CALCULATION OF A TARGET GROUNDWATER CONCENTRATION CORRESPONDING TO A TARGET INDOOR AIR CONCENTRATION

CALCULATION OF A TARGET GROUNDWATER CONCENTRATION CORRESPONDING TO A TARGET INDOOR AIR CONCENTRATION

The target groundwater concentrations were calculated according to the methodology present in Appendix D of USEPA's *Draft Guidance for Evaluating the Vapor Intrusion into Indoor Air from Groundwater and Soils (Subsurface Vapor Intrusion Guidance)* and Appendix A of DoD's *Vapor Intrusion Handbook*. Specifically the target groundwater concentration corresponding to a chemical's target indoor air concentration is calculated by dividing the target indoor air concentration by an appropriate attenuation factor and then converting the vapor concentration to an equivalent groundwater concentration assuming equilibrium between the aqueous and vapor phases at the water table. Diffusion resistances across the capillary fringe are assumed to be accounted for in the value of α. The equilibrium partitioning is assumed to obey Henry's Law so that:

$$C_{gw} = C_{target,ia} \times 10^{-3}\ m^3/L \times 1/H \times 1/\alpha$$

Where:

C_{gw} = target groundwater concentration, ug/L

$C_{target,ia}$ = target indoor air concentration, ug/m^3

α = attenuation factor (ratio of indoor air concentration to source vapor concentration).

H = dimensionless Henry's Law Constant at 25º C.

The residential air concentrations from the current USEPA Regional Screening Level table were used as for target indoor air concentrations. A value of 0.001 was used for the attenuation factor. Table 1 presents the target groundwater concentrations.

TABLE 2-1
OCCURRENCE, DISTRIBUTION, AND SELECTION OF GLOBAL CHEMICALS OF POTENTIAL CONCERN - ALL SURFACE SOIL - DIRECT CONTACT
GREATER STRAWBERRY POINT

Exposure Point	CAS Number	Chemical	Minimum Concentration(1)	Maximum Concentration(1)	Units	Sample of Maximum Concentration	Frequency of Detection	Range of Nondetects(2)	Concentration Used for Screening(3)	Range of Background Concentrations(4)	Adjusted USEPA RSL - Residential Soil(5)	MDE Cleanup Standard - Residential Soil(6)	COPC Flag	Rationale for Contaminant Deletion or Selection(7)

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment Cleanup Standards for Soil and Groundwater, June 2008. Appendix 2 - Attachment 2.
5 - United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, November 2011. Adjusted values correspond to a cancer risk level of 1E-06 or a hazard quotient (HQ) of 0.1.
6 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
7 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
8 - One-tenth the non-carcinogenic level is less than the carcinogenic level; therefore, the non-carcinogenic level is presented.
9 - The value is for 1,4-dichlorobenzene.
10 - The value is for xylenes.
11 - The value is for acenaphthene.
12 - The value is for pyrene.
13 - The value is for hexavalent chromium.
14 - The value is for mercuric chloride (and other mercury salts).
15 - The value is for mercury (inorganic/mercuric dichloride).
16 - See text for BaP equivalent calculation methodology.

Definitions:
BaP = benzo(a)pyrene
C = carcinogen
COPC = chemical of potential concern
J = estimated value
K = biased high
L = biased low
mg/kg = milligram per kilogram
N = non-carcinogen
NA = not applicable/not available
ug/kg = microgram per kilogram

Rationale Codes:
For selection as a COPC:
ASL = above screening level

For elimination as a COPC:
BSL = below screening level
NTX = no toxicity criteria

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - State of Maryland Department of the Environment Cleanup Standards for Soil and Groundwater, June 2008. Appendix 2 - Attachment 2.
5 - United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, soil screening levels (SSLs) for groundwater protection, June 2011.
6 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
7 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
8 - The value is for 1,4-dichlorobenzene.
9 - The value is for xylenes.
10 - The value is for acenaphthene.
11 - The value is for pyrene.
12 - The value is for hexavalent chromium.
13 - Maximum Contaminant Level (MCL)-based soil screening level (SSL).
14 - See text for BaP equivalent calculation methodology.
15 - The screening level for trichloroethene was calculated using revised toxicity criteria from USEPA's Integrated Risk Information System.

Definitions:
BaP = benzo(a)pyrene
C = carcinogen
COPC = chemical of potential concern
J = estimated value
K = biased high
L = biased low
mg/kg = milligram per kilogram
N = non-carcinogen
NA = not applicable/not available
ug/kg = microgram per kilogram

Exposure Point	CAS Number	Chemical	Minimum Concentration[1]	Maximum Concentration[1]	Units	Sample of Maximum Concentration	Frequency of Detection	Range of Nondetects[2]	Concentration Used for Screening[3]	Range of Background Concentrations[4]	USEPA SSL - Groundwater Protection[5]	MDE Cleanup Standard - Groundwater Protection[6]	COPC Flag	Rationale for Contaminant Deletion or Selection[7]

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Rationale Codes:
For selection as a COPC:
ASL = Above screening level

For elimination as a COPC:
BSL = Below screening level
NTX = No toxicity criteria

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - To determine whether chemical concentrations were within background levels, a statistical analysis was conducted using the site and background datasets.
5 - United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, June 2011. Adjusted values correspond to a cancer risk level of 1E-06 or a hazard quotient (HQ) of 0.1.
6 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
7 - USEPA Soil Screening Levels (SSLs). EPA Internet Site at http://rais.ornl.gov/epa/ssl1.shtml.
8 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
9 - The value is for m-xylene.
10 - The value is for xylenes.
11 - One tenth the non-carcinogenic level is less than the carcinogenic level; therefore, the non-carcinogenic level is presented.
12 - The value is for acenaphthene.
13 - The value is for pyrene.
14 - The value is for polychlorinated biphenyls (high risk).
15 - The value is for PCB (total).
16 - The value is for hexavalent chromium.
17 - The value is for mercuric chloride (and other mercury salts).
18 - The value is for mercury (inorganic/mercuric dichloride).
19 - The screening level for trichloroethene was calculated using revised toxicity criteria from USEPA's Integrated Risk Information System.

Definitions:
BaP = benzo(a)pyrene
C = Carcinogen
COPC = Chemical of potential concern
J = Estimated value
L = Biased low
mg/kg = milligram per kilogram
N = Non-carcinogen
NA = Not applicable/not available
PCB = polychlorinated biphenyl
sat = soil saturation concentration
ug/kg = microgram per kilogram

Rationale Codes:
For selection as a COPC:
ASL = Above screening level

For elimination as a COPC:

BSL = Below screening level
NTX = No toxicity criteria

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - To determine whether chemical concentrations were within background levels, a statistical analysis was conducted using the site and background datasets.
5 - United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, June 2011. [Cancer benchmark value = 1E-06, Hazard index (HI) = 0.1].
6 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
7 - USEPA Soil Screening Levels (SSLs). EPA Internet Site at http://rais.ornl.gov/epa/ssl1.shtml.
8 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
9 - The value is for xylenes.
10 - The value is for acenaphthene.
11 - The value is for pyrene.
12 - The value is for polychlorinated biphenyls (high risk).
13 - The value is for hexavalent chromium.
14 - Maximum Contaminant Level (MCL)-based soil screening level (SSL).
15 - See text for BaP equivalent calculation methodology.
16 - The screening level for trichloroethene was calculated using revised toxicity criteria from USEPA's Integrated Risk Information System.

Definitions:
BaP = benzo(a)pyrene
C = carcinogen
COPC = chemical of potential concern
J = estimated value
L = biased low
mg/kg = milligram per kilogram
N = non-carcinogen
NA = not applicable/not available
sat = soil saturation concentration
ug/kg = microgram per kilogram

Rationale Codes:
For selection as a COPC:
ASL = above screening level

For elimination as a COPC:

BSL = below screening level
NTX = no toxicity criteria

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

TABLE 2.5
OCCURRENCE, DISTRIBUTION, AND SELECTION OF GLOBAL CHEMICALS OF POTENTIAL CONCERN - ALL GROUNDWATER - DIRECT CONTACT
GREATER STRAWBERRY POINT
LOCKHEED MARTIN, MARTIN STATE AIRPORT

Exposure Point	CAS Number	Chemical	Minimum Concentration[1]	Maximum Concentration[1]	Units	Sample of Maximum Concentration	Frequency of Detection	Range of Nondetects[2]	Concentration Used for Screening[3]	Range of Background Concentrations[4]	Adjusted USEPA RSL - Tap Water[5]	MDE Cleanup Standard - Groundwater[6]	USEPA MCL[7]	COPC Flag	Rationale for Contaminant Deletion or Selection[8]

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - No background data is available for groundwater.
5 - United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites, June 2011.
Adjusted values correspond to a cancer risk level of 1E-06 or a hazard quotient (HQ) of 0.1.
6 - State of Maryland Department of the Environment (MDE) Cleanup Standards for Soil and Groundwater, June 2008.
7 - 2011 Edition of the Drinking Water Standards and Health Advisories (USEPA, January 2011).
8 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
9 - Value is for xylenes.
10 - The value is for hexavalent chromium.
11 - The value is for total chromium.
12 - The value is for mercuric chloride (and other mercury salts).
13 - The screening level for trichloroethene was calculated using revised toxicity criteria from USEPA's Integrated Risk Information System.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Definitions:
C = carcinogen
COPC = chemical of potential concern
J = estimated value
N = non-carcinogen
NA = not applicable/not available
ug/L = microgram per liter

Rationale Codes:
For selection as a COPC:
ASL = above screening level

For elimination as a COPC:
BSL = below screening level

NTX = no toxicity criteria

Footnotes:
1 - Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
2 - Values presented are sample-specific quantitation limits.
3 - The maximum detected concentration is used for screening purposes.
4 - No background data is available for groundwater.
5 - Calculated using methodology presented in Appendix D of USEPA's Draft Guidance for Evaluating the
Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils, November 2002. EPA530-F-02-052.
Adjusted values correspond to a target cancer risk level of 1E-06 or a hazard quotient (HQ) of 0.1 and an attenuation factor of 0.001.
6 - The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
7 - Value is for trans-1,2-dichloroethene.
8 - Value is for m-xylene.
9 - The screening level for trichloroethene was calculated using revised toxicity criteria from USEPA's Integrated Risk Information System.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Definitions:
ARAR/TBC = Applicable or relevant and appropriate requirements to be considered
C = Carcinogen
COPC = Chemical of potential concern
J = Estimated value
N = Non-carcinogen
NA = Not applicable/not available
ug/L = microgram per liter

Rationale Codes:
For selection as a COPC:
ASL = Above screening level

For elimination as a COPC:
BSL = Below screening level
NTX = No toxicity criteria

1 - Less than 10 samples available; therefore, the maximum concentration is used as the EPC.
2 - One percent of total chromium is assumed to be hexavalent chromium for risk assessment purposes; therefore, the EPC for hexavalent chromium is 0.13 mg/kg.
3 - The EPC for napthalene in the SVOC fraction is greater than that for the VOC fraction; therefore, naphthalene in the SVOC fraction was evaluated in the quantitative risk assessment.

Unit Intake Calculations

Ingestion Intake = (IR-GW x EF x ED)/(BW x AT)

Dermal Intake = (SA x EV x EF x ED)/(BW x AT)

Non-Mutagenic Chemicals

Cancer Ingestion Intake (Age 18 - 30) = 4.70E-06 Cancer Dermal Intake (Age 18 - 30) = 4.23E+01

Mutagenic Chemicals

Cancer Ingestion Intake (Age 18 - 30) = 4.70E-06 Cancer Dermal Intake (Age 18 - 30) = 4.23E+01

Noncarcinogenic Chemicals

Noncancer Ingestion Intake = 2.74E-05 Noncancer Dermal Intake = 2.47E+02

Cancer risk from ingestion = Groundwater concentration x Cancer Ingestion Intake x Oral Cancer Slope Factor

Cancer risk from dermal contact = Groundwater concentration x Cancer Dermal Intake x DAevent x Dermal Cancer Slope Factor

Hazard Index from ingestion = Groundwater concentration x Noncancer Ingestion Intake / Oral Reference Dose

Hazard Index from dermal contact = Groundwater concentration x Noncancer Dermal Intake x DAevent / Dermal Reference Dose

Notes:

1 - Inhalation CSF = Unit Risk * 70 kg / $20m^3$/day.

2 - See text for BaP equivalent calculation methodology.

3 - Benzo(a)pyrene and related compounds and hexavalent chromium are considered to act via the mutagenic mode of action. These chemicals are evaluated in accordance with USEPA's Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens (2005).

4 - Hexavalent chromium toxicity criteria are used to evaluate one percent of total chromium - see text.

Definitions:

BaP = benzo(a)pyrene

Cal EPA(1) = Adoption of Unit Risk Values for Naphthalene, August 2004.

Cal EPA(2) = California Environmental Protection Agency, Technical Support Document for Describing Available Cancer Slope Factors, September 2009.

CSF = cancer slope factor

IRIS = Integrated Risk Information System.

NA = not available

PPRTV = Provisional Peer Reviewed Toxicity Value

USEPA = USEPA, PCBs: Cancer Dose-Response Assessment and Applications to Environmental Mixtures, September 1996, EPA/600/P-96/001F.

	Warning: There are only 3 Distinct Detected Values in this data set										
	The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.										
	Those methods will return a 'N/A' value on your output display!										
	It is necessary to have 4 or more Distinct Values for bootstrap methods.										
	However, results obtained using 4 to 9 distinct values may not be reliable.										
	It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

reliable. Chen's and Johnson's methods provide
adjustments for positvely skewed data sets.

CALCULATION WORKSHEET

CLIENT: LOCKHEED MARTIN, GREATER STRAWBERRY POINT		**JOB NUMBER:** 112IC03279
SUBJECT: CALCULATION OF INTAKE/RISK FROM INCIDENTAL INGESTION OF SOIL CONSTRUCTION WORKERS		
BASED ON: USEPA, DECEMBER 1989		
BY: L.GANSER	**CHECKED BY:**	**DATE:** 10/18/2011

PURPOSE: To estimate intake, carcinogenic and noncarcinogenic risks from incidental ingestion of surface soil at REC 11.

EQUATION:

$$IEX = \frac{CS \times IR \times EF \times ED \times FI \times CF}{BW \times AT}$$

Where:

IEX	=	estimated exposure intake (mg/kg/day)
Cs	=	exposure point concentration in soil (mg/kg)
IR	=	incidental ingestion rate (mg/day)
EF	=	exposure frequency (days/year)
ED	=	exposure duration (years)
FI	=	fraction ingested from contaminated source (unitless)
CF	=	conversion factor (1.0E-6 kg/mg)
BW	=	body weight (kg)
AT	=	averaging time (days)
CSFo	=	oral carcinogenic slope factor ($(mg/kg/day)^{-1}$)
RfDo	=	oral noncarcinogenic reference dose (mg/kg/day)

RISKS:

ILCR (Carcinogens) = Intake (mg/kg/day) x CSFo (mg/kg/day)-1
HQ (Noncarcinogens) = Intake (mg/kg/day) / RFDo (mg/kg/day)

ASSUMPTIONS:

Cs	=	3.3	mg/kg	Chemical: Arsenic
IR	=	480	mg/day	
EF	=	250	days/year	
ED	=	1	years	
FI	=	1

CLIENT: LOCKHEED MARTIN, GREATER STRAWBERRY POINT		**JOB NUMBER:** 112IC03279
SUBJECT: CALCULATION OF THE PARTICULATE EMISSION FACTOR (PEF) FOR RESIDENTIAL, RECREATIONAL, TRESPASSER, AND COMMERCIAL/INDUSTRIAL EXPOSURES		
BASED ON: SUPPLEMENTAL GUIDANCE FOR DEVELOPING SOIL SCREENING LEVELS FOR SUPERFUND SITES (USEPA, DECEMBER, 2002)		
BY: L.GANSER	**CHECKED BY:**	**DATE:** 10/18/2011

PURPOSE: To calculate the particulate emission factor for residential and commercial/industrial exposure scenarios.

EQUATIONS:

$$PEF = Q/C_{wind} \times \frac{3600 \text{ sec/hr}}{0.036 \times (1 - V) \times (U_m/U_t)^3 \times F(x)}$$

$$Q/C_{wind} = A \times \exp\left[\frac{(\ln A_{site} - B)^2}{C}\right]$$

Where:

PEF	=	particulate emission factor (m^3/kg)
Q/C_{wind}	=	Inverse of mean conc. at center of source (g/m^2-s per kg/m^3).
V	=	fraction of vegetative cover (unitless)
U_m	=	mean annual windspeed (m/sec)
U_t	=	equivalent threshold value of windspeed at 7m (m/sec)
F(x)	=	function dependent on Um/Ut derived using Cowherd et al. (1985) (unitless)

CALCULATION WORKSHEET

CLIENT: LOCKHEED MARTIN, GREATER STRAWBERRY POINT		**JOB NUMBER:** 112IC03279
SUBJECT: ESTIMATION OF AMBIENT AIR CONCENTRATIONS IN A TRENCH RESULTING FROM VOLATILE EMISSIONS FROM GROUNDWATER.		
BASED ON: VDEQ, 2004		
BY: L.GANSER	**CHECKED BY:**	**DATE:** 10/18/2011

PURPOSE: To calculate ambient air concentrations resulting from volatilization of Vinyl Chloride from groundwater at REC 11.

Ctrench = CGW x VF

Where:

Ctrench = concentration of contaminant in the trench µg/m^3
CGW = concentration of contaminant in groundwater µg/L
VF = volatilization factor L/m^3

1. Calculate kiG (gas-phase mass transfer coefficient of component i)

$kiG = (MWH2O/MWi)^{0.335} \times (T/298)^{1.005} \times kG, H2O$

Where:

kiG = gas-phase mass transfer coefficient of component i cm/s
MW_{H2O} = molecular weight of water = 18 g/mol
MW_{VC} = molecular weight of Vinyl Chloride = 62.5 g/mol
kG,H_2O = gas-phase mass transfer coefficient of water vapor at 25°C cm/s = 0.833 cm/s
T = average system absolute temperature = 298
The value of kG, H_2O is 0.833 cm/s (Superfund Exposure Assessment Manual, U. S. EPA, April 1988)

$kiG = (18/62.5)^{0.335} \times (298/298)^{1.005} \times 0.833$ cm/s = 5.49E-01 cm/s

2. Calculate kiL (liquid-phase mass transfer coefficient of component i)

$kiL = (MWO_2/MWi)^{0.5} \times (T/298) \times kL, O_2$

Where:
kiL = liquid-phase mass transfer coefficient of component i cm/s
MW_{O2} = molecular weight of O_2 = 32 g/mol
MW_{VC} = molecular weight of Vinyl Chloride = 62.5 g/mol
T = average system absolute temperature = 298
kL, O_2 = liquid-phase mass transfer coefficient of oxygen at 25°C cm/s = 0.002 cm/s

$kiL = (32/62.5)^{0.5} \times (298/298) \times 0.002$ cm/s = 1.43E-03 cm/s

CLIENT: LOCKHEED MARTIN, GREATER STRAWBERRY POINT		**JOB NUMBER:** 112IC03279
SUBJECT: ESTIMATION OF AMBIENT AIR CONCENTRATIONS IN A TRENCH RESULTING FROM VOLATILE EMISSIONS FROM GROUNDWATER.		
BASED ON: VDEQ, 2004		
BY: L.GANSER	**CHECKED BY:**	**DATE:** 10/18/2011

3. Calculate Ki (overall mass transfer coefficient of contaminant)

$Ki = 1 / \{(1/kiL) + [(RT) / (Hi \times kiG)]\}$

Where:

kiL = liquid-phase mass transfer coefficient of i cm/s =	1.43E-03
R = ideal gas constant atm-m^3/mole-°K =	8.20E-05
T = average system absolute temperature =	298
Hi = Henry's Law constant of VC (atm-m^3/mol) =	2.71E-02
KiG = gas-phase mass transfer coefficient of i cm/s	5.49E-01

$Ki = 1 / \{(1/1.43E\text{-}3) + [(298 \times 8.2E\text{-}5) / (2.71E\text{-}2 \times 0.549]\}$ = 1.43E-03 cm/s

4. Calculation of VF (Volatilization Factor)

$VF = (Ki \times A \times F \times 10^{-3} \times 10^{4} \times 3{,}600) / (ACH \times V)$

Where:

VF = volatilization factor (L/m^3)		
Ki = overall mass transfer coefficient of contaminant =		1.43E-03 cm/s
A = area of the trench =		8.18 m^2
F = fraction of floor through which contaminant can enter (unitless) =		1
ACH = air changes per hour =		360 h^{-1}
V = volume of trench =		24.92 m^3
10^{-3} = conversion factor L/cm^3	0.001	
10^{4} = conversion factor cm^2/m^2	10000	
3,600 = conversion factor seconds/hr	3600	

$VF = (1.43E\text{-}3 \times 8.18 \times 1 \times 10^{-3} \times 10^{4} \times 3{,}600) / (360 \times 24.92)$ = 4.68E-02 L/m^3

5. Calculation of C_{trench} (concentration of contaminant in the trench)

$C_{trench} = C_{GW} \times VF$

Where:

C_{trench} = concentration of contaminant in the trench ($\mu g/m^3$)	
C_{GW} = concentration of Vinyl Chloride in groundwater =	0.66 µg/L
VF = volatilization factor =	4.68E-02 L/m^3

C_{trench} = 0.66 µg/L x 4.68E-02 L/m3 = **3.09E-02 $\mu g/m^3$**
3.09E-05 mg/m^3

Appendix 1. Risk Assessment Equations and Tables

Groundwater Ingestion:

Noncarcinogenic:
$$C_{water}\,(mg/l) = \frac{HI \times RfD_o \times BW \times AT_n}{IR_{dw} \times EF \times ED} \quad (1)$$

Carcinogenic (age adjusted):
$$C_{water}\,(mg/l) = \frac{CR \times AT_c}{IF_{dw} \times EF \times CSF_o} \quad (2)$$

Carcinogenic:
$$C_{water}\,(mg/l) = \frac{CR \times BW \times AT_c}{IR_{dw} \times EF \times ED \times CSF_o} \quad (3)$$

Inhalation of Volatiles in Groundwater:

Noncarcinogenic:
$$C_{water}\,(mg/l) = \frac{HI \times RfD_i \times BW \times AT_n}{InhR \times EF \times ED \times ET \times VF} \quad (4)$$

Carcinogenic (age adjusted):
$$C_{water}\,(mg/l) = \frac{CR \times AT_c}{IF_{inh} \times EF \times CSF_i \times VF} \quad (5)$$

Carcinogenic:
$$C_{water}\,(mg/l) = \frac{CR \times BW \times AT_c}{InhR \times EF \times ED \times ET \times CSF_i \times VF} \quad (6)$$

Soil Ingestion:

Noncarcinogenic:
$$C_{soil}\,(mg/kg) = \frac{HI \times RfD_o \times BW \times AT_n}{IR_{soil} \times CF \times EF \times ED} \quad (7)$$

Carcinogenic (age adjusted):
$$C_{soil}\,(mg/kg) = \frac{CR \times AT_c}{CF \times IF_{soil} \times EF \times CSF_o} \quad (8)$$

Carcinogenic:
$$C_{soil}\,(mg/kg) = \frac{CR \times BW \times AT_c}{CF \times IR_{soil} \times EF \times ED \times CSF_o} \quad (9)$$

APPENDIX K—ECOLOGICAL RISK ASSESSMENT SUPPORTING DOCUMENTATION

APPENDIX K-1

CHEMICAL ECOTOXICITY
GREATER STRAWBERRY POINT, LOCKHEED MARTIN, MARTIN STATE AIRPORT
MIDDLE RIVER, MARYLAND

This attachment presents a discussion of the different chemical classes detected at Greater Strawberry Point, including toxicity information, potential food chain and trophic transfer, and bioaccumulation potential.

Volatile Organic Compounds

VOCs are usually very mobile in the environment because they are poorly adsorbed to soil and sediment particles. Also, because they are very volatile, they typically are only detected in surface water, surface soil, and sediment at low concentrations.

Most VOCs have very little potential to bioaccumulate in ecological receptors; therefore, biomagnification through the food chain does not appear to be significant. VOCs are not expected to biomagnify in plants and are typically only toxic to ecological receptors at relatively high concentrations.

Semivolatile Organic Compounds

The most common semivolatile organic compounds that are found at naval facilities include polynuclear aromatic hydocarbons (PAHs) and phthalates. PAHs are a diverse group of compounds consisting of two or more substituted and unsubstituted polynuclear aromatic rings formed by the incomplete combustion of carbonaceous materials. PAHs are ubiquitous in the modern environment and are common constituents of coal tar, soot, vehicle exhaust, cigarette smoke, certain petroleum products, road tar, mineral oils, creosote, and many cooked foods. PAHs also are released to the environment through natural sources such as volcanoes and forest fires.

PAHs are transferred from surface water by volatilization and sorption to settling particles. The compounds are transformed in surface water by photooxidation, chemical oxidation, and microbial metabolism (ATSDR, 1989a). In soil and sediments, microbial metabolism is the major process for degradation of PAHs (ATSDR, 1989a). Although PAHs accumulate in terrestrial and aquatic plants, many organisms are able to metabolize and eliminate these compounds. Vertebrates can readily metabolize PAHs, but lower forms (insects and worms) cannot

metabolize PAHs as quickly. However, food chain uptake does not appear to be a major exposure source to PAHs for aquatic animals (ATSDR, 1989a).

PAHs vary substantially in their toxicity to aquatic organisms. In general, toxicity increases as molecular weight increases, with the exception of some high molecular weight PAHs that have low acute toxicity. Most species of aquatic organisms rapidly accumulate PAHs that occur at low concentrations in the ambient medium. However, uptake of PAHs is highly species-specific, it is higher in algae, mollusks, and other species that are incapable of metabolizing PAHs (Eisler, 1987). The ability of fish to metabolize PAHs may explain why benzo(a)pyrene is frequently not detected or is found at only very low levels in fish from environments heavily contaminated with PAHs (ATSDR, 1989a).

Phthalates are semivolatile organic compounds that are used in production of plastics (ATSDR, 1993). Most phthalates are expected to sorb to soil or sediment particles after their release because of their high Log K_{OC} values (Howard, 1989). Some phthalates may bioconcentrate in aquatic organisms [Spectrum Laboratories, 1999; Howard, 1989; ATSDR, 1989a].

PCBs

The term polychlorinated biphenyls (PCBs) commonly refers to a variety of mixtures of individual biphenyl isomers, each consisting of two joined benzene rings and up to 10 chlorine atoms. Mixtures of these isomers are known by their commercial designation of Aroclor. This trade name is followed by a four-digit number; the first two numbers indicate the type of isomer mixture and the last two numbers indicate the approximate weight percent of chlorine in the mixture (USEPA, 1985).

PCBs released into water adsorb to sediments and other organic matter. Typically, PCB concentrations are greater in the sediment and suspended material than in the water column. Substantial quantities of PCBs in aquatic sediments can act as an environmental reservoir from which PCBs may be released slowly over a long period of time (ATSDR, 1989b). For PCBs that exist in the dissolved state in water, volatilization becomes the primary fate process (USEPA, 1985).

Degradation of PCBs in the environment is dependent upon the degree of chlorination. Generally, the more chlorinated the PCB molecule, the more persistent it will be in the environment. Factors that determine biodegradability include the amount of chlorination, concentration, type of microbial population, available nutrients, and the temperature (ATSDR, 1989b).

Because PCBs are highly lipophilic, they can bioaccumulate in the lipid portions of animals. Bioconcentration factors in the thousands have been reported for various aquatic species (Eisler, 1986). PCBs can also accumulate in upper trophic level animals such as piscivorous birds and mammals that feed on contaminated prey items (Eisler, 1986).

Adverse effects of PCBs on terrestrial wildlife include increased mortality, reproductive effects, and behavioral effects (USEPA, 1985). As a group, birds are more resistant to acutely toxic effects of PCBs than mammals (Eisler, 1986). Among sensitive avian species, PCBs disrupt the normal pattern of growth, reproduction, metabolism, and behavior (Eisler, 1986). Of the mammals, the mink is the most sensitive wildlife species tested for which data are available (Eisler, 1986). Impacts to mink include anorexia, weight loss, lethargy, reproductive effects, and death (Eisler, 1986).

Metals

Many metals occur naturally at various concentrations in the surface water and sediment primarily to chemical weathering of rocks and fallout from volcanoes. Most metals are toxic to aquatic (i.e., fish, invertebrates) and terrestrial (i.e., plants, invertebrates, vertebrates) ecological receptors above certain concentrations, with some metals being more toxic at lower concentrations than others. Also, different chemical forms of the metals may be more toxic than others. For example, hexavalent chromium is typically more toxic than trivalent chromium, and methylmercury is more toxic than inorganic mercury. In addition, the toxicity of several metals (cadmium, chromium, copper, lead, nickel, silver, and zinc) to aquatic receptors in freshwater systems decreases with increasing water hardness.

Many factors (e.g., pH, Eh, clay content, organic matter content) influence the bioavailability of metals to invertebrates in sediment. One way to estimate the bioavailable portion of certain divalent metals (cadmium, copper, lead, nickel, and zinc) in sediment is to measure the amount of acid volatile sulfides (AVS) and simultaneously extracted metals (SEM) in a sediment sample. If the molar concentration of AVS is higher than the molar concentration of SEM, than the SEM metals are expected to be unavailable to aquatic invertebrates and, therefore, nontoxic. AVS plays little or no role in determining interstitial water concentrations of metals in aerobic systems or those with low productivity (i.e., where the absence of organic carbon limits sulfate reduction) (Ankley et al., 1995), or when ingestion of sediments is the primary exposure route (Lee et al., 2000).

SOIL TO PLANT AND EARTHWORM BIOACCUMULATION FACTORS GREATER STRAWBERRY POINT, LOCKHEED MARTIN, MARTIN STATE AIRPORT MIDDLE RIVER, MARYLAND

This attachment presents the bioaccumulation factors (BAFs) that were used in the food chain models. The following sources of BAFs were used in the ecological risk assessment for most of the chemicals:

- Plant and Soil Invertebrate BAFs: EPA Guidance for Developing Ecological Soil Screening Levels, Attachment 4-1 (USEPA, 2007).

- Plant BAFs (organic chemicals and select metals): Toxicity and Chemical-Specific Factors Database (ORNL, 2009).

- Plant BAFs (metals): Empirical Model for the Uptake of Inorganic Chemicals from Soil by Plants (ORNL, 1998).

- Soil Invertebrate BAFs: Development and Validation of Bioaccumulation Models for Earthworms (Sample et al., 1998).

The BAF Table in this Appendix presents the BAFs that were used in the food-chain models for the individual constituents that were detected at Greater Strawberry Point. Note that dry weight BAFs were used for this ERA.

The EPA Guidance for Developing Ecological Soil Screening Levels (Eco SSLs) was the source of the BAFs for some of the chemicals. The majority of these BAFs are actually regression or BAF equations that are used to calculate the tissue concentration from the soil concentration.

The sources of these NOAELS and LOAELS are presented in the table titled "Sources and Endpoints for NOAELS and LOAELS for Terrestrial Wildlife" in this appendix.

The NOAELS and LOAELS in the source table were divided by 10 if a subchronic study was the basis for the value. Also, if only a NOAEL was available, the value was multiplied by 10 to estimate the LOAEL. If only a LOAEL was available, the value was divided by 10 to estimate the NOAEL.

NV - No value available.

Notes:

NOAEL = No Observed Adverse Effects Level

LOAEL = Lowest Observed Adverse Effects Level

The NOAELS and LOAELS for the following PAHs are based on the Low Molecular Weight PAH values: acenapthylene, acenaphthene, anthracene, fluoranthene, fluorene, phenanthrene, and naphthalene.

The NOAELS and LOAELS for the following PAHs are based on the High Molecular Weight PAH values: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, chrysene, dibenzo(a,h)anthracene, dibenzofuran, indeno(1,2,3-c,d)pyrene, and pyrene.

The NOAELS and LOAELS for the PAHs for birds were based on 7,12-dimethylbenz(a)anthracene.

The LOAELs used for several metals were calculated as the geometric mean of growth and reproduction data from the Ecological Soil Screening Levels (U.S. EPA, 2005, 2006, 2007).

The LOAELs for Aroclor-1254 were used as surrogate for Aroclor-1260.

APPENDIX K-2

FOOD CHAIN MODEL RECEPTOR PROFILES
GREATER STRAWBERRY POINT, LOCKHEED MARTIN, MARTIN STATE AIRPORT
MIDDLE RIVER, MARYLAND

The following sections present the receptor profiles for the short-tailed shrew, American robin, meadow vole, and northern bobwhite quail. The majority of the information for the profiles was obtained from the Wildlife Exposure Factors Handbook (USEPA, 1993). The data for the incidental soil ingestion rates were obtained from the Estimates of Soil Ingestion by Wildlife (Beyer, 1994) or the USEPA Ecological Soil Screening Guidance (USEPA, 2007).

The food and water ingestion rates are listed in g/g (of body weight)-day on a wet weight basis but were converted to dry weight for the ERA. The home ranges are presented in hectares in USEPA (1993) but were converted to acres by multiplying the number of hectares by 2.471. Also note that the estimated percent of soil in the diets are listed in dry weight. The attached table presents the calculation of the exposure parameters and how the calculations were done.

Short-Tailed Shrew (*Blarina brevicauda*)

Shrews inhabit a wide variety of habitats and are common in areas with abundant vegetative cover. They need cool, moist habitats because of their high metabolic and water-loss rates. The short-tailed shrew is primarily carnivorous, eating insects such as earthworms, slugs, and snails.

The adult body weight for the short-tailed shrew in various habitats ranged from 0.015 to 0.01921 kg with an average of 0.0161 kg. The listed food ingestion rates for shrews are 0.49 and 0.62 g/g-day (wet-weight). The water ingestion rate was listed as 0.223 g/g-day. The food and water ingestion rates in kg/day and L/day, respectively, were calculated as shown in the attached table. The food ingestion rates were then multiplied by 0.16, which is the percent solids of worms (Sample et al., 1997) to convert the ingestion rate from a wet-weight value to a dry-weight value. The incidental soil ingestion rate was calculated by multiplying the ingestion rate by the percentage of soil that is incidentally ingested (assumed 3% for conservative food chain model and 0.9% for the average food chain model) from USEPA (2007). 3% is the 90^{th} percentile value and 0.9% is the 50^{th} percentile value from USEPA (2007). The home range for the shrew (0. 9699 acres) was calculated using data from a tamarek bog in Manitoba (only value available).

American Robin (*Turdus migratorius*)

American robins' habitats include parks, lawns, moist forests, swamps, open woodlands, and orchards.

Robins forage on the ground in open areas, along habitat edges, or the edges of streams. They also may forage above ground in shrubs and within the lower branches of trees. In the months preceding and during the breeding season, robins feed primarily on invertebrates and on some fruits. During the rest of the year their diet consists primarily of fruits.

The adult body weight for the American robin in New York woodlands and forests and in Pennsylvania ranged from 0.0773 to 0.0862 kg with an average of 0.0804 kg. The only listed food ingestion rates were for robins in Kansas (1.52 g/g-day) and California (0.89 g/g-day), with an average of 1.205 g/g-day. Studies calculating ingestion rates for the robin included in the USEPA (December 1993) are based on a diet comprised of berries. Based on these studies, the food and water ingestion rates in kg/day and L/day, respectively, were calculated as shown in the attached table. The food ingestion rates were then multiplied by 0.23, which is the percent solids of fruit (Sample et al., 1997) to convert the ingestion rate from a wet-weight value to a dry-weight value. However, because it is assumed that the robin 100 percent of the robin's diet are worms for the food chain models, the ingestion rate for the robin was calculated using field metabolism scaling as presented on the attached table (Nagy et al., 1999). These are the values that will be used in the food chain model for this site.

The water ingestion rate was estimated as 0.14 g/g-day. The incidental soil ingestion rate was calculated by multiplying the ingestion rate by the percentage of soil that is incidentally ingested (assumed 16.4% for conservative food chain model and 6.4% for the average food chain model) from USEPA (2007). The 16.4% and 6.4% values are from the American woodcock since it is assumed that both the woodcock and robin are consuming 100% worms, and no incidental soil ingestion rate was available for the robin.

The home range for the robin was calculated using data from Tennessee and a New York dense conifer forest. The values ranged from 0.27 to 1.04 acres with an average home range of 0.6095 acres.

Meadow Vole (*Microtus pennsylvanicus*)

Meadow voles inhabit grassy fields, marshes, and bogs; however, they prefer fields with more grass, more cover, and fewer woody plants. They typically consume green succulent vegetation, sedges, seeds, roots, bark, fungi, insects, and animal matter. However, green succulent vegetation makes up the majority of their diet.

The adult body weight for the vole ranges from 0.017 to 0.0524 kg with an average of 0.0358 kg. The only listed food ingestion rates for voles range from 0.30 to 0.35 g/g-day (wet-weight), with an average of 0.325 g/g-day. The water ingestion rates are 0.14 (estimated) and 0.21 g/g-day, with an average of 0.175 g/g-day. The food and water ingestion rates in kg/day and L/day, respectively, were calculated as shown

in the attached table. The food ingestion rates were then multiplied by 0.15, which is the percent solids of plant foilage (USEPA, 2007) to convert the ingestion rate from a wet-weight value to a dry-weight value. Finally, the incidental soil ingestion rate is calculated by multiplying the ingestion rate by the percentage of soil that is incidentally ingested, which was 3.2% for conservative food chain model and 1.2% for the average food chain model) from USEPA (2007). The home range for the meadow vole ranges from 0.000494 to 0.2051 acres with an average home range of 0.0659 acres.

Northern Bobwhite Quail (*Colinus virginianus*)

Quails inhabit grasslands, idle fields, pastures, and large clumps of grasses. Bobwhite quails forage in areas with open vegetation, some bare ground, and light litter. Seeds from weeds, woody plants, and grasses comprise the majority of an adult's diet, although green vegetation has been found to dominate the diet of this species in winter in the southern areas of the United States.

The adult body weight for the bobwhite quail ranges from 0.154 to 0.1939 kg with an average of 0.1751 kg. The listed food ingestion rates for quails range from 0.067 to 0.093 g/g-day (dry-weight), with an average of 0.078 g/g-day. The water ingestion rate is estimated as 0.10 and 0.11 g/g-day, and measured as 0.10 to 0.13 g/g-day, for an average water ingestion rate of 0.11 g/g-day. The food and water ingestion rates in kg/day and L/day, respectively, were calculated as shown in the attached table. The food ingestion rates were already dry-weight values. Finally, the incidental soil ingestion rate is calculated by multiplying the ingestion rate by the percentage of soil that is incidentally ingested, which was 13.9% for conservative food chain model and 6.1% for the average food chain model from USEPA (2007) and was based on the mourning dove.

The home range for the quail ranges from 8.9 to 41.3 acres with an average home range of 18.8 acres.
