Subject: Transmittal of Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System, Operation Round 29 August 2020 Monitoring Report
Lockheed Martin Corporation – Middle River Complex
2323 Eastern Boulevard, Middle River, Baltimore County, Maryland

Dear Mr. Schold,

For your review, please find enclosed two hard copies with a CD of the above-referenced document. This report documents the second round of indoor air and sub-slab vapor monitoring for calendar year 2020 at the Lockheed Martin Middle River Complex in Middle River, Maryland. This report contains the Round 29 (August 2020) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization vapor -intrusion-mitigation systems originally installed at the Middle River Complex in 2008.

If possible, we respectfully request to receive MDE's document review comments by April 27, 2021.

Please let me know if you have any questions. My office phone is (301) 548-2209.

Sincerely,

Thomas D. Blackman

SECTION 1
INTRODUCTION

Tetra Tech, Inc., (Tetra Tech) has prepared this report on behalf of Lockheed Martin Corporation (Lockheed Martin) to document the second round of indoor air (IA) and sub-slab vapor (SV) monitoring for calendar year 2020 at the Lockheed Martin Middle River Complex (MRC) in Middle River, Maryland. This report contains the Round 29 (August 2020) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems originally installed at the Middle River Complex in 2008: one beneath the Building A plating shop and the other beneath the southern portion of the Building C basement. This monitoring is part of an ongoing investigation to evaluate whether volatile organic compounds (VOCs) in sub-slab vapors (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air at Middle River Complex facilities, and to evaluate whether subsurface vapor contamination remains at concentrations dictating continued operation of the sub-slab-depressurization mitigation system, or if a transition/exit strategy can be performed. The *Vapor Intrusion Management Plan* (Tetra Tech, 2019a), including associated decision matrices, provide the basis for the vapor intrusion strategy for the site. The second monitoring round for calendar year 2020 continues investigations previously described in the reports listed in Table 1-1.

This report is organized into the following sections:

Section 2—Round 29 Indoor-Air and Vapor-Intrusion Investigation: Briefly summarizes previous investigations and interim measures and describes the sampling methodology used for the current investigation round.

Section 3—Round 29 Results: Presents the results of the August 2020 investigation.

Section 4—Sub-Slab-Depressurization-System Data Analysis: Summarizes the operation and monitoring of the sub-slab-depressurization systems in Buildings A and C for the reporting period from April 1, 2020 to September 30, 2020.

Section 5—Conclusions: Presents conclusions based on the Round 29 sampling results.

Section 6—References: Lists the references used in this report.

Tables, figures, and appendices are at the end of the report body following Section 6.

SECTION 2
ROUND 29 INDOOR-AIR-QUALITY AND VAPOR-INTRUSION INVESTIGATION

This section briefly summarizes previous investigations and interim measures and describes the sampling methodology used in the current investigation round.

2.1 PREVIOUS INVESTIGATIONS AND INTERIM MEASURES

The indoor air (IA) and sub-slab vapor (SV) investigation described herein was initially designed to evaluate whether volatile organic compounds (VOCs) associated with soil and groundwater contamination at the site might be moving into IA at Middle River Complex (MRC) facilities. Tetra Tech, Inc., (Tetra Tech) industrial hygienists chose the initial sampling locations for Buildings A, B, and C during a 2006 site reconnaissance. Additional sampling locations were selected throughout program implementation based on previous IA and SV monitoring results (Tetra Tech, 2017d).

Although IA results had predominantly been below risk-based screening levels after the first three rounds of sampling in February 2006, December 2006, and April 2007 (with one trichloroethene [TCE] exceedance in 109 samples [1]), two sub-slab depressurization (SSD) vapor intrusion mitigation systems (one beneath the former Building A plating shop and the other beneath the southern portion of the Building C basement) were installed at the MRC in 2008 (Tetra Tech, 2008d), based on elevated SV concentrations detected beneath the buildings. The Building A SSD system (SSDS) was expanded in 2010 (Tetra Tech, 2010c), in 2016 (Tetra Tech, 2016d), and again in 2017 (Tetra Tech, 2017f) after elevated SV concentrations were detected at additional locations.

[1] One TCE concentration (36 micrograms per cubic meter [µg/m^3]) out of 109 total samples (including duplicates) exceeded the previously used MDE indoor air screening level (25 µg/m^3). The exceedance was observed in the duplicate sample of a field-duplicate pair; TCE was not detected in the corresponding parent sample. Since then, the indoor air screening level has been reduced to 8.8 µg/m^3; even so, that result would have been the only exceedance.

A site-specific TCE screening-level of 35 µg/m^3 for indoor air has been derived for the Building A basement based on limited exposure potential in the basement. This screening level was approved by the Maryland Department of the Environment (MDE) in July 2017. However, the site-specific screening level for the basement does not represent a final risk-based indoor air cleanup criterion.

The Building C SSDS was expanded in 2012 (Tetra Tech, 2012c) and 2013 (Tetra Tech, 2013c) for similar reasons (elevated SV concentrations in the central portion of the basement). Subsequent rounds of IA sampling indicated that main floor contaminant concentrations in IA resulting from vapor intrusion (VI) were being controlled by the SSDSs.

However, recent investigations in Building A and the Building A basement have identified elevated TCE concentrations in SV, water (groundwater and water in sumps), and in basement IA. The following presents a list of subsequent VI investigations in Building A and the Building A basement from 2014–2018, followed by a more detailed description of each investigation:

(a.) portable gas-chromatograph/mass-spectrometer (GC/MS) surveys of IA and sub-slab air from within Building A basement floor features (e.g., sumps, drains) in February 2014 and April 2016 (Tetra Tech, 2014b, 2016b)

(b.) installation of three portable air-filtration units in January 2015 in the Building A basement to mitigate TCE exceedances in indoor air (Tetra Tech, 2016d)

(c.) installation and sampling of additional Vapor Pin™ vapor monitoring points (VMPs), including seven in the eastern wall of Building A basement, two in the Building A basement floor, and one beneath the main floor of Building A in March 2016 (Tetra Tech, 2016b)

(d.) collection of air and water samples from select floor features (i.e., sumps, drains) in Building A basement in May 2016 (Tetra Tech, 2016b, 2016c)

(e.) a continuous air-monitoring survey of SV and breathing-zone IA in the Building A basement over two months (February 24 to April 21, 2017) (Tetra Tech, 2017b)

(f.) a test to determine the effects resulting from covering select floor features (e.g., sumps and drains that had exhibited the highest TCE concentrations) on basement IA concentrations in March 2017 (Tetra Tech, 2017b)

(g.) flow testing in two sumps in the southern portion of Building A basement to determine the volume of water being discharged from each individual sump back to Lift Station #5 in March–May 2018; and sampling of water in Building A basement sumps in March 2018, including water from a sump (not previously sampled) in the utility corridor between Building A basement and the Drop Hammer Building; an assessment of the data obtained from this study sought to determine a constructible, cost-effective solution that effectively controls water and vapor accumulation in the sumps (Tetra Tech, 2018e).

Elevated TCE concentrations detected in air within, and above, select floor features (e.g., sumps) in the Building A basement led to the installation (as an interim measure) of three additional air-purifying filters (for a total of six filters) in the basement in May 2017 to target floor features that have shown elevated TCE concentrations (Tetra Tech, 2018b). The continuous air-monitoring survey also identified significant sources of IA contamination in the basement at sumps associated with abandoned and/or removed heaters (Tetra Tech, 2017b). In addition to the new air-purifying filters, additional activities were completed in the summer of 2017 in Building A and its basement to address the elevated VOC results in SV and sump water from several recent investigations. A closed-circuit television (CCTV) camera survey of floor features in the Building A basement, including the sumps in existing and former heating rooms, the air-duct network that runs behind the eastern basement wall, the storm-drain line that runs north/south under the basement floor, and the smaller floor drains, was conducted to determine their condition, identify possible breaches, and better understand their direction and design. The CCTV survey indicated that the underground network of floor drains, pipes, and manholes/sumps are interconnected. Floor drains that might have mitigated water infiltration in and near pits associated with former equipment in Building A appeared to be connected to nearby sumps and storm drains. Other floor drains appeared to have been abandoned, which is supported by information received while conducting historical interviews of on-site personnel (Tetra Tech, 2018b).

During the VI sampling events conducted in March/April 2016 (Tetra Tech, 2016b) and March 2017 (Round 22), sampling location SV-175-A (Figure 2-1) on the Building A basement floor had the highest TCE concentrations (460,000 and 650,000 micrograms per cubic meter [$\mu g/m^3$], respectively). The maximum August 2017 (Round 23) SV TCE concentration (21,000 $\mu g/m^3$) was also detected at location SV-175-A. Location SV-175-A was removed from the sampling list and not sampled in February 2018 (Round 24) since consistently elevated TCE concentrations detected during previous sampling negated the need to continue collecting data from this location at that time. High TCE SV concentrations were also noted at two locations (SV-171-A and SV-173-A) in the eastern wall of the Building A basement during 2016 (Tetra Tech, 2016b), at three locations (SV-170-A, SV-171-A, and SV-173-A) in the eastern wall of the Building A basement in 2017 (in both the March [Round 22] and August [Round 23] sampling), and at two locations (SV-171-A and SV-173-A) in the eastern wall of the Building A basement in February 2018 (Round 24).

These high TCE concentrations prompted a pilot test conducted on July 6, 2017; this test evaluated the feasibility of extracting vapors from within the basement duct system at former heater room A-9/sump HRS5 (located immediately adjacent to SV-175-A, where the highest TCE concentrations have been detected historically) using the existing SSDS (Tetra Tech, 2018b). The pilot test was successful, HRS5 was left connected to the SSDS, and the system extracted vapor from this sealed sump until it was abandoned by filling it with concrete in December 2019.

In July 2017 (Tetra Tech, 2017b), a FROG 4000™ gas-chromatograph/photoionization detector (GC/PID) survey of the main floor of Building A assessed whether TCE detected in indoor air near the basement sumps was migrating through air ducts connected to the sumps, and through the floor air-vents, to the main floor of Building A. TCE detections ranging from 32.8 µg/m^3 to 103.7 µg/m^3 were recorded in samples collected from inside the vents and in IA above the vents; therefore, in September 2017 each air vent on the main floor (regardless of screening results) was sealed using a vapor barrier and a bolted-down steel plate. Sealing these floor vents on the main floor of Building A closed off this exposure pathway and prevented further migration of TCE vapor from the basement. A subsequent FROG 4000™ survey in October 2017 verified seal integrity at the 42 air-vent locations and confirmed the absence of IA TCE near the vents. No TCE was detected in any IA sample collected; all results were non-detected (Tetra Tech, 2018c).

In January–May 2018, Tetra Tech conducted an inspection of the sump pumps in Building A basement, and conducted flow testing in two sumps (SP1/SP1A, and the utility corridor sump) in the southern portion of Building A to measure the volume of water being discharged (via polyvinyl chloride [PVC] piping) from each sump to sanitary sewer Lift Station #5. Water samples were also collected from sumps in Building A basement during this investigation. Information gained from the January–May 2018 studies was used to determine constructible, cost-effective solutions that control water and vapor accumulation in Building A basement sumps; possible solutions for mitigation currently remain under evaluation (Tetra Tech, 2018e).

The sump inspection determined that the pump in sumps SP1/SP1A was the only one in the target area (southern portion of Building A basement) that pumps a significant volume of water back to Lift Station #5, and subsequently the sanitary sewer system. Only a small amount of water (less than three gallons) was collected in the utility corridor sump over a two-month period.

The respective TCE concentrations detected in sump water at SP1/SP1A during the last three sampling events were: 120 microgram(s) per liter (µg/L) and 2,700 µg/L in May 2016; 160 µg/L and 440 µg/L in March 2017; and 160 µg/L (SP1 only)[2] in March 2018. The TCE concentration detected in the utility corridor sump was 53 µg/L. These concentrations are two to three orders of magnitude higher than the TCE concentrations (2.3 µg/L and 2.6 µg/L) detected in water samples collected from Lift Station #5, indicating that dilution is likely occurring at the lift station due to the other discharged water it receives. Various pipes discharge into the lift station, including those carrying heating, ventilation, and air conditioning (HVAC) condensate water. This additional water is likely responsible for the apparent low concentration of TCE concentrations detected at Lift Station #5 as compared to the concentrations detected at the sumps.

2.2 INVESTIGATION PROCEDURES

The sampling plan for Round 29 was based on historical detections, information obtained during site reconnaissance, and a review of historical information and reports. IA and SV samples were collected from Buildings A, B, and C during Round 29 sampling. Relevant guidance from the United States Environmental Protection Agency [USEPA] (USEPA, 1996, 2004, 2012, and 2015) and the Maryland Department of the Environment [MDE] (MDE, 2006) was used to develop the investigation methodology.

IA and SV sampling within Buildings A, B and C was completed in accordance with the work plan for Rounds 24–29 (Tetra Tech, 2017d). Background outdoor air samples were collected from the same sampling locations as had been used for the previous round (i.e., Round 28 in February 2020; see Figure 2-2). Not all existing monitoring points inside the subject buildings were sampled during Round 29. As in previous rounds, samples were selectively collected in or adjacent to areas where contaminants had been detected previously, or in areas where contaminants are currently suspected of being present.

TCE has been targeted as a primary chemical of concern (COC); it has a history of use at the site; has been detected in groundwater and soil gas; can be toxic to human health depending upon the

[2]The only sample collected in March 2018 was from SP1, as the focus at that time was on that sump. Note that sumps SP1/SP1A are connected underground.

dose received and the duration and means of exposure; and is mobile in the environment. Historical sampling locations and the sub-slab VMPs sampled in Buildings A, B, and C during this round are shown in Figures 2-3, 2-4, and 2-5, respectively. IA sampling locations were co-located with most of the monitored SV sampling locations to evaluate IA and any possible relationship between SV and IA in Building A, B, and C.

Round 29 sampling was performed on August 25 and 26, 2020. Seventy-two samples (and eight duplicates) were collected using Summa® canisters as follows:

- four background ambient-air samples were collected at the same locations used in the previous round (Fig 2-2)
- 35 IA samples (and four duplicates) from Buildings A, B, and C:
  - 15 IA samples (and two duplicates) from Building A
  - two IA samples from Building B
  - 18 IA samples (and two duplicates) from Building C
- 33 SV samples (and four duplicates) from Buildings A, B, and C:
  - 16 SV samples (and two duplicates) from Building A
  - two SV samples from Building B
  - 15 SV samples (and two duplicates) from Building C

The "-A," "-B," and "-C" suffixes in the sampling location designations correspond with Buildings A, B, and C, respectively.

Five IA samples from Building C (144-C, 145-C, 146-C, 150-C, and 152-C) were collected in the machine shop of Lockheed Martin Rotary and Mission Systems (RMS) (formerly the Lockheed Martin Mission Systems & Training [MST] mechanical prototype laboratory [MPL]). Monitoring continues in this area because TCE was detected in IA at a concentration greater than its screening level during Round 15 (August 2013). The five sampling locations that provide data for possible worker-exposure areas within the MPL are:

- 144-C: machine shop area
- 145-C: cubicle area
- 146-C: kitchen area
- 150-C: kitchen area
- 152-C: machine shop area

Six SV samples (four in the eastern wall of the Building A basement [171-A, 172-A, 173-A, and 177-A], one in the Building A basement floor [174-A], and one beneath the main floor of Building A [168-A]), were collected during Round 29 to target possible TCE sources, including a former underground storage tank and vapor degreasers associated with former plating shop operations.

Before SV sampling, the tubing for each VMP was purged of atmospheric air, allowing SV to enter the probe and tubing. Purging was performed by attaching the sample tubing to a low-flow sampling pump set to an approximate flow rate of 200 cubic centimeters per minute to minimize the potential mobilization of SV that could bias the sample. One to three volumes (i.e., the volume of the sample probe and tube) were purged to ensure that collected samples were representative of SV conditions. IA samples were collected on the ground surface, with select samples being co-located with the corresponding SV sampling location.

Each SV sample was collected over one hour and each IA sample was collected over an eight-hour period using preconditioned Summa® canisters to ensure subsurface equilibration and avoid high negative pressure that might mobilize SV and bias the IA results. The one-liter stainless-steel canisters were equipped with in-line particulate filters and integral controllers that control the rate of filling during sampling. SV samples were collected through Teflon® tubing attached to the stainless-steel Vapor Pins® or vapor implants. Each sampling location was routinely inspected during the sampling period to ensure appropriate operation of sampling devices, sample integrity, and to document conditions within the area that might affect results. Samples were collected by opening the valve on the canister, which allowed air to enter the canister at the rate set by the controller (a one-liter canister over a period of one hour [for SV] and over a period of eight hours [for IA]). Controllers were calibrated in the laboratory and shipped to the field with a sufficient flow rate that would maintain the necessary vacuum pressure in the Summa® canister for the one-hour and eight-hour sampling intervals. Samples were collected and analyzed for VOCs by USEPA Method Toxic Organic-15 (TO-15). SV samples were collected in accordance with standard operating procedures developed by the USEPA Environmental Response Team for soil vapor

sampling (USEPA, 1996), and methodologies developed by the USEPA Office of Research and Development (USEPA, 2004). After sampling had been completed, each canister was closed and sent to an off-site laboratory (Eurofins TestAmerica, Inc. in Knoxville, Tennessee) under proper chain of custody procedures.

The SSD systems in the Building C basement area and in Building A were shut down approximately 24 hours before sampling began. The SSD systems were restarted within one hour after sampling had been completed in Buildings A and C; this is consistent with previous monitoring episodes. The following observations were recorded during the August 2020 sampling:

- Mean outdoor ambient temperature during the sampling period was 81 degrees Fahrenheit (°F) on August 25, 2020 and 78°F on August 26, 2020. Barometric pressure increased slightly during the sampling period, from 29.82 inches of mercury (in. Hg) to 29.87 in. Hg. Wind direction on August 25 was from the west/southwest and from the west/northwest/southwest on August 26, with average wind speed ranging from 3 to 20 miles per hour (mph). Skies were mostly cloudy on August 25 and partly cloudy on August 26, 2020.

- 0.03 inches of precipitation (rain) was recorded on August 25, and 0.10 inches on August 26, 2020.

- Water was present in the Building B flush-mounted vault (shallow subsurface groundwater accumulation) at sampling locations 121-B and 140-B, preventing sample collection. Alternate IA and SV samples were collected at nearby locations 101-B and 100-B, respectively. SV locations are limited in this area of Building B; the closest alternate location was chosen to collect a replacement SV sample.

- IA and SV samples from 118-A and SV sample from 139-A were collected in the bond-layup room (Building A production floor), where a positive-pressure HVAC system was operating. The door adjacent to 139-A was opened and closed frequently during sampling.

- The lid for sample location 081-A could not be removed because it had been painted over when the floor was painted; therefore, an SV sample was not collected at 081-A. A replacement SV sample was collected at nearby location 139-A.

- Sampling location 015-A is in the former plating shop area (Building A production floor). After the sampling round in August 2015, this area had undergone redevelopment and construction. A new floor has been installed, and this area is now an extension of the bond-layup room. IA and SV samples from 015-A were collected in this newly expanded bond-layup room (former plating shop), where a positive-pressure HVAC system was operating.

- Sampling locations 018-A, 093-A, 116-A, and 138-A were sampled in the Building A basement. Additional samples were collected from the four basement locations added to the sampling program in the work plan (Tetra Tech, 2017d) due to ongoing TCE VI investigation there. These include four additional sampling locations in the eastern wall (171-A, 172-A, 173-A, and 177-A) and one in the floor (174-A).

- The air-purifying units in the Building A basement were operating when samples were collected.

- Several samples (018-A, 021-A, 075-A, 078-A, 079-A, 081-A, 117-A, 118-A, 100-B, and 101-B) were collected near operating overhead ceiling fans and/or floor fans used to cool the building during warmer months.

- The sample from 168-A was collected near the location of a former vapor degreaser on the main floor of Building A.

- IA and SV samples in Building C basement at locations 001-C and 004-C were collected approximately 70 feet from a bay door to the outside that was opened intermittently.

- Samples IA-144-C through IA-146-C, IA-150-C, and IA-152-C in Building C basement were collected in a positive-pressure, air-conditioned room (the RMS MPL machine shop).

- Building A is a one-story building, except for a basement corridor under an open-air loading dock on its western side. The large doors at the loading docks on the western side of the building were opened periodically to allow carts, forklifts, personnel, and equipment to pass. Increased ventilation associated with open doors might have affected concentrations in samples collected on the first floor of Building A. No personnel or other activities were observed in the Building A basement.

- The bay doors across the southern end of Building B were open during sampling. The automatic bay door at the southeastern corner of Building B was opened and closed quickly to allow carts and equipment to pass. The opening of the bay doors might affect concentrations in samples collected from the southernmost sampling locations (IA-100-B and IA-101-B).

- The Building C basement is generally accessed via two automatic rolling doors on its eastern and southern sides. These doors open and close quickly to allow carts and forklifts to pass. The automatic rolling door approximately 40 feet east of sampling location 141-C was opened and closed intermittently during the day. The bay doors at the southern and southeastern sides of the Building C basement were open during the sampling period. This might have influenced IA concentrations in the samples collected from locations 001-C and 004-C.

- The most personnel and greatest activity were observed in Building B, in locations from the thrust-reverser assembly area in the southern portion of the building to the machining area in its central portion. Less activity was observed in Building A, where activity was

generally focused in the expanded bond-layup room (former plating shop area) and autoclave areas, and in the parts and assembly areas. No activity was observed in the southern portion of Building C, except for a cart or forklift passing through the area periodically. Light activity (three people) was observed in the machine shop area in Building C basement.

- The southern end of the Building C basement is mostly vacant, having been cleared of workstations and equipment by MRA Systems, Inc. (Note that ownership of MRA Systems, Inc., now MRAS Systems LLC, [collectively, MRAS] was transferred from General Electric [GE] to Singapore Technologies Engineering, Ltd. [ST Engineering]. Some materials are being temporarily stored in this area.)

- The pressure gauges on most Summa® canisters responded instantaneously upon opening the valve by dropping to between -23 in. Hg and -30 in. Hg. The ending readings on pressure gauges of most Summa® canisters were between 2 in. Hg and -16 in. Hg when sampling was complete. One pressure gauge (SV-100-B) had an initial reading of 23 in. Hg and an ending reading of 0 in. Hg. Despite the varied pressure reading and faulty regulator, adequate volumes for analysis were collected in all Summa® canisters. Pressure readings for each Summa® canister are recorded on the chain of custody forms (Appendix A).

Samples were analyzed for the current target-compound list, last amended on February 12, 2012:

- 1,1,1-trichloroethane (1,1,1-TCA)
- 1,1,2-trichloroethane (1,1,2-TCA)
- 1,1-dichloroethane (1,1-DCA)
- 1,1-dichloroethene (1,1-DCE)
- 1,2,3-trimethylbenzene (1,2,3-TMB)
- 1,2,4-trichlorobenzene
- 1,2,4-trimethylbenzene (1,2,4-TMB)
- 1,2-dichloroethane (1,2-DCA)
- 1,3,5-trimethylbenzene (1,3,5-TMB)
- benzene
- carbon tetrachloride
- chlorodifluoromethane (Freon 22)
- chloroform
- *cis*-1,2-dichloroethene (*cis*-1,2-DCE)
- dichlorodifluoromethane
- ethylbenzene
- methylene chloride
- methyl-tertiary-butyl ether (MTBE)
- naphthalene
- tetrachloroethene (PCE)
- toluene
- *trans*-1,2-dichloroethene (*trans*-1,2-DCE)
- trichloroethene (TCE)
- vinyl chloride (VC)
- xylenes (total)

All samples collected during Round 29 were submitted to Eurofins TestAmerica in Knoxville, Tennessee for analysis via GC/MS using cryogenic concentration (as described in Sections 9 and 10 of USEPA Method TO-15 [USEPA, 1999]).

This method was used because of its low detection limits (in the parts-per-billion by volume range), and because it can quantify all VOCs of concern. Eurofins TestAmerica is certified in USEPA Method TO-15 analysis and meets all quality assurance/quality control requirements specified in the TO-15 methodology.

All samples were stored at ambient temperatures and shipped to the laboratory via overnight carrier. All samples were submitted and analyzed within the method's specified 30-day holding time. All appropriate chain of custody documentation was completed for each sample (see Appendix A). A table listing Eurofins TestAmerica' s method detection limits is in Appendix B; Appendix C contains the laboratory analytical reports. Data-validation reports and supporting documentation are in Appendix D.

Validated analytical data were qualified in accordance with USEPA *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2017). Attaching data qualifiers to analytical results signifies a quality-control noncompliance. During Round 29, the following data qualifiers were applied to data after validation if applicable:

- *J*—indicates an estimated result below the reporting limit, or an estimated result greater than the reporting limit with a quality control nonconformance.
- *U*—indicates the chemical was not detected at the numerical detection limit (i.e., at the sample-specific quantitation limit).
- *UJ*—indicates the chemical was not detected at the (estimated) numerical detection limit (i.e., the sample-specific quantitation limit).
- *E*—indicates the chemical was detected above the instrument calibration range, so the sample was reanalyzed; the result reported is the from the reanalyzed sample.

(Note that in the discussion that follows, when specific samples are referenced the sampling-round suffix ["-29"] has been left off to increase readability). Field duplicate sampling results were evaluated based on the following criteria: (1) a relative percent difference of less than or equal to 50% when both original and duplicate results were greater than the reporting limit, or (2) a difference within two times the reporting limit when original and duplicate results were less than or equal to the reporting limit. Detected and nondetect results for TCE in samples IA-168-A, and IA-153-C and their corresponding duplicates were qualified as estimated (*J* and UJ, respectively)

due to field duplicate imprecision. Detected and nondetect results for methylene chloride in sample SV-153-C and its corresponding duplicate were also qualified as estimated (*J* and UJ, respectively) due to field duplicate imprecision. Detected results for TCE in sample SV-168-A and its corresponding duplicate were also qualified as estimated (*J*) due to field duplicate imprecision. No other results were qualified for field duplicate imprecision during Round 29. Original and field duplicate results were considered separately when evaluating exceedances; i.e., if an analyte's concentration in either the original or duplicate sample exceeded criteria, that exceedance is noted. In summary statistics (e.g., frequency of detection counts), field duplicate pairs were counted as one sample, and calculated averages were reported (e.g., in the "average of all values" calculation), as shown on Section 3 tables.

Note that several samples were affected by laboratory-instrument calibration-range exceedances, and were therefore reanalyzed. The results from the reanalysis are considered usable data and are reported using an *E* flag in the data summary tables.

SECTION 3
ROUND 29 RESULTS

All analytical results for indoor air (IA) and background (ambient air) samples were compared to screening levels for industrial air; these levels are based on United States Environmental Protection Agency (USEPA) *Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites* (USEPA, 2020). Screening the chemicals of concern (COC) uses the lower of the carcinogenic (*ca*) or noncarcinogenic (*nc*) values. Carcinogenic values are based on a 1×10^{-5} (i.e., a one-in-100,000 probability) excess cancer-risk, whereas the noncarcinogenic values are based on a hazard quotient of 1 (i.e., the "no adverse effect" level). In some tables (e.g., Tables 3-1 and 3-2), more conservative screening levels based on a 1×10^{-6} excess cancer-risk or a hazard quotient of 0.1 are referenced for informational purposes only.

These risk benchmarks were selected in accordance with Maryland Department of the Environment (MDE) requirements. Analytical results were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits.

Sub-slab vapor (SV) sampling results were compared to SV screening values derived in accordance with the methods discussed in USEPA's *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to Indoor Air* (USEPA, 2015), and were calculated by dividing indoor-air (IA) screening levels by a conservative attenuation factor (AF) of 0.03. The AF represents the adjustment applied to IA screening levels to account for concentration reductions due to diffusive, advective, and/or other attenuating mechanisms as vapor migrates from the sub-slab to IA. Simply stated, SV is expected to dilute upon movement into IA; the AF is the ratio of the IA concentration to its SV concentration under a conservative vapor-intrusion (VI) scenario. The recommended AF in the 2015 USEPA guidance results in higher SV screening values than those used for sampling rounds before August 2012, when an earlier

USEPA AF of 0.1 was used. USEPA further acknowledges that applying the AF of 0.03 to industrial buildings is conservative (i.e., more protective of human health and the environment), because the value was developed based on residential VI studies and does not account for industrial buildings that generally have thicker building slabs and stronger heating/ventilation/air-conditioning (HVAC) systems than residential homes.

3.1 ROUND 29 DATA ANALYSIS

The sampling-round designation (29) is not included when identifying samples or sampling locations in the following text, because all data discussed in this section are from Round 29. For example, an IA sample collected from vapor monitoring point (VMP) 076 (e.g., sample IA-076-A-29) is referred to as "076-A." If comparisons are made to specific samples from previous sampling rounds, they will be identified as such in the text or by using the round-designation suffix (e.g., R06 for Round 6).

Descriptive statistics for Round 29 IA and SV samples are shown in Tables 3-1 and 3-2, respectively. Summary statistics for trichloroethene (TCE) and naphthalene in IA over time are shown in Tables 3-3 and 3-4, respectively. Figures 3-1, 3-2, and 3-3 show Round 29 exceedances in Buildings A, B, and C, respectively. The following chemicals were detected in Round 29 IA and/or SV samples at concentrations exceeding their respective MDE industrial risk-management benchmarks:

- IA—Chloroform
- SV—Naphthalene, 1,1-dichloroethane (1,1-DCA), and TCE

Building A—Tables 3-5 and 3-6 present the Building A IA and SV results, respectively. Locations with exceedances are shown on Figure 3-1. The chloroform industrial air screening level of 5.3 µg/m^3 was exceeded at one IA sampling location (19 µg/m^3 at 018-A) and in its corresponding duplicate sample (20 µg/m^3). Although chloroform was detected in several SV samples (maximum concentration of 100 *J* µg/m^3) in Building A, all concentrations were less than the SV screening level (177 µg/m^3).

TCE was the only SV analyte detected at concentrations exceeding screening levels. TCE was detected in all Round 29 SV samples and exceeded its screening level (293 µg/m^3) in three basement and two first floor samples (Figure 3-1). TCE was detected in seven of 17 IA samples, but at concentrations (2.4*J* µg/m^3 to 7.7 µg/m^3) below its screening level (8.8 µg/m^3). TCE is further discussed below.

TCE in Building A Basement

Beginning in Round 15 (August 2013), TCE has periodically been detected in IA in the Building A basement at concentrations greater than its project IA screening level (8.8 µg/m^3), including Round 17 (August–November 2014), Round 20 (February 2016), Round 22 (March 2017), Round 25 (August 2018), and Round 27 (August 2019). However, TCE concentrations have not exceeded the Building A basement-specific screening level for TCE (35 µg/m^3) approved by MDE in 2017. The basement screening-level was developed to account for reduced exposure potential in the basement, as compared to exposure on the main floor of Building A. Access to the Building A basement is controlled by management.

TCE was detected in IA at all four of the sampled Building A basement locations (018-A, 093-A, 138-A, and 174-A) in Round 29, but at concentrations less than its basement-specific screening level. Detected IA TCE concentrations were 5.8 µg/m^3 in both the parent and duplicate samples at location 018-A, 4.4 µg/m^3 at location 093-A, 7.7 µg/m^3 at location 138-A, and 6.4 µg/m^3 at location 174-A.

Note that this is the second VI sampling round since the HRS5 sump was abandoned and sealed by filling it with concrete and disconnecting its vapor extraction pipe. This sump was identified as the likely primary contributor of TCE impacts to indoor air in the Building A basement. Vapor was extracted from HRS5 continuously from June 2017 to December 2019 (five VI sampling rounds) under normal sub-slab depressurization system (SSDS) operating conditions. Per sampling protocol, the SSDS was temporarily shut down for approximately 24 hours before IA and SV sampling started, and restarted immediately after sampling had been completed.

Dissimilar to the SSDS, the indoor air filters are not shut down for the semiannual sampling event. The SSDS system and the IA filters are operating for different purposes.

The SSDS extraction prevents subsurface VOCs from passing into indoor air. Operating SSDS extraction points in the southern end of the Building A basement is difficult because of the high water table. The IA filter system circulates indoor air (potentially contaminated with VOCs) through a granular activated-carbon (GAC) medium that adsorbs any VOCs present, and then discharges the treated air back into the basement. The operation of the IA filters can therefore reduce VOCs, but not eliminate them.

TCE exceeded its SV screening level (293 µg/m^3) at three basement locations (171-A, 173-A, and 174-A) in the central portion of Building A, near or within the area of influence of the sub-slab depressurization (SSD) systems; exceedances were 2,800 µg/m^3 at 171-A, 7,600 µg/m^3 at 173-A, and 140,000 µg/m^3 at 174-A. Locations 171-A, and 173-A are in the eastern wall of the Building A basement and 174-A is in the basement floor; these locations were added to the semiannual IA/SV sampling in Round 22 (March 2017). SV TCE concentrations at sampling locations 171-A and 173-A have been exceeding the screening level since Round 22. SV TCE concentrations at sampling location 174-A also exceeded the screening level in several previous sampling rounds since it has been added to the sampling program.

TCE in First Floor of Building A

TCE was detected at two first-floor Building A IA sampling locations in Round 29. Both TCE detections were well below the IA screening level of 8.8 µg/m^3 (4.7 µg/m^3 at 117-A, and 2.4*J* µg/m^3 at 168-A).

SV TCE exceeded its screening level (293 µg/m^3) at two first floor locations, at 118-A (650*E* µg/m^3), and 136-A (480 µg/m3), during Round 29. Location 118-A is in the central portion of Building A and within the area of influence of the SSD systems. Location 118-A is within the bond-layup room, where a positive-pressure HVAC system was operating at the time of sample collection. TCE SV exceedances have been consistently observed at this location (118-A) since Round 18 (February 2015). TCE SV concentrations at 118-A in Rounds 19 through 29 (August 2015 through August 2020) ranged from 420 µg/m^3 to 2,300 µg/m^3, and are all at least one order of magnitude (i.e., a power of 10) less than the SV concentration (13,100 µg/m^3) detected in Round 18 (February 2015).

In Rounds 20 through 25 (February 2016 through August 2018), SV TCE exceedances were also noted at location 136-A (near the area of influence of the SSD system). TCE concentrations at SV 136-A in Rounds 21 through 29, ranging from 3.5 µg/m^3 to 850 µg/m^3, have decreased by a factor of approximately 100 since the SSDS was expanded to this location in 2016, after a reported TCE-vapor concentration of 35,000 µg/m^3 during Round 20. The SV TCE concentration at this location during Round 29 was 480 µg/m^3.

The SV TCE concentration at first floor location 168-A, added to the semiannual sampling in Round 22 (March 2017) (and located within the area of influence of the SSD systems), was less than the screening level during Rounds 26 through 29, but exceedances were noted at this location during previous sampling rounds including Round 25. SV TCE concentrations at sampling location 168-A exceeded the screening level in Rounds 22 through 25 (concentrations ranged from 920 µg/m^3 to 22,000 µg/m^3), but have notably decreased over time following the SSDS expansion. Concentrations at location 168-A during Rounds 26, 27, and 28 were 180 µg/m^3, 270 µg/m^3, and 100 µg/m^3, respectively, and were less than the TCE screening level (293 µg/m^3). In Round 29, the TCE concentration at sampling location 168-A was 34 *J* µg/m^3, with 180*J* µg/m^3 in the corresponding duplicate sample; both concentrations remain below the TCE screening level.

Building B—Tables 3-7 and 3-8 present Building B IA and SV results, respectively. Sampling locations within Building B are shown on Figure 3-2. No IA or SV exceedances were noted during Round 29. Similarly, no exceedances were noted in Building B IA or SV samples during Rounds 19 through 28. During Round 18, only one slight naphthalene exceedance (4.2 µg/m^3) was detected in IA at location 140-B, and this concentration only marginally exceeded its screening level (3.6 µg/m^3). No exceedances were noted in Building B IA or in SV samples during Round 17. Prior IA naphthalene exceedances were noted at locations 140-B (6.5 µg/m^3) and 0-33B (4*J* µg/m^3) during Round 16 (February 2014), 033-B (5 µg/m^3) during Round 15 (August 2013), and 057-B (3.8 µg/m^3) during Round 6 (July 2009). Prior naphthalene exceedances of the SV screening level (120 µg/m^3) were noted at several locations during Rounds 6, 9, and during Rounds 11 through 15, with the most recent exceedances at locations 140-B (250 µg/m^3) and 123-Z (160 µg/m^3) during Round 15 (August 2013).

Building C—Tables 3-9 and 3-10 present Building C IA and SV results, respectively. All detected IA concentrations in Building C were less than their associated screening levels during Round 29.

TCE was detected in four IA locations in Building C, but at low concentrations (0.27 *J* µg/m^3 to 4.8*J* µg/m^3) and less than its screening level (8.8 µg/m^3). TCE was detected in SV at 14 of 15 sampling locations in Building C, and SV TCE exceedances of the screening level (293 µg/m^3) were noted at four locations (Figure 3-3):

- 004-C (300 µg/m^3), in the southern portion of the Building C basement, and within the SSD area of influence
- 060-C (480 µg/m^3), in the east-central portion of Building C, and within the SSD area of influence
- 102-C (1,800 µg/m^3, in both the parent and corresponding duplicate sample), in the central portion of Building C near REC #31 (former Patriot plating line)
- 126-C (310 µg/m^3), in the northeastern portion of Building C

SV TCE concentrations at 102-C have consistently exceeded the screening level since Round 22, with varying concentrations ranging from 890 µg/m^3 in a duplicate sample from Round 27 to 2,500 µg/m^3 in Round 25 (August 2018). In the previous four sampling rounds (Rounds 25, 26, 27, and 28), SV TCE exceedances were also detected at location 060-C.

TCE was detected in SV at a concentration (210 µg/m^3) below the screening level at 133-C in Round 29 after having exceeded the screening level at that location during each of the four previous sampling rounds (Rounds 25 through 28). Similarly, after recent TCE exceedances (310-340 µg/m^3 in Rounds 24 through 28) at location 141-C, TCE was detected at a concentration (34 µg/m^3) well below the SV screening level in Round 29.

Although an SV TCE exceedance was detected at location 001-C in the southern portion of Building C during Rounds 21 (August 2016) and 25 (August 2018), no exceedance at that location was detected during Rounds 22 (March 2017) through 24 (February 2018), or during Rounds 26 (February 2019), 27 (August 2019), 28 (February 2020), and 29 (the current sampling round). However, a slight SV TCE exceedance was detected in Round 29 at the nearby sampling location 004-C (300 µg/m^3). Prior to Round 29, the most recent SV TCE exceedance at 004-C occurred in July 2012.

An SV TCE exceedance was detected at location 113-C, in the south-central portion of the building, during Round 21 and Round 28, but not during Rounds 22 through 27, or during the current sampling round (180 µg/m^3). SV TCE exceedances at location 152-C, in the east-central portion of Building C, were noted during Rounds 22 and 23 (August 2017), but not during Rounds 24 through 29. SV TCE exceedances in Building C appear to be sporadic and do not follow an observable spatial pattern.

The SV TCE concentration at sampling location 126-C (310 µg/m^3) slightly exceeds the screening level in Round 29. SV TCE exceeded its screening level at location 126-C during Rounds 22 through 26, but not during Rounds 27 and 28. Note that some uncertainty exists regarding Round 27 (August 2019) SV results at locations 126-C and 149-C, as historical trends indicate that the SV data for these locations may have been mislabeled. Round 27 SV TCE concentrations at locations 126-C and 149-C were 3.7 µg/m^3 and 200 µg/m^3, respectively. Round 28 SV concentrations of TCE at both locations (200 µg/m^3 at 126-C, and 2.1 µg/m^3 at 149-C) were less than the screening level (293 µg/m^3). The SV TCE concentration at sampling location 149-C (11 µg/m^3) remained below the screening level during Round 29.

No VC exceedances were observed at any Building C sampling locations during Round 29. Previously during Round 27 (August 2019), a sole VC exceedance (2,700 µg/m^3) of its screening level (933 µg/m^3) was detected in SV at location 149-C. During Rounds 28 and 29, VC was not detected at location 149-C.

SV exceedances of VC had not been detected at location 149-C during rounds of sampling prior to Round 27 (August 2019); however, SV exceedances of VC had consistently been observed at location 126-C from Round 12 (February 2012) to Round 26 (February 2019), with recent concentrations (Rounds 18 [February 2015] through 26 [February 2019]) ranging from 1,100 µg/m^3 to 16,000 µg/m^3. As mentioned previously, historical data, as compared to Round 27 data, appear to indicate that the SV samples for locations 149-C and 126-C may have been mislabeled (switched) during Round 27. Note that VC was not detected in IA during Rounds 12 through 27. No mislabeling occurred during Rounds 28 and 29. In Round 29, VC was not detected in any IA samples and was detected in only two SV samples. Although the maximum concentration of VC

in SV during Round 29 (790 µg/m^3) was detected at 126-C, this concentration is less than the screening level (933 µg/m^3).

In addition to the screening level exceedances discussed above, SV exceedances of 1,1-DCA (5,500*E* µg/m^3 in the parent sample, and 6,000*E* µg/m^3 in the corresponding duplicate sample) and naphthalene (300 µg/m^3 in the parent sample and 430 µg/m^3 in the corresponding duplicate sample) were also detected at 102-C during Round 29 (the screening level is 2,567 µg/m^3 for 1,1-DCA, and 120 µg/m^3 for naphthalene). Exceedances of 1,1-DCA and naphthalene were noted at location 102-C during Rounds 22 through 26 (March 2017 through February 2019) and Round 28 (February 2020), at concentrations ranging from 3,800 µg/m^3 to 7,900 µg/m^3 for 1,1-DCA and 140 µg/m^3 to 330*J* µg/m^3 for naphthalene. In Round 27 (August 2019), 1,1-DCA concentrations (2,900 µg/m^3 and 3800 µg/m^3 in parent and duplicate samples, respectively) exceeded its screening level, but naphthalene concentrations were less than its screening level. No exceedances for 1,1-DCA and naphthalene were detected during Round 21 (August 2016).

The SV naphthalene and 1,1-DCA concentrations in Building C do not appear to impact IA concentrations. Neither naphthalene nor 1,1-DCA were detected in IA during Round 28. In Round 29, 1,1-DCA was only detected at one IA sampling location (0.52*J* µg/m^3 at 001-C), and a trace concentration of naphthalene (1.3 µg/m^3) was detected in only the duplicate sample at location 149-C (i.e., it was not detected in the corresponding parent sample). Naphthalene and 1,1-DCA have been detected in IA during previous sampling rounds (i.e., in Rounds 10 [February 2011] and 11 [August 2011] for 1,1-DCA, and during Rounds 10, 11, 13 through 16 [August 2011 through February 2014], 18 [February 2015], 23 [August 2017], and 25 [August 2018] for naphthalene) at concentrations less than screening levels.

During Round 29, IA and SV concentrations of tetrachloroethene (PCE) did not exceed its screening levels; PCE detections in IA and SV have also been below its screening level in Rounds 18 through 28 (February 2015 through February 2020). An IA exceedance of PCE (870 µg/m^3, as compared to its IA screening level of 180 µg/m^3) was detected at location 149-C in a Round 18 (February 2015) resample, collected because the TCE concentration at the same location approached, but did not exceed, its screening level in the original sample. Before Round 18, PCE had never been detected in IA or SV in Building C.

In addition, SV PCE was not detected at 149-C during Round 18. PCE has not been detected above its detection limit in most SV samples collected at and near location 149-C over time, suggesting that the sole PCE exceedance at location 149-C during Round 18 is anomalous, and possibly attributable to some IA source rather than to VI. Note that when IA concentrations are greater than background concentrations and/or sub-slab concentrations, other interior sources are possibly contributing to IA concentrations. During Round 29 (the current sampling round), PCE was detected at 149-C in both IA (1.0 *J* µg/m^3 in the parent sample, and 0.94 *J* µg/m^3 in the duplicate sample) and SV (2.8 µg/m^3), but at concentrations well below screening levels (180 µg/m^3 for IA and 6,000 µg/m^3 for SV).

3.2 BACKGROUND AMBIENT AIR SAMPLES

Outdoor-air-quality (i.e., background) samples provide baseline concentrations for COC that can be compared to interior concentrations. Comparison to background indicates whether chemicals detected in IA are more likely associated with an exterior (i.e., background) or interior source (e.g., chemicals used in the workplace, or with past spills of chemicals absorbed to above-slab building materials, or sub-slab sources). Analytical results for Round 29 ambient (background) air samples are shown in Table 3-11. Figure 2-2 shows the background sampling locations used for Round 29; these locations are sufficiently far from site operations to avoid any possible site influence.

Table 3-12 lists chemicals detected in background samples and compares IA concentrations to the maximum detected background concentration. Ten VOCs were detected in background samples, and all chemicals detected in background samples were also detected in IA samples. All detected background concentrations are below their respective IA screening criteria. Table 3-12 evaluates whether chemical concentrations detected in IA are possibly due to interior sources, or if they simply reflect background conditions, using the following logic:

- When IA concentrations are equal to or less than background concentrations, IA concentrations likely reflect background conditions.
- When IA concentrations are greater than background concentrations and/or sub-slab concentrations, other interior sources are possibly contributing to IA concentrations.

- ❖ The presence of chlorinated degradation-products in IA samples (at concentrations less than those detected in SV samples), but not in background samples, suggests that sub-slab sources might contribute to these IA concentrations.

The only chemical exceeding screening levels in IA (i.e., chloroform in Building A) was not detected in background samples; therefore, chloroform IA exceedances in Building A are likely due to indoor (or possibly SV) sources rather than being reflective of background conditions. Although chloroform was also detected in Building A SV samples, its maximum concentration (100*J* µg/m^3) was less than its SV screening level (177 µg/m^3) but greater than the maximum IA concentration (20 µg/m^3).

IA detections of several chemicals at concentrations less than screening levels may be influenced by background. As presented in Table 3-12, chemicals with most of their indoor air detections below background (*cis*-1,2-dichloroethene, dichlorodifluoromethane, and methylene chloride) are likely influenced by ambient background contaminant sources. The remaining contaminants, detected in both ambient air and in IA, might be due to IA sources (and possibly VI to IA), and/or ambient background conditions. However, note that none of the chemicals presented on Table 3-12 were detected in SV above their respective screening levels in Round 29. In any case, all background contaminants also detected in IA in Round 29 are below IA screening levels.

SECTION 4
SUB-SLAB-DEPRESSURIZATION-SYSTEM DATA ANALYSIS

This section summarizes the operation and monitoring activities for the sub-slab-depressurization (SSD) systems (SSDS) in Buildings A and C for the reporting period from April 1, 2020 to September 30, 2020. A detailed account of these activities is in the October 2020, remedial action progress report (Appendix E). The location and layout of the SSD systems, and associated sub-slab vapor (SV) extraction points and vapor monitoring points (VMPs), along with the process and instrumentation diagrams for the Building A and Building C SSD systems, are shown in Figures 1 through 5 of Appendix E. This section discusses SV sampling results, extraction points, system influent, vacuum influence, and SSDS performance.

4.1 SUB-SLAB VAPOR MONITORING POINTS

Tables 4-1 and 4-2 summarize the concentrations of target volatile organic compounds (VOCs) detected at SV monitoring points to date near the SSD systems in Building A (in the lay-up room [former plating shop on the main floor], basement, and eastern area [on main floor]), and in the Building C basement, respectively.

4.1.1 Building A

SV samples collected to date near the Building A SSDS are listed by location in Table 4-3. VMPs 015-A (on the main floor of Building A); 078-A, 079-A, and 136-A (in the eastern area of Building A); 168-A (in the northern area of Building A); and 116-A (in the basement of Building A) were sampled in August 2020 (see Figure 2 in Appendix E).

The highest SV trichloroethene (TCE) concentrations detected at VMPs 015-A, 018-A, 079-A, 136-A, and 168-A, before and after the Building A SSDS began operation, are shown in Table 4-4. The concentrations detected at VMPs 015-A, 079-A, 136-A, and 168-A in August 2020 were at least

one order of magnitude (i.e., 10 times) lower than the concentrations detected before SSDS extraction began operating in the area.

While a significant decline in TCE concentrations has been observed at 015-A, concentrations continue to fluctuate over time, with some apparent seasonal variation (typically higher in summer [August] as compared to winter [February]) since 2017 (Figure 4-1). For example, TCE was detected at an estimated 2.3 micrograms per cubic meter ($\mu g/m^3$) in February 2017, at 51.5 $\mu g/m^3$ in August 2017, at 6.3 $\mu g/m^3$ in February 2018, at 73 $\mu g/m^3$ in August 2018, at 4 $\mu g/m^3$ in February 2019, at 10 $\mu g/m^3$ during the August 2019, at 19 $\mu g/m^3$ in February 2020, and at 28 $\mu g/m^3$ in August 2020. VOC-impacted groundwater likely provides a continuing source of VOCs to SV at 015-A. Similar fluctuations also occurred at 018-A between August 2011 and February 2014.

VMPs 079-A and 136-A are near extraction points installed during the system expansion completed in April 2016. August 2020 results show that these locations have had more than a 90% decrease in total VOCs since the SSDS was expanded. Figure 4-2 shows that since August 2016, the summer (August) sampling results at these two points are higher than the winter (February) results, with what appears to be seasonal fluctuation.

VMP 168-A is near the system extraction point SSD-39-A, installed during the third-phase of system expansion completed in July 2017; this location continued to show VOC concentration decreases in August 2020 (TCE at 34 $\mu g/m^3$) as compared to concentrations in August 2018 and August 2019 (TCE at 950 and 270 $\mu g/m^3$, respectively) and before third-phase expansion in February 2017 (TCE at 22,000 $\mu g/m^3$; see Table 4-1 and Figure 4-2).

Concentrations observed after SSDS startup were generally lower than concentrations detected before the system began operation. VOC reductions at 018-A (in the basement, and last sampled in 2014 due to consistently high groundwater levels) might be more limited than those experienced at main floor VMPs, because the shallow groundwater table (typically less than one foot below the basement slab) possibly impedes vapor flow.

4.1.2 Building C

SV samples collected to date near the Building C SSD system are listed in Table 4-5. These points are within 100 feet of the Building C SSD-system extraction points in the basement; most[3] are within the vacuum influence of SSD-system operations. VMPs 001-C, SSD-4-C (in the southern basement area); and 060-C, 088-C, 113-C, 126-C, 133-C, 141-C 149-C, 152-C, 153-C, and 155-C (in the mid-basement area) were sampled in August 2020 (see Figure 4 in Appendix E).

The highest TCE concentrations in Building C were observed at VMPs 001-C, SSD-4-C, 060-C, 113-C, and 133-C before SSDS extraction began in those areas. The most recent concentrations are summarized in Table 4-6. August 2020 TCE concentrations are lower than the concentrations measured before SSD-system startup and are apparently reaching asymptotic levels after several years of vapor extraction in the area. The August 2020 TCE concentrations at VMPs 001-C, SSD-4-C, 060-C, 113-C, 126-C, 149-C, and 152-C were higher than the concentrations measured in the previous semi-annual event (February 2020), but TCE concentrations were lower at 133-C and at 141-C (as compared to February 2020 concentrations); TCE concentrations were similar to the previous results at 088-C, 153-C, and 155-C. Historical concentrations are presented in Table 4-2 and Figure 4-3.

Concentrations of vinyl chloride (VC) observed at 126-C (north of the SSDS extraction points) have also decreased since the SSD-system expansion (see Figure 4-4), but, as shown on Figure 4-4, VC concentrations in sub-slab vapor at 126-C have varied over time with what appears to be seasonal fluctuation; summer (August) sampling results are higher than the winter (February) results. The August 2020 VC result (790 µg/m^3) was higher than the February 2020 result (120 µg/m^3); both results are the lowest VC results detected at 126-C to date. VC has not been detected in SSDS influent samples or in groundwater samples collected from a nearby well pair (MW-88A/B).

4.2 SUB-SLAB VAPOR EXTRACTION POINTS

The Building A and Building C SV extraction points are not sampled as part of the semi-annual SSDS monitoring program, because the combined influent for the Building A system is sampled

[3]Locations 001-C, SSD-4-C, 060-C, 113-C, 127-C, 133-C, 135-C, 149-C, 152-C, 153-C, 155-C, and 156-C

monthly, and the Building C system is sampled every two months (influent sampling results are presented in Section 4.4). Figure 2 in Appendix E shows the Building A extraction points (North, South, Basement North, and Basement South), horizontal extraction laterals, and vertical extraction points in Building A (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, SSD-38-A, and SSD-39-A), and former sump HRS-5 which was connected for vapor extraction from July 2017 until December 2019. Figure 4 in Appendix E shows the 11 vertical extraction points in Building C (SSD-21-C, SSD-23-C, SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C).

4.3 VACUUM INFLUENCE

Induced vacuum levels of target-area sub-slab VMPs over time are shown on the following figures in Appendix E: Figure 6 (Building A lay-up room and basement), Figure 7 (Building A eastern area), Figure 8 (Building C southern basement area), and Figure 9 (Building C mid-basement area). Representative vacuum measurements from the September 15 (Building A) and September 28, 2020 (Building C) monitoring episodes are indicated on plan views on Figures 10, 11, 12, and 13 of Appendix E. Vacuum influence associated with SSDS VMPs is checked biweekly. The target vacuum is 0.01 inches of water column or greater. (Note: negative vacuums at some points indicate pressure readings that are considered not influenced by the SSDS; pressure readings are likely due to undetermined local features.)

As indicated in the October 2020 progress report (Appendix E), extraction trenches near the Building A lay-up room induce a vacuum equal to or greater than 0.01 inches water column over an approximately 5,700-square-foot area; this area encompasses all eight SV monitoring points that had elevated VOC concentrations before system startup. The trenches in the Building A basement induce a vacuum over an approximately 2,600-square-foot area that encompasses three of the four VMPs used to measure the SSDS induced vacuum in the basement. The extraction wells in the eastern area of Building A induce a vacuum over an approximately 8,900-square-foot-area and encompass 10 of 15 VMPs used to measure the SSDS induced vacuum in that area. During the reporting period, extraction point SSD-39-A in the western area of Building A is inducing vacuum at two nearby VMPs; the associated area of induced vacuum influence is approximately 1,100 square feet.

The Building C basement extraction wells induce vacuum influence over an approximately 3,900-square-foot area in the southern end of the basement, while the extraction wells in the mid-basement area induce vacuum influence over an approximately 33,000-square-foot area. In the mid-basement, 16 of 20 monitoring points are within the target area shown to have vacuum influence.

SSD systems are performing as designed by maintaining the target vacuum of 0.01 inches of water column or greater.

4.4 INFLUENT VAPOR SAMPLES

Influent-vapor samples are collected monthly to monitor the Building A SSDS operation, and once every two months to monitor the Building C SSDS operation. VOC concentrations at the granular activated-carbon (GAC) influent, midpoint (after the lead drum), and effluent (after the second drum) points are monitored to determine when the midpoint concentration reaches 50% of the influent; when the 50% breakthrough is reached, or at Tetra Tech's discretion with concurrence from Lockheed Martin Corporation (Lockheed Martin), the lead GAC drum is changed out. These samples also allow monitoring of influent-concentration trends over time. Samples are collected directly from all three sampling ports of both SSD systems by connecting a clean one-liter Summa® canister (batch certified) to the Teflon® tubing of each sampling port and opening the valve for approximately one minute. The samples were submitted to Eurofins TestAmerica Laboratories, Inc. (Eurofins TestAmerica) in Knoxville, Tennessee for VOC analysis using United States Environmental Protection Agency (USEPA) Toxic Organic Method (TO-15).

Tables 4-7A and 4-7B summarize the influent-vapor concentrations of target VOCs in samples over time (from system startup in March 2008 through September 2020). These results are displayed graphically on Figures 14 and 15 in Appendix E. Tables 4-7A and 4-7B also provide average influent concentrations for the current (April–September 2020) and previous (October 2019–March 2020) six-month reporting periods. The six-month average-influent (total) VOC concentration during the current reporting period is similar to the average-influent VOC concentration during the previous semiannual reporting period in Building A (1,490 µg/m^3 versus 1,398 µg/m^3) and in Building C (82 µg/m^3 versus 68 µg/m^3). Overall, influent VOC concentrations

for both SSD-systems have been relatively stable or slowly decreasing since 2009 (see Figures 14 and 15 in Appendix E).

The goal of the SSD systems is to maintain a negative pressure below the slab (relative to the room space), thus minimizing VOC migration from the sub-slab soil into indoor air. VOC mass removal occurs by treatment of the vapor drawn out to maintain the vacuum. VOC removal rates for SSDS influent mass in Building A ranged from 0.02 to 0.05 pounds per day (lbs/day); these rates are similar to the removal rates observed in the previous semiannual reporting period (0.037 to 0.043 lbs/day). The Building A system has removed 6.6 pounds (lbs) of VOCs during this reporting period, seven pounds during the previous reporting period, and has removed approximately 212 lbs since system startup in March 2008.

The VOC removal rate in Building C during the current reporting period ranged from 0.018 to 0.052 pounds per month. The Building C SSDS has removed 0.21 lbs of VOCs this reporting period, 0.15 lbs during the previous reporting period, and has removed 12.8 lbs since system startup in March 2008.

4.5 SYSTEM PERFORMANCE

In general, flow rates and induced vacuums for the SSD systems are performing as designed maintaining a vacuum of 0.01 inches water column in target areas and at the same time reducing sub-slab concentrations in comparison to those prior to SSDS operation. We will continue to monitor system induced vacuum performance; however, some localized areas are likely to remain not amenable to induced vacuum, due to the heterogeneous structure of subsurface soil and water accumulation in the subsurface of these older structures. The induced-vacuum influence of the Building A system is over 5,700 square-feet on the main floor (encompassing the lay-up room), 2,600 square-feet in the basement, 8,900 square-feet in the northern and eastern areas, and 1,100 square feet in the western area. The induced-vacuum influence of the Building C SSDS extends over an approximately 3,900 square-foot area in the southern basement, and over approximately 33,000 square-feet in the mid-basement area.

SECTION 5
CONCLUSIONS

5.1 CONCLUSIONS

Tetra Tech, Inc., (Tetra Tech) has completed Round 29 of vapor-intrusion (VI) monitoring (the second of two scheduled in 2020) in Buildings A, B, and C at the Middle River Complex (MRC) (owned by LMC Properties, Inc.) in Middle River, Maryland. This ongoing investigation seeks to evaluate whether volatile organic compounds (VOCs) in sub-slab vapor (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air (IA) at the Middle River Complex facilities, and whether subsurface vapor contamination remains present at concentrations that dictate continued operation of the sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems (or if a transition/exit strategy can be performed). The *Vapor Intrusion Management Plan* (Tetra Tech, 2019a), including associated decision matrices, provide the basis for the vapor intrusion strategy at the site. The data set is composed of indoor air and sub-slab vapor (SV) samples collected in August 2020. Ambient air samples were also collected at four outdoor background locations around the perimeter of the Middle River Complex. All data were validated to ensure compliance with analytical method requirements.

Indoor air data were compared to risk-based screening levels for industrial air set at the 1×10^{-5} (i.e., one-in-100,000 probability) risk level for carcinogens, or at a hazard quotient of 1 for noncarcinogens (as published in the United States Environmental Protection Agency [USEPA] *Regional Screening Levels for Chemical Contaminants at Superfund Sites* [USEPA, 2020]). For samples collected in the Building A basement only, indoor air levels of trichloroethene (TCE) were compared to a Maryland Department of the Environment-approved basement-specific screening level of 35 micrograms per cubic meter ($\mu g/m^3$), based on the limited exposure potential for workers entering the basement. Indoor air samples were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental

Industrial Hygienists, were used for chemicals without published permissible exposure limits. SV data were compared to screening values derived using methods described in *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to Indoor Air* (USEPA, 2015) by applying an attenuation factor of 0.03 to the indoor-air screening values.

Historically, trichloroethene and naphthalene have been the prevalent contaminants of concern in indoor air at this site. In Round 29, trichloroethene was detected in indoor air in Buildings A, B, and C. Trichloroethene was detected in 11 of 35 indoor air samples collected during Round 29 (see Figure 5-1). No indoor air trichloroethene detections in basement or first floor samples were greater than the (unadjusted for the basement) screening level of 8.8 µg/m^3. The reduced trichloroethene indoor air concentrations in the Building A basement, as compared to previous years, are attributable to sealing and extracting vapors from basement sump HRS5 and then abandoning the sump; this sump was connected to the Building A sub-slab-depressurization system from June 2017 to December 2019 at which time it was abandoned by filling with concrete.

In Round 29, naphthalene was detected in only two of 35 indoor air samples at concentrations below its screening level (3.6 µg/m^3). These naphthalene detections occurred in both the parent and duplicate samples at location 018-A, collected in the western portion of the Building A basement, and the duplicate sample at location 149-C, collected in the northeastern portion of Building C; naphthalene was not detected in the corresponding parent sample at location 149-C. Sub-slab vapor naphthalene was detected in five of 33 samples. The maximum sub-slab vapor concentration of naphthalene (430 µg/m^3 in the duplicate sample at 102-C, with a concentration of 300 µg/m^3 in the corresponding parent sample), was in the central portion of Building C, and outside of the area of influence of the Building C SSDS, and was the only detected concentration higher than its screening level (120 µg/m^3). Naphthalene was not detected in indoor air in Building B.

5.1.1 Building A

Trichloroethene exceeded its screening level in sub-slab vapor during Round 29. Trichloroethene concentrations detected in Building A indoor air and sub-slab vapor are discussed below.

Basement

Trichloroethene was detected in indoor air at all four Building A basement sampling locations, but at concentrations less than its basement-specific screening level (35 µg/m^3), which was derived to account for reduced potential exposure in the basement. None of the basement locations exceeded the (unadjusted for the basement) industrial worker screening level (8.8 µg/m^3). Historical indoor air trichloroethene concentrations in the Building A basement samples have never exceeded the basement-specific screening level but have exceeded the industrial screening level.

Trichloroethene was detected at concentrations greater than the sub-slab vapor screening level (293 µg/m^3) in vapor samples collected from behind the eastern basement wall at locations 171-A, and 173-A, as well as in a sample collected from the Building A basement floor at location 174-A. Direct measurement of air above the sumps and of air trapped in the covered sumps indicates that the sumps and drains in the Building A basement are the sources of the trichloroethene.

The sole indoor air screening-level exceedances occurred in the Building A basement: chloroform (20 µg/m^3) at location 018-A in the west-central portion of the building, near operating fans used to cool the building. Chloroform was detected at 018-A in both the parent (19 µg/m^3) and duplicate (20 µg/m^3) samples at concentrations greater than the industrial screening level (5.3 µg/m^3) during Round 29. Chloroform has historically been detected in basement samples; however, note that prior to an exceedance at sampling location 093-A in Round 28, its concentrations had not exceeded its screening level since Round 17 (September 2014, at location 018-A).

Main floor

Two trichloroethene exceedances of its screening level (293 µg/m^3) were detected in sub-slab vapor at locations 118-A (650*E* µg/m^3), which is located in the bond layup room east of the former plating shop on the main floor, and 136-A (480 µg/m^3), located in the eastern portion of the building. Sample 118-A was collected where a positive-pressure heating/ventilation/air-conditioning (HVAC) system was operating. Both sampling locations (118-A and 136-A) are near the area of influence of the sub-slab depressurization systems. Indoor air concentrations of trichloroethene on the main floor of Building A were all less than the screening level.

The sub-slab-depressurization system in Building A appears to be operating as designed (except for limited vacuum influence in the SSD-136-A area) and appears to be effectively mitigating sub-slab vapor intrusion from known source areas of sub-slab vapor contamination, in concert with the indoor-air filtration units and control of vapor emissions from the sumps. Contaminants are constantly removed from soil vapor during system operation, and indoor air concentrations in the main part of Building A (excluding the basement) rarely exceed screening values. Filter cartridges are changed-out quarterly; no other maintenance is required.

Although basement occupancy is restricted, and screening levels related to restricted occupancy are not exceeded, this area will continue to be monitored as the sub-slab-depressurization system continues to operate. Figures 5-2A, 5-2B, and 5-2C show concentrations of trichloroethene and naphthalene in Building A in sub-slab vapor samples, in indoor air of the basement, and in indoor air on the first floor of the building (respectively). Direct measurement of air above the sumps and of air trapped in the covered sumps indicates that the sumps and drains in the Building A basement are the primary trichloroethene sources. Although seasonal fluctuation was noted in sub-slab vapor concentrations from some Building A locations (see Section 4), the same patterns were not observed in indoor air concentrations.

5.1.2 Building B

No exceedances were noted in the Building B indoor air or sub-slab vapor samples during Round 29. The most recent exceedance of the indoor air screening level was during Round 18 (February 2015), when one slight exceedance of naphthalene was detected.

5.1.3 Building C

Trichloroethene was detected at concentrations below its screening level in all 18 indoor air samples collected from Building C during Round 29. Sub-slab vapor screening level exceedances of trichloroethene (at concentrations ranging from 300 µg/m^3 to 1,800 µg/m^3) were detected at four locations in Round 29: at 004-C, in the southern portion of the Building C basement; at 060-C, in the east-central portion of Building C, and within the system's area of influence; at 102-C, in the central portion of Building C near the former Patriot plating line; and at 126-C, in the northeastern portion of Building C.

These Round 29 exceedances of the sub-slab vapor screening level are consistent with those observed in other recent sampling rounds (e.g., Round 21 [August 2016] through Round 28 [February 2020]). Note that although trichloroethene concentrations in sub-slab vapor have exceeded its screening level at these locations, nearby indoor air concentrations have not, suggesting that vapor intrusion is not significantly impacting indoor air concentrations, and possibly that the sub-slab-depressurization system is mitigating vapor intrusion into indoor air.

During Round 29, vinyl chloride (7.6*J* µg/m^3 [duplicate at 102-C] to 790 µg/m^3 [126-C]) was detected at two sub-slab vapor locations at concentrations below its screening level (933 µg/m^3). Vinyl chloride exceedances in sub-slab vapor have consistently occurred at location 126-C (in the eastern portion of Building C) during previous sampling (Round 18 [February 2015] through Round 26 [February 2019]). Subslab-vapor concentrations of vinyl chloride at 126-C have generally decreased since the sub-slab depressurization system was expanded in Building C, but have fluctuated over time. Vinyl chloride has not been detected in groundwater near 126-C, nor has it been detected in indoor air, despite the presence of trichloroethene in nearby groundwater monitoring well MW-88A (east of Building C) at concentrations up to 1,500 micrograms per liter (µg/L) in 2009. A trichloroethene concentration of 1,030 µg/L was detected at well MW-88A in 2019 (AECOM, 2019). A low concentration of the trichloroethene degradation product *cis*-1,2-dichloroethene (3.6 µg/L) was also detected in well MW-88A in 2019, while vinyl chloride was non-detected (AECOM, 2019).

The sub-slab vapor concentration of 1,1-dichloroethane (5,500*E* µg/m^3 in the parent sample, and 6,000*E* µg/m^3 in the corresponding duplicate sample) exceeded its screening level (2,567 µg/m^3) at location 102-C during Round 29. The sub-slab vapor concentration of naphthalene at same location (300 µg/m^3 in the parent sample, and 430 µg/m^3 in the corresponding duplicate sample) exceeded its screening level (120 µg/m^3) during Round 29 as well. Sub-slab vapor concentrations of 1,1-dichloroethane and naphthalene exceeded their screening levels at location 102-C during other recent sampling rounds (e.g., Rounds 17 [September 2014], 18 [February 2015], 20 [February 2016], and 22 through 28 [March 2017 through February 2020]).

In general, sub-slab vapor concentrations of volatile organic compounds have decreased in the southern basement area (SSD-4-C) of Building C since system startup in March 2008.

Vapor monitoring points (060-C, 088-C, 113-C, 126-C, 133-C, and 135-C) in the mid-basement area also show lower concentrations, as compared to results before system expansion in May 2013. The vapor concentrations are apparently reaching asymptotic levels after several years of vapor extraction in the areas.

The absence of any Building C indoor air screening-level exceedances for any compound suggests that vapor intrusion is likely not occurring. The sub-slab-depressurization system in Building C appears to be operating as designed and appears to be effectively mitigating sub-slab vapor intrusion from known source areas of sub-slab vapor contamination. Figures 5-3A and 5-3B show Round 29 sub-slab vapor and indoor air concentrations (respectively) of 1,1-dichororethane, trichloroethene, and vinyl chloride in Building C.

Tetra Tech, Inc. (Tetra Tech), 2008b. *Indoor-Air-Quality Investigation, 2008 Summary Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. July.

Tetra Tech, Inc. (Tetra Tech), 2008c. *November 2008 Sub-Slab Sampling Report, Sub-Slab-Depressurization Systems, Buildings A and C, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard, Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. December.

Tetra Tech, Inc. (Tetra Tech), 2008d. *SSD System Installation Report for Project # EESHBDF-00897_R642, Sub-Slab Depressurization Systems Installation, Sub-Surface Vapor Intrusion Mitigation, Buildings A and C*, *Middle River Complex, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2010a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation 2009 Summary Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. July.

Tetra Tech, Inc. (Tetra Tech), 2010b. *Indoor-Air-Quality Investigation August 2010 Summary Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

Tetra Tech, Inc. (Tetra Tech), 2010c. *System Startup Summary Report for the Sub-Slab Depressurization System First-Phase Expansion—Building A, Middle River Complex, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2011a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2010 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. January.

Tetra Tech, Inc. (Tetra Tech), 2011b. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2011 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. July.

Tetra Tech, Inc. (Tetra Tech), 2012a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2012 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. March.

Tetra Tech, Inc. (Tetra Tech), 2012b. *Vapor-Intrusion Management Plan, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. September.

Tetra Tech, Inc. (Tetra Tech), 2012c. *Construction Documentation for EESHJAC_20052_R642, Sub-Slab Depressurization System First-Phase Expansion—Building C, Middle River Complex, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech) 2013a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2012 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. January.

Tetra Tech, Inc. (Tetra Tech) 2013b. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2013 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. January.

Tetra Tech, Inc. (Tetra Tech) 2013c. *Construction Documentation: Sub-Slab Depressurization System Second-Phase Expansion—Building C, Middle River Complex, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech) 2014a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2013 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. April.

Tetra Tech, Inc. (Tetra Tech), 2014b. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2014 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. May.

Tetra Tech, Inc. (Tetra Tech) 2015a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation September 2014 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. March.

Tetra Tech, Inc. (Tetra Tech) 2015b. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2015 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. October.

Tetra Tech, Inc. (Tetra Tech), 2015c. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2015 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. December.

Tetra Tech, Inc. (Tetra Tech), 2016a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2016 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. October.

Tetra Tech, Inc. (Tetra Tech), 2016b. *Block I Building A and Building A Basement Vapor-Intrusion Investigation Report, Lockheed Martin Middle River Complex.* Report prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

Tetra Tech, Inc. (Tetra Tech), 2016c. *Block I Building A and Building A Basement Supplemental Vapor-Intrusion Investigation Report, Lockheed Martin Middle River Complex.* Report prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

Tetra Tech, Inc. (Tetra Tech), 2016d. *Construction Report, Sub-Slab Depressurization-System Second-Phase Expansion—Building A*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2017a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2016 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. January.

Tetra Tech, Inc. (Tetra Tech), 2017b. *Block I Building A Basement Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc. Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. November.

Tetra Tech, Inc. (Tetra Tech), 2017c. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation March 2017 Monitoring Report*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. October.

Tetra Tech, Inc. (Tetra Tech), 2017d. *Indoor Air Quality and Sub-Slab Vapor Sampling Work Plan, Rounds 24–29, Buildings A, B, and C, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard, Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. December.

Tetra Tech, Inc. (Tetra Tech), 2017e. *Groundwater Monitoring Report, March–April 2017, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. October.

Tetra Tech, Inc. (Tetra Tech), 2017f. *Construction Report, Sub-Slab Depressurization System, Third-Phase Expansion—Building A*, *Lockheed Martin Middle River Complex, 2323 Eastern Boulevard, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2018a. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2017 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. March.

Tetra Tech, Inc. (Tetra Tech), 2018b. *Block I Building A and Building A Basement Investigation Report—Summer 2017 Lockheed Martin, Middle River Complex, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2018c *Block I Building A Floor Air-Vent Sealing and Survey Report, Middle River Complex, Middle River, Maryland*. Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2018d. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2018 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

Tetra Tech, Inc. (Tetra Tech), 2018e. *Groundwater Leachate Management Block I Flow Testing and Additional Sump Sampling Report,* Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland. Prepared by Tetra Tech, Inc. Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. March.

Tetra Tech, Inc. (Tetra Tech), 2018f. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2018 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. February.

Tetra Tech, Inc. (Tetra Tech), 2018g. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2019 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by

Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

Tetra Tech, Inc. (Tetra Tech), 2019a. *2019 Vapor Intrusion Management Plan, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard, Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland.

Tetra Tech, Inc. (Tetra Tech), 2019b. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation August 2019 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

Tetra Tech, Inc. (Tetra Tech), 2020. *Vapor-Intrusion Investigation and Sub-Slab-Depressurization-System Operation February 2020 Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland.* Prepared by Tetra Tech, Inc., Germantown, Maryland for Lockheed Martin Corporation, Bethesda, Maryland. August.

A gray-shaded maximum background value indicates that the maximum detected value from the site data exceeds the maximum background value.

A bolded chemical name/criterion indicates that at least one concentration exceeds background and the industrial air RSL based on an HQ of 0.1 or an ILCR of 1×10^{-6} (i.e., one-tenth of screening value listed).

A bolded/shaded chemical name/criterion indicates that its concentration exceeds background and the industrial air RSL based on an HQ of 1 or an ILCR of 1×10^{-5} (i.e., the screening value presented).

Footnotes:

1 - Sample and duplicate are considered two separate samples when determining the minimum and maximum concentrations and number of samples exceeding criteria but are considered one sample when determining frequency of detection, average, standard deviation.

2 - Values presented are sample-specific quantitation limits.

3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.

4 - Exceedance counts are based on detected results only.

5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, May 2019. RSLs for carcinogens were adjusted to be based on a lifetime cancer risk of 1E-05. RSLs for noncarcinogens were not adjusted and represent a hazard quotient (HQ) of 1.

6 - Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit (PEL).

A gray-shaded maximum background value indicates that the maximum detected value from the site data exceeds the maximum background value.

A bolded chemical name/criterion indicates that the maximum concentration exceeds the industrial air RSL divided by 0.03 based on an HQ of 0.1 or an ILCR of 1×10^{-6} (i.e., one-tenth the screening value presented).

A bolded/shaded chemical name/criterion indicates that the maximum concentration exceeds the industrial air RSL divided by 0.03 based on an HQ of 1 or an ILCR of 1×10^{-5} (i.e., the screening value presented).

Footnotes:
1 - Sample and duplicate are considered two separate samples when determining the minimum and maximum concentrations and number of samples exceeding criteria but are considered one sample when determining frequency of detection, average, standard deviation.
2 - Values presented are sample-specific quantitation limits.
3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation
4 - Screening values derived in accordance with *Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils* (November 2002), are equal to United States Environmental Protection Agency (USEPA) industrial air screening values divided by an attenuation factor 0.03, and correspond to a target cancer risk level of 1×10^{-5} or a hazard quotient (HQ) of 1.
5 - Exceedance counts are based on detected results only.

Definitions:
-- - no criterion available
ca - screening value based on carcinogenic effects
HQ - hazard quotient
ILCR - incremental lifetime cancer risk
J - estimated value
NA - not available
nc - screening value based on noncarcinogenic effects
RSL - regional screening level
SV - sub-slab vapor

All results are in micrograms per cubic meter air (µg/m^3); a benchmark of 8.8 µg/m3 corresponds to hazard quotient (HQ) of 1.

(1) The original and duplicate samples are considered separate samples when determining the minimum and maximum, but one for frequency of detection

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original and duplicate samples is used for determining the average of all values, average of detected values, and the 95% UCL

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the noncarcinogenic industrial air regional screening level corresponding to HQ = 1 (USEPA, May 2019).

(7) The maximum detected concentration (36 µg/m^3) was detected in a duplicate sample, and the corresponding original sample concentration (0.75 µg/m^3) is considerably less than the maximum concentration. Resampling at the same location found concentrations that were closer to the original sample concentration.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are less than three detections; therefore, a UCL is not presented.

(10) There are no trichloroethene results for the Building B basement.

(11) There are no trichloroethene results for the Building C first floor.

Definitions:

HQ - hazard quotient

J - estimated value

NA - not applicable/not available

UCL - upper confidence limit

USEPA - United States Environmental Protection Agency

All results are in micrograms per cubic meter air (µg/m³); a benchmark of 3.6 µg/m³ corresponds to ILCR of 1×10^{-5}

(1) Original and duplicate samples are considered separately when determining minimum and maximum concentrations, but as one sample for frequency of detection .

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original and duplicate samples is used to determine the averages of all values and detected values, and for the 95% UCL calculation.

(4) One-half the detection limit is used to represent nondetect results when calculating the average of all results.

(5) Value is the carcinogenic industrial air regional screening level corresponding to 1×10^{-5} risk level (USEPA, May 2019).

(6) Duplicate pairs are counted as one sample when determining the number of exceedances, and are considered exceedances if either the original or duplicate exceeds the screening level.

(7) There are less than three detections; therefore, a UCL is not presented.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are no naphthalene results for the Building C first floor.

Definitions:
HQ - hazard quotient
ILCR - incremental lifetime cancer risk
J - estimated value
µg/m³ - micrograms per cubic meter
NA - not applicable (not enough samples to calculate)
UCL - upper confidence limit
USEPA - United States Environmental Protection Agency

Shaded cells indicate a concentration greater than the risk-based screening level.
Bolded cells indicate that the analyte is detected in the sample.
1-This location is in the basement, where the (MDE-approved, in 2017) TCE screening level is 35 $\mu g/m^3$ (not 8.8 $\mu g/m^3$), and is not an exceedance.
Industrial Air Screening Levels from USEPA RSLs for Chemical Contaminants at Superfund Sites, May 2019

Shaded cells indicate a concentration greater than the risk-based screening level.
Bolded cells indicate that the analyte is detected in the sample.

1-This location is in the basement, where the (MDE-approved, in 2017) TCE screening level is 35 $\mu g/m^3$ (not 8.8 $\mu g/m^3$), and is not an exceedance.

Industrial Air Screening Levels from USEPA RSLs for Chemical Contaminants at Superfund Sites, May 2019

ca =carcinogenic screening values based on 1×10^{-5} carcinogenic risk

nc = noncarcinogenic screening values based on noncarcinogenic hazard quotient = 1

-- = not available
A = American Council of Governmental Industrial Hygenists Theshold Limit Value
J = estimated value
MDE = Maryland Department of the Environment

N = National Institute for Occupational Safety and Health Recommended Exposure Limit

OSHA PEL = Occupational Safety and Health Administration Pemissible Exposure Limit

RSLs= Regional Screening Levels
U = not detected
UJ = non-detected value is estimated
USEPA = United States Environmental Protection Agency

Notes: All sample concentrations are in micrograms per cubic meter (µg/m^3)
Shaded cells indicate a concentration greater than risk-based screening level.
Bolded cells indicate that the analyte is detected in the sample.
-- = not available
µg/m^3 = micrograms per cubic meter
J = estimated value
U = nondetect
E = Result exceeded calibration range and was reanalyzed. The result from the reanalysis is displayed.
ca = screening value based on carcinogenic effects
nc = screening value based on noncarcinogenic effects
1 - Screening values derived in accordance with *Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils* (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor of 0.03, and correspond to a target cancer risk level of 1×10-5.

Notes: All sample concentrations are in micrograms per cubic meter ($\mu g/m^3$)
Shaded cells indicate a concentration greater than risk-based screening level.
Bolded cells indicate that the analyte is detected in the sample.

1 - Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor of 0.03, and correspond to a target cancer risk level of 1×10^{-5}.

-- = not available
ca = screening value based on carcinogenic effects
J = estimated value
nc = screening value based on noncarcinogenic effects
U = nondetect

All sample concentrations are in micrograms per cubic meter ($\mu g/m^3$)
Shaded cells indicate concentration greater than risk-based screening level.
Bolded cells indicate that the analyte is detected in the sample.

1-Screening values derived in accordance with *Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils* (November 2002). Screening values are equal to USEPA industrial air screening levels divided by an attenuation factor of 0.3, and correspond to a target cancer risk level of 1×10^{-5}.

-- - not available
ca - screening value based on carcinogenic effects
E - result exceeded instrument calibration and was re-analyzed; reanalysis result is displayed
J - estimated value
nc - screening value based on noncarcinogenic effects
U - nondetect
UJ - non-detected value is estimated
USEPA - United States Environmental Protection Agency

TABLE 3-12
ANALYTE CONCENTRATIONS IN BACKGROUND AIR SAMPLES COMPARED TO INDOOR AIR SAMPES, AUGUST 2020
LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND

Analyte	Maximum background concentration	Maximum indoor air sample concentration[1]	Number of indoor air samples with detects[1]	Number of indoor air detects < background[1][2]	Number of indoor air detects = background[1][2]	Number of indoor air detects > background[1][2]
1,2,4-TRIMETHYLBENZENE	0.53 J	1.9 J	12	3	1	8
1,2-DICHLOROETHANE	0.28 J	0.41 J	2	0	0	2
BENZENE	0.43 J	0.68 J	36	16	2	18
CARBON TETRACHLORIDE	0.45 J	1 J	36	13	1	22
CHLORODIFLUOROMETHANE	1.3 J	65	39	11	1	27
CIS-1,2-DICHLOROETHENE	1.2 J	0.49 J	3	3	0	0
DICHLORODIFLUOROMETHANE	2.1	3	39	20	3	16
METHYLENE CHLORIDE	21	80	12	7	0	5
TOLUENE	1.8 J	200	36	4	0	32
TOTAL XYLENES	1.2 J	17	34	1	1	32

All concentrations are in micrograms per cubic meter air ($\mu g/m^3$).

1 - The original and duplicate are counted as separate samples when determining the minimum and maximum concentration, and when determining the number of samples less than, equal to, or greater than background.
2 - If one sample in a duplicate pair was greater than/equal to background and the other sample was less than background, the maximum detected concentration in the pair was used to represent that sampling location.

Four background samples and 35 indoor air samples (plus 4 duplicates) were analyzed in Round 29.

Notes:

Data presented in this table is from sub-slab vapor samples.

VOC = volatile organic compound
SSDS = sub-slab depressurization system
µg/m³ = micrograms per cubic meter
- = not detected (below reporting limit)
N/A = compound not reported

J = estimated value
J+ = estimated value, may be biased high
K = value is biased high
NS = not sampled
N/A = sampling data for this location not previously included in this table

Notes:
Data presented in this table is from sub-slab vapor samples.
µg/m³ = micrograms per cubic meter
- = not detected (below reporting limit)
DL = diluted analysis
NA = compound not reported
NS = not sampled
NA = compound not reported
K = value is biased high
L = value is biased low
VOC = volatile organic compound
SSDS = sub-slab depressurization system

Notes:
- —point(s) not sampled.
N/A—point may have been sampled but the results were not applicable to the SSD-system
Points with an “SSD” designation were installed and are monitored for the SSD-system
Points without the SSD designation are used for the vapor-intrusion monitoring program.

TABLE 4-4

TRICHLOROETHENE CONCENTRATIONS BEFORE AND DURING SSDS OPERATION, BUILDING A
LOCKHEED MARTIN MIDDLE RIVER COMPLEX, MIDDLE RIVER, MARYLAND

Vapor Monitoring Point	*Before SSD-system operation**		*During SSD-system operation (most recent concentration)*	
	Date	*Sub-Slab Vapor Concentration ($\mu g/m^3$)*	*Date*	*Sub-Slab Vapor Concentration ($\mu g/m^3$)*
015-A	April 2007	326,000	August 2020	28
018-A	August 2010	64,000	February 2014	174

* value reported is for total xylenes

-- - non-detect (below detection limit)
B - compound was found in the blank and sample
D - duplicate
J - estimated value

NA - not applicable/not analyzed
NS - not sampled
SSD - sub-slab depressurization
SV - soil vapor

APPENDIX C—LABORATORY ANALYTICAL REPORTS

ANALYTICAL REPORT

Job Number: 140-20175-1

Job Description: Middle River - MRC

For:
Tetra Tech, Inc.
20251 Century Blvd
Suite 200
Germantown, MD 20874

Attention: Samantha Brenner

Approved for release.
Diana L Lange
Project Management Assistant II
9/10/2020 11:57 AM

Designee for
Jamie A McKinney, Senior Project Manager
5815 Middlebrook Pike, Knoxville, TN, 37921
(865)291-3000
Jamie.McKinney@Eurofinset.com
09/10/2020

cc: Amy Thomson

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Definitions/Glossary

Client: Tetra Tech, Inc. Job ID: 140-20175-1
Project/Site: Middle River - MRC

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
CI	The peak identified by the data system exhibited chromatographic interference that could not be resolved. There is reason to suspect there may be a high bias.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
140-20175-1

Comments
No additional comments.

Receipt
The samples were received on 8/27/2020 10:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice.

Air - GC/MS VOA
Methods 3005A, TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified "zero air" as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of "zero air" by TestAmerica Knoxville.

Methods TO 15 LL, TO-15: Although the BFB is flagged as outside control limits for TO-14 on batch 140-42399, the results are within limits for TO-15, which is required for this project.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42498 recovered above the upper control limit for 1,2,4-Trichlorobenzene, 1,2,4-Trimethylbenzene, Carbon tetrachloride and Naphthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCVIS 140-42498/9).

Method TO 15 LL: The laboratory control sample (LCS) for analytical batch 140-42498 recovered outside control limits for the following analytes: 1,2,4-Trimethylbenzene and Carbon tetrachloride. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-42503 exhibited % difference of > 30% for the following analyte(s) :1,2,3-Trimethylbenzene;however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria and is within marginal exceedance criteria.

Method TO 15 LL: The laboratory control sample (LCS) for analytical batch 140-42503 recovered outside control limits for the following analytes: 1,2,3-Trimethylbenzene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Tetra Tech, Inc.
Project/Site: Middle River - MRC

Job ID: 140-20175-1

Client Sample ID: SV-001-C-29 — Lab Sample ID: 140-20175-1
