Overview

The sample set for Greater Strawberry Point MSA, SDG 240-1342-1 consisted of two (2) aqueous samples analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) total petroleum hydrocarbons (TPH) gasoline and total petroleum hydrocarbons (TPH) diesel, total select metals, dissolved select metals and perchlorate. The select metals were antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, tungsten, vanadium and zinc.

The samples were collected on June 21, 2011 and analyzed by Test America Laboratories Inc. All analyses were conducted in accordance with SW-846 Methods 8260B for VOCs, 8270C for SVOCs, 8015B for TPH (gasoline and diesel), 6010C for metals, 7471B for mercury and MCAWW 314 for perchlorate analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method /preparation blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate, internal standard recoveries, chromatographic resolution, ICP interference results, ICP serial dilution results, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- VOC initial calibration relative response factors (RRFs) for tert-butyl alcohol and vinyl acetate were less than the 0.05 quality control limit on May 29, 2011 for instrument A3UX16 and the continuing calibrations on June 19, 2011 @ 12:41. The nondetected tert-butyl alcohol and vinyl acetate results were qualified as rejected (UR) in the affected samples.

Minor

- The following VOC contaminant was detected in the laboratory method blank 240-6573/5 at the following maximum concentration:

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
Naphthalene	0.264	1.32

An action level of five times the maximum level for other contaminants has been used to evaluate sample data for blank contamination. Sample aliquotand dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level reported for the above analytes were qualified "B" as a result of laboratory blank contamination.

- The VOC continuing calibration percent difference (%D) for acetone was greater than 50% on June 29, 2011 @ 12:41 on instrument A3UX16. The positive acetone results in were qualified as estimated (J).

- The following contaminants were detected in the SVOC soil laboratory method blank 240-5773/1-A at the following maximum concentration:

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
Bis(2-ethylhexyl)phthalate	0.996	9.96

An action level of ten times the maximum level for the phthalates has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The TPH as gasoline laboratory method blank 240-6402/19 contained contaminant.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
TPH as gasoline	37.9	189.5

An action level of 5X the maximum concentration of contaminant was used in order to evaluate the affected samples. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The TPH as diesel laboratory method blank 240-5811/1-A contained contaminant.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
TPH as diesel	479	2395

An action level of 5x the maximum concentration of contaminant was used in order to evaluate the affected samples. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The following contaminants were detected in the laboratory method/preparation/calibration blanks at the following maximum concentrations:

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
Antimony [1]	0.343	1.72
Chromium [2]	0.281	1.41
Cobalt [3]	0.228	1.14
Cobalt [4]	0.234	1.17
Lead [2]	0.176	0.88
Molybdenum [1]	0.475	2.375
Thallium [3]	0.230	1.15
Thallium [4]	0.225	1.13
Tungsten [1]	0.388	1.94
Zinc [2]	0.851	4.26

(1) Maximum concentration of contaminants in the initial calibration blank 200-21675/8 analyzed on July 16, 2011 @ 1:09.
(2) Maximum concentration of contaminants in the method blank 200-20966/1-A affecting all samples both total and dissolved.
(3) Maximum concentration of contaminants in continuing calibration blank 200-21675/26 analyzed on July 16, 2011 @ 10:37 affecting the total metals.
(4) Maximum concentration of contaminants in continuing calibration blank 200-21675/39 analyzed on July 16, 2011 @ 12:05 affecting the dissolved metals.

An action level of 5x the maximum concentration of contaminant was used in order to evaluate the affected samples. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The %Ds in the serial dilution of total and dissolved arsenic and cobalt were greater than 10%. The positive total and dissolved arsenic and cobalt results were qualified as estimated (J).

- Positive results reported below the quantitation limit but above the method detection limit (MDL) were qualified as estimated, (J).

Notes

According to the chain of custody trip blank, TB-062111, should have been analyzed for VOCs. The laboratory was contacted. The laboratory has no record of the trip blank being logged in. The trip blank was not analyzed. No action was taken.

Form 1s of the VOC Tentatively Identified Compounds (TICs) are included in this SDG in Appendix B. No action was taken on these findings. TICS were qualified as (NJ).

The VOC continuing calibration %Ds for several analytes were greater than the 20% quality control limit but less than 50% on June 29, 2011 @ 12:41 and 13:04. The analytes were bromomethane, tert-butyl alcohol, methyl tert-butyl ether, 2,2-dichloropropane, 2-chloroethyl vinyl ether, bromoform, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, naphthalene, 1,2,3-trichlorobenzene, ethyl tert-butyl ether and tert-amyl methyl ether. No action was taken on the nondetected results of the aforementioned analytes in the

affected samples.

The %Rs of 2-chloroethyl vinyl ether were 0% in the matrix spike/matrix spike duplicate (MS/MSD) of sample 240-1438-H-4 which is not included in this SDG. The %Rs of tert-butyl alcohol were less than the lower quality control limit in the MS/MSD. No action was taken.

The percent recovery (%R) of tert-butyl alcohol was less than the lower quality control limit in the laboratory control sample associated with batch 240-6573/4. No further action was taken on the nondetected tert-butyl alcohol results which were qualified due to a more serious noncompliance.

In the SVOC initial calibration of instrument A4HP9 on July 14, 2011, 4,6-dinitro-2-methylphenol had a percent relative standard deviation (%RSD) greater than the 15% quality control limit but less than 50%. No action was taken on the nondetected 4,6-dinitro-2-methylphenol results in the affected samples.

Naphthalene and hexachlorobutadiene were reported in both the VOC and the SVOC fractions.

Nondetected results were reported to the MDL.

Executive Summary

Laboratory Performance: The VOC RRFs for tert-butyl alcohol and vinyl acetate were less than the quality control limit resulting in the rejection of nondetected results. VOC, SVOC, TPH as diesel and gasoline and metals results were qualified due to method blank contamination. Continuing calibration verification percent difference exceeded quality control limits in the VOC fraction for acetone. The LCS %R of tert-butyl alcohol was less than quality control limits.

Other Factors Affecting Data Quality: Trip blank was not analyzed. The serial dilution %D for total and dissolved arsenic and cobalt exceeded quality control limits. Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994) and U.S. EPA National Functional Guidelines for Inorganic Data Validation (April 1993). The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech NUS Inc

Project: MSA Greater Strawberry Point PH. II 2011

Report Number: 240-1342-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/22/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 3.5 C.

Multiple TestAmerica laboratories were used to support this project. Narrative for TestAmerica West Sacramento (Perchlorate) is provided in the lab's report in the Subcontract section of this report. TestAmerica Burlington's narrative for ICP/MS Metals is incorporated herein. See the Method Summary for additional information.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples GSP-SB-WP-54-062111 (240-1342-2) and GSP-SB-WP-71-062111 (240-1342-3) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 06/29/2011.

Naphthalene was detected in method blank MB 240-6573/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

tert-Butyl alcohol failed the recovery criteria low for LCS 240-6573/4. Refer to the QC report for details.

2-Chloroethyl vinyl ether and tert-Butyl alcohol failed the recovery criteria low for the MS/MSD of sample 240-1438-4 in batch 240-6573.

Refer to the QC report for details.

No other difficulties were encountered during the volatiles analyses. All other quality control parameters were within the acceptance limits.

SEMI VOLATILES

Samples GSP-SB-WP-54-062111 (240-1342-2) and GSP-SB-WP-71-062111 (240-1342-3) were analyzed for Semivolatiles in accordance with EPA SW 8270D. The samples were analyzed on 07/15/2011.

Bis(2-ethylhexyl) phthalate was detected in method blank MB 240-5773/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

There was no client requested matrix spike/matrix spike duplicate (MS/MSD) for batch 5773.

No other difficulties were encountered during the semivolatiles analyses. All other quality control parameters were within the acceptance limits.

GRO (C6-C10)

Samples GSP-SB-WP-54-062111 (240-1342-2) and GSP-SB-WP-71-062111 (240-1342-3) were analyzed for gas range organics in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 06/29/2011.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-6402/19 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DRO (C10-C32)

Samples GSP-SB-WP-54-062111 (240-1342-2) and GSP-SB-WP-71-062111 (240-1342-3) were analyzed for Diesel Range Organics (DRO) in accordance with EPA Method 8015B. The samples were analyzed on 06/24/2011.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Total Petroleum Hydrocarbons (C10-C32) was detected in method blank MB 240-5811/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

There was no client requested matrix spike/matrix spike duplicate (MS/MSD) for batch 5811.

No other difficulties were encountered during the Diesel Range Organics (DRO) analyses. All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICPMS)

Samples GSP-SB-WP-54-062111 (240-1342-2) and GSP-SB-WP-71-062111 (240-1342-3) were analyzed for metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were analyzed on 07/16/2011.

Several analytes were detected in method blank MB 200-20966/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

The serial dilution performed for the following samples were outside control limits for As and Co in batch 21675: (240-1342-3 SD), GSP-SB-WP-71-062111 (240-1342-3)

A deviation from the Standard Operating Procedure (SOP) occurred. Eleven injections were analyzed between CCB26 and CCV38. Bracketing CCV/CCB were within control limits. The eleventh sample was not reported from this batch 21675. The proceeding ten (10) samples were reported. The following samples were reported in this job: . (240-1342-3 SD), (CCV 200-21675/38), GSP-SB-WP-54-062111 (240-1342-2) and GSP-SB-WP-71-062111 (240-1342-3)

The internal standard for As, Mo, and Se were reassociated from Y to In for analytical sequence 080111-06b, due to the presence of isobaric interference on the Y line. Data flags in batch 21765 for Y internal standard failures were removed. All results in the batch for As, Mo, and Se are based on internal standard responses for Indium.

Overview

The sample set for Greater Strawberry Point MSA, SDG 240-1365-1 consisted of four (4) aqueous samples and a trip blank analyzed for volatile organic compounds (VOCs). Three (3) aqueous samples were analyzed for semi-volatile organic compounds (SVOCs). Four (4) aqueous samples were analyzed for total petroleum hydrocarbons (TPH) gasoline and total petroleum hydrocarbons (TPH) diesel, total select metals, dissolved select metals and perchlorate. The select metals were antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, tungsten, vanadium and zinc.

The samples were collected on June 22, 2011 and analyzed by Test America Laboratories Inc. All analyses were conducted in accordance with SW-846 Methods 8260B for VOCs, 8270C for SVOCs, 8015B for TPH (gasoline and diesel), 6010C for metals, 7471B for mercury and MCAWW 314 for perchlorate analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method /preparation blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate, internal standard recoveries, chromatographic resolution, ICP interference results, ICP serial dilution results, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- VOC initial calibration relative response factors (RRFs) for tert-butyl alcohol and vinyl acetate were less than the 0.05 quality control limit on May 29, 2011 for instrument A3UX16 and the continuing calibrations on June 19, 2011 @ 12:41. The nondetected tert-butyl alcohol and vinyl acetate results were qualified as rejected (UR) in the affected samples.

Minor

- The following VOC contaminants were detected in the laboratory method blank and trip blank at the following maximum concentrations:

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
Naphthalene [1]	0.264	1.32
Acetone [2]	2.2	22.0

[1] Maximum concentration of contaminant detected in laboratory method blank 240-6573/5.

[2] Maximum concentration of contaminant detected in trip blank TB-062211.

An action level of ten times the maximum level for the common laboratory contaminant, acetone, and five times the maximum level for other contaminants has been used to evaluate sample data for blank contamination. Sample aliquot, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level reported for the above analytes were qualified "B" as a result of laboratory blank contamination.

- The VOC continuing calibration percent difference (%D) for acetone was greater than 50% on June 29, 2011@ 12:41 on instrument A3UX16. The positive acetone result in the trip blank TB-062211 was qualified as estimated (J). The positive acetone results in the samples were qualified due to blank contamination. No further action was taken.

- The following contaminant was detected in the SVOC soil laboratory method blank at the following maximum concentration:

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
Bis(2-ethylhexyl)phthalate	1.56	15.6

Maximum concentration of contaminant detected in laboratory method blank 240-6094/1-A affecting all samples.

An action level of ten times the maximum level for the phthalates has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The TPH as gasoline laboratory method blank 240-6402/19 contained contaminant.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
TPH as gasoline	37.9	189.5

An action level of 5X the maximum concentration of contaminant was used in order to evaluate the affected samples. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The TPH as diesel laboratory method blank 240-6092/1-A contained contaminant.

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
TPH as diesel	334	1670

An action level of 5x the maximum concentration of contaminant was used in order to evaluate the affected samples. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Contaminant	Maximum Concentration (ug/L)	Action Level (ug/L)
Antimony (1)	0.342	1.71
Arsenic (1)	0.149	0.745
Lead (1)	0.146	0.73
Molybdenum (1)	0.649	3.245
Thallium (1)	0.188	0.94
Tungsten (1)	0.288	1.44
Zinc (2)	0.507	2.535
Zinc (3)	1.73	8.65

(1) Maximum concentration of contaminants in the initial calibration blank 200-22997/8 analyzed on August 4, 2011 @ 12:25.
(2) Maximum concentration of contaminant in the method blank 200-20967/1-A affecting all samples both total and dissolved except dissolved GSP-SB-WP-83-062211.
(3) Maximum concentration of contaminant in the method blank 200-21964/1-A affecting dissolved sample GSP-SB-WP-83-062211.

An action level of 5x the maximum concentration of contaminant was used in order to evaluate the affected samples. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The %D in the serial dilution of total and dissolved arsenic was greater than 10%. The positive total and dissolved arsenic results were qualified as estimated (J).

- Positive results reported below the quantitation limit but above the method detection limit (MDL) were qualified as estimated, (J).

Notes

Form 1s of the VOC Tentatively Identified Compounds (TICs) are included in this SDG in Appendix B. No action was taken on these findings. TICS were qualified as (NJ).

The VOC continuing calibration %Ds for several analytes were greater than the 20% quality control limit but less than 50% on June 29, 2011 @ 12:41 and 13:04. The analytes were bromomethane, tert-butyl alcohol, methyl tert-butyl ether, 2,2-dichloropropane, 2-chloroethyl vinyl ether, bromoform, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, naphthalene, 1,2,3-trichlorobenzene, ethyl tert-butyl ether and tert-amyl methyl ether. No action was taken on the nondetected results of the aforementioned analytes in the affected samples.

The %Rs of 2-chloroethyl vinyl ether were 0% in the matrix spike/matrix spike duplicate (MS/MSD) of sample 240-1438-H-4 which is not included in this SDG. The %Rs of tert-butyl alcohol were less than the lower quality control limit in the MS/MSD. No action was taken.

The percent recovery (%R) of tert-butyl alcohol was less than the lower quality control limit in the laboratory control sample associated with batch 240-6573/4. No further action was taken on the nondetected tert-butyl alcohol results which were qualified due to a more serious noncompliance.

In the SVOC initial calibration of instrument A4HP9 on July 14, 2011, 4,6-dinitro-2-methylphenol had a percent relative standard deviation (%RSD) greater than the 15% quality control limit but less than 50%. No action was taken on the nondetected 4,6-dinitro-2-methylphenol results in the affected samples.

Naphthalene and hexachlorobutadiene were reported in both the VOC and the SVOC fractions.

Nondetected results were reported to the MDL.

Executive Summary

Laboratory Performance: The VOC RRFs for tert-butyl alcohol and vinyl acetate were less than the quality control limit resulting in the rejection of nondetected results. VOC, SVOC, TPH as diesel and gasoline and metals results were qualified due to method blank contamination. Continuing calibration verification percent difference exceeded quality control limits in the VOC fraction for acetone. The LCS %R of tert-butyl alcohol was less than quality control limits.

Other Factors Affecting Data Quality: Trip blank contained acetone. The serial dilution %D for total and dissolved arsenic exceeded quality control limits. Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994) and U.S. EPA National Functional Guidelines for Inorganic Data Validation (April 1993). The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech NUS Inc

Project: MSA Greater Strawberry Point PH. II 2011

Report Number: 240-1365-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/23/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.5 and 2.7 C.

Multiple TestAmerica laboratories were used to support this project. Narrative for TestAmerica West Sacramento (Perchlorate) is provided in the lab's report in the Subcontract section of this report. The samples were analyzed on 06/29/2011.

Naphthalene was detected in method blank MB 240-6573/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

tert-Butyl alcohol failed the recovery criteria low for LCS 240-6573/4. Refer to the QC report for details.

2-Chloroethyl vinyl ether and tert-Butyl alcohol failed the recovery criteria low for the MS/MSD of sample 240-1438-4 in batch 240-6573.

Sample GSP-MW-7-062211 (240-1365-3)[17X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample for batch 6573 exceeded control limits for tert-Butyl alcohol. This compound has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for this analyte.These results have been reported and qualified.

No other difficulties were encountered during the volatiles analyses. All other quality control parameters were within the acceptance limits.

SEMI VOLATILES

Samples GSP-SB-WP-50-062211 (240-1365-2), GSP-MW-7-062211 (240-1365-3) and GSP-SB-WP-83-062211 (240-1365-6) were analyzed for Semivolatiles in accordance with EPA SW 8270D. The samples were analyzed on 07/16/2011.

Bis(2-ethylhexyl) phthalate was detected in method blank MB 240-6094/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

There was no client requested matrix spike/matrix spike duplicate (MS/MSD) for batch 6094

No other difficulties were encountered during the semivolatiles analyses. All other quality control parameters were within the acceptance limits.

GRO (C6-C10)

Samples GSP-SB-WP-61-062211 (240-1365-1), GSP-SB-WP-50-062211 (240-1365-2), GSP-MW-7-062211 (240-1365-3) and GSP-SB-WP-83-062211 (240-1365-6) were analyzed for gas range organics in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 06/29/2011.

Total Petroleum Hydrocarbons (C6-C10) was detected in method blank MB 240-6402/19 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the GRO analyses. All other quality control parameters were within the acceptance limits.

DRO (C10-C32)

Samples GSP-SB-WP-50-062211 (240-1365-2), GSP-MW-7-062211 (240-1365-3), GSP-SB-WP-61-062211 (240-1365-4) and GSP-SB-WP-83-062211 (240-1365-6) were analyzed for Diesel Range Organics (DRO) in accordance with EPA Method 8015B. The samples were analyzed on 06/28/2011.

Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Total Petroleum Hydrocarbons (C10-C32) was detected in method blank MB 240-6092/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

There was no client requested matrix spike/matrix spike duplicate (MS/MSD) for batch 6092.

The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

The serial dilution performed for the following sample was outside control limits for As: (240-1365-6 SD)

The internal standard association for As, Mo, and Se was changed from Y to In in analytical sequence 080411-02D batch 22997. Indium internal standardization was applied to all injection results for these elements , due to the possiblity of isobaric interference on the Yttrium line.

Case Narrative

TestAmerica West Sacramento Project Number G1F210484C

WATER, 314.0, Perchlorate
Sample(s): 7, 8, 9, 10
A mid continuing calibration blank had a positive result of 0.623 ug/L. Only sample 9 had a positive result for perchlorate. This sample was re-analyzed and the re-analysis results for this sample were reported. No corrective action was performed on the remaining samples since their results were all non-detect.

There were no other anomalies associated with this project.

Overview

The sample set for MSA - Groundwater, SDG 240-1443-1 consisted of four (4) aqueous environmental samples and one (1) trip blank. All five (5) aqueous samples were analyzed for Target Compound List (TCL) volatile organic compounds (VOC). The four (4) aqueous environmental samples were analyzed for TCL semi-volatile organic compounds (SVOC), diesel range organic compounds (DRO), and gasoline range organic compounds (GRO). No field duplicate sample pair was included in the sample delivery group (SDG).

The samples were collected by Tetra Tech on June 23, 2011 and analyzed by Test America, Inc. All analyses were conducted in accordance with SW-846 Methods 8260B, 8270D, and 8015B analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, trip blank results, surrogate spike recoveries, blank spike results, matrix spike/matrix spike duplicate results, internal standard recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- The initial and continuing calibrations performed on instruments A3UX10 in the VOC fraction had Relative Response Factors (RRFs) for tert-butyl alcohol and vinyl acetate the 0.050 quality control limit. All samples were affected. The positive result reported for tert-butyl alcohol in sample was qualified as estimated, (J). The remaining non-detected results reported for these compounds in the affected samples were qualified as rejected, (UR).

Minor

- The continuing calibration performed on instrument A3UX10 on 07/01/11 @ 22:08 had a Percent Difference (%D) for trichlorofluoromethane above the 20% quality control criterion but greater than 90%. All samples were affected. Only non-detected results were reported for this compound in the affected samples and these non-detects were qualified as estimated, (UJ).

- The following contaminants were detected in the laboratory method or trip blanks at the following maximum concentrations:

Compound	Maximum Concentration (µg/L)	Action Level (µg/L)
Acetone [1]	4.4	44
DRO [2]	334	1670
DRO [3]	538	2690
GRO [4]	33.6	168

[1] Maximum concentration detected in the trip blank, TB-062311, affecting all samples.
[2] Maximum concentration detected in the laboratory method blank, MB 240-6092/1-A, affecting samples GSP-MW-8-062311 and GSP-SB-WP-89-062311.
[3] Maximum concentration detected in the laboratory method blank, MB 240-6574/1-A, affecting samples GSP-SB-WP-66-062311 and GSP-SB-WP-84-062311.
[4] Maximum concentration detected in the laboratory method blank, MB 240-7018/11, affecting all samples.

An action level of 10X the maximum concentration for the common laboratory contaminant, acetone, was used to evaluate for blank contamination. An action level of 5X the maximum concentration was used for the remaining compounds to evaluate for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results reported below the action level were qualified as, (B), due to laboratory method blank contamination.

- Positive results reported below the Reporting Limit (RL) limit but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

Sample GSP-SB-WP-66-062311 was analyzed for the SVOC and DRO fractions even though the Chain of Custody (COC) did not request these analyses. The data was reviewed and reported in this data validation letter.

The VOC continuing calibration performed 07/01/11 @ 22:08 had %Ds for 2-butanone, 2-chloroethyl vinyl ether, 4-methyl-2-pentanone, 2-hexanone, hexachlorobutadiene, naphthalene, and 1,2,3-trichlorobenzene that exceeded the 20% quality control limit but were less than 50%. All samples were affected. No validation action was necessary because only non-detected results were reported for these compounds in the associated samples.

The %D for the continuing calibration verification performed for the GRO fraction on 07/04/11 @ 05:28 exceeded the 15% quality control limit. All samples were affected. No actions were necessary because the affected sample results were qualified for blank contamination.

The following contaminants were detected in the laboratory method blanks at the following maximum concentrations:

Compound	Maximum Concentration (µg/L)	Action Level (µg/L)
Naphthalene [1]	0.784	3.92
1,2,3-Trichlorobenzene [1]	0.508	2.54
Bis(2-ethylhexyl)phthalate [2]	1.56	15.6

[1] Maximum concentration detected in the laboratory method blank, MB 240-6923/5, affecting all samples.
[2] Maximum concentration detected in the laboratory method blank, MB 240-6094/1-A, affecting samples GSP-MW-8-062311, GSP-SB-WP-61-062311, GSP-SB-WP-84-062311, and GSP-SB-WP-89-062311.

An action level of 10X the maximum level was used for the common laboratory contaminant, bis(2-ethylhexyl)phthalate and an action level of 5X the maximum level was used for the remaining contaminants to evaluate the affected samples for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. No qualification was necessary since no positive results were reported for these contaminants below the action level in the associated environmental samples.

The VOC Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses yielded many Percent Recoveries (%Rs) and Relative Percent Differences (RPDs) outside the quality control limits. No action was taken because the sample analyzed was not from this SDG and the blank spike sample had acceptable %Rs.

Acetone exceeded the instrument's linear calibration range in the undiluted analysis of sample GSP-SB-WP-66-062311. The sample was reanalyzed at a 2.5X dilution and acetone was detected below the RL in the dilution analysis. Because of the discrepancy between the undiluted and the diluted analysis results and considering that acetone is a common lab contaminant, the result for acetone from the dilution was used for data validation. This result was qualified for trip blank contamination.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: Initial and continuing calibration RRFs for tert-butyl alcohol and vinyl acetate were below the quality control criteria resulting in the rejection of the non-detected results and estimating one positive result for tert-butyl alcohol. The continuing calibration %D for trichlorofluoromethane exceeded 90%. Continuing calibration %Ds for several VOC compounds were above the 20% quality control criteria. A continuing calibration %D exceed %15 in the GRO fraction. Contaminants were detected in the laboratory method blanks in the VOC, SVOC, DRO, and GRO fractions.

Other Factors Affecting Data Quality: Acetone was detected in the trip blank. Noncompliant %Rs and RPDs were noted in the VOC MS/MSD analyses.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994) and SW-846 Methods 8260B, 8270C, and 8015B analytical and reporting protocols. The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech NUS Inc

Project: MSA Greater Strawberry Point PH. II 2011

Report Number: 240-1443-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/24/2011 and 06/27/2011; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 2.7, 3.6 and 4.2 C.

Multiple TestAmerica laboratories were used to support this project. Narrative for TestAmerica West Sacramento (Perchlorate) is provided in the lab's report in the Subcontract section of this report. TestAmerica Burlington's narrative for ICP/MS Metals is incorporated herein. See the Method Summary for additional information.

Overview

The sample set for Martin State Airport – Greater Strawberry Point, SDG 240-1443-1, consists of four (4) aqueous environmental samples. No field duplicate pairs were included within this SDG.

All samples were analyzed for select total and dissolved metals including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, tungsten, vanadium and zinc and perchlorate. The samples were collected by Tetra Tech on June 23, 2011 and analyzed by TestAmerica. Metals analyses were conducted using SW-846 method 6020. Mercury analyses were conducted using SW-846 method 7470A. Perchlorate analyses were conducted using EPA method 314.0

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike/matrix spike duplicate recoveries, ICP serial dilution results, internal standard recoveries, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems

None.

Minor Problems

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Arsenic	0.155 ug/L	0.775 ug/L
Lead[(1)]	0.150 ug/L	0.75 ug/L
Thallium	0.189 ug/L	0.945 ug/L
Zinc	0.507 ug/L	2.535 ug/L
Perchlorate	0.623 ug/L	3.115 ug/L

  (1) Maximum concentration present in a preparation blank.

  An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive results less than the blank action level reported for arsenic, lead and thallium were qualified "B" as a result of laboratory blank contamination.

- The ICP serial dilutions were > 10% quality control limit (sample results > 50X MDL) for total and dissolved zinc. The positive results reported for total and dissolved zinc were qualified as estimated, "J".

- The ICP internal standard recovery for yttrium-89 was > 120% quality control limit affecting dissolved sample GSP-SB-WP-84-062311. The positive result reported for dissolved zinc in the affected sample was qualified as estimated, "J'.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated, "J".

Notes

Nondetected results are reported to the method detection limits.

It was noted that the laboratory analyzed for perchlorate for sample GSP-MW-8-062311 although it was not listed on the chain of custody.

The laboratory did not include raw data for the metals or mercury analyses. The laboratory submitted the missing data.

The laboratory did not analyze a CRDL standard. No validation actions were warranted.

Executive Summary

Laboratory Performance: Several contaminants were present in the laboratory method / preparation blanks.

Other Factors Affecting Data Quality: Positive results reported below the RL but above the MDL were qualified as estimated. The ICP serial dilutions were > 10% quality control limit for total and dissolved zinc. The ICP internal standard recovery for yttrium-89 was > 120% quality control limit affecting dissolved sample GSP-SB-WP-84-062311.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech NUS Inc

Project: MSA Greater Strawberry Point PH. II 2011

Report Number: 240-1443-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/24/2011 and 06/27/2011; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 2.7, 3.6 and 4.2 C.

Multiple TestAmerica laboratories were used to support this project. Narrative for TestAmerica West Sacramento (Perchlorate) is provided in the lab's report in the Subcontract section of this report. TestAmerica Burlington's narrative for ICP/MS Metals is incorporated herein. See the Method Summary for additional information.

Overview

The sample set for Greater Strawberry Point MSA, SDG 240-635-1 consisted of twenty-four (24) soil environmental samples analyzed for Target Compound List (TCL) volatile organic compounds (VOC), semi-volatile organic compounds (SVOC), total petroleum hydrocarbons (TPH) gasoline and total petroleum hydrocarbons (TPH) diesel. Sixteen (16) environmental soil samples were analyzed for polychlorinated biphenyls (PCBs).

The samples were collected on May 31, 2011 and analyzed by Test America Laboratories Inc. All analyses were conducted in accordance with SW-846 Methods 8260B for VOCs, 8270C for SVOCs, 8015B for TPH (gasoline and diesel), and 8082 for PCBs analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate, internal standard recoveries, chromatographic resolution, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- The VOC initial calibration relative response factors (RRFs) for tert-butyl alcohol and vinyl acetate were less than the 0.05 quality control limit on May 13, 2011 on instrument A3UX14 and the continuing calibrations on June 1, 2011 @ 11:38 and June 12, 2011 @ 8:40. The nondetected tert-

butyl alcohol and vinyl acetate results in the affected samples were qualified as rejected (UR).

- The percent recoveries (%Rs) of all SVOC surrogates were less than 10% in sample GSP-SB-119-0-2. The sample was re-extracted outside of the hold time greater than two times the 14 day extraction hold time criteria. The re-extracted sample analysis was used for validation and reporting purposes because of the acceptable surrogate recoveries. All positive and nondetected results were qualified as estimated (L) and rejected (UR), respectively.

- The %R of SVOC surrogate 2,4,6-tribromophenol was 0% in samples GSP-SB-121-6-8 and GSP-SB-120-18-20. The acid fraction positive results were qualified as biased low (L) and the nondetected results rejected (UR) in sample GSP-SB-120-18-20.

- The matrix spike/matrix spike duplicate (MS/MSD) %Rs of several SVOC target analytes were outside quality control limits in sample GSP-SB-115-0-2. The analytes with 0%Rs were 2,4-dinitrophenol, 3,3'-dichlorobenzidine (MS only), 4,6-dinitro-2-methylphenol (MS only), 4-chloro-3-methylphenol (MS only), hexachlorocyclopentadiene, pentachlorophenol, and 4-nitrophenol. The relative percent differences (%RPDs) exceeded quality control limits for several analytes. The analytes with 0%R were qualified as rejected (UR). The MS had %Rs of anthracene, benzo(a)anthracene, chrysene, fluoranthene, fluorene, phenanthrene and pyrene exceeding quality control limits. These analytes also had relative percent differences (RPDs) that exceeded quality control limits. The positive anthracene, benzo(a)anthracene, chrysene, fluoranthene, fluorene, phenanthrene and pyrene results were qualified as biased high (K) in sample GSP-SB-115-0-2. No action was taken on the analytes with only high RPDs. These analytes include 2,4,6-trichlorophenol, 2,4,5-trichlorophenol, 2-methylphenol, acenaphthene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, bis(2-chloroethyl)ether, indeno(1,2,3-cd)pyrene, N-nitrosodiphenylamine and nitrobenzene.

- The %Rs of 2,4-dinitrophenol (MS only) and hexachlorocyclopentadiene (MS/MSD) were 0% in sample GSP-SB-119-6-8. The %R of caprolactam was less than the lower quality control limit in the MS/MSD. The nondetected 2,4-dinitrophenol and hexachlorocyclopentadiene results were qualified as rejected (UR). The nondetected caprolactam result was qualified as biased low (UL). No action was taken on the fluoranthene and pyrene results because of the high RPD. It should be noted that the MS/MSD was analyzed outside of hold time. No action was taken due to this noncompliance.

Minor

- The continuing calibration percent difference (%D) for chloroethane exceeded 50% on June 11, 2011 @ 11:38 on instrument A3UX14. The nondetected chloroethane results were qualified as estimated (UJ) in the affected samples GSP-SB-115-0-2, GSP-SB-115-10-12, GSP-SB-115-18-20, GSP-SB-117-0-2, GSP-SB-117-6-8, GSP-SB-117-20-22, GSP-SB-119-0-2, GSP-SB-119-6-8, GSP-SB-119-20-22, GSP-SB-118-0-2, GSP-SB-121-18-20, GSP-SB-120-0-2 and GSP-SB-121-6-8.

- The continuing calibration %D for carbon disulfide was greater than the 20% quality control limit but less than 50% on June 12, 2011 @ 8:40. The positive carbon disulfide results were qualified as estimated (J) in the affected samples GSP-SB-121-0-3 and GSP-SB-122-20-22.

- The following VOC contaminants were detected in the laboratory method blanks at the following maximum concentrations:

Contaminant	Maximum Concentration (ug/kg)	Action Level (ug/kg)
Acetone [1]	7.93	79.3
Methylene chloride [1]	6.20	62.0
Naphthalene [1]	0.417	2.085
Acetone [2]	8.55	85.5
Methylene chloride [2]	10.9	109.0
Methylene chloride [3]	550	5500
Naphthalene [3]	13.7	68.5

(1) Maximum concentration of contaminants detected in laboratory method blank 240-4446/6 analyzed on June 12, 2011 on instrument A3UX14.
(2) Maximum concentration of contaminants detected in laboratory method blank 240-4426/28 analyzed on June 11, 2011 on instrument A3UX14.
(3) Maximum concentration of contaminants detected in laboratory method blank 240-3928/1-A analyzed on June 11, 2011 on instrument A3UX14.

An action level of ten times the maximum level for the common laboratory contaminants, acetone and methylene chloride, and five times the maximum level for other contaminants has been used to evaluate sample data for blank contamination. Sample aliquot, percent solid and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level reported for the above analytes were qualified (B) as a result of laboratory blank contamination.

- The %Rs of VOC surrogates 1,2-dichloroethane-d4 and toluene-d8 were less than the lower quality control limit in sample GSP-SB-120-0-2. The positive results were qualified as estimated (J) due to conflicting directional bias. The nondetected results were qualified as biased low (UL).

- The %R of VOC surrogate dibromofluoromethane was less than the lower quality control limit in sample GSP-SB-121-6-8. The positive and nondetected results were qualified as estimated (J) and (UJ), respectively.

- The %R of methylene chloride was greater than the upper quality control limit in the laboratory control sample (LCS) associated with batch 240-3928/2-A analyzed on June 11, 2011 on instrument A3UX14. The positive methylene chloride results in the affected samples were qualified due to blank contamination. No further action was taken.

- The following contaminants were detected in the SVOC soil laboratory method blanks at the following concentrations:

Contaminant	Maximum Concentration (ug/kg)	Action Level (ug/kg)
di-n-butyl-phthalate (1)	19.5	195.0
Bis(2-ethylhexyl)phthalate (2)	26.1	261.0

(1) Maximum concentration of contaminant detected in laboratory method blank 240-6980/18-A analyzed on July 14, 2011 on instrument A4HP7.
(2) Maximum concentration of contaminant detected in laboratory method blank 240-3689/1-A analyzed on June 27, 2011 on instrument A4HP9.

An action level of ten times the maximum level for the phthalates has been used to evaluate sample data for blank contamination. Sample aliquot, percent solid and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. Positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The %Rs of 3,3'-dichlorobenzidine and caprolactam were less than the lower quality control limit in the LCS associated with batch 240-3689/2-A analyzed on June 27, 2011 on instrument A4HP9. The nondetected 3,3'-dichlorobenzidine and caprolactam results were qualified as biased low (UL) in the affected samples.

- The %Rs of all SVOC surrogates were less than the lower quality control limit but greater than 10% in sample GSP-SB-119-6-8. The sample was re-extracted outside of hold time. The original sample analysis was used for validation and reporting purposes because of the large RPD in positive sample results in the re-extracted sample analysis. The positive and nondetected results were qualified as biased low (L) and (UL), respectively.

- The internal standard area of 1,4-dichlorobenzene-d4 and naphthene-d8 were less than the lower quality control limit in sample GSP-SB-121-0-3. The positive and nondetected results in sample GSP-SB-121-0-3 quanitiated using these internal standards were qualified as estimated (J) and (UJ), respectively.

- The TPH as diesel laboratory method blank 240-3872/23-A analyzed on June 14, 2011 contained contaminant.

Contaminant	Maximum Concentration (ug/kg)	Action Level (ug/kg)
TPH as diesel	10.7	53.5

An action level of 5x the maximum concentration of contaminant was used in order to evaluate the affected samples. Positive results less than the action limit were qualified as (B). The affected samples were G-SP-SB-122-20-22, G-SP-SB-129-0-2, G-SP-SB-129-6-8 and G-SP-SB-129-20-22.

- The %R of DRO surrogate n-nonane was 4% in sample GSP-SB-119-20-22. Sample GSP-SB-119-20-22 was re-extracted 3 days outside of 14 day extraction hold time criteria and the surrogate %R was within quality control limits. The re-extracted sample analysis of sample GSP-SB-119-20-22 was used for validation and reporting purposes. The positive DRO results in sample GSP-SB-119-20-22 was

qualified as biased low (L).

- According to the case narrative, sample GSP-SB-119-0-2 positive Aroclor 1260 had poor correlation in the chromatogram with the Aroclor standard. A copy of the chromatogram is included in Appendix C. The lab felt that there was uncertainty in quantifying the positive Aroclor 1260 result. The positive Aroclor 1260 result in sample GSP-SB-96-0-2 was qualified as estimated (J).

- Positive results reported below the quantitation limit but above the method detection limit (MDL) were qualified as estimated, (J).

Notes

The most commonly identified TICs were methyl acetate, 1,3,5-trimethylbenzene, 2-methylnaphthalene, 1-methylnaphthalene, cyclopentane, methylcyclohexane,and cyclohexane. No action was taken on these findings. TICS were qualified as (NJ).

The form 1s, EDD and all of the forms from the laboratory within this data package identify the samples as G-SP-SB-XXXX. According to the chain of custody, sample identifications should be GSP-SB-XXX. The EDD was manually corrected by the data validator.

Executive Summary

Laboratory Performance: The VOC RRFs for tert-butyl alcohol and vinyl acetate were less than the quality control limit resulting in the rejection of nondetected results. VOC, SVOC and TPH as diesel results were qualified due to method blank contamination. Continuing calibration verification percent differences exceeded quality control limits in the VOC fraction for chloroethane and carbon disulfide resulting in the qualification data. The %Rs of surrogates were outside quality control limits in the DRO, SVOC and VOC fractions. LCS percent recovery noncompliances were found in the VOC and SVOC fractions. The SVOC internal standard areas for 1,4-dichlorobenzene-d4 and naphthalene-d8 were less than the lower quality control limit in sample GSP-SB-121-0-3.

Other Factors Affecting Data Quality: MS/MSD percent recovery noncompliances were found in samples GSP-SB-115-0-2 and GSP-119-6-8 in the VOC fraction. Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994). The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech NUS Inc

Project: GSP PHASE II

Report Number: 240-635-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/01/2011; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 1.7 3.0 and 2.2 C.

The samples were analyzed on 06/11/2011 and 06/12/2011.

Methylene Chloride was detected in method blank MB 240-3928/1-A at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Naphthalene was detected in method blank MB 240-3928/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Acetone and Methylene Chloride were detected in method blank MB 240-4426/28 at levels exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Acetone and Methylene Chloride were detected in method blank MB 240-4446/6 at levels exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Naphthalene was detected in method blank MB 240-4446/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

Dibromofluoromethane (Surr) failed the surrogate recovery criteria low for G-SP-SB-121-6-8 (240-635-17). 1,2-Dichloroethane-d4 (Surr) and Toluene-d8 (Surr) failed the surrogate recovery criteria high for G-SP-SB-120-0-2 (240-635-19).

Methylene Chloride failed the recovery criteria high for LCS 240-3928/2-A. Chloroethane failed the recovery criteria high for LCS

240-4426/6. Chloroethane failed the recovery criteria high for LCS 240-4446/5. Refer to the QC report for details.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

The following sample was diluted due to the abundance of non-target analytes: G-SP-SB-120-6-8 (240-635-20). Elevated reporting limits (RLs) are provided.

No other difficulties were encountered during the volatiles analyses.

All other quality control parameters were within the acceptance limits.

Overview

The sample set for Martin State Airport – Greater Strawberry Point, SDG 240-635-1, consists of sixteen (16) soil environmental samples. No field duplicate pairs were included within this SDG.

All samples were analyzed for select metals including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium and zinc. The samples were collected by Tetra Tech on May 31, 2011 and analyzed by TestAmerica. Metals analyses were conducted using SW-846 method 6010C. Mercury analyses were conducted using SW-846 method 7471B.

The findings offered in this report are based upon a general review of all available data. The data review was based on data completeness, holding times, initial and continuing calibration verification results, laboratory method / preparation blank results, ICP interference results, laboratory control sample recoveries, matrix spike/matrix spike duplicate recoveries, ICP serial dilution results, detection limits and analyte quantitation.

Areas of concern with respect to data quality are listed below.

Major Problems

None.

Minor Problems

- The contract required detection limit (CRDL) percent recoveries for lead and zinc were > 110% quality control limit affecting all samples. The positive results < 2X CRDL for lead and zinc were qualified as biased high, "K".

- The following contaminants were detected in the laboratory method/preparation blanks at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
Molybdenum	17.6 ug/L	8.8 mg/kg
Vanadium	0.678 ug/L	0.339 mg/kg
Barium[(1)]	0.0786 mg/kg	0.393 mg/kg
Zinc[(1)]	1.07 mg/kg	5.35 mg/kg

[(1)] Maximum concentration present in a preparation blank affecting all samples.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot, percent solids and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive results less than the blank action level reported for molybdenum and zinc were qualified "B" as a result of laboratory blank contamination.

- The matrix spike / matrix spike duplicate percent recoveries for antimony were < 75% quality control limit. The nondetected results reported for antimony were qualified as biased low, "UL' and the positive results reported for antimony were qualified as estimated, "J", as a result of conflicting noncompliances.

- Positive results reported below the reporting limit (RL) but above the method detection limit (MDL) were qualified as estimated, "J".

Notes

Nondetected results are reported to the method detection limits.

Executive Summary

Laboratory Performance: Several CRDL percent recoveries were outside the 90-110 % quality control limits. Several contaminants were present in the laboratory method / preparation blanks.

Other Factors Affecting Data Quality: Positive results reported below the RL but above the MDL were qualified as estimated. The matrix spike / matrix spike duplicate percent recoveries for antimony were < 75% quality control limit.

The data for these analyses were reviewed with reference to Region III modifications to the "National Functional Guidelines for Inorganic Data Validation", April 1993.

The text of this report has been formulated to address only those problem areas affecting data quality.

CASE NARRATIVE

Client: Tetra Tech NUS Inc

Project: GSP PHASE II

Report Number: 240-635-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 06/01/2011; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 1.7 3.0 and 2.2 C.

The following sample(s) appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: G-SP-SB-119-0-2 (240-635-7). The sample(s) has been quantified and reported as Aroclor 1260. Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result

No other difficulties were encountered during the PCBs analyses.

The samples were analyzed on 07/05/2011.

Barium, Molybdenum and Zinc were detected in method blank MB 240-3490/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

Antimony failed the recovery criteria low for the MS of sample G-SP-SB-115-0-2MS (240-635-1) in batch 240-7218.

Antimony failed the recovery criteria low for the MSD of sample G-SP-SB-115-0-2MSD (240-635-1) in batch 240-7218.

No other difficulties were encountered during the metals analyses.
