1.0 Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech, Inc. (Tetra Tech) has prepared this Remedial Investigation and Remedial Action Progress Report (RI/RAPR) to summarize the results of remedial investigation activities conducted at the former Lockheed Electronics Company (LEC) site (hereinafter the "Site") and to provide the results of the semi-annual groundwater and surface water sampling activities conducted in 2014. These activities were conducted using field and sampling methods consistent with the New Jersey Department of Environmental Protection (NJDEP) Field Sampling Procedures Manual (FSPM) and the NJDEP Technical Requirements for Site Remediation (New Jersey Administrative Code [N.J.A.C.] 7:26E).

Environmental investigation and remedial activities associated with the Site are performed pursuant to the regulatory authority of the Industrial Site Recovery Act (ISRA) and in accordance with the ISRA Rules (N.J.A.C. 7:26B). The Site is recorded within the ISRA program as Case No. E90038 and is also identified under Program Interest ID No. 004334.

This Remedial Investigation and Remedial Action Progress Report is organized as follows:

- The introduction and report organization are provided in Section 1.
- A summary of background information, including a description of the site location, site history and operations, the results of previous investigation activities, and a brief description of the site geology and hydrogeology are provided in Section 2.
- The installation of additional monitoring wells and monitoring well repair activities conducted in the late 2013 are described in Section 3.
- A description of groundwater flow and solute transport modeling activities conducted in 2014 is provided in Section 4.
- A technical overview of the 2014 sampling activities, including an assessment of analytical data quality and an overall assessment of the sampling results, is provided in Section 5.

- The 2014 groundwater and surface water sampling methods and results and the status of both the groundwater extraction system and the vapor intrusion (VI) investigation are discussed in Section 6.

- Investigation findings, a discussion of the site conceptual model, and proposed recommendations are provided in Section 7.

2.0 Site Background

Details regarding the Site background are provided in previous site documents. The Site description, physical setting, and history, including previous remedial investigation and remediation activities, are summarized in the sections below.

2.1 SITE LOCATION AND DESCRIPTION

The Site is located on United States (U.S.) Route 22 West in the Boroughs of Watchung and North Plainfield, Somerset County, New Jersey. The Site is a parcel of land approximately 80 acres in size located on the north side of U.S. Route 22. LEC activities at the Site ceased in 1989, and the Site was re-developed as the Watchung Square Mall in 2000.

The Site is located in a mixed residential and commercial area. The Site is bordered to the south by U.S. Route 22, which is a predominately commercial area with residential properties located on side streets and mapped wetlands in drainage areas. The Site is bordered to the west by an apartment complex (formerly Crystal Ridge Club, presently Avalon Watchung) and a condominium complex (Regency Village Condominiums). Forested areas and residences border the Site to the north, and commercial properties border the Site to the east.

The Site location is shown on Figure 2-1. The Site elevation ranges from 140 to 320 feet above mean sea level (msl), sloping to the south from higher elevations on the First Watchung Mountain, located northwest of the Site, to lower elevations along U.S. Route 22, located southeast of the Site. A map of the Site and the associated monitoring well network is provided in Figure 2-2. The closest surface water body is Crab Brook located south of the Site and U.S. Route 22 (Figure 2-2). Crab Brook is partially fed by runoff from the northwest portion of the First Watchung Mountain and several surface water drainage points along U.S. Route 22. Crab Brook flows into Stony Brook approximately 1.2 miles downstream of the Site. Wetlands areas have been mapped by the NJDEP within one mile of the Site at locations immediately to the north of the Site, and south of the Site along U.S. Route 22.

2.2 SITE HISTORY

The Site was originally developed in 1953 by Stavid Engineering. Lockheed Martin Corporation acquired Stavid Engineering in 1959 and created Lockheed Electronics Corporation, which was subsequently operated by Sanders, a Lockheed Martin Company. Additional land acquisitions resulted in the current Site boundaries. The Site was used to manufacture, assemble, and test electronic components. Trichloroethene (TCE) was used in former Building 3 (near the MW-549 well cluster on Figure 2-2) as a non-flammable liquid coolant in conjunction with low-temperature testing of electronic components. TCE was also used in former Building 7 as a solvent to clean printed circuit boards. Operations at the Site ceased in 1989.

The cessation of Site activities in 1989 triggered a Site investigation under the New Jersey Environmental Cleanup Responsibility Act (ECRA) (superseded by ISRA). The General Information Submission for the Site was submitted to NJDEP on December 4, 1989. A Site Evaluation Submission (SES) for the Site was submitted to NJDEP on January 12, 1990 without a Site Sampling Plan, because final revisions were necessary to characterize areas of environmental concern thoroughly (McLaren, 1990a). The Sampling Plan was submitted as an addendum to the SES on March 28, 1990 (McLaren, 1990b).

The Sampling Plan (McLaren, 1990b), which provided an assessment of environmental impacts at the former LEC facility, was subsequently modified after additional potential areas of concern were noted during NJDEP site walks with Lockheed Martin representatives in May and June 1990. In a letter dated June 29, 1990, NJDEP requested information on the final discharge points of all storm and sanitary sewers, sumps, trenches, and supplemental information on other areas of concern. Lockheed Martin subsequently identified the final discharge points for the interior floor drains at the facility and submitted a Deficiency Letter Response Report to NJDEP on September 6, 1990. NJDEP provided Lockheed Martin with Draft Conditional Sampling Plan Approval on September 12, 1990 and Final Conditional Sampling Plan Approval on October 24, 1990.

Initial investigations based on the approved Sampling Plan identified multiple areas of concern (AOCs) at the Site. Investigation activities included the collection of soil, sediment, groundwater, and surface water samples, and, in several areas, remedial measures were implemented. The

remedial measures were later accepted by NJDEP and assigned No Further Action (NFA) status. Investigation and remedial action results have been documented in a series of reports submitted to the NJDEP since 1991.

A total of 95 AOCs were identified at the Site for potential impacts to soil and groundwater. Details regarding the AOCs, including the potentially impacted media, the potential contaminants of concern, and a summary of the investigation and remedial activities conducted at the AOCs are provided in the Case Inventory Document (CID) attached as Appendix A. As shown in the CID and as summarized in Table 2-1, NJDEP has approved NFA for all of the AOCs except On-Site and Off-Site Groundwater (AOCs 26 and 27, respectively). In the October 24, 1990 letter approving the Sampling Plan, NJDEP approved NFA for 14 AOCs without requiring sampling or further investigation. Based on the results of non-intrusive investigations (e.g., records review, field observations), NJDEP also approved NFA for an additional 16 AOCs in letters dated January 21, 1992, January 27, 1994, and November 14, 1994.

Investigations were conducted at 63 soil AOCs and based on the investigation results, remedial actions were conducted at 19 soil AOCs to achieve NFA status. Remedial activities conducted at the soil AOCs are described below, followed by a summary of both the groundwater investigation and remediation activities and the vapor intrusion investigation activities at the Site.

2.2.1 Soil Remediation

Compounds identified at concentrations exceeding the applicable NJDEP Soil Cleanup Criteria during the soil investigation activities included volatile organic compounds (VOCs), petroleum hydrocarbons, base neutral compounds (BNs), polychlorinated biphenyls (PCBs), and metals. Soil remediation activities conducted at the Site are summarized below by AOC.

AOC 1B (10,000 Gallon No. 4 Fuel Oil Underground Storage Tank [UST] South of Building 1) and AOC 2A (10,000 Gallon No. 4 Fuel Oil UST North of Building 2)

During the removal of two 10,000-gallon fuel oil USTs in November 1989, soil contamination was detected below the tanks and additional excavation was conducted to remove the impacted soil. Soil samples collected following the tank removals identified elevated concentrations of

total petroleum hydrocarbons and BNs in the soil at both tank locations. Additional excavation was conducted at both UST locations until soils were visibly clean and organic vapor free. Excavated petroleum-impacted soil from both locations (approximately 356 tons from the south side of Building 1 and 375 tons from the north side of Building 2) was transported off-site for proper disposal in June and July 1990. Post-excavation soil sample results met Residential Direct Contact Soil Cleanup Criteria (RDCSCC). Details regarding the UST removal and excavation were submitted in the SES dated March 28, 1990 and the No Further Action Summary Report prepared by Lockheed Sanders, Inc., revised August 29, 1995. NJDEP approved no further action for AOCs 1B and 2A in their letter dated June 28, 1991.

AOC 2B (Staining; Loading Dock; Transformer Area; North of Building 2)

Staining was observed from an aerial photo on the north side of Building 2 near the location of a historic loading dock that was reportedly used for the delivery and temporary storage of chemicals used in Building 2 (AOC 2B). Investigation indicated no record of a spill at the loading dock, but soil samples were collected from the stained area around the loading dock and within the driveway area and near the transformer pad in March 1992. Elevated PCB concentrations were reported in a soil sample collected near the transformer pad. Additional sampling was conducted to delineate the PCBs and 3 cubic yards of soil were excavated from the stained area that contained PCBs in April 1992. The excavated soil was transported off site for proper disposal in October 1992. Post-excavation sampling results met the applicable RDCSCC and the NJDEP approved no further action for AOC 2B in their letter dated January 12, 1994. Details regarding the sampling and excavation were submitted in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992) and the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993) and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. revised August 29, 1995.

AOC 2C (Paint Shed North of Building 2)

During a site inspection for the SES, paint was observed on the soil around the paint shed located north of Building 2 (AOC 2C). Paint was reportedly stored on the west side of the shed. Soil samples collected near the paint shed indicated elevated levels of tetrachloroethene (PCE).

Additional sampling was conducted to delineate the PCE and following delineation, soil excavation activities were conducted. One post-excavation sample indicated elevated TCE concentrations, and compliance averaging was employed to meet the RDCSCC for TCE. Approximately 19 cubic yards of VOC-impacted soil was transported off site for proper disposal in June 1992. Post-excavation sampling results met compliance averaging criteria and NJDEP approved no further action for AOC 2C in their letter dated January 27, 1994. Details regarding the paint shed sampling and excavation were submitted in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992) and the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993) and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

AOC 2F (Boiler Room Floor Drain) and AOC 2FR (Boiler Room Floor Drain - Fuel Oil)

Small quantities of chemicals were stored in the Building 2 boiler room where a compressor with a condensate line running to a four-inch diameter floor drain was located (AOC 2F). Some condensate dripping into the drain was observed during a site visit for the SES, but there was no staining, no evidence of a spill, or no cracks or holes were observed in the concrete. One of the initial soil samples collected in the boiler room indicated elevated levels of petroleum hydrocarbons. Delineation sampling was conducted in March 1992 and approximately 2 cubic yards of soil was excavated. Post-excavation sampling results met the applicable RDCSCC and the NJDEP approved no further action for AOC 2F in their letter dated January 27, 1994.

In June 1996, Lockheed Sanders had demolished and removed all structures and foundation systems at the former LEC Site except Building 2. Because soil contamination had been encountered at other Site locations, a soil Remedial Investigation (RI) was performed at Building 2 in 1996 (Building 2 Remedial Investigation/Remedial Action Report [RI/RAR], prepared by Sevee and Maher Engineers, Inc. [SME], dated July 21, 1997b). In September 1996, Lockheed Sanders notified NJDEP of a historic discharge of petroleum hydrocarbons in the soil beneath Building 2 (AOC 2FR). In December 1996, Amendment #2 to the July 1995 Soil Remedial Action Work Plan (SME, 1995) was submitted to NJDEP and re-opened AOC 2F, which had previously received NFA approval form the NJDEP. The Building 2 RI was conducted from June

1996 to January 1997. During the RI, soil sampling data indicated elevated petroleum hydrocarbons concentrations near the boiler room, with the most likely source being No. 4 fuel oil. Delineation sampling was conducted (approximately 1,500 cubic yards of impacted soil was delineated), and in a letter dated December 6, 1996, the NJDEP approved Lockheed's proposal for excavation and off-site disposal of the impacted soil. In April and May 1997, approximately 2,140 tons of impacted soil was excavated and transported off site for proper disposal. Post excavation sampling indicated that the extent of the soil impacted by petroleum hydrocarbons was removed, and the NJDEP approved no further action for AOC 2FR in their letter dated July 22, 1998. Details regarding the investigation and remediation of the Building 2 soils are provided in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992) and the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993), the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995), and the Building 2 RI/RAR.

AOC 3A (10,000 Gallon #4 Fuel Oil UST; North Side of Building 3)

An oil UST that was formerly located on the north side of Building 3 was reportedly removed during the early 1980s. No closure report was filed and no records of post excavation activities could be located. An investigation was conducted during the SES and the UST was located. The UST was subsequently registered, permitted, and removed in accordance with the NJDEP Bureau of Underground Storage Tank requirements. Post-excavation soil samples met the applicable RDCSCC and the NJDEP approved no further action for AOC 3A in their letter dated June 28, 1991. Details regarding the remediation of the UST are provided in the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

AOC 3D (Drop Hammer Pit; Building 3 Interior)

Machinery in a Drop Hammer Testing Pit located in the interior of Building 3 (AOC 3D) was used to support and vibrate a metal plate at floor level to which equipment could be attached and tested for susceptibility to impact and vibration. The walls of the test pit showed visible signs of oil or hydraulic fluid staining. The floor contained some accumulation of what appeared to be oil and water. Delineation of the soils beneath Building 3, including the drop hammer pit area, was

conducted in 1993 (Soil Remedial Investigation Report [RIR], SME, May1994); therefore, no further delineation relative to the drop hammer pit was required. In their letter dated November 14, 1994, the NJDEP indicated that the results of the soil delineation at Building 3 (which included the soil at AOC 3D) were acceptable. Soil in the drop hammer pit area was remediated in conjunction with the Building 3 Soil Remediation activities. The shallow soils (i.e., the fill/Till 1 and silt/clay layers) were remediated from February 1996 to May 1996 via excavation and ex-situ treatment by mechanical processing (approximately 39,800 cubic yards of soil). These soil remediation activities included remediation of the soil at AOC 3D. NJDEP approved no further action for the shallow soil at Building 3 in their letter dated April 18, 1997. Details regarding the remediation of the drop hammer pit area and the Building 3 soil remediation are provided in the May 1994 Soil RIR, the RAR Building 3 Clay Remediation (SME, dated November 1, 1996), and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

AOC 3G (Stained Pavement; Northwest Corner Building 3B; Former Drum Storage)

An oil stain was observed on the pavement from oil storage drums stored at the northwest corner of Building 3B (AOC 3G). The spill was approximately five feet in diameter. Initial soil sampling results indicated that elevated petroleum hydrocarbon concentrations were reported in one sample. Additional sampling was conducted to delineate the petroleum hydrocarbons and 4 cubic yards of soil were excavated from the stained area in April 1992. The excavated soil was transported off site for proper disposal in June 1992. Post-excavation sampling results met the applicable RDCSCC and Impact to Groundwater Soil Cleanup Criteria (IGWSCC) and the NJDEP approved no further action for AOC 3G in their letter dated January 27, 1994. Details regarding the sampling and excavation were submitted in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992), the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993) and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. revised August 29, 1995.

AOC 3N (Building 3 Clay (Fill/Till 1 and Silt/Clay) and AOC 3O (Building 3 Sand)

Soil impacted by VOCs, primarily TCE, was identified in the vicinity of Building 3. Delineation of the soils beneath Building 3 was conducted in 1993 (Soil RIR, SME, May 1994). Approximately 50,000 cubic yards of soil containing TCE concentrations greater than 1 milligram per kilogram (mg/kg) were delineated. The highest TCE concentrations were measured on the northwest side of Building 3 in the shallow soils (i.e., the fill/Till 1 and silt/clay layers). Treatment of these shallow soils was conducted inside a temporary enclosed structure at the Site that contained the volatilized TCE. TCE vapors were removed from the structure via an air pollution control system consisting of an exhaust blower and 12,500 pound carbon units in series. Following testing to confirm that TCE concentrations were below the NJDEP IGWSCC of 1 mg/kg, the treated soil was used to backfill the excavation. Based on NJDEP approval, no post-excavation sampling was required provided that the soil was excavated to the previously determined clean zones. Excavation and ex-situ treatment by mechanical processing of approximately 39,800 cubic yards of soil was conducted from February 1996 through May 1996, as previously described above for AOC 3D. NJDEP approved no further action for AOC 3N in their letter dated April 18, 1997.

The AOC 3N remediation described above treated the shallow impacted soils at Building 3, but elevated TCE concentrations were also reported in the sand/Till 2 layers beneath the silt/clay layer. The remediation of Building 3 Sand (AOC 3O) completed the remediation of the delineated soils in the Building 3 soil area. Remediation was accomplished via SVE methods using three horizontal SVE wells and an air pollution control system consisting of a vacuum pump and activated carbon. The SVE system began operations on December 10, 1996 and was shut down on April 10, 1997. Based on the delineation data, the SVE system treated approximately 23,000 cubic yards of in-situ sand/Till 2 soils. Following shutdown and a six-month stabilization period, post-remediation samples were collected in October 1997 from the sand/Till 2 soils to confirm using compliance averaging methods that the TCE concentrations were below the NJDEP IGWSCC of 1 mg/kg. NJDEP approved no further action for AOC 3O in their letter dated July 22, 1998. Details regarding the Building 3 soil investigation and remediation are provided in the

May 1994 Soil RIR, the RAR Building 3 Clay Remediation (SME, dated November 1, 1996), and the RAR Building 3 Sand AOC (SME, dated February 25, 1998).

AOC 4A (Loading Dock; Southwest of Building 4)

The loading dock on the southwest corner of Building 4 projected both to the south and to the west (AOC 4A). Both docks were surrounded by pavement. Storm water drainage was provided by two storm water drains, one on either side of the southern dock. To assess the potential impact to soil from chemical/hazardous waste spills, soil samples were collected near the loading docks. Soil sampling results indicated elevated concentrations of VOCs and BNs. Additional sampling was conducted to delineate the extent of elevated concentrations. Following delineation, approximately 17 cubic yards of VOC and BN-impacted soil was transported off site for proper disposal in June 1992. Post-excavation sampling results met the applicable RDCSCC and IGWSCC and NJDEP approved no further action for AOC 4A in their letter dated January 27, 1994. Details regarding the loading dock sampling and excavation were submitted in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992), the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993) and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

AOC 4C (Cooling Tower; North of Building 4)

Samples were collected near a cooling tower that was located north of Building 4 to determine whether additives to the cooling water, which may have contained potential contaminants, were discharged onto the surface. Sludge generated from the operation of the cooling tower was disposed on the ground adjacent to the tower. The sludge covered an area of approximately 8 feet by 10 feet and stressed vegetation (i.e., dead grass) was observed in this area during the SES site inspection. An initial sludge sample collected from this area identified elevated concentrations of metals. Soil sampling was conducted to delineate the extent of the elevated metals (primarily cadmium, copper, and lead). In April 1992 following delineation, approximately 14 cubic yards of metals-impacted soil was excavated and staged for subsequent disposal. The excavated soil was transported off site for proper disposal in December 1992. Post-excavation sampling results

met the applicable RDCSCC and IGWSCC and NJDEP approved no further action for AOC 4C in their letter dated January 27, 1994. Details regarding the cooling tower sampling and excavation are provided in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992) the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993), and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

AOC 7A (500 Gallon 1,1,1-TCA UST; West Side of Building 7; RCRA Enclosure)

A 500-gallon 1,1,1-trichlorethane (1,1,1-TCA) UST was removed from beneath the air conditioner pad on the west side of Building 7 (AOC 7A) in August 1988. Soils samples were collected from the base of the excavation at that time and the excavation was backfilled. Concentrations of 1,1,1-TCA (2-7 mg/kg) were detected in the soil located within and surrounding the tank; therefore, additional soil excavation to remove the 1,1,1-TCA-impacted soil was conducted in March 1990, followed by post-excavation sampling. Post-excavation sampling results met the applicable RDCSCC and NJDEP approved no further action for AOC 4C in their letter dated June 28, 1991.

AOC 7F (500 Gallon Acid Waste UST; Northeast corner of Building 7) and AOC 7XX (Building 7A Surface Soils (Asphalt/BN Issue)

A 500-gallon acid waste UST was removed prior to construction of Building 7A in 1978 (AOC 7F). Soil sample results indicated elevated concentrations of BNs in the shallow soil only. Soil sampling was conducted to delineate the extent of the impacted soil. In April 1992 following delineation, the area was excavated and post-excavation samples indicated that BN concentrations remained elevated to the west in the surface soils. Results from test pits excavated further west indicated consistently elevated BN concentrations in the surface soils. The impacted surface soil area was determined to be the former location of an old “tar and chip” road and that the elevated BNs were likely derived from the disintegrated chips that were part of the original construction materials (AOC 7XX). The delineated area was excavated, with approximately 50 cubic yards excavated in April 1992 and 40 cubic yards excavated in August 1993. The excavated material was handled as waste asphalt and was transported offsite to an asphalt plant for recycling. Post-excavation sampling results met the applicable RDCSCC and IGWSCC and NJDEP approved no

further action for AOCs 7F and 7XX in their letter dated January 27, 1994. Details regarding the sampling and excavation of these AOCs are provided in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992) the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993), and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

AOC 7Y (10,000 Gallon Unlined Paint Stripping Waste Sump; Paint Room), AOC 7Z (General Plating Room; Interior Building 7), and AOC 10B (Sumps; Interior Building 10)

Building 7 contained a 10,000-gallon unlined paint stripping waste sump that was located in the paint room and collected runoff from the stripping and painting process (AOC 7Y). In the general plating room (AOC 7Z adjacent to the paint room), floor staining was observed during the SES site inspection. LEC replaced the floor with new concrete and acid resistant tiles in 1988 and although sampling of the concrete and soil indicated no contamination, a sump that predated the new floor remained. The sump received wash water and incidental spillage from the plating and degreasing process. Building 10, located just north of the paint and general plating rooms in Building 7, also contained sumps (AOC 10B). No spills were recorded inside Building 10, but a high volume of solvents were stored in the building and the floor showed visible signs of staining. Initial soil samples collected in 1990 indicated elevated VOC concentrations within and around the paint room and general plating room in Building 7, and near Building 10. Delineation sampling was conducted at the above AOCs, guided in part by a soil gas survey conducted in the area between Buildings 7 and 10.

From August to October 1992, a soil remedial investigation was conducted in the Building 7 area to delineate the extent of VOC impacted soil (SME, May 1994). The results indicated that TCE and PCE were the primary compounds of concern in the soil. Approximately 31,000 cubic yards of VOC-impacted soil were delineated in the Building 7 area. Soil remediation was accomplished via ex-situ SVE methods. The VOC-impacted soil was excavated and placed in SVE cells constructed in Building 7. Extraction wells and piping installed in the cells were connected to vacuum pumps and carbon adsorption air treatment units. Following testing to confirm that the VOC concentrations met applicable NJDEP soil cleanup criteria, the treated soil was used to

backfill the excavation. Based on NJDEP approval, no post-excavation sampling was required provided that the soil was excavated to the previously determined clean zones. Excavation and ex-situ treatment by mechanical processing of approximately 35,000 cubic yards of soil was conducted from November 1993 through June 1994.

During the excavation of Building 7, an abandoned UST was encountered and punctured, releasing soil and liquid that was contained within the excavation. Due to the uncertain history of the tank, emergency cleanup was implemented. Approximately 5,800 pounds of liquid and debris were transported off site in December 1993 and 120,000 pounds of soil were transported off site in March 1994 for proper disposal. It was later determined that the tank had been previously abandoned, since it was filled with sand; therefore, formal UST closure procedures were not required.

NJDEP approved no further action for AOCs 7Y, 7Z, and 10B in their letter dated January 27, 1994. Details regarding the Building 7 soil investigation and remediation are provided in the RAR Building 7 Soil Remediation (SME, dated August 1994), the Data Presentation Report for Revised Supplemental Sampling Plan for Groundwater Investigation (SME, dated January 1993), the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992), the Data Presentation Report for the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 1993), and the No Further Action Summary Report prepared by Lockheed Sanders, Inc. (revised August 29, 1995).

2.2.2 Regulatory Closure Summary - Soils

In summary, a total of 95 AOCs were identified at the Site for potential impacts to soil and groundwater. As shown in the CID and as summarized in Table 2-1, NJDEP has approved NFA for all of the AOCs except On-Site and Off-Site Groundwater (AOCs 26 and 27, respectively). In their October 24, 1990 letter approving the Sampling Plan, NJDEP approved NFA for 14 AOCs without requiring sampling or further investigation. Based on the results of non-intrusive investigations (e.g., records review, field observations), NJDEP also approved NFA for an additional 16 AOCs in letters dated January 21, 1992, January 27, 1994, and November 14, 1994. Based on the investigation results at the remaining 63 soil AOCs, remedial actions were conducted

at 19 soil AOCs to achieve NFA status. As described above, site-wide soil remediation has been completed.

Based on the following lines of evidence, professional judgment was used by the Licensed Site Remediation Professional (LSRP) to determine that previous ECRA/ISRA compliance activities were sufficient to substantively meet the requirements of a Preliminary Assessment to ensure that no AOCs were previously missed, and that previous sampling protocol and data quality are acceptable to meet Site Investigation/Remedial Investigation and remedial action objectives:

- Documentation of at least three site-wide inspections by NJDEP between 1990 and 1991 when the facility was operational.
- One EPA site inspection in 1992 that documented "no soil contamination, spills or sources were identified".
- Reference by NJDEP that aerial photo review was performed.
- Number and distribution of soil sampling locations.
- Extensive active soil remediation via excavation and soil vapor extraction.
- Record of consistent ECRA/ISRA compliance history as evidenced by regulatory submittals and correspondence reviewed during a NJDEP records search.
- Record of No Further Action approval issued by NJDEP for 95 AOCs.
- No previously remediated compounds of concern have newly-adopted soil remediation standards that are an order of magnitude or more lower in concentration compared to soil cleanup criteria.

2.2.3 Groundwater

Initial investigation into potential groundwater impacts at the Site was conducted in 1990 following the closure of a 500-gallon 1,1,1-TCA UST on the west side of Building 7 (AOC 7A) in 1988 (McLaren, 1990c). Groundwater investigation activities were expanded at the former LEC facility during implementation of the Sampling Plan approved by NJDEP in October 1990, as documented in the Revised Supplemental Sampling Plan (McLaren/Hart, dated March 6, 1992).

In response to NJDEP's January 21, 1992 comment letter, additional groundwater investigation activities were conducted by SME in 1992, including the installation and sampling of 17 monitoring wells and 9 piezometers at the former LEC facility, hydraulic conductivity testing (i.e., monitoring well slug tests and laboratory permeability testing of Shelby tube samples), and an

assessment of potential impacts to the LEC production wells (PW-2 and PW-3). The investigation indicated that groundwater beneath the Site was impacted by VOCs, primarily TCE, and that the principle VOC sources were near Building 3 and 7. Free-phase TCE was not encountered in the deep bedrock monitoring wells or the production wells. Details are provided in the Data Presentation Report for Revised Supplemental Sampling Plan for Groundwater Investigation (SME, January 1993).

Groundwater remedial investigation activities conducted at the Site from August 1993 through February 1995 were described in the Remedial Investigation Report and Remedial Action Work Plan (RIR/RAWP; SME dated July 1995). Groundwater investigation activities completed during the RI included, but were not limited to:

- The installation and sampling of 40 monitoring wells and piezometers to investigate TCE concentrations in groundwater at the former LEC facility and downgradient to the southwest
- Surface water sampling in Crab Brook and Stony Brook
- Completion of an on-site 75-hour constant rate groundwater pump test to evaluate hydraulic parameters in the shallow bedrock
- A well search and sampling of water samples from nearby privately-owned domestic wells
- Abandonment of 22 monitoring wells and piezometers and three production wells at the former LEC facility (in advance of building demolitions), and six off-site domestic wells

The well search area was approximately 4 miles long in the northeast-southwest direction (the groundwater flow direction beneath the Site) and 1.5 miles wide in the northwest-southeast direction. The well search was completed by Dan Raviv Associates (DRAI, 1994). The search identified 136 domestic wells, 11 municipal supply wells, 8 industrial supply wells, in the search area. Following a series of public meetings, approximately 45 wells were sampled and the analytical results indicated that the majority of the wells were not impacted by the former LEC Site. Six wells were abandoned and replaced by public water supply.

The groundwater RI concluded that elevated dissolved TCE concentrations were migrating downgradient off site to the southwest and that a portion of the plume was discharging to Crab Brook. The main source area appeared to be located near Building 3. The pumping test results indicated that the migration of the TCE plume could be controlled by extraction and treatment of the groundwater. The groundwater portion of the RAWP focused on the proposed installation of a

groundwater extraction system with multiple recovery wells and ex-situ treatment via air stripping. An amended RAWP was submitted in November 1995 and the RIR/RAWP was approved by NJDEP in a letter dated December 6, 1996.

In response to the December 6, 1996 comment letter, an Off-Site Ground Water Proposal (SME, dated June 10, 1997b) was submitted to NJDEP. The proposed work included sampling of one additional domestic well and two industrial wells identified within in the downgradient plume, a baseline ecological evaluation of Crab Brook, additional downgradient delineation well installations, establishing a Classification Exception Area (CEA) that includes the impacted groundwater downgradient of the former LEC facility, and preparation of an off-site groundwater RAWP. The proposal also included the LEC On-Site Upgradient Hydrogeologic Investigation Report, which concluded that dissolved TCE was migrating on to the Site in the deep bedrock from an unknown source located upgradient to the northeast.

Based on comments from NJDEP, two more additional domestic wells were added to the proposed receptor well sampling program (total five wells). NJDEP approved the sampling program on July 22, 1998. The two industrial wells and one domestic well were no longer in use and were unavailable for sampling. Samples were collected in December 1998 and January 1999 from the two remaining domestic wells, and analytical results indicated no detections of TCE. A Domestic Well Sampling Report was submitted in April 1999 and accepted by the NJDEP in their letter dated August 9, 1999.

The results of the baseline ecological evaluation conducted at the Site are summarized below in Section 2.2.4 of this report.

TRC Companies, Inc. (TRC) became the environmental contractor for the remediation of the Lockheed Site in early 1999. In March 2000, TRC submitted a Revised Remedial Action Workplan (TRC, 2000) that included a proposal to move the groundwater recovery and treatment system to North Drive to better capture the TCE plume. The Revised RAWP included a redesigned remediation system to address impacted groundwater and surface water in Crab Brook, the results of hydrogeologic modeling to design the extraction well, an extraction well aquifer test design, the limits of the proposed CEA, and a proposed monitoring plan. In a letter dated May 17,

2000, NJDEP approved the Revised RAWP. The NJDEP and TRC entered into a Remediation Agreement for the Site in 2001.

To remediate the groundwater plume and intercept groundwater base flow to Crab Brook, a recovery well was installed and a groundwater extraction system (GWES) was constructed. Recovery well RW-1 was installed in June 2000 on North Drive in North Plainfield (Figure 2-2). The well location was selected based upon computer modeling results that suggested that a single extraction well would capture a high percentage of the groundwater plume at this location.

In June 2000, recovery well RW-1 was installed to a depth of 150 feet below ground surface (bgs) and has an open borehole of 130 feet. A 48-hour constant rate aquifer test of RW-1 was conducted in July 2000 to determine aquifer parameters and the appropriate pumping rate for the extraction well. The aquifer test results and the results for additional work conducted at the Site, including additional monitoring well installations and groundwater and surface water monitoring events in 2002, were submitted to NJDEP in an RI Addendum Report (TRC, dated June 2004a).

Groundwater extracted from RW-1 was pumped to the GWES building and treated using three liquid phase granular activated carbon (GAC) vessels. The treated water was discharged to Crab Brook via a storm drain. Following construction, the GWES was activated on July 17, 2003 under New Jersey Pollution Discharge Elimination System (NJPDES) permit No. NJG0105899. Until the GWES was temporarily deactivated in late May 2011, groundwater was pumped from extraction well RW-1 at a rate of approximately 120 gallons per minute (gpm). Until deactivation, the GWES had worked almost continuously from start-up and functioned as designed, providing control of the bedrock groundwater plume and intercepting groundwater base flow to Crab Brook.

The GWES was shut down on May 28, 2011 after one of the system's GAC treatment vessels (Tank No. 1) was found to be leaking due to corrosion holes in the steel tank shell. In July 2012, the residual water remaining in the three GAC vessels was characterized and found to be non-hazardous. In September 2012, the remaining water in the vessels and the appurtenant hoses was drained in preparation for removal of the GAC prior to planned treatment system demolition and reconstruction. The residual water was contained in a poly tank staged next to the GWES building for subsequent off-site disposal. The GAC in the vessels was characterized in September 2012

and also found to be non-hazardous. In February 2013, the GAC and residual water were removed and properly disposed at a Lockheed Martin-approved off-site disposal facility. The steel vessels that contained the GAC were cleaned, removed, and properly disposed as scrap metal in March 2013 in preparation for the GWES system reconstruction. Additional details regarding the GWES decommissioning were provided in the combined RAPR and Remedial Action Report Addendum (RAPR/RAR dated August 2013). Disposal facility documentation and receipts were included in Appendix A of the 2013 RAPR/RAR (dated July 9, 2014).

A long-term groundwater and surface water monitoring program commenced in 2003 coincident with the construction and activation of the GWES. As detailed in the June 2004 Remedial Action Report (TRC, 2004b), the NJDEP approved TRC's proposal to use passive diffusion bag samplers (PDBs) for the long-term monitoring program in correspondence dated April 1, 2003. The NJDEP also accepted a revised sampling schedule proposed in TRC's correspondence dated February 25, 2003. To validate the use of PDBs at the Lockheed Site, both vertical profiling using PDBs and synchronous sampling using PDBs and conventional methods were conducted during the March 2003 quarterly event.

An extensive monitoring well network has been installed to delineate and monitor the TCE concentrations (Figure 2-2). There are currently 50 active monitoring wells and piezometers associated with this project in the Boroughs of Watchung and North Plainfield, nearly all of which were installed as either well couplets or triplets to evaluate the horizontal and vertical distribution of VOCs, primarily TCE. Groundwater monitoring activities are ongoing in accordance with the monitoring schedule provided in the NJDEP-approved Groundwater Remedial Action Permit (RAP) dated June 26, 2014.

As shown on Figure 2-2, five of the active groundwater monitoring wells were installed in the vicinity of the Site between September and November 2013. These wells provide additional monitoring locations to further delineate the existing groundwater contaminant plume and further define the groundwater CEA for the Site. Details regarding the installation and initial sampling of the five additional wells are provided in Section 3 of this report.

As noted above, evaluation of the analytical results from surface water sampling at the Site indicated that groundwater from the former LEC Site contributed base flow to Crab Brook, and historically resulted in measurable impacts to surface water quality between North Avenue (Norwood Avenue) and Watchung Avenue. Although no measurable impacts to Crab Brook have been detected since 2009, surface water samples are collected on a semi-annual basis from four sampling locations along Crab Brook to monitor surface water quality (Figure 2-2). Surface water monitoring activities are ongoing in accordance with the monitoring schedule provided in the NJDEP-approved RAP.

2.2.3.1 Packer Testing of Recovery Well RW-1

Packer testing of recovery well RW-1 was conducted in August 2012 concurrent with the GWES system decommissioning activities. The objective of the packer testing program was to provide data to update the hydrogeologic conceptual site model and to support the overall groundwater closure strategy for the Site, specifically to assess whether, or to what extent, optimization of the GWES via focused pumping from the most VOC-impacted fracture zones was appropriate. The results of the packer testing were provided in a detailed Packer Test Report (Tetra Tech, 2012b) included as an appendix to the RAPR/RAR Addendum dated August 2013 (Tetra Tech, 2013b) and are summarized below.

To facilitate packer testing, the existing recovery well pump and piping were removed from RW-1 and geophysical logging was conducted in the open borehole to identify potentially hydraulically conductive fractured zones and select borehole intervals for packer testing. Based on an evaluation of the geophysical logs and the RW-1 rock core log, seven (7) fracture zones were selected for packer testing. The selected zones were individually isolated using a dual inflatable packer and submersible pump assembly and groundwater was pumped to purge the isolated zones and collect groundwater samples. A total of seven (7) groundwater samples were collected from the packer intervals using dedicated Teflon bailers and submitted for laboratory analysis of Target Compound List (TCL) VOCs plus a library search of fifteen (15) tentatively identified compounds using United States Environmental Protection Agency (USEPA) SW-846 Method 8260, in accordance with the approved Work Plan.

The analytical results for groundwater samples collected during packer testing of RW-1 indicated that low concentrations of TCE, PCE, and chloroform were detected in all of the packer test intervals, but no VOC concentrations were detected above NJDEP Groundwater Quality Standards (GWQS).

The geophysical data and the borehole video indicated that several hydraulically conductive fractures or fracture zones are present in the RW-1 borehole. Significant hydraulically conductive fracture zones were identified at 50.5-50.7 feet bgs, 55.6-56.6 feet bgs, 79.3 feet bgs, 89.1-89.2 feet bgs, 117.7-118.2 feet bgs, and 130.8-131.4 feet bgs.

These fracture zones are primarily low-angle fractures. Stereonet plots of fractures and bedding plane partings indicate that the mean strike and dip of these features is N56E/18NW (strike/dip), which is consistent with the regional bedding strike and dip of the Passaic Formation bedrock in the Site area, as depicted on the New Jersey Geological Survey bedrock geologic map for the Chatham Quadrangle (Geologic Map Series GMS 04-2, Bedrock Geologic Map of the Chatham Quadrangle, Morris, Somerset and Union Counties, New Jersey, Monteverde, Donald H. and Volkert, Richard A., 2005). Given this consistency, the significant hydraulically conductive fractures identified in RW-1 are interpreted as weathered bedding plane partings.

The packer testing results indicated that VOC concentrations in the seven intervals tested and sampled did not exceed NJDEP GWQS. The packer testing intervals were selected based on an assessment of the rock core log and the borehole geophysical logs to identify the fracture zones in RW-1 that are hydraulically conductive. Based on the packer testing results, it was concluded that RW-1 was no longer an effective recovery well for VOC-impacted groundwater at the Site.

The packer testing results indicated that reconstruction and startup of the GWES was unwarranted, and a re-evaluation of remedial alternatives for groundwater at the Site was recommended in the RAPR/RAR Addendum. Following a review of the Site data and discussions with the LSRP, a RAP Application for Groundwater at the Site with a proposed remedy of monitored natural attenuation was prepared and submitted to NJDEP in May 2013. The RAP Application included a revised monitoring and reporting schedule for the Site. The RAP Application was approved, and on

June 26, 2014 NJDEP issued a Groundwater RAP for monitored natural attenuation at the Site, with an effective date of July 2, 2014 (RA Permit No. RAP130001).

2.2.3.2 Classification Exception Area Modification

In their May 17, 2000 letter to Lockheed Martin, NJDEP indicates that an "on-site" CEA was established and approved in the NJDEP letter dated December 4, 1997. In 2013, the existing CEA for the Site was updated pursuant to the NJDEP Administrative Requirements for the Remediation of Contaminated Sites (N.J.A.C. 7:26C) and included groundwater data that was collected through March 2012. An updated CEA/Well Restriction Area (WRA) Permit Fact Sheet Form and supporting documentation was submitted to NJDEP in May 2013. As noted above, a RAP Application for Groundwater was also submitted, as required by N.J.A.C. 7:26C-7.3.

Well Search

Receptor evaluations were previously submitted to NJDEP in the August 28, 2009 public notification submission and in previous submissions. More recently, Lockheed Martin submitted an Interim Receptor Evaluation Form to the NJDEP on March 1, 2012.

As part of the Site's updated groundwater CEA certification, Lockheed Martin completed a NJDEP Bureau of Water Allocation 1-mile radius well records search and a computerized 5-mile radius search of water allocation permitted wells for large diversions (i.e., permitted diversions of more than 100,000 gallons per day). At the time of the May 2013 CEA/WRA submittal, receipt of the well search records from NJDEP was still pending. Following a review of the well search records, a revised CEA/WRA Permit Fact Sheet Form and the well search results were submitted to NJDEP in April 2014. A summary of the well search results is provided below.

The well records search identified well permits and/or well records for a total of 22 well locations within one mile of the Site, including 19 domestic well locations, one non-public community well location, and two industrial well locations.

Based on a review of information provided in the well permits and well records as well as information from other sources (including but not limited to free GIS mapping tools, Google web

searches, tax assessment records, historical aerial photographs, the Somerset County Public Library system, and canvassing of property owners), 18 of the 19 domestic well locations are situated side-gradient to the Site (i.e., to the southeast or northwest) or upgradient of the Site (i.e., to the northeast). These wells are located outside of the CEA boundary and the TCE groundwater plume. Given that the primary flow direction in the bedrock beneath the Site is to the southwest (i.e., approximately parallel to bedding strike), it is unlikely that these well locations are affected by impacted groundwater from the Site.

The well search results indicate that the remaining domestic well location is situated downgradient approximately one mile southwest from the Site, but the available information for this well is incomplete and contradictory. The well owner address on the well permit is Orange, NJ and the drillers sketch is unclear. The well permit indicates an Atlas Grid number that is in North Plainfield, but the well location municipality is listed as Watchung, and the longitude and latitude shown on the Atlas Grid sketch indicate that the well location is more than two miles west of the Site. Based on the above information, the well location is questionable and cannot be verified as being within the canvass area (i.e., within one mile of the Site).

Similarly, there is limited information regarding the one non-public community well location identified within one mile of the Site. Based on available information, the well was located approximately 500 feet or more upgradient of the Site, but the well location cannot be verified as being within the canvass area.

Available information indicates that both of the industrial wells located within one mile of the Site were abandoned. The permit for one of the industrial wells indicates that the well owner was Stavid Engineering, which occupied the former LEC Site prior to being purchased by Lockheed Martin. The well permit provides insufficient information to determine the exact location of the industrial well on the property, but the well was likely one of three production wells that was operated at the facility. The existing production wells at the former LEC Site were abandoned during the remedial investigation in 1994 (SME, 1995), and the former LEC Site was subsequently redeveloped as Watchung Square Mall; therefore, the industrial well is presumed to be abandoned. The other industrial well was located approximately 3500 feet downgradient of the Site to the southwest and

was installed on property owned and occupied by a former department store. The property is now entirely paved and used for auto storage. Discussions with the current property owner indicate that the property is served by city water, not well water, and there is no well on the property. Based on this information, the industrial well is presumed to be abandoned.

Two well permits were also identified for wells at locations more than one mile southwest of the Site but within the downgradient portion of the CEA (one industrial well and one domestic well). There is limited information, however, for both well locations. The location of the domestic well on the well permit is only listed as "Somerset" and the well owner address is only listed as North Plainfield. The drillers sketch is also unclear, indicating that the well is located on or near Hill Avenue, but there is no Hill Avenue in North Plainfield or in Watchung. The location of the industrial well is vague, indicating "Hwy 29, N. Plainfield-Somerset" (likely Route 22), but no exact address. The drillers sketch on the permit is also vague, indicating that the well was installed along "Rt. 29" near a cross street that leads to Watchung, but providing no dimensions or other landmarks. Based on available information, neither well location can be verified as being within the canvass area.

Water Allocation Diversion Radial Search Results

The water allocation diversion radial search identified only one well within approximately one mile of the Site, specifically Lockheed Martin's groundwater recovery well (RW-1) for the groundwater extraction system at the Former LEC Site. Recovery well RW-1 has been inactive since the GWES shutdown in May 2011. In addition, the analytical results for groundwater samples collected during August 2012 packer testing of RW-1 indicated that no VOC concentrations were detected above applicable NJDEP GWQS. Based on the packer testing results, RW-1 is not a receptor of impacted groundwater from the Site.

The water allocation diversion radial search also identified a commercial non-community well located approximately 1.2 miles southwest of the Site, but within the downgradient portion of the CEA. The well record indicates that the well is located at 221 Grove Street, North Plainfield (Block 131, Lot 9). An on-line search of tax assessment records (http://tax1.co.monmouth.nj.us) indicates that Block 131, Lot 9 is now known as Lot 17 (217-21 Grove Street). The well was installed in 1977 for industrial use and the site is currently occupied by an active laundromat (Stony Brook

Laundry). A review of city directories at the North Plainfield Public Library, however, indicates that the property was used for dry cleaning from approximately 1962 to 1982.

Discussions with Thomas Grzymski (NJDEP) in November and December 2013 indicated that elevated concentrations of TCE (12.2 micrograms per liter [µg/L]), cis 1,2-dichloroethene (14.3 µg/L), and PCE (146 µg/L) were reported in a groundwater sample collected from the laundromat well in February 2002. The groundwater sampling results were reported in a Remedial Action Report (dated September 2009) for a former Getty Service Station located approximately 120 feet north of the laundromat well (Tyree Environmental Corporation, 2009). PCE is not a groundwater contaminant of concern at the former LEC site. Analytical results for groundwater samples collected from the nearest site monitoring well cluster located hydraulically upgradient to the laundromat well (well cluster PZ-522) in March 2003 report a PCE concentration in the shallow well (screened from 7.7 to 17.7 feet bgs) of 3.7 µg/L and the reported PCE concentration in the intermediate well (screened from 91 to 101 feet bgs) was 1.3 µg/L. PCE was not detected above reporting limits in the deep well (screened from 187.7 to 197.7 feet bgs). Given the historical use of the 221 Grove Street property for dry cleaning, the reported detection of PCE (which is not a groundwater contaminant of concern at the former LEC site), and concentration gradients in monitoring wells at the former LEC Site that are not consistent with a source related to the former LEC Site, the former dry cleaner at 221 Grove Street may be the source of the detections in the laundromat well. In December 2013, Tetra Tech informed the NJDEP about the historical use of the 221 Grove Street property for dry cleaning.

Well Head Protection Areas

As indicated in the April 2014 Revised CEA/WRA submittal, the CEA boundary is not within either a Tier I or Tier 2 Community Well Head Protection Area (WHPA). A Public Non-Community WHPA was identified approximately 1.1 miles southwest of the former LEC Site and partially overlapping the most downgradient portion of the CEA. The well associated with this WHPA is located at 25 Greenbrook Road (Block 99, Lot 14 in the Borough of North Plainfield), which is situated outside of the CEA but within 500 feet of the CEA boundary. The well is identified by Public Water Supply Identification Number 1814300, but as described below, the well is no longer a

registered public supply well and the calculated WHPA assigned to this well is no longer technically supported.

A site visit was conducted on March 2, 2014 to visually inspect the well and to obtain information directly from the current property owner regarding how water supplied by the well is used. The well is situated in a liquor store maintained on the property. The results of an internet search indicate that the well may have previously supplied water for a bottling company located on the property, but discussions with the property owner revealed that the bottling company ceased operations at the property approximately 40 years ago. The property owner reported that the well is active, but it is only used to supply water to a restroom and a utility sink within the liquor store and is not used as a drinking water supply. The property owner also reported that the store employees drink the bottled water that is sold in the store. The owner indicated that the well also supplies water to a restroom in a tenant space at the back of the building that is currently occupied by a trophy store. According to the property owner, the tenant reported that they use a bottled water dispenser (i.e., a water cooler) and that water from the restroom is not consumed.

The property owner stated that he had no information regarding the well depth or construction, but the well pump was replaced shortly after he purchased the property in 2008. Discussions with a representative of the pump replacement service company (M&T Well & Pump located in Bound Brook, NJ) revealed that the pump was set at approximately 125 feet below ground surface, but the well depth and construction were not known.

Discussions with Lynn Rodriguez at the Somerset County Department of Health revealed that the well was deregistered as a public well in approximately 2003-2004 and has not been inspected by the health department since deregistration. This is consistent with information posted on the NJ Drinking Water Watch website, which contains sampling data indicating that the well was sampled periodically for nitrates and coliform in the 1990's and early 2000's, but identifies no sampling data after 2004. The property owner stated that the well has been sampled monthly for chlorine and coliform since he obtained the property in 2008 and to his knowledge the results are below applicable criteria. During the site visit, the current property owner expressed a reluctance to allow sampling of the well water for other parameters such as volatile organic compounds.

As noted above, the well was deregistered as a public supply well. The geographic information system database for Public Non-Community Water Supply Wells in New Jersey (obtained from the New Jersey Geological and Water Survey) indicates that the WHPA for the well was calculated using default values for well depth (200 feet bgs), pumping rate (10 gpm), and aquifer porosity (0.2), because actual values for these parameters were not recorded or do not exist. Based on the known current limited use of the well (i.e., only supplying water for the liquor store restroom and utility sink and the tenant space restroom), it follows that the pumping rate of the well would be considerably lower than the default rate of 10 gpm listed in the database. Given the lower pumping rate, the actual well radius of influence is likely much smaller than the assigned WHPA for the former public water supply system. A smaller radius of influence reduces the potential influence of the well on groundwater within the nearby portion of the CEA, where TCE concentrations are already interpolated to be close to the NJDEP GWQS based on current conditions recorded at the nearest site monitoring wells.

2.2.4 Vapor Intrusion Investigations

As noted in Section 2.1, following cessation of activities at the Site by LEC, the Site was redeveloped as the Watchung Square Mall with a Wal-Mart Store located in the southwest corner. Avalon Watchung (formerly Crystal Ridge Club) is a residential apartment complex located adjacent to the southwestern boundary of the former LEC property. Southwest of Avalon Watchung is Regency Village, a condominium complex. Due to the proximity of these properties to the groundwater plume source area, the Wal-Mart, Avalon Watchung and Regency Village were the areas of potential concern for vapor intrusion. The locations of the Wal-Mart, Avalon Watchung, and Regency Village are shown on Figure 2-3. All three properties have been the focus of past VI investigations and Avalon Watchung is the remaining area of vapor intrusion concern. The scope of work for the 2014 investigation was limited to confirmatory sampling for three buildings at Avalon Watchung.

2.2.4.1 Prior Investigations

The August 2009 RAPR presented an evaluation of the potential for exposure to vapor within structures located above the Site's groundwater contaminant plume. The August 2009 RAPR

included an evaluation of the known or suspected Site-specific contaminants, contaminant migration pathways, potential human receptors and the exposure routes by which these receptors may come in contact with contaminants. The evaluation concluded that the potential for VI to occur and to result in unacceptable indoor air concentrations in occupied structures nearest to the Site exists, and that further investigation was warranted.

Since the submittal of the August 2009 RAPR, work plans were submitted and VI investigations have been conducted. These investigations have been documented in the following reports that have been submitted to (and approved by) NJDEP and/or the LSRP:

Revised VI Investigation Work Plan, August 2010 – the Work Plan was approved by the NJDEP on December 9, 2010. The Work Plan (TRC, 2010) outlined the proposed investigation activities which focused on sub-slab soil vapor and indoor air sampling at structures present nearest to the ground water plume source area at the Site, specifically the Watchung Square Mall (Walmart store) and one adjoining property (Avalon Watchung).

VI Investigation Report, November 22, 2011 – the results for sub-slab and indoor air sampling conducted at Avalon Watchung and indoor air sampling at Regency Village (Building 26 only) in February 2011 are presented in this report (Camp Dresser & McKee, Inc. [CDM], 2011). During this investigation, sub-slab soil gas samples were collected from Avalon Watchung Buildings 3 through 12 and Building 14. Concentrations of TCE in sub-slab samples collected from Avalon Watchung Buildings 3, 6, 7, and 12 exceeded the NJDEP Soil Gas Screening Level (SGSL) for TCE, but no TCE concentrations in the indoor air samples collected during this event exceeded the Indoor Air Screening Level (IASL) for TCE (the contaminant of concern for the Site) or its related breakdown compounds. NJDEP issued a technical review and comment letter, dated December 9, 2011 in response to this report.

VI Investigation Report Addendum, January 31, 2012 - this investigation implemented the recommendations of the November 22, 2011 report. NJDEP commented via e-mail on June 25, 2012. Sub-slab soil gas and indoor air sampling was conducted in December 2011. During this investigation, sub-slab soil gas samples were collected from the remaining buildings at Avalon Watchung that had not been previously sampled (i.e., Buildings 1, 2, 13, 15, the

Clubhouse, and the Maintenance Building), and indoor air samples were collected from Avalon Watchung Buildings 3, 6, 7, 12, and the Clubhouse. The analytical results indicated that reported TCE concentrations in sub-slab samples collected from Buildings 3, 7, and the Clubhouse exceeded the SGSL for TCE, but no TCE concentrations in the indoor air samples collected during this event exceeded the IASL for TCE or its related breakdown compounds. The report recommended that an additional round of sub-slab soil gas samples be collected from Avalon Watchung Buildings 3, 6, 7 and 12 and from the Clubhouse. To provide correlative data for the evaluation of the sub-slab soil gas sampling proposed, additional indoor air sampling was also recommended for Avalon Watchung Buildings 3, 6, 7 and 12 and the Clubhouse (CDM Smith, 2012a).

VI Investigation Data Submittal, April 10, 2012 - this submittal presented the data collected at Wal-Mart (CDM Smith, 2012b). The analytical results indicated that TCE concentrations in sub-slab samples and indoor air samples collected at the Wal-Mart building did not exceed the NJDEP non-residential SGSL or IASL for TCE.

2013 Comprehensive Vapor Intrusion Investigation Report, June 11, 2013 - The 2013 Comprehensive VI Investigation addressed the recommendations of the January 2012 VI Investigation Report Addendum. The 2013 Comprehensive VI Investigation also addressed the VI concerns related to Regency Village as discussed in the 2011 RAPR (CDM, 2011). The 2011 RAPR recommended that the construction of Regency Village Buildings 3, 4, 5, and 6 (closest to the former LEC facility) be evaluated to determine whether there are any ground floor or basement living units in any of the buildings. These four buildings did not have living spaces but did have crawl spaces and were included as part of the 2013 Comprehensive VI Investigation. The investigation was later expanded to include Buildings 17, 26, 36 and 38 at Regency Village which were found to have (or potentially have) basement living units. The 2013 investigation also included an additional round of sub-slab soil gas and indoor air samples from Avalon Watchung Buildings 3, 6, 7 and 12 and from the Clubhouse. Assessment of the sub-slab and indoor air data from Regency Village indicated that the VI pathway is not complete and no further VI work was recommended at Regency Village. Assessment of the sub-slab and indoor air data from Avalon Watchung indicated that the VI pathway is not complete at Building 12 and

the Clubhouse, and no further work was recommended at these locations. The analytical data for Buildings 3, 6, and 7 indicated that additional sub-slab sampling events were needed to confirm that the concentrations of TCE in sub-slab soil gas beneath these buildings are continuing to decline to levels less than the NJDEP residential SGSL. Additional indoor air sampling might also be required. The scope of the 2014 VI investigation activities was based on these recommendations. The results of the 2014 VI investigation are discussed in Section 7.5 of this report.

2.2.5 Baseline Ecological Evaluation

A Baseline Ecological Evaluation (BEE) was conducted at the Site during February 1999 by Environmental Management Group, Inc. and SME. The scope of the BEE was described in the June 12, 1997 Off-Site Proposal prepared by SME for the former LEC Site ISRA Project (ISRA Case #E90038). The NJDEP granted final approval of the Off-Site Proposal on July 22, 1998.

The BEE was conducted to evaluate the potential for acute aquatic affects from the presence of TCE in the waters of Crab Brook. The BEE concluded that there was no measurable acute effect on aquatic species in Crab Brook from the inflow of TCE-impacted groundwater from the Site. The NJDEP approved the BEE in an August 9, 1999 letter, concluding that no further ecological evaluation with regard to Crab Brook was required.

2.3 PHYSICAL SETTING

2.3.1 Site Geology

Based on previous investigations, the overburden at the Site is generally composed of granular fill associated with the remediation area of former LEC Building #3, a sandy outwash deposit, and a thin layer of glacial till. In the vicinity of the Site, the thickness of the overburden decreases towards the south-southwest but increases south of Crab Brook. The overburden is thinnest near well cluster MW-546 (3 feet) and generally increases in thickness south of U.S. Route 22, with the greatest thickness of 47 feet observed at the former location of well cluster MW-542 (this destroyed well cluster was located near the intersection of Park Place and Somerset Street; see Figure 2-2).

The overburden deposits are underlain by the Passaic Formation, which is a reddish-brown siltstone of Jurassic age. The upper surface of the bedrock is generally weathered and soft, and becomes more competent with depth. Bedrock surface topography generally slopes to the southeast perpendicular to the First Watchung Mountain. The highest bedrock elevation is approximately 171 feet above msl at well MW-3D and the lowest is approximately 45 feet above msl at well cluster MW-545.

2.3.2 Site Hydrogeology

Groundwater at the Site occurs within the bedrock, and locally within the overburden. The migration of dissolved VOCs within the bedrock is influenced by both bedrock structure and local groundwater discharge areas, particularly Crab Brook. The groundwater in the bedrock enters the Site from upgradient to the northeast, moves across the Site to the southwest (roughly parallel to the bedding strike direction of regional bedrock), and then trends in a more southerly direction toward Crab Brook. At monitoring well cluster MW-549 (located at the Site), the depth to groundwater is approximately 55 feet bgs. At monitoring well cluster MW-550 (located near the Regency Village both topographically and hydrogeologically downgradient of the Site), the depth to groundwater is approximately 21 feet bgs. While no monitoring wells are present at Avalon Watchung, the depth to groundwater beneath the apartment complex is expected to be between 21 and 55 feet bgs. Based on the September 2014 groundwater elevation data, the average horizontal hydraulic gradient in the shallow water-table zone across the Site is approximately 0.010 feet per foot (ft/ft), steepening slightly downgradient and southwest of the Site to approximately 0.018 ft/ft. Based on water level measurements at the well clusters, the vertical hydraulic gradient is generally downward across the Site, with some upward gradients in well clusters located immediately south of Crab Brook (MW-504 and MW-505) and in well clusters located southwest of the Site near Stony Brook (PZ-524 and MW-545).

3.0 Monitoring Well Installations and Well Repairs

As noted in Section 2.2, five additional monitoring wells were installed at the Site between September and November 2013. Repairs of existing monitoring wells were also conducted in November 2013. Details regarding the monitoring well installations and the well repairs are provided below.

3.1 ADDITIONAL MONITORING WELL INSTALLATIONS

Five bedrock monitoring wells were installed to provide additional monitoring locations to further delineate the existing groundwater contaminant plume and further define the groundwater CEA for the Site (wells MW-1S, MW-1I, MW-2I, MW-2D, and MW-3D). The monitoring well locations (Figure 2-2) were selected to provide side-gradient groundwater monitoring locations to the northwest and southeast of existing monitoring wells. Monitoring wells MW-1S and MW-1I are co-located northwest of source area monitoring well cluster MW-549, and monitoring well MW-3D is located northwest of downgradient monitoring well cluster MW-546. These wells are essentially side-gradient step-outs in the down-dip direction from existing monitoring well cluster MW-549 and well MW-546D, and were screened in the same bedrock bedding units, to the extent possible, as existing monitoring well cluster MW-549 and MW-546D. Monitoring wells MW-2I and MW-2D are co-located southeast of the downgradient monitoring well cluster PZ-522. These two wells were installed as replacement wells for the destroyed monitoring well cluster MW-542, which was located near the intersection of Park Place and Somerset Street. As such, wells MW-2I and MW-2D were installed and screened at the same depths as former wells MW-542B and MW-542A, respectively. The screen depths for the additional monitoring wells are provided in Table 3-1.

The monitoring wells were installed from September to November 2013 by New Jersey-licensed drillers employed by Summit Drilling, Inc., located in Bridgewater, NJ. Monitoring well installation activities included borehole geophysical logging and the collection of discrete groundwater grab samples during packer testing of the three deepest monitoring wells (wells MW-1I, MW-2D, and

MW-3D). Following installation and development of the additional wells, initial groundwater samples were collected from the new wells in December 2013 and January 2014. Groundwater samples were collected using PDBs and the well screen intervals were vertically profiled during the January 2014 sampling event to assess whether contaminant stratification was present and to determine the appropriate interval for future PDB deployment.

Well construction details for the newly installed wells are summarized in Table 3-1. Monitoring well logs, well records, and Monitoring Well Certification Forms B for the new monitoring wells are included in Appendix B. Borehole geophysical logs and graphs of packer testing data are provided in Appendix C. Details regarding the monitoring well installation procedures, geophysical logging, and packer testing, and initial sampling activities are summarized below.

3.1.1 Monitoring Well Installation Procedures

The wells were installed using air rotary drilling methods (to limit the amount of investigation-derived waste [IDW] water generated during drilling, water rotary methods were employed during the drilling of MW-3D, beginning at approximately 261 feet bgs to total depth). To prevent hydraulic communication between the unconsolidated overburden and the underlying bedrock aquifer, the wells were double-cased. For each well, 10-inch diameter steel surface casing was installed to maintain borehole integrity in the unconsolidated overburden. Following installation of the surface casing, a nominal 10-inch borehole was advanced through the overburden and a minimum of 10 feet into the top of competent bedrock. Permanent 6-inch diameter steel casing was then advanced to the bottom of the 10-inch borehole and grouted in place to secure the casing in the borehole. A nominal 6-inch borehole was then advanced to the planned total borehole depth.

The total constructed well depths were selected based on the results of packer testing and groundwater grab sampling that was conducted in the three deepest boreholes (MW-1I, MW-2D, and MW-3D). The open boreholes for these wells were geophysically logged to identify fractures and partings that might conduct water. The borehole geophysical logs were then evaluated to select fracture zone intervals for packer testing. The fracture zone intervals were isolated using inflatable packers and a submersible pump was used to collect groundwater grab samples from the isolated

intervals to assess TCE concentrations and to select the appropriate screen intervals for the monitoring wells.

The wells were generally constructed with 10 feet of 2-inch diameter Schedule 40 PVC screen (0.020-inch slot) and riser pipe set in the 6-inch diameter borehole. Well MW-3D was constructed with a 15-foot screen. The annulus between the borehole and the 2-inch screen was filter packed with No. 2 silica sand from the bottom of the screen to approximately two feet above the top of screen, followed by approximately two feet of No. 00 silica sand. The remaining annular space was then tremie-grouted with cement-bentonite grout from the top of the No. 00 sand to ground surface. The wells were completed at ground surface with a flush-mount steel protective casing set in a concrete pad and secured with an expandable inner cap and lock.

Details regarding drilling and construction of the individual bedrock monitoring wells are summarized below.

3.1.1.1 MW-1I and MW-1S

As noted above, bedrock monitoring wells MW-1I and MW-1S were installed down-dip and northwest of existing monitoring well cluster MW-549. Wells MW-1I and MW-1S are located in the cul-de-sac on East Drive in Watchung, NJ (Figure 2-2). The deeper well (MW-1I) was drilled first. Steel surface casing (10-inch diameter) was installed from ground surface to the top of weathered bedrock at approximately 51 feet bgs. Competent bedrock was encountered at approximately 53 feet bgs. Drilling continued and a 6-inch diameter steel casing was installed to approximately 64 feet bgs, approximately 10 feet into competent rock to isolate the overburden from the bedrock. The steel casing was grouted in place and allowed to cure at least overnight prior to continuing drilling.

Following installation of the casing, a nominal 6-inch borehole was drilled to a total depth of approximately 290 feet bgs and the borehole was developed via air displacement to reduce fines and prepare for geophysical logging. The borehole was geophysically logged following development. Based on an evaluation of the borehole geophysical logs, selected intervals were packer tested to assess TCE concentrations in the groundwater. The well screen interval was then

selected based on the packer testing data, the geophysical logs, and observations recorded during drilling.

Monitoring well MW-1I was screened from 245-255 feet bgs. Prior to constructing the well, the open borehole beneath the selected screen interval was sealed from the bottom up by tremie-grouting with cement grout (from approximately 255 to 290 feet bgs). The well was installed following curing of the grout.

Monitoring well MW-1S is located approximately 15 feet southwest from MW-1I. Similar to well MW-1I, 10-inch diameter steel surface casing was installed from ground surface to the top of weathered bedrock at approximately 51 feet bgs, and 6-inch diameter steel casing was installed to approximately 64 feet bgs, approximately 10 feet into competent rock. The steel casing was grouted in place and allowed to cure at least overnight prior to continuing drilling.

The total well depth and screen interval for MW-1S was selected based on the results of geophysical logging and packer testing of the borehole for adjacent well MW-1I. Following installation of the casing, a nominal 6-inch borehole was drilled to a total depth of approximately 180 feet bgs and the borehole was developed via air displacement to reduce fines and prepare for well construction. Monitoring well MW-1S was screened from 170-180 feet bgs.

3.1.1.2 MW-2I and MW-2D

As noted above, bedrock monitoring wells MW-2I and MW-2D are located southeast of downgradient monitoring well cluster PZ-522. These two wells were installed as replacement wells for destroyed monitoring well cluster MW-542, which was located near the intersection of Park Place and Somerset Street. Wells MW-2I and MW-2D are located on Allen Place in North Plainfield, NJ (Figure 2-2). The deeper well (MW-2D) was drilled first. Steel surface casing (10-inch diameter) was installed from ground surface to approximately 36 feet bgs. Weathered bedrock was encountered at approximately 32 feet bgs and competent bedrock was encountered at approximately 48 feet bgs. Drilling continued and a 6-inch diameter steel casing was installed to approximately 59 feet bgs, approximately 11 feet into competent rock to isolate the overburden from the bedrock. The steel casing was grouted in place and allowed to cure at least overnight prior to continuing drilling.

Following installation of the casing, a nominal 6-inch borehole was drilled to a total depth of approximately 198 feet bgs and the borehole was developed via air displacement to reduce fines and prepare for geophysical logging. The borehole was geophysically logged following development. Based on an evaluation of the borehole geophysical logs, selected intervals were packer tested to assess TCE concentrations in the groundwater. The well screen interval was then selected based on the packer testing data, the geophysical logs, and observations recorded during drilling. Monitoring well MW-2D was screened from 188-198 feet bgs.

Monitoring well MW-2I is located approximately 20 feet southeast from MW-2D. Similar to well MW-2D, 10-inch diameter steel surface casing was installed from ground surface to approximately 40 feet bgs and 6-inch diameter steel casing was installed to approximately 58 feet bgs, approximately 10 feet into competent rock. The steel casing was grouted in place and allowed to cure at least overnight prior to continuing drilling.

The total well depth and screen interval for well MW-2I was selected based on the results of geophysical logging and packer testing of the borehole for adjacent well MW-2D. Following installation of the casing, a nominal 6-inch borehole was drilled to a total depth of approximately 98 feet bgs and the borehole was developed via air displacement to reduce fines and prepare for well construction. Monitoring well MW-2I was screened from 88-98 feet bgs.

3.1.1.3 MW-3D

As noted above, bedrock monitoring well MW-3D was installed down-dip and northwest of existing monitoring well cluster MW-546. Well MW-3D is located in the cul-de-sac on Upper Drive in Watchung, NJ (Figure 2-2). Steel surface casing (10-inch diameter) was installed from ground surface to approximately 50 feet bgs. Weathered bedrock was encountered at approximately 40 feet bgs and competent bedrock was encountered at approximately 57 feet bgs. Drilling continued and a 6-inch diameter steel casing was installed to approximately 67 feet bgs, approximately 10 feet into competent rock to isolate the overburden from the bedrock. The steel casing was grouted in place and allowed to cure at least overnight prior to continuing drilling.

Following installation of the casing, a nominal 6-inch borehole was drilled to a total depth of approximately 505 feet bgs and the borehole was developed via air displacement to reduce fines

and prepare for geophysical logging. The borehole was geophysically logged following development. Based on an evaluation of the borehole geophysical logs, selected intervals were packer tested to assess TCE concentrations in the groundwater. The well screen interval was then selected based on the packer testing data, the geophysical logs, and observations recorded during drilling.

Monitoring well MW-3D was screened from 335-350 feet bgs. Prior to constructing the well, the open borehole beneath the selected screen interval was sealed from the bottom up by tremie-grouting with cement grout (from approximately 355 to 505 feet bgs). The well was installed following curing of the grout.

3.1.2 Geophysical Logging

Borehole geophysical logging was conducted in bedrock wells MW-1I, MW-2D and MW-3D to identify and select appropriate fracture intervals for packer sampling and to obtain in-well flow data. Geophysical logging was conducted on September 24, 2013 (MW-1I), October 1, 2013 (MW-2D), and October 28, 2013 (MW-3D) by Earth Data Northeast, Inc. located in Exton, Pennsylvania. The wells were also video logged to provide direct observation of borehole conditions such as the location and extent of fractures encountered during drilling. Copies of the geophysical logs and a transcription of observations from the video logs are provided in Appendix C.

The geophysical logging tools were lowered down hole on a wire cable following video logging of a borehole. Final results were provided on strip charts which display multiple logging read-outs side by side with respect to borehole depth. Field copies of individual logs were immediately available for use in selecting packer sampling depth intervals.

The types of geophysical logging performed on the above bedrock monitoring wells included, conventional geophysical logs, such as caliper, natural gamma ray, resistivity, temperature, and spontaneous potential, as well as acoustic televiewer (ATV) logs and heat pulse flowmeter logs. The caliper log was the primary geophysical log used to identify apparent fracture zones and select packer sampling depth intervals and packer seating locations in the boreholes. The remaining logs in the suite, particularly the temperature and heat pulse flowmeter logs, were used to better qualify

apparent fracture zones indicated on the caliper log. Brief descriptions of the acoustic borehole and heat pulse flowmeter logging methods are provided below.

The acoustic televiewer log was used to better qualify apparent fracture zones indicated on the caliper log. The acoustic televiewer logging tool uses a rotating transducer to transmit and receive high-frequency acoustic pulses. This tool generates a 360-degree scan of the borehole wall, and provides high-resolution images of fractures and solution openings. A built-in magnetometer mounted on the tool provides a compass orientation of the features identified on the log. This log was used to characterize fractures and solution openings, and provide strike and dip of fractures and bedding planes. Attitudes reported using acoustic borehole logging were corrected for magnetic declination prior to interpretation for the final log.

The heat pulse flowmeter (HPFM) tool provides direct measurements of both the vertical direction and rate of flow in an open borehole. When situated at the selected depth, the tool generates a pulse or slug of heat by discharging a capacitor. As the heat moves with the flow of water in the borehole, the time required for the heat to reach the tool's sensors is recorded and converted to units of gallons per minute in the appropriate direction. Heat pulse flowmeter test depths were chosen based upon geophysical logging results for a given borehole. Test depth intervals were selected to bracket apparent fracture locations identified on the caliper log. The resulting composite profile of vertical flow in a given borehole is used to assess intervals where water flows into or out of the borehole.

3.1.3 Packer Testing

As noted above, packer testing was conducted on the three deepest monitoring wells (MW-1I, MW-2D, and MW-3D) following drilling to total depth and development and geophysical logging of the boreholes. The packer testing was performed by a New Jersey-licensed driller employed with Summit Drilling and supervised by a Tetra Tech geologist.

Based on a review of the geophysical logging results, the soil log, and the driller's observations, multiple fracture zones were selected for packer testing in each of the above wells. The selected intervals were isolated using inflatable packers, then purged and sampled.

Packer testing and groundwater sampling was conducted using a straddle packer assembly constructed and supported on 2-inch hollow steel riser pipe. The assembly consisted of an upper and lower packer with a submersible pump mounted in between the packers. The packer separation interval ranged from 10 feet to 25 feet, depending on the borehole.

A submersible pump was used during packer testing to evacuate the packer test intervals and collect groundwater grab samples. The pump controls allowed for flow rate adjustment to maintain purging of the packer interval. The groundwater discharge volume was measured manually periodically during pumping to track the flow rate and volume of water purged from the packer test intervals.

Three pressure transducers were mounted to the packer and pump assembly to measure pressure changes (indicative of changes in the potentiometric surface or hydraulic head). Transducers were used to measure pressure changes within the test zone between the packers, in the borehole above the top packer, and in the borehole below the bottom packer. The pressure transducers were connected to a laptop computer for real-time observations so that packer seals could be verified and flow rates could be adjusted during testing.

During packer testing, the packer assembly was suspended within the well using the coupled hollow steel riser pipe. The packer assembly was lowered into place at the test intervals, and the packers were inflated with nitrogen. The well was allowed to equilibrate following inflation of the packers to identify shut-in pressures and potential changes in head above, below, and within the packer interval. After water levels stabilized following inflation of the packers, the pump was activated to evacuate the test zone interval. Changes in pressure were monitored using the pressure transducers and recorded on the computer data logging system at the surface. Approximately three to five interval volumes were purged from the packer test intervals prior to sampling, field conditions permitting.

Water quality measurements (i.e., pH, temperature, conductivity, oxidation-reduction potential, dissolved oxygen, and turbidity) were periodically measured and recorded during purging of the packer test intervals, but the decision to collect a groundwater sample was based primarily upon evacuation of multiple interval volumes, rather than water quality parameter stabilization.

Following purging of the isolated test zone, a groundwater sample was collected. Groundwater samples were collected from the submersible pump discharge. Sampling was conducted immediately after purging was completed and the groundwater sample was immediately transferred to the appropriate laboratory-supplied bottles and submitted for laboratory analysis of TCL VOC+15 using USEPA SW-846 method 8260.

After sampling of the packer interval was completed, the pump was shut off and the changes in pressure during water level recovery in the test interval were monitored and recorded prior to packer deflation. The packers were then deflated, and the packer assembly was moved to the next selected packer test zone. These packer testing procedures were repeated until sampling of all the selected packer test intervals was completed in the borehole.

The results of the geophysical logging and packer testing activities are summarized below by well location. The final geophysical logs are provided in Appendix C. Copies of the completed borehole video logs (on DVD) are provided in Appendix D. A summary of the packer test intervals is provided in Table 3-2. The groundwater analytical results for VOCs are summarized in Table 3-3. The water quality measurements recorded during purging of the packer test intervals are provided in Table 3-4. Graphs of the packer test data for the seven selected packer intervals are provided in Appendix C.

3.1.3.1 MW-1I

Based on the geophysical logs, the soil log, and observations during drilling, six intervals were selected for packer testing in MW-1I (Table 3-2). Given that this borehole was installed to monitor approximately the same bedding units as MW-549I in the down-dip direction, the packer test intervals were selected from the bottom half of the borehole. Groundwater flow rates in the three shallower test intervals (172-182 feet, 217.5-227.5 feet, and 242-252 feet bgs) ranged from 1.3 to 1.7 gpm, but groundwater flow in the deeper test intervals (258-268 feet, 269-279 feet, and 279-290 feet bgs) was lower, ranging from 0.28 to 0.35 gpm, indicating limited yield with depth. None of the intervals went dry during packer testing. The heat pulse flow meter data generally indicated a downward vertical flow gradient in the borehole, with no measureable vertical flow below approximately 230 feet bgs.

The pressure data indicated that the packers achieved a good seal against the borehole wall when inflated, and real-time monitoring of the transducer data during pumping indicated that the packers were well seated.

Geophysical logging, packer test data, and observations during drilling indicate that several hydraulically conductive fractures or fracture zones were identified in the MW-1I borehole. Significant hydraulically conductive fracture zones were identified at approximately 84-86 feet bgs, 174-176 feet bgs, 217-227 feet bgs, and 246-249 feet bgs. Although the zone at 84-86 feet bgs was not packer tested because it was too shallow, the caliper and ATV logs indicate intersecting low angle and high angle fractures at approximately 84-86 feet bgs, and observations during drilling indicate that water production began at approximately the same depth. A similar fracture zone was noted at approximately 174-176 feet bgs and HPFM data indicate that water flow into the borehole at this fracture zone. The caliper log indicates multiple low angle fractures from approximately 217-227 feet bgs. Observations during drilling indicate increased water production at approximately the same depth and HPFM data indicates water flow out of the borehole in this interval. The ATV log indicates intersecting low-angle bedding plane and high angle vertical fractures at approximately 246-249 feet bgs.

Stereonet plots of identified fractures and bedding plane partings in the borehole indicate that the mean strike and dip of these features is approximately N50E/18NW, which is relatively consistent with the regional bedding strike and dip of the Passaic Formation bedrock in the Site area, as depicted on the New Jersey Geological Survey bedrock geologic map for the Chatham Quadrangle (Monteverde and Volkert, 2005).

Groundwater grab sample analytical results indicate that TCE concentrations exceeded the NJDEP GWQS in all of the packer test intervals, ranging from 3 µg/L in the shallowest test interval (172-182 feet bgs) to 68 µg/L in the 242-252 feet bgs interval.

3.1.3.2 MW-2D

Based on the geophysical logs, the soil log, and observations during drilling, four intervals were selected for packer testing in MW-2D (Table 3-2). The sustained groundwater flow rate was generally low, with the highest rate observed in the shallowest test interval (1 gpm at 88-98 feet

bgs). Groundwater flow in the remaining test intervals (138.5-148.5 feet, 174-189 feet, and 189-198 feet bgs) ranged from 0.57 to 0.76 gpm, indicating limited yield at depth. None of the intervals went dry during packer testing. The heat pulse flow meter data generally indicated a downward vertical flow gradient in the borehole, with a slight upward flow measured near the bottom of the 200-foot borehole.

The pressure data indicated that the packers generally achieved a good seal against the borehole wall when inflated, and real-time monitoring of the transducer data during pumping indicated that the packers were well seated. During pumping of the 138.5-148.5 feet bgs interval, a minor but steady reduction in pressure was observed below the bottom packer. This suggests that some water was drawn from below the pumping interval. As noted above, real-time monitoring of the transducer data during pumping indicated that the packers were well seated; therefore, the change in hydraulic head suggests that fractures and partings in the bedrock may be interconnected to some extent above and below the bottom packer.

Geophysical logging, packer test data, and observations during drilling indicate that hydraulically conductive fractures or fracture zones were identified in the MW-2D borehole at approximately 70-72 feet bgs, 89-90 feet bgs, 106-108 feet bgs, and 182-185 feet bgs. As noted above, monitoring wells MW-2I and MW-2D were installed to monitor approximately the bedding units as destroyed monitoring wells MW-542B (intermediate well screened from 80-100 feet bgs) and MW-542A (deep well screened from 180-200 feet bgs), respectively. Although the zone at 70-72 feet bgs was not packer tested because it was too shallow, the caliper and ATV logs indicate intersecting low angle and high angle fractures at approximately 70-72 feet bgs, and observations during drilling indicate that water production increased at approximately the same depth. The HPFM data also indicates water flow into the borehole near this zone. Drilling observations indicated increased water production at another fracture zone at approximately 89-90 feet bgs and HPFM data indicates water flow out of the borehole near this fracture zone. The caliper and ATV logs indicate a low angle fracture zone at 106-108 feet bgs and HPFM data indicates water flow out of the borehole near this zone. Observations during drilling indicate easier drilling and possible fracturing from approximately 182-185 feet bgs with increased water production. The caliper log indicates that the borehole wall at approximately the same depth is rough, suggesting

weathering, and HPFM data indicates water flow into the borehole near this interval with a change to an upward flow gradient.

Stereonet plots of identified fractures and bedding plane partings in the borehole indicate that the mean strike and dip of these features is approximately N73E/8NW. The strike is somewhat inconsistent with both the regional bedding strike and dip and the strike and dip reported for MW-1I and recovery well RW-1. This may be due to the overall low number of fractures identified during the geophysical logging of MW-2D, coupled with the low ratio of bedding plane partings to higher angle fractures identified during logging.

Groundwater grab sample analytical results indicate that TCE was not detected in any of the groundwater samples collected from the packer test intervals in MW-2D.

3.1.3.3 MW-3D

Based on the geophysical logs, the soil log, and observations during drilling, four intervals were selected for packer testing in MW-3D (Table 3-2). Given that this borehole was installed to monitor approximately the same bedding units as MW-546D in the down-dip direction, the packer test intervals were selected from the bottom half of the borehole. During the geophysical logging of MW-3D, a high degree of turbidity was observed in the groundwater and the borehole wall remained silty due to insufficient development of the borehole prior to logging. The silt on the borehole wall reduced the effectiveness of the HPFM tool, resulting in no vertical flow being detected in the borehole.

Despite the limited development, relatively high groundwater flow rates were measured during pumping of the packer test intervals. The highest sustained groundwater flow rate was observed in the shallowest test interval (6.4 gpm at 288-313 feet bgs). The groundwater flow rates in test intervals 330-335 feet bgs and 477-502 feet bgs were also relatively high (3.45 gpm and 4.8 gpm, respectively), but the flow rate in test interval 394-419 feet bgs was relatively low (0.85 gpm). The 394-419 feet bgs interval initially pumped dry at 0.85 gpm; however, following a short recovery period followed by pumping at a lower rate of 0.5 gpm, the interval began to develop and produce more water and the flow rate was increased to 0.85 gpm for the duration of the test.

The pressure data indicated that the packers generally achieved a good seal against the borehole wall when inflated, and real-time monitoring of the transducer data during pumping indicated that the packers were well seated. During packer testing of the 477-502 feet bgs interval, a minor reduction in pressure was observed below the isolated interval during pumping, indicating that hydraulic head below the bottom packer was influenced by pumping of the test interval. Monitoring of the transducer data during pumping, however, indicated that the packers were well seated. This suggests that fractures and partings in the test interval may be in hydraulic communication to some extent with fractures below the test interval. This is supported by the observation that the pressure within the test interval and below the test interval equilibrated to nearly the same levels during the period following packer inflation but prior to pumping, indicating that the fractures within and below the test interval are part of the same aquifer system. In addition, while pumping at 4.8 gpm, the data from the pumping interval indicates small-scale but short duration pressure increases that suggest momentary recovery of groundwater. These events correspond in time with similar small-scale but short duration pressure decreases below the isolated interval, indicating that hydraulic communication is occurring.

Geophysical logging, packer test data, and observations during drilling indicate that hydraulically conductive fractures or fracture zones were identified in the MW-3D borehole at approximately 292-295 feet bgs, 331-342 feet bgs, and 484-485 feet bgs. The caliper and ATV logs indicate a fracture zone at approximately 292-295 feet bgs, and observations during drilling indicate a change in drilling at approximately the same depth. The caliper and ATV logs also indicate a widened borehole wall from approximately 331 to 342, suggesting a weathered zone, and low angle fractures at approximately 484-485.

Stereonet plots of identified fractures and bedding plane partings in the borehole indicate that the mean strike and dip of these features is approximately N58E/8NW, which is relatively consistent with both the regional bedding strike and dip and the strike and dip reported for MW-1I and recovery well RW-1.

Groundwater grab sample analytical results indicate that TCE concentrations exceeded the NJDEP GWQS in packer test intervals 288-313 feet bgs (1.5 µg/L) and 330-355 feet bgs (2.7 µg/L). The

TCE concentration reported for packer test interval 394-419 feet bgs (0.24 J µg/L) did not exceed the NJDEP GWQS, and TCE was not detected in packer test interval 477-502 feet bgs.

3.1.4 Investigation-Derived Waste

Investigation-derived wastes generated during monitoring well installation, well development, and packer testing activities were managed, characterized, and disposed of off-Site in accordance with procedures detailed in the approved Waste Management Plan (Appendix C of the September 2012 Work Plan [Tetra Tech, 2012a]). The IDW generated during monitoring well installation and packer testing activities included both liquid wastes (primarily water generated during drilling and well development, purged groundwater, and decontamination water) and solid wastes (primarily soil cuttings and, personal protective equipment [e.g., nitrile gloves]).

IDW liquids generated during drilling, development, and packer testing activities conducted at wells MW-1I, MW-1S, MW-2D, and MW-2I were contained in 10,000-gallon frac tanks that were staged near the well locations during drilling and packer testing activities. Due to the physical constraints of the Upper Drive cul-de-sac, water generated during the drilling, development, and packer testing of MW-3D was contained in two 4,000-gallon vertical tanks staged near the well. Water generated during drilling and well development, and purge water generated during packer testing and groundwater grab sampling was discharged directly into the tanks. A total of approximately 29,511 gallons of IDW water were generated during the monitoring well installation and packer testing program. A water sample was collected from one of the IDW tanks and submitted to Alpha Analytical Laboratories, Inc. located in Westborough, MA (NJ Laboratory Certification No. MA935) for waste characterization analysis. Analytical results indicated that the IDW water was non-hazardous. The IDW water was pumped into tanker trucks and transported as non-hazardous waste to an approved Lockheed Martin waste facility for proper disposal. Initially, the IDW water was transported to the EQ-York facility (Envirite) located in York, PA. Following notification of procedural changes at the EQ-York facility, IDW water transported from the Site after October 3, 2013 was transported to the NewStream facility located in Attleboro, MA. The non-hazardous waste manifests are provided in Appendix E.

IDW solids were contained in roll-off containers that were staged near the well locations during drilling activities. Due to the physical constraints of the Upper Drive cul-de-sac, soil generated during the drilling and installation of MW-3D was contained in 55-gallon drums and staged near the well. Soil samples were collected from one of the IDW roll-off containers and submitted to Alpha Analytical Laboratories, Inc. for waste characterization analysis. Analytical results indicated that the IDW soil was non-hazardous. Approximately 20.3 tons of soil contained in three roll-offs and 28 drums of soil were transported as non-hazardous waste to an approved Lockheed Martin waste facility (EQ-York) for proper disposal. In addition, silt and water generated during the cleanout of the frac tanks and vertical tanks (approximately 4,173 gallons) was also transported to EQ-York for proper disposal. Copies of the non-hazardous waste manifests and weight tickets are included in Appendix E of this report.

3.2 MONITORING WELL REPAIRS

All of the monitoring wells in the Site monitoring well network were visually inspected and their physical condition was recorded during the September 2013 synoptic water level round. The results of this inspection indicated that many of the monitoring well surface completions were in poor condition (e.g., cracked or missing concrete pads, inner well casings exposed above grade, missing caps and flush mount lid bolts). Based on these observations, monitoring well repairs were conducted to secure the wells and prevent surface water infiltration and potential vandalism.

Monitoring well repairs were conducted in from November 14 to November 20, 2013. The well repairs were conducted by a New Jersey-licensed well driller employed with Advanced Drilling, Inc., located in Pittstown, New Jersey. A Tetra Tech geologist supervised the well repair activities. During the well repairs, fifteen surface completions were replaced (i.e., new flush mount protective casings and concrete pads were installed) and twenty-four wells received minor repairs (e.g., tap and threading of flush mount bolts, replacement of missing gaskets and inner caps). Replacement locks (keyed-alike) were also installed on the monitoring wells. Details regarding the monitoring well repairs performed for the wells at the Site are provided in Table 3-5.

During the well repair activities, monitoring well MW-503S was investigated to assess the nature of an obstruction noted in the well during previous sampling events. Well gauging measurements

recorded during previous semi-annual sampling events indicated that the inner casing of the well was obstructed at approximately 12 feet below ground surface. A down-hole video camera was advanced down the well casing to identify the obstruction. The nature of the obstruction was not determined due to limited visibility; however, it may have been silt, because the obstruction was cleared by advancing the camera down the well and silt was observed on the camera upon removal from the well.

Following the completion of the well repair activities, the entire monitoring well network was surveyed to obtain updated horizontal coordinates and vertical elevations for the wells. The wells will be surveyed by a New Jersey licensed professional land surveyor employed with Carroll Engineering located in Hillsborough, New Jersey. The well survey was conducted in a manner consistent with NJDEP requirements. Horizontal well coordinates were surveyed to the nearest 0.1 foot and reported in latitude/longitude and New Jersey State Planar Coordinates referenced to the North American Datum of 1983 (NAD83). Vertical coordinates were surveyed to the nearest 0.01 foot and referenced to the North American Vertical Datum of 1988 (NAVD 88). The survey included a vertical elevation for the top of the inner well casing and the ground surface at the well to the nearest 0.01 foot. A Tetra Tech geologist supervised the well surveying activities. The measuring point elevations (i.e., top of inner casing) for the existing monitoring wells in Table 3-1 have been updated with the new survey data. The NJDEP Monitoring Well Certifications (Form-B) for the surveyed wells are provided in Appendix B.

4.0 Groundwater Modeling

In 2014, Tetra Tech performed three-dimensional groundwater flow and solute transport modeling of groundwater flow and dissolved contaminant transport in the bedrock aquifer at the Site. The model was applied to simulate both groundwater flow and dissolved TCE plume transport at the Site. The objectives of this modeling effort were to: (1) improve understanding of the fate and transport of dissolved TCE in Site groundwater; (2) estimate the lateral delineation of the dissolved TCE plume; (3) examine the simulated future TCE plume extent and the ability of the monitoring network to monitor plume reduction over time; and, (4) estimate the cleanup timeframe of TCE concentrations in groundwater as part of a monitored natural attenuation (MNA) remedy at the Site.

To accomplish these goals, Tetra Tech constructed a numerical groundwater flow model and calibrated the model to observed water level measurements during both non-pumping and pumping conditions. Following flow model calibration, a solute-transport model was implemented to provide fate and transport simulations of TCE concentrations over time in the study area. Details regarding the groundwater flow and solute transport modeling effort were provided in the Final Groundwater Flow and Solute Transport Modeling Report dated January 15, 2015 (Appendix F) and are summarized below.

The groundwater flow model was developed using MODFLOW 2000, a well-documented, widely used and accepted code developed by the U.S. Geological Survey (McDonald and Harbaugh, 1988; Harbaugh et al., 2000).

Tetra Tech specified the boundaries of the model grid to coincide with natural hydrogeologic boundaries, if possible, and at sufficient distance from the Site to minimize the influence of the model boundaries on the simulation results. The site-specific model used 10 layers to represent the groundwater system beneath the Site. The top and bottom elevations of each model layer were defined based both on regional trends of the geologic units and site-specific boring logs. The model boundary conditions were defined in accordance with guidelines in American Society of

Testing and Materials Standard D5609-94 and were chosen to represent hydrogeologic features in the model domain. The primary source of water into/from the model was from precipitation-derived recharge and evapotranspiration. The principal surface water drainages (including Crab Brook, Green Brook, Stony Brook, and Robinson Branch) were simulated using river-boundary-conditions cells. The base of the model was designated as a no-flow boundary to represent the lower permeability of the more competent bedrock in this zone.

The hydraulic properties specified in the model included horizontal and vertical hydraulic conductivity, and storage coefficients (including specific yield for simulation of water table [unconfined] conditions and specific storativity for simulating confined situations). Site-specific information used to characterize the hydraulic properties included geologic logs, packer testing data, and the results of the RW-1 48-hour pumping test. The 48-hour pumping test results provided the basis for estimating local values of horizontal and vertical hydraulic conductivities and storage coefficients. The initial values in the model were modified as appropriate during model calibration to match the hydraulic responses in the bedrock aquifer.

A steady-state groundwater flow model calibration was performed to match measured water level data in March 2014 using the groundwater flow model MODFLOW. The model was calibrated to 50 target wells in the shallow, intermediate, and deep zones of the bedrock aquifer. The model was also calibrated to observed drawdown data from the 48-hour constant rate (120 gpm) pumping test at the Site. The agreement of the flow model with both observed water levels, hydraulic head gradients, and the observed distribution of dissolved TCE tracer in groundwater at the Site provided additional evidence of a high quality flow model calibration.

Predictive simulations were performed using the calibrated steady-state groundwater flow field. To examine the future performance of MNA at the Site, a forward-in-time simulation was performed. Using measured TCE concentrations (March 2014) in monitoring wells to represent the initial TCE concentration distribution in the intermediate zone of the bedrock aquifer (the zone with the highest TCE concentrations), future TCE concentrations were then simulated over time to examine the future plume extent, concentration levels, and the time to reach cleanup standards. Model simulations indicated that the TCE plume will continue to dissipate, with local concentrations continuing to decrease over time at the Site as a result of natural attenuation.

Based on the simulated spatial extent of TCE in groundwater over time, the results of the transport model simulation also indicated that the existing monitoring network can monitor future TCE concentrations as the TCE plume mass and extent decrease over time. Results of the model simulation indicate an estimated cleanup time of approximately 30 years for the MNA remedy at the Site.

One of the modeling objectives was to estimate the lateral delineation of the dissolved TCE plume, primarily near MW-1I, to assess the completeness of delineation and the protectiveness of the CEA boundary in this area. As noted in Section 3 of this report, monitoring well MW-1I was one of several wells installed to further delineate the existing groundwater contaminant plume and further define the groundwater CEA for the Site. As discussed in Section 6 below, groundwater analytical results from the March and September 2014 sampling events indicate elevated TCE concentrations in monitoring well MW-1I (120 µg/L and 82 µg/L, respectively). This well is located hydraulically side-gradient and northwest of well MW-549I and is structurally down-dip of the former source area. The model results indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I, which is within the current CEA boundary; therefore, TCE concentrations in groundwater are delineated to the northwest and the current CEA boundary in this area remains appropriate for the Site. Based on the model simulations, it is anticipated that the elevated TCE concentrations near MW-1I will continue to dissipate over time as a result of natural attenuation.

5.0 Technical Overview

The 2013 RAPR (dated July 2014) included data collected during two semi-annual sampling events conducted in March 2013 and September 2013 (Tetra Tech, 2014b). This RI/RAPR includes data collected during two subsequent semi-annual sampling events conducted in March and September 2014. The sampling schedule was established in the approved RAP and is provided in Table 5-1.

This RI/RAPR also includes groundwater analytical data generated during packer testing activities and two initial rounds of sampling of the five additional monitoring wells following installation and development (December 2013 and January 2014).

The semi-annual sampling program, the quality of the analytical data, and an overall assessment of the March and September 2014 sampling results, , the packer testing results, and the December 2013 and January 2014 sampling results, are briefly described in this section. A more detailed description of the field methods used during sampling and the specific findings are provided in Section 6 of this report. This includes the groundwater results from the initial sampling of the five additional monitoring wells, the groundwater and surface water results from both semi-annual sampling events, and the status of the GWES.

5.1 GROUNDWATER AND SURFACE WATER REMEDIATION OBJECTIVES

The objectives of the activities conducted at this Site are to identify a closure strategy that is protective of human health and the environment, and to obtain a Response Action Outcome determination from the LSRP for groundwater and surface water.

5.2 SEMI-ANNUAL MONITORING PROGRAM

The purpose of the semi-annual monitoring program is to provide data to:

- Characterize the VOC concentration distribution in groundwater to demonstrate that the established CEA boundaries and duration continue to be protective.

- Demonstrate that the shallow groundwater plume is decreasing and there are no potential VI receptors.
- Provide groundwater and surface water monitoring data as the basis for demonstrating that the plume will not impact any receptors and that VOC concentrations continue to attenuate to support a reduced monitoring frequency.

During the March and September 2014 sampling events, synoptic groundwater level measurements were collected from all Site monitoring wells and piezometers prior to the start of sampling.

As noted above, groundwater and surface water samples were collected semi-annually in March and September 2014. Based on the monitoring schedule in the approved RAP, groundwater samples were collected from 45 monitoring wells (including the five additional monitoring wells) during both events. The sampled monitoring wells are listed in Table 5-1 and identified on Figure 3-1. Surface water samples were collected from four locations along Crab Brook during both semi-annual events (Table 5-1 and Figure 3-1). The groundwater samples were collected using PDBs. The surface water samples were collected as grab samples using laboratory-supplied containers in accordance with the NJDEP FSPM.

Groundwater and surface water samples collected during the March and September 2014 semi-annual sampling events were submitted to Alpha Analytical Laboratories, Inc. for laboratory analysis of TCL VOC+15 using USEPA SW-846 Method 8260.

5.3 DATA QUALITY ASSESSMENT

5.3.1 Groundwater Data – Semi-Annual Sampling

A review of the laboratory analytical data reports indicates that the semi-annual groundwater data quality is acceptable and that all of the data are useable.

Proper preservation of the groundwater samples was verified by the laboratory. All holding times were met and surrogate recoveries met criteria. Analytical results for groundwater samples collected from wells MW-549I, MW-550S, MW-506S, MSW-508D, and PZ-522I during the March and September 2014 sampling events and the corresponding field duplicate samples (DUP-01, DUP-02, DUP-03, DUP-04, and DUP-05, respectively, during both events) generally met the

acceptance criteria specified in the Quality Assurance Project Plan (i.e., the Relative Percent Difference [RPD] between the reported results was less than 30%).

Consistent with the NJDEP FSPM, a modified PDB trip/equipment blank was collected during deployment of the PDBs in the monitoring wells during the March and September 2014 sampling events. The modified trip/equipment blank was obtained by ordering an extra PDB sampler that was shipped to the Site and handled in the same manner as the other PDBs deployed during the sampling event. No compounds were detected in the modified trip blank collected during the March 2014 sampling event. Analysis of the September 2014 modified trip blank indicated low concentrations of toluene (0.43 micrograms per liter [µg/L]) and acetone (8.2 µg/L). Toluene was not detected in the September 2014 groundwater samples. Low Acetone concentrations were reported in nearly all of the September 2014 groundwater samples (concentrations ranging from 5.1-28 µg/L), but all reported concentrations were below the NJDEP GWQS for acetone (6000 µg/L). In addition, the laboratory control sample duplicate recovery was high for acetone in the analytical batch containing samples from wells MW-2I, MW-3D, MWS-501S/I, MW-502S/I, MW-503S/I, and MW-505S/I, indicating a potential bias high for the acetone results in these samples.

5.3.2 Surface Water Data – Semi-Annual Sampling

A review of the laboratory analytical data reports indicates that the surface water data quality is acceptable and that all of the data are useable.

Proper preservation of the surface water samples was verified by the laboratory. All holding times were met and surrogate recoveries met criteria. Analytical results for the surface water sample collected from sampling location SW-4 during the March 2014 sampling event and the corresponding field duplicate sample DUP-06 met the acceptance criteria specified in the Quality Assurance Project Plan, with the exception of acetone. The RPD between reported acetone results in sample SW-4 and DUP-06 exceeded the 30% acceptance criteria (42.4%), but the acetone concentrations in both samples were low (1.3J µg/L and 2.0J µg/L). Acetone is a common laboratory contaminant.

Estimated concentrations of PCE were reported in the field blank (0.42J µg/L) and in the trip blank (0.21J µg/L) during the March 2014 sampling event, but no PCE was reported in the associated surface water samples. Acetone was reported at a concentration of 2.4 µg/L in the field blank and 1.9 µg/L in the trip blank during the September 2014 sampling event. Low estimated concentrations of acetone were reported in sample SW-4 and the associated DUP-6 (3.9J and 3.8J µg/L, respectively), but the reported concentration of acetone in sample SW-3 was 19 µg/L.

5.3.3 Groundwater Data – Packer Testing Groundwater Grab Sampling

The groundwater samples collected during packer testing were submitted for laboratory analysis of TCL VOC+15 using USEPA SW-846 Method 8260. Groundwater grab samples collected from the packer test intervals in the MW-1I and MW-3D boreholes were submitted to Alpha Analytical Laboratories, Inc., and samples collected from packer test intervals in the MW-2D borehole were submitted to Integrated Analytical Laboratories, LLC located in Randolph, NJ (NJ Laboratory Certification No. 14751).

A review of the laboratory analytical data reports indicates that data quality is acceptable and that all of the data are useable. The analytical methods used and the parameters analyzed and reported were consistent with the Work Plan specifications. Proper preservation of the groundwater samples was verified by the laboratory. All holding times were met and surrogate recoveries met criteria. Analytical results for groundwater samples collected from packer test intervals 258-268 feet bgs in MW-1I, 174-189 feet bgs in MW-2D, and 288-313 feet bgs in MW-3D and their corresponding field duplicate samples met the acceptance criteria specified in the Quality Assurance Project Plan.

Low estimated concentrations of acetone were reported in the field blank (2.2 J µg/L) and trip blank (2.7 J µg/L) associated with the samples collected during packer testing of MW-1I, and in the trip blank (1.2 J µg/L) associated with the samples collected during packer testing of MW-3D. As noted above, acetone is a common lab contaminant.

5.3.4 Groundwater Data – Initial Sampling of Additional Wells

Groundwater and surface water samples collected in December 2013 and January 2014 from the five additional monitoring wells were submitted to TestAmerica Laboratories, Inc. located in Edison, NJ (NJ Laboratory Certification No. 12028) for laboratory analysis of TCL VOC+15 using USEPA SW-846 Method 8260. A review of the laboratory analytical data reports indicates that the groundwater data quality is acceptable and that all of the data are useable.

Proper preservation of the groundwater samples was verified by the laboratory. All holding times were met and surrogate recoveries generally met criteria. Analytical results for groundwater samples collected from well MW-1I-B during the December 2013 and January 2014 sampling events and the corresponding field duplicate samples (DUP-01-123113 and DUP-02-011414, respectively) generally met the acceptance criteria specified in the Quality Assurance Project Plan. Given the close consecutive scheduling of the two sampling events, a modified trip blank was collected during the December 2013 sampling event, but not during the January 2014 sampling event. No VOCs were detected in the modified trip blank.

The surrogate recovery for sample MW-1S-B during the December 2013 sampling event was high, indicating that the VOC results may be biased high; however, the VOC results for the sample collected from MW-1S-B in January 2014 are comparable and of similar magnitude to the December 2013 results.

5.3.5 Other Potential Factors Influencing the Data

No other significant events or seasonal variations are known to have affected the sampling procedures or the groundwater and surface water results presented in this report.

5.3.6 Overall Assessment of the Sampling Results

5.3.6.1 Groundwater Results

Analytical results for the groundwater samples collected during the March and September 2014 sampling events indicate that TCE concentrations are either overall the same or slightly lower than the results reported in the 2013 RAPR, but the TCE distribution is similar. TCE concentrations exceeding the NJDEP GWQS in the shallow zone monitoring wells were relatively low (generally

ranging from non-detect to 1.9 µg/L) and were mainly limited to the former LEC Site facility area and immediately downgradient. The reported TCE concentration in MW-547S in September 2014 (6.2 µg/L) is considered to be anomalous and unrelated to the Site, based on concentration gradients in Site monitoring wells that are not consistent with a source related to the former LEC Site and the detection of compounds in MW-547S that are unrelated to the Site. Tetra Tech notified NJDEP (via the NJDEP Hotline, Incident No. 15-01-12-1759-36) regarding the elevated TCE concentrations in well MW-547S on January 12, 2015. On January 13 and January 23, 2015, Tetra Tech provided the NJDEP receptor survey team with additional information about the location of MW-547S to facilitate their search for the potential source(s) of the unknown discharge. On January 26, 2015, Tetra Tech sent an email to NJDEP providing detailed justification for considering the elevated TCE concentrations in MW-547S as anomalous and unrelated to the former LEC Site. The lines of evidence included those noted above (i.e., concentration gradients in monitoring wells located upgradient of MW-547S that are not consistent with a TCE source related to the former LEC Site and the presence of other VOCs in MW-547S that are unrelated to the former LEC Site), as well as the lack of TCE detections in Crab Brook, which receives shallow groundwater flow and is located immediately upgradient of shallow monitoring well MW-547S.

A review of trend graphs and the associated historic TCE concentrations indicates decreasing or stable TCE concentrations in the selected wells.

The analytical results for samples collected from well clusters MW-501 and MW-503 delineate the limit of the TCE plume to the southeast in the shallow and intermediate zones. Similarly, the analytical results for samples collected from shallow wells MW-546S and PZ-521S delineate the downgradient extent of the shallow TCE plume to the southwest. The analytical results for samples collected from intermediate wells MW-546I and PZ-521I delineate the lateral extent (northwest and southeast, respectively) of the downgradient TCE plume and emphasize the narrow spread of the plume in the intermediate zone downgradient of the Site. Further downgradient, the analytical results for well cluster MW-2 delineate the limit of the TCE plume in the intermediate and deep zones to the southeast, and the results for well MW-3D delineate the limit of the TCE plume to the northwest.

The analytical results for samples collected from monitoring wells MW-1S and MW-1I in 2014 indicate that TCE concentrations exceeded the NJDEP GWQS (1 µg/L); however, the groundwater flow and transport modeling results indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I, which is within the current CEA boundary; therefore, TCE concentrations in groundwater are delineated to the northwest near well MW-1I and the current CEA boundary in this area remains appropriate for the Site. Based on the model simulations, it is anticipated that the elevated TCE concentrations near MW-1I will continue to dissipate over time as a result of natural attenuation.

Elevated TCE concentrations reported in wells PZ-524I (3.2 µg/L in March 2014 and 2.6 µg/L in September 2014) and in PZ-524D (2.9 µg/L in March 2014 and 2.7 µg/L in September 2014) were higher than anticipated near the downgradient edge of the groundwater plume. Lower TCE concentrations were reported in the nearest wells located hydraulically upgradient well to the PZ-524 well cluster (PZ-522I and PZ-522D) during the March and September 2014 sampling events. More importantly, elevated PCE concentrations were reported in both PZ-524I (99 µg/L and 110 µg/L in March and September 2014, respectively) and PZ-524D (52 µg/L and 65 µg/L in March and September 2014, respectively). Reported PCE concentrations in the nearest upgradient wells PZ-522I and PZ-522D were either non-detect or below 1 µg/L.

As noted in Section 2 of this report, a former dry cleaner is located at 221 Grove Street, which is situated hydraulically upgradient of well cluster PZ-524. Given the historical use of the 221 Grove Street property for dry cleaning, the reported detections of PCE (which is not a groundwater contaminant of concern at the Site) at concentrations one to two orders of magnitude higher than the PCE concentrations detected in the other Site monitoring wells, and concentration gradients in monitoring wells at the former LEC Site that are not consistent with a source related to the former LEC Site, the former dry cleaner at 221 Grove Street may be the source of the PCE detections in the PZ-524 wells. It is arguable that the elevated TCE concentrations reported in wells PZ-524I and PZ-524D are likely the result of natural attenuation of dissolved PCE in groundwater. Based on the above information, the established downgradient CEA boundary is considered to be appropriate for the Site and no changes to the CEA are required.

The monitoring wells were visually inspected and their physical condition was recorded during the September 2013 synoptic water level round. The results of this inspection indicated that many of the monitoring well surface completions were in poor condition (e.g., cracked or missing concrete pads, inner well casings exposed above grade, missing caps and flush mount lid bolts). Monitoring well repairs and a re-survey of the monitoring well network were completed in November 2013.

5.3.6.2 Surface Water Results

Analytical results for the samples collected in March 2014 indicate the benzene concentration in sample SW-4 (0.41 J µg/L in the field duplicate sample) exceeded the NJDEP FW2-NT Surface Water Quality Standards (SWQS) (N.J.A.C. 7:9B) of 0.15 µg/L. Benzene is not a compound of concern at the Site. The benzene source at SW-4 may be surface runoff from Route 22. Low estimated concentrations of acetone were also reported in all of the surface water samples collected in March 2014, ranging from 1.3 J µg/L in SW-4, to 2.1 J µg/L in SW-2.

Analytical results for the samples collected in September 2014 indicate that no VOC concentrations exceeded their applicable SWQS. Concentrations of acetone (19 µg/L), chloroform (3.5 µg/L) and toluene (0.18 J µg/L) were reported in sample SW-3. A low estimated concentration of acetone was also reported in sample SW-4 (3.9 J µg/L). Acetone and chloroform are both common laboratory contaminants. Benzene concentrations did not exceed reporting limits in any of the surface water samples collected in September 2014.

6.0 Remedial Action Progress Report

Previous groundwater and surface water investigations have delineated a groundwater plume comprised primarily of TCE in the local bedrock and overburden aquifer system. TCE has been reported at concentrations exceeding the NJDEP GWQS of 1 µg/L in groundwater beneath the Site, extending to the southwest approximately 7,000 feet. The Site GWES was activated on July 17, 2003 to remediate the TCE plume and intercept groundwater prior to its entry into Crab Brook. This system was turned off on May 28, 2011. During operation, groundwater was pumped from extraction well RW-1, located on North Drive in North Plainfield, at an approximate rate of 120 gpm. Effluent sampling and monthly performance sampling were also conducted in accordance with the NJPDES permit to monitor the effectiveness of the recovery system. Groundwater and surface water sampling is currently conducted on a semi-annual basis to monitor potential changes in the extent and concentration of TCE in groundwater. Remedial activities and evaluations completed in association with the groundwater monitoring and surface water monitoring activities conducted from March 2014 through September 2014 are described in the sections below.

6.1 GROUNDWATER MONITORING AND SAMPLING ACTIVITIES

Groundwater monitoring and sampling events were conducted on March 20, 2014 and September 11, 2014 in accordance with the sampling schedule presented in Table 5-1. The groundwater sampling locations are shown on Figure 3-1.

As noted above, initial groundwater samples were also collected from the five additional monitoring wells in December 2013 and January 2014. The wells were vertically profiled to assess the potential for contaminant stratification and to determine the appropriate depth for future PDB deployment.

As presented in the 2013 RAPR, groundwater beneath the Site has been conceptually divided into three vertical zones to facilitate hydrogeologic analysis:

- shallow zone – overburden and shallow bedrock groundwater from the groundwater table to approximately 50 feet above msl;
- intermediate zone – bedrock groundwater from approximately 50 feet above msl to approximately 50 feet below msl; and,
- deep zone – bedrock groundwater below 50 feet below msl.

Historically, monitoring well clusters (couplets or triplets) have been installed to monitor groundwater quality in these three vertical zones, with a naming convention that was intended to convey information about the depth of the individual wells within the well cluster. At monitoring well couplets, the deeper monitoring well was designated with an "A" at the end of its name, and the shallower monitoring well was designated with a "B". Similarly, at monitoring well triplets, the deepest monitoring well was designated with an "A", the intermediate-depth monitoring well was designated with a "B", and the shallowest monitoring well was designated with a "C". This naming convention, however, has become cumbersome in practice, in that "A" designated wells may be present in either the deep vertical zone or the intermediate vertical zone, and "B" designated wells may be present in either the shallow or the intermediate vertical zone, depending on whether the monitoring well cluster represented is a well couplet or a well triplet. Therefore, to minimize confusion, this report has presented all monitoring wells in the shallow zone as defined above with an "S" designation, all monitoring wells in the intermediate depth zone with an "I" designation, and all monitoring wells in the deep zone with a "D" designation (replacing the previous "A", "B", and "C" designations). A summary of current monitoring well designations and well construction information is provided in Table 3-1 (historic well designations were retained in Table 3-1 for those monitoring wells that are listed as missing or destroyed). The groundwater sampling methods are summarized below, followed by a discussion of the groundwater analytical results and investigative findings.

6.1.1 Groundwater Sampling Methods

As noted above, groundwater samples were collected from 45 monitoring wells during the March and September 2014 sampling events. Groundwater samples were also collected from the five additional monitoring wells in December 2013 and January 2014. The samples were collected

using PDBs that were pre-filled with laboratory-certified analyte-free water prior to shipment to the Site. The PDB field data sheets are provided in Appendix G.

During deployment in the wells, the PDBs were attached to dedicated weighted tether lines in the wells to keep them positioned in the screened interval. Following a two-week equilibration period, the PDBs were retrieved from the wells using the deployment lines, and the samples were transferred to the appropriate laboratory-supplied bottles. As previously noted, groundwater samples were submitted for laboratory analysis of VOCs via USEPA SW-846 Method 8260.

During the March and September 2014 semi-annual sampling events, a synoptic round of groundwater level measurements was collected from the Site monitoring wells and piezometers on the same day as sample collection. Groundwater levels in recovery well RW-1 were not measured during the synoptic rounds, because the open borehole in RW-1 is approximately 130 feet long and the potentiometric surface in this well is influenced by multiple fracture zones in both the shallow and intermediate bedrock zones. The wells were also visually inspected and their physical condition was recorded during the synoptic rounds.

6.1.2 Vertical Profiling of the Additional Monitoring Wells

The depths of the PDB samplers deployed in the wells existing prior to 2013 were determined based on the results of vertical profiling of the wells in March 2003, as detailed in the 2004 RAR (TRC, 2004b). Due to inconclusive results, wells MW-544D and PZ-522S were vertically profiled again in September 2003, as detailed in the 2005 RAPR (TRC, 2005). The five additional wells installed in 2013 were vertically profiled during the December 2013 sampling event. During this event, PDBs were deployed at the midpoint of every five feet of saturated screen to evaluate the potential for contaminant stratification, in accordance with NJDEP FSPM. The 10-foot screen intervals in wells MW-1S/I and MW-2I/D were profiled using two PDBs, and the 15-foot screen interval in well MW-3D was profiled using three PDBs. Samples collected from the shallowest PDB in each well were designated by the letter "A" (i.e., MW-1S-A), and samples collected from the next deeper PDB in each well was designated by the letter "B". The sample collected from the deepest PDB in well MW-3D was identified as MW-3D-C.

Analytical results for the groundwater samples collected from the five additional monitoring wells in December 2013 and January 2014 are provided in Table 6-1 and 6-2, respectively. Analyte concentrations that exceed NJDEP GWQS are highlighted in the tables. The results from the vertical profiling samples collected in December 2013 indicate that reported TCE concentrations exceeded the NJDEP GWQS of 1 µg/L in MW-1S (2.8 µg/L in sample MW-1S-B) and MW-1I (130 µg/L in sample MW-1I-A and 140 µg/L in sample MW-1I-B). Low estimated concentrations of TCE were reported in the samples collected from MW-2D, and TCE was not detected in the samples collected from MW-2I. Similarly, the TCE concentration in the shallowest sample collected from MW-3D (0.41 J µg/L in sample MW-3D-A) did not exceed the NJDEP GWQS, and TCE was not detected in the remaining two vertical profile samples collected from MW-3D.

Based on the vertical profiling results, the depth interval that exhibited the highest TCE concentration during the December 2013 sampling event was selected as the appropriate depth interval for future PDB sampling of the five additional monitoring wells. In monitoring wells MW-1S, MW-1I, MW-2I, and MW-2D, the lower portion of the 10-foot screen intervals (the "B" depth) was selected, and in monitoring well MW-3D, the shallowest portion of the 15-foot screen interval (the "A" depth) was selected. Groundwater samples collected during the January 2014 sampling event were collected from PDB samplers placed at these intervals.

The groundwater analytical results for the groundwater samples collected from the five additional monitoring wells in January 2014 were similar to the December 2013 results. Reported TCE concentrations in wells MW-1S (2.5 µg/L) and MW-1I (100 µg/L) exceeded the NJDEP GWQS, but were slightly lower than the concentrations reported in the December 2013 sampling event. Reported TCE concentrations in the sample collected from MW-2D did not exceed the NJDEP GWQS, and TCE was not detected in the samples collected from MW-2I and MW-3D.

6.1.3 Groundwater Sampling Results

6.1.3.1 Groundwater Elevations

Synoptic groundwater level measurements were collected on March 20, 2014 and September 11, 2014 from the Site monitoring wells. The depth to groundwater measurements and the calculated water level elevations from both synoptic measurement events are provided in Table 6-3. The groundwater elevation data from both events were used to prepare groundwater elevation contour maps for the shallow, intermediate, and deep aquifer zones (Figures 6-1 through 6-6). The September 2014 groundwater elevation for MW-550I (41.93 feet msl) is anomalously high, presumably due to a problematic water level measurement, and was not considered during preparation of the intermediate groundwater elevation contours for September 2014.

In general, the groundwater elevation measurements presented in Table 6-3 and on Figures 6-1 through 6-6 are consistent with historic groundwater elevation data at the Site. As shown in Figures 6-1 and 6-4, the hydraulic gradient in the shallow zone is relatively flat, sloping to the south-southeast beneath the Site and gradually to the southwest downgradient of the Site. The hydraulic gradient in the intermediate zone is similar to the shallow zone, trending slightly more to the southwest (Figures 6-2 and 6-5). The hydraulic gradient in the deep zone appears to slope more to the southwest, particularly further downgradient of the Site (Figures 6-3 and 6-6). It should be noted that given the anisotropic nature of the bedrock aquifer (i.e., flow occurs primarily in fractures and partings parallel to the bedding strike direction), the preferential flow path will be approximately parallel to bedrock strike (northeast-southwest) and not necessarily in the direction of the maximum hydraulic gradient.

6.1.3.2 Summary of Groundwater Results – Semi-Annual Sampling

The analytical results for groundwater samples collected during the March and September 2014 sampling events are provided in Tables 6-4 and 6-5, respectively. Analyte concentrations that exceed NJDEP GWQS are highlighted in the tables. TCE isoconcentration maps for the shallow, intermediate and deep aquifer zones for the March and September 2014 semi-annual sampling events are provided in Figures 6-7 through 6-12. NJDEP reduced-deliverable analytical data

packages for the March and September 2014 sampling events and for the December 2013 and January 2014 samples from the five additional wells are provided in Appendix H of this report.

The location of a cross-section oriented approximately parallel to the bedrock strike direction and situated within the TCE plume is provided on Figure 6-13. The cross-section with TCE isoconcentration contours is provided on Figure 6-14. As shown in the cross-section, the highest TCE groundwater concentrations are observed in the intermediate zone (i.e., from 50 feet above msl to 50 feet below msl). The highest TCE concentrations in the deep zone groundwater along the plume center line were reported in wells MW-546D (3.6 µg/L) and PZ-524D (2.7 µg/L) located hydraulically downgradient of the Site. The presence of TCE concentrations in the deep zone downgradient of the Site is likely due to the downward vertical gradients observed across most of the Site. As shown on Figures 6-10 and 6-14, elevated TCE concentrations in the shallow zone were reported primarily in wells located immediately downgradient of the Site.

Several monitoring wells located side-gradient to the center line of the TCE plume (i.e. to the northwest and the southeast) were projected onto the cross-section to provide additional data regarding the plume configuration. Some of the side-gradient wells, however, were installed in areas of higher or lower elevations than the wells located along the center line of the plume. Therefore, in some instances the side-gradient wells projected onto the cross-section appear to be completed above or below ground surface, in particular well clusters MW-507 and MW-508, which are located along East Drive at a relatively higher elevation than the wells located closer to the plume center line.

The analytical results for the March and September 2014 sampling events indicate that the groundwater TCE concentrations are overall either the same or slightly lower than the results reported in the 2013 RAPR, and the TCE distribution is similar. The highest TCE concentrations during the March and September 2014 sampling events were reported in MW-549I located near the former source area (330 µg/L reported in the field duplicate sample March 2014) and in MW-1I located northwest and side-gradient to the former source area (120 µg/L reported in March 2014). Monitoring well MW-549I is screened from 190 to 210 feet bgs (-11 to -31 feet below msl) and monitoring well MW-1I is screened from 245 to 255 feet bgs (-52 to -62 feet below msl).

Well MW-1I was installed and screened to monitor approximately the same fractured bedding units as MW-549I in the down-dip direction. Lower concentrations were reported in samples collected from both wells during the September 2014 sampling event (49 µg/L TCE in MW-549I and 82 µg/L TCE in MW-1I). It is unclear why the September 2014 groundwater TCE concentration in MW-549I was substantially lower than the March 2014 result for this well. It is possible that the PDB sampler deployed in September 2014 was not situated at the appropriate sampling depth in MW-549I, resulting in an anomalously low TCE concentration. Vertical profiling conducted in 2003 indicated that contaminant stratification was present in well MW-549I, and an appropriate sampling depth was selected for future PDB sampling of this well. The sampling depth for MW-549I will be confirmed prior to deployment of PDBs during the next sampling event in March 2015.

The next highest TCE concentrations were reported in samples collected in well MW-547S (6.2 µg/L in September 2014), MW-546D (2.9 µg/L in March 2014 and 3.6 µg/L in September 2014), and PZ-524I (3.2 µg/L in March 2014 and 2.6 µg/L in September 2014).

Monitoring well clusters MW-547 and PZ-524 were added to the long-term monitoring program in 2014 as part of the approved RAP (Table 5-1) and were last sampled in 2008. The reported TCE concentration in MW-547S in September 2014 was 6.2 µg/L, but the concentration reported in March 2014 was lower (1.2 µg/L). In addition, groundwater analytical results from multiple shallow monitoring wells located hydraulically downgradient of the former LEC facility but upgradient of MW-547S indicate that TCE concentrations were below 1 µg/L during both the March and September 2014 sampling events. This includes monitoring wells PZ-521S (located immediately upgradient of MW-547S), MW-502S, MW-503S, MW-505S, and MW-506S (Figures 6-7 and 6-10). The March and September 2014 groundwater analytical results for MW-547S also indicate the presence of compounds that are unrelated to the Site, specifically chlorobenzene, 1,2-dichlorobenzene, 1,4-dichlorobenzene, and methyl tert butyl ether (the latter in September 2014). These observations suggest that the elevated TCE concentrations in MW-547S are anomalous and unrelated to the former LEC Site. Based on a discussion with the LSRP and consistent with the NJDEP Administrative Requirements for the Remediation of Contaminated Sites (7:26C-1.7), as well as the NJDEP's off-site source guidance document (Administrative

guidance for Licensed Site Remediation Professionals and Subsurface Evaluators when encountering contamination that is suspected to be unrelated to a known discharge undergoing remediation, dated September 2014), Tetra Tech notified NJDEP regarding the elevated TCE concentrations in well MW-547S on January 12, 2015 (via the NJDEP Hotline, Incident No. 15-01-12-1759-36). On January 13, 2015, Tetra Tech spoke with Kathy Rogacki (NJDEP) who called to obtain additional information about the location of MW-547S, so that NJDEP could assign an investigation team to investigate the potential source(s) of the unknown discharge. On January 23, 2015, Tetra Tech provided additional well location information to Nick Sodano, a member of the NJDEP receptor survey team. On January 26, 2015, Tetra Tech sent an email to Mr. Sodano providing detailed justification for considering the elevated TCE concentrations in MW-547S as anomalous and unrelated to the former LEC Site. The lines of evidence included those noted above (i.e., concentration gradients in monitoring wells upgradient of MW-547S that are not consistent with a TCE source related to the former LEC Site, and the presence of other VOCs in MW-547S that are unrelated to the former LEC Site), as well as the lack of TCE detections in Crab Brook, which receives shallow groundwater flow and is located immediately upgradient of MW-547S. The upward flow gradients in shallow groundwater near Crab Brook (noted in Section 2 of this report) and the low or non-detectable reported TCE concentrations in surface water samples collected from Crab Brook (noted in Section 2 and discussed in Section 6 below), argue against the former LEC Site as the source of elevated TCE in shallow monitoring well MW-547S. Concentration trends in well MW-547S will continue to be monitored semi-annually in 2015.

Elevated TCE concentrations were also reported in PZ-524I, as noted above, and in PZ-524D (2.9 µg/L in March 2014 and 2.7 µg/L in September 2014). These concentrations are higher than anticipated near the downgradient edge of the groundwater plume. The nearest wells located hydraulically upgradient to the PZ-524 well cluster are PZ-522I and PZ-522D, and reported TCE concentrations in these wells are lower than the concentrations reported in PZ-524I and PZ-524D during both the March 2014 (Figures 6-8 and 6-9) and September 2014 (Figures 6-11 and 6-12) sampling events. In addition, as shown in Tables 6-4 and 6-5, elevated PCE concentrations were reported in both PZ-524I (99 µg/L and 110 µg/L in March and September 2014, respectively) and PZ-524D (52 µg/L and 65 µg/L in March and September 2014, respectively). Reported PCE

concentrations in the nearest upgradient wells PZ-522I and PZ-522D were either non-detect or below 1 µg/L.

As noted in Section 2 of this report, a former dry cleaner is located at 221 Grove Street, which is near the intersection of Grove Street and Greenbrook Road and is situated hydraulically upgradient of well cluster PZ-524. Given the historical use of the 221 Grove Street property for dry cleaning, the reported detections of PCE (which is not a groundwater contaminant of concern at the Site) at concentrations one to two orders of magnitude higher than the PCE concentrations detected in the other Site monitoring wells, and concentration gradients in monitoring wells at the former LEC Site that are not consistent with a source related to the former LEC Site, the former dry cleaner at 221 Grove Street may be the source of the PCE detections in the PZ-524 wells. It is further arguable that the elevated TCE concentrations reported in wells PZ-524I and PZ-524D are the result of natural attenuation of dissolved PCE in groundwater. Concentration trends in these wells will continue to be monitored semi-annually in 2015.

Elevated TCE concentrations were also reported in well MW-1S (2.8 µg/L in March 2014, but only 1.3 µg/L in September 2014). Concentrations of TCE in the remaining wells that were sampled during the March and September 2014 events and not already discussed above did not exceed 2.4 µg/L. TCE concentrations in downgradient well clusters MW-544 and MW-545 were either not detected or did not exceed 1 µg/L.

As shown in the shallow TCE isoconcentration maps for the March and September 2014 sampling events (Figures 6-7 and 6-10) the TCE concentrations in the shallow zone (i.e., from the water table to 50 feet above msl) are low and offsite migration is limited. Reported TCE concentrations in the shallow zone that exceeded the NJDEP GWQS of 1 µg/L generally were limited to the former LEC property and immediately downgradient. Concentrations of TCE in this area ranged from 1 µg/L (MW-550S in March 2014) to 2.8 µg/L (MW-1S in March 2014), which was the highest TCE concentration reported in the shallow zone (Figures 6-7 and 6-10). TCE concentrations in shallow groundwater samples collected from wells located further downgradient during both sampling events did not exceed the NJDEP GWQS of 1 µg/L (with the exception of well MW-547S, as discussed above).

As noted above, the highest TCE groundwater concentrations are observed in the intermediate zone (i.e., from 50 feet above msl to 50 feet below msl), as shown on Figures 6-8 and 6-11. The downgradient extent of TCE-impacted groundwater in the intermediate zone appears to be near well PZ-524I, where reported TCE concentrations exceeded the NJDEP GWQS (3.2 µg/L and 2.6 µg/L in March and September 2014, respectively). As noted above, it is arguable that the elevated TCE concentrations reported in wells PZ-524I and PZ-524D are the result of natural attenuation of PCE, which was identified at high concentrations in these wells and is not associated with the former LEC Site. Reported TCE concentrations in intermediate wells MW-544I and MW-545I, which are located downgradient and roughly the same distance from the Site as PZ-524I, were either non-detect or did not exceed 1 µg/L.

In the deep zone (i.e., greater than 50 feet below msl), the highest TCE concentrations were reported in samples collected from deep wells MW-546D (2.9 µg/L and 3.6 µg/L in March and September 2014, respectively) and PZ-524D (2.9 µg/L and 2.7 µg/L in March and September 2014, respectively). Similar to the intermediate zone, the downgradient extent of TCE-impacted groundwater in the deep zone appears to extend to the area near well PZ-524D (Figures 6-9 and 6-12), but the elevated concentrations in this well are considered to the result of natural attenuation of PCE, which is unrelated to the Site. TCE concentrations in deep wells MW-544D and MW-545D, located downgradient and approximately the same distance from the Site as PZ-524D, did not exceed 1 µg/L.

In addition to wells PZ-524I and PZ-524D, PCE was detected at concentrations exceeding the NJDEP GWQS of 1 µg/L in wells MW-549S, MW-549I, MW-545D, MW-550I, and MW-1S (Tables 6-4 and 6-5). Reported concentrations in these wells ranged from 1.1 µg/L to 3.0 µg/L, one to two orders of magnitude lower than the PCE concentrations reported in wells PZ-524I and PZ-524D which are located more than one mile downgradient of the former LEC Site. As noted above, PCE is unrelated to the Site.

The reported concentration of vinyl chloride exceeded the NJDEP GWQS of 1 µg/L in well MW-508D (2.0 µg/L and 1.3 µg/L in March and September 2014). The vinyl chloride concentrations reported during the 2014 sampling events are lower than the concentration reported in MW-508D

in 2013 (2.7 µg/L). Vinyl chloride is a potential degradation product from the natural attenuation of TCE, and has only been detected intermittently during sampling at the Site, usually at marginal concentrations. Vinyl chloride concentrations were not detected in well MW-508D prior to 2010 and concentrations have exhibited a decreasing trend since March 2011. Further, vinyl chloride has not been detected in the adjacent shallow well MW-508S. The concentration trend in well MW-508D will continue to be monitored semi-annually in 2015. Regarding the potential for vapor intrusion, there are no dwellings within 100 feet of the MW-508 well cluster except the Avalon Watchung apartment complex, where a vapor intrusion investigation and monitoring program is ongoing, as described in Section 6.4 below.

No other compounds were detected at concentrations above the NJDEP GWQS. Other compounds detected at low concentrations in various wells included potential lab contaminants (acetone and chloroform), chlorinated VOCs (cis-1,2-dichloroethene, 1,1-dichloroethene, 1,1-dichloroethane, 1,2-dichlorobenzene, 1,4-dichlorobenzene and chlorobenzene), Freon compounds (trichlorofluoromethane, and 1,1,2-trichloro-1,2,2-trifluoroethane), and petroleum-related compounds (benzene, toluene, and ethylbenzene). With the possible exception of cis-1,2-dichloroethene (another potential daughter product from the natural attenuation of TCE), these aforementioned compounds are not Site related.

6.1.3.3 Groundwater Concentration Trends

Historical TCE concentrations are summarized in Table 6-6. Historical TCE concentrations versus time plots are presented in Appendix I for selected wells. As shown on Table 5-1, the same source wells, plume wells, and fringe wells (including the five additional monitoring wells) were sampled during both the March and September 2014 sampling events. The plume wells are located near the former source area or directly downgradient of it; they are also located upgradient of recovery well RW-1 and within the capture zone of RW-1 when the GWES was operating. The fringe wells are located primarily downgradient of the Site, and include the five additional monitoring wells installed in 2013 and the three most downgradient well clusters (MW-544, MW-545 and PZ-524). Background wells MW-532S and MW-532D, located upgradient of the former source area to the northeast, are included with the list of fringe wells. As shown in Appendix I

and Table 6-6, decreasing concentration trends were observed in the source, plume, and fringe monitoring wells since pumping and treatment began in July 2003.

A comparison between TCE concentrations in monitoring well samples collected in November 1999 (prior to activation of the GWES) and in September 2014 is presented in Table 6-7. The results for 19 of the 21 wells considered have either reported a greater than 90% decrease in TCE concentrations or have reported TCE concentrations below the NJDEP GWQS since pumping was initiated. Of significance, 12 of those wells showed decreases of 98% or greater over the period. The reduction for well MW-549I shown on Table 6-7 is 96%, but this is based on a reported TCE concentration of 49 µg/L in September 2014, which as noted above appears to be anomalously low. Using the March 2014 results for MW-549I (330 µg/L) yields a more conservative reduction of 73% since June 2003 and still demonstrates a continued decrease in TCE concentrations in this well near the former source area. As shown in Table 6-6 and Appendix I, reported TCE concentrations in well PZ-522D appear to be reducing gradually. The TCE concentration increased slightly in March and September 2014 (2 µg/L and 2.2 µg/L, respectively), but these concentrations are lower than most of the results reported for PZ-522D since activation of the GWES in July 2003.

With the exception of MW-549I, the TCE concentrations for all of the wells listed on Table 6-7 are less than 3.6 µg/L. Since 1999, before the GWES was activated, TCE concentrations have decreased by more than two orders of magnitude at wells MW-502S, MW-508S, MW-549S (in the former source area), MW-550S, MW-550I, MW-506I, and MW-507I. These wells are situated within the area of pumping influence created by extraction well RW-1, and demonstrate statistically significant TCE reductions. The GWES has been shut down since May 28, 2011. The September 2014 results represent the TCE concentrations after approximately 40 months without system operation.

A review of the trend graphs in Appendix I and the associated historic TCE concentrations in Table 6-6 indicates decreasing or stable TCE concentrations in all of the wells that were sampled periodically over the past 10 to 20 years.

6.2 SURFACE WATER MONITORING AND SAMPLING ACTIVITIES

6.2.1 Surface Water Sampling Methods

Surface water samples were collected from four locations (SW-1, SW-2, SW-3 and SW-4) in Crab Brook on March 21, 2014 and September 11, 2014, in accordance with the sampling schedule presented in Table 5-1. The surface water sample locations are shown on Figure 5-1. The surface water samples were collected as grab samples via hand methods using laboratory-supplied containers. The samples were collected by filling the sampling containers below the water surface in the designated locations adjacent to the edge of the brook. As previously noted, the surface water samples were submitted for laboratory analysis of VOCs via USEPA SW-846 Method 8260.

Surface water quality parameters were measured at the sampling locations during both sampling events. Water quality parameters measured during surface water sampling included pH, temperature, specific conductivity, and dissolved oxygen. The measurement data was recorded on field data sheets (Appendix J).

6.2.2 Summary of Surface Water Results

The analytical results for surface water samples collected during the March and September 2014 sampling events are provided in Tables 6-8 and 6-9, respectively. Analyte concentrations that exceed the NJDEP FW2-NT SWQS are highlighted in the tables. The NJDEP reduced deliverable analytical data packages for the March and September 2014 sampling events are provided in Appendix H of this report.

The concentration of TCE did not exceed the reporting limits in the surface water samples collected in March and September 2014. Analytical results for the samples collected in March 2014 indicate the benzene concentration in sample SW-4 (0.41 J µg/L in the field duplicate sample) exceeds the SWQS of 0.15 µg/L. Sampling location SW-4 is close to Route 22. Since Crab Brook receives runoff water from the highway, this may be the likely source of the detected benzene concentration. Benzene is not a compound of concern at the Site. Low estimated concentrations of acetone were also reported in all of the surface water samples collected in March 2014, ranging from 1.3 J µg/L in SW-4 to 2.1 J µg/L in SW-2.

Analytical results for the samples collected in September 2014 indicate that no VOC concentrations exceeded their applicable SWQS. Concentrations of acetone (19 µg/L), chloroform (3.5 µg/L) and toluene (0.18 J µg/L) were reported in sample SW-3. A low estimated concentration of acetone was also reported in sample SW-4 (3.9 J µg/L). Acetone and chloroform are both common laboratory contaminants. Benzene concentrations did not exceed reporting limits in any of the surface water samples collected in September 2014.

Historical surface water TCE analytical results are summarized in Table 6-10. Historical TCE concentrations versus time plots for each of the four stream sample locations are presented in Appendix K.

6.3 GWES STATUS

As noted in Section 2.2.2 of this report, the groundwater extraction system was shut down on May 28, 2011. The system was subsequently decommissioned and dismantled in preparation for a planned treatment system reconstruction; however, based on the packer testing results for recovery well RW-1, it was concluded that RW-1 was no longer an effective recovery well for VOC-impacted groundwater at the Site.

The packer testing results indicated that reconstruction and startup of the GWES was unwarranted, and a re-evaluation of remedial alternatives for groundwater at the Site was recommended in the 2013 RAPR/RAR. Following a review of the Site data and discussions with the LSRP, a RAP Application for Groundwater at the Site with a proposed remedy of monitored natural attenuation was prepared and submitted to NJDEP in May 2013. The NJDEP-approved Groundwater RAP for monitored natural attenuation (dated June 26, 2014) became effective on July 2, 2014. Based on the approved RAP, the GWES will remain inactive and is slated for demolition in 2015. Recovery well RW-1 is also scheduled to be abandoned in 2015.

Historic GWES performance sampling results are presented in Table 6-11. Influent TCE concentrations from April 2010 to the system shutdown in May 2011 ranged from 0.67 J µg/L to 1.5 µg/L. Effluent TCE concentrations during this monitoring period ranged from 1.2 µg/L to 3.3 µg/L, well below the NJPDES permit effluent limit for TCE (5.4 µg/L). No NJPDES effluent

sample ever exceeded its permitted concentration for any monitored compound during system operation.

6.4 VAPOR INTRUSION INVESTIGATION STATUS

The August 2009 RAPR presented an evaluation of the potential for exposure to vapor within structures located within the Site's groundwater contaminant plume. The August 2009 RAPR included an evaluation of the known or suspected Site-specific contaminants, contaminant migration pathways, potential human receptors and the exposure routes by which these receptors may come in contact with contaminants. The evaluation concluded that the potential for VI to occur and to result in unacceptable indoor air concentrations in occupied structures nearest to the Site exists, and that further investigation was warranted.

Since the submittal of the August 2009 RAPR, a work plan has been submitted to NJDEP and four VI investigations have been conducted at the structures located nearest to the groundwater plume source area at the Site, specifically the Avalon Watchung apartments (formerly Crystal Ridge Club), the Regency Village Condominiums, and the Wal-Mart store in the Watchung Square Mall. A timeline of VI investigation activities is presented in Table 6-12 with the sample locations. These investigations have been documented in the following reports that have been submitted to NJDEP and/or to the LSRP:

- Revised VI Investigation Work Plan dated August 2010. The 2010 Work Plan was approved by NJDEP on December 9, 2010.
- VI Investigation Report dated November 22, 2011. NJDEP issued a technical review and comment letter, dated December 9, 2011 in response to this report.
- VI Investigation Report Addendum dated January 31, 2012. This investigation implemented the recommendations of the November 22, 2011 report. NJDEP commented via e-mail on June 25, 2012.
- VI Investigation Data Submittal dated April 10, 2012. This submittal presented the data collected at Wal-Mart.
- 2013 Comprehensive VI Investigation Report dated June 11, 2013. This investigation implemented the recommendations of the January 31, 2012 VI Investigation Report Addendum.
- 2014 VI Investigation Report dated May 30, 2014. This investigation implemented the recommendations of the 2013 Comprehensive VI Investigation Report.

The conclusions of the January 31, 2012 VI Investigation Report Addendum recommended that an additional round of sub-slab soil gas samples be collected from Avalon Watchung Buildings 3, 6, 7 and 12 and from the Clubhouse. To provide correlative data for the evaluation of the sub-slab soil gas sampling proposed above, additional indoor air sampling was also recommended for the structures noted above. This work was performed in January and February 2013.

The January and February 2013 work also included a VI investigation at the Regency Village Condominiums located within the groundwater plume downgradient of the Site and Avalon Watchung, as proposed in the December 2011 RAPR. A Site visit was conducted on December 10, 2012 to evaluate the construction of Regency Village Buildings 3, 4, 5, and 6 and to select the VI sampling locations. Buildings 3, 4, 5, and 6 represent those closest to the Site and Avalon Watchung. The Site visit indicated that the hallway and first-floor apartments in Buildings 3, 4, and 5 are constructed above ground level. Buildings 3, 4 and 5 were constructed with crawl spaces that can be accessed through hatchways on the side of each building. Building 6 was constructed with a basement that is divided into a laundry area and an unfinished area.

Based on the Site visit, both sub-slab and indoor air samples were collected from the crawl spaces in Buildings 3, 4, and 5, and from the unfinished basement area in Building 6. During discussions with the Regency Village property manager, three additional buildings containing basement residential units (Buildings 17, 26, and 38) and one building containing basement office space (Building 36) were identified. Additional sub-slab and indoor air samples were collected from the basements of these four buildings.

The January and February 2013 VI investigation at Regency Village and Avalon Watchung was conducted consistent with the NJDEP January 2013 Vapor Intrusion Technical Guidance and the results were presented in the 2013 Comprehensive Vapor Intrusion Investigation Report dated June 11, 2013 (Tetra Tech, 2013a). Assessment of the sub-slab and indoor air data from Regency Village indicated that the VI pathway is not complete and no further VI work is warranted at Regency Village. Assessment of the sub-slab and indoor air data from Avalon Watchung indicated that the VI pathway is not complete at Building 12 and the Clubhouse, and no further work is warranted at these locations. The analytical data for Buildings 3, 6, and 7 indicated that

additional sub-slab sampling events were needed to confirm that the concentrations of TCE in sub-slab soil gas beneath these buildings are continuing to decline to levels less than the NJDEP residential SGSL. Additional indoor air sampling might also be required.

Based on the recommendations of the 2013 Comprehensive VI investigation Report, no further VI investigation was warranted for the buildings at Regency Village. For Avalon Watchung, confirmatory investigations were recommended for three of the five buildings investigated in 2013 (Buildings 3, 6, and 7). These three buildings represented the scope of work for the 2014 investigation.

The January 2014 VI investigation at Regency Village and Avalon Watchung was conducted consistent with the NJDEP March 2013 Vapor Intrusion Technical Guidance and the results were presented in the 2014 Vapor Intrusion Investigation Report dated May 20, 2014 (Tetra Tech, 2014a). Assessment of the sub-slab and indoor air data from Avalon Watchung indicated that the VI pathway is not complete at Building 7, and no further work is warranted at this building. The analytical data for Buildings 6 and 7 indicated that additional sub-slab sampling events were needed to confirm that the concentrations of TCE in sub-slab soil gas beneath these buildings are continuing to decline to levels less than the residential SGSL. Additional indoor air sampling may also be required. Details regarding additional VI sampling that will be conducted based on the recommendations in the 2014 Vapor Intrusion Investigation Report are provided in Section 7.5 of this report.

7.0 Conclusions and Recommendations

Conclusions and recommendations based on the information presented in this RI/RAPR are detailed below.

7.1 SOIL REMEDIATION COMPLETION

As noted in Section 2 of this report, a total of 95 AOCs were identified at the Site for potential impacts to soil and groundwater. NJDEP has approved NFA for all of the AOCs except On-Site and Off-Site Groundwater (AOCs 26 and 27, respectively). In their October 24, 1990 letter approving the Sampling Plan, NJDEP approved NFA for 14 AOCs without requiring sampling or further investigation. Based on the results of non-intrusive investigations (e.g., records review, field observations), NJDEP also approved NFA for an additional 16 AOCs in letters dated January 21, 1992, January 27, 1994, and November 14, 1994. Based on the investigation results at the remaining 63 soil AOCs, remedial actions were conducted at 19 soil AOCs to achieve NFA approval by NJDEP. The lines of evidence discussed in Section 2 provide the basis for concluding that previous soil investigation and remediation activities were sufficient to warrant no further action for soil.

7.2 GROUNDWATER EXTRACTION SYSTEM PERFORMANCE

Based upon the information provided in this report, the GWES at the Site continued to function as designed up until the time it was shut down in May 2011. Prior to the shut-down, the treatment plant operated efficiently, with no discharge permit limits being exceeded.

Based on the analytical results from the seven semi-annual sampling events completed since the GWES was shutdown, it does not appear that concentrations of the constituents of concern are rebounding in groundwater or surface water. Surface water samples collected from Crab Brook to monitor the potential impact of TCE concentrations in the groundwater base flow have continually

met the applicable Surface Water Quality Standards, even after the system was shut off approximately forty months before the latest sampling event in September 2014.

As noted in Section 2 of this report, one of the purposes of the packer testing activities conducted in recovery well RW-1 in August 2012 was to generate data that could be used to assess whether, or to what extent, optimization of the GWES via focused pumping from the most VOC-impacted fracture zones in RW-1 is appropriate. Multiple hydraulically conductive fracture zones were identified and sampled during the packer testing activities. The packer testing results indicated that VOC concentrations in the intervals tested and sampled do not exceed NJDEP GWQS. The packer testing intervals were selected based on an assessment of the rock core log and the borehole geophysical logs to identify the fracture zones in RW-1 that are hydraulically conductive. Given these results, it was concluded that RW-1 is no longer an effective recovery well for VOC-impacted groundwater at the Site.

Based on the packer test results, reconstruction and startup of the GWES was determined to be unwarranted, and it was recommended in the 2013 RAPR/RAR that a re-evaluation of remedial alternatives for groundwater at the Site be conducted. Following a review of the Site data and discussions with the LSRP, a RAP Application for Groundwater at the Site with a proposed remedy of monitored natural attenuation was prepared and submitted to NJDEP in May 2013. The NJDEP-approved Groundwater RAP for monitored natural attenuation (dated June 26, 2014) became effective on July 2, 2014. Based on the approved RAP, the GWES will remain inactive and is slated for demolition in 2015. Recovery well RW-1 is also scheduled to be abandoned in 2015.

7.3 GROUNDWATER MONITORING

Analytical results for the groundwater samples collected during the March and September 2014 sampling events indicate that TCE concentrations are either overall the same or slightly lower than the results reported in the 2013 RAPR, but the TCE distribution is similar. TCE concentrations exceeding the NJDEP GWQS in the shallow zone monitoring wells were relatively low and were mainly limited to the former LEC Site facility area and immediately downgradient. Reported TCE concentrations in this area ranged from non-detect to a high of 1.9 µg/L in MW-508S. As discussed in Section 6.1, the reported TCE concentration in MW-547S in September 2014 (6.2

µg/L) is considered to be anomalous and unrelated to the Site, based on concentration gradients in Site monitoring wells that are not consistent with a source related to the former LEC Site and the detection of compounds in MW-547S that are unrelated to the Site.

A review of the trend graphs in Appendix I and the associated historic TCE concentrations in Table 6-6 indicates decreasing or stable TCE concentrations in most of the selected wells.

Based on the relatively consistent distribution of TCE across the Site, the gradually decreasing concentrations, the general lack of apparent increases in TCE concentrations 40 months after the GWES shutdown, and the lack of demonstrable impacts to surface water in Crab Brook, no increase in the monitoring frequency is warranted at this time. The monitoring schedule in the approved RAP was adopted in 2014. This monitoring schedule expanded the long-term monitoring well network to include the five additional monitoring wells installed in 2013 and several more pre-existing monitoring wells (Table 5-1).

As noted in Section 2.2, the five newly installed monitoring wells provide additional monitoring locations to further delineate the existing groundwater contaminant plume and further define the groundwater CEA for the Site. As shown on Figure 2-2, monitoring wells MW-1S and MW-1I were installed northwest of the source area monitoring well cluster MW-549, and monitoring well MW-3D was installed northwest of the downgradient monitoring well cluster MW-546. These wells are essentially side-gradient step-outs in the down-dip direction from existing monitoring well cluster MW-549 and well MW-546D, and were screened in the same bedrock bedding units, to the extent possible, as existing monitoring well cluster MW-549 and MW-546D.

Monitoring wells MW-2I and MW-2D were installed southeast of downgradient monitoring well cluster PZ-522. These wells were installed as a replacement for destroyed monitoring well cluster MW-542, which was located near the intersection of Park Place and Somerset Street. As such, wells MW-2I and MW-2D were installed and screened at the same depths as former wells MW-542B and MW-542A, respectively.

In their February 29, 2012 comment letter on the December 2011 RAPR, NJDEP indicated that the horizontal delineation of VOC concentrations exceeding NJDEP GWQS in several monitoring

wells is not complete to the northwest. This included wells MW-532D, MW-549S and I, MW-508S, MW-507S and I, MW-506S and I, MW-546D, and PZ-522S, I, and D. NJDEP also indicated that delineation (horizontal and vertical) of the contamination within well MW-545D has not occurred.

The analytical results for samples collected from monitoring wells MW-3D in 2014 indicate that TCE concentrations were below the NJDEP GWQS. These results indicate that the TCE concentrations reported in well MW-546D are horizontally delineated to the northwest. The analytical results for samples collected from monitoring wells MW-1S and MW-1I in 2014 indicate that TCE concentrations exceeded the NJDEP GWQS (1 µg/L). As discussed in Section 4 of this report, however, the groundwater flow and transport modeling results indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I, which is within the current CEA boundary; therefore, TCE concentrations in groundwater are delineated to the northwest, and the current CEA boundary in this area remains appropriate for the Site. Based on the model simulations, it is anticipated that the elevated TCE concentrations near MW-1I will continue to decrease over time as a result of natural attenuation. The analytical results for samples collected from monitoring wells MW-2I and MW-2D in 2014 indicate that TCE concentrations were below the NJDEP GWQS. These results indicate that the TCE concentrations reported in well cluster PZ-522 are horizontally delineated to the southeast.

Further review of the data indicates that additional delineation near wells MW-506S, MW-506I, MW-507S, MW-508S, PZ-522S, and MW-545D is not warranted. TCE concentrations in groundwater samples collected from wells MW-506S and MW-506I were below NJDEP GWQS during the seven most-recent and six most-recent sampling events, respectively, and PCE concentrations in MW-506I have been below NJDEP GWQS since March 2010 (1.2 µg/L). TCE concentrations in well MW-507S have exhibited a decreasing trend since 2008, and although the TCE concentration reported in September 2014 exceeded the NJDEP GWQS (1.3 µg/L), there is insufficient data to indicate that the trend has changed. Similarly, TCE concentrations in well MW-508S have also been decreasing since 2009, and both MW-507S and MW-508S are delineated to the northwest based on the groundwater modeling results. The concentration of TCE in PZ-522S was reported at 7.9 µg/L in March 2012, but analysis of samples collected from this

well during five subsequent semi-annual sampling events indicate that TCE was not detected above reporting limits. These results, coupled with the lack of TCE detections in this well since 2006 and the general lack of a long-term TCE trend, suggest that the elevated TCE concentration reported in March 2012 was anomalous. TCE concentrations in well MW-545D have been at or below NJDEP GWQS since 2008. Groundwater at this downgradient well location is impacted primarily by PCE, which is not Site related.

Monitoring well cluster PZ-524 was added to the long-term monitoring program in 2014 as part of the approved RAP. These wells were last sampled in 2008. Elevated TCE concentrations reported in PZ-524I (3.2 µg/L in March 2014 and 2.6 µg/L in September 2014) and in PZ-524D (2.9 µg/L in March 2014 and 2.7 µg/L in September 2014) were higher than anticipated near the downgradient edge of the groundwater plume. Lower TCE concentrations were reported in the nearest wells located hydraulically upgradient well to the PZ-524 well cluster (PZ-522I and PZ-522D) during the March and September 2014 sampling events. More importantly, elevated PCE concentrations were reported in both PZ-524I (99 µg/L and 110 µg/L in March and September 2014, respectively) and PZ-524D (52 µg/L and 65 µg/L in March and September 2014, respectively). Reported PCE concentrations in the nearest upgradient wells PZ-522I and PZ-522D were either non-detect or below 1 µg/L.

As noted in Section 2 of this report, a former dry cleaner is located at 221 Grove Street, which is situated hydraulically upgradient of well cluster PZ-524. Given the historical use of the 221 Grove Street property for dry cleaning, the reported detections of PCE (which is not a groundwater contaminant of concern at the Site) at concentrations one to two orders of magnitude higher than the PCE concentrations detected in the other Site monitoring wells, and concentration gradients in monitoring wells at the former LEC Site that are not consistent with a source related to the former LEC Site, the former dry cleaner at 221 Grove Street may be the source of the PCE detections in the PZ-524 wells. In December 2013, Tetra Tech informed the NJDEP about the historical use of the 221 Grove Street property for dry cleaning. It is arguable that the elevated TCE concentrations reported in wells PZ-524I and PZ-524D are the result of natural attenuation of dissolved PCE in groundwater. Based on the above information, the established downgradient CEA boundary is

considered to be appropriate for the Site and no changes to the CEA are required. Concentration trends in these wells will continue to be monitored semi-annually in 2015.

As noted in Section 6.1.1, all of the monitoring wells in the Site monitoring well network were visually inspected and their physical condition was recorded during the synoptic water level rounds. The results of past inspections indicated that many of the monitoring well surface completions were in poor condition (e.g., cracked concrete pads, missing inner caps, outer caps with missing or stripped bolts). Based on these observations, monitoring well repairs were conducted in November 2013 to secure the wells and prevent surface water infiltration and potential vandalism. It is recommended that monitoring well inspections continue to be performed during the semi-annual sampling events to maintain the integrity of the wells.

7.3.1 Groundwater Modeling

As described in Section 4 of this report, three-dimensional groundwater flow and solute transport modeling of groundwater flow and dissolved contaminant transport in the bedrock aquifer at the Site was conducted. The model was applied to simulate both groundwater flow and dissolved TCE plume transport at the site. A steady-state groundwater flow model calibration was performed to match measured water level data in March 2014 using the groundwater flow model MODFLOW. The model was also calibrated to observed drawdown data from the 48-hour constant rate (120 gpm) pumping test at the Site. Good agreement of the flow model with both observed water levels, hydraulic head gradients, and the observed distribution of dissolved TCE tracer in groundwater at the Site provided evidence of a high quality flow model calibration.

Using measured TCE concentrations (March 2014) in monitoring wells to represent the initial TCE concentration distribution in the intermediate zone of the bedrock aquifer (the zone with the highest TCE concentrations), predictive simulations of future TCE concentrations and plume extent indicated that the TCE plume will continue to dissipate, with local concentrations continuing to decrease over time at the Site as a result of natural attenuation. Based on the simulated spatial extent of TCE in groundwater over time, the results of the transport model simulation also indicated that the existing monitoring network can monitor future TCE concentrations as the TCE plume mass and extent decrease over time. Results of the model

simulation indicate an estimated cleanup time of approximately 30 years for the MNA remedy at the Site.

One of the modeling objectives was to estimate the lateral delineation of the dissolved TCE plume, primarily near MW-1I, to assess the completeness of delineation and the protectiveness of the CEA boundary in this area. Monitoring well MW-1I was one of several wells installed to further delineate the existing groundwater contaminant plume and further define the groundwater CEA for the Site. Groundwater analytical results from the March and September 2014 sampling events indicate elevated TCE concentrations in monitoring well MW-1I (120 µg/L and 82 µg/L, respectively). The model simulations indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I, which is within the current CEA boundary; therefore, TCE concentrations in groundwater are delineated to the northwest near well MW-1I and the current CEA boundary in this area remains appropriate for the Site. Based on the model simulations, it is anticipated that the elevated TCE concentrations near MW-1I will continue to dissipate over time as a result of natural attenuation.

7.3.2 Conceptual Site Model

The 2013 RAPR/RAR included a recommendation that the conceptual site model be updated based on a review of the available data relevant to addressing the impacted groundwater at the Site, including chemical, hydrogeologic, and hydraulic data. A review of NJDEP files for the Site was conducted in January 2014 to obtain missing reports and data. NJDEP files were also reviewed to identify other reports and information necessary to achieve regulatory closure for impacted media at the Site (groundwater, soil, soil vapor) and to obtain a RAO determination from the LSRP.

The development of a conceptual site model (CSM) is a dynamic process that is refined as additional data is collected. The CSM described in this report represents the current understanding of groundwater conditions at the Site and provides a basis for identifying data gaps. The CSM components include the site hydrogeologic conditions, the nature and extent of impacts to groundwater, the source of the impacts, and constituent migration pathways.

7.3.2.1 Hydrogeologic Conditions

The unconsolidated overburden at the former LEC facility area is generally composed of granular fill of varying thickness (primarily associated with the remediation area of former LEC Building 3) underlain by a fine-grained till-like colluvium (identified as Till 1 in the July 1995 RI/RAWP) that is composed of clayey sandy silt, with traces of gravel and cobbles. The till is generally continuous across much of the former LEC facility area, but thins and is absent at elevations of approximately 160 to 170 feet msl. The till thickness ranges from approximately 1 to 15 feet thick. Beneath the till is a layer of silty clay that is interpreted to be glaciolacustrine and underlies much of the former LEC facility area. Beneath the silt and clay layer is a sandy outwash deposit, a continuous layer of fine to medium sand ranging from approximately 1 to 17 feet thick, which is underlain by a thin layer of glacial till (identified as Till 2 in the July 1995 RI/RAWP). Till 2, which overlies the bedrock, is approximately 1 to 5 feet thick and is composed of silty gravelly sand. The thickness of the overburden in the Site vicinity decreases towards the south-southwest but increases south of Crab Brook. The overburden is thinnest near well cluster MW-546 (3 feet) and generally increases in thickness south of U.S. Route 22, with the greatest thickness of 47 feet observed at the former location of well cluster MW-542 (this destroyed well cluster was located near the intersection of Park Place and Somerset Street; see Figure 2-2).

The overburden deposits are underlain by the Passaic Formation, which is a reddish-brown fractured sandstone, siltstone, shale, and mudstone of Jurassic age. The upper surface of the bedrock is generally weathered and soft, and becomes more competent with depth. The top of bedrock is weathered and was encountered during drilling of the five additional monitoring wells at approximately 32-51 feet bgs. The top of competent bedrock was encountered from approximately 38-57 ft bgs. Bedrock surface topography generally slopes to the southeast perpendicular to the First Watchung Mountain. The highest bedrock elevation is approximately 171 feet above msl at well MW-3D and the lowest is approximately 45 feet above msl at well cluster MW-545. This is consistent with the New Jersey Geological Survey bedrock geologic map for the Chatham Quadrangle (Monteverde and Volkert, 2005), which indicates that the top of weathered bedrock slopes generally to the southeast beneath the former LEC facility and slopes gradually to the southwest in the hydraulically downgradient portion of the Site.

Groundwater at the Site occurs within the bedrock, and locally within the overburden at off-site locations. Groundwater flow in the Passaic Formation occurs predominantly in secondary porosity features (e.g., fractures and bedding plane partings). Similar to other sedimentary formations in the Newark Basin, dipping bedding fractures in the Passaic Formation that have comparatively larger apertures act as discrete aquifers and preferential flow pathways with high groundwater transmissivity and low storage capacity. These aquifer units occur at uneven intervals and tend to lose their aquifer properties up-dip and down-dip of their prime extent areas. The groundwater flow direction is generally parallel to bedding strike. Near vertical fractures or joints provide pathways for leakage between the bedding-plane fractures. The weathered bedrock zone typically exhibits higher porosity and storage, but the weathering reduces permeability. Up-dip extensions of the bedding fractures into the weathered zone connect this zone and the overburden with the multiunit bedrock aquifer system (Michalski and Britton, 1997). Geophysical logging results at the Site are consistent with this model, indicating that groundwater flow occurs mainly in low-angle fractures interpreted to be bedding plane partings with a northeast-southwest strike. The geophysical results also indicate that some flow occurs in high-angle, near-vertical fractures, particularly where they intersect with the low-angle fracture sets. Results from groundwater pump testing at the Site indicate that the bedrock is hydraulically anisotropic, with primary groundwater flow to the southwest, roughly parallel to bedding strike direction.

The September 2014 groundwater elevation data indicate that the average horizontal hydraulic gradient in the shallow water-table zone across the Site is approximately 0.010 ft/ft, steepening slightly downgradient and southwest of the Site to approximately 0.018 ft/ft.

Based on water level measurements at the well clusters, the vertical hydraulic gradient is generally downward across the Site, with some upward gradients in well clusters located immediately south of Crab Brook (MW-504 and MW-505) and in well clusters located southwest of the Site near Stony Brook (PZ-524 and MW-545). Geophysical logging results also indicate some variation in vertical flow directions within well boreholes. An upward vertical flow was measured in the upper and lower portions of well RW-1 and at the bottom of the MW-2D borehole. Multiple water-bearing fracture zones were identified in recovery well RW-1 and monitoring wells MW-1I, MW-2D, and MW-3D during geophysical logging and packer testing.

Based on a 48-hour aquifer test conducted in July 2000 at recovery well RW-1 (with an open hole interval from 20 to 150 feet bgs), the average hydraulic conductivity of the bedrock aquifer is 68.8 feet per day (2.43×10^{-2} centimeters per second [cm/sec]).

7.3.2.2 Nature and Extent of Impacts

Groundwater beneath the Site is impacted by TCE. A review of trend graphs and the associated historic TCE concentrations indicates decreasing or stable TCE concentrations in the Site monitoring wells.

The 2014 groundwater sampling results indicate that TCE impacts to shallow zone groundwater are relatively low (generally ranging from non-detect to 2.8 µg/L) and were mainly limited to the former LEC Site facility area and immediately downgradient to the southwest. The highest TCE concentrations at the Site are observed in the intermediate zone groundwater. Concentrations of TCE in the intermediate zone groundwater are highest in well MW-549I (330 µg/L and 49 µg/L in March and September 2014, respectively) near the former Building 3 source area and in well MW-1I (120 µg/L and 82 µg/L in March and September 2014, respectively), located in the down-dip direction northwest of MW-549I and the former source area. Concentrations of TCE in the deep zone groundwater are relatively low (ranging from non-detect to 3.6 µg/L), with the highest concentrations in wells MW-508D, MW-546D, and PZ-524D.

As noted in Section 6, both PZ-524I and PZ-524D are also impacted by elevated PCE unrelated to the Site. Given the presence of a former dry cleaner located immediately upgradient of PZ-524D, the reported detections of PCE at concentrations higher than the PCE concentrations detected in the other Site monitoring wells, and concentration gradients in monitoring wells at the former LEC Site that are not consistent with a source related to the former LEC Site, the former dry cleaner may be the source of the PCE detections in these wells. Elevated concentrations of PCE (146 µg/L), TCE (12.2 µg/L), and cis 1,2-dichloroethene (14.3 µg/L), were reported in a groundwater sample collected from an industrial well at the former dry cleaner location in February 2002 (Tyree Environmental Corporation, 2009). It is arguable that the elevated TCE concentrations reported in wells PZ-524I and PZ-524D are likely the result of natural attenuation of dissolved PCE in groundwater.

As described above, groundwater flow and solute transport modeling was employed to estimate the lateral extent of the TCE plume, primarily northwest of the former source area near MW-1S and MW-1I. These wells were installed to further delineate the existing groundwater contaminant plume and further define the groundwater CEA for the Site. Groundwater analytical results from the March and September 2014 sampling events indicate elevated TCE concentrations in monitoring well MW-1I (120 µg/L and 82 µg/L, respectively). As noted above, the model simulations indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I (and nearby well MW-1S); therefore, for the purposes of the RI, the lateral extent of TCE concentrations exceeding the NJDEP GWQS is delineated northwest of these wells.

The horizontal extent of TCE in the shallow bedrock groundwater is also delineated downgradient to the southwest and side-gradient to the southeast based on reported TCE concentrations below the NJDEP GWQS in wells MW-506S, MW-502S, MW-503S, and MW-501S (Figures 6-7 and 6-10). As noted above, the reported TCE concentration in MW-547S in September 2014 (6.2 µg/L) is considered to be anomalous and unrelated to the Site, based on concentration gradients in Site monitoring wells that are not consistent with a source related to the former LEC Site and the detection of compounds in MW-547S that are unrelated to the Site. Concentration trends in this well will continue to be monitored semi-annually in 2015.

The horizontal extent of TCE in the intermediate bedrock groundwater is delineated to the northwest based on reported TCE concentrations below the NJDEP GWQS in wells MW-506I and MW-546I, as well as the groundwater modeling results near MW-1I. Delineation to the southeast is based on reported TCE concentrations below the NJDEP GWQS in wells MW-501I, MW-503I, MW-502I, MW-505I, and MW-2I. Delineation of TCE concentrations in intermediate zone groundwater downgradient to the southwest is based on reported TCE concentrations at or below the NJDEP GWQS in monitoring wells MW-544I and MW-545I (Figures 6-8 and 6-11). As noted above, the TCE concentrations in well PZ-524I are considered to be the result of natural degradation of PCE that was generated from a source unrelated to the Site.

The horizontal extent of TCE in the deep bedrock groundwater is delineated to the northwest based on reported TCE concentrations below the NJDEP GWQS in well MW-3D, as well as the

groundwater modeling results near well cluster MW-1. Delineation to the southeast is based on reported TCE concentrations below the NJDEP GWQS in well MW-2D. Delineation of TCE concentrations in deep zone groundwater downgradient to the southwest is based on reported TCE concentrations below the NJDEP GWQS in monitoring wells MW-544D and MW-545D (Figures 6-9 and 6-12). As noted above, the TCE concentrations in well PZ-524D are considered to be the result of natural degradation of PCE that was generated from a source unrelated to the Site.

The vertical extent of elevated TCE concentrations in groundwater at the Site is delineated based on the non-detect groundwater analytical results (0.17 U µg/L) for the grab sample collected from the deepest packer test interval at MW-3D (477-502 feet bgs). The elevation of this interval is approximately -250 to -275 feet msl. The NJDEP approved RAP established the vertical depth of the CEA as the depth of the bedrock zone of the Passaic Formation (approximately 420 feet).

The migration of dissolved VOCs within the bedrock is influenced by both bedrock structure and local groundwater discharge areas, particularly Crab Brook. As noted above, the vertical hydraulic gradient is generally downward across the Site, with some upward gradients in well clusters located immediately south of Crab Brook (MW-504 and MW-505). Sampling during previous investigations indicated elevated TCE concentrations in surface water samples collected from Crab Brook, which was interpreted to be the result of the upward seepage and discharge of groundwater impacted by TCE into a portion of the brook. Operation of the GWES mitigated this discharge, resulting in reduced TCE concentration in Crab Brook. Historical surface water analytical results indicate that TCE concentrations have been consistently low since the GWES activation in 2003, and last exceeded the NJDEP FW2-NT SWQS (1 µg/L) in March 2009 (1.5 µg/L at sample location SW-1). Reported TCE concentrations in surface water samples collected from Crab Brook since the GWES shut down in May 2011 have been non-detect.

7.3.2.3 Sources of Impacts

Previous investigations indicate that the primary sources of TCE at the Site were former Buildings 3 and 7. As noted in Section 2, TCE was used in former Building 3 (near the MW-549 well cluster on Figure 2-2) as a non-flammable liquid coolant in conjunction with low-temperature testing of electronic components. TCE was also used in former Building 7 (which was located in the north

portion of the Site) as a solvent to clean printed circuit boards. Dissolved TCE in groundwater emanating from near these two buildings appears to have commingled and migrated downgradient to the southwest. Both source areas were remediated to remove elevated TCE concentrations in the soil. As noted in Section 2.2 of this report, the shallow TCE-impacted soil at Building 3 (i.e., the fill/Till 1 and silt/clay layers) was excavated and treated ex-situ by mechanical processing (SME, dated November 1, 1996), and the deep TCE-impacted soil at Building 3 (i.e., the sand/Till 2) was remediated by SVE methods (SME, dated February 25, 1998). The TCE-impacted soil at Building 7 was remediated via ex-situ SVE methods (SME, dated August 1994).

7.3.2.4 Contaminant Fate and Transport

Prior to the source removal activities at Buildings 3 and 7, reported TCE concentrations in the groundwater near Building 3 ranged up to approximately 40,000 µg/L, suggesting that free-phase product (i.e., dense non-aqueous phase liquid [DNAPL]) might have been discharged during site operations. No free-phase product, however, was measured or observed in the monitoring wells during the ISRA groundwater investigations and sampling conducted at the Site. The Building 7 soil remediation (conducted in in 1993 and1994) and the Building 3 soil remediation (conducted in 1996 and 1997) remediated a substantial amount of source material in the form of TCE-impacted soil. The GWES was constructed and activated in 2003, and the analytical results from subsequent groundwater sampling events indicate that TCE concentrations have decreased substantially across the Site.

If DNAPL was discharged at the Site, the product would likely have migrated downward with gravity through the overburden, potentially reaching the top of bedrock. Migration of DNAPL in the bedrock would most likely occur along the permeable low-angle bedding plane fractures in the down-dip direction to the northwest. No evidence of product was identified during packer testing and sampling of well MW-1I (which was installed down-dip of the former source area at Building 3), and reported TCE concentrations in groundwater samples collected from MW-1I and MW-1S are not indicative of the presence of DNAPL.

Dissolved-phase TCE from the former source areas has migrated via advection downgradient to the southwest in the direction of groundwater flow along available pathways in the bedrock (i.e. primarily along bedding plane partings).

The presence of TCE daughter products (e.g., cis-1,2-dichloroethene and vinyl chloride) in bedrock groundwater samples indicates that some anaerobic degradation of TCE has occurred at the Site. The low concentrations of cis-1,2-dichloroethene and vinyl chloride at the Site, however, indicates that these chemicals are degraded relatively rapidly or that TCE is degraded primarily through abiotic and/or cometabolic degradation mechanisms at the Site.

7.3.3 Evidence for Natural Attenuation

As noted above, the observed decreases of TCE over time are likely caused by natural attenuation mechanisms, which include recharge dilution, hydrodynamic dispersion, and both biotic and abiotic degradation. Degradation processes are biological and chemical processes that decrease the mass of dissolved constituents. These processes include the effects of biodegradation, photolysis, oxidation-reduction, and hydrolysis. They are generally grouped into either biologic or abiotic (i.e., chemical) degradation processes. In aerobic zones, TCE can be degraded both abiotically and by biodegradation through cometabolism. In anaerobic zones, sequential degradation includes transformation of parent compounds (e.g., TCE) into its degradation products (cis-1,2-dichloroethene, vinyl chloride, and ethene). The historical detections of cis-1,2-dichloroethene and vinyl chloride indicate that some anaerobic degradation has occurred. The low concentrations of cis-1,2-dichloroethene and vinyl chloride at the site indicates that these chemicals are degraded relatively rapidly or that TCE is degraded primarily through abiotic and/or cometabolic degradation mechanisms at the Site. Historical water quality data generated during the remedial investigation indicates that the Site groundwater is generally aerobic, which suggests that conditions are more conducive to abiotic and/or cometabolic degradation.

The NJDEP Monitored Natural Attenuation (MNA) Technical Guidance document (Version 1 dated March 1, 2012) outlines a lines of evidence approach to demonstrate that MNA is an acceptable remedial action. The primary line of evidence that directly demonstrates MNA effectiveness is the

observation of decreasing contaminant concentrations with time in conjunction with a stable or receding groundwater plume.

As a result of mass removal by pump-and-treat (from 2003 to 2011) and natural attenuation, the Site data indicate that TCE concentrations have reduced significantly over time. A review of the groundwater sampling data indicates relatively low groundwater concentrations with generally decreasing or stable groundwater concentration trends and a relatively stable groundwater plume. As noted above, the trend graphs in Appendix I and the associated historic TCE concentrations in Table 6-6 indicate decreasing TCE concentrations in all of the wells that were sampled periodically over the past 10 to 20 years. Historical data also indicate decreasing concentration trends in the downgradient wells during and after active remediation (Appendix I).

Decreasing TCE concentrations and relative plume stability are both demonstrated on TCE isoconcentration maps for the intermediate aquifer zone from 2012, 2013, and 2014 (Figures 7-1 through 7-3). As shown on the figures, the highest detected TCE concentration in groundwater near the former source area decreased from 670 µg/L (well MW-549I) in September 2012 to 82 µg/L (in well MW-1I) in 2014. These concentrations are more than 3 orders of magnitude lower than the aqueous solubility of TCE (1,100,000 µg/L), indicating DNAPL-phase chlorinated VOC sources are not present at the Site. The decreasing TCE concentrations near the former source area indicate that limited mass flux is occurring in this zone. As shown on Figures 7-1 through 7-3, the extent of dissolved TCE concentrations in groundwater at the Site has remained relatively stable. The estimated downgradient extent of the TCE plume in 2013 (Figure 7-3) reflects the recent inclusion of monitoring well cluster PZ-524 in the Site monitoring program, as detailed in the approved RAP. As noted above, the TCE concentrations in the PZ-524 monitoring wells are considered to be the result of natural degradation of PCE that was generated from a source unrelated to the Site.

The overall decreasing trend of groundwater concentrations and the presence of daughter products demonstrate that biodegradation is occurring. Historical surface water analytical results indicate that TCE concentrations have been consistently low since the GWES startup and have rarely exceeded the FW2-NT SWQS. In addition, there is no evidence of impacts to private or public water supply wells.

As noted in Section 4 and Appendix F, the groundwater flow and transport model simulations indicate that the TCE plume will continue to dissipate, with local concentrations continuing to decrease over time at the Site as a result of natural attenuation. Based on the simulated spatial extent of TCE in groundwater over time, the results of the transport model simulation also indicate that the existing monitoring network can monitor future TCE concentrations as the TCE plume mass and extent decrease over time. Results of the model simulation also indicate an estimated cleanup time of approximately 30 years for the MNA remedy at the Site.

In summary, the site data indicate that natural attenuation is causing TCE concentrations to decrease along the groundwater flow path. Given that TCE concentrations in the downgradient wells continue to be low, there is no unacceptable risk to off-site potential receptors. The groundwater monitoring data generated since the cessation of active remediation in 2011 continue to support the viability of MNA as a groundwater remedy for the Site. Consistent with the NJDEP MNA guidance, this evidence includes: (1) the absence of an on-Site DNAPL source area; (2) an extensive monitoring network that defines the extent of TCE in groundwater; (2) generally decreasing trends of TCE concentrations and a stable TCE plume; (3) detection of biodegradation products (e.g., cis-1,2-dichloroethene and vinyl chloride); (4) low downgradient chlorinated compound concentrations at the boundary of the CEA, and (5) absence of impacts to surface water, offsite water supply wells, or other downgradient receptors.

7.4 SURFACE WATER MONITORING

Analytical results for the samples collected in March 2014 indicate the benzene concentration in sample SW-4 (0.41 J µg/L in the field duplicate sample) exceeded the SWQS of 0.15 µg/L. Benzene is not a compound of concern at the Site. The benzene source at SW-4 may be surface runoff from Route 22. Low estimated concentrations of acetone were also reported in all of the surface water samples collected in March 2014, ranging from 1.3 J µg/L in SW-4, to 2.1 J µg/L in SW-2. Acetone is also not a compound of concern at the Site.

Analytical results for the samples collected in September 2014 indicate that no VOC concentrations exceeded their applicable SWQS. Concentrations of acetone (19 µg/L), chloroform (3.5 µg/L) and toluene (0.18 J µg/L) were reported in sample SW-3. A low estimated

concentration of acetone was also reported in sample SW-4 (3.9 J µg/L). Acetone and chloroform are both common laboratory contaminants. Benzene concentrations did not exceed reporting limits in any of the surface water samples collected in September 2014.

Historical surface water analytical results indicate that TCE concentrations have been consistently low (mostly reported as non-detect) since the GWES startup and have rarely exceeded the FW2-NT SWQS.

7.5 VAPOR INTRUSION INVESTIGATION

Previous discussions with NJDEP concerning continued and expanded VI investigation activities have, in part, focused on the extent of TCE concentrations in the shallow groundwater TCE plume. A significant change to the VI Ground Water Screening Level (GWSL) for TCE was implemented by NJDEP in January 2013. The previous GWSL for TCE of 1 µg/L was revised based on updated toxicity data and replaced with a GWSL of 2 µg/L. This change has a marked impact on the area of VI concern which is delineated by the 2 µg/L isoconcentration for TCE (with a 100-foot buffer). The revised area of concern with the updated 2 µg/L isoconcentration for TCE is presented as an overlay on an aerial photograph in Figure 7-4. The revised area of VI concern as delineated by the 2 µg/L isoconcentration no longer includes the buildings of Regency Village.

The results of the January 2014 VI investigation at Avalon Watchung are discussed in detail in the 2014 Vapor Intrusion Investigation Report (dated May 30, 2014). The recommendations for additional VI sampling are summarized below.

Assessment of the sub-slab and indoor air data from Avalon Watchung indicates that the VI pathway is not complete at Building 7, and no further work is warranted at this location. Analytical results for sub-slab soil gas samples in Building 7 indicated that NJDEP residential SGSL were not exceeded for any analytes, including TCE. Since the residential SGSL was not exceeded for any of the analytes, the indoor air sample was not analyzed.

The analytical data for Avalon Watchung Buildings 3 and 6 indicated that additional sub-slab sampling events are needed to confirm that the concentrations of TCE in sub-slab soil gas beneath

these buildings are continuing to decline to levels less than the residential SGSL. Additional indoor air sampling may also be required.

Analytical results for sub-slab and indoor air samples collected in the Building 3 indicate that only chloroform and TCE concentrations exceeded their respective residential SGSL, but neither compound was detected in the indoor air samples. Chloroform is not related to the Site and is also listed as a common background indoor air source in the March 2013 guidance (NJDEP lists chloroform as a common household source generated from chlorinated water, i.e., showers). The absence of TCE in indoor air indicates that a complete VI pathway does not exist. Concentrations of TCE in sub-slab soil gas samples collected during the 2014 sampling event, the 2013 sampling event, and the February and December 2011 sampling events, however, exceeded the residential SGSL. Additional sub-slab sampling will be performed in 2015 to confirm that the concentrations of TCE in sub-slab soil gas are continuing to decline to levels less than the residential SGSL, as noted from the 2013 sampling event and the two previous sampling rounds in 2011. If sub-slab soil gas concentrations exceed the residential SGSL during the proposed 2015 event, an indoor air sample will be collected from the ground floor utility room for analysis.

Analytical results for sub-slab samples collected in Building 6 indicated that the TCE concentration in both the original sample and a field duplicate sample exceeded the residential SGSL. The results from the indoor air sample indicated no detections of TCE and only the reported concentration of 1,4-dichlorobenzene exceeded its IASL. The compound 1,4-dichlorobenzene is not a contaminant of concern for the former LEC facility and was not detected in the sub-slab soil gas sample, indicating that the pathway is incomplete and the concentration is likely due to background sources (NJDEP lists 1,4-dichlorobenzene as a common household source from moth balls, general insecticides, air deodorant and toilet disinfectant). The absence of TCE in indoor air indicates that a complete VI pathway does not exist. Concentrations of TCE in sub-slab soil gas samples collected during the 2014 sampling event, the 2013 sampling event, and the February 2011 sampling event, however, exceeded the SGSL. Additional sub-slab sampling will be performed in 2015 to confirm that the concentrations of TCE in sub-slab soil gas are continuing to decline to levels less than the residential SGSL, as noted from the previous sampling rounds in 2013 and February 2011. If sub-slab soil gas concentrations exceed the residential

SGSL during the proposed 2015 sampling event, an indoor air sample will be collected from the ground floor utility room for analysis.

It is worth noting there have been no exceedances of the IASL for TCE or its related breakdown compounds in any of the samples collected to date at the Avalon Watchung complex. This is significant considering that Avalon Watchung and the buildings sampled there are situated immediately downgradient from the former source area, representing the most likely worst-case-scenario location for potential vapor intrusion. Further, reported TCE concentrations in the shallow zone groundwater exceeded the 2 µg/L GWSL in only one well (2.8 µg/L in well MW-1S) during the March 2014 sampling event (as shown on Figures 6-7 and 7-4), but no reported TCE concentrations exceeded the 2 µg/L GWSL in the shallow zone groundwater samples collected during the September 2014 sampling event. This suggests that the vapor intrusion risk due to TCE-impacted groundwater at the Site is reducing with time.

As noted above, the TCE concentration in the groundwater sample collected from MW-1S in March 2014 (2.8 µg/L) exceeded the 2 µg/L GWSL. Based on discussions with the LSRP, the elevated TCE concentration reported in MW-1S in March 2014 was not considered to be a vapor concern based on the following lines of evidence:

- The groundwater analytical results for nearby shallow monitoring well MW-508S (located approximately 156 feet southeast of the private residence) indicated that TCE concentrations were below the 2 µg/L GWSL in March and September 2014 (Figures 6-7 and 6-10) and during the previous year (Tetra Tech, 2014b). The screen interval in well MW-508S (57.7-67.7 feet bgs) is approximately 100 feet shallower that the screen interval in well MW-1S (170-180 feet bgs), indicating that a clean water lens exists between the elevated concentrations in MW-1S and the private residence. Furthermore, the reported TCE concentration in MW-1S in September 2014 (1.3 µg/L) was below the GWSL (Table 6-5).
- The results from previous VI investigations at nearby Avalon Watchung Apartment Buildings 7 and 8 indicate no current VI concerns. The analytical results for sub-slab soil gas samples collected in January 2014 from Avalon Watchung Building 7, which is located within the 2 µg/L TCE contour line and the associated 100-foot buffer (Figure 7-4), indicate that the residential SGSL was not exceeded for any target chemical, and TCE was not detected. Given that the SGSL was not exceeded, the indoor air sample collected in Building 7 was not analyzed. In addition, no target chemical concentrations exceeded the residential SGSL in sub-slab soil gas samples collected from Building 7 in 2013. Based on these results, it was determined that no further VI investigation is warranted at Building 7

(Tetra Tech, 2013a). Similarly, sub-slab sampling conducted prior to 2013 at Building 8, which is adjacent to Building 7 and within the 100 foot buffer of the 2 µg/L TCE contour line, indicated no screening levels were exceeded.

- Monitoring well MW-1S is screened from 170-180 feet bgs and was vertically profiled during the initial December 2013 sampling event. As noted in Section 6, the analytical results indicated reported TCE concentrations of 0.84 µg/L in the top 5 feet of the screen interval and 2.8 µg/L in the bottom 5 feet of the screen interval. The reported TCE concentration in the upper portion of the screen interval was below the 2 µg/L GWSL, indicating that clean water exists above the zone of elevated TCE concentrations in the lower portion of the screen.

- Based on the vertical profiling results, all subsequent samples from MW-1S were collected using PDB samplers placed in the bottom 5 feet of the screen interval. Analytical results for the subsequent samples indicate TCE concentrations of 2.5 µg/L in January 2014, 2.8 µg/L in March 2014, and 1.3 µg/L in September 2014. Section 7.3.2 of the NJDEP Technical Guidance for the Attainment of Remediation Standards and Site-Specific Criteria (Version 1.0, September 24, 2012) provides for averaging of ground water analytical results to determine whether a vapor intrusion investigation is triggered. Using the analytical results for MW-1S to date, the average TCE concentration is 2.35 µg/L, which rounds down to 2 µg/L. The rounded concentration value does not exceed the GWSL for TCE.

Continued monitoring of MW-1S will be conducted as part of the long-term monitoring plan established in the NJDEP-approved Remedial Action Permit for groundwater at the Site. As discussed with the LSRP, vertical profiling of MW-1S will be conducted moving forward (i.e., 2 PDB samples per event) to monitor for potential changes in TCE concentrations in the upper and lower portions of the MW-1S screen interval. In the event that conditions change, this issue will be revisited.

TABLE 2-1
AOC Summary List
Former LEC Site - Watchung and North Plainfield, NJ

AOC ID	AOC Description	NFA Date
1A	Former Septic System; South of Building 1	1/21/1992
1B	10,000 Gallon #4 Fuel Oil UST South of Building 1	6/28/1991
1C	250 Gallon Ammonia AST North of Building 1	10/24/1990
1D	3 Electric Transformers on pad; North of Building 1	1/21/1992
1E	Storage Shed North of Building 1	10/24/1990
1F	Cooling Tower North of Building 1	6/28/1991
1G	French Drain System North of Building 1	6/28/1991
1H	Building 1 Boiler Room Sump	1/21/1992
1I	Photo Lab; Floor Stains; Spills	6/28/1991
1J	Reproduction Lab Floor Stains	10/24/1990
1K	Building 1A (Production Well)	1/27/1994
2A	10,000 Gallon #4 Fuel Oil UST North of Building 2	6/28/1991
2B	Staining; Loading Dock; Transformer Area; North of Building 2	6/28/1991
2C	Paint Shed North of building 2	1/27/1994
2D	Former Drum Storage Area; North of Building 2	6/28/1991
2E	Freon Dispenser; Interior of Building 2	10/24/1990
2F	Boiler Room Floor Drain	1/27/1994
2FR	Boiler Room Floor Drain - Fuel Oil	7/22/1998
2G	Building 2; Conference Room; Former Chemical Process Area	1/21/1992
2H	Cafeteria; Former Chemical Storage	1/21/1992
3A	10,000 Gallon #4 Fuel Oil UST; North Side of Building 3	6/28/1991
3B	1,000 Gallon #4 Fuel Oil AST; North Side of Building 3	10/24/1990
3C	6 Electrical Transformers on Pad; North Side of Building 3	1/27/1994
3D	Drop Hammer Pit; Building 3 Interior	4/18/1997
3E	Hydraulic Fluid Leak; Northeast Corner of Building 3	1/27/1994
3F	Welding shop; Interior Building 3B	1/27/1994
3G	Stained Pavement; Northwest Corner Building 3B; Former Drum Storage	1/27/1994
3H	Stained Area; Northeast Side of Building 3 B (MW-10 Area)	1/27/1994
3I	Floor Staining; Interior Building 3B	1/27/1994
3J	Building 3C Bay Door Entrance; North of Building 3C	1/21/1992
3K	Building 3; Chiller Tower	1/21/1992
3L	Building 3; Paint Can Storage	1/27/1994
3M	Building 3; Possible TCE Storage Area	1/27/1994
3N	Building 3 Clay (Fill/Till 1 and Silt/Clay)	4/18/1997
3O	Building 3 Sand	7/22/1998
4A	Loading Dock; Southwest of Building 4	1/27/1994
4B	French Drain System; North and West Sides of Building 4	6/28/1991
4C	Cooling Tower; North of Building 4	1/27/1994
4D	Boiler Room; Building 4 Interior	1/21/1992
4E	Air Conditioning Room; Building 4	10/24/1990
5	Maintenance shop Sink Outfall; Building 5	1/27/1994
6	Building 6	10/24/1990
7A	500 Gallon 1,1,1 TCA UST	6/28/1991
7B	500 Gallon Kerosene AST; Enclosed in Concrete	10/24/1990
7C	250 Gallon Ammonia AST; West of Building 7	10/24/1990
7D	2 - 20,000 Gallon #2 Fuel Oil ASTs	6/28/1991
7E	Loading Dock; West Side of Building 7	1/21/1992
7F	500 Gallon Acid Waste UST; Northeast corner of Building 7	1/27/1994

TABLE 2-1
AOC Summary List
Former LEC Site - Watchung and North Plainfield, NJ

AOC ID	AOC Description	NFA Date
7G	1,000 Gallon Acid Waste UST; North of Building 7	1/27/1994
7H	Electrical Substation; North of Building 7	1/27/1994
7I	3,000 Gallon Unleaded Gasoline UST; East of Building 7	1/27/1994
7J	1,000 Gallon Unutilized UST; East of Building 7 (Never Filled)	6/28/1991
7K	Storage Shed; North of Building 7	1/27/1994
7L	Parking Lot Chip Bin; Northwest Corner of Building 7	1/27/1994
7M	Compressor Room; Interior Building 7	6/28/1991
7N	Acid Waste System/Chromium AST; Building; Interior Building 7	1/27/1994
7O	Microelectronic Plating Area; Interior Building 7	10/24/1990
7P	Print Shop; Solvent Storage; Interior Building 7	1/21/1992
7Q	Penetrant Dye Area; Interior Building 7	1/27/1994
7R	Flow Solder Area; Interior Building 7	1/27/1994
7S	Microelectronic Inudstrial Waste Treatment Sump; Interior Building 7	1/21/1992
7T	Model Shop Area; Interior Building 7	1/27/1994
7U	Office Waste Incinerator; Interior Building 7	1/27/1994
7V	Machine Shop; Interior Building 7	1/21/1992
7W	Industrial Waste Treatment Plant; Interior Building 7	1/27/1994
7X	Printed Circuit Plating Room; Interior Building 7	1/27/1994
7XX	Bluilding 7A Surface Soils (Asphalt/BN Issue)	1/27/1994
7Y	10,000 Gallon Unlined Paint Stripping Waste Sump; Paint Room	1/27/1994
7Z	General Plating Room; Interior Building 7	1/27/1994
8A	Septic Tank; Southwest of Building 8	1/21/1992
8B	Oil/Cleaning Drums; North of Building 8	1/21/1992
8C	Grease Pit; Former Hot Dog Restaurant	10/24/1990
9A	Building 9	10/24/1990
10A	Exterior drain; Diked Pad Solvent Storage; Building 10	1/27/1994
10B	Sumps; Interior Building 10	1/27/1994
10C	Drum Storage; Building 10	1/27/1994
11A	Inactive Septic System; East of Building 11	1/21/1992
12A	Septic System/Leach Field; East of Building 12	1/21/1992
12B	Concrete Transformer Pad; Building 12, 12A, 12B	1/21/1992
12C	Unknown Septic System	1/21/1992
13A	Building 13	10/24/1990
14	Drywell; Building 2	1/21/1992
15	Maintenance Shop Sink; Building 5	1/27/1994
16	Floor Drains; Building 7	1/27/1994
17	Soil Gas Survey	1/27/1994
18	Aerial Photo; North of Building 2/3	11/14/1994
19	Aerial Photo; Spill; Drainage Ditch North of Building 3	1/27/1994
20	Aerial Photo; Staining North of Building 4	1/21/1992
21	Aerial Photo; Staining Adjacent to Loading Dock West of Building 7	1/27/1994
22	Aerial Photo; Fill Area; East of Gray Street	1/27/1994
23	Aerial Photo; Solid Waste Dump; Near Building 7	10/24/1990
24	Cleanup Plan	1/27/1994
25	Drawings, Plates, Figures, Etc.	1/27/1994
26	On-Site Groundwater	Ongoing
27	Off-site Groundwater	Ongoing

TABLE 3-1
Monitoring Well Construction Details
Former LEC Site - Watchung and North Plainfield, NJ

Wells Screening Shallow Zone (From Water Table to 50 Feet Above Mean Sea Level)

Well Designation	Permit Number	Date Installed	Measuring Point Elevation (ft.msl)	Type/Diameter	Depth (feet)	Approximate Screened Interval (feet below surface)	Approximate Screened Interval Elevation (ft.msl)
MW-501S	25-43364	7/6/1993	120.47	PVC/2	18	8 to 18	113 to 103
MW-502S	25-43366	6/29/1993	102.53	PVC/2	18	8 to 18	96 to 86

MW-545D	25-54784	10/6/1999	84.23	PVC/2	200	180 to 200	-94 to -114
MW-546D	25-55003	10/21/1999	105.38	PVC/2	200	180 to 200	-73 to -93
MW-547D	25-54782	10/15/1999	96.80	PVC/2	200	180 to 200	-82 to -102
PZ-522D	25-45018	6/9/1994	92.60	PVC/2	197.7	187.7 to 197.7	-94 to -104
PZ-523A *	25-45021	6/28/1994	94.13	PVC/2	197.7	187.7 to 197.7	-94 to -104
PZ-524D	25-45024	7/11/1994	67.04	PVC/2	195.7	185.7 to 195.7	-118 to -128
MW-2 D	E201313300	10/25/2013	97.33	PVC/2	198	188 to 198	-91 to -101
MW-3 D	E201313298	11/11/2013	227.52	PVC/2	350	335 to 350	-107 to -122

ft.msl = Feet Above Mean Sea Level
N/A = Not Available
* = Well Has Been Buried or Destroyed

Table 3-2
Summary of Packer Testing Data
Former Lockheed Electronics Corporation Site
Boroughs of Watchung and North Plainfield, New Jersey

Well	Packer Test Interval (ft bgs)	Approximate Water Yield (gpm)	TCE Concentration (µg/l)
MW-1I	172-182	1.65	3
	217.5-227.5	1.7	3.6
	242-252	1.3	68
	258-268	0.35	59
	269-279	0.34	26
	279-290	0.28	12
MW-2D	88-98	1	0.302 U
	138.5-148.5	0.57	0.302 U
	174-189	0.76	0.302 U
	189-198	0.6	0.302 U
MW-3D	288-313	6.4	1.5
	330-355	3.45	2.7
	394-419	0.85	0.24 J
	477-502	4.8	0.17 U

J - Result is less than the reporting limit but greater than or equal to the Method Detection Limit and the concentration is an approximate value

U - Not detected at the method detection limit (MDL)

gpm - gallons per minute

ft bgs - feet below ground surface

NA - Not Analyzed
NS - Not Specified
U - The compound was not detected at the indicated concentration.
J - Result is less than the reporting limit but greater than or equal to the Method Detection Limit and the concentration is an approximate value.

Table 3-3
Summary of VOC Analytical Results for Packer Test Samples
Former Lockheed Electronics Company Site

Table 3-5
Monitoring Well Repair Summary
Former LEC Site - Watchung and North Plainfield, NJ

Well Designation	Date Well Repair Performed	Observations Before Repairs	Repair Summary	Replaced or Installed Lock	Completed Minor Repairs (replace bolts, inner expansion cap)	Replaced Flush Mount and Concrete Pad	Redeveloped Well
MW-501S	11/15/2013	Could not see pad (possibly underneath grass), no bolts, no rubber seal, PVC casing cut low; well is in low area and water frequently in casing	Built up well, complete flush mount and concrete pad replacement, new 2" expansion cap	X		X	
MW-501I	11/15/2013	Could not see pad (possibly underneath grass), no bolts, no rubber seal, PVC casing cut low; well is in low area and water frequently in casing	Complete flush mount and concrete pad replacement	X		X	
MW-502S	11/19/2013	Pad in good shape, missing all bolts on flushmount, no rubber seal	Installed new expansion plug and bolts. Cleaned out area between inner casing and flush mount.	X	X		
MW-502I	11/19/2013	Pad in good shape, missing all bolts on flushmount, no rubber seal	Installed new expansion plug and bolts. Cleaned out area between inner casing and flush mount.	X	X		
MW-503S	11/15/2013	Flushmount casing cracked and damaged, bolts do not screw into threads, could not see pad (possibly underneath grass), no rubber seal; well depth shallower than constructed depth	Complete flush mount and concrete pad replacement. Obstruction observed on 11/15/2013 was cleared on 11/20/2013 when camera was advanced down the well. Silt was observed on the camera upon removal from the well.	X		X	
MW-503I	11/15/2013	Flushmount casing cracked and damaged, inner casing heaved up, no flush mount lid, could not see pad (possibly underneath grass), no rubber seal	Complete flush mount and concrete pad replacement, new 2" expansion cap	X		X	
MW-504S	11/19/2013	Identification label "S" is on road and no labeling on flushmount, pad in good shape, rubber seal worn, bolts are good	PVC cut down to fit expansion plug under lid, tapped bolt threads, and cleaned out area between inner casing and flush mount.	X	X		
MW-504I	11/19/2013	Identification label "I" is on road and no labeling on flushmount, cracked pad, rubber seal worn, 1/2 bolts stripped	Drilled and tapped bolts (oversized to 5/8"). Installed new gasket and cleaned out area between inner casing and flush mount.	X	X		
MW-505S	NA	Needs new lock, pad in good shape	No repairs required	X			
MW-505I	NA	Needs new lock, pad in good shape	No repairs required	X			
MW-506S	11/14/2013	Pad in good shape, central bolt on flushmount stripped, rubber seal in place slightly worn	Cut PVC inner casing down so new 2" expansion plug will fit under flush mount lid, cleaned out bolt threads, added 3 new bolts.	X	X		
MW-506I	11/14/2013; 11/19/13	Pad in good shape, central bolt on flushmount stripped, rubber seal in place slightly worn	Installed new 2" expansion cap, cleaned manhole, new spider gear installed.	X	X		
MW-507S	11/14/2013	Could not see pad (possibly underneath grass), central bolt in flush mount stripped, rubber seal in place slightly worn	Complete flush mount and concrete pad replacement	X		X	
MW-507I	11/14/2013	Could not see pad possibly underneath grass, central bolt in flushmount stripped, rubber seal in place slightly worn	Complete flush mount and concrete pad replacement	X		X	
MW-508S	11/14/2013	Pad in good shape, central bolt in flushmount stripped, no rubber seal	Spider gear replaced, installed new 2" expansion cap	X	X		
MW-508D	11/14/2013; 11/19/13	Pad in good shape, central bolt in flushmount stripped, no rubber seal	Cut down PVC so expansion cap can fit below flush mount lid. Cleaned out area between inner casing and flush mount, installed new 4" expansion cap and spider gear	X	X		

Table 3-5
Monitoring Well Repair Summary
Former LEC Site - Watchung and North Plainfield, NJ

Well Designation	Date Well Repair Performed	Observations Before Repairs	Repair Summary	Replaced or Installed Lock	Completed Minor Repairs (replace bolts, inner expansion cap)	Replaced Flush Mount and Concrete Pad	Redeveloped Well
MW-531S	NA	Pad in good shape	Flush mount in good condition, no repairs needed.	X			
MW-531I	NA	Pad in good shape	Flush mount in good condition, no repairs needed.	X			
MW-532S	11/14/2013	Ants in flush mount, no bolts on flush mount, rubber seal good, pad questionable	Installed new 2" expansion cap, cleaned out bolt threads, and installed 3 new bolts.	X	X		
MW-532D	11/14/2013	No bolts on flush mount, rubber seal good, pad in good shape	Built up well pad with additional concrete, replaced flush mount and installed 2" expansion cap.	X		X	
MW-544S	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, rubber seal good, bolts are good	Complete flush mount replacement.	X		X	
MW-544I	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, rubber seal good, bolts are good	Cut down PVC so new expansion cap can fit below flush mount lid. Tapped threads and added 3 new bolts.	X	X		
MW-544D	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, rubber seal good, 1 missing one bolt on flush mount	Complete flush mount replacement.	X		X	
MW-545S	11/18/2013	Pad good, no rubber seal, no bolts	Complete flush mount replacement.	X		X	
MW-545I	11/18/2013	Pad good, no rubber seal, no bolts	Complete flush mount replacement.	X		X	
MW-545D	11/18/2013	Pad good, no rubber seal, no bolts and nothing to bolt on to (broken inside)	Complete flush mount replacement.	X		X	
MW-546S	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, no rubber seal, bolts stripped	Installed new expansion cap and 2 new 5/8" bolts (one ear on inner casing is broken)	X	X		
MW-546I	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, no rubber seal, bolts stripped	Installed new expansion cap and 3 new 5/8" bolts.	X	X		
MW-546D	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, no rubber seal, bolts stripped	Installed new expansion cap, 3 new 5/8" bolts, and new gasket.	X	X		
MW-547S	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, rubber seal worn, bolts good	Installed new expansion cap and 3 bolts.	X	X		
MW-547I	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, rubber seal worn, missing one bolt	Installed new expansion cap and 2 new bolts (one ear on inner casing is broken)	X	X		
MW-547D	11/19/2013	Identification labeled on road and no labeling on flush mount, pad in good shape, rubber seal worn, bolts good	Cut down PVC so expansion cap fits under flush mount lid, Installed new expansion cap and 3 bolts	X	X		
MW-549S	NA	Pad not visible; otherwise in good condition (stickup well).	No repairs required	X			
MW-549I	NA	Pad not visible; otherwise in good condition (stickup well).	No repairs required	X			
MW-550S	11/15/2013	Pad cracked, bolts stripped	Complete flush mount replacement.	X		X	
MW-550I	11/15/2013	Pad good, bolts stripped	Installed new 2" expansion cap, re-tapped and widened bolt threads.	X	X		

Table 3-5
Monitoring Well Repair Summary
Former LEC Site - Watchung and North Plainfield, NJ

Well Designation	Date Well Repair Performed	Observations Before Repairs	Repair Summary	Replaced or Installed Lock	Completed Minor Repairs (replace bolts, inner expansion cap)	Replaced Flush Mount and Concrete Pad	Redeveloped Well
PZ-521S	11/18/2013	Identification labeled on pad,and no labeling on flush mount, no outer cap, well inner casing appears to be heaved up	Complete flush mount replacement	X		X	
PZ-521I	11/18/2013	Identification labeled on pad and no labeling on flush mount, pad good, central bolt good	Installed new expansion cap, cleaned out area between inner casing and flush mount	X	X		
PZ-522S	11/18/2013	Pad good, central bolt doesn't secure outer lid, rubber seal worn	Cut down PVC so new expansion cap can fit below flush mount lid, cleaned out area between inner casing and flush mount, installed new spider gear	X	X		
PZ-522I	11/18/2013	Pad good, central bolt doesn't secure outer lid, rubber seal worn	Installed new expansion cap and spider gear, cleaned out area between inner casing and flush mount	X	X		
PZ-522D	11/18/2013	Pad good, central bolt doesn't secure outer lid, rubber seal worn	Cut down PVC so new expansion cap can fit below flush mount lid, cleaned out area between inner casing and flush mount	X	X		
PZ-523I	11/15/2013	Ants in flush mount, could not see pad (possibly underneath grass), central bolt is bent and won't secure, rubber seal worn	Complete flush mount replacement, existing 2" expansion cap kept	X		X	
PZ-524S	11/18/2013	Pad good, central bolt doesn't secure outer lid, no rubber seal	Cut down PVC so new expansion cap can fit below flush mount lid, installed new spider gear	X	X		
PZ-524I	11/18/2013	Pad good, central bolt doesn't secure outer lid, no rubber seal	Installed new expansion cap, tapped threads on existing spider gear	X	X		
PZ-524D	11/18/2013	Pad good, bolts good, no rubber seal	Installed new expansion cap, flush mount lid, and spider gear	X	X		
Totals				**45**	**24**	**15**	**0**

Table 5-1
Monitoring and Reporting Schedule
Former Lockheed Electronics Company Site
Program Interest No. 004334

Sample Locations	Sampling Frequency	Reporting Schedule	Years After RAP Approval	Analytical Parameters
Surface Water	Semi-annual	Annual	years 1 and 2	VOC+10
Surface Water	Biennial	Biennial	years 3 through 8	
Surface Water	Every 4 years	Every 4 years	years 9 through 33	
New 2013 Fringe Monitoring Wells	Two rounds within 60 days after installation	First annual report after well installation and sampling	N/A	VOC+10
New 2013 Fringe Monitoring Wells	Semi-annual	Annual	years 1 and 2	
New 2013 Fringe Monitoring Wells	Biennial	Biennial	years 3 through 8	
New 2013 Fringe Monitoring Wells	Every 4 years	Every 4 years	years 9 through 33	
Source Wells	Semi-annual	Annual	years 1 and 2	VOC+10
Source Wells	Biennial	Biennial	years 3 through 8	
Source Wells	Every 4 years	Every 4 years	years 9 through 33	
Plume Wells	Semi-annual	Annual	years 1 and 2	VOC+10
Plume Wells	Biennial	Biennial	years 3 through 8

Tentatively Identified Compound		None		None		None		None		None		None		None		None		None		None		None	

Notes:
All sample results and criteria value are expressed in units of micrograms per liter (µg/l)
1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria
Exceedances are highlighted -
2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted
3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria
4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)
Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C
Acronyms:
ID - identification
N/A - not applicable
NJDEP - New Jersey Department of Environmental Protection
GWQS - Ground Water Quality Standards
Qualifiers:
U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit

Tentatively Identified Compound	N/A	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None

Notes:
All sample results and criteria value are expressed in units of micrograms per liter (µg/l)
1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria
Exceedances are highlighted -
2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted
3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria
4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)
5 - GWQS for Xylene, Total (o-Xylene and p/m-Xylene)
Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C

Acronyms:
ID - identification
N/A - not applicable
VOC - volatile organic compound
NJDEP - New Jersey Department of Environmental Protection
GWQS - Ground Water Quality Standards
TIC - tentatively identified compound

Qualifiers:
U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - recovery or RPD exceeds control limits

Tentatively Identified Compound	N/A	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None

Notes:
All sample results and criteria value are expressed in units of micrograms per liter (µg/l)
1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria Exceedances are highlighted -
2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted
3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria
4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)
5 - GWQS for Xylene, Total (o-Xylene and p/m-Xylene)
Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C

Acronyms:
ID - identification NJDEP - New Jersey Department of Environmental Protection
N/A - not applicable GWQS - Ground Water Quality Standards
VOC - volatile organic compound TIC - tentatively identified compound

Qualifiers:
U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - recovery or RPD exceeds control limits

Tentatively Identified Compound	N/A	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None

Notes:
All sample results and criteria value are expressed in units of micrograms per liter (µg/l)
1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria Exceedances are highlighted -
2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted
3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria
4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)
5 - GWQS for Xylene, Total (o-Xylene and p/m-Xylene)
Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C

Acronyms:
ID - identification NJDEP - New Jersey Department of Environmental Protection
N/A - not applicable GWQS - Ground Water Quality Standards
VOC - volatile organic compound TIC - tentatively identified compound

Qualifiers:
U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - recovery or RPD exceeds control limits

Tentatively Identified Compound	N/A	None	None	None	None	None	None	2.6 J	None	None	1.9 J	None	None	None	None	None	None

Notes:

All sample results and criteria value are expressed in units of micrograms per liter (µg/l)

1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria Exceedances are highlighted -

2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted

3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria

4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)

5 - GWQS for Xylene, Total (o-Xylene and p/m-Xylene)

Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C

Acronyms:

ID - identification
N/A - not applicable
VOC - volatile organic compound
NJDEP - New Jersey Department of Environmental Protection
GWQS - Ground Water Quality Standards
TIC - tentatively identified compound

Qualifiers:

U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - recovery or RPD exceeds control limits

Tentatively Identified Compound	N/A	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None	None

Notes:

All sample results and criteria value are expressed in units of micrograms per liter (µg/l)

1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria

Exceedances are highlighted -

2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted

3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria

4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)

5 - GWQS for Xylene, Total (o-Xylene and p/m-Xylene)

Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C

Acronyms:

ID - identification
N/A - not applicable
VOC - volatile organic compound
NJDEP - New Jersey Department of Environmental Protection
GWQS - Ground Water Quality Standards
TIC - tentatively identified compound

Qualifiers:

U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - recovery or RPD exceeds control limits

Tentatively Identified Compound	N/A	None	None	None	None	None	None	None	None	None	None	None	None	1.7 J	None	None	None	None

Notes:
All sample results and criteria value are expressed in units of micrograms per liter (µg/l)
1 - Bolded compounds have at least one sample which exceeded NJDEP GWQS Criteria
Exceedances are highlighted -
2 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 1 - Specific Ground Water Quality Criteria unless otherwise noted
3 - N.J.A.C. 7:9C Ground Water Quality Standards, Appendix Table 2 - Interim Ground Water Quality Criteria
4 - GWQS for 1,3-Dichloropropene, Total (cis and trans)
5 - GWQS for Xylene, Total (o-Xylene and p/m-Xylene)
Analytical results for the modified trip/equipment blank are provided in the lab report in Appendix C

Acronyms:
ID - identification
N/A - not applicable
VOC - volatile organic compound
NJDEP - New Jersey Department of Environmental Protection
GWQS - Ground Water Quality Standards
TIC - tentatively identified compound

Qualifiers:
U - compound not detected above the method reporting limit
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - recovery or RPD exceeds control limits

All results in micrograms per liter (ug/L) (parts per billion)

Q - Qualifiers

D - Concentration reported at dilution

GWQS - New Jersey Ground Water Quality Standard

Bold- Concentration exceeds GWQS for TCE of 1 micrograms/Liter

ND - Not detected.

* - Represents the highest concentration of the bags sampled on that date.

J - Data indicates the presence of a compound that meets the identification criteria. The result is less than the quantitation limit but greater than zero.

TABLE 6-7
Comparison of Trichloroethene (TCE) Concentrations Prior to and Following Activation of Groundwater Extraction System
Former LEC Site - Watchung and North Plainfield, NJ

Wells Screening Shallow Zone (From Water Table to 50 Feet Above Mean Sea Level)

Well Designation	Depth (feet)	Approximate Screened Interval (feet below surface)	Approximate Screened Interval Elevation (ft.msl)	1999 TCE Concentration (µg/L)	Sept. 2014 TCE Concentration (µg/L)	Approximate Percent Reduction
MW-502 S	18	8 to 18	96 to 86	1,500	<GWQS	100%
MW-506 S	24.6	14.6 to 24.6	107 to 97	50	<GWQS	99%
MW-508 S	67.7	57.7 to 67.7	129 to 119	670	1.9	100%
MW-544 S	23	3 to 23	83 to 63	4.9	ND	100%
MW-545 S	35	15 to 35	71 to 51	ND	ND	N/A
MW-549S	110	90 to 110	90 to 70	2,800*	1.6	100%

PZ-522 S	17.7	7.7 to 17.7	86 to 76	12	ND	100%

Wells Screening Intermediate Zone (From 50 Feet Above Mean Sea Level to 50 Feet Below Sea Level)

Well Designation	Depth (feet)	Approximate Screened Interval (feet below surface)	Approximate Screened Interval Elevation (ft.msl)	1999 TCE Concentration (µg/L)	Sept. 2014 TCE Concentration (µg/L)	Approximate Percent Reduction
MW-502 I	74.7	64.7 to 74.7	39 to 29	5.9	<GWQS	99%
MW-506 I	99	89 to 99	34 to 24	1,700	<GWQS	100%
MW-507 I	152	142 to 152	35 to 25	970	1.3	100%
MW-544 I	100	80 to 100	6 to -14	<GWQS	GWQS	N/A
MW-545 I	93	73 to 93	13 to -7	ND	ND	N/A
MW-549 I	210	190 to 210	-11 to -31	1200*	49	96%
MW-550 I	100	80 to 100	53 to 33	870**	1.6	100%
PZ-522 I	101	91 to 101	3 to -7	200	2.4	99%

Wells Screening Deep Zone (Deeper Than 50 Feet Below Sea Level)

Well Designation	Depth (feet)	Approximate Screened Interval (feet below surface)	Approximate Screened Interval Elevation (ft.msl)	1999 TCE Concentration (µg/L)	Sept. 2014 TCE Concentration (µg/L)	Approximate Percent Reduction
MW-532 D	263	253 to 263	-66 to -76	32	1.9	94%
MW-544 D	200	180 to 200	-94 to -114	ND	<GWQS	N/A
MW-545 D	200	180 to 200	-94 to -114	ND	<GWQS	N/A
MW-546 D	200	180 to 200	-73 to -93	130	3.6	97%
PZ-522 D	197.7	187.7 to 197.7	-94 to -104	<GWQS	2.2	0%

Green percentages Indicate >50% reduction in dissolved TCE Concentrations, or that GWQS is not exceeded.

Yellow percentages indicate 25% to 50% reduction in dissolved TCE concentrations.

Red percentages indicate <25% reduction in dissolved TCE concentrations.

GWQS = New Jersey Department of Environmental Protection Ground Water Quality Standard (1µg/L)
µg/L = milligrams per liter (parts per billion)
ND = Not Detected; N/A = Not Applicable
ft. msl = feet above mean sea level
* = June 2003 Data
** = March 2003 Data

Except where otherwise noted, 1999 data from samples collected in November 1999, and reported in TRC's February 2009 Remedial Investigation Addendum Report and Off-Site Ground Water Investigation.

Notes:

All sample results and criteria value are expressed in units of micrograms per liter (µg/l)

1 - N.J.A.C. 7:9B Surface Water Quality Standards; Section 1.14(f)7 - Surface Water Quality Criteria for Toxic Substances - Fresh Water (FW2) Criteria

2 - Bolded compounds have at least one sample which exceeded NJDEP SWQS Criteria. Exceedences are highlighted.

3 - SWQS for 1,3-Dichloropropene, Total (cis and trans)

Analytical results for the field blank and trip blank samples are provided in the lab report in Appendix C

Acronyms:

ID - identification
N/A - not applicable
VOC - volatile organic compound
NJDEP - New Jersey Department of Environmental Protection
SWQS - Surface Water Quality Standards
TIC - tentatively identified compound

Qualifiers:

U - compound not detected at indicated concentration
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - Recovery or RPD exceeds control limits

Notes:

All sample results and criteria value are expressed in units of m

1 - N.J.A.C. 7:9B Surface Water Quality Standards; Section 1.14(f)7 - Surface Water Quality Criteria for Toxic Substances - Fresh Water (FW2) Criteria

2 - Bolded compounds have at least one sample which exceeded NJDEP SWQS Criteria. Exceedences are highlighted.

3 - SWQS for 1,3-Dichloropropene, Total (cis and trans)

Analytical results for the field blank and trip blank samples are provided in the lab report in Appendix C

Acronyms:

ID - identification
N/A - not applicable
VOC - volatile organic compound
NJDEP - New Jersey Department of Environmental Protection
SWQS - Surface Water Quality Standards
TIC - tentatively identified compound

Qualifiers:

U - compound not detected at indicated concentration
J - an estimated value that is greater than the method detection limit but less than the reporting limit
* - Recovery or RPD exceeds control limits

APPENDIX A — CASE INVENTORY DOCUMENT

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V
1	**Case Name:**	Former Lockheed Electronics Company, Inc.	*1.2*																			
2	**PI #:**	004334																				
3	**IMPORTANT:** *Do not copy and paste into more than 1 cell at a time because it can disrupt hidden equations*																					
4	**Case Inventory Document Version 1.3 06/25/14**																					
5	**AOC ID**	**AOC Type**	***AOC Code***	**AOC Details**	**Confirmed Contamination**	**AOC Status**	***AOC Status Code***	**Status Date**	**Incident #**	**DEP AOC Number**	**Contaminated Media**	**Contaminants of Concern**	**Additional Contaminants of Concern**	**Additional Contaminants of Concern**	**Applicable Remediation Standard**	**Exposure Route**	**Additional Exposure Route**	**RA Type**	**Additional RA Type**	**Additional RA Type**	**Was an Order of Magnitude Evaluation Conducted?**	**Activity**
6	1A	Discharge and disposal area - Waste water treatment systems/septic/seepage pit/dry well	*AAWW*	Former Septic System; South of Building 1	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/1/1992			None	Not Applicable										As per the SES dated 3/28/90, the former septic system consisted of two lateral drain fields south of Building 1 built in 1953 and taken out of service in approximately 1959 when a sanitary sewer service was provided. This area warranted an investigation because a small metal plating operation was conducted in Building 1, and industrial wastes may have been discharged to the septic system. The tank had an approximate capacity of 10,000 gallons. Septic System was proven not to exist. No sampling required. NFA approved 1/21/92.
7	1B	Storage tank and appurtenance - State Regulated Under ground storage tank	*ASUS*	10,000 Gallon #4 Fuel Oil UST South of Building 1	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			Soil	EPH	BN		Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, the 10,000-gallon UST located on the south side of Building 1 was installed in approximately 1953 and removed by November 1989 by Clean Harbors. Upon removal of the tank, soil contamination below the tank was found during subsequent soil sampling. Additional excavation was conducted until soils were visibly clean and organic vapor free. In June/July 1990 approximately 356 Tons of petroleum impacted soil was excavated and shipped offsite for disposal. Post excavation soil sample results met direct contact soil cleanup criteria. NFA approved 6/28/91.
8	1C	Storage tank and appurtenance - Above ground storage tank	*ASAG*	250 Gallon Ammonia AST North of Building 1	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, anhydrous ammonia is gaseous above a temperature of -33.35 degrees celsius and therefore poses no threat to contaminate soil or groundwater. NFA approved 10/24/90.
9	1D	Other areas of concern - Electrical transformer and capacitor	*AOTR*	3 Electric Transformers on pad; North of Building 1	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, three oil cooled transformers were stored on a pad north of Building 1. Inspection of the transformers and the concrete pad on which they were mounted showed no signs of leakage. In addition, LEC staff indicated that the current transformers do not contain PCBs. However, because transformers containing PCBs have been stationed at this location in the past, soil samples were collected and analyzed for PCBs. Soil sample results met RDCSCC. NFA approved 1/21/92.
10	1E	Storage and staging area - Storage pad and area	*ATSP*	Storage Shed North of Building 1	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, there was a shed located north of Building 1. On-site inspection revealed no staining of the pad on which the shed is mounted and there is no record of chemicals or chemical wastes being stored in the shed. Therefore, no sampling took place. NFA approved 10/24/90.
11	1F	Storage tank and appurtenance - Piping, above/below ground pump station, sump/pit	*ASPS*	Cooling Tower North of Building 1	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, there was a cooling tower located north of Building 1. Sampling of soils adjacent to this cooling unit were conducted to determine whether additives to the cooling water, which may have contained potentional contaminants, were discharged to the ground surface and contaminated the soil. Soil sample results meet RDSCC. NFA approved 6/28/91.
12	1G	Drainage system and area - Building floor drain and piping	*ADSF*	French Drain System North of Building 1	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, there was a french drain located on the north side of Building 1. This storm water system collects and transports surface water runoff, including runoff from the loading dock of Building 4, which may otherwise accumulate around Building 1. It consists of a perforated PVC pipe laid in a trench and backfilled with gravel water that infiltrated through the french drain was discharged to the storm sewer system west of Building 1. No chemical spills on the loading dock or on the adjacent drained areas were documented or known to have occurred. Two soil samples were installed adjacent to the french drains just before they connected with the storm sewer. All soil sample results meet RDCSCC. NFA approved 6/28/91.
13	1H	Drainage system and area - Building sump and pit	*ADSP*	Building 1 Boiler Room Sump	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, there was a two foot diameter by three foot deep sump that received boiler blow-down water and possibly spilled fuel oil and boiler room chemicals. All soil sample results meet RDCSCC. NFA approved 1/21/92.
14	1I	Other areas of concern - Discolored area or spill area	*AODA*	Photo Lab; Floor Stains; Spills	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, there was some staining and corrosion noted on the tiles in each of the four adjacent photo lab rooms. This is probably the result of drips and spills of photo developers and fixers. One soil boring was drilled through the floor in each room. All soil sample results met RDCSCC. NFA approved 6/28/91.
15	1J	Other areas of concern - Discolored area or spill area	*AODA*	Reproduction Lab Floor Stains	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, there was a reproduction lab used primarily for copying plans, blueprints, and other large detailed site graphics. Nominal staining was observed on the floor. Anhydrous Ammonia is the only chemical of concern known to be used and it was highly unlikely that it penetrated the floor and migrated to the soil below. No sampling or remediation required. No potential conduits for the discharge of hazardous substances. NFA approved 10/24/90.
16	1K	Environmental media - Media Ground water	*AEGW*	Building 1A (Production Well)	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Production well had been properly sealed and abandoned. NFA approved 1/27/94.
17	2A	Storage tank and appurtenance - State Regulated Under ground storage tank	*ASUS*	10,000 Gallon #4 Fuel Oil UST North of Building 2	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			Soil	EPH	BN		Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, a 10,000 gallon UST oil tank was installed north of Building 2 in 1957 and removed in 1989 by Clean Harbors. Soil contamination was detected below the tank and additional excavation was conducted to remove the impacted soil. UST was cleaned under BUST clean up plan. 375 Tons of soil was shipped offsite as petroleum impacted soil. All post excavation sampling met RDSCC. NFA approved 6/28/91.
18	2B	Storage tank and appurtenance - Loading and unloading area	*ASLU*	Staining; Loading Dock; Transformer Area; North of Building 2	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			Soil	PCBs			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, there was a loading dock located north of Building 2 that historically had been used for the delivery and temporary storage of chemicals used in Building 2. There was no record of a spill. Staining was observed from an aerial photo. 3 cubic yards of PCB contaminated soil removed via excavation. All post excavation soil samples meet RDCSCC. NFA approved 6/28/91.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V

5	**AOC ID**	**AOC Type**	***AOC Code***	**AOC Details**	**Confirmed Contamination**	**AOC Status**	***AOC Status Code***	**Status Date**	**Incident #**	**DEP AOC Number**	**Contaminated Media**	**Contaminants of Concern**	**Additional Contaminants of Concern**	**Additional Contaminants of Concern**	**Applicable Remediation Standard**	**Exposure Route**	**Additional Exposure Route**	**RA Type**	**Additional RA Type**	**Additional RA Type**	**Was an Order of Magnitude Evaluation Conducted?**	**Activity**
19	2C	Storage and staging area - Storage pad and area	*ATSP*	Paint Shed North of building 2	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	VO	BN	Metals	Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, a paint shed was located north of Building 2 that stored paint used throughout the facility. Paint was also stored on the west side of the shed. During the site inspection, some paint was noticed on the soil around the shed. 19 cubic yards of TCE/PCE impacted soil was removed from the AOC in 4/92. Final post excavation soil samples meet compliance averaging criteria. NFA approved 1/27/94.
20	2D	Storage and staging area - Storage pad and area	*ATSP*	Former Drum Storage Area; North of Building 2	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, aerial photographs taken in the early 1960s showed an area approximately 5 feet by 20 feet of possible drum storage north of Building 2. Soil samples were collected on either side of this area. All soil sample results meet RDCSCC. NFA approved 6/28/91.
21	2E	Storage and staging area - Chemical storage cabinet or closet	*ATSC*	Freon Dispenser; Interior of Building 2	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, a freon dispenser was located in Lab D which consisted of a 55-gallon horizontal freon drum with a spigot. Minor staining was observed on the tile beneath the spigot. It was determined that it was unlikely that the freon penetrated the floor and therefore no sampling was required. NFA approved 10/24/90.
22	2F	Drainage system and area - Building floor drain and piping	*ADSF*	Boiler Room Floor Drain	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	EPH	VO	BN	Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, small quantities of chemicals were stored in the boiler room where a compressor with a condensate line running to a four inch diameter floor drain was located. Some condensate dripping into the drain was observed but there was no staining, evidence of a spill, or any cracks or holes observed in the concrete. Approximately 2 cubic yards of soil was excavated in 11/93. Final post excavation soil sample results meet RDCSCC. NFA approved 1/27/94.
23	2FR	Drainage system and area - Building floor drain and piping	*ADSF*	Boiler Room Floor Drain - Fuel Oil	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	7/22/1998			Soil	EPH	VO	BN	Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, the boiler itself had some noticeable staining on the adjacent floor and a pool of dirty liquid between the boiler and the north wall. The liquid was cleaned up. Soil samples collected between June 25, 1996 and January 21, 1997 indicated the presence of fuel oil in the soil near the vicinity of the Boiler room. NJDEP approved proposal for excavation and offsite disposal of impacted soil on 12/6/96. In April and May 1997, the concrete slab was removed along with 2140 Tons of soil impacted with No. 4 fuel oil was excavated from the AOC. Post excavation sampling indicated that the extent of the No. 4 fuel oil impacted soil was removed. NFA was proposed in the July 21, 1997 RAR and approved in the NJDEP letter dated 7/22/98.
24	2G	Storage and staging area - Chemical storage cabinet or closet	*ATSC*	Building 2; Conference Room; Former Chemical Process Area	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the conference room previously was a chemical process area. LEC personnel were unable to define specific activities conducted in this area, but one of the uncarpeted areas with some staining on the floor tiles is known to have contained an air conditioning unit and a freon dispenser. Soil samples were below the RDCSCC. NFA approved 1/21/92.
25	2H	Storage and staging area - Chemical storage cabinet or closet	*ATSC*	Cafeteria; Former Chemical Storage	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the cafeteria was previously used for chemical storage. Some staining was evident on the older tiles. Soil samples meet RDCSCC. NFA approved 1/21/92.
26	3A	Storage tank and appurtenance - Unregulated Under ground storage tank	*ASUU*	10,000 Gallon #4 Fuel Oil UST; North Side of Building 3	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, the underground oil storage tank was formerly located on the north side of Building 3 and was reportedly removed during the early 1980s. No closure report was filed and no records of post excavation activities could be located. Therefore, the tank was registered, permitted, and removed in accordance with BUST requirements. Soil samples were collected. Soil samples met RDCSCC. NFA approved 6/28/91.
27	3B	Storage tank and appurtenance - Above ground storage tank	*ASAG*	1,000 Gallon #4 Fuel Oil AST; North Side of Building 3	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, there was a 1,000-gallon above ground oil storage tank located on the north side of Building 3 on a concrete pad with a cinder block wall serving as a secondary containment and stored #2 Fuel Oil. Neither the tank nor the pad showed any evidence of stains or spills. NFA approved 10/24/90.
28	3C	Other areas of concern - Electrical transformer and capacitor	*AOTR*	6 Electrical Transformers on Pad; North Side of Building 3	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there were six transformers located on a concrete pad located along the north side of Building 3. The pad did not have secondary containment and showed some signs of staining. Soil sample results meet RDCSCC. NFA approved 1/27/94.
29	3D	Drainage system and area - Building sump and pit	*ADSP*	Drop Hammer Plt; Building 3 Interior	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	4/18/1997			Soil	VO	BN	EPH	Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, there was a Drop hammer testing pit located in the interior of building 3. Machinery in the test pit was used to support and vibrate a metal plate at floor level to which equipment could be attached and tested for susceptibility to impact and vibration. The walls of the test pit showed visible sings of oil or hydraulic fluid staining. The floor contained some accumulation of what appeared to be oil and water. Delineation of soils completed in conjunction with May 1994 Soil RIR. NJDEP required no further delineation relative to Building 3 drop hammer pit in their 11/14/94 letter. Area was remediated in conjunction with the Building 3 Soil Remediation as described in the August 1995 Soil RAW. Excavation and ex-situ treatement by mechanical processing of approximately 39,800 cubic yards of shallow soil (i.e., the fill/Till 1 and silt/clay layers) was completed from February 1996-May 1996. These soil remediation activities included remediation of the soil at AOC 3D. NFA for shallow soils at Building 3 approved 4/18/97.

30	3E	Other areas of concern - Discolored area or spill area	*AODA*	Hydraulic Fluid Leak; Northeast Corner of Building 3	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there was a hydraulic leak adjacent to machinery on the northeast corner of Building 3. Testing equipment mounted on a former naval anti-aircraft gun mount located on the northeast corner of the building leaked a minor amount of hydraulic fluid onto the floor (area is approximately ten feet by four feet). A 55-gallon drum of hydraulic fluid rested on the floorn near the spill. There was a prominent floor crack where the floor and wall separated at the east end of the building and there was a possibility that some material may have flowed through the crack. Soil sample results meet RDSCC and IGSCC. NFA approved 1/27/94.
31	3F	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Welding shop; Interior Building 3B	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated, 3/38/90, this building was used as a welding shop. There were no records of spills at this AOC, but there was what appeared to be sporadic oil staining on the floor. Chemicals of concern are used or stored in the building. Soil sample results meet RDSCC. NFA approved 1/27/94.
32	3G	Other areas of concern - Discolored area or spill area	*AODA*	Stained Pavement; Northwest Corner Building 3B; Former Drum Storage	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	BN	EPH		Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, an oil stain was observed on the pavement at the northwest corner of Building 3B. Oil spilled or leaked onto the asphalt from oil storage drums at the northwest corner of Building 3B. The spill was approximately five feet in diameter. 4 cubic yards of impacted soil was removed in April 1992. Post excavation soil sample results meet RDSCC and IGSCC. NFA approved 1/27/94.
33	3H	Other areas of concern - Discolored area or spill area	*AODA*	Stained Area; Northeast Side of Building 3 B (MW-10 Area)	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there was an interpreted liquid spill in the drainage ditch north of Building 3 from aerial photographs taken in April 1979. Soils samples were collected at the approximate center of the spill, and one where the streams turns south along the property line and one below the outfall from Building 3. All soil sample results meet RDSCC. NFA approved 1/27/94.
34	3I	Other areas of concern - Discolored area or spill area	*AODA*	Floor Staining; Interior Building 3B	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Staining was observed in the interior of Building 3B. Soil samples were collected below the floor on 7/18/90. Soil samples results meet RDSCC. NFA approved 1/27/94.
35	3J	Storage tank and appurtenance - Loading and unloading area	*ASLU*	Building 3C Bay Door Entrance; North of Building 3C	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										Soil samples were collected near the Bay door entrance on 7/9/90. Soil sample results meet RDSCC and IGSCC. NFA approved 1/21/92.
36	3K	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Building 3; Chiller Tower	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										No soil sampling required at this AOC. NFA approved 1/21/92.
37	3L	Storage and staging area - Storage pad and area	*ATSP*	Building 3; Paint Can Storage	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										NFA approved 1/27/94 based on the 3/16/93 MH/SME report.
38	3M	Storage and staging area - Storage pad and area	*ATSP*	Building 3; Possible TCE Storage Area	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Six soil samples were collected on 7/6/90. NFA approved on 1/27/94 based on the 3/16/92 MH/SME report.
39	3N	Environmental media - Media Sediment	*AESD*	Building 3 Clay (Fill/Till 1 and Silt/Clay)	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	4/18/1997			Soil	VO			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				Building 3 soil RI data submitted July/August 1993. Soil remediation conducted as per the RAW dated July 1995, as amended November 3, 1995. NJDEP approved RAW 4/8/96. Excavation and ex-situ treatment by mechanical processing of approximately 39,800 cubic yards of soil was completed from February 1996-May 1996. Remedial Action Report for Building 3 clay remediation was submitted to the NJDEP 11/1/96. Soil samples met the IGSCC. NFA approved 4/18/1997.
40	3O	Environmental media - Media Soil, including soil vapor pore spaces	*AESV*	Building 3 Sand	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	7/22/1998			Soil	VO			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal		Soil Vapor Extraction				Building 3 sand remediation was accomplished through three horizontal soil SVE wells, a SVE unit, and an air pollution control system. The SVE system was operated during the period of December 10, 1996 through April 10, 1997. On April 10 the SVE system operation was stopped. As provided in the 1995 RAW, the AOC remained undisturbed for a six month period following the SVE shutdown. This 6 month standby period was observed to allow TCE vapor concentrations to stabilize prior to post-remedial sample collection. In October 1997, 25 soil borings were installed within the limits of the Building 3 sand AOC for the collection of post-remediation samples. Samples were collected from the top and middle of the sand layer as well as from the till 2 layer within each boring. A total of 81 samples were collected for VOC analysis. TCE was detected at this location at a concentration of 1.7 ppm. The sample as collected at the top o f the sand layer in the 25-27 foot interval. Samples collected below this interval reported concentrations of ND. Once the arithmetic mean was determined to be below 1 ppm, the remediation was considered complete. No further action was proposed in the 2/25/98 RAR. The NJDEP letter dated 7/22/98 stated that the remediation of this area was complete at that time and an NFA/Covenant not to sue will be issued for the industrial establishment at the completion of the IEPA AOC.
41	4A	Storage tank and appurtenance - Loading and unloading area	*ASLU*	Loading Dock; Southwest of Building 4	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	VO	BN	EPH	Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, the loading dock on the southwest corner of Building 4 projects both to the south and to the west. Both docks are surrounded by pavement. Storm water drainage is provided by two storm water drains, one on either side of the southern dock. To assess the potential impact to soil from chemical/hazardous waste spills, soil samples were collected in 7/1990 adjacent to the loading docks. 17 cubic yards of soil were removed in March 1992. Post excavation soil sample results meet RDSCC and IGSCC. NFA approved 1/27/94.

42	4B	Drainage system and area - Building floor drain and piping	*ADSF*	French Drain System; North and West Sides of Building 4	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, there was a french drain located on the north and west sides of Building 4. This storm water system collected and transported surface water runoff, including runoff from the loading dock, which may otherwise accumulate around Building 4. The drain consisted of perferoated PVC pipe in a trench which was backfilled with gravel. Water infiltrating the french drain was discharged to the storm sewer system west of Building 4. No chemical spills on the loading dock or on adjacent drained areas have been documented or known to have occurred. Two soil samples were advanced into natice soil adjacent to the french drains at a point prior to connection with the storm sewer. Samples were obtained at the invert elevation of the french drains and again at a depth of three feet below the invert elevation. Soil sample results meet RDSCC. NFA approved 6/28/91.
43	4C	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Cooling Tower; North of Building 4	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	VO			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, there was a cooling tower located north of Building 4. Soil samples were collected adjacent to this cooling unit to determine whether additives to the cooling water, which may have contained potential contaminants were discharged onto the surface. Sludge generated from the operation of the cooling tower north of Building 4 has been disposed of on the ground adjacent to the tower. The sludge covers an area of eight square feet by ten feet in size. There was an area of dead grass between Building 4 and the cooling tower. This area, was approximately eight feet by ten feet in size. 14 cubic yards of impacted soil removed in 4/92 and post excavation samples collected. Post excavation sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
44	4D	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Boiler Room; Building 4 Interior	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the boiler room of Building 4 was in poor condition, with standing water on the floor. To assess the condition of the soil, one soil sample was collected adjacent to the boiler room on 7/19/90. Soil sample results meet RDSCC and IGSCC. NFA approved 1/21/92.
45	4E	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Air Conditioning Room; Building 4	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/38/90, the air conditioning room was alos in disrepair and some staining was noticed on the floor. No chemicals were ever reported to be stored in the room, no record of a spill, and the level of staining did not suggest any penetration below the floor. NFA approved 10/24/90.
46	5	Drainage system and area - Building trench/piping from sink-rec'd process waste	*ADBT*	Maintenance shop Sink Outfall; Building 5	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, Building 5 was constructed in 1955 for Stavid Engineering and used as a garage until it was sold to LEC in 1959. LEC operated Building 5 as a maintenance and carpentry shop from 1959. Chemical usage at Building 5 included wood glue, solvent (Naturesolv 73), liquide pipe opener, cutting oil, and belt dressing. The chemicals were all stored in small quantities and used for minor maintenance work at the facility. No evidence or record of spills was identified. NFA approved 1/27/94.
47	6	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Building 6	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, Building 6 was constructed in 1962 and housed an anechoic chamber used for research and also contained three storage areas. Chemicals used or stored in building 6 included janitorial supply chemicals and carpentry chemicals. There was no evidence or record of spills in Building 6. No sampling required, no sanitary sewer, sumps or floor drains. NFA approved 10/24/90.
48	7A	Storage tank and appurtenance - Federal Regulated Under ground storage tank	*ASUF*	500 Gallon 1,1,1 TCA UST	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			Soil	VO			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, the 500-gallon underground 1,1,1-trichloretheane tank was removed from beneath the air conditioner pad on the west side of Building 7 in August 1988 by ENSI. Soils samples of the base of the excavation were collected at that time and the excavation was backfilled. TCA levels between 2-7 ppm were detected in the soil located within and surround the tank. Three monitoring wells were installed. Two of the monitoring wells were dry and the third had a poor yield because of the high concentration of suspended soilds. The two downgradient monitoring wells (MW3 and MW4) were reactivated and sampled. The TCA tank was excavated in 8/88 and additional soil was excavated in March 1990. Post excavation soil samples meet RDCSCC. NFA approved 6/28/91.
49	7B	Storage tank and appurtenance - Above ground storage tank	*ASAG*	500 Gallon Kerosene AST; Enclosed in Concrete	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, there was a 500-gallon above ground kerosene tank located next to the energy recovery system. The tank was contained inside a completely enclosed concrete block structure. There was no sign or record of leaks. NFA approved 10/24/90.
50	7C	Storage tank and appurtenance - Above ground storage tank	*ASAG*	250 Gallon Ammonia AST; West of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/38/90, there was a 250-gallon ammonia tank located west of Building 7. Anhydrous ammonia is a gas at STP. Does not need sampling requirements for hazardous substance. NFA approved 10/24/90.
51	7D	Storage tank and appurtenance - Above ground storage tank	*ASAG*	2 - 20,000 Gallon #2 Fuel Oil ASTs	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, there were two verticle 20,000-gallon above ground #2 fuel oil tanks that were installed between 1975 and 1979 and stood on a concrete diked pad. There was not indication of leakage. Soil sampling results meet RDCSCC and IGSCC. NFA approved 6/28/91.
52	7E	Storage tank and appurtenance - Loading and unloading area	*ASLU*	Loading Dock; West Side of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, an aerial photographic property survey from April 23, 1975 identified a possible stain at the loading dock on the west side of Building 7. There were no records of a spill in this area and no evidence of staining when investigated. NFA approved 1/21/92.

53	7F	Storage tank and appurtenance - Unregulated Under ground storage tank	*ASUU*	500 Gallon Acid Waste UST; Northeast corner of Building 7	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	BN			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, the 500-gallon non-metallic underground waste acid tank was removed prior to construction of Building 7A in 1978. Soils sample results indicated BN impacted soil. 50 cubic yards were excavated on 4.92 and 40 cubic yards in 8/93. Post Excavation soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
54	7G	Storage tank and appurtenance - Unregulated Under ground storage tank	*ASUU*	1,000 Gallon Acid Waste UST; North of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, this 1,000-gallon UST was reportedly removed, although no documentation concerning its closure and removal are available. LEC personnel stated that the tank contained process of acid waste. Soil sample results meet RDSCC and IGSCC. NFA approved 1/27/94.
55	7H	Other areas of concern - Electrical transformer and capacitor	*AOTR*	Electrical Substation; North of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there was a substation installed in 1968 located north of Building 7. There was no concrete pad or berm. No reported spills are leaks were ever reported. Soil sample results meet RDCSCC. NFA approved 1/27/94.
56	7I	Storage tank and appurtenance - Federal Regulated Under ground storage tank	*ASUF*	3,000 Gallon Unleaded Gasoline UST; East of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, the 3000 gallon unleaded gasoline tank used for motor vehicles was removed in November 1989. There were no evidence of leaks or spills. NFA approved 1/27/94.
57	7J	Storage tank and appurtenance - Unregulated Under ground storage tank	*ASUU*	1,000 Gallon Unutilized UST; East of Building 7 (Never Filled)	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, the 1,000-gallon steel UST process waste tank was installed in 1968 and was never connected or used. The tank was reportedly filled with sand and abandoned in place in the lated 1970s, early 1980s, and was removed in November 1989. There were no evidence of spills or leaks. Soil samples meet RDCSCC. NFA approved 6/28/91.
58	7K	Storage and staging area - Storage pad and area	*ATSP*	Storage Shed; North of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, the shed immediately to the north of Building 7 contained a noticeable solvent smell. There was no evidence or record of spillage, however a solvent spill could have penetrated the aphalt floor and impacted the underlying soil. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
59	7L	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Parking Lot Chip Bin; Northwest Corner of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there were three chip bins located in the parking lot neear the northwest corner of Building 7. There was some staining under each of the bins. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
60	7M	Other areas of concern - Compressor vent discharge	*AOCV*	Compressor Room; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	6/28/1991			None	Not Applicable										As per the SES dated 3/28/90, a site inspection found signs of oil and grease leackage from the vacuum pump in the compressor. Soil sample results meet RDCSCC and IGSCC. NFA approved 6/28/91.
61	7N	Storage tank and appurtenance - Above ground storage tank	*ASAG*	Acid Waste System/Chromium AST; Building; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Endpoint of acid waste system. Soil samples collected on 3/27/92. Soil sample results meet RDCSCC. NFA approved 1/27/94.
62	7O	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Microelectronic Plating Area; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, Solvents and other chemicals were used in moderate quantities in this area. No evidence or record of spills was found. NFA approved 10/24/90.
63	7P	Storage and staging area - Chemical storage cabinet or closet	*ATSC*	Print Shop; Solvent Storage; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										Floor was intact and there was not signs of a spill. NFA approved 1/21/92.
64	7Q	Other areas of concern - Discolored area or spill area	*AODA*	Penetrant Dye Area; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, to assess the potential impact from spills of oil based penetrant (Zyglo) used in fairly large quantities in this area, one soil sample was collected from under the penetrant storage area. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
65	7R	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Flow Solder Area; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there was heavy usage of degreaser solvents and flow solder tinning oils. Soil samples were collected adjacent to the former degreaser and one near the solder area. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
66	7S	Drainage system and area - Building sump and pit	*ADSP*	Microelectronic Inudstrial Waste Treatment Sump; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the sump located in the area of the microelectronics industrial waste treatment area collected spillage form the wastewater pH adjustment process. One soil sample was collected from adjacent to the sump. Soil sample results meet RDSCC and IGSCC. NFA approved 1/21/92.
67	7T	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Model Shop Area; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										The Machine shop floor was intact. NFA approved 1/27/94.
68	7U	Discharge and disposal area - Incinerator	*AAIN*	Office Waste Incinerator; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										The incinerator is located next to the boiler room and was used to supplement the heating system by burning paper wastes and waste solvents. The SES dated 3/28/90 states that the incinerator has been inactive since 1987 because it could not meet the required air emission standards. The incinerator was gas fueled. Soil samples collected from the bottom of the ramp adjacent to the feeder inlet. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
69	7V	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Machine Shop; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the Machine Shop contained a number of large cutting, tapping, and drilling machines. Floor was intact. No sampling required. NFA approved 1/21/92.
70	7W	Other areas of concern - Waste treatment area	*AOWT*	Industrial Waste Treatment Plant; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there were two locations in the industrial waste treament plant where staining was noticed on the floor during a site inspection. One area of staining was noted near the oil/water separator. Because oil is a suspect contaminant, and the size and process flow of the separator would limit the quantity of oil released to the ground, it is unlikely that oil penetrated the floor. Staining was noticed adjacent to the treatment process vessels. Soil samples collected near the staining in 10/90. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.

71	7X	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Printed Circuit Plating Room; Interior Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, there was one area on the printed circuit plating room were staining was detected during the site inspection. To assess the possible impact to soil, one soil sample was collected in the stained area located between the two process lines. There is a concrete collection sump that collects water-wash and incidental spillage from the plating process and therefore one soil sample was collected from adjacent to the sump. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
72	7XX	Environmental media - Media Sediment	*AESD*	Bluilding 7A Surface Soils (Asphalt/BN Issue)	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	BN			Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal		Excavation				BN impacted soil excavated in conjunction with AOC 7F. Post excavation samples meet RDCSCC and IGSCC. NFA approved 1/27/94.
73	7Y	Drainage system and area - Building sump and pit	*ADSP*	10,000 Gallon Unlined Paint Stripping Waste Sump; Paint Room	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	VO	Metals		Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation	Soil Vapor Extraction			Soil remediation conducted under the RAW dated August 1993. Excavation and ex-situ SVE for 35,000 cubic yards of soil from November 1993-June 1994. Offsite shipment of 5800 lbs of liquid and debris in December 1993. Offsite shipment of approximately 120,000 lbs of soil in March 1994. Soils meets IGSCC. NFA approval based on Remedial Action Report dated August 1994. NFA approval date 1/27/94.
74	7Z	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	General Plating Room; Interior Building 7	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	VO	Metals		Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation				As per the SES dated 3/28/90, floor staining was observed in the general plating room. In 1988, LEC replaced the floor with new concrete and acid resistant tiles. LEC had the concrete and soil analyzed and an impact was detected. Soil remediation conducted under the RAW dated August 1993. Excavation and ex situ SVE for 35,000 cubic yards of soil November 1993-June 1994. Offsite shipment of 5800 lbs of liquid and debris in December 1993. Offsite shipment of approximately 120,000 lbs of soil in March 1994. Part of AOC 7Y. NFA based on Remedial Action Report dated August 1994. Soil meets IGSCC. NFA Approved 1/27/94.
75	8A	Discharge and disposal area - Waste water treatment systems/septic/seepage pit/dry well	*AAWW*	Septic Tank; Southwest of Building 8	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, there was a septic tank located southwest of Building 8. Building 8 was used for small scale development of electronic components, and some industrial wastes may have been discharged to the septic system. One sediment sample and one aqueous sample was collected form inside the tank and one soil sample was collected from the drainage field approximately 3 feet downgradient from the laterals at a depth equal to the approximate invert elevation of the lines and four feet below the invert elevation. Initial soil sample results from vicinity of tank meet RDSCC and IGSCC. NFA approved 1/21/92.
76	8B	Other areas of concern - Hazardous substance storage or handling area	*AOHS*	Oil/Cleaning Drums; North of Building 8	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, approximately 15 gallons of "Stay White" brand cleaner and two gallons of clear "oil" was stored in drums along the north exterior wall of Building 8. No evidence of leaks or spills were found. NFA approved 1/21/92.
77	8C	Drainage system and area - Building sump and pit	*ADSP*	Grease Pit; Former Hot Dog Restaurant	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, there was a grease pit located inside Building 8 that was used by the former restaurant. The only materials known to be in the grease pit were animal fats from frying and broiling. NFA Approved 10/24/90.
78	9A	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Building 9	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, Building 9 was constructed in the late 1960s as guard headquarters and security offices, but was removed and replaced by Building 7G in 1985. No chemicals were used or stored in Building 9. NFA approved 10/24/90.
79	10A	Drainage system and area - Building floor drain and piping	*ADSF*	Exterior drain; Diked Pad Solvent Storage; Building 10	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, solvents were stored on the diked pad outside of building 10 and staining was noted in adjacent areas. One soil sample was collected adjacent to the outdoor drain. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
80	10B	Drainage system and area - Building sump and pit	*ADSP*	Sumps; Interior Building 10	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			Soil	VO	BN		Soil Cleanup Criteria (MUST have RAW approved for AOC prior to 12/2/2008)	Ingestion/Dermal	Inhalation	Excavation	Soil Vapor Extraction			As per the SES dated 3/28/90, there was no record or indication of any substantial spill inside Building 10. Since there was a high volume of solvents stored in the building and the floor showed visible sings of staining, the underlying soils were sampled to determine if there were any impacts to soil. Excavation and ex situ SVE for 35,000 cubic yards of soil from November 1993-June 1994. Offsite shipment of 5,800 lbs of liquid and debris in December 1993. Offsite shipment of approximately 120,000 lbs of soil in March 1994. NFA based on remedial action report (August 1994). Soil meets IGSCC. Remediation done in conjunction with AOC #7Y and 7Z. NFA approved 1/27/94.
81	10C	Storage and staging area - Storage pad and area	*ATSP*	Drum Storage; Building 10	Yes	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										As per the SES dated 3/28/90, Building 10 was constructed by LEC in 1970 and used for chemical storage. It was enlarged in 1983 and collection basins were added. Chemicals stored in Building 10 included virgin and hazardous waste chemicals. All contaminants of concern have been restored to background levels. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
82	11A	Discharge and disposal area - Waste water treatment systems/septic/seepage pit/dry well	*AAWW*	Inactive Septic System; East of Building 11	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the leach field located east of Building 11 was sampled to confirm whether industrial wastes were discharged into the Septic System. One aqueous sample and one sediment sample were obtained from inside the septic tank. One soil sample was obtained at the approximate invert elevation of the lines and at approximatley four feet below the invert elevation. Initial soil sample result from vicinity of tank meet RDCSCC. NFA approved 1/21/92.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V

83	12A	Discharge and disposal area - Waste water treatment systems/septic/seepage pit/dry well	*AAWW*	Septic System/Leach Field; East of Building 12	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, a septic tank and drain field are located north of Building 12. No records existed to confirm that the septic tank and drain field were either left in place or removed prior to construction of Building 12A. One soil sample was collected from approximately 3 feet downgradient from the laterals and at the approximate invert elevation of the lines and three feet below the invert elevation to cover the widest likely plume of impact to soil. Initial soil sample results from vicinity of tank meet RDCSCC and IGSCC. NFA approved 1/21/92.
84	12B	Other areas of concern - Electrical transformer and capacitor	*AOTR*	Concrete Transformer Pad; Building 12, 12A, 12B	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, a transformer pad was constructed in 1986 and during a site inspection did not show any signs of staining indicating a leak from the transformer. NFA approved 1/21/92.
85	12C	Discharge and disposal area - Waste water treatment systems/septic/seepage pit/dry well	*AAWW*	Unknown Septic System	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										As per the SES dated 3/28/90, the Building 12 septic system had been dedicated solely to sanitary waste and no industrial activities have been housed in Building 12. It was determined that the system never existed and an NFA was approved 1/21/92.
86	13A	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Building 13	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										As per the SES dated 3/28/90, Building 13 was constructed by LEC in 1978 and was used for surplus equipment storage. There were no chemicals used or stored in this building. No sampling required. NFA approved 10/24/90.
87	14	Drainage system and area - Dry well and sump	*ADDW*	Drywell; Building 2	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										Drywell was used to receive condensate from the air conditioner. No sampling required. NFA approved 1/21/92.
88	15	Drainage system and area - Building trench/piping from sink-rec'd process waste	*ADBT*	Maintenance Shop Sink; Building 5	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Soil sampling conducted near sink outfall. Soil sample results meet RDSCC. See AOC #5. NFA approved 1/27/94.
89	16	Drainage system and area - Building floor drain and piping	*ADSF*	Floor Drains; Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Gray street drainage ditch near outfalls sampled on 3/30/1992. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
90	17	Environmental media - Media Soil, including soil vapor pore spaces	*AESV*	Soil Gas Survey	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Soil samples collected near Buildings 2 and 3 at deptsh to 50 feet bgs. Area to be remediated in conjunction with Building 3 soil remediation as described in Soil Remedial Action Workplan dated August 1995. Related to Soil Gas Survey. NFA approved 1/27/94.
91	18	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Aerial Photo; North of Building 2/3	No	NFA-A DEP Issued (Unrestricted Use)	*36*	11/14/1994			None	Not Applicable										NFA approved 11/14/94.
92	19	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Aerial Photo; Spill; Drainage Ditch North of Building 3	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Soil sample results meet RDCSS. NFA approved 1/27/94.
93	20	Other areas of concern - Discolored area or spill area	*AODA*	Aerial Photo; Staining North of Building 4	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/21/1992			None	Not Applicable										Soil sampling conducted behind building 3C. Soil sampling resulst meet RDCSCC and IGSCC. NFA approved 1/21/92.
94	21	Other areas of concern - Discolored area or spill area	*AODA*	Aerial Photo; Staining Adjacent to Loading Dock West of Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Soil samples collected at loading dock area. Soil sample resits met RDCSCC and IGSCC. NFA approved 1/27/94.
95	22	Discharge and disposal area - Historic fill material area/other fill area	*AAHF*	Aerial Photo; Fill Area; East of Gray Street	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										Soil samples collected 7/90. Soil sample results meet RDCSCC and IGSCC. NFA approved 1/27/94.
96	23	Discharge and disposal area - Waste pile as defined by N.J.A.C. 7:26	*AA72*	Aerial Photo; Solid Waste Dump; Near Building 7	No	NFA-A DEP Issued (Unrestricted Use)	*36*	10/24/1990			None	Not Applicable										See AOC #22. NFA approved 10/24/90.
97	24	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Cleanup Plan	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										NFA approved 1/27/94.
98	25	Other areas of concern - Any area suspected of containing contaminants	*AOCC*	Drawings, Plates, Figures, Etc.	No	NFA-A DEP Issued (Unrestricted Use)	*36*	1/27/1994			None	Not Applicable										NFA approved 1/27/94.
99	26	Environmental media - Media Ground water	*AEGW*	On-Site Groundwater	Yes	RAW	*83*	12/6/1996			Ground Water	VO			Remediation Standards	Ground Water		Pump & Treat	Monitored Natural Attenuation			Ground water extraction and treatment system (GWES) proposed in the July 1995 Ground water RAW. NJDEP approved the onsite Groundwater RAW dated 12/6/96. The GWES was activated on 7/17/93 under NJPDES Permit #NJG0105899. The GWES was temporarily deactivated in late May 2011. See AOC 27.
100	27	Environmental media - Media Ground water	*AEGW*	Off-site Groundwater	Yes	RAR	*84*	12/30/2011			Ground Water	VO			Remediation Standards	Ground Water		Monitored Natural Attenuation				A GW RI was submitted in January 1994. The July 1995 GW RAW was granted conditional approval by the NJDEP on 4/8/96 and 12/6/96. The NJDEP letter dated 4/8/96 requested that Lockheed establish a CEA for the offsite GW impacted by TCE. In accordance with the NJDEP conditional approval dated 12/6/96, an offsite GW proposal was submitted to the NJDEP in June 1997. An Interim CEA was established 12/4/97. The NJDEP letter dated 7/22/98 stated that LMC is not required to sample Green Brook at the present time and approved LMC's proposals to install MW clusters proposed in the 7/95 RAW and to collect gw samples from domestic and industrial wells. A BEE for the Crab Brook was submitted 4/12/99 and the NJDEP concluded in its letter dated 8/9/99 that no further ecological evaluation of the Crab Brook was required. A domestic well sampling report was submitted 4/15/99 and the NJDEP concluded that it was acceptable to discontinue the sampling of the domestic wells as long as hydraulic control of the plume was accomplished within a reasonable timeframe. Offsite GW RI submitted 2/2000. The NJDEP letter dated May 17, 2000 providing comments on the Revised RAW dated 3/27/2000 approves Pump and treat as the remedial technique to eliminate TCE to Crab Brook. NJDEP letter dated 6/24/98 required a biennial certification for the CEA including a new well search, vertical delineation of TCE detected in MW-549A and B. RIR Addendum submitted June 2004. Biennial CEA cert including revised CEA fact sheet submitted 3/2008 since Interim CEA expired 12/07. RAPRs submitted in 2005, 2006, 2007 and yearly from 2009 through 2013. NJDEP RPS letter dated 5/16/12. Biennial CEA cert, submitted [illegible]

181					
182					
183					
184					
185				**Well Construction:**	
186				10" diameter steel casing set to top of bedrock in place to 54'bgs.	
187				6" diameter steel casing set to 64'bgs.	
188				The annulus between the borehole and the 6" casing was tremie grouted from the bottom to near ground surface and allowed to cure a minimum of 12 hours to secure the casing in the borehole.	
189				10 feet of 2-inch diameter (0.020-inch slot) SCH 40 PVC screen set at 170-180 ft bgs.	
190				2-inch diameter SCH 40 PVC riser set from 170 ft bgs (top of screen) to ground surface.	
191				The annulus between the borehole and the 2-inch screen was filter packed with No. 2 silica sand from the bottom of the screen to approximately 2 feet above the top of screen (168'-180'bgs),	
192				followed by approximately 2 feet of No. 00 silica sand (166'-168' bgs).	
193				The remaining annulur space was tremie grouted with cement-bentonite grout from the top of the No 00 sand to ground surface (0-166'bgs).	
194				Well completed at ground surface with a flush mount steel protective casing and an expandable	
195				innercap and lock.

512				**Well Construction:** 10" diameter steel casing set in place to 57'bgs.	
513				6" diameter steel casing set to 67'bgs.	
514				The annulus between the borehole and the 6" casing was tremie grouted from the bottom to near ground surface and allowed to cure a minimum of 12 hours to secure the casing in the borehole.	
515				Cement-bentonite grout placed via tremie from bottom of borehole from 365'-505" ft bgs. in 100' lifts.	
516				Bentonite Plug placed in annular space of the borehole from 356'-365' bgs.	
517				No. 2 Silica Sand placed in annular space of the borehole from 350'-356' bgs.	
518				15 feet of 2-inch diameter (0.020-inch slot) SCH 40 PVC screen set at 335-350' ft bgs.	
519				2-inch diameter SCH 40 PVC riser set from 335ft bgs (top of screen) to ground surface.	
520				The annulus between the boreholde and the 2-inch screen was filter packed with No. 2 silica sand	
521				from the botom of the screen to approximately 2 feet above the top of screen (333'-350' bgs), followed by approximately 2 feet of No. 00 silica sand (331'-333' bgs).	
522				The remaining annulur space between the monitoring well and the borehole was tremie grouted with	
523				cement-bentonite grout from the top of the No 00 sand to ground surface in approximate 100 foot lifts to minimize potential for melting the PVC riser as the grout cured.	
524				Well completed at ground surface with a flush mount steel protective casing and an expandable	
525				inner cap and lock.

Monitoring Well Certification Form B - Location Certification

Date Stamp
(For Department use only)

SECTION A. SITE NAME AND LOCATION

Site Name: Former Lockheed Electronics Company, Inc.

List all AKAs: Lockheed Electronics Company, Lockheed Electronics Co Inc.

Street Address: 1501 Route 22 West

Municipality: North Plainfield, New Jersey (Township, Borough or City) Watchung

County: Somerset County Zip Code: 07060-1821

Program Interest (PI) Number(s): 004334 Case Tracking Number(s): 90038

SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner: Lockheed Martin Corporation
2. Well Location (Street Address): North Plainfield Borough, Highway 22
3. Well Location (Municipal Block and Lot) Block# 6.02 Lot # 5

SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): 25-43364
2. Site Well Number (As shown on application or plans): MW-501S
3. Geographic Coordinate NAD 83 to nearest 1/10 of a second:
   Longitude: West 74 25' 31.01" Latitude: North 40 38'08.69"
4. New Jersey State Plane Coordinates NAD 83 to nearest 10 feet:
   North 656,507.3150' East 512,861.1930'
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 120.474'
6. Source of elevation datum (benchmark, number/description and elevation/datum. If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation.)

KeyNetGPS-Horizontal:NAD 1983(2011 latest adjustment) & Vertical:NAVD 1988

7. Significant observations and notes:

SECTION D. LAND SURVEYOR'S CERTIFICATION

SEAL

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

Monitoring Well Certification Form B - Location Certification

Date Stamp
(For Department use only)

SECTION A. SITE NAME AND LOCATION

Site Name: Former Lockheed Electronics Company, Inc.

List all AKAs: Lockheed Electronics Company, Lockheed Electronics Co Inc.

Street Address: 1501 Route 22 West

Municipality: North Plainfield, New Jersey (Township, Borough or City) Watchung

County: Somerset County Zip Code: 07060-1821

Program Interest (PI) Number(s): 004334 Case Tracking Number(s): 90038

SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner: Lockheed Martin Corporation
2. Well Location (Street Address): North Plainfield Borough, Corbett Place ROW
3. Well Location (Municipal Block and Lot) Block# N/A Lot # N/A

SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): 25-43520
2. Site Well Number (As shown on application or plans): MW-504S
3. Geographic Coordinate NAD 83 to nearest 1/10 of a second:
   Longitude: West 74 25' 33.01" Latitude: North 40 38'02.66"
4. New Jersey State Plane Coordinates NAD 83 to nearest 10 feet:
   North 655,897.0850' East 512,707.8030'
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 110.645'
6. Source of elevation datum (benchmark, number/description and elevation/datum. If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation.)

KeyNetGPS-Horizontal:NAD 1983(2011 latest adjustment) & Vertical:NAVD 1988

7. Significant observations and notes:

SECTION D. LAND SURVEYOR'S CERTIFICATION

SEAL

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

Monitoring Well Certification Form B - Location Certification

Date Stamp
(For Department use only)

SECTION A. SITE NAME AND LOCATION

Site Name: Former Lockheed Electronics Company, Inc.

List all AKAs: Lockheed Electronics Company, Lockheed Electronics Co Inc.

Street Address: 1501 Route 22 West

Municipality: North Plainfield, New Jersey (Township, Borough or City) Watchung

County: Somerset County Zip Code: 07060-1821

Program Interest (PI) Number(s): 004334 Case Tracking Number(s): 90038

SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner: Lockheed Martin Corporation
2. Well Location (Street Address): Watchung Borough, 1511 Route 22 West
3. Well Location (Municipal Block and Lot) Block# 57.03 Lot # 2.01

SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): 25-47890
2. Site Well Number (As shown on application or plans): MW-531I
3. Geographic Coordinate NAD 83 to nearest 1/10 of a second:
   Longitude: West 74 25' 04.17" Latitude: North 40 38'29.66"
4. New Jersey State Plane Coordinates NAD 83 to nearest 10 feet:
   North 658,631.7340' East 514,927.9060'
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 137.036'
6. Source of elevation datum (benchmark, number/description and elevation/datum. If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation.)

KeyNetGPS-Horizontal:NAD 1983(2011 latest adjustment) & Vertical:NAVD 1988

7. Significant observations and notes:

SECTION D. LAND SURVEYOR'S CERTIFICATION

SEAL

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

Monitoring Well Certification Form B - Location Certification

Date Stamp
(For Department use only)

SECTION A. SITE NAME AND LOCATION

Site Name: Former Lockheed Electronics Company, Inc.

List all AKAs: Lockheed Electronics Company, Lockheed Electronics Co Inc.

Street Address: 1501 Route 22 West

Municipality: North Plainfield, New Jersey (Township, Borough or City) Watchung

County: Somerset County Zip Code: 07060-1821

Program Interest (PI) Number(s): 004334 Case Tracking Number(s): 90038

SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner: Lockheed Martin Corporation
2. Well Location (Street Address): North Plainfield Borough, Windsor Street ROW
3. Well Location (Municipal Block and Lot) Block# N/A Lot # N/A

SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): 25-55003
2. Site Well Number (As shown on application or plans): MW-546D
3. Geographic Coordinate NAD 83 to nearest 1/10 of a second:
   Longitude: West 74 26' 07.99" Latitude: North 40 37'47.02"
4. New Jersey State Plane Coordinates NAD 83 to nearest 10 feet:
   North 654,311.9180' East 510,011.8710'
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 105.384'
6. Source of elevation datum (benchmark, number/description and elevation/datum. If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation.)

KeyNetGPS-Horizontal:NAD 1983(2011 latest adjustment) & Vertical:NAVD 1988

7. Significant observations and notes:

SECTION D. LAND SURVEYOR'S CERTIFICATION

SEAL

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

Monitoring Well Certification Form B - Location Certification

Date Stamp
(For Department use only)

SECTION A. SITE NAME AND LOCATION

Site Name: Former Lockheed Electronics Company, Inc.

List all AKAs: Lockheed Electronics Company, Lockheed Electronics Co Inc.

Street Address: 1501 Route 22 West

Municipality: North Plainfield, New Jersey (Township, Borough or City) Watchung

County: Somerset County Zip Code: 07060-1821

Program Interest (PI) Number(s): 004334 Case Tracking Number(s): 90038

SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner: Lockheed Martin Corporation
2. Well Location (Street Address): North Plainfield Borough, Intersection Coddington Ave. and Somerset St.
3. Well Location (Municipal Block and Lot) Block# 74 Lot # 9

SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): 25-45019
2. Site Well Number (As shown on application or plans): PZ-522I
3. Geographic Coordinate NAD 83 to nearest 1/10 of a second:
   Longitude: West 74 26' 09.54" Latitude: North 40 37'34.45"
4. New Jersey State Plane Coordinates NAD 83 to nearest 10 feet:
   North 653,040.6030' East 509,893.7160'
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 92.565'
6. Source of elevation datum (benchmark, number/description and elevation/datum. If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation.)

KeyNetGPS-Horizontal:NAD 1983(2011 latest adjustment) & Vertical:NAVD 1988

SECTION D. LAND SURVEYOR'S CERTIFICATION

SEAL

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

Professional Land Surveyor's Signature: Howard C. Lopshire, PLS Date 1-16-2014

Surveyor's Name: Howard C. Lopshire License Number: 24GS02680300

Mailing Address 105 Raider Boulevard Suite 206

City/Town: Hillsborough State New Jersey Zip Code: 08844

Phone Number 908-874-7500 Ext.: 223 Fax: 908-874-5762

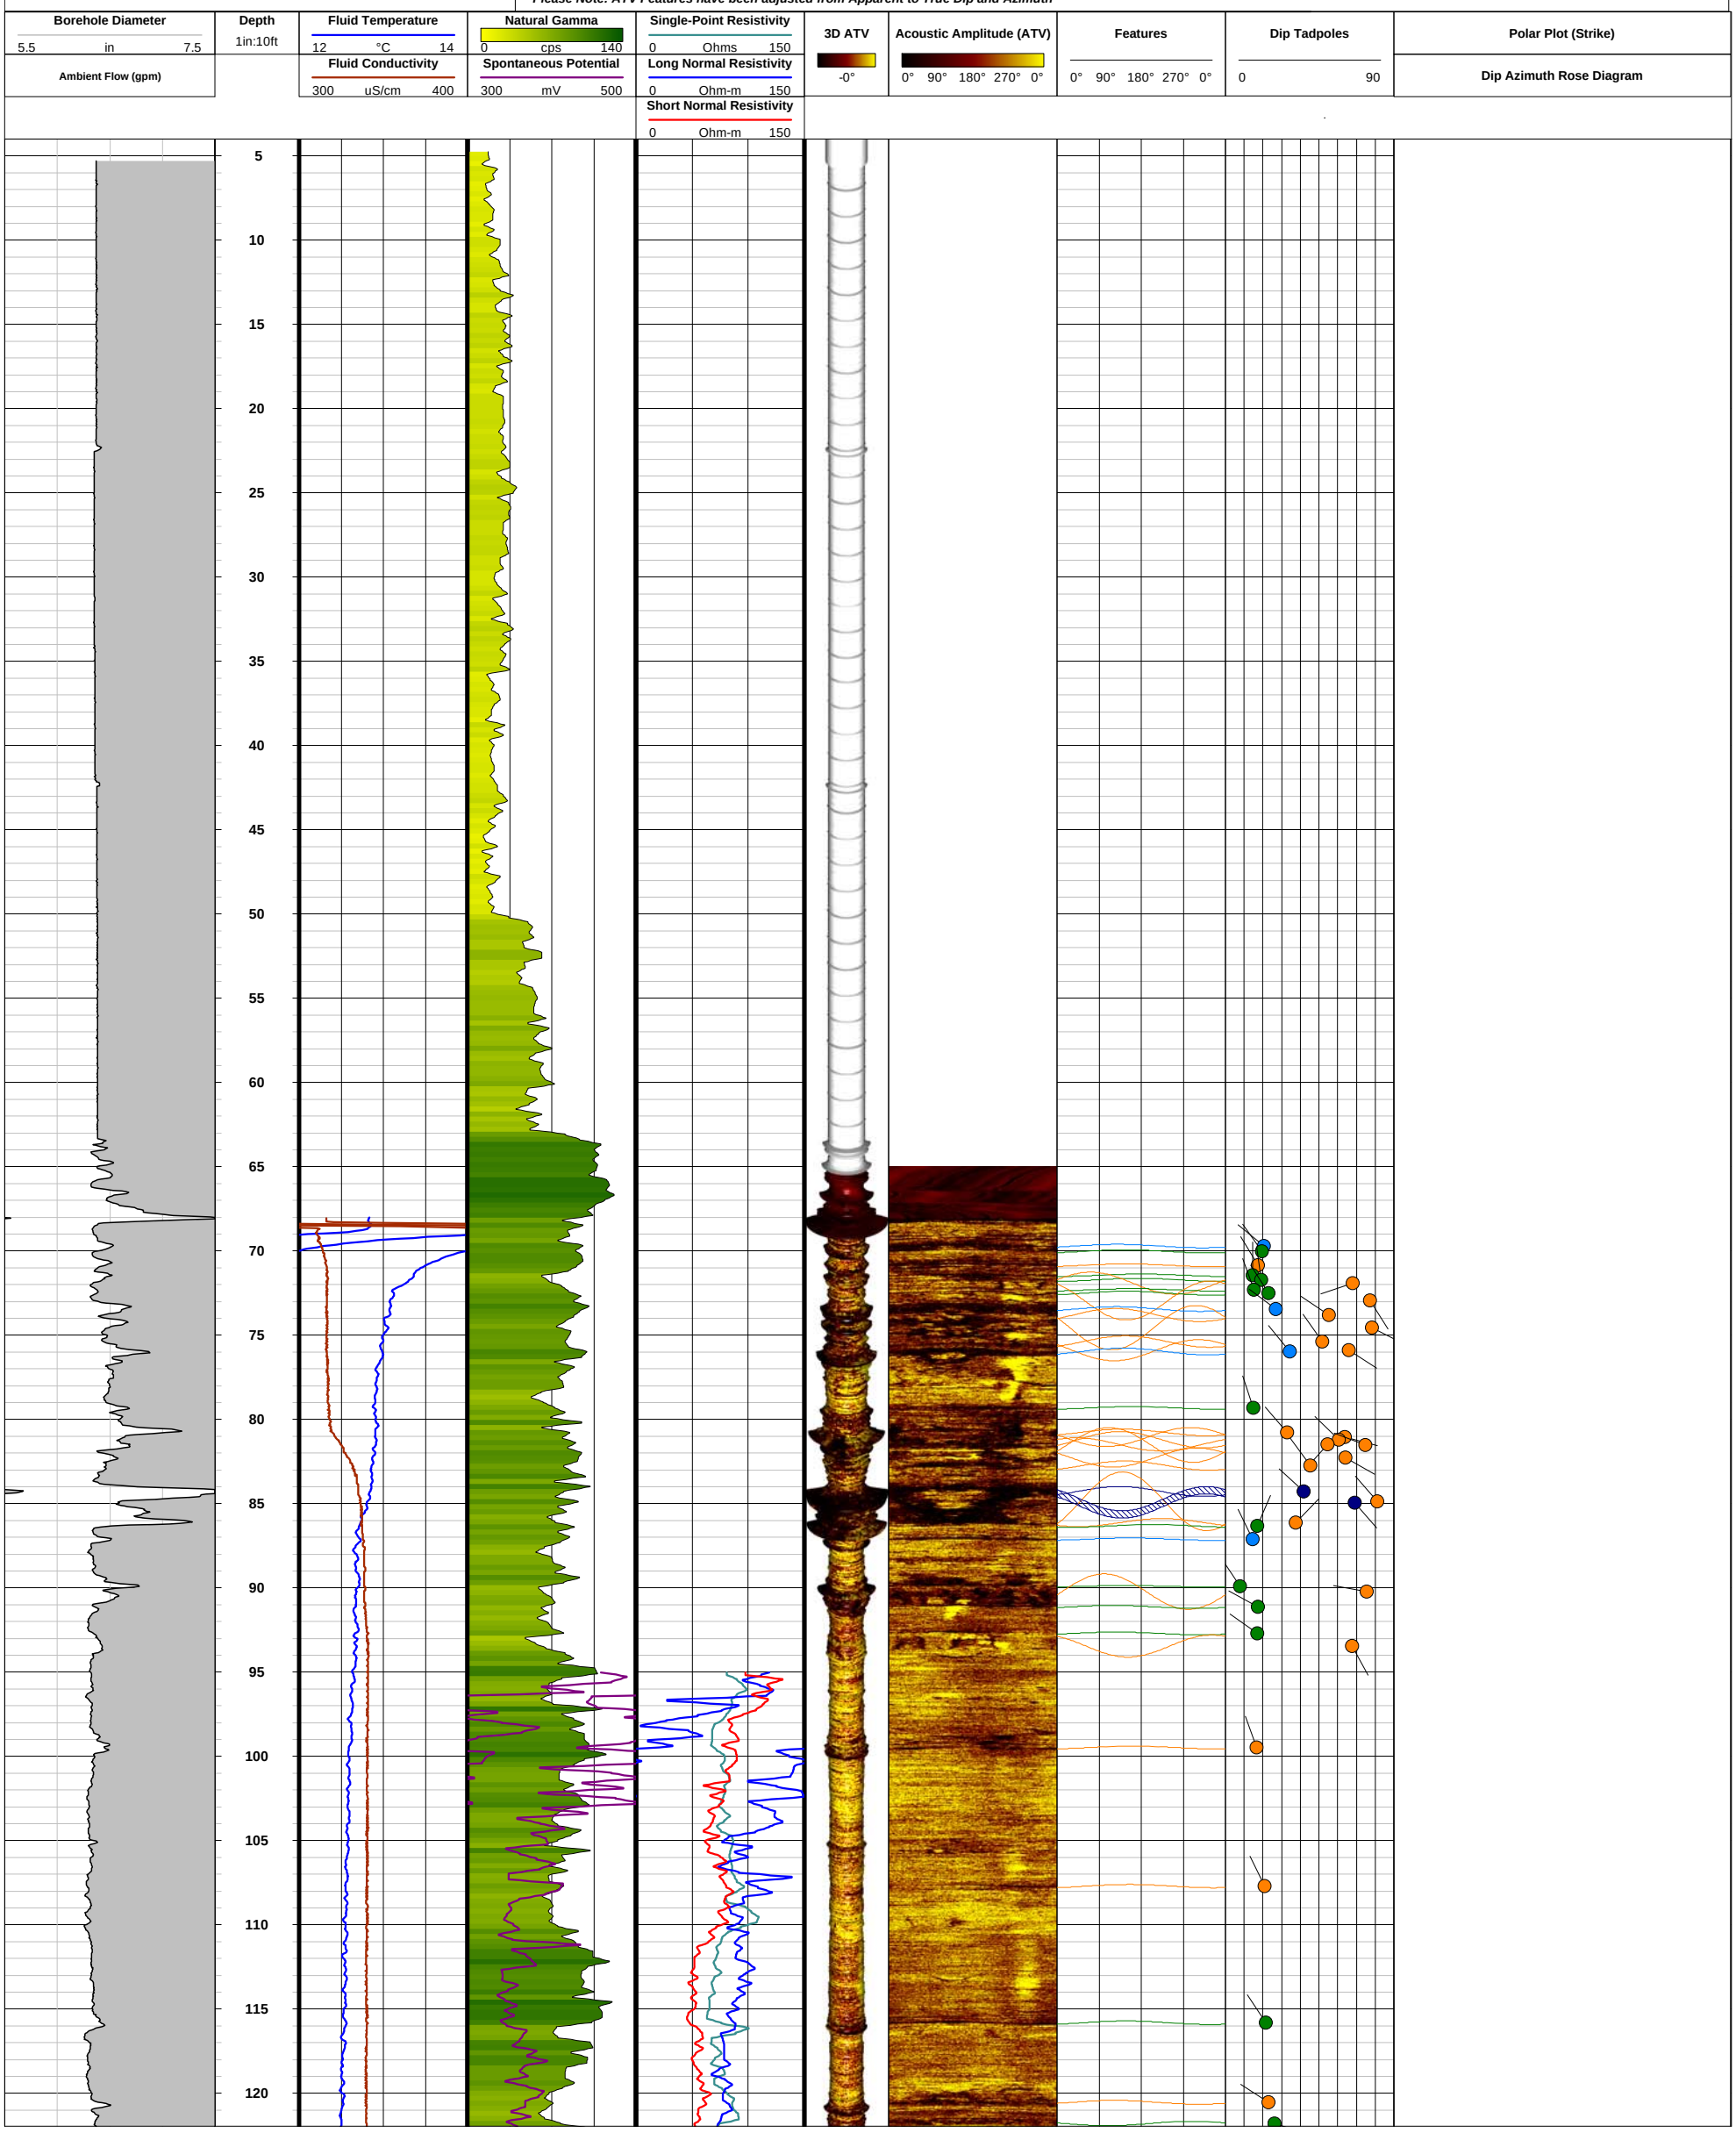
APPENDIX C — BOREHOLE GEOPHYSICAL LOGS AND PACKER TEST GRAPHS



Earth Data Northeast, Inc.

Client: **Tetra Tech**
Location: **LMCO - North Plainfield, NJ**
Well Name: **MW-1i**
Date: **9-24-2013**
Depth Reference: **Ground Surface**
Magnetic Declination: **-12.81**
North reference: **True**

Borehole Diameter: **6" Nominal**
Static Water Level: **69'**
Casing Depth: **64'**
Total Depth: **290'**

Fracture/Feature
Hairline Fracture/Feature
Discontinuous Fracture/Feature
Discontinuous Hairline Fracture/Feature
Bedding/Change in Lithology

Please Note: ATV Features have been adjusted from Apparent to True Dip and Azimuth

Borehole Diameter 5.5 in 7.5

Ambient Flow (gpm)

Depth 1in:10ft

Fluid Temperature 12 °C 14

Fluid Conductivity 300 uS/cm 400

Natural Gamma 0 cps 140

Spontaneous Potential 300 mV 500

Single-Point Resistivity 0 Ohms 150

Long Normal Resistivity 0 Ohm-m 150

Short Normal Resistivity 0 Ohm-m 150

1.0 INTRODUCTION

Tetra Tech Inc. (Tetra Tech) performed three-dimensional groundwater flow and solute transport modeling of groundwater flow and dissolved contaminant transport in the bedrock aquifer at the former Lockheed Electronics Company (LEC) site (hereinafter the "Site") in the Boroughs of Watchung and North Plainfield, Somerset County, New Jersey (Figure 1-1). The report is organized as follows:

- The modeling objectives and the conceptual model for groundwater flow and trichloroethene (TCE) transport at the Site are discussed in Sections 1 and 2.
- The numerical flow model construction based on the conceptual site model is presented in Section 3.
- The flow calibration criteria, the calibration procedure, and the results of the calibration of the numerical groundwater flow model to observed water level data collected at the Site are described in Section 4.
- Based on relevant transport mechanisms discussed in the conceptual site model, the transport modeling approach and construction of the solute transport model are presented in Section 5.
- The modeling analysis results and conclusions are summarized in Section 6.

1.1 SITE INFORMATION AND BACKGROUND

The Site is located on United States (U.S.) Route 22 West in the Boroughs of Watchung and North Plainfield, Somerset County, New Jersey (Figure 1-1). The Site is bordered to the south by U.S. Route 22, which is a predominately commercial area with residential properties located on side streets and mapped wetlands in drainage areas. The Site is bordered to the west by an apartment complex (formerly Crystal Ridge Club, presently Avalon Watchung) and a

condominium complex (Regency Village Condominiums). Forested areas and residences border the Site to the north, and commercial properties border the Site to the east.

The Site elevation ranges from 140 to 320 feet above mean sea level (msl), sloping to the south from higher elevations on the First Watchung Mountain, located northwest of the Site, to lower elevations along U.S. Route 22, located southeast of the Site. The closest surface water body is Crab Brook located south of the Site and U.S. Route 22. Wetlands areas have been mapped by the New Jersey Department of Environmental Protection (NJDEP) within one mile of the Site at locations immediately to the north of the Site, and south of the Site along U.S. Route 22.

Early investigation activities identified a TCE groundwater plume emanating from the Site. An extensive monitoring well network has been installed to delineate and monitor the TCE concentrations (Figure 2-1). There are currently 50 active monitoring wells and piezometers associated with this project in the Boroughs of Watchung and North Plainfield, all of which were installed as either well couplets or triplets to evaluate the horizontal and vertical distribution of volatile organic compounds (VOCs), primarily TCE. To remediate the groundwater plume and intercept groundwater base flow to Crab Brook, a recovery well (RW-1) was installed and a groundwater extraction system (GWES) was constructed. Pumping at a rate of approximately 120 gallons per minute (gpm), well RW-1 and the GWES were operated from July 2003 to May 2011. As a result of mass removal by pump-and-treat and natural attenuation, TCE concentrations have reduced significantly over time. Monitored Natural Attenuation (MNA) is currently being applied to monitor the continued reduction of residual TCE mass in groundwater over time at the Site. Groundwater monitoring activities are ongoing in accordance with the monitoring schedule provided in the NJDEP-approved Groundwater Remedial Action Permit (dated June 26, 2014).

1.2 MODELING OBJECTIVES

The primary objectives of this modeling effort were to: (1) improve understanding of the fate and transport of dissolved TCE in Site groundwater; (2) estimate the lateral delineation of the dissolved TCE plume; (3) examine the simulated future TCE plume extent and the ability of the monitoring network to monitor plume reduction over time; and, (4) estimate the cleanup timeframe of TCE concentrations in groundwater as part of a MNA remedy at the Site.

To accomplish these goals, Tetra Tech conducted the following activities: (1) constructed a numerical groundwater flow model and calibrated the model to observed water level measurements during both non-pumping and pumping conditions; and, (2) implemented a solute-transport model to provide fate and transport simulations of TCE concentrations over time in the study area.

2.0 CONCEPTUAL MODEL

The conceptual model of a hydrogeologic system is a working description of the system's characteristics and dynamics. It consolidates site and regional hydrologic data into a set of assumptions and concepts that can be quantitatively evaluated (American Society of Testing and Materials [ASTM] Standard D5979-96). The conceptual model is translated into a numerical representation to simulate groundwater flow characteristics. It includes simulation-based development and testing, which is useful for evaluating the effectiveness of MNA site remedies over time.

2.1 GEOLOGY

Based on previous investigations, the overburden at the Site is generally composed of granular fill associated with the remediation area of former LEC Building #3, a sandy outwash deposit, and a thin layer of glacial till. In the vicinity of the Site, the thickness of the overburden decreases towards the south-southwest but increases south of Crab Brook. The overburden is thinnest near well cluster MW-546 (3 feet) and generally increases in thickness south of U.S. Route 22, with the greatest thickness of 47 feet observed at the former location of well cluster MW-542 (this destroyed well cluster was located near the intersection of Park Place and Somerset Street; see Figure 2-1).

The overburden deposits are underlain by the Passaic Formation, which is a reddish-brown siltstone of Jurassic age (Figure 2-2). The upper surface of the bedrock is generally weathered and soft, and becomes more competent with depth. Bedrock surface topography generally slopes to the southeast perpendicular to the First Watchung Mountain. The highest bedrock elevation is approximately 171 feet above msl at well MW-3D and the lowest is approximately 45 feet above msl at well cluster MW-545.

2.2 HYDROGEOLOGY

Groundwater at the Site occurs within the bedrock, and locally within the overburden. As presented in previous reports, groundwater beneath the Site has been conceptually divided into three vertical zones to facilitate hydrogeologic analysis:

- Shallow zone – overburden and shallow bedrock groundwater from the groundwater table to approximately 50 feet above msl;
- Intermediate zone – bedrock groundwater from approximately 50 feet above msl to approximately 50 feet below msl; and,
- Deep zone – bedrock groundwater below 50 feet below msl.

The migration of dissolved VOCs within the bedrock is influenced by both bedrock structure and local groundwater discharge areas, particularly Crab Brook (Figures 2-3 through 2-5). Potentiometric surface maps of the shallow, intermediate, and deep zones of the bedrock aquifer are shown in Figures 2-6 through 2-8. As shown on the figures, the groundwater in the bedrock enters the Site from upgradient to the northeast, moves across the Site to the southwest (roughly parallel to the bedding strike direction of regional bedrock), and then trends in a more southerly direction toward Crab Brook. At monitoring well cluster MW-549 (located at the Site), the depth to groundwater is approximately 55 feet below ground surface (bgs). At monitoring well cluster MW-550 (located near the Regency Village both topographically and hydrogeologically downgradient of the Site), the depth to groundwater is approximately 20 feet bgs. While no monitoring wells are present at Avalon Watchung, the depth to groundwater beneath the apartment complex is expected to be between 20 and 55 feet bgs. Based on the September 2014 groundwater elevation data, the average horizontal hydraulic gradient in the shallow zone across the Site is approximately 0.010 feet per foot (ft/ft), steepening slightly downgradient and southwest of the Site to approximately 0.018 ft/ft. Based on water level measurements at the well clusters, the vertical hydraulic gradient is generally downward across the Site, with some upward gradients in well clusters located immediately south of Crab Brook (MW-504 and MW-505) and in well clusters located southwest of the Site near Stony Brook (PZ-524 and MW-545).

2.3 TCE DISTRIBUTION IN GROUNDWATER

The results of previous investigations at the site indicate that TCE is the primary chemical of concern (COC) in groundwater. A vertical cross section of TCE concentrations in the direction of groundwater flow along the plume centerline is presented in Figure 2-2. The distribution of TCE in the shallow, intermediate, and deep zones at the Site based on the March 2014 groundwater sampling data is shown in Figures 2-3 through 2-5. TCE concentrations are highest in the intermediate zone at MW-549I (330 micrograms per liter [µg/L]), which is located near the former source area, with decreasing concentrations further downgradient. As discussed in the 2013 Remedial Action Progress Report (RAPR; Tetra Tech, 2014), time series plots indicate that TCE concentrations in groundwater beneath the Site have decreased significantly over time.

2.4 TCE FATE AND TRANSPORT MECHANISMS

Physical and chemical processes that may affect the fate and transport of dissolved TCE in study area groundwater include advection, hydrodynamic dispersion, molecular diffusion, adsorption, and degradation. These processes change the mass and distribution of dissolved constituents in groundwater, as described below:

- Advection is the migration of dissolved COC in moving groundwater. Advection is typically the dominant factor in transporting dissolved COC. Changes in the groundwater flow patterns over time can also impart "advective dispersion," because contaminant plumes can appear to have dispersed laterally and/or vertically, although the dominant factor was actually a significant change in flow direction.

- Hydrodynamic dispersion is a physical process whereby dissolved constituents spread at the pore-scale level, leading to larger-scale macroscopic spreading, both horizontally and vertically away from the center of the plume mass. As noted above, "advective dispersion" is often the dominant dispersive phenomenon at larger scales.

- Molecular diffusion is a physical process whereby molecules move from an area of higher concentration to an area of lower concentration, and the rate of diffusion is typically dwarfed by advective and dispersive forces. However, molecular diffusion is

often a significant factor in the transfer of COC mass between the bedrock matrix and more heavily fractured zones. Molecular diffusion is also important in low-permeability geologic formations with very slow advective movement, and correspondingly slow dispersive forces.

- Adsorption is a chemical process whereby dissolved chemicals react with the surfaces of solids. Several laboratory studies have shown that the mass of organic constituents adsorbed to soils is proportional to the amount of organic carbon in the soils. Field studies indicate that adsorption is the primary reason organic-compound plumes migrate at a slower rate than groundwater; a retardation factor was therefore applied to the model to account for the reduced migration rate. Given that plume transport is primarily within the weathered bedrock and fractures, adsorption to organic carbon is not expected to be an important transport process at this Site.

- Degradation processes are biological and chemical processes that decrease the mass of dissolved constituents. These processes include the effects of biodegradation, photolysis, oxidation-reduction, and hydrolysis. They are generally grouped into either biologic or abiotic (chemical) degradation processes. In aerobic zones, TCE can be degraded both abiotically and by biodegradation through cometabolism. In anaerobic zones, sequential degradation includes transformation of parent compounds (e.g., TCE) into its degradation products (cis-1,2-dichloroethene [cis-1,2-DCE], vinyl chloride [VC], and ethene). The historical detections of cis-1,2-DCE and VC indicate that some anaerobic degradation has occurred. The low concentrations of cis-1,2-DCE and VC at the site indicates that these chemicals are degraded relatively rapidly or that TCE is degraded primarily through abiotic and/or cometabolic degradation mechanisms at the Site.

3.0 NUMERICAL FLOW MODEL

Developing a numerical groundwater flow model entails transforming the conceptual model into a mathematical form. Fundamental components of the numerical groundwater flow modeling process conducted before model calibration include selection of an appropriate mathematical-solution basis, or code, development of a three-dimensional model grid, assignment of representative initial and boundary conditions for calibration and predictive-simulation purposes, and characterization of hydraulic properties (ASTM Standard D5979-96).

3.1 CODE SELECTION

The groundwater flow model was developed using MODFLOW 2000, a well-documented, widely used and accepted code developed by the U.S. Geological Survey (USGS) (McDonald and Harbaugh, 1988; Harbaugh et al., 2000).

3.2 MODEL GRID AND LAYERING

Tetra Tech specified the boundaries of the model grid to coincide with natural hydrogeologic boundaries, if possible, and at sufficient distance from the Site to minimize the influence of the model boundaries on the simulation results. The domain for this model is shown in Figure 3-1. The model domain is subdivided into a finite difference grid of 437 columns and 369 rows covering 77,000 feet (approximately 14.58 miles) by 56,000 feet (approximately 10.61 miles), respectively. The grid has its origin (southwestern corner) at 480000 E, 627000 N, NAD 1983 coordinate system. The model grid spacing varies from 50 feet in the area of interest to 609 feet at the outer regions of the model domain. The model boundary conditions are shown in Figure 3-1.

The site-specific model uses 10 layers to represent the groundwater system beneath the Site as shown in Figure 3-2. The base of the model is a no-flow boundary. The top and bottom elevations of each model layer are defined based both on regional trends of the geologic units and site-specific boring logs. The model layering information and hydraulic properties are summarized in Table 3-1.

3.3 BOUNDARY CONDITIONS

The model boundary conditions were defined in accordance with guidelines in ASTM D5609-94 and were chosen to represent hydrogeologic features in the model domain. Boundary conditions simulated in Layer 1 include net recharge, river leakage, general head boundary, and zero flux (no flow), as shown in Figure 3-1. The primary source of water into/from the model is from precipitation-derived recharge and evapotranspiration. The principal surface water drainages (including Crab Brook, Green Brook, Stony Brook, and Robinson Branch) are simulated using river-boundary-conditions cells. River cell conductance was calculated as the product of the length and width of the river reach in each river cell, multiplied by the hydraulic conductivity of the river bed and divided by the thickness of the river bed. The length of the river bed is generally the length of the grid cell because the river crosses the entire cell. The thickness of the river bed was assumed to be 1 foot. The hydraulic conductivity of the river bed was assigned 1 foot/day initially, and the values are adjusted during the calibration process to obtain values that are consistent with observed hydraulic heads. Passaic River, Bound Brook, Rahway River, and Raritan River are simulated as general head boundaries. The heads at the general head boundaries are estimated based on the surface water level data from USGS water data for New Jersey. The lateral edges of the model grid were placed sufficiently far from the remediation site so that any groundwater pumping or injection would not affect groundwater conditions at the edges of the grid. Recharge and river boundaries are only applied to Layer 1. The general head boundary and no-flow boundary specifications in model Layers 2 -10 are the same as for model Layer 1. Also, the bottom of Layer 10 is a no-flow boundary to represent the lower permeability of the more competent bedrock in this zone.

3.4 HYDRAULIC PROPERTIES

For groundwater flow modeling, the hydraulic properties to be specified include horizontal and vertical hydraulic conductivity, and storage coefficients (including specific yield for simulation of water table [unconfined] conditions and specific storativity for simulating confined situations). In steady-state simulations, changes in storage are not simulated, and thus the storage coefficients are needed only in transient simulations. Various sources of site information guided the characterization of hydraulic properties. These include geologic logs, packer testing, and a 48-hour pumping test at the Site.

Initial values of hydraulic conductivity in the model were assigned primarily based on estimated hydraulic conductivity values from the RW-1 48-hour pump test (TRC, 2004). Hydraulic testing results from controlled constant rate pumping tests help to improve modeling accuracy by stressing the aquifer over a relatively wide area. The 48-hour pump test results provide the basis for estimating local values of horizontal and vertical hydraulic conductivities and storage coefficients. The initial values in the model were modified as appropriate during model calibration to match the hydraulic responses in the shallow, intermediate, and deep zones of the bedrock aquifer. The calibrated values are summarized in Table 3-1.

4.0 NUMERICAL FLOW AND TRANSPORT MODEL

4.1 FLOW MODEL

Calibration of a groundwater flow model refers to the process of adjusting model parameters to obtain a reasonable match between observed and simulated water levels. In general, model calibration is an iterative procedure that involves variation of hydraulic properties or boundary conditions to achieve the best match between observed and simulated water levels. During model calibration, the constant rate pump test data were used as the primary constraints for the calibrated values of hydraulic conductivity, based on the greater reliability of these data.

For the Site, the flow model calibration consisted of simulating approximate, steady-state conditions in the shallow, intermediate, and deep zones of the bedrock aquifer, based on water level measurements collected in March 2014. In addition, the model was applied to match transient drawdown responses during a 48-hour pumping test performed in the bedrock aquifer. The quality of the steady state calibration was assessed and quantified through statistical analysis of residuals (ASTM Standard D5981-96; Anderson and Woessner, 1992), which are the differences between the measured and simulated water levels on a well-by-well basis. The flow calibration criteria were based on the following statistical measures:

- A mean residual value near zero
- An absolute mean residual less than or equal to 10% of the observed range in water level elevations
- A standard deviation less than or equal to 20% of the observed range in water level elevations
- A random spatial distribution of the positive and negative residuals

To assist in the assessment of calibration criteria, a plot of observed versus predicted water levels was used to examine the spread of points around the ideal line of a perfect calibration.

Calibration of a groundwater flow model to a single set of field measurements (assumed to represent steady-state conditions) does not provide the foundation for obtaining a unique solution. To reduce the problem of "non-uniqueness," the model should be tested against a different set of boundary conditions or stresses, labeled "verification" (ASTM Standard D5979-96). In particular, non-uniqueness can be reduced through calibration to transient responses caused by measured groundwater flows (typically, extraction well pumping). Therefore, the groundwater flow model calibration focused on simulation of groundwater flow during the RW-1 constant-rate pump test in the bedrock aquifer.

The objective of the transient calibration was to examine the model's ability to match both observed pumping test responses over time and final drawdowns after 48 hours. Responses observed in well clusters help estimate both vertical and horizontal hydraulic conductivity values in the bedrock aquifer. This simulation has the dual advantage of verification through matching to a second hydrologic condition, while also testing the model's ability to simulate the aquifer system's transient hydraulic response to carefully measured pumping stresses, thereby helping to reduce non-uniqueness.

Calibration was conducted in sequence from initial steady-state calibration testing and adjustments for an improved match, followed by transient simulations for local area adjustments and model-domain-wide adjustments, and then re-simulation of steady-state conditions for final fine-tuning and consistency checking. In some cases, the transient and steady-state sequence of simulations was re-run to ensure full consistency and sufficient accuracy. Although the steady-state simulations are described in this report before the reporting of the transient calibration efforts, calibration was iterative between the different types of runs.

4.1.1 Steady State Flow

The March 2014 water level data set was chosen for use as model calibration targets. In calibrating the model, hydraulic conductivities of the bedrock were modified within reasonable ranges to match the observed water level data. In addition, the net recharge rate was also

adjusted during model calibration. The final distribution of hydraulic conductivity by model layer is presented in Table 3-1. Calibrated net recharge rate was estimated at 3.7 inches per year (in/yr).

Simulated and observed March 2014 groundwater levels in all 50 wells with water level measurements are presented in Table 4-1. A statistical summary of the model residuals (i.e., simulated minus observed head) for the 50 water level targets is presented in Table 4-2. The mean residual (-0.97 feet) is relatively low and near zero, indicating that positive and negative residuals cancel out with limited bias in the simulated hydraulic heads. In addition, the absolute mean residual is 2.45 feet, which is less than one tenth of the difference between the minimum and maximum water level targets (70.35 feet). An examination of the residual statistics indicates that the flow model calibration criteria were met.

Measured and simulated water levels are plotted relative to one another in Figure 4-1. The linear trend in this plot, the limited spread around the ideal best-fit line, and the favorable residual statistics indicate that the model accurately represents the Site water levels. In addition, the residuals are relatively low in each zone, and their statistical measures are below the calibration criteria. The simulated hydraulic heads for the shallow, intermediate, and deep zones of the bedrock aquifer are presented in Figures 4-2 through 4-4, respectively. The agreement of the flow model with the observed prevailing groundwater flow directions, based on field data, provides additional evidence of a high quality flow model calibration.

4.1.2 Simulation of the Pumping Test

As noted in Section 1, to remediate the groundwater plume and intercept groundwater base flow to Crab Brook, recovery well RW-1 was installed to a total depth of 150 feet bgs and the GWES was constructed. Recovery well RW-1 was installed in June 2000 on North Drive in North Plainfield. A 48-hour constant discharge pumping test was subsequently conducted using a pumping rate of 120 gpm.

For the transient pumping test simulation using MODFLOW, a geometric time-step spacing approach was applied for the 48-hour test period. This approach uses initial smaller time-step sizes to accurately simulate the larger hydraulic head changes early in the pumping test, and later

uses larger time-step sizes when hydraulic head changes are smaller. For this transient simulation, the pumping stress period was subdivided into 62 flow time-steps based on an initial time-step size of 0.43 seconds and a geometric time-step size multiplier of 1.2. The use of the small time-step sizes provided a stable, efficient, and accurate solution. Additional refinements were made to the hydraulic conductivity values for the shallow and intermediate zones to improve the match with the pumping test drawdown data.

The simulated drawdown in the shallow, intermediate, and deep zones of the bedrock aquifer at the end of the pumping test are presented in Figures 4-5 through 4-7. The observed elliptical shape of the zone of influence is consistent with both the regional strike of the bedrock fractures and the anisotropic trend observed in the drawdown data. In Table 4-3, the simulated drawdowns are compared to the observed drawdowns measured at the wells monitored during the 48-hour pumping test. The close match of simulated and observed drawdown indicates that a high quality match was achieved, providing increased confidence in the predictive capability of the model to simulate plume advection at the field scale.

4.1.3 Sensitivity Analysis

A sensitivity analysis was performed to evaluate how changes in selected model parameters affect the model. During the sensitivity analysis, one parameter at a time was varied while all other parameters were held constant. The tested model parameters were varied by 50% of the calibrated values. Results of the sensitivity analysis are shown in Table 4-4. These results were analyzed to identify the parameters that cause the greatest sensitivity when changed, and to confirm that final calibrated values fall within the range of expected values according to the ranges set during conceptual model formulation.

The results indicate that the model is most sensitive to changes in recharge rate and horizontal hydraulic conductivity values in the shallow zone of the bedrock aquifer. This is expected, because recharge is the source of all groundwater flow in the model. In addition, local groundwater flow is primarily horizontal, and horizontal hydraulic conductivity is the primary property that accurately simulates the flow field. Calibrated values for these parameters are consistent with values in the study area, as identified during the conceptual model formulation stage. In addition, no significant improvement in model calibration would be achieved by

adjusting these parameters. Thus, changes to the model are not warranted, and the model was accepted for predictive use, according to the objectives set forth at the beginning of the modeling process and the model-calibration criteria established during numerical model development.

4.2 SOLUTE-TRANSPORT MODEL

Contaminant mass fate and transport modeling was conducted using the finite difference code, MT3DMS (Zheng and Wang, 1999). MT3DMS interfaces directly with the U.S. Geological Survey finite-difference groundwater flow model MODFLOW for the head solution, and supports all the hydrologic and discretization features of MODFLOW. For the simulations presented in this report, the total-variation-diminishing (TVD) solution method is used to simulate solute transport.

4.2.1 Relevant Physical and Chemical Transport Processes

The important physical and chemical processes affecting the fate and transport of dissolved TCE in groundwater at the study area are advection, diffusion, hydrodynamic dispersion, and degradation. These processes cause changes in both the mass and distribution of dissolved constituents in groundwater. A brief review of these processes and their relative importance in the study area is provided below.

For dissolved transport, advection is defined as the movement of contaminants as a result of the dissolved contaminants being carried by moving groundwater. Given that transport is primarily in fracture zones at the field scale, advection is the dominant plume transport mechanism. Molecular diffusion causes local spreading of dissolved TCE from high to low concentration zones. Hydrodynamic dispersion is a physical process whereby dissolved constituents spread at the macroscopic scale both horizontally and vertically away from the plume center of mass. The dispersivity values (lateral, transverse, and vertical) were estimated based on model analysis and best scientific judgment. A longitudinal dispersivity value of 100 feet was assigned based on the transport scale-dependent relationship given in Xu and Eckstein (1995). The transverse and vertical dispersivities were set to 0.1 and 0.01 times the longitudinal dispersivity value, respectively, as recommended in Zheng and Bennett (1995).

Degradation processes are biological and chemical processes that transform the mass of dissolved constituents. These processes include the effects of biodegradation, photolysis, oxidation-reduction, and hydrolysis, and are generally grouped into either biologic or abiotic (chemical) degradation processes. TCE degradation was assumed to be a first order reaction. The site-specific TCE half-life was estimated to be 6.0 years based on historical plume development simulations to match approximate TCE plume conditions prior to operation of the recovery well. This site specific half-life is within the range of reported half-lives for TCE (Wiedemeier et al., 1999) at other sites across the U.S.

Input parameters for the transport simulations include retardation factor (R), effective porosity, half-life, and dispersivity. The values of these parameters used in the contaminant-mass fate and transport modeling are presented in Table 4-5.

4.2.2 Transport Model Simulation

Initial concentrations were specified for TCE at each grid point using the March 2014 groundwater analytical data. Three different concentration distributions were initialized, one each for the shallow zone (layers 1-2), intermediate zone (layers 3-6), and deep zone (layer 7-10). The primary focus was on the intermediate zone, given that this zone exhibits the highest TCE concentrations. The initial plume for TCE in the intermediate zone of the bedrock aquifer is shown in Figure 4-8. The plumes in this zone and in the shallow and deep zones of the bedrock aquifer were constructed using kriging of the March 2014 concentration data with additional non-detect data used as control points to be consistent with the observed limited the extents of the plumes.

The model predictive simulations were performed using the calibrated groundwater flow and solute transport model under the assumption of no further remedial action at the Site. The model was applied to simulate future plume concentrations over time assuming initial TCE plume concentration data in March 2014. The model was simulated forward in time for a 50 year simulation period using monthly stress periods.

The simulated future TCE concentrations for a 25-year period are presented in Figures 4-9 through 4-14. The model simulations indicate that the TCE plume dissipates over time as a

result of natural attenuation. After two years, the transport model simulations indicate that the TCE plume has a zone of higher concentrations at the former source near MW-549 and a separate zone of lower concentrations near the PZ-522 and PZ-524 well clusters. After approximately 10 years, the downgradient low concentration zone decreases to levels below 1 µg/L. The model simulations indicate that the higher concentration zone near the former source will continue to dissipate over time as a result of natural attenuation. Results of the model simulations indicate an estimated cleanup time for the intermediate zone (i.e., the zone with the highest TCE concentrations) of approximately 30 years with the MNA remedy.

One of the modeling objectives was to estimate the lateral delineation of the dissolved TCE plume, primarily near MW-1I, to assess the completeness of delineation and the protectiveness of the Classification Exception Area (CEA) boundary in this area. The CEA is a groundwater institutional control that is established when one or more constituent standards (i.e., NJDEP Groundwater Quality Standards) are not met in a localized area. In the approved Groundwater Remedial Action Permit, NJDEP indicated acceptance of the current CEA boundaries established for the Site. The CEA is shown in Figure 4-15.

The modeling results indicate that the lateral extent of TCE near MW-1I is within the existing CEA boundaries. Groundwater analytical results from the March and September 2014 sampling events indicate elevated TCE concentrations in monitoring well MW-1I (120 µg/L and 82 µg/L, respectively). This well is located hydraulically sidegradient and northwest of well MW-549I and is structurally down-dip of the former source area. The model results indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I (Figure 4-9), which is within the current CEA boundary (Figure 4-15); therefore, TCE concentrations in groundwater are delineated to the northwest and the current CEA boundary in this area remains appropriate for the Site. Based on the model simulations, it is anticipated that the elevated TCE concentrations near MW-1I will continue to dissipate over time as a result of natural attenuation.

5.0 SUMMARY AND CONCLUSIONS

This report describes groundwater flow and solute transport modeling of dissolved TCE in groundwater in the bedrock aquifer beneath the former LEC site in the Boroughs of Watchung and North Plainfield, Somerset County, New Jersey. As a result of mass removal by pump-and-treat methods from July 2003 to May 2011 and natural attenuation, TCE concentrations have reduced significantly over time. MNA is currently being applied to monitor the continued reduction of residual TCE mass in groundwater over time at the Site. Based on the conceptual site model, groundwater in the bedrock enters the Site from upgradient to the northeast, moves across the Site to the southwest (roughly parallel to the bedding strike direction of regional bedrock), and then trends in a more southerly direction toward Crab Brook. The migration of dissolved TCE in the bedrock aquifer is influenced by both bedrock structure and local groundwater discharge areas, particularly Crab Brook. The observed decreases of TCE over time are likely caused by natural attenuation mechanisms including recharge dilution, hydrodynamic dispersion, and both abiotic and biotic degradation.

A three-dimensional groundwater flow and solute transport model was applied to simulate both groundwater flow and dissolved TCE plume transport at the site. The objectives of this modeling effort were to: (1) improve understanding of the fate and transport of dissolved TCE in Site groundwater; (2) estimate the lateral delineation of the dissolved TCE plume; (3) examine the simulated future TCE plume extent and the ability of the monitoring network to monitor plume reduction over time; and, (4) estimate the cleanup timeframe of TCE concentrations in groundwater as part of a MNA remedy at the Site.

A steady-state groundwater flow model calibration was performed to match measured water level data in March 2014 using the groundwater flow model MODFLOW. The model was calibrated to 50 target wells in the shallow, intermediate, and deep zones of the bedrock aquifer. The model was also calibrated to observed drawdown data from a 48-hour constant rate (120 gpm) pumping test at the Site. The agreement of the flow model with both observed water levels, hydraulic head gradients, and the observed distribution of dissolved TCE tracer in groundwater at the Site provides additional evidence of a high quality flow model calibration.

Predictive simulations were performed using the calibrated steady-state groundwater flow field. In order to examine the future performance of MNA at the Site, a forward-in-time simulation was performed. Using measured TCE concentrations (March 2014) in monitoring wells to represent the initial TCE concentration distribution in the intermediate zone of the bedrock aquifer, the future TCE concentrations were then simulated over time to examine the future plume extent, concentration levels, and the time to reach cleanup standards. Model simulations indicate that the TCE plume will continue to dissipate with local concentrations continuing to decrease over time at the Site as a result of natural attenuation. Based on the simulated spatial extent of TCE in groundwater over time, the results of the transport model simulation also indicate that the existing monitoring network can monitor future TCE concentrations as the TCE plume mass and extent decrease over time. Results of the model simulation indicate an estimated cleanup time of approximately 30 years for the MNA remedy at the Site.

The model results also indicate that the farthest lateral extent of the 1 µg/L TCE isoconcentration line is approximately 375 feet northwest of MW-1I, which is within the current CEA boundary; therefore, TCE concentrations in groundwater are delineated to the northwest and the current CEA boundary in this area remains appropriate for the Site. Based on the model simulations, it is anticipated that the elevated TCE concentrations near MW-1I will continue to dissipate over time as a result of natural attenuation.

PARCEL DATA FROM NJ OFFICE OF INFORMATION TECHNOLOGY, OFFICE OF GEOGRAPHIC INFORMATION SYSTEMS, 2008 SOMERSET/UNION COUNTIES

APPENDIX G — CHECKLIST FOR THE SUBMISSION OF SAMPLING DATA FOR PDBS

New Jersey Department of Environmental Protection

Checklist for the Submission of Sampling Data for Passive Diffusion Bag Samplers (PDBS)

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-1S
4. Well Permit Number: E201313296

5. Type of Well: ■ Monitoring ☐ Extraction ☐ Residential ☐ Public Supply ☐ Irrigation ☐ Other
6. Well Surface Finish: ☐ Stick Up ■ Flush Mount
7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.32 feet below grade
9. Total Well Depth (fbgs) 179.68 (TIC)
10. Screened interval/open hole (fbgs) 170 to 180
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size 20 slot

14. Date and Time of Deployment Date: 12/17/13 Time: 13:05
15. Depth to Ground Water Depth to ground water at time of deployment 71.44 feet below TIC
16. Date and Time of Retrieval Date: 12/31/13 Time: 10:30 to 10:35
17. Depth to Ground Water Depth to ground water at time of retrieval 70.63 feet below TIC
18. Type of Deployment Line Used Diameter: 1/16 inch Material: Teflon coated stainless steel

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 8 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
171.98 ft (near top of screen)	176.98 ft		

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ■ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 27° F Wind 5 mph ☐ Sunny ☐ Overcast ☐ Raining ■ Snowing
27. Weather Conditions During Retrieval Temp. 20° F Wind None ■ Sunny ☐ Overcast ☐ Raining ☐ Snowing

28. Field Sampling Technician: Name(s) and Company (please print clearly)

Name	Company
Deploy - Priscilla Merta, Steve Feldmann,	Tetra Tech

6. Well Surface Finish: ☐ Stick Up ■ Flush Mount
7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.0 feet below grade
9. Total Well Depth (fbgs) 197.64 (TIC)
10. Screened interval/open hole (fbgs) 188 to 198
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 12/17/13 Time: 12:20
15. Depth to Ground Water Depth to ground water at time of deployment 19.06 feet below TIC
16. Date and Time of Retrieval Date: 12/31/13 Time: 09:10 to 09:20
17. Depth to Ground Water Depth to ground water at time of retrieval 19.37 feet below TIC
18. Type of Deployment Line Used Diameter: 1/16 inch Material: Teflon coated stainless steel

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 8 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
189.94 ft (near top of screen)	194.94 ft		

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ■ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 27° F Wind 5 mph ☐ Sunny ☐ Overcast ☐ Raining ■ Snowing
27. Weather Conditions During Retrieval Temp. 20° F Wind None ■ Sunny ☐ Overcast ☐ Raining ☐ Snowing

Checklist for the Submission of Sampling Data for Passive Diffusion Bag Samplers (PDBS)

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-1S
4. Well Permit Number: E201313296

5. Type of Well: ■ Monitoring ☐ Extraction ☐ Residential ☐ Public Supply ☐ Irrigation ☐ Other
6. Well Surface Finish: ☐ Stick Up ■ Flush Mount
7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.32 feet below grade
9. Total Well Depth (fbgs) 179.68 (TIC)
10. Screened interval/open hole (fbgs) 170 to 180
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size 20 slot

14. Date and Time of Deployment Date: 3/4/14 Time: 12:00
15. Depth to Ground Water Depth to ground water at time of deployment 68.71 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 8:20
17. Depth to Ground Water Depth to ground water at time of retrieval 68.77 feet below TIC
18. Type of Deployment Line Used Diameter: 1/16 inch Material: Teflon coated stainless steel

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
176.98 ft (Set at bottom hooks)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ■ **Yes**, this well was profiled already. Date when well was profiled: 12/31/13
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

28. Field Sampling Technician: Name(s) and Company (please print clearly)

Name	Company
Roy Wagner, Tetra Tech	
Carl Natter, Tetra Tech, Andrew Kelly, Tetra Tech	

New Jersey Department of Environmental Protection
Checklist for the Submission of Sampling Data for Passive Diffusion Bag Samplers (PDBS)

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-502S
4. Well Permit Number: 25-43366

5. Type of Well: ■ Monitoring ☐ Extraction ☐ Residential ☐ Public Supply ☐ Irrigation ☐ Other
6. Well Surface Finish: ☐ Stick Up ■ Flush Mount
7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.35 feet below grade
9. Total Well Depth (fbgs) 18.51 (TIC)
10. Screened interval/open hole (fbgs) 8 to 18
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/4/14 Time: 13:20
15. Depth to Ground Water Depth to ground water at time of deployment 0.89 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 10:30
17. Depth to Ground Water Depth to ground water at time of retrieval 0.60 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 11.5 ft bgs			

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

28. Field Sampling Technician: Name(s) and Company (please print clearly)

Name	Company
Roy Wagner	Tetra Tech
Carl Natter, Andrew Kelly	Tetra Tech

New Jersey Department of Environmental Protection

Checklist for the Submission of Sampling Data for Passive Diffusion Bag Samplers (PDBS)

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-506I
4. Well Permit Number: 25-43518

5. Type of Well: ■ Monitoring ☐ Extraction ☐ Residential ☐ Public Supply ☐ Irrigation ☐ Other
6. Well Surface Finish: ☐ Stick Up ■ Flush Mount
7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.35 feet below grade
9. Total Well Depth (fbgs) 94.95 (TIC)
10. Screened interval/open hole (fbgs) 89 to 99
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/4/14 Time: 11:35
15. Depth to Ground Water Depth to ground water at time of deployment 18.76 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 8:00
17. Depth to Ground Water Depth to ground water at time of retrieval 18.61 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 91 ft bgs (near top of screen)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

Checklist for the Submission of Sampling Data for Passive Diffusion Bag Samplers (PDBS)

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-544S
4. Well Permit Number: 25-54779

5. Type of Well: ■Monitoring ☐Extraction ☐Residential ☐Public Supply ☐Irrigation ☐Other
6. Well Surface Finish: ☐Stick Up ■Flush Mount
7. Location of Measuring Point: ■Top of Casing ☐Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.13 feet below grade
9. Total Well Depth (fbgs) 22.40 (TIC)
10. Screened interval/open hole (fbgs) 3 to 23
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/5/14 Time: 15:25
15. Depth to Ground Water Depth to ground water at time of deployment 3.0 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 15:15
17. Depth to Ground Water Depth to ground water at time of retrieval 1.72 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 12.4 ft (center of screen)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

Checklist for the Submission of Sampling Data for Passive Diffusion Bag Samplers (PDBS)

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-546I
4. Well Permit Number: 25-55004

5. Type of Well: ■Monitoring ☐Extraction ☐Residential ☐Public Supply ☐Irrigation ☐Other
6. Well Surface Finish: ☐Stick Up ■Flush Mount
7. Location of Measuring Point: ■Top of Casing ☐Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.81 feet below grade
9. Total Well Depth (fbgs) 99.32 (TIC)
10. Screened interval/open hole (fbgs) 80 to 100
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/4/14 Time: 14:35
15. Depth to Ground Water Depth to ground water at time of deployment 9.96 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 10:50
17. Depth to Ground Water Depth to ground water at time of retrieval 9.69 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 89.32 ft (center of screen)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

28. Field Sampling Technician: Name(s) and Company (please print clearly)

Name	Company
Roy Wagner	Tetra Tech
Carl Natter, Andrew Kelly	Tetra Tech

1. Site: Former Lockheed Electronics Company Site
2. Location: Watchung and North Plainfield, NJ
3. Well Designation: MW-546D
4. Well Permit Number: 25-55003

5. Type of Well: ■ Monitoring ☐ Extraction ☐ Residential ☐ Public Supply ☐ Irrigation ☐ Other
6. Well Surface Finish: ☐ Stick Up ■ Flush Mount
7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.60 feet below grade
9. Total Well Depth (fbgs) 197.50 (TIC)
10. Screened interval/open hole (fbgs) 180 to 200
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/4/14 Time: 14:40
15. Depth to Ground Water Depth to ground water at time of deployment 17.74 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 10:55
17. Depth to Ground Water Depth to ground water at time of retrieval 17.52 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 187.50 ft (center of screen)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

7. Location of Measuring Point: ■Top of Casing ☐Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.55 feet below grade
9. Total Well Depth (fbgs) 49.84 (TIC)
10. Screened interval/open hole (fbgs) 30 to 50
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/4/14 Time: 10:45
15. Depth to Ground Water Depth to ground water at time of deployment 19.00 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 10:15
17. Depth to Ground Water Depth to ground water at time of retrieval 18.87 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 39.84 ft			

(center of screen; collected field duplicate sample DUP-02)

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐**No**, this well is being profiled during this sampling round
    ☐**Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■**No**, flow testing has not been conducted in this well
    ☐**Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.16 feet below grade
9. Total Well Depth (fbgs) 13.22 (TIC)
10. Screened interval/open hole (fbgs) 4.7 to 14.7
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 3/4/14 Time: _____
15. Depth to Ground Water Depth to ground water at time of deployment 4.64 feet below TIC
16. Date and Time of Retrieval Date: 3/20/14 Time: 15:35
17. Depth to Ground Water Depth to ground water at time of retrieval 4.08 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
2.5 ft. bgs.			

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 20° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 40° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.32 feet below grade
9. Total Well Depth (fbgs) 348.70 (TIC)
10. Screened interval/open hole (fbgs) 335 to 350
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size 20 slot

14. Date and Time of Deployment Date: 8/27/14 Time: 12:30
15. Depth to Ground Water Depth to ground water at time of deployment 127.90 feet below TIC
16. Date and Time of Retrieval Date: 9/11/14 Time: 10:50
17. Depth to Ground Water Depth to ground water at time of retrieval 128.35 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: _____

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 32 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
336 ft			

(Set on top of hooks 3 sets of hooks - used top set)

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ■ **Yes**, this well was profiled already. Date when well was profiled: 12/31/13
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 90° F Wind None ■ Sunny ☐ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 80° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

7. Location of Measuring Point: ■ Top of Casing ☐ Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.28 feet below grade
9. Total Well Depth (fbgs) 19.70 (TIC)
10. Screened interval/open hole (fbgs) 9.7 to 19.7
11. Well Casing: Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■ PVC ☐ Carbon Steel ☐ Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 8/27/14 Time: 17:30
15. Depth to Ground Water Depth to ground water at time of deployment 6.60 feet below TIC
16. Date and Time of Retrieval Date: _____ Time: 14:40
17. Depth to Ground Water Depth to ground water at time of retrieval 6.80 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■ Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐ Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐ Attached to bottom of PDBS and suspended in well
    ☐ Attached to bottom of deployment line and suspended in well
    ■ Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 17.4 ft bgs			

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 90° F Wind None ■ Sunny ☐ Overcast ☐ Raining ☐ Snowing
27. Weather Conditions During Retrieval Temp. 80° F Wind None ☐ Sunny ■ Overcast ☐ Raining ☐ Snowing

7. Location of Measuring Point: ■Top of Casing ☐Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.31 feet below grade
9. Total Well Depth (fbgs) 262.70 (TIC)
10. Screened interval/open hole (fbgs) 252.7 to 262.7
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 8/27/14 Time: 11:05
15. Depth to Ground Water Depth to ground water at time of deployment 65.56 feet below TIC
16. Date and Time of Retrieval Date: 9/11/14 Time: 10:00
17. Depth to Ground Water Depth to ground water at time of retrieval 66.35 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 256 ft bgs (center of screen) Set DUP-04			

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 90° F Wind None ■Sunny ☐Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 80° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

7. Location of Measuring Point: ■Top of Casing ☐Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0..23 feet below grade
9. Total Well Depth (fbgs) 92.35 (TIC)
10. Screened interval/open hole (fbgs) 73 to 93
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 8/27/14 Time: 14:45
15. Depth to Ground Water Depth to ground water at time of deployment 19.41 feet below TIC
16. Date and Time of Retrieval Date: 9/11/14 Time: 11:40
17. Depth to Ground Water Depth to ground water at time of retrieval 19.48 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 82.35 ft (center of screen)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 90° F Wind Light ■Sunny ☐Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 80° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.43 feet below grade
9. Total Well Depth (fbgs) 189.4 (TIC)
10. Screened interval/open hole (fbgs) 180 to 200
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 8/27/14 Time: 16:40
15. Depth to Ground Water Depth to ground water at time of deployment 5.95 feet below TIC
16. Date and Time of Retrieval Date: 9/11/14 Time: 14:15
17. Depth to Ground Water Depth to ground water at time of retrieval 6.17 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
2.5 ft. bgs.			

5th PDBS	6th PDBS	7th PDBS	8th PDBS

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 90° F Wind None ■Sunny ☐Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 80° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

7. Location of Measuring Point: ■Top of Casing ☐Other (specify) _____
8. **NOTE:** PDBS represent a point sample within the screened interval or open hole of the well. It is critical to know the exact depth within the well where the PDBS is deployed. Well construction specifications, which are typically used to determine where to set the PDBS in the well, are measured in feet below ground surface (fbgs). If the depth interval for PDBS deployment is measured from the reference point identified above, the difference between this reference point and the ground surface must be measured and accounted for to determine the proper depth interval to set the PDBS. Please identify below, any differences between the measuring point identified above and actual ground surface at the well head.

   Distance between measuring point and ground surface (ft.) 0.28 feet below grade
9. Total Well Depth (fbgs) 17.41 (TIC)
10. Screened interval/open hole (fbgs) 7.7 to 17.7
11. Well Casing: Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
12. Well Screen (or open hole diameter): Diameter: 2 inch Material: ■PVC ☐Carbon Steel ☐Stainless Steel
13. Screen Size (slot) Screen Slot Size _____

14. Date and Time of Deployment Date: 8/27/14 Time: 16:20
15. Depth to Ground Water Depth to ground water at time of deployment 7.12 feet below TIC
16. Date and Time of Retrieval Date: 9/11/14 Time: 12:35
17. Depth to Ground Water Depth to ground water at time of retrieval 7.26 feet below TIC
18. Type of Deployment Line Used Diameter: 0.25 inch Material: Nylon line

19. Material and Mass (oz.) of PDBS Weight Stainless Steel, approx. 16 oz. (stainless steel recommended)
20. Type of PDBS Used
    ■Lab Filled (Modified Trip Blank must be taken at time of deployment)
    ☐Field Filled (Modified equipment blank of fill water must be taken at time of deployment. If PDBS isn't filled at well head, blank must travel with samplers until last sampler is deployed. Blank is then taken.)
21. Dimensions of PDBS Length (in.) 24 inches Diameter (in.) 1.25 inches Filled 220 ml
22. Position of PDBS Weight
    ☐Attached to bottom of PDBS and suspended in well
    ☐Attached to bottom of deployment line and suspended in well
    ■Attached to bottom of deployment line and resting on bottom of well (preferred)
23. Position of PDBS in Well Screen (ft. from measuring point to center of PDBS)

1st PDBS	2nd PDBS	3rd PDBS	4th PDBS
approx. 12.41 ft (center of screen)			
5th PDBS	**6th PDBS**	**7th PDBS**	**8th PDBS**

24. If the saturated portion of the well screen or open hole is greater than 5 feet, has the well been vertically profiled to assess the potential for contaminant stratification?
    ☐ **No**, this well is being profiled during this sampling round
    ☐ **Yes**, this well was profiled already. Date when well was profiled: _____
25. If the saturated portion of the well screen or open hole is greater than 10 feet, has the well been flow tested to assess the potential for vertical flow to be present within the well?
    ■ **No**, flow testing has not been conducted in this well
    ☐ **Yes**, flow testing of this well was conducted. Date of testing: _____
    Type of flow meter used: _____
    Measurements taken every _____ feet **[Please Attach Results]**
26. Weather Conditions During Deployment Temp. 90° F Wind None ■Sunny ☐Overcast ☐Raining ☐Snowing
27. Weather Conditions During Retrieval Temp. 80° F Wind None ☐Sunny ■Overcast ☐Raining ☐Snowing

APPENDIX H — LABORATORY ANALYTICAL DATA REPORTS

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 460-68679-1

Job Description: LMC - N. Plainfield

For:
Tetra Tech GEO
One Salem Square
295 Route 22 East
Suite 104E
Whitehouse Station, NJ 08889

Attention: Mr. Steve Feldmann

Maegen Pane

Approved for release.
Maegen C Pane
Project Management Assistant I
12/31/2013 8:37 AM

Designee for
Melissa Haas, Project Manager I
777 New Durham Road, Edison, NJ, 08817
(203)944-1310
melissa.haas@testamericainc.com
12/31/2013

The test results in this report meet all NELAP requirements unless specified within the case narrative. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Edison Project Manager.

TestAmerica Edison Certifications and Approvals: Connecticut: CTDOH #PH-0200, New Jersey: NJDEP (NELAP) #12028, New York: NYDOH (NELAP) #11452, NYDOH (ELAP) #11452, Pennsylvania: PADEP (NELAP) 68-00522 and Rhode Island: RIDOH LAO00132

Comments
No additional comments.

Receipt
The samples were received on 12/18/2013 12:05 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.1° C.

GC/MS VOA
No analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	768195
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.1°C, IR #4
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 460-69122-1

Job Description: LMC - N. Plainfield, NJ

For:
Tetra Tech GEO
One Salem Square
295 Route 22 East
Suite 104E
Whitehouse Station, NJ 08889

Attention: Mr. Steve Feldmann

Maegen Pane

Approved for release.
Maegen C Pane
Project Management Assistant I
1/13/2014 1:12 PM

Designee for
Melissa Haas, Project Manager I
777 New Durham Road, Edison, NJ, 08817
(203)944-1310
melissa.haas@testamericainc.com
01/13/2014

The test results in this report meet all NELAP requirements unless specified within the case narrative. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Edison Project Manager.

TestAmerica Edison Certifications and Approvals: Connecticut: CTDOH #PH-0200, New Jersey: NJDEP (NELAP) #12028, New York: NYDOH (NELAP) #11452, NYDOH (ELAP) #11452, Pennsylvania: PADEP (NELAP) 68-00522 and Rhode Island: RIDOH LAO00132

Comments
No additional comments.

Receipt
The samples were received on 12/31/2013 4:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1° C.

GC/MS VOA
Method(s) 8260B: The continuing calibration verification (CCV) associated with batch 201425 recovered above the upper control limit for Acetone. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method(s) 8260B: The laboratory control sample (LCS) for batch 201425 recovered outside control limits for the following analyte: Acetone. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: Internal standard (ISTD) response for 1,4-Dioxane-d8 for the following samples was outside acceptance criteria: MW-2D-B (460-69122-2), MW-2I-A (460-69122-3), MW-2I-B (460-69122-4). This ISTD does not correspond to any of the requested target compounds; therefore, the data have been reported.

Method(s) 8260B: The continuing calibration verification (CCV) for Vinyl Chloride associated with batch 201600 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method(s) 8260B: Surrogate 1,2-Dichloroethane-d4 recovery for the following sample was outside control limits: MW-1S-B (460-69122-6). Re-analysis was performed with concurring results (Batch 201764 - B64548). The original analysis has been reported.

Method(s) 8260B: The continuing calibration verification (CCV) associated with batch 201764 recovered above the upper control limit for Chloroethane. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

No other analytical or quality issues were noted.

VOA Prep
No analytical or quality issues were noted.

DATA REPORTING QUALIFIERS

Client: Tetra Tech GEO Job Number: 460-69122-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	F1	MS and/or MSD Recovery exceeds the control limits
	*	Recovery or RPD exceeds control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	X	Surrogate is outside control limits

Client: Tetra Tech GEO

Job Number: 460-69122-1

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	768225
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.1°C, IR #4
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

CASE NARRATIVE

Client: Tetra Tech GEO

Project: LMC-North Plainfield, NJ

Report Number: 460-69667-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 1/14/2014 4:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1º C.

Except:

One of the three containers from sample(s) # 11 was received broken.

No sample time was indicate on the COC for the Trip Blank, therefore the latest sample date was used/

The following samples were cancelled by the client on 1/16/14: MW-1I-A (460-69667-7), MW-1S-A (460-69667-5), MW-2D-A (460-69667-1), MW-2I-A (460-69667-3), MW-3D-B (460-69667-11), MW-3D-C (460-69667-12).

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples 460-69667-2, 460-69667-4, 460-69667-6, 460-69667-8 through 460-69667-10 and 460-69667-13 were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 01/15/2014 and 01/16/2014.

No difficulties were encountered during the volatiles analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Tetra Tech GEO Job Number: 460-69667-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Tetra Tech GEO

Job Number: 460-69667-1
