1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec)* has prepared this Sub-Slab Depressurization System Operation, Maintenance, and Monitoring Report (OM&M Annual Report) to meet requirements specified in the Operation, Maintenance, and Monitoring Plan, Sub-Slab Depressurization System (OM&M Plan) (Stantec 2014) for the Former Lockheed Martin French Road Facility (Site) at 525 French Road, Utica, New York. A Site location map is presented as Figure 1, and the Site Plan and System Layout are shown on Figure 2.

As outlined in the OM&M Plan, this OM&M Annual Report documents the following: continuous operation of the sub-slab depressurization system (SSDS); monitoring of differential pressures; quarterly influent and effluent sampling, and system leak testing. This report summarizes the SSDS OM&M activities performed from January through December 2014.

*Note: At the beginning of 2014, Lockheed Martin retained Stantec to serve as Performing Contractor for the remedial program at the Utica site. The former contractor was Arcadis. Portions of this report are based on the *2013 Annual Sub-Slab Depressurization System Operation, Maintenance, and Monitoring Report* (February 2014) prepared by Arcadis.

2.0 SUB-SLAB DEPRESSURIZATION SYSTEM

The SSDS was initially installed in November 2007 and was operated as a pilot test to evaluate the system's effectiveness in addressing sub-slab concentrations of chlorinated volatile organic compounds (VOCs) requiring mitigation per the New York State Department of Health (NYSDOH) *Soil-Vapor-Intrusion Guidance* at the Site.

The initial pilot system extracted soil vapor from two sub-slab depressurization sumps (SDSs); SDS-1 and SDS-2. Based on the pilot-test results and supplemental indoor-air/sub-slab analytical results (*Revised Work Plan for the Interim Corrective Measure,* Arcadis 2008), the pilot-test system was expanded as part of an interim corrective action (ICM) plan to include an additional SDS location (SDS-3), a variable-frequency motor drive, and a programmable-logic controller (PLC) equipped with a cellular modem. Following the SSDS startup-shakedown period, the SSDS began continuous operation in July 2008. The ICM SSDS operated from July 2008 through November 2010.

As presented in the *Sub-Slab Depressurization System 100% Design Work Plan* (Arcadis 2010), OM&M activities during 2009 indicated that the ICM SSDS was not meeting operational goals (specifically in the area north of SDS-1 and west of SDS-3), thereby requiring system expansion and modification. In September 2010, SSDS upgrade activities (which included the installation of four additional depressurization sumps [SDS-4 through SDS-7] and upgrades to other major components of the system) were initiated. The purpose of these upgrades was to expand the capture area of sub-slab vapor from areas of the main building not currently being mitigated by the system. System upgrades continued into February 2011, at which point the expanded system began full-scale operation. A detailed description of the upgraded system was documented in the revised *Sub-Slab Depressurization System Operational, Maintenance, and Monitoring Plan* (Stantec 2014).

As presented in the *Work Plan for SSDS Pilot Test in Area of VMP-7A Solvent Dock Area* (Arcadis 2013), a pilot test was conducted to address the vacuum performance of the existing SSDS in the vicinity of vapor monitoring point (VMP) VMP-7A (*note: for purposes of this report, vacuum and differential pressure are reported as inches of water column [in. W. C.] and expressed as a positive value*).

The objective of the SSDS pilot test was to identify an SDS location(s) that would induce a vacuum greater than 0.004 in. W.C. in the sub-slab soil environment, at a sufficient radius to capture the area of VMP-7A and consistent with the design parameters (as presented within the *Sub-Slab Depressurization System 100% Design Work Plan* (Arcadis 2010). This was accomplished by the installation of SDS-8. The pilot test results indicated that operation of SDS-8 created a sub-slab vacuum at VMP-7A well in excess of the target performance criteria of 0.004 in. W.C. of vacuum. As a result, permanent piping and infrastructure incorporating SDS-8 into the full-scale SSDS was installed with approval from NYSDEC. SDS-8 was permanently brought online on October 23, 2013.

2.1 MAJOR SYSTEM COMPONENTS

Major components of the system are as follows:

- Eight SDSs (SDS-1 through SDS-8) are used to maintain a vacuum within selected Site areas. Each SDS was installed to a depth of two feet below the top of the concrete slab and was constructed of three-inch diameter polyvinyl chloride (PVC) well casing with 1.5 feet (ft) of 10-slot PVC well-screen. The well casing and screen were inserted into the borehole, the annular space between the well screen and the borehole was backfilled with a ⅜-inch diameter washed pea-stone filter pack to the bottom of the concrete slab, and the concrete slab was re-sealed with non-shrinking grout to the top of the slab to restore the facility floor.
- Three-inch diameter schedule-40 PVC conveyance pipe from the SDSs to the SSDS treatment equipment in the former pH Neutralization Building.
- One moisture separator (air/water separator [AWS-200]) for condensate collection.
- One inline-air filter to protect the blower from particulates (F-201).
- A single 15-horsepower regenerative blower (B-200).
- A 2-HP heat exchanger (HX-300) rated for 615 scfm.
- Two vapor-phase granular activated carbon (VPGAC) vessels (VPGAC-300 and VPGAC-301) operated in series to remove VOCs prior to SSDS discharge to the atmosphere. Each carbon vessel contains 1000 pounds (lbs) of granular activated carbon (Siemens VOCARB 36C).

Specific system details, including equipment specifications and model numbers can be found in the *Sub-Slab Depressurization System Operational, Maintenance, and Monitoring Plan* (Arcadis 2011). During SSDS operation, soil vapor is extracted from each SDS to create a vacuum under the floor slab. Refer to Figure 2 for extraction point locations. The applied vacuum extracts soil vapor from beneath the slab at each SDS and directs the soil vapor through individual, aboveground extraction pipelines to a common manifold, and conveys this vapor to the SSDS process equipment in the former pH Neutralization Building (Figure 2). The soil vapor is directed through a moisture separator to remove water vapor, through an inline air filter to remove particulates, by means of the regenerative blower, then to a heat exchanger and finally through VPGAC vessels for VOC removal including targeted VOCs (1,1-Dichloroethene, cis-1,2-Dichloroethene, Tetrachloroethylene, trans-1,2-Dichloroethene, Trichloroethene, and Vinyl Chloride) before SSDS discharge to the atmosphere. The vacuum under the floor slab mitigates the potential for soil vapor to enter the indoor air. Refer to Appendix A, Drawing M-1 and M-2, for the process flow descriptions and the piping and instrumentation diagram, respectively.

3.0 REMEDIAL OPERATIONAL OBJECTIVES

The SSDS operational goal is to reduce the potential for sub-slab soil vapor to intrude into the indoor air of the manufacturing building. The system operational objectives are as follows:

- Demonstrate a sufficient radius of vacuum influence in the sub-slab soil vapor environment beneath the building floor slab. The system achieves this by maintaining a vacuum beneath the building floor slab, creating a downward gradient (i.e., differential pressure) that will prevent migration of soil vapor into the manufacturing building. The Site-specific goal is defined as a constant vacuum in the sub-slab, regardless of heating, ventilation, and air conditioning (HVAC) conditions, maintained at greater than 0.004 in. W.C..
- Maintain and operate the system continuously without significant downtime.
- Demonstrate that the mass concentrations of constituents in the system exhaust remain below the NYSDEC Division of Air Resources (DAR) -1 guidance values before being discharged into the atmosphere.

The operational goals, as recommended in the 2013 OM&M Annual Report, were successfully achieved during the 2014 reporting period by performing the following activities:

- Monitoring the SSDS operation remotely on a daily basis to ensure continuous operation;
- Performing monthly physical system inspections to verify proper operation, and perform required maintenance;
- Performing quarterly system OM&M, which included the following:
    - Recorded SDS flowrates and vacuums, and differential pressure measurements at each VMP location.
    - Performed 24-hour continuous monitoring of differential pressure at select VMPs to verify that the SSDS is maintaining a continuous vacuum of 0.004 in. W.C. in the target areas.
    - Performed critical device testing to verify that the process control logic and instrumentation are functioning properly, and as designed.
    - Collected system effluent vapor samples during each quarter to monitor the effluent discharge concentrations of Site-related VOCs.

4.0 OPERATION AND MAINTENANCE ACTIVITIES

4.1 OPERATIONAL SUMMARY

The system was monitored via regular review of the daily system operational emails that are automatically generated and sent from the system PLC to system operators. System operational parameters are recorded during monthly Site inspections and quarterly system sampling events. Table 1 summarizes system monitoring data including: applied vacuums and extracted flow rates at each SDS, induced vacuum at each of the monitoring points (VMP-1A through VMP-8D), and the combined system effluent flow rate (FT-301). Figure 3 provides the average differential pressures measured at VMPs as part of the quarterly Site inspections. Refer to Appendix A, Drawing M-2, for sampling port and instrument locations.

The operation and maintenance (O&M) log sheets and Critical Device Testing logs sheets were updated in April 2014. Copies of the updated blank forms are included herein in Appendix B, along with completed field forms. An updated electronic copy of the *OM&M Plan* was distributed to the project team, and the hard copy kept onsite was also updated.

System runtime and down-time are summarized in Table 2. This report summarizes activities conducted during the calendar year, and system operational uptime is calculated for the calendar year. Note, however that operational data such as flow rates and mass removal are calculated using data from last readings obtained in December 2013 to the last readings obtained in December 2014.

The SSDS operated with an approximately 99% run time during the reporting period, with minor scheduled maintenance and/or operational interruptions due to system alarm conditions. The system was shut down several times for scheduled routine O&M activities throughout the reporting period, including various monthly, quarterly, and annual system inspections and/or testing. System shutdowns with durations less than three hours are not included in the system runtime calculation noted above.

In the event of an alarm condition, an alarm response log was prepared to document the alarm and any corrective actions and/or modifications made to the SSDS as a result. The section below summarizes the system alarms received during the reporting period.

4.2 NON-ROUTINE OPERATION AND MAINTENANCE ACTIVITIES

During the reporting period no non-routine system repairs were made.

- On February 21, 2014 a site visit was made to diagnose a drop in pressure (approximately 8 to 10 in. W.C.) observed in the PLC data for the pre-blower vacuum transmitter (VT-201). The system vacuum relief valve (VRV) was found to be leaking. The condition was corrected by manipulating the valve until it properly seated and remained closed. The valve functioned normally until the problem reoccurred on April 21. In response, the same action was taken to reseat the valve. VRV function remained normal throughout the remainder of 2014.

- On April 4, 2014 Stantec observed an accumulation of fibrous material on the floor along the north wall of the SSDS building in close proximity to the system. The material appeared to be potential bulk vermiculite insulation, which was historically a common insulating material often used for concrete block walls. The source of the material was uncertain but was suspected to have possibly been disturbed by rodents.

  Vermiculite is considered by the NYSDOH to be potentially asbestos-containing material (ACM) and should be treated and mitigated accordingly. ConMed arranged for the material to be removed by a licensed ACM contractor (Midlantic Environmental, Inc.). The work was performed primarily in April with followup work in July, 2014. Confirmatory air testing was performed in both cases to demonstrate sufficient removal and acceptable air quality. Stantec personnel did not enter the building until cleanup and confirmatory testing were complete. The block wall penetrations suspected to be the source of the material were sealed and no further occurrences have been noted.

4.3 ALARM CONDITIONS AND SYSTEM MODIFICATIONS

Several "fatal" alarm conditions occurred during the reporting period. Fatal alarm conditions are those which result in system shutdown. The cause of each system alarm and corresponding corrective action are summarized in Table 2. Alarm logs describing each alarm and response actions taken are included in Appendix C. Below is a summary of fatal system alarms during 2014 and system modifications (if any) that were made:

- February 3: Process 23 (high post-blower pressure). Site visit (Arcadis), drained condensate from VPGAC vessels and manifold. Restarted system – operation normal.
- March 1: Process 21 (Variable Frequency Drive [VFD] fault). Cause unknown, possibly related to ConMed electrical shutdown activities. System started remotely – operation normal.
- March 6: Process 23 (high post-blower pressure). Unable to connect remotely. Site visit; unplugged manifold drain fitting, drained ~8 gal. condensate; restarted system – operation normal.
- April 25, 27: Process 21 (VFD Fault). Cause unknown; PLC data indicates cause is coded as "Momentary Power Loss." Restarted system remotely each time – operation normal.
- May 1: Process 21 (VFD Fault). Cause unknown. Restarted system remotely – operation normal.
- June 16: Process 21 (VFD Fault). Cause unknown. Restarted system remotely – operation normal.
- June 21: Process 21 (VFD Fault). Cause unknown. Restarted system remotely – operation normal.

In response to the series of VFD faults apparently due to momentary power loss, adjustments will be made to the VFD settings to increase the Momentary Power Loss alarm tolerance. This alarm condition will continue to be tracked in 2015 for resolution.

Several non-fatal alarms or system communication deficiencies were observed during the reporting period. Alarm Logs generated for each of these alarm conditions or deficiencies are included in Appendix C. The following types of non-fatal alarms occurred:

- Process 14 (Air/Water Separator High Liquid Level);
- Lack of daily operational update email;
- Lack of daily operational update email attachments; and
- Process 27 (Low Air Flow Rate).

The lack of daily operational emails or missing daily operational email data attachments occurred several times in the first half of 2014. Stantec worked with EOS Research, the vendor/service provider for the PLC system during this time period in an attempt to resolve the problem. EOS made changes to the firmware used in operation of the PLC, but was not able to completely fix the problem. EOS contacted Verizon Communications who made additional changes to the communication system, including changing the IP address of the PLC. Although occasional missing attachments have been noted in the second half of 2014, the frequency of these occurrences has been significantly reduced, and overall communications with the PLC have remained relatively problem-free.

5.0 ANALYTICAL MONITORING ACTIVITIES

5.1 DAILY MONITORING

Daily remote monitoring of the system was performed during the reporting period. Monitoring included review of the daily system operational e-mails to confirm that the system was operational, that all system variables were within their allowable ranges, and that no alarm conditions were present.

5.2 MONTHLY MONITORING

The SSDS system was monitored monthly in 2014. Monitoring activities included inspection of critical system devices including the following:

- Air/Water separator, condensate collection points, and heat-trace outlet;
- Electrical and safety signage;
- SSDS vapor-exhaust vent screen;
- Process equipment valve locks; and
- Process piping including VPGAC connections.

Completed monthly O&M log sheets are attached in Appendix B.

5.3 QUARTERLY MONITORING

The Site was monitored quarterly during the reporting period. Note that the first quarter event, normally performed in January, was delayed until February to accommodate the transition from Arcadis to Stantec as Lockheed Martin's Performing Contractor for the project. Copies of completed quarterly O&M log sheets are attached in Appendix B. Monitoring activities included collection of the following data:

- Induced vacuum at each VMP location (Figure 3);
- Applied vacuum at the blower and each SDS location;
- Extracted-soil-gas flow rates at each SDS location and system effluent; and
- Barometric pressure and ambient temperature (obtained from local weather station). Note whether barometric pressure is rising or falling.

The results of the system inspections are documented on the O&M log sheets (Appendix B); key system parameters are summarized in Table 1. In addition to the data collection noted above, the following critical system devices were inspected quarterly:

- Air/Water separator, condensate collection points, and heat-trace outlet;
- Electrical and safety signage;
- SSDS vapor-exhaust vent screen;
- Process equipment valve locks; and

- Process piping including VPGAC connections.

Each of the critical system devices passed inspection during the reporting period.

5.3.1 Analytical Sampling

SSDS mid-VPGAC and vapor effluent samples were collected quarterly. Samples were collected with 1-liter batch-certified Summa® canisters with quick-grab regulators. All samples were analyzed by TestAmerica Laboratories of Burlington, Vermont per USEPA "Method TO-15" for VOCs.

SSDS influent vapor analytical results (collected from the individual sumps) are summarized in Tables 3 through 9. Combined influent, mid-VPGAC and effluent analytical results are summarized in Tables 10 and 11 respectively. Time-series plots of the analytical results for the primary COCs for each sump are provided in Figures 36 through 45. The laboratory analytical results for each sampling event are provided in Appendix D.

5.3.2 Checklist Items

In addition to the data collected above, the following critical system devices are inspected and/or tested quarterly:

- System electrical disconnect switch;
- System hand-off-auto switches;
- Control panel indicator lights;
- Battery-operated uninterruptible power-supply (UPS);
- Vacuum relief valve (VRV-200); and
- Inline filter (F-201).
- Vacuum transmitter VT-201 located on the vacuum side of the blower B-200;
- Flowmeter FT-301 located on the vacuum side of the blower B-200;
- Vacuum relief valve VRV-200 located on the vacuum side of the blower;
- High and High-High liquid-level switches LSH-201 and LSHH-201 located on air water separator AWS-200 tank;
- Pressure transmitter PT-201, located on the pressure side of the blower B-200;
- Temperature transmitter TT-201 and TT-301 located pre- and post- heat exchanger HX-300, respectively; and
- Wet Floor Sensor WFS-201 located below the VPGAC manifold.

Each of the critical system devices passed inspection during the reporting period. Copies of the Critical Device Testing forms are included with the OM&M Log Sheets in Appendix B.

5.3.3 Continuous Differential Pressure Monitoring

On February 5-6, April 2-3, July 9-10, and October 8-9, 2014, continuous monitoring of differential pressure at select VMPs was performed using continuous logging micromanometers (OMNIGUARD™ 4). Differential pressure was continuously monitored for a 24-hour period at each VMP location at least once during the reporting period. The micromanometer measures the differential pressure approximately every second and performs a rolling average of the past 15 measurements. Only the maximum and minimum differential pressure measurements over a five-minute period are recorded. Any differential pressures measured between the maximum or minimum values during each five-minute period are not recorded during normal operation.

The differential pressures measured during each of the events are presented on Figures 4 through 35. Not all VMPs are monitored during each event, however each VMP was monitored at least once during the reporting period, and some VMPs were tested more than once.

The majority of the VMP locations met or exceeded the minimum performance criteria for sub-slab vacuum (0.004 in. W.C.). Exceptions to this include:

- VMP-1A: Vacuum level at this point did not meet performance criteria during the Quarter 1 (February) event for approximately 80% of the time. This VMP was also monitored during all three remaining events in 2014 and criteria was successfully met essentially 100% of the time (approximately four readings were slightly above the performance threshold).
- VMP-6B: This VMP was measured during the Quarter 2 event only. The majority of the readings were well below the performance criteria, however a small number of points showed a drop in vacuum for a brief period near the end of the 24-hour test, and approximately seven readings were above the threshold.
- VMP-8D: This VMP was tested during the Quarter 4 event only, and did not achieve performance criteria throughout the entire 24-hour test. This vacuum monitoring point is scheduled for removal, inspection and replacement in 2015.

5.4 ANNUAL VAPOR INTRUSION MONITORING

An annual vapor intrusion study was performed in 2014 that included sub-slab soil-vapor and indoor-air samples collected to evaluate the effectiveness of the SSDS and monitor the current soil-vapor and indoor-air quality at the Site. This annual sampling was completed by a joint Arcadis/Stantec team on February 12-13, 2014; the results were summarized in the *Annual Vapor-Intrusion-Study Report for the Solvent Dock Area* (Stantec 2014), included herein as Appendix E).

Sampling included paired sub-slab soil gas and indoor air samples at 14 VMP locations, "split" samples of sub-slab soil gas at VMP-7B and indoor air at VMP-8D (the sub-slab sample at 8D was unsuccessful) and one ambient outdoor air location. The results determined that three locations (VMP-5A, VMP-6A, and VMP-7A) should be assigned a "Monitor" designation under the NYSDOH

VI guidance, due to concentrations of trichloroethene (TCE) in sub-slab soil gas; however at each location's paired indoor air sample, TCE was not detected above the reporting limit. In some cases this may have been due to higher-than-typical reporting limits for these samples that resulted from sample dilution for non-target compounds. This issue was addressed with the laboratory to avoid a similar situation from occurring in future events. At the remaining paired-sample locations, NYSDOH matrices indicate that (depending on the compound) either "No Further Action" is necessary or that "Actions to Identify Background Sources(s) and Reduce Exposures" should be implemented.

The quarterly performance data and annual VI study results indicate the SSDS is effective at maintaining a vacuum beneath the building slab and mitigating the potential migration of sub-slab soil gas to indoor air within the area of influence of the SSDS, with the exception of the area of VMP-8D. This VMP will be removed, inspected, and replaced in 2015 as necessary to facilitate obtaining further performance data in this area.

5.5 SSDS PIPING LEAK DETECTION TESTING

The SSDS piping was inspected and tested by Stantec for potential leaks on October 14-15, 2014. All solvent-welded and rubber-coupled joints were tested using an ULTRAPROBE 9000 audio detection instrument. No physical deficiencies were observed by the inspection, and no leaks were detected by the audio testing. Accordingly, no repairs or corrective measures are currently recommended for the system piping network. A copy of the *2014 Annual SSDS Piping Leak Detection Testing, Former Lockheed Martin French Road Facility Utica, NY* (Stantec November, 2014) is included in Appendix F.

In accordance with NYSDEC's approval of an 18-month testing interval, the next leak detection testing event will occur in April 2016.

6.0 SSDS PERFORMANCE RESULTS

The following subsections summarize the overall performance of the SSDS.

6.1 SSDS OPERATION

The SSDS operated continuously during the reporting period except for the brief down times noted above in section 4.3 and on Table 2. Overall runtime was approximately 99%.

Average instantaneous differential pressure readings for the vapor monitoring points 1A through 8D during the reporting period range from a vacuum of 0.005 in. W.C. to 7.251 in. W.C. Average vacuum readings for SDS-1 through SDS-8 range from 1.4 in. W.C. to 66.2 in. W.C. It should be noted that the SDS-2, SDS-3, and SDS-4 applied vacuums are lower by design due to their higher extracted soil vapor rates. The average combined influent flow rate for 2014 was approximately 101.2 standard cubic feet per minute (scfm).

The cumulative VOC mass removed by the SSDS was calculated based on the combined influent concentrations (Tables 3 through 10) and calculated flow rates (Table 1). Although the intended purpose of the system is to minimize vapor intrusion into indoor air, the system is also removing VOC mass from the sub-slab area. Cumulative VOC-mass removed from the sub-slab area is summarized in Table 13.

From the start of SSDS operations in July 2008 through December 2014, the system has removed 7.82 pounds of target VOCs (see Table 13). The percentage of target VOCs adsorbed by the VPGAC during the reporting period ranged from approximately 95.7% to 98.2%. The VOC concentrations emitted in the SSDS exhaust over the reporting period are below the allowable short-term guideline concentration (SGC) and annual guideline concentration (AGC) values in NYSDEC DAR-1 for all compounds. The individual VOCs emitted and their maximum allowable concentrations, as per NYSDEC DAR -1, are shown in Table 14.

6.2 ANALYTICAL RESULTS

Analytical data for sump samples and mid-carbon and system effluent samples are summarized in Tables 3 and 10. Figures 36 through 42 show plots of influent vapor VOC concentration versus time for TCE, tetrachloroethene (PCE), total dichloroethene (DCE; values represent combined concentrations of 1,1-DCE, cis-1,2-DCE, and trans-1-2, DCE) and vinyl chloride (VC) at each SDS location. Figures 44 and 45 depict VOC concentrations with time for the mid-carbon and effluent vapor samples. The following summarizes findings from these analyses:

Influent (Sump) Samples

- Sumps SDS-1 through SDS-5 have been in operation since 2008. In that time, sumps SDS-1, -3 and -4 appear to demonstrate stable VOC concentrations, while sumps SDS-2 and -5 appear to show decreasing trends.
- Sumps SDS-6 and -7 have been in operation since 2011. SDS-6 appears to show stable VOC levels, while SDS-7 indicates a decreasing trend through 2013, with stable levels in 2014.
- Sump SDS-8 has been operational since Quarter 4 of 2012 and has shown stable VOC concentrations since then.
- TCE is typically the VOC with the highest concentrations in the sump samples. Exceptions to this are sumps SDS-1 and -2, where PCE has shown the highest concentrations, and SDS-6 where PCE has shown sporadic "spikes" to levels above that of TCE.
- During the 2014 reporting period, the average influent total target VOC (1,1-dichloroethene, cis-1,2-dichloroethene, PCE, trans-1,2-dichloroethene, vinyl chloride and TCE) concentrations from each SDS location, calculated from Table 13, were as follows (concentrations in micrograms per cubic meter, or µg/m^3):
    - SDS-1 1,141.6
    - SDS-2 79.9
    - SDS-3 39.4
    - SDS-4 203.2
    - SDS-5 20.2
    - SDS-6 17.7
    - SDS-7 6.4
    - SDS-8 80.1

Mid-Carbon and Effluent Samples

The current carbon vessels have been in use since October 2009, when they replaced a smaller pair of vessels. The carbon media has not been changed since the vessels were installed. VOC concentrations in the mid-carbon samples (Figure 44) were variable through 2011, but show an apparently slowly increasing trend in total DCE concentrations since then. The carbon effluent samples results for TCE and PCE are variable and do not appear to indicate a trend. Total DCE results do however show an apparent rising trend since mid-2012.

These data indicate that carbon replacement may be warranted in 2015.

6.3 DIFFERENTIAL PRESSURE MONITORING RESULTS

As discussed in Section 4, measurement of differential pressure between the indoor-air and sub-slab environment were collected at each VMP and at each sump during the quarterly events. The differential pressures recorded at each VMP were used to monitor performance of

the system and its ability to maintain the desired vacuum in the soil vapor beneath the building floor slab. The differential pressures recorded are discussed in detail below.

Instantaneous differential pressures were recorded at each VMP with a handheld digital micromanometer; these data are summarized and shown on Table 1. The average instantaneous differential pressure values for each VMP are shown on Figure 3. Note that the differential pressure observed at each VMP location may reflect influence by more than one SDS location. The details of the 2014 monitoring results are discussed in the following sections.

6.3.1 Instantaneous Measurement

The area of vacuum influence measured during this reporting period is similar to the area of influence measured in 2013. The area of influence induced by Sumps 1 through 7 continues to include the eastern and northern Molding Facilities, CET Room in the north, and a main hallway and Warehouse Area J to the south and east. With the installation of SDS-8 at the end of 2013, the applied vacuum in the Warehouse Area J room was strengthened and the system's overall area of influence expanded to include the Molding Offices and a portion of the Molding Raw Material Storage Room to the south. Average readings from 2014 of VMP-8C and VMP-8D show that these points appear to be located at the southern extent of the area of vacuum influence generated by SDS-7 and SDS-8. Figure 3 depicts this data on a map of the system layout. Table 1A, shown below, summarizes the average instantaneous vacuum readings during the reporting period as well as the distance and direction of VMPs relative to associated sumps.

6.3.2 Continuous Data Logging

In addition to recording instantaneous differential pressures, and as discussed in Section 5.3.4 continuous data-logging micromanometers were used during quarterly events to monitor differential pressure over a 24-hour period. Every VMP was tested at least once and some were tested multiple times during the course of the year, in accordance with the recommendations of the 2013 OM&M Annual Report. This data was obtained to complement the instantaneous readings and to observe potential variations in sub-slab vacuum due to HVAC system operation, variation in barometric pressure, or other factors.

The 24-hour continuous data generally indicate that vacuum varies slightly over the course of a day at certain VMPs, as shown in several of the plots included in Figures 4 through 35. The data indicate that the SSDS performance may be slightly affected by HVAC, barometric pressure or other external influences at some locations.

The differential pressures recorded at each VMP, as described above, demonstrate that the SSDS is providing a sufficient vacuum in the sub-slab environment to mitigate the potential migration of sub-slab soil gas to indoor air, with the following exceptions:

- VMP-1A failed to meet the required vacuum criteria for most of the 24-hour test period in Quarter 1; however the results during Quarters 2 through 4 showed the required vacuum was successfully met during each of those tests. VMP-1A also met criteria in the three tests performed at this VMP in 2013 (with occasional brief exceedences). The 2014 Quarter 1 results may have been the result of faulty test equipment.
- VMP-8D did not meet the required vacuum criteria during the Quarter 4 event. The lack of proper vacuum at this VMP may be the result of plugged tubing in the VMP or an accumulation of water; accordingly this VMP is scheduled for further investigation and possible replacement in 2015. An assessment of sub-slab conditions at this location will be made at that time.

7.0 2015 GOALS AND RECOMMENDATIONS

The information presented in this report indicates that the SSDS has operated as designed. The exceptions were the Quarter 1 results at VMP-1A and the Quarter 4 measurement at VMP-8D. VMP-1A showed acceptable readings during subsequent quarterly measurements. VMP -8D will be further investigated in 2015. Continued operation, maintenance, and monitoring activities are planned to be implemented during 2015, and are described in the sections below.

7.1 GOALS

The SSDS 2015 remedial and operational goals remain unchanged from those noted in Section 3.0. The SSDS operation will continue to be monitored via the daily system data that are received by Stantec, along with monthly visual inspections, quarterly testing, and prompt response to alarms.

The operational data to be collected include:

- Review of the daily automated system operation status email logs to ensure continuous operation of the SSDS;
- Monthly system physical inspection to verify the operation of the system and to perform any minimal maintenance required to maintain proper operation (e.g., inspection of critical devices, draining of condensate, etc.);
- Quarterly system inspection information and required O&M and system performance monitoring data, including the recording of flows, pressures, temperatures, and differential pressure measurements at SDSs, VMPs, and the treatment equipment to verify the performance of the system;
- Vapor samples at each SDS, mid-carbon, and system effluent location will be collected during each quarter to monitor the mass removal of Site-related VOCs;
- Quarterly 24-hour continuous monitoring of differential pressure at eight select VMPs using continuous logging micromanometers to verify the system performance goal of maintaining a continuous vacuum of 0.004 in. W.C. in the areas of the Site noted above in Section 2;
- Quarterly critical device testing to verify that the control logic and instrumentation are functioning properly and as designed; and
- Continued demonstration that contaminant concentrations in the SSDS effluent vapor stream remain below the NYSDEC DAR 1 guidance values before being discharged to the atmosphere.

7.2 RECOMMENDATIONS

Our review and analysis of SSDS monitoring data for the 2014 reporting period indicates that the system is successful at mitigating sub-slab impacts noted as part of annual vapor-intrusion monitoring. Recommendations for the next reporting period (January–December 2015) include:

- Continue operation of the SSDS;
- Continue system performance and effluent sampling;
- Monitor VPGAC performance and determine if carbon replacement will be warranted in 2015;
- Continue preventive maintenance and failure-mode-effects analyses to improve system reliability;
- Repair/replace VMP-8D based on the insufficient differential pressure data at that location;
- Update the *OM&M Plan* as needed to include any system modifications; and
- Review results of the 2015 annual VI sampling event to determine if further annual vapor/air sampling is required per previous discussions with NYSDEC and NYSDOH.

Notes:
1. Cumulative influent flow rates shown after and including 12/30/10 obtained using manual anemometer. Prior to 12/30/10, combined influent flow rate value obtained from flow transmitter FT-201.
2. New blower installed as part of system upgrades in operation.
3. Vacuum at SDS-2 and SDS-4 wellheads from 5/12/11 through 8/11/11 were recorded as zero due to the scaled range of the field mounted vacuum gauges. Subsequent vacuum readings at those SDS locations have been recorded with a micromanometer.
4. For instances in which a differential pressure range has been provided for a VMP on a specific date, the middle of the range has been used for average calculations.
These values have not been included in the calculation of the average sub-slab vacuums.

Definitions:
ft - feet
In. W.C. - Inches of Water Column
scfm - standard cubic feet per minute
VMP - Vacuum Monitoring Point

Notes:

1. Samples analyzed for VOCs using USEPA Method TO-15.
2. Cumulative VOCs calculated using only detected concentrations.
3. Target VOCs calculated using only detected concentrations of the following compounds: 1,1-dichloroethene, cis-1,2-dichloroethene, tetrachloroethylene, trans-1,2-dichloroethene, trichloroethene, and vinyl chloride.

-**BOLD** indicates a detected compound.

Definitions:

< - less than reporting limit listed
J - Indicates that the result was less than the RL, but greater than or equal to the MDL and the concentration is an estimate.
B - Indicates that the compound was also identified in the method blank and sample.
D - Indicates that the sample results are obtained from a dilution.
E - Indicates that the result exceeded the calibration range.
U - Indicates that compound was analyzed for but was not detected.
NS - Not Sampled For
Q - data qualifier
µg/m^3 - micrograms per cubic meter

B - Indicates that the compound was also identified in the method blank and sample.
D - Indicates that the sample results are obtained from a dilution.
E - Indicates that the result exceeded the calibration range.
U - Indicates that compound was analyzed for but was not detected.
NS - Not Sampled For
Q - data qualifier
µg/m^3 - micrograms per cubic meter

3. Target VOCs calculated using only detected concentrations of the following compounds: 1,1-dichloroethene, cis-1,2-dichloroethene, tetrachloroethylene, trans-1,2-dichloroethene, trichloroethene, and vinyl chloride.
-**BOLD** indicates a detected compound.

Definitions:
< - less than reporting limit listed
J - Indicates that the result was less than the RL, but greater than or equal to the MDL and the concentration is an estimate.
B - Indicates that the compound was also identified in the method blank and sample.
D - Indicates that the sample results are obtained from a dilution.
E - Indicates that the result exceeded the calibration range.
U - Indicates that compound was analyzed for but was not detected.
NS - Not Sampled For
Q - data qualifier
µg/m^3 - micrograms per cubic meter
VOC - Volatile Organic Compounds

Notes:

1. Samples analyzed for VOCs using USEPA Method TO-15.
2. Samples shown on this table collected prior to 2011 taken with only SDS-1, SDS-2, and SDS-3 online.
3. Samples shown on this table collected after the end of 2010 taken with SDS-1, SDS-2, SDS-3, SDS-4, SDS-5, SDS-6, and SDS-7 online.
4. Cumulative VOCs calculated using only detected concentrations.
5. Target VOCs calculated using only detected concentrations of the following compounds: 1,1-dichloroethene, cis-1,2-dichloroethene, tetrachloroethylene, trans-1,2-dichloroethene, trichloroethene, and vinyl chloride.

-**BOLD** indicates a detected compound.

Definitions:

< - less than reporting limit listed
J - Indicates that the result was less than the RL, but greater than or equal to the MDL and the concentration is an estimate.
B - Indicates that the compound was also identified in the method blank and sample.
U - Indicates that compound was analyzed for but was not detected.
NS - Not Sampled For
Q - data qualifier
µg/m^3 - micrograms per cubic meter
VOC - Volatile Organic Compounds

Notes:
1. Samples analyzed for VOCs using USEPA Method TO-15.
2. Samples shown on this table collected prior to 2011 taken with only SDS-1, SDS-2, and SDS-3 online.
3. Samples shown on this table collected after the end of 2010 taken with SDS-1, SDS-2, SDS-3, SDS-4, SDS-5, SDS-6, and SDS-7 online.
4. Cumulative VOCs calculated using only detected concentrations.
5. Target VOCs calculated using only detected concentrations of the following compounds: 1,1-dichloroethene, cis-1,2-dichloroethene, tetrachloroethylene, trans-1,2-dichloroethene, trichloroethene, and vinyl chloride.
-**BOLD** indicates a detected compound.

Definitions:
< - less than reporting limit listed
J - Indicates that the result was less than the RL, but greater than or equal to the MDL and the concentration is an estimate.
B - Indicates that the compound was also identified in the method blank and sample.
U - Indicates that compound was analyzed for but was not detected.
NS - Not Sampled For
Q - data qualifier
µg/m^3 - micrograms per cubic meter
VOC - Volatile Organic Compounds

Notes:

1. Cumulative target VOC concentrations calculated using only detected concentrations of the following compounds: 1,1-dichloroethene, cis-1,2-dichloroethene, tetrachloroethylene, trans-1,2-dichloroethene, trichloroethene, and vinyl chloride.

2. Following the start of 2011, flowrates from each depressurization sump were estimated by measuring differential pressure at each individual sump's orifice plate. The sump flowrates were adjusted proportionally to one another so that their sum equals a cumulative influent flowrate as measured using an anemometer. Prior to the start of 2011, combined effluent flow rates estimated based on the differential pressure transmitter located between the blower and the carbon. Note that flow rates for SDS-1, SDS-2, and SDS-3 have been estimated based on adjusting them so that the sum of the SDS-1, SDS-2, and SDS-3 flow rates equal the flow rate measured by the differential pressure transmitter. SDS-1, SDS-2, and SDS-3 flow rates were adjusted by maintaining the same proportions observed by air velocities measured in the field at each location. All flow rates have been converted from acfm to scfm for this table.

3. Total target VOC mass removal rate was calculated using the sum of the target VOC mass removal rates for SDS-1, SDS-2, and SDS-3 through 2010. If individual samples were not collected from each SDS, then total mass removal rate is calculated using combined influent sample concentrations. Beginning in 2011 the total target VOC mass removal rate is calculated using the sum of the target VOC mass removal rates for SDS-1 through SDS-7.

4. Target VOC mass removed per reporting period calculated using an average of the current mass removal rate and the mass removal rate from the previous reporting period. Reporting period length used for mass removed calculation is the time elapsed since the previous reading.

5. Cumulative VOC mass removed and mass emitted estimates date back to 7/17/08, when SDS-3 was brought online.

6. Target VOC mass emitted per reporting period calculated using an average of the current mass emission rate and the mass emission rate from the previous reporting period. Reporting period length used for mass emitted calculation is the time elapsed since the previous reading.

7. SDS-1 vapor sample results from 10/9/09 not used in this table due to sampling procedure error. Results from the resampling of SDS-1 on 11/5/09 have been used for this table.

8. Vapor samples were not collected on 12/31/09, 12/31/10, 12/31/11, and 12/31/12. Total target VOC mass removal and target VOC emission rates were estimated for 12/31/09, 12/31/10, 12/31/11, and 12/31/12 by averaging the VOC removal and VOC emission rates from the previous and following sampling events, respectively.

9. It should be noted that samples from 1/7/11, which have been used to estimate mass removal and emission rates for 12/31/10, were collected while the upgraded system was in use and with all seven depressurization sumps online. The combined effluent flowrate used to calculate mass emission rate was the sum of the flowrates measured in the field from SDS-1, SDS-2, and SDS-3. The combined effluent VOC concentration used to calculate mass emission rate was based off of an effluent vapor sample collected with SDS-1 through SDS-7 online. It should also be noted that from 11/11/10 to 1/3/11, the system was typically offline for approximately 8 hours per work day. This has not been accounted for in mass removal or emission estimates.

10. Combined influent vapor samples are not collected, influent mass is tracked only from individual SDS points.

11. The total VOC removal (lbs) was estimated for the period from 10/23/13 and 12/31/13 using the average VOC concentrations and flowrate.

Definitions:

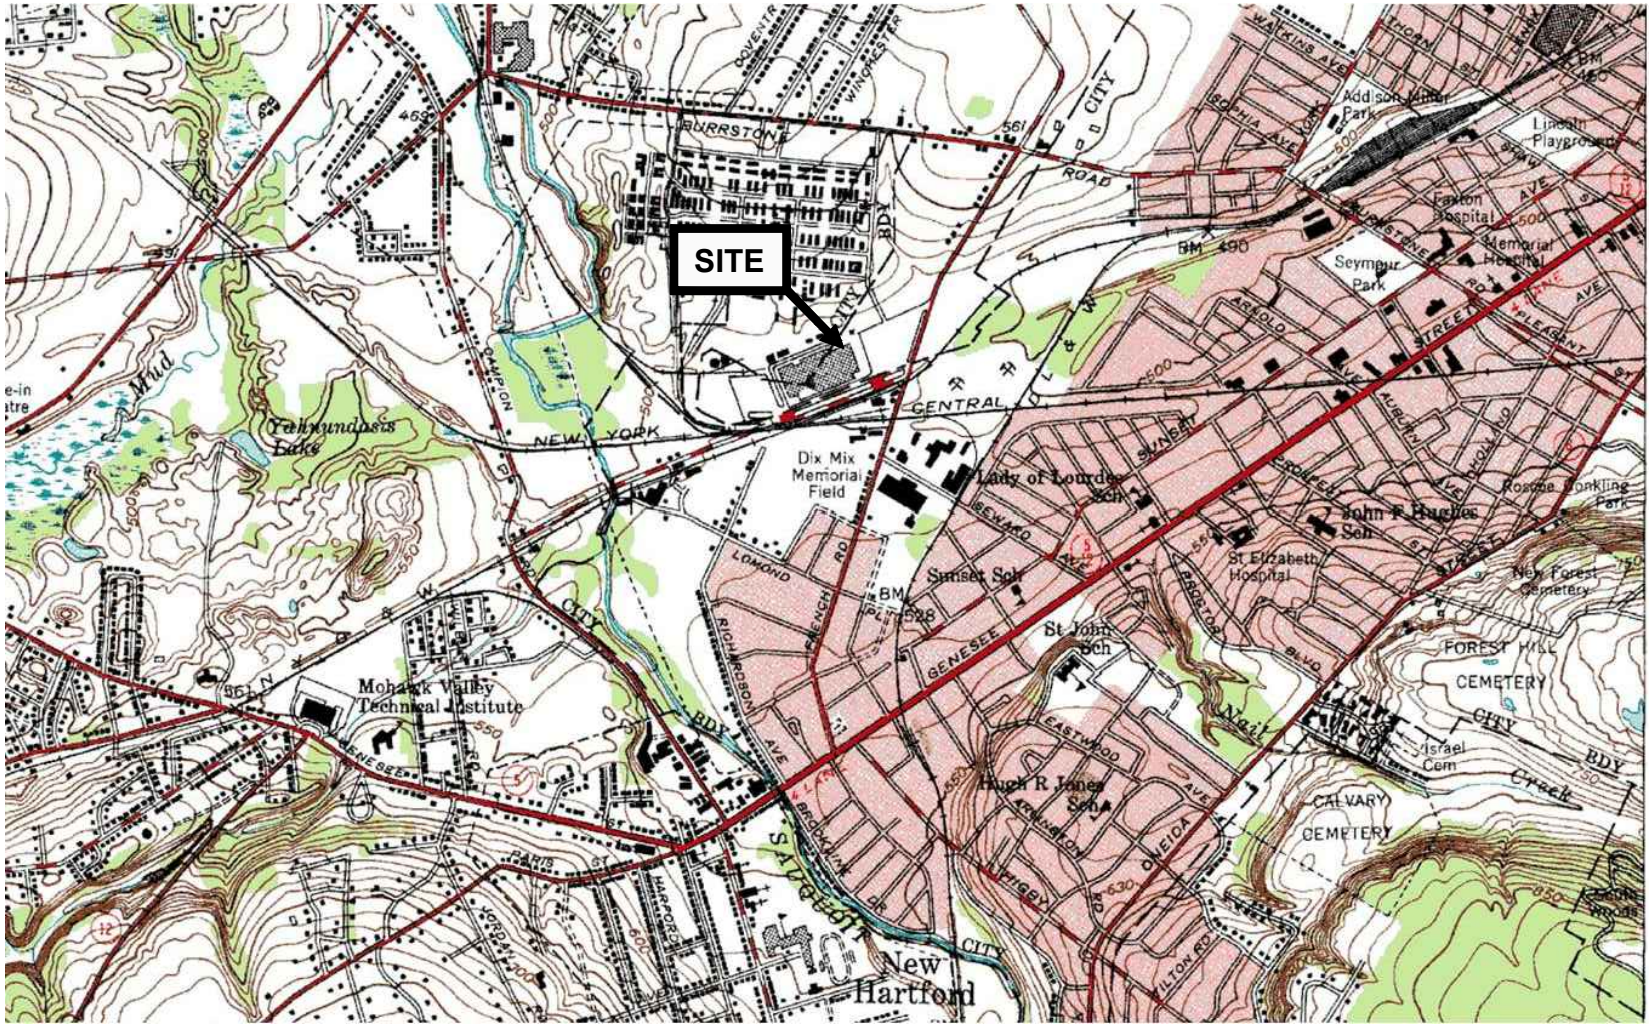
3. Concentrations shown for each volatile organic compound are the maximum concentrations detected between 7/17/08 and 4/24/13.
4. Maximum emission rate calculated using the maximum concentrations for each volatile organic compound and the average combined effluent flow rate (80 scfm) recorded during 2011 and 2012.
5. Actual annual impact calculated by following procedures described in NYSDEC DAR-1 Guidelines for the Control of Toxic Ambient Air Contaminants (NYSDEC 1991). Note effective stack height of 28.5 feet.
6. Maximum emission rate calculated using the maximum concentrations for each volatile organic compound and the average combined effluent flow rate (100 scfm), post the installation of 2013.

Definitions:



< - less than laboratory detection limit listed
"-" - indicates no guideline as been established
AGC - Annual Guideline Concentration
J - Indicates concentration is estimated
B - Indicates that the compound was also identified in the method blank and sample.
lb/day - pounds per day
ND - not detected above reporting limit
NS - parameter not analyzed
Q - data qualifier
SGC - Short-term Guideline Concentration
µg/m^3 - micrograms per cubic meter

GENERAL PROCESS DESCRIPTION:

THE SYSTEM IS SUB-SLAB DEPRESSURIZATION SYSTEM DESIGNED TO CREATE A PRESSURE DIFFERENTIAL BETWEEN THE SUB-SLAB AND INDOOR AIR AREAS WITH THE CONMED FACILITY. THE SYSTEM WILL RECOVER BOTH SOIL VAPORS AND MOISTURE (I.E.CONDENSATE). EACH PHASE IS IMPACTED WITH LOW CONCENTRATION VOLATILE ORGANIC COMPOUNDS (VOCS). ONE REGENERATIVE BLOWER (B-200) WILL BE USED TO CREATE A LOW VACUUM TO PULL/EXTRACT SOIL VAPORS FROM EIGHT (8) SHALLOW SUMPS INTO ONE AIR/WATER SEPARATOR TANK (AWS-200). THE AWS-200 TANK WILL SEPARATE THE FOLLOWING TWO PHASES:

VAPOR PHASE:
THE VAPOR STREAM WILL BE EXTRACTED THROUGH THE TOP OF THE AWS-200 AND TRAVEL TO THE INLET SIDE OF THE B-200. ONCE THE VAPORS EXIT B-200 THEY WILL TRAVEL THROUGH THE HEAT EXCHANGER (HX-300) TO REDUCE ITS TEMPERATURE PRIOR TO THE TRAVELING THROUGH TWO VAPOR PHASE GRANULAR ACTIVATED CARBON (VPGAC-301/302) VESSELS. THE VPGAC VESSELS WILL REMOVE VOCS PRIOR TO EXHAUSTING/VENTING THE TREATED SOIL VAPORS TO THE ATMOSPHERE.

LIQUID PHASE:
THE LIQUID PHASE (e.g. CONDENSATE) WILL BE CAPTURED IN THE BOTTOM OF THE AWS-200. LIQUIDS WILL BE MANUALLY DRAINED TO MANHOLE MH-2 FOR TREATMENT AT THE GCTS.

EQUIPMENT OPERATION:
1. ALL HAND-OFF-AUTO SWITCHES (H-O-A) SHALL OPERATE AS FOLLOWS:

WHEN THE H-O-A SWITCH IS SET TO "OFF" POSITION THE EQUIPMENT WILL BE OFF REGARDLESS OF IF THE PLC IS AUTO AND CALLING FOR THE OPERATION. WHEN THE H-O-A SWITCH HIS PLACED IN THE "AUTO" POSITION THE EQUIPMENT SHALL RUN AS DIRECTED BY THE PLC. WHEN THE H-O-A SWITCH IS SET TO "HAND" THE EQUIPMENT SHALL OPERATE, HOWEVER THE PLC MUST BE IN AUTO MODE.

2. THE GREEN INDICATOR LIGHT YL-201 IS ILLUMINATED WHEN THAT PIECE OF EQUIPMENT IS OPERATING.

3. THE RED INDICATOR LIGHT FL-203 IS ILLUMINATED IF AN ALARM FAULT EXISTS FOR THAT PIECE OF EQUIPMENT.

4. THE PLC IS EQUIPPED WITH A VIRTUAL SYSTEM "STARTUP" SWITCH LOCATED ON PLC INTERFACE WHICH WILL START THE SYSTEM IN AN AUTOMATED SEQUENCE.

BLOWER B-200:
1. B-200 MOTOR SPEED TO BE CONTROLLED BY VFD-200 OUTPUT SIGNAL. THE VFD-200 OUTPUT SIGNAL CORRESPONDS TO THE HERTZ SET POINT. THE HERTZ SET POINT SHALL BE MAINTAINED AT A VALUE WHICH MEETS THE MINIMUM SYSTEM PERFORMANCE CRITERIA, AS SPECIFIED IN THE OM&M PLAN.

2. BLOWER B-200 SHALL OPERATE WHEN THE HAND-OFF-AUTO (H-O-A) SWITCH HS-200 IS SET TO "HAND". THE GREEN INDICATOR LIGHT YL-200 SHALL BE ILLUMINATED WHEN B-200 IS OPERATING.

3. FOLLOWING INITIATION OF THE SYSTEM STARTUP SEQUENCE, AND IF THE H-O-A SWITCH HS-200 IS SET TO "AUTO" BLOWER B-200 SHALL OPERATE UNLESS ANY MAJOR FAULT ALARMS EXIST.

HEAT EXCHANGER HX-300:
1. THE HX-300 TO BE CONTROLLED BY THE TT-301 4-20MA OUTPUT SIGNAL. THE 4-20MA OUTPUT SIGNAL CORRESPONDS TO 0-300 F. THE LOW AND HIGH TEMPERATURE SET POINTS SHALL BE MAINTAINED TO PROTECT THE PIPING, EQUIPMENT, AND CARBON MEDIA DOWNSTREAM OF THE BLOWER. HX-300 SHALL TURN ON AT A THE SPECIFIED HIGH SET POINT VALUE AND TURN OFF AT THE LOW SET POINT VALUE, AS SPECIFIED IN THE OM&M PLAN.

2. HEAT EXCHANGER HX-300 SHALL OPERATE WHEN THE H-O-A SWITCH HS-300 IS SET TO "HAND" THE GREEN INDICATOR LIGHT YL-300 SHALL BE ILLUMINATED WHEN HX-300 IS OPERATING.

3. FOLLOWING INITIATION OF THE SYSTEM STARTUP SEQUENCE, AND WHEN THE H-O-A SWITCH HS-300 IS SET TO "AUTO" HEAT EXCHANGER HX-300 SHALL OPERATE UNLESS ANY OF THE MAJOR FAULT ALARMS EXIST AND/OR AS CALLED FOR AS DETERMINED BY THE TEMPERATURE TRANSMITTER TT-301 OUTPUT.

ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 2/3/2014 Time: 21:51

Alarm Condition:

Process 23 (Fatal) - High post-blower pressure (greater than 15 in.W.C. for 3 seconds)

Cause of Alarm:

Accumulation of condensate within VPGAC manifold and treatment vessels.

Corrective Action:

CMD arrived onsite on 2/4/14 at approximately 10:00. The blower was temporarily restarted to assess the cause of the high post-blower pressure. The vast majority of the pressure drop through the system was observed to occur through the VPGAC vessels. Inspection of the condensate drain located at the bottom of the VPGAC manifold indicated that condensate had built up and was not draining properly, potentially due to the brass ball valve freezing (condensate inside return tubing was not frozen). Additionally, the natural traps located on the manifold (due to butterfly valves being closed on vertical rungs) were also in need of draining. ARCADIS drained a significant volume of condensate from the VPGAC vessels, the VPGAC manifold (including manipulating valves to allow draining from natural traps), the air/water separator, the heat exchanger effluent trap, and the heat exchanger bypass line. All water was either gravity drained into or manually collected/poured into nearby manhole MH-2. The system was restarted after roughly ~30 minutes of allowing the VPGAC vessels to drain. System parameters following restarting of the system were within normal ranges.

A review of pressure transmitter PT-201's values leading up to the Process 23 alarm indicate that the pressure began to gradually increase from the normal operating range (i.e., 3-5 in.W.C.) beginning at around 0:00 on 2/3/14 to the alarm setpoint (15 in.W.C.) at 21:51.

It should noted that the bottom portion of the manifold was drained on 1/7/2014 while responding to the AWS high level alarm condition. However, the top portion of the manifold may have contained some volume of condensate. As such, ARCADIS recommends that condensate draining activities include the manual adjustment of butterfly valves to allow for collection of condensate that accumulates in low spots within the manifold that are not regularly drainable due to valve configurations.

Further corrective actions may include insultating the VPGAC vessels, and/or piping to reduce the generation of condensation.

ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 03/01/14 Time: 0924

Alarm Condition:

Process 21: VFD Fault

Cause of Alarm:

Rich Ferrialoa of Conmed indicated to Stantec that their facility experienced a power surge due to a faulty boiler on the night of 3/1, at about the time the SSDS system shut down. It is assumed this surge caused the SSDS VFD fault.

Corrective Action:

Stantec was able to restart the system remotely at 2315. The system appeared normal and no further action was taken.

ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 3/6/14 Time: 1432

Alarm Condition:

Process 23 - Post Blower High Pressure (Fatal)

Cause of Alarm:

Pressure had been rising over the last 24 hrs. Alarm was tripped at 1432 hours. Could not resolve the issue or restart the sytem remotely

Corrective Action:

Traveled to site (arrived 1830). Manifold condensate drainage tubing recently installed had become plugged with sediment (partial freezing may also have occurred) at the brass fitting location. Blockage was cleared and approx. 8 gal. of condensate was drained. System was restarted and pressure and readings were back to normal ranges, and remained at normal levels at the time of this morning's fax report.

Alarm Condition:

Process 21 - VFD Fault (Fatal)

Cause of Alarm:

Root cause of alarm currently unknown. Stantec plans to assess causes of alarms via the VFD output control interface while onsite for the May monthly O&M visit. PLC-logged data indicated these interruptions were "Code 24 - Momentary Power Loss." ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 2/28/14 Time: 0503

Alarm Condition:

Proces 14 (Non-Fatal) - High liquid level in the AWS tank.

Cause of Alarm:

Continued cold weather this month appears to have caused additional condensate to be produced from the cooling of influent soil gas between the ConMed building and the AWS tank.

Corrective Action:

WA logged into the system remotely on 2/28/2014 and confirmed the alarm. The system was running in "Auto".

The approx. rate of condensate accumulation since the last draining was calculated and it is believed that the system's HH_AWS alarm (fatal alarm) will not trip before Stantec visits the site for routine OMM on 3/4/2014. The initial course of action will be to turn the system off, drain the AWS and pre-carbon manifold of condensate, and restart the system. CDM Smith approved this response plan.

Followup, 3/5/14: System was drained on 3/4, inluding water from the AWS, manifold and both carbon beds. System now operating normally.

ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 3/16/14 Time: 0500

Alarm Condition:

"Non-alarm" issue: No e-mail report was received from the SSDS system on Sunday, 3/16.

Cause of Alarm:

R. Mahoney attempted to log into the system at approx. 1300 hrs on 3/16. No connection could be made; an error message was received related to "an incorrect serial port."

Corrective Action:

Stantec contacted CDM Smith and indicated we planned to visit the site on Monday 3/17; however a standard daily email report was then received on Monday at 0500 (note: only 2 of the 3 data files normally included were attached; no 'discrete" attachment file was included). A remote check of the sytem at approximately 07030 hrs. indicated operation was normal. Accordingly, no visit was made.

EOS Research was contacted regarding this issue. Ron Gehl indicated they have recently experienced intermittent communication interruptions on several other sites; this issue appears to be related to Verizon. They are working with Verizon to correct this problem and may be updating the "firmware' that controls the PLC communication, to prevent future problems. They will contact us when they have completed the modifications and testing to discuss potential actions relative to our site.

Stantec will continue to monitor the connectivity closely.

ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 12/8/14 Time: 1710

Alarm Condition:

Process 27: Low Air Flowrate (nonfatal/warning)

Cause of Alarm:

Cause unknown. Logged into system within 5 min of receiving alarm. Vacuum level was normal (approx -79 IWC) however flow was 0 cfm. Downloaded logged data which indicated the flow began to vary and drop off at about 1440 hours today.

Corrective Action:

Shut system down, restarted and monitored for approx 15 min. Flow rate returned to normal levels (75-80 cfm) almost immediately and remained. All other parameters also appear normal.

On 12/17/14, the two pieces of tubing that connect to the Dwyer differential pressure gauge were trimmed back so that the tubing connection is tighter. Flow readings seemed to increase by approximately 5 cfm. Will continue to monitor condition.

ALARM RESPONSE / CORRECTIVE ACTION LOG SHEET

Date: 12/9/14 Time: 0740

Alarm Condition:

Process 27: Low Air Flowrate (nonfatal/warning)

Cause of Alarm:

Cause unknown. Normal fax report received next morning (12/9/14) with normal flow rate shown. Logged into system 0730 on 12/8/14. flow rate was normal (+/- 80 cfm). System logged data indicates the flow values varied and and dropped off for approx 90 min. between 1740 and 1910 hrs. Alarm may be the result of a faulty sensor, since all other parameter appear normal during the same time period.

Corrective Action:

No action taken at this time as operation appears normal.

Will continue to monitor conditions periodically.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: LMC Utica

Report Number: 200-20861-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 02/10/2014; the samples arrived in good condition.

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): SDS-3. The container has a canister ID of 4074. The COC lists a canister ID of 4075.

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): SDS-7. The container label lists a sample time of 0914. The COC lists a sample time of 0913. Logged in per COC.

VOLATILE ORGANIC COMPOUNDS

Samples SDS-1, SDS-2, SDS-3, SDS-4, SDS-5, SDS-6, SDS-7, SDS-8, SSDS-MID-CARBON and SSDS-EFFLUENT were analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 02/15/2014, 02/17/2014 and 02/18/2014.

The laboratory control sample (LCS) for batches 200-68401/4 and 200-68510/4 recovered outside control limits for the following analytes: 1,2,4-Trichlorobenzeneand Naphthalene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

The laboratory control sample (LCS) for batch 200-68430/4 recovered outside control limits for the following analyte: Naphthalene This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

The analysis of the initial calibration associated with this delivery group yielded a %RSD for Naphthalene that exceeded the upper control limit.

The analysis of the initial calibration verification associated with batch 66774/13 yielded a %D for Naphthalene that exceeded the upper control limit.

The continuing calibration verification (CCV) associated with batch 68401 recovered above the upper control limit for Napthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: SDS-1, SDS-2, SDS-3, SDS-4, SDS-5.

The continuing calibration verification (CCV) associated with batch 68430 recovered above the upper control limit for Acetone and Naphthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: SDS-1, SSDS-MID-CARBON.

The continuing calibration verification (CCV) associated with batch 68510 recovered above the upper control limit for Acetone and Naphthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: SDS-6, SDS-7, SDS-8, SSDS-EFFLUENT.

Samples SDS-1[8X], SDS-2[5X], SDS-5[6.9X], SDS-6[22X], SDS-7[5X], SDS-8[4X], SSDS-MID-CARBON[2X] and SSDS-EFFLUENT[2.5X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the VOC analysis.

All other quality control parameters were within the acceptance limits.

Summa Canister Dilution Worksheet

Client: ARCADIS U.S., Inc.

Job No.: 200-20861-1
SDG No.: 200-20861

Lab Sample ID	Canister Volume (L)	Preadjusted Pressure ("Hg)	Preadjusted Pressure (atm)	Preadjusted Volume (L)	Adjusted Pressure (psig)	Adjusted Pressure (atm)	Adjusted Volume (L)	Initial Volume (mL)	Dilution Factor	Final Dilution Factor	Date	Analyst

Formulae:

Preadjusted Volume (L) = (Preadjusted Pressure ("Hg) + 29.92 "Hg * Vol L) / 29.92 "Hg

Adjusted Volume (L) = (Adjusted Pressure (psig) + 14.7 psig * Vol L) / 14.7 psig

Dilution Factor = Adjusted Volume (L) / Preadjusted Volume (L)

Where:

29.92 "Hg = Standard atmospheric pressure in inches of Mercury (“Hg)

14.7 psig = Standard atmospheric pressure in pounds per square inch gauge (psig)

CASE NARRATIVE

Client: Stantec Consulting Services Inc

Project: LMC Utica

Report Number: 200-21727-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 04/05/2014; the samples arrived in good condition.

VOLATILE ORGANIC COMPOUNDS

Samples GCTS PRE CARBON, GCTS POST CARBON, GCTS MID CARBON, SDS-3, SDS-1, SDS-2, SDS-4, SDS-7, SDS-6, SDS-5, SDS-8, SSDS POST CARBON and SSDS MID CARBON were analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 04/10/2014, 04/11/2014 and 04/12/2014.

The analyses for several samples within this delivery group yielded concentrations for Isopropyl Alcohol that exceeded the range of calibrated instrument response. These samples are being reported with an E flag for this compund in order to report lower reporting limits for other compounds.

The original analyses of samples SDS-1, SDS-7, SDS-5 and SDS-8 did yield concentrations for target analytes that exceeded the range of calibrated instrument response. These samples were diluted and re-analyzed yielding acceptable results. The results from both analyses have been formally presented.

No other difficulties were encountered during the VOC analysis.

All quality control parameters were within the acceptance limits.

Lab Section	Qualifier	Description
Air - GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
