Section 1
Introduction

Tetra Tech, Inc. (Tetra Tech) has prepared this report on behalf of Lockheed Martin Corporation (Lockheed Martin) to document the first round of indoor-air-quality (IAQ) and sub-slab-vapor (SV) monitoring for calendar year 2017 at Lockheed Martin's Middle River Complex (MRC) in Middle River, Maryland. This report contains the Round 22 (March 2017) monitoring results for Buildings A, B, and C, and background sampling locations. This report also includes a status update of the two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems originally installed at the Middle River Complex in 2008: one beneath the Building A plating shop, and the other beneath the southern portion of the Building C basement. This monitoring is part of an ongoing investigation to evaluate whether volatile organic compounds (VOCs) in sub-slab vapors (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air at Middle River Complex facilities. The first monitoring round for calendar year 2017 continues investigations previously described in the following reports:

- *Indoor-Air-Quality Investigation of Buildings A, B, C, and the (Vertical-Launch System) VLS (Facility), Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland* (Tetra Tech, 2007)

- *Block I Building A Basement Monitoring Report, Lockheed Martin Middle River Complex, 2323 Eastern Boulevard Middle River, Maryland [Draft]* (Tetra Tech, 2017b)

This report is organized as follows:

Section 2—Round 22 Indoor-Air-Quality and Vapor-Intrusion Investigation: Briefly describes the sampling methodology used for the current investigation round.

Section 3—Round 22 Results: Discusses the Round 22 results, including results exceeding screening levels, relevant data trends, and comparison of sampling results to background concentrations.

Section 4—Sub-Slab-Depressurization-System Data Analysis: Analyzes relevant data and evaluates sub-slab-depressurization-system performance.

Section 5—Conclusions and Recommendations: Presents conclusions based on the Round 22 sampling results and recommendations for future work at the site related to vapor intrusion.

Section 6—References: Lists the references used in this report.

This page intentionally left blank.

Section 2
Round 22 Indoor-Air-Quality and Vapor-Intrusion Investigation

2.1 INVESTIGATION APPROACH AND GUIDANCE

The indoor-air-quality (IAQ) and sub-slab-vapor (SV) investigation described herein is designed to evaluate whether volatile organic compounds (VOCs) associated with soil and groundwater contamination at the site might be moving into indoor air (IA) at Middle River Complex (MRC) facilities. Initial sampling locations for Buildings A, B, and C were chosen during a 2006 site reconnaissance by Tetra Tech, Inc. (Tetra Tech) industrial hygienists. Additional sampling locations have been selected periodically, based on subsequent monitoring results.

Although IA results are predominantly less than risk-based screening levels after the first three rounds of sampling (with one trichloroethene [TCE] exceedance in 109 samples [1]), two sub-slab-depressurization (SSD) vapor-intrusion-mitigation systems (one beneath the Building A plating shop, and the other beneath the southern portion of the Building C basement) were originally installed at the MRC in 2008, based on elevated SV concentrations detected beneath the buildings. The Building A SSD system (SSDS) was expanded in 2010, and again in 2016, after additional locations of elevated SV were detected. The Building C SSDS was expanded in 2012

[1] One TCE concentration (36 µg/m^3) out of 109 total samples (including duplicates) exceeded the screening level at the time of sampling (18 µg/m^3). The exceedance was observed in the duplicate sample of a field-duplicate pair; TCE was not detected in the corresponding original sample. Since then, the screening level has been reduced to 8.8 µg/m^3; even so, that result would still have been the only exceedance.

A site-specific TCE screening level of 35 µg/m3 for indoor air has been derived for the Building A basement based on limited exposure potential in the basement. The screening level has received approval from the Maryland Department of the Environment (MDE). However, the site-specific screening level for the basement does not represent a final risk-based indoor air cleanup criterion.

and 2013. Subsequent rounds of IA sampling supported that contaminant concentrations in IA on the main floors resulting from vapor intrusion (VI) were controlled by the SSDSs.

However, recent investigations in Building A and the Building A basement have identified elevated TCE concentrations in sub-slab air, water, and, on occasion, in basement IA. Subsequent VI investigations in Building A and the Building A basement from 2014 to 2017 include: (a) portable gas-chromatograph/mass-spectrometer (GC/MS) surveys; (b) installation of additional Vapor Pin™ vapor-monitoring points (VMPs), including seven in the eastern wall of Building A basement, two in the Building A basement floor, and one beneath the main floor of Building A; (c) the collection of air and water samples from select floor features (i.e., sumps, drains) in Building A basement; and (d) a continuous air-monitoring survey of sub-slab and breathing-zone locations in the Building A basement over two months (February 24 to April 21, 2017). Elevated TCE concentrations detected in the Building A basement led to the installation, as an interim measure, of three additional air-purifying filters in the basement in May 2017 to target the floor features that have shown elevated TCE concentrations.

The sampling plan for Round 22 is based on historical detections and information obtained during site reconnaissance and review of historical information and reports. IA and SV samples were collected from Buildings A, B, and C during Round 22 sampling. Relevant guidance from the United States Environmental Protection Agency [USEPA] (USEPA, 1996, 2004, 2012, and 2015) and the Maryland Department of the Environment [MDE] (MDE, 2006) was used to develop the investigation methodology.

2.2 INVESTIGATION PROCEDURES

IAQ and SV sampling within Buildings A, B, and C was done in accordance with the work plan (Tetra Tech, 2015d). Background outdoor air samples were collected from the same sampling locations as had been used for Round 21 (Figure 2-1). Not all existing monitoring points inside the subject buildings were sampled during Round 22. As in previous rounds, samples were collected selectively, in or adjacent to areas where contaminants had been detected previously, or in areas where contaminants are currently suspected of being present.

TCE has been targeted as a primary chemical of concern (COC); it has a history of use at the site, has been detected in groundwater and soil gas, and can be toxic and mobile in the environment.

Historical sampling locations and the sub-slab VMPs sampled in Buildings A, B, and C during this round are shown in Figures 2-2, 2-3, and 2-4, respectively. IAQ sampling locations were co-located with most monitored SV sampling locations to evaluate IA and possible relationships between SV and IAQ.

Round 22 sampling was performed on February 28 and March 1, 3, and 8, 2017. Most samples were collected on February 28 and March 1; only two resamples and nine samples from recently added locations (described below) were collected, on March 3 and/or 8. Seventy-nine eight-hour samples (and seven duplicates) were collected using Summa® canisters and chemically analyzed:

- four background ambient air samples were collected at the same locations used in the previous round
- 41 IAQ samples (and four duplicates) from Buildings A, B, and C:
  - 16 IAQ samples (and two duplicates) from Building A
  - three IAQ samples from Building B
  - 22 IAQ samples (and two duplicates) from Building C
- 38 SV samples (and three duplicates) from Buildings A, B, and C:
  - 22 SV samples (and one duplicate) from Building A
  - two SV samples from Building B
  - 14 SV samples (and two duplicates) from Building C
- The "-A", "-B", and "-C" suffixes in the sampling location designations correspond with Buildings A, B, and C, respectively.

In addition to the samples listed above, one SV sample (SV-DUP04-A-22, a duplicate sample from 136-A) was collected but was not analyzed, due to a faulty regulator and insufficient volume in the canister for analysis. Five IAQ samples from Building C (144-C through 146-C, 150-C, and 152-C) were collected in the machine shop in the Lockheed Martin Rotary and Mission Systems (RMS) (formerly the Lockheed Martin Mission Systems & Training [MST] mechanical prototype laboratory [MPL]). Monitoring continues in this area, because TCE was detected in IA at a concentration greater than its screening level during Round 15 (August 2013). The five sampling locations that provide data for possible worker-exposure areas within the MPL are:

- 144-C: machine shop area
- 145-C: cubicle area
- 146-C: kitchen area
- 150-C: kitchen area
- 152-C: machine shop area

Ten additional Vapor Pin™ VMPs were installed in March and April 2016, including seven in the eastern wall of the Building A basement (169-A, 170-A, 171-A, 172-A, 173-A, 176-A, and 177-A), two in the Building A basement floor (174-A and 175-A), and one beneath the main floor of Building A (168-A). These VMPs were strategically located near possible TCE sources, including a former underground storage tank and vapor degreasers associated with former plating shop operations. In Round 22, one IAQ sample (from location 168-A) and 10 SV samples were collected from these locations.

The SSDSs in the Building C basement area and the Building A plating shop were shut down approximately 24 hours before sampling began. The SSDSs were restarted within one hour after sampling had been completed in Buildings A and C; this is consistent with previous monitoring episodes. The following observations were recorded during the February/March 2017 sampling:

- Mean outdoor ambient temperature during the sampling period was 57 degrees Fahrenheit (°F) on February 28 and March 1, 2017. Barometric pressure decreased during the sampling period, from 30.26 inches of mercury (in. Hg) to 29.76 in. Hg. Wind direction on February 28 was from the south–southeast, and average wind speed ranged from three to 12 miles per hour (mph). Wind direction on March 1 was from the south, with wind speeds averaging 7 mph, with gusts up to 33 mph. Skies were mostly cloudy and overcast on February 28 and March 1.

- Approximately 0.06 inches of precipitation (rain) was recorded on February 28, and no precipitation was recorded on March 1.

- Water was in the flush-mounted vault at sampling location SV-018A, so a sample could not be collected. An alternate sample was collected at nearby location SV-116A.

- SV sampling location 095-A could not be found due to recent construction. An alternate IA and SV sample was collected from 168-A in place of 095-A. A vapor degreaser was once located near sampling location 168-A, which has historically exhibited elevated TCE concentrations.

- IA and SV samples from 118-A and 139-A were collected in the bond layup room, where a positive-pressure air-conditioning system was operating.

- Sampling location 015-A is in the former plating shop area. Subsequent to the sampling round in August 2015, this area has undergone construction and redevelopment. A new

floor has been installed in this area, and the area is now an extension of the bond layup room. IA and SV samples from 015-A were collected in this newly expanded bond layup room (former plating shop), where a positive-pressure air-conditioning system was operating.

- Sampling location IA-130-C/SV-130-C in the museum storage area was covered by a large airplane engine, and therefore could not be sampled; an alternate sample was collected at nearby location IA-131-C/SV-131-C, approximately 40 feet farther south within the museum's caged area.

- IA and SV samples at 001-C and 004-C were collected approximately 70 feet from a bay door to the outside that was opened intermittently.

- IA-005-C was collected approximately 80 feet from a bay door to the outside that opened intermittently.

- Samples IA-144-C through IA-146-C, and IA-150-C and IA-152-C were collected in a positive-pressure, air-conditioned room (RMS MPL machine shop).

- Sampling location 076-A (for both IA and SV) was approximately 20 feet away from a flammable materials storage cabinet and hazardous waste drum (containing rags).

- Additional SV sampling locations were added to the sampling program during Round 22, due to the ongoing TCE VI investigation in the Building A basement. Samples were collected at nine additional locations in the Building A basement, primarily in the eastern wall (169-A through 173-A, 176-A and 177-A), and in the floor (174-A and 175-A).

- The air-purifying units in the Building A basement were operating when IA/SV-093-A and IA/SV-138-A were sampled.

- An insufficient sample volume was collected in the Summa® canister for sample SV-093-A, due to a faulty regulator, and could not be analyzed by the laboratory; however, another sample was collected on March 8 for laboratory analysis.

- An insufficient sample volume was collected in the Summa® canister for sample SV-001-C, due to a faulty regulator, and could not be analyzed by the laboratory; however, another sample was collected on March 3 for laboratory analysis.

- Building A is a one-story building, except for a basement corridor under an open-air loading dock on its western side. Roof vents approximately 50 feet above the work floor were open in Building A during Round 22 sampling. The large doors at the loading docks on the western side of the building were also open to allow carts, forklifts, personnel, and equipment to pass. Increased ventilation associated with open doors and roof vents might affect sample concentrations on the first floor of Building A. No personnel or other activities were observed in the Building A basement.

- The bay doors across the southern end of Building B were closed during sampling. The automatic bay door at the southeastern corner of Building B was opened and closed quickly to allow carts and equipment to pass. The opening of the bay door might affect the concentrations collected from the southernmost sampling locations (IA-100-B and IA-101-B). Open roof vents were also observed in Building B during sampling.

- The Building C basement is generally accessed via two doors on the eastern side and one on the southern side. These are automatic rolling doors that open and close quickly to allow carts and forklifts to pass. The automatic rolling door approximately 40 feet east of sampling location 141-C was opened and closed intermittently during the day. The bay doors at the southern and southeastern sides of the Building C basement were open during the sampling period. This might have influenced IA concentrations in the samples collected from locations 001-C, 004-C, and 005-C.

- The highest number of personnel and greatest activity observed at the MRC was in Building B, in locations from the thrust-reverser assembly area in the southern portion of the building to the machining area in the central portion. Less activity was observed in Building A, where activity was generally focused in the expanded bond-layup room (former plating shop area) and autoclave areas, and in the parts and assembly areas. No activity was observed in the southern portion of Building C. Light activity (three people) was observed in the machine shop area in Building C basement.

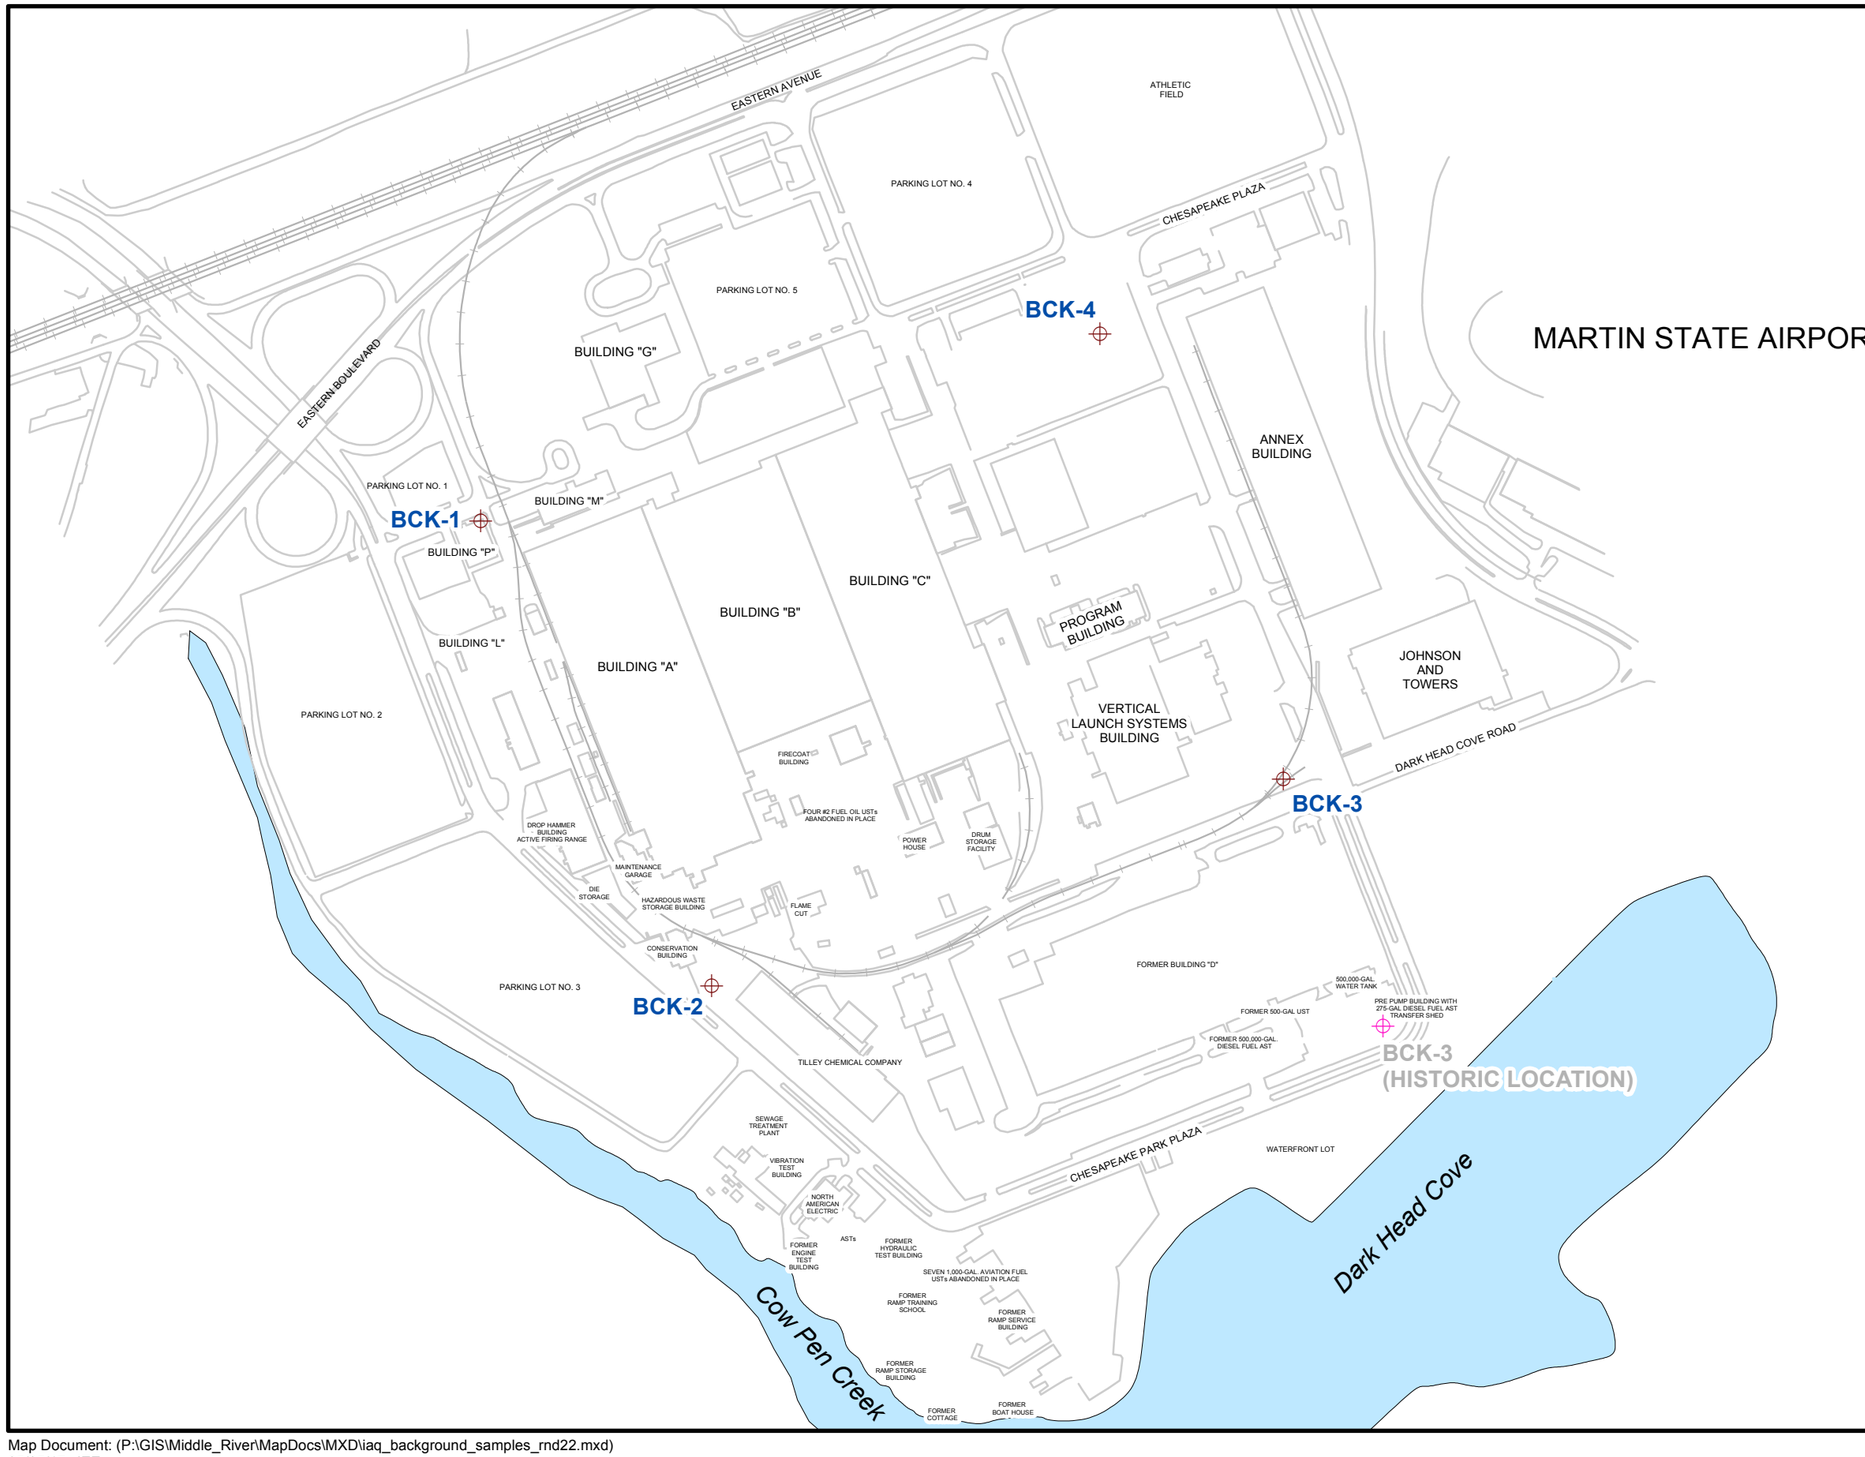
- The southern end of the Building C basement is now vacant and has been cleared of stored materials, workstations, and equipment by MRA Systems, Inc. (MRAS).

- The pressure gauges on most Summa® canisters responded instantaneously upon opening the valve by dropping to between ~28 and ~30 in. Hg. The pressure gauge for sample IA-131-C initially dropped to -22 in. Hg, however, sufficient volume was collected for analysis. Of the remaining Summa® canisters, all but three pressure gauges had a remaining pressure of between zero and ~5 in. Hg: sample SV-001-C had a remaining pressure of ~7 in. Hg; sample IA-004-C had a remaining pressure of -6 in. Hg; and sample IA-153-C had a remaining pressure of -10 in. Hg. These three canisters, despite the elevated remaining pressure, did have adequate sample volumes, and were analyzed by the laboratory. Pressure readings for the Summa® canisters are recorded on the chain of custody forms (Appendix A).

Samples were analyzed for the current target-compound list, last amended on February 12, 2012:

- benzene
- carbon tetrachloride
- chlorodifluoromethane (Freon 22)
- chloroform
- dichlorodifluoromethane
- 1,1-dichloroethane (1,1-DCA)
- 1,2-dichloroethane (1,2-DCA)
- naphthalene
- tetrachloroethene (PCE)
- toluene
- 1,2,4-trichlorobenzene
- 1,1,1-trichloroethane (1,1,1-TCA)
- 1,2,3-trimethylbenzene (1,2,3-TMB)
- 1,2,4-trimethylbenzene (1,2,4-TMB)

- 1,1-dichloroethene (1,1-DCE)
- *cis*-1,2-dichloroethene (*cis*-1,2-DCE)
- *trans*-1,2-dichloroethene (*trans*-1,2-DCE)
- ethylbenzene
- methyl-tertiary-butyl ether
- methylene chloride
- 1,3,5-trimethylbenzene (1,3,5-TMB)
- trichloroethene (TCE)
- 1,1,2-trichloroethane (1,1,2-TCA)
- vinyl chloride (VC)
- xylenes (total)



All samples collected during Round 22 were submitted to TestAmerica in Knoxville, Tennessee for analysis via GC/MS using cryogenic concentration (as described in Sections 9 and 10 of USEPA Method [Toxic Organic-15] TO-15 [USEPA, 1999]). This method was used because of its low detection limit (in the parts-per-billion by volume range), and because it can quantify all VOCs of concern. TestAmerica is certified in USEPA Method TO-15 analysis and meets all quality assurance/quality control requirements specified in the TO-15 methodology.

All samples were stored at ambient temperatures and shipped to the laboratory via overnight carrier. All samples were submitted and analyzed within the method's specified 30-day holding time. All appropriate chain of custody documentation was completed for each sample (see Appendix A). A table listing TestAmerica's method detection-limits is in Appendix B; Appendix C contains the laboratory analytical reports. Data-validation reports and supporting documentation are in Appendix D.

Analytical data were qualified in accordance with USEPA *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA, 2017). Attaching data qualifiers to analytical results signifies a quality-control noncompliance. During Round 22, the following data qualifiers were applied to nonconforming data (i.e., data affected by technical limitations during laboratory analysis) after validation:

- *J*—indicates an estimated result below the reporting limit or an estimated result greater than the reporting limit with a quality control nonconformance.
- *U*—indicates the chemical was not detected at the numerical detection limit (i.e., the sample-specific quantitation limit).
- UJ—indicates the chemical was not detected at the (estimated) numerical detection limit (i.e., the sample-specific quantitation limit).

No results were rejected during data validation.

Section 3
Round 22 Results

All analytical results for indoor-air-quality (IAQ) and background (ambient air) samples were compared to screening levels for industrial air; these levels are based on United States Environmental Protection Agency (USEPA) *Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites* (USEPA, 2016). Screening the chemicals of concern (COC) uses the lower of the carcinogenic (*ca*) or noncarcinogenic (*nc*) values. Carcinogenic values are based on a 1×10^{-5} (i.e., a one-in-100,000 probability) excess cancer-risk, whereas the noncarcinogenic values are based on a hazard quotient of 1 (i.e., the "no adverse effect" level).

These risk benchmarks were selected in accordance with Maryland Department of the Environment (MDE) requirements. The screening level for 1,2,3-trimethylbenzene was used as a surrogate for 1,3,5-trimethylbenzene, because USEPA has not published an industrial-air RSL for this chemical. Analytical results were also compared to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits.

Sub-slab-vapor (SV) sampling results were compared to SV screening values derived in accordance with the methods discussed in Appendix D of USEPA guidance for evaluating vapor intrusion (USEPA, 2002), and were calculated by dividing indoor-air (IA) screening levels by a conservative attenuation factor (AF) of 0.03. The attenuation factor represents the adjustment applied to IA screening levels to account for concentration reductions due to diffusive, advective, and/or other attenuating mechanisms as vapor migrates from the sub-slab to IA. Simply stated, SV is expected to dilute upon movement into IA; the AF is the ratio of the IA concentration to its SV concentration, under a conservative vapor-intrusion (VI) scenario. The most recent USEPA guidance (USEPA, 2015) confirms that an AF of 0.03 is appropriate; this value results in higher SV screening values, as compared to those used for sampling rounds before August 2012, when

an earlier USEPA AF of 0.1 was used. USEPA further acknowledges that applying the AF of 0.03 to industrial buildings is conservative, since the value was developed based on residential VI studies, and does not account for industrial buildings that generally have thicker building slabs and stronger heating/ventilation/air-conditioning (HVAC) systems than residential homes.

3.1 ROUND 22 DATA ANALYSIS

The sampling-round designation (R22) is not included when identifying samples or sampling locations in the following text or tables, because all data discussed in this section are from Round 22. For example, an IA sample collected from vapor monitoring point (VMP) 076 (e.g., sample IA-076-A-R22) is referred to as "076-A." If comparisons are made to specific samples from previous sampling rounds, they will be identified as such in the text or by using the round-designation suffix (e.g., R06 for Round 6).

Descriptive statistics for Round 22 IAQ and SV samples are shown in Tables 3-1 and 3-2, respectively. Summary statistics for trichloroethene (TCE) and naphthalene in IA over time are shown in Tables 3-3 and 3-4, respectively. Figures 3-1, 3-2, and 3-3 show Round 22 exceedances in Buildings A, B, and C, respectively. The following chemicals were detected in Round 22 IAQ and/or SV samples at concentrations exceeding their respective MDE industrial risk-management benchmarks:

- ***IA—***TCE
- ***SV—***1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), naphthalene, TCE, and vinyl chloride (VC)

Building A—Tables 3-5 and 3-6 present Building A IAQ and SV results, respectively. Locations with exceedances are shown in Figure 3-1. TCE in IA exceeded its screening level (8.8 micrograms per cubic meter [µg/m^3]) at location 138-A (in the basement) with a concentration of 11 µg/m^3. No other IA concentrations exceeded screening levels during Round 22.

Normally, this exceedance would have triggered resampling at this location. However, at the time of the sampling, Lockheed Martin Corporation (Lockheed Martin) was continuously monitoring IA in the Building A basement. The continuous air sampling began on February 21, 2017, and the data indicate that air concentrations in the basement fluctuate during any 24-hour period, as well as weekly. Sampling location 138-A is between two continuous-sampling breathing-zone locations

(BZD-24 and BZD-26) currently being monitored. Both breathing-zone locations are near sumps and/or drains that might act as preferential pathways for contaminant transport from contaminated groundwater.

As stated earlier, an exceedance (11 µg/m^3) was detected in the Summa® canister sample at 138-A; this sample was collected on March 1, 2017 between approximately 7:45 a.m. to 4:15 p.m. This result correlates well with the average breathing zone concentrations of 11.2 µg/m^3 (BZD-24) and 12.4 µg/m^3 (BZD-26) that were recorded by continuous air sampling during this eight-hour period. Given the high correlation between the Summa®-canister-sample data and the continuous air-monitoring data, and the overlapping periods of the semiannual sampling and the continuous monitoring, Lockheed Martin and MDE agreed that resampling of 138-A was unnecessary.

TCE has periodically been detected in IA in the Building A basement, beginning with Round 15, at concentrations greater than its IA screening level (8.8 µg/m^3). In addition to the IA sample from location 138-A, TCE was also detected at two other Round 22 Building A basement sampling locations (018-A and 093-A), but at concentrations less than its screening level (8 µg/m^3 and 1.8 µg/m^3, respectively). In Round 22, first-floor Building A IA concentrations did not exceed screening levels. Note, however, that TCE was detected in IA in a duplicate sample collected from 015-A at a concentration of 8.7*J* µg/m^3, a concentration slightly lower than its screening level (8.8 µg/m^3). Some uncertainty is associated with the TCE detection at location 015-A, because it was not detected in the corresponding original sample from this location. However, location 015-A will continue to be monitored during the next sampling round.

SV TCE exceeded its screening level (293 µg/m^3) at eight locations (118-A, 136-A, 168-A, 170-A, 171-A, 173-A, 174-A, and 175-A) in the central portion of Building A. TCE SV exceedances were also observed at two of the same locations (118-A and 136-A) during several recent sampling rounds (e.g., Rounds 18 through 21). Round 22 SV concentrations at locations 118-A and 136-A are within an order of magnitude (i.e., a power of 10) of SV concentrations detected at these locations during Round 21. The TCE concentrations (850 µg/m^3 and 300 µg/m^3, respectively) at SV 136-A in Rounds 21 and 22 have decreased by a factor of approximately 100 since the SSDS was expanded to this location in 2016 after a reported TCE-vapor concentration of 35,000 µg/m^3 during Round 20. Sampling locations 168-A, 170-A, 171-A, 173-A, 174-A, and 175-A are newly

added for Round 22; all of them are in the Building A basement, except for 168-A, which is beneath the main floor.

One detection of 1,1-DCE in SV at location 175-A (48,000 µg/m^3) also exceeded its screening level (29,333 µg/m^3) during Round 22. Other SV detections of 1,1-DCE in Building A are at least approximately 10 times less than the concentration detected at 175-A. SV concentrations of 1,1-DCE did not exceed its screening level during Round 21.

Building B—Tables 3-7 and 3-8 present Building B IAQ and SV results, respectively. No IA or SV exceedances were noted in Building B during Round 22.

Building C—Tables 3-9 and 3-10 present Building C IAQ and SV results, respectively. No IA exceedances were detected in Round 22 samples. TCE exceedances in SV were noted for three locations: 102-C (1,000 µg/m^3), 126-C (310 µg/m^3), and 152-C (1,300 µg/m^3). The SV TCE concentration at 126-C also exceeded its screening level during Round 21. SV TCE exceedances were detected at locations 001-C and 113-C during Round 21, but not during Round 22. A VC exceedance (2,600*J* µg/m^3) of its screening level (933 µg/m^3) also occurred at 126-C. VC exceedances were also noted in SV at location 126-C during Round 18 (1,310 µg/m^3), Round 19 (16,000 µg/m^3), Round 20 (3,100 µg/m^3), and Round 21 (5,000 µg/m^3). The locations of TCE SV exceedances in Building C during Round 22 are sporadic, and do not follow an observable spatial pattern. However, VC exceedances in SV have consistently been observed at location 126-C during recent sampling rounds (i.e., in Rounds 12–22).

In addition to the screening level exceedances discussed above, SV exceedances of 1,1-DCA (3,900 µg/m^3) and naphthalene (310 µg/m^3) were also detected at 102-C during Round 22 (screening levels are 2,567 and 120 µg/m^3, respectively). SV concentrations of 1,1-DCA and naphthalene at 102-C did not exceed their screening levels during Round 21; however, Round 20 SV concentrations of 1,1-DCA (4,800 µg/m^3) and naphthalene (150 µg/m^3) did at the same location (i.e., 102-C).

3.2 BACKGROUND AMBIENT-AIR SAMPLES

Outdoor-air-quality (i.e., background) samples provide baseline concentrations for COC that can be compared to interior concentrations. Comparison to background indicates whether chemicals detected in IA are more likely associated with an exterior (i.e., background) or interior source

(e.g., chemicals used in the workplace, past spills of chemicals absorbed to above-slab building materials, or sub-slab sources). Analytical results for Round 22 ambient (background) air samples are shown in Table 3-11. Figure 2-1 shows the background sampling locations used for Round 22; these locations are sufficiently far from site operations to avoid any possible site influence.

Table 3-12 lists chemicals detected in background samples and compares IA concentrations to the maximum detected background concentration. All chemicals detected in background samples were also detected in IA samples. All background concentrations were below their respective screening criteria. Table 3-12 evaluates whether or not chemical concentrations detected in IA are possibly due to interior sources, or if they simply reflect background conditions, using the following logic:

- When IA concentrations are equal to or less than background concentrations, IA concentrations likely reflect background conditions.
- When IA concentrations are greater than background concentrations and/or sub-slab concentrations, other interior sources are possibly contributing to IA concentrations.
- The presence of chlorinated degradation-products in IA samples (at concentrations less than those detected in SV samples), but not in background samples, suggests that sub-slab sources might contribute to these IA concentrations.

In Round 22, only one IA concentration of TCE (at location 138-A) exceeds the MDE risk-management benchmark. TCE was not detected in background samples, and several of its SV concentrations in Building A and C samples are greater than the VI screening level. Round 22 IA concentrations of other COC exceeding their respective screening levels in SV samples (i.e., 1,1-DCA, 1,1-DCE, naphthalene, and VC) were either nondetected, or were less than their screening levels. 1,1-DCA, 1,1-DCE, naphthalene, TCE, and VC were not detected in background samples, indicating that any concentrations of these chemicals detected in IA are not likely attributable to background.

TCE in IA might be due to VI or IA sources. The IA concentrations for all remaining SV contaminants are less than screening levels; their IA concentrations span a range above and below background concentrations. As presented in Table 3-12, chemicals with the most detections below background (benzene, dichlorodifluoromethane, methylene chloride, and tetrachloroethene [PCE]) are likely influenced by ambient background sources. The remaining IA contaminants might be due to IA sources, and/or ambient background conditions; in any case, all remaining IA contaminants are below screening levels in Round 22.

A shaded maximum background value indicates that the maximum detected value from the site data exceeds the maximum background value.
A bolded chemical name indicates that the chemical exceeds background and the industrial air RSL based on an HQ of 0.1 or an ILCR of 1×10^{-6}.
A bolded/shaded chemical name indicates the chemical exceeds background and the industrial air RSL based on an HQ of 1 or an ILCR of 1×10^{-5}

Footnotes:

1 - Sample and duplicate are considered two separate samples when determining the minimum and maximum concentrations but are considered one sample when determining frequency of detection, average, standard deviation, and the number of samples exceeding screening criteria.
2 - Values presented are sample-specific quantitation limits.
3 - One-half the detection limit was used to represent non-detected results in calculating the average of all results and the standard deviation.
4 - Exceedance counts are based on detected results only.
5 - USEPA Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, May 2016. RSLs for carcinogens were adjusted to be based on a lifetime cancer risk of 1E-05. RSLs for noncarcinogens were not adjusted and represent a hazard quotient (HQ) of 1.
6 - Occupational Safety and Health Administration (OSHA) Permissible Exposure Limit (PEL).

Definitions:

ca = screening value based on 1×10^{-5} carcinogenic risk
HQ - hazard quotient
ILCR - incremental lifetime cancer risk
J - estimated value
µg/m^3 - micrograms per cubic meter
N = National Institute for Occupational Safety and Health Recommended Exposure Limit
NA - not applicable/not available
nc = noncarcinogenic screening values based on noncarcinogenic hazard quotient = 1
ND - not detected
OSHA - Occupational Safety and Health Administration
PEL - permissable exposure limit
RSL - regional screening level
USEPA - United States Environmental Protection Agency

	March 2017	-	-	0.38	0.38	-	-	0/4	0	NA[8]

All results are in µg/m^3.

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the non-carcinogenic industrial air regional screening level corresponding to HQ = 1 (USEPA, May 2016).

(6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.

(7) The maximum detected concentration of 36 µg/m^3 was detected in a duplicate sample, and the corresponding original sample concentration of 0.75 µg/m^3 is considerably less than the maximum concentration. Resampling at the same location found concentrations that were closer to the original sample concentration.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are less than three detections; therefore, a UCL is not presented.

(10) There are no trichloroethene results for the Building C first floor from the March 2017 sampling event.

Definitions:

HQ - hazard quotient

ILCR - incremental lifetime cancer risk

J - estimated value

µg/m^3 - micrograms per cubic meter

NA - not applicable/not available

UCL - upper confidence limit

USEPA - United States Environmental Protection Agency

A benchmark of 8.8 µg/m^3 corresponds to HQ = 1.

	March 2017	-	-	1	1	-	-	0/4	0	NA[8]

All results are in µg/m^3.

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration and as one sample when determining the frequency of detection.

(2) Values presented are sample-specific quantitation limits.

(3) The average of the original sample and duplicate is used for determining the average of all values, average of detected values, and 95% UCL.

(4) One-half the detection limit was used to represent non-detected results in calculating the average of all results.

(5) Value is the carcinogenic industrial air regional screening level corresponding to 1×10^{-5} risk level (USEPA, May 2016).

(6) Field duplicate pair samples are counted as one sample in determining the number of samples exceeding the screening level. The field duplicate pair is considered to exceed the screening level if either the original or duplicate sample is greater than the screening level.

(7) There are less than three detections; therefore, a UCL is not presented.

(8) There are less than five samples; therefore, a UCL is not presented.

(9) There are no naphthalene results for the Building C first floor from historical or March 2017 sampling events.

Definitions:

HQ - hazard quotient

ILCR - incremental lifetime cancer risk

J - estimated value

µg/m^3 - micrograms per cubic meter

UCL - upper confidence limit

USEPA - United States Environmental Protection Agency

A benchmark of 3.6 µg/m^3 corresponds to ILCR = 1×10^{-5}.

Notes: All sample concentrations are in micrograms per cubic meter ($\mu g/m^3$)
Shaded cells indicate a concentration greater than risk-based screening level
$\mu g/m^3$ = micrograms per cubic meter
-- = not available
J = estimated value
U = nondetect
UJ = non-detected value is estimated
ca = screening value based on carcinogenic effects
nc = screening value based on noncarcinogenic effects
(1) Screening values derived in accordance with Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (November 2002). Screening values are equal to United States Environmental Protection Agency (USEPA) Industrial Air Screening Values divided by an attenuation factor of 0.03, and correspond to a target cancer risk level of 1×10^{-5}.
(2) Value is for 1,2,3-trimethylbenzene.

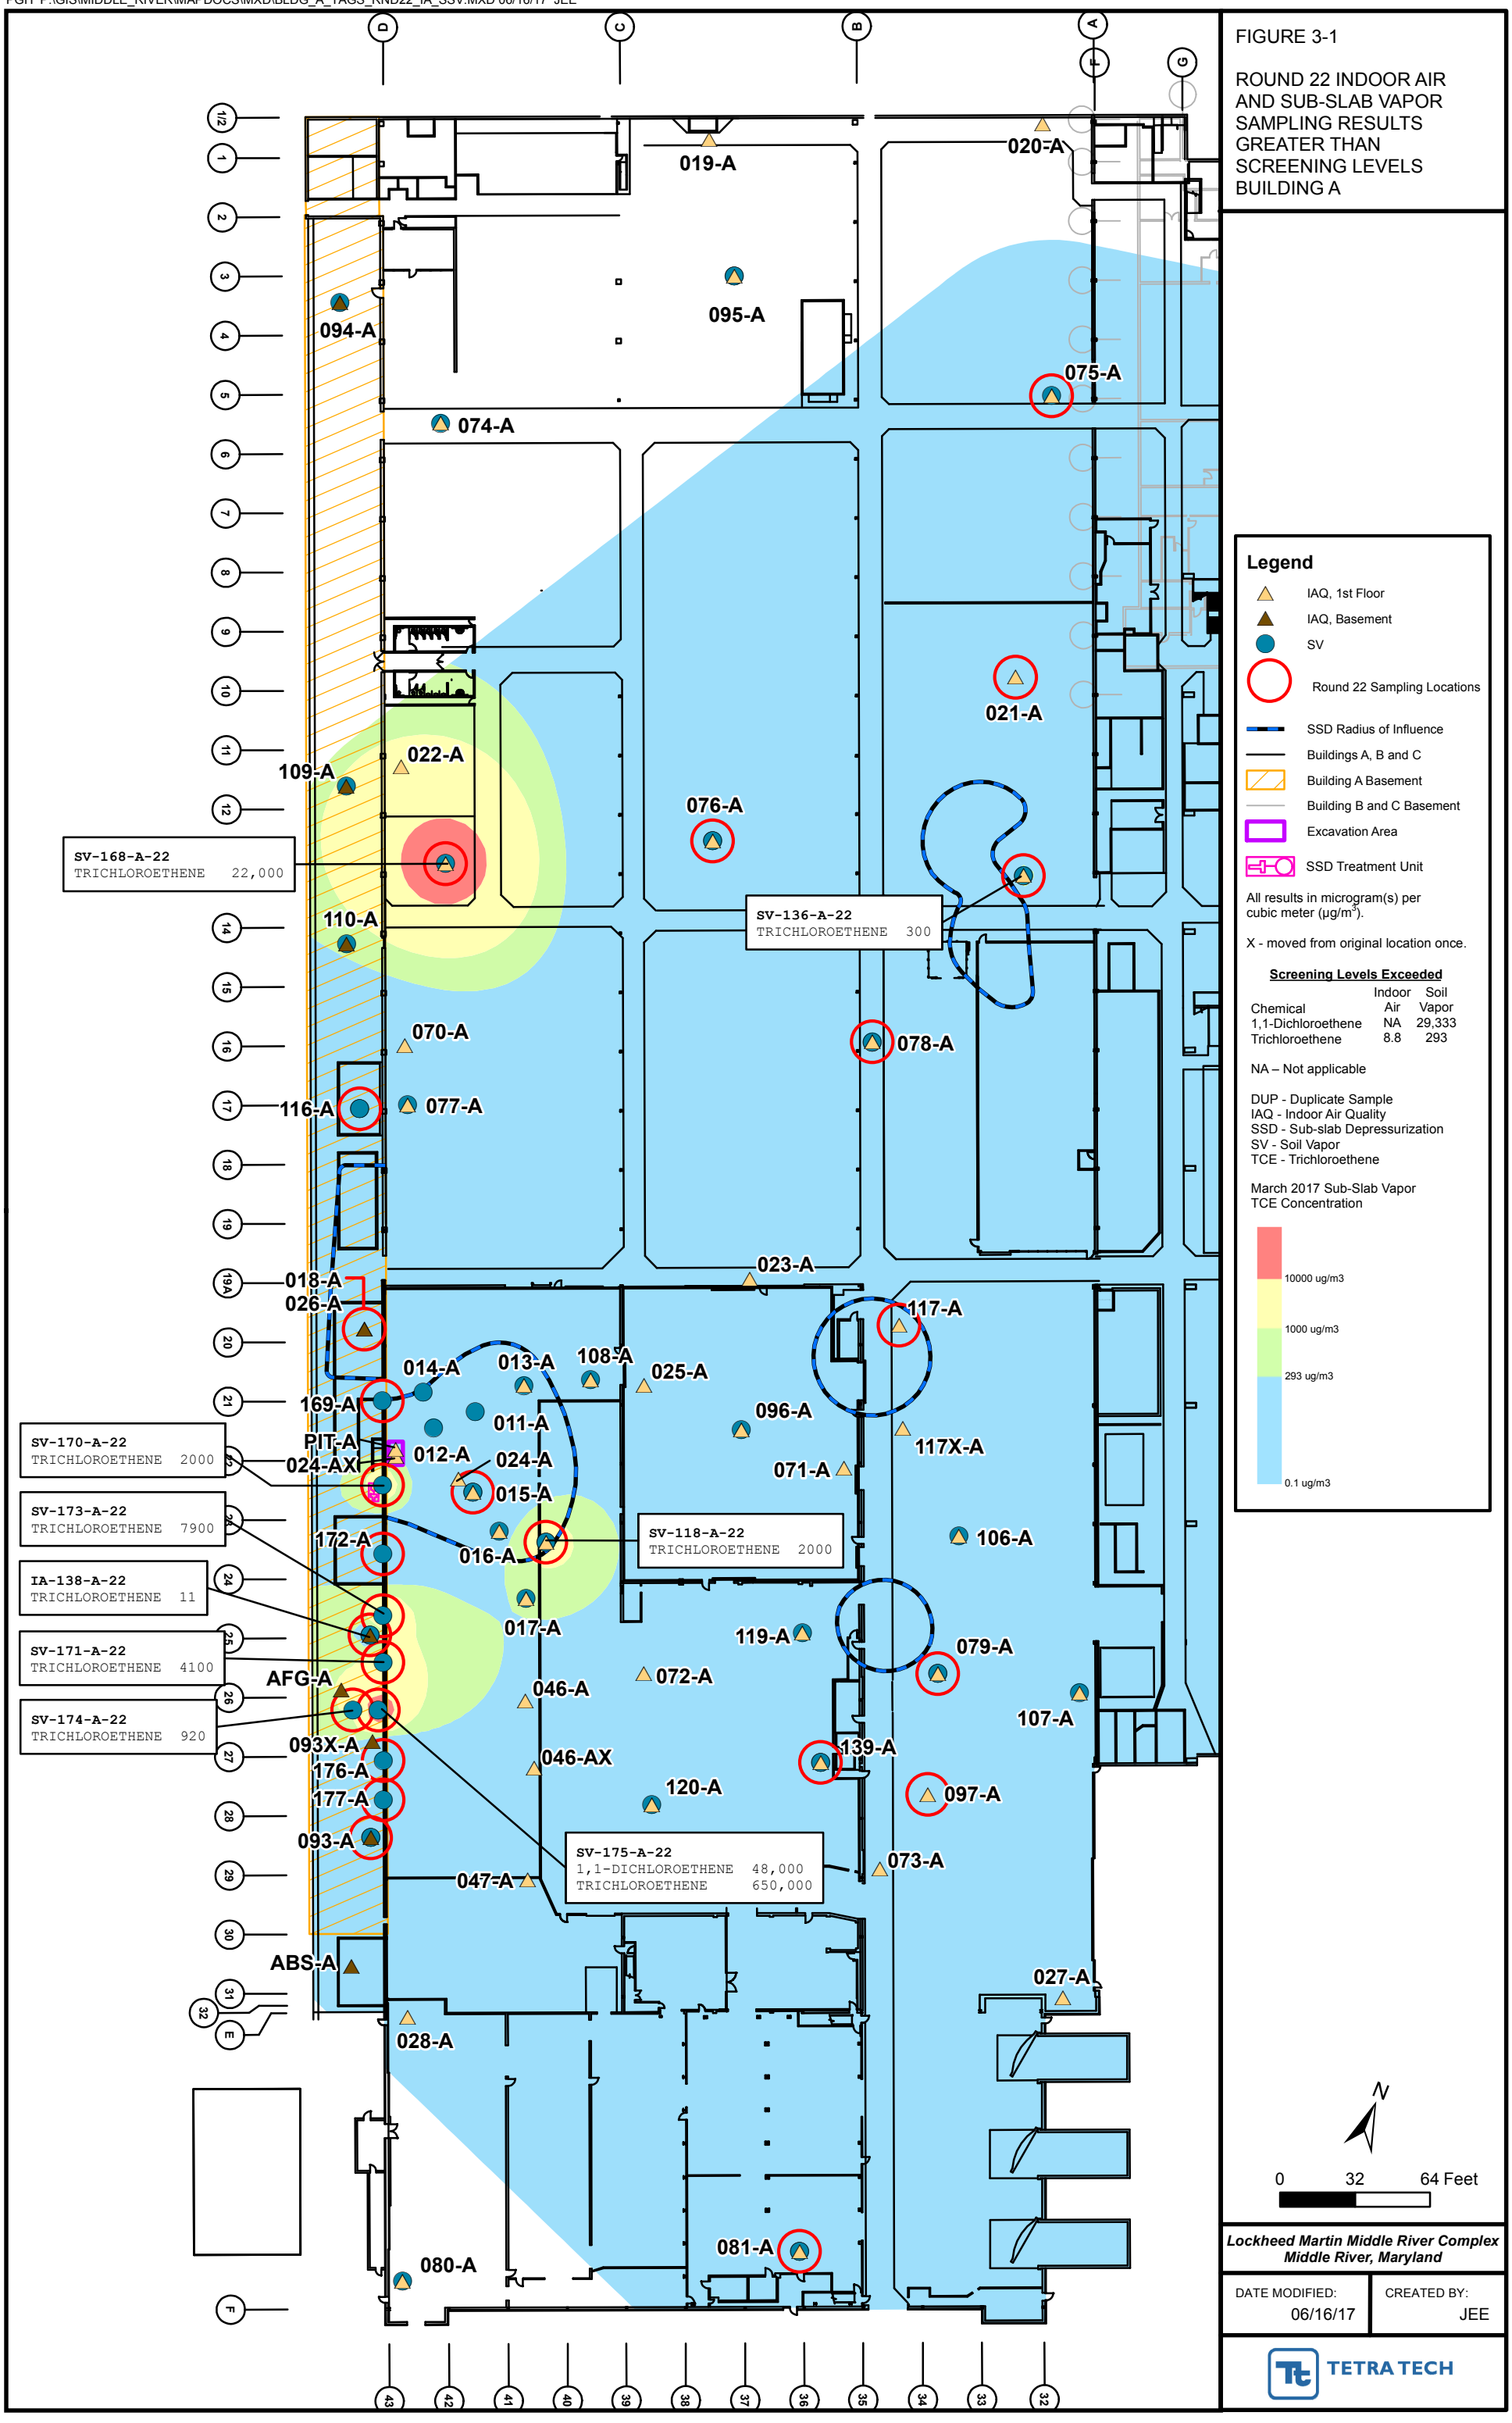
TETRACHLOROETHENE	3.4	36	9	7	0	2
TOLUENE	3.9	2000	39	10	0	29
1,1,1-TRICHLOROETHANE	0.33	0.41	2	0	0	2
TOTAL XYLENES	2.1	28	35	8	0	27

(1) The original sample and duplicate are considered as two separate samples when determining the minimum and maximum concentration, but are considered one sample when determining the number of samples with detects and the number of samples less than, equal to, or greater than background.



(2) If one sample in a duplicate pair was greater/equal to background and the other sample in the duplicate pair was less than background, the maximum detected concentration in the field duplicate pair was used to represent the field duplicate pair.

There are a total of four background samples and 41 indoor air samples for Round 22.

Section 4
Sub-Slab-Depressurization-System Data Analysis

This section summarizes the operation and monitoring of the sub-slab-depressurization systems (SSDSs) in Buildings A and C for the reporting period from October 1, 2016 to March 31, 2017. A detailed account of these activities is in the May 5, 2017 remedial action progress report (Appendix E). The location and layout of the SSDSs and associated sub-slab-vapor (SV) extraction points and vapor monitoring points (VMPs) are shown in Figures 1, 2, and 4 of Appendix E. This section discusses SV sampling results, extraction points, system influent, vacuum influence, and performance of the SSDS.

4.1 SUB-SLAB-VAPOR MONITORING POINTS

Tables 4-1 and 4-2 summarize the concentrations of target volatile organic compounds (VOCs) detected at SV monitoring points to date in the Building A lay-up room (the former plating shop on the main floor), basement, and eastern area (on the main floor), and in the Building C basement, respectively.

4.1.1 Building A

SV samples collected to date near the Building A SSDS are listed in Table 4-3. SV VMP 015-A (on the main floor of Building A) and 018-A (in the basement) have been scoped to be sampled regularly as part of the facility-wide semiannual sub-slab and indoor-air monitoring program (see Figure 2 in Appendix E); however, VMP 018-A has not been sampled since February 2014 because water collects in its flush-mounted vault. Both 015-A and 018-A are within the measured SSDS radius of influence.

The highest trichloroethene (TCE) concentrations detected at SV VMPs 015-A, 018-A, 079-A, and 136-A before and after the SSDSs began operation are shown in Table 4-4. The concentrations detected in February 2017 at these VMPs are one to three orders of magnitude (i.e., 10 to 1,000 times) lower than the concentrations detected before the systems began operation.

The February 2017 TCE concentration (2.3 micrograms per cubic meter [µg/m^3]) at location 015-A is the lowest detected to date. While a significant decline has been observed at 015-A, overall TCE concentrations continue to fluctuate over time. For example, TCE was detected at an estimated 112 µg/m^3 in February 2015, but at 1,300 µg/m^3 in August 2015 (Figure 4-1). VOC-impacted groundwater likely provides a continuing VOC source in soil vapor at 015-A. Similar fluctuations have also occurred at 018-A, where SV TCE was detected at the following concentrations between August 2011 and February 2014 (Figure 4-2):

- 7.2 µg/m^3 in August 2011
- 800,000 µg/m^3 in October 2011
- 95,000 µg/m^3 in February 2013
- 28,000*J* µg/m^3 (estimated) in August 2013
- 174 µg/m^3 in February 2014

Concentrations observed after SSDS startup are generally lower than concentrations detected before the system began operation. VOC reductions at 018-A (in the basement) might be more limited than those observed at main floor VMPs, because the shallow groundwater table (frequently less than one foot below the basement slab) possibly impedes vapor flow. VMPs 136-A and 079-A are near the system extraction points installed as part of the second-phase system expansion completed in April 2016; these locations showed significant VOC concentration decreases in August 2016 as compared to February 2016 (pre-system expansion startup) results. The VOC concentrations at these VMPs show further reduction in the February 2017 sampling round, indicating the decrease is due to SSDS operation.

TCE in VMP 136-A decreased from 35,000 µg/m^3 in February 2016 to 850 µg/m^3 in August 2016, and to 300 µg/m^3 in February 2017. Similarly, in VMP 079-A, TCE decreased from 3,500 µg/m^3 in February 2016 to 120 µg/m^3 in August 2016, to 41 µg/m^3 in February 2017. Figure 2 in

Appendix E shows the February 2016 and February 2017 TCE concentrations at VMPs near the system extraction points.

4.1.2 Building C

SV samples collected to date near the Building C SSDS are listed in Table 4-5. These points are within 100 feet of the Building C SSDS extraction points in the basement; most[2] are within the vacuum influence of SSDS operations. VMPs 001-C, SSD-4-C (in the southern basement area) and 060-C, 088-C, 113-C, 126-C, 149-C, 152-C, 153-C, and 155-C (in the mid-basement area) were sampled in February 2017 (see Figure 4 in Appendix E).

The highest TCE concentrations were observed at VMPs near the SSDS before its operation began. The most recent concentrations (sampled during SSDS operation) are summarized in Table 4-6. The February 2017 TCE concentrations are lower than the concentrations measured before SSDS startup. Compared to the concentrations measured in the previous semiannual sampling (August, 2016), VMPs 001-C, SSD-4-C, 113-C, 126-C, 149-C, 153-C, and 155-C have lower TCE concentrations, but TCE at location 152-C is significantly higher than the concentration detected during the last semiannual event (1,300 µg/m^3 compared to 0.48 µg/m^3, see Table 4-2 and Figure 4-3).

Concentrations of vinyl chloride (VC) observed at 126-C have also decreased since the SSDS expansion (see Figure 4-4). VC concentrations in sub-slab vapor (SV) at 126-C have varied over time, as can be observed in Figure 4-4. The reason for these fluctuations is difficult to determine. VC has not been detected in SSDS-influent samples or in groundwater samples collected from a nearby well pair (MW-88A/B).

4.2 SUB-SLAB-VAPOR EXTRACTION POINTS

The Building A and Building C sub-slab-vapor extraction points are not sampled as part of the semiannual monitoring program, because the combined influent for the Building A system is sampled monthly, and the Building C system is sampled every two months. Figure 2 in Appendix E shows the locations of the Building A extraction points: North, South, Basement North, and Basement South horizontal-extraction laterals, and vertical extraction points: SSD-34-A,

[2]Building C SSDS extraction points 001-C, SSD-4-C, 060-C, 113-C, 127-C, 133-C, 135-C, 149-C, 152-C, 153-C, 155-C, and 156-C.

SSD-35-A, SSD-36-A, SSD-37-A, and SSD-38-A. Figure 4 in Appendix E shows the Building C extraction points (all vertical): SSD-21-C, SSD-23-C, SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C.

4.3 VACUUM INFLUENCE

Induced vacuum levels over time for sub-slab VMPs in the targeted areas are shown on the following figures in Appendix E:

- Figure 6 (Building A lay-up room and basement)
- Figure 7 (Building A eastern area)
- Figure 8 (Building C southern basement area)
- Figure 9 (Building C mid-basement area).

Representative vacuum measurements from the March 8, 2017 monitoring episode are indicated on plan views on Figures 10, 11, 12, and 13 of Appendix E. Vacuum influence associated with SSDS VMPs is checked biweekly. The target vacuum is 0.01 inches of water column or greater. As indicated in the May 2017 progress report (Appendix E), extraction trenches near the Building A lay-up room induce a vacuum equal to or greater than 0.01-inches water column over an approximately 3,800-square-foot area; this area encompasses all SV monitoring points that had high levels of VOCs before system startup.

The trenches in the Building A basement induce a vacuum over an approximately 2,000-square foot area that encompasses two of four VMPs used to measure the SSDS-induced vacuum in the basement. Induced vacuum has been inconsistent at the other basement points, possibly because of high groundwater levels (typically one foot or less below the slab). The extraction wells in the eastern area of Building A induce a vacuum over an approximately 6,100-square-foot-area, and encompass nine of 14 VMPs used to measure the SSDS-induced vacuum in that area.

The Building C basement wells induce vacuum influence over an approximately 3,000-square-foot area in the southern end of the basement, whereas the extraction wells in the mid-basement area induce vacuum influence over an approximately 32,000-square-foot area. In the mid-basement, 13 of 20 monitoring points are within the target area shown to have vacuum influence. Vacuum

influence has not been observed at the northern end of the mid-basement area; possible reasons include high groundwater levels, subsurface preferential pathways, short-circuiting, and/or blockages. However, VOC concentrations at VMP 126-C (outside the area of demonstrated vacuum influence) have decreased by more than 85% since the system was expanded in May 2013.

4.4 INFLUENT-VAPOR SAMPLES

Influent-vapor samples are collected monthly to monitor the Building A SSDS operation and once every two months to monitor the Building C system. VOC concentrations at the granular activated-carbon (GAC) influent, midpoint (after the lead drum), and effluent (after the second drum) points are monitored to determine when the midpoint concentration reaches 50% of the influent; when the 50% breakthrough has been reached, or at Tetra Tech's discretion with concurrence from Lockheed Martin Corporation (Lockheed Martin), the lead GAC drum is changed out. These samples also allow monitoring of influent-concentration trends over time. Samples were collected directly from all three sampling ports of both SSDSs by connecting a clean one-liter Summa® canister (batch certified) to the Teflon® tubing of each sampling port and opening the valve for approximately one minute. The samples were submitted to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee for VOC analysis using United States Environmental Protection Agency (USEPA) Toxic Organic Method (TO-15).

Tables 4-7A and 4-7B summarize the influent-vapor concentrations of target VOCs in samples over time (from system startup in March 2008 through March 2017). These results are displayed graphically on Figures 14 and 15 in Appendix E. Tables 4-7A and 4-7B provide average influent concentrations for the current (October 2016 to March 2017) and previous (April to September 2016) reporting periods. The six-month average-influent (total) VOC concentration in Building A during the current reporting period is higher than that observed during the previous semiannual reporting period (3,142 µg/m^3 and 1,913 µg/m^3, respectively). Note that this is biased high, because samples in two months of six (November 2016 and January 2017) were collected shortly after system restarts, and therefore reflect VOC rebound that occurs when the system is started after being off. In Building C, the six-month average-influent (total) VOC concentration during the current reporting period is lower than the previous semiannual period (106 µg/m^3 and 146 µg/m^3, respectively). Overall, influent VOC concentrations for both SSDSs have been relatively stable or slowly decreasing since 2009 (see Figures 14 and 15 in Appendix E).

The goal of the SSDSs is to maintain a negative pressure below the slab (relative to the room space), thus minimizing the migration of VOCs from the sub-slab soil into indoor air (IA). VOC-mass removal occurs while vapor is drawn out to maintain the vacuum. VOC removal rates for SSDS influent mass in Building A range from 0.029 to 0.117 pounds per day (lbs/day); these rates are higher than the removal rates (0.032 to 0.081 lbs/day) observed in the previous semiannual reporting period, most likely due to the second-phase system expansion. The Building A system has removed 11.3 pounds (lbs) of VOCs during this reporting period, 8.3 lbs in the previous reporting period, and 152 lbs since system startup in March 2008.

VOC removal rates in Building C during the current reporting period range between 0.001 and 0.003 pounds per month (lbs/month); these rates are lower than the removal rates (0.060 to 0.096 lbs/month) observed during the previous semiannual reporting period. The Building C SSDS has removed 0.32 lbs of VOCs this reporting period, 0.45 lbs in the previous reporting period, and 11 lbs since system startup in March 2008.

4.5 SYSTEM PERFORMANCE

In general, flow rates and induced vacuums for the SSDSs are performing as designed, except for a lack of induced vacuum near SSD-136-A in the eastern area of Building A, and near SSD-29-C and SSD-34-C in the northern portion of the mid-basement area of Building C. We will continue to monitor system-induced vacuum performance; however, due to a heterogeneous structure and water accumulation expected in the subsurface of old structures, it is not unusual that some localized areas are not amenable to induced vacuum. The induced-vacuum influence of the Building A system is at least 0.05-inches water column over 3,800-square-feet on the main floor (encompassing the lay-up room), 2,000-square-feet in the basement, and 6,100-square-feet in the eastern area. The induced-vacuum influence of at least 0.05-inches water column of the Building C SSDS extends over an approximately 3,000-square-foot area in the southern basement, and over approximately 32,000-square-feet in the mid-basement area.

Notes:

Data presented in this table is from sub-slab vapor samples.

- = not detected (below reporting limit)
µg/m^3 = micrograms per cubic meter
J = estimated value
N/A = compound not reported
N/S = not sampled
J = estimated value
J+ = estimated value, may be biased high
K = value is biased high
NS = not sampled
N/A = sampling data for this location not previously included in this table

Notes:

Data in this table is from sub-slab vapor samples.

- = not detected (below reporting limit)
µg/m^3 = micrograms per cubic meter
DL = diluted analysis
J = estimated value
J+ = estimated value, may be biased high
K = value is biased high
L = value is biased low
NA = compound not reported
NA = compound not reported
NS = not sampled
SSDS = sub-slab depressurization system
VOC = volatile organic compound

Conclusions and Recommendations

5.1 CONCLUSIONS

Tetra Tech, Inc. (Tetra Tech) has completed Round 22 of vapor-intrusion (VI) monitoring (the first of two scheduled for 2017) in Buildings A, B, and C at the Middle River Complex (MRC) (owned by LMC Properties, Inc.) in Middle River, Maryland. This ongoing investigation seeks to evaluate whether volatile organic compounds (VOCs) in sub-slab vapor (associated with soil and groundwater chemicals of concern [COC] at the site) might be moving into indoor air (IA) at the Middle River Complex facilities. The data set is composed of indoor-air and sub-slab-vapor (SV) samples collected in February/March 2017. Ambient air samples were also collected at four outdoor background locations around the perimeter of the Middle River Complex. All data were validated to ensure compliance with analytical method requirements.

Indoor air quality (IAQ) data were compared to risk-based screening levels for industrial air set at the 1×10^{-5} (i.e., one-in-100,000 probability) risk level for carcinogens, or at a hazard quotient of 1 for noncarcinogens (as published in the United States Environmental Protection Agency [USEPA] *Regional Screening Levels for Chemical Contaminants at Superfund Sites* [USEPA, 2016]), and to federal Occupational Safety and Health Administration (OSHA) permissible exposure limits (PELs). Alternate values, such as the "Threshold Limit Values" published by the American Council of Governmental Industrial Hygienists, were used for chemicals without published permissible exposure limits. SV data were compared to screening values derived using methods described in *Draft Guidance for Evaluating the Vapor-Intrusion to Indoor-Air Pathway from Groundwater and Soils* (USEPA, 2002) by applying an attenuation factor of 0.03 to the indoor-air screening-values.

Historically, trichloroethene (TCE) and naphthalene have been the prevalent contaminants of concern in indoor air at this site; however, only one trichloroethene indoor-air exceedance was

detected in the Building A basement during Round 22. Trichloroethene was detected below its screening level in indoor air in Building B and was not detected in indoor air in Building C (see plan view in Figure 5-1). In total, trichloroethene was detected in 14 of 41 indoor air samples collected during Round 22. Naphthalene was detected in indoor air at concentrations less than its screening level in Building A, and was not detected in indoor air in Buildings B and C. Naphthalene was detected in only two of 41 indoor air samples collected during Round 22.

5.1.1 BUILDING A

Historically, trichloroethene in indoor air has exceeded its screening level at location 093-A in the Building A basement. Trichloroethene was detected in indoor air at location 093-A (1.8 micrograms per cubic meter [µg/m^3]) during Round 22, but at a concentration less than its screening level (8.8 µg/m^3). Indoor air exceedances of trichloroethene at location 093-A occurred between August 2013 and September 2014.

During Round 16 (February 2014), a trichloroethene concentration of 87 µg/m^3 was measured above a nearby floor grate in Building A basement using the hand-held hazardous air pollutants on-*site* (HAPSITE) field instrument. (For comparison, trichloroethene laboratory-analyzed concentrations of 5.9 µg/m^3 and 8.4 µg/m^3 were observed at locations 093-A [approximately 50 feet from grate] and 093X-A [approximately 15 feet from grate], respectively, during conventional sampling in Round 16. Trichloroethene exceedances were observed in all samples collected from location 093-A during Round 17 (in supplemental sampling in August, in September sampling, and in October/November 2014 resampling), with little variability. These results indicate that the floor grate might serve as a preferential vapor-intrusion pathway to this part of Building A basement.

Additional information about the underground network in the Building A basement was obtained during a recent interview with EMCOR, the on-site maintenance contractor. Many of the floor sumps and drains were historically used to manage groundwater infiltration. Sumps collected infiltrated groundwater and pumped it out of the basement. Several large sumps were used to prevent water intrusion into large air handlers that once sat directly on top of the sumps.

The air handlers pumped air through large-diameter heat tunnels and corridors in the Building A basement's eastern wall; these tunnels extend back under the main floor of Building A. These

sumps might also connect to pipes that carry the air to other parts of the building. Anecdotal information indicates that the ductwork extending from the sumps might have been disconnected; however, this has not been confirmed. This network might provide a preferential pathway to transfer contaminants in indoor air.

Existing infrastructure suggests that groundwater in the basement sumps might be pumped back to Lift Station #5 (located farther north in the Building A basement) and possibly discharged to the sanitary system. Several floor drains in this area also drain groundwater from the basement floor; they are connected to the storm-drain system that might provide a direct pathway to Cow Pen Creek. To date, we cannot confirm whether these additional exposure pathways are complete; however, additional investigations focused on the sumps and infrastructure are scheduled for the summer of 2017.

The consistent presence of trichloroethene in the Building A basement at concentrations that fluctuated above and below its indoor-air screening level led to the installation of three indoor-air purifying filter-units in January 2015. Each unit filters 300 cubic feet of indoor air per minute. Trichloroethene concentrations in this area during the last four sampling rounds have been less than the indoor air screening level, but have generally been increasing. Indoor air concentrations of trichloroethene detected at 093-A during additional sampling in January 2015 (before the filters were installed) were 3.6–8.3 µg/m^3; the highest concentration in that range is just below the screening level (8.8 µg/m^3). After filter installation, the trichloroethene concentrations at 093-A during Round 18 in February 2015 (1.5 µg/m^3), Round 19 in August 2015 (3.3 µg/m^3), Round 20 in February 2016 (6.4 µg/m^3), Round 21 in August 2016 (6 µg/m^3), and Round 22 in March 2017 (1.8 µg/m^3) did not exceed the screening level.

Figure 5-2 shows trichloroethene concentrations at location 093-A for regular sampling rounds (i.e., excluding additional January 2015 samples) over time, beginning when it was first sampled in August 2010. This graph suggests that trichloroethene concentrations in this area are increasing over time. However, the reduction in trichloroethene concentrations to below their indoor-air screening level during Rounds 18 through 22 might be due to the use of indoor-air filtration units that were in operation during sampling. The ongoing study of groundwater, sub-slab vapor, indoor air, and the network of sumps and pipes might improve our understanding of how trichloroethene migrates into the building.

In the current round (Round 22), the maximum detected indoor air concentration of trichloroethene (11 µg/m^3) was at location 138-A, which is near location 093-A in the Building A basement; this detection at 138-A is the only indoor air exceedance detected during Round 22. This concentration was confirmed with concurrent continuous air monitoring. A trichloroethene exceedance at location 138-A was also noted in Building A indoor air samples during Round 20. However, when the same location was resampled one month later, the trichloroethene concentration was less than its screening level.

During Round 21, indoor air trichloroethene at location 138-A was 2.7 µg/m^3, a concentration below its screening level. Note that trichloroethene has not historically exceeded its screening level in indoor air at location 138-A (Figure 5-3). However, the initial exceedance at this location during Round 20, and the exceedance detected again during Round 22, indicate that a source continues to contribute trichloroethene to indoor air, despite the air-filtration units in the basement. An additional investigation to determine possible sources and pathways of vapor intrusion was undertaken, because, even with the addition of the portable air-filtration units, indoor air concentrations of trichloroethene continued to exceed its screening level. These additional activities were done in conjunction with the Round 20 indoor-air-quality and sub-slab-vapor sampling in Building A, B, and C in February and March 2016.

Ten additional Vapor Pin™ vapor monitoring points were installed, including seven in the eastern wall of the Building A basement (169-A, 170-A, 171-A, 172-A, 173-A, 176-A, and 177-A), two in the Building A basement floor (174-A and 175-A), and one beneath the main floor of Building A (168-A). Vapor monitoring points were strategically located near possible trichloroethene sources, including a former underground storage tank and vapor degreasers associated with former plating shop operations. In 2016 (Tetra Tech, 2016b) and 2017, sampling location SV-175-A on the Building A basement floor had the highest trichloroethene concentrations (460,000 and 650,000 µg/m^3, respectively).

In 2016 (Tetra Tech, 2016b), sub-slab-vapor trichloroethene exceedances were detected in both the original and the duplicate samples collected from location SV-174-A (580 and 840 µg/m^3), and in a sample collected from the Building A basement floor (460,000 µg/m^3), near the floor grate that exhibited elevated trichloroethene concentrations during a previous indoor air survey using gas chromatography/mass spectrometry. A sub-slab-vapor trichloroethene exceedance also occurred at

location SV-168-A (42,000 µg/m^3) on the main floor of Building A, near the former location of a trichloroethene-vapor degreaser. Sub-slab-vapor trichloroethene exceedances (2,500 and 5,100 µg/m^3) also occurred at two locations (SV-171-A and SV-173-A, respectively) on the eastern wall of the Building A basement. Similar results were seen at the same locations in 2017 at SV-174-A (920 µg/m^3), SV-168-A (22,000 µg/m^3), SV-171-A (4,100 µg/m^3), and SV-173-A (7,300 µg/m^3). A sub-slab-vapor trichloroethene exceedance was also detected at SV-170-A (2,000 µg/m^3).

Trichloroethene in sub-slab-vapor also exceeded its screening level at locations 118-A and 136-A. Sub-slab-vapor concentrations of trichloroethene in samples collected from location 136-A have been consistently greater than its screening level, and sub-slab-vapor concentrations of trichloroethene in samples collected from location 118-A have also been greater than the screening level during some recent sampling rounds (e.g., Rounds 17 through 22). The Round 22 trichloroethene sub-slab-vapor concentration detected at 136-A (300 µg/m^3) only slightly exceeds the screening level (293 µg/m^3), is less than the concentrations detected at this location during Round 21 (850 µg/m^3), and is two orders of magnitude (i.e., 10 to 100 times) less than the concentrations detected at that location during Round 20 (37,000 µg/m^3 in the original sample, and 33,000 µg/m^3 in the duplicate sample) before the sub-slab depressurization system was expanded to this location in February 2016.

Historical sub-slab-vapor exceedances of trichloroethene have been consistently detected at location 079-A, but during Round 22, the trichloroethene concentration (41 µg/m^3) did not exceed its screening level. Locations 079-A and 136-A are in the eastern portion of Building A, in the central and southern areas of the building, respectively. These locations have been within the second-phase expansion's zone of influence since its installation in February 2016.

Historical trichloroethene concentrations in sub-slab vapor have also exceeded screening levels at location 118-A, which is in the southwestern portion of Building A, and some historical exceedances have also been detected at nearby location 015-A. These two locations are within the zone of influence from the original system that was installed in 2008. Figures 5-4A, 5-4B, and 5-4C display the Round 22 sub-slab-vapor and indoor-air exceedances from the basement and first-floor sampling locations in Building A.

Chloroform was detected (at location 136-A) in sub-slab vapor at concentrations greater than its screening level during Round 20, but concentrations of chloroform detected in indoor air and sub-slab vapor during Rounds 21 and 22 did not exceed screening levels. Naphthalene (at location 075-A) exceeded its sub-slab-vapor screening level during Round 19, but naphthalene at the same location during Round 20 (100 µg/m^3), Round 21 (110*J* µg/m^3), and Round 22 (92*J* µg/m^3) did not exceed the screening level. Indoor-air naphthalene concentrations did not exceed its screening level (3.6 µg/m^3) during Round 22.

One sub-slab-vapor detection of 1,1-dichloroethene (1,1-DCE) at new sampling location 175-A (48,000 µg/m^3) exceeded its screening level (29,333 µg/m^3) during Round 22; the maximum detected sub-slab-vapor concentration of trichloroethene (650,000 µg/m^3) was also detected at location 175-A. Concentrations of 1,1-dichloroethene detected in other Round 22 sub-slab-vapor samples are at least approximately one order of magnitude (approximately 10 times) less than the concentration detected at 175-A.

In summary, trichloroethene in indoor air has historically exceeded its screening level at locations in the Building A basement beginning in 2013, and previous investigation results indicate that the nearby floor grate, sumps, or other features might serve as preferential vapor-intrusion pathways. The consistent presence of trichloroethene at concentrations that fluctuate above and below its indoor-air screening level in the Building A basement led to the installation of three indoor-air filter units in January 2015. After filter installation, indoor-air trichloroethene concentrations at 093-A during the following four sampling rounds did not exceed the screening level, possibly due to the use of indoor-air filtration units that were in operation during sampling. However, exceedances of the trichloroethene indoor-air screening level at a nearby location during Rounds 20 and 22 indicate that a source continues to contribute trichloroethene to indoor air, despite the operation of the air-filtration units in the basement. Continuous air-sampling conducted between February 24 and April 21 indicates that indoor air trichloroethene concentrations fluctuated above and below the screening level, even during operation of the air-filtration units in the basement. Monitoring indicates that the sumps and drains in the Building A basement are the sources of the trichloroethene, as increased concentrations in indoor air occurred during rain events.

Trichloroethene was detected in Building A sub-slab vapor at concentrations exceeding its screening level during Round 21 at two previous sampling locations and at six new sampling locations. Only one indoor air concentration of trichloroethene exceeded its screening level. One sub-slab-vapor detection of 1,1-dichloroethene from one location exceeded its screening level during Round 22; however, indoor air concentrations of 1,1-dichloroethene did not exceed the screening level.

The sub-slab-depressurization system in Building A appears to be operating as designed, and appears to be effectively mitigating sub-slab-vapor intrusion from known source areas of sub-slab-vapor contamination, in concert with the indoor-air filtration units. Contaminants are constantly removed from soil vapor during system operation, and indoor air concentrations in the main part of Building A (excluding the basement) rarely exceed screening values. Filter cartridges are changed out quarterly; no other maintenance is required. Although basement occupancy is intermittent, this area will continue to be monitored as the sub-slab-depressurization system continues to operate.

5.1.2 BUILDING B

No exceedances were noted in Building B indoor air or sub-slab-vapor samples during Rounds 22, 21, 20, or 19. During Round 18, only one slight exceedance of naphthalene was noted in Building B indoor air, and this concentration only marginally exceeded its screening level. No exceedances were noted in Building B indoor air or sub-slab-vapor samples during Round 17.

5.1.3 BUILDING C

1,1-Dichloroethane (1,1-DCA), naphthalene, trichloroethene, and vinyl chloride (VC) were detected in Building C sub-slab vapor at concentrations greater than screening levels during Round 22, but no exceedances were detected in Building C indoor air. Comparison of the two graphs in Figures 5-5A and 5-5B shows sub-slab vapor and indoor-air concentrations of 1,1-dichororethane, naphthalene, trichloroethene, and vinyl chloride in Building C. 1,1-Dichoroethane, naphthalene, trichloroethene, and vinyl chloride were not detected in any of the 22 indoor air samples collected from Building C during Round 22 (Figure 5-5B).

Although trichloroethene has been routinely detected in indoor air in Building C, its concentrations have not typically exceeded its screening level. The only exception (a concentration of 20 $\mu g/m^3$)

occurred during Round 15 at sampling location 144-C; this location is in the machine shop of the Rotary and Mission Systems (RMS) mechanical-prototype lab (MPL). The Round 15 exceedance possibly resulted from an indoor source, because the room was air-conditioned and under positive pressure, making it extremely unlikely that sub-slab vapor had migrated into the room. A trace concentration (0.43 µg/m^3) of trichloroethene was detected nearby at location 128-C during Round 18. No indoor air exceedances of trichloroethene were detected in the machine shop or elsewhere in Building C during Rounds 19, 20, 21, or 22.

During Round 18, an indoor-air exceedance of tetrachloroethene (PCE) was detected (870 µg/m^3, as compared to its IA screening level 180 µg/m^3) in a resample, but not in the original sample collected at location 149-C during Round 18. Before Round 18, tetrachloroethene exceedances had never been detected in indoor air or sub-slab vapor in Building C. Additionally, indoor air and sub-slab-vapor concentrations of tetrachloroethene detected in Rounds 19, 20, 21, and 22 did not exceed screening levels. In most sub-slab-vapor samples collected over the course of these investigations from locations at and near location 149-C, concentrations of tetrachloroethene are typically below detection limits. The preponderance of evidence suggests that the elevated tetrachloroethene concentration at location 149-C during Round 18 is anomalous, and possibly attributable to some indoor air source rather than vapor intrusion.

Concentrations of vinyl chloride detected in sub-slab vapor at 126-C have decreased since the system expansion, but have varied over time. The vinyl chloride concentration detected at location 126-C during Round 22 (2,600*J* µg/m^3) is greater than that detected during Round 18 (1,310*J* µg/m^3), but is less than the concentrations detected during Round 15 (28,000 µg/m^3), Round 16 (11,900 µg/m^3), Round 17 (4,030 µg/m^3), Round 19 (16,000 µg/m^3), Round 20 (3,100 µg/m^3), and Round 21 (5,000 µg/m^3). Vinyl chloride's sub-slab screening level is 933 µg/m^3. Although trichloroethene concentrations up to 1,500 micrograms per liter (µg/L) have been detected in groundwater near 126-C, vinyl chloride has not been detected in groundwater. The 126-C area might be affected by groundwater fluctuation (depth to groundwater is between four and five feet), but its correlation to vinyl chloride concentrations is difficult to determine.

Sub-slab-vapor concentrations of 1,1-dichloroethane (3,900 µg/m^3) and naphthalene (310 µg/m^3) also exceeded their screening levels (2,567 and 120 µg/m^3, respectively) at location 102-C during Round 22. Sub-slab vapor concentrations of 1,1-dichloroethane and naphthalene exceeded their

screening levels at location 102-C during other recent sampling rounds (e.g., Rounds 17, 18, and 20). In general, sub-slab-vapor concentrations of volatile organic compounds have decreased in the southern basement area (SSD-4-C) of Building C since system startup in March 2008. Vapor monitoring points (060-C, 088-C, 113-C, 126-C, 133-C, and 135-C) in the mid-basement area also show lower concentrations, as compared to results before system expansion in May 2013.

5.2 RECOMMENDATIONS

Results of the March 2017 Round 22 vapor-intrusion investigation at Buildings A, B, and C lead us to the following recommendations:

- Continue operation of the sub-slab-depressurization systems in Buildings A and C.
- Continue semiannual indoor-air-quality/sub-slab-vapor monitoring to evaluate possible vapor intrusion and assess the performance/effectiveness of the existing mitigation systems. Monitoring results will be used to evaluate the control and reduction (if occurring) of known sources, to identify new sources (if present), and help determine if additional mitigation or sub-slab-depressurization-system modifications are needed. Locations within the Building C sub-slab-depressurization-system areas of influence should continue to be monitored to evaluate whether the recent system expansion affects contaminant concentrations.
- Continue routine semiannual monitoring of indoor air and sub-slab soil-vapor to evaluate concentrations of PCE in the Building C museum area near sampling location 149-C. The absence of indoor-air and sub-slab-vapor PCE concentrations greater than its screening levels near this location suggests that the Round 18 exceedance is most likely an anomaly.
- Expand the Building A sub-slab-depressurization system to address elevated sub-slab-vapor concentrations of trichloroethene at 168-A, near the former location of a degreaser.
- Install three additional air-purifying units in the Building A basement as a precaution, near targeted floor features that have exhibited the highest levels of trichloroethene. These units will supplement the existing air-purifying units.

Additional investigations to assess trichloroethene-related exposure pathways inside and outside the Building A basement are in progress, and more investigation is planned for later in 2017. Results from these additional investigations (to date) are summarized below.

Camera survey of air-duct network and sumps—Historical documents relating to Building A and the Building A basement were reviewed to identify building infrastructure, elevations, and utilities; possible sources of contamination; and connections to nearby buildings. Historical drawings also

show as-built details of the air-duct network that runs under the main floor of Building A. This ductwork connects to the large sumps beneath the Building A basement floor that were once part of the Building A heating system (Tetra Tech, 2017c). Information relevant to this investigation is summarized below:

- Several existing and former heater rooms are in the Building A basement. Twelve heating rooms originally existed, but the heaters and several walls were removed when heat was added to the main floor. Building A is 600-feet-long, so each of the 12 heater rooms supplied air to approximately two structural column widths (an approximately 50-foot span) of Building A. Each heater room included a large air handler that forced hot air through an underground tunnel network beneath the main floor of Building A. The air handlers are no longer in operation, but the sumps remain in each location, and might still connect to ducts, tunnels, and pipes that carry air to other parts of the building.

- Some of the historical air-duct network was filled in with concrete in association with new foundation and construction work in the past. In addition, the southern portion of Building A was filled with concrete during recent installation of a freezer unit by MRA Systems, Inc. Other ducts have been filled with wood and other debris. However, we found no existing documentation that verifies which areas have been filled with concrete or other materials. Furthermore, no documentation regarding the integrity of the plugs or their effectiveness in sealing the ducts is available.

- Currently, five heater rooms are fully intact (i.e., surrounded by walls). Each heater room contains a large air-handler that is no longer in operation, with a sump underneath. During their operation, the sumps likely controlled groundwater infiltration into the basement, thus preventing fouling of the air handlers.

- Two other former heater rooms are no longer walled-in, and no longer have an air handler; however, the rectangular sump associated with each remains in the basement floor.

- The sumps contain intersecting duct networks (associated with the previous air handler operation) with piping that extends up to the main floor of Building A. The ducts connect to vents adjacent to certain columns. These ducts are thought to be associated with the air-return system for the historical air handlers.

Ancillary information from site operations personnel, obtained during previous construction projects, indicates that a large “chamber” (approximate dimensions of eight-by-nine-square feet) is connected to sumps behind the eastern wall of the basement (e.g., under the main slab-on-grade floor of Building A). This chamber is behind the basement sidewall and connects to a four-by-four-foot air duct that runs easterly under the main floor of Building A. From this main duct, offshoot ducts run in a north/south direction along the columns. Air vents associated with these air ducts are present at the foot of many columns, and were used historically to provide heat to the main floor of Building A. Tetra Tech will attempt to verify this information during a camera

survey conducted later this year. Floor features in Building A and Building A basement, including the air-duct network that runs behind the eastern basement wall, the associated air vents on the main floor, the storm drain line that runs north/south under the basement floor, and the smaller floor drains, will be surveyed to determine their condition, identify possible breaches, and to better understand their design.

Frog 4000™ survey—Tetra Tech will conduct a Frog 4000™ survey to assess whether trichloroethene-contaminated air is emanating out of the air vents on the main floor. This will help determine whether trichloroethene detected in the sumps in the basement is venting up to the main floor.

Pilot test to assess connection of sumps to Building A sub-slab-depressurization system—A pilot test will be conducted in Building A basement to determine the feasibility of connecting some of the larger sumps in the basement to the current sub-slab-depressurization system to remove and treat trichloroethene-contaminated air.

Building A groundwater investigation—Operation of the continuous air-monitoring system indicates variable concentrations of trichloroethene in indoor air at the breathing zone, and also above some drains and sumps. Trichloroethene was also detected in water in select floor features at concentrations up to 5,100 micrograms per liter (µg/L). Groundwater recovery in the basement sumps might affect groundwater movement outside and west of Building A. Under a separate program, additional groundwater monitoring wells will be installed west of Building A to target the two trichloroethene plumes apparently emanating from Building A and the Building A basement, to fill in data gaps between the plumes and Building A, and to investigate deeper groundwater zones that might migrate toward Cow Pen Creek.

OVERVIEW

The sample set for LMC – MRC, SDG 140-7292-1, consists of twenty-seven (27) soil vapor environmental samples. All samples were analyzed for select volatile organic compounds (VOC). Original samples from three (3) field duplicate sample pairs are included in this SDG:

- SV-131-C-22 (original) / SV-DUP01-C-22 (duplicate – not in this SDG),
- SV-153-C-22 (original) / SV-DUP02-C-22 (duplicate – not in this SDG),
- SV-015-A-22 (original) / SV-DUP03-A-22 (duplicate – not in this SDG).

The samples were collected by Tetra Tech, Inc. on February 28 and March 1, 2017 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, chromatographic resolution, compound identification, compound quantitation, field duplicate precision, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The initial calibration performed on 11/25/16 on instrument MJ had a percent relative standard deviation (%RSD) for naphthalene that was greater than the 30% quality control limit. Samples SV-004-C-22, SV-060-C-22, SV-088-C-22, SV-113-C-22, SV-131-C-22, SV-149-C-22, SV-150-C-22, SV-153-C-22, SV-155-C-22, SV-015-A-22, SV-116-A-22, SV-075-A-22, SV-076-A-22, SV-078-A-22, SV-079-A-22, SV-081-A-22, SV-136-A-22, SV-138-A-22, SV-139-A-22, and SV-100-B-22 were associated with this calibration. Detected and non-detected naphthalene results were qualified as estimated (J and UJ, respectively) in the associated samples.

- The result for vinyl chloride in sample SV-126-C-22 exceeded the instrument calibration range. The sample was not reanalyzed at a dilution. The detected result for vinyl chloride in sample SB-126-C-22 was qualified as estimated (J) on this basis.

- The field duplicate pair samples SV-131-C-22 / SV-DUP01-C-22 had a relative percent difference (RPD) for naphthalene that was greater than the quality control limit of 50%. The detected results for naphthalene were qualified as estimated (J) in samples SV-131-C-22 and SV-DUP01-C-22.

- Detected results reported below the RL limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Sample SV-001-C-22 was listed on the chain of custody, but this sample was not included in the laboratory data package or the database for this SDG. The laboratory case narrative indicates that this sample was received with the canister valve in the open position at ambient pressure (approximately 0 psi). The laboratory cancelled the analysis for this sample as per instruction from the client.

Sample SV-093-A-22 was listed on the chain of custody, but this sample was not included in the laboratory data package or the database for this SDG. The laboratory case narrative indicates that this sample was received with a pressure of -26 or lower inches of mercury. The laboratory then pressurized the canister due to insufficient sample volume. Upon receipt by the laboratory, the flow controller was found to be faulty due to the present of water. The laboratory cancelled the analysis of this sample as per instruction from the client.

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

Sample SV-118-A-22 was analyzed at a dilution factor of 3.81.

1,1-Dichloroethane in sample SV-102-C-22 was analyzed at a dilution factor of 4.15.

Sample SV-168-A-22 was analyzed at a dilution factor of 11.16.

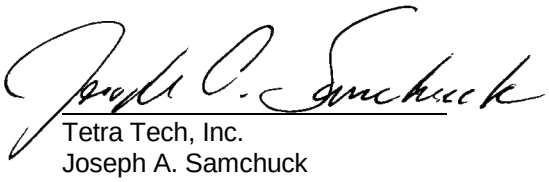
The following analyte was detected in the method blanks at the following maximum concentration:

Analyte	Maximum Concentration
Naphthalene	0.238 ug/m^3 (1)

1 – Maximum concentration detected in method blank associated with preparation batch 140-9073 affecting sample SV-142-C-22.

An action level of the maximum concentration was used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were considered in evaluating for blank contamination. No action was necessary, as the detected result for naphthalene in the affected sample was greater than the action level.

EXECUTIVE SUMMARY



Laboratory Performance: Some detected and non-detected results were qualified due to calibration noncompliance.

Other Factors Affecting Data Quality: Some detected results were qualified for field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Appendix A

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-7292-1

Receipt
The samples were received on 3/2/2017 at 9:50 AM. The samples arrived in good condition and properly preserved.

Sample SV-001-C-22 (140-7292-1) was received with the canister valve in the open position. The sample was at ambient pressure (approximately 0 psi). The client was contacted and the laboratory was instructed to cancel analysis.

Sample SV-093-A-22 (140-7292-22) was received with a pressure of - 26 or lower inches of mercury: Flow controllers are set to fill approximately 3/4 of the summa canister volume. This would result in an ending pressure of approximately - 5 inches of Hg. In order to proceed with analysis, the canister was pressurized due to insufficient sample. This pressurization (dilution) may result in higher reporting limits than desired. All flow controllers are cleaned and verified to be in good working condition prior to being sent to the field. The flow controller was also checked upon receipt and was found to be faulty due to presence water. The client was contacted and the lab was instructed to cancel analysis.

Air - GC/MS VOA
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Methods TO 15 LL, TO-14A, TO-15: This report includes canister certification data for the batch certified and/or individually certified canisters used to collect samples as well as for any canisters used for dilution of those samples. All of the canisters used for sample collection or sample dilution for this job were certified to be clean to the levels listed on the results page. Please note that results for individually certified canisters that were not used for sample collection or sample dilution may also be included in the report because these canisters were in the same cleaning batch as the canisters used for this project. Since these canisters were not used for this job, the results have no bearing on the sample results.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
E	Result exceeded calibration range.
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Log In Number:

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	✓			☐ Containers, Broken
2. Were ambient air containers received intact?			✓	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			✓	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			✓	☐ Cooler Out of Temp, Client Contacted, Proceed/Cancel ☐ Cooler Out of Temp, Same Day Receipt
5. Were all of the sample containers received intact?	✓			☐ Containers, Broken
6. Were samples received in appropriate containers?	✓			☐ Containers, Improper; Client Contacted; Proceed/Cancel
7. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ COC & Samples Do Not Match ☐ COC Incorrect/Incomplete ☐ COC Not Received
8. Were all of the samples listed on the COC received?	✓			☐ Sample Received, Not on COC ☐ Sample on COC; Not Received
9. Is the date/time of sample collection noted?	✓			☐ COC; No Date/Time; Client Contacted
10. Was the sampler identified on the COC?		✓		☑ Sampler Not Listed on COC
11. Is the client and project name/# identified?	✓			☐ COC Incorrect/Incomplete
12. Are tests/parameters listed for each sample?	✓			☐ COC No tests on COC
13. Is the matrix of the samples noted?	✓			☐ COC Incorrect/Incomplete
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ COC Incorrect/Incomplete
15. Were samples received within holding time?	✓			☐ Holding Time - Receipt
16. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ pH Adjusted, pH Included (See box 16A) ☐ Incorrect Preservative
17. Were VOA samples received without headspace?			✓	☐ Headspace (VOA only)
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			✓	☐ Residual Chlorine
19. For 1613B water samples is pH<9?			✓	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			✓	☐ Project missing info

OVERVIEW

The sample set for LMC – MRC, SDG 140-7294-1, consists of twenty-nine (29) indoor air/ambient air environmental samples. All samples were analyzed for select volatile organic compounds (VOC). Original samples from two (2) field duplicate sample pairs are included in this SDG: IA-131-C-22 (original / IA-DUP01-C-22 (duplicate – not in this SDG) and IA-153-C-22 (original) / IA-DUP02-C-22 (duplicate – not in this SDG). The samples were collected by Tetra Tech, Inc. on February 28, 2017 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, chromatographic resolution, compound identification, compound quantitation, field duplicate precision, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The initial calibration performed on 11/25/16 on instrument MJ had a percent relative standard deviation (%RSD) for naphthalene that was greater than the 30% quality control limit. Samples IA-145-C-22, IA-150-C-22, BCK-1-22, and BCK-4-22 were associated with this calibration. Non-detected naphthalene results were qualified as estimated (UJ) in the associated samples.

- The continuing calibration performed on 03/03/17 at 11:17 on instrument MR had a percent difference (%D) for 1,2,3-trimethylbenzene that was greater than the 30% quality control limit. Samples IA-033-B-22, IA-100-B-22, IA-101-B-22, IA-001-C-22, IA-004-C-22, IA-005-C-22, IA-051-C-22, IA-060-C-22, IA-065-C-22, IA-088-C-22, IA-102-C-22, IA-113-C-22, IA-115-C-22, IA-126-C-22, IA-131-C-22, IA-153-C-22, IA-155-C-22, BCK-2-22, and BCK-3-22 were associated

with this calibration. Non-detected results for 1,2,3-trimethylbenzene were qualified as estimated (UJ) in the associated samples.

- The field duplicate pair samples IA-153-C-22 / IA-DUP02-C-22 had a %D for chlorodifluoromethane that was greater than the quality control limit of 2x the reporting limit (RL). The detected and non-detected results for chlorodifluoromethane were qualified as estimated (J and UJ, respectively) in samples IA-153-C-22 and IA-DUP02-C-22.

- Detected results reported below the RL limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The laboratory control sample (LCS) 140-8988/1002 associated with preparation batch 140-8988 had a percent recovery (%R) for 1,2,3-trimethylbenzene that was greater than the laboratory quality control limits. Samples IA-033-B-22, IA-100-B-22, IA-101-B-22, IA-001-C-22, IA-004-C-22, IA-005-C-22, IA-051-C-22, IA-060-C-22, IA-065-C-22, IA-088-C-22, IA-102-C-22, IA-113-C-22, IA-115-C-22, IA-126-C-22, IA-131-C-22, IA-153-C-22, IA-155-C-22, BCK-2-22, and BCK-3-22 were associated with this LCS. No action was necessary because results for 1,2,3-trimethylbenzene were non-detected in the associated samples.

EXECUTIVE SUMMARY

Laboratory Performance: Some non-detected results were qualified due to calibration noncompliance.

Other Factors Affecting Data Quality: Some detected and non-detected results were qualified for field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-7294-1

Receipt
The samples were received on 3/2/2017 at 9:50 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA
EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-8988 exhibited % difference of > 30% for 1,2,4-trimethylbenzene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method TO 15 LL: 1,2,4-Trimethylbenzene recovered outside control limits for the LCS associated with analytical batch 140-8988: This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Methods TO 15 LL, TO-15: Can Certification Comments:
Due to the large number of analytes in the CCV, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for several analytes to recover outside criteria for this method when analyzing for a full list. The CCV associated with the can cleaning batches had analytes outside control limits. These results have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Form No. CA-C-WI-002, Rev. 2, dated 03/06/2012

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	✓			☐ **Containers, Broken**
2. Were ambient air containers received intact?			✓	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			✓	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			✓	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	✓			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	✓			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	✓			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	✓			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?		✓		☑ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	✓			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	✓			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	✓			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	✓			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			✓	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number: _____			✓	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			✓	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			✓	☐ Project missing info

OVERVIEW

The sample set for LMC – MRC, SDG 140-7324-1, consists of twenty-four (24) indoor air/soil vapor environmental samples. All samples were analyzed for select volatile organic compounds (VOC). Seven (7) field duplicate sample pairs have one or more samples included in this SDG:

- IA-131-C-22 (original – not in this SDG) / IA-DUP01-C-22 (duplicate),
- IA-153-C-22 (original – not in this SDG) / IA-DUP02-C-22 (duplicate),
- IA-015-A-22 (original) / IA-DUP03-A-22 (duplicate),
- IA-079-A-22 (original) / IA-DUP04-A-22 (duplicate),
- SV-131-C-22 (original – not in this SDG) / SV-DUP01-C-22 (duplicate),
- SV-153-C-22 (original – not in this SDG) / SV-DUP02-C-22 (duplicate),
- SV-015-A-22 (original – not in this SDG) / SV-DUP03-A-22 (duplicate).

The samples were collected by Tetra Tech, Inc. on February 28 and March 01 and 03, 2017 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, chromatographic resolution, compound identification, compound quantitation, field duplicate precision, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- The initial calibration performed on 11/25/16 on instrument MJ had a percent relative standard deviation (%RSD) for naphthalene that was greater than the 30% quality control limit. Samples IA-DUP01-C-22, IA-DUP02-C-22, IA-DUP03-A-22, IA-DUP04-A-22, SV-DUP01-C-22, IA-139-A-22, and SV-DUP02-C-22 were associated with this calibration. Detected and non-detected

naphthalene results were qualified as estimated (J and UJ, respectively) in the associated samples.

- The continuing calibration performed on 03/06/17 at 13:34 on instrument MR had a percent difference (%D) for vinyl chloride that was greater than the 30% quality control limit. Samples IA-015-A-22, IA-018-A-22, IA-021-A-22, IA-075-A-22, IA-076-A-22, IA-078-A-22, IA-079-A-22, IA-081-A-22, IA-093-A-22, IA-168-A-22, IA-097-A-22, IA-117-A-22, IA-118-A-22, IA-136-A-22, IA-138-A-22, SV-DUP03-A-22, and SV-093-A-22 were associated with this calibration. Non-detected results for vinyl chloride were qualified as estimated (UJ) in the associated samples.

- The laboratory control sample (LCS) 140-9101/1008 associated with preparation batch 140-9101 had a percent recovery (%R) for vinyl chloride that was less than the laboratory quality control limits. Samples IA-015-A-22, IA-018-A-22, IA-021-A-22, IA-075-A-22, IA-076-A-22, IA-078-A-22, IA-079-A-22, IA-081-A-22, IA-093-A-22, IA-168-A-22, IA-097-A-22, IA-117-A-22, IA-118-A-22, IA-136-A-22, IA-138-A-22, SV-DUP03-A-22, and SV-093-A-22 were associated with this LCS. Non-detected results for vinyl chloride were qualified as estimated (UJ) in the associated samples.

- The field duplicate pair samples IA-015-A-22 / IA-DUP03-A-22 had a %D for trichloroethene that was greater than the quality control limit of 2x the reporting limit (RL). The detected and non-detected results for trichloroethene were qualified as estimated (J and UJ, respectively) in samples IA-015-A-22 and IA-DUP03-A-22.

- The field duplicate pair samples IA-153-C-22 / IA-DUP02-C-22 had a %D for chlorodifluoromethane that was greater than the quality control limit of 2x the RL. The detected and non-detected results for chlorodifluoromethane were qualified as estimated (J and UJ, respectively) in samples IA-153-C-22 and IA-DUP02-C-22.

- The field duplicate pair samples SV-131-C-22 / SV-DUP01-C-22 had a relative percent difference (RPD) for naphthalene that was greater than the quality control limit of 50%. The detected results for naphthalene were qualified as estimated (J) in samples SV-131-C-22 and SV-DUP01-C-22.

- Detections of methylene chloride were qualified as estimated, (J), because these detections were considered suspected laboratory contamination despite the absence of methylene chloride in laboratory method blanks.

- Detected results reported below the RL limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Sample SV-DUP04-A-22 was listed on the chain of custody, but this sample was not included in the laboratory data package or the database. The laboratory case narrative indicates that this sample was received with the canister valve in the open position at ambient pressure (approximately 0 psi). The laboratory cancelled the analysis for this sample as per instruction from the client.

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

Sample IA-DUP02-C-22 was analyzed at a dilution factor of 1.53.

The laboratory case narrative report suggests that sample SV-DUP03-A-22 was analyzed at a dilution factor greater than 1; however, the laboratory Form 1 for this sample and the database indicate that this sample was

analyzed at a dilution factor of 1.

EXECUTIVE SUMMARY

Laboratory Performance: Some detected and non-detected results were qualified due to calibration noncompliance. Non-detected results for one analyte were qualified due to LCS noncompliance. Methylene chloride was detected in many samples and was qualified as a suspected laboratory contaminant.

Other Factors Affecting Data Quality: Several detected and non-detected results were qualified for field duplicate imprecision. Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-7324-1

Receipt
The samples were received on 3/4/2017 at 9:15 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions
Sample SV-DUP04-A-22 (140-7324-24) was received with the canister valve in the open position: The sample was at ambient pressure (approximately 0 psi). The client was contacted and the laboratory was instructed to cancel analysis.

Air - GC/MS VOA
Methods TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method TO 15 LL: Sample SV-DUP03-A-22 (140-7324-22) was diluted due to the abundance of non-target analytes. Elevated reporting limits (RLs) are provided.

Method(s) TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-9101 exhibited % difference of > 30% for vinyl chloride; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

Method TO 15 LL: Vinyl chloride recovered outside control limits for the LCS associated with analytical batch 140-9101. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Log In Number:

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			/	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?		/		☐ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Comments/Actions Taken

SV-171-A-22	SV-172-A-22	SV-173-A-22
SV-174-A-22	SV-175-A-22	SV-176-A-22
SV-177-A-22		

OVERVIEW

The sample set for LMC – MRC, SDG 140-7360-1, consists of ten (10) soil vapor environmental samples. All samples were analyzed for select volatile organic compounds (VOC). No field duplicate pair samples are included in this SDG.

The samples were collected by Tetra Tech, Inc. on March 8, 2017 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with EPA Method TO-15 analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, laboratory control sample results, internal standard areas, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

MAJOR PROBLEMS

- None.

MINOR PROBLEMS

- Detected results reported below the reporting limit (RL) limit but above the method detection limit (MDL) were qualified as estimated (J).

NOTES

Twenty-five VOC target compounds were reported for the TO-15 analysis of the samples.

Non-detected results were reported to the MDL.

The laboratory case narrative report states that the asset number for sample SV-171-A-22 did not match the information listed on the chain of custody; the asset number is 10270, but the chain of custody listed 10220.

The following samples were analyzed at a dilution factor greater than 1:

Sample	Dilution Factor
SV-170-A-22	3.18
SV-171-A-22	3.29
SV-173-A-22	10.52
SV-175-A-22	358.2

The following analyte was detected in the method blanks at the following maximum concentration:

Analyte	Maximum Concentration
1,1,1-Trichloroethane	0.0852 ug/m^3 (1)

1 – Maximum concentration detected in method blank associated with preparation batch 140-9483 affecting samples SV-169-A-22, SV-170-A-22, SV-171-A-22, SV-172-A-22, SV-173-A-22, SV-174-A-22, SV-175-A-22, SV-177-A-22, and SV-001-C-22.

An action level of the maximum concentration was used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were considered in evaluating for blank contamination. No action was necessary, as the detected results for 1,1,1-trichloroethane in the affected samples were greater than the action level.

EXECUTIVE SUMMARY

Laboratory Performance: None.

Other Factors Affecting Data Quality: Results above the MDL but below the RL were qualified as estimated.

The data for these analyses were reviewed with reference to the USEPA "National Functional Guidelines for Organic Superfund Methods Data Review" (January 2017) and USEPA Method TO-15 analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Qualified Analytical Results

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted method detection limit for sample and method.
J	The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
Z4 = Sample activity is less than the at uncertainty at 3 standard deviations and greater than the MDC
Z5 = Sample activity is less than the at uncertainty at 3 standard deviations and less than the MDC

Support Documentation

Job Narrative
140-7360-1

Receipt
The samples were received on 3/9/2017 at 10:00 AM. The samples arrived in good condition and properly preserved.

Receipt Exceptions
The asset number for sample SV-171-A-22 (140-7360-3) did not match the information listed on the Chain-of-Custody (COC). The asset number is 10270, while the COC listed 10220.

Air - GC/MS VOA
Methods TO 15 LL, TO-14A, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST **Log In Number:**

Review Items	Yes	No	NA	If No, what was the problem?
1. Are the shipping containers intact?	/			☐ **Containers, Broken**
2. Were ambient air containers received intact?			/	☑ Checked in lab
3. The coolers/containers custody seal if present, is it intact?			/	☐ Yes ☐ NA
4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C) Thermometer ID :_____ Correction factor: _____			/	☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel** ☐ **Cooler Out of Temp, Same Day Receipt**
5. Were all of the sample containers received intact?	/			☐ **Containers, Broken**
6. Were samples received in appropriate containers?	/			☐ **Containers, Improper; Client Contacted; Proceed/Cancel**
7. Do sample container labels match COC? (IDs, Dates, Times)	/			☐ **COC & Samples Do Not Match** ☐ **COC Incorrect/Incomplete** ☐ **COC Not Received**
8. Were all of the samples listed on the COC received?	/			☐ **Sample Received, Not on COC** ☐ **Sample on COC, Not Received**
9. Is the date/time of sample collection noted?	/			☐ **COC; No Date/Time; Client Contacted**
10. Was the sampler identified on the COC?	/			☐ **Sampler Not Listed on COC**
11. Is the client and project name/# identified?	/			☐ **COC Incorrect/Incomplete**
12. Are tests/parameters listed for each sample?	/			☐ **COC No tests on COC**
13. Is the matrix of the samples noted?	/			☐ **COC Incorrect/Incomplete**
14. Was COC relinquished? (Signed/Dated/Timed)	/			☐ **COC Incorrect/Incomplete**
15. Were samples received within holding time?	/			☐ **Holding Time - Receipt**
16. Were samples received with correct chemical preservative (excluding Encore)?			/	☐ **pH Adjusted, pH Included (See box 16A)** ☐ **Incorrect Preservative**
17. Were VOA samples received without headspace?			/	☐ **Headspace (VOA only)**
18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668) Chlorine test strip lot number:			/	☐ **Residual Chlorine**
19. For 1613B water samples is pH<9?			/	☐ If no, lab will adjust
20. For rad samples was sample activity info. Provided?			/	☐ Project missing info

Comments/Actions Taken

- Sample SV-171-A-22 is in canister 11270.

Section 1
Introduction

1.1 SITE LOCATION AND BACKGROUND INFORMATION

This report documents the monitoring activities completed from October 1, 2016 to March 31, 2017 [the 35rd and 36th quarters of operation] for the sub-slab depressurization systems operating in the Building A lay-up room (former plating shop), eastern area, and basement, and the Building C basement of the Lockheed Martin Corporation Middle River Complex in Middle River, Maryland. The locations of the systems are shown on Figure 1. These remedial systems control (by creating a vacuum) and remove volatile organic compounds from sub-slab vapor, thus preventing their migration into indoor air. The systems are operated in accordance with the operation, maintenance, and monitoring manuals for the Building A and Building C systems (Tetra Tech, Inc., 2016a and 2014, respectively).

1.2 DESCRIPTION OF SUB-SLAB DEPRESSURIZATION SYSTEMS

1.2.1 Building A System

The sub-slab depressurization system in Building A includes horizontal and vertical soil vapor extraction points: two horizontal soil vapor extraction laterals in the lay-up room (North and South), two laterals in the basement (Basement North and Basement South), and five vertical soil vapor extraction points (SSD-34-A, SSD-35-A, SSD-36-A, SSD-37-A, and SSD-38-A); see Figure 2.

The soil-vapor extraction points serve as conduits for drawing vapor from beneath the building slab, thus mitigating vapor intrusion into indoor air. Sub-slab vapors are pulled through the extraction points using a single 10-horsepower regenerative blower that is mounted on a skid along with a moisture separator, heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). Following extraction, the vapors enter the moisture separator where entrained condensate droplets are removed to reduce potential

fouling of vapor lines and saturation of the vapor-phase carbon. The extracted vapors are cooled as they are pushed through the heat exchanger and are then filtered to remove volatile organic compounds using four 400-pound granular activated-carbon drums, in two-by-two configuration (two parallel trains of two drums in series)[1]. Vapors are discharged to the atmosphere via an exhaust stack that extends above the roof of the building. Figure 3 shows the process and instrumentation diagram for the Building A sub-slab depressurization system.

The Building A system is also equipped with one drain for each of the granular activated-carbon drums and three pipe sumps (PS-1-A [near SSD-37-A], PS-2-A [near SSD-34-A], and PS-3-A [in the basement]) and one exhaust stack sump. The pipe sumps are installed at low points to allow accumulation and manual drainage of condensation in the pipe.

Three IQAir® GC™ Series-GC VOC indoor-air filters also operate in the basement of Building A near vapor monitoring points (VMPs) 093-A, 093 A-X, and 138-A, in response to elevated trichloroethene (TCE) concentrations in the indoor air. The filters were installed south of the sub-slab depressurization system extraction laterals on January 9, 2015, and are continuously operated to filter 300 standard cubic feet per minute (SCFM) of air. Each filter consists of a high-efficiency particulate air pre-filter, a granular activated-carbon filter, and a post-filter sleeve (collectively referred to as "filter elements"). The pre-filter (GC™ HyperHEPA® Pre-Filter H11 [S]) weighs three pounds; it removes coarse, fine, and ultra-fine dust particles and protects subsequent filters. The granular activated-carbon filter (GC VOC filter cartridge set) removes volatile organic compounds from indoor air; it is comprised of four granular activated-carbon cartridges, collectively weighing nine pounds. The post-filter sleeve (GC™ post-filter sleeve set) is placed over the granular activated-carbon cartridges; this filter removes any remaining fine and ultra-fine particulate matter.

1.2.2 Building C System

The sub-slab depressurization system in the Building C basement consists of 11 vertical soil vapor extraction points: two in the southern-basement area (SSD-21-C and SSD-23-C) and nine

[1] Originally, vapor treatment consisted of one train of two 400-pound carbon drums; the two-by-two configuration was completed in February 2017 to decrease pressure, increase flow of the system, and better capture VOCs; details are in Section 2.4.

in the mid-basement area (SSD-26-C, SSD-27-C, SSD-28-C, SSD-29-C, SSD-30-C, SSD-31-C, SSD-32-C, SSD-33-C, and SSD-34-C); see Figure 4. These extraction points serve as conduits for drawing vapor from beneath the building slab, thus creating a vacuum under the floor slab preventing vapor intrusion into indoor air. The vapors are pulled through the extraction points using a single 7.5-horsepower regenerative blower that is mounted on a skid along with a moisture separator, heat exchanger, filters, and vacuum, pressure, temperature, and flow gauges (collectively referred to as the "blower skid"). Following extraction, the vapors enter the first moisture separator (MS-1) where entrained condensate droplets are removed to reduce fouling of the vapor lines and saturation of the granular-activated carbon. The extracted vapors are cooled as they are pushed through the heat exchanger; any remaining extracted condensate droplets are removed via a second moisture separator (MS-2) [separate from the blower skid] before being treated. The vapors are treated by passing through two 400-pound granular activated-carbon drums and one 600-pound potassium permanganate-impregnated zeolite drum (to remove residual vinyl chloride), in-series, before being discharged to the atmosphere via an exhaust stack that extends above the roof of the building (Figure 5).

The Building C system is also equipped with one drain for each granular activated-carbon and potassium permanganate-impregnated zeolite drum, five pipe sumps (PS-1 [near SSD-25-C and column N26], PS-2 [near SSD-30-C and column N26], PS-3 [near SSD-27-C and column O20], PS-4 [near SSD-32-C and column R19], and PS-5 [near SSD-29-C and column V12]), and one exhaust stack sump. The sumps are installed at low points to allow drainage of condensation in the pipe.

Sound generated by the blower and heat exchanger is controlled by a sound-deadening enclosure that surrounds the blower skid of the Building C system. This enclosure has overlapping soundproof curtains supported on a wooden frame; its plywood roof is lined with one-inch-thick foam board. A vent on the side of the enclosure and a duct extending from the heat exchanger to the ceiling of the enclosure facilitate airflow and prevent the system from overheating.

Section 2
Site Activities

2.1 BIWEEKLY SYSTEM CHECKS

Biweekly system checks were conducted to monitor the performance of the sub-slab depressurization (SSD) systems and to make necessary adjustments to optimize effectiveness. System checks were conducted between October 1 and December 31, 2016 (the 35rd quarter of operation) on the dates listed below.

- October 5, 2016
- October 21, 2016
- November 3, 2016
- November 17, 2016
- December 1, 2016
- December 12 and December 14, 2016
- December 29, 2016

Biweekly system checks were conducted between January 1 and March 31, 2017 (the 36th quarter of operation) on the following dates:

- January 12 and 13, 2017
- January 23 and 27, 2017
- February 7 and 8, 2017
- February 21, 2017
- March 8, 2017
- March 23, 2017

Biweekly system checks were conducted in accordance with the latest operation, maintenance, and monitoring (OM&M) manuals (Tetra Tech, Inc. [Tetra Tech], 2016a and 2014), and included general system monitoring, vacuum influence monitoring, and any necessary adjustments to extraction laterals and wells. Biweekly system checks forms are in Appendix A.

2.1.1 General System Monitoring

Gauge readings on the blower skid were checked, and the vacuum and velocity at each extraction lateral/well were measured. The condition of system components was also checked, and moisture separators/sumps were emptied as necessary. The following specific tasks were performed:

1. Recorded:
    a. vacuum at pre-air filter
    b. vacuum at post-air filter
    c. pressure at post-blower
    d. temperature at post-blower
    e. temperature at post-heat exchanger
    f. system flow
    g. time counter display
    h. vacuum from each extraction lateral/well
    i. velocity from each extraction lateral/well
    j. vacuum from each vapor monitoring point (VMP)
2. Checked the following for damage, leaks, and/or signs of heat stress:
    a. system components
    b. granular activated-carbon (GAC) drums
    c. potassium permanganate-impregnated zeolite (PPZ) drum (Building C only)
    d. GAC and PPZ fittings and flexible hoses
3. Checked the following for condensate, and drained, as necessary:
    a. moisture separators
    b. pipe sumps
    c. exhaust stack sumps
    d. GAC and PPZ drains
4. Confirmed that zip-ties on the GAC- and PPZ-drum cam locks were present and secure
5. Confirmed that the ambient air valve was closed
6. Confirmed that the vacuum relief valve was closed
7. Noted any adjustments to extraction laterals/wells
8. Checked that flow, pressure, and vacuum gauges fell to zero, and that temperature gauges fell, when systems were turned off
9. Checked each of the three Building A IQAir® GC™ Series-GC indoor air filters to:

a. verify filter was on
b. verify fan was running
c. check control panel for filter-life status
d. document any signs of tampering

Approximately 279 gallons of water were drained from the Building A system during the reporting period. Approximately two gallons of water were drained from the Building C exhaust stack sump during the reporting period.

2.1.2 Vacuum Influence Monitoring

The objective for the SSD systems is to maintain a vacuum of at least 0.01 inches water column (WC) in the targeted areas. The vacuum influence (differential sub-slab vapor vacuum versus indoor air) at sub-slab VMPs was monitored using a dual[2]-port manometer (Fieldpiece Instruments, Inc. model SDMN5). This instrument was used to identify sub-slab-air short-circuiting or other problems (indicated by a significant drop in vacuum at one or more VMPs), and to determine each system's area of influence. Short-circuiting was not identified at the Building A or Building C SSD systems during this reporting period.

Vacuum influence in the Building A target areas consistently[3] exceeded the vacuum influence objective (0.01 inches WC) during the reporting period in the following monitoring points:

- At seven of eight VMPs in the layup room (SSD-12-A-X, SSD-11-A-X, SSD-13-A-X, SSD-2-A-X, SSD-15-A-X, SSD-16-A-X, and SSD-3-A-X) with vacuums ranging from 0.14 to 13.83 inches WC.
- At eight of 14 VMPs in the eastern area of Building A (166-A, 167-A, 165-A, 117-A, 164-A, 136-A-S, 161-A, and 160-A) with vacuums ranging from 0.01 to 2.76 inches WC.
- At two of four VMPs in the Building A basement (SSD-21-A and SSD-22-A) with vacuums ranging from 0.01 to 0.54 inches WC. Induced vacuum has not been consistent at the other VMPs (SSD-19-A and SSD-20-A), possibly because of high groundwater levels (typically one foot or less below the slab.

Figures 6 and 7 show induced vacuum in Building A over time. Negative vacuum (pressure)

[2] Only one port is used for monitoring vacuum influence; the second port is used to measure static pressure.

[3] Exceeded vacuum monitoring objective of 0.01 inches water column at more than half of the biweekly system checks.

readings were measured at VMP 163-A in the eastern area of Building A during most biweekly system checks, indicating higher pressure in the sub-slab than in the indoor air. Induced vacuum has not been observed at 119-A, 121-B, 162-A, 136-A, or 136-A-N, possibly because of the greater distance to the nearest extraction point for 119-A and 121-B. The reason for the lack of vacuum influence at 162-A, 136-A-N, and 163-A, is not clear but could be related to subsurface preferential pathways and heterogeneity. VMP 162-A was removed on July 14, 2016 after it was found to be loose; the vapor monitoring pin was reinstalled on July 25, 2016. However, during the subsequent system check on August 12, 2016, it was observed that new facility operations in the area made VMP 162-A permanently inaccessible. It will be replaced nearby during the next quarter.

Vacuum influence in the Building C target areas consistently exceeded the vacuum influence objective (0.01 inches WC) during the reporting period in the following monitoring points:

- At four of seven VMPs in the southern-basement area (001-C, SSD-2-C, SSD-3-C, and SSD-22-C) with vacuums ranging from 0.01 to 0.98 inches WC.
- At 14 of 20 VMPs in the mid-basement area (159-C, 135-C, 113-C, 156-C, 151-C, 149-C, 127-C, 152-C, 060-C, 155-C, 133-C, 154-C, 158-C, and 153-C.) with vacuums ranging from 0.00 to 4.68 inches WC.

On October 5, 2016, during a routine system check, it was observed that VMP SSD-4-C was covered by equipment moved to that area for storage and has not been accessible since. Negative vacuum[4] (pressure) readings were measured during some of the monitoring events at SSD-2-C, SSD-25-C, SSD-3-C, and 141-C. Figures 8 and 9 show induced vacuum in Building C over time.

Vacuum Summary

Induced vacuum measurements indicate that the systems are performing as designed, except near VMP SSD-136-A in the eastern area of Building A and near extraction points SSD-29-C and SSD-34-C in the northern end of the Building C mid-basement area. The sub-slab vapor extraction laterals in the Building A lay-up room induce a vacuum influence over an

[4] Negative vacuum readings indicate higher pressure in the sub-slab than in the indoor air, which may be related to subsurface heterogeneity or preferential pathways.

approximately 3,800-square foot area, and consistently encompass five of six VMPs that had elevated volatile organic compound (VOC) concentrations before system start-up. The extraction laterals in the Building A basement induce a vacuum influence over an approximately 2,000-square foot area, and consistently encompass two of four VMPs that measure the system's induced vacuum in the basement (Figure 10). The vertical extraction points in the eastern area of Building A induce a vacuum influence over an approximately 6,100-square foot area, and consistently encompass nine of 14 VMPs (Figure 11).

In Building C, the sub-slab vapor extraction points in the southern-basement area induce a vacuum influence over an approximately 3,000-square foot area, with four of seven VMPs showing consistent influence (Figure 12). Extraction points in the mid-basement area induce a vacuum influence over an approximately 32,000-square foot area, with 13 of 20 VMPs showing consistent influence (Figure 13). Vacuum influence at the northern end of the mid-basement area has not been apparent during monitoring; possible reasons include high groundwater levels, subsurface preferential pathways, short-circuiting, and/or blockages. However, VOC concentrations at VMP 126-C, at the northern end, have decreased by approximately 85 percent (%) since the system was expanded in May 2013.

2.1.3 Adjustments to Extraction Points

Vapor flow from the sub-slab soil vapor extraction points was adjusted during the reporting period as follows:

- November 3, 2016, December 1, 2016, January 13, 2017, and March 1, 2017: Due to issues related to the Building A blower (discussed in Section 2.4), vapor flow from the extraction laterals in the lay-up room and basement (North, South, Basement North and Basement South) was reduced during the periods that the system ran using a smaller spare blower. The flow from each extraction lateral was restored to its normal operating rate on March 1, 2017.

- February 21, 2017: To gain better influence in the Building C south area, the flow valve on extraction point SSD-21-C was completely closed and the flow valve on extraction point SSD-23-C was opened 100%.

2.2 VAPOR SAMPLING

Grab vapor samples were collected monthly at Building A and every other month at Building C during the reporting period. Samples were collected from each SSD system at the influent, mid-GAC, and effluent positions of the treatment drums. Samples were collected from the Building A SSD system on October 5, 2016, November 3, 2016, and December 14, 2016, January 13, 2017, February 8, 2017, and March 8, 2017. Samples were collected from the Building C SSD system on November 3, 2016, January 12, 2017, and March 8, 2017. Samples were collected directly from each sampling port using the following steps:

- A moisture filter was connected to the sampling port on one end, and a piece of Teflon® tubing was attached to the other end.
- A clean, one-liter Summa® canister under vacuum was connected to the tubing, and the canister valve was opened until the canister gauge reached zero or stopped falling (approximately one minute).

Samples were labeled A-INFLUENT, A-MID-GAC, A-EFFLUENT, C-INFLUENT, C-MID-GAC, and C-EFFLUENT and shipped to TestAmerica Laboratories, Inc. (TestAmerica) in Knoxville, Tennessee. TestAmerica is accredited through the National Environmental Laboratory Accreditation Program and United States Department of Defense Environmental Laboratory Accreditation Program for VOC analysis by United States Environmental Protection Agency Toxic Organic Method 15 (TO-15).

Laboratory results are summarized in Tables 1 through 6; analytical reports are in Appendix B. During this reporting period, total influent VOC concentrations in Building A ranged from 1,205 micrograms per cubic meter (µg/m^3) (October 2016) to 6,656 µg/m^3 (January 2017), while VOC influent concentrations in Building C ranged from 83 µg/m^3 (March 2017) to 150 µg/m^3 (November 2016). Average influent VOC concentrations in Building A were approximately 61% higher than those observed during the previous reporting period (April 1, 2016 through September 31, 2016), while average influent concentrations for the Building C system were approximately 30% lower.

2.3 QUARTERLY SYSTEM CHECKS

Quarterly system checks were completed on December 12, 2016 and March 15, 2017. Quarterly system checks included the following tasks:

1. Inspected the condition of the:
    a. system components
    b. system piping
    c. pre-blower air filter and intake (ambient) air filter; replacing filter(s) as necessary
    d. GAC and PPZ drums
    e. GAC and PPZ drum sample ports
    f. VMP well lids, bolts, and sample tubing
2. Checked that the Building A system shuts down, the control panel alarm lights illuminate, and the auto-dialer activates upon alarms for:
    a. high temperature – post-blower
    b. high temperature – post-heat exchanger
    c. high-water level – moisture separator
    d. high pressure
    e. low vacuum
3. Checked that the Building C system shuts down, the control panel alarm lights illuminate, and the auto-dialer activates upon alarms for:
    a. high temperature – post-blower
    b. high temperature – post-heat exchanger
    c. high-water level – MS-1
    d. high-water level – MS-2
    e. high pressure
    f. low vacuum
4. Checked vacuum relief valves for proper operation
5. Recorded amperage draw on blowers
6. Checked that auto-dialers activate when power is turned off
7. Checked auto-dialer batteries and replaced, as necessary
8. Confirmed that a fire extinguisher is next to each system
9. Vacuumed the underside of the heat exchanger
10. Cleaned the systems and areas around the systems

No issues were identified for Building A or Building C during the quarterly system checks except those indicated in Section 2.4. Both systems are running within the normal operating

parameters. Quarterly system checks forms are in Appendix A.

2.4 NON-ROUTINE SYSTEM MAINTENANCE

2.4.1 Building A Blower Replacement

The Building A SSD system was found non-operational during the routine system check on October 21, 2016. Through the time counter display on the control panel, it was estimated that the system had shut down on October 19, 2016. The autodialer did not call out due to corroded and non-working batteries found on October 21, 2016. Electrical measurements from inside the system control panel revealed that two of three fuses had blown; new fuses were ordered. Initial diagnosis via teleconference with Gasho, the blower manufacturer representative and vendor, indicated possible blower failure. The blower failure and autodialer battery issues were unusual given that they had been replaced with new units earlier in the year (in April 2016 as part of the second-phase expansion of the Building A SSD system) and based on continued system operation since its installation in 2008.

On October 24, 2016, additional troubleshooting was conducted before installing the new blower fuses. This including manually rotating the blower fan blades to confirm that the blower had not seized and inspecting the condition of the wires inside the blower electrical box. The blower fan blades moved freely, and the wires in the blower electrical box showed signs of heat stress. However, they were not obviously damaged otherwise, so a re-start was attempted. The new fuses were installed and the system was restarted. Upon restart, the same two blower fuses immediately blew, allowing only the heat exchanger to run. The heat exchanger remained in operation for less than a minute and then shut down, as designed, due to a low vacuum alarm. The autodialer batteries were replaced and the autodialer was confirmed to operate properly.

On October 25, 2016, S&S Technologies, Inc., the SSD system installation contractor, inspected the system to confirm blower failure. During the inspection, the fuses were replaced again, and the system was restarted with the GAC drums offline and the dilution valve fully open (to confirm that the issue was not back-pressure). Upon restart, the same two fuses immediately blew. Electrical measurements from inside the control panel showed that the system was pulling the proper amps/voltage. Based on this information, S&S was able to confirm blower failure.

Subsequently, Gasho was contacted to initiate return of the blower to the manufacturer (Ametek) for repair.

On October 30, 2016, S&S removed the blower from the system and shipped it to the manufacturer. To expedite installation, S&S transferred a rental blower (Ametek model DR858AY72W) from Gasho in Pennsylvania to the site on November 2, 2016. To accommodate the smaller rental blower, the influent and effluent piping connecting to the blower were reduced from 4-inch to 2.5-inch diameter. The system was restarted with the rental blower on November 3, 2016. The flow at each vapor extraction point was adjusted to optimize vacuum influence and a system check was conducted. Gasho reported that an electrical issue within the failed blower motor had caused it to operate as a single-phase motor instead of the necessary three-phase motor.

The blower was repaired under the manufacturer's warranty by replacing the blower motor with a new motor. The repaired blower was installed on December 1, 2016; the rental blower was purchased and stored in Building C as a back-up blower[5]. To help ensure the autodialer for each SSD system is working properly, autodialer battery checks were added to the biweekly system checks and a call to each system twice per week (between biweekly checks) was added to the operation to confirm the systems are running.

On January 12, 2017, the system was found non-operational during a routine system check due to a recurrence of the blower motor failure. Through the time counter display on the control panel, it was determined that the system had shut down on January 10, 2017. The autodialer had not properly called out upon the shutdown. The failed blower (unit previously repaired by Ametek) was replaced with the spare blower and the system restarted on January 13, 2017.

The failed blower was shipped to the manufacturer on January 27, 2017. The manufacturer determined that the blower motor had failed potentially due to power-supply voltage fluctuations. The manufacturer replaced the motor with a new motor. The repaired blower was

[5] The spare blower will fit both the Building A and Building C SSD systems in the event of a blower failure.

re-installed in the system equipment skid and normal system operation resumed on March 1, 2017. Per discussions with Lockheed Martin, the following Building A SSD system modifications were implemented to minimize the potential for future blower motor failure:

- February 7, 2017: The vapor treatment components (including piping) were modified from a single treatment train to two parallel treatment trains (each train consisting of two 400-pound GAC drums in series) to decrease pressure on the blower, increase system flow, and to better capture VOCs.
- March 1, 2017: A voltage monitor was installed to monitor possible power fluctuations at Building A SSD system.

In addition, a second moisture separator (post-blower and post-heat exchanger) will be installed in the next quarter to remove any remaining extracted condensate droplets in the vapor stream before being treated. This will minimize pressure buildup in the GAC drums.

2.4.2 Other Non-Routine Maintenance

The following non-routine system maintenance was completed during the reporting period:

- November 17, 2016: A ball valve was installed in the system's influent flow line of each SSD system to aid in quarterly alarm testing of the vacuum relief valve. The original sample port on extraction point SSD-33-C was plugged and a new point was drilled and tapped. VMP-113-C was found to be sunken and was raised with concrete grout. The secondary containment pad for the spent air filters and drained condensate drums was moved indoors next to the Building C SSD system with facility approval to prevent rainfall accumulation in the containment pad.
- December 12, 2016: The Building C main disconnect was broken during routine quarterly checks on December 12, 2016 rendering the Building C SSDS inoperable. The main disconnect was replaced and the system restarted on December 14, 2016.

2.5 GAC AND PPZ CHANGE-OUTS

GAC change-outs were conducted for Building A on November 11, 2016, January 12, 2017, and February 7, 2017; no GAC change-outs were necessary for Building C during the reporting period. The November 11, 2016 and January 12, 2017 change-outs were conducted based on the November and December 2016 sampling results. The February 7, 2017 change-out was completed at the time the second GAC vapor treatment train was added to provide three new and one relatively unused GAC drums in the new configuration.

The change-outs were conducted by removing the lead GAC drum (the spent drum) from the

system, moving the lag GAC drum into the lead GAC position, and adding a new GAC drum to the lag GAC position. The Building C PPZ drum was not changed out during the reporting period. The spent GAC will be returned to the vendor for regeneration.

2.6 SYSTEM SHUTDOWNS

2.6.1 Operator-Controlled Shutdowns

Both systems were briefly turned off during each biweekly system check to: (1) confirm that flow, pressure, and vacuum gauges fall to zero (thereby indicating proper operation), and (2) check and drain (as necessary) condensate accumulation in the moisture separators and sumps. Both systems were also briefly turned off during the quarterly system checks to test proper operation of the fail-safe alarms. In addition, the Building A and Building C SSD systems were shut down on the following days for semi-annual sub-slab vapor and indoor air sampling events:

- February 27-28, 2017: The Building C system was shutdown for approximately 32.3 hours for the semi-annual sub-slab vapor and indoor air sampling event.
- March 7-8 2017: The Building A system was shut down for approximately 20.6 hours for a sub-slab and indoor air sampling event in the basement.

2.6.2 Alarms and Other Shutdowns

The following alarms and other shutdowns occurred during the reporting period:

- October 19-November 2, 2016: The Building A system was down for approximately 337 hours due to the blower failure discussed in Section 2.4.
- December 1, 2016: The Building A SSD system was shut down for approximately two hours to re-install the repaired blower.
- December 15, 2016: The Building C SSD system was down for approximately seven hours due to a power outage in the building.
- December 21, 2016: The Building C SSD system was down for approximately three hours due to a power outage in the building.
- January 10-15, 2017: The Building A SSD system was down for approximately 61 hours due to a recurrence of the blower motor failure on January 10, 2017. The system was restarted on January 15, 2017 after the spare blower was installed.
- January 20-23, 2017: The Building C SSD system was down for approximately 63 hours due to a power outage in the building on January 20, 2017. The system was restarted after

power was restored on January 23, 2017.

- January 27, 2017: The Building A SSD system was shut down for approximately two hours to replace the autodialer's wireless phone terminal antenna and power supply.

- February 7, 2017: The Building A system was shut down for approximately nine hours to modify the vapor treatment from one GAC treatment train to two parallel GAC treatment trains.

- February 17-18, 2017: A high water level alarm on February 17, 2017 caused the Building A system to shut down for approximately 16 hours. The system was restarted on February 18, 2017 after removing approximately 50 gallons of water.

2.6.3 System Uptime

During this reporting period, the Building A and Building C SSD systems were operational for approximately 3,865 hours (89%) and 4,190 hours (96%), respectively. Downtime does not include the brief shutdown periods for biweekly and quarterly system checks.

2.7 REMEDIATION SUMMARY

2.7.1 Building A System

Continuous operation of the SSD system in the Building A lay-up room (former plating shop) began on March 31, 2008; the SSD system was expanded on October 22, 2010 to include the basement and on April 13, 2016 to include select areas on the eastern side of the building. On February 7, 2017 the GAC drums were modified to add a second parallel treatment train (with two 400-pound GAC drums in series) to increase flow and decrease pressure on the new blower. Building A extraction points are open to allow a combined airflow rate of approximately 360 standard cubic feet per minute (SCFM). Each extraction point operates at an airflow rate of 7–85 SCFM; the system vacuum and flows are adjusted to maintain a vacuum of 0.01 inches water column (WC) or greater at each vapor monitoring point within areas where elevated concentrations of volatile organic compounds (VOCs) are in sub-slab soil.

Since system startup on March 31, 2008, total influent VOC concentrations have decreased more than 98%, from 94,310 µg/m^3 to 1,865 µg/m^3. The addition of the basement extraction laterals in October 2010 did not appear to change influent concentrations. The system expansion in April 2016 including a higher-flow blower and five new vertical extraction points resulted in an increase in Building A influent system concentration for approximately one month. The two

main chemicals of concern in Building A are 1,1,1-trichloroethane and trichloroethene (see Table 1). VOC trends for the Building A system are shown in Tables 1 through 3 and on Figure 14.

VOC mass removal rates (based on influent concentrations) in Building A ranged from 0.029 to 0.117 pounds per day (lbs/day) during this reporting period. The total VOC mass removed was approximately 11.3 pounds; total VOC removal since system startup in March 2008 is approximately 152 pounds. VOC mass removal rates are lower than the levels (20 lbs/day VOCs) that require Maryland Department of Environment (MDE) permitting.

2.7.2 Building C System

Continuous operation of the SSD system in the southern-basement area of Building C began on March 31, 2008; the system was expanded to the mid-basement area in May 2013. Extraction points were installed at locations that maximized vacuum influence (based on startup tests). The total flow rate of the Building C system is approximately 180 SCFM. Extraction well SSD-23-C in the southern-basement area was shut off after the expansion to promote higher flow rates from the new wells installed in the mid-basement area. Vacuum influence in the southern-basement area was maintained by the operation of well SSD-21-C only until February 21, 2017 when SSD-23-C was reopened and SSD-21-C was closed. Vacuum influence and flow rates in the mid-basement area have increased and stabilized since system expansion. On November 7, 2013, mid-basement wells SSD-27-C and SSD-32-C flow rates were reduced to promote higher flow rates from other extraction wells in the mid-basement area. In April 2016, flows at mid-basement extraction points SSD-26-C and SSD-30-C were also reduced to promote high flows from other extraction points. These efforts have been done in an attempt to improve vacuum influence and VOC mass removal in the northern extraction points.

From system startup on March 31, 2008 to April 8, 2013, and before the system expansion, total influent VOCs had decreased by 99%, from 31,170 µg/m^3 to 117 µg/m^3. VOC concentrations increased to 3,100 µg/m^3 after the system was expanded, but have since decreased to 85 µg/m^3 (a 97% decrease). Trichloroethene is the primary chemical of concern in Building C (see Table 4). VOC trends for the Building C system are shown in Tables 4 through 6 and on Figure 15.

Mass removal rates for VOCs in Building C during this reporting period ranged from 0.001 to

0.003 pounds per day, for a total mass of approximately 0.323 pounds. Total VOC removal since system startup in March 2008 is 11 pounds. Building C VOC removal rates are lower than levels requiring MDE permitting (20 lbs/day VOCs, 20 pounds per year vinyl chloride).

2.7.3 Indoor Air Filters in Building A

Three IQAir® GC™ Series-GC indoor air filters operate in the basement of Building A near VMPs 093-A, 093-A-X, and 138-A (south of the SSD system extraction trenches). While in operation, the filters were inspected every two weeks. The high-efficiency particulate air (HEPA) pre-filters, GAC cartridges, and post-filter sleeves were replaced on December 29, 2016 and March 15, 2017. The spent filter elements were placed in a dedicated 55–gallon drum in the designated drum storage area at the Building C SSD system. This waste drum was inspected during the biweekly system checks to ensure it was properly labeled and in good condition. Results from GAC cartridge and post-filter sleeve sampling in June 2015 and HEPA pre-filter sampling in November 2015 indicate that all spent filters can be disposed of as non-hazardous waste.

Section 3
Conclusions and Recommendations

3.1 SYSTEM PERFORMANCE

Induced vacuum measurements indicate that the sub-slab depressurization systems are performing as designed, except near SSD-136-A in the eastern area of Building A and near SSD-29-C and SSD-34-C in the northern end of the Building C mid-basement area. Soil vapor extraction points in the Building A lay-up room induce a vacuum influence over an approximately 3,800-square foot area, and consistently encompass all five vapor-monitoring points that had elevated volatile organic compound concentrations before system startup. The soil vapor extraction points in the Building A basement induce a vacuum influence over an approximately 2,000-square foot area that encompasses two of four vapor monitoring points installed to measure the system-induced vacuum in the basement (Figure 10). The soil vapor extraction points in the eastern area of Building A induce a vacuum influence over an approximately 6,100-square foot area, and consistently encompass nine of 14 VMPs used to measure the system-induced vacuum in that area (Figure 11). The soil vapor extraction points in the southern-basement area of Building C induce a vacuum influence over an approximately 3,000-square foot area, with five of seven vapor monitoring points showing influence (Figure 12). The soil-vapor extraction points in the mid-basement area of Building C induce a vacuum influence over an estimated 32,000-square foot area, with 13 of 20 vapor monitoring points showing influence (Figure 13).

The sub-slab depressurization systems have removed volatile organic compound mass, and have treated emissions with granular-activated carbon (both buildings) and potassium permanganate-impregnated zeolite (Building C only). A summary of the granular activated-carbon drums used during the lifespan of each system follows:

	Number of granular-activated-carbon drums used	
	200-pound drums	400-pound drums
Building A	23	13
Building C	17	4

The 600-pound potassium permanganate-impregnated zeolite drum in Building C has not been changed out since its installation in April 2013. The drum counts listed above do not include the granular-activated carbon drums currently attached to each system, or the potassium permanganate-impregnated zeolite drum currently attached to the Building C system.

The Building A system has used approximately 64 pounds of granular activated-carbon per pound of volatiles removed, while the Building C system has used approximately 441 pounds of granular activated-carbon per pound of volatiles removed. Note that the removal efficiency of granular-activated carbon is reduced as vapor concentrations decrease. Although influent concentrations of volatile organic compound for both systems have decreased significantly since startup (March 31, 2008), concentration fluctuations have occurred over time (see Figures 14 and 15).

3.2 CONTINUED MONITORING

The Building A and Building C systems will continue to operate during the next semi-annual reporting period (April 1, 2017 through September 30, 2017) so that the vapor migration barrier in both buildings is maintained. Operation, maintenance, and monitoring activities conducted during the next reporting period will include biweekly system checks, quarterly system checks, system maintenance, monthly vapor sampling in Building A, and bimonthly (every other month) vapor sampling in Building C. Granular activated-carbon change-outs will occur when the concentration of the sample collected at the mid-point drum reaches 50 percent of the influent concentration, or as determined based on change-out history and laboratory result trends especially TCE adsorption effectiveness trends. Change-out of the potassium permanganate-impregnated zeolite drum is not expected during the next reporting period. The next remedial action progress report will be issued in October 2017.

3.3 FUTURE PLANS

We will continue to analyze vacuum influence and concentrations to optimize operation of the Building A and Building C SSD systems. In addition, per discussions with Lockheed Martin, we are planning on the following changes at the Building A system in the first half 2017:

- Addition of a moisture separator on the pressure side of the blower (post-blower and post-heat exchanger) to prevent condensate accumulation in the carbon drums;
- Extension of the header pipe and installation of an extraction point near vapor monitoring point 168-A; and,
- Extension of the header pipe to the southern end of the basement (where the indoor air filters are operating) for testing vapor removal from ducts/sumps and potential sidewall extraction points.

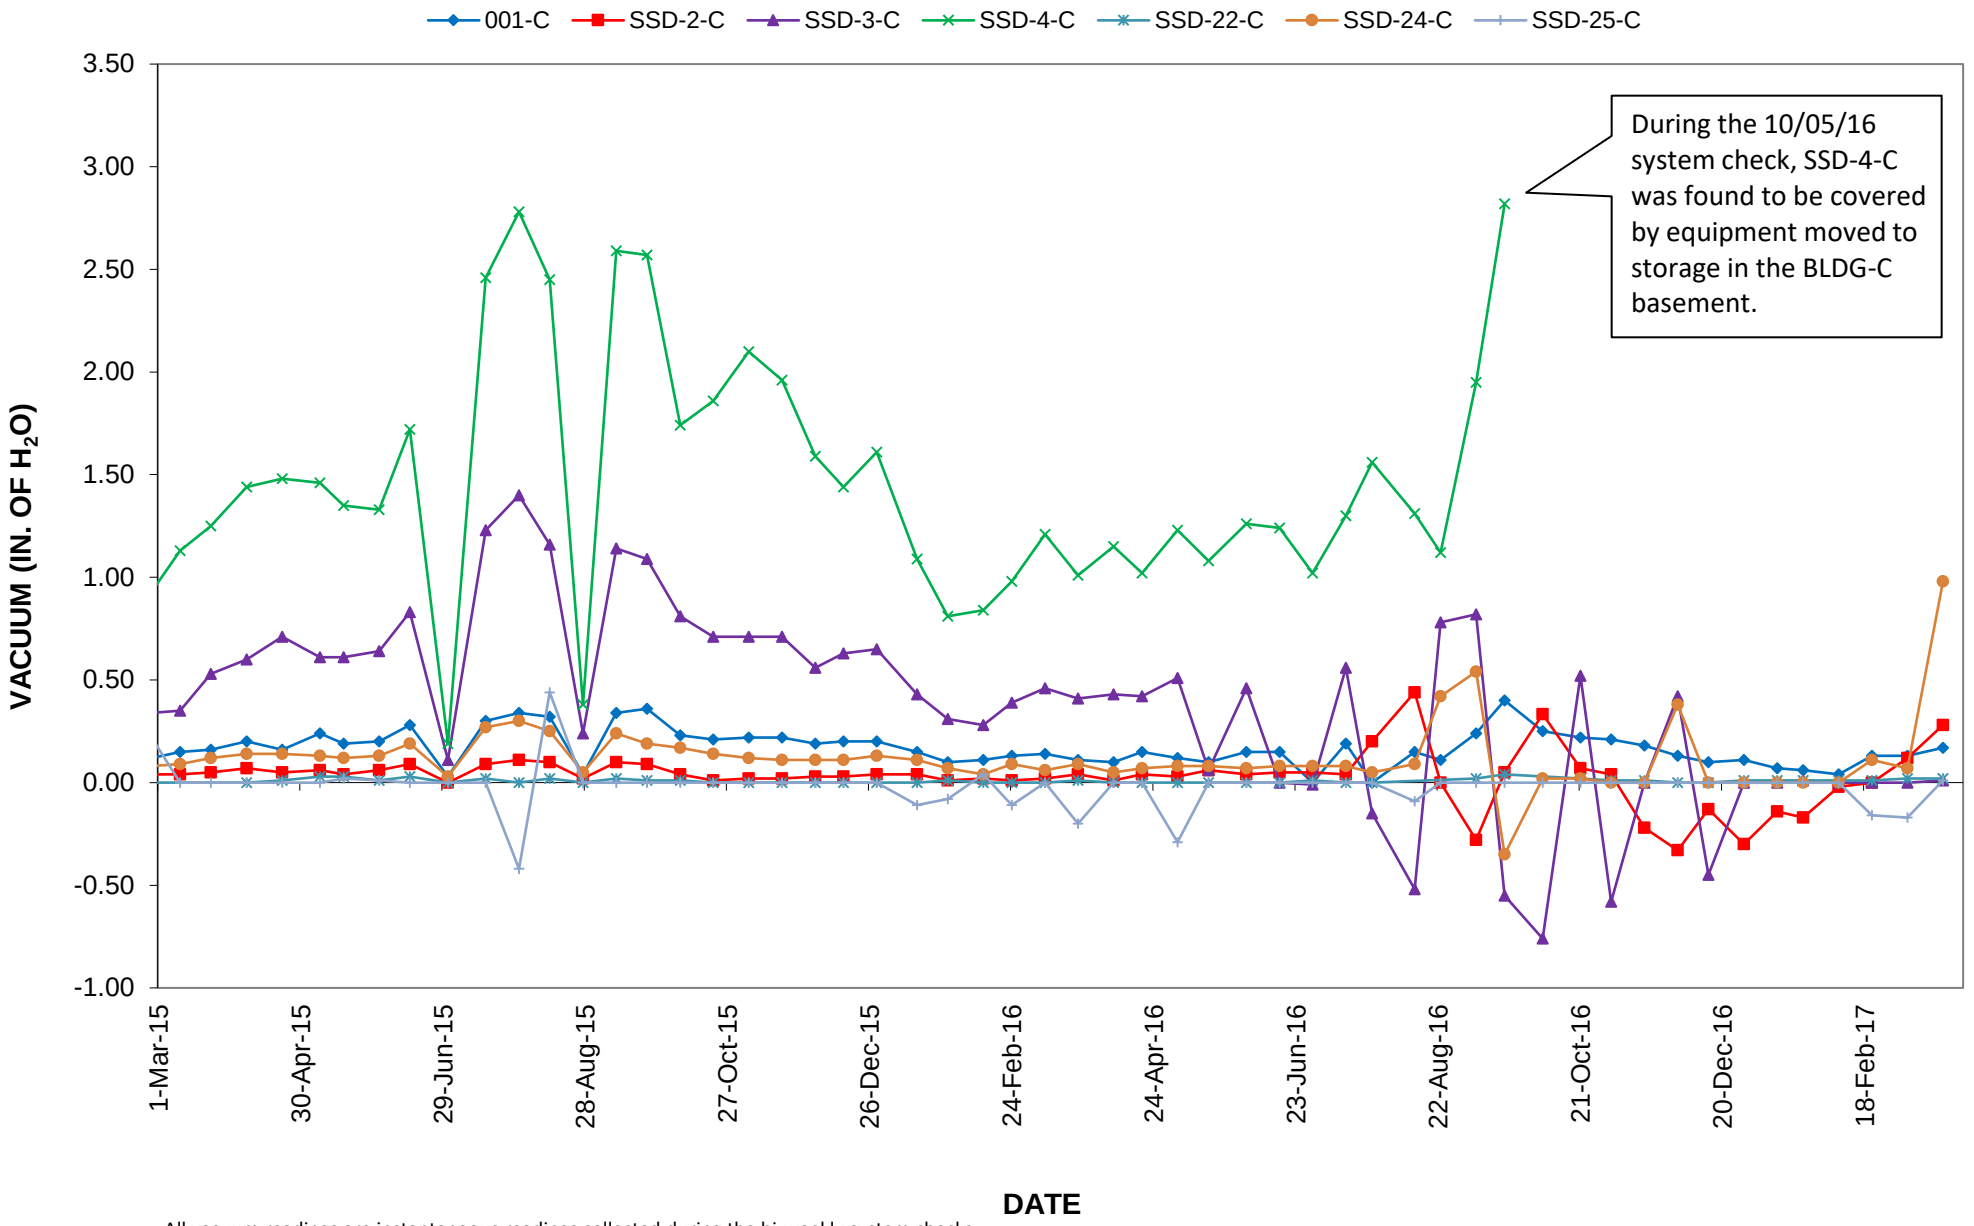
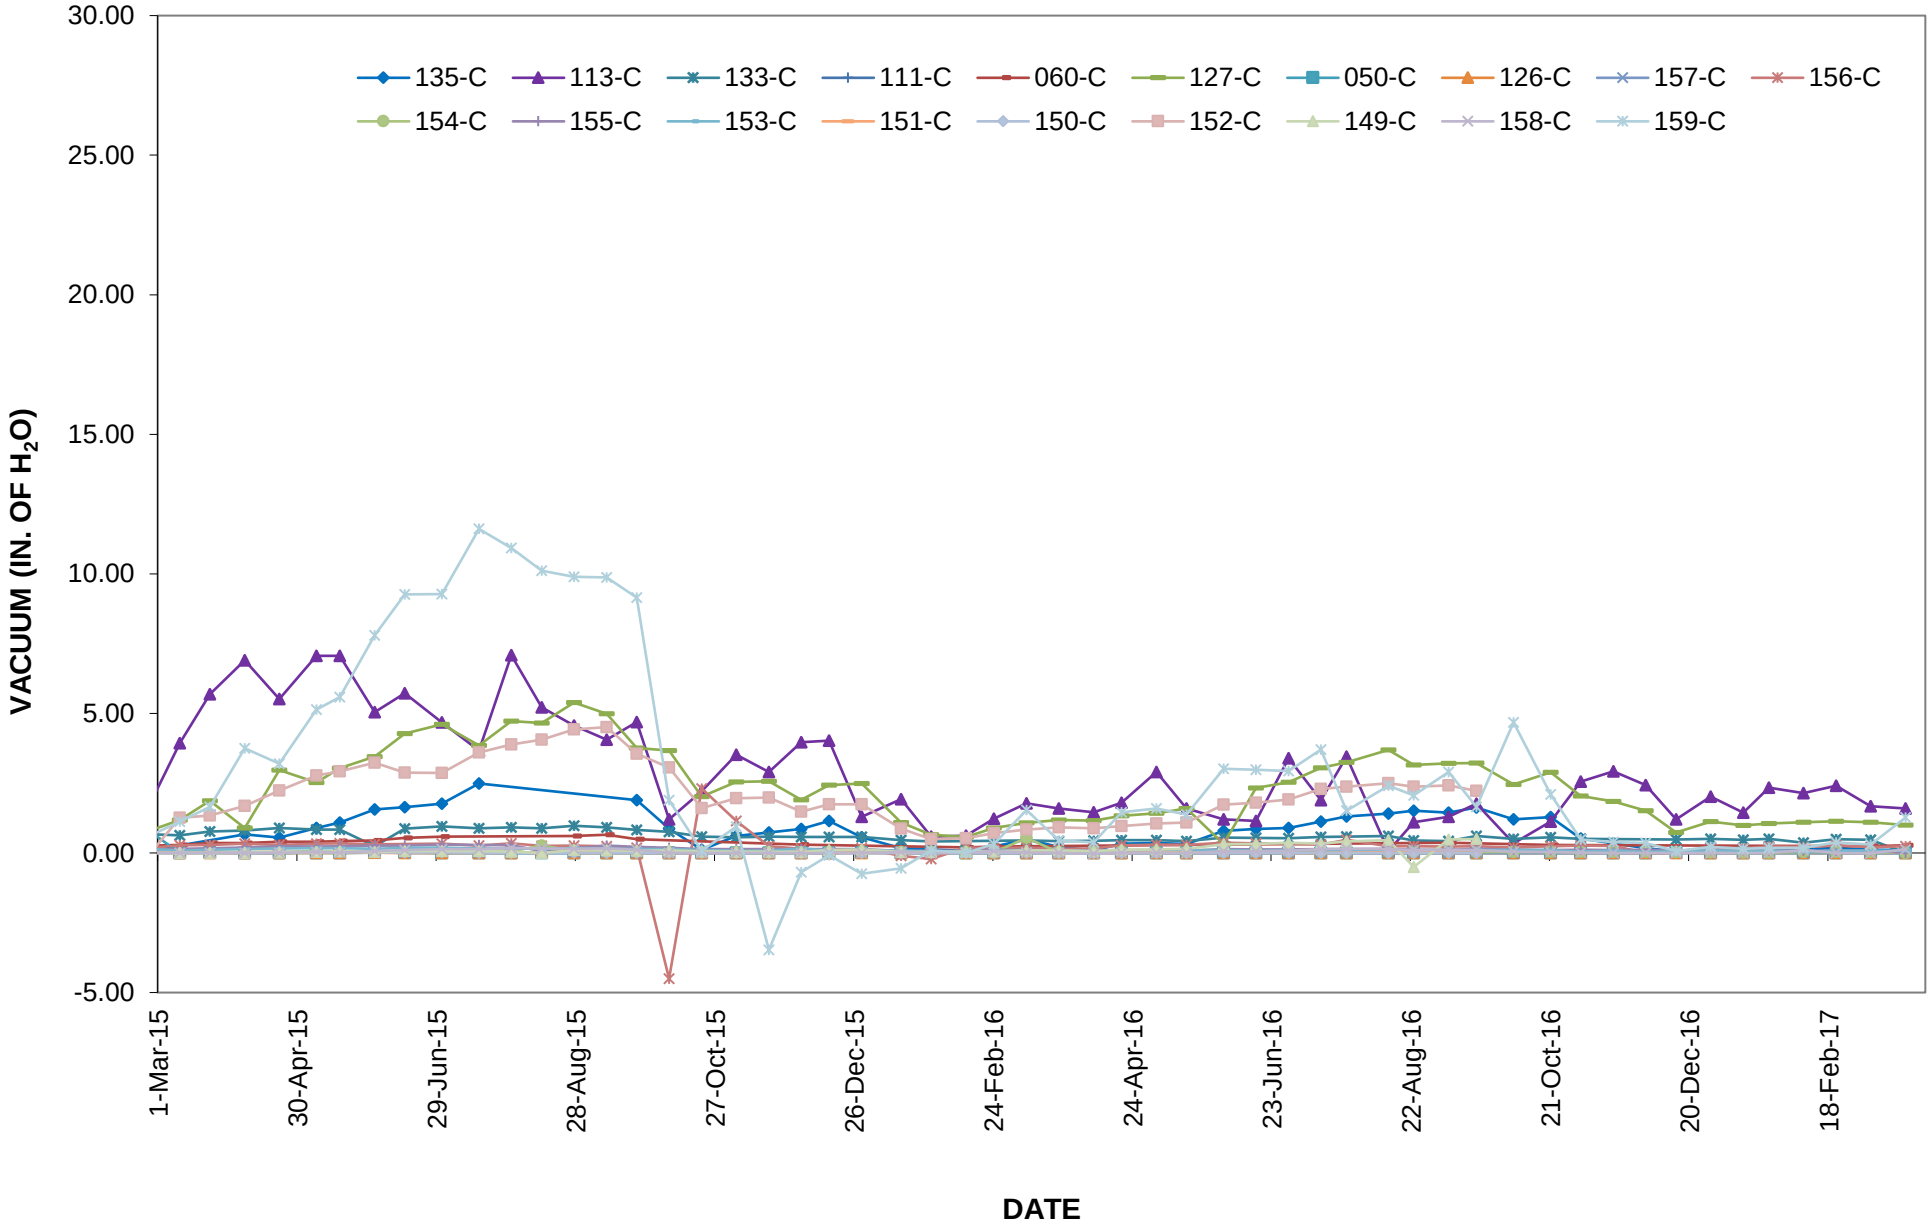
FIGURE 6
INDUCED VACUUM
MARCH 2015 TO MARCH 2017
BUILDING A SSD SYSTEM - LAY-UP ROOM AND BASEMENT



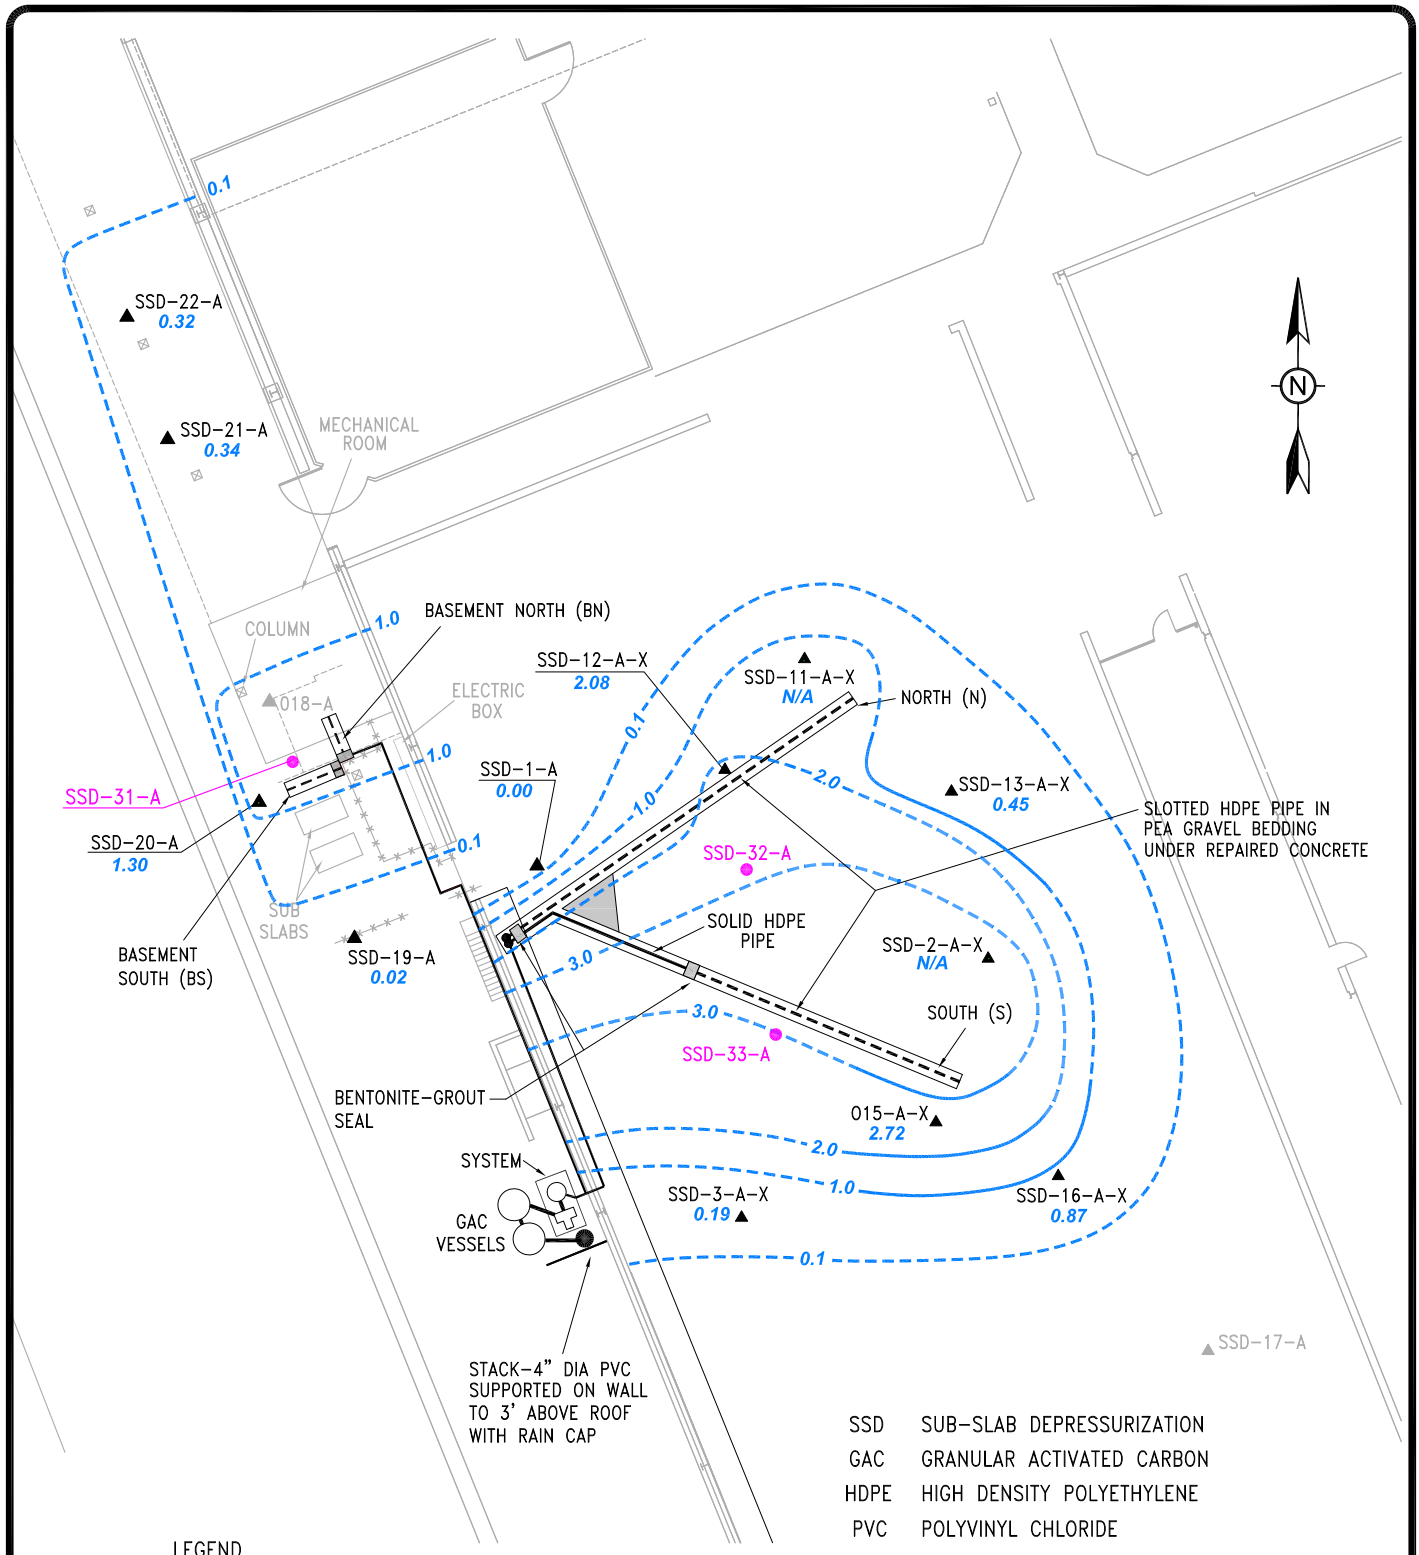
All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
Only the past two years of vacuum data are depicted above.
Increase in vacuum influence beginning April 4, 2016 a result of the installation and operation of the larger blower skid associated with the second-phase expansion.
** NOTE: As of May 18, 2015, all vacuum readings for SSD-11-A, SSD-12-A, SSD-13-A, 015-A, SSD-16-A, SSD-2-A, and SSD-3-A were taken from the SSD-11-A-X, SSD-12-A-X, SSD-13-A-

FIGURE 7
INDUCED VACUUM
APRIL 2016 TO MARCH 2017
BUILDING A SSD SYSTEM - EASTERN AREA



All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
VMPs we included in bi-weekly system checks upon start-up of the second-phase expansion on April 13, 2016.

FIGURE 8
INDUCED VACUUM
MARCH 2015 TO MARCH 2017
BUILDING C SSD SYSTEM - SOUTHERN BASEMENT AREA



All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
Only the past two years of vacuum data are depicted above.

FIGURE 9
INDUCED VACUUM
MARCH 2015 TO MARCH 2017
BUILDING C SSD SYSTEM - MID-BASEMENT AREA

All vacuum readings are instantaneous readings collected during the bi-weekly system checks.
Sub-slab vapor monitoring points routinely monitored beginning May 1, 2013 following second-phase system expansion in the middle basement area of Building C.

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

DL - dilution analysis

E - results exceeded calibration range

EPA - United States Environmental Protection Agency

GAC - granular activated-carbon

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

lbs./day - pounds per day

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

scfm - standard cubic feet per minute

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

Completed first-phase system expansion (to Building A basement) on October 22, 2010.

Completed second-phase system expansion (to eastern area) on April 13, 2016.

Increase in concentrations following 19-day system shutdown due to blower failure. Blower was replaced on 4/8/13.

Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

DL - dilution analysis

E - results exceeded calibration range

EPA - United States Environmental Protection Agency

GAC - granular activated-carbon

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

lbs./day - pounds per day

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

scfm - standard cubic feet per minute

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

E - results exceeded calibration range

EPA - United States Environmental Protection Agency

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

lbs./day - pounds per day

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

The chlorodifluoromethane and 1,2,3-trimethylbenzene concentrations reported in the 12/5/2013 sample were reported as tentatively identified compounds and were converted from 238 ppbv and 2.3. ppbv, respectively.

Samples not collected in May 2014 and August 2014 as system was shut down due to firewater line break.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

EPA - United States Environmental Protection Agency

lbs. - pounds

lbs./day - pounds per day

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

scfm - standard cubic feet per minute

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

Sampling not conducted in July 2012 due to system shutdown test.

Completed first-phase system expansion on October 31, 2012.

Completed second-phase system expansion on May 10, 2013.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

3/8/17	5.3	ND	4.4	0.66 J	1.7	2.6	0.69 J	ND	ND	0.66 J	2.4 J	ND	70	4.4	ND	ND	5.3	0.55 J	N/A	ND	ND	ND	ND	3.8	N/A	N/A	102	0.001

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

EPA - United States Environmental Protection Agency

GAC - granular activated carbon

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

lbs./day - pounds per day

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

Sampling not conducted in July 2012 due to shutdown test.

November 2012 sample collected while four new extraction wells installed in October 2012 were operating (November 5-26, 2012). Wells temporarily closed until May 16, 2013.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

3/8/17	5.0	ND	4.4	0.61 J	0.5 J	2.8	1.7	ND	0.36 J	1.1 J	2.9 J	ND	ND	ND	7.9	ND	ND	0.72 J	ND	ND	ND	2.7	1.0 J	ND	1.4	N/A	N/A	33	0.000

Notes:

µg/m^3 - micrograms per cubic meter

B - compound was found in the blank and sample

EPA - United States Environmental Protection Agency

lbs./day - pounds per day

J - result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value

N/A - not applicable (samples not analyzed for compound)

ND - non-detect (below detection limit)

OM&M - operation, maintenance, and monitoring

SSD - sub-slab depressurization

TO-15 - Toxic Organic Method 15

VOCs - volatile organic compounds

Sampling not conducted in July 2012 due to system shutdown test.

November 2012 sample collected after the potassium permanganate zeolite (PPZ) unit. PPZ unit was taken offline prior to the December 2012 sample.

Samples analyzed from 4/2/08 to 11/7/13 and from 7/1/15 to present analyzed by TestAmerica, Inc. of Knoxville, TN.

Samples analyzed from 12/5/13 to 6/2/15 analyzed by Pace Analytical Services, Inc. of Minneapolis, MN.

APPENDIX A— BIWEEKLY AND QUARTERLY SYSTEM CHECK FORMS

SSD SYSTEM CHECK - BUILDING A

LMC Middle River Complex, Middle River, Maryland

Date: 10-5-16 **Time:** 1230 **Personnel:** JMW

1. **Was the system running upon arrival?** (YES) NO
2. **Where there any alarm conditions upon arrival?** YES (NO)
   Comment: _____
3. **Is the blower vacuum relief valve open?** YES (NO)
4. **Is the dilution valve open?** YES (NO) % Open: _____
5. **Are there any leaks or damage to system hoses?** YES (NO)
6. **Is there any damage to system components?** YES (NO)
7. **Are all locks and zip-ties secure?** (YES) NO
8. **Was there a GAC change out?** YES (NO)
9. **How many GAC units are at this location?** NEW _____ SPENT _____
10. **Do the these fall to zero when system is turned off?**
    Flow Gauge (YES) NO
    Pressure Gauge (YES) NO
    Vacuum Gauges (YES) NO
11. **Do the temp. gauges fall when system is turned off?** (YES) NO
12. **Does the heat-exchanger have dust on the underside?** (YES) NO
13. **Was the underside of the heat-exchanger vacuumed?** (YES) NO

Comment: _____

GENERAL SYSTEM MONITORING

Vacuum pre-Filter (in. H_2O)	Vacuum post-Filter (in. H_2O)	Diff Pressure of Filter* (in. H_2O)	Temp post-Blower (°F)	Temp post-HE (°F)	Pressure (in. H_2O)	Flow (scfm)	Time Counter Display (hours)
37	44	7	155	90		270	4291.6

SSD SYSTEM CHECK - BUILDING A

LMC Middle River Complex, Middle River, Maryland

Date: 10/21/16 **Time:** _____ **Personnel:** DM

1. Was the system running upon arrival?
YES NO

2. Where there any alarm conditions upon arrival?
YES NO

Comment: _____

3. Is the blower vacuum relief valve open?
YES NO

4. Is the dilution valve open?
YES NO % Open: _____

5. Are there any leaks or damage to system hoses?
YES NO

6. Is there any damage to system components?
YES NO

7. Are all locks and zip-ties secure?
YES NO

8. Was there a GAC change out?
YES NO

9. How many GAC units are at this location?
NEW 3 SPENT 0

10. Do the these fall to zero when system is turned off?

Flow Gauge	YES	NO
Pressure Gauge	YES	NO
Vacuum Gauges	YES	NO

11. Do the temp. gauges fall when system is turned off?
YES NO

12. Does the heat-exchanger have dust on the underside?
YES NO

13. Was the underside of the heat-exchanger vacuumed?
YES NO

Comment: _____

SSD SYSTEM CHECK - BUILDING A

LMC Middle River Complex, Middle River, Maryland

Date: 12-29-16 **Time:** 1145 **Personnel:** JMW

1. Was the system running upon arrival?
YES NO

2. Where there any alarm conditions upon arrival?
YES (NO)

Comment: _____

3. Is the blower vacuum relief valve open?
YES (NO)

4. Is the dilution valve open?
YES (NO) % Open: _____

5. Are there any leaks or damage to system hoses?
YES (NO)

6. Is there any damage to system components?
YES (NO)

7. Are all locks and zip-ties secure?
(YES) NO

8. Was there a GAC change out?
YES (NO)

9. How many GAC units are at this location?
NEW 2 SPENT 1

10. Do the these fall to zero when system is turned off?

Flow Gauge	YES	NO
Pressure Gauge	YES	NO
Vacuum Gauges	YES	NO

11. Do the temp. gauges fall when system is turned off?
YES NO

12. Does the heat-exchanger have dust on the underside?
YES NO

13. Was the underside of the heat-exchanger vacuumed?
YES NO

Comment: _____

SSD SYSTEM CHECK - BUILDING A

LMC Middle River Complex, Middle River, Maryland

Date: 2-27-17 **Time:** 1215 **Personnel:** JMW

1. **Was the system running upon arrival?** (YES) NO
2. **Where there any alarm conditions upon arrival?** YES (NO)
   Comment: _____
3. **Is the blower vacuum relief valve open?** YES (NO)
4. **Is the dilution valve open?** YES (NO) % Open: _____
5. **Are there any leaks or damage to system hoses?** YES (NO)
6. **Is there any damage to system components?** YES (NO)
7. **Are all locks and zip-ties secure?** (YES) NO
8. **Was there a GAC change out?** YES (NO)
9. **How many GAC units are at this location?** NEW 1 SPENT 0
10. **Do the these fall to zero when system is turned off?**

Flow Gauge	YES	NO
Pressure Gauge	YES	NO
Vacuum Gauges	YES	NO

11. **Do the temp. gauges fall when system is turned off?** YES NO
12. **Does the heat-exchanger have dust on the underside?** (YES) NO
13. **Was the underside of the heat-exchanger vacuumed?** (YES) NO

Comment: _____

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
E	Result exceeded calibration range.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
140-6042-1

Receipt
The samples were received on 10/6/2016 at 10:30 AM. The samples arrived in good condition and properly preserved.

Air - GC/MS VOA
Method(s) TO 15 LL, TO-15: EPA methods TO-14A and TO-15 specify the use of humidified “zero air” as the blank reagent for canister cleaning, instrument calibration and sample analysis. Ultra-high purity humidified nitrogen from a cryogenic reservoir is used in place of “zero air” by TestAmerica Knoxville.

Method TO 15 LL: The continuing calibration verification (CCV) associated with batch 140-6849 exhibited % difference of > 30% for 1,2,4-Trichlorobenzene; however, the results were within the LCS acceptance limits. The EPA method requires that all target analytes in the continuing calibration verification standard be within 30% difference from the initial calibration. According to the laboratory standard operating procedure, the continuing calibration is acceptable if it meets the laboratory control sample acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Comments
No additional comments.
