

LOCKHEED MARTIN 

ATACMS™

Long-Range Precision Tactical Missile System

ATACMS

ATACMS UNITARY

Lockheed Martin Missiles and Fire Control produces the Army Tactical Missile System for the U.S. Army and partner nations.

ATACMS is a long-range, guided missile that gives commanders the immediate firepower to shape the battlespace. Each ATACMS missile is packaged in an MLRS® launch pod, and fired from the MLRS® family of launchers.

The ATACMS Unitary configuration employs an upgraded guidance and control system, new software and an improved fuze. These upgrades provide a vertical impact capability that increases the reliability, accuracy and lethality of the missile while reducing collateral damage. This configuration is fielded by the U.S. Army and several allied countries.

ATACMS provides a critical precision engagement capability and has demonstrated extremely high rates of combat accuracy and reliability.

“Precision Fires expresses their appreciation to Lockheed Martin Missiles and Fire Control for the outstanding record of 20 years production of ‘on time’ or ‘ahead of schedule’ ATACMS that have been delivered to the warfighter and successfully employed against the evolving enemy. The hard work and diligent efforts of Lockheed Martin provides the warfighter a full quiver of arrows that work the first time, every time, capable of engaging all targets.”

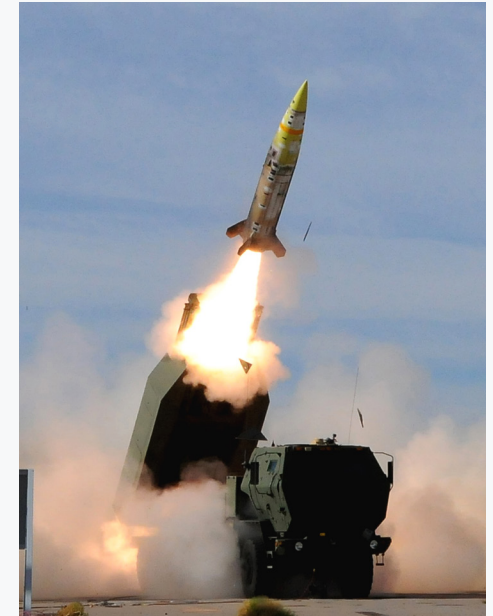

– Col. (Ret.) David Rice, U.S. Army Project Manager/
Precision Fires Rocket and Missile Systems

FEATURES

- The Unitary delivers a monolithic high explosive warhead using GPS guidance
- The Unitary has vertical impact capability and collateral damage is less than 100m from the point of impact
- The system has a more effective logistical trail and expands the target set

SPECIFICATIONS

LENGTH:	Approximately 13 ft
DIAMETER:	Approximately 24 in
RANGE:	300km
PROPELLANT:	Solid fuel rocket motor
GUIDANCE:	Inertial Navigation with GPS
WARHEAD:	Precision unitary
LOAD:	Two missiles per M270 launcher — one missile per HIMARS® launcher
