SECTION 1
INTRODUCTION

AECOM Technical Services, Inc. has prepared this Post-temporary Solution Status Report Number 10 and the first Periodic Review of the Temporary Solution on behalf of Lockheed Martin Corporation in fulfillment of the requirements of Post-temporary Solution Operation, Maintenance, and/or Monitoring, and Periodic Review of the Temporary Solution, under the Massachusetts Contingency Plan, 310 Code of Massachusetts Regulations 40.0897 and 40.1050, respectively. This report also has been prepared in accordance with the Temporary Solution Statement submitted in May 2017 for Release Tracking Number 3-0518 (AECOM Technical Services, Inc., 2017a), which pertains to the former General Electric Company Facility at 50 Fordham Road, Wilmington, Massachusetts (site). The site location is depicted on Figure 1-1.

This report is being submitted electronically via eDEP, the electronic filing site for the Massachusetts Department of Environmental Protection, along with the Permanent and Temporary Solution Statement form (Bureau of Waste Site Cleanup form BWSC104), Comprehensive Response Action Transmittal/Phase 1 Completion Statement form (Bureau of Waste Site Cleanup form BWSC-108) and the Remedial Monitoring Report form, which provide additional responsible party and Licensed Site Professional certifications.

1.1 BACKGROUND

Contamination of the Stickney Well, a currently inactive public supply well for the Town of North Reading, was discovered in the late 1970s. Subsequent investigations of multiple surrounding properties, including the former General Electric property, began in the early 1980s. On October 9, 1987, prior to the adoption of the Massachusetts Contingency Plan in 1988, the Massachusetts Department of Environmental Quality Engineering (subsequently Massachusetts Department of Environmental Protection or MassDEP) classified the former General Electric facility as a Priority Disposal Site. Under the Massachusetts Contingency Plan (Massachusetts Department of Environmental Protection, 2014), the site is a Tier 1 Classified site, under Release

Tracking Number 3-0518, with four original operable units, as listed below and further defined in previous reports submitted to the Massachusetts Department of Environment.

- Operable Unit-1—Former Tank Farm source area (includes Pump House/Vault and Oil House) and adjacent Eastern Parking Lot
- Operable Unit-2—Former Tank Farm source area and downgradient groundwater plume both on- and off-property
- Operable Unit-3—Storm water/Wastewater Outfalls 001 and 002
- Operable Unit-4—Former Tank K Source Area and immediately downgradient groundwater plume

Areas relating to sediment at storm water/wastewater Outfalls 001 and 002 within Operable Unit-3 have been resolved and closed via a partial Response Action Outcome (Class A-2) submitted in December 2004 (TRC Companies, Inc., 2004). The former Tank K area that comprised Operable Unit-4 has been resolved and closed via a partial Response Action Outcome (Class A-2) dated November 9, 2010 (TRC Companies, Inc., 2010). The remaining two areas, Operable Unit-1 (petroleum contamination in former Tank Farm and Eastern Parking Lot areas) and Operable Unit-2 (chlorinated volatile organic compounds in former Tank Farm and downgradient groundwater plume), make up Release Tracking Number 3-0518. Figure 1-2 depicts an overview of the disposal site, including relevant site features, and Figure 1-3 depicts all monitoring wells located within the site boundary and in the general vicinity of the site.

A Tier 1A Permit was in place from 1999 until a Remedy Operation Status Opinion was filed on April 20, 2006 (TRC Companies, Inc., 2006). Lockheed Martin Corporation and AECOM Technical Services, Inc., determined on February 28, 2013, that the requirements to maintain Remedy Operation Status were no longer being met, and therefore submitted the required Remedy Operation Status Termination Notice and a Tier 1 Permit Extension Application on March 27, 2013, returning the site to Phase II/Phase III status under the Massachusetts Contingency Plan (AECOM Technical Services, Inc., 2013). On October 10, 2014, Lockheed Martin Corporation submitted a Tier Classification Extension (AECOM Technical Services, Inc., 2014) that was approved by the Massachusetts Department of Environmental Protection, extending the Tier Classification deadline to May 3, 2017. On May 2, 2017, Lockheed Martin Corporation electronically submitted to the Massachusetts Department of Environmental Protection the required reports including a Phase II Comprehensive Site Assessment with a Method 3 Risk Characterization (AECOM Technical

Services, Inc., 2017b), a Phase III Remedial Action Plan (AECOM Technical Services, Inc., 2017c), and a Temporary Solution Statement (AECOM Technical Services, Inc., 2017a). The Massachusetts Department of Environmental Protection acknowledged receipt of the reports on May 2, 2017, via electronic stamp on the transmittal form. Currently, the site is in Temporary Solution status and, therefore, Post-temporary Solution Status and Remedial Monitoring Reports are required to be submitted to the Massachusetts Department of Environmental Protection every six months, by May 2 and November 2 of each year, with evaluations of the Temporary Solution conducted every five years.

Additional details related to Release Tracking Number 3-0518 (comprehensive release history, site assessment, and remedial activities completed) can be found in reports previously submitted to the Massachusetts Department of Environmental Protection, specifically the Phase II Comprehensive Site Assessment (AECOM Technical Services, Inc., 2017b), Phase III Remedial Action Plan (AECOM Technical Services, Inc., 2017c), and Temporary Solution Statement (AECOM Technical Services, Inc., 2017a).

1.2 OBJECTIVE

The objective of this Post-temporary Solution Status Report Number 10 is to document the monitoring activities conducted at the site during the six-month reporting period of November 2, 2021, through May 1, 2022, in accordance with the Operations, Maintenance, and/or Monitoring Plan detailed in the Temporary Solution Statement submitted to the Massachusetts Department of Environmental Protection in May 2017. The objectives of the Periodic Review of the Temporary Solution are to document:

1. the feasibility of implementing a Permanent Solution,
2. the effectiveness of the Temporary Solution,
3. the definitive or enterprising steps taken to identify, develop, and implement a feasible permanent solution at the site,
4. any changes in activities, uses, and/or exposures that may cause actual or potential increase in exposure for human or environmental receptors,
5. an evaluation of the Activity and Use Limitations in place, and its effectiveness in maintaining a condition of No Substantial Hazard,

6. any necessary and required response actions to maintain the Temporary Solution.

1.3 LIST OF CONTACTS

This section identifies the potentially responsible party, the Licensed Site Professional-of-record, and the owner of the site.

Potentially Responsible Party:

Lockheed Martin Corporation
6801 Rockledge Drive
MP CCT246
Bethesda, MD 20817
Contact: Mr. Paul E. Calligan
Phone: (240) 687-1813

LSP-of-Record:

Daniel W. Folan, PhD, PG, LSP (License No. 1736)
AECOM Technical Services, Inc.
250 Apollo Drive
Chelmsford, MA 01824
Phone: (978) 905-2205

Current Property Owner:

Hilco Redevelopment Partners (HRP)
99 Summer Street, Suite 1110
Boston, MA 02110
www.hilcoredev.com
Contacts: Ms. Julianna Connolly (617) 240-8695 and Mr. Eric Darci (617) 308-3659

1.4 REPORT ORGANIZATION

This Post-temporary Solution Status Report and Periodic Review of the Temporary Solution is organized as follows:

- **Section 2**—provides a description of the type and frequency of monitoring/field activities conducted during this reporting period, plus a statement of compliance with the conditions of the activity and use limitation in place at the site.

- **Section 3**—presents a description of the comprehensive monitoring well gauging program as well as the resulting measurements and updated groundwater contours based on these measurements.

- **Section 4**—presents a description and the results of the light non-aqueous phase liquid monitoring and subsequent product recovery, a discussion of the performance of the monitored natural attenuation relating to the light non-aqueous phase liquid, and a discussion

of the remedial objectives related to the light non-aqueous phase liquid and the progress toward meeting these objectives.

- **Section 5**—presents the groundwater laboratory analytical results and data validation and includes an evaluation of the field and analytical data presented. An evaluation of the performance of the remedial monitoring program is also presented.

- **Section 6**—presents a description of the indoor air sampling activities as well as laboratory analytical results and data validation activities completed during the reporting period.

- **Section 7**—provides a description of conditions identified during the monitoring period, which may be affecting the performance of the remedial action.

- **Section 8**—provides a description of modifications made to the monitoring program.

- **Section 9**—provides the five-year Periodic Review of the Temporary Solution.

- **Section 10**—provides a description of the schedule for future monitoring activities.

- **Section 11**—provides the conclusions and Licensed Site Professional Opinion regarding this report.

- **Section 12**—provides a discussion of the public notification requirements for the site and copies of any required notifications.

- **Section 13**—provides a list of references.

SECTION 2
MONITORING AND FIELD ACTIVITIES

The Post-temporary Solution Operations, Maintenance, and/or Monitoring (OMM) Program continued during this reporting period in accordance with the monitoring plan presented in the Temporary Solution Statement submitted to the Massachusetts Department of Environmental Protection (MassDEP) on May 2, 2017, and the updated Post-temporary Solution OMM annual groundwater monitoring plans submitted to MassDEP on September 6, 2018, and as Table 10-2 of Post-Temporary Solution Status Report Number 8 submitted to the MassDEP on May 2, 2021. The activities completed as part of the OMM Program during this reporting period (November 2, 2021 through May 1, 2022) are discussed below.

2.1 GROUNDWATER SAMPLING

The annual groundwater-gauging and subsequent groundwater sampling event concluded in September 2021 are summarized below. These activities are reported in this status report as opposed to the November 2021 status report based on receipt of the laboratory analytical results in October 2021 with data validation completed in November 2021.

2.1.1 Site-Wide Water Level Measurements – August 31, 2021

On August 31, 2021, prior to commencing the groundwater sampling event, AECOM Technical Services, Inc. (AECOM) measured depth to water in all on-site and off-site monitoring wells. AECOM also obtained measurements of surface water at 12 well locations where standing water was present. In addition, AECOM obtained surface water elevations from the pond on Concord Street east of the site and northeast of the STM-3 wells, and from two stream gauges, SG-1 in the wetlands north of the Eastern Parking Lot (EPL) and SG-2 adjacent to the Ipswich River on the Wilmington Masonry property. During this gauging event, AECOM measured depth to water in 15 monitoring wells on the YRC Freight (YRC) property at 95 Concord Street including AE-106-S-M-D and AE-106-R1-R5, in the wetland, AE-111-R1-R7 adjacent to the wetland, and five YRC wells MW-1-S-R, MW-12S, and MW-13-S-R. Table 2-1 presents a summary of water levels measured along with the resulting groundwater and surface water elevations, including wells on the YRC

property. AECOM purged the standard Water FLUTes™ on August 30, 2021 to equilibrate the water levels prior to the site-wide measurements on August 31, 2021. AECOM measured the water levels within the Shallow Water FLUTes™ using the procedure provided by FLUTe™. The field records from the site-wide water level measurement event are included in Appendix A. An evaluation of the measurements collected is included in Section 3 of this report.

2.1.2 Groundwater-Sampling Event – September 2021

From September 1 to 23, 2021, AECOM collected groundwater samples from a comprehensive list of the site-wide monitoring wells in accordance with the Post-temporary Solution OMM Plan. Table 2-2 details the September 2021 updated annual groundwater monitoring plan. This scope was executed with one deviation, which is that the groundwater sample from AE-109R-5 was not analyzed for 1,4-dioxane via 8270 with selective ion monitoring due to a miscommunication with the laboratory. Figure 1-3 shows all monitoring well locations sampled in September 2021.

All conventional monitoring wells along with shallow Water FLUTes^{TM} (AE-26R, AE-28R, and AE-29R) and continuous multi-channel tubing (AE-101R and TRC-301R) intervals were purged and sampled with either a peristaltic pump or a bladder pump using low-flow techniques. All standard Water FLUTe^{TM} intervals were purged and sampled using compressed gas. Purging and sampling was conducted in accordance with United States Environmental Protection Agency (USEPA) Region 1 *Low Stress (low flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells* (USEPA, January 2010, revised September 2017).

Groundwater quality parameters (temperature, pH, specific conductance, dissolved oxygen, and oxidation-reduction potential) were measured during purging at all wells using a YSI water quality meter with flow through cell and a separate Geotech turbidity meter. These September 2021 groundwater quality parameter data are summarized in Table 2-3. Field records (water level forms, calibration logs, groundwater-sampling forms, and field logbook notes) from the sampling event are provided in Appendix A.

All samples were collected into laboratory-supplied glassware and either picked up by the lab courier or shipped to each laboratory in accordance with standard chain-of-custody procedures. Samples were analyzed for volatile organic compounds with select samples analyzed by area for additional site chemical(s) of concern (COC), including 1,4-dioxane, total and dissolved arsenic,

and extractable and volatile petroleum hydrocarbons. A focused group of samples was analyzed to evaluate monitored natural attenuation processes that may be affecting the COC at the site. These select samples were analyzed for some or all the following: chloride, the terminal electron acceptor processes (e.g., dissolved iron, manganese, nitrate, nitrite, sulfate, sulfide), total organic carbon, and dissolved gases including hydrogen, ethane, ethene, methane, propane, and acetylene, as well as compound-specific isotope analyses, and microbial analyses. Groundwater samples were submitted to Phoenix Environmental Laboratories, Pace Analytical Gulf Coast, and Microbial Insights. Groundwater samples from select wells were also analyzed via PIANO [acronym for n-paraffins (P), iso-paraffins (I), aromatics (A), naphthenes (N) and olefins (O)] analyses at Alpha Analytical. Groundwater analyses are detailed in Table 2-2. The analytical results are discussed in Section 5 of this report.

2.2 LIGHT NON-AQUEOUS PHASE LIQUID MONITORING AND PRODUCT RECOVERY

In accordance with the OMM Program, AECOM conducted quarterly light non-aqueous phase liquid (LNAPL) monitoring from select monitoring wells in December 2021 and February 2022. These gauging events are summarized below. An evaluation of the LNAPL monitoring results is presented in Section 4.

2.2.1 December 2021 Gauging Event

On December 2, 2021, AECOM gauged seven overburden monitoring wells for depth to water and the presence of LNAPL: AE-3, AE-4, CW-1, CW-2, GZA-102S, PZ-2S, and TRC-101. At the time of the gauging, none of the wells contained an absorbent sock. LNAPL was not detected in any of the monitoring wells gauged. Based on the lack of measurable LNAPL, AECOM did not install absorbent socks in any of the wells. Monitoring wells gauged during this event are depicted on Figure 1-3, and Table 2-4 includes a summary of LNAPL gauging and removal data. A copy of the field record completed during the LNAPL-gauging event is included in Appendix B.

2.2.2 February 2022 Gauging Event

On February 23, 2022, AECOM gauged seven overburden monitoring wells for depth to water and the presence of LNAPL: AE-3, AE-4, CW-1, CW-2, GZA-102S, PZ-2S, and TRC-101. At the time of the gauging, none of the wells contained an absorbent sock. LNAPL was not detected in any of

the monitoring wells gauged. Based on the lack of measurable LNAPL, AECOM did not install absorbent socks in any of the wells. Monitoring wells gauged during this event are depicted on Figure 1-3. Table 2-4 includes a summary of LNAPL gauging and removal data. A copy of the field record completed during the LNAPL-gauging event is included in Appendix B.

2.3 MONITORING WELL REPAIRS

AECOM subcontracted Maher Services of North Reading, Massachusetts to replace roadboxes and concrete pads at six monitoring wells in Wilmington and North Reading. On September 27-29, 2021, Maher Services with oversight from AECOM, replaced roadboxes and concrete pads at five monitoring wells (AE03, AE04, AE103R, TRC-102, and TRC-103) in the Eastern Parking Lot and at one monitoring well (STM-3) along the edge of Concord Street in North Reading. These six monitoring well locations are depicted in Figure 1-3 with a yellow circle around the well symbol. Maher Services jackhammered out the existing roadboxes and concrete/asphalt and placed this material into 55-gallon drums for recycling. The replacement roadboxes are traffic-rated cast iron with minimum 12 to 18-inch long steel skirts. The new concrete pads were reinforced with wire mesh.

During roadbox replacement on September 29, Maher Services cut down the top of polyvinyl chloride well casing at one well, AE03, to accommodate the locking expansion plug within the roadbox. On October 15, 2021, AECOM surveyed the new top of casing reference elevation at monitoring well AE03 using a TopCon RX 2805 level (US Environmental Rental SN: 5000-1010). AECOM used the top of casing elevations from four existing monitoring wells (AE-100R, GZA-102S, PZ-2S, and TRC-101). As shown in the field notes included in Appendix A, the survey yielded top of AE03 casing elevations of 82.23 and 82.24 feet using the four nearby monitoring wells. The new AE03 top of casing elevation post September 29, 2021, is 82.23 feet. The top of casing elevation prior to September 29, 2021, was 82.41 feet.

2.4 INVESTIGATION-DERIVED WASTE MANAGEMENT

During the groundwater-sampling event completed in September 2021, five 55-gallon drums of purge water and decontamination rinse water were generated. This investigation-derived waste (IDW) was properly containerized and temporarily stored at a central staging area on-site, pending characterization and off-site disposal in accordance with Lockheed Martin Corporation procedures.

Similar to past years, this IDW was characterized as hazardous waste based on the elevated trichloroethene and tetrachloroethene concentrations. Clean Harbors Environmental Services (CHES) removed the drums under a uniform hazardous waste manifest on December 2, 2021. A copy of the manifest documenting receipt at the CHES Braintree, MA facility on December 2, 2021, is included in Appendix C.

During the monitoring well repair activities completed September 27-29, 2021, three drums of concrete, asphalt and metal were generated. This material was characterized as non-impacted debris as it was free of soils. On December 2, 2021, CHES removed the debris under a standard bill of lading (BOL) to the EL Harvey facility in Westborough, Massachusetts, for recycling. A copy of the signed BOL is included in Appendix C.

2.5 INDOOR AIR SAMPLING

In accordance with the OMM Program, AECOM performed annual indoor air monitoring during the heating season in January 2022. In October 2017 the United Parcel Service (UPS) began occupying Building 1, under a lease with the former property owner, Wilmington Realty Trust (WRT), and has conducted seasonal operations from October through December in 2017, 2018, and 2019. In September 2020, UPS began full-time occupancy within Building 1 with active operations six days-per-week Monday through Saturday. UPS operations were active during the indoor air sampling on January 18, 2022. In order to obtain samples as representative of the indoor air as possible, AECOM collected indoor air samples when the trucks were out on delivery between approximately 9:00 am and 5:00 pm.

AECOM recorded indoor air and ambient air temperature and barometric pressure readings onsite. During sampling on January 18, 2022, the ambient air temperature ranged from a low of 27 degrees Fahrenheit (°F) to a daytime high of 36°F. Building 1 indoor air temperatures ranged from 58°F to 66°F on the first floor, and from 63°F to 65°F on the second floor. The heating, ventilation, and air conditioning units were operational in Building 1 during the sampling event. The units were preset by UPS to maintain cool conditions and prevent freezing of pipes within the building. As a result, the heating units kicked on/off occasionally and were not continually running during the January 18, 2022 sampling event.

Barometric pressure readings on January 18, 2022, ranged from 748.9 to 765.1 millimeters as measured with a portable barometer onsite.

Prior to and during the sample collection, on January 11, 2022, AECOM completed an indoor air quality building survey per WSC #16-435 Vapor Intrusion Guidance dated October 14, 2016 (MassDEP, 2016a). The purpose of such survey is to document general building information such as construction, structural integrity, utility, materials storage, operations, and occupancy information that could be relevant to the indoor air sampling event. The survey was completed based on visual inspection of the building and information contained in prior survey forms. A copy of the completed survey is included in Appendix D.

Indoor air screening for volatile organic compounds (VOCs) was conducted with a photoionization detector (PID) (Ion Sciences Tiger with 10.6 electron volt lamp) on January 18, 2022, concurrent with the sample collection. The PID readings were recorded at each of the indoor air sample locations, at holes, drains, trenches, or cracks in the floor, and near the materials that could potentially be sources of VOCs. The PID readings at the indoor and ambient air sample locations were all less than 1 part-per-million by volume (ppmv). Additionally, PID readings of less than 1 ppmv were noted at holes, drains, and joints in the floor, and near the materials that could potentially be sources of VOCs within Building 1. These PID readings are all similar to past PID screening results conducted in Building 1.

The January 18, 2022 indoor air sampling event included the collection of air samples from five locations (IA-2, IA-3, IA-4, IA-7, and IA-8) on the first floor and one second floor location (IA-9) of Building 1. All indoor air samples were co-located (within approximately 10 to 20 feet) with the prior indoor air locations sampled from 2009-2021. Historical sample locations IA-10 on the mezzanine of Building 1, IA-5 in Building 3, and IA-6 in the guard shack physically no longer exist. One field duplicate sample was collected at location IA-8 by collecting two canisters concurrently immediately adjacent to each other.

One ambient background air sample (22A-AA1-1) was collected outside the south end of Building 1 during the same period as the indoor air sampling event. The ambient air sample location south of Building 1 under the awning was selected to shield the canister from any potential light rain or snowfall, and to be consistent with recent years. Sample locations are shown on Figures 2-1 and

2-2. The field records, including indoor air sampling records and photographs, are provided in Appendix D.

All samples were collected into 6-liter, batch-certified SUMMA® canisters using eight-hour calibrated regulators set by the laboratory. The SUMMA® canisters were submitted to Alpha Analytical, located in Mansfield, Massachusetts, under chain-of-custody within 24 hours of sampling. All samples were analyzed for Massachusetts Contingency Plan volatile organics in air via Method TO-15 with selective ion monitoring. Analytical results are discussed in Section 6 of this document.

2.6 ACTIVITY AND USE LIMITATION

On July 13, 2015, WRT placed a voluntary activity and use limitation (AUL) on the southwestern portion of the site, encompassing Buildings 1, 1A, and 2, and the EPL. A copy of the AUL is included in Appendix E. The AUL prevents uses of the site which would be inconsistent with maintaining a condition of No Substantial Hazard under the Massachusetts Contingency Plan. The prohibited uses include residential, school, playground, park, or daycare use, as well as activities that would result in exposure to or the disturbance of potentially contaminated soils, bedrock, groundwater, and indoor air, unless appropriate precautions to prevent human exposure are taken as described in the AUL.

The AUL does not restrict the use of groundwater for drinking water purposes. However, the Stickney Well in North Reading and the Reading municipal wells south of the Ipswich River remain inactive, and no drinking water wells exist within one half mile of the site. AECOM checked the Massachusetts online drinking water well data portal (https://eeaonline.eea.state.ma.us/portal#!/search/drinking-water) annually to confirm that no new drinking water wells have been installed within 0.5 miles of the site in the towns of Wilmington, Reading, or North Reading between January 21, 2016 and February 9, 2022.

Based on site inspections and monitoring activities conducted from January 1, 2016 through May 1, 2022, the conditions of the AUL continue to be met.

SECTION 3
GROUNDWATER FLOW EVALUATION

AECOM Technical Services, Inc. (AECOM) conducted a site-wide round of water level measurements on August 31, 2021, prior to commencing the groundwater-sampling event. Table 2-1 presents a summary of all water levels measured along with the resulting groundwater and surface water elevations.

Groundwater contours were developed for three depth intervals, 0 to 60 feet (ft) below ground surface (bgs), 61 to 121 ft bgs, and 122 to 250 ft bgs. These intervals were used for evaluation in prior reports submitted to the Massachusetts Department of Environmental Protection and will be used going forward to evaluate site groundwater flow for consistency. Although the 0 to 60 ft bgs interval includes both overburden and shallow bedrock groundwater elevations, this is consistent with the conceptual site model of bedrock groundwater in the Eastern Parking Lot (EPL) discharging to the deep overburden beneath the wetlands. The deep interval contour consists of only bedrock groundwater elevations; the middle interval is predominantly bedrock groundwater elevations (except for well AE-105D, which is screened in deep overburden from 73 to 75 ft bgs). AECOM assigned the YRC Freight (YRC) overburden and bedrock wells to the same three depth intervals based on well screen depth and elevations. Groundwater piezometric contours generated from the groundwater elevations summarized in Table 2-1 are depicted on Figures 3-1, 3-2, and 3-3.

The groundwater contours are consistent with previous depictions that show shallow (0 to 60 ft bgs) groundwater generally flowing to the east-northeast on the subject property, then trending more eastward beneath the wetlands, and finally southeast at Concord Street towards the Ipswich River. The intermediate (61 to 121 ft bgs) and deep (122 to 250 ft bgs) intervals show groundwater flowing generally to the east-northeast from the EPL and to the east-southeast beneath the wetlands.

The groundwater contour maps (Figures 3-1, 3-2, and 3-3) include elevations from 20 wells (AE-106-S-M-D, AE-106-R1-R5, AE-111-R1-R7, MW-1-S-R, MW-12S, and MW-13-S-R) on the YRC property measured on August 31, 2021. The contours generated during the August 2021 event are based on a smaller data set compared to the groundwater contours from 2018 and 2019, when

YRC had concurrently conducted water level measurements of wells on its property in addition to the 20 measured in 2021.

Because the YRC property is located on a bedrock knob that is higher in elevation than surrounding areas, natural radial groundwater flow from the YRC property is typically observed. The groundwater contours derived from the August 31, 2021 site-wide measurements are similar to previous years and indicate radial flow from the YRC property. As shown in Figures 3-1, 3-2, and 3-3, this radial flow from YRC causes diversion of flow from the eastern portion of the Hilco Redevelopment Partners property around the YRC property. A review of the January 2022 *Remedy Operation Status/Remedial Monitoring and Release Abatement Measure (RAM) Status Report* for the YRC site (Release Tracking Number 3-2363) indicates that the groundwater recirculation system was not operational at YRC during the August 31, 2021 gauging event. Groundwater recirculation was discontinued in June 2021 at the YRC property, and the current remedial activities involve groundwater monitoring only (CCC Environmental Services, 2022). A groundwater contour map provided in the January 2022 *YRC Remedy Operation Status/Remedial Monitoring and RAM Status Report* indicates bedrock groundwater flow on October 21, 2021, within the YRC treatment area, was to the southeast consistent with previous observations during non-pumping conditions (CCC Environmental Services, 2022).

Water level trends presented in this section of the report include groundwater hydrographs from established wells for the period of 1987 through 2021. Hydrographs from 10 wells located within the site boundary are presented in Figure 3-4. In general, groundwater levels did not fluctuate greater than plus/minus 3 ft over the period of record. As expected, due to lower storativity, the bedrock wells tended to fluctuate more than did the overburden wells. The water level fluctuations observed in bedrock wells GZA-102R1 and GZA-105R between 1991 and 2006 are believed to be due to on-site pumping from bedrock extraction wells in the former Tank Farm area and in the EPL. Between 2016 and 2021, all plots generally show the same pattern of fluctuations that range from approximately 1 to 3 ft and are likely due to the wide variations in annual precipitation during this period. A plot of monthly precipitation is presented in Figure 3-5 that also includes the annual precipitation recorded every year from 2016 through 2021. The mean precipitation rate for this area is approximately 45 inches per year. As shown in Figure 3-5, the years 2017, 2019, and 2020 received near average annual precipitation. Drought conditions were observed in 2016

(34.69 inches), whereas high levels of precipitation were recorded in 2018 (58.7 inches) and 2021 (62.5 inches).

For the Former General Electric Company facility property, shallow groundwater elevations recorded on August 31, 2021 were higher than in September 2020. Groundwater elevations in overburden and areas with shallow depth to bedrock onsite near the source area were up approximately 1 to 3 ft from 2020 to 2021 and were some of the highest groundwater elevations recorded at the site since 2012 to 2014. This is believed to be a result of above average precipitation recorded in the area in 2021 (see Figure 3-5).

SECTION 4
LIGHT NON-AQUEOUS PHASE LIQUID MONITORING AND PRODUCT RECOVERY

This section presents the results of the light non-aqueous phase liquid (LNAPL) monitoring, including discussion of the performance of the monitored natural attenuation relating to the LNAPL, and of the LNAPL remedial objectives and the progress during the reporting period toward meeting these objectives.

4.1 LIGHT NON-AQUEOUS PHASE LIQUID FREE PRODUCT RECOVERY

AECOM Technical Services Inc. (AECOM) performs LNAPL free product recovery intermittently as detailed in the Temporary Solution Statement (AECOM, 2017a). AECOM did not deploy any absorbent socks during this monitoring period, as a measurable thickness of LNAPL greater than 0.1 foot (ft) was not detected in any monitoring wells gauged during the monitoring events completed in December 2021 and February 2022.

4.2 LIGHT NON-AQUEOUS PHASE LIQUID MONITORED NATURAL ATTENUATION PERFORMANCE

The sections below include details related to the presence of LNAPL at the site and the monitored natural attenuation (MNA) of site LNAPL.

4.2.1 Demonstration that Monitored Natural Attenuation is Occurring as Expected for Light Non-Aqueous Phase Liquid

During this reporting period, LNAPL was not detected at a measurable thickness greater than 0.1-ft in any monitoring well when gauged. These results are consistent with seasonal fluctuations observed since 2010, as the thicknesses and frequency of LNAPL detections have decreased overall. The presence of LNAPL over the past 10 years has primarily been limited to wells CW-1 and CW-2 with occasional sheen in well PZ-2S. Wells CW-1 and CW-2 are shallow wells installed within a former excavation immediately downgradient of where the bedrock surface dips to the east beneath the Eastern Parking Lot (EPL). The current conceptual site model indicates that the presence of

LNAPL in these wells is typically observed during periods of low water levels which apparently allow small amounts of residual LNAPL to weep from petroleum-impacted bedrock into the wells. Table 2-4 includes a summary of the historical LNAPL measurements, and Figure 4-1 depicts the reduction of the LNAPL plume onsite from 1992 to the present.

Although the very limited LNAPL plume size has not changed significantly in some time, it continues to generate a dissolved plume of petroleum hydrocarbons. In September 2020 and September 2021, AECOM completed a natural source zone depletion (NSZD) assessment utilizing both temperature and soil gas screening methods to evaluate the rate of LNAPL depletion through the natural mechanisms of volatilization, dissolution, and biodegradation (Interstate Technology and Regulatory Council, 2018). A detailed memorandum presenting the NSZD assessment, background, calculations, and results was included as Appendix C to Post-temporary Solution Status Report Number 9 submitted to Massachusetts Department of Environmental Protection (MassDEP) in November 2021. Table 4-1 presents a summary of the NSZD rates. The results of the NSZD assessment are summarized below.

A quantitative analysis showed that NSZD rates, provided below, ranged from approximately 100 to 2,800 gallons per acre per year (gal/ac/yr), with a median rate of approximately 670 gal/ac/yr, based on rates from both the soil gas screening and temperature profiling methods. These NSZD rates are consistent with values typically reported in the literature, ranging from 300 to 7,700 gal/acre/yr, with the middle 50% of the NSZD rates ranging from 700 to 2,800 gal/acre/yr (Garg et. al., 2017).

- LNAPL depletion rates estimated from the soil gas data ranged from approximately 100 to 970 gal/ac/yr, with an average value of approximately 440 gal/ac/yr.
- LNAPL depletion rates estimated from the temperature profiling ranged from approximately 420 to 2,800 gal/ac/yr, with an average value of approximately 1,400 gal/ac/yr.

These estimated NSZD rates, although seemingly high for an old, weathered LNAPL body, are not unreasonable considering:

- An LNAPL smear zone thickness of approximately 5 ft based on site water table fluctuations;

- Soil porosity of approximately 0.3, based on the range of porosity values estimated for coarse sands and gravels (0.25) and fine sands (0.35) observed within the smear zone depth interval (AECOM 2017b).

Given the above values for smear zone thickness and soil porosity, the median estimated depletion rate of 670 gal/acre/yr (approximately 0.002 cubic ft per square ft per year) is equivalent to an annual reduction in LNAPL saturation of approximately 0.14 percent of pore space per year.

Historical fluid level gauging data at the site indicate that the extent of LNAPL in monitoring wells has gradually declined over time as shown in Figure 4-1. This decline indicates that LNAPL saturation has gradually decreased to residual saturation levels, likely in the range of 2 to 19 percent of pore space (Brost and DeVaull, 2000), consistent with the small annual reduction in LNAPL saturation estimated from the NSZD results at the site.

Historical data and results of the NSZD assessment support the selected remedial alternative outlined in the Phase III Remedial Action Plan (AECOM 2017c) that entails continued monitoring and removal of LNAPL in wells when present. The NSZD rates are expected to fluctuate year to year with seasonal variation in groundwater elevations and temperature fluctuations within the area of residual LNAPL impacts onsite (approximately 0.5-0.7 acres). The NSZD processes will continue to decrease the volatile organic compounds and volatile petroleum hydrocarbon (VPH) fraction concentrations in groundwater.

Further discussion of the extractable petroleum hydrocarbons (EPH) and VPH fractions associated with the LNAPL is presented in Section 5.7.3.

4.2.2 Change in Conditions Affecting Light Non-Aqueous Phase Liquid Monitored Natural Attenuation

During this reporting period, there have been no changes in conditions affecting LNAPL MNA. As shown in Figures 4-2 through 4-5, detectable LNAPL thicknesses generally coincide with increased depth to groundwater. Groundwater elevations naturally fluctuate year-to-year, and as a result, the NSZD rate and the potential for the presence of LNAPL in wells CW-1 and CW-2 also fluctuate. Groundwater elevations from September 2021 in overburden and areas with shallow depth to bedrock were 1.5 to 3 ft higher than in September 2020 and were some of the highest groundwater elevations recorded at the site since 2012 to 2014. The depths to water measured in monitoring wells

during this reporting period are similar to those measured in past periods when little to no measurable LNAPL was detected.

4.2.3 Verification that the Light Non-Aqueous Phase Liquid Plume is not Expanding

Response actions have been performed previously to assess LNAPL mobility and to meet the requirements of 310 Code of Massachusetts Regulation (CMR) 40.1003(7)(b). Based on the extensive measurement and evaluation of the LNAPL present at the site, it is apparent that the LNAPL is stable, as defined at 310 CMR 40.0006. The LNAPL footprint is not expanding as shown in Figure 4-1, nor is LNAPL migrating through any subsurface strata or discharging to a surface water body, structure, or utility. The extent of LNAPL has been well defined and measured regularly, with successful product removal via three former recovery wells operating between 1992 and 2002 and through subsequent manual and passive measures from 1999 to present. LNAPL at the site has micro-scale mobility, as it continues to be observed in small amounts intermittently in wells CW-1 and CW-2 when the water table is depressed sufficiently for residual LNAPL to weep from bedrock into soil.

Graphs of the depth to groundwater compared to LNAPL thickness over time in wells CW-1, CW-2, PZ-2S, and TRC-201R are presented in Figures 4-2 through 4-5. These graphs show that, in general, greater LNAPL thickness tends to coincide with increased depth to groundwater. The amount of LNAPL recoverable during periods of low water levels has decreased over time due to the LNAPL removal efforts. As a result, LNAPL removal via passive measures is currently minimal. The lack of LNAPL in monitoring wells TRC-101, AE-03, AE-04, and PZ-2S bounds the area around CW-1 and CW-2, where LNAPL is periodically detected.

4.2.4 Verification of the Absence of Non-Stable Light Non-Aqueous Phase Liquid

Since December 2010, well CW-1 has had little evidence of LNAPL while CW-2 generally exhibits a sheen. Both wells have had periodic measurable LNAPL thickness generally ranging from 0.01 to 0.03 ft, with the thickest measurements of 0.12 ft in CW-1 observed in September 2016 and 0.08 ft in CW-2 in September 2015. The two thickest measurements were taken when the seasonal depth to groundwater was the greatest observed on-site in over 10 years. LNAPL has not been detected in TRC-101 since 2002. LNAPL has not been detected in wells AE-03 or AE-04 since their installation

in 2012. It is apparent that the LNAPL remaining at the site is limited, stable, and only has micro-scale mobility at most, based on the behavior of the LNAPL in the wells.

4.2.5 Verification of Attainment of Remedial Objectives for Light Non-Aqueous Phase Liquid

The remedial objectives for LNAPL are being attained by continued monitoring and passive recovery (when possible), as detailed below and in the Temporary Solution Statement submitted to the MassDEP in May 2017. Given the intermittent presence of LNAPL in monitoring wells in the EPL area and the limited recoverability of LNAPL (approximately 2.81 gallons removed between December 2010 and November 2017), it has been demonstrated, in accordance with the MassDEP LNAPL Guidance (MassDEP, 2016a), that active LNAPL recovery is no longer feasible. However, based on recent gauging data, LNAPL with micro-scale mobility remains within the area adjacent to the former Tank Farm and EPL.

A remedial alternative evaluation was presented as Table 5-1 of the Phase III Remedial Action Plan (AECOM, 2017c) relating to residual petroleum contaminants at the aquifer capillary fringe in the former Tank Farm and EPL areas, where free product with micro-scale mobility has been observed. Continued monitoring of natural attenuation processes and passive recovery of product, if possible, was selected as the alternative for LNAPL present in these areas. These areas have been shown to have low levels of volatile organic compounds in groundwater and soils, but contain EPH/VPH, particularly the C5-C8 aliphatic and C9-C10 aromatic fractions, above standards, in addition to the potential for free-phase LNAPL with micro-scale mobility.

The selected remedial alternative, which entails monitoring and passive removal of LNAPL (if present), is being performed and appears to be proceeding toward attainment of the remedial objectives for LNAPL. Given the limited presence of measurable LNAPL from 2017 to 2022, frequent monitoring of LNAPL thickness in the EPL is no longer necessary. Lockheed Martin plans to reduce LNAPL gauging to once per year beginning in the fall of 2022 for the next five-year monitoring period.

SECTION 5
EVALUATION OF GROUNDWATER QUALITY CONCENTRATION TRENDS

This section provides an evaluation of the concentration trends and distribution of the chemicals of concern (COC) in site groundwater: arsenic, 1,4-dioxane (1,4-D), petroleum hydrocarbons, and chlorinated volatile organic compounds (CVOCs).

The Massachusetts Department of Environmental Protection (MassDEP) has established three categories for groundwater within the Massachusetts Contingency Plan (MCP, 310 Code of Massachusetts Regulations [CMR] 40.0932) that relate to the following types of groundwater exposures:

- GW-1 applies to groundwater assumed to be a current or potential source of drinking water.
- GW-2 applies to groundwater considered to be a potential source of vapors that could migrate into building air.
- GW-3 applies to all groundwaters in the Commonwealth since it is assumed that it all eventually discharges to surface water.

The site is located within an Interim Wellhead Protection Area for the inactive North Reading Stickney public water supply (PWS) well and a Zone II for nine emergency backup PWS wells in Reading (Revay Well #1, Well #2, Well #3, B Line Well, Town Forest, Well #82-20, Well #66-8, Well #13, and Well #15). Therefore, site groundwater is categorized as GW-1.

A portion of site groundwater, which has an average depth less than 15 feet (ft) below ground surface (bgs) and is within 30 ft of Building 1/1A at 50 Fordham Road, is also categorized as GW-2. Additionally, site groundwater within 30 feet of occupied buildings along Concord Street, where the average depth to groundwater is less than 15 ft bgs, is categorized as GW-2.

All site groundwater is categorized as GW-3.

5.1 QUALITY ASSURANCE AND QUALITY CONTROL

In August 2021, AECOM Technical Services, Inc. (AECOM) collected groundwater samples from 174 monitoring wells/screens. All samples were analyzed for volatile organic compounds (VOCs) with select samples analyzed for additional parameters, as detailed in Table 2-2. Upon receipt of the laboratory analytical reports, the data contained in each report was validated and reviewed for compliance with the MassDEP Compendium of Analytical Methods (CAM) performance standards, as detailed in Policy WSC-02-3209 (MassDEP, 2010). Results of the validation are discussed in detail in the data validation memoranda prepared with each laboratory data package included in Appendix F.

The results of the validation of the chemical data indicate that the data are valid as reported and may be used for decision-making purposes. Most of the data were accepted, with qualifiers added where required. As noted in the data validation memoranda, select data points were rejected. The rejected data were limited to non-detect results of one polycyclic aromatic hydrocarbon (PAH) compound from the extractable petroleum hydrocarbon (EPH) analysis, acenaphthylene, from four wells, AE03, GZA105D, GZA105S, and TRC101, as the relative percent difference between the laboratory control sample and duplicate (LCS/LCSD) were out of range. Acenaphthylene is not a key COC for the site. In addition, non-detect dissolved gases data were rejected from well AE103D as dissolved gases were not recovered in the matrix spike/matrix spike duplicate (MS/MSD) sample despite the QC analysis being rerun on this sample.

Laboratory analytical results for dissolved iron and manganese exceed the total iron and manganese results from wells AE100R5 and AE105R1. The laboratory analytical result for dissolved iron exceeds the total iron result from well GZA105R. The concentrations were confirmed by the laboratory. The total and dissolved results for iron and/or manganese in these samples are qualified as estimated (J).

The analytical results met the requirements for “presumptive certainty” status for all compounds for which there is a CAM protocol under the MCP. See Appendix F for further details.

5.2 ANALYTICAL RESULTS – ARSENIC

A summary of the 2016-2021 arsenic analytical results is presented in Table 5-1. The arsenic concentrations are consistent from 2016 through 2021. The total and dissolved arsenic results are

similar in all wells analyzed indicating that the arsenic present is predominantly dissolved arsenic. Eight of the 36 wells sampled had dissolved and total arsenic concentrations above the GW-1 standard of 10 micrograms per liter (µg/L) in 2021. The dissolved arsenic plume in groundwater at four intervals (overburden and upper, middle, and lower bedrock) is presented in Figures 5-1 through 5-4. These figures depict the 2016, 2017, 2018, 2019, 2020, and 2021 plumes from results in the wells sampled each year. The extent of the plumes is the same with concentrations on the same order of magnitude at each interval from 2016 to 2021 with insignificant differences.

Concentration trend graphs of the dissolved arsenic results from all wells sampled in September 2021 are presented in Appendix G. The graphs include all available historical dissolved arsenic results for these wells. A summary of Mann Kendall statistical analyses based on these trend graphs is presented in Table 5-2. Fifteen monitoring wells have enough data from which to generate statistical trends. A downward trend (at 80% or at both 80% and 90% confidence levels) is noted in six monitoring wells. These include three overburden wells: AE-03 and GZA-10 at the Eastern Parking Lot (EPL), and AE-105S in the wetland, plus three bedrock wells: AE-102RR-6 in the EPL, TRC-301R-4 in the wetland, and STM-8R-1 at Transect C. An upward trend (at 80% or at both 80% and 90% confidence levels) is noted in four monitoring wells: GZA-101R in the Building 1 Tank F area, EMW-11R2 and GZA-06 at the EPL, and MW-4A in the wetland. In each of these wells the concentrations remain at the same order of magnitude and below the GW-1 standard in each well except EMW-11R2 where the concentration is equal to the GW-1 standard. The remaining five monitoring wells (AE-102M, AE-103S, GZA-105S, GZA-14A, and TRC-102) show no trend or non-significant trends.

Based on these results, dissolved arsenic concentrations are similar to past results. No significant upward trends are evident. The plume is identical from 2016 to 2021 and is stable in overburden and bedrock intervals.

5.3 ANALYTICAL RESULTS – 1,4-DIOXANE

A summary of the 2016-2021 1,4-D analytical results is presented in Table 5-3. The 1,4-D concentrations are of the same order of magnitude from 2016 to 2021 in all wells with the exception of well AE-101S, which exceeded the GW-1 standard (0.3 µg/L) in 2021 after being non-detect from 2016-2019 and below GW-1 in 2020. A total of 42 wells show 1,4-D concentrations above the GW-1 standard of 0.3 µg/L in 2021. The 1,4-D plume in groundwater at four intervals (overburden

and upper, middle, and lower bedrock) is presented in Figures 5-5 through 5-8. These figures depict the 2016, 2017, 2018, 2019, 2020, and 2021 plumes from results in wells sampled each year. The extent of the plumes is the same with concentrations fluctuating within the same order of magnitude in each of the four intervals from 2016 to 2021.

Concentration trend graphs of the 1,4-D results from all wells sampled in September 2021 are included on the CVOC trend graphs presented in Appendix G. The graphs include all available historical 1,4-D results for these wells that were analyzed via United States Environmental Protection Agency (USEPA) SW-846 Method 8270 or 8270 selective ion monitoring. A summary of Mann Kendall statistical analyses based on these trend graphs is presented in Table 5-8. Forty-two monitoring wells sampled have enough data from which to generate statistical trends. Ten wells in the EPL, Transect A, and wetland/Transect B show a downward trend (at 80% or at both 80% and 90% confidence levels). Eleven wells, mostly in Transect A with a few source area (Building 1) and Transect C wells, show an upward trend (at 80% or at both 80% and 90% confidence levels). In each of the 12 wells with upward trends, the concentrations remain at the same order of magnitude. The remaining 21 of 42 wells show no trend or non-significant trends.

Based on these results, 1,4-D concentrations are of the same order of magnitude as past results. The 2021 plume geometry is like the 2016-2020 plumes and is stable in the overburden and bedrock intervals.

5.4 ANALYTICAL RESULTS – PETROLEUM HYDROCARBONS

A summary of the 2016-2021 EPH and volatile petroleum hydrocarbon (VPH) analytical results is presented in Table 5-4. The EPH and VPH concentrations are similar in 2016, 2017, 2018, 2019, 2020, and 2021 in all wells with changes discussed herein. As discussed in Section 4 above, petroleum light non-aqueous phase liquid (LNAPL) has been identified near the former Tank Farm and EPL. Since 2010, the periodic presence of LNAPL has been limited to wells CW-1 and CW-2 where the bedrock dips to the east beneath the EPL. Sampling for EPH and VPH is being conducted to monitor the levels of petroleum hydrocarbons present in a focused group of wells (AE-03, AE-04, GZA-105S, GZA-105D, and TRC-102 with five wells AE-100R-1, GZA-102S, PZ-2S, TRC-101, and TRC-103 added in 2018) immediately surrounding CW-1 and CW-2. Several EPH and VPH compounds including various PAHs, benzene, toluene, ethylbenzene, xylenes (BTEX), naphthalene,

and hydrocarbons have been detected at concentrations below the GW-1 standard. Detected concentrations above GW-1 standards from 2016 to 2021 include:

- C5-C8 hydrocarbons in 2016 and 2017 and C11-C22 hydrocarbons in 2017 in GZA-105D;
- C5-C8 hydrocarbons in 2018 in AE-100R-1;
- C9-C10 hydrocarbons in AE-03 from 2016-2021;
- C9-C10 hydrocarbons from 2018-2021 and C9-C18 hydrocarbons in 2020 in TRC-101;
- C9-C18 hydrocarbons in PZ-2S in 2021;
- Toluene in AE-23R beneath Building 1 from 2016-2021;
- PAHs:
    - Benzo(a)pyrene in five wells, four in the EPL (AE-03, PZ-2S, TRC-101, and TRC-102) and EMW-11R-2 at the edge of the wetland in 2018;
    - Dibenzo(a,h)anthracene and indeno(123-cd)pyrene in GZA-105D in the EPL in 2017;
    - Chrysene in GZA-14 in 2016;

None of these PAH exceedances of GW-1 were observed in 2019, 2020 or 2021.

A significant increase in C9-C18 hydrocarbons (3,000 µg/L) was detected in well PZ-2S in 2021. Isolated spikes such as this have been detected before in two wells: 1,060 µg/L in GZA-105D in 2017 and 1,100 µg/L in TRC-101 in 2020. In both cases the C9-C18 hydrocarbon concentrations were non-detect in the prior year, and non-detect since. As such, it is anticipated that the elevated detection in PZ-2S in 2021 will also drop back to non-detect levels in future sampling rounds.

These localized fluctuations include more decreases than increases in 2021 dissolved phase petroleum hydrocarbon compound concentrations which coincide with a 1 to 3 ft rise in the overburden and shallow bedrock groundwater elevations from 2020 to 2021 and higher precipitation totals in recent years (Figures 3-4 and 3-5).

Elevated concentrations of C5-C8 and/or C11-C22 hydrocarbons were detected at several wells in bedrock (AE-23R, AE-26R-1, AE-28R-2, AE-29R-6. AE-102RR-6, AE-103R-1, EMW-11R-2, AE-104R-4, and AE-109R-5) from 2016-2021. As explained in Section 5.5, hydrocarbon

concentrations at these wells are attributed to false positive VPH results due to interference from elevated CVOC concentrations.

There were no exceedances of GW-2 or GW-3 standards for EPH/VPH compounds in 2021.

Concentration trend graphs of the petroleum results from all wells sampled in September 2021 (whether analyzed for EPH/VPH or not) are presented in Appendix G. The graphs depict BTEX, methyl-tertiary-butyl ether (MTBE), naphthalene, and calculated VPH fractions of all available historical results for these wells. A summary of Mann Kendall statistical analyses based on these trend graphs is presented in Table 5-5. The BTEX, MTBE, and naphthalene, where detected, are observed at low concentrations entirely below GW-1, GW-2, and GW-3 standards for the past decade 2012 through 2021. Therefore, this text summarizes only the trend graph results for the calculated VPH fraction data and excludes data from wells with documented false positive VPH results as noted above. For the 12 wells with enough VPH fraction data to run statistics, an upward trend at both 80% and 90% confidence levels is noted in one well, TRC-101. Downward trends (at 80% or at both 80% and 90% confidence levels) are noted in six wells (AE-04, AE-100R-1, AE-105R-4, GZA-105D, GZA-105S, and TRC-102) in the former tank farm EPL area and Transects A and B. The remaining five wells show no trends or non-significant trends for calculated VPH fractions.

Based on these results, petroleum concentrations are like past results with fluctuations in concentrations of select compounds and some downward trends at this time. The 2021 petroleum plume geometry is like the 2016-2020 plume geometry and is stable or shrinking in the overburden and bedrock intervals.

5.5 INTERFERENCE OF CHLORINATED VOLATILE ORGANIC COMPOUNDS CAUSING FALSE POSITIVES IN VOLATILE PETROLEUM HYDROCARBON ANALYSES

In the former Tank Farm EPL area and in the Building 1 former Tank F area, source materials were released directly into the overburden, and subsequently into shallow fractured bedrock because the overburden has limited thickness onsite. The top of the shallow fractured bedrock ranges from 3 to 45 ft bgs beneath the former Tank Farm EPL area and in the Building 1 former Tank F area. Comingling with CVOCs may account for some of the hydrocarbon concentrations migrating deeper into bedrock; however, in the absence of significant downward gradients, detections of lighter phase

hydrocarbons are not expected at depth in bedrock in areas away from source areas. In contrast, in 2016-2021, elevated total petroleum impacts (particularly C5-C8 aliphatics) were detected in deep bedrock wells EMW-11R-2, AE-102RR-6, and AE-104R-4 that also displayed elevated CVOC concentrations. There are no significant downward gradients observed at the site and these observations of petroleum hydrocarbons in deep bedrock away from source areas have been determined to be false positive detections due to analytical method interference from chlorinated solvents.

In 2016, the MassDEP recognized potential interference issues associated with the 2004 VPH analytical method (MassDEP, 2004) known as VPH by the gas chromatography/photoionization detector/flame ionization detector (GC/PID/FID) method (MassDEP, 2016b). In 2017, MassDEP issued an alternate method for quantifying VPH using gas chromatography/mass spectrometry (GC/MS) (MassDEP 2017). Certain organic compounds not associated with the release of petroleum products, including chlorinated solvents, alkyl benzenes, ketones (e.g., methyl ethyl ketone), and ethers, may be detected using the VPH by GC/PID/FID Method and may contribute to the collective response quantified within an aliphatic or aromatic hydrocarbon range. In 2018, MassDEP issued a new CAM referred to as WSC-CAM-IV A for the VPH by GC/MS Method to provide more detailed guidance regarding compliance with the quality control requirements and performance standards (MassDEP, 2018).

To better quantify petroleum hydrocarbon concentrations in groundwater, and to separate potential CVOC interferences, in September 2018 AECOM submitted groundwater samples from four wells for analysis of VOCs via Method 8260, VPH via the MassDEP GC/PID/FID Method at Eurofins Spectrum Laboratories, and VPH by MassDEP GC/MS Method at Alpha Analytical Laboratories. The laboratory data were included in Post-temporary Solution Status Report Number 4 submitted to the MassDEP in May 2019. In three of the four wells sampled, the VPH-GC/MS Method did not identify C5-C8 aliphatics or C9-C12 aliphatics where those compounds were identified using the VPH-FID/PID Method and clearly showed interference from tentatively identified non-VPH compounds. These results were supported by the VOC-8260 data (i.e., lack of identification of BTEX and alkyl-benzene compounds). A review of the data indicated that the interferences causing false positive results for C5-C8 aliphatics and C9-C12 aliphatics in the VPH-FID/PID Method were predominantly from CVOCs (tetrachloroethene [PCE], trichloroethene [TCE], 1,1-dichloroethane [1,1-DCA], 1,1-dichloroethene [1,1-DCE], cis-1,2-dichloroethene [cis-1,2-DCE], and

trans-1,2-dichloroethene [trans-1,2-DCE]). One of the three samples did show the presence of many alkyl-benzene compounds and no CVOCs. The VPH-GC/MS and VPH-GC/FID/PID results were similar for this sample.

The VPH-GC/MS Method is suitable for volatile petroleum products, including gasoline and the volatile fractions of mineral spirits, kerosene, #2/diesel fuel oil, and jet fuels (MassDEP, 2017). The site petroleum hydrocarbon of interest is Stoddard Fuel which contains the shorter chain volatile hydrocarbons. In November 2020, AECOM submitted an LNAPL sample from well CW-2 collected in September 2020 to Alpha Analytical for fingerprint analysis. Alpha provided qualitative information regarding the LNAPL sample based on tentative interpretation of chromatographic pattern recognition and boiling point ranges; the LNAPL is predominantly an unresolved complex petroleum hydrocarbon mixture eluting between n-Octane (C8) and n-Octadecane (C18) and is similar to a weathered mineral spirit or aviation fuel type product. Stoddard Fuel is also known as a mineral spirit.

The existing site groundwater data indicate that the petroleum hydrocarbons detected contain mostly VPH range (C5-C8 and C9-C10) hydrocarbons. Due to the presence of elevated CVOCs, which may interfere with analysis of VPH by the GC/PID/FID Method and cause artificially elevated VPH readings, the VPH by GC/MS Method is suitable for quantifying the VPH levels in site groundwater. Based on these results, Lockheed Martin Corporation proposed to switch the VPH analysis to the GC/MS Method under the Operations, Maintenance, and/or Monitoring (OMM) Program with EPH still to be analyzed by MassDEP EPH Method (GC/PID/FID). However, the lack of demand for the VPH-GC/MS method by the Licensed Site Professional community forced the only remaining laboratory (Alpha Analytical Laboratories) to discontinue running this method in July 2019. Therefore, Lockheed Martin Corporation evaluated alternate analytical methods to identify those wells currently being sampled for VPH using the GC/FID/PID method that lead to false positive VPH results.

In September 2020 and September 2021, AECOM submitted groundwater samples from multiple wells for PIANO (acronym for n-paraffins [P], iso-paraffins [I], aromatics [A], naphthenes [N] and olefins [O]) analysis at Alpha Analytical Laboratories. A PIANO analysis is a forensic GC/MS analytical tool for fingerprinting light-end refined products, e.g., gasoline and jet fuel, in contaminated soil and groundwater. This method identifies and measures 144 volatile petroleum

hydrocarbon compounds. AECOM submitted 6 samples in 2020 and 13 samples in 2021. In September 2020, AECOM selected six wells for PIANO analysis: two overburden wells (AE-03 and TRC-101) as they exhibit petroleum impacts and little to no CVOC impacts, plus four bedrock wells in Transect A (AE-102RR-6, AE-103R-1, AE-104R-4, and EMW-11R2) which exhibit elevated CVOC and C5-C8 hydrocarbon concentrations in bedrock groundwater away from the source areas. In September 2021, AECOM submitted 13 samples from 4 wells (AE-102RR-6, AE-103R-1, AE-104R-4, and EMW-11R2) to compare 2020 and 2021 results, as well as 4 wells (AE-23R, AE-26R-1, AE-28R-2, and AE-29R-6) in the Building 1 Former Tank F Area, 3 wells in the EPL (GZA-105S, GZA-105D, and GZA-105R), and 1 additional bedrock well in Transect A (AE-109R-5). The laboratory analytical results of the 2020 and 2021 analyses are presented in Table 5-6.

The PIANO analytical results from Alpha indicate that all 144 compounds were below laboratory detection limits in 2 bedrock wells in 2020 (AE-102RR-6 and AE-103R-1) and in 9 overburden and bedrock wells in 2021 (AE-26R-1, AE-29R-6, GZA-105D, GZA-105R, EMW-11R-2, AE-102RR-6, AE-103R-1, AE-104R-4, and AE-109R-5). In 2020, in the other two bedrock wells, AE-104R-4 and EMW-11R-2, all compounds were below laboratory detection limits, except for low concentrations of toluene. Similarly, in 2021, only low concentrations of single compounds were detected (i.e., indane in GZA-105S and 1,2,4-trimethylbenzene in AE-28R-2). In 2021, toluene was the lone compound detected in well AE23R at an elevated concentration, which is consistent with historical toluene concentrations in this well. In contrast, in 2020, 19 and 25 light-end refined petroleum products were detected in both overburden wells AE-03 and TRC-101, respectively. In 2021, 5 light-end refined petroleum products were detected in shallow bedrock well AE-100R-1.

For the wells analyzed, these results support the conclusion that, despite having comingled chlorinated VOCs and petroleum products in groundwater at the site, the petroleum products are not detected at depth in bedrock away from the source area, and that elevated concentrations of chlorinated VOCs are causing false positives in the VPH GC analyses (VPH is a GC method with no MS).

Based on this evaluation, Lockheed Martin Corporation will discontinue sampling of EPH/VPH at depth in overburden and bedrock wells away from source areas and will focus only on nine overburden wells in the EPL and one shallow bedrock well AE-100R-1 in the former tank farm

onsite where LNAPL has formerly been detected. This reduced monitoring is defined in the future monitoring scope presented in Section 10.

5.6 ANALYTICAL RESULTS – VOLATILE ORGANIC COMPOUNDS

A summary of the annual 2016 through 2021 VOC analytical results is presented in Table 5-7. The detected VOC concentrations are consistent from 2016 to 2021. Ten different CVOCs were detected in groundwater in 2021 at concentrations above MCP groundwater standards. These compounds include: 1,1,1-trichloroethane, 1,1,2-trichloroethane, 1,1-DCA, 1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, PCE, TCE, toluene, and vinyl chloride (VC). One or more of these ten constituents were detected above GW-1 standards at 98 different well screen/port locations. One or more of the following CVOCs (1,1-DCE, cis-1,2-DCE, trans-1,2-DCE, PCE, TCE, and VC) were detected at concentrations greater than MCP GW-2 standards (within 30 feet of a building with depth to groundwater less than 15 ft) in the following wells sampled within 30 ft of or beneath Building 1 in 2021: AE-23R, AE-23S, AE-24, AE-25R, AE-26R1, AE-26R2, AE26R3, AE26R4, AE-26R5, AE-26S, AE-27R, AE-28R1, AE-28R2, AE-28R3, AE-28R4, and GZA-101R. Only PCE and TCE were detected at concentrations greater than GW-3 standards, TCE at 14 well screen/port locations under Building 1, in the EPL, and Transect A, and PCE at 1 well screen/port location (AE-23R) beneath Building 1.

Consistent with observations from 2016-2020, the highest total CVOC concentration (212,660 µg/L) observed at the site in 2021 is in upper bedrock well AE-23R located beneath Building 1. The concentration of TCE (150,000 µg/L) detected in 2021 exceeds the upper concentration limit (UCL) of 50,000 µg/L. Concentrations of TCE have historically exceeded the UCL in this well. This was the only UCL exceedance for any constituent at any monitoring well location in 2021. In 2021, the highest PCE concentration (56,000 µg/L) was also detected in AE-23R, which is above the GW-3 standard but below the UCL for PCE. The current and historical PCE and TCE concentrations at AE-23R suggest the potential for dense non-aqueous phase liquid (DNAPL), however, DNAPL has never been detected in AE-23R when gauged.

Figures 5-13 through 5-24 present the 2016-2021 PCE, TCE, and total CVOC plumes in groundwater at four intervals (overburden and upper, middle, and lower bedrock). These figures depict the 2016, 2017, 2018, 2019, 2020, and 2021 plumes from results in wells sampled each year. The total CVOCs is a sum of the eight CVOCs predominantly detected onsite including: PCE, TCE,

VC, cis-1,2-DCE, trans-1,2-DCE, 1,1-DCE, 1,1-DCA, and 1,2-DCA. The 2016-2021 PCE, TCE, and total CVOC plumes are similar in size at all four intervals with the following order of magnitude differences in concentrations:

- One order of magnitude increase of TCE in AE-100R-1 from 2.5 to 44 µg/L.
- One order of magnitude increase of 1,4-D in AE-23R from non-detect to 12 µg/L.
- One order of magnitude increase of vinyl chloride in AE26R-1 from 2.5 to 130 µg/L, and in AE-26R-2 from non-detect to 33 µg/L.

Each of these wells are located in the Building 1 and former Tank Farm source area where fluctuations in concentrations are not unexpected.

Concentration trend graphs of the CVOC results from all wells sampled in 2021 are presented in Appendix G. The graphs depict all available historical PCE, TCE, cis-1,2-DCE, toluene, VC, and 1,4-D results for wells sampled in September 2021. A summary of Mann Kendall statistical analyses based on these trend graphs is presented in Table 5-8.

In September 2021, 172 monitoring well screen/port locations were sampled. Of those 172, 132 have enough data from which to generate statistical trends at this time. Thirty-eight percent of the 2021 CVOC data (165 of 435 records) show no trend or non-significant trends. Downward trends at (80% or at both 80% and 90% confidence levels) for parent compounds (i.e., PCE and TCE) are noted in 58 of the 172 well screens sampled across the site in 2021 in the bedrock at Building 1, overburden and bedrock in the EPL, and Tank F area, in the overburden in the downgradient wetland, and in overburden and bedrock in Transects, A, B, and C. Upward trends (80% or at both 80% and 90% confidence levels) of daughter products (e.g., cis-1,2-DCE, and VC) are noted in 60 well screens sampled in 2021 mainly in middle to lower bedrock and to a lesser extent in overburden and upper bedrock in Building 1, the EPL, and Transects A, B, and B1/2, and also in overburden in the downgradient woods, wetland, and Transect C.

The Mann Kendall results indicate that 26 well screen/port locations have upward trends (80% or at both 80% and 90% confidence levels) for parent compounds (i.e., PCE and/or TCE). These include: AE-100R-3, AE-100R-4, AE-100R-5, AE-100R-6, AE-101R-1, AE-101S, AE-102RR-5, AE-102RR-6, AE-103R-6, AE-105R-5, AE-108R-2, AE-108R-3, AE-108R-4, AE-108R-5, AE-112R-3, AE-23R, AE-26R-1, AE-26R-4, AE-26R-5, AE-28R-2, AE-28R-4, EMW-10D,

EMW-11R1, EMW-11R-2, GZA-105R, and MW-7. Twenty-three of these wells are in areas of elevated CVOC concentrations in the source areas and Transect A, with only three wells in the wetland and Transect B, therefore, fluctuations in concentrations are not unexpected.

The STM-8 well cluster is a key monitoring point since it is located at the furthest extent of the plume. The results from this well cluster are indicative of ongoing attenuation of parent compounds to daughter products at the tail end of the plume. In STM-8D, the concentration of cis-1,2-DCE over the last eight sampling rounds in 2014-2021 has consistently been one order of magnitude higher than PCE and TCE. The maximum PCE and TCE concentrations were 2 µg/L from 2015 through 2019, and non-detect in 2020 and 2021, whereas cis-1,2-DCE concentrations have ranged from 17.9 µg/L in 2016 to 3.9 µg/L in 2021. The concentration ratio of parent compounds to cis-1,2-DCE is consistently low, indicative of degradation.

5.7 MONITORED NATURAL ATTENUATION

This Post-temporary Solution monitoring period consists of active performance of a comprehensive monitored natural attenuation (MNA) groundwater sampling program for site management. Details for each COC are provided below.

5.7.1 Arsenic Monitored Natural Attenuation Performance

This section presents an evaluation of arsenic MNA performance.

5.7.1.1 Demonstration that Monitored Natural Attenuation is Occurring as Expected for Arsenic

The presence of dissolved arsenic is considered to be a temporary deviation from the state of naturally-occurring conditions typical in this region. The presence of organic COC such as petroleum hydrocarbons and VOCs in site groundwater has temporarily altered the natural redox conditions from aerobic to anaerobic, causing dissolution of naturally-occurring insoluble forms of arsenic in site soils/weathered rock to the dissolved state. Plume figures suggest that dissolved arsenic concentrations are related to localized conditions immediately downgradient from the former Tank Farm and former Tank K source areas and are not expansive in nature. It is anticipated that as the concentrations of organic COC decrease over time and the aquifer returns to its normal aerobic redox conditions, dissolved arsenic levels will decrease naturally. This appears to be the

case based on the depictions of the limited arsenic plume, particularly downgradient where contaminant concentrations are lowest.

5.7.1.2 Changed Conditions Affecting Arsenic Monitored Natural Attenuation

There are no new data during this monitoring period that would indicate new environmental conditions or new releases of contaminants have occurred, which could reduce MNA efficiency for arsenic in groundwater.

5.7.1.3 Absence of Toxic Transformation Products of Arsenic

There are no toxic transformation products from natural attenuation of arsenic.

5.7.1.4 Verification that Arsenic Plume is not Expanding

As shown in Figures 5-1 through 5-4, the extent of the plumes is the same with concentrations on the same order of magnitude in each interval from 2016 to 2021. In addition, dissolved arsenic concentrations have decreased slightly in wells GZA-14A, AE-103S, and AE-105S. The dissolved arsenic concentration decreased significantly in GZA-10 from 2019 to 2021.

5.7.1.5 Demonstration of Effective Institutional Controls

The institutional controls under the activity and use limitation (AUL) at the site remain effective in limiting potential exposure to arsenic in groundwater. Although there are no institutional controls regarding the restriction of groundwater as a drinking water source at the site, the municipal wells near the site remain inactive and no drinking water wells exist within 0.5 miles of the site.

5.7.1.6 Verification of Attainment of Remedial Objective for Arsenic

The remedial objective for arsenic is reduction of arsenic concentrations in overburden and bedrock groundwater over time through MNA. Given the elevated concentrations of organic COC (petroleum hydrocarbons and VOCs) contributing to dissolved arsenic concentrations, the time frame for a general decrease in arsenic concentrations or a decrease to below applicable standards is on the order of decades. Based on groundwater data collected during this reporting period, the existing groundwater plume for dissolved arsenic is stable and not expanding. Therefore, the remedial objective for arsenic in groundwater is being met.

5.7.2 1,4-Dioxane Monitored Natural Attenuation Performance

This section presents an evaluation of 1,4-D MNA performance.

5.7.2.1 Demonstration that Monitored Natural Attenuation is Occurring as Expected for 1,4-Dioxane

It is understood that the presence of 1,4-D is related to the CVOC contamination as it was most likely a co-contaminant. The 1,4-D distribution appears consistent with the trends observed for the CVOCs during this sampling event (see Section 5.7.4). While the literature has identified the possibility of both metabolic (energy source) and co-metabolic (co-oxidation) degradation pathways of 1,4-D under certain conditions, these biological processes are unlikely to significantly affect the levels on-site in reaching the low-level regulatory criteria in the near term. A combination of these and physical attenuation processes would contribute to the long-term natural attenuation of 1,4-D.

5.7.2.2 Changed Conditions Affecting 1,4-Dioxane Monitored Natural Attenuation

There are no new data during this monitoring period that would indicate that new environmental conditions or new releases of contaminants have occurred, which could reduce MNA efficiency for 1,4-D in groundwater.

5.7.2.3 Absence of Toxic Transformation Products of 1,4-Dioxane

Although not considered a significant attenuation mechanism for 1,4-D at the site, current literature indicates that 1,4-D may biodegrade to various compounds such as ethylene glycol, glycolic acid, or oxalic acid (Rodriguez, 2016). These compounds are non-toxic and expected to biodegrade rapidly in the environment, and therefore, are not included in this monitoring program.

5.7.2.4 Verification that 1,4-Dioxane Plume is not Expanding

As shown in Figures 5-5 through 5-8, the extent of the 1,4-D plumes are the same with concentrations on the same order of magnitude in each interval from 2016 to 2021. Slight increases and decreases in concentrations are noted in some wells. Slight concentration increases are primarily detected in wells within Transect A where elevated CVOCs are present. The Ricker Method Plume Stability analysis results for 1,4-D indicate stable or decreasing trends for all three plume metrics (area, average concentration, and mass indicator) in the overburden and deep bedrock units. In the upper and middle bedrock zones, the 1,4-D plume stability analysis resulted in a decreasing, but not statistically significant, trend for all three Ricker Method plume metrics (Appendix H). Therefore, the 1,4-D plumes are considered stable and not expanding.

5.7.2.5 Demonstration of Effective Institutional Controls

The institutional controls under the AUL at the site remain effective in limiting potential exposure to 1,4-D in groundwater. Although there are no institutional controls regarding the restriction of groundwater as a drinking water source at the site, the municipal wells near the site remain inactive and no drinking water wells exist within 0.5 miles of the site.

5.7.2.6 Verification of Attainment of Remedial Objective for 1,4-Dioxane

Evaluation of 1,4-D is being addressed with continued sampling and analysis under the Post-temporary Solution OMM program. Recent monitoring data indicate increasing concentrations in some wells in middle and lower bedrock and to a lesser extent in overburden. This is likely related to fluctuations in CVOC concentrations, which along with 1,4-D concentrations are expected to fluctuate over time given the anticipated timeframe (decades or more) for MNA to reduce overall concentrations of CVOCs and 1,4-D. The groundwater remedial objective for 1,4-D will be attained through MNA as shown by long-term trend analysis. Based on groundwater data collected during this reporting period, there is evidence that the existing groundwater plume for 1,4-D is not expanding. Therefore, the remedial objective for 1,4-D in groundwater is being met.

5.7.3 Petroleum Hydrocarbons Monitored Natural Attenuation Performance

This section presents an evaluation of petroleum hydrocarbon MNA performance.

5.7.3.1 Demonstration that Monitored Natural Attenuation is Occurring as Expected for Petroleum Hydrocarbons

Relative to the LNAPL presence and distribution described in Section 4 above, the petroleum hydrocarbon plume has not changed significantly. While the LNAPL thickness has varied over the past decade and is only observed as a sheen in wells CW-1 and CW-2, certain wells in the former Tank Farm/EPL area (AE-03, AE-04, GZA-105D, PZ-2S, and TRC-101) have shown recent fluctuations in both VPH and EPH fractions. This observation may be due to fluctuations in groundwater elevations flushing the smear zone and the continued dissolution of LNAPL constituents into the aqueous phase, which would further decrease the residual LNAPL and make the dissolved constituents more available to natural attenuation processes over time, as documented by the 2020-2021 natural source zone depletion (NSZD) assessment summarized in Section 4.2.1.

5.7.3.2 Changed Conditions Affecting Petroleum Hydrocarbons

There are no new data during this monitoring period that would indicate that new environmental conditions or new releases of contaminants have occurred, which could reduce MNA efficiency for petroleum hydrocarbons in groundwater.

As detailed in Section 5.5, the 2020 and 2021 groundwater data from the PIANO and SW8260 analytical methods confirm false positive interferences from elevated CVOC concentrations, particularly in bedrock wells away from source areas onsite. Based on this data, Lockheed Martin will stop monitoring EPH/VPH in wells at depth and away from the source areas and focus monitoring to overburden and shallow bedrock wells in the EPL.

5.7.3.3 Absence of Toxic Transformation Products of Petroleum Hydrocarbons

Petroleum hydrocarbons typically degrade to less toxic forms as they undergo biological degradation in the environment. The most toxic petroleum hydrocarbons include PAHs and smaller aromatic compounds such as BTEX. Based on the 2016-2021 analytical results, there have been some noted fluctuations in petroleum hydrocarbon concentrations but no significant increases in the amounts of PAHs or BTEX compounds.

5.7.3.4 Verification that Petroleum Hydrocarbons Plume is not Expanding

As shown in Figures 5-9 through 5-12, the 2016, 2017, 2018, 2019, 2020, and 2021 plumes of petroleum hydrocarbons in overburden and bedrock are nearly identical in shape in all four intervals from 2016 to 2021 with some reduction in size from 2017 to 2021. The plumes are therefore considered stable and not expanding.

5.7.3.5 Demonstration of Effective Institutional Controls

The institutional controls under the AUL at the site remain effective in limiting potential exposure to petroleum hydrocarbons in groundwater. Although there are no institutional controls regarding the restriction of groundwater as a drinking water source at the site, the nearby municipal wells remain inactive, and no drinking water wells exist within 0.5 miles of the site.

5.7.3.6 Verification of Attainment of Remedial Objective for Petroleum Hydrocarbons

The remedial objective for petroleum hydrocarbons is reduction of the concentrations in overburden and bedrock groundwater over time through MNA. Based on groundwater data collected during this

reporting period, there is evidence of some biodegradation of petroleum hydrocarbons and the existing groundwater plume for petroleum hydrocarbons is stable and not expanding. Additionally, the results of the NSZD assessment confirm LNAPL reduction through natural processes, which in turn will reduce dissolved-phase petroleum hydrocarbon concentrations over time. Therefore, the remedial objective for petroleum hydrocarbons in groundwater is being met.

5.7.4 Mass Flux Evaluation of Chlorinated Volatile Organic Compounds

This section provides the results of a mass flux evaluation of the 2021 CVOC data. The results are compared to the same analysis conducted in 2016 to evaluate changes in mass flux over the last five years. Mass flux/mass discharge analysis is an effective approach to site characterization, risk assessment, and remedial planning (ITRC, 2010). The USEPA Scientific Advisory Board (USEPA, 2001) recommends that site characterization and monitoring should be proactively designed to incorporate mass flux estimates. Mass flux (J) is defined as the mass moving across a unit area of porous media (aquifer) and mass discharge (M) is defined as the mass of contaminant in groundwater passing through a given cross sectional area (ITRC, 2010). Although the strict definition of mass flux is mass discharge per unit area (in units of mass per time per area), many researchers and practitioners use the term mass flux to denote the rate of "mass discharge" or "total mass discharge." This document will use the term "mass flux" to represent data in units of mass per time passing by a plume transect perpendicular to groundwater flow. The calculation typically requires the following information:

- Concentration of contaminant (C) in groundwater at a given time from discrete upgradient and downgradient locations (mass/length^3)
- Hydraulic conductivity (K) of the aquifer (length/time)
- The hydraulic gradient (i) of the aquifer (length/length)
- Cross sectional area (length^2) of the groundwater plume

The Mass Flux Toolkit software (ITRC, 2010) was used to calculate J and M along mass flux transect lines situated perpendicular to groundwater flow at four locations of the site. The four transect lines roughly coincide with the following locations along the CVOC plume:

- within Building 1
- at Transect A on the eastern edge of the EPL

- at Transect B in the wetland
- at Transect C along Concord Street

Details of the rationale, setup, and performance of the model including a summary of the input and output data are provided in Appendix J.

The limitations of this mass flux analysis are that only PCE and TCE were used to calculate mass flux, as they represent the majority of the groundwater contamination. In addition, the site geology and number/location of wells in the monitoring well network may not be ideal for an accurate quantification of the mass flux, however, they are suitable to allow comparison of relative changes in mass flux from one transect to the next.

The calculated mass flux of PCE and TCE in overburden and bedrock across the four transects from 2016 and 2021 is shown in Table 5-9. This table presents the sum of mass flux in overburden and bedrock and the overall sum of mass flux for each transect along with the percent change in mass flux from 2016 to 2021. A plot of the total mass flux with distance from the source area in overburden and bedrock for 2016 and 2021 is provided in Figure 5-25.

The tables and figures cited above provide the following general insights about mass flux and the overall conceptual site model (CSM):

- Significant reductions in total mass flux in the overburden has occurred at all transects between 2016 to 2021. As shown in Table 5-9, between 2016 to 2021, the percent (%) reduction in mass flux in the overburden has decreased in the range of 39.0% to 89.2%. The highest reductions were seen in both the Building 1 Transect (89.2%) and Transect A (84.6%).
- The changes in mass flux over the last 5 years in the bedrock aquifer showed an increase of 17.8% at the Building 1 Transect and a slight decrease (3.8%) at Transect A. The observed increase of mass flux at the Building 1 Transect is most likely due to wide fluctuations of dissolved phase PCE and TCE concentrations in the source due to the potential presence of DNAPL. It is not uncommon to see large variations of dissolved phase concentrations in areas where DNAPL is known or suspected. The slight decrease (3.8%) at Transect A is an indication that concentrations are steady and not changing significantly over time in the bedrock at Transect A.
- In both 2016 and 2021, there is a significant (one order of magnitude) decrease in mass flux from Transect A to Transect B, i.e, approximately 5 gallons per day (g/d) to 0.1 g/d.

- Due to a combination of elevated total VOC concentrations around 20,000 µg/L and high total borehole transmissivities at AE-101R, AE-102RR, and AE-103R, significantly more of the mass flux at Transect A is in the bedrock than in the overburden.
- There is negligible mass flux across Transect C.

To further illustrate mass flux in the bedrock across Transect A, the predicted PCE mass flux calculated in the Mass Flux Toolkit for bedrock were contoured using kriging methods in Surfer 8.04 (Golden Software Inc., 2003). The contouring results show that the core of the mass flux in bedrock at Transect A passes directly through well AE-102RR over a width of approximately 150 feet and at a depth interval from approximately 110 to 170 ft bgs. The resulting contours are shown in Figure 5-26 . Outside of the area higlighted in red, the PCE mass flux is observed to significantly decrease (i.e., by orders of magnitude). This observation coupled with the observed concurrent downgradient transect mass flux decreases suggests that ongoing attenaution processes are capable of managing the mass flux into the future.

5.7.5 Diffusion

This section describes the process of diffusion as it relates to attenuation of CVOCs in fractured rock settings. Also, the results of matrix diffusion modeling simulations using the CRAFLUSH fracture plane model demonstrate the importance of matrix diffusion as an attenuation mechanism of CVOCs in fractured bedrock at the site.

5.7.5.1 Matrix Diffusion Process

Diffusion describes the spread of particles (or compounds) through random motion from regions of higher concentration to regions of lower concentration. In groundwater, diffusion is driven by chemical gradients and not hydraulic gradients; therefore, diffusion can cause compound concentrations in groundwater to increase in upgradient directions. Diffusion can also act to attenuate plumes, even in fractured rock. While fractures dominate advective transport in most crystalline fractured rocks, the presence of matrix porosity may also be an important attenuation mechanism. According to Schild, et al. (2001), matrix porosities of crystalline rocks are usually less than 1% (0.01) and are attributed to intra- and inter-granular micro-cracks. The primary porosity of bedrock at the site has been measured to range from 0.015 to 0.045 (AECOM, 2017b). Although nowhere near as large as the primary porosity of sedimentary rocks (10-20%), the amount of matrix porosity in crystalline rocks may still allow for moderate contaminant storage and attenuation.

Under these circumstances, diffusive contaminant transport occurs between the rock matrix and the open fractures.

The conceptual model of source zone evolution following a release of DNAPL to fractured rocks and its subsequent disappearance due to diffusion effects is described by Parker et al., 1997. Following a release of chlorinated solvent DNAPL into a fractured rock system, the DNAPL will dissolve into flowing groundwater giving rise to dissolved phase plumes. Following the release, dissolved PCE and TCE will diffuse into the primary porosity of the rock. This process is referred to as forward matrix diffusion (Kueper et al., 2014). A schematic diagram illustrating forward matrix diffusion is presented in Figures 5-27a and 27b.

Following the initial release of soluble contaminants to fractured media, rapid diffusion into the available rock matrix occurs. The end result of the rapid forward matrix diffusion into the rock matrix is that, depending on the matrix porosity, a fair amount of contaminant will reside within the matrix in a relatively short period. According to a study conducted by VanderKwaak and Sudicky (1996), the rock matrix attained equilibrium with the contaminant mass moving through secondary fractures within one year of it entering the system.

The rock matrix porosity acts as a reservoir that can sustain long-term release of contaminants back into fractures through reverse or back-diffusion as illustrated in Figure 5-27 (Reynolds and Kueper, 2002; Lipson, et al., 2005). Unlike the forward matrix diffusion process, which is relatively rapid due to initially high concentration (presumptive DNAPL) gradients, the back-diffusion process will be much slower due to a slowly decreasing concentration gradient between the matrix and dissolved CVOCs in the open fractures.

A modeling study completed by Reynolds and Kueper (2002) for a fractured sedimentary rock site discovered that despite gradually lower concentration gradients that may be re-established during source zone remediation activities, groundwater cleanup times can exceed hundreds or even thousands of years due to slow back-diffusion of CVOCs out of the downgradient plume rock matrix into the secondary fractures.

For fractured rock media with measurable matrix porosity, one implication of the forward matrix diffusion process is that PCE and TCE, migrating through the bedrock fractures, will travel at a rate slower than that of the groundwater (Parker et al., 2007). Using a one-dimensional flow model,

Lipson et al. (2005) concluded that plumes in fractured bedrock decelerate as they grow. Lipson et al. (2005) determined that the retardation factor attributable to forward matrix diffusion increases with time and distance, eventually reaching an asymptotic value (β) given by:

$$\beta = \{(N_m)/ (N_f)\} \times R'$$

where N_m is the primary porosity, N_f is the secondary or fracture porosity, and R′ is the retardation factor due to diffusion into the rock matrix. The average matrix porosity (N_m) for site bedrock is 0.023 based on rock core samples collected from the site and a site-specific N_f value of 1.61E-5 was calculated using the Cubic Law for groundwater flow in fractured bedrock (AECOM, 2017b). This yields an asymptotic R′ value (β) = 1429 x R′. Therefore, according to this model, as the bedrock plume travels from the source area with groundwater flow, its rate of migration becomes increasingly retarded with distance and time attaining a maximum R′ rate that is approximately 1429 times slower than that of advective groundwater flow.

In addition to bringing about a 'retardation' effect to plume velocity, a second implication of forward matrix diffusion is that most dissolved phase mass may be stored in the micro-fractures and micro-cracks in the matrix, not the secondary open fractures. For example, the ratio of dissolved CVOC storage capacity in the matrix to the fractures (N_m/N_f) at the site is 1429.

5.7.5.2 CRAFLUSH Diffusion Modeling

Groundwater monitoring data along Transects A and B show that PCE and TCE concentrations in the core of the groundwater plume are 90 to 99% less in Transect B than in Transect A. Given the limited evidence for significant biotic and abiotic degradation (see Section 5.7.6), it is hypothesized that diffusion into the rock matrix is responsible for this large difference in contaminant concentration as groundwater migrates from Transect A to Transect B. To test this hypothesis, the CRAFLUSH model (Sudicky and Frind 1982) was employed using site-specific input parameters (AECOM, 2017b). The overall objective for employing this screening model was to determine if the difference in concentration between Transects A and B could be explained by diffusive uptake into the micro-fractures and micro-cracks in the rock matrix.

The results of the CRAFLUSH modeling simulations, using site-specific input parameters, indicates that PCE concentrations (or, mass discharge) will decrease by approximately 85% between Transect A and B (Transect B is approximately 500 ft downgradient of Transect A). This simulation

result is in reasonable agreement with field data along Transects A and B. The CRAFLUSH simulation likely underestimates the PCE attenuation because biodegradation, abiotic degradation, dilution, and dispersion processes, are not considered in the model. The CRAFLUSH modeling technical memorandum is provided in Appendix J.

5.7.6 Chlorinated Volatile Organic Compounds Monitored Natural Attenuation Performance

This section presents an evaluation of CVOC MNA performance. Site CVOCs have been monitored in the same fashion from 2016 through 2021. The 2016-2021 CVOC data have been relatively consistent, with natural fluctuations observed due to seasonal variability, changes in water levels year-to-year, and fluctuations in concentrations where CVOCs are elevated in the former source areas onsite. This section focuses on discussion of the most recent 2021 data, with supporting evaluations of the 2016 through 2021 data where applicable, to provide lines of evidence for evaluating MNA. In addition, the Ricker Method Groundwater Plume Analytics evaluation was conducted as a means to highlight CVOC (and 1,4-D) plume stability and shrinkage. This evaluation is summarized in Section 5.7.6.5 and a copy is provided in Appendix H.

5.7.6.1 Demonstration that Monitored Natural Attenuation is Occurring as Expected for Chlorinated Volatile Organic Compounds

This section documents the review of the 2021 CVOC and associated MNA data which indicate that the subsurface conditions at the site are complex and continue to yield differing interpretations of where natural attenuation (NA) is observed and other areas where NA appears limited. Based on statistical trends that are used to evaluate the effectiveness of the remedial components in achieving cleanup levels (i.e., migration of site COC, and changes in COC concentrations in both time and distance from source area) some monitoring well locations show clear indications of MNA (both biological and abiotic), while other monitoring wells have limited indications of MNA (i.e., some select parameters suggest MNA). However, taking the entire set of data and site considerations into account, the main conclusion from the ongoing MNA evaluation is that the observed COC plume configuration and size has not increased or exhibited further migration, thus demonstrating the natural attenuation mechanisms remaining functional at the site. A summary of the MNA parameters analyzed in groundwater 2016 – 2021 is provided in Table 5-10.

The majority of the monitoring wells located underneath Building 1 and within Transects A, B, and C indicate reducing conditions in the groundwater (dissolved oxygen [DO] levels less than 1 milligram per liter [mg/L] and oxidation-reduction potential as low as -275 millivolts [mV]). The presence of reducing conditions is conducive to the reduction of CVOCs from reductive dechlorination processes (biological or abiotic), if other factors are also favorable. A summary of the 2021 geochemical parameters is provided in Table 2-3.

Based on data collected to date, evidence of reductive dechlorination of CVOCs is observed at the site (at varying degrees), in both the overburden and bedrock. Complete mineralization of CVOCs is also observed in a few wells, based on the presence of ethene and ethane (e.g., AE-103R-5). The detection of these biodegradation end products is attributable to either ongoing biological or abiotic reductive dechlorination. Methane is also present at increased levels in a few wells (e.g., EMW-11R-2), indicating that redox conditions have progressed sufficiently for reductive dechlorination. Elevated sulfide levels were present in select wells indicating evidence of some sulfate reduction observed from the 2021 analytical data. The presence of degradation daughter products such as cis-1,2-DCE or VC, relative to their parent PCE and TCE concentrations, further supports ongoing biodegradation.

Reductive dechlorination of chlorinated compounds is associated with the accumulation of daughter products and an increase in the concentration of chloride ions. Parent and daughter products related to the reductive dechlorination and/or abiotic transformation of chlorinated ethenes (PCE, TCE, cis-1,2-DCE, VC, ethene-ethane-acetylene, and chloride) observed during the 2021 groundwater-sampling event for selected wells were plotted on radar plots (Figure 5-28). Larger colored hexagonal areas indicate stronger evidence of degradation than smaller areas. The figures show that wells AE-108R-1, AE-106D, GZA-12, AE-106D, and AE-03 demonstrate that biodegradation and/or abiotic transformation processes are occurring to some extent and more than in other wells evaluated. As can be seen in Figures 5-21 through 5-24, there are a number of wells that contain concentrations of CVOCs below 100 µg/l. These not only include wells further downgradient in the plume, but also select wells in Transect A and the EPL. At these low concentrations, it is well known that reductive dechlorination processes may be inhibited, or exhibited cis-1,2-DCE “stall”, without added electron donor (natural organic carbon, petroleum hydrocarbons, or remedial amendments) as the levels of the CVOCs are not significant enough to act as sufficient electron acceptors for the process. The relative plume stability in all four zones is

also illustrated in Figures 5-21 through 5-24. Review of these figures indicates the general stability and/or decrease of source concentration areas along with observed areal extents of the CVOC impacts in the respective zones.

As parent product (i.e., PCE/TCE) degrades through daughter products (i.e., cis-1,2-DCE and VC) to end products (i.e., ethene/ethane) chloride ions are sequentially removed from the various CVOCs. This process provides another way to evaluatethe occurrence and progress of NA processes such as reductive dechlorination. This line of evidence (LOE) is evaluated by determining what is referred to as the chlorine index/chlorine number. The chlorine index/number provides an estimate of the average number of chlorine atoms present on the CVOCs as they move downgradient. With PCE/TCE/cis-1,2-DCE/VC/ethene having from 4 to 0 chlorine atoms, respectively, it is possible to determine the average chlorine number based on the observed concentrations of PCE through VC, molecular amount to convert concentration to moles, and the total number to CVOC moles at a given location. In general, as the chlorine number decreases from 4 to 0 this is an indication of ongoing reductive dechlorination of the parent product to end products. As the parent product decreases and the daughter/end products increase, the chlorine number decreases. Using data from the site from 2015 through 2021 and plotting the chlorine number at a monitoring well location and the given distance from the former source area, a consistent decrease the chlorine number from the source area to downgradient areas of the plume can be observed as shown in Figure 5-29. Additionally, the data in Figure 5-29 has been fit with linear trend lines which show that the downward slope of these lines has increased slightly in 2020 and 2021 as compared to 2015 through 2019. The observed decrease in chlorine number from upgradient to downgradient in the plume is supportive of ongoing attenuation/transformation of the parent CVOCs in the former source area.

Hydrologic and geochemical conditions amenable to natural attenuation are likely to change over time and could adversely impact the remedial effectiveness. Geochemical data (DO, manganese, iron, nitrate, sulfate, and methane) from the 2021 groundwater sampling event for selected wells were plotted on radar plots shown on Figure 5-30. Smaller sized colored hexagonal graph areas indicate more favorable conditions for reductive dechlorination than larger hexagonal areas when comparing select well locations to background and other site wells. The figures for the wells evaluated indicate that wells AE-03, AE-102M, and AE-108R-1 show more favorable geochemical conditions than other wells evaluated.

Groundwater samples from select monitoring locations and intervals were submitted for microbial population and reductase gene analyses using the Microbial Insights QuantArray™ in 2016, 2017, and 2021 (Table 5-11 and Figure 5-31). Samples were collected from locations in former source areas and extended through downgradient Transect A and B. Overall interpretation of the microbial data suggests that the overburden and bedrock portions of the aquifer have some capacity to support microbial degradation. The microbe responsible for the complete reductive dechlorination of PCE/TCE to ethene, *Dehalococcoides* (DHC), has been detected in a number of monitoring well locations along the length of the observed plume, albeit at less than optimal populations (cells/milliliter [cells/mL]). The general rule of thumb is that DHC populationss should be $1x10^{+4}$ cells/mL or higher to support robust reductive dechlorination. At the site DHC populations generally range from $1x10^{+1}$ to greater than $1x10^{+3}$ cells/mL, where detected, but monitoring well AE28R-2 has detected DHC concentrations greater than $1X10^{+4}$ cells/mL. Addditonally, specific reductase genes (tceA, bvcA, and VCR reductase) also need to be present to facilitate the reductive dechlorination from c-DCE through VC to ethene. As with DHC, the reductase genes are also found to be present but again the population values are relatively low. While the reductase gene populations are low, the fact that they are detectable indicates that microbial activity is ongoing. The observed microbial results are also supported by the detection of dissolved gases (methane, ethane, and ethene) which are the end products of reductive dechlorination. The low microbial populations are likely being impacted by lower values of total organic carbon and the presence of higher concentrations of nitrate and sulfate in portions of the site. That said, the presence of the specific microorganisms combined with other lines of evidence (i.e., parent-daughter transformation, dissolved gases, etc.) suggest that biological attenuation, while not the primary mechanism, is contributing to the ongoing natural attenuation of CVOCs at the site (at least in specific areas of the site). Considering the fact that MNA normally requires extended time frames, the above microbial results support the fact that biological processes are ongoing but at a slower rate. Although these results are not unexpected based on the available data, the overall evaluation does not suggest that MNA should be abandoned for other remedial approaches.

Compound specific isotope analysis (CSIA) can be utilized to provide another LOE to support the biological transformation and attenuation of CVOCs in groundwater. To that end, CSIA sampling has been completed at a select number of monitoring well locations in 2016, 2017, and 2021 (Table 5-12 and and Figure 5-32) with a similar distribution to the microbial analysis outlined in the

previous paragraph. In general, with respect to the interpretation of CSIA data, the enrichment of the C^{13}/C^{12} ratio (i.e., reported values become less negative) indicates the biological transformation of a contaminant as it moves along a given flowpath (e.g., plume centerline) as compared to observed source area C^{13}/C^{12} ($\delta^{13}C$) ratios that have undergone little to no biological degradation. Microbes preferentially degrade C^{12} over C^{13}. Overall, the results of the CSIA data indicate similar results to the microbial data. Enrichment of the $\delta^{13}C$ value is observed downgradient of the source area to varying degrees in the overburden and bedrock intervals. The yellow horizontal line in Figure 5-32 represents the most negative $\delta^{13}C$ value for the parent compound PCE. The dotted blue horizontal line in Figure 5-32 represents a $\delta^{13}C$ value of 2‰ above the yellow line to provide a margin for possible variability since the exact source of the parent PCE cannot be determined. As an example, in well AE28R-2 the highest DHC populations were observed along with an enrichment in the C^{13}/C^{12} ratio. Further, the enrichment of the C^{13}/C^{12} ratio is also observed with distance from the source area (i.e., Transects A, B and C), particularly in the overburden and upper/middle portions of the bedrock interval. As part of the overall CSIA evaluation the molar fractions of the parent, daughter and end products, as shown in Figure 5-33, were evaluated along the observed CVOC plume centerline (blue dashed line). In general, moving from the upgradient source area to the downgradient (distal) end of the plume a shift in the mole fraction distribution is observed moving from the parent products (i.e., PCE/TCE) to daughter products (i.e., c-DCE and VC).

Further, shifts in the C^{13}/C^{12} ratios ($\delta^{13}C$‰) are also observed for the CVOCs (i.e., PCE, TCE, c-DCE, and VC) as illustrated in Figure 5-34. If the $\delta^{13}C$ value of a contaminant increases by more than 2 ‰ over time or downgradient of the source, it is proof that the compound has degraded. When the original $\delta^{13}C$ value of a contaminant is unknown, published literature values of manufactured, undegraded parent compound (i.e. shaded light orange area) can be used as an approximation and an additional ±2‰ range (i.e. shaded blue area) is included with the assumed manufactured $\delta^{13}C$ value (see Figure 5-34). Any time that a contaminants $\delta^{13}C$ value is greater than 2‰ above the manufactured range, it is conclusive evidence of degradation. The enrichment of the $\delta^{13}C$ values is observed at several monitoring well locations within the existing network and this provides an LOE supporting the ongoing reductive dechlorination of the CVOCs in groundwater. The manufactured ranges for the $\delta^{13}C$ values are provided within the Microbial Insights (MI) CSIA Database. More information on the MI CSIA Database can be found at https://microbe.com/compound-specific-isotope-analysis-csia/.

In addition to the graphical display of the CSIA data as shown in Figure 5-32, CSIA data can be evaluated using what are referred to as Modified Kuder Plots. Modified Kuder Plots relate the analyzed $\delta^{13}C$ value of a specific contaminant to the mole fraction of the target contaminant left undegraded at each sampling location, based on the following Simplified Rayleigh Equation:

$$\delta^{13}C = \varepsilon\ (lnC/C_0) + \delta^{13}C_0$$

Where: ε = the $^{13}C/^{12}C$ enrichment factor, C/C_0 = the concentration after degradation divided by the concentration prior to degradation, δ13C = the delta value of the isotopic ratio in the sampled target analyte, and $\delta^{13}C_0$ = the delta value of the original target analyte prior to degradation. Modified Kuder Plots also depict two (2) comparison ranges 1) "Abiotic Enrichment Range"; and 2) "Biotic Enrichment Range". These ranges highlight the respective enrichment values that have been published in the literature for the target compound and the site-specific data is plotted and compared to these ranges. An evaluation of this data provides an added LOE for evaluating biotic (blue shaded region) and abiotic (red shaded region) contributions to contaminant degradation. The primary focus of this evaluation is the general trend of the site-specific data with respect to the abiotic and biotic ranges.

Figure 5-35 provides Modified Kuder Plots for PCE, TCE , c-DCE and VC based on the site-specific $\delta^{13}C$ values. For PCE (upper left of Figure 5-35), the dotted trend line (yellow line) of the site-specific $\delta^{13}C$ values indicate evidence of mostly biotic degradation processes. For TCE (upper right of Figure 5-35), the trend line of the observed $\delta^{13}C$ values fit into both abitoic and biotic degradation processes. This is notable since both abiotic and biotic processes are believed to be active at the site. With respect to daughter products (c-DCE and VC) the interpretation of the Modified Kuder Plots is more complicated because the results include daughter products that are being generated from the parent products (with typically more negative $\delta^{13}C$ values) and daughter products that are also being degraded (with typically lower $\delta^{13}C$ values). This complexity is reflected in the c-DCE plot (lower left of Figure 5-35) where two trend lines are potentially feasible based on the site-specific data. Lastly, for VC (lower right of Figure 5-35). Even though CSIA data has not beeen collected for a period of time, the available data provides further evidence related to ongoing degradation processes (both abitotic and biotic) in the subsurface and continues to support to that NA mechanisims are active at in site groundwater . The continued use of CSIA analysis as part of future sampling events will provide additional data to continue to evaluate this LOE and the ongoing NA at the site.

Abiotic degradation by reactive iron minerals may also play a role in the natural transformation of certain CVOCs. This is also supported by the CSIA data discussed above. Iron sulfides such as pyrite have been documented to react with PCE, TCE, and cis-1,2-DCE to cause a complete dechlorination transformation to acetylene and ethene without daughter products. Groundwater hydrogen levels indicate that sulfate reducing conditions could occur, and sulfate is observed at 7-60 milligrams per liter in the aquifer. Although hydrogen sulfide is only present in elevated levels in a few wells (e.g., AE-28R-2, AE-03, TRC-101, and AE-26R-2), sulfide may be sequestered by iron minerals in the soil and rock during the reduction process, generating the reactive minerals needed for abiotic transformation of CVOCs.

Acetylene is a signature product from the abiotic transformation process. Although acetylene is not always observed in groundwater where abiotic degradation is occuring, its presence suggests that abiotic reductive dechlorination may play at least some role in transformation of CVOCs in specific areas of the site. The groundwater at all of these locations is reduced to some extent but noticeable concentrations of acetylene were not observed. However, there were a few limited detections of propane, which is another of the dissolved gases that is indicative of the abiotic pathway. Despite the limited detections of acetylene and propane the abiotic transformation of CVOCs cannot be excluded and therefore can be contributing to the overall attenuation mechanisms in the subsurface.

Other potential natural attenuation processes affecting CVOCs at the former GE site are occurring in both the overburden and bedrock, as detailed in the Phase II Comprehensive Assessment (AECOM, 2017b). These include adsorption, volatilization, dispersion, and diffusion. Diffusion of CVOCs into rock matrix, micro-fractures and micro-cracks is believed to be a prominent attenuation mechanism at the site for bedrock groundwater contamination. Diffusion modeling results discussed in Section 5.7.5 show an 85% attenuation of PCE from Transect A to Transect B and are in general agreement with the mass flux calculations and groundwater monitoring data. Matrix diffusion assists in the retardation and storage of mass, with subsequent forward- and back-diffusion over specific periods of time. Based on the current CSM, the diffusion of CVOCs into the rock matrix micro-fractures and micro-cracks is another important attenuation mechanism at the site for bedrock groundwater contamination.

In summary, based on the collective evaluation of the data from 2016 through 2021, there is evidence of MNA occurring to at least a limited extent in select areas of the site to provide for the ongoing

attenuation and control of the observed dissolved phase groundwater CVOC impacts. The exact processes and their proportional contributions to the overall apparent ongoing attenuation are not clear, but there are a number of lines of evidence that support the continued application of MNA at the site. As noted above, both biotic and abiotic degradation appear to be actively occuring within specific areas and their contribution to attenuation of the CVOC plume in combination with the diffusion of CVOCs into the bedrock mechanism support the continued application of MNA.

5.7.6.2 Changed Conditions Affecting Chlorinated Volatile Organic Compounds Monitored Natural Attenuation

There are no new data during this monitoring period that would indicate new environmental conditions or new releases of contaminants have occurred, which could reduce MNA efficiency for CVOCs in groundwater.

5.7.6.3 Absence of Toxic Transformation Products of Chlorinated Volatile Organic Compounds

Although elevated VC concentrations are detectable in a few monitoring wells, the presence of VC is not unexpected and is likely attributable to ongoing microbial degradation and is considered an indicator of reductive dechlorination where it aligns with elevated parent concentrations. As discussed in Section 2.5, the groundwater at the site is not used for drinking water purposes.

Analytical data from many wells exhibit mixed behavior (upward and downward trends) and the fluctuations are likely the result of different influences, such as reductive dechlorination (transformation of c-DCE to VC and VC to ethene at differing rates), changes in water levels, changes in subsurface geochemical conditions, and high concentrations near source areas. Elevated concentrations of VC were observed in wells AE-28R-1 and AE-28R-3 (located in Building 1-Tank F area), and wells AE-101R-6 and AE-103R-6 (located in Transect A) for the 2021 sampling round. VC is the last CVOC to be degraded through reductive dechlorination because it is the least oxidized of these compounds. Therefore, the rate of reductive dechlorination decreases as the degree of chlorination decreases. In other words, the reductive dechlorination of VC to ethene is a slow reaction under anaerobic conditions, which favors the persistence of VC in PCE and TCE plumes that are undergoing reductive dechlorination. However, as the VC moves out of the anaerobic zone with ambient groundwater flow into more aerobic zones, the concentrations of VC are expected to continue to decrease since VC is known to more quickly biodegrade under aerobic conditions.

5.7.6.4 Verification that Chlorinated Volatile Organic Compounds Plume is not Expanding

Groundwater contamination has been documented at the site since the 1980s. Although groundwater monitoring wells have been sampled at this site for over 30 years, the number of monitoring wells over the entire MCP site has increased significantly over time, particularly between 2012 and 2016. For this reason, the volume of data available for any point in time in the past is not consistent with the volume of data available currently, though the number of wells has not changed since 2016. This situation makes an analysis of changes over time difficult to interpret relative to historical data.

For the 2021 analytical data, observed PCE, TCE and cis-1,2-DCE concentrations have increased in a few select wells. However, PCE and TCE have also generally decreased in a large number of wells. Localized increases in concentrations noted in 2021 are primarily in wells at the source area underneath Building 1, where potential residual DNAPL may be present, and in wells at Transect A. Of the wells evaluated for trend statistics (Table 5-8), there are 94 individual cases in which wells (or well screens/ports) show decreasing concentration trends in PCE, TCE, cis-1,2-DCE, or VC that would be an indication of improving conditions, at all depths in overburden and bedrock wells site-wide from the source area to the downgradient edge of the plume. There are another 43 cases in which cis-1,2-DCE trends appear to be increasing, at wells mostly in the source area and Transect A, and at some wells in Transects B and C. It is believed that these well ports are exhibiting increased daughter product generation based on downward trends and reduction of parent PCE and TCE concentrations. Similarly, 10 cases of increasing trends of VC were documented, that are likely due to the degradation of cis-1,2-DCE. A number of additional well port cases evaluated also exhibited stable trends.

Most of the trend graphs presented in Appendix G show that the visual trend of the groundwater CVOC concentrations are either stable or decreasing over time. This is believed to be the result of ongoing natural attenuation of the plume described above.

As shown in Figures 5-13 through 5-24, the extent of the 2016, 2017, 2018, 2019, 2020, and 2021 PCE, TCE, and total CVOC plumes are similar in each of the four depth intervals. The concentrations are generally on the same order of magnitude with fluctuations discussed herein. The plumes are therefore considered stable and not expanding.

Three-dimensional volumetric calculations of the total CVOC groundwater data were made using the Earth Volumetric Studio (EVS) model (http://www.ctech.com) to create a plume volume used to create a 3-dimentional conceptual visualization of the plume and estimate the plume mass in overburden and bedrock for the years 2017 through 2021. The sum of total CVOCs includes concentrations greater than 50 µg/L of the eight predominantly detected CVOCs (PCE, TCE, cis-1,2-DCE, VC, trans-1,2-DCE, 1,1-DCE, 1,1-DCA, and 1,2-DCA). The power of this visualization is to compare results generated from a similar scope of monitoring well data. These data are, therefore, presented in two figures. Figure 5-36 presents plume visualizations of the 2018, 2019, and 2020 groundwater data, and Figure 5-37 presents 3D visualizations of the 2017 and 2021 groundwater data. The results of this calculation for 2018-2020 indicate total plume masses of 149 kilograms (kg) in 2018 and 2019 and 132 kg in 2020, with apparent decreasing mass in the overburden (23.13 kg to 18.32 kg to 12.53 kg) and variable mass in bedrock (148 kg to 157 kg to 144 kg). The results of this calculation for 2017 and 2021 indicate total plume masses of 141 kg and 126 kg, respectively, with apparent decreases in mass in both overburden (12.79 kg to 9.03 kg) and bedrock (128 kg to 117 kg). The center of contaminant mass within the bedrock is depicted on Figures 5-33 and 5-34.

The decrease in contaminant mass in 2021, which also corresponds to an upgradient movement of the center of plume mass, is consistent with historical data showing that the center of the mass is closer to the source area. Figure 5-38 presents a conceptual site model cross section of the site. This Figure depicts isopleth contours of the 2021 total CVOC concentrations with groundwater trend graphs of wells at the source area, in the EPL and at Transects A, B, and C. These circumstances indicate that the plume is stable or shrinking while undergoing natural attenuation.

Although increased PCE and TCE concentrations have been observed in suspected source areas, which could be due to seasonal and localized changes in groundwater levels, this phenomenon is not unexpected within source areas that have shown historical fluctuations over time. The primary evidence for demonstration of MNA occurring at the site includes a continuing shift of parent to daughter product contaminant concentrations over time (Mann Kendall statistics) in conjunction with a stable groundwater plume. The data presented in this report show that, over time, the extent of the CVOC plume emanating from the former GE facility is stable and the mass of the plume is slowly shrinking.

5.7.6.5 Ricker Method Plume Stability Evaluation

WSP, on behalf of Lockheed Martin, performed the Ricker Method Groundwater Plume Analytics evaluation to evaluate CVOC and 1,4-D plume stability and shrinkage. The use of plume analytics provides for the detailed evaluation of a number of elements including:

- Plume Stability Analysis
- Spatial Change Indicator Analysis
- Mass Flux Evaluation
- Well Sufficiency Analysis

WSP performed the plume analytics evaluation on the following constituents:

- PCE
- TCE
- cis-1,2-DCE
- VC
- 1,4-D
- Total Chloroethenes (molar basis)

A summary of the plume analytic results for each of the four geologic zones (i.e., overburden, upper bedrock, middle bedrock, and lower bedrock) is provided in this section. The complete analysis including graphical displays for each of the above constituents is presented in Appendix H.

Overburden

- The constituent plumes in the overburden are all decreasing or stable. The Spatial Change Indicator™ evaluation for chloroethenes shows that the overburden plume has attenuated significantly in upgradient source areas, as well as in the downgradient plume area. Slight increases are observed in the immediate downgradient portions of the plume and are due primarily to increases in the generation of daughter product cis-1,2-DCE.

- Based on data from 2015 through 2021, there was an average of 28.5% reduction in chloroethenes mass flux from Transect A to Transect B in overburden.

Upper Bedrock

- In the upper bedrock, the chloroethene plume is generally increasing or stable. The Spatial Change Indicator evaluation indicates that the upper bedrock chloroethene plume has attenuated in upgradient source areas but also shows areas of increase in the core of the

plume. The total chloroethene plume area has decreased approximately 8% from 2014 to 2021.

- Based on data from 2015 through 2021, there was an average of 99.1% reduction in chloroethenes mass flux from Transect A to Transect B in upper bedrock.

Middle Bedrock

- The parent chloroethene plumes (PCE and TCE) in the middle bedrock are generally decreasing or stable, whereas the daughter chloroethene plumes are increasing. The total chloroethenes plume mass indicator likewise resulted in an increasing trend; however, the average concentration and mass indicator are observed to be decreasing, but not at a statistical level of significance. It is also observed that the plume-wide molar fractions exhibit a slight decreasing trend in TCE fraction coupled with an increasing trend in cis-1,2-DCE fraction.

- Based on data from 2015 through 2021, there was an average of 95.4% reduction in chloroethenes mass flux from Transect A to Transect B in middle bedrock.

Lower Bedrock

- The parent chloroethene plumes (PCE and TCE) in the lower bedrock are decreasing, whereas the daughter chloroethene plumes are stable to increasing. The total chloroethenes plume, however, exhibits a strong decreasing trend. The 1,4-D plume stability analysis in the lower bedrock likewise resulted in stable or decreasing trends for all three plume metrics.

- The Spatial Change Indicator™ evaluation for chloroethenes shows that the lower bedrock plume has attenuated in the core of the plume. There are observed areas of increase primarily in the site source area and portions of the downgradient plume. The total chloroethenes plume area has increased slightly from 2016 to 2021; however, the plume mass indicator has decreased by approximately 15% during the same period.

- Based on data from 2015 through 2021, there was an average of 97.5% reduction in chloroethenes mass flux from Transect A to Transect B in lower bedrock.

Overall, the results of the plume analytics/plume stability evaluation, using the Ricker Method, provides further compelling evidence that natural attenuation processes are occurring at the site to stabilize and reduce the groundwater plumes.

5.7.6.6 Demonstration of Effective Institutional Controls

The institutional controls under the AUL at the site remain effective in limiting potential exposure to CVOCs in groundwater. Although there are no institutional controls regarding the restriction of groundwater as a drinking water source at the site, the Stickney Well remains inactive and no drinking water wells exist within one half mile of the site.

5.7.6.7 Verification of Attainment of Remedial Objective for Chlorinated Volatile Organic Compounds

The remedial objective for CVOCs at the site is the reduction of dissolved phase groundwater concentrations within the overburden and bedrock zones over time MNA has been implemented and is being demonstrated through the ongoing monitoring of MNA. It is noted that given the elevated concentrations of CVOCs at the site, including mass within bedrock fractures and micro-fractures, the time frame for reduction in overall CVOC concentrations is estimated to be on the order of decades. Data from 2016 through 2021 has been reviewed as part of this first Periodic Review of the Temporary Solution and the results have been documented herein. Based on the available data collected during this reporting period, multiple lines of evidence support ongoing MNA of CVOCs at the site including:

1. Observed COC concentration decreases versus time and distance from the source;
2. Mann-Kendall statistical evaluations supporting typical stable/decreasing trends;
3. Downgradient appearance of daughter and end products (cis-DCE/VC/ethene);
4. Decreasing chlorine numbers from upgradient to downgradient along the plume centerline;
5. Presence of microbial populations capable of the complete reductive dechlorination of PCE/TCE;
6. CSIA data demonstrating the enrichment of the C^{13}/C^{12} ratio from upgradient to downgradient along the plume;
7. Demonstrated reductions in mass flux of CVOCs from upgradient to downgradient transects oriented perpendicular to the primary direction of groundwater flow;
8. Observed geochemical conditions within the plume (i.e., reducing conditions);
9. Evidence of abiotic attenuation processes in addition to biotic processes; and
10. Modeling and associated monitoring data that support the diffusion of CVOCs into the deeper bedrock fracture/rock matrices.

While no one evaluation approach provides a definitive demonstration of NA, collectively all of the lines of evidence provide a fairly significant demonstration that the overall effect of the various attenuation mechanisms is facilitating the ongoing attenuation of the site-specific COC and the existing groundwater plumes for dissolved CVOCs are at a minimum, stable and not expanding. Therefore, the remedial objective for CVOCs in groundwater is continuing to be met.

SECTION 6
INDOOR AIR SAMPLING RESULTS

Table 6-1 presents a summary of the historical laboratory analytical results for each of the air sample locations within Building 1. A copy of the Alpha Analytical Laboratory data package from the January 2022 sampling event is included as Appendix K. Results from the January 2022 air sampling event are summarized below.

6.1 QUALITY ASSURANCE AND QUALITY CONTROL

The quality of the analytical data from the January 18, 2022 sampling event is acceptable for decision-making purposes based on the data validation results. All sampling canisters were batch-certified by the laboratory prior to sampling. There was good precision in the data based on the close agreement of the parent and duplicate samples from IA-8, as observed in Table 6-1. The volatile organic compound (VOC) data were validated and are discussed in detail in the data validation summary memorandum included in Appendix K. Data were evaluated and all were accepted with no qualifications as noted in the data validation memorandum. All results complied with the applicable Massachusetts Department of Environmental Protection (MassDEP) Compendium of Analytical Methods performance standards listed in Policy WSC-02-320 (MassDEP, 2010).

6.2 INDOOR AIR ANALYTICAL RESULTS

The ambient air analytical sample results obtained outside of Building 1 detected several VOC compounds at low concentrations; however, none were above the MassDEP Commercial/Industrial (C/I) Threshold Values (*Vapor Intrusion Guidance WSC#16-435,* October 14, 2016).

The indoor air analytical sample results from Building 1 detected several solvent and petroleum-related VOCs at low concentrations. The detected compounds in Building 1 are consistent with compounds observed in previous indoor air sampling events from 2009 to 2021. The detected concentrations of these compounds in January 2022 are consistent for each sampling

location and are also consistent with concentrations detected in past indoor air sampling events with the changes noted below.

As also observed in January 2021, in January 2022, increased concentrations of acetone, styrene, and naphthalene, as well as benzene, toluene, ethylbenzene, and xylenes (BTEX) were present at sample locations in Building 1. The 2022 detected concentrations of these compounds were higher at the high bay sample locations than in sample locations in the southwest corner room and on the second floor. Each of these compounds were detected in sub-slab vapor samples collected beneath Building 1 between 2009-2013 at concentrations similar to or higher than detected in indoor air in Building 1. The BTEX compounds along with naphthalene and styrene are common constituents of the gasoline and/or exhaust from gasoline combustion engines such as the trucks in the high bay of Building 1. Given that these compounds have historically been detected in Building 1 and were not increasing between 2009-2020, the sub-slab vapors are not considered to be the source of the increases in 2021 and 2022 indoor air concentrations. Also, detected concentrations of other compounds such as chlorofluorocarbon halomethane, 1,1,2-trichloro-1,2,2-trifluoroethane, tetrachloroethene, and trichloroethene, historically present in sub-slab vapor, did not increase in indoor air in 2021 nor 2022. This, along with the timing of the increased concentrations in 2021 aligning with United Parcel Service starting full time operations in fall 2020, indicate that the source of the increased concentrations in indoor air is likely the gasoline contained in, and the exhaust from, the approximately 30 to 40 trucks that drive in and out of Building 1 daily and park within Building 1 each night during operations (Monday through Saturday).

The concentrations detected in indoor air at locations within Building 1 were compared to the MassDEP C/I Threshold Values, as shown in Table 6-1. All concentrations in Building 1 were below the current C/I Threshold Values and therefore do not pose a risk to facility workers.

SECTION 7 CONDITIONS/PROBLEMS AFFECTING THE REMEDIAL ACTION

No conditions or problems were identified during this reporting period that may have the potential to affect the remedial action.

SECTION 8 MODIFICATIONS TO THE MONITORING PROGRAM

No modifications to the monitoring program occurred during this monitoring period. The wells and analytes monitored were as detailed in the updated Operations, Maintenance, and/or Monitoring Program groundwater monitoring plan submitted to the Massachusetts Department of Environmental Protection in September 2018, with one exception: analysis of 1,4-dioxane via Method 8270 was accidentally omitted at monitoring well AE109R5.

SECTION 9
PERIODIC REVIEW OF THE TEMPORARY SOLUTION

This Periodic Review of the Temporary Solution has been prepared in accordance with the requirements contained in 310 Code of Massachusetts Regulations (CMR) 40.1050(4)(b). The Review is based on an evaluation of current site conditions and an assessment of the conclusions and basis for the Temporary Solution. In addition, as part of the feasibility evaluation, the results of the Phase III Remedial Action Plan (RAP) (AECOM, 2017c) have been reviewed and an evaluation of whether new or innovative technologies have been developed that may change the previous conclusions regarding infeasibility of a Permanent Solution for groundwater and light nonaqueous phase liquid (LNAPL) at the site.

9.1 FEASIBILITY OF IMPLEMENTING ONE OR MORE PERMANENT SOLUTIONS

As part of this Periodic Review, the Phase III RAP (AECOM, 2017c) has been reviewed with particular attention given to the identification and potential feasibility of remedial alternatives for achieving a Permanent Solution for the site. As stated in the Phase III RAP (AECOM, 2017c) and Temporary Solution Statement (AECOM, 2017a), a Permanent Solution could not be achieved for groundwater at the site because a condition of "No Significant Risk" could not be demonstrated because groundwater concentrations are above Massachusetts Contingency Plan (MCP) upper concentration limits (UCLs).

According to the MCP, the status of the Temporary Solution shall be re-evaluated every five years to determine whether the Disposal Site (or portions thereof) may be eligible for a Permanent Solution.

The evaluation was completed based on experience of remediation staff and review of recent literature on remediation technologies.

9.1.1 Dissolved Phase Plume (Chlorinated Volatile Organic Compounds, Arsenic, and 1,4-Dioxane)

The Phase III RAP included a screening of seven potential technologies and detailed evaluation of four remediation technologies. Based on that evaluation, monitored natural attenuation (MNA) was the selected remediation approach. As discussed in Section 5, the MNA approach has generally performed as expected in this reporting period (2017 to 2022). The dissolved phase plume has not expanded and an overall gradual decrease in dissolved phase concentrations has been observed. Most importantly, site conditions observed during the reporting period do not pose a risk to human health or the environment.

The selection of MNA for groundwater was based primarily on conditions at the site that rendered other remedial technologies not feasible. The key site conditions and changes since 2017, if any, are discussed below:

- Chlorinated volatile organic compounds (CVOCs) in the bedrock matrix: This condition makes it very difficult to extract CVOCs or to have in-situ treatment reagents make the contact necessary to destroy or transform the contaminants. This condition is unchanged since 2017.

- Contaminants at depth of approximately 230 feet below ground surface: This depth renders contaminants very difficult to access for some technologies (in-situ injections such as chemical oxidation or chemical reduction) and not economically feasible for other technologies (thermal treatment). This condition is unchanged since 2017.

- Primary source of groundwater impacts is present beneath Building 1: The building makes it difficult or infeasible to implement some technologies (injection and extraction). Other technologies (thermal treatment and chemical oxidation) are very difficult to safely implement inside a building. Building 1 is still present and occupied.

- Groundwater contains a mixture of contaminants: The groundwater primarily contains CVOCs but arsenic, 1,4-dioxane, and petroleum compounds are also present at levels above the remedial goals. The combination of contaminants limits the application of some remedial technologies because, in general, technologies that work on organic compounds (CVOCs, 1,4-dioxane, and petroleum) do not work for inorganics like arsenic. Some remedial methods such as in-situ chemical oxidation can have adverse side-effects such as creating more mobile forms of arsenic and other metals. For organics, reductive dechlorination (one of the most common and effective methods for CVOCs) is not effective for 1,4-dioxane or petroleum compounds. The combination of contaminants and thus the difficulties treating all the contaminants has not changed since 2017.

- The area of groundwater impacts is relatively large: The areal extent of the plume is approximately 28 acres. The size of the plume does not render technologies ineffective but can make some technologies not economically feasible.

Site conditions have not changed in a manner that creates an opportunity for use of alternative technologies to MNA.

Research and implementation of new remediation technologies is an on-going process. Remediation staff at AECOM are familiar with advances in remediation technologies through review of academic literature, attending conferences, AECOM's Technical Practice Group, as well as implementation of projects for clients. The 2017 Phase III RAP provided a screening of a comprehensive list of remediation technologies. A completely new or novel technology with potential application to this site has not been identified. However, since 2017, there have been advances and improvements in some of the technologies. Those advances and how they relate to remedies for this site are discussed below.

At the time of the Phase III RAP, implementation of in-situ thermal treatment in bedrock was limited in general and specifically limited only to sandstone materials (sedimentary rock). More recently, thermal treatment vendors have developed some experience with igneous rocks similar to the granite at the site; however, this cannot be considered a fully developed or realized application. Significant challenges have included recovery of desorbed vapors, mobilization of CVOCs to downgradient areas, and uneven/inadequate heat distribution. The other problems for thermal treatment previously identified remain valid, including the presence of the building, the depth of impacts, and the footprint of the plume. While thermal treatment has advanced, it remains infeasible for this site. A further review of thermal treatment is recommended for the next five-year review.

Containment by pump and treat was considered in the 2017 Phase III RAP but not selected. The fundamental drawback of pump and treat identified in 2017 is the inability of pump and treat to extract CVOCs that have diffused into the bedrock matrix and micro-fractures. There has been no change in site conditions. While experiments with increasing desorption of CVOCs by use of surfactants and heating have been attempted, these technologies are not expected to be effective for the low permeability granite with diffusion-limited CVOCs. Other advances in pump and treat include greater use of directional drilling under buildings and new options for above ground treatment of 1,4-dioxane (use of resins instead of oxidation). These advances partially address some of the secondary reasons pump and treat was not selected in 2017. There remains, however, no

realistic expectation that pump and treat can achieve the remediation goals significantly faster than MNA.

In-situ biological treatment was considered in the 2017 Phase III RAP. Since 2017 this technology has become more sophisticated with innovations such as in-situ microcosm testing and additional laboratory methods for specific genes involved in dechlorination. These innovations, together with combination reagents including zero valent iron and reagents to promote favorable geochemical conditions are on-going developments. None of these developments, unfortunately, address the primary challenge of effective delivery in a granitic bedrock system. The potential difficulties with mobilizing arsenic and not treating 1,4-dioxane also remain unresolved.

Inability to effectively deliver reagents, either biological or abiotic, is a common challenge, especially at sites with impacts in bedrock groundwater. Hydraulic and pneumatic fracturing (fracking) has been considered for some sites. The ability of this technology to be precisely deployed without damage to utilities, buildings or others features at this site is uncertain. As discussed in detail in this report, the plume is stable, not expanding, and is not impacting drinking water wells, surface water, or indoor air. Fracking could create pathways to surface water, indoor air, and/or downgradient groundwater. For this site, fracking creates more risks than potential benefits.

9.1.2 Light Nonaqueous Phase Liquid

The 2017 Phase III RAP included screening of five technologies and detailed evaluation of three technologies for LNAPL. The selected remedy was MNA (AECOM, 2017c).

As discussed in Section 4, little LNAPL has been detected from 2016 to 2022. LNAPL appears to be slowly declining as predicted by the modeling conducted in support of the 2017 Phase III RAP. Additionally, rates of natural source zone depletion have been documented for the site. Given these conditions, there appears to be little reason to consider alternative remediation technologies for LNAPL.

In summary, no information, such as emerging technologies that may be more cost-effective and implementable than technologies available at the time the Temporary Solution Statement was submitted, has arisen in the past five years that would alter this conclusion. Therefore, based on a review of this information as presented in the 2017 Phase III RAP, the conclusions of the Phase III (as summarized above) remain valid, and a Temporary Solution continues to be appropriate for

groundwater and LNAPL at the site. MNA remains the best remediation technology for this site. Other remediation technologies have advanced but, thus far, are not suitable replacements for MNA at this site.

9.2 EFFECTIVENESS OF THE TEMPORARY SOLUTION

Over the last five years, there have been significant reductions in groundwater concentrations of CVOCs and LNAPL constituents in overburden. In addition, no changes of any significance to the groundwater concentrations and plume size or stability, have been observed in the bedrock groundwater over the last five years. Therefore, the Temporary Solution continues to be effective and appropriate for site groundwater and LNAPL.

9.3 DEFINITIVE AND/OR ENTERPRISING STEPS

Per 310 CMR 40.0861(2)(h), "definitive and enterprising steps" to achieve a Permanent Solution must be presented when the selected remedial alternative is a Temporary Solution. As specified in 310 CMR 40.0861(2)(h), such steps may include performing pilot tests or bench-scale studies, investigating ways to reduce the costs or risks of implementing a specific remedial alternative, and developing new technologies. These steps are not generally applicable to groundwater or LNAPL at the site. During the past five years potentially feasible options or emerging technologies for reducing concentrations of compounds of concern in groundwater or for the LNAPL have not been identified.

Based on the results of this Periodic Review, a Temporary Solution remains the most feasible and appropriate alternative for site groundwater and LNAPL.

9.4 CHANGES IN ACTIVITIES, USES AND/OR EXPOSURES THAT MAY CAUSE AN ACTUAL OR POTENTIAL INCREASE IN EXPOSURE

Based on an evaluation of site activities and uses over the last five years, current conditions are consistent with those documented during preparation of the Temporary Solution Statement in 2017 and, therefore, there is no actual or potential increase in exposure.

Since the submittal of the Temporary Solution Statement in 2017, no major changes to the site activities and uses have occurred. As discussed in Section 2.6, the site Activity and Use Limitation (AUL) prohibits use of the site for residential, school, playground, park, or daycare use. Building

1A continues to house an indoor public go-cart racing facility (K1 Speed Boston). A sports equipment retailer (CranBarry) occupied Building 1A from 2015 or 2016 through 2021 and recently vacated its space in Building 1A. United Parcel Service (UPS) operated within Building 1 seasonally (October to December) from 2017 to 2019. As of September 2020, UPS started using the building full time, Monday through Saturday as a parcel distribution center and a will-call customer center, holding packages for customer pick up. This usage is similar to that of the former sporting goods retail shop in Building 1A. Ametek Aerospace continues to occupy Building 2 for testing of aerospace equipment. The Guard Shack was razed in 2017, eliminating the potential for indoor air exposure.

Table 9-1 lists the source property on Fordham Road and the commercial/industrial properties that are located on Concord Street downgradient of the site and compares current use to the use documented in 2017. These properties are partially within the site boundary as they extend back into the site's woodland and wetland. Changes to the property use are minimal and therefore, there is no increase in potential exposure.

9.5 UPDATE TO RISK CHARACTERIZATION AND SUBSTANTIAL HAZARD EVALUATION

The results of a Substantial Hazard Evaluation presented in the Temporary Solution Statement submitted to Massachusetts Department of Environmental Protection (MassDEP) in May 2017 were reviewed as part of this Periodic Review. A Method 3 Risk Characterization for human health, public welfare, and safety was completed as part of the Phase II Report (AECOM, 2017c). At that time, a Substantial Hazard Evaluation for human health was conducted.

The Method 3 risk characterization (Collaborative Risk Solutions LLC and AECOM, 2017) performed to support the Temporary Solution Statement evaluated current and potential future exposures for commercial/industrial workers exposed to soil and indoor air, utility and construction workers exposed to soil and groundwater during intrusive site activities, and site trespassers (including local residents) exposed to soil, wetland soil, wetland sediment, and wetland surface water. A future drinking water scenario was evaluated for local residents. A residential soil exposure pathway was not conducted because soil contaminants are limited to the 50 Fordham Road property, which has an AUL preventing residential use.

The risk characterization concluded that a condition of No Significant Risk (NSR) was met for all current exposures and for all future exposures, with the exception of the use of groundwater as tap water. Further, site groundwater concentrations were found to exceed Massachusetts and federal drinking water standards. Therefore, a condition of NSR of harm to human health was not achieved for the site. Due to the exceedance of the MCP UCL for trichloroethene (TCE), a condition of NSR to public welfare was also not achieved. The risk characterization concluded that conditions of NSR of harm to safety and the environment do exist. The Temporary Solution Statement concluded that a condition of No Substantial Hazard to Human Health existed, because groundwater was not used for drinking and was not anticipated to be used for drinking over the next five years.

The risk characterization was implemented using MassDEP Shortforms where available, and AECOM spreadsheets for scenarios lacking Shortforms. Shortforms include the most current default MassDEP risk characterization parameters, including toxicity values, exposure assumptions, and absorption factors, which were also used in the AECOM spreadsheets. These factors have not changed since 2017, and site use and exposure potential has not changed with the exception of the use of Building 1 by UPS and CranBarry vacating Building 1A. Indoor air sampling was conducted annually in January or February from 2017-2022 as part of the OMM Program, including samples in Building 1 and 1A. All sample results were below the MassDEP C/I Threshold values (See Table 6-1) with the exception of 1,2-dichloroethane which is not present in soil or groundwater onsite and, therefore, was attributed to indoor sources within the tenant spaces. Therefore, the results of the risk characterization remain valid; there are no unacceptable risks for current or future receptors due to indoor air, soil, sediment, or surface water.

Groundwater monitoring occurred annually as part of the OMM Program from 2017 to 2021. As discussed in Section 5, there are no significant upward trends for arsenic, 1,4-dioxane, or petroleum hydrocarbons. The arsenic and 1,4-dioxane plume geometries are stable, and the petroleum hydrocarbon plume is shrinking in the overburden and bedrock intervals. Total arsenic concentrations ranged from not detected to 175 micrograms per liter (µg/L) in 2021 samples, with exceedances of the GW-1 standard of 10 µg/L in 10 wells. Concentrations of 1,4-dioxane ranged from not detected to 48 ug/L, with concentrations in most wells exceeding the GW-1 standard of 0.3 µg/L. Three wells exhibited exceedances of GW-1 standards for petroleum hydrocarbon constituents (C9-C18 Aliphatics, or C9-C10 Aromatics). Concentrations of at least one chlorinated VOC exceeded GW-1 standards in most wells. Concentrations of TCE continue to exceed the UCL

in bedrock groundwater in well AE23R beneath building 1. Due to these exceedances, a condition of NSR to human health and public welfare has not been achieved. As was concluded in 2017, the only exposure pathway with unacceptable risk is future use of groundwater as drinking water. Site groundwater is not used as drinking water, and drinking water use is not considered likely during the next five years. As noted in Section 2.6, no drinking water wells are located within 0.5 miles of the site. Therefore, based on an assessment of the 2017 risk characterization, the groundwater and indoor air data collected since then, and no use of groundwater as drinking water, a condition of No Substantial Hazard continues to be present at the site.

The potential risks to the environment and ecological receptors were also evaluated as part of the Method 3 risk characterization (Collaborative Risk Solutions LLC and AECOM, 2017). The Environmental Risk Characterization (ERC) focused on exposures of aquatic organisms to wetland soil, surface water, and sediment located in the wetlands in the eastern portion of the site and downstream in the Ipswich River. Ecological exposures in the upland portion of the site were determined to be insignificant due to the upland commercial land uses and lack of habitat due to the presence of structures and pavement. There have been no major changes to site uses or activities since 2017, so the assumptions of ecological exposures made in the ERC are still valid.

The ERC involved the screening of sediment, surface water, and wetland soil analytical data against the effects-based screening levels per MCP guidance, which have not changed since 2017. The ERC determined that there was no potential for risks based on the results of the ecological screening of samples collected in 2016 in the wetlands on site and in the surrounding area (i.e., “local conditions”), comparisons of soil and groundwater concentrations to the Method 3 UCLs, and the general observations made during site visits in October 2016 that indicated that the wetland supported typical plant and invertebrate communities. In addition, based on modeled dietary exposures for wildlife to post-excavation wetland soils, there were no significant risks to wildlife residing in the wetland. Finally, the transport of contaminants to the surface waters of the Ipswich River were not evident as site-related contaminants were not detected downgradient of the site in the river.

As detailed above and discussed in Section 5, there are no significant upward trends for arsenic, 1,4-dioxane, or petroleum hydrocarbons in groundwater and only one VOC (TCE) was detected in 2021 at one location beneath Building 1 above the UCL. As stated in the ERC, these compounds

were not identified as chemicals of concern in the wetland surface water and were not detected in surface water downgradient in the river. In addition, these compounds were not detected or were detected sporadically at low levels that do not exceed the UCLs from 2017-2021 at two well clusters closest to the Ipswich River (STM-3 and STM-8). Therefore, based on the lack of changes to site activities and uses and the groundwater data collected since the ERC, the conclusions of No Significant Risk to the Environment remain valid and a condition of No Substantial Hazard continues to be present at the site.

In summary, due to risks posed by potential future use of groundwater as drinking water, a condition of NSR to human health and public welfare has not been achieved. However, the exposure potential for human health or the environment is not increased from the conditions evaluated in the 2017 risk evaluation. Therefore, there is no anticipated increased significant risk to human health for current site uses or the environment, and a condition of No Substantial Hazard exists as is required for a Temporary Solution.

9.6 NECESSARY AND REQUIRED RESPONSE ACTIONS TO MAINTAIN THE TEMPORARY SOLUTION

Based on the current site conditions and uses, which are consistent with the conclusions of the 2017 Temporary Solution Statement, no response actions are necessary to maintain the Temporary Solution or the AUL.

9.7 ACTIVITY AND USE LIMITATION

The Temporary Solution for the site includes the implementation of an AUL to eliminate potential human health risks. A copy of the AUL is included in Appendix E.

On July 13, 2015, then owner Wilmington Realty Trust (WRT) placed an AUL on the portion of the site owned by WRT, encompassing Buildings 1, 1A, and 2, and the Eastern Parking Lot. This AUL was established to prevent uses of the property that would be inconsistent with maintaining a condition of No Substantial Hazard under the Massachusetts Contingency Plan (MCP). These prohibited uses include the following:

- Residential, school, playground, park, or daycare use

- Activities that would result in exposure to or the disturbance of potentially contaminated soils, bedrock, groundwater, and indoor air, unless appropriate precautions to prevent human exposure are taken, as described in the AUL

In addition, the AUL imposes certain obligations and conditions to maintain a condition of No Substantial Hazard, including maintenance of concrete floors, management of any excavated soil and/or bedrock under Soil Management Procedures set forth in 310 CMR 40.0030, and appropriate management of any groundwater removed during dewatering activities. Lastly, any activities which could result in exposure to, or disturbance of soil, bedrock, or groundwater must be conducted in accordance with some or all of the following, as determined by a Licensed Site Professional:

- The performance standards for Release Abatement Measures set forth by the MCP at 310 CMR 40.0440 (MassDEP, 2014)
- The soil management procedures pursuant to 310 CMR 40.0030, the Similar Soils Provisions Guidance (WSC# 13500; MassDEP, 2014)
- Construction of Buildings in Contaminated Areas (Policy WSC# 00 425; MassDEP, 2000a)
- Applicable health and safety procedures outlined in 310 CMR 40.0018.

The AUL is recorded on the property deed; therefore, responsibility of maintaining compliance with the AUL requirements transitioned with the sale of the property in December 2021 from WRT to Hilco Redevelopment Partners (HRP). HRP is listed as the current property owner in Section 1.3. Lockheed Martin confirmed as part of the property transfer from WRT to HRP, that HRP is aware of the AUL requirements and is legally bound to follow the requirements of the AUL.

Building 1 was renovated between 2017 and 2020 and is now occupied by UPS. The renovations did not violate the restrictions of the AUL.

The objectives of the AUL are being met and the institutional controls in place at the site are effectively maintaining a condition of No Substantial Hazard.

SECTION 10
FUTURE MONITORING

The Post-temporary Solution Operations, Maintenance, and/or Monitoring Plan schedule of activities for the first five-year period is presented in Table 10-1. This schedule will be implemented according to the updated schedule presented in Table 10-2, which includes activities described below to be completed up to the submittal of the second five-year Periodic Review of the Temporary Solution in May 2027. The schedule presented in Table 10-2 reflects a reduction in monitoring scope as detailed below.

- Lockheed Martin Corporation (Lockheed Martin) will discontinue annual indoor air monitoring of onsite buildings. Despite the results of the human health risk assessment in the 2017 Phase II Comprehensive Site Assessment showing no risk to indoor workers, Lockheed Martin voluntarily performed the indoor air monitoring for the first five years of monitoring under the Temporary Solution. The historical indoor air data from 2009 through January 2022 show that indoor air concentrations within Buildings 1 and 1A pose no risk to indoor workers with results below the Massachusetts Commercial/Industrial Threshold values.

- Following completion of the second quarter 2022 gauging event in May, Lockheed Martin will reduce light non-aqueous phase liquid (LNAPL) gauging and passive removal of LNAPL from quarterly to annually from 2022-2027. Historical LNAPL gauging results document a significant reduction in measurable LNAPL in shallow overburden wells in the Eastern Parking Lot onsite. Measurable LNAPL greater than 0.1 feet has not been detected in the wells monitored since September 2016 and has been limited to a sheen in wells CW-1 and CW-2. Lockheed Martin plans to conduct LNAPL gauging of seven monitoring wells (AE-03, AE-04, CW-1, CW-2 GZA-102S, PZ-2S, and TRC-101) located in the western portion of the Eastern Parking Lot annually each September from 2022 through 2027. If LNAPL thickness of greater than 0.1 feet is detected in a well, an adsorbent sock will be deployed to adsorb the LNAPL for subsequent off-site disposal.

- Lockheed Martin will reduce the groundwater sampling frequency from annually to biennially (every other year) with sampling to occur in 2022, 2024, and 2026. Groundwater analytical data support this reduction in frequency as concentrations are either stable, decreasing, or where increasing are not showing risk-relevant statistical increases. Biennial groundwater sampling of 95 monitoring wells for analysis of site chemicals of concern (i.e., chlorinated volatile organic compounds [VOCs], 1,4-dioxane, petroleum hydrocarbons, and arsenic) and relevant MNA parameters in overburden and bedrock groundwater will be conducted to provide horizontal and vertical coverage at upgradient, source zone, and downgradient locations onsite. Each groundwater-sampling event will include a site-wide

water level measurement round of the wells to be sampled. The next annual groundwater-sampling event will occur in September-October 2022. The 2022-2027 groundwater monitoring plan is detailed in Table 10-3 with the following notes:

- The list of 95 wells to be monitored for VOCs was selected based on a detailed review of historical data and concentration trend statistics (Mann Kendall). The list of wells provides sufficient coverage in overburden and bedrock site-wide as documented by the results of the Ricker Plume Sufficiency evaluation (Appendix H).

- Of the 95 wells to be monitored for VOCs, 35 of these wells will also be monitored for 1,4-dioxane to provide horizontal and vertical coverage in overburden and bedrock site-wide.

- The list of wells to be monitored for total and dissolved arsenic has been reduced to primarily overburden wells, with select bedrock wells where dissolved arsenic concentrations are above the GW-1 standard.

- Based on the significant reduction in total petroleum concentrations, the lack of fuel related VOCs detected in the VOC and/or PIANO (n-paraffins [P], iso-paraffins [I], aromatics [A], naphthenes [N], and olefins [O]) results, and the results of the forensic evaluation to identify petroleum hydrocarbon false positives using the PIANO analysis, the group of wells to be sampled for extractible petroleum hydrocarbons/volatile petroleum hydrocarbons (EPH/VPH) will be reduced to just nine overburden wells (AE-03, AE-04, GZA-102S, GZA-105S, GZA-105D, PZ-2S, TRC-101, TRC-102, and TRC-103) in the Eastern Parking Lot and one shallow bedrock well (AE-100R-1) in the former tank farm area surrounding wells CW-1 and CW-2. Wells at depth in bedrock and away from source areas no longer require monitoring for EPH/VPH.

- Groundwater samples from a focused group of monitoring wells will be submitted for monitored natural attenuation parameters including inorganics, anions/cations, dissolved gases, compound-specific isotopes, and microbial analyses.

- Post-temporary Solution Status and Remedial Monitoring Reports will continue to be submitted semiannually in May and November. The next semiannual report is due to the Massachusetts Department of Environmental Protection (MassDEP) in November 2022.

- Periodic reviews of site conditions will be conducted every five years to evaluate new technologies and their potential to achieve a Permanent Solution. The next five-year review of the Temporary Solution is due to the MassDEP in May 2027.

SECTION 11
LICENSED SITE PROFESSIONAL OPINION AND CONCLUSIONS

Comprehensive Response Actions at the site are limited to active remedial monitoring that includes monitored natural attenuation under Temporary Solution status. It is the opinion of AECOM Technical Services, Inc. that the Remedial Action Performance Standards are being accomplished as outlined in 310 Code of Massachusetts Regulation 40.0897, and as presented in the Temporary Solution Statement submitted to the Massachusetts Department of Environmental Protection by AECOM Technical Services, Inc. in May 2017. Based upon indoor air data collected to date, a critical exposure pathway or imminent hazard does not exist within Buildings 1 and 1A. Based upon light non-aqueous phase liquid gauging data collected during this five-year period, the existing light non-aqueous phase liquid has micro-scale mobility (can flow into a well); however, the light non-aqueous phase liquid is stable and not expanding. Based on groundwater data collected during this five-year period, the existing groundwater plumes for chlorinated volatile organic compounds, petroleum, and dissolved arsenic are stable and not expanding.

The seal and signature of the Licensed Site Professional who reviewed this Post-temporary Solution Status Report No. 10 and Periodic Review of the Temporary Solution are contained on the applicable Massachusetts Department of Environment Protection Permanent and Temporary Solution Statement form (Bureau of Waste Site Cleanup form BWSC104), Comprehensive Response Action Transmittal/Phase 1 Completion Statement form (Bureau of Waste Site Cleanup form BWSC108), and the Remedial Monitoring Report Form, submitted via eDEP.

SECTION 12
PUBLIC NOTIFICATION

The former General Electric facility is part of a joint Public Involvement Plan (PIP) with other Potentially Responsible Parties that was prepared in 2000 by the Massachusetts Department of Environmental Protection (MassDEP). As a PIP site, the former General Electric facility must meet additional regulatory requirements above the minimum requirements of the Massachusetts Contingency Plan.

During the Post-temporary Solution period, Post-temporary Solution Status Reports are required by the Massachusetts Contingency Plan (MCP) to be submitted every six months to the MassDEP. In accordance with the November 17, 2000 PIP (MassDEP, 2000b), these Status Reports are also required to be provided to the designated information repository at the Flint Memorial Library in the Town of North Reading. Members of the PIP mailing list, including the Chief Municipal Officer and Board of Health agents for the towns of Reading, North Reading, and Wilmington, have been notified of the availability of this report by mail. A copy of the letter sent to the PIP mailing list and listed municipal officers concerning the availability of documents in the repository including this status report and five-year review, as required under the PIP (MassDEP, 2000b), is included in Appendix L. The mailing included the updated 2022 Fact Sheet, also included in Appendix L.

Prior to groundwater sampling activities completed during this reporting period and after receipt of associated laboratory analytical results, AECOM Technical Services, Inc. (AECOM) submitted notifications using MassDEP Form BWSC-123 to the property owners listed below:

- Hilco Redevelopment Partners – 40-50 Fordham Road in Wilmington and North Reading
- Howland Development – 87 Concord Street in North Reading
- International Family Church – 99 Concord Street in Wilmington and North Reading
- Town of North Reading – 0 Furbish Pond Lane in North Reading
- North Reading Town Water – Wells along Concord Street in North Reading

- Wilmington Masonry – 62 Concord Street in North Reading
- YRC Freight – 95 Concord Street in North Reading

In addition, AECOM obtained verbal permission from the resident at 3 Furbish Pond Lane in North Reading to measure the depth to water in their private irrigation well, and subsequently provided the resident the groundwater elevation information.

Appendix L includes copies of the Bureau of Waste Site Cleanup forms and related notifications sent to property owners documenting the prior notification of the sampling event and the presentation of the analytical results resulting from that sampling event, as required by the MCP.

LEGEND

- ● INDOOR AIR SAMPLE LOCATION
- × AMBIENT AIR SAMPLE; LOCATION VARIED 2009–2021; IA–1 (TRC 2009–2011) AA–1 (AECOM 2012–2021)
- ⌖ MONITORING WELL LOCATION
- ⌖ SUB–SLAB VAPOR POINT

NOTES:

1.) INDOOR AIR LOCATIONS CO–LOCATED WITH PRIOR INDOOR AIR LOCATIONS FROM 2009–2021.
2) SUB–SLAB VAPOR POINTS INSTALLED BY TRC IN 2009–2010. POINTS ABANDONED IN DECEMBER 2012 EXCEPT SG–13 REMOVED IN 2017. POINTS SG–10,11,12 REMOVED WHEN BUILDING 3 WAS RAZED IN JULY 2011.
3.) R – DENOTES VAPOR PIN LOCATIONS INSTALLED IN FEBRUARY 2013, AND ABANDONED IN FEBRUARY 2014. "R" LOCATIONS WERE WITHIN ~5 FT OF ORIGINAL POINTS.
4.) IA–6 NOT SAMPLED 2011 OR 2014–2017.
5.) LOCATIONS IA–11 THROUGH IA–14 SAMPLED IN 2017 AND 2019.

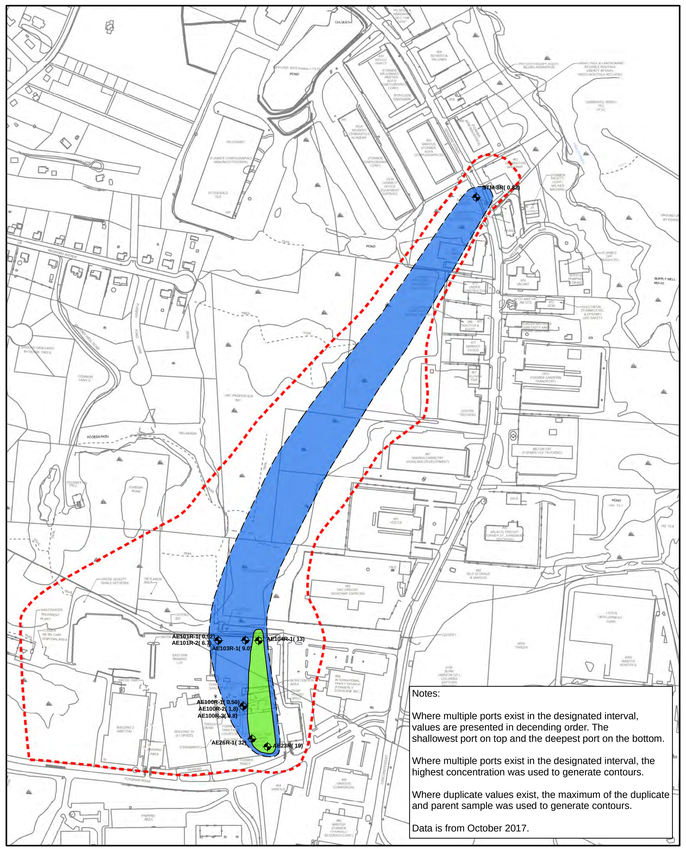
Notes:



Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

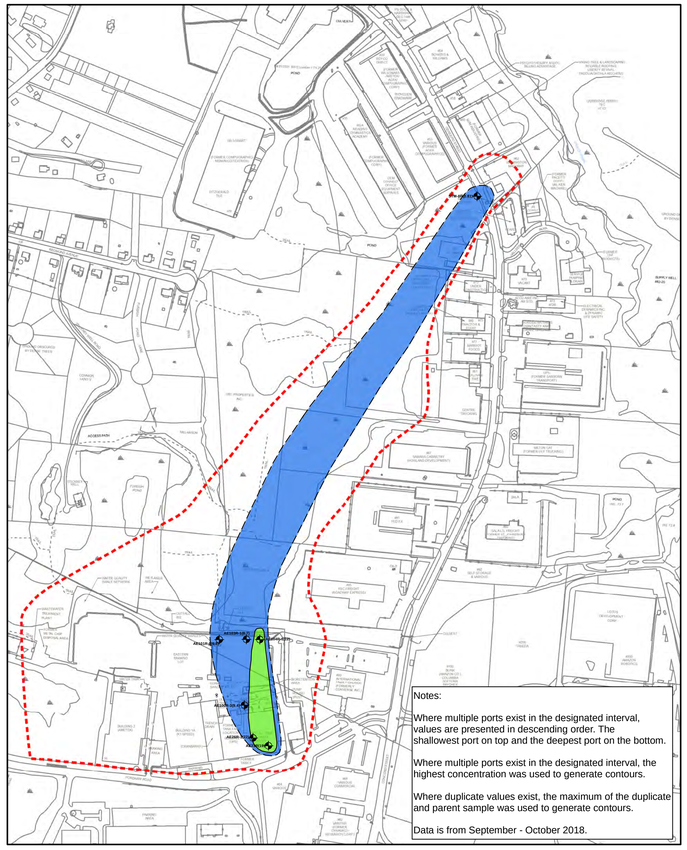
Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Data from June 2016.

Figure is a modified version from that published in May 2017 Phase II (historical off site data turned off).

2016 1,4-Dioxane (SW8270D-SIM) in Groundwater
Upper Bedrock (0 - 60 ft bgs)

Notes:



Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

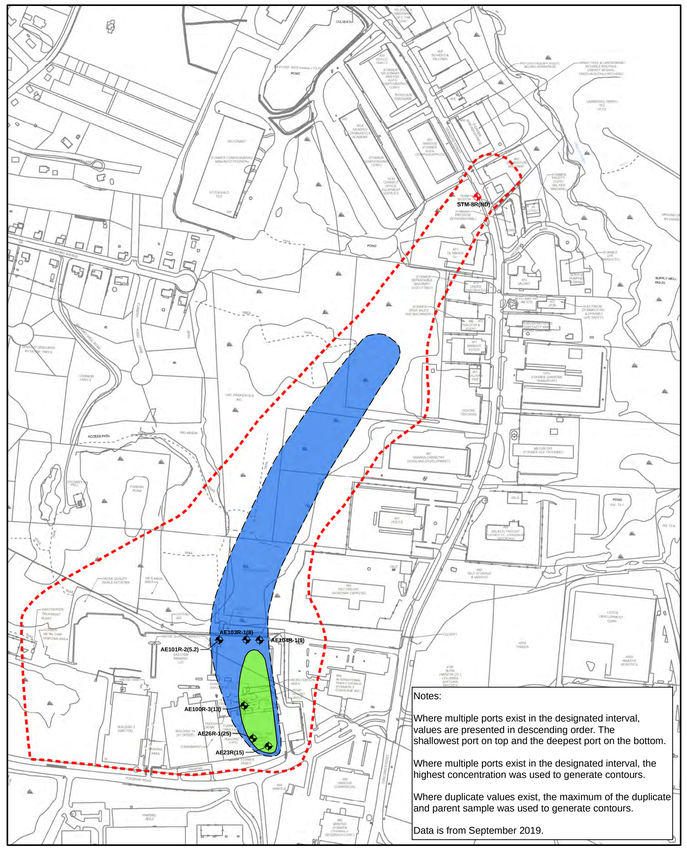
Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from October 2017.

2017 1,4-Dioxane (SW8270D-SIM) in Groundwater
Upper Bedrock (0 - 60 ft bgs)

Notes:



Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

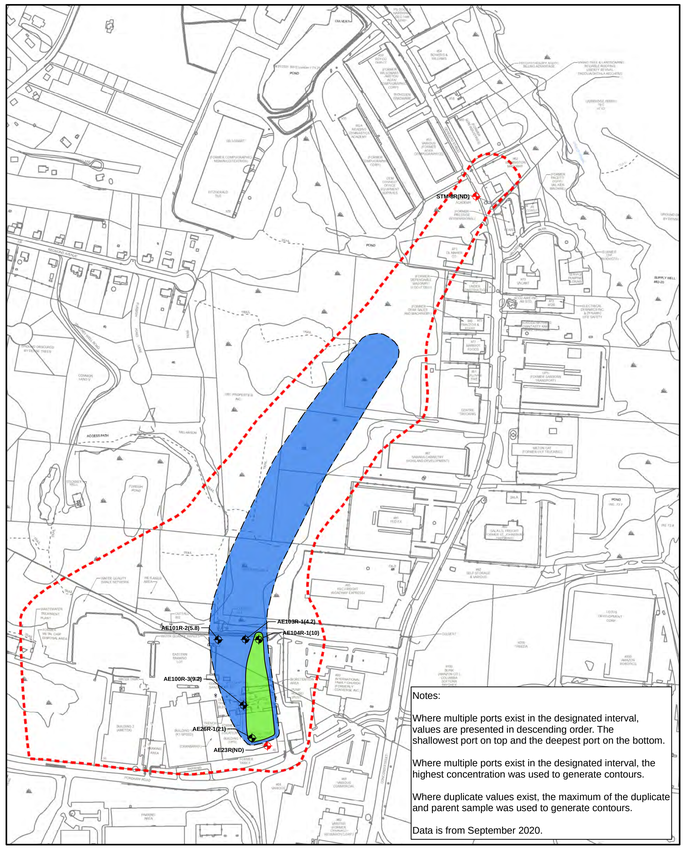
Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September - October 2018.

2018 1,4-Dioxane (SW8270D-SIM) in Groundwater
Upper Bedrock (0 - 60 ft bgs)

Notes:



Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

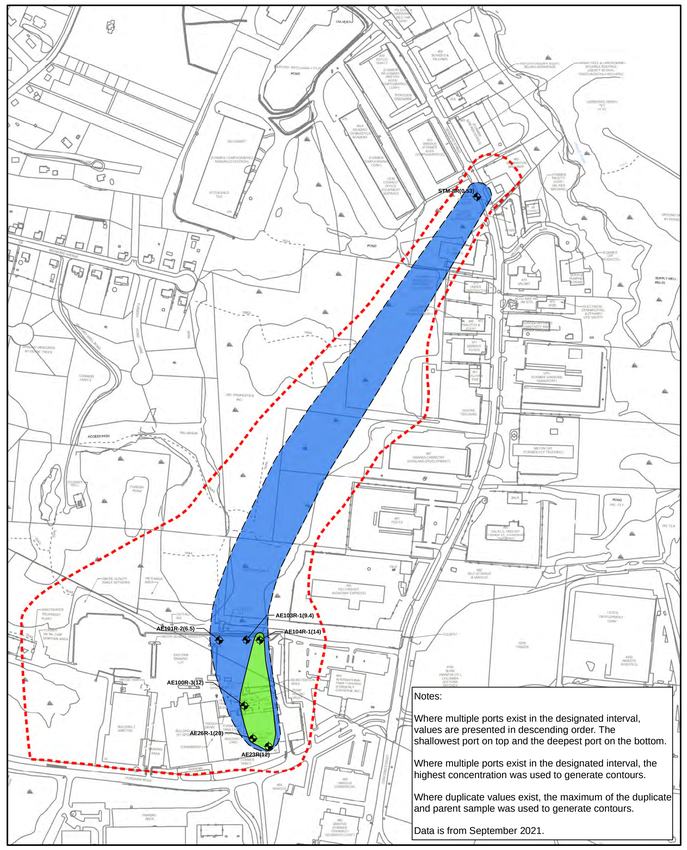
Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September 2019.

2019 1,4-Dioxane (SW8270D-SIM) in Groundwater
Upper Bedrock (0 - 60 ft bgs)

Notes:



Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September 2020.

2020 1,4-Dioxane (SW8270D-SIM) in Groundwater
Upper Bedrock (0 - 60 ft bgs)

Notes:

Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September 2021.

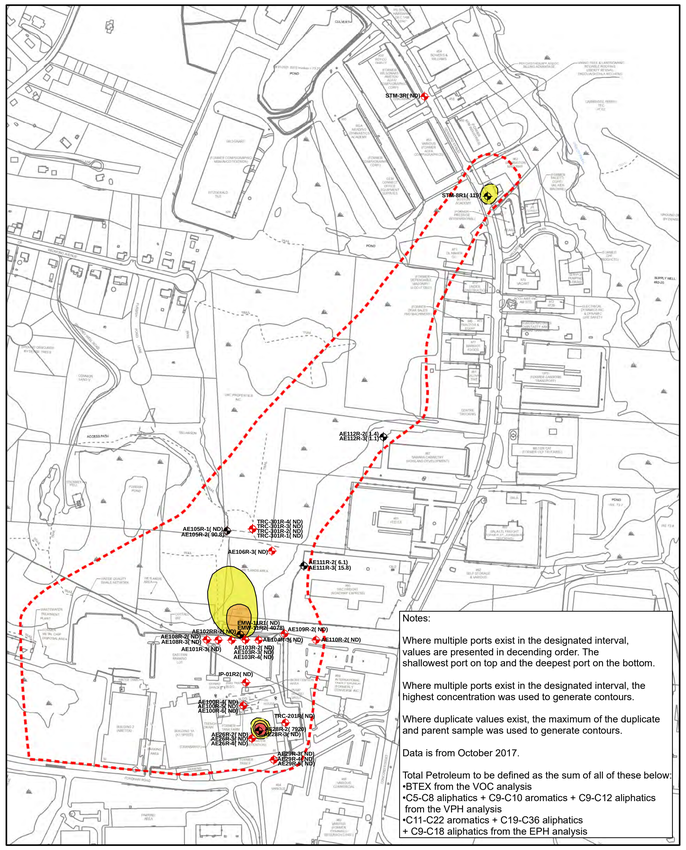
Notes:



Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.

Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

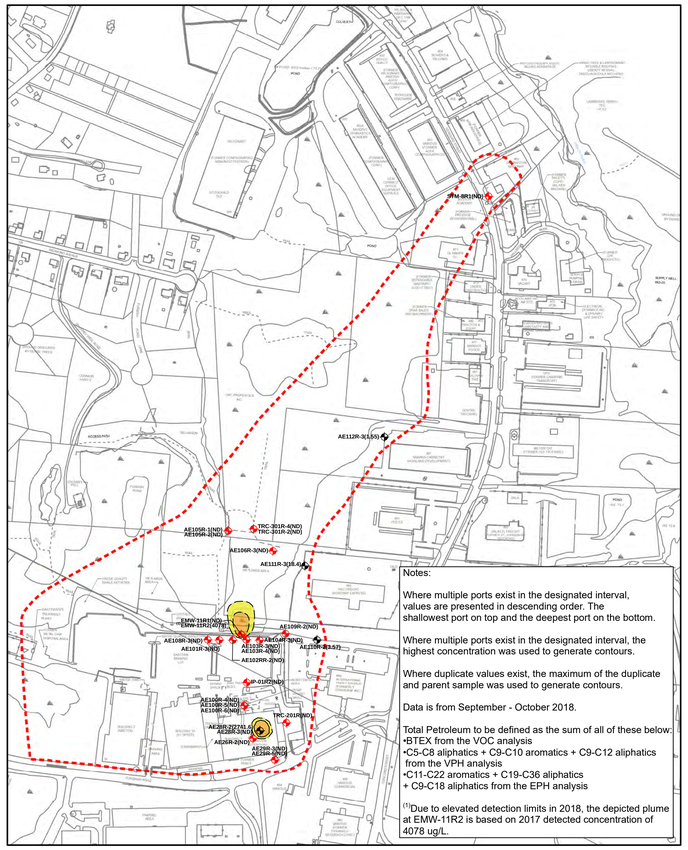
Data from May and June 2016.

Total Petroleum to be defined as the sum of all of these below:
- BTEX from the VOC analysis
- C5-C8 aliphatics + C9-C10 aromatics + C9-C12 aliphatics from the VPH analysis
- C11-C22 aromatics + C19-C36 aliphatics + C9-C18 aliphatics from the EPH analysis

2016 Total Petroleum in Groundwater
Middle Bedrock (61 - 120 ft bgs)

Notes:

Where multiple ports exist in the designated interval, values are presented in decending order. The shallowest port on top and the deepest port on the bottom.



Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from October 2017.

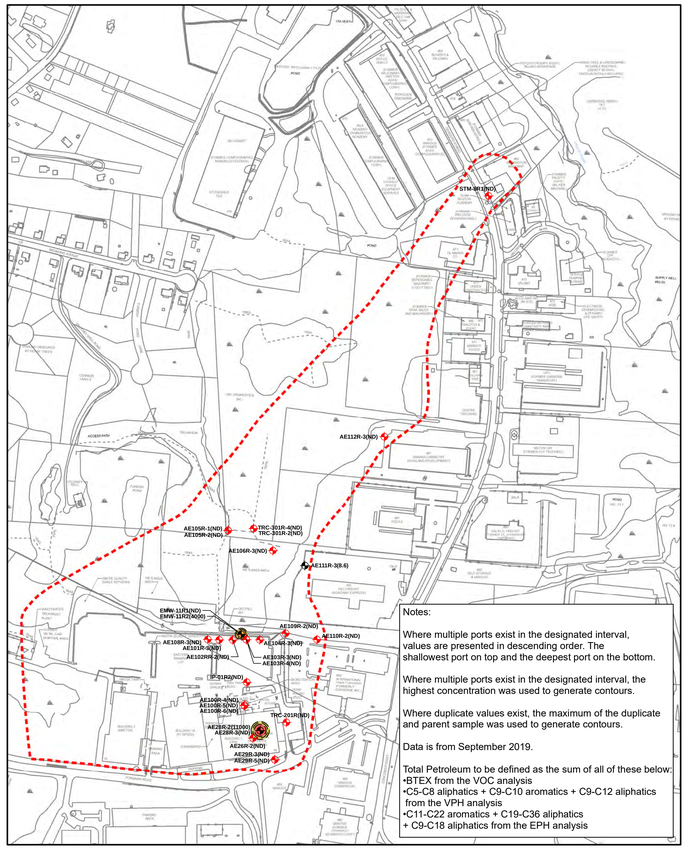
Total Petroleum to be defined as the sum of all of these below:
- BTEX from the VOC analysis
- C5-C8 aliphatics + C9-C10 aromatics + C9-C12 aliphatics from the VPH analysis
- C11-C22 aromatics + C19-C36 aliphatics + C9-C18 aliphatics from the EPH analysis

2017 Total Petroleum in Groundwater
Middle Bedrock (61 - 120 ft bgs)

Notes:

Where multiple ports exist in the designated interval, values are presented in descending order. The shallowest port on top and the deepest port on the bottom.

Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.



Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September - October 2018.

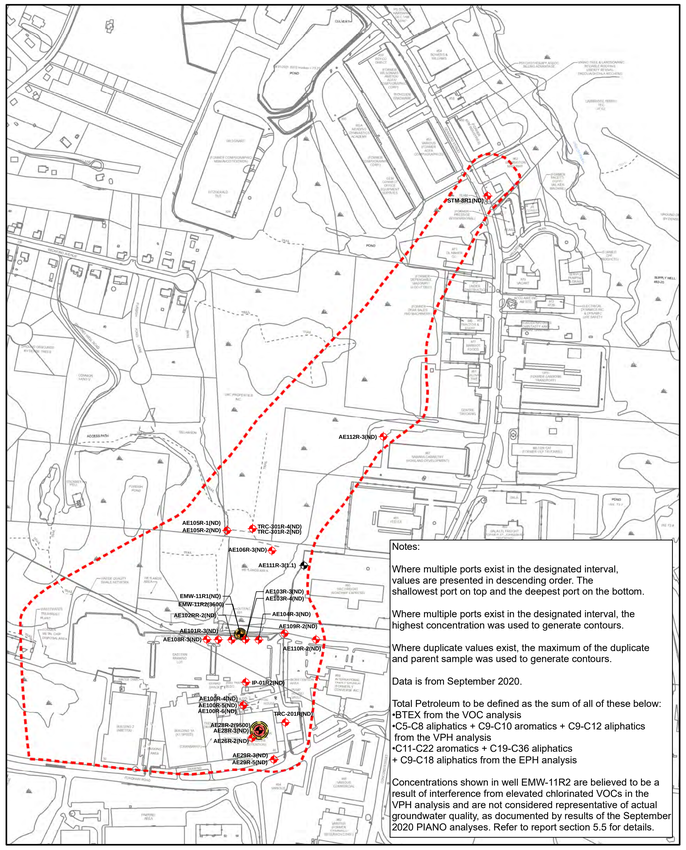
Total Petroleum to be defined as the sum of all of these below:
- BTEX from the VOC analysis
- C5-C8 aliphatics + C9-C10 aromatics + C9-C12 aliphatics from the VPH analysis
- C11-C22 aromatics + C19-C36 aliphatics + C9-C18 aliphatics from the EPH analysis

(1)Due to elevated detection limits in 2018, the depicted plume at EMW-11R2 is based on 2017 detected concentration of 4078 ug/L.

2018 Total Petroleum in Groundwater
Middle Bedrock (61 - 120 ft bgs)

Notes:

Where multiple ports exist in the designated interval, values are presented in descending order. The shallowest port on top and the deepest port on the bottom.



Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September 2019.

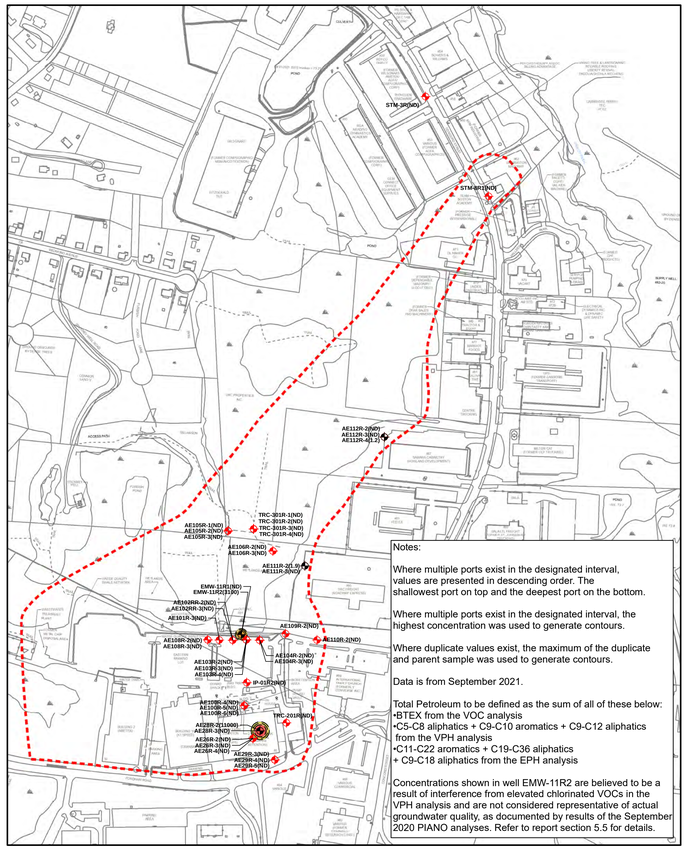
Total Petroleum to be defined as the sum of all of these below:
- BTEX from the VOC analysis
- C5-C8 aliphatics + C9-C10 aromatics + C9-C12 aliphatics from the VPH analysis
- C11-C22 aromatics + C19-C36 aliphatics + C9-C18 aliphatics from the EPH analysis

2019 Total Petroleum in Groundwater
Middle Bedrock (61 - 120 ft bgs)

Notes:

Where multiple ports exist in the designated interval, values are presented in descending order. The shallowest port on top and the deepest port on the bottom.

Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.



Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September 2020.

Total Petroleum to be defined as the sum of all of these below:
- BTEX from the VOC analysis
- C5-C8 aliphatics + C9-C10 aromatics + C9-C12 aliphatics from the VPH analysis
- C11-C22 aromatics + C19-C36 aliphatics + C9-C18 aliphatics from the EPH analysis

Concentrations shown in well EMW-11R2 are believed to be a result of interference from elevated chlorinated VOCs in the VPH analysis and are not considered representative of actual groundwater quality, as documented by results of the September 2020 PIANO analyses. Refer to report section 5.5 for details.

2020 Total Petroleum in Groundwater
Middle Bedrock (61 - 120 ft bgs)

Notes:

Where multiple ports exist in the designated interval, values are presented in descending order. The shallowest port on top and the deepest port on the bottom.

Where multiple ports exist in the designated interval, the highest concentration was used to generate contours.

Where duplicate values exist, the maximum of the duplicate and parent sample was used to generate contours.

Data is from September 2021.

Total Petroleum to be defined as the sum of all of these below:
- BTEX from the VOC analysis
- C5-C8 aliphatics + C9-C10 aromatics + C9-C12 aliphatics from the VPH analysis
- C11-C22 aromatics + C19-C36 aliphatics + C9-C18 aliphatics from the EPH analysis

Concentrations shown in well EMW-11R2 are believed to be a result of interference from elevated chlorinated VOCs in the VPH analysis and are not considered representative of actual groundwater quality, as documented by results of the September 2020 PIANO analyses. Refer to report section 5.5 for details.

Microbial Groundwater Data Summary
2016, 2017, 2021

60552044 Date: 2022-03-22

AECOM

FIGURE: 5-31

NOTES:
1) The yellow horizontal line represents the most negative $\delta^{13}C$ value for the parent compound PCE.
2) The dotted blue horzontal line represents a $\delta^{13}C$ value of 2‰ above the yellow line to provide a margin for possible variability since the exact source of the parent PCE cannot be determined.

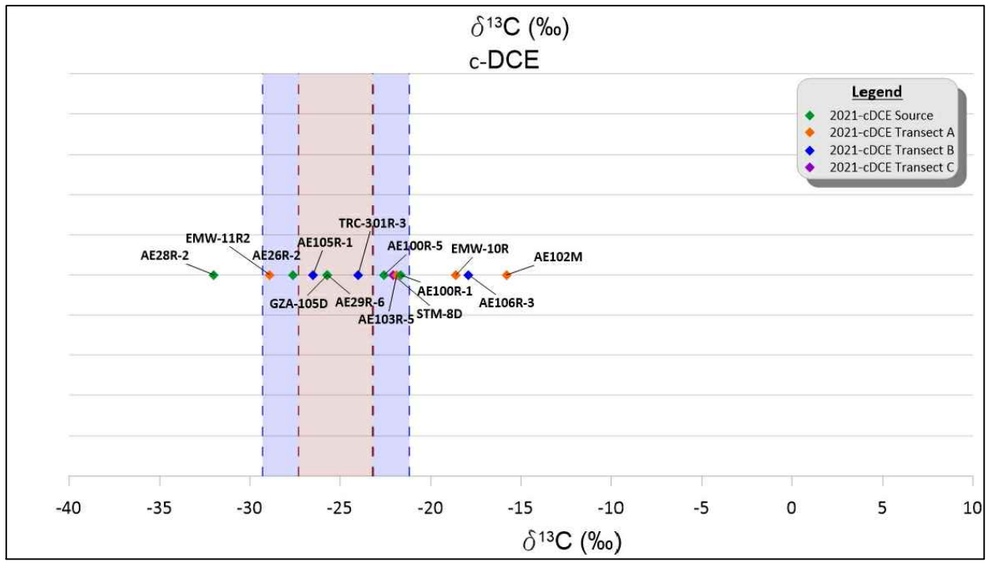
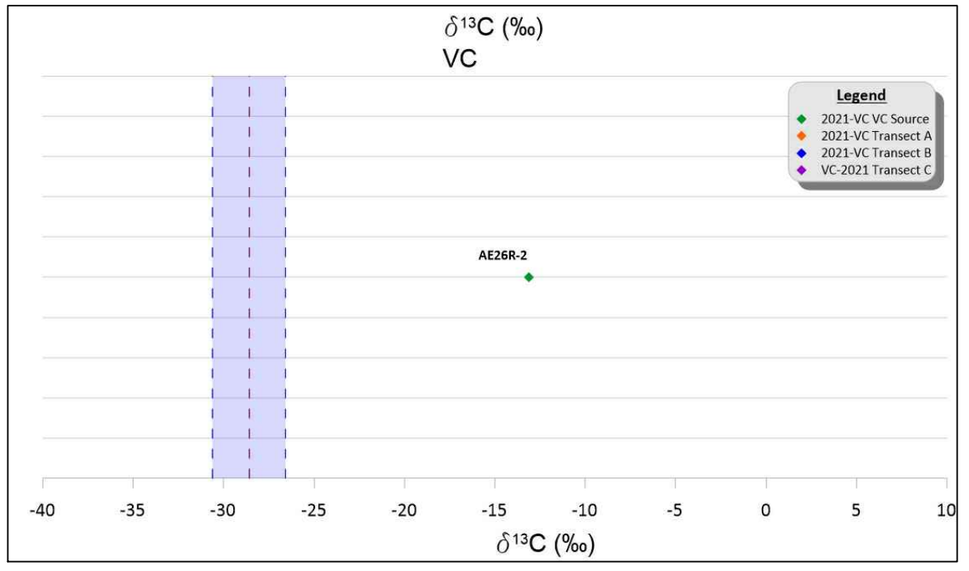
CVOC MOLE FRACTIONS
ALONG PLUME CENTERLINE



AECOM



60552044 Date: 2022-04-18

FIGURE: 5-33

NOTE:

Pink Shaded Area - represents range (max/min) of un-degraded Manufactured PCE/TCE/c-DCE/VC based on data from Microbial Insights CSIA Database; Max/Min values for VC were the same therefore only single dashed red line shown.

Blue Shaded Area - represents +/- 2 ‰ on either side of the displayed Manufactured Range for particular CVOC.

$\delta^{13}C$ values appearing outside of Pink/Blue Shaded Areas have been enriched and provides evidence of biotic/abiotic reductive degradation processes.

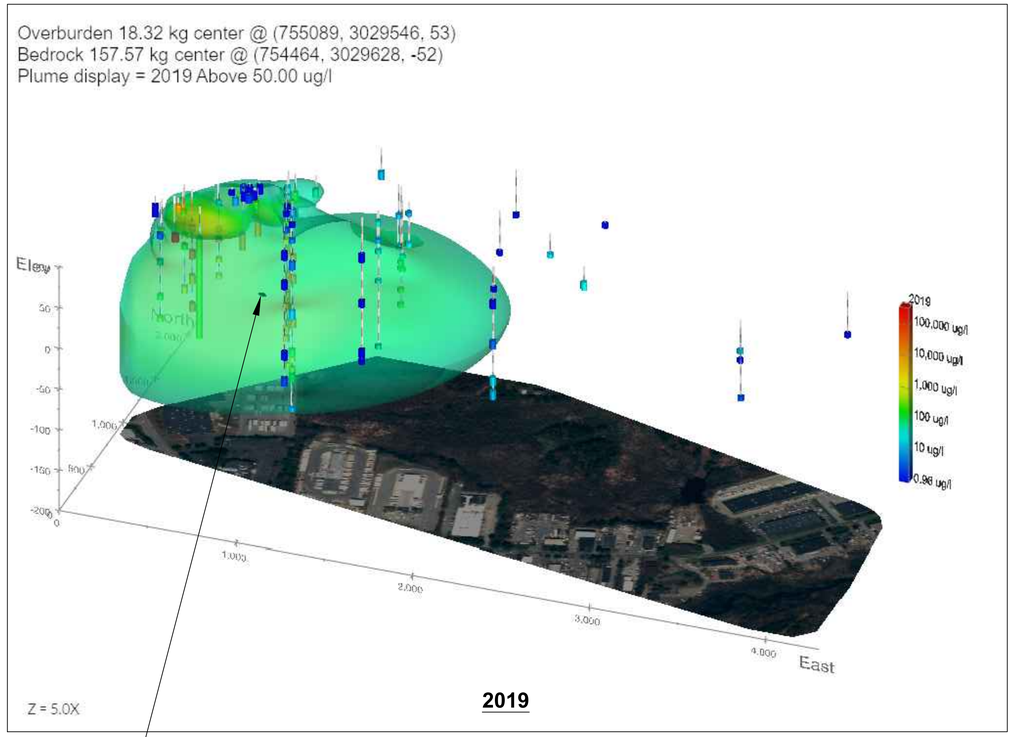
NOTE:
(Modified) Kuder Plots based on the 2021 sampling event and generated from the Microbial Insights CSIA Database https://database.microbe.com/csia/?



NOTES:
1. Values falling within the orange color range (upper left) are indicative of solely abiotic reductive degradation processes.
2. Values falling within the blue color range (right) are indicative of solely biotic reductive degradation processes.
3. Values falling within the red color range (middle) are indicative of both biotic and abiotic reductive degradation processes.
4. Yellow dashed line represents best fit trend of the $\delta^{13}C$ values.

Notes:

* All wells measured during site-wide water level event 8/31/2021.

** 1 per 20 for wells with non-dedicated sampling equipment

Rinse Blanks:

21A-EB01-091621-1 Hurricane Pump at STM8R1 - all analyses except H2, CSIA, Quantarray, and PIANO

21A-EB02-091601-1 Bladde pump at TRC201R - VOCs only

Notes:

Summary presents the final stabilized reading at each well just prior to sampling.

C - Celsius
uS/cm - microsiemens per centimeter
mg/l - milligrams per liter
SU - standard units
mV - millivolts
NTU - nephelometric turbidity units
NM - not measured

Notes:

LNAPL gauging results above from 1994 through 2011 collected by TRC or others. Data collection by AECOM started in 2012.
Bgs – Below ground surface.
NA – Not Applicable.
NM – Not Measured.
* LNAPL gauging at monitoring well PZ-2S was conducted on a semi-annual basis from April 1994 through May 2000. TRC then increased gauging frequency to monthly. MA DEP then requested that monthly LNAPL gauging continue at PZ-2S, CW-1, and CW-2 as part of the requirements of the Phase V O&M program, beginning December 2000.
During roadbox replacement on September 29, Maher Services cut down the top of PVC casing at one well, AE03, to accommodate the locking expansion plug within the roadbox. The new AE03 top of casing elevation post September 29, 2021 is 82.23 feet. The top of casing elevation up to September 29, 2021 was 82.41 feet.

(1) Not documented by Emcon.
(2) No recoverable LNAPL present.
(3) Well not installed.
(4) Water level meter may have been unreliable due to low temperature.
(5) Four-inch diameter well installed on November 30, 2000 to replace existing PZ-2S 0.5-inch diameter well.
(6) Noted a sheen on water surface.
(7) Product was detected with interface probe but not a measurable amount (product thickness < 0.01 ft)
(8) It is not understood why in November and December of 2011 that 3 gallons were indicated as removed from wells PZ-2S and TRC-101R when no LNAPL was detected. These 3 gallons are not included in approximate total LNAPL volume removed from these wells.

Notes:

LNAPL gauging results above from 1994 through 2011 collected by TRC or others. Data collection by AECOM started in 2012.
Bgs – Below ground surface.
NA – Not Applicable.
NM – Not Measured.
* LNAPL gauging at monitoring well PZ-2S was conducted on a semi-annual basis from April 1994 through May 2000. TRC then increased gauging frequency to monthly. MA DEP then requested that monthly LNAPL gauging continue at PZ-2S, CW-1, and CW-2 as part of the requirements of the Phase V O&M program, beginning December 2000.
During roadbox replacement on September 29, Maher Services cut down the top of PVC casing at one well, AE03, to accommodate the locking expansion plug within the roadbox. The new AE03 top of casing elevation post September 29, 2021 is 82.23 feet. The top of casing elevation up to September 29, 2021 was 82.41 feet.

(1) Not documented by Emcon.
(2) No recoverable LNAPL present.
(3) Well not installed.
(4) Water level meter may have been unreliable due to low temperature.
(5) Four-inch diameter well installed on November 30, 2000 to replace existing PZ-2S 0.5-inch diameter well.
(6) Noted a sheen on water surface.
(7) Product was detected with interface probe but not a measurable amount (product thickness < 0.01 ft)
(8) It is not understood why in November and December of 2011 that 3 gallons were indicated as removed from wells PZ-2S and TRC-101R when no LNAPL was detected. These 3 gallons are not included in approximate total LNAPL volume removed from these wells.

Notes:

LNAPL gauging results above from 1994 through 2011 collected by TRC or others. Data collection by AECOM started in 2012.
Bgs – Below ground surface.
NA – Not Applicable.
NM – Not Measured.
* LNAPL gauging at monitoring well PZ-2S was conducted on a semi-annual basis from April 1994 through May 2000. TRC then increased gauging frequency to monthly. MA DEP then requested that monthly LNAPL gauging continue at PZ-2S, CW-1, and CW-2 as part of the requirements of the Phase V O&M program, beginning December 2000.
During roadbox replacement on September 29, Maher Services cut down the top of PVC casing at one well, AE03, to accommodate the locking expansion plug within the roadbox. The new AE03 top of casing elevation post September 29, 2021 is 82.23 feet. The top of casing elevation up to September 29, 2021 was 82.41 feet.

(1) Not documented by Emcon.
(2) No recoverable LNAPL present.
(3) Well not installed.
(4) Water level meter may have been unreliable due to low temperature.
(5) Four-inch diameter well installed on November 30, 2000 to replace existing PZ-2S 0.5-inch diameter well.
(6) Noted a sheen on water surface.
(7) Product was detected with interface probe but not a measurable amount (product thickness < 0.01 ft)
(8) It is not understood why in November and December of 2011 that 3 gallons were indicated as removed from wells PZ-2S and TRC-101R when no LNAPL was detected. These 3 gallons are not included in approximate total LNAPL volume removed from these wells.

Table 2-4
Summary of LNAPL Observations and Removal

	PZ-2S				CW-1				CW-2				TRC-101				AE-3				AE-4				GZA-102S

Notes:

LNAPL gauging results above from 1994 through 2011 collected by TRC or others. Data collection by AECOM started in 2012.
Bgs – Below ground surface.
NA – Not Applicable.
NM – Not Measured.
NR – Not Recorded.
* LNAPL gauging at monitoring well PZ-2S was conducted on a semi-annual basis from April 1994 through May 2000. TRC then increased gauging frequency to monthly. MA DEP then requested that monthly LNAPL gauging continue at PZ-2S, CW-1, and CW-2 as part of the requirements of the Phase V O&M program, beginning December 2000.
During roadbox replacement on September 29, Maher Services cut down the top of PVC casing at one well, AE03, to accommodate the locking expansion plug within the roadbox. The new AE03 top of casing elevation post September 29, 2021 is 82.23 feet. The top of casing elevation up to September 29, 2021 was 82.41 feet.

(1) Not documented by Emcon.
(2) No recoverable LNAPL present.
(3) Well not installed.
(4) Water level meter may have been unreliable due to low temperature.
(5) Four-inch diameter well installed on November 30, 2000 to replace existing PZ-2S 0.5-inch diameter well.
(6) Noted a sheen on water surface.
(7) Product was detected with interface probe but not a measurable amount (product thickness < 0.01 ft)
(8) It is not understood why in November and December of 2011 that 3 gallons were indicated as removed from wells PZ-2S and TRC-101R when no LNAPL was detected. These 3 gallons are not included in approximate total LNAPL volume removed from these wells.
(9) Well not measured, or data has not been located in historical TRC reports.

Table 4-1
Summary of Natural Source Zone Depletion Rates

Well ID	Measurement Year	NSZD Rate (gallons/acre/year)	
		Soil Gas Concentration Gradient	Biogenic Heat
AE-3	2020	590	420
	2021	250	1,800
CW-1	2020	550	2,500
	2021	100	1,600
CW-2	2020	520	NA
	2021	130	NA
GZA-102R	2020	NA	750
	2021	NA	600
GZA-105S/D	2020	540	1,300
	2021	170	1,300
PZ-2S	2020	970	≥ 940
	2021	530	≥ 700
TRC-101	2020	630	NA
	2021	260	NA
TRC-102	2020	NA	2,000
	2021	NA	2,800
TRC-103	2020	NA	1,000
	2021	NA	1,000
Minimum	**100**		
Maximum	**2,800**		
Median	**670**		

≥ only upward heat flux could be estimated from PZ-2S data, providing a lower-bound estimate of the total

TRC-301R-4	Arsenic (Diss)	7	7	-12	-12	7	Downward Trend	11	Downward Trend

Notes:
Datasets presented for wells that were included in the sampling program in September 2021.
Field duplicates assigned the maximum value for the purposes of the trend test.
The detection limit was used for non-detect concentrations for the purposes of the trend test.
Trend test results were interpreted using a confidence level of 80% and 90%. If the absolute value of the statistic is equal to or greater than the critical value, a significant trend is concluded. The direction of the trend is determined by the sign of the statistic with positive statistics indicating an upward trend and negative statistics indicating a downward trend.
* When sample size > 10, the normal approximation is used and calculated per box 4-9 in Data Quality Assessment: Statistical Methods for Practitioners, EPA QA/G-9S. When the normal approximati used, the critical value is the standard normal distribution.
When S is 0, no critical value is calculated and a conclusion of no trend is made.
NA = The Mann-Kendall trend test was not performed because there were less than 4 samples.
ND = The Mann-Kendall trend test was not performed because there were less than 3 detected concentrations.
- Analyte results not available for location.

Notes:
Datasets presented for wells that were included in the sampling program in September 2021.
Field duplicates assigned the maximum value for the purposes of the trend test.
The detection limit was used for non-detect concentrations for the purposes of the trend test.
Trend test results were interpreted using a confidence level of 80% and 90%. If the absolute value of the statistic is equal to or greater than the critical value, a significant trend is concluded. The direction of the trend is determined by the sign of the statistic with positive statistics indicating an upward trend and negative statistics indicating a downward trend.
* When sample size > 10, the normal approximation is used and calculated per box 4-9 in Data Quality Assessment: Statistical Methods for Practitioners, EPA QA/G-9S. When the normal approximation is used, the critical value is the standard normal distribution.
When S is 0, no critical value is calculated and a conclusion of no trend is made.
NA = The Mann-Kendall trend test was not performed because there were less than 4 samples.
ND = The Mann-Kendall trend test was not performed because there were less than 3 detected concentrations.
- Analyte results not available for location.
(1) Calculated VPH results are likely false positives due to interference from CVOC concentrations

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased low, R = rejected

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:

ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:

ft = feet

ug/l = micrograms per liter

NE = not established

U - Non-detect at laboratory detection limit

J = Estimated Value, J+ = biased high, J- = biased

Detects are bolded

Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7
Summary of 2016 - 2021 Groundwater Analytical Results for Volatile Organic Compounds

Notes:
ft = feet
ug/l = micrograms per liter
NE = not established

U - Non-detect at laboratory detection limit
J = Estimated Value, J+ = biased high, J- = biased
Detects are bolded
Criteria exceedances are highlighted

Table 5-7

Notes:
Datasets presented for wells that were included in the sampling program in September 2021.
Field duplicates assigned the maximum value for the purposes of the trend test.
The detection limit was used for non-detect concentrations for the purposes of the trend test.
Trend test results were interpreted using a confidence level of 80% and 90%. If the absolute value of the statistic is equal to or greater than the critical value, a significant trend is concluded. The direction of the trend is determined by the sign of the statistic with positive statistics indicating an upward trend and negative statistics indicating a downward trend.
* When sample size > 10, the normal approximation is used and calculated per box 4-9 in Data Quality Assessment: Statistical Methods for Practitioners, EPA QA/G-9S. When the normal approximation is used, the critical value is the standard normal distribution.
When S is 0, no critical value is calculated and a conclusion of no trend is made.
NA = The Mann-Kendall trend test was not performed because there were less than 4 samples.
ND = The Mann-Kendall trend test was not performed because there were less than 3 detected concentrations.
- Analyte results not available for location.

Notes:
All units are in micrograms per cubic meter ($\mu g/m^3$)
Detected values are shown in bold.
Detection Limit indicated is above the MA-C/I threshold value
Detected value is above the MA-C/I threshold value
MA - C/I = Mass Industrial/Commercial threshold values from MassDEP Vapor Intrusion Guidance Policy #WSC-16-435 of October 2016.
* MA - C/I value shown for cis- and trans- 1,3-dichloropropene
** MA - C/I value shown for xylenes is for total xylenes

J = Estimated value
U = Not detected at the reported detection limit for the sample.
UJ = Not detected above laboratory detection limit; detection limit is estimated.
NE = Not established
IA - Indoor Air samples except as noted above for IA-01 (ambient air samples 2009-11)
AA - Ambient air samples (outdoors)
APH - Air-phase Petroleum Hydrocarbons
MassDEP - Massachusetts Department of Environmental Protection
SIM - Selective Ion Monitoring

Notes:
All units are in micrograms per cubic meter ($\mu g/m^3$)
Detected values are shown in bold.
Detection Limit indicated is above the MA-C/I threshold value
Detected value is above the MA-C/I threshold value
MA - C/I = Mass Industrial/Commercial threshold values from MassDEP Vapor Intrusion Guidance Policy #WSC-16-435 of October 2016.
* MA - C/I value shown for cis- and trans- 1,3-dichloropropene
** MA - C/I value shown for xylenes is for total xylenes

J = Estimated value
U = Not detected at the reported detection limit for the sample.
UJ = Not detected above laboratory detection limit; detection limit is estimated.
NE = Not established
IA - Indoor Air samples except as noted above for IA-01 (ambient air samples 2009-11)
AA - Ambient air samples (outdoors)
APH - Air-phase Petroleum Hydrocarbons
MassDEP - Massachusetts Department of Environmental Protection
SIM - Selective Ion Monitoring

Table 6-1
Summary of Historical Indoor Air Results through January 2022

Notes:
All units are in micrograms per cubic meter (µg/m^3)
Detected values are shown in bold.
Detection Limit indicated is above the MA-C/I threshold value
Detected value is above the MA-C/I threshold value
MA - C/I = Mass Industrial/Commercial threshold values from MassDEP Vapor Intrusion Guidance Policy #WSC-16-435 of October 2016.
* MA - C/I value shown for cis- and trans- 1,3-dichloropropene
** MA - C/I value shown for xylenes is for total xylenes

J = Estimated value
U = Not detected at the reported detection limit for the sample.
UJ = Not detected above laboratory detection limit; detection limit is estimated.
NE = Not established
IA - Indoor Air samples except as noted above for IA-01 (ambient air samples 2009-11)
AA - Ambient air samples (outdoors)
APH - Air-phase Petroleum Hydrocarbons
MassDEP - Massachusetts Department of Environmental Protection
SIM - Selective Ion Monitoring

Table 6-1
Summary of Historical Indoor Air Results through January 2022

Notes:
All units are in micrograms per cubic meter ($\mu g/m^3$)
Detected values are shown in bold.
Detection Limit indicated is above the MA-C/I threshold value
Detected value is above the MA-C/I threshold value
MA - C/I = Mass Industrial/Commercial threshold values from MassDEP Vapor Intrusion Guidance Policy #WSC-16-435 of October 2016.
* MA - C/I value shown for cis- and trans- 1,3-dichloropropene
** MA - C/I value shown for xylenes is for total xylenes

J = Estimated value
U = Not detected at the reported detection limit for the sample.
UJ = Not detected above laboratory detection limit; detection limit is estimated.
NE = Not established
IA - Indoor Air samples except as noted above for IA-01 (ambient air samples 2009-11)
AA - Ambient air samples (outdoors)
APH - Air-phase Petroleum Hydrocarbons
MassDEP - Massachusetts Department of Environmental Protection
SIM - Selective Ion Monitoring

Table 6-1
Summary of Historical Indoor Air Results through January 2022

Site Location:			Building 1 - First Floor					Building 1 - Second Floor											Building 1 - Mezzanine (Removed 2016-2017)						
Sample Location ID:			IA-08, continued					IA-09											IA-10

Notes:
All units are in micrograms per cubic meter ($\mu g/m^3$)
Detected values are shown in bold.
Detection Limit indicated is above the MA-C/I threshold value
Detected value is above the MA-C/I threshold value
MA - C/I = Mass Industrial/Commercial threshold values from MassDEP Vapor Intrusion Guidance Policy #WSC-16-435 of October 2016.
* MA - C/I value shown for cis- and trans- 1,3-dichloropropene
** MA - C/I value shown for xylenes is for total xylenes

J = Estimated value
U = Not detected at the reported detection limit for the sample.
UJ = Not detected above laboratory detection limit; detection limit is estimated.
NE = Not established
IA - Indoor Air samples except as noted above for IA-01 (ambient air samples 2009-11)
AA - Ambient air samples (outdoors)
APH - Air-phase Petroleum Hydrocarbons
MassDEP - Massachusetts Department of Environmental Protection
SIM - Selective Ion Monitoring

Table 6-1
Summary of Historical Indoor Air Results through January 2022

Notes:
All units are in micrograms per cubic meter ($\mu g/m^3$)
Detected values are shown in bold.
Detection Limit indicated is above the MA-C/I threshold value
Detected value is above the MA-C/I threshold value
MA - C/I = Mass Industrial/Commercial threshold values from MassDEP Vapor Intrusion Guidance Policy #WSC-16-435 of October 2016.
* MA - C/I value shown for cis- and trans- 1,3-dichloropropene
** MA - C/I value shown for xylenes is for total xylenes

J = Estimated value
U = Not detected at the reported detection limit for the sample.
UJ = Not detected above laboratory detection limit; detection limit is estimated.
NE = Not established
IA - Indoor Air samples except as noted above for IA-01 (ambient air samples 2009-11)
AA - Ambient air samples (outdoors)
APH - Air-phase Petroleum Hydrocarbons
MassDEP - Massachusetts Department of Environmental Protection
SIM - Selective Ion Monitoring

Table 9-1
Properties and Uses - 2017 versus 2021

Address	2017 Owner/Occupant	2017 Site Use	Changes in Owner/Occupant and Site Use
Source Property:			
40-50 Fordham Rd	Wilmington Realty Trust	Owner	Hilco Redevelopment Partners as of October 29, 2021
	Vacant (Bldg 1)	Under Renovation	United Parcel Service (UPS) seasonal from 2017-2019 and full time from fall 2020-present
	CranBarry (Bldg 1A)	Sporting goods retail/wholesale	Vacant as of late 2021 or early 2022
	K1 Speed Boston (Bldg 1A)	Public go-cart racing facility	No change
	Ametek (Bldg 2)	Aerospace industry	No change
Downgradient Properties:			
99 Concord St	International Family Church	Headquarters, offices, worship services	No change
95 Concord St	YRC Freight	Active Trucking Terminal	No change
91 Concord St	Central Transport/FedEx	Active FedEx Shipping Terminal	No change
87 Concord St	Howland Development/Various	Various light commercial uses	Same Owner; Occupant is now Samara Cabinetry; Site use is the same/similar
73-79 Concord St	Centre Trucking-Sullivan Tire	Various commercial/industrial uses	No change
71 Concord St	DL Maher	Well and Pump Services	No change
62 Concord St	Wilmington Masonry	Commercial Masonry Retailer	No change

Concord Street Pond				75.91		Ref Elev is top of 2nd outfall pipe into Pond, west of Fordham Rd

For each of the MWs above, if there is standing water present at the well, measure depth to surface water from the TOC reference elevation. This may require two measurements from TOC to Rim of stickup then rim of stickup down to surface water.
At gauges SG-1 and SG-2, if no standing water, dig down up to 12 inches to see water is present; if yes, allow water to fill hole/stabilize and take measurement of depth to water below ground.

Concord Street Pond				75.91		Ref Elev is top of 2nd outfall pipe into Pond, west of Fordham Rd

3 Furbish Pond Ln:

For each of the MWs above, if there is standing water present at the well, measure depth to surface water from the TOC reference elevation. This may require two measurements from TOC to Rim of stickup then rim of stickup down to surface water.
At gauges SG-1 and SG-2, if no standing water, dig down up to 12 inches to see water is present; if yes, allow water to fill hole/stabilize and take measurement of depth to water below ground.

Water level meter make/model/SN:

AECOM

Lockheed Martin Corporation
Former GE Site - Wilmington, MA
Water Level Measurements

Weather: 80's Sunny | Recorders: Floyd Burton / Katy Teske

Well	Date	Time	Depth to Water	TOC Ref Elev	Calc'ed Elevation	Comments
AE-106S				78.42		
AE-106R-1 (47-52)				79.15		
TRC-301R-1 (96.5-100.5)				78.57		
MW-4				77.23		
MW-4A				76.46		
MW-5				78.99		
PS-1S				79.21		
PS-1M				77.30		
PS-1D				76.51		
PS-2S				77.71		
PS-2M				77.61		
PS-2D				76.91		
GZA-1 (wwtp)				79.05		
GZA-2 (wwtp)				79.12		
SG-1				75.78		
SG-2				70.82		
Concord Street Pond		1501	0.70	75.91		Ref Elev is top of 2nd outfall pipe into Pond, west of Fordham Rd

For each of the MWs above, if there is standing water present at the well, measure depth to surface water from the TOC reference elevation. This may require two measurements from TOC to Rim of stickup then rim of stickup down to surface water.
At gauges SG-1 and SG-2, if no standing water, dig down up to 12 inches to see water is present; if yes, allow water to fill hole/stabilize and take measurement of depth to water below ground.

Water level meter make/model/SN:

From September 2020 - Small number of monitoring wells on YRC property measured by AECOM on 9/9/2020, one day following the site-wide water levels on 9/8/2020. Unable to measure depths to water in more YRC site wells on 9/8 due to ongoing groundwater remediation pumping/recirculation.

confirm with Scott - NO!!

Common Field Data Error Codes

Error codes are used to explain common mistakes and are written above or close to the mistake. Commonly used error codes include:

RE	Recording Error
CE	Calculation Error
TE	Transcription Error
SE	Spelling Error
CL	Changed for Clarity
DC	Original Sample Description Changed After Further Evaluation
WO	Write Over
NI	Not Initialed and Dated at Time of Entry
OB	Not Recorded at the Time of Initial Observation

Note: Error code should be circled, dated, and initialed when recorded.

Hazard Classifications

Class 1 Explosives
Class 2 Gas
Class 3 Flammable Liquid
Class 4 Flammable Solids (Potential spontaneous combustion, or emission of flammable gases when in contact with water)
Class 5 Oxidizing Substances and Organic Peroxides
Class 6 Toxic (poisonous) and infectious substances
Class 7 Radioactive material
Class 8 Corrosives
Class 9 Miscellaneous dangerous goods

APPENDIX D
INDOOR AIR SAMPLING FIELD RECORDS

Indoor Air Quality Building Survey

Date: 1/11/2022 (pre-visit) 1/18/2022 - sampling RTN: 3-0518

Address: 40 Fordham Rd, Wilmington, MA

Building Contact: Eric Darci (HilCo) Phone: Tel:
Cell: 617-308-3659
Work: _____

Current Occupants: UPS workers - Ken Rich is manager

INITIALS	AGE	SEX (M/F)

Building Construction Characteristics: (Circle or underline appropriate responses)

Single Family	Multiple Family	School	(Commercial)
Ranch	2-Family		
Raised Ranch	Duplex		
Cape	Apartment House		
Colonial	# of units ____		
Split Level	Condominium		
Colonial	# of units ____		
Mobile Home	Other _____		
Other _____			

Bld age 45-50 yrs

General Description of Building Construction Materials:

Wood (Brick) Stone (Metal) Other_____

How many occupied stories does the building have? 2

Has the building been weatherized with any of the following?

(Insulation) Storm Windows Energy-Efficient Windows Other _____

Exterior of 2nd floor was wrapped in 2018

Indoor Air Quality Building Survey, continued

What type of basement does the building have?

Full basement Crawlspace (Slab-on-Grade) Other _____

What are the characteristics of the basement? Finished Unfinished Other N.A.

Basement Floor:	Foundation Walls:	Moisture:
Concrete	Poured Concrete	Wet
Dirt	Block	Damp
	Stone	Dry

Is a basement sump present? (Y/N) N.A.

Does the basement have any of the following characteristics (i.e., preferential pathways into the building) that might permit soil vapor entry?

Cracks Pipes/Utility Conduits Foundation/slab drainage

Sump pumps Other N.A.

Heating and Ventilation System(s):

What type(s) of heating system are used in this building?

(Hot Air Circulation) Heat Pump Wood Stove

Hot Air Radiation Unvented Kerosene Heater Electric Baseboard

Forced Hot Water Steam Radiation Other _____

What type(s) of fuel are used in this building?

(Natural Gas) (Electric) Coal Other _____

Fuel Oil Wood Solar

What type(s) of mechanical ventilation system are present and/or currently operating in this building? 2 cambridge units on high bay roof for fresh air
4 smaller units for re-circulating indoor air

Central Air Conditioning Mechanical Fan Bathroom Ventilation Fan

Kitchen Range Hood Open Window Individual Air Conditioning Unit

Air-to-Air Heat Exchange Other _____

Indoor Air Quality Building Survey, continued

Sources of Chemical Contaminants: Refer to Photo Log

Potential VOC Source	Check if present in building prior to sampling	Location of Source	Removed 48 hours prior to sampling? (Yes/No/NA)
Paints or paint thinners			
Gas-powered equipment			
Gasoline storage cans			
Cleaning solvents			
Air fresheners			
Oven cleaners			
Carpet/upholstery cleaners			
Hairspray			
Nail polish/polish remover			
Bathroom cleaner			
Appliance cleaner			
Furniture/floor polish			
Moth balls			
Fuel tank			
Wood stove			
Fireplace			
Perfume/colognes			
Hobby supplies (e.g., solvents, paints, lacquers, glues, photographic darkroom chemicals)			
Scented trees, wreaths, potpourri, etc.			
Other			
Other			

☒ YES ☐ NO Do one or more smokers occupy this building on a regular basis?
Smoking occurs outside of eastern entrance

☐ YES ☒ NO Has anybody smoked in the building in the last 48 hours?

☒ YES ☐ NO Does the building have an attached garage?
High bay area houses UPS trucks

☒ YES ☐ NO If so, is the garage used for parking cars
Trucks loaded in morning, leave ~9 am and return ~5 pm

Indoor Air Quality Building Survey, continued

☐ YES ☐ NO — Do the occupants of the building frequently have their clothes dry-cleaned?
unknown

☒ YES ☐ NO — Was there any recent remodeling or painting done in the building?
new wall constructed in SW corner room in 2021

☐ YES ☑ NO — Are there any new pressed wood products in the building (e.g., hardwood plywood, wall paneling, particleboard, fiberboard)?

☐ YES ☑ NO — Are there any new upholstery, drapes or other textiles in the building?

☐ YES ☐ NO unk. — Has the building interior been treated with any insecticides/pesticides?

If yes, what chemicals are used and how often are they applied?

Outdoor Sources of Contamination/Conditions:

Do any of the occupants apply pesticides/herbicides in the yard or garden? If yes, what chemicals are used and how often are they applied?

Is there any stationary emission source in the vicinity of the building?
2 generators in Bld 1 and a 2nd-floor electrical substation

Are there any mobile emission sources (e.g., highway, bus stop, high-traffic area) in the vicinity of the building?
UPS trucks leaving and entering the high bay area

Type of ground cover (e.g., grass, pavement, etc.) outside the building: asphalt with areas of grass

Other Information:

Is there other information about the structural features of the building, habits of its occupants or potential sources of contaminants to the indoor air that may be of significance to the evaluation of the indoor air quality of the building?

Weather Conditions during Sampling:

Outside Temperature (°F): 27°F

Prevailing wind direction and approximate wind speed: WNW 19 mph

Describe the general weather conditions (e.g., sunny, cloudy, rain): mostly cloudy

Was there significant precipitation (≥ 0.1 inches) within 12 hours preceding the sampling? NO

Pressure:

	9AM	1PM	5PM
outside	749.0	752.0	756.1
inside	748.9	752.0

Project / Client Annual Indoor Air Sampling

0730- D. Potter on site.
Task: Indoor Air Sampling
Weather: Partly sunny, 25-30°F, windy
Begin setting up sampling locations
0830- off site to get battery for regulator
0900- UPS trucks begin to leave
0920- Trucks off site
0925- Begin sampling. 3 trucks enter and leave building between 0930-1000
1040- Take PID readings
Make & Model: ion Tiger
S/N: 1000-1075
Fresh air reading: 0.0 ppm
Isobutylene (Lot # 4013570): 100 ppm
1115- check canister levels. See logs for pressure information and periodic checks
1200- Take temperature readings
1650- Trucks begin to arrive back. Stop sampling
1700- De-mob
1745- off site to office

APPENDIX E
ACTIVITY AND USE LIMITATION

NOTICE OF ACTIVITY AND USE LIMITATION
M.G.L. c. 21E, §6 and 310 CMR 40.0000

Note: Pursuant to 310 CMR 40.1074(5), upon transfer of any interest in or a right to use the property or a portion thereof that is subject to this Notice of Activity and Use Limitation, the Notice of Activity and Use Limitation shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer. Within 30 days of so incorporating the Notice of Activity and Use Limitation in a deed that is recorded or registered, a copy of such deed shall be submitted to the Department of Environmental Protection.

Disposal Site Name: 50 Fordham Road
DEP Release Tracking No.: 3-0000518

This Notice of Activity and Use Limitation ("Notice") is made as of this ____ day of _____, 2015, by Rosemarie Stanieich, Victoria J. Miyara, and Annette Maria Given as Trustees of the Wilmington Realty Trust, established by Declaration of Trust dated September 7, 1973, registered in the Middlesex North Registry District of the Land Court as Document No. 63541 and noted on Certificate of Title No. 19837 and registered further in the Middlesex South Registry of the Land Court as Document No. 515729 and noted on Certificate of Title No. 142138, together with their successors and assigns (collectively "Owner").

W I T N E S S E T H:

WHEREAS, the Wilmington Realty Trust, of Wilmington, Middlesex County, Massachusetts is the owner in fee simple of those certain parcels of land located at 40 and 50 Fordham Road in Wilmington, Middlesex County, Massachusetts, with the buildings and improvements thereon;

WHEREAS, said parcels of land, which are more particularly bounded and described in Exhibit A, attached hereto and made a part hereof ("Property"), are subject to this Notice of Activity and Use Limitation. The Property is shown on plans registered in the Middlesex County North Registry District of the Land Court as Land Court Plan Nos. 31713-C, 34588-B, 34588-E, and 36899-B, and in the Middlesex County South Registry District of the Land Court as Land Court Plan No. 31713-D;

WHEREAS, a portion of the Property ("Portion of the Property") is more specifically subject to this Notice of Activity and Use Limitation. This Portion of the Property is more particularly bounded and described in Exhibit A-1, attached hereto and made a part hereof. The Portion of the Property is shown on a sketch plan attached hereto and filed herewith for registration;

WHEREAS, the Portion of the Property comprises part of a disposal site as the result of a release of oil and/or hazardous materials. Exhibit B is a sketch plan showing the relationship of the Portion of the Property subject to this Notice of Activity and Use Limitation to the boundaries of said disposal site existing within the limits of the Property and to the extent such boundaries have been established. Exhibit B is attached hereto and made a part hereof; and

WHEREAS, one or more response actions have been selected for the Portion of the Disposal Site in accordance with M.G.L. c.21E ("Chapter 21E") and the Massachusetts Contingency Plan, 310 CMR 40.0000 ("MCP"). Said response actions are based upon (a) the restriction of human access to and contact with oil and/or hazardous material in soil and/or groundwater, and (b) the restriction of certain activities occurring in, on, through, over or under the Portion of the Property. A description of the basis for such restrictions, and the oil and/or hazardous material release event(s) or site history that resulted in the contaminated media subject to the Notice of Activity and Use Limitation is attached hereto as Exhibit C and made part hereof.

NOW, THEREFORE, Notice is hereby given that the activity and use limitations set forth in this Notice of Activity and Use Limitation are as follows:

1. Activities and Uses Consistent with Maintaining No Substantial Hazard Conditions. The following Activities and Uses are consistent with maintaining a condition of No Substantial Hazard and, as such, may occur on the Portion of the Property pursuant to 310 CMR 40.0000:

i. Industrial and commercial uses;

ii. Such other activities which, in the Opinion of a Licensed Site Professional, shall present no greater risk of harm to health, safety public welfare or the environment than the activities and uses set forth in this Paragraph; and

iii. Such other activities and uses not identified in Paragraph 2 as being Activities and Uses inconsistent with maintaining No Substantial Hazard Conditions.

2. Activities and Uses Inconsistent with Maintaining No Substantial Hazard. The following Activities and Uses are inconsistent with maintaining a condition of No Substantial Hazard pursuant to 310 CMR 40.0000, and, as such, may not occur on the Portion of the Property:

i. Residential, school, playground, park, or daycare use; and

ii. In the area as defined by the Activity and Use Limitation ("AUL") boundary presented in Figure 1 of the Activity and Use Limitation Opinion annexed hereto as Exhibit C, activities that would result in exposure to or the disturbance of potentially contaminated soils, bedrock, groundwater, and indoor air, unless appropriate precautions to prevent human exposure are taken as described in paragraph 3 below.

3. Obligations and Conditions. The following obligations or conditions are necessary and shall be undertaken and/or maintained at the Portion of the Property to maintain a condition of No Substantial Hazard:

i. The concrete floors within the footprint of the AUL boundary, if present, must be maintained in a condition that will prevent potential exposure to potentially contaminated soil, groundwater, and soil gas. Interior building floors will be inspected annually with repairs made to seal cracks larger than one-fourth (1/4) inch in width. The penetration of and the subsequent repairs made to the concrete floor of any buildings within the AUL boundary will be evaluated by a Licensed Site Professional to maintain the safety of construction and on-site workers.

ii. Excavated soil and bedrock removed from the AUL area must be managed in accordance with the Soil Management Procedures pursuant to 310 CMR 40.0030.

a. If the soils and bedrock are suspected or are pre-determined by a Licensed Site Professional to be Remediation Waste as defined under 310 CMR 40.0006, then the soils and bedrock will be managed under a Release Abatement Measure ("RAM") set forth by the MCP at 310 CMR 40.0440, as determined by a Licensed Site Professional.

b. If the excavated soils and bedrock from the AUL area are determined not to be Remediation Waste, then they will be managed under a RAM or in accordance with the Similar Soils Provisions Guidance, WSC#-13-500, as determined by a Licensed Site Professional.

iii. If groundwater dewatering activities are required within the AUL area, then the groundwater will be managed appropriately as described here:

a. If the groundwater is determined to be a Remediation Waste, then it will be managed under a Release Abatement Measure ("RAM") set forth by the MCP at 310 CMR 40.0440, as determined by a Licensed Site Professional.

b. If the groundwater removed from the AUL area is not determined to be a Remediation Waste, then other appropriate options may be used to manage the water as determined by a Licensed Site Professional.

iv. Activities that could result in exposure to or the disturbance of soils, bedrock or groundwater in the AUL area, must be conducted in accordance with the performance standards for RAMs set forth by the MCP at 310 CMR 40.0440, the Soil Management Procedures pursuant to 310 CMR 40.0030, the Similar Soils Provisions Guidance (WSC#-13-500), Construction of Buildings in Contaminated Areas (Policy WSC#-00-425) and applicable Health and Safety

procedures outlined in 310 CMR 40.0018, as determined by a Licensed Site Professional.

4. Proposed Changes in Activities and Uses. Any proposed changes in activities and uses at the Portion of the Property which may result in higher levels of exposure to oil and/or hazardous material than currently exist shall be evaluated by a Licensed Site Professional who shall render an Opinion, in accordance with 310 CMR 40.1080 *et seq.*, as to whether the proposed changes are inconsistent with maintaining a condition of No Substantial Hazard. Any and all requirements set forth in the Opinion to meet the objective of this Notice shall be satisfied before any such activity or use is commenced.

5. Violation of the AUL. The activities, uses and/or exposures upon which this Notice is based shall not change at any time to cause a significant risk of harm to health, safety, public welfare, or the environment or to create substantial hazards due to exposure to oil and/or hazardous material without the prior evaluation by a Licensed Site Professional in accordance with 310 CMR 40.1080, and without additional response actions, if necessary, to maintain a condition of No Substantial Hazard.

If the activities, uses, and/or exposures upon which this Notice is based change without the prior evaluation and additional response actions determined to be necessary by a Licensed Site Professional in accordance with 310 CMR 40.1080, the owner or operator of the Portion of the Property subject to this Notice at the time the activities, uses and/or exposures change, shall comply with the requirements set forth in 310 CMR 40.0020.

6. Incorporation Into Deeds, Mortgages, Leases, and Instruments of Transfer. This Notice shall be incorporated either in full or by reference into all future deeds, easements, mortgages, leases, licenses, occupancy agreements or any other instrument of transfer, whereby an interest in and/or a right to use the Property or a portion thereof is conveyed in accordance with 310 CMR 40.1074(5).

Owner herby authorizes and consents to the filing and recordation and/or registration of this Notice, said Notice to become effective when executed under seal by the undersigned Licensed Site Professional, and recorded and/or registered with the appropriate Registry(ies) of Deeds and/or Land Registration Office(s).

EXHIBIT A

DESCRIPTION OF PROPERTY SUBJECT TO THE AUL

LEGAL DESCRIPTION

LOT 4 and LOT 6

Two (2) certain parcels of land located in the Town of Wilmington, County of Middlesex, Massachusetts; said two (2) parcels of land located easterly of Fordham Road, in Wilmington, Massachusetts; and said two (2) parcels of land shown as Lot 4 and Lot 6 on "Plan of land in Wilmington, Mass." dated February 28, 1978, Dana F. Perkins & Assoc., Inc., Civil Engineers and Surveyors, Reading-Lowell, Massachusetts; which plan is filed in Middlesex North Registry District of the Land Court, as Plan No. 36899-B.

The said two (2) parcels of land are bounded and described as follows:

LOT 4 as shown on said plan.

NORTHWESTERLY:	by land now or formerly of Carl Realty, Inc., seven hundred thirty-one and 40/100 (731.40) feet;
NORTHEASTERLY:	by Lot 6 as shown on said plan, two hundred seventy-five and 02/100 (275.02) feet;
EASTERLY:	by Lot 3 as shown on said plan, ninety-two and 44/100 (92.44) feet; and
SOUTHEASTERLY:	by land now or formerly of George E. Dunn, along the Town Line dividing Wilmington and North Reading, seven hundred fifty-five and 87/100 (755.87) feet; and
SOUTHWESTERLY:	by land now or formerly of South Mass. Land Developers, Inc., two hundred thirty and 27/100 (230.27) feet.

LOT 6 as shown on said plan.

NORTHWESTERLY:	by land now or formerly of Carl Realty, Inc., two hundred ninety-seven and 00/100 (297) feet;
SOUTHEASTERLY:	by Lot 5 as shown on said plan, four hundred thirty-five and 67/100 (435.67) feet; and
NORTHEASTERLY:	by Lot 4 as shown on said plan, two hundred seventy-five and 02/100 (275.02) feet.

For title of Trustees of THE WILMINGTON REALTY TRUST to said Lot 4 and Lot 6, see Middlesex North Registry District of the Land Court, Certificate of Title No. 19842, recorded in Registration Book 102, Page 83.

LOT 7

A certain parcel of land, located in the Town of Wilmington, County of Middlesex, Commonwealth of Massachusetts, said parcel shown as Lot 7 upon a plan entitled "Plan of Land in NORTH READING & WILMINGTON, MASS.", dated September 21, 1983, DANA F. PERKINS and Assoc., Inc., Civil Engineers and Surveyors, and filed with the Engineering Division of the Land Court of Massachusetts as Plan 31713^{C} and Plan 31713^{D} bounded and described as follows:

NORTHWESTERLY	by the Northeasterly line of Fordham Road, eighty-four and 60/100 (84.60) feet;
NORTHWESTERLY	by a radius 1081.41 along the Northeasterly line of Fordham Road, six hundred fifty-nine and 84/100 (659.84) feet;
NORTHERLY	by the Northeasterly line of Fordham Road, two hundred (200) feet;
NORTHEASTERLY	by lands shown on said Plan as "Lot 30", six hundred twenty-one and 74/100 (621.74) feet;
NORTHERLY	by lands shown on said Plan as "Lot 30", ninety-two and 55/100 (92.55) feet;
NORTHEASTERLY	by lands shown on said Plan as "Lot 30", two hundred thirty and 29/100 (230.29) feet;
SOUTHWESTERLY	by the Town Line between Wilmington and North Reading, as shown on said plan, nine hundred seven and 9/100 (907.9) feet;
WESTERLY	by Lot 8, as shown on said Plan, eighty-eight and 69/100 (88.69) feet;
SOUTHEASTERLY	by Lot 8, as shown on said Plan, eighty (80) feet; and
SOUTHWESTERLY	by Lot 8 as shown on said Plan, two hundred fifty-five (255) feet.

Said Lot 7, all within the Town of Wilmington, comprises 12.63 acres, more or less, (549,973 square feet of land, more or less), as shown on said plan.

Said Lot 7 is a subdivision of certain lots, title to which is registered in the Land Registration Office, North Registry District of Middlesex County, and as follows:

- of Lot 31, as shown on Plan No. 34588-C (Certificate of Title No. 19837); Book 102-73

- ~~of Lot 35, as shown on Plan No. 34588-A (Certificate of Title No. 19841);~~ and

- of ~~Lots 4~~ 2 & 4, as shown on Plan No. 31713-A (Certificate of Title No. 19838), Book 102-75

For

LOT 10

A certain parcel of land, located in the Town of North Reading, County of Middlesex, Commonwealth of Massachusetts, said parcel shown as Lot 10 upon a plan entitled "Plan of Land in NORTH READING & WILMINGTON, MASS.", dated September 21, 1983, DANA F. PERKINS and Assoc., Inc., Civil Engineers and Surveyors, and filed with the Engineering Division of the Land Court of Massachusetts as Plan 31713C and Plan 31713D bounded and described as follows:

NORTHERLY	by the Town Line between North Reading and Wilmington, as shown on said Plan, nine hundred seven and 09/100 (907.09) feet;
NORTHWESTERLY	by land shown on said Plan as "Town of North Reading", ninety-eight and 43/100 (98.43) feet;
SOUTHEASTERLY	by Lot 9, as shown on said Plan, four hundred twenty-three and 16/100 (423.16) feet;
SOUTHWESTERLY	by Lot 9, as shown on said Plan, one hundred ten and 41/100 (110.41) feet;
SOUTHEASTERLY	by Lot 9, as shown on said Plan, three hundred ninety and 49/100 (390.49) feet; and
SOUTHWESTELRY	by Lot 9, as shown on said Plan, two hundred forty-eight and 36/100 (248.36) feet.

Said Lot 10, all within the town of North Reading, comprises 3.91 acres of land, more or less (170,477) square feet of land, more or less), as shown on said Plan.

Said Lot 10 is a subdivision of certain lots, title to which is registered in the Land Registration Office, South Registry District of Middlesex County, and as follows:

~~- of Lot 26, as shown on Plan No. 31508-A (Certificate of Title No. 142137)~~; and

Ø of Lot 6, as shown on Plan No. 31713-B (Certificate of Title No. 142138), Bk. 840-188

LOT 30

That certain parcel of land situate in Wilmington, County of Middlesex, Commonwealth of Massachusetts bounded and described as follows:

SOUTHWESTERLY	by the Northeasterly line of Fordham Road, two hundred fifty (250) feet;
NORTHWESTERLY	by land now or formerly of Carl Realty, Inc., six hundred seventy-two and 36/100 (672.36) feet;
EASTERLY	by land now or formerly of So. Mass. Land Developers, Inc., two hundred fifty-five and 07/100 (255.07) feet; and
SOUTHEASTERLY	by land now or formerly of Carl Realty, Inc., six hundred twenty-one and 74/100 (621.74) feet.

All of said boundaries are determined by the Land Court to be located as shown on subdivision plan 34588-B, drawn by Dana F. Perkins & Sons, Inc., Surveyors, dated April 9, 1968, as approved by the Court, filed in the Land Registration Office, a copy of a portion of which is filed with Certificate of title 16261, and said land is shown as Lot thirty (30) on said plan.

Being the same premises evidenced by Certificate of Title No. 19839 (Middlesex North Registry District). Bk. 702-77

LOT 33

That certain parcel of land situate in Wilmington, in the County of Middlesex Commonwealth of Massachusetts, bounded and described as follows:

WESTERLY	by the Easterly line of Fordham Rd. by several lines measuring together, eleven hundred eighty-seven and 97/100 (1,187.97) feet;
NORTHEASTERLY	by land now or formerly of Carl Realty, Inc., five hundred thirty-two and 01/100 (532.01) feet;
NORTHEASTERLY	again by land now or formerly of Max Siegel et al, two hundred ninety-seven (297) feet;
EASTERLY	by land now or formerly of So. Mass. Land Developers, Inc., five hundred ninety-nine and 28/100 (599.28) feet; and
SOUTHEASTERLY	by Lot 30, six hundred seventy-two and 36/100 (672.36) feet.

All of said boundaries are determined by the Land Court to be located as shown on subdivision plan 34588-E, drawn by Dana F. Perkins and Sons, Inc., Surveyors, dated January 27, 1969, as approved by the Court, filed in the Land Registration Office, a copy of a portion of which is filed with Certificate of Title 16620, and said land is shown as Lot thirty-three (33) on said plan.

Being the same premises evidenced by Certificate of Title No. 19840 (Middlesex North Registry District). Bk. 702-77

ACTIVITY AND USE LIMITATION OPINION

EXHIBIT C - ACTIVITY AND USE LIMITATION OPINION

Purpose of the AUL

This Notice of Activity and Use Limitation ("AUL") provides notice to current and future interest holders of the property commonly known as 50 Fordham Road (including the addresses of 40 and 50 Fordham Road), Wilmington, Massachusetts (the "Property") of residual contamination remaining at the Property. It should be noted that this AUL is being used voluntarily, in accordance with Section 40.1012(3)(h) of the Massachusetts Contingency Plan (MCP), 310 CMR 40.0000, and is not required by the MCP, to confirm certain assumptions regarding future uses at the Property for purposes of Risk Characterization of human health and ecological risks at the Disposal Site. This AUL describes certain restrictions upon the use of the Property to promote the ongoing protection of human health and the environment.

This AUL will serve as a notification, concerning appropriate health and safety measures to be taken during any future construction-related or other activities that disturb the subsurface, including (but not limited to) penetration of concrete building slabs, subsurface soil or bedrock excavations and groundwater dewatering activities. It will also be protective of human health and the environment by requiring that any contaminated media generated during construction activities be managed in accordance with Massachusetts Contingency Plan (MCP) Soil Management procedures as described in 310 CMR 40.0030 and the Massachusetts Department of Environmental Protection (MassDEP) guidance documents, including Construction of Buildings in Contaminated Areas (Policy WSC#-00-425) and the Similar Soils Provisions Guidance (WSC#-13-500), as determined by a Licensed Site Professional ("LSP").

Relevant Property History

Contamination of the Stickney Well, a currently inactive public supply well for the town of North Reading, was discovered in the late 1970s. Subsequent investigations of multiple surrounding properties, including the Property (formerly owned and operated by GE Aerospace (sometimes referred to as "GE" herein)), began in the early 1980s. The Property has been subject to remedial investigations and cleanup since 1986, when the MassDEP (then the Department of Environmental Quality Engineering or DEQE) issued GE a Notice of Responsibility. In 1987, the MassDEP

classified the former GE facility as a Priority Disposal Site,[1] and in 1994 the MassDEP assigned Release Tracking Number (RTN) RTN-3-0518 to the site.[2]

The Property has had a history of manufacturing processes that have contributed to releases of fuels, oils, solvents, and metals to the environment. Analytical data have shown that six primary types of organic and inorganic compounds are associated with RTN 3-0518. These include chlorinated volatile organic compounds (CVOCs); total petroleum hydrocarbons (TPH); benzene, toluene, ethyl benzene and xylenes (BTEX) compounds; methyl tertiary butyl ether (MTBE); several metals; and light non-aqueous phase liquids (LNAPL) identified as Stoddard fuel (solvent). Known impacted areas of the Property include four separate operating units (OU), as well as the Tank F and Building 1 Areas, and are summarized in the following table and shown on the attached Figure 1. These areas are designated "Restricted Areas."

Restricted Areas	Description	Affected Media	Compounds of Concern	Regulatory Status
OU-1	Former Tank Farm source area and adjacent Eastern Parking Lot (EPL). Tank Farm had 4 underground storage tanks (USTs) removed in 1987.	Vadose zone soils, and shallow groundwater	Stoddard Solvent LNAPL in groundwater and extractable petroleum hydrocarbons (EPH)-volatile petroleum hydrocarbons (VPH) in both soils and groundwater; associated arsenic	Open
OU-2	Former Tank Farm source area and down-gradient plume on- and off-property	Groundwater	CVOCs and 1,4-dioxane	Open
OU-3	Storm water/Waste water Outfalls 001 and 002	Sediment	Metals and petroleum hydrocarbons	Closed, Partial Class A-2 Response Action Outcome (RAO) (Submitted 2004)

[1] Under 310 CMR 40.0006 (1)(b), the term "Disposal Site" is used to refer to a place or area where an uncontrolled release of oil and/or hazardous material from or at a site or vessel has come to be located.

[2] Martin Marietta acquired GE Aerospace in 1993 and subsequently Martin Marietta and Lockheed merged to form Lockheed Martin Corporation.

Restricted Areas	Description	Affected Media	Compounds of Concern	Regulatory Status
OU-4	Former Tank K source area and immediately down-gradient of plume.	Vadose zone soils and shallow groundwater	Gasoline related petroleum hydrocarbons (VOCs) from former gasoline UST. UST was removed in 1986.	Closed, Partial Class A-2 RAO (Submitted 2010)
Tank F/Building 1 Area	Former Tank F area and area below concrete slab of Building 1	Vadose zone soils and groundwater	CVOCs and petroleum hydrocarbons	Open

OU-1 Area

The Response Actions taken at the Tank Farm/EPL Petroleum Area (OU-1) have included LNAPL recovery, removal of Building 3 and the Oil House/drum storage, and excavation and off-site disposal of petroleum contaminated soil. Since 2011, LNAPL gauging has indicated the absence of measurable LNAPL in any wells that have been gauged. Soil impacts in the OU-1 appear to be consistent with current MCP Industrial/Commercial standards; however, the deeper groundwater and down-gradient plume is impacted with the CVOCs emanating from the former Tank Farm OU-2 Area (see below).

OU-2 Area

The Response Actions taken at the Tank Farm CVOC Source Area (OU-2) have been extensive and included:

- Removal in 1987 of four Underground Storage Tanks ("USTs") at the Tank Farm (Tank D, a 10,000-gal "waste fuel" tank that received waste fuel and oil, thinners, and solvents; Tank G, a 10,000-gal tank used for storing jet fuel and oil; Tank H, a 1,000- gal tank used for storing JP-4 jet fuel; and Tank I, a 500-gal tank used for storing methanol).
- Groundwater pump and treat at the Tank Farm Area between 1993 and 2002. During operation, approximately 1.9 million gallons of groundwater were treated, and approximately 31 pounds of VOCs were removed from the groundwater.
- Groundwater pump and treat in a bedrock well (TRC-202R) located down-gradient of the Tank Farm Area between 2003 and 2008. During operation, approximately 4.3 million gallons of groundwater were treated, and approximately 159 pounds of VOCs were

removed from the groundwater. Groundwater data trends did not indicate significant reductions in contaminant concentrations. The system remains shut down at the present time.

- Addition of a remedial treatment solution known as Emulsified Zero Valent Iron (EZVI) in 2005 through 2006. EZVI was injected directly into bedrock fractures and into the overburden-bedrock interface within the Tank Farm Area. The EZVI treatment was not considered successful.

- Analysis of monitored natural attenuation (MNA) geochemical and microbiological parameters in 2012 for groundwater, indicating conditions supportive of limited enhanced reductive dechlorination. A review of plume geometry and other trends indicate that the off-site CVOC impacts appear to be stable or shrinking.

- Additional groundwater investigation activities from 2012 through 2014 in the Tank Farm, the EPL and off-site in the adjacent wetland areas. This work is on-going and the data will be evaluated and presented in a Supplemental Phase II report in the future.

OU-3 and OU-4 Areas

Areas within OU-3 and OU-4 have been remediated and closed under the MCP in 2004 and 2010, respectively. Response Actions taken at OU-3 included excavation of metal-impacted sediments and wetland restoration. Response Actions taken at OU-4 have included UST removal, soil excavation, and biosparge/soil vapor extraction. Although these areas have been closed under the MCP, it should be noted that contaminated media were cleaned up to Industrial/Commercial standards and that low level impacts may remain. That is, the soil, sediments and groundwater have not been cleaned up to conditions such that these locations would be suitable for Residential, Institutional, or park/playground land use without first completing further response actions.

Tank F and Building 1 Areas

Tank F, formerly located on the southwest side of Building 1 on the former GE facility property, which received acid and caustic wastes plus other degreasing solvent and fuel wastes through floor drains from Building 1, was removed from the Property in 1990. No obvious impacts were

observed during its removal or from samples obtained from soils and other liquids associated with the tank prior to its removal. No remedial efforts have been associated with this tank area.

Investigation results suggest CVOC impacts in the southwestern area of Building 1 and/or the former Tank F area. Shallow groundwater in the overburden does not exhibit elevated CVOC concentrations; however, bedrock wells in this area exhibited much higher concentrations of both PCE and TCE. In June 1987, a small tank was removed adjacent to Tank F and field screening levels of VOCs ranging from 100 to 200 parts per million (ppm) were encountered near the bottom of the excavation. In addition, sampling of sediment from within the chase troughs in Building 1 exhibited petroleum hydrocarbon and CVOC impacts. Soils within the top foot under the metals finishing floor sumps indicated low levels of CVOCs.

Sub-slab and indoor air sampling has been conducted within Building 1 between 2009 through 2014. Elevated levels of petroleum hydrocarbons and CVOCs have been detected below the concrete slab of Building 1. Low levels of CVOCs have also been detected in indoor air samples, however, they have consistently been below MassDEP available MA Commercial/Industrial (C/I) Threshold Values and do not pose a risk to industrial/ commercial workers. It is therefore the opinion of the LSP that industrial and commercial use is a permissible use under the AUL.

In 2013 and 2014, additional soil and groundwater investigation activities have been performed underneath Building 1. This work is on-going and the data will be evaluated and presented in a Supplemental Phase II report in the future.

Nature and Extent of Contamination

The lateral extent of the MCP Disposal Site encompasses a large portion of the Property as shown on the attached **Figure 1**. Within this site boundary, residual levels of contaminants are likely present within soil or groundwater or both. Higher concentrations are expected within the Operable Units and the Tank F/Building 1 Areas than in areas outside of these designated areas. However, low level residual contamination above applicable MCP standards may be present in areas outside of these areas within the Disposal Site boundary. The AUL boundary has been set to encompass a large portion of the Property, including the Restricted Areas, but exclusive of the

northern wetland areas where future construction-related activities are considered to be highly unlikely, and exclusive of the areas beneath and between Buildings 1A and 2.

Recommendations

It is the opinion of the LSP that the restrictions on Activities and Uses of the Property and the Obligations and Conditions contained in the AUL are appropriate, based on the foregoing.

TRUSTEE CERTIFICATE

WILMINGTON REALTY TRUST
TRUSTEES' CERTIFICATE

The undersigned, Rosemarie Stanieich, Victoria J. Maiyara, and Annette Maria Given, as Trustees of Wilmington Realty Trust under Declaration of Trust dated September 7, 1973, registered in the Middlesex North Registry District of the Land Court as Document No. 63541 and noted on Certificate of Title No. 19837 and registered further in the Middlesex South Registry of the Land Court as Document No. 515729 and noted on Certificate of Title No. 142138 (the "Trust"), hereby certify as follows:

1. That they are all of the current Trustees of the Trust;

2. That the Trust is in full force and effect and has not been revoked, terminated or rescinded in whole or in part;

3. That the undersigned Trustees have been duly authorized and specifically directed by all of the beneficiaries of the Trust to execute, acknowledge and deliver that certain Activity and Use Limitation with respect to the property owned by the Trust and having an address of 50 Fordham Road in Wilmington, Massachusetts, and:

4. No beneficiary of the Trust is a minor, a Massachusetts corporation selling all or substantially of all its Massachusetts assets, or a personal representative of an estate subject to an estate tax lien, deceased, or under any other legal incapacity.

EXECUTED as a sealed instrument this 13th day of July, 2015

RL/PQL=Reporting/Practical Quantitation Level ND=Not Detected BRL=Below Reporting Level
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

MAEPH:
1* Hydrocarbon range data exclude concentrations of any surrogate(s) and/or internal standards eluting in that range.
2* C11-C12 Aromatic Hydrocarbons exclude the concentration of Target PAH analytes eluting in that range.

VPH:
*1 Range data exclude conc.s of any surrogate(s) and/or Int. std.s eluting in that range.
*2 C5-C8 and C9-C12 Aliphatic exclude the conc. of Target Analytes in that range.
*3 C9-C12 Aliphatic also exclude C9-C10 Aromatic Hydrocarbon

Volatile Comment:
Elevated reporting limits for volatiles due to the presence of target and/or non-target compounds.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

QA/QC Data

SDG I.D.: GCJ17882

Parameter	Blank	Blk RL	LCS %	LCSD %	LCS RPD	MS %	MSD %	MS RPD	% Rec Limits	% RPD Limits
Comment:										
A LCS and LCS Duplicate were performed instead of a matrix spike and matrix spike duplicate.										
Additional 8260 criteria: 10% of compounds can be outside of acceptance criteria as long as recovery is 10%. The RPD criteria for the LCS/LCSD is 20%, The MS/MSD RPD criteria is listed above.										
QA/QC Batch 591823 (ug/L), QC Sample No: CJ22041 (CJ17883 (100X))

Comment:										
This batch consists of a Blank, LCS and LCSD.										

r = This parameter is outside laboratory RPD specified recovery limits.

If there are any questions regarding this data, please call Phoenix Client Services at extension 200.

RPD - Relative Percent Difference
LCS - Laboratory Control Sample
LCSD - Laboratory Control Sample Duplicate
MS - Matrix Spike
MS Dup - Matrix Spike Duplicate
NC - No Criteria
Intf - Interference
