Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	Not present
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	Thermal preservation not required.
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	AMBIENT
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A

EXECUTIVE SUMMARY

This report presents the results of the 2014 Vapor Intrusion (VI) Study performed at the former Lockheed Martin French Road Facility in Utica, New York. The study was conducted and this report was prepared in accordance with the *Draft Revised Work Plan for the Interim Corrective Measures* prepared for the site.

Because of previously-detected VOC presence in sub-slab and indoor air, mitigation in the form of a sub-slab depressurization system (SSDS) has been in operation since July 2008 as an interim corrective measure (ICM). The goal of the SSDS is to prevent volatile organic compounds (VOCs) present in sub-slab soil vapor from entering the indoor air, by creating a negative pressure under the floor slab. Sub-slab vapors removed by the SSDS are treated with granular activated carbon to remove VOC contaminants. The ICM also includes performance of an annual study to assess the effectiveness of the system.

The recent sampling program (including the facility chemical inventory) was completed during the period February 11-13, 2014. Sampling included sub-slab, indoor air and outdoor ambient air samples, obtained using summa canisters in accordance with New York State Department of Health (NYSDOH) guidelines. Sub-slab/indoor air sample pairs were obtained from 14 monitoring points. Due to the inability to obtain a sub-slab sample at one location, a sample from a nearby monitoring point was substituted. The samples were analyzed for the presence of volatile organic compounds (VOCs) using United States Environmental Protection Agency Compendium Method TO-15.

Regarding 2014 results, three sample locations are assigned a Monitor designation under the NYSDOH VI guidance due to concentrations of trichloroethene (TCE) in sub-slab soil gas, although at each location's paired indoor air sample TCE was not detected above the reporting limit (this may be due in part to higher-than-typical reporting limits for these samples). At the remaining 11 paired sample locations, NYSDOH matrices indicate that (depending on the compound) either No Further Action is necessary or "take reasonable and practical actions to identify source(s) and reduce exposure."

1.0 Introduction

On behalf of Lockheed Martin Corporation (Lockheed Martin), Stantec Consulting Services Inc. (Stantec)** has prepared this report on the *2014 Annual Vapor Intrusion Study, Solvent Dock Area* (VI report) to present the results of a February 11-13, 2014 sub-slab soil gas and indoor air sampling event at the former Lockheed Martin French Road Facility in Utica, New York (site; see Figure 1). A sub-slab depressurization system (SSDS) has been in operation in selected areas since July 2008 as an interim corrective measure (ICM). The goal of the SSDS is to prevent elevated chlorinated volatile organic compound (VOC) vapors detected below the concrete slab of the northeast corner of the main ConMed Corporation (ConMed) manufacturing building from entering indoor air. This is accomplished by creating a negative pressure under the slab to reduce the potential of VOC vapors migrating to indoor air. The ICM was implemented as proposed in the *Draft Revised Work Plan for the Interim Corrective Measure* (ARCADIS 2008a).

The sample results included in this report are used to evaluate current soil gas and indoor air quality. Specifically, this VI report describes the sampling methodology, summarizes the sampling results, and provides an evaluation of the results. Previous VI sampling at the site is summarized in the following section.

** Note that in January 2014 Lockheed Martin retained Stantec to assume the previous role of ARCADIS as the consultant for this site. For this sampling event, ARCADIS staff installed the canisters and collected air for analysis. Stantec shadowed ARCADIS during the sampling event and has prepared this report.

2.0 Previous Vapor Intrusion Sampling

A summary of data collected during previous investigations is provided in Appendix A, including a table listing the analytical results for all historical sampling and a figure showing the sampling locations. Beginning in February 2006, sub-slab soil gas and indoor air samples were collected at multiple locations inside the ConMed building and above the area of known groundwater contamination. Analytical results from this sampling event indicated the presence of elevated VOCs including primarily tetrachloroethene (PCE) and trichloroethene (TCE) in the soil gas beneath the ConMed building, as presented in the *Vapor Intrusion Study Report* (Earth Tech 2006). At that time, the source of several VOCs observed in indoor air samples could not be determined due to the use of materials containing VOCs inside the building. This chemical use was documented in a chemical inventory prepared by Earth Tech based on its observations inside the building. The locations where elevated VOCs in the sub surface soil gas were detected did not directly correlate with locations where indoor air concentrations were observed. Although a correlation could not be established, concentrations of VOCs in sub-slab soil gas samples were greater than New York State Department of Health (NYSDOH) guidance levels that require mitigation measures to be implemented (in accordance with NYSDOH's then-current *Public Comment Draft, Guidance for Evaluating Soil Vapor Intrusion in the State of New York, February 2005*).

In April 2007, ARCADIS collected co-located sub-slab soil gas and indoor air samples in the eastern portion of the building. Based on these results, ARCADIS recommended re-sampling sub-slab soil gas at two locations (sample locations SS-1 and SS-2, which are indicated on Figure A-1 in Appendix A), and installing an SSDS.

On October 2, 2007, ARCADIS sampled sub-slab soil gas at the SS-1 and SS-2 locations, data for which are included within the historical data summary of Appendix A. This sampling was conducted to confirm the results of previous sub-slab soil gas sampling. On November 14–15, 2007, additional sub-slab soil gas and indoor air sampling was conducted at the ConMed facility to:

- Confirm previous results;
- Better understand sub-slab soil gas and indoor air quality; and
- Further define areas in the building that should be mitigated as part of the planned ICM for the ConMed facility.

Results of this study were submitted to NYSDEC in the *Addendum to the Vapor Intrusion Study Report for the Solvent Dock Area* (ARCADIS 2008b). The study results identified elevated TCE in sub-slab soil gas and indoor air at concentrations that could warrant mitigation along the eastern/northeastern side of the ConMed facility, in

accordance with *Guidance for Evaluating Soil Vapor Intrusion in the State of New York, October 2006* (VI guidance; NYSDOH 2006).

In August 2009, after the SSDS had been installed and operated, 14 paired sub-slab soil gas and indoor air samples were collected to evaluate post-mitigation soil gas and indoor air quality. The SSDS was operational during the sampling period. The results of this sampling event were submitted to NYSDEC in the *Annual Post-Mitigation Vapor Intrusion Study Report for the Solvent Dock Area* (ARCADIS 2010a). The sampling confirmed that the SSDS was mitigating sub-slab soil gas concentrations of site-related VOCs, but also confirmed the need for additional mitigation at sampling location VMP-3A (as indicated on the historical tables and figure in Appendix A). This area was targeted for application of additional vacuum as part of the upgraded SSDS design and installation.

In January 2010, sub-slab soil gas and indoor air were sampled at 12 locations at the ConMed facility to evaluate soil gas and indoor air quality. Results of this sampling event indicated that, except for an area associated with SSDS system sump SDS-3 (Figure 2), sub-slab soil gas concentrations of site-related VOCs (including TCE and PCE) were reduced relative to the previous sampling round (ARCADIS 2010b). Similar conclusions were derived from sampling conducted during January 2011 and January 2012 (ARCADIS 2011, 2012).

Location VMP-7A was deemed to require mitigation based on the January 2011 sampling results. Results from the January 2012 sampling indicated that this location had been reduced to a “monitor” status under NYSDOH guidance. Location VMP-7A continues to be monitored on an annual basis, and has since been the subject of additional mitigation efforts (as described in the following section).

It should be noted that the 2013 Annual Vapor Intrusion Monitoring Report identified sample recovery issues which led to a significant amount of rejected data after review of the data usability report (DUSR). Due to the affected data usability, ARCADIS recommended a different laboratory be considered for future VI sample analysis. For the 2014 event, analytical testing services were provided by Test America Laboratories, Inc. (TestAmerica).

3.0 Interim Corrective Measure: Sub-Slab Depressurization System

A vapor intrusion mitigation system (i.e., the SSDS) began operating in July 2008. The primary objective of the SSDS is to maintain a negative pressure (i.e., a vacuum) below the building slab relative to the air pressure in the building above the slab, thereby reducing the potential migration (intrusion) of vapors into the building. In order to achieve an effective pressure differential across the concrete slab, soil gas is extracted from the subsurface and conveyed through carbon treatment to the atmosphere outside the building. This mitigates the potential migration of VOCs from sub-slab soil gas to indoor air.

The original SSDS included three sub-slab depressurization sumps (SDSs), a regenerative vacuum blower, effluent air treatment via vapor-phase granular activated carbon (VPGAC), and associated piping. The system layout is shown on Figure 2.

Operation, maintenance and monitoring (OM&M) activities of the SSDS during 2009 indicated that the ICM SSDS was not meeting operational goals (specifically in the area north of SDS-1 and west of SDS-3), thereby requiring system expansion and modification. In September 2010, SSDS upgrade activities were initiated, which included the installation of four additional depressurization sump locations and upgrades to other major components of the system. The purpose of these upgrades was to expand capture of sub-slab gas to areas where VOCs were present but were not being mitigated by the system. These system upgrades were completed in April 2011. Based on data collected during the 2012 calendar year, the upgraded SSDS was determined to be largely meeting performance goals, with the exception of the area of vapor monitoring point VMP-7A (near extraction sump SDS-7, Figure 2). Vacuum monitoring in the vicinity of VMP-7A was performed during the fourth quarter of 2012 and a follow-up pilot test was completed in 2013. Based on results of the pilot test, design and installation of an additional sub-slab depressurization sump (SDS-8) and four (4) additional VMP locations (VMP-8A, VMP-8B, VMP-8C, and VMP-8D) in the vicinity of VMP-7A was completed in October 2013. The enhanced system, when operating under designed conditions, now consists of eight SDSs (SDS-1 through SDS-8) operating under vacuum to create a pressure differential below the building slab.

4.0 Sampling Approach

4.1 INTRODUCTION

To evaluate the current quality of sub-slab soil gas and indoor air, 14 paired sub-slab soil gas and indoor air samples were obtained. One additional sub-slab sample (VMP-7B) and one additional indoor air sample (VMP-8D) were collected from locations that were not paired. In addition, one outdoor ambient air sample, one duplicate sub-slab soil gas sample and one duplicate indoor air sample were collected. All samples were collected on February 12, 2014, with the exception of sub-slab sample SS-VMP-7B and the outdoor ambient air sample, which were collected on February 13, 2014. The SSDS operated under normal conditions during sampling. Sampling methods used for the co-located sub-slab soil gas samples and indoor air samples are discussed below. Sampling locations are shown on Figure 3. Sampling logs are provided in Appendix B.

4.2 SUB-SLAB SOIL GAS SAMPLING

Samples were collected from 15 permanent points (Vacuum Monitoring Points VMP-1B, VMP-2B, VMP-2C, VMP-3A, VMP-3B, VMP-3D, VMP-3E, VMP-4, VMP-5A, VMP-5B, VMP-6A, VMP-6B, VMP-7, VMP-7A, and VMP-7B) previously installed to monitor the pressure differential under the slab. Each of these locations had been previously monitored as part of the annual vapor intrusion sampling program with the exception of location VMP-7B, which was included to further evaluate sub-slab vapor concentrations in that area due to sampling difficulties at VMP-8D.

A sub-slab sample could not be collected from VMP-8D due to a lack of air flow from the sub-slab to the canister. Inspection of the canister, regulator, and syringe indicated that there were no issues with sampling equipment. In addition, none of these individual sampling components identified vacuum. VMP-8D, VMP-8A, VMP-8B, and VMP-8C, were installed in 2013 as a means to evaluate expanded SSDS performance related to new sub-slab depressurization sump SDS-8. During startup and testing related to the installation of SDS-8, a cyclical differential pressure was observed at VMP-8D that did not achieve vacuum performance criteria. Location VMP-8D is part of the SSDS quarterly vacuum monitoring program. Conditions at this location are under evaluation.

All 16 samples, including the sub-slab duplicate, were collected in 6-liter SUMMA® canisters pre-set by the laboratory to draw soil gas at a flow rate of no more than approximately 12.5-milliliters per minute. Samples were collected over an approximately 8-hour sampling period. As indicated in the sample logs (Appendix B), however, some samples were collected in less than 8 hours, based on the flow regulator gauge reading, and some samples were given longer than 8 hours to ensure the laboratory-required minimum air volume requirement had been met. The valve on the SUMMA® canister was closed when approximately 5-inches of mercury vacuum were left in the canister, leaving a

vacuum in the canister as a means for the laboratory to verify that the canister did not leak during transit. Samples were submitted to TestAmerica Laboratories, Inc. (TestAmerica) in South Burlington, Vermont for laboratory analysis in accordance with United States Environmental Protection Agency Compendium Method TO-15. Laboratory results of sub-slab and indoor air sample analyses are provided in Appendix C.

4.3 INDOOR AIR SAMPLING

All 16 indoor air samples, including the indoor air duplicate, were collected in accordance with the methods described in the *Vapor Intrusion Work Plan – Revised* (Lockheed Martin 2005) and the VI guidance (NYSDOH 2006), and as described above for sub-slab samples. The indoor air sample canisters were exposed to room air at an elevation approximately three to five feet above the floor over the same time frame as collection of the sub-slab soil gas samples at each VMP location.

4.4 OUTDOOR AMBIENT AIR SAMPLING

One outdoor ambient air sample was collected to evaluate outdoor ambient air conditions in comparison to the indoor air and sub-slab vapor conditions. This sample was collected in the area of the fire hydrant just southwest of monitoring well MW-9, in a paved area north of the main building. This area is away from the main building and has limited activity. Results are provided in Appendix C.

5.0 Results and Findings

5.1 INTRODUCTION

This section discusses the results of the February 2014 VI sampling. This evaluation includes a comparison of the paired sample results to the matrices presented in the NYSDOH VI guidance. As part of the February 2014 sampling event, a facility chemical inventory was conducted and ConMed was also consulted regarding facility operations.

Sub-slab soil gas results are presented in Table 1; indoor air results are presented in Table 2. Results from the outdoor ambient air sample are presented in Table 3. Table 4 summarizes the data, including the frequency of detection for samples collected from the main building and minimum- and maximum-detected concentrations for each constituent. Figure 3 presents the analytical results for PCE and TCE in both sub-slab soil gas and indoor air samples.

A copy of the analytical laboratory report for the February 2014 sampling event is provided in Appendix C. Data packages were provided by the laboratory and prepared as New York State (NYS) "Analytical Services Protocol" (ASP) "Category B" deliverables. A *Data Usability Summary Report* (included in Appendix D) was completed in accordance with NYSDEC DER-10 (*Technical Guidance for Site Investigation and Remediation* [May 2010]).

The project data validator reviewed the usability of the analytical data, including determining if the data were accurate, precise, representative, complete, and comparable. Valid data are data for which all quality assurance/quality control (QA/QC) review criteria have been met and are acceptable. Data were characterized as usable where QA/QC parameters were marginally outside acceptable limits (e.g., sample holding times were slightly exceeded), such that the data may be questionable, but still usable within limitation. As a result of the DUSRs, all analytical results are considered usable and, therefore, no data were rejected. The DUSRs indicated that only minor qualifications, or minor changes to data qualifiers, were required; data qualifiers are included in the summary data tables of this report.

Sub-slab soil gas and indoor air data from the February 2014 sampling event were evaluated in two ways, as discussed below in the following section. These include:

1. Analytical data were evaluated using the matrices provided in the NYSDOH VI guidance.
2. Results from the 2014 sampling event were compared to historical results from co-located samples collected in 2009 through 2013 where available.

This evaluation is described in the following sections.

5.2 DATA EVALUATION USING NYSDOH MATRICES

Sub-slab soil gas and indoor air results are compared to the matrices presented in the NYSDOH VI guidance. Indoor air data were considered in conjunction with the sub-slab soil gas data.

Matrix 1 applies to carbon tetrachloride, TCE, and vinyl chloride. Matrix 2 applies to 1,1-dichloroethene, cis-1,2-dichloroethene, PCE, and 1,1,1-trichloroethane. Table 5 compares the indoor air and sub-slab soil gas results to the matrix-recommended action. The matrices allow for five different options or actions:

- No further action;
- Take reasonable and practical actions to identify source(s) and reduce exposures (i.e., concentration in indoor air is likely associated with indoor and/or outdoor sources); designated as “Background” in the matrices presented in this report);
- Monitor;
- Monitor/mitigate; and
- Mitigate.

As presented in Table 5, 15 sub-slab soil gas samples (plus one duplicate sample) and 15 indoor air samples (plus one duplicate sample) were collected from 15 locations as part of the February 2014 sampling. Paired sub-slab soil gas and indoor air results were used together to generate recommended actions based on the NYSDOH decision matrices. As described in Section 4.2, no sub-slab sample was collected at VMP-8D due to a lack of air flow. A replacement sub-slab sample was collected at VMP-7B the following day, but without a paired indoor air sample. Therefore, there are 14 paired sample locations to which the NYSDOH matrix guidance can be applied. To apply the NYSDOH matrix guidance, any non-detect analytes were considered present at concentrations set by the reporting limit, as has been done for previous reporting.

Per Table 5, the majority of matrix outputs for the evaluated locations are assigned No Further Action or Background designations. Monitor designations are assigned to locations VMP-5A, VMP-6A, and VMP-7A as a result of TCE concentrations.

Seven indoor air samples and eleven sub-slab vapor samples were diluted in the lab due to interference or elevated analyte concentrations. The dilutions resulted in higher analyte reporting limits for those samples. In instances where concentrations of a given compound were not detected per reporting limits that are higher than recommended by the NYSDOH Guidance or those typically employed in earlier monitoring events, using the reporting limit as the reported concentration (whether the compound is present or

not) in the NYSDOH matrix output provides a conservative determination resulting from sub-slab and indoor air data. Monitoring locations within this category are as follows:

- VMP-3A
- VMP-5A
- VMP-5B
- VMP-6A
- VMP-6B
- VMP-7
- VMP-7A

At these seven locations, the reporting limits are greater than the first, and sometimes second tier of the NYSDOH matrices. In these cases, matrices provide a conservative output, as the use of higher reporting limits assumes higher concentrations whether the compound is present or not. Nonetheless, among these locations relatively elevated reporting limits result in Background status assigned for all considered compounds at VMP-5B, VMP-6B, and VMP-7, meaning the matrices indicate the recommended action is to "take reasonable and practical actions to identify source(s) and reduce exposures reasonable and practical action should be implemented to identify sources(s) and reduce exposures.

For locations VMP-3A and VMP-5A, and with the exception of carbon tetrachloride and TCE, the matrices also identify Background as the assigned status. With regard to carbon tetrachloride and TCE at these locations, matrices identify a Monitor or Mitigate status due in part to the elevated reporting limits. Further clarification is as follows.

- Carbon tetrachloride results for VMP-3A indicate a Monitor status based on the approach to use analyte reporting limits although carbon tetrachloride was not detected in either the sub-slab or indoor air sample. Using the method detection limit (as opposed to the reporting limit) for the sub-slab result indicates it would belong in a lower tier status (i.e. Background sources). Under these circumstances, use of the method detection limit for carbon tetrachloride in sub-slab soil vapor is considered justified as this is the minimum concentration at which carbon tetrachloride can be identified, if not reliably quantified. This approach is used to assign matrix output in Tables 5 and 6. Nonetheless, a conservatively-assigned Monitor status is consistent with current operation, maintenance, and monitoring performed in conjunction with the SSDS and as such is noted in Tables 5 and 6.

- TCE results for VMP-5A indicate a Mitigate status due to the sub-slab reported concentration and indoor air reporting limit, although the compound was not

detected in the indoor air sample. Using the method detection limit (as opposed to the reporting limit) for TCE in the indoor air sample results in assignment to a lower tier designation, namely Monitor. Similar to VMP-3A, use of the method detection limit for TCE in indoor air is employed for matrix output. VMP-5A is conservatively assigned a Monitor status, which is consistent with current OM&M performed in conjunction with the SSDS and as such is noted in Tables 5 and 6.

For locations VMP-6A and VMP-7A, and as noted above, Monitor status is assigned per matrix output of Table 5 based on TCE concentrations and reporting limits. Although TCE was not detected in indoor air samples at these locations during the 2014 monitoring, Monitor status based on TCE has been assigned to both locations during past annual monitoring events. As with selected compounds for VMP-3A and VMP-5A, a Monitor status assigned to VMP-6A and VMP-7A for TCE is consistent with current operation, maintenance, and monitoring of the SSDS. Vacuum monitoring data collected in 2012 and 2013 indicated that location VMP-7A was not consistently under the influence of the SSDS. In response, sub-slab depressurization sump SDS-8 was installed proximate to VMP-7A (Figure 2). Startup and testing of SDS-8 was completed in October 2013 and the extraction point has since been left online as part of the expanded SSDS. Since the addition of SDS-8, vacuum monitoring indicates that VMP-7A achieves the target vacuum performance criteria for the SSDS.

With regard to increased analytical reporting limits in the 2014 data set, previous analyses were performed by Centek Laboratories in Syracuse, New York, whereas the current samples were analyzed by TestAmerica. Stantec has discussed the methods and results of this sampling event with TestAmerica, which has agreed to revise the analytical procedures in order to avoid future effects of interference or elevated analyte concentrations on analytical reporting limits.

At the remaining seven paired sample locations, NYSDOH matrices indicate (depending on the compound) that either No Further Action is necessary or that reasonable and practical actions should be implemented to identify background sources(s) and reduce exposures.

As part of the 2014 sampling event, a chemical inventory (Appendix E) was completed in accordance with the NYSDOH VI guidance (NYSDOH 2006). One product containing PCE was observed during the chemical inventory. Several other constituents detected in indoor air (such as acetone, ethylbenzene, heptane, hexane, isopropyl alcohol, toluene, and xylenes) are used by ConMed in its various operations in specific locations within the facility and were identified during the chemical inventory.

5.3 COMPARISON WITH HISTORICAL DATA

Matrix results for sub-slab soil gas and indoor air sampling data obtained from 2009 through 2014 are compared per sampling location in Table 6. Overall, matrix results remained generally constant or improved from 2009 to 2013 (Table 6). For 2014 data, a number of matrix results may be influenced by relatively higher reporting limits for undetected compounds, resulting in higher-tiered status relative to earlier results. However, as noted above, the majority of 2014 determinations indicate No Further Action or Background assigned status.

TCE results for VMP-7A continue to indicate a Monitor designation due to the sub-slab reported concentration. This location has maintained a Monitor designation since 2011 when vapor intrusion sampling results indicated the location warranted a Mitigation designation. For VMP-5A, TCE was detected in sub-slab soil vapor during the 2014 event at 26 µg/m^3, an increase from 1.6 µg/m^3 detected in the 2013 sub-slab sample. For VMP-6A, TCE in sub-slab soil vapor increased from 1.2 µg/m^3 (2013) to 11 µg/m^3 (2014). At both locations, matrix determinations increased from Background to Monitor designations for TCE. As noted above, monitoring will continue at both locations as part of SSDS operation, maintenance, and monitoring and annual vapor intrusion sampling.

6.0 Summary and Conclusions

Sub-slab soil gas and/or indoor air were sampled at 16 locations and one ambient outdoor air location was sampled at the ConMed facility in February 2014 to evaluate soil gas and soil gas intrusion. Results of this sampling event indicate that three locations (VMP-5A, VMP-6A, and VMP-7A) are assigned a Monitor designation under the VI guidance due to concentrations of TCE in sub-slab soil gas, although at each location's paired indoor air sample TCE was not detected above the reporting limit, the latter of which may be due to higher-than-typical reporting limits for these samples. At the remaining 11 paired sample locations, NYSDOH matrices indicate that (depending on the compound) either No Further Action is necessary or that Actions to Identify Background Sources(s) and Reduce Exposures should be implemented.

Notes:

Detected concentrations are in **bold font**.

µg/m^3 = Micrograms per cubic meter.

[1.0 U] = Duplicate results in brackets.

B = Compound was found in the blank and sample.

D = Diluted concentration reported.

E = Result exceeded calibration range.

J = Analyte detected at or below quantitation limits and/or estimated value.

JB = Analyte was detected at or below quantitation limits and/or estimated value and was also detected in the blanks.

NJ = Analyte has been "tentatively identified" and the result is an approximated value.

U = Not detected at the reporting limit.

UJ = Analyte was not detected above the reported sample quantitiation limit; however, the reported quantitation limit is approximate.

Notes:

Detected concentrations are in **bold font**.

µg/m^3 = Micrograms per cubic meter.

[1.0 U] = Duplicate results in brackets.

B = Compound was found in the blank and sample.

D = Diluted concentration reported.

E = Result exceeded calibration range.

J = Analyte detected at or below quantitation limits and/or estimated value.

JB = Analyte was detected at or below quantitation limits and/or estimated value and was also detected in the blanks.

NJ = Analyte has been "tentatively identified" and the result is an approximated value.

U = Not detected at the reporting limit.

UJ = Analyte was not detected above the reported sample quantitiation limit; however, the reported quantitation limit is approximate.

Notes:

Detected concentrations are in **bold font**.

µg/m^3 = Micrograms per cubic meter.

[1.0 U] = Duplicate results in brackets.

* = Recovery or RPD exceeds control limits

B = Compound was found in the blank and sample.

D = Diluted concentration reported.

J = Analyte detected at or below quantitation limits and/or estimated value.

JB = Analyte was detected at or below quantitation limits and/or estimated value and was also detected in the blanks.

NJ = Analyte has been "tentatively identified" and the result is an approximated value.

U = Not detected at the reporting limit.

UJ = Analyte was not detected above the reported sample quantitiation limit; however, the reported quantitation limit is approximate

Notes:

Detected concentrations are in **bold font**.

µg/m^3 = Micrograms per cubic meter.

[1.0 U] = Duplicate results in brackets.

* = Recovery or RPD exceeds control limits

B = Compound was found in the blank and sample.

D = Diluted concentration reported.

J = Analyte detected at or below quantitation limits and/or estimated value.

JB = Analyte was detected at or below quantitation limits and/or estimated value and was also detected in the blanks.

NJ = Analyte has been "tentatively identified" and the result is an approximated value.

U = Not detected at the reporting limit.

UJ = Analyte was not detected above the reported sample quantitiation limit; however, the reported quantitation limit is approximate

Notes:

µg/m^3 = Micrograms per cubic meter.

FOD = Frequency of detection.

- = parameter not analyzed

% = Detection percent.

* "Yes" entry identifies chemical observed in facility during building survey. Chemical identified on ConMed product inventory form where indicated (bold font).

Location ID:		VMP-8D	VMP-8D	
Sample Type:		Sub-slab Soil Vapor	Indoor Air	Matrix*
Date Collected:	Units	-	02/12/14	Output
1,1,1-Trichloroethane	ug/m3	NS	1.1 U	-
1,1-Dichloroethene	ug/m3	NS	0.79 U	-
Carbon Tetrachloride	ug/m3	NS	**0.26**	-
cis-1,2-Dichloroethene	ug/m3	NS	0.79 U	-
Tetrachloroethene	ug/m3	NS	1.4 U	-
Trichloroethene	ug/m3	NS	0.21 U	-
Vinyl Chloride	ug/m3	NS	0.1 U	-

Notes:

* The cannister placed at VMP-8D did not collect any sub-slab vapor, therefore no sample was analyzed; a sub-slab sample was taking from VMP-7B the following day. Because the indoor air and sub-slab sample were not taken at the same location, the NYSDOH guidance cannot be applied as they are not considered a pair.

[A] = Analyte reporting limit

[B] = Analyte method detection limit

[C] = NYSDOH matrix output based on analyte method detection limit

[a] Take reasonable and practical actions to identify source(s) and reduce exposures.

$\mu g/m^3$ = Micrograms per cubic meter.

J = Analyte detected at or below quantitation limits and/or estimated value.

NJ = Analyte has been "tentatively identified" and the result is an approximated value.

NS = not sampled

U = Not detected at the reporting limit.

[1.0 U] = Duplicate results in brackets.

Notes:
µg/m^3 = Micrograms per cubic meter.
[1.0 U] = Duplicate results in brackets.
D = Concentration is based on a diluted sample analysis.
E = Concentration exceeded calibrated range.
J = Analyte detected at or below quantitation limits.
U = Not detected at the reporting limit.

Vinyl Chloride	µg/m^3	0.39 U	0.39 U	0.39 U	0.39 U

Notes:

Detected concentrations are in **bold font**.

µg/m^3 = Micrograms per cubic meter.

[1.0 U] = Duplicate results in brackets.

J = Analyte detected at or below quantitation limits and/or estimated value.

U = Not detected at the reporting limit.

R = Data rejected as part of validation.

D = Diluted concentration reported.

Sampling Logs

Ambient Air Sample Collection Log

Sample ID: AMB-021314

Client:	Lockheed Martin	**Date/Day:**	Thursday, 2/13/14
Project:	LMC Sub-Slab and Indoor Monitoring	**Weather:**	P/C
Location:	Utica, NY	**Temperature:**	24° F, 29.96 in Hg, 78% Humidity
Project #:	NJ001050.0001	**Wind Speed/Direction:**	6 mph SE
Samplers:	Dan Zuck	**Subcontractor:**	NA
Logged By:	Dan Zuck	**Equipment:**	Truck Traffic
Background PID Ambient Air Reading:	6.0 ppm	**Moisture Content of Sampling Zone (circle one):**	NA
Sampling Depth:	~4' ALS	**Approximate Volume of Sampling Train:**	NA
Time of Collection:	Start: 1155 Finish: 2000	**Approximate Purge Volume:**	NA

Nearby Groundwater Monitoring Wells/Water Levels:

Well ID	Depth to Groundwater (feet)
---	See Quarterly WL Round

Size (circle one): 1 L (6 L)

Canister ID: 3015

Flow Controller ID: 5178

Tracer Gas Information (if applicable)

Tracer Gas: NA

SUMMA Canister Information

Canister Pressure (inches Hg):		
Reported By Laboratory	**Measured Prior to Sample Collection**	**Measured Following Sample Collection**
-30.2	-30	-10.5

Tracer Gas Concentration (if applicable):				
Measured from Soil Vapor Tubing		**Measured in 'Concentrated' Area**		
Post Purge	**Post Sample**	**Prior to Purging**	**Post Purging**	**Post Sampling**
---	---	---	---	---

General Observations/Notes:

Photo #: 101-6470	**Weather @ Sample End:**
Temperature (F)	27°
Relative Humidity (%)	91
Wind	11 NW
Barometric Pressure (in Hg)	29.53
PID (ppb)	0.0

Approximating Sampling Train Volume (for purgings):
When using 1 ¼-inch "Dummy Point" and a 6-inch sampling interval, the sampling space will have a volume of approximately 150 mL.
Each foot of ¼-inch tubing will have a volume of approximately 10 mL.

Indoor Air Sample Collection Log

Tracer Gas Information (if applicable)

Tracer Gas: NA

SUMMA Canister Information

Canister Pressure (inches Hg):		
Reported By Laboratory	**Measured Prior to Sample Collection**	**Measured Following Sample Collection**
-30.1	-30	-7.5

Tracer Gas Concentration (if applicable):				
Measured from Soil Vapor Tubing		**Measured in 'Concentrated' Area**		
Post Purge	**Post Sample**	**Prior to Purging**	**Post Purging**	**Post Sampling**
---	---	---	---	---

General Observations/Notes:

Photo #: 101-6466
Pre-sample can check: -30.1

Approximating Sampling Train Volume (for purgings):
When using 1 ¼-inch "Dummy Point" and a 6-inch sampling interval, the sampling space will have a volume of approximately 150 mL.
Each foot of ¼-inch tubing will have a volume of approximately 10 mL.

CASE NARRATIVE

Client: ARCADIS U.S., Inc.

Project: LMC Utica

Report Number: 200-20955-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 02/14/2014 and 02/17/2014; the samples arrived in good condition.

The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC): IA-VMP-2B. The container labels lists a stop time of 1725, while the COC lists A stop time of 1724.Used stop time from COC for Log in.

The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC): IA-VMP-7, IA-VMP-7A. The container labels lists IA-VMP-7A and IA-VMP-7, while the COC lists IA-VMP-7 and IA-VMP-7A. The client was contacted, and the lab was instructed to use ID's from canister labels for log in.

VOLATILE ORGANIC COMPOUNDS

Samples IA-VMP-1B, AMB-021314, IA-VMP-2B, IA-VMP-2C, IA-VMP-3A, IA-VMP-3B, IA-VMP-3D, IA-VMP-5B, IA-VMP-6A, IA-VMP-6B, IA-VMP-3E, IA-VMP-4, IA-VMP-5A, IA-VMP-7A, IA-VMP-7, IA-VMP-8D and IA-DUP-021214 were analyzed for Volatile Organic Compounds in accordance with EPA Method TO-15. The samples were analyzed on 02/17/2014, 02/18/2014, 02/22/2014, 02/24/2014, 02/25/2014 and 02/26/2014.

1,3-Dichlorobenzene and 1,4-Dichlorobenzene were detected in method blank MB 200-68730/4 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Several analytes were detected in method blank MB 200-68870/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Hexachloro-1,3-butadiene failed the recovery criteria high for LCS 200-68811/3. 1,2,4-Trichlorobenzene and Naphthalene failed the recovery criteria high for LCS 200-68870/4. Refer to the QC report for details.

The continuing calibration verification (CCV) associated with batch 68811 recovered above the upper control limit for Hexachlorobutadiene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: IA-VMP-7.

The continuing calibration verification (CCV) associated with batch 68870 recovered above the upper control limit for Acetone and Naphthalene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: IA-VMP-5A.

Several samples in this delivery group yielded concentrations of Isopropyl Alcohol that exceeded the range of calibrated instrument response. Per the client's instructions additional dilution analyses were not performed, in order to provide for lower reporting limits.

Samples IA-VMP-3A[12.9X], IA-VMP-5B[13X], IA-VMP-6A[14.8X], IA-VMP-6B[10X], IA-VMP-5A[38.3X], IA-VMP-7A[10X] and IA-VMP-7[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the VOC analysis.

All other quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: ARCADIS U.S., Inc.

Job Number: 200-20955-1
Sdg Number: 200-20955-1

Lab Section	Qualifier	Description
Air - GC/MS VOA		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	^	Instrument related QC exceeds the control limits
	*	Recovery or RPD exceeds control limits
	E	Result exceeded calibration range.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: ARCADIS U.S., Inc.

Job Number: 200-20955-1

FORM V
AIR - GC/MS VOA INSTRUMENT PERFORMANCE CHECK

Lab Name: TestAmerica Burlington Job No.: 200-20955-1

SDG No.: 200-20955-1

Lab File ID: 6282_001.d BFB Injection Date: 02/24/2014

Instrument ID: CHW.i BFB Injection Time: 10:20

Analysis Batch No.: 68730

M/E	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE	
50	8.0 - 40.0% of mass 95	13.6	
75	30.0 - 66.0% of mass 95	45.3	
95	Base peak, 100% relative abundance	100.0	
96	5.0 - 9.0% of mass 95	6.7	
173	Less than 2.0% of mass 174	0.5	(0.5)1
174	50.0 - 120.0% of mass 95	100.9	
175	4.0 - 9.0 % of mass 174	7.3	(7.3)1
176	93.0 - 101.0% of mass 174	98.6	(97.7)1
177	5.0 - 9.0% of mass 176	6.4	(6.5)2

1-Value is % mass 174 2-Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS AND STANDARDS:
