Section 1
Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this report documenting the 2013 field sampling and chemical analysis program at the Dump Road Area (DRA) of Martin State Airport (MSA) in Middle River, Maryland. The locations of Martin State Airport and the Dump Road Area are shown on Figure 1-1. The Dump Road Area is along the northeastern side of the runway at Martin State Airport. A portion of the area extends across Taxiway Tango into the median between the taxiway and airport runway.

This investigation performed additional characterization of the 0.7-acre wetland area east of Ponds 1 and 2 and immediately west of Frog Mortar Creek. It included (1) installation and sampling of additional groundwater monitoring-well clusters adjacent to Frog Mortar Creek along the limits of buried waste, (2) additional soil and groundwater sampling, and (3) additional sediment and surface water sampling in the wetland near the Frog Mortar Creek shoreline. Additional characterization included test pit excavations, soil borings and soil sampling, direct-push groundwater profiling, installation and monitoring of multi-level monitoring wells, and sediment and surface water sampling in the Dump Road Area site.

This investigation further evaluates the extent of hazardous materials that were historically placed or spilled in the Dump Road Area of Martin State Airport. The depth and volume of the source areas were further defined to help select and design remedial options. This investigation also incorporated additional scope to address comments from the Maryland Department of the Environment (MDE) regarding Tetra Tech's *Dump Road Source Areas Investigation Work Plan* (Tetra Tech, 2012a) and *Technical Memorandum for the Dump Road Area, Source Area Delineation* (Tetra Tech, 2012b). Specific activities of this investigation include:

- characterizing soil, surface water, sediment, groundwater, and waste conditions in the 0.7-acre wetland area west of Frog Mortar Creek and downgradient of Ponds 1 and 2, and along the creek shoreline downgradient of the landfilled waste material

- further characterizing the chemical characteristics of surface water and sediment in Pond 1

- characterizing additional areas in the Dump Road Area, based on Maryland Department of the Environment comments for Tetra Tech's *Dump Road Source Areas Investigation Work Plan* (Tetra Tech, 2012a) and *Technical Memorandum for the Dump Road Area, Source Area Delineation* (Tetra Tech, 2012b)

- assessing groundwater flow direction and gradient

- determining aquifer parameters

- assessing contaminant concentrations (horizontally and vertically) to support and update the site conceptual model

- determining the source and extent of chemicals of potential concern (COPC) detected in soil and groundwater during direct-push technology (DPT) investigations

In 2012, Tetra Tech compiled available existing data relating to possible source areas in the Dump Road Area into a technical memorandum (Tetra Tech, 2012b). Tetra Tech evaluated historical soil and groundwater data from borings, monitoring wells, membrane-interface probes (MIPs), and temporary monitoring wells (i.e., the PA-series from the Petroleum Area and the DA-series from the Drum Area) to prepare the memorandum. The memorandum summarizes the evaluated data and identifies possible source areas.

The known or suspected horizontal and vertical extent of contamination was detailed using cross-sections of the identified source areas. The memorandum also identifies data gaps and provides recommendations for additional characterization. Recommendations from this memorandum and the data obtained during the 2012 Dump Road Area source-areas investigation are the basis for the technical approach implemented in this investigation. Tetra Tech, Inc. prepared this document for Lockheed Martin Corporation as part of continuing environmental investigations at Martin State Airport, under the oversight of the Maryland Department of the Environment (MDE) Controlled Hazardous Substances Enforcement Division, formerly the state Superfund program.

This report is organized as follows:

Section 2—Site Background: Presents an overview and history of the site and describes surface and subsurface conditions observed in the field during investigations to date. This section also describes the regional geology and hydrogeology, as determined from site soil borings and the scientific literature.

Section 3—Investigation Approach and Methodology: Describes the technical approach and field methodologies for the investigation conducted in 2013.

Section 4—Investigation Results: Discusses data evaluation and results for the 2013 investigation and the distributions of primary site contaminants.

Section 5—Source Areas Evaluation Methodology: Discusses the methods used to evaluate source areas for chlorinated and petroleum volatile organic compounds at the Dump Road Area.

Section 6—Source Areas Characterization: Describes site conditions and past operations and evaluates the current distributions of volatile organic compounds in possible source areas.

Section 7—Summary: Summarizes the major findings presented in Sections 4 and 6.

Section 8—References: Cites references used in compiling this report.

Section 2
Site Background

2.1 SITE DESCRIPTION

2.1.1 Location

Martin State Airport (MSA) is at 701 Wilson Point Road in Middle River, Maryland, and is bounded by Frog Mortar Creek to the east and Stansbury Creek to the west (Figure 2-1). Both creeks are tidal tributaries of the Chesapeake Bay and join the bay at the south side of the airport. The Dump Road Area (DRA) is in the southeastern portion of MSA and is bounded by Frog Mortar Creek to the east and the airport runway to the west. This area has been investigated since the 1990s, and Lockheed Martin Corporation (Lockheed Martin) designated the site as the DRA to distinguish it from other MSA areas under investigation (e.g., Frog Mortar Creek, Strawberry Point [SP], Greater Strawberry Point [GSP], and the Main Terminal area).

2.1.2 History

The current MSA property was part of the Glenn L. Martin Company's original 1,260-acre property, which previously included both the MSA and the manufacturing portion of the original facility now known as Lockheed Martin's Middle River Complex (MRC) (see Figure 2-1). In the spring and summer of 1929, the Glenn L. Martin Company purchased six parcels of land from private landowners. During the 1940s and 1950s, nine additional parcels were acquired from private landowners; together these parcels comprise the current areas of MSA and the MRC.

In 1932, the B-10 bomber was one of the first aircraft produced at the Glenn L. Martin Company Baltimore facility. Three runways, Hangars 1–3, and the airport administration building were built at the MSA in 1939 and 1940. Hangars 4–6 and the SP hangar were completed in 1940 and 1941, respectively. After World War II, commercial transports and jet aircraft were produced at the manufacturing portion of the facility. In July 1955, the Maryland Air National Guard (MDANG) 104th Tactical Fighter Group began leasing property from the Glenn L. Martin Company. On April 1, 1960, the 135th Tactical Airlift, previously based in Baltimore, was

transferred to MSA, and by October 1962, the 104th Tactical Fighter Group had been reorganized and designated the 175th Tactical Fighter Group.

The Glenn L. Martin Company consolidated with American Marietta Corporation in September 1961 to form Martin Marietta Corporation. On September 20, 1975, the Maryland Aviation Administration (MAA) purchased 747 acres that are now used as the airfield, of which 175 acres in the northeastern portion are now leased to MDANG. In 1995, Lockheed Corporation and Martin Marietta merged to form Lockheed Martin Corporation. Lockheed Martin, northwest of the airport, occupies 338 acres of the original 1,260-acres, and currently conducts environmental investigations and remediation at MSA and the MRC.

2.1.3 Current Conditions

MAA currently operates MSA on behalf of the Maryland Department of Transportation. MSA has an administration building (Main Terminal building), aircraft hangars, a 7,000-foot long runway, several taxiways, and the SP Hangar. MAA manages more than 130,000 square feet of heated hangar space and 190 smaller aircraft "T-hangars." The southwestern portion of MSA contains numerous aboveground fuel storage tanks for Jet A and Avgas 100LL fuels. MSA is also home to more than 20 commercial tenants providing fuels and lubricants, helicopter avionics repair, and flight instruction, as well as the Baltimore County Police aviation and marine units and the Glenn L. Martin Museum (MAA, 2012).

The DRA consists mostly of mowed grass surrounding Taxiway Tango and the runway, with heavily wooded areas in the northern, eastern, and southeastern portions of the site, and open meadows in the east–central and southeastern portions of the site. The DRA also includes portions of Taxiway Tango and the airport runway, and two small ponds (Ponds 1 and 2). Site topography is generally flat and slopes gently to the northeast toward Frog Mortar Creek. Along the Frog Mortar Creek shoreline lies a steeply sloped embankment comprised of fill placed there as part of airport construction.

2.1.4 Land Use

MSA is generally characterized as a moderately developed tract in a largely suburbanized, moderate density, populated setting. Land use surrounding MSA is, to a significant degree, a combination of mixed suburban, industrial, commercial, lightly to moderately developed tracts,

and woodland tracts. MSA is bordered to the north by Eastern Boulevard (Maryland Route 150) and Amtrak railroad lines.

Undeveloped woodland tracts and low-density residential properties are north of MSA and the Amtrak line. The MSA's eastern, southern, and western boundaries are bordered by Frog Mortar Creek and Stansbury Creek, which are wide, brackish, tidal tributaries of the middle Chesapeake Bay. The MRC lies along MSA's northwestern boundary. The Old Navy Depot—Bengies (Plant 2) is across from the MSA on Eastern Avenue. Low- to medium-density residential and light commercial land uses (e.g., shopping centers, convenience stores, restaurants, etc.) are beyond the creeks east, south, and west of MSA. Farther east and west of MSA are the high-density residential communities of Bengies Corner and Hawthorne Park. The town of Middle River is approximately 1.5 miles northwest of MSA.

2.1.5 Climate

The MSA has a humid, temperate climate, with hot humid summers and relatively mild winters. The Middle River, Maryland area receives an average of 42 inches of precipitation annually, distributed evenly throughout the year. Rainfall normally occurs in the summer as showers and thunderstorms. In winter, precipitation is typically light to heavy rainfall or snow. Tropical storms in late summer and fall, and occluded, meso-scale frontal systems (i.e., coastal low pressure systems) in winter and spring occasionally provide short-term above-average precipitation.

2.1.6 Physiography

MSA is in the western shore of the Coastal Plain physiographic province. The Coastal Plain consists of sediments composed of alluvium from the Pleistocene Epoch and Potomac Group sediments from the Cretaceous Period. Coastal Plain sediments begin at the Fall Line and follow a regional dip to the southeast at approximately 110 feet per mile (Hansen and Edwards, 1986). The Fall Line is the division between the Piedmont and Atlantic Coastal physiographic provinces. It refers to an imaginary line connecting changes in stream flow characteristics between the hard-rock upland areas of the Piedmont and the soft-sediment lowland areas of the Coastal Plain. The Coastal Plain is generally characterized by low topographic relief. However, steep embankments and hills are found along stream channels, rivers, and Chesapeake Bay.

2.1.7 Topography

Most of MSA's land surface is generally flat to gently sloping in the areas of the runway, taxiways, and surrounding support operations. The MSA runway forms a trending topographic ridge, or drainage divide, that slopes gently from the northwest to the southeast. Runway elevations range from slightly more than 20 feet above the North American Vertical Datum of 1988 (NAVD 1988) at the northern end to slightly more than 10 feet above NAVD 1988 at the southern end. The land slopes away from the runway toward Frog Mortar Creek to the northeast, and Stansbury Creek to the southwest.

In the northern portion of the DRA, land elevations range from approximately 11 feet above NAVD 1988 near the runway to approximately seven feet above NAVD 1988 at Pond 2. In the southeastern portion of the site near Frog Mortar Creek, land elevations are approximately 20 feet above NAVD 1988 at a mounded area near the creek embankment. The elevation at the top of the creek embankment ranges from approximately 10 feet above NAVD 1988 at the northern portion of the DRA to approximately 20 feet above NAVD 1988 in the southern portion. Land surface elevation at the Frog Mortar Creek shoreline is near zero feet, relative to NAVD 1988.

2.1.8 Surface Water Hydrology

MSA is bordered to the east, south, and west by Frog Mortar Creek and Stansbury Creek, which are wide, brackish, tidal tributaries of the middle Chesapeake Bay. Surface water runoff from MSA enters these creeks via localized gullies in the eastern and western undeveloped portions of the site, or via storm sewers that drain the airport runway, taxiways, and developed portions of the facility. MSA encompasses 47 drainage areas in three watersheds, forming a total drainage area of 700 acres (MAA, 2008). The airport drainage areas range from seven to more than 170 acres.

In the DRA, six drainage areas drain the runway, taxiways, and wooded areas, discharging to Frog Mortar Creek on the east side of MSA. The DRA has two small ponds (Pond 1 and Pond 2), wetlands, and a stormwater-management pond near the fire pump-house in the western portion of MSA. Pond 1 and the wetland are contained within each drainage area and do not discharge to Frog Mortar Creek. The stormwater pond near the fire pump-house discharges to the upper reaches of the Stansbury Creek tidal area.

All stormwater runoff originating from MSA discharges to outfall areas that are monitored monthly to ensure that no oily discharges to surface water occur. Secondary containment drains are also routinely inspected and emptied of stormwater. The facility maintains a "General National Pollutant Discharge Elimination System" permit (No. MDR 05501, "General Discharge" permit No. 05-SF-5501), with an effective date of November 12, 2004 and an expiration date of November 12, 2009. However, the current permit remains in effect because the Maryland Department of the Environment (MDE) has administratively extended it until they issue a new general permit.

The site general industrial permit has no monitoring requirements. However, limited monitoring is performed for the municipal storm-sewer system permit required per the federal Illicit Discharge Detection and Elimination program. This limited monitoring occurs annually and includes laboratory analysis for ammonia, dissolved oxygen, surfactants, fecal coliform, potassium, water temperature, conductivity, pH, and fluoride. Visual inspections are also routinely performed. Annual reports are submitted to MDE.

2.1.9 Geology and Hydrogeology

MSA is in the western shore of the Coastal Plain physiographic province. Regional and local studies (Vroblesky and Fleck, 1991; Chapelle, 1985) indicate that MSA lies on the Patapsco Formation. This formation consists of complex and interbedded mixtures of gray, brown, and red sands, silts, and clays originating from sediment deposition in a low coastal plain traversed by low-gradient meandering streams. The Patapsco aquifer in the Baltimore area has been divided into a sand facies and a clay facies. The sand facies consists predominantly of medium to fine sand and has moderate permeabilities (approximately 0.1 foot per day). In the Baltimore area, the Patapsco aquifer coincides with the sand facies of the Patapsco Formation and is mostly unconfined. Storage coefficients for unconfined portions of the Patapsco aquifer have been estimated at 0.01 to 0.1 (dimensionless parameter). In the confined portions of the aquifer, transmissivity values range between 1,900–3,800 square feet per day, and storativity ranges between 0.0027–0.000053 (dimensionless parameter), with an average of 0.00061 (Chapelle, 1985). Recharge to the Patapsco aquifer occurs primarily where the Patapsco Formation outcrops subparallel to the Fall Line (Vroblesky and Fleck, 1991). In the Middle River area, the Patapsco Formation outcrops within and west of the MSA. The Patapsco aquifer is the aquifer of concern at the DRA.

Below the Patapsco Formation lies a regionally extensive thick-clay confining-unit known as the Arundel Formation. It is a massive and probably impermeable unit underlying the site and surrounding area. The Arundel Formation outcrops northwest of the site and dips and thickens to the southeast. The Arundel Formation extends as far east as Cambridge, Maryland, where it is more than 600 feet thick. Regional lithologic information indicates that the Arundel Formation may be up to 150 feet thick at MSA (Vroblesky and Fleck, 1991; Chapelle, 1985). The formation probably acts as an impermeable barrier to the downward movement of any constituents found in the surficial aquifer. The base of the Arundel Formation (i.e., the top surface of the deeper Patuxent Formation) is approximately 225 feet below NAVD 1988 near MSA (Vroblesky and Fleck, 1991; Chapelle, 1985). The depth to the base of the Arundel Formation may therefore range from 235–255 feet below grade at MSA.

Below the Arundel Formation is the Patuxent Formation. The Patuxent Formation is a multi-aquifer unit comprised of various interbedded sand and silt/clay layers and rapid changes of deposited material types over short distances. Permeable sand-rich units range from bounded sand sheets to isolated sand bodies (Glaser, 1969). In the MSA area, potentiometric maps of the Patuxent Formation indicate that groundwater flows to the south and southwest, in response to industrial wells withdrawing water southwest and west of the site (Chapelle, 1985 and Curtin, 2006).

2.1.10 Vicinity Subsurface Conditions

An extensive subsurface investigation of the DRA continues. Less extensive environmental investigations have been conducted at SP and GSP, which are south and southwest of the DRA. As part of the DRA investigation, numerous shallow and deep soil borings have been advanced to collect soil samples for subsurface lithologic information. Synoptic water-level measurements, single-well permeability tests, and pumping tests have been conducted to characterize subsurface hydraulic conditions at the DRA. Figure 2-2 is a fence diagram of the generalized geology at the DRA, based on the lithology encountered in the course of subsurface investigations.

Early studies at the DRA indicated that the subsurface hydrogeology is comprised of a surficial aquifer (i.e., the Patapsco Formation) containing highly heterogeneous mixtures of unconsolidated sand, silt, gravel/sand mixtures, and clay. A layer of fill, consisting of heterogeneous sand, silt, clay, and localized industrial debris and wastes overlies these native

sediments. In the northern portion of the DRA and south of the current MDANG munitions storage area, a former tidal cove (identified as Limehouse Cove on a 1951 United States Geological Survey [USGS] topographic map) was filled in with hydraulically placed fill beginning sometime between 1938 and 1945, with most the filling work completed by 1960 (Tetra Tech, Inc., [Tetra Tech], 2013a). Current topography suggests that 10 or more feet of fill is likely present in portions of the former cove.

For data evaluation and correlation, the surficial aquifer is divided into upper, intermediate, and lower surficial-aquifer zones. The lower surficial-aquifer zone is encountered up to approximately 45–73 feet below NAVD 1988. It overlies at least several feet of stiff, dense clay. A deep groundwater study investigated the lithology beneath the lower surficial-aquifer in the DRA of MSA (Tetra Tech, 2009). Lithologic data from four deep wells indicate six to 40 feet of clay beneath the lower surficial-aquifer. Deep-well logs also indicate alternating sand and silt aquifers and clay aquitards beneath the lower surficial-aquifer. These sandy units are referred to as the deep confined-aquifer zones.

2.2 AREAS OF CONCERN

From the 1930s through the 1960s, three pits were reportedly used to dump spent battery acid, acid-type strippers, and other acidic solutions. Dredge spoils and construction debris associated with industrial operations were also reportedly placed in the pits. MDE found only two of three pits during site visits made as part of a preliminary assessment (PA) conducted in 1989 (MDE, 1989). MDE referred to the two pits as ponds in the PA; these pits were later named Acid Pit #1 (Pond 1) and Acid Pit #2 (Pond 2) in subsequent studies. Pond 1 and Pond 2 are shown in Figure 2-3. Additionally, aerial photographs from 1952 and 1957 reviewed during a 1996 DRA investigation (i.e., the July 1996 expanded investigation [Maryland Environmental Service, 1996]) show an open “burial area” or “dump” adjacent to what is now Taxiway Tango.

In July 1991, four drums containing dried zinc-chromate paint were uncovered during installation of underground electric cables adjacent to Taxiway Tango (Figure 2-3). This discovery prompted MDE to order MAA to conduct additional studies of the Taxiway Tango area. Early investigations from 1991–1996 identified four areas of concern known as the Taxiway Tango Median Anomaly Area (TT Median Area), the Drum Area (DA), two ponds

(Pond 1 and Pond 2), and the Petroleum Hydrocarbon Area (PHA). These four areas are shown in Figure 2-3. Brief descriptions of these four areas follow:

- *Taxiway Tango Median Anomaly Area*—In 1991, four buried drums containing dried zinc-chromate paint were unearthed and removed from the area between Taxiway Tango and the airport runway, northwest of Taxiway D. A construction drawing indicates fill and trash, and an initial geophysical survey indicates several electromagnetic (EM) anomalies, suggesting buried metal.

- *Drum Area*—In the forested area near wells MW-2 and MW-5, northeast of Taxiway Tango, several drums were uncovered when surface vegetation was cleared during a 1996 site investigation.

- *Two ponds*—Historical records indicate that acids may have been discharged at the present location of these ponds (approximately 450 feet and 600 feet northeast of Taxiway Tango, respectively) sometime during the 1930s through the 1960s. A third pond in the area is shown on a USGS topographic map (photo-revised in 1985) in the PA, but MDE could not locate a third pond during the 1989 site visits.

- *Petroleum Hydrocarbon Area*—The PHA is approximately 200 feet west of the ponds. Petroleum hydrocarbons were encountered while drilling a soil boring in this area during the 1996 site investigation.

These four areas became the focus of subsequent studies when chemical constituent impacts to soil, pond sediment, and groundwater became apparent. MAA first investigated Frog Mortar Creek in 1998.

From 1999–2010, Lockheed Martin conducted a remedial investigation (RI) (Tetra Tech, 2012c) and supplemental work to further delineate the extent of soil, groundwater, and pond sediment chemical contamination indicated by earlier studies at MSA. Through geophysical surveys, membrane-interface probes (MIPs), test pits, soil borings, and chemical analyses of soil and pond sediment samples, the RI identified large areas of buried fill and debris, and surface and subsurface soil contamination in and around the buried fill material and in pond sediment. Buried fill and debris were estimated to be present over approximately 25 acres of the DRA.

The fill material consists of soil, stained soil, and debris, the latter of which is comprised of concrete rubble and disposed industrial items (e.g., batteries, deteriorated drums, tires, paint cans, burned items, sludge, buckets, glass, wood, etc.). Volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and several metals have been detected in soil at concentrations exceeding human health risk screening levels.

Chlorinated VOCs (cVOCs) (trichloroethene [TCE] and its degradation products), petroleum VOCs (pVOCs) (e.g., benzene, toluene, etc.), and metals have also been detected in surficial aquifer groundwater at concentrations exceeding Maryland groundwater and drinking water standards.

2.3 SOURCE AREAS CHARACTERIZATION

The DRA investigation area was initially identified in the 1989 PA as possible acid pits and was investigated in 1991 after the MAA encountered four drums adjacent to Taxiway Tango during trenching to install an electrical cable. Preliminary investigations from 1992–1996 and follow-on work to date have identified soil and groundwater contaminant-source areas through geophysical surveys, soil-gas surveys, trenches, test pits, MIP screening, soil borings, soil sample analyses, and groundwater sampling and analyses. These investigations identified a large area of soil fill and buried debris east of Taxiway Tango, extending to the base of the embankment at Frog Mortar Creek. Investigation of this fill area identified geophysical EM anomalies and areas containing buried debris, soil containing VOCs, and soil containing other contaminants such as polycyclic aromatic hydrocarbons (PAHs) and metals from past dumping and backfilling. Past dumping and backfilling has resulted in VOC contamination in soil and pond sediment at the DRA, and the development of large contaminant plumes of VOCs in groundwater in the upper, intermediate, and deep portions of the surficial aquifer east of Taxiway Tango that extend to Frog Mortar Creek.

2.3.1 Dump Road Fill Characteristics

Several events indicate that fill, debris, and wastes have been placed in the area of the DRA. According to the 1989 PA, the MSA facility manager reported that former aircraft facility employees had told him that spent battery acid, acid-type strippers, and other acidic solutions had been routinely dumped into three ponds, or "acid pits," east of Taxiway Tango. The former aircraft facility employees also told the MSA facility manager that dredge spoils and construction debris had been disposed of in these ponds. The PA investigation did not include follow-up work at the acid pits (MDE, 1989).

A recent study of historical drawings and aerial photographs identified the locations of several disposal pits and open burning areas that were present in the 1950s (Tetra Tech, 2013a). One as-built engineering drawing identified what is now Pond 1 as a designed "acid and oil disposal"

pit (see feature #1 in Figure 2-4). Historical aerial photographs show a second, slightly smaller pit southeast of and adjacent to Pond 1 (feature #2 on Figure 2-4), and a small linear pond (feature #24 on Figure 2-4) along the eastern end of feature #2. These photographs show dark, stained soil on the sides of both pits, presumably from chemical and/or fuel dumping. One photograph shows what appears to be dark product floating on the surface of the smaller pit adjacent to Pond 1. A pit and an open burning area (features #44 and #15 on Figure 2-4) are visible in the photographs near DRA wells MW-45S and DMW-1A. Other pits were identified beneath Taxiway Tango approximately 600 feet northwest of Taxiway Delta, between wells MW-24S and MW-2 (feature #43 on Figure 2-4); northwest of the PHA (features #46 and #47 on Figure 2-4); and east of wells MW-18S/I/D (feature #42 on Figure 2-4). Another open burning area and more debris piles were identified west–southwest of the DA (see features #45 and #51 on Figure 2-4).

The aerial photograph study confirms that, before filling done in the 1950s, a cove in Frog Mortar Creek existed in the northern portion of the DRA (see blue dashed outline of Limehouse Cove in Figure 2-4). These photographs show the upper reach of Limehouse Cove as near present-day Taxiway Tango. The upper reaches of Limehouse Cove were filled between 1938 and 1945, and filling of the cove continued into the 1950s, with much of it during the mid-1950s. The cove appears completely filled in in a 1959 photograph. Present day topography suggests that more than 10 feet of fill was placed in certain portions of the former cove area. The aerial photograph study also found evidence of grading and filling in areas south of the cove and in the Compass Rose Area (CRA).

A 1956 United States Army Corps of Engineers map and soil profile found during a subsequent file review indicates an area of fill and trash west of the ponds, approximately 900 feet long and five feet deep, underlying Taxiway Tango. This discovery prompted MAA to conduct a geophysical survey of a 200- by 1,600-foot area adjacent to Taxiway Tango between the taxiway and the runway. Numerous geophysical anomalies were detected, indicating possible buried metal within the survey area. This area became known as the TT Median Area because of these anomalies. The top surfaces of the anomalies were estimated to be at shallow depths of 2–3 feet below grade. During a 1996 environmental investigation of the DRA (Maryland Environmental Service, 1996), several drums were uncovered in the forested area near wells MW-2 and MW-5

northeast of Taxiway Tango. These discoveries indicate that industrial debris and wastes may possibly be in the subsurface at the DRA.

In 2000, trenches and two test pits were excavated in the TT Median Area and DA of the DRA (Tetra Tech, 2000). Debris types were noted in the field and fill depths and thicknesses were determined for each test pit and trench. A geophysical survey of the TT Median Area and the area east of Taxiway Tango in 2007 identified EM anomalies suspected of containing conductive metallic/magnetic objects in the subsurface (Tetra Tech, 2012c). These anomalous areas were investigated via test pits A1 through A44 in 2008–2009 to confirm the geophysical investigation findings, to evaluate fill depth, and assess any buried materials.

The 2007 geophysical survey and follow-on test-pit investigation (Tetra Tech, 2012c) delineated several geophysical anomaly areas at the DRA. The EM anomaly areas range in size from 0.18 acres for Area 3 to 5.10 acres for Area 2. Non-anomalous EM areas were also found on-site that do not indicate buried metal or debris. The geophysical survey indicated areas and buried debris suspected of containing waste. These were designated Areas 1–10, and the fill/debris thicknesses and fill/debris maximum depths of the test pits and trenches were plotted and contoured in figures included in the *Dump Road Area Characterization of Possible Source Areas Report* (Tetra Tech, 2013b). Detailed descriptions of the 10 areas and test pit results are in that report and are therefore not repeated herein. However, the findings described below are for the areas related to the scope of work of this investigation (Tetra Tech, 2013b).

- *Area 2*, in the northern portion of the site, includes Pond 2 to the east and extends past Taxiway Tango to the west. This area includes test-pit excavations TT-EX-1, A1, A2, A14, A15, A24, A25, A34, and A36. Test pits A26, A35, and A42 are immediately south, north, and east, respectively, of the Area 2 boundaries. Elevated field measurements of VOCs in soil (jar head-space analysis) range from 1.2 parts per million per volume (ppmv) at A26 to greater than 2,000 ppmv at excavation TT-EX1.

- *Area 9* is a 2.07-acre area in the northeastern portion of the site. It is a densely vegetated area outside the MSA security fence bordering Frog Mortar Creek where geophysical surveying could not be conducted due to steep terrain and dense vegetation. Three test pits (A16, A17, and A44) were excavated in this area to determine the presence, thickness, and depth of possible fill and buried debris. Fill was not encountered at A16, although a black sludge-like soil and a strong odor of what was described as paint thinner was found at eight to 10 feet below grade.

- *Non-anomalous areas*—Test pits N2, N3, N4, N6, N7, and N8 were excavated in non-anomalous areas outside of Areas 1 through 10. The fill material at test pit N4 (north of Pond 1) is three feet thick and contained a greenish-black liquid and an odor that provided a field reading of 700 ppmv for VOC. Debris encountered in this pit includes glass and wood.

2.3.2 Soil Borings B-8 and B-15

MAA expanded its investigation of soil and groundwater quality in 1996 to include the fill area between Taxiway Tango and Frog Mortar Creek (Maryland Environmental Service, 1996). This investigation involved the area east of Taxiway Tango, including the two former acid pits (i.e., ponds) that had been identified in the 1989 PA. Three groundwater monitoring wells (MW-4, MW-5, and MW-6) were installed during the expanded investigation. In addition, 25 DPT soil borings and five manual soil-probe borings were advanced in this area to depths ranging from six to 22 feet below grade. Boring B-8 was advanced in the DA southwest of current well MW-5, and soil boring B-15 was advanced near the unpaved road in the PHA, adjacent to current well cluster DMW-9S/I/D.

A void was encountered while advancing soil boring B-8. Neither the boring log nor the report includes clear details regarding this void; however, the boring log does indicate that the void may be from a buried tank or container at depths of eight to 13 feet. No lithology is listed from two to eight feet in the soil lithology column of the boring log for B-8, but soil samples from five and 10 feet are described, and continuous lithology is shown in the log from eight to 14 feet (the bottom depth of the soil boring). The report indicates that the void is 11 feet long.

Soil at the 12 to 14 feet depth interval in boring B-8 was reported as having a strong odor and a high field reading (greater than 2,500 ppmv for total VOCs using a portable photoionization detector [PID]). The boring log also indicates that pure product was observed at this depth. Soil samples from the 12–14 foot depth interval (as noted in the soil boring log) were submitted to both the field laboratory and to an off-site analytical laboratory for chemical analyses (note, however, that Table 1 in the 1996 expanded investigation report lists the sampling depth as 10–14 feet). The field laboratory-analyses of soil from boring B-8 found high concentrations of TCE (6.2 milligrams per kilogram [mg/kg]) and total petroleum hydrocarbons (TPH)-diesel-range organics (DRO) (19,000 mg/kg). However, the off-site laboratory analyses reported a much lower TCE concentration (130 micrograms per kilogram [µg/kg], which is equivalent to 0.130 mg/kg).

Monitoring well MW-5 was installed in January 1996 directly downgradient and 12 feet east of boring B-8; this well is screened from 19 to 39 feet below grade. In January 1996, TCE, *cis*-1,2-dichloroethene (*cis*-1,2-DCE), and toluene were detected in groundwater samples collected from MW-5 at concentrations of 63,000, 38,000, and 6,900 micrograms per liter (µg/L), respectively. The January 1996 TCE concentration (63,000 µg/L) indicated the likely presence of TCE dense non-aqueous phase liquid (DNAPL) at or near well MW-5.

During the same investigation, "free product" was also observed at depths of four to seven feet in boring B-15, located in the dirt access road near the PHA. The type of product observed was not described in the report. A soil VOC reading of 9,300 ppmv was recorded at the groundwater table six feet below grade. This was presumably petroleum-related product (light non-aqueous-phase liquid), based on elevated field analysis of soil samples from four to seven feet indicating elevated diesel-range organics (17,000 parts per million) and a subsequent laboratory analysis indicating elevated xylenes (13,000 µg/kg). Laboratory results also reported TCE in boring B-15 soil at 140 µg/kg.

Well MW-4 was installed in January 1996 near borings B-1 and B-15 to assess the strong petroleum odor observed at B-1. In January 1996, TCE was not detected, and only low concentrations of other VOCs were detected in groundwater from this well. MW-4 is screened from four- to 30-feet below grade.

From March to May 2000, the source identification and assessment program (Tetra Tech, 2000) further investigated areas previously identified as possible chemical-release areas. Each area was investigated through a combination of excavations, localized trenching, drilling of soil borings, and sampling and laboratory chemical analyses of soil, sediment, and groundwater samples. Shallow soil from Pond 1, Pond 2, and the PHA was investigated by collecting 15 soil samples at depths of 11 feet or less (typically four to five feet deep) from drilled soil borings. The PHA soil borings were near soil boring B-15 (advanced during the 1996 confirmation investigation), which contained petroleum hydrocarbons.

The highest reported concentration of the petroleum-related compounds of benzene, toluene, ethylbenzene, and xylenes (BTEX) at the PHA was 2,138,900 µg/kg, detected in a sample collected from test pit DR-A33 (six-feet deep). Soil boring PHA-SB-1, advanced adjacent to soil boring B-15 (where free product had been observed at 4–7 feet), had a field VOC reading of

9,300 ppmv for soil at six feet below grade. BTEX were detected at 1,470 µg/kg adjacent to boring B-15 in sample PHA-SB-1–4 collected at a depth of four feet. Many elevated BTEX concentrations, including the concentration detected at DR-A33, were detected at depths near the water table. BTEX were detected at low concentrations ranging from 2.97 to 20.47 µg/kg in deep subsurface soil samples at borings DR-SB-7 (16 and 20 feet), DR-SB-17 (19 feet), DR-SB-10 (24 feet), and MIP-25 (40 feet).

In general, however, current (2012-2013) TCE concentrations from wells DMW-7S (4,700 µg/L), MW-5 (not detected), MW-40S/I (3,900 and 6,800 µg/L, respectively) and probe groundwater-samples CPT-11 through CPT-15 (10-9600 µg/L) do not indicate the presence of DNAPL. However, TCE concentrations of 9,600 µg/L at CPT-13 (40 feet deep), 8,000 µg/L at CPT-12 (30 feet deep), and 7,200 µg/L at CPT-11 (35 feet deep) suggest that additional probe groundwater sampling are required to further assess the possible presence of DNAPL in these areas. High concentrations of *cis*-1,2-DCE and vinyl chloride at many DA probe–groundwater sampling locations, particularly those downgradient of DMW-7, indicate that degradation of TCE is occurring at the DA. This higher level of degradation is likely in response to past injections of substrate during a pilot-scale test in 2007.

2.3.3 Soil and Groundwater Contaminant Sources

As discussed in Section 2.2, previous investigations have identified four primary contaminant source areas for TCE (and other associated cVOCs) and BTEX:

- TT Median Area
- DA
- Ponds 1 and 2
- PHA

Review of existing data confirms all but Pond 2 as primary source areas for DRA soil, pond sediment, and groundwater contamination. Results for shallow sediment samples collected from Pond 2 do not indicate that this pond is a VOC source for the DRA. The four possible source areas were the focus of the initial investigations conducted in the 1990s and of follow-on work conducted to date. However, the *Dump Road Source Areas Investigation Work Plan* (Tetra Tech, 2012a) and *Technical Memorandum for the Dump Road Area, Source Area Delineation* (Tetra Tech, 2012b) identified three additional areas of elevated VOCs in soil and groundwater that require further investigation. These areas were identified as:

- *Taxiway Tango Area*—East (TT East)
- *Taxiway Tango Area*—North (TT North)
- *area east of Pond 1*

The 2012 source area investigation was designed to gather additional environmental data at all seven identified areas. The 2012 historical aerial photograph and document review (Tetra Tech, 2013a) confirmed the location and use of Pond 1 as an acid and oil pit, and identified other operational features such as debris piles at the DA (feature #51 on Figure 2-4) and an open burning area and open pit at TT East (features #44 and #15 on Figure 2-4). Based on the review of aerial photographs, historical documents, and previous chemical data, the *Dump Road Area Characterization of Possible Source Areas Report* (Tetra Tech, 2013b) also identified other features that may be possible chemical source areas. That investigation identified the following possible source areas:

- *former Pond 3 and linear pond*—ponds south of Pond 1 (features #2 and #24 on Figure 2-4)
- *former open burning area and pit*—features #15 and #44 on Figure 2-4
- *former Ponds 5 and 6*—features #46 and #47 on Figure 2-4
- *DMW-4 former debris pile area*—feature #51 on Figure 2-4
- *Taxiway Tango South—former disturbed area*—feature #53 on Figure 2-4
- *former Pond 7*—feature #42 on Figure 2-4 and currently a wetland
- *former ammunition or fuel bunkers*—features #20 and #26 on Figure 2-4 (same area as TT North)

The former ammunition or fuel bunkers (features #20 and #26) are in TT North, feature #51 (former debris piles) is in the DA, and the former open burning area and pit (features #15 and #44) are in TT East. Therefore, these features are combined with the previously identified TT North, DA, and TT East source areas. Combining previous sites and historical (former) features, the following areas and media have been identified as possible TCE source areas:

- *PHA, Pond 1*—surface sediment/subsurface soil, groundwater
- *TT Median Area*—subsurface soil, groundwater

- *TT East, former open burning area and pit (features #44 and #15)*—subsurface soil, groundwater
- *DA, former debris piles (feature #51)*—surface and subsurface soil, groundwater
- *TT North, former ammunition or fuel bunkers (features #20 and #26)*—subsurface soil, groundwater
- *area east of Pond 1*—subsurface soil, groundwater
- *former Pond 3 and former linear pond (features #2 and #24)*—groundwater, soil is unknown
- *DMW-4 former debris pile area (feature #50)*—soil, groundwater

The affected media are unknown for the following possible source areas:

- *former Pond 4/open burning (OB) area (features #43 and #45)*—surrounding samples indicate trace to low concentrations of TCE in soil and groundwater
- *former Ponds 5 and 6 (features #46 and #47)*
- *former Pond 7 (feature #42)*
- *Taxiway Tango South*—former disturbed area (feature #53)

The following areas and media are considered possible BTEX sources, as identified through previous investigations (Tetra Tech, 2013b) and combining sites with historical (former) features:

- *PHA, Pond 1*—surface sediment/subsurface soil, groundwater
- *TT Median Area*—subsurface soil, groundwater
- *TT East-former open burning area and pit (features #44 and #15)*—subsurface soil, groundwater
- *DA, former debris pile (feature #51)*—groundwater
- *DMW4 former debris pile area (feature #50)*—soil (groundwater is unknown)

Affected media are unknown for the following possible BTEX source areas:

- *former Pond 3 and linear pond (features #2 and #24)*—soil is unknown
- *former Pond 4/open burning (OB) area (features #43 and #45)*—samples collected nearby indicate trace to low concentrations in soil and groundwater
- *former Ponds 5 and 6 (features #46 and #47)*

- *former Pond 7 (feature #42)*
- *Taxiway Tango South*—former disturbed area (feature #53)

Detailed discussions of known and possible VOC source areas, along with the chemical results of historical and 2012 sampling, are in the DRA source area characterization report (Tetra Tech, 2013b) and are not repeated herein. The known and possible VOC source areas listed above are shown in figures of the current report.

Section 3
Investigation Approach and Methodology

Tasks conducted in 2013 at the Dump Road Area (DRA) were intended to assess the subsurface conditions adjacent to Frog Mortar Creek and east of monitoring wells MW-18I, DMW-3I, and DMW-2, and to determine potential contaminant pathways and concentrations toward the creek. Additional samples were also collected to further delineate known source areas in the DRA and to help define the possible source areas identified in the DRA source area characterization report (Tetra Tech, Inc. [Tetra Tech], 2013b). The 2013 DRA field program entailed the following activities:

- obtaining utility clearances, an access agreement, and associated permits for intrusive investigations from Lockheed Martin Corporation (Lockheed Martin), Martin State Airport (MSA) and the Maryland Aviation Administration (MAA) to conduct the planned field activities

- excavating a total of seven test pits in three areas based on comments from the Maryland Department of the Environment (MDE) for the previous version of this DRA source area characterization report (Tetra Tech, 2013b):

    - the area east of Ponds 1 and 2 and along Frog Mortar Creek, and in the area near four test pits (at soil boring locations B8 and B15, advanced in 1996), to further assess free product and/or subsurface anomalies described on the boring and test pit logs

    - test pit location N4, to further evaluate the black/green liquid described on the N4 test pit log

    - test pit location A16, where a black sludge-like soil and a strong solvent odor were previously encountered

- advancing 10 soil borings for lithological characterization using a direct-push technology (DPT) drill rig, and collected discrete soil samples to a depth of approximately 30 feet below grade

- collecting more than 100 discrete groundwater samples from 22 locations to depths of up to 60 feet below grade (typically at five-foot intervals) using a DPT drill rig

- installing six monitoring well clusters (each consisting of three two-inch-diameter groundwater monitoring wells, including a shallow, intermediate, and deep well screened at approximately 20, 40, and 60 feet below grade, respectively) to characterize groundwater conditions downgradient of the wetlands west of Frog Mortar Creek, downgradient of Ponds 1 and 2, and along the Frog Mortar Creek shoreline downgradient of the landfilled waste material

- conducting a synoptic round of water level measurements that included existing monitoring wells throughout MSA and the 18 newly installed groundwater monitoring wells

- collecting groundwater samples from the 18 new monitoring wells

- collecting surface water samples from three locations in the 0.7-acre wetland near the Frog Mortar Creek shoreline and from two sampling points in Pond 1

- collecting sediment samples from three locations in the 0.7-acre wetland near the Frog Mortar Creek shoreline, and from three sampling points in Pond 1

- surveying the locations of test pits, soil borings, DPT groundwater borings, and newly installed groundwater monitoring wells using a Maryland-licensed surveyor

- collecting, storing, and characterizing investigation-derived waste (IDW), and disposing of that waste at an off-site, Lockheed Martin-approved treatment or disposal facility

- performing laboratory chemical analyses and chemical-data validation on soil, groundwater, surface water, and sediment samples

3.1 MOBILIZATION/DEMOBILIZATION

Tetra Tech procured the required subcontractors and began mobilization in July 2013. Mobilization included:

- coordinating site access with Lockheed Martin and MSA facilities personnel

- obtaining utility clearance for the proposed soil borings and groundwater monitoring wells, using both the Miss Utility clearinghouse and a private utility-locating firm, as described in Section 3.2

- mobilizing subcontractors, equipment, personnel, and materials to the site

- implementing a site-specific health and safety plan (HASP)

- arranging a decontamination area

Demobilization activities included:

- demobilizing equipment and materials from the site
- performing general site cleanup and trash removal at work completion
- repairing landscaping, ground, and other surfaces as necessary at work completion
- managing IDW (as described in Section 3.10)

The Tetra Tech field operations leader coordinated mobilization/demobilization, including an equipment inventory to ensure availability, purchasing and leasing of equipment as required, and staging equipment for efficient loading and transport to and from the site after each activity.

Appropriate Tetra Tech personnel familiarized themselves with the site-specific HASP and the respective safe work permits therein. Tetra Tech held mandatory health and safety tailgate meetings for all involved workers, including subcontractors, before each day's field events. All personnel working on-site received site-specific safety training from the Lockheed Martin safety manager. Subsequent to this training, subcontractors were issued a security pass allowing site access.

3.2 SITE ACCESS, PERMITS, AND UTILITY CLEARANCE

Tetra Tech obtained the required access agreements and permits and completed the required utility-clearance activities before starting fieldwork. Site preparation included:

- notifying the underground utility-location center Miss Utility (1-800-257-7777; www.missutility.net)
- reviewing facility and site utility maps
- following Enterprise Operation 28 (Lockheed Martin, 2008) and the Lockheed Martin "digging authorization" form and obtaining the required signatures (Lockheed Martin, 2009). Activities described in this report were not carried out on Lockheed Martin-owned or operated property, so signatures of Lockheed Martin representatives were obtained at the discretion of the approving personnel.
- obtaining required permits from MAA (airport zoning permit, building inspection permit, and the digging authorization permit) for the proposed work before beginning any drilling
- obtaining monitoring well permits
- contracting a private utility-locating firm (Enviroscan, Inc. of Lancaster, Pennsylvania) to identify and mark any subsurface utilities/anomalies

Tetra Tech worked closely with MSA, MAA, and their tenants to inform all parties of the field schedule. The project team conducted a site walk to observe current operations, structures, and ground conditions, including topography, vegetation, and ground-surface anomalies that could represent possible constraints on field activities.

Each drilling location was screened for subsurface utilities. In addition to calling in a Miss Utility ticket, Enviroscan was contracted to mark any underground utilities and subsurface geophysical anomalies. This private utility-locating firm used typical utility-locating equipment representing the best available technology, including a Fisher TW-6 electromagnetic pipe and cable locator/tracer, a Radiodetection cable-avoidance tool and Genny pipe and cable locator/tracer, a Radiodetection model RD4000 multi-frequency pipe and cable tracer, and a GSSI SIR-2000 ground-penetrating radar (GPR) system. All utilities within a 30-foot radius of each designated location were located and marked with paint on the ground.

Soil boring and monitoring well locations were offset as necessary based on the location of subsurface utilities. Borings were located at the minimum allowable distances from underground utilities, as stipulated in the HASP. Permits, the Miss Utility clearance, and the Enviroscan utility screening report are in Appendix A. Access to the DRA was coordinated through MSA operations. Tetra Tech maintained radio communication with the MSA air traffic control tower during field activities with regard to the daily field schedule.

3.3 FIELD METHODOLOGY

Methods used for the 2013 DRA field investigation are discussed in the following sections. Methods are provided for:

- test pit excavation and associated sampling
- installation of groundwater monitoring wells and associated soil sampling
- sampling and chemical analyses of soil, groundwater, surface water, and sediment
- DPT soil and groundwater sampling
- collection of groundwater levels

3.3.1 Test Pit Investigation

Four test pits (TP-A76 through TP-A79) were excavated in the following areas (Figure 3-1):

1) **Test pit location A16 in Area 9 (TP-A76)—**to investigate the black sludge-like soil and a strong solvent odor previously encountered

2) **Test pit location N4 (TP-A77)—**to further evaluate the black/green liquid described in the N4 test pit log

3) **Near 1996 soil borings B-8 (TP-A79) and B15 (TP-A78)—**to evaluate the presence of strong odors and product (likely petroleum product) in soil in areas with elevated VOC levels (near previous soil borings B-8 and B-15, advanced in 1996)

Three additional test pits (TP-A80 through TP-A82) were excavated in areas of concern indicated by historical observations and detections. Figure 3-1 is a map showing the test pit locations. The summary and rationale for the test pit locations are in Table 3-1.

Test pits were excavated using an excavator (rubber-tired backhoe) to depths that extended through the waste material to natural subsurface soils, or until further excavation was precluded by equipment limitations or by encountering groundwater. At each test pit excavation, soils were described and logged by a qualified geologist. Soils were screened for volatile organic compounds (VOCs) using a photoionization detector (PID) and a consistent-headspace screening methodology (e.g., zip-top bag technique). Waste materials, soil type, and anthropogenic (human-made) material encountered in the test pits were described in the test pit logs and photographed (field-sample log sheets and test pit logs/photographs are in Appendix B and Appendix C, respectively). Each test pit was located using a global positioning system (GPS), and final locations were surveyed by a Maryland-licensed surveyor.

One composite soil sample was collected from each test pit, as requested by MDE, and submitted for laboratory analyses. These composite samples consisted of a minimum of five grab samples from the excavated soil and waste pile, focusing on material exhibiting clear evidence of contamination (i.e., odor, PID readings, appearance, etc.). Two grab soil-samples were also collected from the three remaining test pits using the same criteria and methodology. In the absence of identifiable impacts, grab samples were collected from the upper three feet of the test pit and from the interval directly above the water table. Large debris such as pieces of glass, metal, fabric, or masonry was not included with the samples. The presence of such debris and the grab-sampling location(s) were recorded on the test pit log. Approximate percentages of debris

types based on volume (e.g., 50% concrete, 10% plastic, etc.) were estimated for each test pit and recorded on the test pit log sheet. Soil samples were analyzed for VOCs; semi-volatile organic compounds (SVOC), including 1,4-dioxane; polychlorinated biphenyls (PCB); total petroleum hydrocarbons (TPH) -diesel-range organics (DRO)/gasoline-range organics (GRO); and priority pollutant metals.

Test pits were backfilled after environmental characterization was completed. Excavated material was used as backfill; any large debris was placed in the bottom of the excavation. The backfill material was compacted in lifts using the excavator bucket, to prevent subsidence, and the ground surface was restored to its original grade. Surface soil that had been set aside during test pit excavation was restored at the surface to complete the site restoration. No personnel were allowed to enter the pits, and test pits did not remain open overnight. No debris or excess soil were left near the test pit. Test pit excavations in 1999 uncovered several inactive (i.e., dummy) bombs; Tetra Tech therefore provided visual monitoring for unexploded ordnance (UXO) during test pit excavations. No UXO were found during this investigation.

3.3.2 DPT Soil Investigation

Ten soil borings (SB-187 through SB-196) were advanced to depths of approximately 30 feet below grade using a mobile all-terrain-vehicle track-mounted DPT drill-rig. These borings specifically targeted the following three areas of the DRA, as shown in Figure 3-2:

- *boring SB-187*—in Taxiway Tango Area—North (TT North), where elevated levels of trichloroethene (TCE) have been detected in soil at SB-31
- *borings SB-188 through SB-192*—in the eastern portion of the DRA near Frog Mortar Creek and downgradient of wells that have exhibited elevated VOC concentrations (i.e., monitoring wells MW-18S/I/D, DMW-3S/I/D, and DMW5S/I/D)
- *borings SB-193 through SB-196*—in the Drum Area (DA), where elevated concentrations of TCE have been detected in shallow soil, but no deep soil samples have been collected here

Locations of the soil borings were based on MDE comments regarding the 2012 DRA source areas work plan (Tetra Tech, 2012a), historical observations and detections, and the results of the test pit investigation discussed in the previous section. Figure 3-2 shows the locations of the DPT soil borings. Table 3-2 provides a summary and the rationale for the boring locations.

Continuous soil samples (DPT macro-cores) were collected for lithologic description and field screening. Soil borings were advanced by a Maryland-licensed driller and continuously logged and screened in the field for VOCs. Soils were described on a lithologic log prepared by a qualified geologist and screened with a PID using a consistent headspace screening methodology (e.g., foil-sealed jar or zip-top bag technique).

Two soil samples from each boring were collected for laboratory analysis based on the water table depth, DPT/vertical–aquifer sampling (VAS) groundwater-data field-screening results, and visual evidence of possible contamination, such as staining, discolorations, and odors. When no contamination was evident and no preferential migration or preclusion layers were identified, shallow and deep soil samples were collected. Soil samples were analyzed for VOCs, SVOCs including 1,4-dioxane, PCBs, TPH-GRO and TPH-DRO, and priority pollutant metals. A subset of these soil samples were analyzed for total organic carbon (TOC), total inorganic carbon (TINC), cation-exchange capacity (CEC), nitrates, phosphates, total Kjeldahl nitrogen (TKN), and pH. These parameters are used to assess soil reactivity and buffering of metals, nutrient availability, and buffering capacity for possible *in situ* remediation technologies.

Borings were located using a GPS, and final locations were surveyed by a Maryland-licensed surveyor. Brush and small trees had to be cleared to enable the DPT rig to access boring locations; MAA approved this clearing. Upon completion, all boreholes were pressure-grouted from the bottom of the borehole to ground surface, using a tremie pipe.

3.3.3 DPT Groundwater Investigation

Discrete groundwater samples were collected from 22 locations using DPT (DPT-23 through DPT-43B) to undergo VOC chemical analyses at an off-site laboratory. At each DPT location (shown on Figure 3-3), groundwater samples were collected approximately every five feet below the depth at which groundwater was first encountered, to a maximum target depth of 60 feet below grade. However, all but one DPT boring were terminated at depths less than 60 feet due to probe refusal.

Groundwater samples were collected using a reusable, three-foot-long stainless steel groundwater-sampling probe fitted with a one-foot screen. The push rods and stainless steel sampling probe were decontaminated before each sample collection to minimize sample

cross-contamination. After the groundwater samples had been collected at each location, the DPT borehole was grouted using bentonite chips.

Groundwater was analyzed by TestAmerica of North Canton, Ohio at their off-site laboratory. Analytical results are in Appendix D, as are the data-validation reports. The summary and rationale for the DPT groundwater sampling locations is in Table 3-3.

3.3.4 Borehole Drilling and Monitoring Well Installation

Eighteen groundwater-monitoring wells were installed at the DRA as part of this investigation. Soil samples were collected during borehole drilling. The locations of the new wells are shown in Figure 3-4. A summary and rationale for their location is in Table 3-4.

The objectives of these wells were to:

- characterize groundwater conditions east of previously existing downgradient perimeter wells and at locations closer to Frog Mortar Creek to update the conceptual site model
- provide data to further assess chemical loadings and groundwater flow (i.e., vertical flow components) near Frog Mortar Creek in support of the groundwater modeling program
- provide data to further evaluate the hydraulic relations between groundwater and Frog Mortar Creek for the groundwater modeling program
- provide locations to estimate surficial aquifer parameters near Frog Mortar Creek for the groundwater modeling program
- provide long-term monitoring locations to evaluate the performance of the groundwater remedy at locations near Frog Mortar Creek

Six well clusters were installed (MW-46S/I/D, MW-47S/I/D, MW-48S/I/D, MW-49S/I/D, MW-50S/I/D, and MW-51S/I/D), comprised of three wells each: the shallow- ["S"] and intermediate- ["I"] depth wells were nested, and the deep ["D" level] well was independently installed nearby. Screen midpoints for the shallow, intermediate, and deep monitoring wells were set at approximately 20 feet, 40 feet, and 60 feet below grade, respectively. The screen depths were selected to monitor zones with maximum VOC concentrations that had been identified by the DPT VAS program, and in some cases to monitor lower VOC concentration zones above or below the zones containing the maximum detected VOC concentrations.

Drilling and soil sampling—Well boreholes were advanced using the Roto-Sonic drilling method to provide methods consistent with existing DRA monitoring wells. Cascade Drilling, L.P., (formerly Boart-Longyear) conducted borehole drilling and well installation/construction under the supervision and direction of a Maryland-licensed driller. The Roto-Sonic method uses a four-inch by six-inch drill-rod/override-casing configuration (with temporary casing) to install the well to the target depth. Soil was continuously sampled via a four-inch-diameter by 10-foot-long core-barrel while drilling each borehole. Soil samples were collected for soil screening, including lithologic characterization, visual observations (e.g., staining, discoloration, etc.), and odor detection. A qualified and experienced geologist documented soil descriptions via lithologic logs, and then placed samples into sealable plastic bags where they were screened for VOCs using a PID. The boring log forms are in Appendix E.

Twenty-seven soil samples were collected from well borings for laboratory chemical analyses. Sampling depths were based on the location of the water table, DPT lithologic and groundwater VOC data, PID field-screening results, and evidence of possible contamination such as staining, discoloration, and odors. Samples collected from each boring are summarized in Table 3-2. Soil sample record sheets are in Appendix B. Soil samples were analyzed VOCs, SVOCs, PCBs, TPH-GRO, TPH-DRO, and priority pollutant metals. A subset of representative soil samples were analyzed for TOC, TINC, CEC, nitrates, phosphates, TKN, and pH. These parameters are used to assess soil reactivity and buffering of metals, nutrient availability, and buffering capacity for possible *in situ* remediation technologies.

Trip blanks were provided by the laboratory. One trip blank was analyzed daily per cooler of VOC samples collected; no other quality assurance/quality control (QA/QC) samples were collected. Duplicate samples for matrix-spike purposes were collected and analyzed on a 1:20 basis (two duplicate samples were collected, in addition to the 27 standard samples).

Monitoring well construction—A summary of the wells installed and their depths is in Table 3-4. Monitoring wells were constructed of Schedule 40 polyvinyl chloride (PVC) solid-riser casing and 10-slot Schedule 40 PVC well screen. The 18 newly installed wells have 10-foot-long screens. Construction details for the newly installed wells are on the well construction forms in Appendix E.

A filter pack consisting of #1-size factory-washed sand was placed around each well screen from one foot (minimum) below the bottom of the well screen to two feet (minimum) above the top of the well screen. The depth to sand was measured using a weighted tape or known length of tremie pipe. Following placement of the sand pack, the well was pre-developed by purging to settle the sand pack around the screen. If settlement of the sand pack was noticed, additional sand was placed in the borehole annulus to bring the sand pack up to the desired depth.

The nested shallow and intermediate wells contain a bentonite seal placed above the sand pack of the "I-interval." This seal was allowed to hydrate before installing the sand pack for the upper "S-interval" well screen. A two-foot (minimum) bentonite seal was then placed above the "S-interval" sand pack and hydrated. A grout mixture of cement/bentonite was used to completely fill the remaining annular space to approximately two feet below the ground surface.

Protective steel stick-up casings were secured around the PVC well casings using concrete. The highest point on the top of the PVC well casing was marked with an indelible marker. The marked location of each PVC well casing, the ground elevation, and the outer protective casing were surveyed by a Maryland-licensed land surveyor.

Monitoring well development—Following installation, each monitoring well was developed to remove fines from the well filter-pack and casing, and to ensure a hydraulic connection between the well and the geologic formation. Wells were developed by hand bailing to remove heavy sediments, then by gentle surging and purging with a submersible pump or air lifting to remove fines and sediment from the sand pack and well screen. Development began at the bottom of the well screen and continued incrementally to the top of the screened interval then back down to the bottom of the well.

Water-level-drawdown measurements and physical parameters (including pH, temperature, specific conductance, dissolved oxygen [DO], and oxidation-reduction potential [ORP]) were collected during well development until pumping was complete; these parameters were recorded in the appropriate site-specific logbook and on a well development record. Water quality parameters were measured using a portable water quality meter. Well development records are in Appendix E.

Development was considered complete when the monitored water-quality parameters stabilized or when a minimum of three saturated well-casing volumes had been removed (if wells were pumped dry). Stabilization of water quality parameters was considered achieved when three consecutive readings were within ±0.1 standard unit for pH, ±3% for specific conductance and temperature, ±10% for DO and ORP, and less than 50 nephalometric turbidity units for turbidity. All development water was collected in United States Department of Transportation (USDOT)-approved 55-gallon steel drums, properly labeled, and stored at a facility-approved location until the wastes were removed for disposal.

3.3.5 Water Level Measurements

Monitoring wells—Groundwater levels were measured at the 92 existing and 18 newly installed DRA groundwater monitoring wells on October 14, 2013. These water-level data provide information regarding groundwater flow characteristics and were used to create groundwater contour maps for the upper, intermediate, and deep surficial-aquifer zones. Static water levels were measured by lowering the meter's probe into the well until the liquid level indicator emitted an audible tone, indicating the air/water interface. Each water level was recorded to the nearest 0.01 foot as the depth to water from the marked location on top of the PVC well casing, or from the highest point of the top of the PVC well casing. Water level measurements were recorded on a groundwater-level measurement field form. The groundwater-level measurement forms are in Appendix F.

3.3.6 Monitoring Well Sampling

Groundwater samples were collected from the newly installed monitoring wells on October 16-21, 2013. All groundwater monitoring wells were sampled using the low-flow, minimal drawdown method (USEPA, 1996a). This method removes groundwater from the well at a low-flow rate (typically less than 300 milliliters per minute) while monitoring and recording the groundwater level and water quality parameters (such as pH, temperature, conductivity, ORP, DO, and turbidity).

A peristaltic pump and Teflon™ tubing were used to purge and sample the monitoring wells. Groundwater purging continued until at least four water quality parameters stabilized, indicating that fresh groundwater from the formation was being pumped, or for a maximum of two hours, whichever occurred first. Stabilization of the field parameters was considered complete when

three consecutive readings were within ±0.1 standard unit for pH, ±3% for conductivity, ±10 millivolts (mV) for ORP, and ±10% for turbidity. Sample information was recorded on the sample log sheets in Appendix B.

Groundwater samples from the monitoring wells were analyzed for the following parameters (see Table 3-4):

- VOCs by SW846 Method 8260B
- SVOCs and 1,4-dioxane by SW846 Method 8270D
- TPH-GRO and TPH-DRO by SW846 Method 8015D
- total and dissolved priority pollutant metals by SW846 Method 6010C/7470A
- hexavalent chromium by SW846 Method 7199

Three groundwater samples (MW-51S, MW-51I, and MW-51D) were also analyzed for natural-attenuation parameters, which include: nitrate, nitrite, ammonia nitrogen, phosphate, sulfate, total alkalinity, dissolved organic carbon, total iron, total manganese, total potassium, total calcium, total magnesium, total chloride, total sodium, total silica, total dissolved solids, and methane, ethene and ethane (Microseeps® AM 20GAX protocols). Groundwater samples for VOCs and TPH-GRO were collected first, followed by samples to be analyzed for SVOCs/1,4-dioxane, TPH-DRO, metals, and hexavalent chromium. Groundwater samples to be analyzed for dissolved metals were filtered in the field before sample preservation using a dedicated, disposable, 0.45-micron filter and a peristaltic pump. Trip blanks were analyzed at a rate of one per cooler containing VOC samples; no other QA/QC samples were collected because sufficient data quality has been indicated by previous DRA sampling and analyses. One duplicate sample was collected for matrix-spike purposes.

3.3.7 Pond and Wetland Surface Water Sampling

Surface water samples were collected on October 15 and 18, 2013 from Pond 1 and from the 0.7-acre wetland near the Frog Mortar Creek shoreline. Pond water sampling locations are shown on Figure 3-5. The rationale for sampling locations and sample analytical parameters is in Table 3-5. As shown in Figure 3-5, five water samples were collected: two from Pond 1 (EP1-SW15, and EP1-SW16) and three from the wetland area near the Frog Mortar Creek

shoreline (EWT-SW1, EWT-SW2, EWT-SW3). Sufficient water was not available to collect a sample at EWT-SW3. Therefore, a small-diameter perforated PVC pipe was pushed into the first foot of sediment to collect a water sample at this location; however, only a small sample aliquot was obtained for VOC analysis.

Samples were collected from Pond 1 using a small rowboat. To obtain the samples from the wetland area, field personnel wore waders and walked through the shallow water until sampling locations were reached. At locations where surface water and sediment samples were co-located, the surface water sample was collected before the sediment sample to avoid sediment disturbance in the surface water samples. Pond water samples were collected as grab samples, using direct-fill sampling techniques.

All samples were collected from approximately one foot below the water surface by submerging a pre-cleaned, unpreserved bottle and allowing it to fill. The collected sample volume was decanted into the appropriate sample containers, taking care to minimize agitation of the collected water. Water quality parameters (including temperature, pH, specific conductance, hardness, salinity, turbidity, DO, and ORP) were measured at all surface water sampling locations and on both sides of the pond during sample collection. The water depth at the time of sampling was also recorded. Sampling information was recorded on surface water sample forms provided in Appendix B.

Pond water samples were analyzed for the following parameters:

- VOCs by SW846 Method 8260B
- 1,4-dioxane by SW846 Method 8270D
- TPH-GRO and TPH-DRO by SW846 Method 8015D
- total and dissolved priority pollutant metals by SW846 Method 6010C/7470A
- hexavalent chromium by SW846 Method 7199
- perchlorate by USEPA Method 314
- hardness by USEPA SW846 protocol

Trip blanks were provided by the laboratory and analyzed daily at a rate of one per cooler of VOC samples collected; no other quality control samples were collected because data obtained

from previous DRA investigations are satisfactory. All surface water sampling locations were surveyed using a handheld GPS receiver and the Maryland State Plane North American Datum 1983 (in feet).

3.3.8 Pond and Wetland Sediment Sampling

Pond sediment samples were collected to assess sediment contaminant concentrations (both horizontally and vertically), to update the conceptual site model, to further assess the extent of constituents detected in Pond 1 sediment (locations EP1-SD15, EP1-SD16, and EP1-SD17 on Figure 3-5), and to determine the presence or absence of site contaminants within the wetland area sediment (locations EWT-SD1, EWT-SD2, and EWT-SD3 on Figure 3-5) near the Frog Mortar Creek. Sediment samples were collected using means similar to those used for collecting surface water samples (i.e., via manual methods using a small rowboat. Field personnel wore waders and walked through shallow water until reaching the sampling locations in the wetland area.

At each location (shown on Figure 3-5), sediment samples were collected using a stainless steel corer to a depth of approximately two feet below the sediment surface. Samples for laboratory analyses were collected at two depths at each location: a shallow sediment sample was collected from the sediment surface to one foot below the sediment surface, and a deeper sediment sample was collected from one to two feet below the sediment surface. The rationale for sampling locations is shown in Table 3-6.

Sediment for VOC analyses was transferred directly from the sampling device into the sample container. The remaining portion of the sample was placed in a stainless steel bowl and homogenized before placing the sediment in sample containers. Excess water in the sample was decanted from the sample container before sealing, and care was taken to retain the fine sediment fraction during decanting.

Sediment samples were analyzed for the following parameters:

- VOCs by SW846 Method 8260B
- SVOCs including 1,4-dioxane by SW846 Method 8270D
- PCBs by SW846 Method 8082

- TPH including GRO and DRO by SW846 Method 8015B
- priority pollutant metals by SW846 Method 6010

Trip blanks were provided by the laboratory, and were analyzed daily per cooler of VOC samples collected; no other QA/QC samples were collected because satisfactory data quality was obtained during previous DRA sampling and analyses programs.

Additionally, grain-size distribution analyses (ASTM International [ASTM] Method D422) and soil permeability tests (ASTM Method D2434) were conducted on the six wetland area sediment samples. Two samples were collected at depth intervals of 0–1 feet, and 1–2 feet below the surface water/sediment interface from each of the three wetland sediment sampling locations shown on Figure 3-5. The geotechnical test results are in Appendix G.

3.3.9 Surveying

A qualified Maryland-licensed land surveyor provided horizontal and vertical coordinates for each test pit, soil boring, DPT groundwater boring, and for new groundwater monitoring well locations. Surveyed locations are accurate to the nearest 0.01 foot for vertical elevations (at the top of the well casings) in the North American Vertical Datum 1988, and to the nearest 0.1 foot for horizontal coordinates in the North American Datum 1983. This information was used to update the MSA environmental geographic information system (EGIS). Appendix H contains the survey report.

3.3.10 General Sampling Procedures, Nomenclature, and Handling

A master site-logbook was maintained at the site as an overall record of field activities. Each sample received a unique sample-identification consisting of the site location; the test pit, DPT soil boring, DPT water, surface water, sediment sample, or well number; a sampling depth for soil or DPT water samples; and a six-digit sampling date for groundwater samples, as follows:

- Soil samples collected from test pits carry the designation DR-TP (for Dump Road test pit), followed by the unique identifier "A," and then the test pit number. The sample identification ends in a two-digit label indicating the depth of the soil sample. For example, "DR-TP-A67-08" designates that the sample was collected from the DRA at test pit location A67 at eight feet below grade.

- Soil samples collected from the soil borings and monitoring wells bear a sample identification tag with the designation DR-SB (for Dump Road soil boring), followed by the boring number, followed by the depth range of the soil sample. For example, DR-SB-190-10-12 designates that the soil sample was collected from the DRA at soil boring 190 from 10 to 12 feet below grade.

- DPT water samples carry the designation DR-DPT (for Dump Road direct-push technology), followed by the boring number, followed by the depth of the water sample. For example, DR-DPT-23-20 designates that the DPT water sample was collected from the DRA at DPT location 23, from a depth of 20 feet below grade.

- Surface water samples collected from Pond 1 and the wetland area carry the designation EP1-SW (for existing Pond 1 surface water) and EWT-SW (for existing wetland surface water), followed by the sample number, followed by the depth of the sample below the water surface. For example, EP1-SW-15-1 designates that the surface water sample was collected from Pond 1, at location 15, and at a depth of 1 foot below the water surface.

- Sediment samples collected from Pond 1 and the wetland area carry the designation EP1-SD (for existing Pond 1 sediment) and EWT-SD (for existing wetland sediment), followed by the sample number, followed by the depth of the sample below the sediment surface. For example, EWT-SD-15-0-1 designates that the sample was collected from the wetland area, at location 15, from the top of the sediment surface to a depth of one foot below the sediment surface.

- Groundwater monitoring-well samples are designated by MSA-MW followed by the well location number and a six-digit number indicating the date of sample collection. For example, a groundwater sample collected on July 24, 2013 from the DRA monitoring well MSA-MW-46S would be labeled MSA-MW46S-072413.

- Trip blanks (TB) were labeled with a TB prefix followed by a six-digit submittal date (e.g., TB-072413).

Sample handling includes field-related considerations concerning the selection of sample containers, preservatives, allowable holding times, and analyses requested. Proper custody procedures were followed throughout all phases of sample collection and handling. Chain of custody protocols were used throughout sample handling to establish the evidentiary integrity of sample containers. These protocols demonstrate that the samples were handled and transferred in a manner that would eliminate (or detect) possible tampering. Water samples to be analyzed for hexavalent chromium were expedited to the laboratory so they could be analyzed within 24 hours of collection, as required by the analytical method. Samples were analyzed by TestAmerica, Inc. of North Canton, Ohio, a laboratory accredited by the United States Department of Defense Environmental Laboratory Accreditation Program, the United States Department of Agriculture,

the National Environmental Laboratory Accreditation Program (10 states), and seven state programs.

Sample containers were released under signature from the laboratory and were accepted under signature by the samplers or other individual responsible for maintaining custody until the sample containers were transferred to the sampling team. Each sample container was placed in a cooler with ice immediately after each sample container had been filled in the field. Trip blanks were placed in the coolers with ice at the beginning of each day, and remained in the cooler along with the VOC samples at all times. Coolers returning to the laboratory with samples were sealed with strapping tape and a tamper-resistant custody seal. The custody seal contains the signature of the individual releasing the sample transport container, along with the release date and time.

3.3.11 Equipment Decontamination

A decontamination area and a clean zone were established at the perimeter of the restricted work zone to prepare, assemble, and disassemble sampling equipment. Dedicated and/or disposable equipment was used whenever possible (e.g., dedicated stainless steel spoons and bowls for sediment samples). Reusable equipment (e.g., samplers, DPT drill rods, water level meters) was decontaminated before and after each use. Dedicated stainless steel spoons and bowls were cleaned before use, and reusable equipment was decontaminated according to the following procedures:

- laboratory-grade, phosphate-free, ionic-anionic surfactant (Alconox®, Liquinox®, or equivalent) and potable-water wash
- potable-water rinse
- analyte-free water rinse
- air drying
- collection of decontamination solutions for disposal

All down-hole drilling equipment, including the rear of the DPT rig, Roto-Sonic drill rig, and other equipment, was cleaned before arriving on-site using heated high-pressure water. This equipment was cleaned before beginning work, between drilling locations, any time the drill rig left the site, and at the conclusion of the drilling program. All equipment decontamination associated with a given drilling location was conducted at that location. Decontamination rinsate

was collected in USDOT-approved 55-gallon drums and properly labeled for waste characterization and disposal.

3.3.12 Waste Management

A waste management plan conforming to Lockheed Martin *EESH Remediation Waste Management Procedure No. EROP-03, Revision 4* (effective April 17, 2009) was included in the 2013 DRA soil and groundwater work plan (Tetra Tech, 2013c) and was followed during this investigation to store, manage, test, and dispose of project IDW. IDW for this project consisted of soil cuttings from drilling, decontamination rinsate, well-development water, groundwater-sampling purge water, and used personal protective equipment (PPE). PPE IDW was brushed off, placed in trash bags, and disposed of in an MSA facility trash receptacle designated by facility personnel. Soil cuttings from drilling, decontamination rinsates, well-development water, and groundwater sampling purge water were stored in USDOT-approved 55-gallon steel drums.

All drums were properly labeled and logged on a drum inventory form in accordance with the waste management plan. Drums were moved to a designated staging area in the Maryland Air National Guard (MDANG) equipment storage area near well MW-34S/I. Wastes were characterized and disposed of in accordance with applicable state and federal regulations. IDW was removed from the facility and properly disposed of at a Lockheed Martin-approved disposal facility in accordance with federal, state, and local regulations.

3.4 DATA REVIEW

Data validation involves having a party independent of the analytical laboratory review the laboratory data to ensure that specific criteria were met. These criteria are concerned with specifications that are not sample-dependent; they specify performance requirements that should be fully under a laboratory's control. For organic data analyses, specific validation areas include blanks, performance-evaluation-standard materials, and instrument-performance checks. For metals data analyses, specific validation areas include blanks, calibration standards, calibration-verification standards, laboratory-control standards, and interference-check standards. The chemical data were validated by Tetra Tech's data validation group in Pittsburgh, Pennsylvania.

Chemical data were supplied by the laboratory as hard-copy reports and electronic databases. After sampling was complete, chemical data were validated to assess their reliability and accuracy, in accordance with established USEPA protocols. This review was based on USEPA Region 3 guidelines (USEPA, 1993 and 1994) and the specifics of the analytical method employed. Data validation reports with chains of custody (COC) and data tables that include all sampling results (including non-detects) are in Appendix D.

Collectively, these data are acceptable for their intended use, except for data that have been qualified as unreliable. For this validation, the following data qualifiers (i.e., flags) were applied to the chemical results presented in this report:

B The analyte was not detected substantially above the level reported in the laboratory or field blank (i.e., the result is considered an artifact of the laboratory analysis and is not considered a site contaminant).

J The analyte is considered present in the sample. However, the value is estimated and may not be accurate or precise.

K The analyte is considered present in the sample. However, the value is biased high and the actual value is expected to be lower than the reported value.

L The analyte is considered present in the sample. However, the value is biased low and the actual value is expected to be higher than the reported value.

U Not detected. The analyte is considered not detected at the reported value.

NJ The analyte has been tentatively identified. This qualifier indicates presumptive evidence of a compound. Special methods may be required to confirm its presence or absence in future sampling efforts.

UJ The analyte was not detected. However, the quantitation or detection limit may be inaccurate or imprecise.

UL The analyte was not detected. However, the quantitation or detection limit is likely greater than the reported value.

UR The result is considered qualitatively or quantitatively unreliable. Non-detected results for 2-butanone, tertiary butyl alcohol, and vinyl acetate were the only results flagged with "UR" data qualifiers.

The "*J,*" "*K,*" and "*L*" qualifiers appear in the chemical results tables and the figures in Section 4. All flags appear in Appendix D.

Common laboratory or field contaminants occasionally may be detected in the samples. Analysis of quality control blanks and other internal laboratory blanks (e.g., method blanks, etc.) is used to determine the significance of the analytical results versus possible laboratory or field contaminants. Common laboratory contaminants for VOCs include acetone, methylene chloride, and 2-butanone. According to USEPA *National Functional Laboratory Guidelines*, any compound detected in both the sample and an associated blank must be qualified (i.e., flagged with a "*B*").

For the common laboratory contaminants listed above, results were qualified with a "*B*" flag when the sample concentration was less than 10 times the blank concentration in accordance with USEPA protocol. For other analytes, the results were flagged with a *"B"* qualifier when the sample concentration is less than five times the concentration detected in the blank in accordance with USEPA protocol. In addition to the common laboratory blanks listed above, several TPH and common metals were reported as blank contamination. Qualified results are in the chemical tables in Section 4 and in Appendix D.

3.5 DATA MANAGEMENT

Laboratory data handling procedures met the requirements set forth in the laboratory subcontract. All analytical and field data are maintained in the project files. The project files contain copies of the COC forms, sampling log forms, sampling location maps, and data quality-assurance documentation.

3.5.1 Data Tracking and Control

A "cradle to grave" sample tracking system was used from the beginning to the end of the sampling event. The field operations leader coordinated sample tracking before field mobilization. Sample jar labels were handwritten in the field or pre-printed. Labels were reviewed to ensure their accuracy and adherence to work plan requirements. The project manager's (PM) assistant coordinated with the analytical laboratory to ensure that they were aware of the number and type of samples and analyses to expect.

When field sampling was underway, the field operations leader forwarded the chain of custody forms to the PM's assistant and to the laboratory for each day that samples were collected. The PM's assistant confirmed that the COC form provided the information required by the work plan.

This allowed early detection of errors made in the field so adjustments could be made while the field team was mobilized. The laboratory submitted an electronic deliverable for the sample delivery groups. When all electronic deliverables were received from the laboratory, the PM's assistant confirmed that the laboratory performed all analyses requested.

3.5.2 Sampling Information

Data from field measurements were recorded using the appropriate log sheets, as per Tetra Tech standard operating procedures. Reduction of field data entailed summarizing and presenting these data in tabular form. Reduction of laboratory data entailed manipulation of raw data-instrument output into reportable results. Laboratory data were verified by the group supervisor and by the laboratory's quality control/documentation department.

3.5.3 Project Data Compilation

The analytical laboratory generated an Adobe *Acrobat*® portable document format (PDF) file of the analytical data packages, as well as an electronic database deliverable. The electronic database was checked against the PDF file provided by the laboratory and updated as required, based on data qualifier flags applied during data validation. Data generated during implementation of the sampling and analysis plan were incorporated into the MSA EGIS database. All data (such as units of measure and chemical nomenclature) were checked to maintain consistency with the project database.

3.5.4 Geographical Information System

The data management system for this effort consists of a relational database and EGIS to manage environmental information pertaining to MSA. The relational database stores chemical, geological, hydrogeological, and other environmental data collected for the MSA environmental investigations. The EGIS is built from the relational database and contains subsets of the larger data pool. Using the EGIS, environmental data were posted onto base maps to represent the information graphically for this report.

Table 3-1

Test Pit Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 1 of 3

Test pit number	Test pit location	Approximate dimensions	No. of samples	Analysis (method)	Rationale/purpose[1]
A76	Dump Road Area 9 east of Pond #2	Length—10 feet Width—2 feet Depth—15 feet maximum	Two grab samples focusing on areas of suspected contamination	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO and -DRO by (8015D); priority pollutant metals (6010C, 7471A)	To further investigate the area of historical test pit A16 in Dump Road Area 9 where black sludge-like soil with a strong solvent odor was previously encountered
A77	Dump Road Area 2 north of Pond #1	Length—10 feet Width—2 feet Depth—15 feet maximum	One VOC grab sample; one composite sample for non-VOC analytes consisting of a minimum of five grab samples from the test pit	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO/DRO (8015D); priority pollutant metals (6010C, 7471A)	To further investigate area of 2008 test pit N4 where a green-black liquid with a very strong solvent odor was encountered

Test Pit Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 2 of 3

Test pit number	Test pit location	Approximate dimensions	No. of samples	Analysis (method)	Rationale/purpose[1]
A78	West of monitoring well cluster DMW-9S/I/D in the Petroleum Hydrocarbon Area	Length—10 feet Width—2 feet Depth—15 feet maximum	One VOC grab sample; one composite sample for non-VOC analytes consisting of a minimum of five grab samples from the test pit	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO/DRO (8015D); priority pollutant metals (6010C, 7471A)	To further investigate 1996 soil boring B-15 where free product was identified
A79	Northeast of the Drum Area and southwest of monitoring well MW-5	Length—10 feet Width—2 feet Depth—15 feet maximum	One VOC grab sample; one composite sample for non-VOC analytes consisting of a minimum of five grab samples from the test pit	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO/DRO (8015D); priority pollutant metals (6010C, 7471A)	To further investigate 1996 soil boring B-8 where a suspected buried tank/container and pure product were identified

Table 3-1

Test Pit Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 3 of 3

Test pit number	Test pit location	Approximate dimensions	No. of samples	Analysis (method)	Rationale/purpose[1]
A80	West of the 0.7 acre wetland area west of Frog Mortar Creek and east of well cluster DMW-3S/I/D	Length—10 feet Width—2 feet Depth—15 feet maximum	Two grab samples focusing on areas of suspected contamination	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO/DRO (8015D); priority pollutant metals (6010C, 7471A)	To further investigate the area downgradient (east) of well cluster DMW-3S/I/D where elevated VOC concentrations have been detected
A81	Dump Road Area 2 west of Pond #2 and north of Pond #1 between the location of historical test pits A2 and A14	Length—10 feet Width—2 feet Depth—15 feet maximum	One VOC grab sample; one composite sample for non-VOC analytes consisting of a minimum of five grab samples from the test pit	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO/DRO (8015D); priority pollutant metals (6010C, 7471A)	To investigate Dump Road Area 2 where field measurements of VOCs, ranging from 1.2 to 2,000 parts per million (ppm) per volume, were detected in soil in the location of a possible source area (former pit/pond; feature #46 in Figure 2-4) visible in the 1956 aerial photo survey
A82	Dump Road Area 9 east/southeast of Pond #2	Length—10 feet Width—2 feet Depth—15 feet maximum	Two grab samples focusing on areas of suspected contamination	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO/DRO (8015D); priority pollutant metals (6010C, 7471A)	To further investigate the area downgradient (east) of well cluster DMW-18S/I/D where elevated VOC concentrations have been detected

[1]Rationale and purpose partially based on MDE comments (Appendix B) on the 2012 *Dump Road Source Areas Investigation Work Plan* (Tetra Tech, *2012a)* and *Technical Memorandum for the Dump Road Area, Source Area Delineation* (Tetra Tech, 2012b).

DRO = diesel-range organics
GRO = gasoline-range organics
MDE = Maryland Department of the Environment
PCBs = polychlorinated biphenyls
SVOCs = semi-volatile organic compounds
TPH = total petroleum hydrocarbons
VOCs = volatile organic compounds

Table 3-2

DPT Soil Boring Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 1 of 2

Direct-push-technology (DPT) soil boring number	Location	Number of direct-push-technology (DPT) soil samples/depth (feet)	Analysis (method)	Rationale/purpose[1]
SB-187	Taxiway Tango Area North	Two soil samples based on the water table depth and visual evidence of possible contamination, such as staining, discolorations, and odors	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH-GRO and -DRO by (8015D); priority pollutant metals (6010C, 7471A) one representative soil sample will also be analyzed for TOC/TINC (SW-848 9060), CEC (SW-846 9081), nitrates/phosphates (SW-846 9056), TKN (USEPA 351.3), and pH (SW-846 9045C)	To further investigate soil conditions in the southern end of the VOC source area (Taxiway Tango Area-North) based on elevated TCE (11,000 µg/kg in boring SB-27 and 1,100 µg/kg in boring SB-31), vinyl chloride (580 µg/kg in boring SB-31) and *cis*-1,2-DCE (4,400 µg/kg in boring SB-31) concentrations detected in 2011
SB-188 through SB-191	East of Pond #2 and west of Frog Mortar Creek	Two soil samples based on the water table depth and visual evidence of possible contamination, such as staining, discolorations, and odors	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH GRO/DRO (8015D); priority pollutant metals (6010C, 7471A) representative soil samples will also be analyzed for TOC/TINC (SW-848 9060), CEC (SW-846 9081), nitrates/phosphates (SW-846 9056), TKN (USEPA 351.3), and pH (SW-846 9045C)	To further investigate soil and waste conditions in the area east of Pond #2 and west of Frog Mortar Creek (former Pond 7, feature #42) along with the areas downgradient of monitoring well clusters MW-18S/I, DMW-3S/I, and DMW-2A/B that have exhibited elevated VOC concentrations

Table 3-2

DPT Soil Boring Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 2 of 2

Direct-push-technology (DPT) soil boring number	Location	Number of direct-push-technology (DPT) soil samples/depth (feet)	Analysis (method)	Rationale/purpose[1]
SB-192	East of wells DMW-5S/I/D and west of Frog Mortar Creek	Two soil samples based on the water table depth and visual evidence of possible contamination, such as staining, discolorations, and odors	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH GRO/DRO (8015D); priority pollutant metals (6010C, 7471A); one representative soil sample will also be analyzed for TOC/TINC (SW-848 9060), CEC (SW-846 9081), nitrates/phosphates (SW-846 9056), TKN (USEPA 351.3), and pH (SW-846 9045C)	To further investigate soil and waste conditions in the area west of Frog Mortar Creek and east and hydraulically downgradient of well DMW-5S, which has exhibited elevated VOC concentrations in upper surficial-aquifer groundwater
SB-193 through SB-196	Drum Area	Two soil samples based on the water table depth and visual evidence of possible contamination, such as staining, discolorations, and odors	VOCs (8260B); SVOCs including 1,4-dioxane (8270D); PCBs (8082A); TPH GRO/DRO (8015D); priority pollutant metals (6010C, 7471A); representative soil samples will also be analyzed for TOC/TINC (SW-848 9060), CEC (SW-846 9081), nitrates/phosphates (SW-846 9056), TKN (USEPA 351.3), and pH (SW-846 9045C)	To further investigate the Drum Area based on elevated TCE concentrations detected in soil and groundwater in 2000 and 2002. Areas of elevated TCE concentrations include: former DA Trench 2 (highest surface soil TCE concentration detected in the DRA site); groundwater from boring DA-7 collected from 26 feet below grade east of the DA trenches and excavation (191,384 µg/L); and the indication of DNAPL extending from the DA Trench area west of sampling location DA-1 to several hundred feet northeast between DA-6 and DA-9

[1]Rationale and purpose partially based on MDE Comments on Tetra Tech's *2012 Dump Road Source Areas Investigation Work Plan* and *Technical Memorandum for the Dump Road Area, Source Area Delineation*.

CEC = cation-exchange capacity
COPC = chemical(s) of potential concern
DA = Drum Area
1,2-DCE = 1,2-dichloroethene
DNAPL = dense non-aqueous-phase liquid
DRO = diesel-range organics
GRO = gasoline-range organics
PCBs = polychlorinated biphenyls
SVOCs = semi-volatile organic compounds
TCE = trichloroethene
TINC = total inorganic carbon
TKN = total Kjeldhar nitrogen
TOC = total organic carbon
TPH = total petroleum hydrocarbons
USEPA = United States Environmental Protection Agency
VOCs = volatile organic compounds

Table 3-3

DPT Groundwater Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 1 of 5

Direct-push-technology (DPT) groundwater boring number	Location	Number of direct-push-technology (DPT) water samples/total depth (feet)	Analysis (method)	Rationale/purpose
DPT-23 through DPT-29	East of Ponds 1 and 2 and immediately west of Frog Mortar Creek along the limits of buried waste	4–7 each/40–60	Volatile organic compounds (VOCs) by SW846 Method 8260B	To provide vertical-aquifer sampling to assess shallow subsurface groundwater conditions immediately west of Frog Mortar Creek. The boring locations are strategically placed to coincide with the proposed groundwater monitoring well locations, which will provide groundwater data to help determine the position of the well screens.
DPT 30, DPT-31 and DPT-33	Taxiway Tango Area-North	4–5 each/40–45	VOCs by SW846 Method 8260B	To characterize groundwater conditions in the southern end of the possible VOC source area (Taxiway Tango Area-North) based on elevated TCE (11,000 µg/kg in boring SB-27 and 1,100 µg/kg in boring SB-31), vinyl chloride (580 µg/kg in boring SB-31) and *cis*-1,2-DCE (4,400 µg/kg in boring SB-31) concentrations detected in 2011.TCE has been detected in groundwater at wells MW-33S (TCE at 1,500 µg/L in 2009 and 690 µg/L in 2010), MW-15S/I (TCE at 63 and 1,500 µg/L for MW-15S and MW-15I in 2011) and MW-28I (TCE at 1,000 µg/L in 2011), which are hydraulically downgradient of the Taxiway Tango Area—North possible VOC source area. These groundwater TCE concentrations exceed the Maryland groundwater standard of 5 µg/L.

Table 3-3

DPT Groundwater Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 2 of 5

Direct-push-technology (DPT) groundwater boring number	Location	Number of direct-push-technology (DPT) water samples/total depth (feet)	Analysis (method)	Rationale/purpose
DPT-32 and DPT-39	Taxiway Tango Median Area	5 each/38–50	VOCs by SW846 Method 8260B	DPT-32: to characterize groundwater south/southeast of well DMW-11S to delineate VOCs in the area of highest chlorinated VOC (cVOC) concentrations in monitoring well groundwater samples in the Dump Road Area. DPT-39: to further investigate elevated TCE concentrations in CPT-01 down to 55 feet below grade (highest concentration of 630 µg/L at 23–25 feet). Boring is adjacent to the runway to investigate the source area contributing to the elevated concentrations detected in DMW-11S/I, and whether the source is west/southwest of CPT-01 or possibly on the western side of the runway.
DPT-34	South of the Petroleum Hydrocarbon Area (PHA)	4/45	VOCs by SW846 Method 8260B	To further characterize groundwater quality upgradient of the Petroleum Hydrocarbon Area, where elevated VOCs have been detected at CPT-16, MW-42S/I and DMW-9S/I/D. DPT-34 is upgradient of CPT-16 and MW-42S/I/D (elevated VOC concentrations); doing so will help determine whether the contamination in the Taxiway Tango Median Area (DMW-11S/I and CPT-03, which exhibited the highest TCE and second highest BTEX groundwater concentration at the site) extends under Taxiway Tango toward the Petroleum Hydrocarbon Area.

Table 3-3

DPT Groundwater Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 3 of 5

Direct-push-technology (DPT) groundwater boring number	Location	Number of direct-push-technology (DPT) water samples/total depth (feet)	Analysis (method)	Rationale/purpose
DPT-35	Between the Drum Area (DA) and the Petroleum Hydrocarbon Area (PHA)	6/45	VOCs by SW846 Method 8260B	North of monitoring well MW-45S and CPT-08, where elevated concentrations of VOCs were detected in 2012
DPT-36 and DPT-37	West/upgradient of the Drum Area (DA)	5–6 each/45–50	VOCs by SW846 Method 8260B	To further characterize groundwater conditions near former Pond 4/open burning area—features #43 and #45

Table 3-3

DPT Groundwater Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 4 of 5

Direct-push-technology (DPT) groundwater boring number	Location	Number of direct-push-technology (DPT) water samples/total depth (feet)	Analysis (method)	Rationale/purpose
DPT-38, DPT-43 and DPT-43B	Area of Former Pond #3 and a former linear pond	3–5 each/20–40	VOCs by SW846 Method 8260B	To further characterize groundwater conditions in former Pond 3 (feature #2) and a former linear pond (feature #24) south and southeast of previous sampling location CPT-22. CPT-22 is in an area southeast of Pond 1, which is indicated as a third pit or pond in historical aerial photographs and on a historical U.S. Geological Survey topographic map. Interviews conducted as part of the 1989 preliminary assessment indicate that a third pit was used to dump wastes; however, the third pit was not found during the preliminary assessment site visits. The third pit, as well as an earlier linear pond or pit, were identified in historical aerial photographs of the site. TCE in groundwater at well DMW-2A (13,000 µg/L), which is hydraulically downgradient of the former third pond and linear pond area, indicates possible TCE DNAPL in this area. Additionally, a groundwater sample collected near the third pond area (MIP-26 with a TCE groundwater concentration of 8,000 µg/L and $TCE_{(EQ)}$ of 58,006 µg/L in the intermediate surficial-aquifer) also indicates the possible presence of TCE DNAPL in this area.

Table 3-3

DPT Groundwater Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization, Martin State Airport, Middle River, Maryland
Page 5 of 5

Direct-push-technology (DPT) groundwater boring number	Location	Number of direct-push-technology (DPT) water samples/total depth (feet)	Analysis (method)	Rationale/purpose
DPT-40 through DPT-42	Upgradient/ downgradient of the Drum Area	4–6 each/35–45	VOCs by SW846 Method 8260B	High cVOC concentrations are in the upper surficial-aquifer, and TCE concentrations detected in the wells and temporary wells in this area suggest the presence of DNAPL. VOCs have not been sufficiently delineated to the north, east, south, and west in this area. Therefore, three sampling locations are distributed around the Drum Area and wells DMW-7S and MW-5S. These sampling locations will provide additional characterization of the upgradient side of the Drum Area and areas north and east (downgradient) of wells DMW-7S and MW-5S, will delineate the extent of VOCs in the upper surficial-aquifer, and will confirm lower concentrations in the intermediate surficial-aquifer.

Abbreviations:

bgs = below ground surface
BTEX = benzene, toluene, ethylbenzene, xylenes
COPC = chemicals of potential concern
cVOCs = chlorinated volatile organic compounds
DCE = dichloroethene
DNAPL = dense non-aqueous-phase liquid
DPT = direct-push technology
DRO = diesel-range organic
GRO = gasoline-range organic
MDE = Maryland Department of the Environment
MIP = membrane-interface probe
µg/kg = microgram(s) per kilogram
µg/L = microgram(s) per liter
PCBs = polychlorinated biphenyls

Surface Water Sample Summary and Rationale
Dump Road Source Area Soil and Groundwater Characterization,
Martin State Airport, Middle River, Maryland

Sample number	Location	Sampling depth	Sample analysis and method	Rationale/purpose
EP1-SW15 EP1-SW16	Pond 1	One sample from each location at one foot below the water surface	VOCs by SW846 Method 8260; 1,4-dioxane by SW826 Method 8270D; TPH-GRO and -DRO by 8015D; total and dissolved priority pollutant metals including hexavalent chromium by SW846 Method 6010; perchlorate by USEPA Method 314; hardness by USEPA SW846 protocol ***Field measurements***: temperature, pH, specific conductance, hardness, salinity, turbidity, DO, ORP	Surface water samples were collected to update and characterize pond water contaminant concentrations. Surface water from Pond 1 was previously sampled in 2004 and 2012. The sample analyses provide updated and additional chemical data to assess contaminant concentrations possibly dissolving/migrating into the pond water-column from highly contaminated sediments, and to gather data to evaluate potential risks to human health and ecological receptors.
EWT-SW1 EWT-SW2 EWT-SW3	0.7 acre wetland area east of Ponds 1 and 2 and immediately west of Frog Mortar Creek	One sample from each location at one foot below the water surface	VOCs by SW846 Method 8260; 1,4-dioxane by SW826 Method 8270D; TPH including -GRO and -DRO by Method 8015D; total and dissolved priority pollutant metals including hexavalent chromium by SW846 Method 6010; perchlorate by USEPA Method 314; hardness by USEPA SW846 protocol ***Field measurements***: temperature, pH, specific conductance, hardness, salinity, turbidity, DO, ORP	Surface water samples were collected to characterize wetland water quality. To date, surface water from the wetland area has not been sampled. The sample analyses provide chemical data to assess possible dissolved contaminant concentrations that could migrate from the water column to groundwater, and data to evaluate potential risks to human health and ecological receptors.

Section 4
2013 Investigation Results

This section presents the results of the source area investigation tasks conducted from July to November 2013. Results are included for test pit excavation and soil sampling, soil and groundwater sampling by direct-push technology (DPT), installation and sampling of groundwater monitoring wells, groundwater-level monitoring, and surface water and sediment sampling. Results of the chemical analyses of soil, groundwater, pond and wetland water, pond and wetland sediment, and physical analyses of soil samples, are also detailed in this section.

Chemical-specific screening criteria are used to evaluate concentrations of constituents detected in soil, groundwater, surface water, and sediments. Screening objectives are to: (1) gauge the degree of observed contamination in relation to regulatory standards/criteria, and its potential adverse effects on human health or the environment, and (2) to evaluate the need for further sampling or remedial action. Therefore, regulatory risk-based criteria are used whenever possible.

Soil and groundwater results are screened against the Maryland Department of the Environment (MDE) *Cleanup Standards for Soil and Groundwater* (MDE, 2008). Soil results are screened against non-residential soil standards, because site access is restricted and the site is likely to remain a commercial facility for the indefinite future. Surface water results are screened against the lower of the United States Environmental Protection Agency (USEPA) Region 3 Biological Technical Advisory Group (BTAG) freshwater and saltwater screening-benchmarks (USEPA, 2006).

Chemical results for sediment samples are compared to both human health and ecological screening criteria. For human health screening, the results are compared against 10 times the USEPA regional screening level (RSL) for soil. RSLs not adjusted for sediment exposure are based on hazard indices (HIs) of 1 for noncarcinogenic chemicals, or a lifetime cancer risk for carcinogenic chemicals of 1×10^{-6} (i.e., a one in a million probability). RSLs are normally

adjusted by a factor of 10 for sediment screening because human exposures to bottom sediment are anticipated to be less than exposures to soil. For carcinogens, these adjusted values correspond to a carcinogenic risk level of 10^{-5} (i.e., a one in 100,000 probability). The 10^{-5} risk level is considered within the USEPA acceptable-risk range for human exposure, assuming no other chemical risks are present.

Human health sediment-screening criteria are used only as a reference to identify and highlight constituents that could adversely affect human health as a result of hypothetical exposure to contaminated sediment; they are not considered fully applicable because the Dump Road Area (DRA) is essentially restricted, and Martin State Airport (MSA) is likely to remain a commercial facility for the indefinite future. For ecological-exposure screening, sediment results are compared to the USEPA Region 3 BTAG sediment screening benchmarks (USEPA, 2006), USEPA ecological toxicity levels (USEPA, 1996b), and the National Oceanic and Atmospheric Administration (NOAA) quick-reference screening tables (NOAA, 2008).

Medium-specific (i.e., soil, groundwater, surface water, and sediment) tables in the following sections summarize chemical results. Shaded cells in these tables indicate constituent concentrations exceeding screening criteria. These tables provide complete lists of detected concentrations and data validation qualifiers for the 2013 investigation samples. Tables showing all sampling results (detected and not-detected, including detection limits) are in Appendix D.

4.1 GROUNDWATER LEVEL DATA

Table 4-1 presents the October 2013 groundwater level measurements and computed groundwater elevations for DRA wells. Figures 4-1 through 4-3 show the October 2013 groundwater-elevation contour maps for the upper, intermediate, and lower surficial-aquifer zones, respectively. Figure 4-4 shows the October 2013 groundwater-elevation contour map for the deep confined-aquifer below the surficial aquifer. As presented in Table 4-1, static groundwater levels are reported at depths measured from the top of the well casings. Accounting for well-casing stickup associated with aboveground well-casing risers, and well stick-downs for flush-mounted well designs, depth to groundwater ranges from approximately 5–21 feet below grade in each of the upper, intermediate, and lower surficial-aquifer wells. Shallow groundwater is encountered in the western part of the site near the airport runway, whereas deeper groundwater is found in the eastern portion of the site.

As shown in Figures 4-1 through 4-3, groundwater in the upper, intermediate, and lower surficial-aquifer generally flows east–northeast from the runway and taxiway to Frog Mortar Creek. Elevated groundwater at wells MW-43S, MW-39S, DMW-3S, and MW-44S (Figure 4-1) indicates local groundwater mounding east and northeast of Pond 1 and Pond 2. Wells MW-39S, MW-43S, and DMW-3S are installed in clay-rich soil, above the more permeable sands in which the surrounding upper surficial-aquifer wells are installed. Therefore, groundwater levels in these wells may reflect localized perched groundwater in this portion of the DRA. The groundwater elevations of wells MW-39S, MW-43S, and MW-44S in Figure 4-1 indicate that a portion of the higher groundwater surface may also be due to infiltrating water from Pond 1 and Pond 2. Groundwater flow in the deep confined-aquifer is toward the southeast (Figure 4-4).

4.2 TEST PIT EXCAVATION AND SOIL SAMPLING

Test pit locations DR-A76 through DR-A82 were selected to further investigate substances encountered during previous investigations, as detailed in Table 3-1. The general lithology of the soils excavated from the test pits consists primarily of slightly moist to moist clay with varying amounts of silt and sand. Soils at shallow depths often include increased amounts of gravel and sand.

Ten subsurface-soil grab samples (two each from test pits DR-A76, DR-A80, and DR-A82, and one each from test pits DR-A77, DR-A78, DR-A79, and DR-A81) and four composite samples (from test pits DR-A77, DR-A78, DR-A79, and DR-A81) were collected and submitted for laboratory analysis. The test pits were documented on the field sheets and photographed (photos, logs, and data tables are in Appendices C and D, respectively). Chemical results for the test pit soil samples are summarized in Tables 4-2 and 4-3 and described below. Analytes exceeding the industrial screening criteria are highlighted in Table 4-3 and shown in Figure 4-5.

4.2.1 Test Pit DR-A76

Test pit DR-A76 is slightly northeast of previous test pit DR-A-16. Debris was uncovered during the excavation, including wood, metal pieces, pipes, asphalt, and concrete. The debris was found from 1.5 feet below grade to 10 feet below grade. VOC readings collected using a portable photoionization detector (PID) range from 1.7 parts per million (ppm) near the surface to 46.3 ppm at 11 feet below grade. Two samples (DR-A76-10 and DR-A76-11) were collected from this location at 10 feet and 11 feet below grade. Sample DR-A76-10 contained exceedances

of industrial screening-levels for benzo(a)pyrene (2.4 milligrams per kilogram [mg/kg]), benzo(a)pyrene-equivalent (BaPEq) half-non-detect ($BaPEq_{HALFND}$) [3.59 mg/kg], BaPEq-positive-detect ($BaPEq_{PD}$) [3.59 mg/kg], and total petroleum hydrocarbon (TPH)-diesel-range organics (DRO) [1,200 mg/kg]. Sample DR-TP-DR-A76-11 had exceedances for benzo(a)anthracene (27 mg/kg), benzo(a)pyrene (24 mg/kg), benzo(b)flouranthene (28 mg/kg), dibenz(a,h)anthracene (3.3 mg/kg), indeno(1,2,3-cd)pyrene (12 mg/kg), $BaPEq_{HALFND}$ (34.1 mg/kg), $BaPEq_{PD}$ (34.1 mg/kg), vanadium (82 mg/kg), and TPH-GRO (630 mg/kg).

4.2.2 Test Pit DR-A77

Test pit DR-A77 was excavated slightly north of previous test pit DR-N-04. From three to 15.5 feet below grade, minor debris including glass, asphalt, some electrical components, and some wood was encountered. PID readings range from 0.0 ppm near the surface to 115 ppm at 14 feet below grade. Samples collected for laboratory analysis include a grab sample (DR-A77-14) collected from 14 feet below grade and a composite sample (DR-A77-C) comprised of soil from seven, nine, 11, 14, and 13 feet below grade. Concentrations of benzo(a)pyrene (0.64 mg/kg) and TPH-DRO (1,110 mg/kg) were detected in sample DR-A77-14 above industrial screening levels. No exceedances were detected in the composite sample from this test pit.

4.2.3 Test Pit DR-A78

Test Pit DR-A78 was excavated southwest of previous test pit DR-A-33 and groundwater monitoring well cluster DMW-9S/I/D. A white material was observed from 3–3.5 feet below grade, and wet, black, silty sand with a visible sheen and noticeable petroleum odor was encountered from four to six feet below grade. The PID readings range from 1.6 ppm near the surface to 222 ppm at five feet below grade, with another notable concentration of 201 ppm detected at eight feet below grade. Samples collected for laboratory analysis include a grab sample (DR-TP-A78-05) collected from five feet below grade and a composite sample (DR-TP-A78-C) comprised of soil from 5–9 feet below grade. No industrial screening-standard was exceeded for any of the analyzed compounds in these samples.

4.2.4 Test Pit DR-A79

Test pit DR-A79 was excavated slightly south of groundwater monitoring well MW-5. Significant debris was encountered in this test pit at depths from four to eleven feet below grade, consisting of copper wire, cinderblocks, masonry, metal shards (possibly deteriorated drums), and concrete. PID readings range from 4.4 ppm near the surface to 24.7 ppm at four feet below grade. A grab sample (DR-A79-04) from four feet below grade and a composite sample (DR-TP-A79-C) were collected for laboratory analysis. Sample DR-TP-A79-04 contained trichloroethene (TCE) at 13,000 µg/kg, which exceeds the industrial screening level (7,200 micrograms per kilogram [µg/kg]). Nine analytes exceeded industrial screening levels in composite sample DR-TP-A79-C: benzo(a)anthracene (6.8 mg/kg), benzo(A)pyrene (9.6 mg/kg), benzo(b)flouranthene (14 mg/kg), dibenz(a,h)anthracene (1.3 mg/kg), indeno(1,2,3-cd)pyrene (4.2 mg/kg), $BaPEq_{HALFND}$ (13.4 mg/kg), $BaPEq_{PD}$ (13.4 mg/kg), chromium (430 mg/kg), and lead (1,500 mg/kg).

4.2.5 Test Pit DR-A80

Test pit DR-A80 was excavated slightly southeast of groundwater monitoring well cluster DMW-3S/I/D. The debris uncovered in this test pit includes concrete and burned wood from two to three feet below grade, and some glass and rock from 6.5 to 10 feet below grade. The PID readings range from 0.1 ppm near the surface to 1.3 ppm at three feet below grade. Two grab samples were collected from the test pit for laboratory analysis: one from three feet below grade (DR-TP-A80-03) and one from 11 feet below grade (DR-TP-A80-11). Sample DR-TP-A80-03 contained exceedances of industrial screening levels for Aroclor-1242 (4,100 mg/kg), total Aroclor (4100 mg/kg), chromium (360*J* mg/kg), and TPH-DRO (910 mg/kg). None of the analyzed compounds exceeded industrial screening levels in the sample collected at 11 feet below grade (DR-TP-A80-11).

4.2.6 Test Pit DR-A81

Test pit DR-A81 was excavated approximately 100 feet west of test pit DR-A77. No significant debris was uncovered during excavation of this test pit. PID readings range from 3.9 ppm at five feet below grade to 15.8 ppm near the surface. A grab sample (DR-TP-A81-07) from seven feet below grade and a composite sample (DR-TP-A81-C) were collected for laboratory analysis. Four analytes in composite sample DR-TP-A81-C exceeded their respective industrial

screening levels: benzo(a)pyrene (3.1 mg/kg), benzo(b)flouranthene (4.4 mg/kg), $BaPEq_{HALFND}$ (4.3 mg/kg), and $BaPEq_{PD}$ (4.3 mg/kg).

4.2.7 Test Pit DR-A82

Test pit DR-A82 was excavated approximately 100 feet east of monitoring well cluster MW-18S/I/D. Significant debris, including metal shards, plastic bags, lumber, Styrofoam™, and asphalt, was uncovered during excavation of this test pit, at depths from three feet to 7.5 feet below grade. PID readings were 2.9 ppm at three feet below grade and 2.2 ppm at eight feet below grade. Two grab samples (DR-TP-A82-03 and DR-TP-A82-08) were collected for laboratory analysis from three feet below grade and eight feet below grade, respectively. Sample DR-TP-A82-03 had industrial screening-level exceedances for benzo(a)pyrene (3.1 mg/kg), benzo(b)flouranthene (4.8 mg/kg), dibenz(a,h)anthracene (0.62 mg/kg), $BaPEq_{HALFND}$ (4.76 mg/kg), $BaPEq_{PD}$ (4.76 mg/kg), and TPH-DRO (930 mg/kg). No compounds exceeded the industrial screening levels in sample DR-TP-A82-08.

4.3 SOIL SAMPLING

Soil borings were advanced in 16 locations throughout the DRA. As described in Section 3, 10 soil borings were advanced by direct-push drilling (DR-SB-187 through DR-SB-196) for lithological characterization and soil sampling, and six borings (DR-SB-46 through DR-SB-51) were advanced during installation of new groundwater monitoring well clusters. Chemical results for the soil samples are shown in Tables 4-4 and 4-5; analytes exceeding their respective industrial screening criteria are highlighted in Table 4-5 and shown in Figure 4-6.

Four of the10 soil borings (DR-SB-188, DR-SB-191, DR-SB-194, and DR-SB-196) advanced by DPT produced samples with compounds exceeding industrial screening levels. Soil from 22 to 24 feet below grade in soil boring DR-SB-191 had exceedances for benzo(a)anthracene (6.9 mg/kg), benzo(a)pyrene (6.4 mg/kg), benzo(b)flouranthene (9.4 mg/kg), dibenz(a,h)anthracene (1.2 mg/kg), $BaPEq_{HALFND}$ (9.63 mg/kg), and $BaPEq_{PD}$ (9.63 mg/kg) at concentrations exceeding industrial screening levels. The three other samples with industrial soil exceedances were collected from 24–25 feet below grade in soil boring DR-SB-188 (benzo[a]pyrene 1 mg/kg and cadmium 52 mg/kg), from 13 to 15 feet below grade in soil boring DR-SB-194 (vanadium 82 mg/kg), and from two to four feet below grade in soil boring DR-SB-196 (vanadium 69K mg/kg). Only one soil sample (DR-SB-46S-19-20) with industrial screening level

exceedances was collected during installation of the new monitoring wells. Arsenic (21 mg/kg) and vanadium (130 mg/kg) were detected in those wells at 19–20 feet below grade.

4.4 DIRECT-PUSH TECHNOLOGY GROUNDWATER SAMPLING

Twenty-two DPT-probe groundwater sample borings were advanced throughout the DRA. Chemical results for the DPT groundwater samples are shown in Tables 4-6 and 4-7. Analytes exceeding the groundwater standards are highlighted in Table 4-7. Exceedances for the chlorinated volatile organic compounds (cVOCs) trichloroethene (TCE), *cis*-1,2-dichloroethene (*cis*-1,2-DCE), and vinyl chloride (VC) are shown in Figure 4-7. Exceedances for benzene, toluene, ethylbenzene, and xylenes (BTEX) are shown in Figure 4-8.

4.4.1 Frog Mortar Creek Western Shoreline

DPT-23 through DPT-29 were advanced near the edge of the DRA embankment or constructed berm area adjacent to the western shoreline of Frog Mortar Creek. As shown on Figures 4-7 and 4-8, these locations were positioned east of Ponds 1 and 2 and along the eastern limits of the buried waste, near the newly installed monitoring well clusters (MW-46 through MW-51). TCE concentrations were highest at locations DPT-25 (40-foot depth) and DPT-26 (30-foot depth), with detections of 25,000 micrograms per liter (µg/L) and 26,000 µg/L, respectively. TCE concentrations generally decreased at DPT locations north and south of DPT-25 and DPT-26.

Maximum TCE concentrations at the surrounding DPT borings (DPT-24, DPT-27, and DPT-28) occurred at depths of 25–30 feet below grade (i.e., -8 to -20 feet elevation). The highest concentrations of two additional cVOCs were also detected at location DR-DPT-26: *cis*-1,2-DCE (24,000 µg/L) and VC (7,600 µg/L) were detected at 25 feet below grade. Several exceedances for other cVOCs, one exceedance for benzene, and two exceedances for acetone were also detected in these samples, but TCE is the prevailing contaminant in this area.

4.4.2 Taxiway Tango Area North

DPT-30, DPT-31, and DPT-33 were advanced in the northern region of the Taxiway Tango area. Elevated concentrations of at least one cVOC were detected in all samples. The highest TCE (9,900*J* µg/L) and *cis*-1,2-DCE concentrations (4,200 µg/L) were at DPT-33 (30-foot depth). TCE and *cis*-1,2-DCE exceeded screening levels in all samples collected at DPT-30, except for the shallowest sample (15-foot depth). Exceedances of TCE (ranging from 6 µg/L to

1,000 µg/L), *cis*-1,2-DCE (ranging from 100 µg/L to 2,000 µg/L), and VC (ranging from 2.6*J* µg/L to 580 µg/L) were also detected in DPT-30 and DPT-31. However, the elevated TCE concentration (9,900 µg/L) detected at a depth of 40 feet (-30 feet elevation) at DPT-33 indicates a possible TCE source area. TCE exceedances were also detected in previously collected groundwater samples from nearby monitoring well clusters: MW-15S/15I (63 µg/L and 1,500 µg/L, respectively, in 2011), MW-28I (1,000 µg/L in 2011), and MW-33S (1,500 µg/L in 2009 and 690 µg/L in 2010). These historical exceedances are lower than the TCE groundwater concentrations at DPT-33. This evidence strongly suggests that DPT-33 is near the source area. Slight exceedances for benzene (ranging from 5.7*J* µg/L to 9.4*J* µg/L) were detected in four of 20 samples collected. All benzene exceedances except the highest detected concentration were from DPT-30. The maximum benzene concentration (9.4*J* µg/L) was detected in a sample from DPT-33 at a 45-foot depth.

4.4.3 Petroleum Hydrocarbon Area

DPT-34 was advanced to further characterize the groundwater quality upgradient of the Petroleum Hydrocarbon Area and downgradient of elevated TCE at well DMW-11S and CPT-03 (Taxiway Tango Median Area). However, samples from DPT-34 produced significantly higher concentrations of TCE (up to 16,000*J* µg/L), *cis*-1,2-DCE (820*J* µg/L to 75,000 µg/L), and VC (210*J* µg/L to 87,000 µg/L). Benzene, toluene, and xylenes were also detected in this location at maximum concentrations of 120*J* µg/L, 37,000 µg/L, and 670 µg/L, respectively, but only benzene and toluene concentrations exceeded groundwater screening levels. Acetone (in one of four samples), chloroform (in three of four samples), and methylene chloride (in one of four samples) also exceeded their respective groundwater standards. The TCE and toluene concentrations at DPT-34 indicate the eastward continuation of the Taxiway Tango Median Area TCE source area (i.e., well DMW-11S and CPT-03) and the westward continuation of the Petroleum Hydrocarbon Area source.

4.4.4 Taxiway Tango East

DPT-35 is north of the Taxiway Tango East area where elevated cVOCs have been detected at wells MW-45S and DMW-1B, and at CPT-08. The relatively low detections of cVOCs at DPT-35 (maxima for TCE, *cis*-1,2-DCE, and VC at 230 µg/L, 860 µg/L, and 720 µg/L, respectively) indicate that this DPT location is north of the Taxiway Tango East source area.

4.4.5 Former Pond 4/Open Burning Area—Features #43 and #45

DPT-36 and DPT-37 were advanced adjacent to Taxiway Tango in areas suspected of being the former locations of a chemical dumping pit and an open burning area (both observed in historical aerial photographs). These DPT locations are also west/northwest of and hydraulically upgradient/cross-gradient to the Drum Area. The maximum cVOC concentration (260 µg/L of *cis*-1,2-DCE at DPT-37) does not indicate a cVOC source in this area. Only infrequent trace concentrations of benzene, toluene, and xylenes were detected at these two locations.

4.4.6 The Drum Area

DPT-40, DPT-41, and DPT-42 were advanced near the Drum Area. DPT-40 and DPT-41 are northeast and downgradient of the Drum Area, and DPT-42 is upgradient and to the southwest. As expected, the upgradient location produced samples with relatively low contaminant concentrations, similar to concentrations detected at DPT-32, DPT-36, and DPT-37 farther to the west, while the downgradient locations produced significantly higher concentrations. DPT-41 produced the sample with the highest TCE concentration in this area: 28,000*K* µg/L at 35 feet below grade, and an elevated *cis*-1,2-DCE concentration (17,000 µg/L) at 30 feet below grade. DPT-40 produced considerably lower TCE concentrations (maximum concentration of 5,800 µg/L) as compared to DPT-41, but had consistently high *cis*-1,2-DCE concentrations, ranging from 1,100 µg/L to 9,100 µg/L. Samples collected from these three locations indicate a northeast trending contaminant plume extending from the Drum Area.

4.4.7 Taxiway Tango Median Area

DPT-32 was advanced to characterize groundwater south/southeast of well DMW-11S and CPT-05 and to delineate the boundary of cVOCs in the area where some of the highest cVOC concentrations have been detected in DRA groundwater samples. DPT-32 is also near the location of a probe groundwater sample collected at MIP-61, with a high TCE concentration (3,630 µg/L) in the upper surficial-aquifer. Groundwater results from DPT-32 indicate the presence of TCE, with increasing concentrations down to a depth of 50 feet below grade (elevation of -40 feet).

The maximum TCE concentration (130 µg/L) was detected at DPT-32 at 50 feet; this concentration is nearly 30 times less than the TCE concentration (3,630 µg/L) at MIP-61. TCE

concentrations at DPT-32 are also less than those to the north at CPT-05, and show a gradual decrease in TCE concentrations from DMW-11S to CPT-04, CPT-05, and DPT-32. Slight exceedances for carbon tetrachloride (6.6 µg/L and 12 µg/L) and vinyl chloride (8.6 µg/L and 19 µg/L) were detected in samples from the 50-, 40-, 35-, and 30-foot depths, respectively.

DPT-39 was advanced near (previously sampled) CPT-01, along the eastern edge of the runway, to further investigate elevated TCE concentrations in CPT-01 and monitoring well DMW-11S/I. The samples collected from DPT-39 contained no significant concentrations indicating contamination. However, one TCE concentration (16 µg/L) collected at a depth of 30 feet (elevation of -19 feet) is three times higher than the MDE groundwater standard of 5 µg/L.

4.4.8 Area of Former Pond 3 and Former Linear Pond

DPT-38, DPT-43, and DPT-43B were advanced in the area that was suspected of being the location of a former chemical pit (Pond 3) and a former linear pond. DPT-38 is north of this area; only slight cVOC exceedances were detected there. In contrast, elevated concentrations of TCE at DPT-43 and DPT-43B (490,000 µg/L at 35 feet below grade, and 30,000 µg/L at 40 feet below grade, respectively) indicate a possible source area. TCE concentrations at DPT-43B were 22,000 µg/L at 20 feet below grade, and 3,700 µg/L at 15 feet below grade. Toluene exceedances (up to 10,000 µg/L) were also detected in DPT-43 and DPT-43B. These concentrations indicate sources for cVOCs and petroleum hydrocarbons. Downgradient of these locations, highly elevated contaminant concentrations have been detected in historical investigations as well as in the newly installed monitoring wells and the DPT groundwater samples collected for this investigation.

4.5 WELL GROUNDWATER SAMPLING

Groundwater sampling results from the new monitoring wells are shown in Tables 4-8 and 4-9. Analytes exceeding groundwater standards or other screening levels are highlighted in Table 4-9 and shown on Figure 4-9. As shown in Table 4-9 and Figure 4-9, cVOCs, 1,4-dioxane, metals, TPH-GRO, and TPH-DRO exceed groundwater standards at wells installed at the top of the embankment or berm near Frog Mortar Creek. Of note is the elevated TCE concentration in well MW-51S (13,000 µg/L). This well is installed at a shallow depth (20 feet) at the southern end of the DRA between wells MW-50S/I/D and DPT-29, the latter of which had mostly no detections

of cVOCs and only three trace concentrations (i.e., 2.1 µg/L and less) of cVOCs in vertical-aquifer screening groundwater samples.

Farther north, the next highest concentrations of TCE were detected in wells MW-49D and MW-49I, at concentrations of 9,300 µg/L and 6,900 µg/L, respectively. These wells are east of DMW-4S/I/D. The next highest TCE concentrations are from MW-47I (4,300 µg/L) east of Pond 2 and MW-18I, and from MW-48I (3,900 µg/L) east of wells DMW-2S/A/B. Overall, TCE concentrations in the new wells are less than those detected in the DPT groundwater samples. TCE results for wells MW-46S/I/D, MW-47S/I/D, MW-48S/I/D, and MW-50S/I/D are less than concentrations for upgradient wells MW-18I, DMW-3I, DMW-2A, and DMW-5S, whereas TCE concentrations for MW-49I/D are greater than for upgradient wells DMW-4I/D. Although TPH-GRO exceeds the groundwater standard in several new wells, BTEX were detected infrequently and at low to trace concentrations (typically less than 1 µg/L), well below groundwater standards.

4.6 SURFACE WATER SAMPLING

Chemical results for the Pond 1 and wetland area water samples are shown in Tables 4-10 and 4-11. Analytes exceeding the screening criteria are highlighted in Table 4-11 and shown on Figure 4-10. Only metals, TPH-GRO, and TPH-DRO exceed their respective screening levels. (EWT-SW3-1 was only analyzed for VOCs due to limited water available in the shallow drive-point sampler.) Cadmium and chromium concentrations in Pond 1 samples are lower than concentrations in 2012 Pond 1 samples, and mercury was not detected in 2013. Pond 1 barium concentrations in 2013 (39–41 µg/L) are approximately five to eight times higher than the concentrations in 2012 samples (5–8.7 µg/L); however, the Pond 1 barium concentrations in 2013 are consistent with barium levels reported for other nearby water bodies, such as Pond 2 and Frog Mortar Creek. Barium and cadmium concentrations in wetland water samples (EWT-SW1 and EWT-SW2) are higher than those in Pond 1 samples. Additionally, concentrations of cobalt, cooper, nickel, and zinc exceed their screening levels in two wetland water samples, and hexavalent chromium exceeds its lowest screening level in one wetland water sample (EWT-SW1).

4.7 SEDIMENT SAMPLING

Chemical results for sediment samples collected from Pond 1 and the wetland area are in Tables 4-12 and 4-13. Analytes exceeding screening criteria are highlighted in Table 4-13, and major analytes exceeding their criteria are shown in Figure 4-11. Major analytes exceeding the screening levels in the pond sediment samples include BTEX, cVOCs (TCE, *cis*-1,2-DCE, and VC), 2-methylnaphthalene, naphthalene, PCBs, cadmium, chromium, copper, lead, zinc, TPH-DRO, and TPH-GRO. Numerous PAHs (e.g., benzo(a)pyrene, benzo(b)fluoranthene, chrysene, fluoranthene, etc.) also exceed screening levels. Similar to previous Pond 1 sediment samples, higher concentrations of chemicals were detected in deeper (1–2 foot) samples. Constituents exceeding the screening levels in wetland area sediment samples (EWT-SD-1 through EWT-SD3) are primarily metals. PAHs also exceeded the screening levels (see Table 4-13), but are not shown on Figure 4-11. Primary cVOCs (TCE, *cis*-1,2-DCE, and VC) and BTEX were not detected in the wetland area sediment samples.

Consistent with previous sampling, results for EP1-SD15 and EP1-SD16 in the northern portion of Pond 1 show non-detect or low concentrations of cVOCs in sediment. However, BTEX were detected in these samples, with the maximum total BTEX concentration (737,000 µg/kg) detected at 1–2 feet at EP1-SD16. The maximum TCE concentrations detected in the central and southern portions of Pond 1 were 5,400 µg/kg at EP1-SD17-1–2 (southern portion of Pond 1) and 2,400 µg/kg at EP1-SD18-1–2 (central portion of Pond 1). Maximum BTEX concentrations in southern and central portions of the pond were 883,100 µg/kg at EP1-SD17-1–2 and 4,480 µg/kg at EP1-SD18-1–2, respectively (ethylbenzene concentration is below the screening levels and is therefore not shown on Figure 4-11).

The geotechnical analyses indicate that the wetland sediment samples consist primarily of fines with some sand and trace gravel. Samples were comprised of 71.6–90.3% fines, 9.7–25.9% sand, and, in one instance, 2.1% fine gravel. Permeabilities range from 5.09×10^{-6} to 1.23×10^{-5} centimeters per second, and were consistently higher in the zero- to one-foot interval than in the one- to two-foot interval.

Table 4-3
Detected Analytes and Screening Criteria for Test Pit Soil Samples-2013
Dump Road Area
Lockheed Martin, Martin State Airport, Middle River, Maryland

Notes:

1 Maryland Department of the Environment soil cleanup standards (MDE, 2008) unless noted otherwise.

2 Benzo(a)pyrene equivalent (BaPEq), Aroclor-1248, and arsenic criteria are the Preliminary Remedial Goal for soil based on a 10-5 target cancer risk level under the industrial worker future use scenario per the Dump Road Remedial Investigation, Table 6-36 (Tetra Tech, 2012c).

Cells shaded gray indicate values that exceed the residential screening level.

Cells shaded black indicate values that exceed residential and non-residential/industrial worker screening criteria.

B - analyte detected in laboratory blank

DRO - diesel-range organics

GRO - gasloine-range organics

HI - hazard index (non-carcinogenic)

J - Positive result is considered estimated as a result of technical noncompliance.

K - Positive result is considered biased high as a result of technical noncompliance.

L - Positive result is considered biased low as a result of technical noncompliance.

MDE - Maryland Department of the Environment

µg/kg - micrograms per kilogram

mg/kg - milligrams per kilogram

NA - not analyzed, not applicable

-- = not detected

TPH - total petroleum hydrocarbons

Detected Analytes and Screening Criteria for Soil Boring Soil Samples-2013
Dump Road Area
Lockheed Martin, Martin State Airport, Middle River, Maryland
Page 22 of 22

Notes:

1 Maryland Department of the Environment soil cleanup standards (MDE, 2008) unless noted otherwise.

2 Benzo(a)pyrene equivalent (BaPEq) and arsenic criteria are the Preliminary Remedial GoalS for soil based on a 10^{-5} target cancer risk level under the industrial worker future use scenario per the Dump Road Remedial Investigation, Table 6-36 (Tetra Tech, 2012c).

Cells shaded gray indicate values that exceed the residential screening level.

Cells shaded black indicate values that exceed residential and non-residential/industrial worker screening criteria.

B - analyte detected in laboratory blank

DRO - diesel-range organics

GRO - gasloine-range organics

HI - hazard index (non-carcinogenic)

J - Positive result is considered estimated as a result of technical noncompliance.

K - Positive result is considered biased high as a result of technical noncompliance.

L - Positive result is considered biased low as a result of technical noncompliance.

MDE - Maryland Department of the Environment

µg/kg - micrograms per kilogram

mg/kg - milligrams per kilogram

NA - not analyzed, not applicable

-- = not detected

TPH - total petroleum hydrocarbons

MEQ/100 - milliequivalents per 100 square centimeter

S.U. - standard units

Table 4-6

Statistical Summary of Analytes Detected in in DPT Groundwater Samples-2013

Table 4-9
Detected Analytes and Screening Criteria for Monitoring Well Groundwater Samples-2013
Dump Road Area
Lockheed Martin, Martin State Airport, Middle River, Maryland

Notes

1 Maryland Department of the Environment groundwater standards (MDE, 2008).

Cells shaded gray indicate values that exceed the screening level.

--- not detected

µg/L - micrograms per liter

B - analyte detected in blank sample

J - estimated concentration

K - concentration biased high

mg/L milligrams per liter

NA - not analyzed

Notes:

1 - USEPA Region 3 Biological Technical Assistance Group (BTAG) screening levels for freshwater and marine surface water (USEPA, July 2006). Lowest of freshwater and marine values were selected as screening value.

2 - Screening criteria for surface water are based on USEPA Regional Screening Levels (RSLs) for tap water (November, 2013). To account for the anticipated reduced exposure to surface water, the screening criteria presented in the table for surface water are 10 times those typically used for tap water (which are also based on RSLs). Therefore, the screening criteria for carcinogens in surface water are set at 10 times the RSL for tap water. The screening criteria for non-carcinogens in surface water are set equal to the RSL for tap water because they are adjusted for a hazard quotient of 0.1.

3 - Code of Maryland Regulations 26.04.01.06 (MCL-inorganics), 26.04.01.07 (MCL-organics), and 26.04.01.06-2 (control of lead and copper). MDE Groundwater Cleanup Standards (MDE, 2008) are used for acetone, hexavalent chromium, nickel, zinc, and total petroleum hydrocarbons.

4 - The value is for total chromium.

5 - The value is for trivalent chromium.

6 - NOAA Quick Reference Tables (Buchman, 2008)

7 - The BTAG screening benchmark is based on total metal concentration for this analyte. Therefore, the dissolved metals result for this metal is not screened against the BTAG screening benchmark.

Gray shading indicates a result that exceeds a screening criterion.

B - analyte detected in laboratory blank

C - carcinogenic

J - Positive result is considered estimated.

MDE - Maryland Department of the Environment

mg/L - milligrams per liter

N - Non-carcinogenic

NA - Not applicable or not analyzed

NOAA - National Oceanic and Atmospheric Administration

1 Sediment screening values are from the following sources:
Region 3 BTAG (FW) - USEPA Region 3 BTAG Freshwater Sediment Screening Benchmark (August 2006)
(http://www.epa.gov/reg3hscd/risk/eco/btag/sbv/fwsed/R3_BTAG_FW_Sediment_Benchmarks_07-06.pdf).

Region 3 BTAG (SW) - USEPA Region 3 BTAG Marine Sediment Screening Benchmark (August 2006)
(http://www.epa.gov/reg3hwmd/risk/eco/btag/sbv/marsed/R3_BTAG_Marine_Sediment_Benchmarks_7-06.pdf).

Ecotox - USEPA. ECO Update, Ecotox Thresholds. Office of Solid Waste and Emergency Response. Intermittent Bulletin, Volume 3, Number 2. EPA540/F-95/038. (January, 1996).

NOAA - Buchman, M. F., 2008. NOAA Screening Quick Reference Tables, NOAA HAZMAT Report 99-1, Seattle, WA, Coastal Protection and

2 Benzo(a)pyrene equivalent (BaPEq) and arsenic criteria are the Preliminary Remedial Goal for soil based on a 10-5 target cancer risk level under the industrial worker future use scenario per the Dump Road Remedial Investigation, Table 6-36 (Tetra Tech, 2012c).
The Preliminary Remediation Goals are adjusted by a factor of 10 for expected reduced exposure to sediments.

3 The Dump Road Area Preliminary Remediation Goal developed for Aroclor-1248 is used as a surrogate screening concentration for this analyte. The

4 Maryland Department of the Environment soil cleanup standards (MDE, 2008).

Cells shaded gray indicate values that exceed a screening level.

HI - hazard index (non-carcinogenic)

J - Positive result is considered estimated as a result of technical noncompliance.

µg/kg - micrograms per kilogram

mg/kg - milligrams per kilogram

NA - not available, not applicable

-- = not detected

Section 5
Source Areas Evaluation Methodology

The Dump Road Area (DRA) is an unlined dump, so areas of fill and/or buried debris would be expected to be possible contaminant source areas. Results of geophysical surveys, test pits, and soil- and groundwater-sample chemical analyses to date have been used in conjunction with hydrogeologic data to assess and define possible source areas of volatile organic compounds (VOCs) in the unsaturated- and saturated- (soil)-zones at the DRA. Chemical results used in the evaluation also include VOC data for soil samples collected beneath and around Taxiway Tango in 2013 as part of a separate investigation (Tetra Tech, Inc. [Tetra Tech], 2014). The source area evaluation further identifies, assesses, and describes VOC source areas at the DRA, identifies data gaps, and evaluates actions required to further characterize the source areas. Chemical results for the chlorinated VOC (cVOC) trichloroethene (TCE) and the aromatic hydrocarbons benzene, toluene, ethylbenzene, and xylenes (BTEX) are plotted in plan view and on geologic cross-sections in this report and compared to TCE-saturation concentrations to evaluate the possible presence of TCE dense-non-aqueous-phase liquids (DNAPLs) and areas of elevated BTEX.

5.1 EVALUATION OF GEOPHYSICAL SURVEY AND TEST PIT RESULTS

The results of a 2007 geophysical survey of the DRA (Tetra Tech, 2012c) and contour maps of the depth and thickness of buried fill and debris areas were used to identify possible contaminant source areas. These maps are based on the results of test pits excavated throughout the site in 2000, 2007–2009, 2012, and 2013. Test pits provide a method of exposing and identifying fill and debris and directly measuring its depth and thickness.

5.2 EVALUATION OF SOIL SAMPLING CHEMICAL RESULTS

Surface soil (soil at depths of zero to two feet below ground surface [bgs]) samples are typically used to evaluate risk to human health posed by direct contact with soil; surface soil samples may also indicate sources from surface spills or leaks. TCE and BTEX results for soil samples were divided into three soil categories:

- samples collected from zero to two feet bgs (surface soil or pond sediment)
- samples collected between two- and 15-feet bgs (shallow subsurface soil)
- samples collected at depths greater than 15 feet bgs (deep subsurface soil)

Surface soil at the DRA also represents the upper portion of the vadose (or unsaturated) zone. Subsurface soil is defined as the shallow portion of the unsaturated zone down to the average depth of the water table. Deep subsurface soil typically represents soil in the saturated zone of the surficial aquifer.

Soil data are plotted and contoured in plan view in Section 6 of this report for each of these three categories. Groundwater results are also plotted against soil results in plan view and on geologic cross-sections in Section 6. The contour maps and cross-sections generated from the available data provide the basis for determining the locations and depths of elevated VOC concentrations in groundwater at the DRA.

5.3 EVALUATION OF GROUNDWATER SAMPLING CHEMICAL RESULTS

Groundwater at the DRA site has been assessed in three depth zones to better characterize VOC concentrations in three dimensions. The three zones (described in Section 2) are defined as:

- *upper surficial-aquifer zone ("S" wells)*—this zone extends from the groundwater surface (approximately five to 15 feet below grade) to approximately 30 feet below grade
- *intermediate surficial-aquifer zone ("I" monitoring wells)*—this zone occurs at depths approximately 30–60 feet below grade
- *lower surficial-aquifer zone ("D", or deep, monitoring wells)*—this zone occurs at depths approximately 60–90 feet below grade

Groundwater data from the 2012 and 2013 sampling rounds (Tetra Tech, 2013d,e) and from new wells MW-46S/I/D through MW-51S/I/D were used for these analyses. The maximum TCE or

BTEX concentrations from 2012 or 2013 are plotted on the cross-sections. Several wells (DMW-2B, MW-2, MW-17D, MW-18D, MW-22I, MW-23I, MW-26I, and MW-26D) were not sampled in 2012–2013, so chemical data from 2008 were used for these wells. Chemical results from the 2012 and 2013 direct-push technology (DPT)-probe samples (i.e., CPT-01 through CPT-22, and DPT-23 through DPT-43B), from temporary well samples collected in 2002 (e.g., TT-1, PA-1, and DA-1 groundwater samples), and the 2007 DPT groundwater samples (e.g., MIP-28) are also used in the cross-section plots.

Note that DPT-probe samples (e.g., CPT-01, DPT-23, and MIP-28) or temporary wells can yield higher concentrations of cVOCs than samples collected from long-term monitoring wells, because DPT and temporary-well groundwater samples reflect smaller, discrete sampling intervals. The smaller sampling interval can isolate the more highly contaminated portions of the aquifer from less contaminated portions during groundwater sampling, so using DPT and temporary well results to develop detailed vertical profiles of contaminants in the subsurface is more effective at assessing the possible presence of DNAPL. DPT sampling is particularly effective when groundwater samples are collected at multiple depths from the top of the water table to the base of the target aquifer. DPT sampling programs can thus rapidly delineate contaminant concentrations in three dimensions and guide the installation of groundwater monitoring wells.

5.4 DNAPL ASSESSMENT

TCE, the primary parent-VOC of concern at the DRA, is an industrial degreaser previously used in machining operations. Its release at MSA has produced large groundwater plumes of dissolved TCE and its degradation, or "daughter," VOCs *cis*-1,2-dichloroethene (*cis*-1,2-DCE), vinyl chloride (VC), ethane, and ethene. TCE has low solubility in water and is more dense than water. Its physical characteristics enable it to be in the subsurface as DNAPL, or what is known as "product form."

TCE DNAPL degrades slowly in most subsurface environments, so it persists as a long-term source of dissolved-phase VOC contamination. The location of DNAPL determines the spatial distribution and concentrations of VOCs in the plume. The delineation of DNAPL in the subsurface is an important component of a conceptual site model, and is critical to selecting the proper remedial approach (Kueper and Davies, 2009).

When product is released to the subsurface, DNAPL may become distributed in disconnected blobs and ganglia of organic liquid within the soil, referred to as "residual DNAPL." If sufficiently large volumes of product are released, the ganglia may become connected and form pools of DNAPL. Residual DNAPL can be found above and below the water table in the soil column in which it was released. Residual DNAPL is trapped (i.e., immobilized) within the soil by capillary forces, but its presence can result in dissolved-phase plumes of contamination in groundwater that persist for decades to hundreds of years.

DNAPL pools represent a connected distribution of DNAPL and can flow vertically and horizontally as "product" in the subsurface. DNAPL pool-spreading can increase the size of the DNAPL source area, which then contributes to the dissolved-phase plume over time. DNAPL spreading can be parallel to groundwater flow or in other directions. For example, DNAPL in pools may migrate along low-permeability barriers that dip away from groundwater flow, or within rock or saprolite (crumbling) fractures that radiate in several directions (Kueper and Davies, 2009).

The United States Environmental Protection Agency (USEPA) provides a multi-step process for evaluating DNAPL in the subsurface at hazardous waste sites (Kueper and Davies, 2009). Determining whether DNAPL is in the subsurface involves many uncertainties, so USEPA recommends using converging lines of evidence to assess whether it is present. These lines of evidence were used in this evaluation for the DRA site. The following sections describe the recommended DNAPL source-zone investigation methods (Kueper and Davies, 2009) that are used to evaluate DRA investigation results.

5.4.1 Soil Methods

DNAPL typically migrates through the subsurface very selectively and meanderingly. It may be present as residual DNAPL distributed in noncontiguous portions of the soil column, or a significant portion of the contaminant mass may have diffused into lower permeability zones. DNAPL migration can occur within thin lenses and laminations of soil at the scale of inches or less (Kueper and Davies, 2009). Some DNAPLs are colorless and not readily visible in soil. DNAPL in the subsurface is extremely difficult to locate because of the complex nature of subsurface geology, the complex distribution of preferential contaminant pathways in soil, the location and history of DNAPL releases, and solvent density that creates downward migration.

DNAPL in soil can also vaporize into air-filled pore spaces, lowering contaminant concentrations in soil, but creating vapor-phase plumes. DNAPL persistence in soil may be short relative to its persistence in groundwater; therefore, the absence of DNAPL in the unsaturated zone may not be sufficient evidence to conclude that DNAPL has not migrated below the water table. Furthermore, flushing the upper portion of the water table via recharge and downward hydraulic gradients in many aquifer systems may reduce groundwater concentrations near the top of the water table and mask higher contaminant concentrations in deeper portions of the aquifer.

5.4.1.1 Visual Observations

DNAPL may be directly observed in soil or groundwater samples, or in drill cuttings or soil samples collected during drilling. DNAPL in groundwater may be observed in samples collected at the bottom of a well using a bailer, or measured using an electronic water-level and product-interface probe. Soil-boring logs, well drilling logs, and test-pit logs to date indicate elevated field-screening levels using a portable photoionization detector (PID). The logs also provide limited indications of DNAPL from visual observations made during fieldwork.

During the 1996 expanded investigation (Maryland Environmental Service, 1996) conducted for the Maryland Aviation Administration (MAA), soil at 12–14 feet bgs from Drum Area (DA) boring B-8 was reported to have a strong odor and had a high total VOC reading (greater than 2,500 parts per million) using a portable PID in the field. The boring log also reports that pure product was observed at this depth. Soil samples were collected from this interval (12–14 feet, as noted in the log) and submitted to both the field laboratory and an off-site analytical laboratory for chemical analyses.

The field laboratory analyses detected TCE at 6.2 milligrams per kilogram (mg/kg) and total petroleum hydrocarbons (TPH)-diesel-range organics (DRO) at 19,000 mg/kg. However, the off-site laboratory analyses reported a much lower TCE concentration: 130 micrograms per kilogram (µg/kg) or 0.130 mg/kg. Therefore, product observed at this shallow depth (i.e., near the top of the groundwater table) was likely petroleum-related product, or light non-aqueous-phase liquid (LNAPL).

Monitoring well MW-5 was installed in January 1996 directly downgradient and 12 feet east of boring B-8 to further investigate soil results. In January 1996, TCE, *cis*-1,2-DCE, and toluene

were detected in groundwater samples from MW-5 at concentrations of 63,000, 38,000, and 6,900 micrograms per liter (µg/L), respectively. MW-5 is screened from 19–39 feet below grade. The TCE concentration of 63,000 µg/L indicated the likely presence of TCE DNAPL at or near well MW-5. In 2013, test pit DR-TP-DR-A79 was excavated near B-8 to further investigate the possible presence of VOCs and product in this area. As described in Section 4, debris was encountered in this area to a depth of 4–11 feet below grade. Debris consisted of copper wire, cinderblocks, bricks, concrete, blue-green-stained sediment, drum fragments, and metal shards. A soil sample was collected at four feet and a composite sample was also collected.

During the same investigation, free product was observed at depths of four to seven feet in boring B-15, advanced in the dirt access road near the Petroleum Hydrocarbon Area (PHA). A VOC reading of 9,300 parts per million (ppm) was recorded for soil at the groundwater table (six feet bgs). The observed product is presumably petroleum-related LNAPL. A sample from four to seven feet (which is the depth indicated in the log, although 7–10 feet is shown in the report's table) was collected for chemical analyses (Maryland Environmental Service, 1996). TCE (140 µg/kg) and the petroleum VOC xylenes (13,000 µg/kg, or 13 mg/kg) were detected.

Well MW-4 was installed in January 1996 near borings B-1 and B-15 to assess the strong petroleum odor observed at B-1. TCE was not detected in this well, and only low concentrations of other VOCs were detected. MW-4 is screened from 4–30 feet below grade. In 2013, test pit DR-TP-DR-A78 was excavated near boring B-15 to further investigate the possible presence of product. A sheen and petroleum odors were observed at 4–6 feet, and elevated PID readings ranging from 105–222 ppm were measured in soil at depths of 8–10 feet and 12–16 feet below grade.

Test pit N4 was excavated north of Pond 1 in 2008; a greenish-black liquid reportedly oozed from the ground after the test pit was backfilled. The liquid had a very strong odor similar to nail polish remover (i.e., a solvent odor). The PID recorded a total VOC reading of more than 700 parts per million volume (ppmv). Test pit DR-TP-DR-A77 was excavated in 2013 near N4 to further investigate the possible presence of the greenish-black liquid. Small debris was encountered from 3–15 feet, and an unknown white material and gray clay were observed at a depth of 2.5 feet below grade, but a greenish-black liquid was not observed at this test pit.

Grab groundwater samples from temporary wells placed in the Taxiway Tango Median Anomaly Area (TT-1 through TT-10), the DA (DA-1 through DA-14), the PHA (PA-1 through PA-16), and six "previously disturbed areas" (PDA-1 through PDA-6), were inspected for free product in response to MDE's request in an August 15, 2001 letter to Lockheed Martin Corporation (Lockheed Martin); free product was not found in these samples (Tetra Tech, 2002). However, oil/water-interface probes (instruments that can be used to screen for free product) had not been used at the site, and Tetra Tech geologists had not observed DNAPL during site investigations. Therefore, visual observations were not used in this study as a line of evidence to confirm the presence of DNAPLs.

5.4.1.2 Chemical Concentrations in Soil above DNAPL-Saturation Threshold

TCE concentrations detected in soil samples can be compared to a DNAPL-saturation threshold concentration. An exceedance of this threshold indicates DNAPL in the unsaturated zone. The threshold DNAPL-saturation in soil is typically assumed to be between five and 10% of the soil's pore-space. The chemical concentration in soil corresponding to threshold DNAPL saturation (C_D) can be estimated using the following equation (Kueper and Davies, 2009):

$$C_D = \frac{S_r \emptyset \rho_N 10^6}{\rho_b} + C^T$$

where:

C_D = threshold DNAPL soil-saturation concentration (mg/kg)

S_r = threshold DNAPL saturation (set between 0.05 and 0.10), the minimum fraction of soil pore-space occupied by the DNAPL-saturated product

Ø = effective porosity (unitless): the porosity of the soil that can be occupied by a liquid

ρ_N = DNAPL density, in grams per cubic centimeter (g/cm^3)

ρ_b = dry-soil bulk density (g/cm^3)

C^T = partitioning threshold concentration: the contaminant amount (mg/kg) in a soil sample in aqueous, vapor, and sorbed phases

For a TCE DNAPL, the threshold saturation concentration (C_D) equals 9,188 mg/kg (or 9,188,000 µg/kg), using the following assumptions:

S_r = 0.05

$Ø$ = 0.25
ρ_N = 1.47
ρ_b = 2.0 grams per cubic centimeter (g/cm^3)

Using these assumptions ignores C^T, but that value is negligible compared to the DNAPL-saturation term. A TCE concentration in soil greater than 9,188 mg/kg is considered conclusive evidence of DNAPL (Kueper and Davies, 2009). TCE concentrations detected in soil and pond sediment at the DRA have not exceeded this concentration.

5.4.1.3 Chemical Concentrations in Soil above the Partitioning Threshold

Soil sampling results can also be compared to the partitioning threshold concentration (C^T). This soil concentration is based on the partitioning relationship of the cVOC between soil, air, and water at equilibrium, and is typically estimated using site-specific soil parameters, if available. A cVOC concentration above this concentration indicates the possible presence of DNAPL in the unsaturated or saturated zones only, not conclusive evidence as does the saturation-threshold concentration discussed in Section 5.4.1.2. The partitioning threshold can be estimated using the following equation (Kueper and Davies, 2009):

$$C^T = \frac{C_i}{\rho_b}(K_d\rho_b + \theta_w + H'\theta_a)$$

where:

C^T = soil concentration (mg/kg) threshold for a chemical
C_i = effective solubility of chemical, in milligrams per liter (mg/L)
ρ_b = dry-soil bulk density (g/cm^3)
K_d = soil/water partition coefficient, in milliliters per gram (mL/g) [$K_d = K_{oc}f_{oc}$]
θ_w = water-filled porosity (unitless) from moisture content
H' = unitless Henry's Constant
θ_a = air-filled porosity (unitless)
K_{oc} = organic-carbon/water partition coefficient (mL/g)
f_{oc} = fraction of organic carbon (unitless)

Assuming a TCE DNAPL with C_i = 1,100 mg/L, K_{oc} = 126 mL/g, and H' = 0.31 in a soil sample having θ_w = 0.15, θ_a = 0.10, ρ_b = 2.0 g/cc, and f_{oc} = 0.003, the value of C^T is 515 mg/kg (or

515,000 µg/kg). This C^T value (515 mg/kg) is used in this study to evaluate soil samples for TCE DNAPL. Soil samples in the saturated zone have a θ_a of zero and a θ_w of 0.25. Therefore, C^T in the saturated zone is 553 mg/kg (or 553,000 µg/kg). The C^T calculation requires knowledge of site-specific soil parameters and quantitative chemical analyses of the soil. Measured concentrations that only marginally exceed this concentration may be false positives, primarily because of uncertainty associated with estimating the soil/water partition coefficient (Kueper and Davies, 2009).

5.4.1.4 Site Use/Site History

USEPA studies indicate that DNAPL is associated with specific types of industries, processes, and practices. Some industries and processes that typically use solvents include electronic manufacturing, dry cleaning, metal product manufacturing, engine manufacturing, metal machining, and tool and die operations. Past practices, such as the disposal of solvents in unlined pits, may also contribute to DNAPL formation.

The DRA is an unlined dump historically used to dispose of debris and industrial wastes. Historical site activities during full-scale site operations included aircraft manufacturing; TCE use as a solvent in these operations has been confirmed. Various petroleum-based fuels, oils, and lubricants were also used at the facility to operate and maintain ground vehicles, aircraft, and machinery. Aerial photographs from the mid-1950s show black stains along the sides of constructed acid and oil pits, and what appears to be a floating black substance on the water surface of one pit (Tetra Tech, 2013a). Therefore, site history and use provide a positive line of evidence (in conjunction with other lines of evidence) that DNAPLs may be at the site.

5.4.1.5 Vapor Concentrations

Groundwater flowing past residual or pooled DNAPL will result in dissolved-phase plumes of VOCs. Above the water table, DNAPLs may produce vapor plumes in the unsaturated soil zone. Vapor plumes can be measured using active or passive soil-gas sampling techniques. Passive soil-gas sampling and membrane-interface probes (MIPs) have been used at the DRA to guide the placement of soil borings, test pits, and monitoring wells. However, MIP results were not used for the DNAPL evaluation in this study because soil or groundwater samples were collected at these locations, and sampling results provide a more direct indication of DNAPL than do MIP readings.

5.4.2 Groundwater Methods

As discussed previously, using soil sampling results to evaluate for DNAPLs entails numerous difficulties and uncertainties. Therefore, groundwater methods typically offer better means of inferring DNAPL source areas. Groundwater samples generally represent water quality conditions over a larger area, as compared to a soil sample. A groundwater sample at a particular point integrates conditions near the sampling location and, to a lesser extent, groundwater conditions hydraulically upgradient of the sampling location along its flow path. Therefore, groundwater data can be used to "trace" detected constituents back along a groundwater flow path.

5.4.2.1 Magnitude of Groundwater Concentrations

Solvent concentrations in groundwater greater than 1% of the solvent's solubility typically indicate that the groundwater may have contacted DNAPL. The solubility of TCE in water can vary based on several factors. However, the effective solubility of TCE at 20°–25° Celsius is generally accepted to be 1,100 milligrams per liter (mg/L), if TCE is assumed to be the only product in the DNAPL. Therefore, the TCE concentration at 1% effective solubility ($C_{i(1\%)}$) is 11 mg/L or 11,000 µg/L. Thus, a groundwater TCE concentration exceeding 11 mg/L indicates that the groundwater may have come into contact with DNAPL.

Section 6 uses plots of TCE in groundwater to identify possible TCE source areas. A combined BTEX concentration is used to evaluate the locations of possible BTEX source areas. The chemical data used for these analyses are in Section 6 and Appendix I.

5.4.2.2 Other Groundwater Methods

Other methods of evaluating DNAPL in groundwater consider the factors listed below. If applicable, the methods mentioned here are noted and briefly discussed in the evaluation of individual source areas in Section 6:

- a persistent plume
- increasing groundwater concentrations with depth
- contamination in apparently anomalous locations
- evaluation of groundwater-concentration trends with time
- the use of partitioning inter-well tracer tests and MIPs

Section 6
Source Areas Characterization

As discussed in Section 2, the Dump Road Area (DRA) investigation area was initially identified in the 1989 preliminary assessment (PA) as possible acid pits and investigated in 1991 after the Maryland Aviation Administration (MAA) encountered four drums adjacent to Taxiway Tango during trenching to install an electrical cable (Maryland Department of the Environment [MDE], 1989). Preliminary investigations from 1992–1996 and follow-on work to date have identified soil- and groundwater-contaminant source areas through geophysical surveys, soil-gas surveys, trenches, test pits, membrane-interface probe (MIP) screening, soil borings, soil sample analyses, and groundwater sampling and analyses. These investigations identified a large area of soil fill and buried debris east of Taxiway Tango, extending to the base of the embankment at Frog Mortar Creek. Investigation of this fill area identified geophysical electromagnetic (EM) anomalies, areas containing buried debris, and soil containing volatile organic compounds (VOCs) and other contaminants such as polycyclic aromatic hydrocarbons (PAHs) and metals associated with past dumping and backfilling. Past dumping and backfilling practices have led to VOC contamination in DRA soil and pond sediment, and to the development of large contaminant plumes in groundwater in the upper, intermediate, and deep portions of the surficial aquifer east of Taxiway Tango extending to Frog Mortar Creek.

6.1 TCE SOURCE AREAS AND DNAPL ASSESSMENTS

Figures 6-1 through 6-3 are contour maps of trichloroethene (TCE) in soil, displayed by three soil-depth categories: surface soil (zero to two feet), shallow subsurface soil (between two to 15 feet below ground surface [bgs]), and deep subsurface soil (greater than 15 feet deep). The contours illustrated in Figure 6-1 include sediment samples collected from Ponds 1 and 2. Figures 6-4 through 6-6 are maps of TCE concentrations in groundwater and groundwater potentiometric surfaces (i.e., groundwater flow potential) for the upper, intermediate, and lower surficial-aquifer zones, respectively. In these figures, horizontal groundwater flow is assumed perpendicular to the blue groundwater-elevation contour lines. Vertical or downward/upward

groundwater flow can also occur, but is considered secondary to horizontal groundwater flow. These figures include chemical results from samples collected from 2000 (e.g., soil samples and one-time probe groundwater samples) through 2013.

At the DRA, groundwater in the surficial aquifer generally flows from southwest (airport runway area) to northeast toward Frog Mortar Creek. Within the DRA, local groundwater flow may deviate from the overall southwest–northeast trend due to variations in geologic materials, permeabilities, and recharge. Figure 6-7 shows the locations of hydrogeologic cross-sections developed for this study. Figure 6-8 is a hydrogeologic cross-section through the Taxiway Tango Median Anomaly Area (TT Median Area), the Petroleum Hydrocarbon Area (PHA), Pond 1, and the area east of Pond 1 to Frog Mortar Creek. Figure 6-9 is a hydrogeologic cross-section through the TT Median Area, Taxiway Tango Area East (TT East), and the southern portion of the area east of Pond 1 at wells DMW-2S/A/B. Figure 6-10 is a hydrogeologic cross-section through the Drum Area (DA) and a thick fill area near well cluster DMW-5S/I/D.

Figures 6-11 and 6-12 are northwest–southwest geologic cross-sections through the PHA, TT East, DA, the area east of Pond 1, and the former Pond 3 area, using the lithologic results from cone-penetration testing (CPT) and probe groundwater TCE concentrations. These two figures show concentrations of TCE and total cVOCs, because some locations have considerable cVOC concentrations but low concentrations of TCE. Figure 6-13 is along the line of new wells MW-46S/I/D to the north to MW-51S/I/D and DPT-29 to the south. Information shown on these figures will help target future possible source-area remedies in areas that can achieve the greatest remedial impact, thus reducing treatment duration and exceedances of surface-water quality criteria. These figures are referenced in the discussion that follows.

The following areas and environmental media are possible TCE source areas (Figures 6-1 through 6-10):

- PHA, Pond 1—surface sediment/subsurface soil, groundwater
- TT Median Area—subsurface soil, groundwater
- TT East, former open burning and pit (features #44 and #15)—subsurface soil, groundwater
- Drum Area (feature #51)—surface and subsurface soil, groundwater

- Taxiway Tango Area North (TT North), former ammunition bunkers (features #20 and #26)—subsurface soil, groundwater
- area east of Pond 1 and former Pond 7 (feature #42)—subsurface soil, groundwater
- former Pond 3 (feature #2)—groundwater, soil is unknown

6.1.1 Petroleum Hydrocarbon Area and Pond 1

Elevated TCE concentrations have been detected in Pond 1 shallow sediments (Figure 6-1) and in intermediate subsurface soil at the PHA. Sediment samples from Pond 1 contain the highest levels of TCE in sediment or soil at the DRA, with concentrations of 55,000 µg/kg in sample EP1-SD9 (2012 sample), 69,000 µg/kg in sample EP1-SD2 (2000 sample), and 270,000 µg/kg in EP1-SD5 (2005 sample). In 2013, concentrations of TCE detected in the central and southern portions of Pond 1 at EP1-SD17-1–2 (5,400 µg/kg) and EP1-SD18-1–2 (2,400 µg/kg) were lower.

The TCE concentration (270,000 µg/kg) in sample EP1-SD5 is approximately 50% of the saturated (i.e., wet sample) dense non-aqueous-phase liquid (DNAPL) saturation threshold concentration (C^T = 553,000 µg/kg) for TCE. Although this sample's TCE concentration does not exceed C^T, it is within the same order of magnitude (i.e., within a power of 10), which indicates that TCE DNAPL may have been in the Pond 1 sediment, either in unsampled areas of the pond or in deeper sediments below the depths at which samples EP1-SD5 and EP1-SD2 were collected. The 2012 TCE concentration (55,000 µg/kg) and presence of the TCE-degradation product *cis*-1,2-dichloroethene (*cis*-1,2-DCE) in sample EP1-SD9 may indicate that TCE has degraded, resulting in lower TCE concentrations in Pond 1 sediment as compared to the concentration detected in 2005 (270,000 µg/kg), or that areas with higher TCE concentrations were not sampled in 2012.

Lithologic logs for CPT-21, MW-43S, and MW-39S indicate thick subsurface clay downgradient of Pond 1 (Figure 6-8). Although groundwater-elevation contours suggest that water from Pond 1 may be infiltrating to the subsurface, organic matter in pond sediments and the thick layer of dense clay underlying the pond likely inhibit any significant movement of VOCs to groundwater. This is confirmed by TCE concentrations in samples from CPT-21 (maximum TCE detection of 1 microgram per liter (µg/L), with most samples registering as non-detect), MW-43S (TCE not detected), and MW-39S (TCE at 5 µg/L) (see Figures 6-4, 6-5, and 6-8).

The PHA is northwest of and adjacent to Pond 1. TCE in surface soil has only been detected in this area at low concentrations, or not at all (Figure 6-1). Therefore, surface soil at the PHA does not appear to represent a TCE source. However, TCE has been detected at elevated concentrations in shallow subsurface soil (Figure 6-2) at depths of four feet (2,000 µg/kg at PHA-SB4-4 and 420 µg/kg at PHA-SB1-4), nine feet (4,000 µg/kg at PHA-SB3-9 and 1,800 µg/kg at MW42-0910), and 12 feet (2,000 µg/kg at PHA-SB2-12). As shown in Figure 6-3, TCE was not detected in deep subsurface soil samples at borings DR-SB-7 (16 and 20 feet), DR-SB-17 (19-feet), DR-SB-10 (24 feet), or MW-42-3435 (34–35 feet).

Figures 6-4, 6-8, and 6-11 show groundwater TCE concentrations of 120 µg/L (well DMW-9S) and 1,900 µg/L (CPT-16) in the upper surficial-aquifer. As shown in Figures 6-5 and 6-6, wells DMW-9I and DMW-9D have TCE concentrations of 1,000 µg/L and 2,600 µg/L, respectively; TCE concentrations at CPT-16, CPT-17, and CPT-19 are all less than 3,000 µg/L. These concentrations do not exceed the groundwater TCE-DNAPL threshold ($C_{i(1\%)}$) of 11,000 µg/L, and do not indicate TCE DNAPL in the surficial aquifer in the PHA area. However, high concentrations of *cis*-1,2-DCE and vinyl chloride (VC) at these locations suggest a possible upgradient (i.e., southwest) source of TCE DNAPL.

As illustrated in Figures 6-3, 6-4, and 6-8, TCE concentrations at CPT-03 (53,000 µg/L at 20 feet), well DMW-11S (16,000 µg/L at approximately 15 feet), and DPT-34 (16,000 µg/L at 40 feet) indicate the possible presence of TCE DNAPL in the upper and intermediate surficial-aquifer. The highest TCE concentrations at these three locations appear to be contained within fine-grained silts and clays of the upper surficial-aquifer (Figure 6-8). Groundwater contours in Figures 6-4 through 6-6 indicate that CPT-16 and DMW-9S/I/D are hydraulically downgradient of DPT-34, and are likely receiving dissolved-phase TCE from the TT Median area, rather than subsurface soil TCE at the PHA. The dissolved-phase TCE appears to be moving within the more permeable sands west and north of Pond 1, and around the low permeability clay found near Pond 1. As shown in Figures 6-6 and 6-8, concentrations of TCE at DMW-9D, MW-20D, MW-26D, MW-18D, DMW-3D, and DMW-2B do not indicate DNAPL in the lower surficial-aquifer at the PHA, Pond 1 area, and area east of Pond 1.

6.1.2 Taxiway Tango Median Anomaly Area

The TT Median Area is an open grass area that runs parallel to and between the airport runway on the west and Taxiway Tango to the east. It also includes areas underneath the taxiway and runway, and areas west of the runway (Figure 6-1). As shown in Figure 6-1, TCE was either not detected (e.g., samples DR-SB-32-02, DR-SB-34-02, TT-EX3-T15D-2) or was detected at low concentrations in surface soil (e.g., DR-SB-3-SS) in this area. Therefore, surface soil at the TT Median Area does not appear to represent a TCE source. However, TCE was detected at elevated concentrations in shallow subsurface soil (Figure 6-2) at depths of 10 feet (7,680 µg/kg at MIP-58-SS-10), six feet (1,300 µg/kg at DR-A-52-06, and 1,200 µg/kg at DR-A23), five feet (6,200 µg/kg at DR-A-62-05, and 1,300 µg/kg at DR-A-53-05), and four feet (1,300 µg/kg at DR-A-54-04, and 550 µg/kg at TT-EX2-T11A-4). As shown in Figure 6-3, TCE concentrations are also moderately high in two deep subsurface soil samples collected from 18 feet (4,240 µg/kg at MIP-58-SS-18) and 20 feet (315 µg/kg at MIP-61-SS-20). Concentrations in these samples indicate only residual (i.e., sorbed) TCE contamination in soil, and do not indicate DNAPL (i.e., TCE free product).

As shown in Figures 6-4, 6-5, and 6-8, groundwater TCE concentrations at well DMW-11S, CPT-03, (in the upper surficial-aquifer in the TT Median Area), and DPT-34 (intermediate surficial-aquifer) are 16,000, 53,000, and 16,000 µg/L, respectively. These TCE concentrations exceed the TCE $C_{i(1\%)}$ (11,000 µg/L) and indicate that TCE DNAPL is likely present. Results for CPT-01, CPT-02, CPT-04, CPT-05, MIP-58 (at a 9–11 foot depth), and MIP-61 (at a 13–15 foot depth) indicate that the possible DNAPL area is limited laterally to the north, south, and west. DNAPL is not indicated in the lower surficial-aquifer zone (Figures 6-6, and 6-8) in this area.

As shown in Figures 6-4 through 6-8, surrounding wells MW-38S, MW-37S, MW-25S/I, MW-26S/I/D, DMW-10S/I, MW-3, MW-22I/D, DMW-1S, and MW-21I/D have TCE concentrations well below the threshold level (11,000 µg/L). These results indicate that DNAPL is likely restricted to the upper clay-rich portion of the surficial aquifer near CPT-03 and well DMW-11S, and the clay-rich soils of the intermediate surficial-aquifer near DPT-34.

More than 20 feet of clay beneath well DMW-11S (Figure 6-8) probably limits TCE detected in groundwater at this location to the immediate vicinity of this well. Permeability tests (i.e., slug tests) on wells DMW-11S and DMW-11I show low hydraulic conductivities, ranging from

0.50 feet per day (ft/day) at DMW-11S to 0.90 ft/day at DMW-11I. Although the wells were screened in silty-clay and sand, test results primarily reflect the response of the sand layers. Therefore, the silty-clay underlying DMW-11S is expected to have a substantially lower permeability than is indicated by these wells.

6.1.3 Taxiway Tango Area East—Open Burning Area and Former Pit—Features #44 and #15

Southeast of DMW-11S, TCE concentrations in groundwater (Figures 6-4, 6-5, 6-9, and 6-11) exceed the DNAPL threshold (11,000 µg/L) at PA-7 (220,000 µg/L at 15 feet), MW-45S (52,000 µg/L at 15–25 feet), CPT-08 (40,000 µg/L at 30 feet), and MIP-30 (13,000 µg/L at 31-33 feet). TCE concentrations at CPT-08 (9,700 µg/L at 35 feet) and MIP-26 (8,000 µg/L at 44-46 feet) are slightly less than the TCE-DNAPL threshold. Samples with high TCE concentrations at CPT-08 (35 feet), MIP-30 (31–33 feet deep), MIP-26 (44–46 feet deep), and DMW-1A (45–55 feet) are from the intermediate surficial-aquifer zone. Results for CPT-07, CPT-09, CPT-10, and DPT-35 and surrounding wells DMW-1B (screened below DMW-1A), MW-23S/I/D, DMW-1S, MW-21I/D, DMW-8S/I/D, MW-2, and MW-19I/D indicate that the TCE DNAPL area is localized near MW-45S/CPT-08, PA-7, and MIP-30. TCE concentrations in the lower surficial-aquifer zone (Figures 6-6 and 6-9) do not indicate the likely presence of DNAPL.

6.1.4 Drum Area and Feature #51

The DA is in the southern portion of the DRA, east of Taxiway Tango (Figure 6-1). A group of deteriorated drums was discovered at this location in 1996 during preliminary environmental investigations at the DRA (Maryland Environmental Service, 1996). Trenches were subsequently excavated and soil samples were collected for chemical analyses. The drums were discovered at the surface, so any possible soil contamination is likely to have occurred through leaking, spilling, or direct disposal to the ground. East of the DA between wells DMW-7S/I/D and DMW-5S/I/D is a large, northwest–southeast trending fill area where up to 11 feet of fill and debris were encountered in test pit excavations. Materials found there include 55-gallon drums, metal scraps, glass, burned materials, plastic, wood, and vehicle parts.

As shown in Figure 6-1, elevated TCE concentrations in DA surface soil samples range from 1,900 to 7,000 µg/kg. The higher concentrations of TCE follow a northwest–southeast linear path running along sampling locations DA-NC-4-1 (6,500 µg/kg), DA-T2-1-2 (7,000 µg/kg),

DA-T2-2-2 (7,000 µg/kg), DA-T2-3-2 (5,100 µg/kg), and DA-T4-3-2 (5,900 µg/kg). These concentrations are nearly two orders of magnitude (i.e., 100 times) less than the soil-TCE C^T concentration (553,000 µg/kg) and therefore do not indicate DNAPL, but instead indicate TCE sorbed to soil. However, these elevated concentrations may be a continuing source of TCE contamination in soil and groundwater in the DA. The extent of the TCE contamination in surface soil here has not yet been fully delineated, particularly in areas northwest, north, east, and southeast of the sampled area.

Shallow subsurface soil samples (between two and 15 feet deep) show sorbed TCE at depth, but at concentrations lower than surface soil samples (Figure 6-2). Higher TCE concentrations in the shallow subsurface soil in the DA range from 1,500 µg/kg (test pit DR-A39) to a maximum of 68,000 µg/kg at well MW-40S/I (4–6 foot depth). Although this area has fewer shallow subsurface-soil sampling locations than surface-soil sampling locations, sampling results indicate that TCE distribution in both soil zones is the same. TCE (865 µg/kg) has been detected in soil 35 feet deep south of wells DMW-7S/I/D at MIP-55 (Figure 6-3). However, TCE concentrations are 220 µg/kg or less in deep subsurface soil north and southwest of wells DMW-7S/I/D. Except for two samples collected from well boring MW-40S/I in 2012 (samples collected at 22–24 feet and at 30–32 feet depths), deep subsurface soil samples (depths greater than 15 feet) have not been collected below the DA trench samples.

Figures 6-4, 6-10, and 6-12 show groundwater TCE concentrations exceeding the TCE $C_{i(1\%)}$ (11,000 µg/L) in the upper surficial-aquifer at CPT-13 (17,000 µg/L), DPT-41 (28,000 µg/L), DA-1 (12,000 µg/L), and at DA-3 through DA-7 (ranging from 33,000 µg/L to 130,000 µg/L). The maximum TCE concentration in these groundwater samples is DA-7 (130,000 µg/L), collected from 26 feet below grade east of the DA trenches and excavation. As shown in Figure 6-5, TCE was also detected in groundwater at concentrations greater than DNAPL threshold concentration at DA-8 (70,000 µg/L) and MIP-28 (68,600 µg/L). DA-1 through DA-14 were collected at depths ranging from 15 feet (DA-2) to 28 feet bgs (DA-5, DA-8, DA-10, DA-11, and DA-14). MIP-28 was collected from 34 to 36 feet below grade. Lower TCE concentrations (below $C_{i(1\%)}$) were detected at DMW-7S (4,700 µg/L) screened 19–29 feet bgs, and at DA-9 (7,300 µg/L), screened at 44–54 feet below grade.

TCE concentrations recorded before 2005 at DMW-7S and before 2004 at MW-5 consistently exceeded 11,000 µg/L. These results support the possible presence of DNAPL in groundwater at the DA. Sampling results indicate that DNAPL in the upper surficial-aquifer may extend from the trench area west of sampling location DA-1 to the area between DA-6 and DA-9, several hundred feet northeast of DA-1.

As shown in Figures 6-4 through 6-6, surrounding wells MW-2, MW-19S/I, DMW-8S/I/D, DMW-5I/D, DMW-6S/I/D, and MW-32S/I exhibit TCE concentrations well below the TCE-DNAPL threshold-concentration (11,000 µg/L). Groundwater results indicate that DNAPL may be extensive in the upper surficial-aquifer, but it is likely restricted to the upper portion of the surficial aquifer in this area. TCE concentrations in the DA are shown in cross-section in Figures 6-10 and 6-12. The cross-sections show residual concentrations of TCE in unsaturated-zone soil at the DA, south of well DMW-7S. However, TCE groundwater concentrations in areas southwest and northeast of well DMW-7S indicate possible DNAPL.

TCE concentrations of 2,300 µg/L (DA-12), 8,780 µg/L (MIP-41, at 24 to 26 feet), and 7,500 µg/L (DMW-5S) do not support the presence of DNAPL (Figure 6-4). Wells DMW-7S and DMW-5S appear hydraulically connected via a three- to six-foot-thick sand layer at the base of both wells (Figure 6-10). This sand layer is underlain by 2.5 to nine feet of clay that is expected to attenuate downward TCE movement into the intermediate and lower surficial-aquifer zones. Substantially lower concentrations of TCE in groundwater at DMW-7I/D, CPT-13, DPT-41, DMW-5I/D, and MIP-41 (39–41 foot depth) appear to confirm this (see Figures 6-5, 6-6, and 6-10).

6.1.5 Taxiway Tango Area North—Former Ammunition Bunkers—Features #20 and #26

Soil samples were collected in the northwestern area of the DRA (e.g., DR-SB-26, DR-SB-27, DR-SB-28, DR-A-49, DR-A-66, DR-SB-187, etc.) during recent investigations (Figures 6-1 through 6-3). These samples were collected because TCE was detected in soil-gas samples collected in 2010 and in newly installed wells (MW-33S and MW-34S/I) in this area. A recent aerial photograph review indicates that two former ammunition bunkers were in TT North in the 1950s. The two former bunkers were in areas shown in Figures 6-1 through 6-3 as features #26 and #20; the exact locations of the former bunkers are uncertain. Soil boring DR-SB-6 was advanced near feature #26, and soil boring DR-SB-5 and test pit DR-A-49 are near feature #20.

Well MW-36S is hydraulically upgradient of feature #20, whereas wells MW-33S/I are probably almost directly downgradient of feature #20. Well MW-33S had a concentration of TCE in groundwater of 110 µg/L in 2012. Wells MW-34S/I and MW-35S are considered cross-gradient of feature #26.

TCE was detected in this area in only one surface soil sample (DR-SB-29-02), at a trace concentration of 12 µg/kg (see Figure 6-1). As shown in Figure 6-2, TCE was detected at a concentration of 11,000 µg/kg in soil at a depth of 10 feet in sample DR-SB-27-10 (see northwestern contours in Figure 6-2), at 1,100 µg/kg at 14 feet deep in sample DR-SB31-14, and 3,300 µg/kg at 18–20 feet deep in sample DR-SB187-18–20. TCE was not detected or was detected at low concentrations in surrounding soil samples collected at this depth (e.g., DR-SB-6-11, DR-SB-29-10, DR-SB-30-08, DR-SB-26, and DR-SB-28-10).

Considering the general configuration of these former features, soil borings DR-SB-27 and DR-SB-31/DR-SB-187 are similarly arranged. The TCE concentrations detected in soil samples at these boring locations (11,000 µg/kg at DR-SB-27, 1,100 µg/kg at DR-SB-31, and 3,300 µg/kg at DR-SB-187) may well represent the actual previous locations impacted by past operations at these former features. Figures 6-4 through 6-6 show low concentrations of TCE in groundwater at CPT-18, DPT-31, and surrounding wells MW-33S/I, MW-35S, and MW-36S. However, higher TCE concentrations were detected in groundwater east of Taxiway Tango at DPT-33 (9,900 µg/L) and DPT-30 (1,000 µg/L). The concentration of 9,900 µg/L in the intermediate aquifer zone at DPT-33 indicates this area or nearby areas as a TCE source and location for possible TCE DNAPL.

6.1.6 Area East of Pond 1 and Former Pond 7 (Feature #42)

Feature #42 was interpreted in the 2012 aerial photograph study as a pond or pit near Frog Mortar Creek (Tetra Tech, 2013a); it is currently a wetland area. This pond was observed in a 1957 aerial photograph; before 1957, feature #42 appears in photographs as the lowest point in the larger fill area of (former) Limehouse Cove, so water in this area may have ponded near the earthen berm. Photographs do not indicate dumping here, but chemical dumping and backfilling with debris have historically occurred in the DRA; therefore, dumping of chemicals in this area cannot be ruled out. Furthermore, because this area was the lowest point near (former)

Limehouse Cove in the 1950s, liquids released to the larger fill area that did not infiltrate locally into the ground may have accumulated there.

Analytical results for surface and shallow-subsurface soil samples and sediment samples collected east of Pond 1 near former Pond 7 and the current wetland do not indicate a soil-based source of TCE east of Pond 1 (Figures 6-1 and 6-2). TCE (2,500 µg/kg) detected in deep subsurface soil (20 feet deep) at MIP-51, approximately 200 feet east of Pond 1, was well below the DNAPL threshold. TCE (3.7 µg/kg) in a sample collected at a 40-foot depth is substantially lower. These two samples were collected in the saturated zone, and likely represent concentrations in groundwater rather than TCE sorbed to soil.

Farther east and hydraulically downgradient of well DMW-9S and Pond 1 (Figure 6-5), several intermediate surficial-aquifer wells have TCE concentrations at or near $C_{i(1\%)}$ (11,000 µg/L), possibly indicating DNAPL in these areas: MW-18I and DMW-2A (both at 11,000 µg/L) and DMW-3I (10,000 µg/L). Groundwater data collected in 2013 (Figures 6-4, 6-5, and 6-13) indicate that elevated TCE concentrations extend farther east to DPT-24 (17,000 µg/L), DPT-25 (25,000 µg/L), and DPT-26 (26,000 µg/L). These results (Figure 6-13) indicate a wider TCE source area in the intermediate surficial-aquifer at DPT-25 and upgradient of DPT-25.

Groundwater elevation contours in Figures 6-4 and 6-5 show that wells MW-18S/I, DMW-3S/I, and DMW-2S/A are hydraulically downgradient of the PHA, well DMW-9S, and Pond 1. TCE results at CPT-21, well MW-43S, and well MW39S, directly downgradient of Pond 1 (Figures 6-4, 6-5, and 6-12), indicate only trace to low VOC concentrations in groundwater. Farther east, at MIP-51, groundwater samples collected at depths of 19–21 feet (upper surficial-aquifer) and 39–41 feet (intermediate surficial-aquifer) had TCE concentrations of 305 µg/L and 1,485 µg/L, respectively. TCE concentrations in these samples do not support the presence of DNAPL in the upper surficial-aquifer between Pond 1 and DMW-3S/I/D and DMW-2A. TCE detected in wells MW-18S/I, DMW-3S/I, and DMW-2S/A appears to be from a source other than Pond 1 or the area east of Pond 1.

6.1.7 Former Pond 3—Feature #2

CPT-22 was advanced in 2012 and DPT-43 and DPT-43B were advanced in 2013 in an area southeast of Pond 1 that had been indicated as a third pit or pond in historical aerial photographs

and topographic maps (Tetra Tech, 2013a). Interviews conducted during the 1989 preliminary assessment indicated that a third pit had been used to dump wastes; however, the third pit was not found during the preliminary assessment site visits (MDE, 1989). TCE (11,000 µg/L) in groundwater at well DMW-2A, hydraulically downgradient of the former Pond 3 area (see Figures 6-5, 6-9, and 6-12), indicates the possible presence of TCE DNAPL. A groundwater sample collected from the intermediate surficial-aquifer at MIP-26 (near former Pond 3) had a TCE groundwater concentration of 8,000 µg/L, a concentration slightly below the TCE-DNAPL threshold (11,000 µg/L), also indicating possible TCE DNAPL in this area.

As shown in Figures 6-1 through 6-3, soil samples have been collected around, but not in, former Pond 3 (feature #2). The lithologic log for CPT-22 (Figure 6-12) indicates mostly clay from 10 to 20 feet below grade. Below 20 feet, sand and silt mixtures are common. Thinner clay layers occur at approximate depths of 22 feet and 30–32 feet bgs. cVOCs were detected in most groundwater samples collected between 20 and 40 feet deep at CPT-22 (40 feet was the deepest sample collected due to probe refusal, and concentrations increased with depth (Figure 6-12). The maximum TCE concentration (140 µg/L) at CPT-22 was detected in the intermediate surficial-aquifer at 40 feet. Lithology could not be logged and groundwater samples could not be collected below 38 feet at CPT-22 due to probe refusal. However, materials logged at the bottom of the boring, near the depth of the maximum TCE concentration (140 µg/L), are silt mixtures, stiff sand to clayey sand, and very stiff fine-grained material (Figure 6-12).

Additional DPT groundwater samples at DPT-43 and DPT-43B were collected in 2013 near former Pond #3. TCE was detected at concentrations of 490,000 µg/L and 22,000 µg/L at DPT-43 (depth of 35 feet) and at DPT-43 (depth of 20 feet), respectively (Figures 6-4, 6-5, and 6-9). Groundwater sampling results from these two locations had TCE concentrations above the groundwater threshold (11,000 µg/L) in both the upper (DPT-43B) and intermediate (DPT-43) portions of the surficial aquifer.

6.2 BTEX SOURCE AREA EVALUATION

Figures 6-14 through 6-16 are contour maps of benzene, toluene, ethylbenzene, and xylenes (BTEX) in soil for the three soil-depth categories of surface soil (zero to two feet bgs), shallow subsurface soil (between two and 15 feet bgs), and deep subsurface soil (greater than 15 feet bgs), respectively. Figure 6-14 also includes BTEX results for the shallow sediment samples

collected from Ponds 1 and 2. Figures 6-17 through 6-19 are contour maps of BTEX groundwater concentrations and groundwater potentiometric surfaces (i.e., groundwater flow potential) for the upper, intermediate, and lower surficial-aquifer zones, respectively. These figures include chemical results from samples collected in 2000 (e.g., soil samples and one-time probe groundwater samples) through 2013. In these figures, horizontal groundwater flow is assumed perpendicular to the blue groundwater-elevation contour lines.

Figure 6-20 is a hydrogeologic cross-section through the TT Median Area, the PHA, Pond 1, and the area east of Pond 1. Figure 6-21 is a hydrogeologic cross-section through the TT Median Area, TT East, and the southern portion of the area east of Pond 1 at wells DMW-2S/A/B. Figure 6-22 is a hydrogeologic cross-section through the DA and a thick fill area near well cluster DMW-5S/I/D. Figure 6-23 is a hydrogeologic cross-section along the line of new wells (MW-46S/I/D to MW-51S/I/D) and DPT-29. These figures are referenced in the following discussion.

Figures 6-13 through 6-22 show the following areas and environmental media as possible BTEX sources:

- *PHA, Pond 1*—surface sediment/subsurface soil, groundwater
- *TT Median Area*—subsurface soil, groundwater
- *TT East—former open burning and pit (features #44 and #15)*—subsurface soil, groundwater
- *Drum Area (feature #51)*—groundwater
- *DMW-4 former debris pile area (feature #50)*—soil; groundwater is unknown

6.2.1 Petroleum Hydrocarbon Area and Pond 1

Highly elevated BTEX concentrations have been detected in Pond 1 shallow sediments (Figure 6-14) and in intermediate subsurface soil (Figure 6-15). Sediment samples from Pond 1 contain the second highest levels of BTEX detected in sediment or soil at the DRA, with BTEX concentrations ranging from 1,942 µg/kg at EP1-SD4 (2005) to 567,000 µg/kg at EP1-SD9 (2012). As shown in Figure 6-13, the highest BTEX concentrations are in sediment samples collected in the center and at the southern end of the pond. High concentrations of BTEX were also found in deeper 1–2 foot samples. Benzene (16–230 µg/kg) was detected in six samples in

2012; however, high levels of benzene isomers, such as 1,2,4-trimethylbenzene (up to 31,000 µg/kg), chlorobenzene (up to 11,000 µg/kg), and 1,2,3-trimethylbenzene (up to 11,000 µg/kg), were also detected.

The PHA is northwest and adjacent to Pond 1. BTEX were either not detected or were detected at low concentrations in PHA surface soil (Figure 6-14). Therefore, surface soil at the PHA does not appear to represent a BTEX source. However, BTEX was detected at elevated concentrations in numerous shallow subsurface soil samples (Figure 6-15) at depths of four feet (200,380 µg/kg at PHA-SB4-4) to 12 feet (100,200 µg/kg at DR-SB-2).

The highest reported concentration of BTEX in soil at the PHA (2,138,900 µg/kg) was detected in a sample collected from test pit DR-A33 (six-feet deep). Soil boring PHA-SB-1 (Figure 6-15) was advanced adjacent to the 1996 soil boring B-15, where free product had been observed at four to seven feet, and a field VOC reading of 9,300 parts per million had been recorded for soil at six feet below grade. BTEX (1,470 µg/kg) were detected adjacent to boring B-15 in sample PHA-SB-1–4 (Figure 6-14), collected at a depth of four feet bgs. Many elevated BTEX concentrations are near the water table, including the sample from DR-A33. As shown in Figure 6-16, BTEX were detected at low concentrations (2.97-20.47 µg/kg) in deep subsurface soil samples at borings DR-SB-7 (16 and 20 feet), boring DR-SB-17 (19 feet), boring DR-SB-10 (24 feet), and boring MIP-25 (40 feet).

The highest BTEX concentrations in groundwater at the PHA are generally in the upper surficial-aquifer samples (e.g., at well MW-42S, the BTEX concentration is 16,699 µg/L [Figure 6-17]). Southwest of DMW-9S, BTEX were detected at concentrations at PA-1 (43,520 µg/L at 12 feet; primarily xylenes at 35,000 µg/L and toluene at 6,800 µg/L), at CPT-16 (6,340 µg/L at 30 feet bgs), at TT-3 (1,300 µg/L at 14.5 feet bgs; toluene only); and at SB-13 (8 µg/L at 28 feet bgs; benzene only). A moderately low BTEX concentration (75.8 µg/L) was detected southeast of DMW-9S and west of Pond 1 at MIP-25 (14–16 feet). BTEX were not detected southeast of the PHA at PA-3 (28 feet) or north of the PHA at well MW-4 (screened from three to 30 feet, with groundwater typically at seven to eight feet). However, BTEX were detected at CPT-03 (32,260 µg/L at 20 feet) and at DPT-34 (37,670 µg/L at 15 feet) on the western and eastern sides of Taxiway Tango (respectively), and appear to be co-mingling with BTEX detected closer to the PHA.

As shown in Figures 6-18 and 6-20, the highest groundwater BTEX concentration (62,300 µg/L) was detected at a depth of 45 feet at CPT-16, and at relatively high concentrations in samples collected from 20–55 feet in the same location (Figure 6-20). As shown in Figures 6-18 and 6-19, the intermediate and deep wells DMW-9I, MW-42I, and DMW-9D, and the intermediate samples at CPT-17 and CPT-19 at the PHA, have BTEX concentrations ranging from 4 µg/L (CPT-17) to 169 µg/L (CPT-19), indicating that high concentrations of BTEX are typically not found at depth near the apparent PHA source area. However, the high BTEX concentrations found at depth in CPT-16 appear to contradict this trend.

In surrounding wells (MW-4, MW-26S/I/D, DMW-10S/I, and DMW-20S/I/D) and CPT samples, BTEX were either not detected or were detected at low concentrations (range of 4.38-66.8 µg/L). Farther east and hydraulically downgradient of well DMW-9S and Pond 1, upper surficial-aquifer groundwater samples PA-12, PA-13, CPT-20, and CPT-21, and wells MW-39S, DMW-3S, and DMW-2S (Figure 6-14) all have lower BTEX concentrations (range is 2-44 µg/L). As shown on Figures 6-18 and 6-19, BTEX were not detected in other downgradient wells (DMW-3I/D, MW-18S/I/D, DMW-2A and DMW-2B).

The PHA and Pond 1 BTEX sediment concentrations in cross-section (Figure 6-20) show high concentrations detected in the unsaturated and saturated zones. As described above, the highest BTEX concentrations in groundwater (62,300 and 43,520 µg/L) were found at CPT-16 and PA-1, southwest of well DMW-9S. High BTEX concentrations were not found in the deeper wells (DMW-9I and DMW-9D) of that well cluster, or at any of the surrounding well locations.

6.2.2 Taxiway Tango Median Anomaly Area

As mentioned previously, the TT Median Area is the open grass area that runs parallel to and between the airport runway on the west and Taxiway Tango to the east. It also includes areas underneath the taxiway and runway, and areas west of the runway. As shown in Figure 6-14, BTEX were not detected or were detected at low concentrations in surface soil in this area. Although sampling coverage is sparse, surface soil at the TT Median Area does not appear to represent a BTEX source.

BTEX was detected at elevated concentrations in shallow subsurface soil at the TT Median Area at depths up to 10 feet at TT-EX11 and TT-EX2 (see Figure 6-14). The highest detected BTEX

concentration (2,348,720 µg/kg) is in sample TT-EX2-T1-5 (Excavation 2), collected from a depth of five feet. Few deeper subsurface soil samples (greater than 15 feet bgs) were collected in the TT Median Area (Figure 6-15), but moderate BTEX concentrations were detected in the few collected: 6,997 µg/kg at MIP-58 (18 feet), and 931 µg/kg at MW41 (24-26 feet). MIP-58 is between TT-EX2 (Excavation 2) and TT-EX3 (Excavation 3).

As shown in Figures 6-17 to 6-20, BTEX in the TT Median Area have substantially affected shallow groundwater in the upper surficial-aquifer at CPT-03 (32,260 µg/L), MIP-58 (5,224 µg/L, at 9–11 feet), TT-1 (762 µg/L), well DMW-11S (550 µg/L), and MIP-61 (317 µg/L, at 13–15 feet). Toluene is the predominant BTEX component detected in MIP-58 and MIP-61, and is the only BTEX component detected at DMW-11S. Low concentrations of BTEX were also detected at MW-23S and DMW-1S, southeast of DMW-11S and MW-26S. BTEX at CPT-03 appear to co-mingle with BTEX downgradient and to the northeast at probe sample TT-3 and near CPT-16/MW-42S/I.

6.2.3 Taxiway Tango Area East—Former Open Burning Area and Pit—Features #44 and #15

Southeast of DMW-11S, soil samples were collected near wells DMW-1A and DMW-1B in an area now designated TT East. Historically, BTEX have been detected in groundwater wells DMW-1A/B, east of Taxiway Tango; however, the BTEX source was unknown. Recent historical research indicates that open burning was done near DMW-1A/1B in 1952, and that in 1955 a pit was northeast of DMW-1A/1B (Tetra Tech, 2013a).

Samples DR-SB-12-5 and DR-SB-12-9 (collected near well DMW-1A/B) indicate BTEX in shallow subsurface soil at depths of five to nine feet. A sample collected from eight feet deep at test pit A27 (excavated near DR-SB-12) had a BTEX concentration of 506,700 µg/kg, corroborating the results of samples DR-SB-12-5 and DR-SB-12-9. Northeast of test pit A27, BTEX were detected at high concentrations in the soil boring for well MW-41S/I. BTEX were also detected in soil samples at concentrations greater than 1,000 µg/kg in test pit soil samples from DR-A-60 and DR-A-61 near Taxiway Tango.

Soil sampling results confirm that petroleum hydrocarbons are in the TT East area, and are likely responsible for BTEX in groundwater detected in temporary-well samples PA-7 and TT-5 (which had a chlorobenzene concentration of 50,000 µg/L), and in groundwater samples from CPT-08,

MIP-30, MIP-26, MW-45S, MW-41S/I, DMW-1A, and DMW-1B (Figures 6-17 through 6-19 and 6-21). Although deep subsurface soil samples have not been collected near well DMW1A/1B, soil samples DR-MW-41-2426 and MIP-30-SS-20, collected at depths of 24–26 and 20 feet, respectively, indicate residual levels of BTEX (931 µg/kg and 84.6 µg/kg, respectively) in deep subsurface soil.

6.2.4 Drum Area and Feature #51

BTEX were not detected in most DA soil samples, and detected BTEX concentrations in surface, shallow subsurface, and deep subsurface soil in the DA (Figures 6-14 through 6-17 and 6-22) do not indicate a significant soil-based BTEX source. The maximum BTEX concentration (110 µg/kg) detected in the DA was in a soil sample (DR-SB-14 at 15 feet) adjacent to wells DMW-7S/I/D (Figure 6-15). As shown in Figure 6-17, BTEX were detected at moderate to high concentrations in the upper surficial-aquifer at DA-6 (26,200 µg/L), MIP-28 (4,632 µg/L), DA-7 (1,820 µg/L), DA-5 (1,700 µg/L), DPT-41 (1,700 µg/L), and DA-8 (580 µg/L). These samples were collected in 2001-2002 (DA samples), 2007–2008 (MIP sample), and 2013 (DPT-41). Samples collected from multiple depths at CPT-11 through CPT-15, DPT-40, DPT-42, and at wells DMW-7S and MW-40S (area of DA-7) indicate substantially lower BTEX concentrations in the upper surficial-aquifer, ranging from 63 µg/L (at DMW-7S) to 250 µg/L (at CPT-13 at 25 feet bgs).

Except for the BTEX concentration (27 µg/L) at MW-40I, only trace concentrations were detected in intermediate and lower surficial-aquifers wells (1.2 µg/L at DMW-7I [Figure 6-18], and not detected at DMW7D [Figure 6-19]). BTEX were not detected in the DA trench area (DA-1, DA-2, and DA-3), or south of the DA (MIP-55 and MIP-36). However, the analytical detection limits for DA-1 and DA-3 were elevated; therefore, moderate concentrations of 500-2,500 µg/L (the range of sampling detection limits) for each BTEX component would not have been detected in these two samples.

As shown in Figure 6-22, wells DMW-7S and DMW-5S appear hydraulically connected via a three-to six-feet-thick sand layer at the base of both wells. BTEX were detected hydraulically downgradient of the DA in upper surficial-aquifer samples DA-9 (590 µg/L), DA-12 (2,200 µg/L), and MIP-41 (10.4 µg/L at 24–26 feet). However, BTEX were not detected downgradient in upper surficial-aquifer wells DMW-5S and MW-50S (although trace

concentrations [below 1 µg/L] were detected at DPT-28). The upper surficial-aquifer sand layers at wells DMW-7S, DMW-5S, and MW-50S are underlain by 2.5–9 feet of clay, which are expected to attenuate the downward movement of BTEX to the intermediate and lower surficial-aquifer zones. This is confirmed by low BTEX concentrations at DMW-5I/D and MW-50I/D, and the substantially lower BTEX concentrations (less than 1 µg/L) at DMW-7I/D and MIP-41.

6.2.5 DMW-4 Former Debris Pile Area—Feature #50

Feature #50 is an area of former fill or debris piles visible in a 1956 oblique aerial photograph used in the 2012 historical aerial photograph study (Tetra Tech, 2013a). The piles appear to be adjacent to dump-truck-sized mounds. The piles covered a large area and were possibly later used during grading and construction of Taxiway Tango. This former feature is in the area of present-day monitoring wells DMW-4S/I/D.

Test pits advanced west of this area in 2012 (DR-A-67 through DR-A-75) and previous soil boring samples (DR-SB-22) indicated elevated BTEX and chlorobenzene concentrations in soil in this area (Figures 6-14 through 6-17). Chlorobenzene (830,000 µg/kg) was detected in a soil sample collected at a depth of seven feet in test pit DR-A-74, located east of the DRA unpaved roadway. BTEX were also detected in the seven-foot sample (129,000 µg/kg), and at 10 feet (37,700 µg/kg) at DR-A-74.

BTEX (182,250 µg/kg) were also detected at a depth greater than 15 feet at test pit DR-A-68, located east of DR-A-74 and approximately 100 feet from wells DMW-4S/I/D. BTEX were detected at low concentrations or were not detected in wells DMW-4S/I/D, MW-49S/I/D, and DPT-27, which appear to be hydraulically downgradient of these test pits (Figures 6-17 through 6-19). Historically, BTEX have not been detected in wells DMW-4S/I/D. Probe groundwater sampling has not been conducted upgradient of these wells.

6.2.6 Former Pond 3—Feature #2

In 2012–2013, CPT-22, DPT-43, and DPT-43B were advanced southeast of Pond 1in an area suspected to be a third pit or pond in historical aerial photographs and topographic maps. Interviews conducted as part of the 1989 preliminary assessment (MDE, 1989) indicate that a third pit was used to dump wastes; however, the third pit was not found during the preliminary assessment site visits. As shown in Figures 6-14 through 6-17, soil samples have been collected

around, but not in, the former Pond 3 area (feature #2). The lithologic log for CPT-22 indicates mostly clay from 10 to 20 feet below grade. Below 20 feet, sand and silt mixtures are common. Thinner clay layers occur at approximate depths of 22 feet and 30–32 feet.

BTEX were not detected in CPT-22 groundwater samples collected in the upper and intermediate surficial-aquifer zones from 20–40 feet (40 feet was the deepest sample collected due to probe refusal). BTEX were also not detected in nearby upper surficial-aquifer well DMW-8S and probe locations PA-8 and PA-13 (Figure 6-17). BTEX were detected only at trace to low concentrations in samples PA-6 (3 µg/L), MIP-26 (1.6 and 216 µg/L), MW-39S (3.15 µg/L), and CPT-21 (2 µg/L).

Additional DPT groundwater samples collected in 2013 at DPT-43 and DPT-43B were near former Pond #3 (Figures 6-17, 6-18, and 6-21). BTEX were detected at concentrations of 11,030 µg/L at DPT-43B (depth of 15 feet) and 2,610 and 3,700 µg/L at DPT-43 (depths of 30 and 40 feet, respectively). Groundwater sampling results from these two locations indicate elevated concentrations of BTEX in both the upper and intermediate portions of the surficial aquifer.

Section 7
Summary

The 2013 Dump Road Area (DRA) field program included the following activities:

- excavating seven test pits in three areas based on comments from Maryland Department of the Environment (MDE)
- advancing 10 soil borings for lithological characterization using a direct-push-technology (DPT) drill rig and collecting discrete soil samples to a depth of approximately 30 feet below grade
- collecting discrete groundwater samples, typically at five-foot intervals, from 22 locations using a direct-push-technology drill rig, to a depth of up to 60 feet below grade
- installing six monitoring well clusters (18 wells) to characterize groundwater conditions along the Frog Mortar Creek shoreline, and collection of 13 soil samples during drilling
- collecting surface water samples from two sampling points in Pond 1 and from three locations in the wetland area near the Frog Mortar Creek shoreline
- collecting sediment cores using a Shelby Tube, piston tube, or comparable sediment sampling device from three locations within the wetland area near the Frog Mortar Creek shoreline and from four locations in Pond 1, to a depth of two-feet below the sediment surface.
- conducting a synoptic round of water level measurements that included existing monitoring wells and the 18 newly installed groundwater monitoring wells
- collecting groundwater samples from the 18 new monitoring wells
- chemically analyzing soil, groundwater, surface water, and sediment samples at an off-site laboratory
- surveying the test pits, soil borings, probe groundwater sampling locations, and newly installed groundwater monitoring wells using a Maryland-licensed surveyor

The probe groundwater-sampling results helped define volatile organic compound (VOC) concentrations in three dimensions at 22 locations around possible groundwater source-areas at the Dump Road Area. Significant findings of the probe groundwater-sampling program are:

- Trichloroethene (TCE) was detected in probe groundwater samples at a maximum concentration of 490,000 micrograms per liter (µg/L) at DPT-43 (elevation of -23.58 feet) near a former pond or pit (former Pond 3) found on historical photographs (Tetra Tech, Inc. [Tetra Tech], 2013a). TCE was also detected in groundwater at 22,000 µg/L at DPT-43B (elevation of 6.77 feet) east of DPT-43 in the area of the same former pond or pit. These concentrations indicate the likely presence of trichloroethene dense non-aqueous phase liquids (DNAPL) at or near these sampling elevations.

- Trichloroethene was detected at elevated concentrations (up to 26,000 µg/L) in probe groundwater samples collected in the upper and intermediate surficial-aquifer zones along the dump embankment and raised berm near Frog Mortar Creek. These concentrations indicate the likely presence of trichloroethene dense non-aqueous-phase liquids at or near these sampling elevations. The highest trichloroethene concentrations in this portion of the site were detected in samples collected east of the wetland area. The wetland is nearly coincident with the lowest drainage area present during filling activities for the former Limehouse Cove.

- DPT-41 results confirm previous results at CPT-13, which indicate elevated concentrations of chlorinated volatile organic compounds east of well DMW-7S in the Drum Area. These concentrations indicate the likely presence of trichloroethene dense non-aqueous-phase liquids at or near these sampling elevations.

- A trichloroethene result (9,900 µg/L) in groundwater for DPT-33 indicates the location of the volatile organic compound source area east and hydraulically upgradient of wells MW-15S/I/D. This concentration indicates the possible presence of trichloroethene dense non-aqueous-phase liquids at or near this sampling location.

- Low concentrations of benzene, toluene, ethylbenzene, and xylenes (BTEX) were generally detected in samples collected along the embankment and berm along Frog Mortar Creek. Only three concentrations of benzene (DPT-24, DPT-26, and DPT-28) exceed the Maryland Department of the Environment groundwater standard.

- Benzene, toluene, ethylbenzene, and xylenes were generally not detected or were detected at relatively low concentrations in the probe groundwater samples, except near former Pond 3 (DPT-43 and 43B) and west of the Petroleum Hydrocarbon Area (PHA) near Taxiway Tango (DPT-34).

Significant findings of the groundwater level measurement program are as follows:

- Elevated groundwater levels at wells MW-43S, MW-39S, DMW-3S, and MW-44S indicate local groundwater mounding east and northeast of Pond 1 and Pond 2.

- The groundwater elevation configuration of wells MW-39S, MW-43S, and MW-44S indicates that the higher groundwater surface may be partially due to infiltrating water from Pond 1 and Pond 2.

- Groundwater flow at the site is generally southwest to northeast, and east from the airport runway towards Frog Mortar Creek.

Soil samples, monitoring-well groundwater samples, surface water samples, and sediment samples were screened against chemical-specific criteria to gauge the degree of observed contamination relative to regulatory standards/criteria, to assess potential adverse effects on human health or the environment, and to evaluate the need for further sampling or remedial action. Soil and groundwater results were screened against the Maryland Department of the Environment (MDE) cleanup standards for soil and groundwater. Surface water results were screened against the United States Environmental Protection Agency (USEPA) Region 3 Biological Technical Advisory Group (BTAG) freshwater and saltwater screening benchmarks. Sediment results were compared against USEPA regional screening-levels (RSL) for soil, using an order of magnitude adjustment (i.e., by 10 times) to account for less frequent human exposure to sediment than to soil. Sediment results were also compared to the USEPA Region 3 BTAG sediment-screening benchmarks, ecological toxicity levels, and the National Oceanic and Atmospheric Administration (NOAA) screening quick-reference tables.

Significant findings of the soil, groundwater monitoring well, and pond sampling program include:

- Aroclor-1242, a polychlorinated biphenyl (PCB), was detected at 4,100 milligrams per kilogram (mg/kg) in the 2–3 foot sample at test pit DR-A80. This is the highest polychlorinated biphenyl concentration detected to date in a soil sample at the Dump Road Area site and the only soil sample to have exceeded 50 mg/kg polychlorinated biphenyls.

- Trichloroethene was detected at 13,000 micrograms per kilogram (µg/kg) in a soil sample collected at four feet below grade from test pit DR-A79. Test pit DR-A79 is in the eastern portion of the Drum Area near soil boring B-8 (advanced in 1996), which indicated the presence of product at a depth of 12–14 feet below grade: trichloroethene at 6,200 µg/kg and total petroleum hydrocarbons (TPH)-diesel-range organics (DRO) at 19,000 mg/kg.

- Only one soil sample (DR-SB-46S-19–20) from the new monitoring well boreholes had concentrations of constituents exceeding industrial-soil screening levels. Arsenic (21-mg/kg) and vanadium (130 mg/kg) were detected in this soil sample collected from a depth of 19–21 feet below grade from the soil boring for well DR-SB-46S/I.

- Soil borings DR-SB-188, DR-SB-191, DR-SB-194, and DR-SB-196 produced samples with compounds (several polycyclic aromatic hydrocarbons and three metals) exceeding industrial screening levels.

- Elevated trichloroethene concentrations were detected in several groundwater samples collected from the newly installed monitoring wells, including a trichloroethene concentration of 13,000 µg/L for well MW-51S, located at the southern end of the Dump

Road Area. In addition, the other elevated trichloroethene concentrations (3,900-9,300 µg/L) were detected in samples from monitoring wells MW-49D, MW-49I, MW-47I, and MW-48I. The groundwater samples collected through direct-push technology generally produced significantly higher trichloroethene concentrations than those collected from these monitoring wells.

- Sediment samples collected from Pond 1 contained elevated concentrations of benzene, toluene, ethane, and xylene, several chlorinated volatile organic compounds, 2-methylnaphthalene, naphthalene, polychlorinated biphenyls, cadmium, chromium, copper, lead, zinc, total petroleum hydrocarbons-diesel-range organics, total petroleum hydrocarbons-gasoline-range organics, and numerous polycyclic aromatic hydrocarbons. Higher concentrations of chemicals were detected in the one- to two-foot samples, consistent with previously collected Pond 1 sediment samples. Sediment samples EP1-SD15 and EP1-SD16 from the northern portion of Pond 1 contained non-detect or low concentrations of chlorinated volatile organic compounds, but a highly elevated benzene, toluene, ethane, and xylene concentration (737,000 µg/kg) was detected at location EP1-SD16. Samples collected from the southern portion of the pond (EP1-SD17) produced the highest concentrations of benzene, toluene, ethane, and xylene (883,100 µg/kg) and trichloroethene (5,400 µg/kg) in Pond 1, but those from the central portion of the pond were also high (4,480 µg/kg and 2,400 µg/kg, respectively).

- Constituents exceeding screening levels in wetland area sediment samples (EWT-SD-1 through EWT-SD3) are primarily metals, with polycyclic aromatic hydrocarbons also exceeding screening levels. Unlike Pond 1 sediment samples, benzene, toluene, ethane, and xylene, and the chlorinated volatile organic compounds trichloroethene, *cis*-1,2-dichloroethene, and vinyl chloride were not detected in the wetland area sediment samples.

- Metals, total petroleum hydrocarbons-gasoline-range organics, and total petroleum hydrocarbons-diesel-range organics are the only compounds detected in Pond 1 and wetland area surface water samples at concentrations exceeding their respective screening levels. The barium concentrations in Pond 1 water samples were approximately five to eight times higher than those detected in 2012, but are now consistent with levels reported in nearby water bodies. Cadmium and chromium concentrations in the Pond 1 water samples have decreased since 2012.

- Barium and cadmium concentrations in wetland water samples (EWT-SW1 and EWT-SW2) are higher than those in Pond 1 samples. Additionally, concentrations of cobalt, cooper, nickel, and zinc exceed screening levels in two wetland water samples, and hexavalent chromium exceeds the lowest screening level in one wetland water sample (EWT-SW1).

The 2013 sampling results and historical data are used in this study to evaluate the occurrence and distribution of major chlorinated and aromatic volatile organic compounds that have been detected in various environmental media at the Dump Road Area. Evaluating current and historical data identifies, characterizes, and spatially delineates source areas or possible source

areas of these compounds. Early environmental investigations (1991–1996) identified four areas of concern:

- Taxiway Tango Median Anomaly Area
- Drum Area
- Pond 1 and Pond 2
- Petroleum Hydrocarbon Area

Soil- and groundwater-chemical analytical results were also evaluated to identify possible areas of trichloroethene dense-non-aqueous-phase liquids (DNAPLs); these free-product sources can remain in the subsurface for long periods and provide a continuous source for dissolved-phase groundwater plumes.

Trichloroethene concentrations were compared to a calculated saturation-threshold concentration (C_D) and partitioning-threshold concentration (C^T) to evaluate soil and sediment sampling results for the presence of dense non-aqueous-phase liquids. A saturation threshold concentration of 9,188,000 micrograms per kilogram (µg/kg), a partitioning threshold concentration of 515,000 µg/kg for vadose-zone soil samples, and a 535,000 µg/kg threshold concentration for soil in groundwater or saturated pond sediment were computed for this study using typical soil and chemical characteristics available in the scientific literature. Detection of trichloroethene in soil at a concentration greater than 9,188,000 µg/kg was considered conclusive evidence of dense non-aqueous-phase liquids in soil. A trichloroethene concentration above 515,000 µg/kg, or above 535,000 µg/kg, would indicate the possible presence of dense non-aqueous-phase liquids in unsaturated or saturated soil zones, respectively.

A threshold screening concentration (11,000 µg/L) was also used to screen groundwater sampling results for trichloroethene; i.e., if concentrations were above this value, residual dense non-aqueous-phase liquids were likely present. Dense non-aqueous-phase liquids in groundwater can act as a continuing source of volatile organic compounds. The groundwater screening concentration is equivalent to 1% of the effective solubility ($C_{i[1\%]}$) for trichloroethene in water. Groundwater sample concentrations exceeding this value indicate that groundwater may have come in contact with DNAPL (Kueper and Davies, 2009). Historical and current groundwater concentrations at the Dump Road Area site exceed 11,000 µg/L at several locations, indicating dense non-aqueous-phase liquids in the subsurface.

Existing data confirm that all the areas listed above (except for Pond 2) are primary sources for soil, pond sediment, and groundwater contamination. Results of surface water and pond sediment samples from Pond 2 do not indicate that it is a source for volatile organic compounds at the Dump Road Area. The source area study conducted in 2012 for the Dump Road Area (Tetra Tech, 2012b) identified three additional areas of elevated volatile organic compounds in soil and groundwater requiring further investigation:

- Taxiway Tango Area East (TT East)
- Taxiway Tango Area North (TT North)
- the area east of Pond 1

The fieldwork discussed in Sections 3 and 4 of this report was designed to gather additional environmental data at the initial and possible new source areas listed above.

A 2012 historical aerial photograph and document review (Tetra Tech, 2013a) confirmed the location and use of Pond 1 as an acid and oil pit and identified other past features, such as debris piles in the Drum Area and an open burning area and open pit in Taxiway Tango Area East. This study also identified other features considered possible chemical source areas, identified in this investigation as follows:

- *former Pond 3*—a pond south of Pond 1—feature #2 in Figure 7-1
- *former Pond 4/open burning area*—features #43 and #45 in Figure 7-1
- *former Ponds 5 and 6*—features #46 and #47 in Figure 7-1
- *former Pond 7*—feature #42 in Figure 7-1; currently a wetland
- *DMW-4/former debris pile area*—feature #51 in Figure 7-1
- *former ammunition bunkers*—features #20 and #26 in Figure 7-1 (same area as Taxiway Tango Area North)

The former ammunition bunkers (features #20/#26) are in the Taxiway Tango Area North area; feature #51 (the former debris piles) is in the Drum Area; and the former open burning area and pit (features #15 and #44) are in Taxiway Tango Area East. These features were therefore combined with the previously identified Taxiway Tango Area North, Drum Area, and Taxiway Tango Area East. These former features/possible source areas are shown in Figures 7-1 and 7-2

and listed in Table 7-1 with the environmental media affected by trichloroethene and petroleum hydrocarbons (i.e., benzene, toluene, ethylbenzene, and xylenes).

Although light non-aqueous-phase liquids (LNAPL) have been observed at soil borings and test pits (e.g., floating oil sheens, apparent product at or above the water table, etc.), dense non-aqueous-phase liquids have not been directly observed in soil or groundwater samples collected during drilling and sampling at the Dump Road Area. High photoionization-detector (PID) field readings for subsurface soil samples or odors may be associated with high concentrations of volatile organic compounds, or possibly dense non-aqueous-phase liquids, but field screening results or odors alone do not indicate dense non-aqueous-phase liquids.

Concentrations of trichloroethene in soil samples are less than the threshold chemical concentrations used to evaluate whether trichloroethene dense non-aqueous-phase liquids are present (553,000 µg/kg for soil samples in groundwater or saturated pond sediment, and 515,000 µg/kg for vadose zone samples). Results for Pond 1 sediment samples collected in 2000 and 2005 indicate that trichloroethene dense non-aqueous-phase liquids may have been present in Pond 1 sediment at those times. Sampling results for Pond 1 sediment samples collected in 2012 and 2013 show lower trichloroethene concentrations; therefore, dense non-aqueous-phase liquids may no longer be present in the bottom sediment or may be non-uniformly distributed in the sediment.

Alternatively, high concentration areas in Pond 1 may have been missed or not sampled in 2012-2013. High concentrations of total benzene, ethylbenzene, toluene, and xylenes in Pond 1 sediments were detected in 2012–2013, indicating that Pond 1 sediments are a possible groundwater source of volatile aromatic hydrocarbons. However, lithologic logs for CPT-21, MW-43S, and MW-39S indicate thick clay in the subsurface downgradient of Pond 1. Although groundwater elevation contours suggest that water from Pond 1 may be infiltrating to the subsurface, organic matter in the pond sediments and a thick layer of dense clay underlying the pond likely inhibit movement of volatile organic compounds to groundwater. This is confirmed by trace trichloroethene concentrations detected in groundwater samples at CPT-21. Most other samples were non-detect, except for MW-39S, which had a trichloroethene concentration of 5 µg/L. Trichloroethene concentrations exceeding 11,000 µg/L in groundwater indicate possible residual dense non-aqueous-phase liquids in the surficial aquifer in the following areas: Taxiway

Tango Median Anomaly Area (in well DMW-11S and probe samples at CPT-03 and DPT-34), Taxiway Tango Area East (in well MW-45S/CPT-08/PA-7), former Pond 3 (DPT-43 and DPT-43B), around new well MW-50S, the southeastern corner of Taxiway Tango North (DPT-33), and the area east of Pond 1 (in wells MW-18I, DMW-3I, DMW-2A, DPT-24, DPT-25, and DPT-26).

Historical trichloroethene groundwater data in the Drum Area for probe samples DA-1, DA-3, DA-5, DA-6, DA-7, DA-8, MIP-28, and pre-2004 results for wells DMW-7S and MW-5 also indicate possible residual dense non-aqueous-phase liquids in the surficial aquifer. Generally, however, current trichloroethene concentrations (ranging from not detected to 6,800 µg/L) in groundwater samples from area wells (DMW-7S, MW-5, MW-40S/I, DPT-40, and DPT-42), and probe groundwater samples CPT-11 through CPT-15 (10-9600 µg/L) do not indicate that residual dense non-aqueous-phase liquids in groundwater are currently in this part of the Drum Area. TCE concentrations (7,200 µg/L–28,000 µg/L) at DPT-41, CPT-13 (30 feet deep), CPT-12 (30 feet deep), and at CPT-11 (35 feet deep) suggest that additional probe groundwater sampling may be required to further assess possible residual dense non-aqueous-phase liquids in these areas. High concentrations of *cis*-1,2-dichloroethene and vinyl chloride at many Drum Area probe groundwater-sampling locations, particularly those downgradient of DMW-7, indicate that degradation of trichloroethene is occurring at the Drum Area, likely in response to past injections of substrate into the surficial aquifer during a pilot-scale test in 2004.

High concentrations of petroleum hydrocarbons (total benzene, ethylbenzene, toluene, and xylenes) in soil at the Petroleum Hydrocarbon Area (PHA) northwest of DMW-9S/I/D indicate that this area is a significant source of volatile aromatic hydrocarbons. Oily sheens observed at soil boring B-15 and in test pit A33 also indicate the presence of light non-aqueous-phase liquids at the Petroleum Hydrocarbon Area. High concentrations of petroleum hydrocarbons (total benzene, ethylbenzene, toluene, and xylenes [total BTEX]) have also been detected in soil in the Taxiway Tango Median Area, west of well DMW-4, and near the former debris pile. Probe groundwater-sampling in 2012–2013 identified and delineated well-defined petroleum hydrocarbon groundwater plumes in the Taxiway Tango Median Anomaly Area, the Petroleum Hydrocarbon Area, Taxiway Tango Area East, and the Drum Area. Groundwater concentrations were primarily detected in the upper surficial-aquifer zone, and appear to be attenuating to low concentrations before reaching the eastern boundary of the Dump Road Area. However, low

concentrations of toluene have been detected infrequently in surface water samples collected from Frog Mortar Creek.

Several previously unknown historical features were identified in the Dump Road Area as part of the 2012 aerial photograph study (Tetra Tech, 2013a). These features had characteristics or operations that indicate that they may be possible source areas. Several features identified in the photograph review coincide with current known volatile organic compound source areas, such as Pond 1 (acid and oil disposal pit), former Pond 3, and Taxiway Tango Area East (former open burning area and pit).

Table 7-1
Source Areas, Possible Source Areas, and Affected Environmental Media—
Dump Road Area, Lockheed Martin, Martin State Airport, Middle River, Maryland

Area	Affected environmental media: trichloroethene	Affected environmental media: petroleum hydrocarbons (benzene, toluene, ethylbenzene, xylenes)
Petroleum Hydrocarbon Area, Pond 1	surface sediment/subsurface soil, groundwater	surface sediment/subsurface soil, groundwater
Taxiway Tango Median Area	subsurface soil, groundwater	subsurface soil, groundwater
Taxiway Tango East— former open burning area and pit (features #44 and #15)	subsurface soil, groundwater	subsurface soil, groundwater
Drum Area (feature #51)	surface and subsurface soil, groundwater	groundwater
Taxiway Tango North— former ammunition bunkers (features #20 and #26)	subsurface soil, groundwater	—
Area east of Pond 1	subsurface soil, groundwater	—
Former Pond 3 (feature #2)	soil is unknown, groundwater	soil is unknown
DMW-4 former debris pile area (feature #50)	soil; groundwater	soil; groundwater is unknown
Former Pond 4/open burning area (features #43 and #45)	unknown; surrounding samples indicate trace to low concentrations in soil and groundwater	unknown; surrounding samples indicate trace to low concentrations in soil and groundwater

Executive Director/CEO

June 27, 2013

Mr. Anthony Apanavage
Tetra Tech
20251 Century Boulevard Suite 200
Germantown, Maryland 20874

SUBJECT: Permit BP-13-027 Martin State Airport Dump Road Source Areas Groundwater Characterization

Dear Mr. Apanavage:

Please find enclosed the approved Permit for the above referenced project. Permit approval is subject to compliance with provisions and stipulations contained in the Permits Information Guide and Tenant Directive 007.01. The issuance or granting of this permit shall not be construed to be an approval of any violation of other Maryland Aviation Administration (MAA) or Code of Maryland (COMAR) regulations. MAA reserves the right to suspend or revoke the permit whenever it is deemed to be issued on the basis of incorrect, inaccurate or incomplete information provided by the applicant.

Please see the attached list of MAA departments and offices that need to be contacted prior to the start of work. Also, please refer to the Permits Information Guide to see if any other permit or authorization is required. The approved Permit, Permit Plan Set and Permit Comments shall be kept at the project location until the completion of the project. Revisions to design shall be submitted to and approved by MAA Division of Document & Permits prior to construction. ***As-Built Drawings are to be received no later than 70 days from Final Inspection acceptance.***

This permit shall become invalid unless the work on the site authorized by this permit is commenced within 180 days after issuance, or if the work is suspended or abandoned for a period of 180 days after the work is commenced. The issuance of this permit shall not relieve the applicant from his/her responsibility to ensure proper design and construction of this project.

Sincerely,

Syed Shariq R.A., Manager

Division of Documents & Permits

Approval	Permit No. **BP-13-027**
Syed Shariq, R.A. Manager, Division of Documents & Permits	Date Issued: 6-27-12

THIS PERMIT IS ISSUED BY MARYLAND AVIATION ADMINISTRATION AS AUTHORIZATION TO PERFORM APPROVED CONSTRUCTION ACTIVITIES AS DESCRIBED AND SHOWN ON APPROVED PERMIT PLANS AND SPECIFICATIONS

Post in a Conspicuous Place at Job Site

Building Permit No. BP-13-027 is ***approved as noted*** and subject to compliance with the applicable codes, MAA Design Standards and the follow comments:

1. Excavation within non-tidal wetlands for the purpose of groundwater investigation qualifies as an exempt activity under COMAR 26.23.01.02 F(7) - Soil Investigation. Construction access should be via existing cleared areas. Restore any temporary disturbance to wetland areas by restoring grades, removing excess fill and seed.

GENERAL COMMENTS

1. Applicable Codes & Regulations as per Tenant Directive 007.1 apply.
2. Display MAA Permit on site at all times
3. Secure all tools and equipment in public/sterile areas and ensure that all doors are locked when no one is present in the construction area. No tools are to be left unattended. Follow proper escort procedures in the SIDA.
4. All loose debris/trash, on or about AOA, shall be deposited in an acceptable, covered trash receptacle. No debris/trash shall be left about roof; spaces open to the AOA, conveyance, or near open trash receptacles at any time.
5. Firestop penetrations through fire rated assemblies and seal all unused/abandoned openings using appropriate UL-listed firestopping systems.
6. Sleeves:
   - Sleeves shall be installed for cable and raceway penetrations of concrete slabs, masonry and fire rated gypsum walls and other floor and wall assemblies.
   - Sleeves will be installed during erection of concrete and masonry walls.
   - Sleeves shall be installed in concrete slabs supported by pan decking to ensure full sealing of the uneven lower surface around the pan.
   - New concrete slabs are acceptable to be poured with the concrete surrounding the new conduit without the use of sleeves.
7. Provide support to structural member for any mechanical, electrical or other building elements not scheduled for removal but attached to items being demolished.
8. Core drilling, concrete floor cutting or other removal methods (on-grade, elevated, and post tensioned) shall be preceded by NDT to show that no embedded conduits or structural reinforcing will be disturbed in the proposed locations. The MAA Design Standard DST 2007-01 Core Drilling of Concrete Floors shall be used as reference.

9. Electrical:
   - Electrical, communication, security or fire safety wiring/systems shall not be interrupted without notification and coordination with authority having jurisdiction and written approval by said authority.
   - MC/FMC ¾ inch minimum size, 6 foot maximum length; except as allowed to fish existing walls per MAA Design Standards. Cont'
   - Raceway size shall be ¾" minimum.
   - All conduit fittings shall be steel.
   - All wire/cable shall be plenum rated.
   - Only brushed stainless steel device covers allowed.
   - Exothermic weld required for electrical grounding to building steel per MAA-DST.
   - Install expansion joints at points required.
10. Mechanical/Plumbing:
    - Roof mounted equipment issues:
      -Gas pipe exposure on the roof shall be minimized.
      -Roof mounted equipment condensate drains shall be routed to the nearest roof drain.
      -Condensate drains shall not rest directly on the roof.
      -Existing roof warranties shall be maintained.
    - High pressure stainless steel couplings shall be used on all sanitary waste and vent piping.
11. Hot Work & Welding:
    - Open flame welding and cutting shall not be allowed without burning permit as issued.
    - During flame welding and flame/mechanical cutting operations install protective weld screens and non-flammable fire protection blankets.

12. The Office of Airport Security (OAS) recommend/requires a Security Plan for this project including requirements as stipulated on ITEM X-1 Security Requirements during Construction. These would include/but not limit to the following: The OAS requires MAA/ Contractor and all Subcontractors must obtain appropriate BWI ID badges for all personnel requiring access to any restricted area work site prior to commencement of work. Secondly, the Contractor/all Subcontractors must obtain appropriate BWI Airfield Registration stickers for all essential work vehicles requiring access to any restricted area work site prior to commencement of work. Thirdly, the Contractor/Subcontractors must ensure that escort authorized BWI ID badge holders will conduct continuous escorting of all non-badge personnel. Maintain all escorted non-badged personnel /vehicles within sight and reasonable speaking distance at all times while within a restricted areas to/ from/ at the work site. Finally, no vehicles/equipment without an authorized/current Air field Stickers is left unattended at anytime.

SOIL & SEDIMENT SAMPLE LOG SHEET

Project Site Name: Dump Road Source Areas Soil and Groundwater Characterization
Project No.: 112IC04882

Sample ID No.: DR-TP-A80-11
Sample Location: MSA Middle River, MD
Sampled By: W. O'Niell
C.O.C. No.:

[] Surface Soil
[X] Subsurface Soil
[] Sediment
[] Other:
[] QA Sample Type:

Type of Sample:
[] Low Concentration
[] High Concentration

GRAB SAMPLE DATA:

Date: 8/14/13	Depth Interval	Color	Description (Sand, Silt, Clay, Moisture, etc.)
Time: 0910	11	gray	silty clay w/some silt & sand plastic moist
Method: Backhoe/Excavator			
Monitor Reading (ppm): 0.05			

COMPOSITE SAMPLE DATA:

Date:	Time	Depth Interval	Color	Description (Sand, Silt, Clay, Moisture, etc.)
Method:				
Monitor Readings (Range in ppm):				

SAMPLE COLLECTION INFORMATION:

Analysis	Container Requirements	Collected	Other
VOCs 8260C	Terra Core kit	✓	
SVOCs incl. 1,4-Dioxane (8270D), PCBs (8082A), TPH-DRO (8015D),	8 oz glass	✓	
Priority Pollutant Metals (1010C, 7471A)	4 oz glass	✓	
TPH-GRO (8015D)	4 oz glass	✓

APPENDIX C—TEST PIT LOGS AND PHOTOGRAPHS

Tetra Tech
20251 Century Blvd Ste 200
Germantown Maryland/20874

Log of Test Pit TP-A76

Project Name: Dump Road Area Test Pit Investigation **Project Number:** 112IC04882

Depth (ft)	Debris Percentage	Graphic Log	Material Description	Elev. (ft)	Environmental Data (PPM)
0			Dark brown TOPSOIL with organic debris		PID = 0
					PID = 0
			Brown SILTY CLAY, moderate plasticity, minor (<5%) debris, slightly moist, water leaking in side seam @ 4.5' but bottom of pit is not saturated.		PID = 0
	0-5(%)				PID = 0
					PID = 0
5				5	PID = 1.7
			Brown gray CLAY to SILTY CLAY, medium plasticity, slight moisture, < 5% debris including asphalt, plastic debris, brick and tile encountered.		PID = 0
	0-5(%)				PID = 3.9
					PID = 2.6
	10-10(%)		Gray/Black, SANDY CLAY, plastic, moist, 10% debris including, pipe, metal pieces, asphalt, concrete.		PID = 14.2
10				0	PID = 46.3
			Brown/gray SANDY SILT CLAY plastic, slightly moist		PID = 2.1
			Gray brown SILTY CLAY, plastic, slightly moist. Pit filling with water		
			Gray CLAY with some silt and sand, plastic, slightly moist, no debris after 12 feet.

B - Result considered to be from laboratory blank contamination based on USEPA 5 times
J - Positive result is considered estimated as a result of technical
L - result is biased low. Actual result n
MG/KG - milligrams per kilogram (i.e
MEQ/100 - I
MSA - Mart
NA - not ana
SB - soil bor
SO - soil
S.U. - standa
TPH - total petroleum hy
U - Not detected at the detection limit shown left o
UG/KG - micrograms per kilogram (i.e
UJ -The analyte was not detected. However, the quantitation or detection limit may be inaccurate or imprecise.

UR - The result is considered qualitatively or quantitatively unreliable.

Table D-5-2

Chemical Results for Test Pit Soil Samples - 2013
Dump Road Area
Lockheed Martin, Martin State Airport, Middle River, Maryland

B - Result considered to be from laboratory blank contamination based on USEPA 5 times or 10 times rule.
C= composite
J - Positive result is considered estimated as a result of technical noncompliance.
K - result is biased high. Actual result may be lower.
L - result is biased low. Actual result may be higher.
MG/KG - milligrams per kilogram (i.e., parts per million)
MSA - Martin State Airport
NA - not analyzed
PCBs - polychlorinated biphenyls
TP - test pit
TPH - total petroleum hydrocarbon
U - Not detected at the detection limit shown left of the letter.
UG/KG - micrograms per kilogram (i.e., parts per billion)
UJ -The analyte was not detected. However, the quantitation or detection limit may be inaccurate or imprecise.
UR - The result is considered qualitatively or quantitatively unreliable.
USEPA - United States Environmental Protection Agency

MSA-MW47S-101613		

Overview

The sample set for LMC-MSA Dump Road source areas, SDG 240-30344-1 consisted of four (4) aqueous environmental samples and one (1) trip blank. All five (5) aqueous samples were analyzed for volatile organic compounds (VOC), semi-volatile organic compounds (SVOC), diesel range organics (DRO), gasoline range organics (GRO), and total and dissolved metals, with the exception of the trip blank which was analyzed for VOC only. No field duplicate sample pair was included in this SDG.

The samples were collected by Tetra Tech, Inc. on October 16, 2013 and analyzed by TestAmerica, Inc. All analyses were conducted in accordance with SW-846 Methods 8260C, 8270C, 8015B, 6010C, and 7470A analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method/calibration blanks, Interference Check Sample (ICS), surrogate spike recoveries, blank spike results, matrix spike/matrix spike duplicate results, laboratory duplicate results, internal standard areas and recoveries, ICP serial dilution results, chromatographic resolution, compound identification, tentatively identified compounds, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- The initial and continuing calibrations performed on instrument A3UX15 in the VOC fraction had Relative Response Factors (RRFs) for tert-butyl alcohol and vinyl acetate below the 0.050 minimum response criterion. All samples were affected with the exception of sample MSA-MW46S-101613. The non-detected results reported for these compounds in the affected samples were qualified as rejected, (UR).

- The initial calibration performed on instrument A3UX17 in the VOC fraction had a RRF for tert-butyl alcohol below the 0.050 minimum response criterion. Sample MSA-MW46S-101613 was affected. The non-detected result reported for this compound in the affected sample was qualified

as rejected, (UR).

Minor

- The following contaminants were detected in the laboratory method, trip blank, and calibration blanks at the following maximum concentrations:

Compound/Analyte	Maximum Concentration (µg/L)	Action Level (µg/L)
Methylene Chloride [1]	1.12	11.2
Chloroform [2]	0.58	2.9
Bis(2-ethylhexyl)phthalate [3]	0.235	2.35
Di-n-butylphthalate [3]	0.758	7.58
Barium [4]	1.17	5.85
Zinc [4]	8.97	44.85
Antimony [5]	1.96	9.8

1 Maximum concentration detected in the laboratory method blank, MB240-107712/5, affecting the samples associated with analytical batch #240-107712-5.
2 Maximum concentration detected in the trip blank, TB-101613.
3 Maximum concentration detected in the laboratory method blank, MB240-106515/16-A, affecting all samples.
4 Maximum concentration detected in the laboratory preparation blank, MB240-106546/1-A, affecting all total and dissolved metal samples.
5 Maximum concentration detected in the continuing calibration blank, CCB 240-98850/20, affecting the solid samples.

An action level of 10X the maximum concentration for the common laboratory contaminants, methylene chloride, bis(2-ethylhexyl)phthalate, and di-n-butylphthalate, and an action level of 5X the maximum concentration for the remaining contaminants were used to evaluate for blank contamination. Sample aliquot and dilution factor, if applicable, were taken into consideration when evaluating for blank contamination. The detected results for the compounds/analytes below the established action levels were qualified as non-detected, (B).

- The Contract Required Quantitation Limit (CRQL) samples analyzed on 10/29/13 had Percent Recoveries (%Rs) for antimony, arsenic, copper, chromium, lead, thallium, and molybdenum greater than 110% quality control limit affecting the total and dissolved metal samples. The detected results for arsenic, chromium, copper, and molybdenum reported below 2X the Reporting Limit (RL) were qualified as estimated, (J), due to conflicting directional bias. The detected result for copper in total metal sample MSA-MW46S-101613 was qualified as biased high, (K).

- The CRQL samples analyzed on 06/05/12 had %Rs for vanadium less than the 90% quality control limit affecting the total and dissolved metal samples. The detected result for vanadium in dissolved sample MSA-MW46S-101613 reported below 2X the RL was qualified as estimated, (J), due to conflicting directional bias. The non-detected results reported for vanadium in the total and dissolved metals analyses were qualified as biased low, (UL).

- The Tentatively Identified Compounds (TICs) trimethylsilanol and dimethyl(1,1,2-trimethylpropyl)silanol were detected in samples MSA-MW46I-101613 and MSA-MW46S-101613, respectively. These TICs are considered column bleed from the GCMS instrument. The results were qualified as rejected, (R).

- Detected results reported below the RL limit but above the Method Detection Limit (MDL) were qualified as estimated, (J).

Notes

The trip blank, TB-101613, was mislabeled on the sample Chain of Custody (COC) form as TB-061713. The data validator manually corrected the COC and corrected the identification in the database.

The VOC continuing calibration performed on 10/29/13 @ 10:12 on instrument A3UX15 had a Percent Difference (%D) which exceeded the 20% quality control limit but was less than 50% for 1,2,4-trichlorobenzene. No validation action was necessary because no detected results were reported for this compound in the affected samples.

The VOC continuing calibration performed on 10/30/13 @ 10:36 on instrument A3UX15 had %Ds for tert-butyl alcohol, 2-hexanone, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, and 1,2,3-trichlorobenzene which exceeded 20% but were less than 50%. No validation action was necessary because no detected results were reported for these compounds in the affected samples.

The VOC initial calibration verification performed on 10/29/13 @ 22:29 on instrument A3UX17 had %Ds for dichlorodifluoromethane and 1,2,3-trichlorobenzene which exceeded 20% but were less than 50%. No validation action was necessary because no detected results were reported for these compounds in the affected sample.

The Continuing Calibration Verification (CCV) sample 10/29/13 @ 14:09 had a %R for thallium greater than 110%. All total and dissolved metal samples were affected. No action was taken because thallium was not detected in the affected samples.

The VOC blank spike sample associated with analytical batch #240-107534 had %Rs for 2-hexanone, trans-1,3-dichloropropene, and vinyl chloride above the upper quality control limits affecting samples MSA-MW46D-101613 and TB-101613. No action was taken because these compounds were not detected in the affected samples.

The VOC blank spike sample associated with analytical batch #240-107712 had %Rs for 1,3-dichloropropane, 2-hexanone, 4-chlorotoluene, sec-butylbenzene, and trans-1,3-dichloropropene above the upper quality control limits affecting samples MSA-MW46I-101613 and MSA-MW47S-101613. No action was taken because these compounds were not detected in the affected samples.

The VOC blank spike sample associated with analytical batch #240-107637 had a %R for 1,1-dichloropropene above the upper quality control limit affecting sample MSA-MW46S-101613. No action was taken because this compound was not detected in the affected sample.

The VOC Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses had %Rs outside quality control limits. No action was taken because the parent samples in these fractions were not samples of interest.

The following samples were diluted prior to analysis in the fraction below:

Sample	Fraction	Dilution
MSA-MW46I-101613	VOC	6.67X
MSA-MW47S-101613	VOC	55.56X
	SVOC	2X

The RLs of the non-detected results were elevated.

Non-detected results were reported to the MDL.

Executive Summary

Laboratory Performance: Initial and/or continuing calibration RRFs for tert-butyl alcohol and vinyl acetate were below the quality control criterion resulting in the rejection of the non-detected results. VOC continuing calibration %Ds exceeded 20% but were less than 50%. A CCV %R for thallium exceeded 110%. Some CRQL %Rs were outside the 90-110% quality control limits. Several contaminants were detected in the laboratory method and/or calibration blanks. Blank spike %Rs were noncompliant in the VOC fraction.

Other Factors Affecting Data Quality: Some samples required dilutions. Chloroform was detected in the trip blank. Column bleed was detected as TICs. Results below the RL were estimated.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994), Region III modifications to U.S. EPA National Functional Guidelines for Inorganic Data Validation (April 1993), and SW-846 Methods 8260C, 8270C, 8015B, 6010C, and 7470A analytical and reporting protocols. The text of this report has been formulated to address only those areas affecting data quality.

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate

CASE NARRATIVE

Client: Tetra Tech, Inc.

Project: DUMP ROAD MSA

Report Number: 240-30344-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 10/17/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 2.2 and 2.6 C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3), TB-061713 (240-30344-4) and MSA-MW47S-101613 (240-30344-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 10/29/2013 and 10/30/2013.

Methylene Chloride was detected in method blank MB 240-107712/5 at a level exceeding the reporting limit. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

2-Hexanone, trans-1,3-Dichloropropene and Vinyl chloride failed the recovery criteria high for LCS 240-107534/4. 1,1-Dichloropropene failed the recovery criteria high for LCS 240-107637/15. 1,3-Dichloropropane, 2-Hexanone, 4-Chlorotoluene, sec-Butylbenzene and trans-1,3-Dichloropropene failed the recovery criteria high for LCS 240-107712/4.

Samples MSA-MW46I-101613 (240-30344-2)[6.67X] and MSA-MW47S-101613 (240-30344-5)[55.56X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 107534 recovered outside control limits for the following analytes: 2-Hexanone, Vinyl Chloride, trans-1,3-Dichloropropene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

The laboratory control sample (LCS) for batch 107712 recovered outside control limits for the following analytes: 2-Hexanone, sec-Butylbenzene, trans-1,3-Dichloropropene, 1,3-Dichloropropane, 4-Chlorotoluene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

The laboratory control sample (LCS)for batch 107637 recovered outside control limits for the following analytes: 1,1-Dichloropropene. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data has been reported.

No MS/MSD in batch 107534 due to incorrect sample dilution.

There was an MS/MSD analyzed in batch 107637 but could not be reported because the associated sample needed reanalyzed in a different batch.

No other difficulties were encountered during the VOCs analysis. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)
Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 10/22/2013 and analyzed on 10/29/2013.

Surrogates are added during the extraction process prior to dilution. When the sample is diluted, surrogate recoveries are diluted out and no corrective action is required.

Bis(2-ethylhexyl) phthalate and Di-n-butyl phthalate were detected in method blank MB 240-106515/16-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Sample MSA-MW47S-101613 (240-30344-5)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 106515, 3520C, 8270D.

No other difficulties were encountered during the SVOCs analysis. All other quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)
Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015C - GRO. The samples were analyzed on 10/19/2013.

An MS/MSD was analyzed with batch 106236, but could not be reported with samples: MSA-MW46D-101613 (240-30344-3), MSA-MW46I-101613 (240-30344-2), MSA-MW46S-101613 (240-30344-1), MSA-MW47S-101613 (240-30344-5).

No other difficulties were encountered during the gasoline analysis. All quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)
Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for diesel range organics (DRO) in accordance with EPA-SW-846 Method 8015C - DRO. The samples were prepared on 10/18/2013 and analyzed on 10/23/2013.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with batch 106111, 8015.

No other difficulties were encountered during the DRO analysis. All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICP)
Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 10/22/2013 and analyzed on 10/29/2013.

The continuing calibration verification (CCV) for Thallium associated with batch 107650 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. MSA-MW46D-101613 (240-30344-3), MSA-MW46I-101613 (240-30344-2), MSA-MW46S-101613 (240-30344-1), MSA-MW47S-101613 (240-30344-5).

No other difficulties were encountered during the metals analysis. All quality control parameters were within the acceptance limits.

TOTAL RECOVERABLE METALS (ICP)
Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for total recoverable metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 10/22/2013 and analyzed on 10/29/2013.

Barium and Zinc were detected in method blank MB 240-106546/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The continuing calibration verification (CCV) for Thallium associated with batch 107650 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. MSA-MW46D-101613 (240-30344-3), MSA-MW46I-101613 (240-30344-2), MSA-MW46S-101613 (240-30344-1), MSA-MW47S-101613 (240-30344-5).

No other difficulties were encountered during the metals analysis. All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 10/22/2013 and analyzed on 10/24/2013.

No difficulties were encountered during the mercury analysis. All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples MSA-MW46S-101613 (240-30344-1), MSA-MW46I-101613 (240-30344-2), MSA-MW46D-101613 (240-30344-3) and MSA-MW47S-101613 (240-30344-5) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 10/22/2013 and analyzed on 10/24/2013.

No difficulties were encountered during the mercury analysis. All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-30344-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	J	Indicates an Estimated Value for TICs
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	F	MS/MSD Recovery and/or RPD exceeds the control limits
	T	Result is a tentatively identified compound (TIC) and an estimated value.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	N	This flag indicates the presumptive evidence of a compound.
GC/MS Semi VOA		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc. Job Number: 240-30344-1

Lab Section	Qualifier	Description
Metals		
	B	Compound was found in the blank and sample.
	^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

1/Aqueous/VOC

TB-081213-240-27894-1

Overview

The sample set for Lockheed Martin – MSA Dump Road Source Areas, SDG 240-27894-1 consists of four (4) soil environmental samples and one (1) trip blank. The samples were analyzed for volatile organic compounds (VOC), semivolatile organic compounds (SVOC), petroleum hydrocarbons (PET), polychlorinated biphenyls (PCB), and metals as outlined above.

The samples were collected by Tetra Tech on August 12, 2013 and analyzed by Test America (North Canton). All analyses were conducted in accordance with SW-846 Methods 8260B, 8270D, 8015C, 8082A, 6010C, and 7471B analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, internal standard recoveries, ICP interference results, laboratory duplicate results, ICP serial dilution results, chromatographic resolution, analyte identification, analyte quantitation, and detection limits. Areas of concern are listed below.

Major

- The VOC initial calibration relative response factors (RRFs) were less than the 0.05 quality control limit for tert-butyl alcohol and vinyl acetate on instrument A3UX11. Only non-detected results were reported for tert-butyl alcohol and vinyl acetate in sample TB-081213-240-27894-1 and these results were rejected (UR).

- The VOC initial calibration and associated continuing calibration relative response factors (RRFs) were less than the 0.05 quality control limit for tert-butyl alcohol and vinyl acetate on instrument A3UX14. Only non-detected results were reported for tert-butyl alcohol and vinyl acetate in samples DR-TP-A76-10 and DR-TP-A76-11 and these results were rejected (UR).

- The VOC initial calibration and associated continuing calibration relative response factors (RRFs) were less than the 0.05 quality control limit for tert-butyl alcohol and vinyl acetate on instrument A3UX8. Only non-detected results were reported for tert-butyl alcohol and vinyl

acetate in samples DR-TP-A82-03 and DR-TP-A82-03A and these results were rejected (UR).

- The VOC continuing calibration RRF was less than the 0.05 quality control limit for tert-butyl alcohol on instrument A3UX11 on 8/21/13 @10:29. The non-detected result reported for tert-butyl alcohol for sample TB-081213-240-27894-1 was rejected (UR).

Minor

- The VOC continuing calibration %Ds were greater than the quality control limit of 20% and greater than 50% for bromomethane and trichlorofluoromethane, for instrument A3UX14 on 08/14/13 @ 10:17. The nondetected results reported for the aforementioned compounds in samples DR-TP-A76-10 and DR-TP-A76-11 were qualified as estimated (UJ).

- The following contaminants were detected in the laboratory method blank at the following maximum concentrations:

Analyte	Maximum Concentration	Action Level
1,2,4-Trichlorobenzene[1]	9.7 ug/kg	48.5 ug/kg
Carbon Disulfide[1]	23.9 ug/kg	119.5 ug/kg
Naphthalene[1]	13.2 ug/kg	66 ug/kg
Toluene[1]	33.9 ug/kg	169.5 ug/kg
Naphthalene[2]	0.357 ug/kg	1.785 ug/kg
Methylene chloride[2]	1.91 ug/kg	19.1 ug/kg

1 - Maximum concentration present in the method blank (MB 240-97336/1-A) affecting samples DR-TP-A76-10 and DR-TP-A76-11.
2 - Maximum concentration present in the method blank (MB 240-97446/1-A) affecting samples DR-TP-A82-03 and DR-TP-A82-03A.

An action level of 10X the maximum contaminant level was established for methylene chloride; 5X for all other compounds to evaluate sample data for blank contamination. Sample aliquot, percent solids and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive results for the aforementioned compounds less than the blank action level for soil samples were qualified (B) as a result of laboratory blank contamination.

- The SVOC laboratory control sample (LCS) associated with batch 97388/14-A had a percent recovery less than the quality control limit for benzaldehyde. The nondetected benzaldehyde results for all soil samples were qualified as biased low (UL).

- The TPH (C10-32) continuing calibration %Ds were greater than the quality control limit of 20% for instrument A2HP5F on 08/16/13 @07:17 and @09:47. The nondetected TPH (C10-32) result for sample DR-TP-A82-03A was qualified as estimated (UJ).

- The PCB surrogate spike compound decachlorobiphenyl, had %Rs on both GC columns greater than the quality control limits and tetrachloro-m-xylene greater than the quality control limit on CLP-1 column for sample DR-TP-A76-10. The positive Aroclor-1260 result for sample DR-TP-A76-10 has been qualified as estimated (J).

- The PCB surrogate spike compound decachlorobiphenyl, had zero %Rs on both GC columns less than the quality control limits for sample DR-TP-A76-11. The nondetected results for all Aroclor's for sample DR-TP-A76-11 have been qualified as estimated (UJ).

- The following contaminant was detected in the laboratory method blanks at the following maximum concentration:

Analyte	Maximum Concentration	Action Level
Antimony[1]	3.32 ug/L	16.6 ug/L

[1] Maximum concentration present in CCB 98850/31 affecting all samples.

An action level of 5X the maximum contaminant level has been used to evaluate sample data for blank contamination. Sample aliquot, percent solids, and dilution factors, if applicable, were taken into consideration when evaluating for blank contamination. The positive results less than the blank action level were qualified (B) as a result of laboratory blank contamination.

- The contract required detection limit (CRDL) analyzed on 08/23/13 @ 16:59 had a percent recovery for silver > 110% quality control limit affecting all samples. Positive results < 2X CRDL reported for silver in samples DR-TP-A76-10 and DR-TP-A82-03 were qualified as estimated (J) due to conflicting directional bias. Positive result < 2X CRDL reported for silver in sample DR-TP-A76-11 was qualified as estimated biased high (K).

- The ICP serial dilution %Ds were > 10% quality control limit (sample result > 50X IDL) for chromium and lead. The positive results > 50X IDL reported for chromium and lead were qualified as estimated (J).

- The matrix spike percent recoveries for antimony and copper were < 75% quality control limit for sample DR-TP-A76-10. The nondetected result reported for antimony in sample DR-TP-A82-03A was qualified as biased low (UL). The positive copper results for all samples were qualified as biased low (L).

- The matrix spike percent recoveries for barium and cadmium were >125% quality control limit for sample DR-TP-A76-10. Positive cadmium results for all samples were qualified as biased high (K). Positive barium results for samples DR-TP-A76-10, DR-TP-A76-11 and DR-TP-A82-03 were qualified as biased high (K). Positive barium result for sample DR-TP-A82-03A was qualified as estimated (J), due to conflicting directional bias.

- Positive results less than the reporting limit (RL) were qualified as estimated, (J), due to uncertainty near the detection limit.

Notes

The VOC continuing calibration %Ds were greater than the quality control limit of 20% and less than 50% for acetone, vinyl acetate, and bromoform, for instrument A3UX11 on 08/21/13 @ 10:29. No action was taken on this basis because all the affected sample results were previously qualified due to RRF noncompliance or were nondetected for the aforementioned compounds.

The VOC continuing calibration %Ds were greater than the quality control limit of 20% and less than 50% for 1,1,2-trichlorotrifluoroethane, 2,2-dichloropropane,1,1,1-trichloroethane, and carbon tetrachloride, for instrument A3UX14 on 08/14/13 @ 10:17. No action was taken on this basis because all the affected sample results were nondetected for the aforementioned compounds.

A VOC continuing calibration %D was greater than the quality control limit of 20% and less than 50% for tert-amyl-methyl ether, for instrument A3UX14 on 08/14/13 @ 10:38. No action was taken on this basis because all the affected sample results were nondetected for tert-amyl-methyl ether.

The VOC continuing calibration %Ds were greater than the quality control limit of 20% and less than 50% for

trans-1,3-dichloropropene, 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, naphthalene, and 1,2,3-trichlorobenzene, for instrument A3UX8 on 08/16/13 @ 01:08. No action was taken on this basis because all the affected sample results were previously qualified due to blank contamination or were nondetected for the aforementioned compounds.

The LCS associated with batch 97336/2-A had a percent recovery greater than the quality control limit for bromomethane. No action was taken on this basis because the affected sample results were nondetected for bromomethane.

The PCB surrogate spike compound decachlorobiphenyl, had a %R on the CLP-1 column greater than the quality control limits for sample DR-TP-A82-03. No action was taken on this basis because all other surrogate recoveries were acceptable.

The CRDL percent recovery for vanadium on 08/23/13 @16:59 was > 110% quality control limit affecting all samples. No validation actions were required as all results were > 2X CRDL.

The CRDL percent recoveries for antimony on 08/23/13 @14:05 and @16:59 were > 110% quality control limit. No validation actions were required as all results were either qualified as a result of blank contamination or were nondetects.

The laboratory received two samples identified as DR-TP-A82-03. The suffix "A" was added to sample collected @14:20 in the database to make the sample identification unique.

Samples DR-TP-A76-10 and DR-TP-A76-11 were analyzed as VOC medium level samples due to concentrations greater than the linear calibration range of the instrument. This accounts for the elevated detection limits for the nondetected compounds.

Samples DR-TP-A76-10, DR-TP-A76-11 and DR-TP-A82-03 were analyzed at dilutions for the SVOC and TPH (C10-C32) fractions due to concentrations greater than the linear calibration range of the instrument. This accounts for the elevated detection limits for the nondetected compounds.

Samples DR-TP-A76-11 and DR-TP-A82-03 were analyzed at dilutions for the PCB fraction. Sample DR-TP-A76-11 was diluted due to a matrix issue. Sample DR-TP-A82-03 was diluted due to an Aroclor-1248 concentration greater than the linear calibration range of the instrument. This accounts for the elevated detection limits for the nondetected compounds.

Executive Summary

Laboratory Performance: Blank contamination resulted in the qualification of data for the VOC and metals fractions. Two VOC compounds had RRF noncompliances resulting in the rejection of data. Continuing calibration %D noncompliances in the VOC and TPH (C10-C32) fractions resulted in the qualification of data. The CRDL percent recoveries for several analytes were outside the 90-110% quality control limits. LCS percent recovery noncompliance resulted in the qualification of SVOC data. Surrogate percent recovery noncompliances resulted in the qualification of PCB data.

Other Factors Affecting Data Quality: The ICP serial dilution percent difference was > 10% quality control limit for chromium and lead affecting several samples. Matrix spike percent recovery noncompliances for barium and cadmium resulted in the qualification of data. Positive results less than the reporting limit (RL) were qualified as estimated, (J), due to uncertainty near the detection limit.

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994) and Region III modifications to the National Functional Guidelines for Inorganic Data Validation (April 1993). The text of this report has been formulated to address only those problem areas affecting data quality.

Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This report is confidential and is intended for the sole use of TestAmerica and its client. All questions regarding this report should be directed to the TestAmerica Project Manager who has signed this report.

CASE NARRATIVE

Client: Tetra Tech, Inc

Project: Dump Road Test Pits

Report Number: 240-27894-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 08/13/2013; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.8 C.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were prepared on 08/13/2013 and 08/14/2013 and analyzed on 08/14/2013 and 08/16/2013.

1,2,4-Trichlorobenzene, Carbon disulfide, Naphthalene and Toluene were detected in method blank MB 240-97336/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Methylene Chloride and Naphthalene were detected in method blank MB 240-97446/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

The laboratory control sample for prep. batch 97336 recovered outside control limits for the following analyte(s): Bromomethane. Bromomethane has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

Insufficient sample volume was available to meet method-mandated requirements for matrix spike/matrix spike duplicate (MS/MSD) analyses for prep. batch 97336 on these samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2).

No other difficulties were encountered during the VOCs analysis. All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GCMS)

Sample TB-081213 (240-27894-3) was analyzed for volatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 08/21/2013.

No MS/MSD in batch 98342 due to instrument failure.

No other difficulties were encountered during the VOCs analysis. All other quality control parameters were within the acceptance limits.

SEMIVOLATILE ORGANIC COMPOUNDS (GCMS)

Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for semivolatile organic compounds (GCMS) in accordance with EPA SW-846 Method 8270D. The samples were prepared on 08/14/2013 and analyzed on 08/27/2013.

Benzaldehyde failed the recovery criteria low for LCS 240-97388/14-A. Refer to the QC report for details.

Samples DR-TP-A76-10 (240-27894-1)[10X], DR-TP-A76-11 (240-27894-2)[50X] and DR-TP-A82-03 (240-27894-4)[6.67X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The laboratory control sample (LCS) for batch 97388 recovered outside control limits for the following analytes: Atrazine, Benzaldehyde. Since these are non-controlling analytes, no corrective action was taken.

The following sample was diluted due to the nature of the sample matrix: DR-TP-A76-10 (240-27894-1). Elevated reporting limits (RLs) are provided.

The laboratory control sample (LCS) for prep batch 97388, associated with samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4), DR-TP-A82-03 (240-27894-5), had a recovery for benzaldehyde below acceptance criteria. This compound is not a control analyte; therefore, no corrective action was required. The data have been flagged accordingly.

No other difficulties were encountered during the SVOCs analysis. All other quality control parameters were within the acceptance limits.

GASOLINE RANGE ORGANICS (GRO)

Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for gasoline range organics (GRO) in accordance with EPA SW-846 Method 8015B - GRO. The samples were analyzed on 08/22/2013.

No difficulties were encountered during the GRO analysis. All quality control parameters were within the acceptance limits.

DIESEL RANGE ORGANICS (DRO)

Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for diesel range organics (DRO) in accordance with EPA SW-846 Method 8015C - DRO. The samples were prepared on 08/14/2013 and analyzed on 08/16/2013 and 08/17/2013.

Samples DR-TP-A76-10 (240-27894-1)[10X], DR-TP-A76-11 (240-27894-2)[10X] and DR-TP-A82-03 (240-27894-4)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The continuing calibration verification (CCV) for diesel associated with batch 97627 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. DR-TP-A82-03 (240-27894-5)

No other difficulties were encountered during the DRO analysis. All other quality control parameters were within the acceptance limits.

POLYCHLORINATED BIPHENYLS (PCBS)

Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for polychlorinated biphenyls (PCBs) in accordance with EPA SW-846 Method 8082A. The samples were prepared on 08/26/2013 and analyzed on 08/28/2013 and 08/30/2013.

Decachlorobiphenyl failed the surrogate recovery criteria high for DR-TP-A76-10 (240-27894-1). Decachlorobiphenyl failed the surrogate recovery criteria low for DR-TP-A76-11 (240-27894-2).

Samples DR-TP-A76-11 (240-27894-2)[5X] and DR-TP-A82-03 (240-27894-4)[5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

The following sample required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur: DR-TP-A76-11 (240-27894-2).

Two surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample(s) contained an allowable number of surrogate compounds outside limits: DR-TP-A76-10 (240-27894-1). These results have been reported and qualified.

The following sample(s) appears to contain polychlorinated biphenyls (PCBs); however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: DR-TP-A82-03 (240-27894-4). Due to the poor match with the Aroclor standard(s), there is increased qualitative and quantitative uncertainty associated with this result.

The following sample required a tetrabutylammonium sulfite (TBA) clean-up to reduce matrix interferences caused by sulfur:

DR-TP-A76-10 (240-27894-1). Lot # S65830

No other difficulties were encountered during the PCBs analysis. All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICP)
Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 08/16/2013 and analyzed on 08/23/2013.

Antimony, Molybdenum and Silver exceeded the RPD limit for the duplicate of sample DR-TP-A76-10DU (240-27894-1).

No other difficulties were encountered during the metals analysis. All other quality control parameters were within the acceptance limits.

MERCURY
Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for mercury in accordance with EPA SW-846 Method 7471B. The samples were prepared on 08/16/2013 and analyzed on 08/19/2013.

No other difficulties were encountered during the mercury analysis. All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS
Samples DR-TP-A76-10 (240-27894-1), DR-TP-A76-11 (240-27894-2), DR-TP-A82-03 (240-27894-4) and DR-TP-A82-03 (240-27894-5) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 08/13/2013.

No difficulties were encountered during the % solids analysis. All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc

Job Number: 240-27894-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	J	Indicates an Estimated Value for TICs
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	F	MS/MSD Recovery and/or RPD exceeds the control limits
	T	Result is a tentatively identified compound (TIC) and an estimated value.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	N	This flag indicates the presumptive evidence of a compound.
GC/MS Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
GC VOA		
	U	Indicates the analyte was analyzed for but not detected.
GC Semi VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate is outside control limits

DATA REPORTING QUALIFIERS

Client: Tetra Tech, Inc

Job Number: 240-27894-1

Lab Section	Qualifier	Description
Metals		
	U	Indicates the analyte was analyzed for but not detected.
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	F	MS/MSD Recovery and/or RPD exceeds the control limits
	W	PS: Post-digestion spike was outside control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	V	Serial Dilution exceeds the control limits

Batch Notes	
Balance ID	b037
Na2SO4 Lot Number	963867
Prep Solvent Lot #	1115251

Basis	Basis Description
T	Total/NA

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

DUMP ROAD SOURCE AREAS
SAMPLE DELIVERY GROUP (SDG) 240-28322-1

SAMPLES: 4/Soil/VOC SVOC/PCBGRO/DRO/Metals

DR-SB-190-18-20 DR-SB-190-28-30 DR-SB-190-8-10 DR-SB-191-22-28

1/Aqueous/VOC

TB-082313

Overview

The sample set for Dump Road Source Areas, SDG 240-28322-1 consisted of four (4) soil environmental samples and a trip blank analyzed for volatile organic compounds (VOCs). Four (4) soil environmental samples were also analyzed for semivolatile organic compounds (SVOCs). total petroleum hydrocarbons (TPH) gasoline and total petroleum hydrocarbons (TPH) diesel, polychlorinated biphenyls and metals.

The samples were collected on August 23, 2013 and analyzed by Test America Laboratories Inc. All analyses were conducted in accordance with SW-846 Methods 8260B for VOCs, 8270D for SVOCs, 8015C for TPH (gasoline and diesel), 8082A for PCBs, 6010C for metals, and 7471B for mercury analytical and reporting protocols.

The data contained in this SDG were validated with regard to the following parameters: data completeness, holding times, GC/MS tuning, initial/continuing calibrations, laboratory method /preparation blank results, surrogate spike recoveries, blank spike/blank spike duplicate results, matrix spike/matrix spike duplicate, internal standard recoveries, chromatographic resolution, ICP interference results, ICP serial dilution results, compound identification, compound quantitation, and detection limits. Areas of concern are listed below.

Major

- The VOC relative response factors (RRFs) for tert-butyl alcohol and vinyl acetate were less than the lower quality control limit in the initial calibration on August 17, 2013 and the continuing calibration on August 30, 2013 @ 10:39 for instrument A3UX17. The nondetected tert-butyl alcohol and vinyl acetate results were qualified as rejected in the affected sample TB-082313.

- The VOC RRFs for tert-butyl alcohol and vinyl acetate were less than 0.05 quality control limit in the initial calibration on April 18, 2013 and the continuing calibration on August 29, 2013 @ 2:42 on instrument A3UX8. The nondetected tert-butyl alcohol and vinyl acetate results were qualified as rejected (UR) in the affected samples.

Minor

- The continuing calibration percent differences (%Ds) for several compounds were greater than the 20% quality control limit and less than 50% on August 29, 2013 @ 2:42 on instrument A3UX8. The compounds were carbon disulfide, methylene chloride, tert-butyl alcohol, trans-1,3-dichloropropene, 1,1,2,2-

tetrachloroethane, 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane, naphthalene, and 1,2,3-trichlorobenzene. The detected carbon disulfide, methylene chloride, and 1,2,3-trichlorobenzene results were qualified as estimated (J). No action was taken on the detected results qualified due to blank contamination or the nondetected results of the aforementioned compounds.

- Contamination was detected in the VOC laboratory method blank associated with batch 240-99442/6 analyzed on August 29, 2013 on instrument A3UX8 affecting the soil samples.

Contaminant	Maximum Concentration (ug/kg)	Action Level (mg/kg)
1,2,4-trichlorobenzene	0.389	1.945
Acetone	6.77	67.7
Naphthalene	0.636	3.18
Methylene chloride	1.06	10.6
Toluene	0.513	2.565

An action level of 10X the maximum concentrations of common laboratory contaminants, acetone and methylene chloride, and 5X the concentration of 1,2,4-trichlorobenzene, naphthalene and toluene was established in order to evaluate samples for blank contamination. Sample aliquot, percent solids and dilution factors were taken into consideration when applying the action level. Detected results less than the action level were qualified as (B).

- Tentatively identified compounds (TIC) were detected in the trip blank and sample DR-SB-191-22-28 were qualified as presumptively present (NJ).

- The laboratory control sample (LCS) percent recovery (%R) of benzaldehyde was less than the lower quality control limit in batch 240-100222/24. The nondetected benzaldehyde results were qualified as biased low (UL) in the affected samples.

- The CRDL %Rs of copper and lead were greater than the 110% quality control limit. The detected lead result less than 2X CRDL was qualified as estimated (J) due to conflicting directional bias in sample DR-DB-190-8-10.

- The CRDL %R of mercury was less than the lower 80% quality control limit. The detected mercury result less than 2X the CRDL was qualified as estimated (J) due to conflicting directional bias in sample DR-DB-190-18-20.

- Contamination was detected in a continuing calibration blank in the metals fraction.

Contaminant	Maximum Concentration (ug/L)	Action Level (mg/kg)
Barium	0.744	0.372
Molybdenum	2.36	1.18

An action level of 5X the maximum concentration was established in order to evaluate samples for blank contamination. Sample aliquot, percent solids and dilution factors were taken into account when applying the action level. Positive results less than the action level were qualified as (B).

- The matrix spike (MS) %R of antimony was less than the lower quality control limit in sample DR-DB-190-18-20. The detected and nondetected antimony results were qualified as biased low (L) and (UL), respectively.

- The serial dilution %Ds for barium, chromium, cobalt, lead, nickel, vanadium and zinc were greater than 10% in sample DR-SB-190-18-20. The detected barium, chromium, cobalt, lead, nickel, vanadium and zinc results were qualified as estimated (J).

- Positive results reported below the quantitation limit but above the method detection limit (MDL) were qualified as estimated, (J).

Notes

The continuing calibration %Ds for 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, naphthalene and 1,2,3-trichlorobenzene were greater than the 20% quality control limit and less than 50% on August 30, 2013 @ 10:39 on instrument A3UX17. No action was taken on the nondetected 1,2-dibromo-3-chloropropane, 1,2,4-trichlorobenzene, hexachlorobutadiene, naphthalene and 1,2,3-trichlorobenzene results in the affected sample TB-082313.

Contamination was detected in the VOC laboratory method blank associated with batch 240-99702/6 analyzed on August 30, 2013 affecting the sample TB-082313.

Contaminant	Maximum Concentration (ug/L)
Benzene	0.148
Methylene chloride	0.854

No action was taken on the nondetected benzene and methylene chloride results in the affected sample.

The matrix spike/ matrix spike duplicate (MS/MSD) percent recoveries (%Rs) of vinyl acetate were less than the lower quality control limit in sample DR-SB-190-18-20. No action was taken on the nondetected vinyl acetate results which were qualified as rejected due to a more severe noncompliance.

The trip blank, TB-082313, contained chloromethane and bromomethane. No action was taken on the nondetected chloromethane and bromomethane results in the soil samples.

In the initial calibration of instrument A4HP7 on September 5, 2013, pentachlorophenol and di-n-octyl phthalate had relative standard deviations (RSDs) greater than the 15% quality control limit and less than 50%. No action was taken on the nondetected pentachlorophenol and di-n-octyl phthalate results in the affected samples.

The RPD for TPH as diesel was greater than the quality control limit in the MS/MSD %Rs in sample 240-28436-4. No action was taken since the MS/MSD %Rs were within quality control limits and this sample is not included in this SDG.

The surrogate recoveries of tetrachloro-m-xylene and decachlorobiphenyl were greater than the upper quality control limit on column CLP-1 in sample DR-SB-191-22-24. This sample was diluted 5X for analysis. The detected Aroclor 1254 result was reported from column CLP-2. No action was taken.

Naphthalene and hexachlorobutadiene were reported in both the VOC and the SVOC fractions.

Nondetected results were reported to the MDL.

Executive Summary

Laboratory Performance: The VOC RRFs for tert-butyl alcohol and vinyl acetate were less than the quality control limit resulting in the rejection of nondetected results. The continuing calibration %Ds for several VOC compounds were greater than the 20% quality control limit and less than 50%. VOC and metals results were qualified due to blank contamination. The CRDL %Rs of copper, lead and mercury were outside quality control limits.

Other Factors Affecting Data Quality: TICs were detected in trip blank and DR-SB-191-22-28. The MS %R of antimony was less than the lower quality control limit. The serial dilution %Ds for barium, chromium, cobalt, lead, nickel, vanadium and zinc were greater than 10% in sample DR-SB-190-18-20. Positive results reported below the quantitation limit but above the method detection limit were qualified as estimated, (J).

The data for these analyses were reviewed with reference to Region III modifications to U.S. EPA National Functional Guidelines for Organic Data Validation (Sept. 1994) and U.S. EPA National Functional Guidelines for Inorganic Data Validation (April 1993). The text of this report has been formulated to address only those problem areas affecting data quality.

Appendix B – Results as Reported by the Laboratory
Appendix C – Support Documentation

Appendix A

Qualified Analytical Results

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = ICP PDS Recovery Noncompliance; MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = RPD between columns/detectors >40% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 standard deviations is greater than sample activity
Z1 = Tentatively Identified Compound considered presumptively present
Z2 = Tentatively Identified Compound column bleed
Z3 = Tentatively Identified Compound aldol condensate
