SECTION 1
Introduction

In the summer of 2008 Lockheed Martin Corporation (Lockheed Martin) began a program of continuous long-term water level monitoring (LTWLM) at its Tallevast, Florida site. The Lockheed Martin facility (Facility) is located at 1600 Tallevast Road in Sarasota, Florida. The Facility and the surrounding area of groundwater impacted by contaminants of concern (COCs) are collectively referred to as the Site. The LTWLM program includes instrumented wells both within and surrounding the Site. A map of the Site and surrounding area is provided as **Figure 1-1.** This report is presented as an appendix to the annual Remedial Action Status Report (RASR); more-detailed figures showing the Site, Facility, surface water bodies, well locations, and other features are provided in the annual RASR report.

1.1 GOALS AND OBJECTIVES

Measurements of groundwater elevation, such as those obtained during annual or quarterly monitoring events, provide a snapshot picture of groundwater flow. However, continuous monitoring significantly adds to the understanding of seasonal and climatic variations as well as the shorter-term impacts and effects of individual storm events, water supply pumping, and remediation system operations. The goals of the LTWLM program are:

1. Assist in assessing relationships and gradients between water-bearing zones on-Facility and off-Facility;
2. Display and help evaluate local groundwater elevation trends within water-bearing zones;
3. Identify and monitor nearby groundwater extraction influences;
4. Assist in identifying regional groundwater flow patterns and water level trends not due to the effects of local groundwater extraction;
5. Supplement the manually-measured water levels used in the main text of the RASR to evaluate the effectiveness and capture extent of the Remedial Action Plan Addendum (RAPA) system; and,

6. Provide data for numerical model calibration and updating.

The objective of this report is to present a review of data gathered from LTWLM conducted at the Site and in the surrounding area from June 2015 to June 2016. Changes to the monitoring network during this time period are noted in Section 2.2 of this report. This represents the 2015-2016 installment of annual LTWLM reports that will be submitted as described in the Remedial Action Plan Addendum (RAPA) submitted to the Florida Department of Environmental Protection (FDEP) on July 14, 2009, and approved by FDEP in a letter dated November 11, 2010.

SECTION 2

Monitoring Network

There are currently 307 monitoring and stilling wells at the Site that are available for monitoring. Of these, seven wells are located in wetlands and instrumented as part of the Wetlands Monitoring Program described in the RAPA (ARCADIS, 2009) and documented in the annual Wetlands Monitoring Report (AECOM, 2016). The RAPA specified that LTWLM would be performed at selected locations as part of effectiveness monitoring for the remedy (ARCADIS, 2009). The LTWLM network currently consists of 47 monitoring and stilling wells equipped with pressure transducers and located both on the Facility and in the surrounding area (see **Figure 1-1**). The furthest monitored well location is just over 2000 feet from the Facility boundary. The monitoring wells are grouped into well nests consisting of closely spaced wells that are each screened in a different water-bearing zone. The transducers are installed in selected surface water bodies as shown on **Figure 1-1** and in the following water-bearing zones, which are described in more detail in the main text of the 2014 Remedial Action Status Report (AECOM, 2014).

- Upper Surficial Aquifer System (USAS) – the uppermost, unconsolidated water-bearing zone, generally consisting of silica sand with variable clay content.
- Lower Shallow Aquifer System (LSAS) – the uppermost portion of the Intermediate Aquifer System (IAS) and of the Hawthorn Group, consisting of interbedded limestone, clay, and carbonate mudstone layers, located approximately 30 feet below ground surface (ft bgs) in the vicinity of the Site.
- Arcadia Formation (AF) Gravels – a laterally correlated, fractured carbonate unit located at about 100 ft bgs in the vicinity of the Site.
- Salt and Pepper (S&P) Sands – a laterally correlated quartz-rich sand unit that has moderate to high phosphatic content, located at approximately 145 ft bgs in the vicinity of the Site.
- Lower Arcadia Formation (AF) Sands – a laterally continuous, quartz-rich sand unit that is located below the zone of groundwater impacted by COCs. This is the deepest transmissive zone of the IAS, located approximately 280 ft bgs in the vicinity of the Site.

- Upper Floridan Aquifer System (Floridan) – the uppermost portion of a series of heterogeneous limestone and dolomite units with highly developed secondary porosity due to dissolution. The Floridan aquifer is first encountered approximately 350-400 ft bgs in the vicinity of the Site. The Hawthorn Group ends with the uppermost portion of the Upper Floridan Aquifer

Two barometric pressure transducers located at the Facility are also used to record barometric pressure data. Because barometric pressure adjustment is crucial to analyzing the water levels, two barometric pressure units are used to reduce the likelihood of missing data. In addition, if necessary, data from a barometric transducer installed as part of the wetlands monitoring program may be re-formatted for use with the LTWLM transducer data.

The monitoring program consists of quarterly data downloads and monitoring system maintenance, along with periodic review of the data. The following sections describe the selection of the LTWLM network wells, the monitoring equipment used, the maintenance of the transducers, and the efforts associated with data collection, management, validation, and assessment.

2.1 MONITORING EQUIPMENT

The LTWLM network utilizes Solinst® and In Situ® brand pressure transducers. The initial set of transducers selected for deployment in 2008 was comprised of both non-vented units (Solinst®) and vented units (In Situ®). A detailed discussion of the original transducer types is provided in the 2014 RASR Appendix F (AECOM, 2014). Currently, all transducers in the LTWLM network are non-vented and are suspended in the well below the water surface using monofilament line. The transducers must be removed from the wells for programming or data download. They are suspended far enough below the water surface that they will remain submerged under the groundwater conditions normally observed at that well but will not exceed their sensor pressure limit.

In addition to downhole pressure transducers, two other types of monitoring equipment are used. A hand-held water level meter accurate to 0.01 ft is used to measure the water level in the well just prior to downloading the transducers. Also, two barometric pressure transducers are located at the Facility, as noted above. These transducers provide the

barometric pressure data used to compensate the pressure measured by non-vented transducers for atmospheric pressure changes. The BaroTroll® (produced by In Situ®) is currently used for barometric compensation of LTWLM data due to its more conventional data format; the Barologger (produced by Solinst®) is used as backup.

2.2 SELECTION OF MONITORING LOCATIONS

Monitoring locations were selected based on known groundwater flow directions and proximity to known or suspected groundwater withdrawal from the IAS. Transducers were initially placed in seven clusters of monitoring wells. Later, two more clusters were added. The locations of the wells in the LTWLM network are shown on **Figure 1-1,** and well completion details are described in **Table 2-1**. Monitoring wells were selected from six different water-bearing zones for LTWLM to assess changing vertical gradients, horizontal gradients, on-facility and off-facility hydraulic influences, and localized groundwater/surface water interactions. Accessibility and spatial distribution were also considered when selecting locations for LTWLM. The rationale for monitoring well selection is discussed in detail in the 2014 RASR Appendix F (AECOM, 2014).

When necessary, the LTWLM program allows for modifications that are needed based on such factors as loss of accessibility and identification of enhanced capability for monitoring targeted aquifer units and/or locations. Such modifications are intended to preserve the layout of the LTWLM network, while also being able to enhance its capabilities strategically, as needed during remedial operations.

The RAPA LTWLM monitoring program as originally implemented at the time of RAPA submittal in 2009 now includes some modifications. Modifications up to June 2014 are described in the 2014 RASR Appendix F (AECOM, 2014). In addition, wells MW-183 through MW-187 were abandoned in November 2014, so the Highway 301 transducers were moved to wells MW-188 through MW-192 in June 2014 (AECOM, 2015). The following modification has been implemented during the June 2015 to June 2016 monitoring period:

- Stilling well SW-1R was replaced with SW-1R2 on April 8, 2016. The new survey data are provided in Table 2-1.

2.3 DATA COLLECTION

The data collection procedures include those associated with accessing the well, gauging the well, stopping the data collection, downloading the instrument, and setting up the transducer to record new data. A general summary of these procedures is provided below.

Prior to accessing the well the appropriate notifications are sent to the Tallevast community and/or property owner, as required. Upon arrival at the well the technician gauges the water level in the well and records it. The technician then removes the transducer from the well, downloads the data at the surface, and replaces the transducer in the well. Any problems that are noted during download (i.e., transducer damage or malfunction) are documented.

Downloaded data are stored on a laptop computer or handheld download device until the field technician reaches the office. Once in the office, the field technician transfers the data files and field notes to the Tallevast team for evaluation.

2.4 MONITORING NETWORK OPERATIONS AND MAINTENANCE

A total of 47 down-hole pressure transducers and two barometric pressure transducers are currently installed in long-term monitoring locations at the Site. The pressure transducers were programmed to record data on an hourly basis. Data from the transducers have been downloaded quarterly since that time.

Quarterly maintenance is performed on the transducers as needed and generally occurs at the same time as data download. Typically, the maintenance includes checking calibration if there appears to be a problem, raising or lowering the instrument in the well as needed based on changes in water levels, and replacing faulty transducers or cables. Over the course of the eight years of monitoring, from the end of May 2008 to June 2016, 53 instruments have required either repair or replacement with comparable instruments. Most instrument failures were due to reaching the end of battery life, since the instruments do

not have replaceable batteries. The instrument batteries were designed to last five to ten years, depending on data collection interval, so replacements were made as the instruments reached the end of their battery life. Information regarding transducer maintenance is generally transferred to the Tallevast team at the same time as downloaded data and field notes.

SECTION 3

Data Management and Processing

This section describes the data management, quality control, and analytical procedures applied to the LTWLM transducer data.

3.1 DATA MANAGEMENT

The purpose of the LTWLM data management procedures is to ensure that data gathered in the field is stored securely and accurately for future use.

Data collected in the field are assembled in transferable files and transmitted to selected team members for barometric pressure adjustment, graphing, and analysis. Once the data have been transferred from the field technician to other team members, the data are evaluated for quality control (QC). Initial QC consists of checking to make sure all transducers have been downloaded, that the data sets are complete, and that any problems with transducers that could not be downloaded are being resolved. In addition, the field notes are scanned and sent, along with the raw transducer data files, to other team members for analysis. This ensures that the team members have the complete set of data and observations collected by the field personnel during the transducer download event.

A database containing the raw transducer data, serial numbers, and major maintenance history has been established and is updated quarterly. Additionally, the raw binary data and exported text files are stored in two separate locations for data preservation purposes. The groundwater elevations are calculated from the raw water level data, and additional QC is performed on the calculations prior to importing the calculated groundwater elevation data into the database.

The water levels measured by hand in the field at the time of transducer download are entered into the database. The data are subjected to QC to ensure that they were correctly

entered and then imported to the database for distribution and technical analysis. The water level data collected for the LTWLM clusters from June 2015 to June 2016 are provided in **Table 3-1**. In a few cases manual water level data collected from LTWLM wells as part of other programs were used to supplement transducer data analysis. These manual water level measurements are also included in **Table 3-1** for completeness.

3.2 INITIAL DATA PROCESSING

The initial database analysis consists of formatting data, importing the raw data into the database, performing barometric compensation on the data, and exporting the data with a unique database identification number for further analysis.

The data must be formatted prior to import into the database. There are three types of data currently used on a quarterly basis: non-vented transducer data, barometric pressure data, and manual water level data. These data types are all treated differently.

Manual water level data are entered into Microsoft Excel from the scanned field notebook pages. These data are checked for accuracy against the field notes and then are appended to the database table containing manual water level data. The top-of-casing elevation that was current at the time of data collection is associated with each manual measurement to ensure that any well casing modifications are explicitly represented. A query is used to calculate groundwater elevation from the manual water level data. These data are exported to Microsoft Excel to use in calculating groundwater elevation for the transducer data.

All the transducer data are downloaded as binary files. Each transducer manufacturer provides software that is used to export the data in text file format. The text files are then formatted for import into the Microsoft Access database. The raw pressure and barometric transducer data are imported to different tables based on differences in the type and format of data collected. The different data formats are tied to the two brands of transducer used and to changes in data collection format within brands as transducer models are upgraded. The different types of data are currently barometric pressure data and non-vented pressure transducer data.

Barometric pressure data initially are in units of millimeters of mercury (mm Hg). Because the downhole pressure transducer data use feet of water (feet H_2O), the barometric pressure data are converted to feet H_2O and stored in a new table.

Non-vented transducers record a single pressure value at each recording time. In other words, the pressure recorded by a non-vented transducer actually consists of the barometric pressure added to the pressure of the water above the transducer. Therefore, non-vented transducer data must be corrected for barometric pressure before the data can be converted to a groundwater elevation. The data are imported, assigned a unique key, and subjected to barometric pressure correction to produce a corrected level. The corrected level data from the non-vented transducers are exported to Microsoft Excel for further analysis.

3.3 CALCULATING GROUNDWATER ELEVATION

The transducer data are converted to groundwater elevations using Microsoft Excel. The groundwater elevation in each well is calculated to produce agreement between the transducer data and the manually-collected groundwater elevation data. For every manual measurement the nearest transducer measurement in time is subtracted from the groundwater elevation measured manually. The resulting value, called the individual transducer datum, is the elevation of the transducer above mean sea level. The elevation of the transducer is then directly added to the transducer measurements to convert them to groundwater elevation above mean sea level.

Individual transducer datum adjustments based on manual water level measurements are completed quarterly as a QC measure for several reasons. Often the transducer is not placed in the well at exactly the same depth after download and manual measurement is used to calculate the datum adjustment for the new position in the well. Sometimes transducers experience data drift over time or may cease to record accurate data. Quarterly manual measurements ensure that these problems are identified in a timely manner so that transducer can be repaired or replaced. On occasion a manual measurement may be inaccurate or anomalous. Regular measurements allow anomalous measurements to be identified so that they do not affect the final calculated groundwater elevations.

The calculated groundwater elevation data are plotted on graphs and visually checked for anomalies. Any anomalies noted are investigated to determine whether they are related to groundwater extraction, rainwater infiltration, irrigation, transducer problems, sampling, or other causes. Once the cause is identified, appropriate action is taken, such as including a note on the graphs and in the database or asking the field technicians to check the well seal.

The adjustments made to calculate groundwater elevation are described in a table, subjected to QC by a hydrogeologist not involved in the original calculations, and imported into the database for storage. The Excel calculations and graphs are subjected to QC, both during the quarter in which they are completed and again during the following quarter, by comparing to the next manual measurement. After these checks have been completed, the groundwater elevations are imported to the database and associated with the original data using the unique key assigned to each measurement.

SECTION 4

LTWLM Results and Discussion

Eight years of long-term water-level monitoring (2008-2016) have been completed to date. Of these, the first five years documented water levels during background conditions, Interim Remedial Action (IRA) system operation, and installation of the RAPA system. The sixth year of data documents water levels during testing and initial operation of the RAPA system. The subsequent data document water levels during the development of the capture zones associated with the RAPA system. The groundwater elevation data for each cluster are presented as **Figures 4-1 to 4-9**.

4.1 GROUNDWATER EXTRACTION EFFECTS

The following sections describe groundwater extraction effects observed during the most recent year of monitoring, June 2015 to June 2016.

4.1.1 RAPA SYSTEM

The RAPA system was installed between March 2011 and August 2013 and 24-hour operation began in September 2013. Since that date the RAPA system has operated continuously, except for brief shutdowns such as those related to maintenance of the system, specific capacity testing, or electrical outages. The RAPA system has the following components, all of which are shown on **Figure 1-1**:

- Extraction wells – There are a total 77 extraction wells. These consist of 37 USAS, 27 LSAS, 11 AF Gravels, and two S&P Sands wells.
- Extraction trenches – There are four extraction trenches, all completed in the USAS.
- Injection wells – There are five USAS wells designed to allow reinjection of treated groundwater for enhanced flushing on-Facility.

- Infiltration galleries – There are three infiltration galleries located around wetlands to allow localized groundwater recharge.

Because RAPA pumping has been ongoing during the entire period from June 2015 to June 2016, the full effects of RAPA operation on water levels are difficult to discern from the associated graphs. However, a comparison of the water levels measured during the current monitoring period (see **Figure 4-1)** with water levels measured before RAPA operation (see 2014 RASR, Appendix F, AECOM, 2014) indicates that the maximum drawdown recorded On-Facility due to RAPA operation is as follows:

- USAS – 9 ft;
- LSAS – 20 ft;
- AF Gravels – 25 ft; and,
- S&P Sands – 15 to 25 ft, depending on pumping rate.

A comparison of measured water levels for the period of June 2014 to June 2015 (2015 RASR, Appendix F, AECOM, 2015) to the measured water levels for the current period (see **Figure 4-1**) indicates that the maximum drawdown in each zone has remained relatively consistent over the last two years of RAPA operation.

The effects of RAPA pumping are clearly evident in the response of wells to brief shutdowns of the RAPA system. On **Figure 4-1**, shutdowns are evident as vertical lines showing the water level recovery measured during each shutdown; smaller responses to brief shutdowns are noted in some wells on **Figures 4-4 and 4-6**. Water levels only partially recover during these brief shutdowns.

4.1.2 PRIVATE WELLS

A number of private commercial irrigation wells operate in the vicinity of the site. The private commercial irrigation wells are used to maintain landscaping around local businesses. Several of these wells have been abandoned during the course of the LTWLM program. This section provides a brief summary of the primary wells observed to operate from June 2015 to June 2016.

4.1.2.1 7921 15TH ST E WELL

This well was used to maintain a decorative pond on the property located at 7921 15th St E. The well had an open-hole completion from 45 to 143.7 feet bgs and operated on and off until it was abandoned and replaced with a Floridan well in October 2011. The locations of the original well and the replacement well are shown on **Figure 1-1**. The replacement well was the only active well at 7921 15th St E from June 2015 to June 2016.

4.1.2.2 THE 8005 15TH ST E WELL

An irrigation well was identified on the 8005 15th St E parcel during previous well searches, but the well was not in use. The well was returned to operation in September 2009 to provide irrigation water for landscaping. The well had open-hole completion from 55 to 161.2 feet bgs and was abandoned and replaced with a Floridan well in September 2011. The locations of the original and replacement wells are shown on **Figure 1-1**. The replacement well was the only open well at 8005 15th St E from June 2015 to June 2016; the well is currently in use.

4.1.2.3 7741 AND 7851 15TH ST E WELLS

Two wells were located on a property with the addresses above. The 7741 15th St E well was screened from 220 to 360 feet bgs and was installed in 2000, but was not in use. The 7851 15th St E well was screened from 237 to 480 feet bgs, was installed in 1999, and was used for irrigation. Both wells were abandoned in September 2011 and replaced with a single Floridan well. The locations of the original and replacement wells are shown on **Figure 1-1**. The replacement well was the only active well at this location from June 2015 to June 2016.

The minor pumping signature of the replacement well can be seen as a distinctive irregular drawdown and recovery pattern in On-Facility Floridan well MW-123, as shown on **Figure 4-1**. The new well is pumped on an irregular schedule to fill a pond that is used for irrigation. When the pond level declines below a float switch's lower elevation boundary, the pump turns on to fill the pond. When the float switch reaches its upper elevation boundary, the pond is full and the pump shuts off. Testing performed in July 2012

confirmed that the irregular drawdown and recovery pattern observed in Floridan well MW-123 was attributable to the pumping of this well.

4.1.2.4 7660 MATOAKA RD WELL

Evidence from the Northeast Area, Rt. 301, and 26th Ct. E well clusters resulted in identification of a well at 7660 Matoaka Rd (west of the facility) that is pumped approximately twice a week for irrigation purposes as needed. In other words, it appears that under sufficiently wet conditions the well is shut off, but otherwise it operates on a twice weekly schedule. **Figure 1-1** identifies the location of this well, which was installed in January 2000 and has open-hole completion between 31 and 142.5 feet bgs. LTWLM will continue in the vicinity of this well to evaluate the potential impact of pumping at the irrigation well on operation of the RAPA system. The operation of this well is most evident as regular drawdown and recovery signatures in the LSAS and AF Gravels on **Figure 4-9**.

4.1.2.5 1201 TALLEVAST RD WELL

Figure 1-1 identifies the location of an irrigation well at 1201 Tallevast Rd. This well is cased from the ground surface to 44 ft bgs and has open-hole completion below that depth. A video camera log indicated that the hole collapsed at 138 ft bgs; the pump installation contractor indicated the total depth of the well is approximately 280-320 ft bgs. The irrigation schedule for the well was originally quite distinctive: the well was pumped all night (12 hours/night) at 95 gpm for four consecutive days, and then was completely off for the remaining three days of the week. This pumping had originally been observable in the Tallevast Road Ditch and Golf Course well clusters. Currently, this well is reportedly used for nightly irrigation.

4.1.2.6 NORTHWEST AREA WELLS

Prior to installation of the LTWLM transducers, the FDEP and Lockheed Martin suspected that groundwater supply wells were being operated at the industrial park located to the northwest of the Site. Based on hydrographs presented on **Figures 4-5** it is apparent that at least one extraction well is operating in the Northwest Area. A door-to-door survey, combined with an intensive records search, was completed in 2011 and 2012. The results

indicated that there are multiple wells in the area potentially extracting water from the AF Gravels, S&P Sands, and vertically adjacent lithologic units for irrigation purposes. The USAS was not targeted by any of the wells identified in these surveys. These wells, along with their expected primary groundwater extraction zone, are shown on **Figure 1-1**. Based on LTWLM data patterns, it appears that the overall distribution and pumping rates of wells in this area have not changed since 2012.

The following wells were identified in 2012 as likely pumping influences due to their use in irrigating the properties on which they are located and their proximity to the Northwest Area well cluster:

- 7300 15th St E – This well is screened from 46-153 ft bgs and is used for irrigation approximately twice a week.
- 7230 15th St E – The well depth is greater than 150 ft but could not be confirmed, although it was reportedly originally used for orange grove irrigation. The well is used for irrigation about once a week.
- 7260 15th St E – The well is screened from 46-165 ft bgs and is used for irrigation, although the frequency of irrigation is not known.
- 7455 16th St E – This well is screened from 36-235 ft bgs and used for irrigation at least 4 times a week, but possibly daily.

The drawdown observed in the Northwest Area monitoring cluster in response to the combined pumping effects of these wells is generally less than one foot in the LSAS, one to three feet in the AF Gravels, and a few inches in the S&P Sands. No drawdown response was observed in the USAS. The Tallevast Road Ditch area monitoring well cluster may also be responding to this pumping, but the response in the AF Gravels is very small (about 2 inches). Long-term monitoring of the interaction of the RAPA system and the drawdown caused by the Northwest Area extraction wells is ongoing, but the interaction between these wells and the RAPA system appears to be minimal.

4.2 GROUNDWATER LEVEL MONITORING

Transducers were installed in well clusters at nine different locations. Assessment of the water levels over time reveals that, in general, variability in the water levels is due to nearby

groundwater extraction, precipitation, and regional influences. Regional influences typically are a combination of environmental effects (droughts and wet years) and the human response to those effects. For example, in droughts or dry seasons, irrigation requirements increase, resulting in increased pumping of both public and private wells across the region. This is noticeable as a generalized decline in water levels in the pumped aquifers, although the effects of individual pumping wells are often not distinguishable from one another. Thus, a pattern of higher groundwater elevations is often observed in all units when the rainfall has been high, even though the precipitation is not directly recharging the deeper units.

Each cluster of instrumented wells is described in the following sections and the insights gained from monitoring that cluster of wells during the June 2015 to June 2016 monitoring period are summarized. Often, the data gathered were used for multiple purposes that are not called out individually in the summary. For example, data from the Golf Course and On-Facility wells were used to help assess well efficiency in nearby extraction wells and trenches. The data collected have also been used to supplement manual water level measurements and aid in their interpretation.

4.2.1 ON-FACILITY

The On-Facility cluster wells are equipped with transducers to monitor the hydraulic effects in the area of highest COC concentrations, which were also the focus of the remedial systems in place at the Facility. Thus, this cluster has been a primary tool in monitoring the effects of the RAPA system. Variation in the water levels within and between groundwater zones is generally due to operation of nearby remedial system extraction wells and precipitation. The large influence of the RAPA system tended to mask the effects of any regional trends. Some items of interest on **Figure 4-1** are discussed below.

The effects of RAPA operation are clearly evident at the Facility. The yearly average water levels based on pre-RAPA data sets for the USAS, LSAS, AF Gravels, and S&P Sands units at the Facility would be approximately 26, 22, 15, and 12 ft above mean sea level (amsl), respectively, in the absence of the RAPA pumping. From the data presented in **Figure 4-1** it is evident that the effects of groundwater extraction have significantly

decreased the average water levels in each of these units. Comparison with the corresponding data from last year's monitoring report (AECOM, 2015) indicates that the drawdown on-Facility has remained fairly consistent over the past two years.

The on-Facility storm-water retention pond has been affected by RAPA operations. RAPA pumping from the USAS causes declines in the water level below the pond, which induces the movement of water from the pond into the underlying USAS. As a result, contrary to pre-RAPA conditions, the pond typically only contains water temporarily after it captures storm water runoff; otherwise it is dry.

Stilling Well-1R (located in, but near the edge, of the pond) was replaced with Stilling Well-1R2, which is located in the deeper, center portion of the pond, in April 2016 to allow improved monitoring of water levels in the pond. Both locations are shown in **Figure 1-1**.

In contrast to the shallow zones targeted by RAPA groundwater extraction, water levels at Floridan well MW-123 were slightly higher than those observed in prior years. To confirm this observation, average groundwater elevations at MW-123 were calculated for each year-long period running from June 1 to May 31, starting with 2008 and ending with 2015. The calculated averages for this period ranged from 13.4 to 16.3 ft amsl. The average groundwater elevation from June 1, 2015 to May 31, 2016 was 17.6 ft amsl.

4.2.2 SOUTHWEST AREA

The Southwest Area cluster wells are equipped with transducers to monitor for off-site pumping near the edges of the Site that might influence transport of COCs. No new pumping influences were identified during the June 2015 to June 2016 monitoring period (**Figure 4-2)**. When nearby RAPA system wells are shut down for a few hours, the response is evident as a few inches of recovery in the water levels at the LSAS, AF Gravel, and S&P Sands wells. Such minor changes in water levels are generally not evident in the USAS well at this location.

4.2.3 CONVENTION CENTER

The Convention Center cluster wells are equipped with transducers to monitor for off-site pumping near the edges of the Site that might influence COC transport. No new pumping influences were identified during the June 2015 to June 2016 monitoring period (**Figure 4-3)**. When nearby RAPA AF Gravels extraction wells are briefly shut off, the response is between 0.2 and 1.5 feet of recovery in the AF Gravels monitoring well, depending on which extraction wells are shut off and how long they remain off. No response to temporary RAPA well shutdowns is evident at the wells completed in the LSAS and S&P Sands, although several feet of drawdown due to RAPA operation have been observed at these wells since startup.

4.2.4 NORTHEAST AREA

The Northeast Area cluster wells are equipped with transducers to evaluate whether the presence of the nearby pond (TW-2) allowed improved connection between the USAS and LSAS and to investigate the possible presence of pumping wells in that vicinity. The hydrographs for the June 2015 to June 2016 monitoring period are presented as **Figure 4-4**. Groundwater elevations in **Figure 4-4** for the USAS and LSAS are nearly identical in this area; this is likely because TW-2 is recharging both units. As in previous years, the drawdown pattern in the AF Gravels associated with regular pumping of the irrigation well at 7660 Matoaka Rd (see Section 4.1.3.4) can be identified on **Figure 4-4**, although the drawdown is only about four inches because these monitoring wells are approximately 3000 feet away from the irrigation well. Superimposed on that small regular drawdown are irregular, one- to five-foot recovery curves associated with brief shutdowns of nearby AF Gravels RAPA system extraction wells.

4.2.5 NORTHWEST AREA

The Northwest Area cluster wells were equipped with transducers primarily to monitor for possible irrigation well influences in the nearby industrial area. As is evident in **Figure 4-5**, there is a consistent daily decline in water levels at the LSAS, AF Gravels, and S&P Sands wells that is associated with the combined effects of pumping from multiple

irrigation wells in the industrial area. Because the irrigation wells all operate at night and screen similar intervals, identifying which well(s) are responsible for each drawdown effect is difficult.

The water removed from the LSAS, AF Gravels, and S&P Sands by the irrigation wells in the industrial area is applied to the USAS as irrigation water and, in some cases, is also used to maintain decorative ponds. In addition, a number of residences located northwest of the industrial area utilize privately owned irrigation wells, though on a smaller scale. These wells may also influence groundwater levels. The process of applying water from deeper zones to the USAS during irrigation has likely been both ongoing and consistent for many years. As a result, the groundwater levels in the LSAS, AF Gravels, and S&P Sands are generally about ten feet lower than those in the USAS. Because the pumping is consistent over time, the average water level trends in the three affected units tend to track with regional trends.

The effects of the RAPA system on the LSAS, AF Gravels, and S&P Sands, if present, are masked by the effects of local irrigation pumping. Any effects of the RAPA system on the USAS water levels in the Northwest Area wells are overshadowed by the consistent nearby lawn irrigation. The current groundwater elevations in this area are very similar to the groundwater elevations observed before RAPA startup, and a comparison with specific RAPA extraction well shutdown and restart events did not reveal any clear responses in the Northwest Area wells. In addition, inspection of potentiometric maps (Figures 3-1 through 3-5 of the RASR main text) suggests that the effects of the RAPA system pumping in this area are likely to be small. Thus, it appears that the interaction of the RAPA system with the Northwest Area extraction wells is minimal.

4.2.6 GOLF COURSE POND

Transducers are currently installed in three groundwater wells near the Golf Course pond to monitor the effects of RAPA operations. **Figure 4-6** presents the hydrographs from June 2015 to June 2016 for this well cluster. The effects of temporary shutdowns of nearby RAPA system extraction wells are evident as small recovery curves or as vertical lines (in the case of very brief shutdowns) in the USAS, LSAS, and AF Gravels. Any potential

drawdown due to operation of more distant irrigation wells was masked by the effects of the nearby RAPA extraction system wells.

4.2.7 TALLEVAST ROAD DITCH

The Tallevast Road Ditch area cluster wells are equipped with transducers, in part, to monitor the interaction of the ditch with the USAS and LSAS over time. The water in the ditch typically has an elevation of between 12 to 12.5 ft amsl, which is typically lower than the elevation of the groundwater in the USAS and LSAS at this location, as illustrated in **Figure 4-7**. Thus, groundwater would be expected to discharge to the ditch from both the USAS and LSAS most of the time. During periods of high storm flow, water in the ditch briefly serves as a source of highly localized recharge to these units. Good examples of this situation are evident in hydrographs in October 2015 and May 2016 time frame (**Figure 4-7)**. At these times, rainfall events with precipitation over 2.5 inches raised the ditch water level above the groundwater elevation in the adjacent USAS and LSAS wells.

Several private wells have influenced water levels in the AF Gravels and S&P Sands at the Tallevast Road Ditch well cluster; the USAS and LSAS were not visibly affected by these wells. The 1201 Tallevast Rd irrigation well is located only 700 feet from the Tallevast Road Ditch cluster and reportedly operates on a regular basis. The small ups and downs evident in water levels in the AF Gravels well indicates that there are likely other wells operating in the area. This is to be expected, since the industrial complex immediately north of Tallevast Road Ditch has multiple operating irrigation wells.

Drawdown in the AF Gravels and S&P Sands due to RAPA system operation was evident at the Tallevast Road Ditch cluster based upon observations during RAPA startup as described in the 2014 RASR, Appendix F (AECOM, 2014). However, individual recovery curves resulting from temporary well shutdowns were not evident. There was no visually-discernible evidence of drawdown due to RAPA system operation in the USAS or LSAS at this location.

4.2.8 HIGHWAY 301

The current Highway 301 cluster wells are equipped with transducers to monitor pumping influences on the eastern edge of the Site, including influences from both private irrigation wells and the RAPA system. In the current Highway 301 well cluster, only water levels in the AF Gravels well showed any response to pumping (**Figure 4-8**). The AF Gravels well responded to twice-weekly (when needed) pumping of the 7660 Matoaka Rd irrigation well, characterized by a few inches of drawdown and recovery.

Water levels at that monitoring well also responded to RAPA system extraction, with up to two feet of recovery when the nearest AF Gravels extraction wells (approximately 1600 feet away) were shut down temporarily. A good example of such recovery response was associated with the shutdown of some RAPA extraction wells due to nearby gas line construction activity in early December 2015. This shutdown was longer than usual (approximately eight days) and involved a number of RAPA wells, of which seven were in the AF Gravels.

4.2.9 EAST AREA

The East Area cluster wells were equipped with transducers at the same time as the original Highway 301 cluster wells to improve the monitoring of potential pumping influences in the adjacent industrial complex. As is evident on **Figure 4-9**, twice weekly (when needed) pumping of the 7660 Matoaka Rd irrigation well, located less than 500 feet from the well cluster, regularly causes drawdown in groundwater levels in both the LSAS and the AF Gravels.

Declines in water levels at the LSAS, AF Gravels, and S&P Sands wells in response to RAPA system pumping continue to be observed. In the AF Gravels, temporary shutdowns of the nearest AF Gravels extraction wells (located about 1700 ft away) result in up to two feet of recovery, depending on the number of wells shut down and the length of time they remain off. Recoveries of up to six inches are evident in the LSAS in response to the same AF Gravels well shutdowns, indicating that communication between the LSAS and AF Gravels may be better than is noted elsewhere. For example, the shutdown in early

December 2015 for gas line construction activity resulted in two feet of recovery in the AF Gravels and six inches of recovery in the LSAS. Although some LSAS wells were also shut down at that time, shutdowns in prior years involving only AF Gravels wells have induced a similar response in the LSAS at this location, indicating that shutdown of the nearby AF Gravels wells is likely driving the response.

4.3 COMPARISON OF WATER LEVELS BETWEEN WATER-BEARING ZONES

One goal of the LTWLM program is to provide data to facilitate a comparison of groundwater elevations in, and evaluate the potential interaction between, water-bearing zones on a relatively detailed and continuous time scale. As noted at the outset, continuous monitoring has significant advantages over manual water level events when characterizing the long- and short-term relationships between water-bearing zones. Continuous monitoring supplements the tracking of seasonal and climatic variation of vertical gradient and also permits evaluation of the effects of individual storm events, water supply pumping, and remediation system operations on the gradients between water-bearing zones.

The focus of the following sections is on the direction of vertical gradients and degree of separation between hydraulic units during the June 2015 to June 2016 period of monitoring. More specific calculations of vertical gradient are provided in the main text of the RASR and a detailed discussion of the data collected in prior years is provided in previous RASR documents. While a strong vertical gradient often implies hydraulic separation between water-bearing zones, the lack of a vertical gradient does not always indicate a connection between zones. In some cases, the similarity of hydraulic heads and responses may be due to separate water-bearing zones responding to the same hydraulic stresses.

4.3.1 USAS AND LSAS

Groundwater levels in the USAS wells are generally moderately to significantly higher than those in the corresponding LSAS wells, with the difference ranging from less than one foot to over ten feet. The difference in groundwater elevation between the USAS and

LSAS varies between well nests. In the Northeast Area, Southwest Area, and near Tallevast Road Ditch, the groundwater elevation in the USAS is generally less than a foot higher than that in the LSAS. This is likely due to the proximity of these clusters to surface water features that affect both units and the lack of significant pumping influences on the LSAS in those areas. Water levels at the golf course used to fall into the same category. However, the RAPA system operation creates greater drawdown in the LSAS than in the USAS, resulting in a greater separation of the heads (**Figure 4-6**). On-Facility, the RAPA-related drawdown currently results in a head differential of approximately 15 feet between the USAS and LSAS.

The exact vertical position of the LSAS well screen has a bearing on the magnitude of the difference in groundwater elevation between the USAS and LSAS. For example, the On-Facility well cluster has one well (PZ-LSAS-7) screened very near the top of the LSAS and another well (MW-37) screened near the bottom. These two LSAS wells have very different groundwater elevations, as shown in **Figure 4-1**. The upper LSAS well is closer in groundwater elevation to the nearby USAS well (MW-36), due to its screened interval. Previous reports have identified the finely laminated nature of the LSAS that results in a sharp head drop across the unit.

Local pumping also has an influence on water levels in the LSAS in some locations. Some production wells in the industrial and commercial areas surrounding the Site are cased down to the top of the LSAS or deeper into the same unit, followed by open-hole completion through portions of the Hawthorn Group and Arcadia Formations. This can result in portions of the LSAS (which is the uppermost portion of the Hawthorn Group) being open to or influenced by pumping from the deeper units. Water levels in the LSAS at the Northwest Area and the East Area well clusters are affected by operation of local industrial or commercial wells. Pumping of these wells increases the difference in groundwater elevation between the USAS and LSAS because the USAS is generally not subject to pumping and often is irrigated using the water removed from lower units. Also, some unlined decorative ponds in the USAS are maintained using well water, resulting in additional localized recharge to the USAS.

4.3.2 LSAS AND AF GRAVELS

Groundwater levels in the LSAS are typically higher than those in the corresponding AF Gravels well in most locations. However, the operation of nearby LSAS remediation wells or irrigation system extraction wells open to the LSAS can result in groundwater levels in the LSAS being the same or lower than those in the AF Gravels. For example, as shown on **Figure 4-1**, the groundwater level in the AF Gravels well at this location was briefly higher than that in the LSAS well in mid-October 2015, when the AF Gravels extraction wells were off but the LSAS extraction wells were still operating.

In addition, irrigation wells affect water levels in both the AF Gravels and the LSAS in the Northwest Area and the East Area (**Figures 4-5** and **4-9**). In both areas, the groundwater elevation in the LSAS is only marginally higher than that in the AF Gravels, even when the irrigation wells are not operating. The response of the LSAS to remedial pumping from the AF Gravels near the East Area (discussed in Section 4.2.9) implies that, in the East Area, there may be a better connection between the two units. In the Northwest Area, the LSAS heads are most likely decreased by persistent pumping that is so frequent that the heads never recover to static levels. However, it's also possible that the LSAS and AF Gravels heads in the Northwest Area would be similar even in the absence of pumping, perhaps due to a locally enhanced connection between the two water-bearing zones.

4.3.3 AF GRAVELS AND S&P SANDS

The difference between groundwater levels in the AF Gravels and the S&P Sands varies by location and with time. At the On-Facility cluster (**Figure 4-1**), the RAPA system operation currently governs the gradient between the AF Gravels and S&P Sands. The direction of the gradient varies with extraction rates from nearby wells in each unit. During the period from June 2015 to June 2016 the groundwater levels in the S&P Sands have been about three feet higher than those in the AF Gravels.

At the Southwest Area, Convention Center, Northeast Area, Highway 301, and East Area clusters, groundwater levels in the AF Gravels were consistently lower than those in the S&P Sands during the period from June 2015 to June 2016. This condition is likely due to

consistent RAPA and/or irrigation pumping in the AF Gravels during that time period. The pre-RAPA groundwater elevations are known for all but the current Highway 301 cluster. The pre-RAPA hydraulic heads in the S&P Sands at the Convention Center, Northeast Area, and East Area tended to be lower than those in the AF Gravels when irrigation pumping was low. In the Southwest Area (**Figure 4-2**), the hydraulic heads of the two units were nearly the same prior to RAPA startup and when not influenced by nearby irrigation pumping. After RAPA system startup, water levels in the AF Gravels declined such that the groundwater elevation was below that of the S&P Sands in all the areas mentioned. Although the current Highway 301 cluster was not instrumented prior to RAPA system startup, manual water levels indicate that a similar pattern of decline in the AF Gravels head after RAPA startup occurred at this location.

In the Northwest Area (**Figure 4-5**), the groundwater levels in the S&P Sands are typically two to four feet lower than those in the AF Gravels when nearby wells are not actively pumping. The water levels in the two units tend to follow similar trends.

In the Southwest Area and near Tallevast Road Ditch, the water levels in the AF Gravels and S&P Sands are very similar during times of minimal pumping (**Figures 4-2 and 4-7**) . Water level changes over time in both units follow approximately the same trends. However, this does not necessarily mean that these two units are in direct hydraulic communication; rather, the same regional hydraulic influences are affecting both units. Experience has shown that applying stress (i.e., pumping) to the AF Gravels often doesn't produce a response in the S&P Sands, illustrating that the intervening sequences of carbonate rock impede hydraulic communication.

4.3.4 S&P SANDS AND LOWER AF SANDS

In general, the groundwater levels in the Lower AF Sands are higher than those in the S&P Sands. Groundwater does not appear to be extracted from the Lower AF Sands in the vicinity of the LTWLM monitoring well clusters. The LTWLM monitoring well clusters that include wells completed in the Lower AF Sands are the On-Facility, Convention Center, Northeast, Northwest, Tallevast Road Ditch, Highway 301, and East areas.

The water level trends in the Lower AF Sands and S&P Sands are typically quite different because the S&P Sands is often affected by water supply pumping, while the Lower AF Sands generally is not targeted for water supply. However, during the current period (June 2015 to June 2016) water levels in the two units often followed approximately the same trend because some of the nearby water supply wells that previously targeted the S&P Sands have been abandoned. In the absence of pumping, the main influences on hydraulic head are regional and thus affect both the Lower AF Sands and the S&P Sands. The exception was at the On-Facility monitoring well cluster, where water levels at the S&P Sands well were strongly influenced by RAPA extraction, while water levels at the Lower AF well were not (**Figure 4-1**). The fact that the RAPA system strongly affects the S&P Sands but does not visibly influence the Lower AF sands supports the concept that the two units are hydraulically disconnected. Water levels in the Lower AF Sands are usually higher than those in the S&P Sands, even during non-pumping conditions. This indicates that water in the S&P Sands is not recharging the Lower AF Sands, or, perhaps, that the Lower AF Sands serve as a very minor source of water to the S&P Sands.

4.3.5 LOWER AF SANDS AND UPPER FLORIDAN AQUIFER

MW-123 is a Floridan monitoring well located on the Facility; it is the sole Floridan well in the LTWLM monitoring well network. This is because the regional significance of the Floridan Aquifer as a water supply source means that it is extensively monitored by other entities. In addition, the LTWLM program demonstrated early in its history that the Lower AF Sands and Upper Floridan units are hydraulically separated from the overlying aquifer units. This same conclusion was reached based on extraction well performance testing at the Facility as the RAPA system was being implemented.

The MW-123 hydrograph for June 2015 to June 2016 is included in **Figure 4-1**. The Upper Floridan Aquifer is subject to significant water supply and irrigation well pumping, the effect of which is evident in the hydrograph. The groundwater elevation variations over time are much greater at MW-123 (Upper Floridan Aquifer) than at nearby MW-19 (Lower AF Sands); the effects of pumping from the nearby Golf Course well are evident in the MW-123 hydrograph as small drawdown and recovery curves. Thus, while the overall

pattern of rising and falling groundwater levels is comparable between the two wells, changes in level at the Floridan well are more extreme and the direction of the gradient between the two aquifers changes over time as a result.

4.4 WATER LEVELS WITHIN AQUIFER ZONES

The main text of the RASR provides a discussion of horizontal gradients within each zone based on contour maps created from the most recent synoptic water level gauging event. The LTWLM data collection has provided supplemental information for helping guide the analyses and interpretations presented in the RASR and in prior groundwater monitoring reports.

SECTION 5
Conclusions

The LTWLM program, begun in 2008, has generated data of great value for purposes of characterizing the hydrogeologic system at the Tallevast site, identifying off-site pumping stresses of potential concern, and monitoring the initial and ongoing effects of the RAPA system. During the current monitoring period, from June 2015 to June 2016, the LTWLM data were used for the following purposes:

- Tracking RAPA-related drawdown effects both at the Facility and at the edges of the Site and guiding related potentiometric surface representation;
- Monitoring the hydraulic interaction (or lack thereof) between water-bearing zones and providing information on how that interaction is affected by known pumping influences;
- Guiding representation of the effects of surface water bodies on groundwater potentiometric surfaces based on the data from On-Facility, Tallevast Road Ditch, and Northeast Area clusters;
- Providing data for groundwater model testing and calibration; and
- Identifying the need to move well SW-1R to SW-1R2 (located a deeper portion of the On-Facility Pond) as water levels in the USAS remain low.

The LTWLM program will be continued as RAPA operations proceed. Modifications for maintaining LTWLM effectiveness will continue to be made, when appropriate.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

Job Narrative
660-69143-1

Comments
No additional comments.

Receipt
The samples were received on 9/11/2015 at 1:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.0º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-69143-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Number: 1
Creator: Betancourt, Jonathan

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U	Indicates that the compound was analyzed for but not detected.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Login Number: 69507
List Number: 1
Creator: Southers, Kristin B

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
660-69705-1

Comments
No additional comments.

Receipt
The samples were received on 10/8/2015 at 1:20 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.9º C.

GC/MS VOA
Method(s) 8260C SIM: The following sample was anlayzed 4 minutes beyond the 12 hour tune window: Combined Influent (660-69705-7). This result matches historical data, therefore it has been reported without re-analysis.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast Process Sampling

TestAmerica Job ID: 660-69705-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U	Indicates that the compound was analyzed for but not detected.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
660-69706-1

Comments
This is a revised report. It replaces the report issued previously on 10/13/2015. Per the client's request, Sulfate was added to the 300.0 analyte list for sample RO permeate (660-69706-1).

Receipt
The samples were received on 10/8/2015 at 1:20 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 5.9º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

HPLC/IC
Method(s) 300.0: The matrix spike/matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-405135 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recoveries were within acceptance limits.

Method(s) 300.0: The native sample, matrix spike, and matrix spike duplicate (MS/MSD) associated with analytical batch 680-405135 were performed at the same dilution. Due to the additional level of analyte present in the spiked samples, the concentration of Chloride in the MS/MSD was above the instrument calibration range. The data have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method(s) SM 2540C: In analytical batch 660-162167, the following sample duplicate had TDS/conductivity ratio above 0.95: (660-69733-A-3 DU).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

HPLC/IC

Qualifier	Qualifier Description
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
L	Off-scale high. Actual value is known to be greater than the value given.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U	Indicates that the compound was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

General Chemistry

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Detection Summary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast Quarterly RO Performance

TestAmerica Job ID: 660-69706-1

Client Sample ID: RO permeate — Lab Sample ID: 660-69706-1

Analyte	Result	Qualifier	PQL	MDL	Unit	Dil Fac	D	Method	Prep Type
Chloride	1.1		0.50	0.20	mg/L	1		300.0	Total/NA
Sulfate	0.46	I	1.0	0.40	mg/L	1		300.0	Total/NA

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Sample Summary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-70021-1

Lab Sample ID	Client Sample ID	Matrix	Collected	Received
660-70021-1	AOP Feed	Water	10/22/15 08:30	10/22/15 14:00
660-70021-2	AOP-A effluent	Water	10/22/15 08:35	10/22/15 14:00
660-70021-3	AOP-B effluent	Water	10/22/15 08:40	10/22/15 14:00
660-70021-4	AOP-C Effluent	Water	10/22/15 08:45	10/22/15 14:00
660-70021-5	PGE	Water	10/22/15 08:50	10/22/15 14:00
660-70021-6	SGE	Water	10/22/15 08:55	10/22/15 14:00
660-70021-7	Combined Influent	Water	10/22/15 09:00	10/22/15 14:00

Job ID: 660-70021-1

Laboratory: TestAmerica Tampa

Narrative

Job Narrative
660-70021-1

Comments
No additional comments.

Receipt
The samples were received on 10/22/2015 2:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.4° C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-70021-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Detection Summary

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 11/5/2015 3:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 3.0º C, 3.2º C and 4.1º C.

GC/MS VOA
Method(s) 8260B: The following sample was diluted to bring the concentration of target analytes within the calibration range: EW3012_INF (660-70273-52). Elevated reporting limits (RLs) are provided. Batch 163352.

Method(s) 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: EW3023_INF (660-70273-63) and EW4003_INF (660-70273-70). Elevated reporting limits (RLs) are provided. Batch 163362.

Method(s) 8260B: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 163358 recovered outside control limits for the following analytes: dichlorodifluoromethane.

Method(s) 8260B: The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 163404 recovered outside control limits for the following analytes: dichlorodifluoromethane, trichlorofluoromethane and vinyl chloride.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Analysis Requested

Preservation Codes:

A - HCL	M - Hexane
B - NaOH	N - None
C - Zn Acetate	O - AsNaO2
D - Nitric Acid	P - Na2O4S
E - NaHSO4	Q - Na2SO3
F - MeOH	R - Na2S2SO3
G - Amchlor	S - H2SO4
H - Ascorbic Acid	T - TSP Dodecahydrate
I - Ice	U - Acetone
J - DI Water	V - MCAA
K - EDTA	W - ph 4-5
L - EDA	Z - other (specify)

Other:

Sample Identification	Sample Date	Sample Time	Sample Type (C=comp, G=grab)	Matrix (W=water, S=solid, O=waste/oil, BT=Tissue, A=Air)	Field Filtered Sample (Yes or No)	Perform MS/MSD (Yes or No)	8260B - VOC + SIM	Total Number of containers	Special Instructions/Note:
			Preservation Code:				A		
EW4010_INF	11/03/15	1523	G	Water	N	Y	X	4	
EW4011_INF	11/03/15	1540	G	Water	N	Y	X	4	
EW5001_INF	11/04/15	1354	G	Water	N	Y	X	4	
EW5002_INF				Water					
				Water					
				Water					
				Water					
				Water					

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown ☐ Radiological

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Deliverable Requested: I, II, III, IV, Other (specify)

Special Instructions/QC Requirements:

Empty Kit Relinquished by:	Date:	Time:	Method of Shipment:

Relinquished by:	Date/Time:	Company	Received by:	Date/Time:	Company

Custody Seals Intact: ☐ Yes ☐ No | Custody Seal No.:

Cooler Temperature(s) °C and Other Remarks: 4.5/4.1 2.4/2.0 3.6/3.2

Login Sample Receipt Checklist

Client: AECOM Technical Services Inc.

Job Number: 660-70273-1

Login Number: 70273
List Number: 1
Creator: Betancourt, Jonathan

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

Job Narrative
660-70290-1

Comments
No additional comments.

Receipt
The samples were received on 11/6/2015 1:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.5º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-70290-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
660-70293-1

Comments
No additional comments.

Receipt
The sample was received on 11/6/2015 1:15 PM; the sample arrived in good condition, properly preserved and, where required, on ice.
The temperature of the cooler at receipt was 0.5º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-70293-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Creator: Betancourt, Jonathan

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

Job Narrative
660-70571-1

Comments
No additional comments.

Receipt
The samples were received on 11/20/2015 5:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.8º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-70571-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
660-71008-1

Comments
No additional comments.

Receipt
The samples were received on 12/14/2015 1:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.0º C.

GC/MS VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-71008-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
U	Indicates that the compound was analyzed for but not detected.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Source: TestAmerica Tampa

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

Job Narrative
660-71124-1

Comments
No additional comments.

Receipt
The samples were received on 12/16/2015 4:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.6º C.

GC/MS VOA
Method(s) 8260B: The laboratory control sample (LCS) for batch 164968 recovered outside control limits for the following analyte: hexachlorobutadiene. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: Both low level analysis had internal standard failures; therefore, sample was taken from an alternate container and analyzed. Batch 164968.
Spent Carbon (660-71124-1)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method(s) 1311: EPA Method 1311 requires the room temperature to be maintained at 23 +/- 2 degrees Celsius for the duration of the leaching process. For batch 415744 the temperature was outside of this range. As a result, the test was not fully compliant with the requirements of 40 CFR Part 261. MIN:23.6 MAX:25.6

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-71124-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.
I	The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.
J3	Estimated value; value may not be accurate. Spike recovery or RPD outside of criteria.

Metals

Qualifier	Qualifier Description
U	Indicates that the compound was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Detection Summary

Client: AECOM Technical Services Inc.
Project/Site: Tallevast

TestAmerica Job ID: 660-71124-1

Client Sample ID: Spent Carbon — Lab Sample ID: 660-71124-1
