Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg
Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig
Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)
14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

OVERVIEW

The sample set for LMC – MRC, SDG 140-20175-1, consists of forty-one (41) indoor air (IA) and soil vapor (SV) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Four (4) field duplicate pairs are included in this SDG: IA-153-C-29 / IA-DUP1-C-29; IA-149-C-29 / IA-DUP2-C-29; SV-102-C-29 / SV-DUP1-C-29; and SV-153-C-29 / SV-DUP2-C-29.

The samples were collected by Tetra Tech on August 25, 2020 and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 09/08/2020 at 15:52 on instrument MG had a percent difference (%D) for 1,2,3-trimethylbenzene that was greater than the 30% quality control limit. Sample SV-126-C-29 was associated with this calibration. The non-detected result for 1,2,3-trimethylbenzene was qualified as estimated (UJ) in the affected sample.

- The continuing calibration performed on 09/06/2020 at 17:12 on instrument MH had %Ds for carbon tetrachloride, 1,2,4-trimethylbenzene, 1,2,4-trichlorobenzene, and naphthalene that were greater than the 30% quality control limit. The following samples were associated with this calibration: IA-113-C-29, IA-088-C-29, IA-142-C-29, IA-155-C-29, IA-133-C-29, IA-153-C-29, IA-DUP1-C-29, IA-060-C-29, IA-152-C-29, IA-150-C-29, IA-145-C-29, and IA-146-C-29. Detected and non-detected results for these analytes were qualified as estimated (J and UJ, respectively) in the associated samples.

- The laboratory control sample (LCS) 140-42503/1002 had a percent recovery (%R) that was less than the laboratory quality control limits for 1,2,3-trimethylbenzene. Sample SV-126-C-29 was associated with this LCS. The non-detected result for 1,2,3-trimethylbenzene was qualified as estimated (UJ) in the associated sample.

- The LCS 140-42498/1009 had %Rs that were greater than the laboratory quality control limits for carbon tetrachloride and 1,2,4-trimethylbenzene. The following samples were associated with this LCS: IA-113-C-29, IA-088-C-29, IA-142-C-29, IA-155-C-29, IA-133-C-29, IA-153-C-29, IA-DUP1-C-29, IA-060-C-29, IA-152-C-29, IA-150-C-29, IA-145-C-29, and IA-146-C-29. Detected results for carbon tetrachloride and 1,2,4-trimethylbenzene were qualified as estimated (J) in the associated samples. No qualification was necessary for associated non-detected results.

- The laboratory noted that the results for chlorodifluoromethane for samples SV-113-C-29 SV-142-C-29 were calculated from peaks identified by the data system that exhibited chromatographic interference that could not be resolved. The laboratory suspects the results may be biased high. The results reported for chlorodifluoromethane in the affected samples were qualified as estimated (J).

- The field duplicate pair samples IA-153-C-29 / IA-DUP1-C-29 had a difference that was greater than quality control limit of 2x the reporting limit (RL) for trichloroethene. The detected and non-detected results for trichloroethene in samples IA-153-C-29 / IA-DUP1-C-29 were qualified as estimated (J and UJ, respectively).

- The field duplicate pair samples SV-153-C-29 / SV-DUP2-C-29 had a difference that was greater than the quality control limit of 2x the RL for methylene chloride. The detected and non-detected results for this analyte was qualified as estimated (J and UJ, respectively) in samples SV-153-C-29 and SV-DUP2-C-29.

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The following samples were analyzed at dilution factors greater than 1:

Sample	Dilution Factor
IA-004-C-29	1.77
IA-088-C-29	1.35
IA-113-C-29	1.33
IA-133-C-29	1.56
IA-146-C-29	1.48
IA-155-C-29	1.43
IA-BCK-2-29	2.29
IA-BCK-3-29	1.59
IA-BCK-4-29	1.52
IA-DUP2-C-29	1.4
SV-102-C-29	3.43
SV-126-C-29	12.39
SV-DUP1-C-29	3.6

1,1-Dichloroethane exceeded the instrument calibration range in samples SV-102-C-29 and SV-DUP1-C-29. These samples were reanalyzed, and the results from the reanalyses were selected for validation.

The GC/MS tunes performed on 09/03/2020 at 07:22 on instrument MG and 09/03/2020 at 09:43 on instrument MH had percent relative abundances for m/z 176 that were less than the ion abundance criteria listed on the forms. However, the laboratory case narrative indicates that the ion abundance criteria listed on the forms are for Method TO-14. The percent relative abundances for m/z 176 are within the limits for Method TO-15. Therefore, no action was necessary.

EXECUTIVE SUMMARY

Laboratory Performance: Some results were qualified due to calibration noncompliance. Several results were qualified due to LCS noncompliance. Two results were qualified due to chromatographic interference.

Other Factors Affecting Data Quality: Several results were qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Receipt
The samples were received on 8/27/2020 10:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice.

Air - GC/MS VOA
Methods 3005A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

Methods TO 15 LL, TO-15: Although the BFB is flagged as outside control limits for TO-14 on batch 140-42399, the results are within limits for TO-15, which is required for this project.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42498 recovered above the upper control limit for 1,2,4-Trichlorobenzene, 1,2,4-Trimethylbenzene, Carbon tetrachloride and Naphthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCVIS 140-42498/9).

Method TO 15 LL: The laboratory control sample (LCS) for analytical batch 140-42498 recovered outside control limits for the following analytes: 1,2,4-Trimethylbenzene and Carbon tetrachloride. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42503 exhibited % difference of > 30% for the following analyte(s) :1,2,3-Trimethylbenzene;however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria and is within marginal exceedance criteria.

Method TO 15 LL: The laboratory control sample (LCS) for analytical batch 140-42503 recovered outside control limits for the following analytes: 1,2,3-Trimethylbenzene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

OVERVIEW

The sample set for LMC – MRC, SDG 140-20194-1, consists of twenty (20) soil vapor (SV) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: SV-116-A-29 / SV-DUP 3-A-29 and SV-168-A-29 / SV-DUP 4-A-29.

The samples were collected by Tetra Tech on August 26, 2020 and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 09/08/2020 at 15:52 on instrument MG had a percent difference (%D) for 1,2,3-trimethylbenzene that was greater than the 30% quality control limit. The following samples were associated with this calibration: SV-139-A-29, SV-172-A-29, SV-116-A-29, SV-DUP 3-A-29, SV-138-A-29, SV-173-A-29, SV-171-A-29, SV-177-A-29, and SV-118-A-29. The detected and non-detected results for 1,2,3-trimethylbenzene were qualified as estimated (J and UJ, respectively) in the affected samples.

- The continuing calibration performed on 09/08/2020 at 13:10 on instrument MH had %Ds for 1,2,4-trichlorobenzene and naphthalene that were greater than the 30% quality control limit. The following samples were associated with this calibration: SV-015-A-29, SV-078-A-29, SV-076-A-29, SV-DUP 4-A-29, SV-075-A-29, SV-136-A-29, SV-101-B-29, SV-100-B-29, SV-079-A-29, and SV-168-A-29. Detected and non-detected results for these analytes were qualified as estimated (J and UJ, respectively) in the associated samples.

- The continuing calibration performed on 09/09/2020 at 11:27 on instrument MR had a %D that was greater than the 30% quality control limit for dichlorodifluoromethane. Sample SV-174-A-29 was associated with this calibration. The non-detected result for dichlorodifluoromethane was qualified as estimated (UJ) in the affected sample.

- The laboratory control sample (LCS) 140-42503/1002 had a percent recovery (%R) that was less than the laboratory quality control limits for 1,2,3-trimethylbenzene. The following samples were associated with this LCS: SV-139-A-29, SV-172-A-29, SV-116-A-29, SV-DUP 3-A-29, SV-138-A-29, SV-173-A-29, SV-171-A-29, SV-177-A-29, and SV-118-A-29. The detected and non-detected results for 1,2,3-trimethylbenzene were qualified as estimated (J and UJ, respectively) in the associated samples.

- The field duplicate pair samples SV-168-A-29 / SV-DUP 4-A-29 had a relative percent difference (RPD) that was greater than the 50% quality control limit for trichloroethene. The detected results for trichloroethene were qualified as estimated (J) in samples SV-168-A-29 and SV-DUP 4-A-29.

- Detected results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The following samples were analyzed at dilution factors greater than 1:

Sample	Dilution Factor
SV-171-A-29	3.03
SV-173-A-29	9.23
SV-174-A-29	120

Trichloroethene exceeded the instrument calibration range in sample SV-118-A-29. This sample was reanalyzed, and the trichloroethene result from the reanalysis was selected for validation.

The GC/MS tune performed on 09/09/2020 at 10:50 on instrument MR had a percent relative abundance for m/z 75 that was greater than the ion abundance criterion listed on the form. However, the laboratory case narrative indicates that the ion abundance criteria listed on the forms are for Method TO-14. The percent relative abundance for m/z 75 is within the limits for Method TO-15. Therefore, no action was necessary.

The LCS 140-45042/1002 had a %R that was greater than the laboratory quality control limits for 1,2,4-trichlorobenzene. The following samples were associated with this LCS: SV-015-A-29, SV-078-A-29, SV-076-A-29, SV-DUP 4-A-29, SV-075-A-29, SV-136-A-29, SV-101-B-29, SV-100-B-29, SV-079-A-29, and SV-168-A-29. No qualification was necessary because associated results for 1,2,4-trichlorobenzene were non-detected.

EXECUTIVE SUMMARY

Laboratory Performance: Some results were qualified due to calibration noncompliance. Several results were qualified due to LCS noncompliance.

Other Factors Affecting Data Quality: Two results were qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Air - GC/MS VOA
Methods 3005A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42503 exhibited % difference of > 30% for the following analyte(s) :1,2,3-Trimethylbenzene;however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria and is within marginal exceedance criteria.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42504 exhibited % difference of > 30% for the following analyte(s) Naphthalene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42504 recovered above the upper control limit for 1,2,4-Trichlorobenzene, 1,4-Dichlorobenzene and Hexachlorobutadiene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method TO 15 LL: The laboratory control sample (LCS) for analytical batch 140-42504 recovered outside control limits for the following analytes: 1,2,4-Trichlorobenzene, 1,4-Dichlorobenzene and Hexachlorobutadiene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Methods TO 15 LL, TO-15: Although the BFB is flagged as outside control limits for TO-14 on batch 140-42515, the results are within limits for TO-15, which is required for this project.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42515 exhibited % difference of > 30% for the following analyte(s) Dichlorodifluoromethane; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method TO 15 LL: The following analyte(s) recovered outside control limits for the LCS associated with analytical batch 140-42503: 1,2,3-Trimethylbenzene. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

OVERVIEW

The sample set for LMC – MRC, SDG 140-20195-1, consists of nineteen (19) indoor air (IA) environmental samples. All samples were analyzed for select volatile organic compounds (VOCs). Two (2) field duplicate pairs are included in this SDG: IA-018-A-29 / IA-DUP 3-A-29 and IA-168-A-29 / IA-DUP 4-A-29.

The samples were collected by Tetra Tech on August 26, 2020, and analyzed by Eurofins TestAmerica. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, field duplicate precision, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The continuing calibration performed on 09/05/2020 at 11:32 on instrument MG had a percent difference (%D) for 1,2,3-trimethylbenzene that was greater than the 30% quality control limit. Samples IA-081-A-29, IA-100-B-29, and IA-101-B-29 were associated with this calibration. The non-detected results for 1,2,3-trimethylbenzene was qualified as estimated (UJ) in the affected samples.

- The laboratory control sample (LCS) 140-42481/1002 had a percent recovery (%R) that was less than the laboratory quality control limits for 1,2,3-trimethylbenzene. Samples IA-081-A-29, IA-100-B-29, and IA-101-B-29 were associated with this LCS. The non-detected results for 1,2,3-trimethylbenzene was qualified as estimated (UJ) in the associated samples.

- The field duplicate pair samples IA-168-A-29 / IA-DUP 4-A-29 had a difference that was greater than the quality control limit of 2x the reporting limit (RL) for trichloroethene. The detected and non-detected results for trichloroethene were qualified as estimated (J and UJ, respectively) in samples IA-168-A-29 and IA-DUP 4-A-29.

- Detected results reported below the RL but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The following samples were analyzed at dilution factors greater than 1:

Sample	Dilution Factor
IA-018-A-29	1.49
IA-021-A-29	1.41
IA-078-A-29	1.45
IA-079-A-29	1.45
IA-100-B-29	1.65
IA-136-A-29	1.56
IA-DUP 4-A-29	1.56

The GC/MS tune performed on 09/05/2020 at 10:56 on instrument MG had a percent relative abundance for m/z 176 that were less than the ion abundance criteria listed on the form. However, the laboratory case narrative indicates that the ion abundance criteria listed on the forms are for Method TO-14. The percent relative abundance for m/z 176 is within the limits for Method TO-15. Therefore, no action was necessary.

EXECUTIVE SUMMARY

Laboratory Performance: Some results were qualified due to calibration noncompliance. Several results were qualified due to LCS noncompliance.

Other Factors Affecting Data Quality: One analyte (TCE) was qualified due to field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA “National Functional Guidelines for Organic Superfund Methods Data Review” (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Receipt
The samples were received on 8/28/2020 10:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice.

Air - GC/MS VOA
Methods 3005A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

Methods TO 15 LL, TO-15: Although the BFB is flagged as outside control limits for TO-14 on batch 140-42481, the results are within limits for TO-15, which is required for this project.

Methods TO 15 LL, TO-15: The continuing calibration verification (CCV) associated with batch 140-42481 exhibited % difference of > 30% for the following analyte(s) 1,2,3-Trimethylbenzene and 1,4-dioxane; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method TO 15 LL: The following analyte(s) recovered outside control limits for the LCS associated with analytical batch 140-42481: 1,2,3-Trimethylbenzene. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

INTRODUCTION

1.1 SITE LOCATION AND BACKGROUND INFORMATION

This report documents the monitoring activities completed from April 1 to September 30, 2020 [the 49th and 50th quarters of operation] for the sub-slab depressurization systems operating in the Building A lay-up room (former plating shop), eastern area, and basement, and the Building C basement of the Lockheed Martin Corporation Middle River Complex in Middle River, Maryland. The locations of the systems' influence are shown on Figure 1. These remedial systems control (by creating a vacuum) and remove volatile organic compounds from sub-slab vapor, thus preventing their migration into indoor air. The systems are operated in accordance with the operation, maintenance, and monitoring manuals for the Building A and Building C systems (Tetra Tech, Inc., 2019a and 2019b, respectively).

1.2 DESCRIPTION OF SUB-SLAB DEPRESSURIZATION SYSTEMS

1.2.1 Building A System

The sub-slab depressurization system in Building A includes the following soil vapor extraction points (see Figure 2):

- Two (2) horizontal soil vapor extraction laterals in the lay-up room (North and South)
- Two (2) laterals in the basement (Basement North and Basement South)
- Six (6) vertical soil vapor extraction points (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, SSD-38-A, and SSD-39-A)
- Extraction piping connected to basement sump HRS-5 (through December 2019)

The soil vapor extraction points serve as conduits for drawing vapor from beneath the building slab, thus mitigating vapor intrusion into indoor air. Previously the system's extraction piping was also connected to basement sump HRS-5; the connection was removed and the sump abandoned in December 2019 by filling it with concrete. The sump abandonment and post-abandonment

monitoring results were documented in a separate report submitted in April 2020 (Tetra Tech, 2020).

Sub-slab vapors are pulled through the extraction points, vapor-extraction manifold, and "pre-blower" moisture separator using a single 10-horsepower regenerative blower. The blower is mounted on a skid along with the pre-blower moisture separator, a heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). A spare 10-horsepower blower of the same model is kept at the site in case it is needed. The extracted vapors are cooled as they are pushed through the heat exchanger. Following the heat exchanger, the vapors enter the post-blower moisture separator where entrained condensate droplets are removed to reduce saturation and pressure buildup in the vapor-phase carbon drums. The extracted vapors are then treated to remove volatile organic compounds (VOCs) using four 400-pound granular activated-carbon (GAC) drums, in two-by-two configuration (two parallel trains of two drums in series)[1]. Vapors are discharged to the atmosphere via an exhaust stack that extends above the roof of the building. Figure 3 shows the process and instrumentation diagram for the Building A sub-slab depressurization system.

The Building A system is also equipped with drains for each of the granular activated-carbon drums, for each of the three pipe sumps (PS-1-A [near SSD-37-A], PS-2-A [near SSD-34-A], and PS-3-A [in the basement]), and for the one exhaust stack sump. The pipe sumps are installed at low points to allow accumulation and manual drainage of condensation in the pipe. In addition, two freestanding drains adjacent to the south side of the system's equipment skid are available for use in winter months to drain condensate in the vapor entering the two trains of granular activated-carbon drums.

Six IQAir® GC™ Series-GC VOC indoor-air filters also operate in the basement of Building A near vapor monitoring points (VMPs) 093-A, 093-A-X, and 138-A, in response to elevated trichloroethene (TCE) concentrations in the indoor air. The filters were installed south of the sub-

[1] Originally, vapor treatment consisted of one train of two 400-pound carbon drums; the two-by-two configuration was completed in February 2017 to decrease pressure, increase flow of the system, and better capture VOCs; details are in Section 2.4.

slab depressurization system extraction laterals in January 2015 (designated AF-N, AF-M, and AF-S) and May 2017 (designated AF-NX, AF-MX, and AF-SX), and are continuously operated to filter 300 standard cubic feet per minute (SCFM) of air each. Each filter consists of a high-efficiency particulate air pre-filter, a granular activated-carbon filter, and a post-filter sleeve (collectively referred to as "filter elements"). The pre-filter (GC™ HyperHEPA® Pre-Filter H11 [S]) weighs three pounds; it removes coarse, fine, and ultra-fine dust particles and protects subsequent filters. The granular activated-carbon filter (GC VOC filter cartridge set) removes volatile organic compounds from indoor air; it is comprised of four granular activated-carbon cartridges, collectively weighing nine pounds. The post-filter sleeve (GC™ post-filter sleeve set) is placed over the granular activated-carbon cartridges and removes any remaining fine and ultra-fine particulate matter.

1.2.2 Building C System

The sub-slab depressurization system in the Building C basement consists of 11 vertical soil vapor extraction points: two in the southern-basement area (SSD-21-C and SSD-23-C) and nine in the mid-basement area (SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C); see Figure 4. These extraction points serve as conduits for drawing vapor from beneath the building slab, thus creating a vacuum under the floor slab preventing vapor intrusion into indoor air. The vapors are pulled through the extraction points using a single 7.5-horsepower regenerative blower that is mounted on a skid along with a moisture separator, heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). A spare 7.5-horsepower blower of the same model is kept at the site in case it is needed. Following extraction, the vapors enter the first moisture separator (MS-1) where entrained condensate droplets are removed to reduce fouling of the vapor lines and saturation of the granular activated-carbon. The extracted vapors are cooled as they are pushed through the heat exchanger; any remaining extracted condensate droplets are removed via a second moisture separator (MS-2) [separate from the blower skid] before being treated. The vapors are treated by passing through two 400-pound granular activated-carbon drums and one 600-pound potassium permanganate-impregnated zeolite drum (to remove residual vinyl chloride), in-series, before being discharged to the atmosphere via an exhaust stack that extends above the roof of the building (Figure 5).

The Building C system is also equipped with drains for each granular activated-carbon and potassium permanganate-impregnated zeolite drum, for each of the five pipe sumps (PS-1 [near SSD-25-C and column N35, PS-2 [near SSD-30-C and column N26], PS-3 [near SSD-27-C and column O20], PS-4 [near SSD-32-C and column R19], and PS-5 [near SSD-29-C and column V12]), and for the one exhaust stack sump. The sumps are installed at low points to allow drainage of condensation in the pipe.

2.1.2 Vacuum Influence Monitoring

The objective for the SSD systems is to maintain a vacuum of at least 0.01 inches water column (WC) in the targeted areas. The vacuum influence (differential sub-slab vapor vacuum versus indoor air) at sub-slab VMPs was monitored using a dual[2]-port manometer (Fieldpiece Instruments, Inc. model SDMN5). This instrument was used to identify sub-slab-air short-circuiting or other problems (indicated by a significant drop in vacuum at one or more VMPs), and to determine each system's area of influence. Short-circuiting was not identified at the Building A or Building C SSD systems during this reporting period. Figures 6 through 9 show induced vacuum over time; Figures 10 through 13 show induced vacuum influence contours on plan views using induced vacuum readings from September 15, 2020 for Building A and September 28, 2020 for Building C.

Vacuum influence in the Building A target areas consistently[3] exceeded the vacuum influence objective (0.01 inches WC) during the reporting period at the following monitoring points:

- At eight of eight VMPs in the layup room (SSD-1-A, SSD-12-A-X, SSD-11-A-X, SSD-13-A-X, SSD-2-A-X, 15-A-X, SSD-16-A-X, and SSD-3-A-X) with vacuums ranging from 0.03 to 4.51 inches WC (see Figure 10)
- At three of four of the VMPs in the Building A basement (SSD-20-A, SSD-21-A, and SSD-22-A) with vacuums ranging from 0.01 to 2.65 inches WC (see Figure 10)
- At 10 of 15 VMPs in the eastern area of Building A (165-A, 166-A, 167-A, 117-A, 136-

[2] Only one port is used for monitoring vacuum influence; the second port is used to measure static pressure.

[3] Exceeded vacuum monitoring objective of 0.01 inches water column at more than half of the biweekly system checks completed.

A-S, 136-A, 160-A, 161-A, 162-A, 163-A) with vacuums ranging from 0.01 to 2.88 inches WC (see Figure 11).

- At the two VMPs in the western area of Building A (168-A and 188-A) with vacuums ranging from 0.01 to 0.71 inches WC.

Induced vacuum has not been consistently observed at 79-A, 119-A, 121-B, or 136-A-N. The lack of induced vacuum at 119-A and 121-B might possibly be due to the greater distance to the nearest extraction point. The reason for the lack of vacuum influence at the remaining locations (79-A and 136-A-N) is not clear but could be related to subsurface preferential pathways and heterogeneity. It should be noted that VMPs 163-A, 168-A, and 188-A, which were not accessible in the previous reporting period(s), were accessible and monitored during this reporting period.

Vacuum influence in the Building C target areas consistently exceeded the vacuum influence objective (0.01 inches WC) during the reporting period in the following monitoring points:

- At five of seven VMPs in the southern-basement area (001-C, SSD-2-C, SSD-3-C, SSD-4-C, and SSD-24-C) with vacuums ranging from 0.01 to 2.19 inches WC (see Figure 12)
- At 16 of 20 VMPs in the mid-basement area (060-C, 113-C, 126-C, 127-C, 133-C, 135-C, 141-C, 149-C, 150-C, 151-C, 152-C, 153-C, 154-C, 155-C, 156-C, and 157-C,) with vacuums ranging from 0.01 to 5.57 inches WC (see Figure 13)

The reason for the lack of vacuum influence at 050-C, 111-C, 158-C, and 159-C is not clear but could be related to subsurface preferential pathways and heterogeneity.

Vacuum Summary

Induced vacuum measurements indicate that the systems are performing as designed. The sub-slab vapor extraction laterals in the Building A lay-up room induce a vacuum influence over an approximately 5,700-square foot area, and in this reporting period consistently encompass all eight VMPs that had elevated volatile organic compound (VOC) concentrations before system start-up. The extraction laterals in the Building A basement induce a vacuum influence over an approximately 2,600-square foot area, and consistently encompass three of four VMPs that measure the system's induced vacuum in the basement (Figure 10). The vertical extraction points in the eastern area of Building A induce a vacuum influence over an approximately 8,900-square foot area, and in this reporting period consistently encompass 10 of 15 VMPs (Figure 11). In the western area of Building A, extraction point SSD-39A is inducing vacuum at the two nearby VMPs

and the area of induced vacuum is approximately 1,100-square feet (Figure 11).

In Building C, the sub-slab vapor extraction points in the southern-basement area induce a vacuum influence over an approximately 3,900-square foot area, with five of seven accessible VMPs showing consistent influence in the reporting period (Figure 12). Extraction points in the mid-basement area induce a vacuum influence over an approximately 33,000-square foot area, with 16 of 20 VMPs showing consistent influence in the reporting period (Figure 13).

2.1.3 Adjustments to Extraction Points

The throttling valve at extraction point SSD-36-A was opened slightly in April 2020 to increase the extraction flow and induce vacuum at nearby VMP 162-A. Since the installation of three extraction points and VMPs in the area near VMP 136-A in 2016, induced vacuum at VMP 162-A and this area in general has not been consistent, possibly due to the known significant concrete masses in the subsurface nearby. The change in the flow adjustment at extraction point SSD-36-A achieved the goal of inducing vacuum in the area; vacuum readings during the reporting period ranging from 0.01 to 0.21 inches WC were measured at VMP 162-A during each biweekly check.

2.2 VAPOR SAMPLING

Grab vapor samples were collected monthly at Building A and every other month at Building C during the reporting period. Samples were collected from each SSD system at the influent, mid-GAC (between lead and lag vessels), and effluent positions of the treatment drums. Samples were collected from the Building A SSD system on April 14, May 13, June 25, July 23, August 18, and September 28, 2020. Samples were collected from the Building C SSD system on May 13, July 23, and September 28, 2020. Samples were collected directly from each sampling port using the following steps:

- A piece of Teflon® tubing was connected to the sampling port.
- A clean, one-liter Summa® canister under vacuum was connected to the tubing, and the canister valve was opened until the canister gauge reached zero or stopped falling (approximately one minute).
- For the Building A mid-GAC samples, the two sample ports were connected using Teflon® tubing with a "T" fitting to connect to the canister.

Samples were labeled A-INFLUENT, A-MID-GAC, A-EFFLUENT, C-INFLUENT, C-MID-GAC, and C-EFFLUENT and shipped to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee. TestAmerica is accredited through the National Environmental Laboratory Accreditation Program and United States Department of Defense Environmental Laboratory Accreditation Program for VOC analysis by United States Environmental Protection Agency Toxic Organic Method 15 (TO-15).

Laboratory results are summarized in Tables 1 through 6; analytical reports are in Appendix B. During this reporting period, total influent VOC concentrations in Building A ranged from 941 micrograms per cubic meter ($\mu g/m^3$) (September 2020) to 1,994 $\mu g/m^3$ (July 2020), while VOC influent concentrations in Building C ranged from 47 $\mu g/m^3$ (September 2020) to 139 $\mu g/m^3$ (July 2020). Influent concentrations have been consistent at both systems over the past three years with minor fluctuations. Average influent VOC concentrations in Building A were approximately 7% higher than those observed during the previous reporting period (October 1, 2019 to March 31, 2020); average influent concentrations for the Building C system were approximately 19% higher. Influent concentrations have been consistent at both systems over the past three years with minor fluctuations.

2.3 QUARTERLY SYSTEM CHECKS

Quarterly system checks were completed on June 29 and September 15, 2020. Quarterly system checks included the following tasks:

1. Inspected the condition of the:
    a. system components
    b. system piping
    c. pre-blower air filter and intake (ambient) air filter; replacing filter(s) as necessary
    d. GAC and PPZ drums
    e. GAC and PPZ drum sample ports
    f. VMP well lids, bolts, and sample tubing
2. Checked that the Building A system shuts down, the control panel alarm lights illuminate, and the auto-dialer activates upon alarms for:
    a. high temperature – post-blower
    b. high temperature – post-heat exchanger
    c. high-water level – moisture separator

d. high pressure
e. low vacuum

3. Checked that the Building C system shuts down, the control panel alarm lights illuminate, and the auto-dialer activates upon alarms for:
    a. high temperature – post-blower
    b. high temperature – post-heat exchanger
    c. high-water level – MS-1
    d. high-water level – MS-2
    e. high pressure
    f. low vacuum
4. Checked vacuum relief valves for proper operation
5. Recorded amperage draw on blowers
6. Checked that auto-dialers activate when power is turned off
7. Checked auto-dialer batteries and replaced, as necessary
8. Confirmed that a fire extinguisher with up to date inspection record is next to each system
9. Vacuumed the underside of the heat exchanger
10. Cleaned the systems and areas around the systems

During the June 2020 quarterly check, the Building C post-blower temperature switch and pressure gauge were found to not be working properly; both were replaced on July 23, 2020. In addition, the Building A SSDS blower motor starter overload switch was replaced on August 5, 2020 and the flow meter was replaced on August 18, 2020. No issues were identified for Building A or Building C SSD systems during the quarterly system check on September 15, 2020. Both systems are running within the normal operating parameters. Quarterly system checks forms are in Appendix A.

2.4 NON-ROUTINE SYSTEM MAINTENANCE

2.4.1 Non-Routine Maintenance

The following non-routine system maintenance was completed during the reporting period:

- The Building C post-blower temperature switch and pressure gauge were replaced on July 23, 2020.
- The Building A SSDS blower motor starter overload switch was replaced on August 5, 2020.

The combined volume of condensate drained from the Building A SSD system during the reporting period (mainly in April 2020) was 26 gallons. The water was transferred to 55-gallon drums temporarily staged in the in the designated drum storage area at the Building C SSD system pending proper off-site disposal. At the Building C SSD system, there was no condensate that required draining during the reporting system.

2.5 GAC AND PPZ CHANGE-OUTS

GAC change-outs were not conducted during the reporting period. The Building C PPZ drum was also not changed out during the reporting period.

2.6 SYSTEM SHUTDOWNS

2.6.1 Operator-Controlled Shutdowns

Both systems were briefly turned off during each biweekly system check to: (1) confirm that flow, pressure, temperature, and vacuum gauges fall to zero (thereby indicating proper operation), and (2) check and drain (as necessary) condensate accumulation in the moisture separators and sumps. Both systems were also briefly turned off during the quarterly system checks to test proper operation of the fail-safe alarms. In addition, the Building A and Building C SSD systems were shut down (with advance notification to the facility) for semi-annual sub-slab vapor and indoor air sampling events on the following days:

- August 25-26, 2020: The Building A system was shut down for an estimated 31.4 hours for the semi-annual sub-slab vapor and indoor air sampling event.
- August 24-25, 2020: The Building C system was shut down for an estimated 33.7 hours for a sub-slab and indoor air sampling event.

2.6.2 Alarms and Other Shutdowns

The following alarms and other shutdowns occurred during the reporting period:

- The Building A SSDS was down on April 6, 11, and 30, 2020 for 1.0, 7.7, and 17.3 hours, respectively, due to power outages. The system was restarted when power was restored.
- The Building A SSDS was down for 46.6 hours from July 6 to July 8, 2020 due to a low-vacuum alarm this indicated the blower shut off, likely because of a power surge. During troubleshooting, the operator found several fuses blown and some damaged wiring in the blower motor. The system was restarted on July 8, 2020, after completing the repairs.

- The Building A SSDS was down for 13.9 hours on July 26, 2020 due to a high temperature alarm; the operator responded that day and restarted the system after inspecting it. The system was down for another 20.6 hours from July 26 to July 27, 2020 due to second high temperature alarm. The operator did a thorough cleaning of the heat exchanger and restarted the system. A replacement overload switch was also installed.

- The Building C SSDS was down on April 6, 2020 for 1.5 hours, April 30, 2020 for 17.3 hours, July 3, 2020 for 14.1 hours due power outages. The system was restarted when power was restored.

2.6.3 System Uptime

During this reporting period, the Building A and Building C SSD systems were operational for approximately 4,230 hours (97%) and 4,301 hours (98%), respectively. Downtime does not include the brief shutdown periods for biweekly and quarterly system checks.

2.7 REMEDIATION SUMMARY

2.7.1 Building A System

Continuous operation of the SSD system in the Building A lay-up room (former plating shop) began on March 31, 2008; the SSD system was expanded on October 22, 2010 to include the basement, and on April 13, 2016 to include select areas on the eastern side of the building. A third-phase expansion was completed on July 6, 2017 to address areas along the western side of Building A (near VMP 168-A) and basement sump HRS-5 near column D26. On February 7, 2017 the GAC drums were modified to add a second parallel treatment train (with two 400-pound GAC drums in series) to increase flow and decrease pressure on the new blower. Continuous vapor monitoring of basement indoor air identified basement sump HRS-5 as a significant VOC source for indoor air contamination, therefore the sump was covered, and vapor extraction piping was installed under the cover in June 2017. Subsequently, basement sump HRS-5 was abandoned by filling with concrete and associated extraction piping was removed in December 2019 to remove exposure pathways of water and vapor contaminated with VOCs. Building A extraction points are open to allow a combined airflow rate of approximately 300 SCFM. Each extraction point operates at an airflow rate of 10–100 SCFM; the system vacuum and flows are adjusted to maintain a vacuum of 0.01 inches water column (WC) or greater at each vapor monitoring point within areas where elevated concentrations of VOCs are in sub-slab soil.

Since system startup on March 31, 2008 to September 28, 2020, total influent VOC concentrations have decreased more than 98%, from 94,310 $\mu g/m^3$ to 940 $\mu g/m^3$. The addition of the basement extraction laterals in October 2010 did not appear to change influent concentrations. The system expansion in April 2016 including a higher-flow 10-horsepower blower and five new vertical extraction points resulted in an increase in Building A influent system concentration for approximately one month. The system expansion in July 2017 resulted in a slight increase in the result for the sample collected on July 6, 2017 immediately following the expansion. The two main chemicals of concern in Building A are 1,1,1-trichloroethane and trichloroethene (see Table 1). VOC trends for the Building A system are shown in Tables 1 through 3 and on Figure 14. The influent concentrations have decreased but remain above screening levels.

VOC mass removal rates (based on influent concentrations) in Building A ranged from 0.02 to 0.05 pounds per day (lbs/day) during this reporting period. The total VOC mass removed was approximately 6.6 pounds; total VOC removal since system startup in March 2008 is approximately 212 pounds. VOC mass removal rates are lower than the levels (20 lbs/day VOCs) that require Maryland Department of Environment (MDE) permitting.

2.7.2 Building C System

Continuous operation of the SSD system in the southern-basement area of Building C began on March 31, 2008; the system was expanded to the mid-basement area in May 2013. Extraction points were installed at locations that maximized vacuum influence (based on startup tests). The total flow rate of the Building C system is approximately 150 SCFM. Extraction well SSD-23-C in the southern-basement area was shut off after the expansion to promote higher flow rates from the new wells installed in the mid-basement area. Vacuum influence in the southern-basement area was maintained by the operation of well SSD-21-C only until February 21, 2017, when SSD-23-C was re-opened and SSD-21-C was closed. SSD-21-C was re-opened and SSD-23-C was closed again on October 12, 2018. Vacuum influence and flow rates in the mid-basement area have increased and stabilized since system expansion. On November 7, 2013, mid-basement wells SSD-27-C and SSD-32-C flow rates were reduced to promote higher flow rates from other extraction wells in the mid-basement area. In April 2016, flows at mid-basement extraction points SSD-26-C and SSD-30-C were also reduced to promote high flows from other extraction points. These efforts have been performed to attempt to improve vacuum influence and VOC mass removal in

the northern extraction points.

From system startup on March 31, 2008 to April 8, 2013, and before the system expansion, total influent VOCs had decreased by 99%, from 31,170 µg/m^3 to 117 µg/m^3. VOC concentrations increased to 3,100 µg/m^3 after the system was expanded but have since decreased to 47 µg/m^3 (a 98% decrease). Trichloroethene is the primary chemical of concern in Building C (see Table 4). VOC trends for the Building C system are shown in Tables 4 through 6 and on Figure 15.

Mass removal rates for VOCs in Building C during this reporting period ranged from 0.018 to 0.052 pounds per month, for a total mass of approximately 0.21 pounds. Total VOC removal since system startup in March 2008 is approximately 12.8 pounds. Building C VOC removal rates are lower than levels requiring MDE permitting (20 lbs/day VOCs, 20 pounds per year vinyl chloride).

2.7.3 Indoor Air Filters in Building A

Six IQAir® GC™ Series-GC indoor air filters operate in the basement of Building A near VMPs 093-A, 093-A-X, and 138-A (south of the SSD system extraction trenches). These filters were inspected every two weeks. The high-efficiency particulate air (HEPA) pre-filters, GAC cartridges, and post-filter sleeves were replaced on June 29 and September 15, 2020. The spent filter elements were placed in a dedicated 55–gallon drum in the designated drum storage area at the Building C SSD system pending proper off-site disposal. This waste drum was inspected during the biweekly system checks to ensure it was properly labeled and in good condition.

SECTION 3
CONCLUSIONS AND RECOMMENDATIONS

3.1 SYSTEM PERFORMANCE

Induced vacuum measurements indicate that the sub-slab depressurization systems are performing as designed. Soil vapor extraction points in the Building A lay-up room induce a vacuum influence over an approximately 5,700-square foot area, and consistently encompass all eight VMPs vapor monitoring points that had elevated volatile organic compound concentrations before system startup. In the Building A basement, the soil vapor extraction points induce a vacuum influence over an approximately 2,600-square foot area that encompasses three of four vapor monitoring points installed to measure the system-induced vacuum in the basement (Figure 10). The soil vapor extraction points in the eastern area of Building A induce a vacuum influence over an approximately 8,900-square foot area, and consistently encompass 10 of 15 VMPs used to measure the system-induced vacuum in that area (Figure 11). Extraction point SSD-39A in the western area of Building A is inducing vacuum at two nearby VMPs; the area of induced vacuum is approximately 1,100-square feet (Figure 10).

In the southern-basement area of Building C, the soil vapor extraction points induce a vacuum influence over an approximately 3,900-square foot area, with five of seven accessible vapor monitoring points showing influence (Figure 12). The soil vapor extraction points in the mid-basement area of Building C induce a vacuum influence over an estimated 33,000-square foot area, with 16 of 20 vapor monitoring points showing influence (Figure 13).

The sub-slab depressurization systems have removed volatile organic compound mass and have treated emissions with granular activated-carbon (both buildings) and potassium permanganate-impregnated zeolite (Building C only). A summary of the granular activated-carbon drums used during the lifespan of each system follows:

	Number of granular-activated-carbon drums used	
	200-pound drums	400-pound drums
Building A	23	20
Building C	17	6

The 600-pound potassium permanganate-impregnated zeolite drum in Building C has not been changed out since its installation in April 2013. The drum counts listed above do not include the granular activated-carbon drums currently attached to each system, or the potassium permanganate-impregnated zeolite drum currently attached to the Building C system.

The Building A system has used approximately 60 pounds of granular activated-carbon per pound of volatiles removed, while the Building C system has used approximately 460 pounds of granular activated-carbon per pound of volatiles removed. Note that the removal efficiency of granular activated-carbon is reduced as vapor concentrations decrease. Although influent concentrations of volatile organic compounds for both systems have decreased significantly since startup (March 31, 2008), concentration fluctuations have occurred over time (see Figures 14 and 15).

3.2 CONTINUED MONITORING

The Building A and Building C systems will continue to operate during the next semi-annual reporting period (October 1, 2020 through March 31, 2021) so that mitigation of vapor migration in both buildings is maintained. Operation, maintenance, and monitoring activities conducted during the next reporting period will include biweekly system checks, quarterly system checks, remote camera and phone checks at least three times per week, system maintenance, bimonthly (every other month) vapor sampling in Building A, and vapor sampling every four months at the Building C system. This is a change from the current sampling frequency and will begin in December 2020. Granular activated-carbon change-outs are scheduled for October 2020; additional change-outs, if needed, will occur when the concentration of the sample collected following the lead granular activated-carbon vessel(s) reaches 50% of the influent concentration, or as determined based on removal measured in the lag vessel or change-out history and laboratory result trends (especially trichloroethene adsorption effectiveness trends). Change-out of the potassium permanganate-impregnated zeolite drum is not expected during the next reporting period. The next remedial action progress report will be issued in April 2021.

3.3 FUTURE PLANS

We will continue to analyze vacuum influence and concentrations to optimize operation of the Building A and Building C sub-slab depressurization systems as we have done since system start-up.

A decrease in vapor sampling frequency to every two months for the Building A SSDS and every four months for the Building C SSDS starts in December 2020. We will continue to look for ways to reduce SSDS operating, maintenance and monitoring costs. If either SSDS is off for more than 48 hours for any reason, we will consider sampling the system influent upon the restart to evaluate for any rebound in VOC concentrations.

The Building C system continues to operate with low influent VOC concentrations below 100 $\mu g/m^3$ in total and well below screening levels for TCE and other individual VOCs. It may be worth considering a greater focus on any remaining "hot-spot" areas and extraction points while shutting down other extraction points and testing rebound to determine if portions of the Building C basement subsurface will not rebound above screening levels as the start of a phased-approach to shut off the entire Building C system. We can discuss specifics of which extraction points to focus extraction and which to shut off when requested.

Completed first-phase system expansion (to Building A basement) on October 22, 2010.
Completed second-phase system expansion (to eastern area) on April 13, 2016.
Increase in concentrations following 19-day system shutdown due to blower failure. Blower was replaced on 4/8/13.
Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.
Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.
Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

EPA - United States Environmental Protection Agency

lbs./day - pounds per day

CL - result suspected to be biased high due to chromatographic interference

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

* - LCS or LCSD is outside acceptance limits

Sampling not conducted in July 2012 due to system shutdown test.

November 2012 sample collected after the potassium permanganate zeolite (PPZ) unit. PPZ unit was taken offline prior to the December 2012 sample.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

Comments
No additional comments.

Receipt
The samples were received on 4/15/2020 9:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Air - GC/MS VOA
Methods TO 14A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by Eurofins TestAmerica Knoxville.

Methods TO 15 LL, TO-15: Although the BFB is flagged as outside control limits for TO-14 on batch 140-39061, the results are within limits for TO-15, which is required for this project.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
