Subject: Transmittal of the Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System
Operation, Round 26 February 2019 Monitoring Report
Lockheed Martin Corporation – Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Dietz,

For your review please find enclosed two hard copies with a CD of the above-referenced document. This report contains the Round 26 (February 2019) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization vapor-intrusion-mitigation systems at the Middle River Complex in Middle River Maryland. If possible, we respectfully request to receive MDE's document review comments by October 4, 2019.

Please let me know if you have any questions. My office phone is (301) 548-2209.

Sincerely,

A handwritten signature in black ink, appearing to read "Tom D. Blackman".

SECTION 1 INTRODUCTION

Tetra Tech, Inc., (Tetra Tech) has prepared this report on behalf of Lockheed Martin Corporation (Lockheed Martin) to document the first round of indoor air (IA) and sub-slab vapor (SV) monitoring for calendar year 2019 at the Lockheed Martin Middle River Complex (MRC) in Middle River, Maryland. This report contains the Round 26 (February 2019) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems originally installed at the Middle River Complex in 2008: one beneath the Building A plating shop and the other beneath the southern portion of the Building C basement. This monitoring is part of an ongoing investigation to evaluate whether volatile organic compounds (VOCs) in sub-slab vapors (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air at Middle River Complex facilities, and to evaluate whether subsurface vapor contamination remains at concentrations dictating continued operation of the sub-slab-depressurization mitigation system, or if a transition/exit strategy can be performed. The first monitoring round for calendar year 2019 continues investigations previously described in the reports listed in Table 1-1.

This report is organized into the following sections:

- Section 2—Round 26 Indoor-Air and Vapor-Intrusion Investigation: Briefly summarizes previous investigations and interim measures and describes the sampling methodology used for the current investigation round.
- Section 3—Round 26 Results: Presents the results of the February 2019 investigation.
- Section 4—Sub-Slab-Depressurization-System Data Analysis: Summarizes the operation and monitoring of the sub-slab-depressurization systems in Buildings A and C for the reporting period from October 1, 2018 to March 31, 2019.

-
- Section 5—Conclusions: Presents conclusions based on the Round 26 sampling results.
 - Section 6—References: Lists the references used in this report.

Tables, figures, and appendices are at the end of the report body following Section 6.

SECTION 2

ROUND 26 INDOOR-AIR-QUALITY AND VAPOR-INTRUSION INVESTIGATION

This section briefly summarizes previous investigations and interim measures and describes the sampling methodology used in the current investigation round.

2.1 PREVIOUS INVESTIGATIONS AND INTERIM MEASURES

The indoor air (IA) and sub-slab vapor (SV) investigation described herein was initially designed to evaluate whether volatile organic compounds (VOCs) associated with soil and groundwater contamination at the site might be moving into IA at Middle River Complex (MRC) facilities. Tetra Tech, Inc. (Tetra Tech) industrial hygienists chose the initial sampling locations for Buildings A, B, and C during a 2006 site reconnaissance. Additional sampling locations were selected throughout program implementation based on previous IA and SV monitoring results (Tetra Tech, 2017d).

Although IA results had predominantly been below risk-based screening levels after the first three rounds of sampling in February and December 2006 and April 2007 (with one trichloroethene [TCE] exceedance in 109 samples¹), two sub-slab depressurization (SSD) vapor intrusion mitigation systems (one beneath the former Building A plating shop and the other beneath the southern portion of the Building C basement) were installed at the MRC in 2008 (Tetra Tech, 2008d), based on elevated SV concentrations detected beneath the buildings. The Building A SSD system (SSDS) was expanded in 2010 (Tetra Tech, 2010c), in 2016 (Tetra Tech, 2016d), and again in 2017 (Tetra Tech, 2017f) after elevated SV concentrations were detected at additional locations.

¹One TCE concentration (36 micrograms per cubic meter [$\mu\text{g}/\text{m}^3$]) out of 109 total samples (including duplicates) exceeded the indoor air screening level (18 $\mu\text{g}/\text{m}^3$) at the time of sampling. The exceedance was observed in the duplicate sample of a field-duplicate pair; TCE was not detected in the corresponding parent sample. Since then, the indoor air screening level has been reduced to 8.8 $\mu\text{g}/\text{m}^3$; even so, that result would have been the only exceedance.

A site-specific TCE screening-level of 35 $\mu\text{g}/\text{m}^3$ for indoor air has been derived for the Building A basement based on limited exposure potential in the basement. This screening level was approved by the Maryland Department of the Environment (MDE) in July 2017. However, the site-specific screening level for the basement does not represent a final risk-based indoor air cleanup criterion.

The Building C SSDS was expanded in 2012 (Tetra Tech, 2012c) and 2013 (Tetra Tech, 2013c) for similar reasons (elevated SV concentrations in the central portion of the basement). Subsequent rounds of IA sampling support that contaminant concentrations in IA on the main floors resulting from vapor intrusion (VI) are being controlled by the SSDSs.

However, recent investigations in Building A and the Building A basement have identified elevated TCE concentrations in SV, water (groundwater and water in sumps), and in basement IA. The following presents a list of subsequent VI investigations in Building A and the Building A basement from 2014–2018, followed by a more detailed description of each investigation:

- (a.) portable gas-chromatograph/mass-spectrometer (GC/MS) surveys of IA and sub-slab air from within Building A basement floor features (e.g., sumps, drains) in February 2014 and April 2016 (Tetra Tech, 2014b, 2016b)
- (b.) installation of three portable air-filtration units in January 2015 in the Building A basement to mitigate TCE exceedances in indoor air (Tetra Tech, 2016d)
- (c.) installation and sampling of additional Vapor Pin™ vapor monitoring points (VMPs), including seven in the eastern wall of Building A basement, two in the Building A basement floor, and one beneath the main floor of Building A in March 2016 (Tetra Tech, 2016b)
- (d.) collection of air and water samples from select floor features (i.e., sumps, drains) in Building A basement in May 2016 (Tetra Tech, 2016b, 2016c)
- (e.) a continuous air-monitoring survey of SV and breathing-zone indoor air locations in the Building A basement over two months (February 24 to April 21, 2017) (Tetra Tech, 2017b)
- (f.) a test to determine effects covering select floor features (e.g., sumps, drains) that had exhibited the highest TCE concentrations had on IA concentrations in the basement in March 2017 (Tetra Tech, 2017b)
- (g.) flow testing conducted in two sumps in the southern portion of Building A basement to determine the volume of water being discharged from each individual sump back to Lift Station #5 in March–May 2018; sampling of water in Building A basement sumps in March 2018 including water from a sump (not previously sampled) in the utility corridor between Building A basement and the Drop Hammer Building; an assessment of the data obtained from this study, sought to determine a constructible, cost-effective solution that effectively controls water and vapor accumulation in the sumps (Tetra Tech, 2018e).

Elevated TCE concentrations detected in air within, and above, select floor features (e.g., sumps) in the Building A basement led to the installation, as an interim measure, of three additional air-purifying filters (for a total of six) in the basement in May 2017 to target floor features that have shown elevated TCE concentrations (Tetra Tech, 2018b). The continuous air-monitoring survey also identified significant sources of IA contamination in the basement at sumps associated with abandoned and/or removed heaters (Tetra Tech, 2017b). In addition to the new air-purifying filters, additional activities were completed in the summer of 2017 in Building A and its basement to address the elevated VOC results in SV and sump water from several recent investigations. A closed-circuit television (CCTV) camera survey of floor features in the Building A basement, including the sumps in existing and former heating rooms, the air-duct network that runs behind the eastern basement wall, the storm-drain line that runs north/south under the basement floor, and the smaller floor drains, was conducted to determine their condition, identify possible breaches, and better understand their direction and design. The CCTV survey indicated that the underground network of floor drains, pipes, and manholes/sumps are interconnected. Floor drains that might have mitigated water infiltration in and near pits associated with former equipment that operated in Building A appeared to be connected to nearby sumps and storm drains. Other floor drains appeared to have been abandoned, which is supported by information received while conducting historical interviews of on-site personnel (Tetra Tech, 2018b).

In 2016 (Tetra Tech, 2016b) and March 2017 (Round 22), sampling location SV-175-A (Figure 2-1) on the Building A basement floor had the highest TCE concentrations (460,000 and 650,000 micrograms per cubic meter [$\mu\text{g}/\text{m}^3$], respectively). The maximum August 2017 (Round 23) SV TCE concentration (21,000 $\mu\text{g}/\text{m}^3$) was also detected at location SV-175-A. Location SV-175-A was removed from the sampling list and not sampled in February 2018 (Round 24) since consistently elevated TCE concentrations detected during previous sampling negates the need to continue collecting data from this location at this time. High TCE SV concentrations were also noted at two locations (SV-171-A and SV-173-A) in the eastern wall of the Building A basement during 2016 (Tetra Tech, 2016b), three locations (SV-170-A, SV-171-A, and SV-173-A) in the eastern wall of the Building A basement in 2017 (in both the March [Round 22] and August [Round 23] sampling), and two locations (SV-171-A and SV-173-A) in the eastern wall of the Building A basement in February 2018 (Round 24).

These high TCE concentrations prompted a pilot test conducted on July 6, 2017; this test evaluated the feasibility of extracting vapors from within the basement duct system at former heater room A-9/sump HRS5 (located immediately adjacent to SV-175-A, where the highest TCE concentrations have been detected historically) using the existing SSDS (Tetra Tech, 2018b). The pilot test was successful, HRS5 was left connected to the SSDS, and the system continues to extract vapor from this sealed sump.

In July 2017 (Tetra Tech, 2017b), a FROG 4000™ gas-chromatograph/photoionization detector (GC/PID) survey of the main floor of Building A assessed whether TCE detected in indoor air near the basement sumps was migrating through air ducts connected to the sumps, and through the floor air-vents, to the main floor of Building A. TCE detections ranging from 32.8 to 103.7 µg/m³ were recorded in samples collected from inside the vents and in indoor air above the vents; therefore, in September 2017 all floor air-vents on the main floor (regardless of screening results) were sealed using a vapor barrier and bolt-down steel plate to close off this exposure pathway and prevent migration of TCE vapor from the basement. A subsequent FROG 4000™ survey in October 2017 verified the integrity of the seals at the 42 air-vent locations and confirmed the absence of TCE in indoor air near the vents. No TCE was detected in any sample collected; all results were non-detected (Tetra Tech, 2018c).

In January–May 2018, Tetra Tech conducted a sump inspection of the pumps in Building A basement, and conducted flow testing in two sumps (SP1/SP1A and the utility corridor sump) in the southern portion of Building A to measure the volume of water being discharged (via polyvinyl chloride [PVC] piping) from each sump to sanitary sewer Lift Station #5. Water samples were also collected from sumps in Building A basement during this investigation. Information gained from the January–May 2018 studies were used to determine constructible, cost-effective solutions that control water and vapor accumulation in Building A basement sumps; possible mitigation solutions currently remain under evaluation (Tetra Tech, 2018e).

The sump inspection determined that the pump in sumps SP1/SP1A was the only one in the target area (southern portion of Building A basement) that pumps a significant volume of water back to Lift Station #5, and subsequently the sanitary sewer system. Only a small amount of water (less than three gallons) was collected in the utility corridor sump over a two-month period. The

respective TCE concentrations detected in sump water at SP1/SP1A during the last three sampling events were: 120 microgram(s) per liter ($\mu\text{g/L}$) and 2,700 $\mu\text{g/L}$ in May 2016; 160 $\mu\text{g/L}$ and 440 $\mu\text{g/L}$ in March 2017; and 160 $\mu\text{g/L}$ (SP1 only)² in March 2018. The TCE concentration detected in the utility corridor sump was 53 $\mu\text{g/L}$. These concentrations are two to three orders of magnitude higher than the TCE concentrations (2.3 $\mu\text{g/L}$ and 2.6 $\mu\text{g/L}$) detected in water samples collected from Lift Station #5. This indicated that dilution is likely occurring at the lift station due to other water that is discharged to it. Various pipes discharge into the lift station, including those carrying heating, ventilation, and air conditioning (HVAC) condensate water. This additional water is likely responsible for the apparent low concentration of TCE concentrations detected at Lift Station #5 when compared to the concentrations detected at the sumps.

2.2 INVESTIGATION PROCEDURES

The sampling plan for Round 26 was based on historical detections, information obtained during site reconnaissance, and a review of historical information and reports. IA and SV samples were collected from Buildings A, B, and C during Round 26 sampling. Relevant guidance from the United States Environmental Protection Agency [USEPA] (USEPA, 1996, 2004, 2012, and 2015) and the Maryland Department of the Environment [MDE] (MDE, 2006) was used to develop the investigation methodology.

IA and SV sampling within Buildings A, B and C was done in accordance with the work plan (Tetra Tech, 2017d). Background outdoor air samples were collected from the same sampling locations as had been used for the previous Round 25 (Figure 2-2). Not all existing monitoring points inside the subject buildings were sampled during Round 26. As in previous rounds, samples were selectively collected in or adjacent to areas where contaminants had been detected previously, or in areas where contaminants are currently suspected of being present.

TCE has been targeted as a primary chemical of concern (COC); it has a history of use at the site, has been detected in groundwater and soil gas, can be toxic to human health depending upon dose, duration, and means of exposure, and is mobile in the environment. Historical sampling locations

²The only sample collected in March 2018 was from SP1, as the focus at that time was on that sump. Note that sumps SP1/SP1A are connected underground.

and the sub-slab VMPs sampled in Buildings A, B and C during this round are shown in Figures 2-3, 2-4 and 2-5, respectively. IA sampling locations were co-located with most of the monitored SV sampling locations to evaluate IA and any possible relationship between SV and IA in Building A, B and C.

Round 26 sampling was performed on February 19 and 21, 2019. Seventy-three samples (and eight duplicates) were collected using Summa[®] canisters as follows:

- four background ambient-air samples were collected at the same locations used in the previous round
- 36 IA samples (and four duplicates) from Buildings A, B, and C:
 - 15 IA samples (and two duplicates) from Building A
 - two IA samples from Building B
 - 19 IA samples (and two duplicates) from Building C
- 33 SV samples (and four duplicates) from Buildings A, B and C:
 - 15 SV samples (and two duplicates) from Building A
 - two SV samples from Building B
 - 16 SV samples (and two duplicates) from Building C
- The “-A,” “-B,” and “-C” suffixes in the sampling location designations correspond with Buildings A, B, and C, respectively.

Five IA samples from Building C (144-C, 145-C, 146-C, 150-C, and 152-C) were collected in the machine shop of the Lockheed Martin Rotary and Mission Systems (RMS) (formerly the Lockheed Martin Mission Systems & Training [MST] mechanical prototype laboratory [MPL]). Monitoring continues in this area, because TCE was detected in IA at a concentration greater than its screening level during Round 15 (August 2013). The five sampling locations that provide data for possible worker-exposure areas within the MPL are:

- 144-C: machine shop area
- 145-C: cubicle area
- 150-C: kitchen area
- 152-C: machine shop area

-
- 146-C: kitchen area

Five SV samples (three in the eastern wall of the Building A basement [170-A, 171-A, and 173-A], one in the Building A basement floor [174-A], and one beneath the main floor of Building A [168-A]), were collected during Round 26 to target possible TCE sources, including a former underground storage tank and vapor degreasers associated with former plating shop operations. SV-170-A was not analyzed because this sample was lost by the laboratory.

Before SV sampling, the tubing for each VMP was purged of atmospheric air, allowing SV to enter the probe and tubing. Purging was performed by attaching the sample tubing to a low-flow sampling pump set to an approximate flow rate of 200 cubic centimeters per minute to minimize the potential mobilization of SV that could bias the sample. One to three volumes (i.e., the volume of the sample probe and tube) were purged to ensure that collected samples were representative of SV conditions. IA samples were collected on the ground surface, with select samples being co-located with the corresponding SV sample location.

Each SV sample was collected over one hour and each IA sample was collected over a period of eight hours using preconditioned Summa[®] canisters to ensure subsurface equilibration and avoid high negative pressure that might mobilize SV and bias the IA results. The one-liter stainless steel canisters were equipped with in-line particulate filters and integral controllers to control the rate of filling during sampling. SV samples were collected through Teflon[®] tubing attached to the stainless-steel Vapor Pins[®] or vapor implants. Each sampling location was routinely inspected during the sampling period to ensure appropriate operation of sampling devices, sample integrity, and to document conditions within the area that might affect results. Samples were collected by opening the valve on the canister, which allowed air to enter the canister at the rate set by the controller (a one-liter canister over a period of one hour [for SV] and over a period of eight hours [for IA]). Controllers were calibrated in the laboratory and shipped to the field with a sufficient flow rate that would maintain the necessary vacuum pressure in the Summa[®] canister for the one-hour and eight-hour sampling intervals. Samples were collected and analyzed for VOCs by TO-15. SV samples were collected in accordance with standard operating procedures developed by the USEPA Environmental Response Team for soil vapor sampling (USEPA, 1996), and methodologies developed by the USEPA Office of Research and Development (USEPA, 2004).

After sampling had been completed, each canister was closed and sent to an off-site laboratory (TestAmerica, Inc. in Knoxville, Tennessee) under proper chain of custody procedures.

The SSD systems in the Building C basement area and the Building A plating shop were shut down approximately 24 hours before sampling began. The SSD systems were restarted within one hour after sampling had been completed in Buildings A and C; this is consistent with previous monitoring episodes. The following observations were recorded during the February 2019 sampling:

- Mean outdoor ambient temperature during the sampling period was 34 degrees Fahrenheit (°F) on February 19, 2019 and 44°F on February 21, 2019. Barometric pressure decreased slightly during the sampling period, from 30.6 inches of mercury (in. Hg) to 30.0 in. Hg. Wind direction on February 19 was from the west/northwest and on February 21 from the south/southwest, with average wind speed ranging from calm to 13 miles per hour (mph). Skies were mostly clear on February 19 and February 21, 2019.
- No precipitation (rain) was recorded on February 19 or February 21, 2019.
- Water was present in the Building B flush-mounted vault (shallow subsurface groundwater accumulation) at sampling locations 121-B and 140B, preventing sample collection. Alternate IA and SV samples were collected at nearby locations 101-B and 100-B, respectively.
- IA and SV samples from 118-A were collected in the bond-layup room (Building A production floor), where a positive-pressure air-conditioning system was operating.
- Sampling location 015-A is in the former plating shop area (Building A production floor). After the sampling round in August 2015, the area had undergone construction and redevelopment. A new floor has been installed and this area is now an extension of the bond-layup room. IA and SV samples from 015-A were collected in this newly expanded bond-layup room (former plating shop), where a positive-pressure air-conditioning system was operating.
- Sampling locations 018-A, 093-A, 116-A, and 138-A were collected in the Building A basement. Select samples from the basement were added to the sampling program in the work plan (Tetra Tech, 2017d) due to the ongoing TCE VI investigation. These include three additional locations in the eastern wall (170-A, 171-A and 173-A) and one in the floor (174-A). As stated previously, sample SV-170-A was not analyzed during Round 26 because this sample was not received by the laboratory.
- The air-purifying units in the Building A basement were operating when samples were collected.

-
- The sample from 168-A was collected near the location of a former vapor degreaser on the main floor of Building A.
 - IA and SV samples in Building C basement at 001-C and 004-C were collected approximately 70 feet from a bay door to the outside that was opened intermittently.
 - Samples IA-144-C through IA-146-C, IA-150-C, and IA-152-C in Building C basement were collected in a positive-pressure, air-conditioned room (the RMS MPL machine shop).
 - Building A is a one-story building, except for a basement corridor under an open-air loading dock on its western side. Roof vents approximately 50 feet above the work floor were open in Building A during Round 26 sampling. The large doors at the loading docks on the western side of the building were also open to allow carts, forklifts, personnel, and equipment to pass. Increased ventilation associated with open doors and roof vents might have affected concentrations in samples collected on the first floor of Building A. No personnel or other activities were observed in the Building A basement.
 - The bay doors across the southern end of Building B were closed during sampling. The automatic bay door at the southeastern corner of Building B was opened and closed quickly to allow carts and equipment to pass. The opening of the bay door might affect concentrations in samples collected from the southernmost sampling locations (IA-100-B and IA-101-B). Open roof vents were also observed in Building B during sampling.
 - The Building C basement is generally accessed via two automatic rolling doors on its eastern and southern sides. These doors open and close quickly to allow carts and forklifts to pass. The automatic rolling door approximately 40 feet east of sampling location 141-C was opened and closed intermittently during the day. The bay doors at the southern and southeastern sides of the Building C basement were open during the sampling period. This might have influenced IA concentrations in the samples collected from locations 001-C and 004-C.
 - The most personnel and greatest activity were observed in Building B, in locations from the thrust-reverser assembly area in the southern portion of the building to the machining area in its central portion. Less activity was observed in Building A, where activity was generally focused in the expanded bond-layup room (former plating shop area) and autoclave areas, and in the parts and assembly areas. No activity was observed in the southern portion of Building C. Light activity (three people) was observed in the machine shop area in Building C basement.
 - The southern end of the Building C basement is now vacant, having been cleared of workstations and equipment by MRA Systems, Inc. (MRAS). Some materials are being temporarily stored in this area.
 - The pressure gauges on most Summa[®] canisters responded instantaneously upon opening the valve by dropping to between -25 in. Hg and -30 in. Hg. Four pressure gauges (IA-004-C, SV-DUP04-A, IA-078-A and IA-081-A) had beginning pressures of less than

- 25 in. Hg. The ending readings on pressure gauges of most Summa[®] canisters were between 0 and -4 in. Hg when sampling was complete. The pressure gauge for IA-DUP01-C showed an end pressure of -11 in. Hg. Pressure readings for samples SV-004-C and IA-117-A were not able to be read due to faulty gauges on the regulators. Despite these varied pressure readings and faulty gauges, all regulators operated properly, and adequate volumes for analysis were collected in all Summa[®] canisters. Pressure readings for each Summa[®] canister are recorded on the chain of custody forms (Appendix A).

Samples were analyzed for the current target-compound list, last amended on February 12, 2012:

- 1,1,1-trichloroethane (1,1,1-TCA)
- 1,1,2-trichloroethane (1,1,2-TCA)
- 1,1-dichloroethane (1,1-DCA)
- 1,1-dichloroethene (1,1-DCE)
- 1,2,3-trimethylbenzene (1,2,3-TMB)
- 1,2,4-trichlorobenzene
- 1,2,4-trimethylbenzene (1,2,4-TMB)
- 1,2-dichloroethane (1,2-DCA)
- 1,3,5-trimethylbenzene (1,3,5-TMB)
- benzene
- carbon tetrachloride
- chlorodifluoromethane (Freon 22)
- chloroform
- *cis*-1,2-dichloroethene (*cis*-1,2-DCE)
- dichlorodifluoromethane
- ethylbenzene
- methylene chloride
- methyl-tertiary-butyl ether (MTBE)
- naphthalene
- tetrachloroethene (PCE)
- toluene
- *trans*-1,2-dichloroethene (*trans*-1,2-DCE)
- trichloroethene (TCE)
- vinyl chloride (VC)
- xylenes (total)

All samples collected during Round 26 were submitted to TestAmerica in Knoxville, Tennessee for analysis via GC/MS using cryogenic concentration (as described in Sections 9 and 10 of USEPA Method [Toxic Organic-15] TO-15 [USEPA, 1999]). This method was used because of its low detection limit (in the parts-per-billion by volume range), and because it can quantify all VOCs of concern. TestAmerica is certified in USEPA Method TO-15 analysis and meets all quality assurance/quality control requirements specified in the TO-15 methodology.

All samples were stored at ambient temperatures and shipped to the laboratory via overnight carrier. All samples were submitted and analyzed within the method's specified 30-day holding time. All appropriate chain of custody documentation was completed for each sample (see Appendix A). A table listing TestAmerica's method detection limits is in Appendix B; Appendix C

contains the laboratory analytical reports. Data-validation reports and supporting documentation are in Appendix D.

Validated analytical data were qualified in accordance with USEPA *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2017a). Attaching data qualifiers to analytical results signifies a quality-control noncompliance. During Round 26, the following data qualifiers were applied to data after validation if applicable:

- *J*—indicates an estimated result below the reporting limit or an estimated result greater than the reporting limit with a quality control nonconformance.
- *J+*—The result is an estimated quantity, but the result may be biased high.
- *U*—indicates the chemical was not detected at the numerical detection limit (i.e., the sample-specific quantitation limit).
- *UJ*—indicates the chemical was not detected at the (estimated) numerical detection limit (i.e., the sample-specific quantitation limit).
- *UR*—indicates the sample result (non-detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Several non-detected results in two samples were rejected during data validation. As documented in the data validation reports in Appendix D, samples IA-113-C-26 and IA-131-C-26 were received with the canister valve in the open position. These samples were at ambient pressure (approximately 0 pounds per square inch). As stated in the laboratory case narrative, the integrity of the samples could have been jeopardized due to changes in ambient pressure after the sample was taken. The client was contacted and told the laboratory to proceed with the analyses. The detected results were qualified as estimated (*J*). The non-detected results were qualified as rejected (*UR*). Note that a field duplicate was collected at location IA-131-C, and results for the field duplicate sample were not rejected. As discussed below, results for two analytes within the field duplicate pair samples were qualified for field duplicate precision. The associated data validation report notes that result comparability for this field pair is limited because the original sample arrived at the laboratory with an opened canister valve.

Field duplicate sampling results were evaluated based on the following criteria: a relative percent difference of less than or equal to 50% when both original and duplicate results were greater than the reporting limit, or a difference within two times the reporting limit when original and duplicate results were less than or equal to the reporting limit. Detected and non-detected results for toluene and total xylenes in sample IA-131-C-26 and its corresponding duplicate were qualified as estimated (*J* and *UJ*, respectively) due to field duplicate precision (Appendix D). No other results were qualified for field duplicate imprecision during Round 26. Original and field duplicate results were considered separately when evaluating exceedances; i.e., if either the original or duplicate sample exceeded criteria, that exceedance is noted. In summary statistics (e.g., frequency of detection counts), field duplicate pairs were counted as one sample, and calculated averages were reported (e.g., in the “average of all values” calculation), as shown on Section 3 tables.

SECTION 3

ROUND 26 RESULTS

All analytical results for indoor air (IA) and background (ambient air) samples were compared to screening levels for industrial air; these levels are based on United States Environmental Protection Agency (USEPA) *Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites* (USEPA, 2018). Screening the chemicals of concern (COC) uses the lower of the carcinogenic (*ca*) or noncarcinogenic (*nc*) values. Carcinogenic values are based on a 1×10^{-5} (i.e., a one-in-100,000 probability) excess cancer-risk, whereas the noncarcinogenic values are based on a hazard quotient of 1 (i.e., the “no adverse effect” level).

These risk benchmarks were selected in accordance with Maryland Department of the Environment (MDE) requirements. Analytical results were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the “Threshold Limit Values” published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits.

Sub-slab vapor (SV) sampling results were compared to SV screening values derived in accordance with the methods discussed in USEPA’s *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to Indoor Air* (USEPA, 2015), and were calculated by dividing indoor-air (IA) screening levels by a conservative attenuation factor (AF) of 0.03. The AF represents the adjustment applied to IA screening levels to account for concentration reductions due to diffusive, advective, and/or other attenuating mechanisms as vapor migrates from the sub-slab to IA. Simply stated, SV is expected to dilute upon movement into IA; the AF is the ratio of the IA concentration to its SV concentration under a conservative vapor-intrusion (VI) scenario. The recommended AF in the 2015 USEPA guidance results in higher SV screening values than those used for sampling rounds before August 2012, when an earlier USEPA AF of 0.1 was used. USEPA further acknowledges that applying the AF of 0.03 to industrial buildings is conservative (i.e., more protective of human health and the environment), because the

value was developed based on residential VI studies and does not account for industrial buildings that generally have thicker building slabs and stronger heating/ventilation/air-conditioning (HVAC) systems than residential homes.

3.1 ROUND 26 DATA ANALYSIS

The sampling-round designation (R26) is not included when identifying samples or sampling locations in the following text, because all data discussed in this section are from Round 26. For example, an IA sample collected from vapor monitoring point (VMP) 076 (e.g., sample IA-076-A-R26) is referred to as “076-A.” If comparisons are made to specific samples from previous sampling rounds, they will be identified as such in the text or by using the round-designation suffix (e.g., R06 for Round 6).

Descriptive statistics for Round 26 IA and SV samples are shown in Tables 3-1 and 3-2, respectively. Summary statistics for trichloroethene (TCE) and naphthalene in IA over time are shown in Tables 3-3 and 3-4, respectively. Figures 3-1, 3-2, and 3-3 show Round 26 exceedances in Buildings A, B, and C, respectively. The following chemicals were detected in Round 26 IA and/or SV samples at concentrations exceeding their respective MDE industrial risk-management benchmarks:

- IA—none
- SV—1,1-dichloroethane (1,1-DCA), naphthalene, TCE, and vinyl chloride (VC)

Building A—Tables 3-5 and 3-6 present the Building A IA and SV results, respectively. Locations with exceedances are shown in Figure 3-1. All detected IA concentrations were less than screening levels during Round 26. In SV, only TCE concentrations exceeded screening levels. TCE was detected in all Round 26 SV samples, and exceeded its screening level ($293 \mu\text{g}/\text{m}^3$) in three samples; TCE is further discussed below.

TCE in Building A Basement

TCE has periodically been detected in IA in the Building A basement at concentrations greater than its IA screening level ($8.8 \mu\text{g}/\text{m}^3$), beginning with Round 15 (August 2013) and including Round 17 (August through November 2014), Round 20 (February 2016), Round 22 (March 2017),

and Round 25 (August 2018), but has not exceeded the Building A basement-specific screening level of 35 $\mu\text{g}/\text{m}^3$ that MDE approved in 2017. The basement screening-level was developed to account for reduced exposure potential in the basement, as compared to the main floor of Building A. Access to the basement is controlled by management. TCE was detected in IA at all four Round 26 Building A basement sampling locations (018-A, 093-A, 138-A, and 174-A) at concentrations less than its basement-specific screening level. Detected IA TCE concentrations were 3.4 $\mu\text{g}/\text{m}^3$ and 3.5 $\mu\text{g}/\text{m}^3$ in parent and duplicate samples (respectively) at location 018-A, 4 $\mu\text{g}/\text{m}^3$ at location 093-A, 2.9 $\mu\text{g}/\text{m}^3$ at location 138-A, and 7 $\mu\text{g}/\text{m}^3$ at location 174-A.

Note that this is the fourth VI sampling round since vapor extraction began at the HRS5 sump. This sump has been identified as likely the primary contributor of TCE impacts to indoor air in the Building A basement. Vapor is now being extracted there continuously under normal SSDS operating conditions; however, per sampling protocol, the SSDS was temporarily shut down for approximately 24 hours before starting IA and SV sampling and restarted immediately after sampling had been completed.

SV TCE exceeded its screening level (293 $\mu\text{g}/\text{m}^3$) at two basement locations (171-A and 173-A) in the central portion of Building A near the radii of influence of the SSD systems; exceedances were 1,000 $\mu\text{g}/\text{m}^3$ at 171-A and 1,700 $\mu\text{g}/\text{m}^3$ at 173-A. SV TCE concentrations at sampling locations 171-A and 173-A, added to the semiannual sampling in Round 22, also exceeded the screening level in Rounds 22, 23, and 25. These locations are in the eastern wall of the Building A basement. SV TCE exceedances were not detected at location 174-A during Round 26; this basement location was also added to the semiannual sampling plan in Round 22 along with 170-A and 175-A. Location 175-A was not sampled during Round 26. Location 170-A was sampled during Round 26, but the sample from this location was not analyzed because it was not received by the laboratory.

TCE in First Floor of Building A

TCE was detected at concentrations less than the screening level in six of 11 Round 26 first-floor Building A IA samples, at concentrations ranging from 0.43 $\mu\text{g}/\text{m}^3$ to 2 $\mu\text{g}/\text{m}^3$.

SV TCE (1,800 $\mu\text{g}/\text{m}^3$) exceeded its screening level (293 $\mu\text{g}/\text{m}^3$) at only one first floor location (118-A) in the central portion of Building A and within the radii of influence of the SSD systems.

Location 118-A is within the bond-layup room, where a positive-pressure-air-conditioning system was operating at the time of sample collection. TCE SV exceedances were also observed at that location during Rounds 18 through 25. TCE SV concentrations at 118-A in Rounds 19, 20, 21, 22, 23, 24, 25, and 26 ($900 \mu\text{g}/\text{m}^3$, $2,300 \mu\text{g}/\text{m}^3$, $890 \mu\text{g}/\text{m}^3$, $2,000 \mu\text{g}/\text{m}^3$, $690 \mu\text{g}/\text{m}^3$, $1,500 \mu\text{g}/\text{m}^3$, $590 \mu\text{g}/\text{m}^3$, and $1,800 \mu\text{g}/\text{m}^3$, respectively) are all approximately one order of magnitude (i.e., a power of 10) less than the SV concentration detected in Round 18 ($13,100 \mu\text{g}/\text{m}^3$).

SV TCE concentrations at first floor locations 136-A and 168-A, located within or near the radii of influence of the SSD systems, were less than screening levels during Round 26, but exceedances were noted at these locations during the previous sampling round (Round 25). TCE concentrations at SV 136-A in Rounds 21, 22, 23, 24, and 25 ($850 \mu\text{g}/\text{m}^3$, $300 \mu\text{g}/\text{m}^3$, $790 \mu\text{g}/\text{m}^3$, $380 \mu\text{g}/\text{m}^3$, and $660 \mu\text{g}/\text{m}^3$, respectively) have decreased by a factor of approximately 100 since the SSDS was expanded to this location in 2016, after a reported TCE-vapor concentration of $35,000 \mu\text{g}/\text{m}^3$ during Round 20. SV TCE concentrations at sampling location 168-A, added to the semiannual sampling in Round 22, exceeded the screening level in Rounds 22 through 25 ($22,000 \mu\text{g}/\text{m}^3$ [in Round 22]; $8,300 \mu\text{g}/\text{m}^3$, and $7,900 \mu\text{g}/\text{m}^3$ [for original and duplicate, respectively, in Round 23]; $1,300 \mu\text{g}/\text{m}^3$ [in Round 24]; and $950 \mu\text{g}/\text{m}^3$ and $920 \mu\text{g}/\text{m}^3$ [for original and duplicate, respectively, in Round 25]), but have notably decreased over time following the SSDS expansion. Concentrations at locations 136-A and 168-A during Round 26 were $270 \mu\text{g}/\text{m}^3$ and $180 \mu\text{g}/\text{m}^3$, respectively, less than the screening level of $293 \mu\text{g}/\text{m}^3$.

Building B—Tables 3-7 and 3-8 present Building B IA and SV results, respectively. Sampling locations within Building B are shown on Figure 3-2. No IA or SV exceedances were noted during Round 26. Similarly, no exceedances were noted in Building B IA or SV samples during Rounds 19 through 25. During Round 18, only one slight exceedance ($4.2 \mu\text{g}/\text{m}^3$) of naphthalene in IA was detected at location 140-B, and this concentration only marginally exceeded its screening level ($3.6 \mu\text{g}/\text{m}^3$). No exceedances were noted in Building B IA or in SV samples during Round 17. Prior IA exceedances were noted at location 140-B ($6.5 \mu\text{g}/\text{m}^3$) and 0-33B ($4J \mu\text{g}/\text{m}^3$) during Round 16 (February 2014), 033-B ($5 \mu\text{g}/\text{m}^3$) during Round 15 (August 2013), and 057-B ($3.8 \mu\text{g}/\text{m}^3$) during Round 6 (July 2009). Prior exceedances of the SV screening level ($120 \mu\text{g}/\text{m}^3$) were noted at several locations during Rounds 6, 9, and during Rounds 11 through 15, with the most recent

exceedances at locations 140-B (250 $\mu\text{g}/\text{m}^3$) and 123-Z (160 $\mu\text{g}/\text{m}^3$) during Round 15 (August 2013).

Building C—Tables 3-9 and 3-10 present Building C IA and SV results, respectively. All detected IA concentrations were less than screening levels during Round 26.

TCE was detected in three of 18 IA samples, but at low concentrations (1.2 $\mu\text{g}/\text{m}^3$ to 1.5 $\mu\text{g}/\text{m}^3$) less than its screening level (8.8 $\mu\text{g}/\text{m}^3$). TCE was detected at 13 of 16 SV sampling locations, and TCE exceedances in SV were noted at five locations (Figure 3-3):

- 060-C (600 $\mu\text{g}/\text{m}^3$), in the east-central portion of Building C, within the SSD radius of influence
- 102-C (1,100 $\mu\text{g}/\text{m}^3$), in the central portion of Building C near REC #31 (former Patriot Plating Line)
- 126-C (400 $\mu\text{g}/\text{m}^3$) inside the museum room and 141-C (340 $\mu\text{g}/\text{m}^3$) south of the museum room and north of the machine shop, both in the northeastern portion of Building C
- 133-C (760 $\mu\text{g}/\text{m}^3$), in the central portion of Building C, north of REC #31 (former Patriot Plating Line), and within in the SSD radius of influence

SV TCE concentrations at 102-C and 126-C also exceeded its screening level during Rounds 22 through 25. In the previous two sampling rounds (Rounds 24 and 25), SV TCE exceedances were also detected at locations 060-C and 133-C, and an SV TCE exceedance was also detected at location 141-C during Round 24.

Although an SV TCE exceedance was detected at location 001-C, in the southern portion of Building C, during Rounds 21 and 25, no exceedance at that location was detected during Rounds 22 through 24 and during Round 26. An SV TCE exceedance was detected at location 113-C, in the south-central portion of the building, during Round 21, but not during Rounds 22 through 26. SV TCE exceedances at location 152-C, in the east-central portion of Building C, were noted during Rounds 22 and 23, but not during Rounds 24 through 26. SV TCE exceedances in Building C appear to be sporadic and do not follow an observable spatial pattern.

A sole VC exceedance (1,100 $\mu\text{g}/\text{m}^3$) of its screening level (933 $\mu\text{g}/\text{m}^3$) was detected in SV at 126-C, in the museum room in the northeastern portion of Building C. SV exceedances of VC were also noted at location 126-C during Round 18 (1,310 $\mu\text{g}/\text{m}^3$), Round 19 (16,000 $\mu\text{g}/\text{m}^3$), Round 20

(3,100 $\mu\text{g}/\text{m}^3$), Round 21 (5,000 $\mu\text{g}/\text{m}^3$), Round 22 (2,600 $\mu\text{g}/\text{m}^3$), Round 23 (3,300 $\mu\text{g}/\text{m}^3$), Round 24 (2,700 $\mu\text{g}/\text{m}^3$), and 25 (6,300 $\mu\text{g}/\text{m}^3$). VC exceedances in SV have consistently been observed at location 126-C during recent sampling rounds (i.e., in Rounds 12–26). However, VC was not detected in IA during Rounds 12 through 26.

In addition to the screening level exceedances discussed above, SV exceedances of 1,1-DCA (4,800 $\mu\text{g}/\text{m}^3$) and naphthalene (210 $\mu\text{g}/\text{m}^3$) were also detected at 102-C during Round 26 (screening levels are 2,567 $\mu\text{g}/\text{m}^3$ and 120 $\mu\text{g}/\text{m}^3$, respectively). These exceedances are similar to those noted at location 102-C during Rounds 23 (5,900 $\mu\text{g}/\text{m}^3$ for 1,1-DCA, and 180 $\mu\text{g}/\text{m}^3$ for naphthalene), Round 24 (5,600 $\mu\text{g}/\text{m}^3$ for 1,1-DCA and 180 $\mu\text{g}/\text{m}^3$ for naphthalene), and Round 25 (7,900 $\mu\text{g}/\text{m}^3$ and 7,600 $\mu\text{g}/\text{m}^3$ for 1,1-DCA in parent and duplicate samples, respectively, and 280 $\mu\text{g}/\text{m}^3$ and 330 $\mu\text{g}/\text{m}^3$ for naphthalene in parent and duplicate samples, respectively). SV exceedances of 1,1-DCA (3,900 $\mu\text{g}/\text{m}^3$) and naphthalene (310 $\mu\text{g}/\text{m}^3$) at 102-C also occurred during Round 22, but not during Round 21. The SV naphthalene and 1,1-DCA exceedances in Building C do not appear to impact IA concentrations. Naphthalene and 1,1-DCA were not detected in IA during Round 26 but were detected in previous sampling rounds (i.e., Rounds 10 and 11 for 1,1-DCA, and during Rounds 10, 11, 13 through 16, 18, 23, and 25 for naphthalene) at concentrations less than screening levels.

During Round 26, IA and SV concentrations of tetrachloroethene (PCE) did not exceed screening levels. An IA exceedance of PCE (870 $\mu\text{g}/\text{m}^3$, as compared to its IA screening level of 180 $\mu\text{g}/\text{m}^3$) was detected at location 149-C in a Round 18 resample, collected because the TCE concentration at the same location approached, but did not exceed, its screening level in the original sample. Before Round 18, PCE had never been detected in IA or SV in Building C. Additionally, IA and SV concentrations of PCE in Rounds 19 through 25 did not exceed screening levels. In most SV samples collected over time in these investigations from locations at and near location 149-C, PCE was not detected above its detection limit. This suggests that the sole PCE exceedance at location 149-C during Round 18 is anomalous, and possibly attributable to some IA source rather than to VI. In Round 26, PCE was not detected in IA at 149-C, but was detected in SV at a concentration (0.97 $\mu\text{g}/\text{m}^3$) less than its screening level (6,000 $\mu\text{g}/\text{m}^3$) at that location.

3.2 BACKGROUND AMBIENT-AIR SAMPLES

Outdoor-air-quality (i.e., background) samples provide baseline concentrations for COC that can be compared to interior concentrations. Comparison to background indicates whether chemicals detected in IA are more likely associated with an exterior (i.e., background) or interior source (e.g., chemicals used in the workplace, or with past spills of chemicals absorbed to above-slab building materials, or sub-slab sources). Analytical results for Round 26 ambient (background) air samples are shown in Table 3-11. Figure 2-1 shows the background sampling locations used for Round 26; these locations are sufficiently far from site operations to avoid any possible site influence.

Table 3-12 lists chemicals detected in background samples and compares IA concentrations to the maximum detected background concentration. Five VOCs were detected in background samples, and all chemicals detected in background samples were also detected in IA samples. All detected background concentrations are below their respective IA screening criteria. Table 3-12 evaluates whether chemical concentrations detected in IA are possibly due to interior sources, or if they simply reflect background conditions, using the following logic:

- When IA concentrations are equal to or less than background concentrations, IA concentrations likely reflect background conditions.
- When IA concentrations are greater than background concentrations and/or sub-slab concentrations, other interior sources are possibly contributing to IA concentrations.
- The presence of chlorinated degradation-products in IA samples (at concentrations less than those detected in SV samples), but not in background samples, suggests that sub-slab sources might contribute to these IA concentrations.

All COC detected in IA during Round 26 were at concentrations less than their respective screening levels. However, IA detections of several chemicals at concentrations less than screening levels may be influenced by background. As presented in Table 3-12, chemicals with most of their indoor air detections below background (1,3,5-trimethylbenzene and dichlorodifluoromethane) are likely influenced by ambient background contaminant sources. The

remaining contaminants, if detected in both ambient air and in IA, might be due to IA sources (and possibly VI to IA), and/or ambient background conditions. In any case, all background contaminants also detected in IA in Round 26 are below IA screening levels.

SECTION 4

SUB-SLAB-DEPRESSURIZATION-SYSTEM DATA ANALYSIS

This section summarizes the operation and monitoring activities for the sub-slab-depressurization (SSD) systems (SSDS) in Buildings A and C for the reporting period from October 1, 2018 to March 31, 2019. A detailed account of these activities is in the April 22, 2019, remedial action progress report (Appendix E). The location and layout of the SSD systems, and associated sub-slab vapor (SV) extraction points and vapor monitoring points (VMPs), are shown in Figures 1, 2, and 4 of Appendix E. This section discusses SV sampling results, extraction points, system influent, vacuum influence, and SSDS performance.

4.1 SUB-SLAB VAPOR MONITORING POINTS

Tables 4-1 and 4-2 summarize the concentrations of target volatile organic compounds (VOCs) detected at SV monitoring points to date near the SSD systems in Building A (in the lay-up room [former plating shop on the main floor], basement, and eastern area [on main floor]), and in the Building C basement, respectively.

4.1.1 Building A

SV samples collected to date near the Building A SSDS are listed in Table 4-3. VMPs 015-A (on the main floor of Building A); 078-A, 079-A and 136-A (in the eastern area of Building A); 168-A (in the northern area of Building A); and 093-A and 116-A (in the basement of Building A) were sampled in February 2019 (see Figure 2 in Appendix E).

VMPs 015-A (on the main floor of Building A) and 018-A (in the basement) had originally been scoped to be sampled regularly as part of the facility-wide semiannual SV and indoor-air (IA) monitoring program (see Figure 2 in Appendix E). However, VMP 018-A has not been sampled since February 2014, because water regularly collects in its flush-mounted vault. Subsequently, VMPs 093-A and 116-A were added to the SSDS monitoring program.

The highest SV trichloroethene (TCE) concentrations that have been measured in Building A were detected at VMPs 015-A, 018-A, 079-A, 136-A, and 168-A before and after the SSDS began operation, as shown in Table 4-4. The concentrations detected at VMPs 015-A, 079-A, 136-A, and 168-A in February 2019 were at least one order of magnitude (i.e., 10 times) lower than the concentrations detected before a Building A SSDS extraction point began operation in the area.

While a significant decline in TCE concentrations has been observed at 015-A, concentrations continue to fluctuate over time, with some apparent seasonal variation (higher in summer [August] as compared to winter [February] since 2017). For example, TCE was detected at an estimated 2.3 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) in February 2017, at 51.5 $\mu\text{g}/\text{m}^3$ in August 2017, at 6.3 $\mu\text{g}/\text{m}^3$ in February 2018, at 73 $\mu\text{g}/\text{m}^3$ in August 2018, and at 4 $\mu\text{g}/\text{m}^3$ in February 2019 (Figure 4- 1). VOC-impacted groundwater likely provides a continuing source of VOCs to SV at 015-A. Similar fluctuations had also occurred at 018-A between August 2011 and February 2014.

VMPs 079-A and 136-A are near extraction points installed during the system expansion that was completed in April 2016. August 2018 results show that these locations have had more than a 90% decrease in total VOCs since the SSDS was expanded. Figure 4-2 shows that since August 2016, the summer (August) sampling results at these two points are higher than the winter (February) results, with what appears to be seasonal fluctuation.

VMP 168-A is near the system extraction point SSD-39-A, installed during the third-phase of system expansion completed in July 2017; this location continued to show VOC concentration decreases in February 2019 (TCE at 180 $\mu\text{g}/\text{m}^3$) as compared to concentrations in August 2018 (TCE at 950 $\mu\text{g}/\text{m}^3$) and before third-phase expansion in February 2017 (TCE at 22,000 $\mu\text{g}/\text{m}^3$).

Concentrations observed after SSDS startup were generally lower than concentrations detected before the system began operation. VOC reductions at 018-A (in the basement, and last sampled in 2014 due to consistent high groundwater levels) might be more limited than those experienced at main floor VMPs, because the shallow groundwater table (typically less than one foot below the basement slab) possibly impedes vapor flow.

4.1.2 Building C

SV samples collected to date near the Building C SSD system are listed in the Table 4-5. These points are within 100 feet of the Building C SSD-system extraction points in the basement; most³ are within the vacuum influence of SSD-system operations. VMPs 001-C, SSD-4-C (in the southern basement area); and 060-C, 088-C, 113-C, 126-C, 133-C, 141-C 149-C, 152-C, 153-C, and 155-C (in the mid-basement area) were sampled in February 2019 (see Figure 4 in Appendix E).

The highest TCE concentrations were observed at VMPs 001-C, SSD-4-C, 060-C, 113-C, and 133-C before SSDS extraction points began operation in those areas. The most recent concentrations are summarized in Table 4-6. February 2019 TCE concentrations are lower than the concentrations measured before SSD-system startup. Compared to the concentrations measured in the previous semiannual event (August 2018), VMPs 001-C, SSD-4-C, 126-C, 133-C, 149-C, 153-C, and 155-C have lower TCE concentrations, most notably at 001-C, SSD-4-C, 126-C, 133-C, and 149-C; see Table 4-2 and Figure 4-3 for details. The concentrations at VMPs 060-C, 088-C, 113-C, 141-C are slightly higher or similar to those detected during the previous semi-annual event, and are apparently reaching asymptotic levels after several years of vapor extraction in the area. TCE at VMP 152-C continued to decrease; its February 2019 concentration was lower than its August 2018 concentration (49 $\mu\text{g}/\text{m}^3$, as compared to 77 $\mu\text{g}/\text{m}^3$; see Table 4-2 and Figure 4-3).

Concentrations of vinyl chloride (VC) observed at 126-C (north of the SSDS extraction points) have also decreased since the SSD-system expansion (see Figure 4-4), but, as shown on Figure 4-4, VC concentrations in sub-slab vapor at 126-C have varied over time (the respective VC concentrations there in August 2018 and February 2019 were 6,300 $\mu\text{g}/\text{m}^3$ and 1,100 $\mu\text{g}/\text{m}^3$). The reason for these fluctuations may possibly be due to seasonal fluctuation (see 2015, 2016, 2017, and 2018 results in Figure 4-4). VC has not been detected in SSDS influent samples or in groundwater samples collected from a nearby well pair (MW-88A/B).

³Locations 001-C, SSD-4-C, 060-C, 113-C, 127-C, 133-C, 135-C, 149-C, 152-C, 153-C, 155-C, and 156-C

4.2 SUB-SLAB VAPOR EXTRACTION POINTS

The Building A and Building C SV extraction points are not sampled as part of the semi-annual SSDS monitoring program, because the combined influent for the Building A system is sampled monthly, and the Building C system is sampled every two months (influent sampling results are presented in Section 4.4). Figure 2 in Appendix E shows the Building A extraction points (North, South, Basement North, and Basement South), horizontal extraction laterals, extraction pipe from basement sump HRS-5, and vertical extraction points in Building A (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, SSD-38-A, and SSD-39-A). Figure 4 in Appendix E shows the vertical extraction points in Building C: SSD-21-C, SSD-23-C, SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C.

4.3 VACUUM INFLUENCE

Induced vacuum levels over time for sub-slab VMPs in the targeted areas are shown on the following figures in Appendix E: Figure 6 (Building A lay-up room and basement), Figure 7 (Building A eastern area), Figure 8 (Building C southern basement area), and Figure 9 (Building C mid-basement area). Representative vacuum measurements from the March 28, 2019 monitoring episode are indicated on plan views on Figures 10, 11, 12, and 13 of Appendix E. Vacuum influence associated with SSDS VMPs is checked biweekly. The target vacuum is 0.01 inches of water column or greater (Note: negative vacuums at some points indicate pressure readings that are considered not influenced by the SSDS; pressure readings are likely due to undetermined local features).

As indicated in the April 2019 progress report (Appendix E), extraction trenches near the Building A lay-up room induce a vacuum equal to or greater than 0.01 inches water column over an approximately 5,900-square-foot area; this area encompasses all SV monitoring points that had elevated VOC concentrations before system startup. The trenches in the Building A basement induce a vacuum over an approximately 1,900-square-foot area that encompasses all four VMPs used to measure the SSDS induced vacuum in the basement. The extraction wells in the eastern area of Building A induce a vacuum over an approximately 6,100-square-foot-area, and encompass nine of 15 VMPs used to measure the SSDS induced vacuum in that area. Extraction point SSD-

39-A in the western area of Building A is inducing vacuum at two nearby VMPs; the associated area of induced vacuum influence is approximately 1,100 square feet.

The Building C basement extraction wells induce vacuum influence over an approximately 4,200-square-foot area in the southern end of the basement, while the extraction wells in the mid-basement area induce vacuum influence over an approximately 36,800-square-foot area. In the mid-basement, 14 of 20 accessible monitoring points are within the target area shown to have vacuum influence. .

SSD systems are performing as designed except for a lack of induced vacuum near SSD-136-A in the eastern area of Building A, as indicated by the lack of influence seen at 136-A-N and 162-A. However, TCE concentrations at 136-A and 136-A-N have both decreased more than 98% since the system was expanded in 2016

4.4 INFLUENT-VAPOR SAMPLES

Influent-vapor samples are collected monthly to monitor the Building A SSDS operation, and once every two months to monitor the Building C SSDS operation. VOC concentrations at the granular activated-carbon (GAC) influent, midpoint (after the lead drum), and effluent (after the second drum) points are monitored to determine when the midpoint concentration reaches 50% of the influent; when the 50% breakthrough is reached, or at Tetra Tech's discretion with concurrence from Lockheed Martin Corporation (Lockheed Martin), the lead GAC drum is changed out. These samples also allow monitoring of influent-concentration trends over time. Samples are collected directly from all three sampling ports of both SSD systems by connecting a clean one-liter Summa[®] canister (batch certified) to the Teflon[®] tubing of each sampling port and opening the valve for approximately one minute. The samples were submitted to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee for VOC analysis using United States Environmental Protection Agency (USEPA) Toxic Organic Method (TO-15).

Tables 4-7A and 4-7B summarize the influent-vapor concentrations of target VOCs in samples over time (from system startup in March 2008 through March 2019). These results are displayed graphically on Figures 14 and 15 in Appendix E. Tables 4-7A and 4-7B provide average influent concentrations for the current (October 2018–March 2019) and previous (April–September 2018)

reporting periods. The six-month average-influent (total) VOC concentration in Building A and Building C during the current reporting period (1,429 $\mu\text{g}/\text{m}^3$ for Building A and 49 $\mu\text{g}/\text{m}^3$ for Building C) are lower than the average-influent VOC concentration during the previous semiannual reporting period (2,005 $\mu\text{g}/\text{m}^3$ for Building A and 110 $\mu\text{g}/\text{m}^3$ for Building C). Overall, influent VOC concentrations for both SSD-systems have been relatively stable or slowly decreasing since 2009 (see Figures 14 and 15 in Appendix E).

The goal of the SSD systems is to maintain a negative pressure below the slab (relative to the room space), thus minimizing VOC migration from the sub-slab soil into indoor air. VOC mass removal occurs by treatment of the vapor drawn out to maintain the vacuum.

VOC removal rates for SSDS influent mass in Building A ranged from 0.04 to 0.07 pounds per day (lbs/day); these rates are similar to the removal rates observed in the previous semiannual reporting period (0.05 to 0.08 lbs/day). The Building A system has removed eight pounds (lbs) of VOCs during this reporting period, nine pounds during the previous reporting period, and has removed approximately 190 lbs since system startup in March 2008.

The VOC removal rate in Building C during the current reporting period was less than the previous reporting period, approximately 0.02 pounds per month (lbs/month). The Building C SSDS has removed 0.12 lbs of VOCs this reporting period, 0.29 lbs during the previous reporting period, and has removed 12.2 lbs since system startup in March 2008.

4.5 SYSTEM PERFORMANCE

In general, flow rates and induced vacuums for the SSD systems are performing as designed except for a lack of induced vacuum near SSD-136-A in the eastern area of Building A. We will continue to monitor system induced vacuum performance; however, some localized areas are likely to remain not amenable to induced vacuum, due to the heterogeneous structure of subsurface soil and water accumulation in the subsurface of these older structures. The induced-vacuum influence of the Building A system is over 5,900 square-feet on the main floor (encompassing the lay-up room), 1,900 square-feet in the basement, 6,100 square-feet in the northern and eastern areas, and 1,100 square feet in the western area. The induced-vacuum influence of the Building C SSDS

extends over an approximately 4,200 square-foot area in the southern basement, and over approximately 36,800 square-feet in the mid-basement area.

SECTION 5 CONCLUSIONS

5.1 CONCLUSIONS

Tetra Tech, Inc., (Tetra Tech) has completed Round 26 of vapor-intrusion (VI) monitoring (the first of two scheduled in 2019) in Buildings A, B, and C at the Middle River Complex (MRC) (owned by LMC Properties, Inc.) in Middle River, Maryland. This ongoing investigation seeks to evaluate whether volatile organic compounds (VOCs) in sub-slab vapor (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air (IA) at the Middle River Complex facilities, and whether subsurface vapor contamination remains present at concentrations that dictate continued operation of the sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems mitigation system (or if a transition/exit strategy can be performed). The data set is composed of indoor air and sub-slab vapor (SV) samples collected in February 2019. Ambient air samples were also collected at four outdoor background locations around the perimeter of the Middle River Complex. All data were validated to ensure compliance with analytical method requirements.

Indoor air data were compared to risk-based screening levels for industrial air set at the 1×10^{-5} (i.e., one-in-100,000 probability) risk level for carcinogens, or at a hazard quotient of 1 for noncarcinogens (as published in the United States Environmental Protection Agency [USEPA] *Regional Screening Levels for Chemical Contaminants at Superfund Sites* [USEPA, 2018]). For samples collected in the Building A basement only, indoor air levels of trichloroethene (TCE) were compared to a Maryland Department of the Environment-approved basement-specific screening level of 35 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), based on the limited exposure potential for workers entering the basement. Indoor air samples were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the “Threshold Limit Values” published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits. SV

data were compared to screening values derived using methods described in *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to Indoor Air* (USEPA, 2015) by applying an attenuation factor of 0.03 to the indoor-air screening values.

Historically, trichloroethene and naphthalene have been the prevalent contaminants of concern in indoor air at this site. In Round 26, trichloroethene was not detected in indoor air in Building B, but was detected in indoor air in Buildings A and C. Trichloroethene was detected in 13 of 35 indoor air samples collected during Round 26. However, all indoor air trichloroethene detections were less than the screening level ($8.8 \mu\text{g}/\text{m}^3$) (see plan view in Figure 5-1) and the Building A basement-specific screening level ($35 \mu\text{g}/\text{m}^3$). The reduced trichloroethene indoor air concentrations in the Building A basement, compared to previous years, are attributable to sealing and extracting vapors from basement sump HRS5; this sump was connected to the Building A sub-slab-depressurization system in June 2017.

In Round 26, naphthalene was detected in only one of 35 indoor air samples at a concentration less than its screening level. The sole naphthalene detection occurred in Building A (location 021-A). Sub-slab vapor naphthalene was detected in six of 33 samples, with one concentration exceeding its screening level (at location 102-C). Naphthalene was not detected in indoor air in Buildings B or C.

5.1.1 Building A

Trichloroethene exceeded its screening level in sub-slab vapor (but not in indoor air) during Round 26. Trichloroethene concentrations in Building A are discussed below.

Basement

- Trichloroethene was detected in indoor air at all four Building A basement sampling locations, but at concentrations less than its basement-specific screening level ($35 \mu\text{g}/\text{m}^3$), which was derived to account for reduced potential exposure in the basement, and at concentrations less than its industrial worker screening level ($8.8 \mu\text{g}/\text{m}^3$). Historical indoor-air trichloroethene concentrations in the Building A basement in samples using Summa[®] canisters have never exceeded the basement-specific screening level but have exceeded the industrial screening level. Trichloroethene was detected at concentrations greater than the sub-slab vapor screening level in vapor samples collected from behind the eastern basement wall at locations 171-A and 173-A. Direct measurement of air above the sumps

and of air trapped in the covered sumps indicates that the sumps and drains in the Building A basement are the sources of the trichloroethene.

Main floor

- Trichloroethene was detected in sub-slab vapor at location 118-A (1,800 $\mu\text{g}/\text{m}^3$), located on the main floor in the Bond Layup Room, east of the former Plating Shop, at a concentration greater than the screening level (293 $\mu\text{g}/\text{m}^3$). This sample was collected where a positive-pressure air-conditioning system was operating. This sampling location is within the radii of influence of the sub-slab depressurization systems. Indoor air concentrations of trichloroethene on the main floor of Building A were all less than the screening level.

The sub-slab-depressurization system in Building A appears to be operating as designed (except for limited vacuum influence in the SSD-136-A area), and appears to be effectively mitigating sub-slab vapor intrusion from known source areas of sub-slab vapor contamination, in concert with the indoor-air filtration units and control of vapor emissions from the sumps. Contaminants are constantly removed from soil vapor during system operation, and indoor air concentrations in the main part of Building A (excluding the basement) rarely exceed screening values. Filter cartridges are changed-out quarterly; no other maintenance is required.

Although basement occupancy is restricted, and screening levels related to restricted occupancy are not exceeded, this area will continue to be monitored as the sub-slab-depressurization system continues to operate. Figures 5-2A, 5-2B, and 5-2C show concentrations of trichloroethene in Building A in sub-slab vapor samples, in indoor air of the basement, and in indoor air on the first floor of the building (respectively). Direct measurement of air above the sumps and of air trapped in the covered sumps indicates that the sumps and drains in the Building A basement are the primary trichloroethene sources.

5.1.2 Building B

No exceedances were noted in the Building B indoor air or sub-slab vapor samples during Round 26. The most recent exceedance of the indoor air screening level was during Round 18, when one slight exceedance of naphthalene was detected (February 2015).

5.1.3 Building C

Trichloroethene was detected in three of 18 indoor air samples collected from Building C during Round 26. Sub-slab vapor exceedances of trichloroethene were detected at five locations (060-C,

in the east-central portion of Building C, and within the system's radius of influence; 102-C, in the central portion of Building C near REC #31 (former Patriot Plating Line); 126-C (inside the museum room) and 141-C (south of the museum room and north of the machine shop), both of which are in the northeastern portion of Building C; and 133-C, in the central portion of Building C, north of REC #31(former Patriot Plating Line), and within in the system's radius of influence) in Building C during Round 26, with concentrations ranging from 340 $\mu\text{g}/\text{m}^3$ to 1,100 $\mu\text{g}/\text{m}^3$. The Round 26 exceedances in sub-slab vapor are consistent with those observed in other recent sampling rounds (e.g., Rounds 21 through 25).

Vinyl chloride was detected in sub-slab vapor at location 126-C at a concentration (1,100 $\mu\text{g}/\text{m}^3$) greater than its screening level (933 $\mu\text{g}/\text{m}^3$) during Round 26. Concentrations of vinyl chloride in sub-slab vapor at 126-C have decreased since the sub-slab depressurization system expansion, but have fluctuated over time. Vinyl chloride has not been detected in groundwater near 126-C, nor in indoor air, despite the presence of trichloroethene in nearby groundwater monitoring well MW-88A at concentrations up to 1,500 micrograms per liter ($\mu\text{g}/\text{L}$) in 2009.

Sub-slab vapor concentrations of 1,1-dichloroethane (4,800 $\mu\text{g}/\text{m}^3$) and naphthalene (210 $\mu\text{g}/\text{m}^3$) also exceeded their screening levels (2,567 $\mu\text{g}/\text{m}^3$ and 120 $\mu\text{g}/\text{m}^3$, respectively) at location 102-C during Round 26. Sub-slab vapor concentrations of 1,1-dichloroethane and naphthalene also exceeded their screening levels at location 102-C during other recent sampling rounds (e.g., Rounds 17, 18, 20, 22, 23, 24, and 25).

In general, sub-slab vapor concentrations of volatile organic compounds have decreased in the southern basement area (SSD-4-C) of Building C since system startup in March 2008. Vapor monitoring points (060-C, 088-C, 113-C, 126-C, 133-C, and 135-C) in the mid-basement area also show lower concentrations, as compared to results before system expansion in May 2013.

The absence of any Building C indoor air screening-level exceedances for any compound suggests that vapor intrusion is likely not occurring. The sub-slab-depressurization system in Building C appears to be operating as designed, and appears to be effectively mitigating sub-slab vapor intrusion from known source areas of sub-slab vapor contamination. Figures 5-3A and 5-3B show

sub-slab vapor and indoor air concentrations of 1,1-dichloroethane, naphthalene, trichloroethene, and vinyl chloride in Building C.

A shaded maximum background value indicates that the maximum detected value from the site data exceeds the maximum background value.

A bolded chemical name indicates that its concentration exceeds background and the industrial air RSL based on an HQ of 0.1 or an ILCR of 1×10^{-6} (i.e., one-tenth of screening value listed).

A bolded/shaded chemical name indicates that its concentration exceeds background and the industrial air RSL based on an HQ of 1 or an ILCR of 1×10^{-5} (i.e., the screening value presented).

Footnotes:

- 1 - Sample and duplicate are considered two separate samples when determining the minimum and maximum concentrations but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding screening criteria.
- 2 - Values presented are sample-specific quantitation limits.
- 3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.
- 4 - Exceedance counts are based on detected results only.
- 5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November 2018. RSLs for carcinogens were adjusted to be based on a lifetime cancer risk of 1×10^{-5} . RSLs for noncarcinogens were not adjusted and represent a hazard quotient (HQ) of 1.
- 6 - Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit (PEL).

Definitions:

ca = screening value based on 1×10^{-5} carcinogenic risk

HQ - hazard quotient

ILCR - incremental lifetime cancer risk

J - estimated value

J+ - estimated value, biased high

µg/m³ - micrograms per cubic meter

N = National Institute for Occupational Safety and Health Recommended Exposure Limit

NA - not applicable/not available

nc = noncarcinogenic screening values based on noncarcinogenic hazard quotient = 1

ND - not detected

OSHA - Occupational Safety and Health Administration

PEL - permissible exposure limit

RSL - regional screening level

USEPA - United States Environmental Protection Agency

A bolded chemical name indicates that its concentration exceeds the industrial air RSL divided by 0.03 based on an HQ of 0.1 or an ILCR of 1×10^{-6} (i.e., one-tenth the screening value presented).

A bolded/shaded chemical name indicates that its concentration exceeds the industrial air RSL divided by 0.03 based on an HQ of 1 or an ILCR of 1×10^{-5} (i.e., the screening value).

Footnotes:

- 1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations, but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding criteria.
- 2 - Values presented are sample-specific quantitation limits.
- 3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.
- 4 - Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor 0.03, and correspond to a target cancer risk level of 1.0×10^{-5} or a hazard quotient (HQ) of 1.
- 5 - Exceedance counts are based on detected results only.

Definitions:

-- = no criterion available

ca = screening value based on carcinogenic effects

HQ = hazard quotient

ILCR = incremental lifetime cancer risk

J = estimated value

NA = not available

nc = screening value based on noncarcinogenic effects

RSL = regional screening level

All results are in µg/m³.

- (1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.
- (2) Values presented are sample-specific quantitation limits.
- (3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.
- (4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.
- (5) Value is the non-carcinogenic industrial air regional screening level corresponding to HQ = 1 (USEPA, November 2018).
- (6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.
- (7) The maximum detected concentration (36 µg/m³) was detected in a duplicate sample, and the corresponding original sample concentration (0.75 µg/m³) is considerably less than the maximum concentration. Resampling at the same location found concentrations that were closer to the original sample concentration.
- (8) There are less than five samples; therefore, a UCL is not presented.
- (9) There are less than three detections; therefore, a UCL is not presented.
- (10) There are no trichloroethene results for the Building C first floor from the February 2019 sampling event.

Definitions:

- HQ - hazard quotient
- J - estimated value
- µg/m³ - micrograms per cubic meter
- NA - not applicable/not available
- UCL - upper confidence limit
- USEPA - United States Environmental Protection Agency

Notes: All sample concentrations are in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)

Shaded cells indicate a concentration greater than risk-based screening level.

Bolded cells indicate that the analyte is detected in the sample.

$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

-- = not available

J = estimated value

J+ = estimated value, may be biased high

U = nondetect

UJ = non-detected value is estimated

ca = screening value based on carcinogenic effects

nc = screening value based on noncarcinogenic effects

1 - Screening values derived in accordance with Draft Guidance for Evaluating the

Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002).

Screening values are equal to United States Environmental Protection Agency (USEPA)

Industrial Air Screening Values divided by an attenuation factor of 0.03, and correspond

to a target cancer risk level of 1×10^{-5} .

Bolded cells indicate analyte was detected in background sample(s).

Industrial Air Screening Levels from USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, November 2018

-- = not available

A = American Council of Governmental Industrial Hygienists Threshold Limit Value

ca = screening value based on 1×10^{-5} carcinogenic risk

J = estimated value

N = National Institute for Occupational Safety and Health Recommended Exposure Limit

nc = screening value based on noncarcinogenic hazard quotient = 1

OSHA PEL = Occupational Safety and Health Administration Permissible Exposure Limit

U = not detected

USEPA = United States Environmental Protection Agency

TABLE 3-12

ANALYTE CONCENTRATIONS IN BACKGROUND AIR SAMPLES
 COMPARED TO INDOOR AIR SAMPLES - FEBRUARY 2019
 LOCKHEED MARTIN CORPORATION MIDDLE RIVER COMPLEX
 MIDDLE RIVER, MARYLAND

Analyte	Maximum Background Concentration ($\mu\text{g}/\text{m}^3$)	Maximum Indoor Air Sample Concentration ($\mu\text{g}/\text{m}^3$) ⁽¹⁾	Number of Indoor Air Samples with Detects ⁽¹⁾	Number of Indoor Air Detects < Background ⁽¹⁾⁽²⁾	Number of Indoor Air Detects = Background ⁽¹⁾⁽²⁾	Number of Indoor Air Detects > Background ⁽¹⁾⁽²⁾
1,3,5-TRIMETHYLBENZENE	0.72	0.88	3	2	0	1
BENZENE	0.47	1.9	36	2	0	34
CHLORODIFLUOROMETHANE	1.1	21	34	1	0	33
DICHLORODIFLUOROMETHANE	2.3	2.3	36	32	4	0
METHYLENE CHLORIDE	4.1	21	36	12	1	23

1 - The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration, but are considered one sample when determining the number of samples with detects and the number of samples less than, equal to, or greater than background.

2 - If one sample in a duplicate pair was greater/equal to background and the other sample in the duplicate pair was less than background, the maximum detected concentration in the field duplicate pair was used to represent the field duplicate pair.

There are a total of four background samples, 35 indoor air samples for 1,3,5-trimethylbenzene, and 36 indoor air samples for the remaining analytes for Round 26.

Notes:

Data presented in this table is from sub-slab vapor samples.

µg/m³ = micrograms per cubic meter
 - = not detected (below reporting limit)

DL = diluted analysis
 NA = compound not reported

NS = not sampled
 NA = compound not reported

K = value is biased high
 L = value is biased low

VOC = volatile organic compound
 SSDS = sub-slab depressurization system

Notes:

- —point(s) not sampled.

N/A—point may have been sampled but the results were not applicable to the SSD-system.

Points with an "SSD" designation were installed and are monitored for the SSD-system.

Points without the SSD designation are used for the vapor-intrusion monitoring program.

TABLE 4-4

TRICHLOROETHENE CONCENTRATIONS BEFORE AND DURING SSDS OPERATION, BUILDING A
 LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND
 PAGE 14 OF 16

<i>Vapor Monitoring Point</i>	<i>Before SSD-system operation*</i>		<i>During SSD-system operation (most recent concentration)</i>	
	<i>Date</i>	<i>Sub-Slab Vapor Concentration ($\mu\text{g}/\text{m}^3$)</i>	<i>Date</i>	<i>Sub-Slab Vapor Concentration ($\mu\text{g}/\text{m}^3$)</i>
015 A	April 2007	326,000	February 2019	4
018 A	August 2010	64,000	February 2014	174
079-A	February 2016	3,500	February 2019	57

Notes:

- —point(s) not sampled.

N/A—point may have been sampled but the results were not applicable to the SSD-system.

Points with an "SSD" designation were installed and are monitored for the SSD-system.

Points without the SSD designation are used for the vapor-intrusion monitoring program.

TABLE 4-6

TRICHLOROETHENE CONCENTRATIONS BEFORE AND DURING SSDS OPERATION, BUILDING C
 LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND
 PAGE 16 OF 16

<i>Vapor Monitoring Point</i>	<i>Before SSD-system operation*</i>		<i>During SSD-system operation (most recent concentration)</i>

149-C	Not Sampled		February 2019	0.42 J
152-C	Not Sampled		February 2019	49
153-C	Not Sampled		February 2019	5.5
155-C	Not Sampled		February 2019	-

Notes:

*SSD-system startup in the south end of the Building C basement was in March 2008.

**SSD-system startup in the mid-basement area of Building C was in May 2013.

$\mu\text{g}/\text{m}^3$ —microgram(s) per cubic meter air

J—estimated value

- = not detected (below reporting limit)

SSD—sub-slab depressurization

APPENDIX C—LABORATORY ANALYTICAL REPORTS

ANALYTICAL REPORT

Job Number: 140-14386-1

Job Description: MRC Indoor Air - MRC

For:

Tetra Tech, Inc.

20251 Century Blvd

Suite 200

Germantown, MD 20874

Attention: Samantha Brenner

Approved for release.
Terry Walker Wasmund
Project Manager II
3/6/2019 4:47 PM

Terry Walker Wasmund, Project Manager II

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: MRC Indoor Air - MRC

TestAmerica Job ID: 140-14386-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
140-14386-1

Receipt

The samples were received on 2/23/2019 at 10:10 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. The COC listed canister asset number as 12276, but it should be 11276.

Air - GC/MS VOA - Method TO-15LL

EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments

No additional comments.

Summa Canister Dilution Worksheet

Client: Tetra Tech, Inc.

Job No.: 140-14386-1

Lab Sample ID	Canister Volume (L)	Preadjusted Pressure ("Hg)	Preadjusted Pressure (atm)	Preadjusted Volume (L)	Adjusted Pressure (psig)	Adjusted Pressure (atm)	Adjusted Volume (L)	Initial Volume (mL)	Dilution Factor	Final Dilution Factor	Date	Analyst
140-14386-8	1	-7.5	0.75	0.75	2.6	1.18	1.18		1.57	1.57	02/25/19 15:10	Barlozhetskaya, Anna F
140-14386-12	1	-8.8	0.71	0.71	2.5	1.17	1.17		1.66	1.66	02/25/19 15:10	Barlozhetskaya, Anna F

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg

Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig

Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury ("Hg)

14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: MRC Indoor Air - MRC

TestAmerica Job ID: 140-14386-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
140-14386-1

Receipt

The samples were received on 2/23/2019 at 10:10 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. The COC listed canister asset number as 12276, but it should be 11276.

Air - GC/MS VOA - Method TO-15LL

EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments

No additional comments.

TestAmerica Knoxville GC/MS Air - Initial Calibration Data Review Checklist
Methods: TO-14 and TO-15 - KNOX-MS-0001, Rev 19 & KNOX-MS-0023, Rev 4

Analysis Date:	7/11/19	Instrument:	UG	Chrom WL #:	10492	TALS Batch & Event #	TO14/15: 1781/26755						
							DOD:	1782/26846	OHIO: 1783/26847				
Chrom/Worklist Review							1 st	Comments		2 nd			
1. Re-read each Limit Group [method editor-limit groups]							✓			na			
2. Verify LODV in Chrom [method editor -> edit -> MDL]							✓			na			
3. Are the reagents and ini/final volumes correct and first level "unlock/clear"? (Verify reagents & amt. injected at each level) [WL Sample Reagents Tab vs. Entech]							✓			✓			
4. Files linked properly to calibration levels? [Sample List- Lab ID vs. Info]							✓			✓			
5. Did BFB meet tune criteria? [F8]							✓			✓			
6. Were all standards injected within 24 hr of BFB? [F7]							✓			✓			
7. High point checked for saturation and point removed if so? [Chrom]							✓			✓			
8. If manual integrations performed, are they properly performed, correct, baseline clearly identified, and correct reason given? [Chrom]							✓			NA			
9. RT for each IS +20 sec avg. RT? [F6 IstdRec]							✓			✓			
10. Area for each IS + 40% avg. area? [F6 IstdRec]							✓			✓			
11. Each analyte + 0.06 RRT of avg. RRT? [F6 - RRT]							✓			✓			
12. Elution order checked on isomeric pairs? [Chrom]													
• dichlorodifluoromethane / 1,2-dichlorotetrafluoroethane							✓			✓			
• 2-methyl butane / acrolein							✓			✓			
• trichlorofluoromethane / 1,1,2-trichlorotrifluoroethane							✓			✓			
• vinyl acetate / hexane							✓			✓			
• cis- and trans- isomers							✓			✓			
• ethyl benzene / m/p-xylene / o-xylene							✓			✓			
• n-propylbenzene/4-ethyl toluene/1,3,5-trimethylbenzene/1,2,4-trimethylbenzene/ sec-butylbenzene/1,2,3-trimethylbenzene							✓			✓			
• tert-butylbenzene/4-isopropyltoluene							✓			✓			
• 1,3-, 1,4-, and 1,2-dichlorobenzene							✓			✓			
• 1,2-dimethyl-4-ethylbenzene/1,2,4,5-, 1,2,3,5-, and 1,2,3,4-tetramethylbenzenes							✓	mic		✓			
• 1,2,4- and 1,2,3-trichlorobenzenes							✓			✓			
• 2-, and 1-methylnaphthalene							✓			✓			
13. "Range" analytes & internal standard RIC ID'd correctly, inspected for interferences & proper integration?							✓			✓			
MLG Review							TO	DOD	OH	Comments	TO-	DOD	OH
14. Is %RSD for all target analytes ≤ 30%? (with up to 2 compounds with RSD ≤ 40%) 1 & 2 methylnaphthalene ≤ 50% Mechl 30.5 [F6 Σ]							✓	✓	✓		✓	✓	✓
15. Were at least 5 levels of each compound analyzed? [F6]							✓	✓	✓		✓	✓	✓
16. Is low level std at or <RL and are the remaining points consec.? [F6]							✓	✓	✓		✓	✓	✓
17. At least 6 consec. points used for quad curves; at least 5 consec. points for linear curves? (Note: Ohio does not allow quad) [F6]							✓	✓	✓		NA		→
18. If curves were used, is correlation coefficient ≥ 0.990? [F6]							na	→	→		NA		→
19. Is the intercept less than the RL for each curve? [F6]							na	→	→		NA		→
20. For quadratic: is a tangent's slope to the curve entirely positive or negative and continuous. [Cntl-C, details]							na	→	na		NA	→	na
21. Is low point RSE ≤ 50%? Mechl 63% 58% 7/14/19 [F6]							✓	✓	✓		✓	✓	✓

Instrument/Date	MG 2/26/2019		Routine	DOD	OHIO VAP
CCAL Chrom WL #	10931	CCAL Batch #	27931		
ICAL Chrom WL #	10492	ICAL Batch # / Event #	26755 / 1781	/	/
Chrom Review			1st	If No, why is data reportable?	2nd
1. Are the reagents & init/final volumes correct? (Verify reagents & amt. injected) [WL Sample Reagent Tab]			/		na
2. Did BFB meet tune criteria? [F8]			/	<input type="checkbox"/> [Failed TO-14A, but passes TO-15]	/
3. Was the CCAL compared to the most recent & correct ICAL (correct last ICAL File batch #/start/end Cal date/time)? [F8]			/	List Target analytes outside CCV limits: _____ _____	/
4. Elution order checked on isomeric pairs? [Chrom]					
• dichlorodifluoromethane / 1,2-dichlorotetrafluoroethane			/		/
• 2-methyl butane / acrolein			/		/
• trichlorofluoromethane / 1,1,2-trichlorotrifluoroethane			/		/
• vinyl acetate / hexane			/		/
• cis- and trans- isomers			/		/
• ethyl benzene / m/p-xylene / o-xylene			/		/
• n-propylbenzene/4-ethyl toluene/1,3,5-trimethylbenzene/1,2,4-trimethylbenzene/sec-butylbenzene/1,2,3-trimethylbenzene			/		/
• tert-butylbenzene/4-isopropyltoluene			/		/
• 1,3- , 1,4- , and 1,2-dichlorobenzene			/		/
• 1,2-dimethyl-4-ethylbenzene/1,2,4,5-, 1,2,3,5-, and 1,2,3,4-tetramethylbenzenes			NA		NA
• 1,2,4-trichlorobenzene/1,2,3-trichlorobenzene			/		/
• 2-, and 1-methylnaphthalene			/		/
5. "Range" analytes & internal standard RIC ID'd correctly, inspected for interferences & proper integration?			NA		NA
6. Has the RT been updated to the method?			/		/
Analyst/date	Suphanna Kh 2/27/2019		2nd Level Reviewer/date w 03/01/19		
7. Has the vol injected been verified vs Entech & corrected if actual amount differs >5%? [WL Sample Info: init amt = sample amt; final amt = 500 mL]			/		/
8. Do the lab ID, Info 1 and Dilution Factor columns correlate in Chrom? [Sample List - Lab ID vs. Info 1 vs. Dilution]			/		/
9. Can dilution history verified? [Mgmt Report]			/		/
10. Are all analytes present in the system blank < RL? (<1/2 RL for DoD). If no, list blank ID:			/	<input type="checkbox"/> Method Blank - Report, ND (NCM# _____) <input type="checkbox"/> Method Blank - Report, 10X (NCM# _____)	/
11. All runs - peaks ID'd correctly and false positives removed?			/		/
12. If manual integrations performed, are they properly performed, baseline clearly identified, and correct reason given?			/		/
13. IS/Surr within limits? List samples and reason (e.g., 1 thru 5): [Batch Results IS & SUR Tab]			/	<input type="checkbox"/> (1) Surrogate - Matrix (NCM# _____) <input type="checkbox"/> (2) Surrogate - High, ND (NCM# _____) <input type="checkbox"/> (3) ISTD - RA/RA Concur (NCM# _____) <input type="checkbox"/> (4) Surrogate -RX concur, Report both (NCM# _____) <input type="checkbox"/> (5) ISTD - Matrix, DL required (NCM# _____)	/
Sample Reason Sample Reason					
14. Samples outside calibration range scheduled for dilution?			NA	<input type="checkbox"/> ICAL - Range Exceeded; Minimum Dilution	NA
Chrom Review			1st	If No, why is data reportable?	2nd
15. For first analysis that is at a dilution, is highest target analyte >20% cal range? List samples and reason:			/	<input type="checkbox"/> (1) Reporting Limit - Dilution, Matrix (NCM# _____) <input type="checkbox"/> (2) Reporting Limit - Dilution, Non-Target (NCM# _____) <input type="checkbox"/> (3) Issues with initial collection volume; see DRC.	/
Sample Reason Sample Reason					
16. RIC inspected for proper integration for TPH?			NA		NA
17. Obvious non-TPH peaks excluded?			/		/
18. Individual TPH peak area < octane high point area?			/		/

Summa Canister Dilution Worksheet

Client: Tetra Tech, Inc.

Job No.: 140-14386-1

Lab Sample ID	Canister Volume (L)	Preadjusted Pressure ("Hg)	Preadjusted Pressure (atm)	Preadjusted Volume (L)	Adjusted Pressure (psig)	Adjusted Pressure (atm)	Adjusted Volume (L)	Initial Volume (mL)	Dilution Factor	Final Dilution Factor	Date	Analyst
140-14386-8	1	-7.5	0.75	0.75	2.6	1.18	1.18		1.57	1.57	02/25/19 15:10	Barlozhetskaya, Anna F
140-14386-12	1	-8.8	0.71	0.71	2.5	1.17	1.17		1.66	1.66	02/25/19 15:10	Barlozhetskaya, Anna F

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg
 Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig
 Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury ("Hg)
 14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

ANALYTICAL REPORT

Job Number: 140-14387-1
Job Description: MRC Indoor Air, MRC

For:
Tetra Tech, Inc.
20251 Century Blvd
Suite 200
Germantown, MD 20874
Attention: Samantha Brenner

Approved for release.
Terry Walker Wasmund
Project Manager II
3/7/2019 1:47 PM

Terry Walker Wasmund, Project Manager II
5815 Middlebrook Pike, Knoxville, TN, 37921

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: MRC Indoor Air, MRC

TestAmerica Job ID: 140-14387-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.
E	Result exceeded calibration range.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
140-14387-1

Receipt

The samples were received on 2/23/2019 at 10:10 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions

Sample SV-170-A-26 (140-14387-17) was listed on the Chain of Custody (COC); however, no sample was received.

Per note on the Chain of Custody, sample SV-187-MB-3 was not logged for analysis.

Air - GC/MS VOA - Method TO-15 LL

EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-27935 exhibited % difference of > 30% for the following analytes 1,2,4-Trichlorobenzene and Naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Naphthalene recovered outside control limits for the LCS associated with analytical batch 140-27935. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments

No additional comments.

Definitions/Glossary

Client: Tetra Tech, Inc.
Project/Site: MRC Indoor Air, MRC

TestAmerica Job ID: 140-14387-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.
E	Result exceeded calibration range.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
140-14387-1

Receipt

The samples were received on 2/23/2019 at 10:10 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions

Sample SV-170-A-26 (140-14387-17) was listed on the Chain of Custody (COC); however, no sample was received.

Per note on the Chain of Custody, sample SV-187-MB-3 was not logged for analysis.

Air - GC/MS VOA - Method TO-15 LL

EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

The continuing calibration verification (CCV) associated with batch 140-27935 exhibited % difference of > 30% for the following analytes 1,2,4-Trichlorobenzene and Naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Naphthalene recovered outside control limits for the LCS associated with analytical batch 140-27935. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments

No additional comments.
