, in concert with the indoor-air filtration units. Indoor-air naphthalene concentrations at one location exceeded the screening level during Round 21; however, sub-slab-vapor naphthalene concentrations did not exceed the screening level.

5.1.2 BUILDING B

No exceedances were noted in Building B indoor air or sub-slab-vapor samples during Round 21, Round 20, or Round 19. Historically, during Round 18, only one slight exceedance of naphthalene was noted in Building B indoor air; this concentration only marginally exceeded its screening level. No exceedances were noted in Building B indoor air or sub-slab-vapor samples during Round 17.

5.1.3 BUILDING C

Trichloroethene, and vinyl chloride (VC) were detected in Building C sub-slab vapor at concentrations greater than screening levels during Round 21, but no chemicals exceeded their screening levels in Building C indoor air. Comparison of the two graphs in Figures 5-5A and 5-5B shows sub-slab vapor and indoor air concentrations of trichloroethene and vinyl chloride in Building C. Trichloroethene was infrequently detected in indoor air samples collected from Building C during Round 21 (Figure 5-5B).

Trichloroethene was detected in only three of 21 indoor air samples, at a maximum concentration of 1.3 µg/m^3 (at location 145-C). During Round 20, the only detection of trichloroethene (1.3 µg/m^3) was also at this location. Trichloroethene was not detected at 149-C, where the highest concentrations were detected in Round 19 (1.1 µg/m^3), Round 18 (8.6 µg/m^3), and Round 17 (1.8 µg/m^3). However, all of these concentrations were less than its screening level (8.8 µg/m^3).

Although trichloroethene has been routinely detected in indoor air in Building C, its concentrations have not typically exceeded its screening level. The only exception (a concentration of 20 µg/m^3) occurred during Round 15 at sampling location 144-C, which is in the machine shop of the Rotary and Mission Systems (RMS) mechanical prototype lab (MPL). A trace concentration (0.43 µg/m^3) of trichloroethene was detected nearby at location 128-C during Round 18. The Round 15 exceedance possibly resulted from an indoor source, because the room was air-conditioned and under positive pressure, making it extremely unlikely that sub-slab vapor had migrated into the room. No indoor air exceedances of trichloroethene were detected in the machine shop or elsewhere in Building C during Rounds 19, 20, or 21.

During Round 18, tetrachloroethene (PCE) was detected at a concentration (870 µg/m^3) greater than its indoor-air screening level (180 µg/m^3) in a resample (but not in the original sample)

collected from indoor air at location 149-C. Before Round 18, tetrachloroethene had never been detected in Building C indoor air or sub-slab vapor at concentrations greater than its screening levels. Additionally, concentrations of tetrachloroethene detected in Rounds 19, 20, and 21 indoor air and sub-slab-vapor samples did not exceed screening levels. In most sub-slab-vapor samples collected over the course of the investigation, from locations at and near location 149-C, concentrations of tetrachloroethene are typically below detection limits. The preponderance of evidence suggests that the elevated tetrachloroethene concentration at location 149-C during Round 18 is anomalous and possibly attributable to some indoor air source rather than vapor intrusion.

Concentrations of vinyl chloride detected in sub-slab vapor at 126-C have decreased since the SSD-system expansion, but have varied over time. The vinyl chloride concentration detected at location 126-C during Round 21 (5,000 µg/m^3) is greater than those detected during Rounds 16 through 18, and 20, but is less than the concentration detected during Round 15 (28,000 µg/m3) and Round 19 (16,000 µg/m^3). Vinyl chloride's sub-slab screening level is 933 µg/m^3. Trichloroethene concentrations up to 1,500 micrograms per liter have been detected in groundwater near 126-C, but vinyl chloride has not been detected in groundwater. The 126-C area might be affected by groundwater fluctuation (depth to groundwater is between four and five feet), but its correlation to vinyl chloride concentrations is difficult to determine. In general, sub-slab-vapor concentrations of volatile organic compounds have decreased in the southern basement area (SSD-4-C) of Building C since system startup in March 2008. Vapor monitoring points (060-C, 088-C, 113-C, 126-C, 133-C, and 135-C) in the mid-basement area also show lower concentrations, as compared to results before system expansion in May 2013.

5.2 RECOMMENDATIONS

Results of the August 2016 Round 21 vapor intrusion investigation at Buildings A, B, and C lead us to the following recommendations:

- Operation of the sub-slab-depressurization systems in Buildings A and C should continue.
- Continue semiannual indoor-air-quality/sub-slab-vapor monitoring to evaluate possible vapor intrusion and assess the performance/effectiveness of the existing mitigation systems. Monitoring results will be used to evaluate the control and reduction (if occurring) of known sources, to identify new sources (if present), and help determine if additional mitigation or sub-slab-depressurization-system modifications are needed. Locations within

the Building C sub-slab-depressurization-system areas of influence should continue to be monitored to evaluate whether the recent system expansion affects contaminant concentrations.

- Continue routine semiannual monitoring of indoor air and sub-slab soil-vapor to evaluate concentrations of tetrachloroethene in the Building C museum area near location 149-C. The absence of tetrachloroethene concentrations greater than screening levels in indoor air and sub-slab vapor near this location suggests that the Round 18 exceedance is most likely an anomaly.

- Evaluate ways to reduce trichloroethene concentrations in the Building A basement. Trichloroethene may result from venting through storm drains, tunnels, or walls, rather than or in addition to beneath the floor slab. Therefore, sealing the floor drain (if sealing does not cause other problems) might further reduce indoor air concentrations of trichloroethene. Expanding the influence of the existing sub-slab-depressurization system in this area may be ineffective, because the water table there is high. Despite continuous operation of the air-filtration units in this area, trichloroethene is still being detected near or above its IA screening concentration. Increased air exchange and ventilation should be considered in this area to further reduce indoor air concentrations of trichloroethene.

- Continue to investigate conditions in the Building A basement. An expanded investigation program is currently in preparation. The investigation objective is to define the vapor-intrusion conceptual site-model through incorporation of groundwater contamination, soil vapor, indoor air and the open drains, and other preferential pathways in the basement as possible.

OVERVIEW

The sample set for LMC - MRC, SDG 140-5667-1, consists of twenty-three (23) indoor air environmental samples. All samples were analyzed for select volatile organic compounds (VOC). Two (2) field duplicate sample pairs were included in this SDG: IA-131-C-21 (original) / IA-DUP01-C-21 (duplicate), and IA-153-C-21 (original) / IA-DUP02-C-21 (duplicate).

The samples were collected by Tetra Tech, Inc. on August 16, 2016 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The initial calibration performed on 06/22/16 on instrument MJ had a percent relative standard deviation (%RSD) that was greater than the 30% quality control limit for naphthalene. Samples IA-131-C-21, IA-DUP01-C-21, IA-004-C-21, IA-102-C-21, IA-155-C-21, IA-153-C-21, IA-115-C-21, IA-152-C-21, IA-144-C-21, IA-145-C-21, IA-150-C-21, IA-051-C-21, IA-065-C-21, IA-113-C-21, IA-142-C-21, and IA-DUP02-C-21 were affected. Detected and non-detected results for naphthalene were qualified as estimated (J and UJ, respectively) in the affected samples.

- The continuing calibration performed on 08/24/16 at 11:57 on instrument MJ had a percent difference (%D) for naphthalene that was greater than the 30% quality control limit. Samples IA-131-C-21, IA-DUP01-C-21, IA-004-C-21, IA-102-C-21, IA-155-C-21, IA-153-C-21, IA-115-C-21, IA-152-C-21, IA-144-C-21, IA-145-C-21, IA-150-C-21, IA-051-C-21, IA-065-C-21, IA-113-C-21, IA-142-C-21, and IA-DUP02-C-21 were affected. Detected and non-detected results for

naphthalene were qualified as estimated (J and UJ, respectively) in the affected samples.

- The relative percent difference (RPD) for toluene exceeded the 50% quality control limit in the field duplicate pair IA-131-C-21 / IA-DUP01-C-21. The detected results for toluene were qualified as estimated (J) in samples IA-131-C-21 and IA-DUP01-C-21 due to field duplicate imprecision.

- Detected results reported below the reporting limit (RL) limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

The laboratory case narrative report includes the following notes about sample receipt:

- "The container for sample IA-DUP01-C-21 (140-5667-2) did not match the information listed on the Chain-of-Custody (COC). The COC showed canister ID as 10309; the canister ID was11309." The discrepancy appears to be a transcription error. No action was required.

- "Sample IA-060-C-21 (140-5667-10) was received with the canister valve in the open position. The sample was at ambient pressure (approximately 0 psi). The sample integrity could have been jeopardized due to changes in ambient pressure after the sample was taken (i.e., ambient air not associated with the sampling event could have been introduced into the canister at any point after the sampling was completed). The client was contacted and instructed the lab to cancel analysis of the sample."

Sample IA-060-C-21 was listed on the chain of custody but was not analyzed, as explained in the laboratory case narrative note above.

Non-detected results were reported to the MDL.

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

The following analyte was detected in the method blanks at the following maximum concentration:

Analyte	Maximum Concentration
1,1,1-Trichloroethane	0.157 ug/m^3 (1)

1 – Maximum concentration detected in method blank associated with preparation batch 140-6409 affecting samples IA-131-C-21, IA-DUP01-C-21, IA-004-C-21, IA-102-C-21, IA-155-C-21, IA-153-C-21, IA-115-C-21, IA-152-C-21, IA-144-C-21, IA-145-C-21, IA-150-C-21, IA-051-C-21, IA-065-C-21, IA-113-C-21, IA-142-C-21, and IA-DUP02-C-21.

An action level of the maximum concentration was used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were considered in evaluating for blank contamination. No action was necessary, as detected results for 1,1,1-trichloroethane were greater than the action levels for the affected samples.

EXECUTIVE SUMMARY

Laboratory Performance: Some detected and non-detected naphthalene results were qualified due to calibration noncompliance.

Other Factors Affecting Data Quality: Field duplicate imprecision was noted for one analyte in one field

duplicate pairs. Results above the MDL but below the RL were estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Superfund Organic Methods Data Review" (August 2014) and EPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-5667-1

Receipt
The samples were received on 8/22/2016 at 9:00 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions
The container for sample IA-DUP01-C-21 (140-5667-2) did not match the information listed on the Chain-of-Custody (COC). The COC showed canister ID as 10309; the canister ID was11309.

Sample IA-060-C-21 (140-5667-10) was received with the canister valve in the open position. The sample was at ambient pressure (approximately 0 psi). The sample integrity could have been jeopardized due to changes in ambient pressure after the sample was taken (i.e., ambient air not associated with the sampling event could have been introduced into the canister at any point after the sampling was completed). The client was contacted and instructed the lab to cancel analysis of the sample.

Air - GC/MS VOA
Method(s) TO 15 LL, TO-15: Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

Method(s) TO 15 LL, TO-14A, TO-15: This report includes canister certification data for the batch certified and/or individually certified canisters used to collect samples as well as for any canisters used for dilution of those samples. All of the canisters used for sample collection or sample dilution for this job were certified to be clean to the levels listed on the results page. Please note that results for individually certified canisters that were not used for sample collection or sample dilution may also be included in the report because these canisters were in the same cleaning batch as the canisters used for this project. Since these canisters were not used for this job, the results have no bearing on the sample results.

Method(s) D1946, TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method(s) TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-6409 exhibited % difference of > 30% for naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	N/A	This is checked in the lab.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	N/A	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

OVERVIEW

The sample set for LMC - MRC, SDG 140-5668-1, consists of twenty-six (26) indoor air/soil vapor environmental samples. All samples were analyzed for select volatile organic compounds (VOC). Three (3) field duplicate sample pairs were included in this SDG: IA-018-A-21 (original) / IA-DUP03-A-21 (duplicate), IA-139-A-21 (original) / IA-DUP04-A-21 (duplicate), and SV-153-C-21 (original) / SV-DUP02-C-21 (duplicate).

The samples were collected by Tetra Tech, Inc. on August 16 and 17, 2016 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 08/26/16 at 10:40 on instrument ME had a percent difference (%D) for naphthalene that was greater than the 30% quality control limit. Samples SV-001-C-21, SV-126-C-21, SV-004-C-21, SV-102-C-21, SV-155-C-21, SV-153-C-21, SV-DUP02-C-21, SV-060-C-21, SV-152-C-21, SV-150-C-21, SV-149-C-21, and SV-113-C-21 were affected. Detected and non-detected results for naphthalene were qualified as estimated (J and UJ, respectively) in the affected samples.

- The relative percent difference (RPD) for methylene chloride exceeded the 50% quality control limit in the field duplicate pair IA-018-A-21 / IA-DUP03-A-21. The detected results for methylene chloride were qualified as estimated (J) in samples IA-018-A-21 / IA-DUP03-A-21 due to field

duplicate imprecision.

- The RPD for methylene chloride exceeded the 50% quality control limit in the field duplicate pair SV-153-C-21 / SV-DUP02-C-21. The detected results for methylene chloride were qualified as estimated (J) in samples SV-153-C-21 and SV-DUP02-C-21 due to field duplicate imprecision.

- Detected results reported below the reporting limit (RL) limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

The laboratory case narrative report includes the following notes about sample receipt:

- "Samples SV-131-C-21 (140-5668-1) and SV-DUP01-C-21 (140-5668-2) were received with a pressure of - 26 or lower inches of mercury. Flow controllers are set to take approximately 4 to 5 liters of sample. This would result in an ending pressure of approximately - 5 inches of Hg. In order to proceed with analysis, the canister was pressurized due to insufficient sample. This pressurization (dilution) may result in higher reporting limits than desired. All flow controllers are cleaned and verified to be in good working condition prior to being sent to the field. The flow controllers were also checked upon receipt and were confirmed to be working properly. Moisture was noted in the filters. The client was contacted and instructed the lab to cancel analysis."

Samples SV-DUP01-C-21 and SV-113-C-21 were listed on the chain of custody but were not analyzed, as explained in the laboratory case narrative note above.

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

Sample SV-126-C-21 was analyzed at a dilution factor of 4.

Total xylenes in sample SV-060-C-21 exceeded the instrument calibration range in the original analysis. The result from the dilution was within the calibration range and was selected for validation purposes.

Vinyl chloride in sample SV-126-C-21 exceeded the instrument calibration range in the original analysis. The result from the dilution was within the calibration range and was selected for validation purposes.

EXECUTIVE SUMMARY

Laboratory Performance: Some detected and non-detected naphthalene results were qualified due to calibration noncompliance.

Other Factors Affecting Data Quality: Field duplicate imprecision was noted for one analyte in two field duplicate pairs. Results above the MDL but below the RL were estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Superfund Organic Methods Data Review" (August 2014) and EPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Appendix A

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-5668-1

Receipt
The samples were received on 8/22/2016 at 9:00 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions
Samples SV-131-C-21 (140-5668-1) and SV-DUP01-C-21 (140-5668-2) were received with a pressure of - 26 or lower inches of mercury. Flow controllers are set to take approximately 4 to 5 liters of sample. This would result in an ending pressure of approximately - 5 inches of Hg. In order to proceed with analysis, the canister was pressurized due to insufficient sample. This pressurization (dilution) may result in higher reporting limits than desired. All flow controllers are cleaned and verified to be in good working condition prior to being sent to the field. The flow controllers were also checked upon receipt and were confirmed to be working properly. Moisture was noted in the filters. The client was contacted and instructed the lab to cancel analysis.

Air - GC/MS VOA
Method(s) TO 15 LL, TO-15: Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

Method(s) TO 15 LL, TO-14A, TO-15: This report includes canister certification data for the batch certified and/or individually certified canisters used to collect samples as well as for any canisters used for dilution of those samples. All of the canisters used for sample collection or sample dilution for this job were certified to be clean to the levels listed on the results page. Please note that results for individually certified canisters that were not used for sample collection or sample dilution may also be included in the report because these canisters were in the same cleaning batch as the canisters used for this project. Since these canisters were not used for this job, the results have no bearing on the sample results.

Method(s) D1946, TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method(s) TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-6407 exhibited % difference of > 30% for naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	N/A	This is checked in the lab.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	N/A	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

OVERVIEW

The sample set for LMC - MRC, SDG 140-5670-1, consists of thirty (30) indoor air/soil vapor/ambient air environmental samples. All samples were analyzed for select volatile organic compounds (VOC). Two (2) field duplicate sample pairs were included in this SDG: SV-116-A-21 (original) / SV-DUP03-A-21 (duplicate) and SV-139-A-21 (original) / SV-DUP04-A-21 (duplicate).

The samples were collected by Tetra Tech, Inc. on August 16 and 17, 2016 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 08/26/16 at 10:40 on instrument ME had a percent difference (%D) for naphthalene that was greater than the 30% quality control limit. Samples SV-095-A-21 and SV-100-B-21 were affected. Detected and non-detected results for naphthalene were qualified as estimated (J and UJ, respectively) in the affected samples.

- The initial calibration performed on 06/22/2016 on instrument MJ had a percent relative standard deviation (%RSD) for naphthalene that was greater than the 30% quality control limit. Samples SV-139-A-21, SV-DUP04-A-21, SV-079-A-21, SV-078-A-21, SV-136-A-21, SV-076-A-21, SV-075-A-21, SV-101-B-21, BCK-1-21, BCK-2-21, BCK-3-21, BCK-4-21, and SV-081-A-21 were affected. Detected and non-detected results for naphthalene were qualified as estimated (J and

UJ, respectively) in the affected samples.

- The continuing calibration performed on 08/25/16 at 12:56 on instrument MJ had %Ds for 1,2,4-trichlorobenzene and naphthalene that were greater than the 30% quality control limit. Samples SV-139-A-21, SV-DUP04-A-21, SV-079-A-21, SV-078-A-21, SV-136-A-21, SV-076-A-21, SV-075-A-21, SV-101-B-21, BCK-1-21, BCK-2-21, BCK-3-21, BCK-4-21, and SV-081-A-21 were affected. Detected and non-detected results for 1,2,4-trichlorobenzene and naphthalene were qualified as estimated (J and UJ, respectively) in the affected samples.

- The relative percent difference (RPD) for naphthalene exceeded the 50% quality control limit in the field duplicate pair SV-139-A-21 / SV-DUP04-A-21. The detected results for naphthalene were qualified as estimated (J) in samples SV-139-A-21 and SV-DUP04-A-21 due to field duplicate imprecision.

- Detected results reported below the reporting limit (RL) limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

Sample IA-076-A-21 was analyzed at a dilution factor of 2.66.

Sample SV-100-B-21 was analyzed at a dilution factor of 1.76.

Trichloroethene in sample SV-136-A-21 exceeded the instrument calibration range in the original analysis. The result from the dilution was within the calibration range and was selected for validation purposes.

EXECUTIVE SUMMARY

Laboratory Performance: Some detected and non-detected naphthalene results were qualified due to calibration noncompliance.

Other Factors Affecting Data Quality: Field duplicate imprecision was noted for one analyte in one field duplicate pair. Results above the MDL but below the RL were estimated.

The data for these analyses were reviewed with reference to the USEPA “National Functional Guidelines for Superfund Organic Methods Data Review” (August 2014) and EPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-5670-1

Receipt
The samples were received on 8/22/2016 at 9:00 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA
Method(s) TO 15 LL, TO-15: Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

Method(s) TO 15 LL, TO-14A, TO-15: This report includes canister certification data for the batch certified and/or individually certified canisters used to collect samples as well as for any canisters used for dilution of those samples. All of the canisters used for sample collection or sample dilution for this job were certified to be clean to the levels listed on the results page. Please note that results for individually certified canisters that were not used for sample collection or sample dilution may also be included in the report because these canisters were in the same cleaning batch as the canisters used for this project. Since these canisters were not used for this job, the results have no bearing on the sample results.

Method(s) D1946, TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method(s) TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-6398 exhibited % difference of > 30% for naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method(s) TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-6407 exhibited % difference of > 30% for naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method(s) TO 15 LL: Sample SV-015-A-21 (140-5670-14) was diluted due to the abundance of non-target analytes. Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Definitions/Glossary

Client: Tetra Tech, Inc. TestAmerica Job ID: 140-5670-1
Project/Site: MRC SVE/IA - Round 21 - Block I

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Number: 1
Creator: Wilson, Ken

List Source: TestAmerica Knoxville

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	N/A	
Cooler Temperature is recorded.	N/A	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	N/A	This is checked in the lab.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	N/A	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

Section 1
Introduction

1.1 SITE LOCATION AND BACKGROUND INFORMATION

This report documents the monitoring activities completed from April 1 to September 30, 2016 [the 33rd and 34th quarters of operation] for the sub-slab depressurization systems operating in the Building A lay-up room (former plating shop), eastern area, and basement, and the Building C basement of the Lockheed Martin Corporation Middle River Complex in Middle River, Maryland. The locations of the SSD systems are shown on Figure 1. These remedial systems control (by creating a vacuum) and remove volatile organic compounds from sub-slab vapor, thus preventing their migration into indoor air. The systems are operated in accordance with the operation, maintenance, and monitoring manuals for the Building A and Building C systems (Tetra Tech, Inc., 2016a and 2014, respectively).

1.2 DESCRIPTION OF SUB-SLAB DEPRESSURIZATION SYSTEMS

1.2.1 Building A System

The sub-slab depressurization system in Building A includes horizontal and vertical soil vapor extraction points: two horizontal soil vapor extraction laterals in the lay-up room ("North" and "South") and two laterals in the basement ("Basement North" and "Basement South"), and five vertical soil vapor extraction points ("SSD-34-A," SSD-35-A," SSD-36-A," SSD-37-A," and SSD-38-A; see Figure 2).

The soil vapor extraction points serve as conduits for drawing vapor from beneath the building slab, thus mitigating vapor intrusion into indoor air. Sub-slab vapors are pulled through the extraction points using a single 10-horsepower regenerative blower that is mounted on a skid along with a moisture separator, heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). Following extraction, the vapors enter the moisture separator where entrained condensate droplets are removed to reduce potential

fouling of vapor lines and saturation of the vapor-phase carbon. The extracted vapors are cooled as they are pushed through the heat exchanger and are then filtered to remove volatile organic compounds using two 400-pound granular activated-carbon drums, in-series. Vapors are discharged to the atmosphere via an exhaust stack that extends above the roof of the building. Figure 3 shows the process and instrumentation diagram for the Building A sub-slab depressurization system.

The Building A system is also equipped with three pipe sumps (PS-1-A [near SSD-37-A], PS-2-A [near SSD-34-A], and PS-3-A [in the basement]) and one exhaust stack sump. The sumps are installed at low points to allow drainage of condensation in the pipe.

Three IQAir® GC™ Series-GC VOC indoor-air filters also operate in the basement of Building A near vapor monitoring points (VMPs) 093-A, 093 A-X, and 138-A in response to elevated trichloroethene (TCE) concentrations in the indoor air. The filters were installed south of the sub-slab depressurization system extraction laterals on January 9, 2015, and are continuously operated to filter 300 standard cubic feet per minute (SCFM) of air. Each filter consists of a high-efficiency particulate air pre-filter, a granular activated-carbon filter, and a post-filter sleeve (collectively referred to as "filter elements"). The pre-filter (GC™ HyperHEPA® Pre-Filter H11 [S]) weighs three pounds; it removes coarse, fine, and ultra-fine dust particles and protects subsequent filters. The granular activated-carbon filter (GC VOC filter cartridge set) removes volatile organic compounds from indoor air; it is comprised of four granular activated-carbon cartridges, collectively weighing nine pounds. The post-filter sleeve (GC™ post-filter sleeve set) is placed over the granular activated-carbon cartridges, and removes any remaining fine and ultra-fine particulate matter.

1.2.2 Building C System

The sub-slab depressurization system in the Building C basement consists of 11 vertical soil vapor extraction points: two in the southern-basement area (SSD-21-C and SSD-23-C) and nine in the mid-basement area (SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C; see Figure 4). These extraction points serve as conduits for drawing vapor from beneath the building slab, thus creating a vacuum under the floor slab preventing vapor intrusion into indoor air. The vapors are pulled through the extraction points

using a single 7.5-horsepower regenerative blower that is mounted on a skid along with a moisture separator, heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). Following extraction, the vapors enter the first moisture separator (MS-1) where entrained condensate droplets are removed to reduce fouling of the vapor lines and saturation of the granular activated-carbon. The extracted vapors are cooled as they are pushed through the heat exchanger; any remaining extracted condensate droplets are removed via a second moisture separator (MS-2) [separate from the blower skid] before being treated. The vapors are treated by passing through two 400-pound granular activated-carbon drums and one 600-pound potassium permanganate-impregnated zeolite drum (to remove residual vinyl chloride), in-series, before being discharged to the atmosphere via an exhaust stack that extends above the roof of the building (Figure 5).

The Building C system is also equipped with one drain for each granular activated-carbon and potassium permanganate-impregnated zeolite drum, five pipe sumps (PS-1 [near SSD-25-C and column N26], PS-2 [near SSD-30-C and column N26], PS-3 [near SSD-27-C and column O20], PS-4 [near SSD-32-C and column R19], and PS-5 [near SSD-29-C and column V12]), and one exhaust stack sump. The sumps are installed at low points to allow drainage of condensation in the pipe.

Sound generated by the blower and heat exchanger is controlled by a sound-deadening enclosure that surrounds the blower skid. This enclosure has overlapping soundproof curtains supported on a wooden frame; its plywood roof is lined with one-inch-thick foam board. A vent on the side of the enclosure and a duct extending from the heat exchanger to the ceiling of the enclosure facilitate airflow and prevent the system from overheating.

This page intentionally left blank.

Section 2
Site Activities

2.1 BIWEEKLY SYSTEM CHECKS

Biweekly system checks were conducted to monitor the performance of the sub-slab depressurization (SSD) systems and to make necessary adjustments to optimize effectiveness. System checks were conducted between April 1 and June 30, 2016 (the 33rd quarter of operation) on the following dates. System checks in addition to the biweekly system checks were conducted between April and May 2016 as part of the startup of the Building A system expansion. The Building A system expansion is detailed in the *Construction Report, Sub-Slab Depressurization-System Second-Phase Expansion – Building A* prepared by Tetra Tech in May 2016 (Tetra Tech, 2016b).

- April 4 and 7, 2016
- April 13, 2016 (Building A only)
- April 14, 2016 (Building A only)
- April 19, 2016
- April 27, 2016 (Building A only)
- May 4, 2016
- May 12, 2016 (Building A only)
- May 17, 2016
- June 2, 2016
- June 16, 2016
- June 30, 2016

Biweekly system checks were conducted between July 1 and September 30, 2016 (the 34th quarter of operation) on the following dates:

- July 14, 2016
- July 25, 2016
- August 12, 2016
- August 23, 2016
- September 7, 2016
- September 19, 2016

Biweekly system checks were conducted in accordance with the latest operation, maintenance, and monitoring (OM&M) manuals (Tetra Tech, Inc. [Tetra Tech], 2016a and 2014), and

included general system monitoring, vacuum influence monitoring, and any necessary adjustments to extraction laterals and wells. Biweekly system checks forms are in Appendix A.

2.1.1 General System Monitoring

Gauge readings on the blower skid were checked, and the vacuum and velocity at each extraction lateral/well were measured. The condition of system components was also checked, and moisture separators/sumps were emptied as necessary. The following specific tasks were performed:

1. Recorded:
    a. vacuum at pre-air filter
    b. vacuum at post-air filter
    c. pressure at post-blower
    d. temperature at post-blower
    e. temperature at post-heat exchanger
    f. system flow
    g. time counter display (Building C only)
    h. vacuum from each extraction lateral/well
    i. velocity from each extraction lateral/well
    j. vacuum from each vapor monitoring point (VMP)
2. Checked the following for damage, leaks, and/or signs of heat stress:
    a. system components
    b. granular activated-carbon (GAC) drums
    c. potassium permanganate-impregnated zeolite (PPZ) drum (Building C only)
    d. GAC and PPZ fittings and flexible hoses
3. Checked the following for condensate, and drained, as necessary:
    a. moisture separators
    b. pipe sumps
    c. exhaust stack sumps
    d. GAC and PPZ drains
4. Confirmed that zip-ties on the GAC- and PPZ-drum cam locks were present and secure
5. Confirmed that the ambient air valve was closed
6. Confirmed that the vacuum relief valve was closed
7. Noted any adjustments to extraction laterals/wells

8. Checked that flow, pressure, and vacuum gauges fell to zero, and that temperature gauges fell, when systems were turned off

9. Checked each of the three Building A IQAir® GC™ Series-GC indoor air filters to:
    a. verify filter was on
    b. verify fan was running
    c. check control panel for filter-life status
    d. document any signs of tampering

No water was drained from the Building A system during the reporting period. Approximately 0.02 gallons of water were drained from the Building C exhaust stack sump on April 19, 2016.

2.1.2 Vacuum Influence Monitoring

The objective for the SSD systems is to maintain a vacuum of at least 0.01 inches water column (WC) in the targeted areas. The vacuum influence (differential versus indoor air) at sub-slab VMPs was monitored using a dual[1]-port manometer (Fieldpiece Instruments, Inc. model SDMN5). This instrument was used to identify sub-slab-air short-circuiting or other problems (indicated by a significant drop in vacuum at one or more VMPs), and to determine each system's area of influence.

No short-circuiting was identified at the Building A SSD system during this reporting period except for a small hole on the concrete of the North extraction lateral in the lay-up room, which was observed on April 4, 2016. The hole was patched on April 12, 2016, using epoxy. During the reporting period, vacuum influence in the Building A lay-up room consistently[2] exceeded the vacuum influence objective (0.01 inches WC) in seven of eight VMPs (SSD-12-A-X, SSD-11-A-X, SSD-13-A-X, SSD-2-A-X, SSD-15-A-X, SSD-16-A-X, and SSD-3-A-X) with vacuums ranging from 0.18 to 10.57 inches WC. Negative vacuum (pressure) readings were measured at vapor monitoring point SSD-1-A on April 13, April 14, June 2, July 14, and September 7, 2016; pressure readings on these dates indicated higher pressure in the sub-slab than in the indoor air.

[1] Only one port is used for monitoring vacuum influence; the second port is used to measure static pressure.

[2] Exceeded vacuum monitoring objective of 0.01 inches water column at more than half of the biweekly system checks.

In the eastern area of Building A, nine of 14 VMPs (166-A, 167-A, 165-A, 117-A, 164-A, 136-A-S, 136-A, 161-A, and 160-A) consistently exceeded the vacuum influence objective (0.01 inches WC) during the reporting period with vacuums ranging from 0.00 to 3.11 inches WC. Negative vacuum (pressure) readings were measured at VMP 163-A during most biweekly system checks. Induced vacuum has not been observed at 119-A, 121-B, 162-A, or 136-A-N, possibly because of the distance to the nearest extraction point for 119-A and 121-B. The reason for the readings at 162-A, 136-A-N, and 163-A, is not clear but could be related to subsurface preferential pathways and heterogeneity. VPM 162-A was removed on July 14, 2016 after it was found to be loose; the vapor monitoring pin was reinstalled on July 25, 2016. However, during the subsequent system check on August 12, 2016, it was observed that new facility operations in the area made VMP 162-A permanently inaccessible. It will be replaced nearby during the next quarter.

In the Building A basement, two of four VMPs (SSD-21-A and SSD-22-A) consistently exceeded the vacuum influence objective (0.01 inches WC) during the reporting period, with vacuums ranging from 0.01 to 0.54 inches WC. Induced vacuum has not been consistent at the other VMPs (SSD-19-A and SSD-20-A), possibly because of high groundwater levels (typically one foot or less below the slab). Figures 6 and 7 show induced vacuum in Building A over time.

No short-circuiting was identified at the Building C SSD system during this reporting period. Vacuum influence at five of seven VMPs in the southern-basement area of Building C and 14 of 21 VMPs in the mid-basement area consistently exceeded the vacuum influence objective (0.01 inches WC). In the southern-basement area, vacuum influence ranged from 0.00 to 2.82 inches WC in VMPs 001-C, SSD-2-C, SSD-3-C, SSD-4-C, and SSD-24-C. In the mid-basement area, vacuum influence ranged from 0.00 to 3.69 inches WC in VMPs 159-C, 135-C, 113-C, 156-C, 151-C, 149-C, 127-C, 152-C, 060-C, 155-C, 133-C, 154-C, 158-C, and 153-C). Negative vacuum readings (pressure) were measured during some of the monitoring events at SSD-2-C, SSD-24-C, SSD-3-C, 149-C, and 158-C, indicating higher pressure in the sub-slab than in the indoor air. Figures 8 and 9 show induced vacuum in Building C over time.

Induced vacuum measurements indicate that the systems are performing as designed, except near SSD-136-A in the eastern area of Building A and near SSD-29-C and SSD-34-C in the northern end of the Building C mid-basement area. The sub-slab vapor extraction laterals in the

Building A lay-up room induce a vacuum influence over an approximately 3,800-square foot area, and consistently encompass five of six VMPs that had elevated volatile organic compound (VOC) concentrations before system start-up. The extraction laterals in the Building A basement induce a vacuum influence over an approximately 2,000-square foot area, and consistently encompass two of four VMPs that measure the system's induced vacuum in the basement (Figure 10). The vertical extraction points in the eastern area of Building A induce a vacuum influence over an approximately 6,100-square foot area, and consistently encompass nine of 14 VMPs (Figure 11).

In Building C, the sub-slab vapor extraction points in the southern-basement area induce a vacuum influence over an approximately 4,000-square foot area, with five of seven VMPs showing consistent influence (Figure 12). Extraction points in the mid-basement area induce a vacuum influence over an approximately 32,000-square foot area, with 14 of 21 VMPs showing consistent influence (Figure 13). Vacuum influence at the northern end of the mid-basement area has not been apparent during monitoring; possible reasons include high groundwater levels, subsurface preferential pathways, short-circuiting, and/or blockages. However, VOC concentrations at VMP 126-C have decreased by approximately 85 percent (%) since the system was expanded in May 2013.

2.1.3 Adjustments to Extraction Points

Sub-slab soil vapor extraction points were adjusted during the reporting period as follows:

- April 4, 2016: The horizontal sub-slab soil vapor extraction laterals in the Building A lay-up room and basement were adjusted to accommodate the larger blower skid associated with the second-phase expansion completed in May 2016 (Tetra Tech, 2016b).
- April 7, 2016: In Building C, extraction points SSD-30-C and SSD-26-C were each adjusted from 100% open to 25% open to more effectively balance the system.
- April 13-14, 2016: The new vertical extraction points on the eastern area of Building A were opened and adjusted to pull approximately 260 SCFM.
- April 19, 2016: To more effectively balance the expanded Building A system, flow from new extraction point SSD-37-A was reduced.
- May 12, 2016: To more effectively balance the expanded Building A system, flow from new extraction point SSD-36-A was increased.

2.2 VAPOR SAMPLING

Grab vapor samples were collected monthly at Building A and every other month at Building C during the reporting period. Samples were collected from each SSD system at the influent, mid-GAC, and effluent positions of the treatment drums. Samples were collected from the Building A SSD system on April 7, April 27 (per startup of the expanded system), May 12, June 2, July 14, August 4, and September 7, 2016. Samples were collected from the Building C SSD system on May 12, July 14, and September 7, 2016. Samples were collected directly from each sampling port using the following steps:

- A moisture filter was connected to the sampling port on one end, and a piece of Teflon® tubing was attached to the other end.
- A clean, one-liter Summa® canister under vacuum was connected to the tubing, and the canister valve was opened until the canister gauge reached zero or stopped falling (approximately one minute).

Samples were labeled A-INFLUENT, A-MID-GAC, A-EFFLUENT, C-INFLUENT, C-MID-GAC, and C-EFFLUENT and shipped to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee. TestAmerica is accredited through the National Environmental Laboratory Accreditation Program and United States Department of Defense Environmental Laboratory Accreditation Program for VOC analysis by United States Environmental Protection Agency Toxic Organic Method 15 (TO-15).

Laboratory results are summarized in Tables 1 through 6; analytical reports are in Appendix B. During this reporting period, total influent VOC concentrations in Building A ranged from 1,388 micrograms per cubic meter (µg/m^3) (September 2016) to 3,120 µg/m^3 (April 2016), while VOC influent concentrations in Building C ranged from 124 µg/m^3 (September 2016) to 195 µg/m^3 (July 2016). Average influent VOC concentrations in Building A were approximately 14% lower than those observed during the previous reporting period (October 1, 2015 through March 31, 2016), while average influent concentrations for the Building C system were approximately 71% lower.

2.3 QUARTERLY SYSTEM CHECKS

Quarterly system checks were completed on June 24 and September 8, 2016. Quarterly system checks included the following tasks:

1. Inspected the condition of the:
    a. system components
    b. system piping
    c. pre-blower air filter and intake (ambient) air filter; replacing filter(s) as necessary
    d. GAC and PPZ drums
    e. GAC and PPZ drum sample ports
    f. VMP well lids, bolts, and sample tubing
2. Checked that the Building A system shuts down, the control panel alarm lights illuminate, and the auto-dialer activates upon alarms for:
    a. high temperature – post-blower
    b. high temperature – post-heat exchanger
    c. high-water level – moisture separator
    d. high pressure
    e. low vacuum
3. Checked that the Building C system shuts down, the control panel alarm lights illuminate, and the auto-dialer activates upon alarms for:
    a. high temperature – post-blower
    b. high temperature – post-heat exchanger
    c. high-water level – MS-1
    d. high-water level – MS-2
    e. high pressure
    f. low vacuum
4. Checked vacuum relief valves for proper operation
5. Recorded amperage draw on blowers
6. Checked that auto-dialers activate when power is turned off
7. Checked auto-dialer batteries and replaced, as necessary
8. Confirmed that a fire extinguisher is next to each system
9. Vacuumed the underside of the heat exchanger
10. Cleaned the systems and areas around the systems

No issues were identified for Building A or Building C during the quarterly system checks. Both systems are running within the normal operating parameters. Quarterly system checks forms are in Appendix A.

2.4 NON-ROUTINE SYSTEM MAINTENANCE

The following non-routine system maintenance was completed during the reporting period:

- April 12, 2016: As mentioned previously, a small hole in the concrete of the North extraction lateral was sealed with epoxy. Cracks observed in the concrete at extraction points SSD-37-A and SSD-38-A in the eastern area of the Building were also sealed with epoxy to prevent potential system short-circuiting.

- June 2 and June 11, 2016: The underside of the Building A heat exchanger was vacuumed to remove a build-up of dirt/dust, which was triggering the post-heat exchanger high temperature alarm.

- June 24, 2016: An approximately one-foot by one-foot wooden box was constructed and placed underneath the Building A heat exchanger to prevent excessive build-up of dirt/dust.

- July 14 and July 19, 2016: The Building A post-heat exchanger high temperature switch was adjusted after it triggered a high temperature alarm.

- July 20, 2016: The Building A system auto-dialer batteries were replaced after it was discovered that the auto-dialer could not be reached via telephone. The time stamps at both the Building A and Building C systems were corrected.

- July 25, 2016: As indicated previously, the vapor monitoring pin at VMP 162-A was reinstalled after it had come loose and initially could not be reinstalled properly.

- September 7, 2016: The front side of the secondary containment pad outside Building C was reattached after it had come loose and fallen over. This pad is adjacent to the Building C SSD system exhaust stack and is the designated storage area for drums holding spent indoor air filters and condensate drained from the moisture separators and sumps prior to proper off-site disposal.

2.5 GAC AND PPZ CHANGE-OUTS

GAC change-outs were conducted for Building A on April 21, June 2, and September 19, 2016, and on September 29, 2016 for Building C. Change-outs were conducted by removing the lead GAC drum (the spent drum) from the system, moving the lag GAC drum into the lead GAC position, and adding a new GAC drum to the lag GAC position. The Building C PPZ drum was

not changed out during the reporting period. The spent GAC will be returned to the vendor for regeneration.

2.6 SYSTEM SHUTDOWNS

2.6.1 Operator-Controlled Shutdowns

Both systems were briefly turned off during each biweekly system check to: (1) confirm that flow, pressure, and vacuum gauges fall to zero (thereby indicating proper operation), and (2) check and drain (as necessary) condensate accumulation in the moisture separators and sumps. Both systems were also briefly turned off during the quarterly system checks to test proper operation of the fail-safe alarms. In addition, the Building A and Building C SSD systems were shut down on the following days:

- April 12-13, 2016: The Building A system was shut down to fill a hole in the concrete of the North lateral in the layup room, with epoxy. Cracks in the concrete at extraction points SSD-37-A and SSD-38-A in the eastern area of the building were also filled with epoxy to prevent potential system short-circuiting. The system was left off overnight to allow the epoxy to dry. The system was shutdown for approximately 24.7 hours.

- May 11-12, 2016: The Building A system was shutdown for approximately 26.2 hours for a sub-slab sampling event in the basement.

- August 15-16, 2016: The Building C system was shutdown for approximately 31.9 hours for the semi-annual sub-slab vapor sampling event.

- August 16 -17, 2016: The Building A system was shutdown for approximately 32.4 hours for the semi-annual sub-slab vapor sampling event.

2.6.2 Alarms and Other Shutdowns

The following alarms and other shutdowns occurred during the reporting period:

- April 14, 2016: A power loss at the facility caused both the Building A and Building C systems to shutdown. The Building A system self-started[3] once power returned; it is estimated that the system was down for approximately two hours. The Building C

[3] The Building A SSD system only self-restarts after power outages.

system, which does not self-start, was restarted on April 15, 2016 after approximately 12.5 hours.

- May 28, 2016: A post-heat exchanger high temperature alarm caused the Building A system to shutdown for approximately 64.3 hours. Several unsuccessful restarts of the system were attempted on May 29, 2016. On May 31, 2016, the system was restarted successfully without incident. No signs of damage or necessary maintenance were observed.

- June 1, 2016: A post-heat exchanger high temperature alarm caused the Building A system to shutdown for approximately 19.2 hours. An excessive build-up of dirt/dust was observed on the underside of the heat exchanger. The dirt/dust was removed using a shop vacuum and the system was restarted on June 2, 2016.

- June 11, 2016: A post-heat exchanger high temperature alarm caused the Building A system to shutdown for approximately 6.0 hours. Dirt/dust was removed from the underside of the heat exchanger using a shop vacuum and the system was restarted.

- July 14, 2016: A post-heat exchanger high temperature alarm caused the Building A system to shutdown for approximately 1.9 hours. The underside of the heat exchanger was free of dirt/dust, as it had been vacuumed earlier in the day as part of the bi-weekly system checks. The temperature switch setting was observed to be set at 115 degrees Fahrenheit (°F) instead of the desired 140°F. The temperature switch was adjusted to approximately 140°F and the system was successfully restarted.

- July 16, 2016: A power loss at the facility caused both the Building A Building C systems to shutdown. Both systems were restarted on July 17, 2016 after 16.1 and 16.3 hours, respectively.

- July 18, 2016: A post-heat exchanger high temperature alarm alarm caused the Building A system to shutdown for approximately 16.6 hours. The underside of the heat exchanger was free of dirt/dust. The temperature switch was readjusted to 140°F and the system was successfully restarted on July 19, 2016.

- July 25, 2016: A power loss at Building C caused the Building C system to shutdown. The system was restarted after approximately 2.9 hours.

2.6.3 System Uptime

During this reporting period, the Building A and Building C SSD systems were operational for approximately 4,159 hours (95%) and 4,304 hours (99%), respectively. Downtime does not include the brief shutdown periods for biweekly and quarterly system checks.

2.7 REMEDIATION SUMMARY

2.7.1 Building A System

Continuous operation of the SSD system in the Building A lay-up room (former plating shop) began on March 31, 2008; the SSD system was expanded on October 22, 2010 to include the basement and on April 13, 2016 to include select areas on the eastern side of the building. The Building A extraction points are open to allow a combined airflow rate of approximately 260 standard cubic feet per minute (SCFM). Each extraction point operates at an airflow rate of 7–85 SCFM; the system vacuum and flows are adjusted to maintain a vacuum of 0.01 inches water column (WC) or greater at each vapor monitoring point within areas where elevated concentrations of volatile organic compounds (VOCs) are in sub-slab soil.

Since system startup on March 31, 2008, total influent VOC concentrations have decreased more than 98%, from 94,310 µg/m^3 to 1,388 µg/m^3. The addition of the basement extraction laterals in October 2010 did not appear to change influent concentrations. The system expansion in April 2016 including a higher-flow blower and five new vertical extraction points resulted in an increase in Building A influent system concentration for approximately one month. The two main chemicals of concern in Building A are 1,1,1-trichloroethane and trichloroethene (see Table 1). VOCs trends for the Building A system are shown in Tables 1 through 3 and on Figure 14.

VOC mass removal rates (based on influent concentrations) in Building A ranged from 0.032 to 0.081 pounds per day (lbs/day) during this reporting period. The total VOC mass removed was approximately 8.3 pounds; total VOC removal since system startup in March 2008 is approximately 141 pounds. VOC mass removal rates are lower than the levels (20 lbs/day VOCs) that require Maryland Department of Environment (MDE) permitting.

2.7.2 Building C System

Continuous operation of the SSD system in the southern-basement area of Building C began on March 31, 2008; the system was expanded to the mid-basement area in May 2013. Extraction points were installed at locations that maximized vacuum influence (based on startup tests). The total flow rate of the Building C system is approximately 180 SCFM. Extraction well SSD-23-C in the southern-basement area was shut off after the expansion to promote higher flow rates from

the new wells installed in the mid-basement area. Vacuum influence in the southern-basement area is maintained by the operation of well SSD-21-C only. Vacuum influence and flow rates in the mid-basement area have increased and stabilized since system expansion. On November 7, 2013, mid-basement wells SSD-27-C and SSD-32-C were reduced to promote higher flow rates from other extraction wells in the mid-basement area. In April 2016, flows at mid-basement extraction points SSD-26-C and SSD-30-C were also reduced to promote high flows from other extraction points. These efforts have been done in an attempt to improve vacuum influence and VOC mass removal in the northern extraction points.

From system startup on March 31, 2008 to April 8, 2013, and before the system expansion, total influent VOCs had decreased by 99%, from 31,170 µg/m^3 to 117 µg/m^3. VOC concentrations increased to 3,100 µg/m^3 after the system was expanded, but have since decreased to 124 µg/m^3 (a 96% decrease). Trichloroethene is the primary chemical of concern in Building C (see Table 4). VOCs trends for the Building C system are shown in Tables 4 through 6 and on Figure 15.

Mass removal rates for VOCs in Building C during this reporting period ranged from 0.002-0.003 pounds per day, for a total mass of approximately 0.45 pounds. Total VOC removal since system startup in March 2008 is 11 pounds. Building C VOC removal rates are lower than levels requiring MDE permitting (20 lbs/day VOCs, 20 pounds per year vinyl chloride).

2.7.3 Indoor Air Filters in Building A

Three IQAir® GC™ Series-GC indoor air filters operate in the basement of Building A near VMPs 093-A, 093-A-X, and 138-A (south of the SSD system extraction trenches). While in operation, the filters were inspected every two weeks. The high-efficiency particulate air (HEPA) pre-filters, GAC cartridges, and post-filter sleeves were replaced on June 16 and September 8, 2016. The spent filter elements were placed in a dedicated 55–gallon drum in the designated drum storage area adjacent to the Building C SSD system exhaust stack. This waste drum was inspected during the biweekly system checks to ensure it was properly labeled and in good condition. Results from GAC cartridge and post-filter sleeve sampling in June 2015 and HEPA pre-filter sampling in November 2015 indicate that all spent filters can be disposed of as non-hazardous waste.

Section 3
Conclusions and Recommendations

3.1 SYSTEM PERFORMANCE

Induced vacuum measurements indicate that the sub-slab depressurization systems are performing as designed, except near SSD-136-A in the eastern area of Building A and near SSD-29-C and SSD-34-C in the northern end of the Building C mid-basement area. Soil vapor extraction points in the Building A lay-up room induce a vacuum influence over an approximately 3,800-square foot area, and consistently encompass all five vapor monitoring points that had elevated volatile organic compound concentrations before system startup. The soil vapor extraction points in the Building A basement induce a vacuum influence over an approximately 2,000-square foot area that encompasses two of four vapor monitoring points installed to measure the system-induced vacuum in the basement (Figure 10). The soil vapor extraction points in the eastern area of Building A induce a vacuum influence over an approximately 6,100-square foot area, and consistently encompass nine of 14 VMPs used to measure the system-induced vacuum in that area (Figure 11). The soil vapor extraction points in the southern-basement area of Building C induce a vacuum influence over an approximately 4,000-square foot area, with five of seven vapor monitoring points showing influence (Figure 12). The soil vapor extraction points in the mid-basement area of Building C induce a vacuum influence over an estimated 32,000-square foot area, with 14 of 21 vapor monitoring points showing influence (Figure 13).

The sub-slab depressurization systems have removed volatile organic compound mass, and have treated emissions with granular activated-carbon (both buildings) and potassium permanganate-impregnated zeolite (Building C only). A summary of the granular activated-carbon drums used during the lifespan of each system follows:

	Number of granular-activated carbon drums used	
	200-pound drums	400-pound drums
Building A	23	10
Building C	17	4

The 600-pound potassium permanganate-impregnated zeolite drum in Building C has not been changed out since its installation in April 2013. The drum counts listed above do not include the two granular activated-carbon drums currently attached to each system, or the potassium permanganate-impregnated zeolite drum currently attached to the Building C system.

The Building A system has used approximately 61 pounds of granular activated-carbon per pound of volatiles removed, while the Building C system has used approximately 454 pounds of granular activated-carbon per pound of volatiles removed. Note that the removal efficiency of granular activated-carbon is reduced as vapor concentrations decrease. Although influent concentrations of volatile organic compound for both systems have decreased significantly since startup (March 31, 2008), concentration fluctuations have occurred over time (see Figures 14 and 15).

3.2 CONTINUED MONITORING

The Building A and Building C systems will continue to operate during the next semi-annual reporting period (October 1, 2016 through March 31, 2017) so that the vapor migration barrier in both buildings is maintained. Operation, maintenance, and monitoring activities conducted during the next reporting period will include biweekly system checks, quarterly system checks, system maintenance, monthly vapor sampling in Building A, and bimonthly (every other month) vapor sampling in Building C. Granular activated-carbon change-outs will occur when the concentration of the sample collected at the mid-point drum reaches 50 percent of the influent concentration, or as determined based on change-out history and laboratory result trends. Change-out of the potassium permanganate-impregnated zeolite drum is not expected during the next reporting period. The next remedial action progress report will be issued in April 2017.

3.3 FUTURE PLANS

We will continue to examine Building C system influence and sub-slab concentrations to target higher volatile organic compound levels while maintaining vacuum influence. Sampling in

August 2016 indicates significant volatile organic compound concentration reductions at vapor monitoring points in Building A near the new extraction points. We will continue to analyze vacuum influence and concentrations to optimize system operation.

ND - non-detect (below detection limit)

N/A - not applicable (samples not analyzed for compound)

lbs./day - pounds per day

lbs. - pounds

SSD - sub-slab depressurization

OM&M - operation, maintenance, and monitoring

VOCs - volatile organic compounds

scfm - standard cubic feet per minute

TABLE 1

Building A Influent Concentrations (µg/m^3)

LABORATORY DATA SUMMARY

SSD System OM&M, Middle River Complex, Middle River, Maryland

Samples analyzed by EPA Method TO-15

Date	FLOW (scfm)	benzene	carbon tetrachloride	chlorodifluoromethane	chloroform	cis-1,2-dichloroethene	dichlorodifluoromethane	1,1-dichloroethane	1,2-dichloroethane	1,1-dichloroethene	ethylbenzene	methylene chloride	naphthalene	tetrachloroethene	toluene	trans-1,2-dichloroethene	1,1,1-trichloroethane	trichloroethene	trichlorofluoromethane	1,2,3-trimethylbenzene	1,2,4-trimethylbenzene	1,3,5-trimethylbenzene	vinyl chloride	total xylenes	m-xylene & p-xylene	o-xylene	Total VOCs	Mass (lbs./day)	Mass (lbs. removed in period)

µg/m^3 - micrograms per cubic meter

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

E - results exceeded calibration range

B - compound was found in the blank and sample

DL - dilution analysis

EPA - Environmental Protection Agency

TO-15 - Toxic Organic Method 15

Completed first-phase system expansion (to Building A basement) on October 22, 2010.

Completed second-phase system expansion (to eastern area) on April 13, 2016.

Increase in concentrations following 19-day system shutdown due to blower failure. Blower was replaced on 4/8/13.

Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

TABLE 2

Building A Mid-GAC Concentrations (µg/m^3)

LABORATORY DATA SUMMARY

SSD System OM&M, Middle River Complex, Middle River, Maryland

Samples analyzed by EPA Method TO-15

Date	benzene	carbon tetrachloride	chlorodifluoromethane	chloroform	cis-1,2-dichloroethene	dichlorodifluoromethane	1,1-dichloroethane	1,2-dichloroethane	1,1-dichloroethene	ethylbenzene	methylene chloride	naphthalene	tetrachloroethene	toluene	trans-1,2-dichloroethene	1,1,1-trichloroethane	trichloroethene	trichlorofluoromethane	1,2,3-trimethylbenzene	1,2,4-trimethylbenzene	1,3,5-trimethylbenzene	vinyl chloride	total xylenes	m-xylene & p-xylene	o-xylene	Total VOCs	Mass (lbs./day)
9/7/2016	5.8	0.58 J	1.6	2.8	160	2.8	22	1.1 J	77	ND	3.6		1.7 J	ND	2.9	480 DL	1.1	N/A	ND	1.2 J	ND	0.40 J	1.8 J	N/A	N/A	766	0.0076

ND - non-detect (below detection limit)

N/A - not applicable (samples not analyzed for compound)

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

B - compound was found in the blank and sample

DL - dilution analysis

SSD - sub-slab depressurization

OM&M - operation, maintenance, and monitoring

GAC - granular activated carbon

VOCs - volatile organic compounds

scfm - standard cubic feet per minute

µg/m^3 - micrograms per cubic meter

lbs./day - pounds per day

EPA - Environmental Protection Agency

TO-15 - Toxic Organic Method 15

Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

ND - non-detect (below detection limit)

N/A - not applicable (samples not analyzed for compound)

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

B - compound was found in the blank and sample

SSD - sub-slab depressurization

VOCs - volatile organic compounds

OM&M - operation, maintenance, and monitoring

µg/m^3 - micrograms per cubic meter

lbs./day - pounds per day

EPA - Environmental Protection Agency

TO-15 - Toxic Organic Method 15

The chlorodifluoromethane and 1,2,3-trimethylbenzene concentrations reported in the 12/5/2013 sample were reported as tentatively identified compounds and were converted from 238 ppbv and 2.3. ppbv, respectively.

Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

ND - non-detect (below detection limit)

N/A - not applicable (samples not analyzed for compound)

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an app

B - compound was found in the blank and sample

SSD - sub-slab depressurization

OM&M - operation, maintenance, and monitoring

VOCs - volatile organic compounds

µg/m^3 - micrograms per cubic meter

lbs./day - pounds per day

lbs. - pounds

scfm - standard cubic feet per minute

EPA - Environmental Protection Agency

TO-15 - Toxic Organic Method 15

TABLE 4

Building C Influent Concentrations (µg/m^3)

LABORATORY DATA SUMMARY

SSD System OM&M, Middle River Complex, Middle River, Maryland

Samples analyzed by EPA Method TO-15

Date	FLOW (scfm)	benzene	carbon tetrachloride	chlorodifluoromethane	chloroform	chloromethane	cis-1,2-dichloroethene	dichlorodifluoromethane	1,1-dichloroethane	1,2-Dichloroethane	1,1-dichloroethene	ethylbenzene	methylene chloride	naphthalene	tetrachloroethene	toluene	trans-1,2-dichloroethene	1,1,1-trichloroethane	trichloroethene	1,1,2-trichloro-1,2,2-trifluoroethane	1,2,3-trimethylbenzene	1,2,4-trimethylbenzene	1,3,5-trimethylbenzene	vinyl chloride	total xylenes	m-xylene & p-xylene	o-xylene	Total VOCs	Mass (lbs./day)	Mass (lbs. removed in period)
Sampling not conducted in July 2012 due to system shutdown test.																													
Completed first-phase system expansion on October 31, 2012.																													
Completed second-phase system expansion on May 10, 2013.																													
Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.																													
Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

ND - non-detect (below detection limit)

N/A - not applicable (samples not analyzed for compound)

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

B - compound was found in the blank and sample

SSD - sub-slab depressurization

TABLE 5

Building C Mid-GAC Concentrations (µg/m^3)

LABORATORY DATA SUMMARY

SSD System OM&M, Middle River Complex, Middle River, Maryland

Samples analyzed by EPA Method TO-15

Date	benzene	carbon tetrachloride	chlorodifluoromethane	chloroform	cis-1,2-dichloroethene	dichlorodifluoromethane	1,1-dichloroethane	1,2-dichloroethane	1,1-dichloroethene	ethylbenzene	methylene chloride	naphthalene	tetrachloroethene	toluene	trans-1,2-dichloroethene	1,2,4-Trichlorobenzene	1,1,1,-trichloroethane	trichloroethene	1,1,2-trichloro-1,2,2-trifluoroethane	1,2,3-trimethylbenzene	1,2,4-trimethylbenzene	1,3,5-trimethylbenzene	vinyl chloride	total xylenes	m-xylene & p-xylene	o-xylene	Total VOCs	Mass (lbs./day)

OM&M - operation, maintenance, and monitoring

GAC - granular activated carbon

VOCs - volatile organic compounds

µg/m^3 - micrograms per cubic meter

lbs./day - pounds per day

EPA - Environmental Protection Agency

TO-15 - Toxic Organic Method 15

Sampling not conducted in July 2012 due to shutdown test.

November 2012 sample collected while four new extraction wells installed in October 2012 were operating (November 5-26, 2012). Wells temporarily closed until May 16, 2013.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

TABLE 6

Building C Effluent Concentrations (µg/m^3)

LABORATORY DATA SUMMARY

SSD System OM&M, Middle River Complex, Middle River, Maryland

Samples analyzed by EPA Method TO-15

Date	benzene	carbon tetrachloride	chlorodifluoromethane	chloroform	cis-1,2-dichloroethene	dichlorodifluoromethane	1,1-dichloroethane	1,2-dichloroethane	1,1-dichloroethene	ethylbenzene	methylene chloride	methyl-tert-butyl ether	naphthalene	tetrachloroethene	toluene	trans-1,2-dichloroethene	1,2,4-trichlorobenzene	1,1,1,-trichloroethane	1,1,2,-trichloroethane	trichloroethene	1,2,3-trimethylbenzene	1,2,4-trimethylbenzene	1,3,5-trimethylbenzene	vinyl chloride	total xylenes	m-xylene & p-xylene	o-xylene	Total VOCs	Mass (lbs./day)

N/A - not applicable (samples not analyzed for compound)

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

B - compound was found in the blank and sample

SSD - sub-slab depressurization

OM&M - operation, maintenance, and monitoring

VOCs - volatile organic compounds

µg/m^3 - micrograms per cubic meter

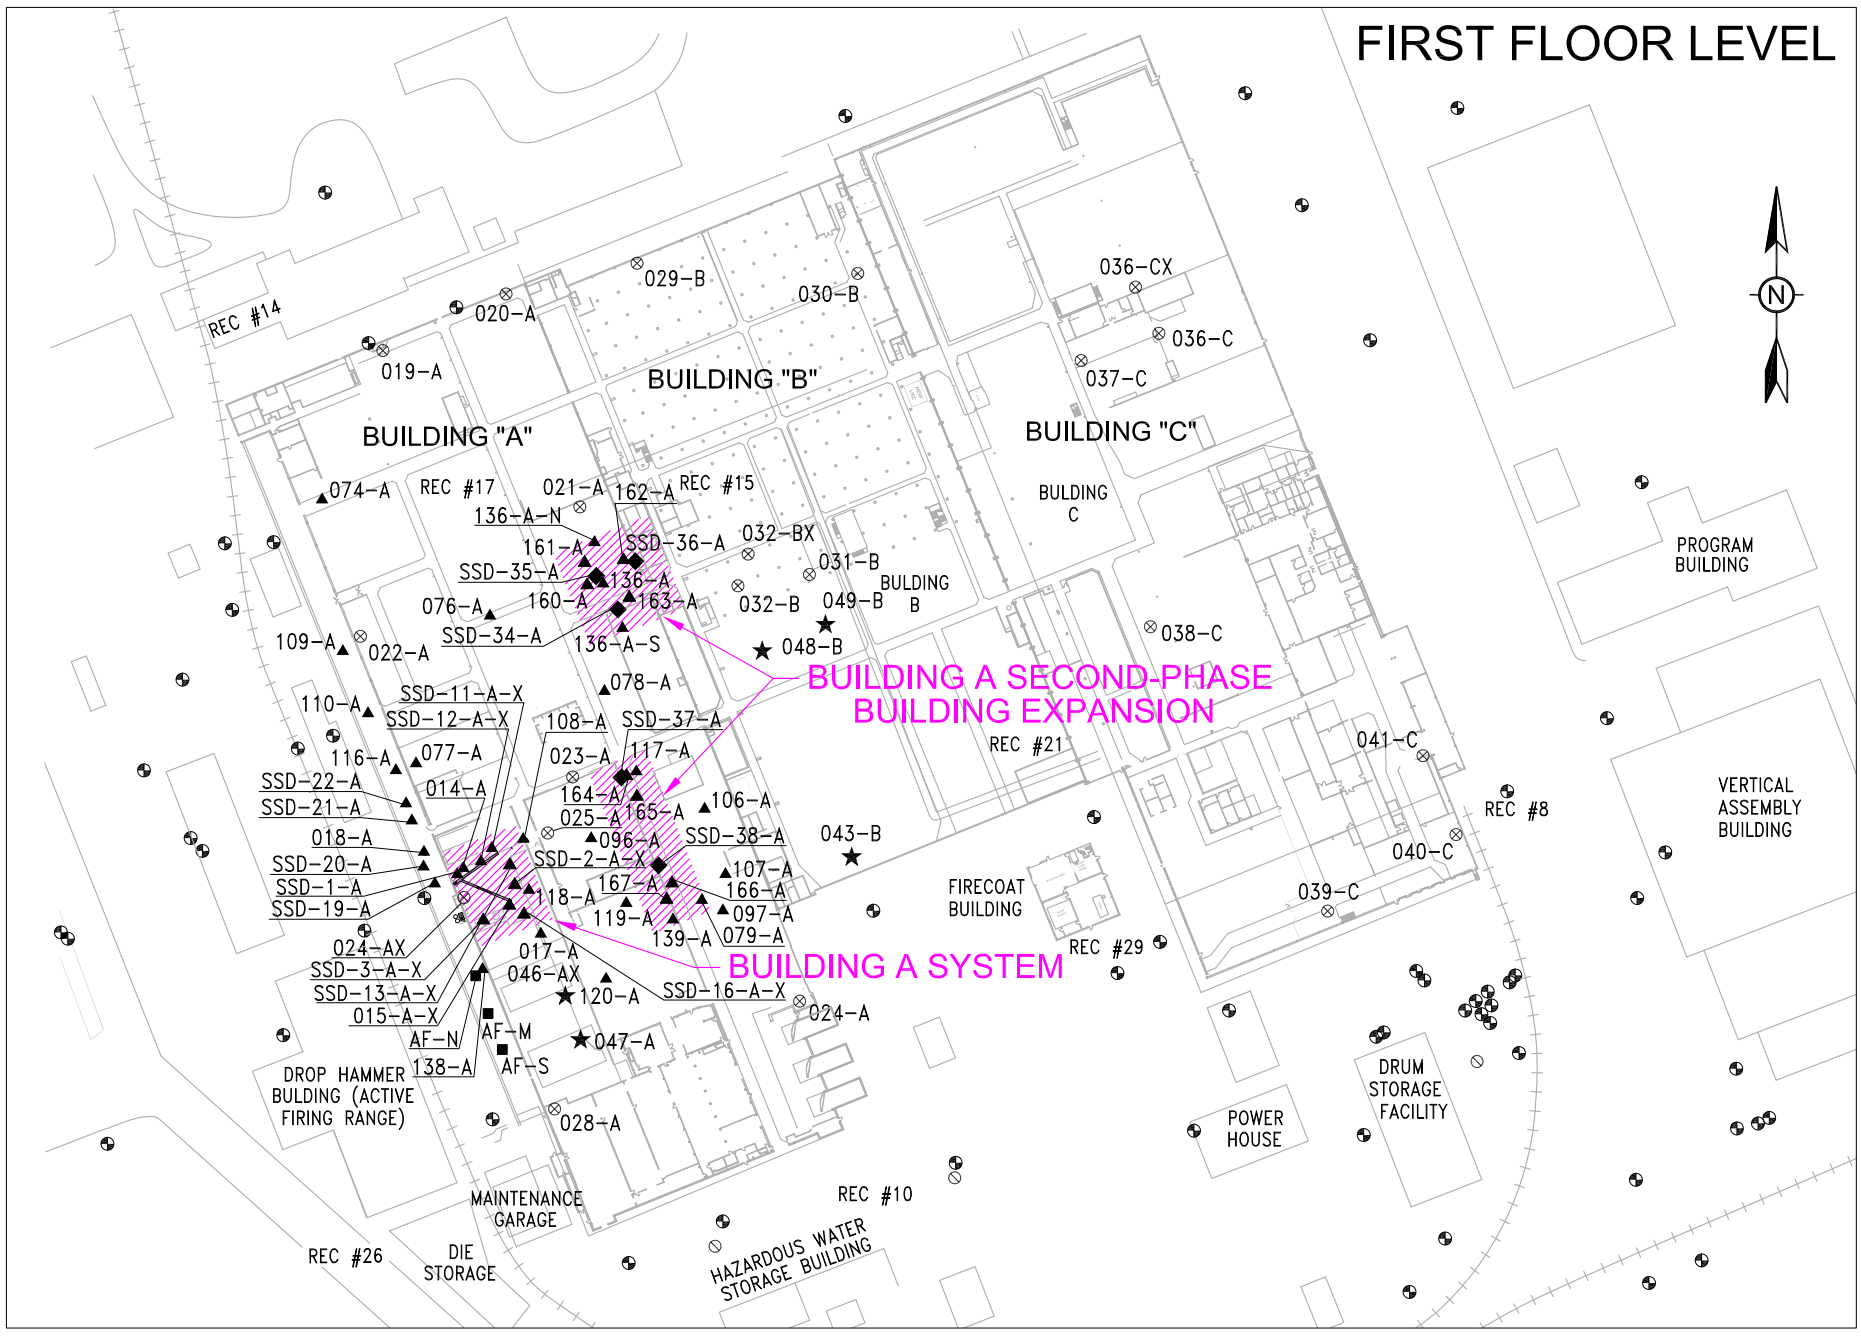
lbs./day - pounds per day

EPA - Environmental Protection Agency

TO-15 - Toxic Organic Method 15

Sampling not conducted in July 2012 due to system shutdown test.

November 2012 sample collected after the potassium permanganate zeolite (PPZ) unit. PPZ unit was taken offline prior to the December 2012 sample.



Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

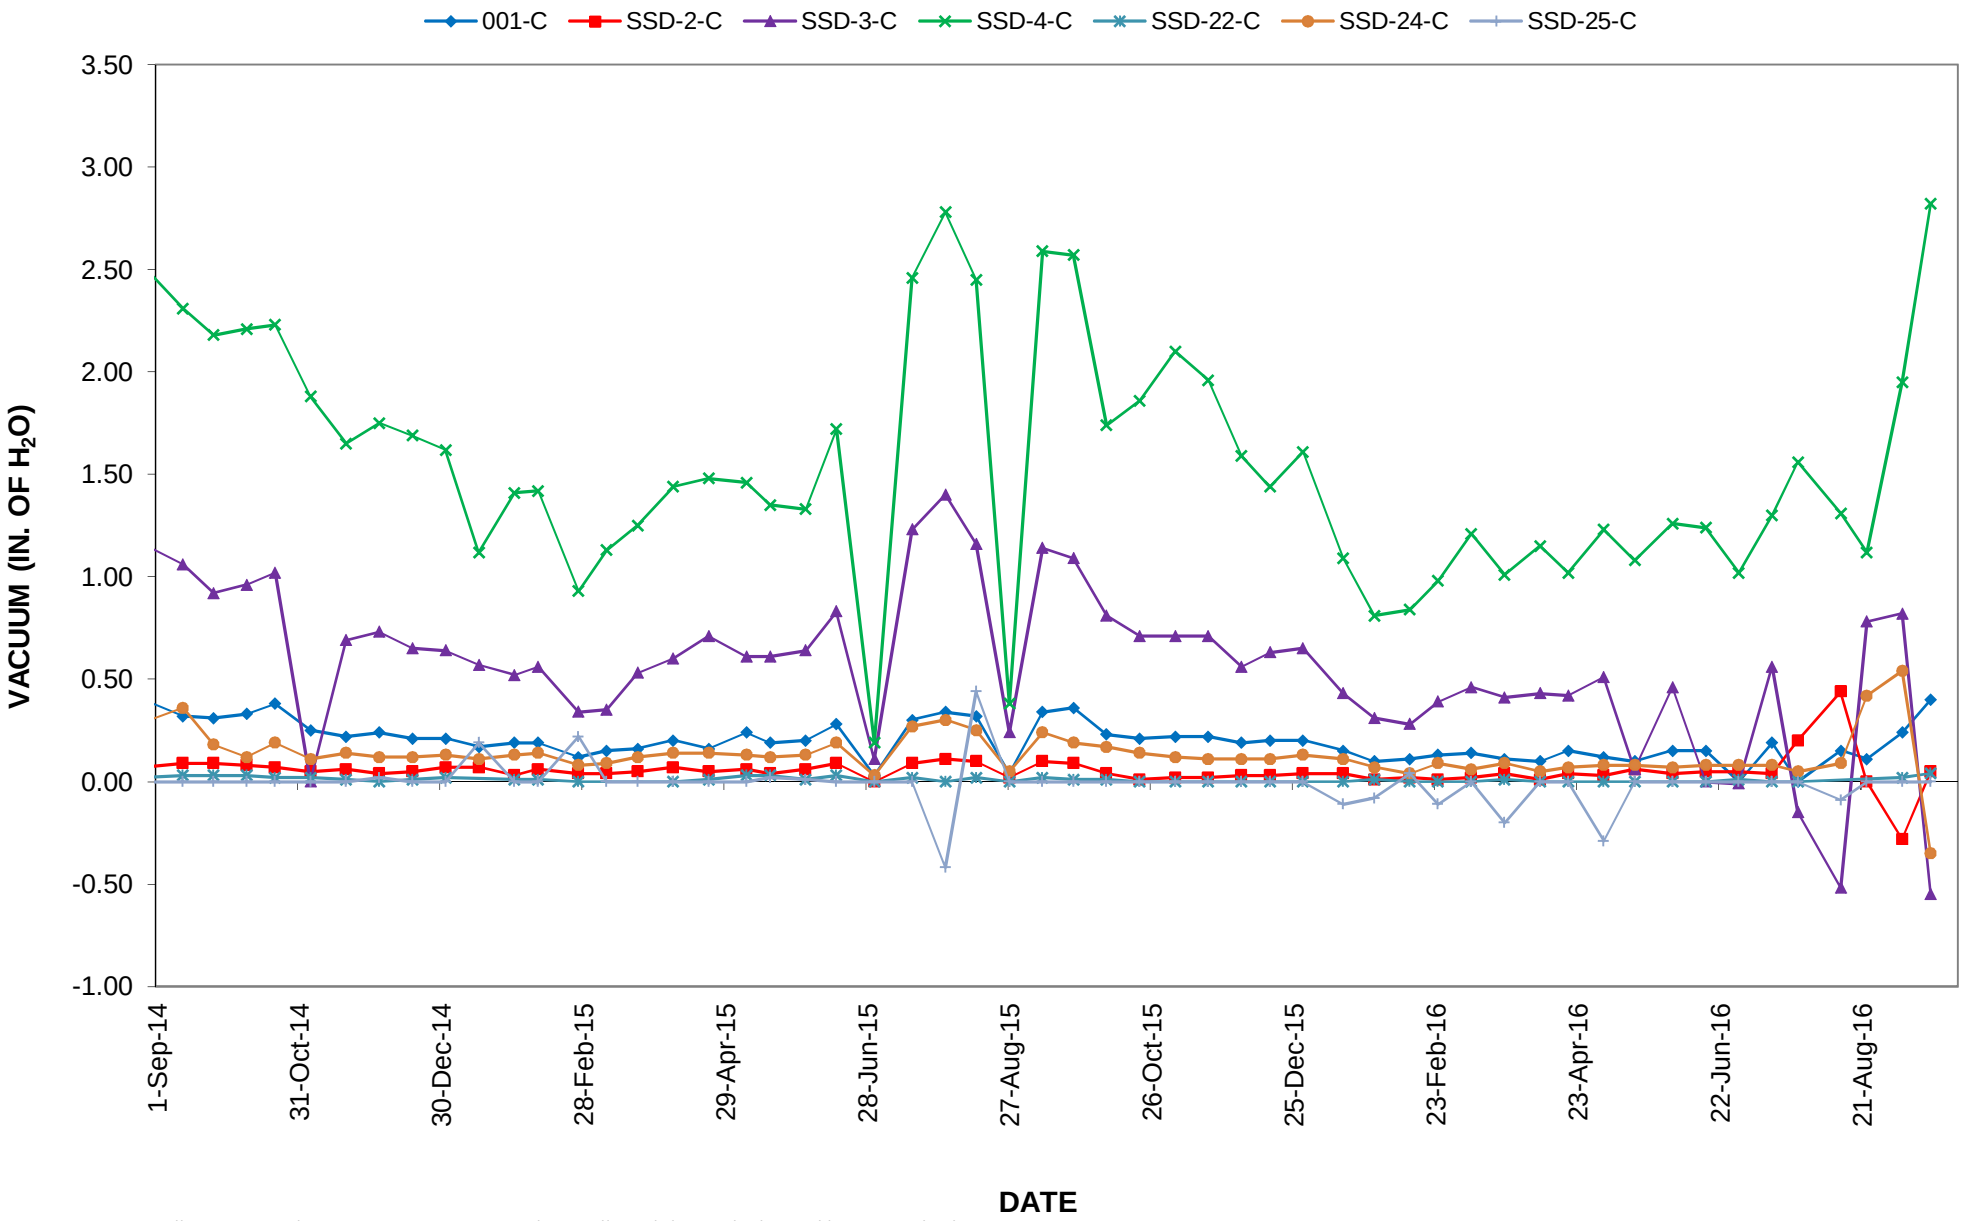
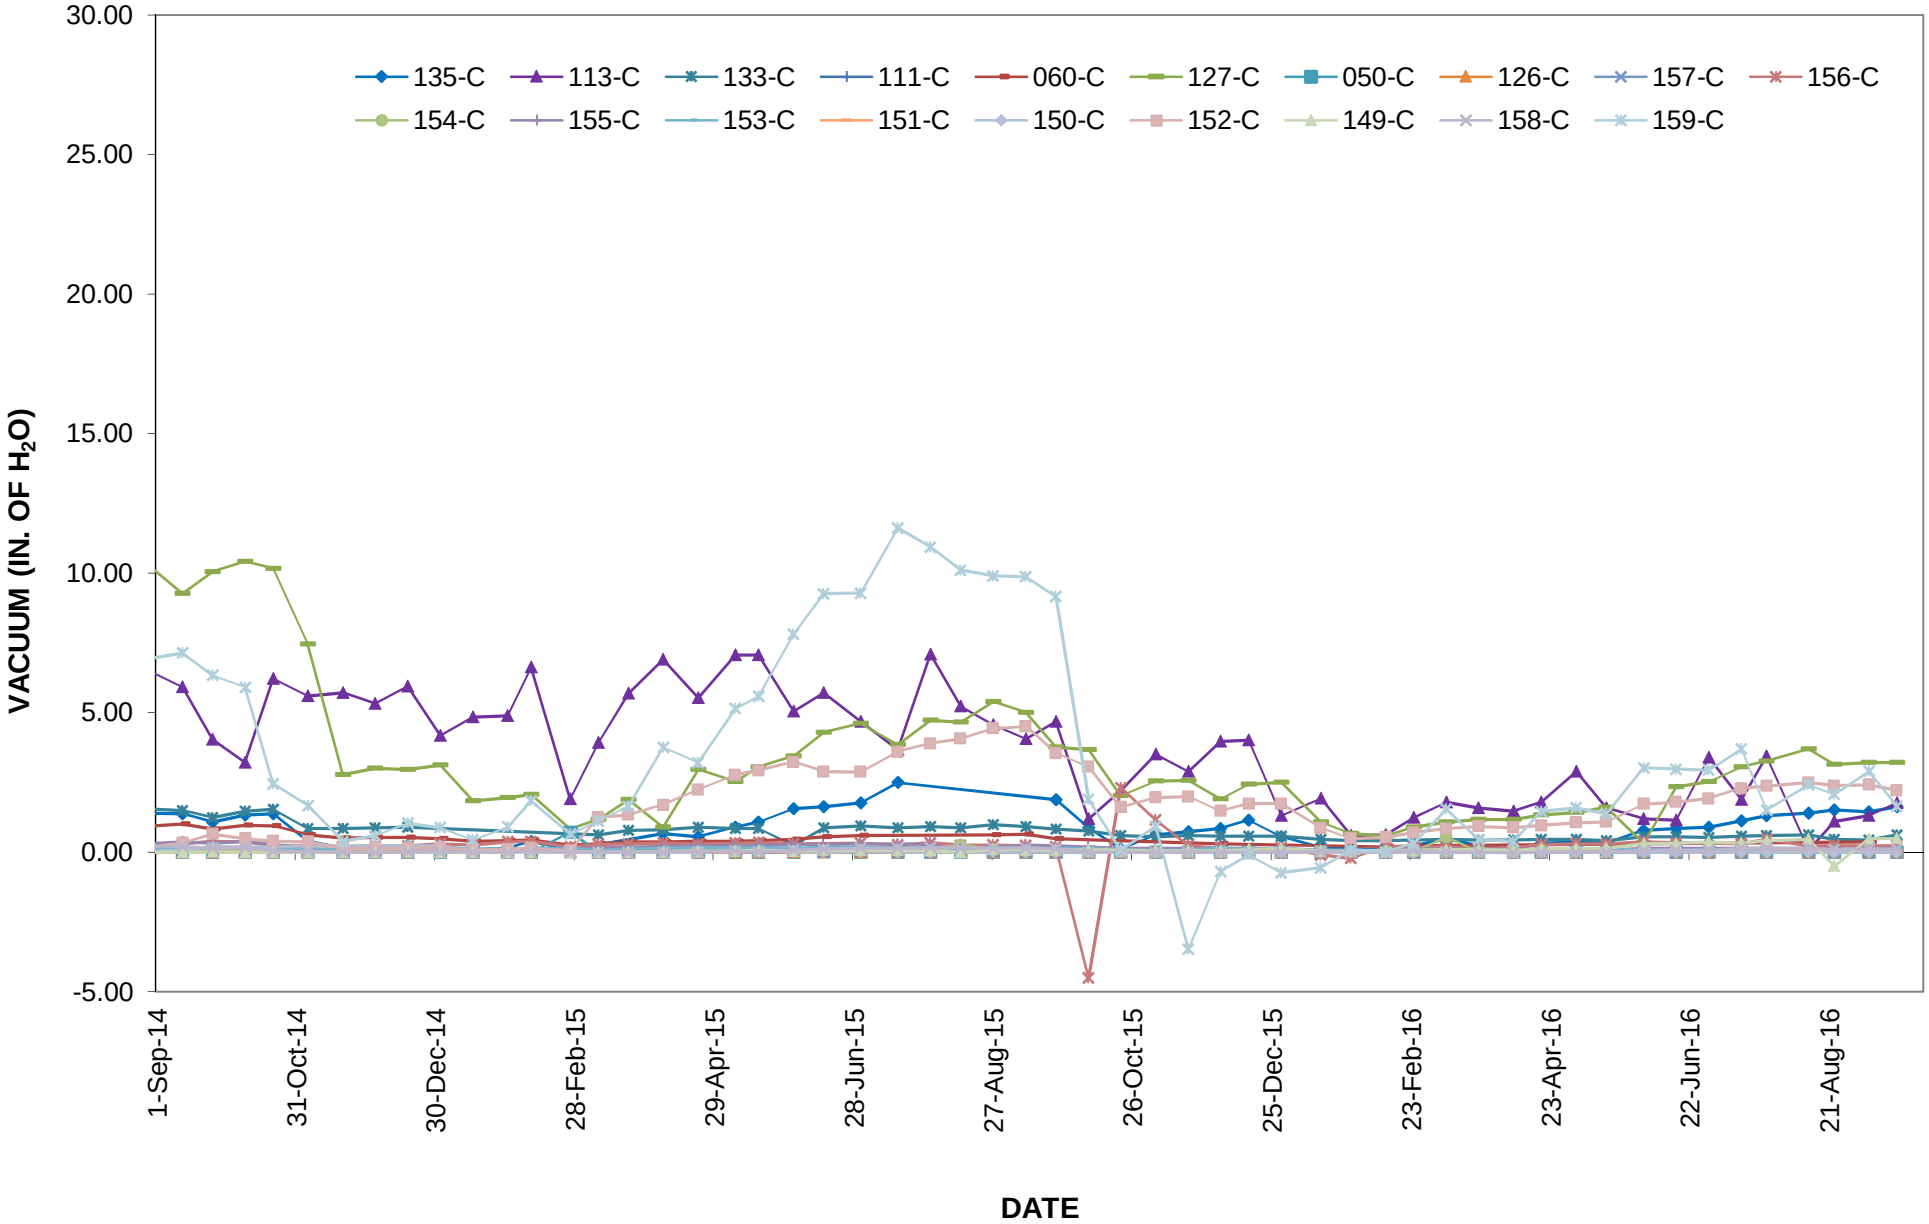
FIGURE 6
INDUCED VACUUM
SEPTEMBER 2014 TO SEPTEMBER 2016
BUILDING A SSD SYSTEM - LAY-UP ROOM AND BASEMENT



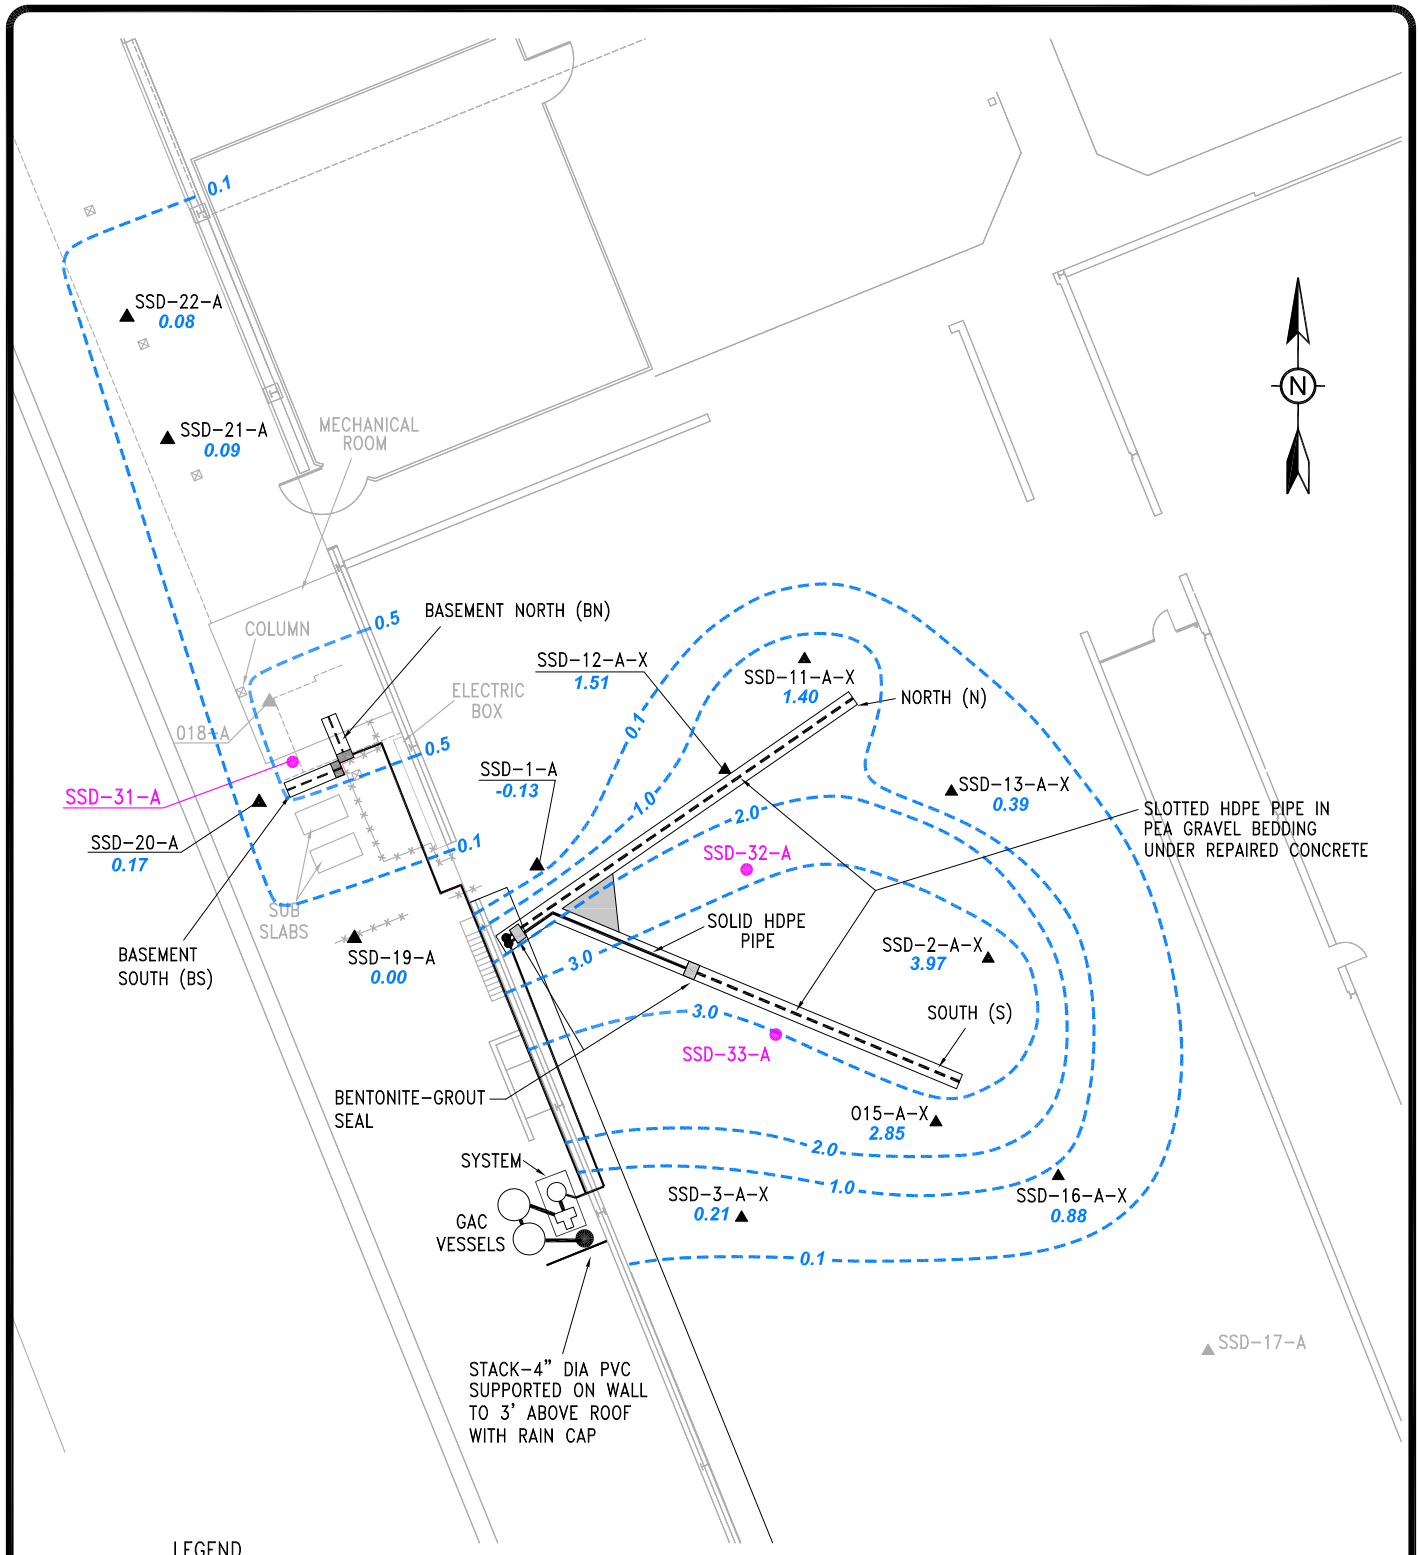
All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
Only the past two years of vacuum data are depicted above.
Increase in vacuum influence beginning April 4, 2016 a result of the installation and operation of the larger blower skid associated with the second-phase expansion.
** NOTE: As of May 18, 2015, all vacuum readings for SSD-11-A, SSD-12-A, SSD-13-A, 015-A, SSD-16-A, SSD-2-A, and SSD-3-A were taken from the SSD-11-A-X, SSD-12-A-X, SSD-13-A-

FIGURE 7
INDUCED VACUUM
APRIL 2016 TO SEPTEMBER 2016
BUILDING A SSD SYSTEM - EASTERN AREA



All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
VMPs we included in bi-weekly system checks upon start-up of the second-phase expansion on April 13, 2016.

FIGURE 8
INDUCED VACUUM
SEPTEMBER 2014 TO SEPTEMBER 2016
BUILDING C SSD SYSTEM - SOUTHERN BASEMENT AREA



All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
Only the past two years of vacuum data are depicted above.

FIGURE 9
INDUCED VACUUM
SEPTEMBER 2014 TO SEPTEMBER 2016
BUILDING C SSD SYSTEM - MID-BASEMENT AREA

All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
Sub-slab vapor monitoring points routinely monitored beginning May 1, 2013 following second-phase system expansion in the middle basement area of Building C.

APPENDIX A— BIWEEKLY AND QUARTERLY SYSTEM CHECK FORMS

SSD SYSTEM CHECK - BUILDING A

LMC Middle River Complex, Middle River, Maryland

Date: 4/4/16 Time: 1220 Personnel: DLM

1. Was the system running upon arrival?
   (YES) NO
2. Where there any alarm conditions upon arrival?
   YES (NO)
   Comment: _____
3. Is the blower vacuum relief valve open?
   YES (NO)
4. Is the dilution valve open?
   YES (NO) % Open: _____
5. Are there any leaks or damage to system hoses?
   YES (NO)
6. Is there any damage to system components?
   YES (NO)
7. Are all locks and zip-ties secure?
   (YES) NO
8. Was there a GAC change out?
   YES (NO)
9. How many GAC units are at this location?
   NEW 2 SPENT 1
10. Do the these fall to zero when system is turned off?
    Flow Gauge (YES) NO
    Pressure Gauge (YES) NO
    Vacuum Gauges (YES) NO
11. Do the temp. gauges fall when system is turned off?
    (YES) NO

GENERAL SYSTEM MONITORING

Vacuum pre-Filter (in. H_2O)	Vacuum post-Filter (in. H_2O)	Diff Pressure of Filter* (in. H_2O)	Temp post-Blower (°F)	Temp post-HE (°F)	Pressure (in. H_2O)	Flow (scfm)	Time Counter Display (hours)
27	34	7	143	76	49	288	96.0

* Clean or change filter if differential pressure increases by 10 in. H_2O

System Start-Up

SSD SYSTEM CHECK - BUILDING A
LMC Middle River Complex, Middle River, Maryland

Date: 4/13/16 **Time:** 1200 **Personnel:** DLM/mw/ms

1. **Was the system running upon arrival?** YES NO
2. **Where there any alarm conditions upon arrival?** YES NO
   Comment: _____
3. **Is the blower vacuum relief valve open?** YES NO
4. **Is the dilution valve open?** YES NO % Open: _____
5. **Are there any leaks or damage to system hoses?** YES NO
6. **Is there any damage to system components?** YES NO
7. **Are all locks and zip-ties secure?** YES NO
8. **Was there a GAC change out?** YES NO
9. **How many GAC units are at this location?** NEW _____ SPENT _____
10. **Do the these fall to zero when system is turned off?**
    Flow Gauge YES NO
    Pressure Gauge YES NO
    Vacuum Gauges YES NO
11. **Do the temp. gauges fall when system is turned off?** YES NO

GENERAL SYSTEM MONITORING

5. Are there any leaks or damage to system hoses?
   YES NO
6. Is there any damage to system components?
   YES NO
7. Are all locks and zip-ties secure?
   YES NO
8. Was there a GAC change out?
   YES NO
9. How many GAC units are at this location?
   NEW 3 SPENT 0
10. Do the these fall to zero when system is turned off?
    Flow Gauge YES NO
    Pressure Gauge YES NO
    Vacuum Gauges YES NO
11. Do the temp. gauges fall when system is turned off?
    YES NO

GENERAL SYSTEM MONITORING

Vacuum pre-Filter (in. H_2O)	Vacuum post-Filter (in. H_2O)	Diff Pressure of Filter* (in. H_2O)	Temp post-Blower (°F)	Temp post-HE (°F)	Pressure (in. H_2O)	Flow (scfm)	Time Counter Display (hours)
40	44	4	158	74	38	250	785.2

* Clean or change filter if differential pressure increases by 10 in. H_2O

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
140-4736-1

Receipt
The samples were received on 4/9/2016 at 9:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA
Method(s) TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.
